Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

enforce-first-as *boolean*

Synopsis	Enforce the configured peer AS value in received routes
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* enforce-first-as *boolean*
Tree	enforce-first-as
Description	When configured to **true** for an EBGP session, all routes received from an EBGP peer are checked to ensure that the most recent ASN in the AS_PATH attribute of each route matches the configured AS of the session. If there is not a match, the session is reset (if the **update-fault-tolerance** command in the **error-handling** context is set to **false**) or the session is left up but the route is treated as withdrawn (if **update-fault-tolerance** is set to **true**). This command does not flap an established session because it applies only to routes received after the command is issued. When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, received routes are not checked for compliance with the rule.
Introduced	25.3.R2
Platforms	SAR Gen 2

error-handling

Synopsis	Enter the **error-handling** context
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* error-handling

Tree	helper-override-stale-time
Description	This command configures a locally-imposed LLGR stale time that overrides the long-lived stale routes time that is advertised by the router in its LLGR capability. This is a family-specific override value.
Range	0 to 16777216
Default	16777216
Introduced	25.3.R2
Platforms	SAR Gen 2

forwarding-bits-set *keyword*

Synopsis	BGP LLGR forwarding-bit behavior for address family
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* graceful-restart long-lived forwarding-bits-set *keyword*
Tree	forwarding-bits-set
Description	This command determines the setting of the F bit in the GR and LLGR capabilities advertised by the router. When the F bit is set for an address family, it indicates that the advertising router is able to preserve forwarding state for the routes of that address family across the last restart. When the session is re-established after a restart and the F bit is not set, all stale routes from the peer are immediately removed for the corresponding address family. This command allows the F bit to be set for all address families or only for non-forwarding address families (L2-VPN, route target, flow-IPv4, and flow-IPv6).
Options	none, all, non-fwd
Default	none
Introduced	25.3.R2
Platforms	SAR Gen 2

helper-override-restart-time *number*

Synopsis	Locally-configured override for restart time

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* graceful-restart long-lived helper-override-restart-time *number*
Tree	helper-override-restart-time
Description	This command overrides the restart time advertised by a peer (in its GR capability) with a locally-configured value. This override applies only to AFI/SAFI that were included in the GR capability of the peer. The restart-time is always zero for AFI/SAFI not included in the GR capability. This command is useful if the local router wants to force the LLGR phase to begin after a set time for all protected AFI/SAFI.
Range	0 to 4095
Introduced	25.3.R2
Platforms	SAR Gen 2

helper-override-stale-time *number*

Synopsis	Locally-configured stale routes override time
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* graceful-restart long-lived helper-override-stale-time *number*
Tree	helper-override-stale-time
Description	This command configures a locally-imposed LLGR stale time that overrides the long-lived stale routes time that is advertised by the router in its LLGR capability. This command applies to all AFI/SAFI in the advertised LLGR capability except for any AFI/SAFI with a family-specific override.
Range	0 to 16777215
Introduced	25.3.R2
Platforms	SAR Gen 2

without-no-export *boolean*

Synopsis	Advertise LLGR stale routes to non-LLGR peers
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* graceful-restart long-lived without-no-export *boolean*
Tree	without-no-export
Description	When configured to **true**, LLGR stale routes can be advertised to any peer (EBGP or IBGP) that did not signal the LLGR capability. For IBGP and confederation-EBGP peers that did not advertise the LLGR capability, the local preference attribute in the advertised stale routes is automatically set to 0. When configured to **false**, LLGR stale routes are not advertised to any EBGP peer that did not signal the LLGR capability. For IBGP and confederation-EBGP peers that did not advertise the LLGR capability, the local preference attribute in the advertised stale

seconds *number*

Synopsis	Maximum hold time between successive messages
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* hold-time seconds *number*
Tree	seconds
Description	The BGP hold time specifies the maximum time BGP waits between successive messages (either keepalive or update) from its peer, before closing the connection. Even though the implementation allows setting the keepalive timer at the BGP neighbor level times separately, the configured keepalive timer is overridden by this value under the following circumstances:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- If the specified hold time is less than the configured keepalive time, then the operational keepalive time is set to a third of the hold-time; the configured keepalive time is not changed.
- If the hold time is set to zero, the operational value of the keepalive time is set to zero; the configured keepalive time is not changed. This means that the connection with the peer is up permanently and no keepalive packets are sent to the peer.

When unconfigured, the command setting is inherited from the BGP group-level configuration.

Range	0 | 3 to 65535
Introduced	25.3.R2
Platforms	SAR Gen 2

Tree	local-as
Introduced	25.3.R2
Platforms	SAR Gen 2

as-number *number*

Synopsis	Local (or virtual) BGP AS number
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* local-as as-number *number*
Tree	as-number
Range	1 to 4294967295
Introduced	25.3.R2
Platforms	SAR Gen 2

prepend-global-as *boolean*

Synopsis	Prepend global ASN when advertising routes to BGP peer
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* local-as prepend-global-as *boolean*
Tree	prepend-global-as
Description	When configured to **true**, the global ASN is added to the AS_PATH attribute in outbound routes sent to the peer. When configured to **false**, the global ASN is not included in the AS_PATH attribute.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

private *boolean*

Synopsis	Hide the local ASN in sent paths learned from peering
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* local-as private *boolean*
Tree	private
Description	When configured to **true**, the local AS number is only advertised to peers that use the local ASN for establishing BGP peering sessions. When configured to **false**, the local ASN is advertised to all peers, including those that can use the global ASN for establishing BGP peering sessions.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

local-preference *number*

Synopsis	Default local preference if not in incoming routes
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* local-preference *number*
Tree	local-preference
Range	0 to 4294967295
Introduced	25.3.R2
Platforms	SAR Gen 2

loop-detect *keyword*

Synopsis	Strategy for loop detection in the AS path
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* loop-detect *keyword*
Tree	loop-detect
Options	drop-peer, ignore-loop, off, discard-route
Introduced	25.3.R2
Platforms	SAR Gen 2

loop-detect-threshold *number*

Synopsis	Threshold for the global ASN in a received AS path
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* loop-detect-threshold *number*
Tree	loop-detect-threshold
Range	0 to 15
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.

med-out *(number | keyword)*

Synopsis	Default MED attribute value to advertise to peers
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* med-out *(number | keyword)*
Tree	med-out
Max. range	0 to 4294967295
Options	igp-cost
Introduced	25.3.R2
Platforms	SAR Gen 2

min-route-advertisement *number*

Synopsis	Minimum interval between successive prefix updates
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* min-route-advertisement *number*
Tree	min-route-advertisement
Range	1 to 255
Introduced	25.3.R2
Platforms	SAR Gen 2

multihop *number*

Synopsis	TTL in IP packet headers for EBGP peers multi-hops away
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* multihop *number*
Tree	multihop
Range	1 to 255
Introduced	25.3.R2
Platforms	SAR Gen 2

multipath-eligible *boolean*

Synopsis	Allow routes from this peer in multipath eligibility
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* multipath-eligible *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	multipath-eligible
Introduced	25.3.R2
Platforms	SAR Gen 2

next-hop-self *boolean*

Synopsis	Advertise routes with local address as next-hop address
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* next-hop-self *boolean*
Tree	next-hop-self
Description	When configured to **true**, this command configures BGP to advertise routes to members of a group using a local address of the BGP instance as the BGP next-hop address. Note that this command is set without exception, regardless of the route source (EBGP or IBGP) or its family. When used with VPN-IPv4 and VPN-IPv6 routes, the **configure router bgp rr-vpn-forwarding** command should also be configured. When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, protocol standard behavior is applied to determine whether to set **next-hop-self** in advertised routes.
Introduced	25.3.R2
Platforms	SAR Gen 2

origin-validation

Synopsis	Enable the **origin-validation** context
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* origin-validation
Tree	origin-validation
Description	Commands in this context configure the marking of every inbound IPv4, IPv6, and labeled IPv4 route from the BGP peer with one of the following origin validation states: • Valid (0) • Not-Found (1) • Invalid (2) The configurations apply to all types of VPRN BGP peers, but generally should be applied only to EBGP peers and groups that contain only EBGP peers.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipv4 *boolean*

Synopsis	Enable support for unlabeled unicast IPv4 routes
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* origin-validation ipv4 *boolean*
Tree	ipv4
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ipv6 *boolean*

Synopsis	Enable support for unlabeled unicast IPv6 routes
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* origin-validation ipv6 *boolean*
Tree	ipv6
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

label-ipv4 *boolean*

Synopsis	Enable support for labeled-unicast IPv4 routes
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* origin-validation label-ipv4 *boolean*
Tree	label-ipv4
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

passive *boolean*

Synopsis	Use passive mode for BGP communication
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* passive *boolean*
Tree	passive

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	25.3.R2
Platforms	SAR Gen 2

path-mtu-discovery *boolean*

Synopsis	Enable path MTU discovery
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* path-mtu-discovery *boolean*
Tree	path-mtu-discovery
Description	When configured to **true**, Path MTU Discovery (PMTUD) is enabled for the associated TCP connections. When set to **true**, PMTUD is activated toward an IPv4 BGP neighbor and the Don't Fragment (DF) bit is set in the IP header of all IPv4 packets sent to the peer. If any device along the path toward the peer cannot forward the packet because the IP MTU of the interface is smaller than the IP packet size, this device drops the packet and sends an ICMP or ICMPv6 error message encoding the interface MTU. When the router receives the ICMP or ICMPv6 message, it lowers the TCP maximum segment size limit from the previous value so that the IP MTU constraint can be accommodated. When PMTUD is configured to **false** and there is no TCP MSS configuration that can be associated with a BGP neighbor (in either the BGP configuration or the first hop IP interface configuration), the router advertises a value of only 1024 bytes as the TCP MSS option value, limiting received TCP segments to that size.
Introduced	25.3.R2
Platforms	SAR Gen 2

peer-as *number*

Synopsis	Peer AS number
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* peer-as *number*
Tree	peer-as
Description	This command configures the autonomous system number for the peer. The peer AS number must be configured for each configured peer. For EBGP peers, the peer AS number configured must be different from the autonomous system number configured for this router under the global level since the peer will be in a different autonomous system than this router. For IBGP peers, the peer AS number must be the same as the autonomous system number of this router configured under the global level.
Range	1 to 4294967295
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

peer-creation-type *keyword*

Synopsis	Peer creation type
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* peer-creation-type *keyword*
Tree	peer-creation-type
Options	static, dynamic, dynamic-if-remote, dynamic-if-local
Default	static
Introduced	25.3.R2
Platforms	SAR Gen 2

peer-ip-tracking *boolean*

Synopsis	Enable BGP peer tracking
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* peer-ip-tracking *boolean*
Tree	peer-ip-tracking
Description	When configured to **true**, this command enables BGP peer tracking. Peer tracking should be used with caution. Peer tracking can tear a session down even if the loss of connectivity turns out to be short-lived (for example, while the IGP protocol is re-converging). Next-hop tracking, which is always enabled, handles temporary connectivity issues more effectively. When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, peer tracking is disabled.
Introduced	25.3.R2
Platforms	SAR Gen 2

preference *number*

Synopsis	Route preference for routes learned from all peers
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* preference *number*
Tree	preference
Description	This command configures the route preference for routes learned from the configured peers.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The lower the preference value, the higher the chance of the route being the active route. The router assigns BGP routes the highest default preference as compared to routes that are direct, static or learned via MPLS or OSPF.

When unconfigured, the command setting is inherited from the group-level configuration.

Range	1 to 255
Introduced	25.3.R2
Platforms	SAR Gen 2

prefix-limit [family] *keyword*

Synopsis	Enter the **prefix-limit** list instance
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* prefix-limit *keyword*
Tree	prefix-limit
Introduced	25.3.R2
Platforms	SAR Gen 2

[**family**] *keyword*

Synopsis	Address family to which the limit applies
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* prefix-limit *keyword*
Tree	prefix-limit
Options	ipv4, ipv6, mcast-ipv4, flow-ipv4, flow-ipv6, mcast-ipv6, label-ipv4
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

hold-excess *number*

Synopsis	Percentage of maximum routes to install in route table
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* prefix-limit *keyword* hold-excess *number*
Tree	hold-excess
Description	This command specifies the percentage of maximum routes that are allowed to be installed in the route table for the configured address family. If a peer within scope of the configuration exceeds the limit, the overflow routes are held in the BGP RIB as inactive routes and are ineligible for forwarding and advertisement to other peers. If the **post-**

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

import command is configured to **true**, only routes not rejected by import policies count toward the limit.

A BGP route in an overflow state is reconsidered for activation and reinstallation when an UPDATE message is received for the route.

This command is mutually exclusive with the **idle-timeout** and **log-only** commands.

Range	1 to 100
Introduced	25.3.R2
Platforms	SAR Gen 2

idle-timeout *number*

Synopsis	Time which BGP peering remains idle before reconnecting
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* prefix-limit *keyword* idle-timeout *number*
Tree	idle-timeout
Description	This command defines the idle time after an administrative take-down before BGP re-establishes a session and reconnects to a peer. When unconfigured, the command inherits the value from the group-level configuration.
Range	1 to 1024
Introduced	25.3.R2
Platforms	SAR Gen 2

log-only *boolean*

Synopsis	Send warning message at threshold instead of take-down
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* prefix-limit *keyword* log-only *boolean*
Tree	log-only
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

maximum *number*

Synopsis	Maximum number of routes to be learned from a peer
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* prefix-limit *keyword* maximum *number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	maximum
Description	This command configures the maximum number of BGP routes than can be received from a peer before administrative action is taken.
Range	1 to 4294967295
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

post-import *boolean*

Synopsis	Apply limit only to routes accepted by import policies
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* prefix-limit *keyword* post-import *boolean*
Tree	post-import
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

threshold *number*

Synopsis	Percentage threshold that triggers a warning message
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* prefix-limit *keyword* threshold *number*
Tree	threshold
Range	1 to 100
Default	90
Introduced	25.3.R2
Platforms	SAR Gen 2

remove-private

Synopsis	Enable the **remove-private** context
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* remove-private

split-horizon *boolean*

Synopsis	Prevent routes being reflected back to best-route peer
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* split-horizon *boolean*
Tree	split-horizon
Description	When configured to **true**, this command enables the use of split-horizon. This command prevents routes from being reflected back to a peer that sends the best route. It applies to routes of all address families and to any type of sending peer; confed-EBGP, EBGP and IBGP. Enabling the split-horizon functionality may have a detrimental impact on peer and route scaling and should only be used when absolutely necessary. When unconfigured, the command inherits the value of the group-level setting (**true** or **false**). The command cannot be explicitly configured to **false**. When this command inherits a value of **false**, the use of split-horizon is disabled.
Introduced	25.3.R2
Platforms	SAR Gen 2

tcp-mss *(number | keyword)*

Synopsis	TCP maximum segment size override
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* tcp-mss *(number | keyword)*
Tree	tcp-mss
Description	This command configures an override for the TCP maximum segment size to use with a specific peer or set of peers (depending on the scope of the command). The configured value controls two properties of the TCP connection as follows: TCP MSS option - The router advertises the TCP MSS option value in the TCP SYN packet it sends as part of the 3-way handshake. The advertised value may be lower than the configured value, depending on the IP MTU of the first hop IP interface. The peers must abide by this value when sending TCP segments to the local router. TCP maximum segment size - The actual transmitted size may be lower than the configured value, depending on the TCP MSS option value signaled by the peers, the effect of path MTU discovery, or other factors.
Range	384 to 9746
Options	ip-stack
Introduced	25.3.R2
Platforms	SAR Gen 2

third-party-nexthop *boolean*

Synopsis	Apply third-party next-hop processing to EBGP peers
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* third-party-nexthop *boolean*
Tree	third-party-nexthop
Introduced	25.3.R2
Platforms	SAR Gen 2

ttl-security *number*

Synopsis	Minimum TTL value for an incoming BGP packet
Context	**configure** service vprn *service-name* bgp neighbor *(ipv4-address-with-zone | ipv6-address-with-zone)* ttl-security *number*
Tree	ttl-security
Description	This command configures the minimum TTL value that BGP will accept from an incoming packet. A packet with a TTL value less than the minimum configured TTL value is discarded.

use-bgp-routes *boolean*

Synopsis	Use BGP routes to resolve BGP next hops

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vprn *service-name* bgp next-hop-resolution use-bgp-routes *boolean*
Tree	use-bgp-routes
Description	When configured to **true**, BGP routes resolve BGP next hops. When this command is enabled, any unlabeled IPv4 or IPv6 BGP route received from a VPRN BGP peer becomes resolvable by up to four other BGP routes in order to resolve the route to a VPRN IP interface. A VPRN BGP route is not resolvable by another VPRN BGP route or by a BGP-VPN route. This command also allows unlabeled IPv4 or IPv6 BGP routes leaked from the GRT with unresolved next hops (in the GRT) to be resolvable by BGP-VPN routes (of the VPRN). When configured to **false**, BGP next hops are not resolved.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

use-leaked-routes

Synopsis	Enter the **use-leaked-routes** context
Context	**configure** service vprn *service-name* bgp next-hop-resolution use-leaked-routes

static *boolean*

Synopsis	Use leaked static routes to resolve BGP next hop
Context	**configure** service vprn *service-name* bgp next-hop-resolution use-leaked-routes static *boolean*
Tree	static
Description	When configured to **true**, the router allows any non-leaked unlabeled unicast IPv4 or IPv6 route in the BGP RIB to be resolved by a leaked static route with direct next hops. A BGP route resolved this way cannot resolve other routes (including BGP routes) and cannot be redistributed into non-BGP protocols, such as IGP. When configured to **false**, the router prevents the use of leaked static routes to resolve BGP routes.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

path-mtu-discovery *boolean*

Synopsis	Enable Path MTU Discovery
Context	**configure** service vprn *service-name* bgp path-mtu-discovery *boolean*
Tree	path-mtu-discovery
Description	When configured to **true**, Path MTU Discovery (PMTUD) is activated toward an IPv4 BGP neighbor. The Don't Fragment (DF) bit is set in the IP header of all IPv4 packets sent to the peer. If any device along the path toward the peer cannot forward the packet because the IP MTU of the interface is smaller than the IP packet size, the device drops the packet and sends an ICMP or ICMPv6 error message encoding the interface MTU. When the router receives the ICMP or ICMPv6 message, it lowers the TCP maximum segment size limit from the previous value to accomodate the IP MTU constraint. When configured to **false**, PMTUD is disabled and there is no TCP MSS configuration to associate with a BGP neighbor (in either the BGP configuration or the first-hop IP interface configuration). The router advertises a TCP MSS option of only 1024 bytes, limiting the received TCP segments to that size.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

peer-ip-tracking *boolean*

Synopsis	Enable BGP peer tracking
Context	**configure** service vprn *service-name* bgp peer-ip-tracking *boolean*
Tree	peer-ip-tracking
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

peer-tracking-policy *reference*

Synopsis	Policy for BGP peer tracking on router instance
Context	**configure** service vprn *service-name* bgp peer-tracking-policy *reference*
Tree	peer-tracking-policy
Description	This command specifies the name of a policy statement to use with the BGP peer-tracking function on BGP sessions where peer tracking is enabled. When unconfigured, the default peer-tracking policy allows any type of route to match the neighbor IP address except aggregate routes and LDP shortcut routes.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Peer tracking should be used with caution. The peer-tracking policy should only permit one of direct-interface or direct routes to be advertised to a BGP peer. Advertising both routes causes the best route to oscillate.

Reference **configure** policy-options policy-statement *named-item-64*

Introduced 25.3.R2

Platforms SAR Gen 2

preference *number*

Synopsis Route preference for routes learned from all peers

Context **configure** service vprn *service-name* bgp preference *number*

Tree preference

Description This command configures the route preference for routes learned from the configured peers.

The lower the preference value, the higher the chance of the route being the active route. The router assigns BGP routes the highest default preference as compared to routes that are direct, static or learned via MPLS or OSPF.

Range 1 to 255

Default 170

Introduced 25.3.R2

Platforms SAR Gen 2

rapid-update

Synopsis Enter the **rapid-update** context

Context **configure** service vprn *service-name* bgp rapid-update

Tree rapid-update

Description Commands in this context specify the address families that are configured to support the rapid update functionality.

The rapid update functionality overrides the remaining time on a peer's MRAI timer and immediately sends routes belonging to the specified address families (and all other pending updates) to the peers receiving these routes.

Introduced 25.10.R1

policy-name *reference*

Synopsis	Name of policy that controls route importation into RIB
Context	**configure** service vprn *service-name* bgp rib-management ipv4 route-table-import policy-name *reference*
Tree	policy-name
Description	This command specifies the name of a policy that controls the importation of active routes from the IP route table into one of the BGP RIBs. When this command is configured, routes dropped or rejected by the policy are not installed in the associated RIB. Rejected routes cannot be advertised to BGP peers associated with the RIB, but they can still be used to resolve BGP next hops of routes in that RIB. If the active route for a prefix is rejected by the policy, the best BGP route for that prefix in the BGP RIB can be advertised to peers as though it is used. Aggregate routes are always imported into each RIB, independent of the specified policy. Route modifications specified in the actions of the policy are ignored and have no effect on the imported routes. When unconfigured, or if the command refers to an empty policy, all non-BGP routes from the IP route table are imported into the applicable RIB.

split-horizon *boolean*

Synopsis	Prevent routes being reflected back to best-route peer
Context	**configure** service vprn *service-name* bgp split-horizon *boolean*
Tree	split-horizon
Description	When configured to **true**, this command enables the use of split-horizon. This command prevents routes from being reflected back to a peer that sends the best route. It applies to routes of all address families and to any type of sending peer; confed-EBGP, EBGP and IBGP.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Enabling the split-horizon functionality may have a detrimental impact on peer and route scaling and should only be used when absolutely necessary.

When configured to **false**, the use of split-horizon is disabled.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

tcp-mss *number*

Synopsis TCP maximum segment size override

Context **configure** service vprn *service-name* bgp tcp-mss *number*

Tree tcp-mss

Description This command configures an override for the TCP maximum segment size to use with a specific peer or set of peers (depending on the scope of the command).

The configured value controls two properties of the TCP connection as follows:

TCP MSS option - The router advertises the TCP MSS option value in the TCP SYN packet it sends as part of the 3-way handshake. The advertised value may be lower than the configured value, depending on the IP MTU of the first hop IP interface. The peers must abide by this value when sending TCP segments to the local router.

TCP maximum segment size - The actual transmitted size may be lower than the configured value, depending on the TCP MSS option value signaled by the peers, the effect of path MTU discovery, or other factors.

Range 384 to 9746

Introduced 25.3.R2

Platforms SAR Gen 2

third-party-nexthop *boolean*

Synopsis Apply third-party next-hop processing to EBGP peers

Context **configure** service vprn *service-name* bgp third-party-nexthop *boolean*

Tree third-party-nexthop

Description When configured to **true**, this command enables the router to send third-party next hop to EBGP peers in the same subnet as the source peer. The address family of the transport must match the address family of the route.

When an IPv4 or IPv6 route is received from one EBGP peer and advertised to another EBGP peer in the same IP subnet, the BGP next hop is left unchanged.

When configured to **false**, third-party next-hop processing is disabled and the next hop carries the IP address of the interface used to establish the TCP connection to the peer.

enforce-strict-tunnel-tagging *boolean*

Synopsis	Allow enforcement of strict tunnel tagging
Context	**configure** service vprn *service-name* bgp-evpn mpls *number* auto-bind-tunnel enforce-strict-tunnel-tagging *boolean*
Tree	enforce-strict-tunnel-tagging
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

enforce-untagged-route *keyword*

Synopsis	Untagged route type enforcement
Context	**configure** service vprn *service-name* bgp-evpn mpls *number* auto-bind-tunnel enforce-untagged-route *keyword*
Tree	enforce-untagged-route
Description	This command configures the enforcement of BGP routes with no administrative tag policy applied by modifying the next-hop resolution behavior for autobind services. If the **untagged-tunnel** option is configured, untagged routes only bind to LSPs with no administrative tag configured. If both tagged and untagged tunnels to the next hop exist, the system only considers the untagged tunnels. If no untagged tunnels to the next hop exist, the resolution of untagged routes fails. The **untagged-tunnel** option can be used in combination with the **enforce-strict-tunnel-tagging** command configured to **true**, in which case tagged routes resolve to tagged LSPs, and untagged routes only resolve to untagged LSPs. When unconfigured, untagged routes can bind to tagged or untagged LSPs.
Options	none – Untagged routes can bind to tagged or untagged LSPs untagged-tunnel – Untagged routes only bind to LSPs without an admin tag
Default	none

Platforms	SAR Gen 2

ldp *boolean*

Synopsis	Use LDP tunneling for next-hop resolution
Context	**configure** service vprn *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter ldp *boolean*
Tree	ldp
Description	When configured to **true**, BGP searches for an LDP LSP with a FEC prefix corresponding to the address of the BGP next hop. When configured to **false**, LDP tunneling is not used for next-hop resolution.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

rsvp *boolean*

Synopsis	Use RSVP tunneling for next-hop resolution
Context	**configure** service vprn *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter rsvp *boolean*
Tree	rsvp
Description	When configured to **true**, BGP searches the best metric RSVP LSP to determine the address of the BGP next hop. This address can correspond to the system interface or to another loopback interface used by the BGP instance on the remote node. The LSP metric is provided by MPLS in the tunnel table. In the case of multiple RSVP LSPs with the same lowest metric, BGP selects the LSP with the lowest tunnel ID. When configured to **false**, the RSVP LSP is not used for next-hop resolution.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

sr-isis *boolean*

Synopsis	Use IS-IS SR tunneling for next-hop resolution
Context	**configure** service vprn *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-isis *boolean*
Tree	sr-isis

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, BGP uses an IS-IS tunnel type to resolve the BGP next hop. When the **sr-isis** command is enabled, an SR tunnel to the BGP next hop is selected in the TTM according to the following procedure. • Select the SR tunnel submitted by the IS-IS instance with the lowest tunnel table preference. • If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest metric. • If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest instance ID. When configured to **false**, IS-IS tunneling is not used for next-hop resolution.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

sr-ospf *boolean*

Synopsis	Use OSPF SR tunneling for next-hop resolution
Context	**configure** service vprn *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-ospf *boolean*
Tree	sr-ospf
Description	When configured to **true**, BGP uses an OSPF tunnel type to resolve the BGP next hop. When enabled, an SR tunnel to the BGP next hop is selected in the TTM according to the following procedure. • Select the SR tunnel submitted by the OSPF instance with the lowest tunnel table preference. • If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest metric. • If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest instance ID. When configured to **false**, OSPF tunneling is not used for next-hop resolution.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

sr-ospf3 *boolean*

Synopsis	Use OSPFv3 SR tunneling for next-hop resolution

© 2026 Nokia.

Context	**configure** service vprn *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-ospf3 *boolean*
Tree	sr-ospf3
Description	When configured to **true**, BGP uses an OSPF3 tunnel type to resolve the BGP next hop. When enabled, an SR tunnel to the BGP next hop is selected in the TTM according to the following procedure. • Select the SR tunnel submitted by the OSPFv3 instance with the lowest tunnel table preference. • If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest metric. • If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest instance ID. When configured to **false**, OSPF3 tunneling is not used for next-hop resolution.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

sr-policy *boolean*

Synopsis	Use SR policies for next-hop resolution
Context	**configure** service vprn *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-policy *boolean*
Tree	sr-policy
Description	When configured to **true**, this command enables the use of SR policies to resolve the next hop of BGP-EVPN service routes. This command configures BGP to search for an SR policy with: • a non-null endpoint that matches the next hop of the service route, and • a color value that matches the highest numbered color for the extended community attached to the service route
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

sr-te *boolean*

Synopsis	Use SR-TE tunneling for next-hop resolution
Context	**configure** service vprn *service-name* bgp-evpn mpls *number* auto-bind-tunnel resolution-filter sr-te *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	sr-te
Description	When configured to **true**, BGP uses an SR-TE tunnel type to resolve the BGP next hop. In the case of multiple SR-TE tunnels with the same lowest metric, BGP selects the tunnel with the lowest tunnel ID. When configured to **false**, SR-TE tunneling is not used for next-hop resolution.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

default-route-tag *one-byte-value*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Default route tag
Context	**configure** service vprn *service-name* bgp-evpn mpls *number* default-route-tag *one-byte-value*
Tree	default-route-tag
Description	This command configures a route tag that is used when sending a route to the BGP application (for the corresponding service and BGP instance). If the corresponding BGP instance is enabled, the command cannot be changed. When used for BGP EVPN contexts, only one route tag can be passed to BGP for matching on export policies. In case of a conflict with other route tags pushed by EVPN, the default route tag has the least priority.
Introduced	25.3.R2
Platforms	SAR Gen 2

domain-id *domain-id*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Domain ID of received BGP route before readvertisement
Context	**configure** service vprn *service-name* bgp-evpn mpls *number* domain-id *domain-id*
Tree	domain-id
Description	This command specifies the D-PATH domain ID. The domain ID identifies the network from which the BGP route was received before the RTM advertises it to a different

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

neighbor. The domain ID is part of a domain, represented as domain-id:isf_safi_type in the D-PATH attribute, as described in *draft-ietf-bess-evpn-ipvpn-interworking*. Gateway routers modify the D-PATH attribute. A gateway is a PE where a VPRN is instantiated. The VPRN in this case advertises or receives routes from multiple BGP owners (for example, EVPN-IFL and BGP-IPVPN) or multiple instances of the same owner (for example, VPRN with two BGP-IPVPN instances).

Gateways use the D-PATH attribute to detect loops (for received routes where the D-PATH contains a local domain ID) and to make BGP best-path selection decisions based on the D-PATH length (shorter D-PATH is preferred).

In the following example, suppose a gateway receives prefix P in an EVPN-IFL instance with the following D-PATH from neighbor N:

Seg Len=1 / 65000:1:128

If the router imports the route in VPRN-1, BGP-EVPN SRv6 instance with domain 65000:2, it readvertises it to its BGP-IPVPN MPLS instance as follows:

Seg Len=2 / 65000:2:70 / 65000:1:128

That is, the gateway prepends the local domain ID and family to the D-PATH before readvertising the route into a different instance.

String format 'domain-id' must be global-field:local-field (uint32:uint16 range)

Introduced 25.3.R2

Platforms SAR Gen 2

dynamic-egress-label-limit *boolean*

Synopsis Enables dynamic egress label limit

Context **configure** service vprn *service-name* bgp-evpn mpls *number* dynamic-egress-label-limit *boolean*

Tree dynamic-egress-label-limit

Description When configured to **true**, this command relaxes the egress MPLS label limit check when resolving BGP next hops in the tunnel table.

For VPRN services, the OAM label is never computed and, therefore, one more egress label is allowed.

For EVPN (Epipe and VPLS) services, the system only computes the control word and ESI label if they are used. For the control word, the system reduces the egress label limit by one label if the control word is configured in the service. When configured, the ESI label is not counted for Epipes or VPLS services without an ES.

When configured to **false** this command, for EVPN, Epipe, and VPLS services, always accounts for the ESI label and control word.

Default false

weighted-ecmp *boolean*

Synopsis	Enable weighted ECMP
Context	**configure** service vprn *service-name* bgp-evpn mpls *number* evpn-link-bandwidth weighted-ecmp *boolean*
Tree	weighted-ecmp
Description	When configured to **true**, the router supports the processing of the EVPN link bandwidth extended community when installing an ECMP set for an EVPN IP-Prefix route in the VPRN route table.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Flows to an IP Prefix received with a weight and a zero ESI value are sprayed according to the weight. If the EVPN IP-Prefix route received with the weight has a non-zero ESI, the weight is divided into the number of PEs attached to the Ethernet Segment (and rounded up if the result is not an integer).

The command also enables the weighted ECMP functionality for BGP CEs that are configured with an **evpn-link-bandwidth add-to-received-bgp** weight.

When configured to **false**, the router disables the processing of the EVPN link bandwidth extended community.

Default false

attribute-set

Synopsis	Enter the **attribute-set** context
Context	**configure** service vprn *service-name* bgp-ipvpn attribute-set
Tree	attribute-set
Description	Commands in this context configure the handling of attribute set (ATTR_SET) attributes attached to VPN-IP routes imported into or exported from the VPRN. ATTR_SET is an optional transitive BGP path attribute standardized by RFC 6368 that is added to BGP L3 VPN routes to provide logical separation between the BGP domain of a customer and the BGP domain of a service provider.
Introduced	25.3.R2
Platforms	SAR Gen 2

export *boolean*

Synopsis	Add ATTR_SET path attribute to exported VPN-IP routes
Context	**configure** service vprn *service-name* bgp-ipvpn attribute-set export *boolean*
Tree	export

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description When configured to **true**, the router adds an ATTR_SET path attribute to all VPN-IP routes that come from the VRF export of BGP routes advertised by PE-CE peers of the VPRN. This attribute contains an exact copy of all BGP path attributes (post-import policy) of the PE-CE BGP route, excluding the NEXT_HOP, MP_REACH, and MP_UNREACH attributes, as well as the AS4_PATH or AS4_AGGREGATOR attributes. The origin AS in the ATTR_SET encodes the ASN (or confederation ID, if configured) of the exporting VPRN service. Neither the VRF export policy nor a regular BGP export policy is allowed to modify the contents of the ATTR_SET.

When configured to **false**, the router does not add an ATTR_SET path attribute to VPN-IP routes exported by the VPRN. Nokia recommends configuring this command to **false**, unless there is a requirement for the VPRN to deliver an independent domain L3 VPN service.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

import *keyword*

Synopsis Reception behavior of ATTR_SET

Context **configure** service vprn *service-name* bgp-ipvpn attribute-set import *keyword*

Tree import

Description This command configures the reception behavior for ATTR_SETs in received VPN-IP routes.

- **accept** — BGP accepts and processes ATTR_SETs in received unicast VPN-IP routes (MPLS or SRv6) when they are imported into the VPRN. The path attributes contained inside the ATTR_SET are used for best path selection within the VPRN, instead of the outer path attributes attached to the imported VPN-IP route. The path attributes inside the ATTR_SET determine the path attributes of BGP routes advertised to PE-CE peers of the VPRN. However, the ATTR_SET is removed at the time of advertisement. VPRN BGP routes with attributes derived from **accept** processing can only be advertised to EBGP peers and IBGP route reflector client peers. VPRN BGP routes cannot be advertised to BGP confederation peers. If the origin AS in the ATTR_SET attribute does not match the configured ASN, VPRN BGP routes with attributes derived from **accept** processing are advertised to IBGP peers that are not covered by a cluster configuration.
- **drop** — BGP ignores and silently discards ATTR_SETs in received VPN-IP routes when they are imported into the VPRN. The path attributes contained inside the ATTR_SET are not used for best path selection within the VPRN. If a VPRN is not involved in an independent domain L3 VPN service, Nokia recommends configuring this command to use the **drop** option.
- **ignore** — BGP ignores ATTR_SETs in received VPN-IP routes when they are imported into the VPRN. The path attributes contained inside the ATTR_SET are not used for best path selection within the VPRN. With the **ignore** option, the ATTR_SET

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

attribute is transmitted unchanged to the CE. Nokia recommends not to configure this command to use the **ignore** option in most deployments.

mpls

Synopsis	Enter the **mpls** context
Context	**configure** service vprn *service-name* bgp-ipvpn mpls
Tree	mpls
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of BGP-IPVPN MPLS
Context	**configure** service vprn *service-name* bgp-ipvpn mpls admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	25.3.R2
Platforms	SAR Gen 2

auto-bind-tunnel

Synopsis	Enter the **auto-bind-tunnel** context
Context	**configure** service vprn *service-name* bgp-ipvpn mpls auto-bind-tunnel
Tree	auto-bind-tunnel
Description	Commands in this context configure the automatic-binding options of a BGP-IPVPN service using tunnels to MP-BGP peers.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

allow-flex-algo-fallback *boolean*

Synopsis	Enable flexible algorithm fallback
Context	**configure** service vprn *service-name* bgp-ipvpn mpls auto-bind-tunnel allow-flex-algo-fallback *boolean*
Tree	allow-flex-algo-fallback
Description	When configured to **true**, a BGP router with a Flex-Algorithm action configured (via the **configure policy-options policy-statement entry action flex-algo** command) can resolve to a tunnel with algorithm 0 if no target Flex-Algorithm tunnel is available**.** When configured to **false**, the BGP router can resolve only to the intended Flex-Algorithm tunnel, which may cause traffic loss if no corresponding Flex-Algorithm tunnel is available.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ecmp *number*

Synopsis	Maximum ECMP routes allowed
Context	**configure** service vprn *service-name* bgp-ipvpn mpls auto-bind-tunnel ecmp *number*
Tree	ecmp
Description	This command configures the maximum number of tunnels that can be used as ECMP next hops for the VPRN. This value overrides the ECMP value configured at the **configure service vprn** context level.
Range	1 to 32
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

enforce-strict-tunnel-tagging *boolean*

Synopsis	Allow enforcement of strict tunnel tagging
Context	**configure** service vprn *service-name* bgp-ipvpn mpls auto-bind-tunnel enforce-strict-tunnel-tagging *boolean*
Tree	enforce-strict-tunnel-tagging
Description	When configured to **true**, the system must only consider LSPs marked with an administrative tag for next-hop resolution.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, tagged RSVP and SR-TE LSPs are considered first. The system then uses untagged LSPs of other types.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

enforce-untagged-route *keyword*

Synopsis Untagged route type enforcement

Context **configure** service vprn *service-name* bgp-ipvpn mpls auto-bind-tunnel enforce-untagged-route *keyword*

Tree enforce-untagged-route

Description This command configures the enforcement of BGP routes with no administrative tag policy applied by modifying the next-hop resolution behavior for autobind services.

If the **untagged-tunnel** option is configured, untagged routes only bind to LSPs with no administrative tag configured. If both tagged and untagged tunnels to the next hop exist, the system only considers the untagged tunnels. If no untagged tunnels to the next hop exist, the resolution of untagged routes fails.

The **untagged-tunnel** option can be used in combination with the **enforce-strict-tunnel-tagging** command configured to **true**, in which case tagged routes resolve to tagged LSPs, and untagged routes only resolve to untagged LSPs.

When unconfigured, untagged routes can bind to tagged or untagged LSPs.

Options none – Untagged routes can bind to tagged or untagged LSPs
untagged-tunnel – Untagged routes only bind to LSPs without an admin tag

Default none

Introduced 25.3.R2

Platforms SAR Gen 2

resolution *keyword*

Synopsis Resolution method for tunnel selection

Context **configure** service vprn *service-name* bgp-ipvpn mpls auto-bind-tunnel resolution *keyword*

Tree resolution

Options none, filter, any

Default none

Introduced 25.3.R2

Platforms SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

resolution-filter

Synopsis	Enter the **resolution-filter** context
Context	**configure** service vprn *service-name* bgp-ipvpn mpls auto-bind-tunnel resolution-filter
Tree	resolution-filter
Description	Commands in this context configure the subset of tunnel types that can be used in the resolution of BGP-IPVPN routes within the automatic binding of the BGP-IPVPN MPLS service to tunnels to MP-BGP peers.
Introduced	25.3.R2
Platforms	SAR Gen 2

bgp *boolean*

Synopsis	Use BGP tunneling for next-hop resolution
Context	**configure** service vprn *service-name* bgp-ipvpn mpls auto-bind-tunnel resolution-filter bgp *boolean*
Tree	bgp
Description	When configured to **true**, BGP searches the BGP LSP for the address of the BGP next hop. When configured to **false**, BGP tunneling is not used and inter-area or inter-as prefixes are not resolved.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

gre *boolean*

Synopsis	Use GRE tunneling for next-hop resolution
Context	**configure** service vprn *service-name* bgp-ipvpn mpls auto-bind-tunnel resolution-filter gre *boolean*
Tree	gre
Description	When configured to **true**, this command enables setting the tunnel type for the auto bind tunnel.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ldp *boolean*

Synopsis	Use LDP tunneling for next-hop resolution
Context	**configure** service vprn *service-name* bgp-ipvpn mpls auto-bind-tunnel resolution-filter ldp *boolean*
Tree	ldp
Description	When configured to **true**, BGP searches for an LDP LSP with a FEC prefix corresponding to the address of the BGP next hop. When configured to **false**, LDP tunneling is not used for next-hop resolution.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

rsvp *boolean*

Synopsis	Use RSVP tunneling for next-hop resolution
Context	**configure** service vprn *service-name* bgp-ipvpn mpls auto-bind-tunnel resolution-filter rsvp *boolean*
Tree	rsvp
Description	When configured to **true**, BGP searches the best metric RSVP LSP to determine the address of the BGP next hop. This address can correspond to the system interface or to another loopback interface used by the BGP instance on the remote node. The LSP metric is provided by MPLS in the tunnel table. In the case of multiple RSVP LSPs with the same lowest metric, BGP selects the LSP with the lowest tunnel ID. When configured to **false**, the RSVP LSP is not used for next-hop resolution.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

sr-isis *boolean*

Synopsis	Use IS-IS SR tunneling for next-hop resolution
Context	**configure** service vprn *service-name* bgp-ipvpn mpls auto-bind-tunnel resolution-filter sr-isis *boolean*
Tree	sr-isis
Description	When configured to **true**, BGP uses an IS-IS tunnel type to resolve the BGP next hop. When the **sr-isis** command is enabled, an SR tunnel to the BGP next hop is selected in the TTM according to the following procedure.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- Select the SR tunnel submitted by the IS-IS instance with the lowest tunnel table preference.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest metric.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest instance ID.

When configured to **false**, IS-IS tunneling is not used for next-hop resolution.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

sr-ospf *boolean*

Synopsis Use OSPF SR tunneling for next-hop resolution

Context **configure** service vprn *service-name* bgp-ipvpn mpls auto-bind-tunnel resolution-filter sr-ospf *boolean*

Tree sr-ospf

Description When configured to **true**, BGP uses an OSPF tunnel type to resolve the BGP next hop.

When enabled, an SR tunnel to the BGP next hop is selected in the TTM according to the following procedure.

- Select the SR tunnel submitted by the OSPF instance with the lowest tunnel table preference.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest metric.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest instance ID.

When configured to **false**, OSPF tunneling is not used for next-hop resolution.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

sr-ospf3 *boolean*

Synopsis Use OSPFv3 SR tunneling for next-hop resolution

Context **configure** service vprn *service-name* bgp-ipvpn mpls auto-bind-tunnel resolution-filter sr-ospf3 *boolean*

Tree sr-ospf3

Description When configured to **true**, BGP uses an OSPF3 tunnel type to resolve the BGP next hop.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When enabled, an SR tunnel to the BGP next hop is selected in the TTM according to the following procedure.

- Select the SR tunnel submitted by the OSPFv3 instance with the lowest tunnel table preference.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest metric.
- If more than one SR tunnel exists, select the SR tunnel from the instance with the lowest instance ID.

When configured to **false**, OSPF3 tunneling is not used for next-hop resolution.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

sr-policy *boolean*

Synopsis Use SR policies for next-hop resolution

Context **configure** service vprn *service-name* bgp-ipvpn mpls auto-bind-tunnel resolution-filter sr-policy *boolean*

Tree sr-policy

Description When configured to **true**, this command enables the use of SR policies to resolve the next hop of BGP IP-VPN service routes.

This command configures BGP to search for an SR policy with:

- a non-null endpoint that matches the next hop of the service route, and
- a color value that matches the highest numbered color for the extended community attached to the service route

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

sr-te *boolean*

Synopsis Use SR-TE tunneling for next-hop resolution

Context **configure** service vprn *service-name* bgp-ipvpn mpls auto-bind-tunnel resolution-filter sr-te *boolean*

Tree sr-te

Description When configured to **true**, BGP uses an SR-TE tunnel type to resolve the BGP next hop.

In the case of multiple SR-TE tunnels with the same lowest metric, BGP selects the tunnel with the lowest tunnel ID.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, SR-TE tunneling is not used for next-hop resolution.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

static-blackhole-first *boolean*

Synopsis Check for static blackhole route to resolve next hop

Context **configure** service vprn *service-name* bgp-ipvpn mpls auto-bind-tunnel static-blackhole-first *boolean*

Tree static-blackhole-first

Description When configured to **true**, the router uses a modified next-hop resolution sequence for each imported VPN-IP route. The router first checks for a static route in the Base routing table that matches the BGP next-hop address. If at least one such static route exists, and the route that is the longest match of the BGP next-hop address is a blackhole static route, the router resolves the VPN-IP route and programs it into the VPRN IP FIB table with a next-hop action that discards all matching packets. If there is no matching static route, or the longest matching static route is not a blackhole, the router resolves the VPN-IP route in the Base routing table as normal, that is, according to the configured VPRN auto-bind filter options.

When configured to **false**, the router resolves the VPN-IP route in the Base routing table according to the configured VPRN auto-bind filter options.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

weighted-ecmp *boolean*

Synopsis Allow weighted load-balancing

Context **configure** service vprn *service-name* bgp-ipvpn mpls auto-bind-tunnel weighted-ecmp *boolean*

Tree weighted-ecmp

Description When configured to **true**, this command enables weighted ECMP for packets using tunnels that a VPRN automatically binds to. Packets are sprayed across LSPs in the ECMP according to the outcome of the hash algorithm and the configured load balancing weight of each LSP.

When configured to **false**, this command disables weighted ECMP for next-hop tunnel selection.

Default false

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	25.3.R2
Platforms	SAR Gen 2

domain-id *domain-id*

Synopsis	Domain ID of received BGP route before readvertisement
Context	**configure** service vprn *service-name* bgp-ipvpn mpls domain-id *domain-id*
Tree	domain-id
Description	This command specifies the D-PATH domain ID. The domain ID identifies the network from which the BGP route was received before the RTM advertises it to a different neighbor. The domain ID is part of a domain, represented as domain-id:isf_safi_type in the D-PATH attribute, as described in *draft-ietf-bess-evpn-ipvpn-interworking*. Gateway routers modify the D-PATH attribute. A gateway is a PE where a VPRN is instantiated. The VPRN in this case advertises or receives routes from multiple BGP owners (for example, EVPN-IFL and BGP-IPVPN) or multiple instances of the same owner (for example, VPRN with two BGP-IPVPN instances). Gateways use the D-PATH attribute to detect loops (for received routes where the D-PATH contains a local domain ID) and to make BGP best-path selection decisions based on the D-PATH length (shorter D-PATH is preferred). In the following example, suppose a gateway receives prefix P in an EVPN-IFL instance with the following D-PATH from neighbor N: Seg Len=1 / 65000:1:128 If the router imports the route in VPRN-1, BGP-EVPN SRv6 instance with domain 65000:2, it readvertises it to its BGP-IPVPN MPLS instance as follows: Seg Len=2 / 65000:2:70 / 65000:1:128 That is, the gateway prepends the local domain ID and family to the D-PATH before readvertising the route into a different instance.
String format	'domain-id' must be global-field:local-field (uint32:uint16 range)
Introduced	25.3.R2
Platforms	SAR Gen 2

dynamic-egress-label-limit *boolean*

Synopsis	Enables dynamic egress label limit
Context	**configure** service vprn *service-name* bgp-ipvpn mpls dynamic-egress-label-limit *boolean*
Tree	dynamic-egress-label-limit
Description	When configured to **true**, this command relaxes the egress MPLS label limit check when resolving BGP next hops in the tunnel table.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

For VPRN services, the OAM label is never computed and, therefore, one more egress label is allowed.

For EVPN (Epipe and VPLS) services, the system only computes the control word and ESI label if they are used. For the control word, the system reduces the egress label limit by one label if the control word is configured in the service. When configured, the ESI label is not counted for Epipes or VPLS services without an ES.

When configured to **false** this command, for EVPN, Epipe, and VPLS services, always accounts for the ESI label and control word.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

route-distinguisher *(string | keyword)*

Synopsis Route distinguisher

Context **configure** service vprn *service-name* bgp-ipvpn mpls route-distinguisher *(string | keyword)*

Tree route-distinguisher

Description This command specifies a unique route distinguisher (RD) to be associated with each routing instance to identify which VPN the route belongs to.

Options auto-rd

String format 'vprn-bgp-evpn-mpls-rd' must be IP:comm or AS-number pair per RD rules

Introduced 25.3.R2

Platforms SAR Gen 2

vrf-export

Synopsis Enable the **vrf-export** context

Context **configure** service vprn *service-name* bgp-ipvpn mpls vrf-export

Tree vrf-export

Description Commands in this context specify route policies that control how routes are exported from the local VRF to other VRFs on the same or remote PE routers (via MP-BGP).

Aggregate routes are not advertised via MP-BGP protocols to other MP-BGP peers.

Route policies are configured in the **configure policy-options** context.

Introduced 25.3.R2

Platforms SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

policy *(policy-expr-string | string)*

Synopsis	Policy name
Context	**configure** service vprn *service-name* bgp-ipvpn mpls vrf-export policy *(policy-expr-string | string)*
Tree	policy
Description	This command configures VRF route policies that control routes between local VRFs and other VRFs on the same or remote PE routers (using MP-BGP). Each referenced object is either a policy logical expression or the name of a single policy. Only one referenced object can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The objects are evaluated in the specified order to determine whether to accept or reject the route. Only the first policy can have the maximum length and the rest can be up to 64 characters. Aggregate routes are not advertised using MP-BGP protocols to the other MP-BGP peers.
String length	1 to 255
String format	'policy-expr-string' must contain [for a bracketed policy name in a routing policy logical expression (e.g. [policyA])
Max. instances	15
Min. instances	1
Notes	This element is ordered by the user.
Introduced	25.3.R2
Platforms	SAR Gen 2

vrf-import

Synopsis	Enable the **vrf-import** context
Context	**configure** service vprn *service-name* bgp-ipvpn mpls vrf-import
Tree	vrf-import
Description	Commands in this context specify route policies that control how VPN-IP and EVPN-IFL routes that are exported by other VRFs on the same or remote PEs, are imported into the local VRF. Route policies are configured in the **configure policy-options** context. Unless the preference value is changed by the policy, the preference value for BGP-VPN and EVPN-IFL routes specified in this context is set to 170 when imported from

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

remote PE routers, or the value is retained from the protocol preference value of the exported route when imported from other VRFs on the same router.

Introduced	25.3.R2
Platforms	SAR Gen 2

policy *(policy-expr-string | string)*

Synopsis	Policy name
Context	**configure** service vprn *service-name* bgp-ipvpn mpls vrf-import policy *(policy-expr-string | string)*
Tree	policy
Description	This command configures VRF route policies that control routes between local VRFs and other VRFs on the same or remote PE routers (using MP-BGP). Each referenced object is either a policy logical expression or the name of a single policy. Only one referenced object can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The objects are evaluated in the specified order to determine whether to accept or reject the route. Only the first policy can have the maximum length and the rest can be up to 64 characters. Aggregate routes are not advertised using MP-BGP protocols to the other MP-BGP peers.
String length	1 to 255
String format	'policy-expr-string' must contain [for a bracketed policy name in a routing policy logical expression (e.g. [policyA])
Max. instances	15
Min. instances	1
Notes	This element is ordered by the user.
Introduced	25.3.R2

vrf-target

Synopsis	Enter the **vrf-target** context
Context	**configure** service vprn *service-name* bgp-ipvpn mpls vrf-target
Tree	vrf-target

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context configure the route target that is added to advertised routes or compared against received routes from other VRFs on the same or remote PE routers (via MP-BGP). BGP-VPN and EVPN-IFL routes imported using a VRF target configuration use the BGP preference value of 170 when imported from remote PE routers, or retain the protocol preference value of the exported route when imported from other VRFs in the same router. Configured VRF import or export policies override the VRF target policy.
Introduced	25.3.R2
Platforms	SAR Gen 2

community *route-target*

Synopsis	Extended BGP community
Context	**configure** service vprn *service-name* bgp-ipvpn mpls vrf-target community *route-target*
Tree	community
Description	This command configures an extended BGP community in the form type:x:y. Type can only be target and x and y are 16-bit integers.
String length	10 to 28
String format	'route-target-32' must be target:(IPv4:comm|AS pairs|IEEE MAC) per ext-community rules

Synopsis	Administrative state of the failover mechanism
Context	**configure** service vprn *service-name* dhcp-server dhcpv4 *named-item* failover admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	25.3.R2
Platforms	SAR Gen 2

ignore-mclt-on-takeover *boolean*

Synopsis	Ignore maximum client lead during takeover from partner
Context	**configure** service vprn *service-name* dhcp-server dhcpv4 *named-item* failover ignore-mclt-on-takeover *boolean*
Tree	ignore-mclt-on-takeover
Description	When configured to **true**, the remote IP address range can be taken over immediately when the intercommunication link enters the PARTNER-DOWN state, without having to wait for the MCLT to expire. When configured to **false**, the DHCP lease time for new clients is restricted to the MCLT during a failure. For existing clients, the lease time is gradually reduced over time to the MCLT by consecutive DHCP renewals.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

maximum-client-lead-time *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Maximum time that DHCP server can extend client's lease
Context	**configure** service vprn *service-name* dhcp-server dhcpv4 *named-item* failover maximum-client-lead-time *number*
Tree	maximum-client-lead-time
Description	This command configures the maximum client lead time (MCLT), which is the maximum time that a DHCP server can extend the client's lease time beyond the lease time currently known by the DHCP partner node. In dual-homed environments, the initial lease time for all DHCP clients is restricted to the MCLT by default. Consecutive DHCP renewals can extend the lease time beyond the MCLT.
Range	600 to 86399
Units	seconds
Default	600
Introduced	25.3.R2
Platforms	SAR Gen 2

partner-down-delay *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Delay to prevent lease duplication during link failure
Context	**configure** service vprn *service-name* dhcp-server dhcpv4 *named-item* failover partner-down-delay *number*
Tree	partner-down-delay
Description	This command configures the interval before a failed intercommunication link transitions from the COMM-INT state to the PARTNER-DOWN state. This delay prevents IP lease duplication during link failure by not allowing new IP addresses to be assigned from the remote IP address range. This timer is intended to provide the operator with enough time to remedy the failed situation and avoid duplication of IP addresses and prefixes during the failure.
Range	0 to 86399
Units	seconds

end *ipv4-unicast-address*

Synopsis	Upper bound of the IP address range
Context	**configure** service vprn *service-name* dhcp-server dhcpv4 *named-item* pool *named-item* subnet *ipv4-unicast-prefix* exclude-addresses *ipv4-unicast-address* end *ipv4-unicast-address*
Tree	exclude-addresses
Description	This command specifies the end of a range of IP addresses that are excluded from the pool of IP addresses in this subnet.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

maximum-declined *number*

Synopsis	Maximum number of declined addresses allowed
Context	**configure** service vprn *service-name* dhcp-server dhcpv4 *named-item* pool *named-item* subnet *ipv4-unicast-prefix* maximum-declined *number*
Tree	maximum-declined
Max. range	0 to 4294967295
Default	64
Introduced	25.3.R2
Platforms	SAR Gen 2

minimum-free

Synopsis	Enter the **minimum-free** context
Context	**configure** service vprn *service-name* dhcp-server dhcpv4 *named-item* pool *named-item* subnet *ipv4-unicast-prefix* minimum-free
Tree	minimum-free

Description	Commands in this context specify the minimum number of free addresses in this pool.
Introduced	25.3.R2
Platforms	SAR Gen 2

absolute *number*

Synopsis	Minimum number of free addresses in this pool or subnet
Context	**configure** service vprn *service-name* dhcp-server dhcpv4 *named-item* pool *named-item* subnet *ipv4-unicast-prefix* minimum-free absolute *number*
Tree	absolute
Range	0 to 255
Default	1
Notes	The following elements are part of a choice: **absolute** or **percent**.
Introduced	25.3.R2
Platforms	SAR Gen 2

event-when-depleted *boolean*

Synopsis	Generate notification when addresses are depleted
Context	**configure** service vprn *service-name* dhcp-server dhcpv4 *named-item* pool *named-item* subnet *ipv4-unicast-prefix* minimum-free event-when-depleted *boolean*
Tree	event-when-depleted
Description	When configured to **true**, a system-generated event is generated when all available addresses in the pool or subnet of a local DHCP server are depleted. When configured to **false**, no action is taken when all available addresses in the pool or subnet of a local DHCP server are depleted.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

percent *number*

Synopsis	Minimum free addresses as a percentage
Context	**configure** service vprn *service-name* dhcp-server dhcpv4 *named-item* pool *named-item* subnet *ipv4-unicast-prefix* minimum-free percent *number*
Tree	percent

Synopsis	Enter the **pool-selection** context
Context	**configure** service vprn *service-name* dhcp-server dhcpv4 *named-item* pool-selection
Tree	pool-selection
Introduced	25.3.R2
Platforms	SAR Gen 2

use-gi-address

Synopsis	Enable the **use-gi-address** context
Context	**configure** service vprn *service-name* dhcp-server dhcpv4 *named-item* pool-selection use-gi-address
Tree	use-gi-address
Description	Commands in this context configure gateway interface (GI) address matching. When configured, the pool can be used for address matching even if a subnet is not found. If the local user database name is not used, addresses are provided only by GI. If a user must be blocked from getting an address, the server maps to a local user database and configures the user with no address. A pool can include multiple subnets. Since the GI is shared by multiple subnets in a subscriber interface, the pool can provide IP addresses from any of the subnets included when the GI is matched to one of its subnets. This allows a pool to be created that represents a sub-net.
Introduced	25.3.R2
Platforms	SAR Gen 2

preferred-lifetime *number*

Synopsis	Time this lease remains preferred
Context	**configure** service vprn *service-name* dhcp-server dhcpv6 *named-item* defaults preferred-lifetime *number*
Tree	preferred-lifetime
Description	This command configures the preferred lifetime of the IPv6 lease address or prefix. When the preferred lifetime expires, any derived addresses are deprecated. The preferred lifetime must be less than or equal to the valid lifetime. Each address or prefix assigned to the client has associated preferred and valid lifetimes specified by the address assignment authority (such as the DHCP server,

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

RADIUS, or ESM). To request an extension of the lifetimes assigned to an address, the client sends a renew message to the addressing authority. The authority sends a reply message to the client with the new lifetimes, allowing the client to continue to use the address/prefix without interruption. The lifetimes are transmitted from the addressing authority to the client in the identity association (IA) option at the top level of the message (not the address or prefix level).

Range	300 to 315446399
Units	seconds
Default	3600
Introduced	25.3.R2
Platforms	SAR Gen 2

rebind-time *number*

Synopsis	Rebind time for the lease
Context	**configure** service vprn *service-name* dhcp-server dhcpv6 *named-item* defaults rebind-time *number*
Tree	rebind-time
Description	This command configures the rebind time, known as T2, at which the client contacts the addressing authority to extend the lifetimes of its leases. The IP addressing authority (such as the DHCP server, RADIUS, or ESM) controls the time for extending lifetimes on assigned addresses/prefixes through the T1 and T2 parameters assigned to an identity association (IA). At renew time, T1, the client initiates a renew or reply message exchange to extend the lifetimes of any addresses in the IA. The client includes an IA option with all addresses or prefixes currently assigned to the IA in its renew message. Recommended values for T1 and T2 are 0.5 and 0.8 times the shortest preferred lifetime of the addresses or prefixes in the IA that the addressing authority is willing to extend, respectively. The configured rebind timer value should always be less than or equal to the rebind timer. The T1 and T2 values are carried in the IPV6 address option in the IA.
Range	0 to 1209600
Units	seconds
Default	2880
Introduced	25.3.R2
Platforms	SAR Gen 2

renew-time *number*

Synopsis	Renew time for the lease

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vprn *service-name* dhcp-server dhcpv6 *named-item* defaults renew-time *number*
Tree	renew-time
Description	This command configures the renew time, known as T1, at which the client makes a transition to the lease-renewal state. The IP addressing authority (such as the DHCP server, RADIUS, or ESM) controls the time for extending lifetimes on assigned addresses/prefixes through the T1 and T2 parameters assigned to an identity association (IA). At renew time, T1, the client initiates a renew/reply message exchange to extend the lifetimes of any addresses in the IA. The client includes an IA option with all addresses/prefixes currently assigned to the IA in its renew message. Recommended values for T1 and T2 are 0.5 and 0.8 times the shortest preferred lifetime of the addresses or prefixes in the IA that the addressing authority is willing to extend, respectively. The configured renew timer value should always be shorter than or equal to the rebind timer. The T1 and T2 values are carried in the IPV6 address option in the IA.
Range	0 to 604800
Units	seconds
Default	1800
Introduced	25.3.R2
Platforms	SAR Gen 2

valid-lifetime *number*

Synopsis	Time for the lease to remain valid
Context	**configure** service vprn *service-name* dhcp-server dhcpv6 *named-item* defaults valid-lifetime *number*
Tree	valid-lifetime
Description	This command configures a valid lifetime for a DHCPv6 lease address or prefix. The valid lifetime is the length of time an address and prefix remains in the valid state. The valid lifetime must be greater than or equal to the preferred lifetime. When the valid lifetime expires, the address and prefix becomes invalid and must not be used in communications. RFC 2461 recommends a default value of 30 days. Each address and prefix assigned to the client has associated preferred and valid lifetimes specified by the address assignment authority (such as the DHCP server, RADIUS, or ESM). To request an extension of the lifetimes assigned to an address, the client sends a renew message to the addressing authority. The authority sends a reply message to the client with the new lifetimes, allowing the client to continue to use the address and prefix without interruption. The lifetimes are transmitted from the addressing authority to the client in the identity association (IA) option at the top level of the message (not the address or prefix level).

ignore-mclt-on-takeover *boolean*

Synopsis	Ignore maximum client lead during takeover from partner
Context	**configure** service vprn *service-name* dhcp-server dhcpv6 *named-item* failover ignore-mclt-on-takeover *boolean*
Tree	ignore-mclt-on-takeover
Description	When configured to **true**, the remote IP address range can be taken over immediately when the intercommunication link enters the PARTNER-DOWN state, without having to wait for the MCLT to expire. When configured to **false**, the DHCP lease time for new clients is restricted to the MCLT during a failure. For existing clients, the lease time is gradually reduced over time to the MCLT by consecutive DHCP renewals.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

maximum-client-lead-time *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Maximum time that DHCP server can extend client's lease
Context	**configure** service vprn *service-name* dhcp-server dhcpv6 *named-item* failover maximum-client-lead-time *number*
Tree	maximum-client-lead-time
Description	This command configures the maximum client lead time (MCLT), which is the maximum time that a DHCP server can extend the client's lease time beyond the lease time currently known by the DHCP partner node. In dual-homed environments, the initial lease time for all DHCP clients is restricted to the MCLT by default. Consecutive DHCP renewals can extend the lease time beyond the MCLT.

partner-down-delay *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Delay to prevent lease duplication during link failure
Context	**configure** service vprn *service-name* dhcp-server dhcpv6 *named-item* failover partner-down-delay *number*
Tree	partner-down-delay
Description	This command configures the interval before a failed intercommunication link transitions from the COMM-INT state to the PARTNER-DOWN state. This delay prevents IP lease duplication during link failure by not allowing new IP addresses to be assigned from the remote IP address range. This timer is intended to provide the operator with enough time to remedy the failed situation and avoid duplication of IP addresses and prefixes during the failure.
Range	0 to 86399
Units	seconds
Default	86399

Introduced	25.3.R2
Platforms	SAR Gen 2

interface-id-mapping *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Map hosts within interface-to-prefix combinations
Context	**configure** service vprn *service-name* dhcp-server dhcpv6 *named-item* interface-id-mapping *boolean*
Tree	interface-id-mapping
Description	When configured to **true**, this command specifies an interface-mapping method that uses a combination of unique /64 prefixes and interface IDs. A /64 prefix is allocated to each interface ID, and all clients with the same interface ID are assigned an address from the prefix. This method is used for bridging clients in the same local loop and SAP, so that sharing the prefix allows communication to stay local. For SLAAC-based assignment, downstream neighbor discovery is automatically enabled to resolve the assigned address.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

lease-hold

Synopsis	Enter the **lease-hold** context
Context	**configure** service vprn *service-name* dhcp-server dhcpv6 *named-item* lease-hold
Tree	lease-hold
Introduced	25.3.R2
Platforms	SAR Gen 2

additional-scenarios

Synopsis	Enter the **additional-scenarios** context
Context	**configure** service vprn *service-name* dhcp-server dhcpv6 *named-item* lease-hold additional-scenarios
Tree	additional-scenarios
Description	Commands in this context configure additional types of leases or triggers that cause the system to hold up leases.
Introduced	25.3.R2
Platforms	SAR Gen 2

fwa-address-assignment *boolean*

Synopsis	Apply lease hold timer to FWA session
Context	**configure** service vprn *service-name* dhcp-server dhcpv6 *named-item* lease-hold additional-scenarios fwa-address-assignment *boolean*
Tree	fwa-address-assignment
Description	When configured to **true**, the router applies the lease hold timer to non-deferred IP addresses or SLAAC prefixes assigned to FWA sessions.
Default	false
Introduced	26.7.R1
Platforms	SAR Gen 2

internal-lease-ipsec *boolean*

Synopsis	Apply the lease hold timer to local IPsec clients
Context	**configure** service vprn *service-name* dhcp-server dhcpv6 *named-item* lease-hold additional-scenarios internal-lease-ipsec *boolean*

ignore-mclt-on-takeover *boolean*

Synopsis	Ignore maximum client lead during takeover from partner
Context	**configure** service vprn *service-name* dhcp-server dhcpv6 *named-item* pool *named-item* failover ignore-mclt-on-takeover *boolean*
Tree	ignore-mclt-on-takeover
Description	When configured to **true**, the remote IP address range can be taken over immediately when the intercommunication link enters the PARTNER-DOWN state, without having to wait for the MCLT to expire. When configured to **false**, the DHCP lease time for new clients is restricted to the MCLT during a failure. For existing clients, the lease time is gradually reduced over time to the MCLT by consecutive DHCP renewals.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

maximum-client-lead-time *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Maximum time that DHCP server can extend client's lease
Context	**configure** service vprn *service-name* dhcp-server dhcpv6 *named-item* pool *named-item* failover maximum-client-lead-time *number*
Tree	maximum-client-lead-time
Description	This command configures the maximum client lead time (MCLT), which is the maximum time that a DHCP server can extend the client's lease time beyond the lease time currently known by the DHCP partner node. In dual-homed environments, the initial lease time for all DHCP clients is restricted to the MCLT by default. Consecutive DHCP renewals can extend the lease time beyond the MCLT.
Range	600 to 86399
Units	seconds

Default	600
Introduced	25.3.R2
Platforms	SAR Gen 2

partner-down-delay *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Delay to prevent lease duplication during link failure
Context	**configure** service vprn *service-name* dhcp-server dhcpv6 *named-item* pool *named-item* failover partner-down-delay *number*
Tree	partner-down-delay
Description	This command configures the interval before a failed intercommunication link transitions from the COMM-INT state to the PARTNER-DOWN state. This delay prevents IP lease duplication during link failure by not allowing new IP addresses to be assigned from the remote IP address range. This timer is intended to provide the operator with enough time to remedy the failed situation and avoid duplication of IP addresses and prefixes during the failure.
Range	0 to 86399
Units	seconds
Default	86399
Introduced	25.3.R2
Platforms	SAR Gen 2

preferred-lifetime *number*

Synopsis	Time this lease remains preferred
Context	**configure** service vprn *service-name* dhcp-server dhcpv6 *named-item* pool *named-item* prefix *ipv6-prefix* preferred-lifetime *number*
Tree	preferred-lifetime
Description	This command configures the preferred lifetime of the IPv6 lease address or prefix. When the preferred lifetime expires, any derived addresses are deprecated. The preferred lifetime must be less than or equal to the valid lifetime. Each address or prefix assigned to the client has associated preferred and valid lifetimes specified by the address assignment authority (such as the DHCP server, RADIUS, or ESM). To request an extension of the lifetimes assigned to an address, the client sends a renew message to the addressing authority. The authority sends a reply message to the client with the new lifetimes, allowing the client to continue to use the address/prefix without interruption. The lifetimes are transmitted from the addressing authority to the client in the identity association (IA) option at the top level of the message (not the address or prefix level).
Range	300 to 315446399
Units	seconds
Default	3600

Context	**configure** service vprn *service-name* dhcp-server dhcpv6 *named-item* pool *named-item* prefix *ipv6-prefix* rebind-time *number*
Tree	rebind-time
Description	This command configures the rebind time, known as T2, at which the client contacts the addressing authority to extend the lifetimes of its leases. The IP addressing authority (such as the DHCP server, RADIUS, or ESM) controls the time for extending lifetimes on assigned addresses/prefixes through the T1 and T2 parameters assigned to an identity association (IA). At renew time, T1, the client initiates a renew or reply message exchange to extend the lifetimes of any addresses in the IA. The client includes an IA option with all addresses or prefixes currently assigned to the IA in its renew message. Recommended values for T1 and T2 are 0.5 and 0.8 times the shortest preferred lifetime of the addresses or prefixes in the IA that the addressing authority is willing to extend, respectively. The configured rebind timer value should always be less than or equal to the rebind timer. The T1 and T2 values are carried in the IPV6 address option in the IA.
Range	0 to 1209600
Units	seconds

renew-time *number*

Synopsis	Renew time for the lease
Context	**configure** service vprn *service-name* dhcp-server dhcpv6 *named-item* pool *named-item* prefix *ipv6-prefix* renew-time *number*
Tree	renew-time
Description	This command configures the renew time, known as T1, at which the client makes a transition to the lease-renewal state. The IP addressing authority (such as the DHCP server, RADIUS, or ESM) controls the time for extending lifetimes on assigned addresses/prefixes through the T1 and T2 parameters assigned to an identity association (IA). At renew time, T1, the client initiates a renew/reply message exchange to extend the lifetimes of any addresses in the IA. The client includes an IA option with all addresses/prefixes currently assigned to the IA in its renew message. Recommended values for T1 and T2 are 0.5 and 0.8 times the shortest preferred lifetime of the addresses or prefixes in the IA that the addressing authority is willing to extend, respectively. The configured renew timer value should always be shorter than or equal to the rebind timer. The T1 and T2 values are carried in the IPV6 address option in the IA.

Units	seconds
Default	1800
Introduced	25.3.R2
Platforms	SAR Gen 2

valid-lifetime *number*

Synopsis	Time for the lease to remain valid
Context	**configure** service vprn *service-name* dhcp-server dhcpv6 *named-item* pool *named-item* prefix *ipv6-prefix* valid-lifetime *number*
Tree	valid-lifetime
Description	This command configures a valid lifetime for a DHCPv6 lease address or prefix. The valid lifetime is the length of time an address and prefix remains in the valid state. The valid lifetime must be greater than or equal to the preferred lifetime. When the valid lifetime expires, the address and prefix becomes invalid and must not be used in communications. RFC 2461 recommends a default value of 30 days.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Each address and prefix assigned to the client has associated preferred and valid lifetimes specified by the address assignment authority (such as the DHCP server, RADIUS, or ESM). To request an extension of the lifetimes assigned to an address, the client sends a renew message to the addressing authority. The authority sends a reply message to the client with the new lifetimes, allowing the client to continue to use the address and prefix without interruption. The lifetimes are transmitted from the addressing authority to the client in the identity association (IA) option at the top level of the message (not the address or prefix level).

Introduced	25.3.R2
Platforms	SAR Gen 2

entropy-label *boolean*

Synopsis	Use entropy label
Context	**configure** service vprn *service-name* entropy-label *boolean*
Tree	entropy-label
Description	When configured to **true**, this command enables the use of entropy labels. The entropy label and indicator (EL/ELI) are inserted on relevant packets. Applicable packets are those for which at least one LSP in the stack at the far end has advertised the entropy-label capability. These LSPs are in LDP or RSVP tunnels used by an IGP

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

or BGP shortcut. If the tunnel is of type RSVP, the entropy-label capability must also be enabled under the **configure router mpls** or **configure router mpls lsp** context.

This command also results in other traffic that is forwarded over an LDP or RSVP LSP for which this router is the LER, and for which there is no explicit service endpoint on this router, to have the EL/ELI enabled, subject to the LSP far-end advertising entropy-label-capability. An example of such traffic includes packets arriving on a stitched LDP LSP forwarded over an RSVP LSP.

The entropy label and the hash label features are mutually exclusive. The entropy label cannot be configured on a spoke SDP or service where the hash label feature has already been configured.

When configured to **false**, the use of entropy labels is disabled.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

evpn-neighbor-synchronization

evi-route-target *evi-route-target*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	EVI route target to use for EVPN neighbor synchronization
Context	**configure** service vprn *service-name* evpn-neighbor-synchronization evi-route-target *evi-route-target*
Tree	evi-route-target
Description	This command configures the EVI route target used on the MAC/IP routes advertised for the routing context. On reception, the EVI route target is used to identify the routing context in which the ARP and ND entries are installed.
String length	10 to 28
String format	'evi-route-target-32' must be evi-target:(IPv4:comm|AS pairs|IEEE MAC) per ext-community rules
Introduced	26.3.R1
Platforms	SAR Gen 2

retention-timer *number*

Synopsis	Time that an EVPN ARP or ND entry is retained
Context	**configure** service vprn *service-name* evpn-neighbor-synchronization retention-timer *number*
Tree	retention-timer
Description	This command sets the timer that determines how long an EVPN ARP or ND entry is retained after the remote PE withdraws the MAC/IP route that originated it. The behavior for a synchronized ARP and ND entry is as follows: **1.** When the originating EVPN MAC/IP route is withdrawn, the retention timer starts, and the entry remains present until the timer expires. **2.** While the retention timer is active, the system attempts to refresh the entry by sending an ARP Request or Neighbor Solicitation to the IP owner. This refresh may occur at any point from the start of the timer until 30 seconds before it expires. **3.** ARP Requests and Neighbor Solicitations are staggered within the timeout period to prevent overloading the CPM transmitter when many entries require refreshing.
Range	1 to 65535
Units	seconds
Introduced	26.3.R1
Platforms	SAR Gen 2

Tree	route-distinguisher
Description	This command configures the route distinguisher of the MAC/IP routes used for synchronization.
String format	'vpn-route-distinguisher' must be IP:comm or AS-number pair per RD rules
Introduced	26.3.R1
Platforms	SAR Gen 2

route-tag *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	BGP route tag for MAC/IP routes synchronization
Context	**configure** service vprn *service-name* evpn-neighbor-synchronization route-tag *number*
Tree	route-tag
Description	This command applies the BGP route tag to MAC/IP routes generated from local ARP and ND entries. This tag can be matched by any export policy.
Range	1 to 255
Introduced	26.3.R1
Platforms	SAR Gen 2

export-inactive-bgp *boolean*

Synopsis	Export preferred BGP route even if inactive
Context	**configure** service vprn *service-name* export-inactive-bgp *boolean*
Tree	export-inactive-bgp
Description	When configured to **true**, the preferred BGP route learned by a VPRN is exported as the VPN-IP route even if it is inactive in the route table because a preferred BGP

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

VPRN route from another PE is present. This overrides the default state in which the VPRN cannot export an inactive BGP route. For the BGP route to be exported, the VRF export policy must accept it. This command applies to both MPLS VPN and SRv6 VPN routes. In SRv6 VPN routes the advertised instruction is an End.DT, while in MPLS VPN routes the advertised label is a per-next-hop label.This “best-external” type of route advertisement is useful in active/standby multi-homing scenarios because it ensures that all PEs know about the backup path provided by the standby PE.

When configured to **false**, the preferred BGP route is not exported if it is inactive.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

export-inactive-bgp-enhanced *boolean*

Synopsis Export best BGP route when better non-BGP route present

Context **configure** service vprn *service-name* export-inactive-bgp-enhanced *boolean*

Tree export-inactive-bgp-enhanced

Description When configured to **true**, the router allows a BGP route that is inactive (because a better non-BGP route for the same prefix is present) to be exportable as a VPN-IP route.

A BGP route learned from a VPRN BGP peer is exportable as a VPN-IP route, only if it is the best route for the prefix and is installed in the route table of the VPRN. If the **export-inactive-bgp** command is **true** in the VPRN configuration, this rule is relaxed, and the best inactive VPRN BGP route is exportable as a VPN-IP route, provided that the active installed route for the prefix is an imported VPN-IP route.

The rule described in the preceding paragraph can be relaxed even further by configuring this command to **true**. When this command is **true**, the best inactive VPRN BGP route (best amongst all routes received from all CEs) is exportable as a VPN-IP route, regardless of the route type of the active installed route.

The configuration of this command overrides the **export-inactive-bgp** command. If this command is **true**, the **export-inactive-bgp** command does not need to be **true**.

When configured to **false**, the router disables allowing an inactive BGP route in the presence of a better non-BGP route to be exportable as a VPN-IP route.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

fib-priority *keyword*

Synopsis FIB priority for VPRN BGP routes

Context **configure** service vprn *service-name* fib-priority *keyword*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	fib-priority
Description	This command prioritizes the order in which BGP FIB entries across different routing instances are pushed to the IOM for updating. This allows BGP route updates for higher priority router instances to occur as quickly as possible by assigning a FIB priority to the associated router instances (base and VPRN instances). If routing updates are available for multiple router instances, the IOMs or IMMs update the FIB with entries with **high** priority router instances before entries with **standard** priority router instances.
Options	standard – Standard FIB priority for routing instances high – High FIB priority for routing instances
Default	standard
Introduced	25.3.R2

maximum-number-group-sources *number*

Synopsis	Maximum number of group sources for this interface
Context	**configure** service vprn *service-name* igmp interface *interface-name* maximum-number-group-sources *number*
Tree	maximum-number-group-sources
Description	This command configures the maximum number of group sources for which IGMP or MLD can have local receiver information based on received IGMP or MLD reports on this interface. When this configuration is changed dynamically to a lower value than the currently accepted number of group sources, the group sources that are already accepted are not deleted. Only new group sources are not allowed.
Range	1 to 32000
Introduced	25.3.R2
Platforms	SAR Gen 2

maximum-number-groups *number*

Synopsis	Maximum number of groups for this interface
Context	**configure** service vprn *service-name* igmp interface *interface-name* maximum-number-groups *number*
Tree	maximum-number-groups
Range	1 to 16000

source [source-address] *ipv4-unicast-address*

Synopsis	Add a list entry for **source**
Context	**configure** service vprn *service-name* igmp interface *interface-name* ssm-translate group-range start *ipv4-multicast-address* end *ipv4-multicast-address* source *ipv4-unicast-address*
Tree	source
Min. instances	1
Introduced	25.3.R2
Platforms	SAR Gen 2

[**source-address**] *ipv4-unicast-address*

Synopsis	Source IP address of multicast channel sending data
Context	**configure** service vprn *service-name* igmp interface *interface-name* ssm-translate group-range start *ipv4-multicast-address* end *ipv4-multicast-address* source *ipv4-unicast-address*
Tree	source
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

static

Synopsis	Enter the **static** context
Context	**configure** service vprn *service-name* igmp interface *interface-name* static
Tree	static
Introduced	25.3.R2
Platforms	SAR Gen 2

group [group-address] *ipv4-multicast-address*

Synopsis	Enter the **group** list instance

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vprn *service-name* igmp interface *interface-name* static group *ipv4-multicast-address*
Tree	group
Introduced	25.3.R2
Platforms	SAR Gen 2

[**group-address**] *ipv4-multicast-address*

Synopsis	Group address of static IGMP multicast channel
Context	**configure** service vprn *service-name* igmp interface *interface-name* static group *ipv4-multicast-address*
Tree	group
Description	This command configures an address that receives data on an interface. The IP address must be unique for each static group.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id) 'ipv4-multicast-address' must be in 224.0.0.0-239.255.255.255 range with valid dotted-quad form
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

source [source-address] *ipv4-unicast-address*

Synopsis	Add a list entry for **source**
Context	**configure** service vprn *service-name* igmp interface *interface-name* static group *ipv4-multicast-address* source *ipv4-unicast-address*
Tree	source
Notes	The following elements are part of a mandatory choice: **source** or **starg**.
Introduced	25.3.R2
Platforms	SAR Gen 2

[**source-address**] *ipv4-unicast-address*

Synopsis	Source IP address of multicast channel sending data
Context	**configure** service vprn *service-name* igmp interface *interface-name* static group *ipv4-multicast-address* source *ipv4-unicast-address*

© 2026 Nokia.

version *keyword*

Synopsis	IGMP protocol version
Context	**configure** service vprn *service-name* igmp interface *interface-name* version *keyword*
Tree	version
Options	1, 2, 3
Default	3
Introduced	25.3.R2
Platforms	SAR Gen 2

query-interval *number*

Synopsis	Time between two consecutive host-query messages
Context	**configure** service vprn *service-name* igmp query-interval *number*
Tree	query-interval
Description	This command configures the timing of the host-query messages that solicit group membership information. The messages are sent to the all-systems multicast group address, 224.0.0.1.
Range	2 to 1024
Units	seconds
Default	125
Introduced	25.3.R2
Platforms	SAR Gen 2

query-last-member-interval *number*

Synopsis	Time between group-specific query messages
Context	**configure** service vprn *service-name* igmp query-last-member-interval *number*
Tree	query-last-member-interval
Description	This command configures the timing of the query-message interval, defining the interval for leave-group messages among others. The lower the interval that is configured, the faster the detection of the loss of the last member of a group.
Range	1 to 1023
Units	seconds
Default	1

Introduced	25.3.R2
Platforms	SAR Gen 2

dynamic-tunnel-redundant-nexthop *ipv4-unicast-address*

Synopsis	Redundant next-hop address for the dynamic IPsec tunnel
Context	**configure** service vprn *service-name* interface *interface-name* dynamic-tunnel-redundant-nexthop *ipv4-unicast-address*
Tree	dynamic-tunnel-redundant-nexthop
Description	This command configures a redundant next-hop address on a public or private IPsec interface (with a public or private tunnel SAP) for dynamic IPsec tunnel in 1:1 MC-IPsec. A standby node uses the specified next-hop address to shunt traffic to the master in case it receives traffic destined to a tunnel endpoint address. The standby tunnel group needs to be operationally up for the feature to work.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	The next-hop address is resolved in the routing table of a corresponding service.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Notes	The following elements are part of a choice: **multi-chassis-shunting-profile** or (**dynamic-tunnel-redundant-nexthop** and **static-tunnel-redundant-nexthop**).
Introduced	25.3.R2
Platforms	SAR Gen 2

hold-time

Synopsis	Enter the **hold-time** context
Context	**configure** service vprn *service-name* interface *interface-name* hold-time

bfd-liveness

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable the **bfd-liveness** context
Context	**configure** service vprn *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* bfd bfd-liveness
Tree	bfd-liveness
Description	Commands in this context configure a BFD session to provide a heart-beat mechanism for a specified IPsec tunnel. There can be only one BFD session assigned to any given IPsec tunnel, but there can be multiple IPsec tunnels using the same BFD session. BFD controls the state of the association tunnel. If the BFD session goes down, the system brings down the associated non-designated IPsec tunnel.
Introduced	25.3.R2
Platforms	SAR Gen 2

dest-ip *ipv4-unicast-address*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Destination address used for the BFD session

Synopsis	Default result for Certificate Status Verification
Context	**configure** service vprn *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* key-exchange dynamic cert status-verify default-result *keyword*
Tree	default-result
Description	This command specifies the default certificate revocation status result to use when all configured CSV methods fail to return a result.
Options	revoked, good
Default	revoked
Introduced	25.3.R2
Platforms	SAR Gen 2

primary *keyword*

Synopsis	Primary method of CSV to verify the revocation status
Context	**configure** service vprn *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* key-exchange dynamic cert status-verify primary *keyword*
Tree	primary
Description	This command configures the primary method of Certificate Status Verification (CSV) that is used to verify the revocation status of the certificate of the peer.
Options	crl, ocsp
Default	crl
Introduced	25.3.R2
Platforms	SAR Gen 2

secondary *keyword*

Synopsis	Secondary method used to verify certificate revocation
Context	**configure** service vprn *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* key-exchange dynamic cert status-verify secondary *keyword*
Tree	secondary
Description	This command specifies the secondary method of Certificate Status Verification (CSV) that is used to verify the revocation status of the peer certificate.
Options	none, crl, ocsp
Default	none

remote-gateway-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Remote IPsec tunnel endpoint address
Context	**configure** service vprn *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* remote-gateway-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	remote-gateway-address
Introduced	25.3.R2
Platforms	SAR Gen 2

replay-window *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Anti-replay window size
Context	**configure** service vprn *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* replay-window *number*
Tree	replay-window
Description	This command specifies the size of an IPsec anti-replay window. If unconfigured, IPsec anti-replay is disabled.
Range	32 | 64 | 128 | 256 | 512
Units	packets
Introduced	25.3.R2
Platforms	SAR Gen 2

security-policy

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **security-policy** context
Context	**configure** service vprn *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* security-policy

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	security-policy
Description	Commands in this context specify a security policy used by the tunnel.
Introduced	25.3.R2
Platforms	SAR Gen 2

id *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Security policy ID for use by the tunnel
Context	**configure** service vprn *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* security-policy id *number*
Tree	id
Max. range	0 to 4294967295
Introduced	25.3.R2
Platforms	SAR Gen 2

strict-match *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable strict match of the security policy entry
Context	**configure** service vprn *service-name* interface *interface-name* ipsec ipsec-tunnel *named-item* security-policy strict-match *boolean*
Tree	strict-match
Description	When configured to **true**, this command enables strict match of the security policy entry. When a CREATE_CHILD exchange request is received for a static IPsec tunnel, and this request is not a rekey request, ISA matches the received TSi and TSr with the configured security policy. This can be a match only when a received TS (in TSi or TSr) address range matches exactly with the subnet in a security policy entry. If there is no match, the setup fails, and TS_UNACCEPTABLE is sent. If there is a match, but there is an existing CHILD_SA for the matched security policy, the setup fails, and NO_PROPOSAL_CHOSEN is sent. If there is a match, and there is not a CHILD_SA for the matched entry, the subnet is sent in the matched security policy entry as TSi and TSr, and the CHILD_SA is created.

Tree	echo-receive
Range	100 to 100000
Units	milliseconds
Introduced	25.3.R2
Platforms	SAR Gen 2

multiplier *number*

Synopsis	Number of consecutive BFD messages missed from the peer
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 bfd multiplier *number*
Tree	multiplier
Description	This command configures the number of missed messages before the BFD session state is changed to down and the upper-level protocol is notified of the fault. A multiplier of less than 3 should not be used in production environments.

Range	1 to 20
Default	3
Introduced	25.3.R2
Platforms	SAR Gen 2

receive *number*

Synopsis	BFD receive interval over this interface
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 bfd receive *number*
Tree	receive
Description	This command specifies the receive interval for the BFD session.
Range	10 to 100000
Units	milliseconds
Default	100
Introduced	25.3.R2
Platforms	SAR Gen 2

transmit-interval *number*

Synopsis	BFD transmit interval over this interface
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 bfd transmit-interval *number*
Tree	transmit-interval
Description	This command configures the transmit intervals.
Range	10 to 100000
Units	milliseconds
Default	100
Introduced	25.3.R2
Platforms	SAR Gen 2

dhcp

Synopsis	Enter the **dhcp** context
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 dhcp
Tree	dhcp

String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.3.R2
Platforms	SAR Gen 2

gi-address *ipv4-unicast-address*

Synopsis	GI address for the DHCP relay
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 dhcp gi-address *ipv4-unicast-address*
Tree	gi-address
Description	This command configures the GI address to distinguish between the different subscriber interfaces (and potentially group interfaces) defined when the router functions as a DHCP relay. By default, the GI address used in the relayed DHCP packet is the primary IP address of a normal IES interface. Specifying the GI address allows the user to choose a secondary address. For group interfaces, a GI address must be specified under the group interface DHCP context or subscriber interface DHCP context for DHCP to function.

Platforms	SAR Gen 2

none

Synopsis	Do not include the circuit ID
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 dhcp option-82 circuit-id none
Tree	none
Notes	The following elements are part of a choice: **ascii-tuple**, **ifindex**, **none**, **sap-id**, or **vlan-ascii-tuple**.
Introduced	25.3.R2
Platforms	SAR Gen 2

sap-id

Synopsis	Use the SAP ID
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 dhcp option-82 circuit-id sap-id
Tree	sap-id
Notes	The following elements are part of a choice: **ascii-tuple**, **ifindex**, **none**, **sap-id**, or **vlan-ascii-tuple**.
Introduced	25.3.R2
Platforms	SAR Gen 2

vlan-ascii-tuple

Synopsis	Include the VLAN ID and dot1p bits in the ASCII tuple
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 dhcp option-82 circuit-id vlan-ascii-tuple
Tree	vlan-ascii-tuple
Description	When configured, the router includes the VLAN ID and dot1p bits with the ASCII-tuple information. This only occurs on dot1q and QinQ-encapsulated ports. When the Option 82 bits are stripped, dot1p bits are copied to the Ethernet header of the outgoing packet. When unconfigured, the router leaves the circuit ID sub-option of the DHCP packet empty.
Notes	The following elements are part of a choice: **ascii-tuple**, **ifindex**, **none**, **sap-id**, or **vlan-ascii-tuple**.
Introduced	25.3.R2

Introduced	25.3.R2
Platforms	SAR Gen 2

server *ipv4-unicast-address*

Synopsis	IP addresses for DHCP server requests
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 dhcp server *ipv4-unicast-address*
Tree	server
Description	This command configures a list of servers that this interface forwards requests to. The operator can enter the list of servers as either IP addresses or fully qualified domain names. The operator must specify at least one server specified for DHCP relay to work. If there are multiple servers, the system forwards the request to all the servers in the list.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Max. instances	8
Notes	This element is ordered by the user.
Introduced	25.3.R2
Platforms	SAR Gen 2

src-ip-addr *keyword*

Synopsis	Type of source address to use for DHCP relay
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 dhcp src-ip-addr *keyword*
Tree	src-ip-addr
Options	auto, gi-address
Default	auto
Introduced	25.3.R2
Platforms	SAR Gen 2

trusted *boolean*

Synopsis	Relay untrusted packets
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 dhcp trusted *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	trusted
Description	When configured to **true**, the router enables the trusted mode on the interface. When enabled, the relay agent changes the existing GI address (of the request) to the ingress interface, and forwards the request. A DHCP request that contains a GI address of 0.0.0.0 and an Option 82 field in the packet is discarded unless it arrives on a trusted circuit. This behavior only applies if the Relay Agent Information Option action is to keep the existing information. When the Option 82 field is replaced by the relay agent, the original Option 82 information is lost, and there is no reason to enable the trusted option.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

use-arp *boolean*

Synopsis	Use ARP to determine the destination hardware address
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 dhcp use-arp *boolean*
Tree	use-arp
Default	false

cpm-nat-policy *reference*

Synopsis	CPM NAT policy association with public IPv4 interface
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 nat cpm-nat-policy *reference*
Tree	cpm-nat-policy
Description	This command associates a CPM NAT policy to the interface. The NAT policy applies to traffic that either originates from, or is destined to, the local node itself (CPM traffic). Specifically, it is used when the traffic is routed through a public NAT IPv4 interface in the outside routing context. A CPM NAT policy should be used when the local node communicates with public networks over NAT, and the source or destination is a local interface within the outside routing context. This can include the public IPv4 interface or any other interface assigned to that routing context.
Reference	**configure** service nat cpm-nat-policy *external-named-item*
Introduced	25.7.R1
Platforms	SAR Gen 2

cpm-spf-nat-policy *reference*

Synopsis	CPM NAT policy for static port forwards
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 nat cpm-spf-nat-policy *reference*
Tree	cpm-spf-nat-policy
Description	This command associates a CPM NAT policy to the interface for static port forwards. The configurations for traffic using static port forwards to a local IP address in the outside routing context are separate from those used for other CPM traffic going through NAT. This command allows the router to apply different NAT behavior for port-forwarded traffic than for general traffic originating from the local node.
Reference	**configure** service nat cpm-nat-policy *external-named-item*
Introduced	25.7.R1
Platforms	SAR Gen 2

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Tag value used with the host route from an ARP/ND entry
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 neighbor-discovery host-route populate *keyword* route-tag *number*
Tree	route-tag
Description	This command specifies the route tag that is added in the route table for ARP or ND host routes. This tag can be matched on BGP VRF export and BGP peer export policies.
Range	1 to 255
Introduced	25.3.R2
Platforms	SAR Gen 2

learn-unsolicited *boolean*

Synopsis	Learn new entries from any received NA message
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 neighbor-discovery learn-unsolicited *boolean*
Tree	learn-unsolicited
Description	When configured to **true**, the router can learn neighbor entries from received unsolicited Neighbor Advertisement (NA) messages, with or without the solicited (S) flag set. The command can be enabled for global addresses, link-local addresses, or for both. When configured to **false**, the router follows standard behavior for learning neighbor entries. • If an unsolicited NA (regardless of the S flag) is received from a neighbor that is not yet in the Neighbor Discovery (ND) cache, the NA is ignored. • If an NS, RS, RA, or Redirect message with a Link Layer Address (MAC) is received from a neighbor that is not yet in the ND cache, a new neighbor entry is created in the cache to store the received Link Layer MAC. The neighbor is put in the STALE state.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of VRRP
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 vrrp *number* admin-state *keyword*
Tree	admin-state
Description	The command determines the administrative state of non-owner virtual router instances. Non-owner virtual router instances can be administratively disabled. This allows the termination of VRRP participation in the virtual router and stops all routing and other access capabilities with regards to the virtual router IP addresses. Disabling the virtual router instance provides a mechanism to maintain the virtual routers without causing false backup or master state changes. When **disabled**, no VRRP advertisement messages are generated and all received VRRP advertisement messages are silently discarded with no processing. Whenever the administrative or operational state of a virtual router instance transitions, a log message is generated. An owner virtual router context does not use this command. To administratively disable an owner virtual router instance, use the **admin-state** command within the parent IP interface node which administratively disables the IP interface.
Options	enable, disable
Default	enable
Introduced	25.3.R2
Platforms	SAR Gen 2

authentication-key *encrypted-leaf*

Synopsis	Password for simple text authentication
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 vrrp *number* authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command optionally assigns a simple text password authentication key to generate master VRRP advertisement messages and validate received VRRP advertisement messages.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If this command is re-executed with a different password key defined, the new key immediately replaces the old key. This command may be executed at any time.

This command uses a protected format where the specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7705 SAR Gen 2 System Management Guide* for more information.

String length 1 to 94

Introduced 25.3.R2

backup *ipv4-unicast-address*

Synopsis Virtual router IP addresses for the interface

Context **configure** service vprn *service-name* interface *interface-name* ipv4 vrrp *number* backup *ipv4-unicast-address*

Tree backup

Description This command associates virtual router IP addresses with those of the parental IP interface.

This command has two different functions based on whether it is being executed on an owner or non-owner virtual router instance.

Non-owner virtual router instances create a routable IP interface address that is operationally dependent on the virtual router instance mode (master or backup). This command, when executed on an owner virtual router instance, does not create a routable IP interface address; it simply defines the existing IP addresses of the parental IP interface that are advertised by the virtual router instance.

For owner virtual router instances, this command defines the IP addresses that are advertised within VRRP advertisement messages. This communicates the IP addresses that the master is advertising to backup virtual routers receiving the messages. The specified *unicast-ipv4-address* must be equal to one of the existing IP addresses in the parental IP interface (primary or secondary) or this command fails.

See "Owner and non-owner VRRP" in the *7705 SAR Gen 2 Router Configuration Guide* for more information about owner and non-owner virtual router instances.

String format 'ipv4-address' must use only digits and dots (no %zone)
'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)

Max. instances 16

mac *mac-unicast-address*

Synopsis	Virtual MAC address to use in ARP responses
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 vrrp *number* mac *mac-unicast-address*
Tree	mac
Description	This command sets an explicit MAC address for the virtual router instance that overrides the VRRP default derived from the VRID. Changing the default MAC address is useful when an existing HSRP or other non-VRRP default MAC is in use by the IP hosts that use the virtual router IP address. Many hosts do not monitor unessential ARPs and continue to use the cached non-VRRP MAC address after the virtual router becomes master of the host's gateway address.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Additionally, this command sets the MAC address used in ARP responses when the virtual router instance is master. Routing of IP packets with *unicast-mac-address* as the destination MAC is also enabled. The MAC must be the same for all virtual routers participating as a virtual router or indeterminate connectivity by the attached IP hosts results. All VRRP advertisement messages are transmitted with *unicast-mac-address* as the source MAC.

An operator can execute this command at any time and it takes effect immediately. When the virtual router MAC on a master virtual router instance changes, a gratuitous ARP is immediately sent with a VRRP advertisement message. If the virtual router instance is disabled or operating as a backup, the gratuitous ARP and VRRP advertisement messages are not sent.

String format 'ieee-address' must be 6 hex byte pairs with ':' or '-' (e.g. 00:11:22:33:44:55)

Introduced 25.3.R2

Platforms SAR Gen 2

master-int-inherit *boolean*

Synopsis Allow master instance to dictate the master down timer

Context **configure** service vprn *service-name* interface *interface-name* ipv4 vrrp *number* master-int-inherit *boolean*

Tree master-int-inherit

Description When configured to **true**, the virtual router instance inherits the advertisement interval timer of the master VRRP router, which backup routers use to calculate the master down timer.

When configured to **false**, the locally configured message interval must match the master's VRRP advertisement message advertisement interval field value or the message is discarded.

Introduced 25.3.R2

Platforms SAR Gen 2

message-interval *number*

Synopsis Interval for sending VRRP advertisement messages

Context **configure** service vprn *service-name* interface *interface-name* ipv4 vrrp *number* message-interval *number*

Tree message-interval

Description This command configures the administrative advertisement message timer used by the master virtual router instance to send VRRP advertisement messages. The backup master down timer is derived from the value configured using this command.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The usage of this command varies for non-owner virtual router instances, depending on the state of the virtual router (master or backup) and the state of the **master-int-inherit** command:

- When a non-owner is operating as master for the virtual router, the system uses the configured value of this command as the operational advertisement timer, similar to an owner virtual router instance. The **master-int-inherit** command has no effect when operating as master.
- When a non-owner is in the backup state with **master-int-inherit** disabled, the system uses the configured value of this command to match the incoming advertisement interval field of the VRRP advertisement message. If the locally configured message interval does not match the advertisement interval field, the system discards the VRRP advertisement.
- When a non-owner is in the backup state with **master-int-inherit** enabled, the configured value of this command is ignored. The master down timer is indirectly derived from the advertisement interval field value of the incoming VRRP advertisement message.

owner *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Designate the virtual router instance as owner
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 vrrp *number* owner *boolean*
Tree	owner

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the router designates this virtual router instance as the owner of the virtual router IP addresses. Therefore, this virtual router becomes responsible for forwarding packets sent to the virtual router IP addresses. The owner also assumes the role of master virtual router. When configured to **false**, this virtual router instance is designated as a non-owner.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

passive *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Suppress the processing of VRRP advertisement messages
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 vrrp *number* passive *boolean*
Tree	passive
Description	When configured to **true**, the router identifies this virtual router instance as passive; and therefore the owner of the virtual router IP addresses. A passive virtual router instance does not transmit or receive VRRP advertisement messages and is always in either the master state (if the interface is operationally up) or the init state (if the interface is operationally down). When configured to **false**, this virtual router instance is not identified as passive, meaning that it transmits and receives VRRP advertisement messages.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ping-reply *boolean*

Synopsis	Allow non-owner master to reply to ICMP echo requests
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 vrrp *number* ping-reply *boolean*
Tree	ping-reply
Description	When configured to **true**, the router allows the non-owner master to reply to ICMP echo requests directed at the IP addresses of the virtual router instance. Any routed interface can receive the ping request. Ping must not have been disabled at the management security level (either on the parental IP interface or on the Ping source host address).

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, ICMP echo requests sent to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to ICMP echo requests, regardless of the configuration of this command.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

policy *reference*

Synopsis VRRP priority control policy

Context **configure** service vprn *service-name* interface *interface-name* ipv4 vrrp *number* policy *reference*

Tree policy

Description This command configures a VRRP priority control policy to associate with the virtual router instance.

VRRP priority control policies can override or adjust the base priority value of the virtual router instance, depending on events or conditions within the chassis.

An operator can associate a policy with more than one virtual router instance. The priority events within the policy either override or diminish the base priority set with the **priority** command. As priority events clear in the policy, the in-use priority can eventually be restored to the base priority value.

For non-owner virtual router instances, if this command is not executed, the base priority is used as the in-use priority.

Reference **configure** vrrp policy *number*

Introduced 25.3.R2

Platforms SAR Gen 2

preempt *boolean*

Synopsis Allow the VRRP to override an existing non-owner master

Context **configure** service vprn *service-name* interface *interface-name* ipv4 vrrp *number* preempt *boolean*

Tree preempt

Description When configured to **true**, this virtual router instance overrides any non-owner master with an in-use message priority value less than the in-use priority value of this virtual router.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, this virtual router only becomes master if the master down timer expires before a VRRP advertisement message is received from another virtual router.

Default true

Introduced 25.3.R2

Platforms SAR Gen 2

priority *number*

Synopsis Base priority for the VRRP

Context **configure** service vprn *service-name* interface *interface-name* ipv4 vrrp *number* priority *number*

Tree priority

Description This command configures the base router priority for the virtual router instance, which defines the selection order of the virtual router in the master election process.

The in-use priority is derived from the base priority. However, the in-use priority is modified by optional VRRP priority control policies. An operator can use VRRP priority control policies to either override or adjust the base priority value depending on events or conditions within the chassis.

Range 1 to 255

Introduced 25.3.R2

Platforms SAR Gen 2

ssh-reply *boolean*

Synopsis Allow the non-owner master to reply to SSH requests

Context **configure** service vprn *service-name* interface *interface-name* ipv4 vrrp *number* ssh-reply *boolean*

Tree ssh-reply

Description When configured to **true**, the router allows the non-owner master to reply to SSH requests directed at the IP addresses of the virtual router instance. Any routed interface can receive the SSH request. SSH cannot be disabled at the management security level (either on the parental IP interface or on the SSH source host address).

When configure to **false**, SSH requests to non-owner master virtual IP addresses are silently discarded.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

standby-forwarding *boolean*

Synopsis	Allow standby router to forward traffic
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 vrrp *number* standby-forwarding *boolean*
Tree	standby-forwarding
Description	When configured to **true**, the standby router forwards all traffic. When configured to **false**, the standby router cannot forward traffic sent to the MAC address of the virtual router. However, the standby router still forwards traffic sent to its own MAC address.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

telnet-reply *boolean*

Synopsis	Allow non-owner master to reply to Telnet requests
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 vrrp *number* telnet-reply *boolean*
Tree	telnet-reply
Description	When configured to **true**, the router allows the non-owner master to reply to Telnet requests directed at the IP addresses of the virtual router instance. Any routed interface can receive Telnet requests. Telnet cannot be disabled at the management security level (either on the parental IP interface or on the Telnet source host address). When configured to **false**, the router silently discards Telnet requests sent to non-owner master virtual IP addresses.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

traceroute-reply *boolean*

Synopsis	Allow non-owner master to reply to traceroute requests
Context	**configure** service vprn *service-name* interface *interface-name* ipv4 vrrp *number* traceroute-reply *boolean*
Tree	traceroute-reply
Description	When configured to **true**, the router allows a non-owner master to reply to traceroute requests directed to the IP addresses of the virtual router instance.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, the router silently discards traceroute requests sent to non-owner master virtual IP addresses.

Traceroute must not have been disabled at the management security level (either on the parental IP interface or the source host address).

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

ipv6

Synopsis Enable the **ipv6** context

Context **configure** service vprn *service-name* interface *interface-name* ipv6

Tree ipv6

Description This command enables the context to configure IPv6 parameters for the interface.

Introduced 25.3.R2

Platforms SAR Gen 2

address [ipv6-address] *ipv6-address*

Synopsis Enter the **address** list instance

Context **configure** service vprn *service-name* interface *interface-name* ipv6 address *ipv6-address*

Tree address

Description This command assigns an IPv6 address/subnet to the interface.

Up to 16 total primary and secondary IPv4 and IPv6 addresses can be assigned to network interfaces, and up to 256 to access interfaces.

Caution: Configurations must not exceed 16 secondary IP addresses when IPsec, GRE, L2TPv3, or IP in IP protocols are active on an access interface.

Introduced 25.3.R2

Platforms SAR Gen 2

[**ipv6-address**] *ipv6-address*

Synopsis IPv6 address assigned to the interface

Context **configure** service vprn *service-name* interface *interface-name* ipv6 address *ipv6-address*

Tree address

Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

duplicate-address-detection *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Enable Duplicate Address Detection
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 address *ipv6-address* duplicate-address-detection *boolean*
Tree	duplicate-address-detection
Description	When configured to **true**, the router enables Duplicate Address Detection (DAD). When configured to **false**, the router disables DAD and sets the address to preferred, even if there is a duplicated address.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

eui-64 *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Form IPv6 address from prefix and 64-bit interface ID
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 address *ipv6-address* eui-64 *boolean*
Tree	eui-64
Description	When configured to **true**, the router forms a complete IPv6 address from the supplied prefix and 64-bit interface identifier. The 64-bit interface identifier is derived from the MAC address on Ethernet interfaces. For interfaces without a MAC address, for example POS interfaces, use the base MAC address of the chassis.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

prefix-length *number*

Synopsis	IPv6 address prefix length
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 address *ipv6-address* prefix-length *number*
Tree	prefix-length
Range	4 to 128
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

primary-preference *number*

Synopsis	Index assigned to the IPv6 address of the interface
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 address *ipv6-address* primary-preference *number*
Tree	primary-preference
Description	This command assigns a primary preference index to an IPv6 address of the interface to enforce the order in which the address is used by control plane protocols and applications that require a fixed address of the interface, such as LDP and Segment Routing. In cases where a fixed address is required when originating packets from the interface, the IPv6 address with the lowest primary preference index is selected. If the selected address is removed, the next IPv6 address with the next lowest primary preference index is selected. If this index is not specified for the IPv6 address, the system assigns the next available index value to the address. The address index space is unique across all addresses of a given interface.
Range	1 to 4294967295
Introduced	25.3.R2
Platforms	SAR Gen 2

tag *(number | keyword)*

Synopsis	Route tag to be matched by BGP export policy rules
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 address *ipv6-address* tag *(number | keyword)*
Tree	tag
Description	This command associates an administrative tag value with an interface IP address. This tag value is added to the IP FIB entries corresponding to the subnet route and host route

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

created by IP address configuration. This tag can be used to filter these routes when they are processed by a BGP export policy, a BGP RIB-management route table import policy, as IS-IS export policy or an OSPF export policy.

Range	1 to 4294967295
Options	no-tag
Default	no-tag
Introduced	26.3.R1
Platforms	SAR Gen 2

bfd

Synopsis	Enter the **bfd** context
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 bfd
Tree	bfd
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of BFD sessions
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 bfd admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	25.3.R2
Platforms	SAR Gen 2

echo-receive *number*

Synopsis	Minimum echo interval over this interface
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 bfd echo-receive *number*
Tree	echo-receive
Range	100 to 100000
Units	milliseconds

Introduced	25.3.R2
Platforms	SAR Gen 2

multiplier *number*

Synopsis	Number of consecutive BFD messages missed from the peer
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 bfd multiplier *number*
Tree	multiplier
Description	This command configures the number of missed messages before the BFD session state is changed to down and the upper-level protocol is notified of the fault. A multiplier of less than 3 should not be used in production environments.
Range	1 to 20
Default	3
Introduced	25.3.R2
Platforms	SAR Gen 2

receive *number*

Synopsis	BFD receive interval over this interface
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 bfd receive *number*
Tree	receive
Description	This command specifies the receive interval for the BFD session.
Range	10 to 100000
Units	milliseconds
Default	100
Introduced	25.3.R2
Platforms	SAR Gen 2

transmit-interval *number*

Synopsis	BFD transmit interval over this interface
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 bfd transmit-interval *number*
Tree	transmit-interval
Description	This command configures the transmit intervals.

Range	1 to 255
Introduced	25.3.R2
Platforms	SAR Gen 2

learn-unsolicited *keyword*

Synopsis	Type of entries learned from unsolicited NA messages
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 neighbor-discovery learn-unsolicited *keyword*
Tree	learn-unsolicited
Description	This command enables the ability to learn neighbor entries out of received unsolicited Neighbor Advertisement (NA) messages, with or without the solicited flag set. When unconfigured, the router follows standard RFC 4861 behavior for learning of neighbor entries. The neighbor is put in the stale state. This is the standard RFC behavior.
Options	global, link-local, both
Introduced	25.3.R2
Platforms	SAR Gen 2

limit

Synopsis	Enter the **limit** context
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 neighbor-discovery limit
Tree	limit
Introduced	25.3.R2
Platforms	SAR Gen 2

log-only *boolean*

Synopsis	Generate log entries when limit is reached
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 neighbor-discovery limit log-only *boolean*
Tree	log-only
Description	When configured to **true**, the router sends the warning message at the specified threshold percentage or upon exceeding the specified limit. Entries that exceed the limit are learned.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, the router does not send the warning message.

Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

max-entries *number*

Synopsis	Maximum number of entries learned on an IP interface
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 neighbor-discovery limit max-entries *number*
Tree	max-entries
Description	This command configures the maximum number of entries that can be learned on an IP interface. When unconfigured, no maximum limit is imposed.
Range	0 to 102400
Introduced	25.3.R2
Platforms	SAR Gen 2

threshold *number*

Synopsis	Threshold percentage that triggers a warning message
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 neighbor-discovery limit threshold *number*
Tree	threshold
Range	1 to 100
Units	percent
Default	90
Introduced	25.3.R2
Platforms	SAR Gen 2

local-proxy-nd *boolean*

Synopsis	Enable local proxy neighbor discovery on the interface
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 neighbor-discovery local-proxy-nd *boolean*
Tree	local-proxy-nd

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the router enables local proxy neighbor discovery on the interface and replies to neighbor solicitation requests when both the hosts are on the same subnet. In this case, ICMP redirects are disabled. When configured to **false**, the router disables local proxy neighbor discovery on the interface and does not reply to neighbor solicitation requests if both the hosts are on the same subnet.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

proactive-refresh *keyword*

Synopsis	Proactive refresh of neighbor entries
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 neighbor-discovery proactive-refresh *keyword*
Tree	proactive-refresh
Description	This command enables a proactive refresh of the neighbor entries. After the stale timer expires, the router sends an NUD message to the host (regardless of the existence of traffic to the IP address on the IOM), so the entry can be refreshed or removed.
Options	global, link-local, both
Introduced	25.3.R2
Platforms	SAR Gen 2

proxy-nd-policy *reference*

admin-state *keyword*

Synopsis	Administrative state of VRRP
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 vrrp *number* admin-state *keyword*
Tree	admin-state
Description	The command determines the administrative state of non-owner virtual router instances. Non-owner virtual router instances can be administratively disabled. This allows the termination of VRRP participation in the virtual router and stops all routing and other access capabilities with regards to the virtual router IP addresses. Disabling the virtual router instance provides a mechanism to maintain the virtual routers without causing false backup or master state changes. When **disabled**, no VRRP advertisement messages are generated and all received VRRP advertisement messages are silently discarded with no processing. Whenever the administrative or operational state of a virtual router instance transitions, a log message is generated. An owner virtual router context does not use this command. To administratively disable an owner virtual router instance, use the **admin-state** command within the parent IP interface node which administratively disables the IP interface.
Options	enable, disable
Default	enable
Introduced	25.3.R2
Platforms	SAR Gen 2

backup *ipv6-address*

Synopsis	Virtual router IP addresses for the interface
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 vrrp *number* backup *ipv6-address*
Tree	backup
Description	This command associates router IPv6 virtual router IP addresses with those of the parental IP interface. This command has two different functions based on whether it is being executed on an owner or non-owner virtual router instance. Non-owner virtual router instance create a routable IP interface address that is operationally dependent on the virtual router instance mode (master or backup). This command, when executed on an owner virtual router instance, does not create a routable IP interface address; it simply defines the existing IP addresses of the parental IP interface that are advertised by the virtual router instance.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

For owner virtual router instances, this command defines the IP addresses that are advertised within VRRP advertisement messages. This communicates the IP addresses that the master is representing to backup virtual routers receiving the messages. The specified IPv6 address must be equal to one of the existing parental IP addresses in the parental IP interface (primary or secondary) or this command fails.

See "Owner and non-owner VRRP" in the *7705 SAR Gen 2 Router Configuration Guide* for more information about owner and non-owner virtual router instances.

Introduced	25.3.R2
Platforms	SAR Gen 2

bfd-liveness

mac *mac-unicast-address*

Synopsis	Virtual MAC address to use in ARP responses
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 vrrp *number* mac *mac-unicast-address*
Tree	mac
Description	This command sets an explicit MAC address for the virtual router instance that overrides the VRRP default derived from the VRID. Changing the default MAC address is useful when an existing HSRP or other non-VRRP default MAC is in use by the IP hosts that use the virtual router IP address. Many hosts do not monitor unessential ARPs and continue to use the cached non-VRRP MAC address after the virtual router becomes master of the host's gateway address. Additionally, this command sets the MAC address used in ARP responses when the virtual router instance is master. Routing of IP packets with *unicast-mac-address* as the destination MAC is also enabled. The MAC must be the same for all virtual routers participating as a virtual router or indeterminate connectivity by the attached IP hosts results. All VRRP advertisement messages are transmitted with *unicast-mac-address* as the source MAC. An operator can execute this command at any time and it takes effect immediately. When the virtual router MAC on a master virtual router instance changes, a gratuitous ARP is immediately sent with a VRRP advertisement message. If the virtual router instance is disabled or operating as a backup, the gratuitous ARP and VRRP advertisement messages are not sent.
String format	'ieee-address' must be 6 hex byte pairs with ':' or '-' (e.g. 00:11:22:33:44:55)
Introduced	25.3.R2
Platforms	SAR Gen 2

master-int-inherit *boolean*

Synopsis	Allow master instance to dictate the master down timer
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 vrrp *number* master-int-inherit *boolean*
Tree	master-int-inherit
Description	When configured to **true**, the virtual router instance inherits the advertisement interval timer of the master VRRP router, which backup routers use to calculate the master down timer. When configured to **false**, the locally configured message interval must match the master's VRRP advertisement message advertisement interval field value or the message is discarded.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

message-interval *number*

Synopsis	Interval for sending VRRP advertisement messages
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 vrrp *number* message-interval *number*
Tree	message-interval
Description	This command configures the administrative advertisement message timer used by the master virtual router instance to send VRRP advertisement messages. The backup master down timer is derived from the value configured using this command. The use of this command varies for non-owner virtual router instances, depending on the state of the virtual router (master or backup) and the state of the **master-int-inherit** command: • When a non-owner is operating as master for the virtual router, the system uses the configured value of this command as the operational advertisement timer, similar to an owner virtual router instance. The **master-int-inherit** command has no effect when operating as the master. • When a non-owner is in the backup state with **master-int-inherit** disabled, the system uses the configured value of this command to match the incoming advertisement interval field of the VRRP advertisement message. If the locally configured message interval does not match the advertisement interval field, the system discards the VRRP advertisement. • When a non-owner is in the backup state with **master-int-inherit** enabled, the configured value of this command is ignored. The master down timer is indirectly derived from the advertisement interval field value of the incoming VRRP advertisement message.
Range	10 to 4095
Units	centiseconds
Default	100
Introduced	25.3.R2
Platforms	SAR Gen 2

monitor-oper-group *reference*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	VRRP instance to follow a specified operational group
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 vrrp *number* monitor-oper-group *reference*
Tree	monitor-oper-group

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures VRRP to associate with an operational group. When associated, VRRP notifies the operational group of its state changes so that other protocols can monitor it to provide a redundancy mechanism. When VRRP is the master router, the operational group is up and the operational group is down for all other VRRP states.
Reference	**configure** service oper-group *named-item*
Introduced	25.3.R2
Platforms	SAR Gen 2

ntp-reply *boolean*

Synopsis	Allow processing of NTP requests
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 vrrp *number* ntp-reply *boolean*
Tree	ntp-reply
Description	When configured to **true**, the router redirects NTP requests to the VRRP virtual IP address. This behavior only applies to the router acting as the master VRRP router. When configured to **false**, the router does not process NTP requests.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

oper-group *reference*

Synopsis	Operational group name associated with the VRRP
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 vrrp *number* oper-group *reference*
Tree	oper-group
Description	This command configures an operational group to associate with the VRRP. When associated, VRRP notifies the operational group of its state changes so that other protocols can monitor it to provide a redundancy mechanism. When VRRP is the master router (MR), the operational group is up. The operational group is down for all other VRRP states.
Reference	**configure** service oper-group *named-item*
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

owner *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Designate the virtual router instance as owner
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 vrrp *number* owner *boolean*
Tree	owner
Description	When configured to **true**, the router designates this virtual router instance as the owner of the virtual router IP addresses. Therefore, this virtual router becomes responsible for forwarding packets sent to the virtual router IP addresses. The owner also assumes the role of master virtual router. When configured to **false**, this virtual router instance is designated as a non-owner.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

passive *boolean*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Suppress the processing of VRRP advertisement messages
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 vrrp *number* passive *boolean*
Tree	passive
Description	When configured to **true**, the router identifies this virtual router instance as passive; and therefore the owner of the virtual router IP addresses. A passive virtual router instance does not transmit or receive VRRP advertisement messages and is always in either the master state (if the interface is operationally up) or the init state (if the interface is operationally down). When configured to **false**, this virtual router instance is not identified as passive, meaning that it transmits and receives VRRP advertisement messages.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ping-reply *boolean*

Synopsis	Allow non-owner master to reply to ICMP echo requests
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 vrrp *number* ping-reply *boolean*
Tree	ping-reply
Description	When configured to **true**, the router allows the non-owner master to reply to ICMP echo requests directed at the IP addresses of the virtual router instance. Any routed interface can receive the ping request. Ping must not have been disabled at the management security level (either on the parental IP interface or on the Ping source host address). When configured to **false**, ICMP echo requests sent to non-owner master virtual IP addresses are silently discarded. Non-owner backup virtual routers never respond to ICMP echo requests, regardless of the configuration of this command.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

policy *reference*

Synopsis	VRRP priority control policy
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 vrrp *number* policy *reference*
Tree	policy
Description	This command configures a VRRP priority control policy to associate with the virtual router instance. VRRP priority control policies can override or adjust the base priority value of the virtual router instance, depending on events or conditions within the chassis. An operator can associate a policy with more than one virtual router instance. The priority events within the policy either override or diminish the base priority set with the **priority** command. As priority events clear in the policy, the in-use priority can eventually be restored to the base priority value. For non-owner virtual router instances, if this command is not executed, the base priority is used as the in-use priority.
Reference	**configure** vrrp policy *number*
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

preempt *boolean*

Synopsis	Allow the VRRP to override an existing non-owner master
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 vrrp *number* preempt *boolean*
Tree	preempt
Description	When configured to **true**, this virtual router instance overrides any non-owner master with an in-use message priority value less than the in-use priority value of this virtual router. When configured to **false**, this virtual router only becomes master if the master down timer expires before a VRRP advertisement message is received from another virtual router.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

priority *number*

Synopsis	Base priority for the VRRP
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 vrrp *number* priority *number*
Tree	priority
Description	This command configures the base router priority for the virtual router instance, which defines the selection order of the virtual router in the master election process. The in-use priority is derived from the base priority. However, the in-use priority is modified by optional VRRP priority control policies. An operator can use VRRP priority control policies to either override or adjust the base priority value depending on events or conditions within the chassis.
Range	1 to 255
Introduced	25.3.R2
Platforms	SAR Gen 2

standby-forwarding *boolean*

Synopsis	Allow standby router to forward traffic
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 vrrp *number* standby-forwarding *boolean*
Tree	standby-forwarding

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the standby router forwards all traffic. When configured to **false**, the standby router cannot forward traffic sent to the MAC address of the virtual router. However, the standby router still forwards traffic sent to its own MAC address.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

telnet-reply *boolean*

Synopsis	Allow non-owner master to reply to Telnet requests
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 vrrp *number* telnet-reply *boolean*
Tree	telnet-reply
Description	When configured to **true**, the router allows the non-owner master to reply to Telnet requests directed at the IP addresses of the virtual router instance. Any routed interface can receive Telnet requests. Telnet cannot be disabled at the management security level (either on the parental IP interface or on the Telnet source host address). When configured to **false**, the router silently discards Telnet requests sent to non-owner master virtual IP addresses.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

traceroute-reply *boolean*

Synopsis	Allow non-owner master to reply to traceroute requests
Context	**configure** service vprn *service-name* interface *interface-name* ipv6 vrrp *number* traceroute-reply *boolean*
Tree	traceroute-reply
Description	When configured to **true**, the router allows a non-owner master to reply to traceroute requests directed to the IP addresses of the virtual router instance. When configured to **false**, the router silently discards traceroute requests sent to non-owner master virtual IP addresses. Traceroute must not have been disabled at the management security level (either on the parental IP interface or the source host address).
Default	false
Introduced	25.3.R2

Notes	The following elements are part of a choice: **multi-chassis-shunting-profile** or (**dynamic-tunnel-redundant-nexthop** and **static-tunnel-redundant-nexthop**).
Introduced	25.3.R2
Platforms	SAR Gen 2

ptp-hw-assist

Synopsis	Enter the **ptp-hw-assist** context
Context	**configure** service vprn *service-name* interface *interface-name* ptp-hw-assist
Tree	ptp-hw-assist
Description	Commands in this context enable the port-based timestamping assist of PTP packets at the physical interface. This capability is supported on specific hardware. The command may be blocked if not all hardware has the required level of support. Only one interface per physical port can have port-based timestamping assist enabled. This feature cannot be enabled if the physical port supporting the interface is configured as a PTP port.
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

admin-state *keyword*

Synopsis	Administrative state of the PTP timestamping assist
Context	**configure** service vprn *service-name* interface *interface-name* ptp-hw-assist admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

[**scheduler-name**] *named-item*

Synopsis Scheduler name

Context **configure** service vprn *service-name* interface *interface-name* sap *sap* egress qos scheduler-policy overrides scheduler *named-item*

Tree scheduler

Description This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can be reused in multiple scheduler policies. If the scheduler name already exists within the policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands.

If the scheduler name exists within the policy on a different tier, an error occurs and the current context does not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name.

If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context is not change.

String length 1 to 32

String format 'string-not-all-spaces' must contain at least one non-space character

Notes This element is part of a list key.

scheduler [scheduler-name] *named-item*

Synopsis	Enter the **scheduler** list instance
Context	**configure** service vprn *service-name* interface *interface-name* sap *sap* ingress qos scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Introduced	25.3.R2
Platforms	SAR Gen 2

[**scheduler-name**] *named-item*

Synopsis	Scheduler name
Context	**configure** service vprn *service-name* interface *interface-name* sap *sap* ingress qos scheduler-policy overrides scheduler *named-item*
Tree	scheduler
Description	This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can be reused in multiple scheduler policies. If the scheduler name already exists within the policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands. If the scheduler name exists within the policy on a different tier, an error occurs and the current context does not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context is not change.
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

clear-df-bit *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Clear the Do-not-Fragment bit
Context	**configure** service vprn *service-name* interface *interface-name* sap *sap* ip-tunnel *interface-name* clear-df-bit *boolean*
Tree	clear-df-bit
Description	When configured to **true**, the DF bit is cleared (set to 0) in all payload IP packets associated with the GRE or IPsec tunnel, before any potential fragmentation resulting from the ip-mtu command. This requires a modification of the header checksum. When configured to **false**, clearing of the DF bit is disabled.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

delivery-service *service-name*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Service to originate and terminate GRE packets
Context	**configure** service vprn *service-name* interface *interface-name* sap *sap* ip-tunnel *interface-name* delivery-service *service-name*
Tree	delivery-service
Description	This command specifies the service used to originate and terminate the GRE encapsulated packets belonging to the GRE tunnel. The delivery service may be the same service that owns the private tunnel SAP associated with the GRE tunnel. The GRE tunnel does not come up until a valid delivery service is configured.

local-ip-address *(ipv4-address-no-zone | ipv6-address-no-zone)*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Local IP address of this tunnel
Context	**configure** service vprn *service-name* interface *interface-name* sap *sap* ip-tunnel *interface-name* local-ip-address *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	local-ip-address
Description	This command specifies the local IP address to use for the IP tunnel. This configuration applies to the outer IP header of the encapsulated packets. The address must belong to one of the IP subnets associated with the public SAP interface of the tunnel group. The source IP address, the remote IP address, and the backup remote IP address of a tunnel must all belong to the same address family (IPv4 or IPv6). When this command specifies an IPv6 address, it must be a global unicast address.
Introduced	25.3.R2
Platforms	SAR Gen 2

interval *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Interval for sending ICMP messages
Context	**configure** service vprn *service-name* interface *interface-name* sap *sap* ipsec-tunnel *named-item* icmp-generation frag-required interval *number*
Tree	interval
Description	This command configures the interval for sending ICMP Destination Unreachable "fragmentation needed, DF set" messages (type 3, code 4).
Range	1 to 60
Units	seconds
Default	10
Introduced	25.3.R2
Platforms	SAR Gen 2

message-count *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Maximum number of ICMP messages that can be sent

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vprn *service-name* interface *interface-name* sap *sap* ipsec-tunnel *named-item* icmp-generation frag-required message-count *number*
Tree	message-count
Description	This command configures the maximum number of ICMP Destination Unreachable "fragmentation needed, DF set" messages (type 3, code 4) that can be sent during the configured interval.
Range	10 to 1000
Default	100
Introduced	25.3.R2
Platforms	SAR Gen 2

icmp6-generation

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **icmp6-generation** context
Context	**configure** service vprn *service-name* interface *interface-name* sap *sap* ipsec-tunnel *named-item* icmp6-generation
Tree	icmp6-generation
Description	Commands in this context configure settings for ICMPv6 message generation.
Introduced	25.3.R2
Platforms	SAR Gen 2

packet-too-big

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **packet-too-big** context
Context	**configure** service vprn *service-name* interface *interface-name* sap *sap* ipsec-tunnel *named-item* icmp6-generation packet-too-big
Tree	packet-too-big
Description	Commands in this context configure the parameters to send ICMPv6 PTB (Packet Too Big) messages on the private side. The system sends PTB messages if a received IPv6 packet on the private side is greater than 1280 bytes and it exceeds the private MTU of the tunnel.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The private MTU for the tunnel is configured via the **configure router interface ipsec ipsec-tunnel ip-mtu** command for the interface.

Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Administrative state of Packet Too Big message sends
Context	**configure** service vprn *service-name* interface *interface-name* sap *sap* ipsec-tunnel *named-item* icmp6-generation packet-too-big admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	25.3.R2
Platforms	SAR Gen 2

interval *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Interval for sending Packet Too Big messages
Context	**configure** service vprn *service-name* interface *interface-name* sap *sap* ipsec-tunnel *named-item* icmp6-generation packet-too-big interval *number*
Tree	interval
Range	1 to 60
Units	seconds

Platforms	SAR Gen 2

status-verify

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **status-verify** context
Context	**configure** service vprn *service-name* interface *interface-name* sap *sap* ipsec-tunnel *named-item* key-exchange dynamic cert status-verify
Tree	status-verify
Description	Commands in this context configure attributes of Certificate Status Verification (CSV).
Introduced	25.3.R2
Platforms	SAR Gen 2

default-result *keyword*

Synopsis	Default result for Certificate Status Verification
Context	**configure** service vprn *service-name* interface *interface-name* sap *sap* ipsec-tunnel *named-item* key-exchange dynamic cert status-verify default-result *keyword*
Tree	default-result
Description	This command specifies the default certificate revocation status result to use when all configured CSV methods fail to return a result.
Options	revoked, good
Default	revoked
Introduced	25.3.R2
Platforms	SAR Gen 2

primary *keyword*

Synopsis	Primary method of CSV to verify the revocation status
Context	**configure** service vprn *service-name* interface *interface-name* sap *sap* ipsec-tunnel *named-item* key-exchange dynamic cert status-verify primary *keyword*
Tree	primary

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the primary method of Certificate Status Verification (CSV) that is used to verify the revocation status of the certificate of the peer.
Options	crl, ocsp
Default	crl
Introduced	25.3.R2
Platforms	SAR Gen 2

secondary *keyword*

Synopsis	Secondary method used to verify certificate revocation
Context	**configure** service vprn *service-name* interface *interface-name* sap *sap* ipsec-tunnel *named-item* key-exchange dynamic cert status-verify secondary *keyword*
Tree	secondary
Description	This command specifies the secondary method of Certificate Status Verification (CSV) that is used to verify the revocation status of the peer certificate.
Options	none, crl, ocsp
Default	none
Introduced	25.3.R2
Platforms	SAR Gen 2

trust-anchor-profile *reference*

Synopsis	Trust anchor profile name
Context	**configure** service vprn *service-name* interface *interface-name* sap *sap* ipsec-tunnel *named-item* key-exchange dynamic cert trust-anchor-profile *reference*
Tree	trust-anchor-profile
Reference	**configure** ipsec trust-anchor-profile *named-item*
Introduced	25.3.R2
Platforms	SAR Gen 2

id

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enter the **id** context

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vprn *service-name* interface *interface-name* sap *sap* ipsec-tunnel *named-item* key-exchange dynamic id
Tree	id
Description	Commands in this context specify the local ID used for IDi or IDr for IKEv2 negotiation. The default behavior depends on the local authentication method as follows: • Psk: local tunnel IP address • Cert-auth: subject of the local certificate
Introduced	25.3.R2
Platforms	SAR Gen 2

fqdn *fully-qualified-domain-name*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	FQDN used as the local ID IKE type
Context	**configure** service vprn *service-name* interface *interface-name* sap *sap* ipsec-tunnel *named-item* key-exchange dynamic id fqdn *fully-qualified-domain-name*
Tree	fqdn
String length	1 to 255
Notes	The following elements are part of a choice: **fqdn**, **ipv4**, or **ipv6**.
Introduced	25.3.R2
Platforms	SAR Gen 2

ipv4 *ipv4-unicast-address*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	IPv4 as the local ID type
Context	**configure** service vprn *service-name* interface *interface-name* sap *sap* ipsec-tunnel *named-item* key-exchange dynamic id ipv4 *ipv4-unicast-address*
Tree	ipv4
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Notes	The following elements are part of a choice: **fqdn**, **ipv4**, or **ipv6**.

Introduced	25.3.R2
Platforms	SAR Gen 2

strict-match *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable strict match of the security policy entry
Context	**configure** service vprn *service-name* interface *interface-name* sap *sap* ipsec-tunnel *named-item* security-policy strict-match *boolean*
Tree	strict-match
Description	When configured to **true**, this command enables strict match of the security policy entry. When a CREATE_CHILD exchange request is received for a static IPsec tunnel, and this request is not a rekey request, ISA matches the received TSi and TSr with the configured security policy. This can be a match only when a received TS (in TSi or TSr) address range matches exactly with the subnet in a security policy entry. If there is no match, the setup fails, and TS_UNACCEPTABLE is sent. If there is a match, but there is an existing CHILD_SA for the matched security policy, the setup fails, and NO_PROPOSAL_CHOSEN is sent. If there is a match, and there is not a CHILD_SA for the matched entry, the subnet is sent in the matched security policy entry as TSi and TSr, and the CHILD_SA is created.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

static-tunnel-redundant-nexthop *ipv4-unicast-address*

Synopsis	Address for the static ISA tunnel redundant next-hop
Context	**configure** service vprn *service-name* interface *interface-name* static-tunnel-redundant-nexthop *ipv4-unicast-address*
Tree	static-tunnel-redundant-nexthop
Description	This command configures a redundant next-hop address on a public or private IPsec interface (with a public or private tunnel SAP) for a static IPsec tunnel in 1:1 MC-IPsec. A standby node uses the specified next-hop address to shunt traffic to the master in case it receives traffic destined to a tunnel endpoint address. The standby tunnel group needs to be operationally up for the feature to work. The next-hop address is resolved in the routing table of the corresponding service.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Notes	The following elements are part of a choice: **multi-chassis-shunting-profile** or (**dynamic-tunnel-redundant-nexthop** and **static-tunnel-redundant-nexthop**).

Context	**configure** service vprn *service-name* interface *interface-name* vpls *named-item-64* evpn nd advertise *keyword* route-tag *number*
Tree	route-tag
Description	This command specifies the route tag that is added separately to dynamic or static ARP or ND entries that are advertised in EVPN MAC/IP routes. This tag can be matched on BGP vsi-export (in the R-VPLS) and BGP peer export policies.
Range	0 to 255
Introduced	25.3.R2
Platforms	SAR Gen 2

learn-dynamic *boolean*

Synopsis	Process ARP or ND messages on EVPN tunnels
Context	**configure** service vprn *service-name* interface *interface-name* vpls *named-item-64* evpn nd learn-dynamic *boolean*
Tree	learn-dynamic
Description	When configured to **true**, the system processes ARP or ND messages that arrive on EVPN tunnels. When configured to **false**, learning is disabled and table entries are not created for these messages.

supplementary-broadcast-domain *boolean*

Synopsis	Use the EVPN tunnel as a Supplementary Broadcast Domain
Context	**configure** service vprn *service-name* interface *interface-name* vpls *named-item-64* evpn-tunnel supplementary-broadcast-domain *boolean*
Tree	supplementary-broadcast-domain
Description	When configured to **true**, this command allows the EVPN tunnel to be used as a Supplementary Broadcast Domain (SBD). The SBD is used in EVPN OISM to advertise the SMET routes and to receive the multicast traffic on egress PEs that are not attached to the source R-VPLS service. When configured to **false**, this command disables EVPN tunnel use as an SBD.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ingress

Synopsis	Enter the **ingress** context

Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vprn *service-name* interface *interface-name* vpls *named-item-64* ingress routed-override-filter ip *reference*
Tree	ip
Description	This command specifies an IP filter that is applied to routed unicast ingress packets entering the VPLS service and destined to the R-VPLS interface MAC address. The filter overrides any existing ingress IP filter applied to SAPs or SDP bindings for packets associated with the routing IP interface. The override filter is optional and when it is not defined or it is removed, the IP routed packets use the existing ingress IP filter configured on the VPLS endpoint.
Reference	**configure** filter ip-filter *filter-name*
Introduced	25.3.R2
Platforms	SAR Gen 2

ipv6 *reference*

Synopsis	IPv6 filter policy name
Context	**configure** service vprn *service-name* interface *interface-name* vpls *named-item-64* ingress routed-override-filter ipv6 *reference*
Tree	ipv6
Description	This command specifies an IPv6 filter that is applied to routed unicast ingress packets entering the VPLS service and destined to the R-VPLS interface MAC address. The filter overrides any existing ingress IP filter applied to SAPs or SDP bindings for packets associated with the routing IP interface. The override filter is optional and when it is not defined or it is removed, the IP routed packets use the existing ingress IP filter configured on the VPLS endpoint.

Tree	mtu
Range	1280 to 9800
Introduced	25.3.R2
Platforms	SAR Gen 2

nd-router-preference *keyword*

Synopsis	Default router preference for Router Advertisements
Context	**configure** service vprn *service-name* ipv6 router-advertisement interface *reference* nd-router-preference *keyword*
Tree	nd-router-preference
Description	This command configures the default router preference for Router Advertisements (RAs) and allows IPv6 hosts to discover and select a default gateway address by listening to RAs. This feature provides basic traffic engineering functionality for host devices. When this command is applied, the router advertises the respective router preference to the connected host to assist in its selection of the most appropriate default gateway on a link. This extension is backward compatible, both for routers (setting the router preference bits) and hosts (interpreting the router preference bits). These bits are ignored by hosts that do not implement the RFC 4191 functionality by configuring this command. Similarly, hosts that do not implement the RFC 4191 functionality interpret the values sent by devices that do not implement the RFC 4191 extension as a medium preference.
Options	medium, high, low
Default	medium

Introduced	25.3.R2
Platforms	SAR Gen 2

export-policy *reference*

Synopsis	Export policies that determine exported routes
Context	**configure** service vprn *service-name* isis *number* export-policy *reference*
Tree	export-policy
Description	This command configures export routing policies for the routes exported from the routing table to IS-IS. If the export policy is undefined, the system does not export non IS-IS routes from the routing table manager to IS-IS.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied.

If the **aggregate** command is also configured in the **configure router** context, the aggregation is applied before the export policy is applied.

Routing policies are created in the **configure router policy-options** context.

conditional-advertise-prefix *reference*

Synopsis	Policy to conditionally advertise interface prefixes

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vprn *service-name* isis *number* interface *interface-name* conditional-advertise-prefix *reference*
Tree	conditional-advertise-prefix
Description	This command specifies the policy that allows IS-IS, OSPF, and OSPFv3 to selectively advertise system or loopback interface prefixes (including associated SIDs and SRv6 locators) only when conditions defined in the route policy are met. The route policy evaluates the presence or absence of specific routes in the routing table, typically using constructs like route-exists. If the policy evaluates to accept, the interface prefix is advertised; if not, the prefix is suppressed.
Reference	**configure** policy-options policy-statement *named-item-64*
Introduced	25.10.R1
Platforms	SAR Gen 2

hello-authentication-key *encrypted-leaf*

Synopsis	Authentication key for Hello PDUs
Context	**configure** service vprn *service-name* isis *number* interface *interface-name* level *keyword* hello-authentication-key *encrypted-leaf*
Tree	hello-authentication-key
Description	This command configures the authentication key (password) for Hello PDUs. Both the Hello authentication key and the Hello authentication type on a segment must match. If both IS-IS and Hello authentication are configured, Hello messages are validated using Hello authentication. If only IS-IS authentication is configured, it is used to authenticate all IS-IS (including Hello) protocol PDUs. This command uses a protected format where the specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7705 SAR Gen 2 System Management Guide* for more information.
String length	1 to 422
Introduced	25.3.R2
Platforms	SAR Gen 2

hello-authentication-keychain *reference*

Synopsis	Authentication keychain to use for the session

Platforms	SAR Gen 2

overload-export-external *boolean*

Synopsis	Advertise the external routes when router is in overloaded
Context	**configure** service vprn *service-name* isis *number* overload-export-external *boolean*
Tree	overload-export-external
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

overload-export-interlevel *boolean*

Synopsis	Advertise the inter-level routes when router is overloaded
Context	**configure** service vprn *service-name* isis *number* overload-export-interlevel *boolean*
Tree	overload-export-interlevel
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

overload-fib-error-notify-only

Synopsis	Enable the **overload-fib-error-notify-only** context
Context	**configure** service vprn *service-name* isis *number* overload-fib-error-notify-only
Tree	overload-fib-error-notify-only
Description	Commands in this context configure the IS-IS router to send a notification when an overload condition occurs while programming the FIB, instead of advertising the overload condition of the router in the IS-IS LSP. **Note**: Nokia recommends being careful using this command. When you configure the router not to advertise the IS-IS overload state in the IS-IS LSP, other routers are not instructed to take the overloaded router out of the IS-IS forwarding topology and this will cause suboptimal forwarding and non-deterministic behavior on the overloaded router. To avoid changing the default IS-IS overflow behavior, leave this command disabled. When this command is configured, the IS-IS router enters a suboptimal state where it sends only a notification trap; transit traffic can still use the router in this state. The IS-IS router tracks the segment routing prefix SIDs where FIB programming failed. With the **retry** command configured, the router retries programming the segment routing prefix SIDs in the FIB using this tracked information.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When this command is not configured, during normal operation, the system may force the router to enter an overload state because of a lack of FIB resources. In this state, the router is used to terminate traffic and is not used to transit traffic.

Introduced	25.3.R2
Platforms	SAR Gen 2

retry *number*

Synopsis	Time to retry programming failed entries in the FIB
Context	**configure** service vprn *service-name* isis *number* overload-fib-error-notify-only retry *number*
Tree	retry
Description	This command configures the time the router uses to retry programming the failed entries in the FIB. The **overload-fib-error-notify-only** command must be configured to use the retry timer. The removal of the **overload-fib-error-notify-only** configuration causes the system to program the failed entries in the FIB by triggering an immediate SPF.
Range	10 to 1800
Units	seconds
Default	10
Introduced	25.3.R2
Platforms	SAR Gen 2

overload-on-boot

Synopsis	Enable the **overload-on-boot** context
Context	**configure** service vprn *service-name* isis *number* overload-on-boot
Tree	overload-on-boot
Introduced	25.3.R2

local-routes-domain-id *domain-id*

Synopsis	Local routes domain ID
Context	**configure** service vprn *service-name* local-routes-domain-id *domain-id*
Tree	local-routes-domain-id
Description	This command specifies the domain ID that is used in the D-PATH attribute for local routes before those routes are exported to a BGP neighbor using BGP-IPVPN, EVPN-IFF, EVPN-IFL, or PE-CE BGP. A local route is a non-BGP route installed in the VPRN route table and learned using static route or an IGP. The domain IDs are used in the D-PATH attribute, in accordance with draft-ietf-bess-evpn-ipvpn-interworking. Gateway routers modify the D-PATH attribute. A gateway is a PE where a VPRN is instantiated. The VPRN in this case advertises or receives routes from multiple BGP owners (for example, EVPN IFL and BGP IPVPN). Gateways use the D-PATH attribute to detect loops (for received routes where the D-PATH contains a local domain ID) and to make BGP best-path selection decisions based on the D-PATH length (shorter D-PATH is preferred).
String format	'domain-id' must be global-field:local-field (uint32:uint16 range)
Introduced	25.3.R2
Platforms	SAR Gen 2

tls-client-profile *reference*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	TLS client profile used to encrypt syslog communication
Context	**configure** service vprn *service-name* log syslog *log-vprn-syslog-name* tls-client-profile *reference*
Tree	tls-client-profile
Description	This command specifies the Transport Layer Security (TLS) client profile used to encrypt syslog communications. When configured, syslog messages are sent using TLS. Any change to this command results in a brief interruption of the event log, which may cause the loss of a few syslog messages. When this command is unconfigured, the syslog messages are sent over UDP.
Reference	**configure** system security tls client-tls-profile *named-item*
Introduced	25.3.R2
Platforms	SAR Gen 2

management

Synopsis	Enable the **management** context
Context	**configure** service vprn *service-name* management
Tree	management
Description	Commands in this context control which management protocols can be used to access the SR OS router via the VPRN router instance. For SNMP control, see the **configure service vprn snmp access** command.
Introduced	25.3.R2
Platforms	SAR Gen 2

allow-ftp *boolean*

Synopsis	Allow access to the FTP server
Context	**configure** service vprn *service-name* management allow-ftp *boolean*
Tree	allow-ftp
Description	When configured to **true**, this command allows FTP access to the SR OS router via the VPRN router instance.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, this command disallows access to the SR OS FTP server.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

allow-grpc *boolean*

Synopsis Allow access to the gRPC server

Context **configure** service vprn *service-name* management allow-grpc *boolean*

Tree allow-grpc

Description When configured to **true**, this command allows access to the gRPC server via the VPRN router instance.

When configured to **false**, this command disallows gRPC server access.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

allow-netconf *boolean*

Synopsis Allow access to the NETCONF server

Context **configure** service vprn *service-name* management allow-netconf *boolean*

Tree allow-netconf

Description When configured to **true**, this command allows NETCONF server access to the SR OS router via the VPRN router instance.

When configured to **false**, this command disallows access to the NETCONF server.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

allow-ssh *boolean*

Synopsis Allow access to the SSH server

Context **configure** service vprn *service-name* management allow-ssh *boolean*

Tree allow-ssh

Description When configured to **true**, this command allows SSH server access to the SR OS router via the VPRN router instance.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, this command disallows SSH server access.

Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

allow-telnet *boolean*

Synopsis	Allow access to the IPv4 Telnet server
Context	**configure** service vprn *service-name* management allow-telnet *boolean*
Tree	allow-telnet
Description	When configured to **true**, this command allows IPv4 Telnet server access to the SR OS router via the VPRN router instance. When configured to **false**, this command disallows access to the IPv4 Telnet server.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

allow-telnet6 *boolean*

Synopsis	Allow access to the Telnet IPv6 server
Context	**configure** service vprn *service-name* management allow-telnet6 *boolean*
Tree	allow-telnet6
Description	When configured to **true**, this command allows IPv6 Telnet server access to the SR OS router via the VPRN router instance. When configured to **false**, this command removes access to the IPv6 Telnet server.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

maximum-ipv4-routes

Synopsis	Enter the **maximum-ipv4-routes** context
Context	**configure** service vprn *service-name* maximum-ipv4-routes
Tree	maximum-ipv4-routes
Introduced	25.3.R2

maximum-number-group-sources *number*

Synopsis	Maximum number of group sources for this interface
Context	**configure** service vprn *service-name* mld interface *interface-name* maximum-number-group-sources *number*
Tree	maximum-number-group-sources
Description	This command configures the maximum number of group sources for which IGMP or MLD can have local receiver information based on received IGMP or MLD reports on this interface. When this configuration is changed dynamically to a lower value than the currently accepted number of group sources, the group sources that are already accepted are not deleted. Only new group sources are not allowed.
Range	1 to 32000
Introduced	25.3.R2
Platforms	SAR Gen 2

maximum-number-groups *number*

Synopsis	Maximum number of groups for this interface
Context	**configure** service vprn *service-name* mld interface *interface-name* maximum-number-groups *number*
Tree	maximum-number-groups
Range	1 to 16000
Introduced	25.3.R2
Platforms	SAR Gen 2

maximum-number-sources *number*

Synopsis	Maximum number of sources that are allowed per group
Context	**configure** service vprn *service-name* mld interface *interface-name* maximum-number-sources *number*

Tree	address-map
Description	Commands in this context map inside IPv4 addresses of deterministic NAT44 subscribers to the outside IPv4 addresses in a NAT pool. This context is only applicable to deterministic NAT44 with a single ESA-VM in a NAT-group. The number of subscribers per outside IPv4 address is flexible and not restricted to a discrete range governed by the 2^n rule.
Introduced	25.3.R2
Platforms	SAR Gen 2

[**from**] *ipv4-address*

Synopsis	First IP address of inside IP NAT range
Context	**configure** service vprn *service-name* nat inside large-scale nat44 deterministic address-map *ipv4-address* to *ipv4-address* nat-policy *reference*
Tree	address-map
Description	This command specifies the starting IPv4 address, IPv6 address, or IPv6 prefix on the inside IP address range.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

to *ipv4-address*

Synopsis	Ending IP address of inside IP NAT range
Context	**configure** service vprn *service-name* nat inside large-scale nat44 deterministic address-map *ipv4-address* to *ipv4-address* nat-policy *reference*
Tree	address-map
Description	This command specifies the ending IPv4 address, IPv6 address, or IPv6 prefix on the inside IP address range.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Notes	This element is part of a list key.

cpm-reserved-ports *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Number of ports per protocol reserved for CPM traffic
Context	**configure** service vprn *service-name* nat outside pool *named-item* large-scale use-interface-ip cpm-reserved-ports *number*
Tree	cpm-reserved-ports
Description	This command configures the router to reserve ports specifically for local (CPM) traffic. On the public IPv4 address of a NAT interface, the ports are shared between CPM traffic and transit traffic passing through the node. This reservation ensures that NAT traffic destined for the local node (CPM traffic) is guaranteed a minimum number of available ports, even if the public IPv4 port pool becomes exhausted.
Range	0 to 65535
Default	10
Introduced	25.7.R1
Platforms	SAR Gen 2

use-well-known-ports *boolean*

Synopsis	Enable dynamic allocation of well-known ports
Context	**configure** service vprn *service-name* nat outside pool *named-item* large-scale use-interface-ip use-well-known-ports *boolean*
Tree	use-well-known-ports

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the router configures the dynamic allocation of well-known ports for interface-based NAT. When configured to **false**, well-known ports are not dynamically allocated for either transit traffic or traffic initiated from the control plane. This command can only be configured when the **configure service vprn nat outside pool application use-interface-ip** is set to **true**. Ports within the well-known range (0-1023) can still be allocated statically using static port forwarding.
Default	false
Introduced	26.3.R1
Platforms	SAR Gen 2

dynamic-block-reservation *boolean*

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Reserve dynamic block for subscriber
Context	**configure** service vprn *service-name* nat outside pool *named-item* port-forwarding dynamic-block-reservation *boolean*
Tree	dynamic-block-reservation
Description	When configured to **true**, the system reserves dynamic port block when the first port forward for the subscriber is created. The dynamic port block allocation is logged only if the block is being used and mappings are created. Dynamic port block reservation due to the port forward creation but without any dynamic mapping, is not logged. The reserved port block is released only when the last mapping in the block expires and there are no port forwards associated with the subscriber. The de-allocation log (syslog or RADIUS) is generated when the dynamic port block is completely released. Dynamic port block reservations can be enabled only if the configured maximum number of subscribers per outside IP addresses are less than or equal to the maximum number of configured port blocks per outside IP address. When configured to **false**, dynamic port blocks are not reserved when the first port forward for the subscriber is created.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Port block size for NAT subscribers
Context	**configure** service vprn *service-name* nat outside pool *named-item* port-reservation port-blocks *number*
Tree	port-blocks
Description	In CGN, this command specifies the number of port-blocks per outside IP address in the NAT pool. The available ports per outside IP address (the end port minus the upper bound value of the static port-forwarding range) are divided into the number of port blocks specified in this command. This implicitly determines the size of each port block. For L2-aware NAT, this command can be configured only if the port block extensions (extended port blocks) are disabled. You must disable the **l2-aware port-block-extension** hierarchy in the NAT pool.
Range	0 to 64512
Notes	The following elements are part of a choice: **port-blocks** or **ports**.
Introduced	25.3.R2
Platforms	SAR Gen 2

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

WARNING:
Modifying this element clears ISA state, such as flow state, for the new value to take effect.

Synopsis	Size of the port block for NAT subscribers
Context	**configure** service vprn *service-name* nat outside pool *named-item* port-reservation ports *number*
Tree	ports
Description	For carrier-grade NAT (CGN), this command specifies the size of port blocks for NAT subscribers in the NAT pool. For Layer 2 aware NAT, this command specifies the size of the initial port block of a subscriber in the pool. Additional port blocks (extended port blocks) for the Layer 2 aware subscriber must be explicitly enabled under the **l2-aware port-block-extension** hierarchy in the NAT pool. This command does not affect the size of extended port blocks.

© 2026 Nokia.

Tree	bfd
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of BFD sessions
Context	**configure** service vprn *service-name* network-interface *interface-name* ipv4 bfd admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	25.3.R2
Platforms	SAR Gen 2

echo-receive *number*

Synopsis	Minimum echo interval over this interface
Context	**configure** service vprn *service-name* network-interface *interface-name* ipv4 bfd echo-receive *number*
Tree	echo-receive
Range	100 to 100000
Units	milliseconds
Introduced	25.3.R2
Platforms	SAR Gen 2

multiplier *number*

Synopsis	Number of consecutive BFD messages missed from the peer
Context	**configure** service vprn *service-name* network-interface *interface-name* ipv4 bfd multiplier *number*
Tree	multiplier

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the number of missed messages before the BFD session state is changed to down and the upper-level protocol is notified of the fault. A multiplier of less than 3 should not be used in production environments.
Range	1 to 20
Default	3
Introduced	25.3.R2
Platforms	SAR Gen 2

receive *number*

Synopsis	BFD receive interval over this interface
Context	**configure** service vprn *service-name* network-interface *interface-name* ipv4 bfd receive *number*
Tree	receive
Description	This command specifies the receive interval for the BFD session.
Range	10 to 100000
Units	milliseconds
Default	100
Introduced	25.3.R2
Platforms	SAR Gen 2

transmit-interval *number*

Synopsis	BFD transmit interval over this interface
Context	**configure** service vprn *service-name* network-interface *interface-name* ipv4 bfd transmit-interval *number*
Tree	transmit-interval
Description	This command configures the transmit intervals.
Range	10 to 100000
Units	milliseconds
Default	100
Introduced	25.3.R2
Platforms	SAR Gen 2

Platforms	SAR Gen 2

mode *keyword*

Synopsis	Unicast RPF check mode
Context	**configure** service vprn *service-name* network-interface *interface-name* ipv4 urpf-check mode *keyword*
Tree	mode
Options	strict – Check source address match in RT and interface loose – Check source address match in RT only strict-no-ecmp – Check source address match in ECMP route
Default	strict
Introduced	25.3.R2
Platforms	SAR Gen 2

lag

Synopsis	Enter the **lag** context
Context	**configure** service vprn *service-name* network-interface *interface-name* lag
Tree	lag
Introduced	25.3.R2
Platforms	SAR Gen 2

load-balancing

Synopsis	Enter the **load-balancing** context
Context	**configure** service vprn *service-name* network-interface *interface-name* load-balancing
Tree	load-balancing
Introduced	25.3.R2
Platforms	SAR Gen 2

ip-load-balancing *keyword*

Synopsis	IP load-balancing algorithm

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vprn *service-name* network-interface *interface-name* load-balancing ip-load-balancing *keyword*
Tree	ip-load-balancing
Description	This command specifies whether to include the source address, destination address, or both in LAG or ECMP hash on IP interfaces. Additionally, when the **l4-load-balancing** command is enabled, this command also includes the source or destination port in the hash inputs.
Options	both, destination, source, inner-ip
Default	both
Introduced	25.3.R2
Platforms	SAR Gen 2

lsr-load-balancing *keyword*

Synopsis	LSR load-balancing algorithm
Context	**configure** service vprn *service-name* network-interface *interface-name* load-balancing lsr-load-balancing *keyword*
Tree	lsr-load-balancing
Description	This command specifies whether the IP header is used in the LAG and ECMP LSR hashing algorithm. This is the per-interface setting.
Options	lbl-only, lbl-ip, ip-only, eth-encap-ip, lbl-ip-l4-teid
Introduced	25.3.R2
Platforms	SAR Gen 2

loopback

Synopsis	Use interface as a loopback interface
Context	**configure** service vprn *service-name* network-interface *interface-name* loopback
Tree	loopback
Notes	The following elements are part of a choice: **loopback** or **port**.
Introduced	25.3.R2
Platforms	SAR Gen 2

mac *mac-unicast-address*

Synopsis	MAC address for the interface

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vprn *service-name* network-interface *interface-name* mac *mac-unicast-address*
Tree	mac
Description	This command assigns a specific MAC address to an IP interface.
String format	'ieee-address' must be 6 hex byte pairs with ':' or '-' (e.g. 00:11:22:33:44:55)
Introduced	25.3.R2
Platforms	SAR Gen 2

port *port-and-encap*

Synopsis	Port to bind the interface
Context	**configure** service vprn *service-name* network-interface *interface-name* port *port-and-encap*
Tree	port
String length	1 to 45
Notes	The following elements are part of a choice: **loopback** or **port**.
Introduced	25.3.R2
Platforms	SAR Gen 2

qos

Synopsis	Enter the **qos** context
Context	**configure** service vprn *service-name* network-interface *interface-name* qos
Tree	qos
Introduced	25.3.R2
Platforms	SAR Gen 2

egress-instance *number*

Synopsis	Port egress queue group instance for this interface
Context	**configure** service vprn *service-name* network-interface *interface-name* qos egress-instance *number*
Tree	egress-instance
Description	This command specifies which instance to associate with this specific network IP interface since multiple instances of the same egress queue-group can be applied to the same port.

authentication-keychain *reference*

Synopsis	Keychain used to authenticate broadcast messages
Context	**configure** service vprn *service-name* ntp broadcast *reference* authentication-keychain *reference*
Tree	authentication-keychain
Description	This command configures the keychain used to authenticate messages sent by this node. The keychain infrastructure is queried using this keychain name to get the youngest key used for generating the authentication value for the message. When an NTP packet is received by this node, the keychain infrastructure is queried using the keychain name and the key ID extracted from the received message to get the key used to perform the authentication check. If authentication does not pass, the packet is rejected. Keychain entries also have a direction. The key ID and authentication keychain are mutually exclusive. When neither one is set, for example, the key ID has a value of '0' and the value of this command is empty, no authentication is performed.
Reference	**configure** system security keychains keychain *named-item*
Notes	The following elements are part of a choice: **authentication-keychain** or **key-id**.
Introduced	25.3.R2
Platforms	SAR Gen 2

bfd-liveness

Synopsis	Enable the **bfd-liveness** context
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* interface *interface-name* bfd-liveness
Tree	bfd-liveness
Introduced	25.3.R2
Platforms	SAR Gen 2

remain-down-on-failure *boolean*

Synopsis	Force adjacency down on failure until session returns
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* interface *interface-name* bfd-liveness remain-down-on-failure *boolean*
Tree	remain-down-on-failure
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

strict *boolean*

Synopsis	Enable BFD strict mode
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* interface *interface-name* bfd-liveness strict *boolean*
Tree	strict
Description	When configured to **true**, the system uses BFD strict-mode. BFD strict-mode mandates that an active BFD session must exist between the OSPF neighbors before establishing a full adjacency. When configured to **true**, the router uses Link-Local Signaling (LLS) with the B-flag set to instruct the OSPF neighbors that BFD must be enabled on the link. BFD strict-mode requires both sides to have the B-flag set. During OSPFv3 BFD strict-mode operations, the router advertises the local interface IPv4 address TLV using LLS, but the SR OS router continues to use IPv6-based BFD sessions for both the IPv4 and IPv6 address families.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

strict-mode-holddown *number*

Synopsis	Adjacency up time delay after BFD session establishment
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* interface *interface-name* bfd-liveness strict-mode-holddown *number*
Tree	strict-mode-holddown
Description	This command configures a delay timer before bringing up the OSPF adjacency after the BFD session establishment. Holddown helps mitigate potential routing churn when BFD sessions are unstable. The holddown timer is reset when a BFD session operationally toggles.
Range	1 to 600
Units	seconds
Introduced	25.3.R2
Platforms	SAR Gen 2

conditional-advertise-prefix *reference*

Synopsis	Policy to conditionally advertise interface prefixes
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* interface *interface-name* conditional-advertise-prefix *reference*
Tree	conditional-advertise-prefix
Description	This command specifies the policy that allows IS-IS, OSPF, and OSPFv3 to selectively advertise system or loopback interface prefixes (including associated SIDs and SRv6 locators) only when conditions defined in the route policy are met. The route policy evaluates the presence or absence of specific routes in the routing table, typically using constructs like route-exists. If the policy evaluates to accept, the interface prefix is advertised; if not, the prefix is suppressed.
Reference	**configure** policy-options policy-statement *named-item-64*
Introduced	25.10.R1
Platforms	SAR Gen 2

dead-interval *number*

Synopsis	OSPF wait time for Hellos before neighbor declared down
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* interface *interface-name* dead-interval *number*
Tree	dead-interval

interface-type *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Interface type
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* interface *interface-name* interface-type *keyword*
Tree	interface-type
Description	This command specifies the interface type. **broadcast** - Broadcast network To significantly improve adjacency forming and network convergence, configure a network as point-to-point if only two routers are connected, even if the network is a broadcast media such as Ethernet. **non-broadcast** - Non-broadcast network **point-to-point** - Point-to-point link Set the interface type of an Ethernet link to **point-to-point** to avoid having to carry the broadcast adjacency maintenance overhead if the Ethernet link provided is used as a point-to-point. **p2mp-nbma** - Point-to-multipoint on a link without broadcast or multicast support

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

No designated router or backup designated router is elected on this type of interface and all OSPF neighbors connect through individual point-to-point links. Only VPRN and IES services interfaces support this interface type.

secondary - Multiple secondary adjacencies allowed

A **secondary** interface allows multiple secondary adjacencies, in addition to the primary adjacency, to be established over a single IP interface. This interface type can also be applied to the system interface and to loopback interfaces to allow them to participate in multiple areas, although no adjacencies are formed over these types of interfaces.

Options	broadcast, non-broadcast, point-to-point, secondary, p2mp-nbma
Introduced	25.3.R2
Platforms	SAR Gen 2

load-balancing-weight *number*

Synopsis	Interval for Hellos to non-adjacent OSPF NBMA neighbor
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* interface *interface-name* poll-interval *number*
Tree	poll-interval
Max. range	0 to 4294967295
Units	seconds
Default	120
Introduced	25.3.R2
Platforms	SAR Gen 2

priority *number*

Synopsis	Interface priority in the DR election on the subnet
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* interface *interface-name* priority *number*
Tree	priority
Range	0 to 255
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.

retransmit-interval *number*

Synopsis	Time before OSPF retransmits an unacknowledged LSA
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* interface *interface-name* retransmit-interval *number*
Tree	retransmit-interval
Range	1 to 1800
Units	seconds
Default	5
Introduced	25.3.R2
Platforms	SAR Gen 2

rib-priority *keyword*

Synopsis	RIB priority for OSPF
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* interface *interface-name* rib-priority *keyword*
Tree	rib-priority
Options	high
Introduced	25.3.R2
Platforms	SAR Gen 2

transit-delay *number*

Synopsis	Required LSA transmit time
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* interface *interface-name* transit-delay *number*
Tree	transit-delay
Range	1 to 1800
Units	seconds
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

loopfree-alternate-exclude *boolean*

Synopsis	Exclude interfaces in OSPF areas in SPF LFA computation
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* loopfree-alternate-exclude *boolean*
Tree	loopfree-alternate-exclude
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

nssa

Synopsis	Enable the **nssa** context
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* nssa
Tree	nssa
Introduced	25.3.R2
Platforms	SAR Gen 2

area-range [ip-prefix-mask] *ipv4-unicast-prefix*

Synopsis	Enter the **area-range** list instance
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* nssa area-range *ipv4-unicast-prefix*
Tree	area-range
Introduced	25.3.R2
Platforms	SAR Gen 2

[**ip-prefix-mask**] *ipv4-unicast-prefix*

Synopsis	IPv4 unicast address prefix and mask
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* nssa area-range *ipv4-unicast-prefix*
Tree	area-range
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

advertise *boolean*

Synopsis	Advertise summarized range of addresses to other areas
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* nssa area-range *ipv4-unicast-prefix* advertise *boolean*
Tree	advertise
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

originate-default-route

Synopsis	Enable the **originate-default-route** context
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* nssa originate-default-route
Tree	originate-default-route
Introduced	25.3.R2
Platforms	SAR Gen 2

adjacency-check *boolean*

Synopsis	Perform adjacency checks before originating a default route
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* nssa originate-default-route adjacency-check *boolean*
Tree	adjacency-check
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

type-nssa *boolean*

Synopsis	Generate a default route using NSSA-LSA type
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* nssa originate-default-route type-nssa *boolean*
Tree	type-nssa
Default	false

Introduced	25.3.R2
Platforms	SAR Gen 2

redistribute-external *boolean*

Synopsis	Redistribute external routes into the NSSA
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* nssa redistribute-external *boolean*
Tree	redistribute-external
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

summaries *boolean*

Synopsis	Send summary (Type 3) LSAs into the NSSA on an ABR
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* nssa summaries *boolean*
Tree	summaries
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

sham-link [interface] *interface-name* ip-address *ipv4-unicast-address*

Synopsis	Enter the **sham-link** list instance
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* sham-link *interface-name* ip-address *ipv4-unicast-address*
Tree	sham-link
Introduced	25.3.R2
Platforms	SAR Gen 2

[**interface**] *interface-name*

Synopsis	Local interface name used for the sham-link

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* sham-link *interface-name* ip-address *ipv4-unicast-address*
Tree	sham-link
String length	1 to 32
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

ip-address *ipv4-unicast-address*

Synopsis	IP address of the sham-link neighbor
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* sham-link *interface-name* ip-address *ipv4-unicast-address*
Tree	sham-link
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of the OSPF interface
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* sham-link *interface-name* ip-address *ipv4-unicast-address* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	25.3.R2
Platforms	SAR Gen 2

authentication-key *encrypted-leaf*

Synopsis	Authentication key to send and receive OSPF packets
Context	**configure** service vprn *service-name* ospf *number* area *ipv4-address* sham-link *interface-name* ip-address *ipv4-unicast-address* authentication-key *encrypted-leaf*

© 2026 Nokia.

export-limit

Synopsis	Enable the **export-limit** context
Context	**configure** service vprn *service-name* ospf *number* export-limit
Tree	export-limit
Introduced	25.3.R2
Platforms	SAR Gen 2

log-percent *number*

Synopsis	Export limit before warning and SNMP notification sent
Context	**configure** service vprn *service-name* ospf *number* export-limit log-percent *number*
Tree	log-percent
Range	1 to 100
Introduced	25.3.R2
Platforms	SAR Gen 2

number *number*

Synopsis	Maximum routes or prefixes exported from route table
Context	**configure** service vprn *service-name* ospf *number* export-limit number *number*
Tree	number
Range	1 to 4294967295
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

export-policy *reference*

Synopsis	Export policies that determine exported routes
Context	**configure** service vprn *service-name* ospf *number* export-policy *reference*
Tree	export-policy
Description	This command configures export routing policies for the routes exported from the routing table to IS-IS. If the export policy is undefined, the system does not export non IS-IS routes from the routing table manager to IS-IS.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied.

If the **aggregate** command is also configured in the **configure router** context, the aggregation is applied before the export policy is applied.

Routing policies are created in the **configure router policy-options** context.

Reference	**configure** policy-options policy-statement *named-item-64*
Max. instances	5
Notes	This element is ordered by the user.
Introduced	25.3.R2
Platforms	SAR Gen 2

external-db-overflow

Synopsis	Enable the **external-db-overflow** context

Introduced	25.3.R2
Platforms	SAR Gen 2

external-preference *number*

Synopsis	Preference for OSPF external routes
Context	**configure** service vprn *service-name* ospf *number* external-preference *number*
Tree	external-preference
Range	1 to 255
Default	150
Introduced	25.3.R2
Platforms	SAR Gen 2

graceful-restart

Synopsis	Enable the **graceful-restart** context
Context	**configure** service vprn *service-name* ospf *number* graceful-restart
Tree	graceful-restart
Description	Commands in this context enable OSPF graceful restart (GR) to minimize service interruption. When the control plane of a GR-capable router fails or restarts, the neighboring routers (GR helpers) temporarily preserve OSPF forwarding information. Traffic continues to be forwarded to the restarting router using the last-known forwarding tables. If the control plane of the restarting router becomes operationally and administratively up within the grace period, the restarting router resumes normal OSPF operation. If the grace period expires, the restarting router is presumed inactive and the OSPF topology is recalculated to route traffic around the failure.
Introduced	25.3.R2
Platforms	SAR Gen 2

helper-mode *boolean*

Synopsis	Enable graceful restart helper for OSPF
Context	**configure** service vprn *service-name* ospf *number* graceful-restart helper-mode *boolean*
Tree	helper-mode

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the router operates in OSPF graceful restart helper mode and assists restarting neighbors by maintaining adjacencies and forwarding state during their graceful restart interval. When configured to **false**, the router does not provide helper support and does not preserve adjacency or forwarding state for neighbors performing a graceful restart.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

helper-resync-timeout *number*

Synopsis	Maximum resynchronization period
Context	**configure** service vprn *service-name* ospf *number* graceful-restart helper-resync-timeout *number*
Tree	helper-resync-timeout
Description	This command configures the maximum resynchronization period. If the resynchronization takes longer than the configured value, the graceful restart process stops, and the OSPF neighbor session falls back to the ExStart state for normal adjacency establishment.
Range	120 to 900
Units	seconds
Default	120
Introduced	26.3.R1
Platforms	SAR Gen 2

protocol

Synopsis	Enter the **protocol** context
Context	**configure** service vprn *service-name* ospf *number* graceful-restart protocol
Tree	protocol
Description	Commands in this context configure which RFC is used for OSPF graceful restart signaling. If both protocols are enabled, the OSPF interface automatically uses the method indicated by the first received graceful restart signaling packet on that interface.
Introduced	26.3.R1
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

lls-restart-signaling *boolean*

Synopsis	Enable LLS restart signaling protocol
Context	**configure** service vprn *service-name* ospf *number* graceful-restart protocol lls-restart-signaling *boolean*
Tree	lls-restart-signaling
Description	When configured to **true**, the system enables support for RFC 4811 and RFC 4812. When configured to **false**, the system disables support for RFC 4811 and RFC 4812.
Default	false
Introduced	26.3.R1
Platforms	SAR Gen 2

standard *boolean*

Synopsis	Enable standard protocol for restart signaling
Context	**configure** service vprn *service-name* ospf *number* graceful-restart protocol standard *boolean*
Tree	standard
Description	When configured to **true**, the system enables support for RFC 3623. When configured to **false**, the system disables support for RFC 3623.
Default	true
Introduced	26.3.R1
Platforms	SAR Gen 2

strict-lsa-checking *boolean*

Synopsis	Perform strict LSA checking during graceful restart
Context	**configure** service vprn *service-name* ospf *number* graceful-restart strict-lsa-checking *boolean*
Tree	strict-lsa-checking
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.

ignore-dn-bit *boolean*

Synopsis	Ignore the DN bit for OSPF LSA packets for the instance
Context	**configure** service vprn *service-name* ospf *number* ignore-dn-bit *boolean*
Tree	ignore-dn-bit
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

import-policy *reference*

Synopsis	Import policy names for routes from IGP to route table
Context	**configure** service vprn *service-name* ospf *number* import-policy *reference*
Tree	import-policy
Reference	**configure** policy-options policy-statement *named-item-64*
Max. instances	5
Notes	This element is ordered by the user.
Introduced	25.3.R2
Platforms	SAR Gen 2

loopfree-alternate

Synopsis	Enable the **loopfree-alternate** context
Context	**configure** service vprn *service-name* ospf *number* loopfree-alternate
Tree	loopfree-alternate
Description	Commands in this context enable Loop-Free Alternate (LFA) computation by SPF under the IS-IS routing protocol level or under the OSPF routing protocol instance. When this command is enabled, it instructs the IGP SPF to attempt to pre-compute both a primary next hop and an LFA next hop for every learned prefix. IS-IS computes the primary SPF first and then computes the LFA SPF. The LFA backup next hop is only available after the LFA SPF is completed. When found, the LFA next hop is populated into the routing table along with the primary next hop for the prefix.
Introduced	25.3.R2
Platforms	SAR Gen 2

strict *boolean*

Synopsis	Enable BFD strict mode
Context	**configure** service vprn *service-name* ospf3 *number* area *ipv4-address* interface *interface-name* bfd-liveness strict *boolean*
Tree	strict
Description	When configured to **true**, the system uses BFD strict-mode. BFD strict-mode mandates that an active BFD session must exist between the OSPF neighbors before establishing a full adjacency. When configured to **true**, the router uses Link-Local Signaling (LLS) with the B-flag set to instruct the OSPF neighbors that BFD must be enabled on the link. BFD strict-mode requires both sides to have the B-flag set. During OSPFv3 BFD strict-mode operations, the router advertises the local interface IPv4 address TLV using LLS, but the SR OS router continues to use IPv6-based BFD sessions for both the IPv4 and IPv6 address families.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

strict-mode-holddown *number*

Synopsis	Adjacency up time delay after BFD session establishment
Context	**configure** service vprn *service-name* ospf3 *number* area *ipv4-address* interface *interface-name* bfd-liveness strict-mode-holddown *number*
Tree	strict-mode-holddown
Description	This command configures a delay timer before bringing up the OSPF adjacency after the BFD session establishment. Holddown helps mitigate potential routing churn when BFD sessions are unstable. The holddown timer is reset when a BFD session operationally toggles.

Range	1 to 600
Units	seconds
Introduced	25.3.R2
Platforms	SAR Gen 2

conditional-advertise-prefix *reference*

Synopsis	Policy to conditionally advertise interface prefixes
Context	**configure** service vprn *service-name* ospf3 *number* area *ipv4-address* interface *interface-name* conditional-advertise-prefix *reference*
Tree	conditional-advertise-prefix
Description	This command specifies the policy that allows IS-IS, OSPF, and OSPFv3 to selectively advertise system or loopback interface prefixes (including associated SIDs and SRv6 locators) only when conditions defined in the route policy are met. The route policy evaluates the presence or absence of specific routes in the routing table, typically using constructs like route-exists. If the policy evaluates to accept, the interface prefix is advertised; if not, the prefix is suppressed.
Reference	**configure** policy-options policy-statement *named-item-64*
Introduced	25.10.R1
Platforms	SAR Gen 2

dead-interval *number*

Synopsis	OSPF wait time for Hellos before neighbor declared down

interface-type *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Interface type
Context	**configure** service vprn *service-name* ospf3 *number* area *ipv4-address* interface *interface-name* interface-type *keyword*
Tree	interface-type
Description	This command specifies the interface type. **broadcast** - Broadcast network To significantly improve adjacency forming and network convergence, configure a network as point-to-point if only two routers are connected, even if the network is a broadcast media such as Ethernet. **non-broadcast** - Non-broadcast network **point-to-point** - Point-to-point link Set the interface type of an Ethernet link to **point-to-point** to avoid having to carry the broadcast adjacency maintenance overhead if the Ethernet link provided is used as a point-to-point. **p2mp-nbma** - Point-to-multipoint on a link without broadcast or multicast support No designated router or backup designated router is elected on this type of interface and all OSPF neighbors connect through individual point-to-point links. Only VPRN and IES services interfaces support this interface type. **secondary** - Multiple secondary adjacencies allowed A **secondary** interface allows multiple secondary adjacencies, in addition to the primary adjacency, to be established over a single IP interface. This interface type can also be applied to the system interface and to loopback interfaces to allow them to participate in multiple areas, although no adjacencies are formed over these types of interfaces.
Options	broadcast, non-broadcast, point-to-point, secondary, p2mp-nbma
Introduced	25.3.R2
Platforms	SAR Gen 2

number *number*

Synopsis	Maximum routes or prefixes exported from route table
Context	**configure** service vprn *service-name* ospf3 *number* export-limit number *number*
Tree	number
Range	1 to 4294967295
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

export-policy *reference*

Synopsis	Export policies that determine exported routes
Context	**configure** service vprn *service-name* ospf3 *number* export-policy *reference*
Tree	export-policy
Description	This command configures export routing policies for the routes exported from the routing table to IS-IS. If the export policy is undefined, the system does not export non IS-IS routes from the routing table manager to IS-IS. If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If the **aggregate** command is also configured in the **configure router** context, the aggregation is applied before the export policy is applied. Routing policies are created in the **configure router policy-options** context.

external-preference *number*

Synopsis	Preference for OSPF external routes
Context	**configure** service vprn *service-name* ospf3 *number* external-preference *number*
Tree	external-preference
Range	1 to 255
Default	150
Introduced	25.3.R2
Platforms	SAR Gen 2

graceful-restart

Synopsis	Enable the **graceful-restart** context
Context	**configure** service vprn *service-name* ospf3 *number* graceful-restart
Tree	graceful-restart
Description	Commands in this context enable OSPF graceful restart (GR) to minimize service interruption. When the control plane of a GR-capable router fails or restarts, the neighboring routers (GR helpers) temporarily preserve OSPF forwarding information. Traffic continues to be forwarded to the restarting router using the last-known forwarding tables. If the control plane of the restarting router becomes operationally and administratively up within the grace period, the restarting router resumes normal OSPF operation. If the grace period expires, the restarting router is presumed inactive and the OSPF topology is recalculated to route traffic around the failure.
Introduced	25.3.R2
Platforms	SAR Gen 2

helper-mode *boolean*

Synopsis	Enable graceful restart helper for OSPF
Context	**configure** service vprn *service-name* ospf3 *number* graceful-restart helper-mode *boolean*
Tree	helper-mode
Description	When configured to **true**, the router operates in OSPF graceful restart helper mode and assists restarting neighbors by maintaining adjacencies and forwarding state during their graceful restart interval.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, the router does not provide helper support and does not preserve adjacency or forwarding state for neighbors performing a graceful restart.

Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

strict-lsa-checking *boolean*

Synopsis	Perform strict LSA checking during graceful restart
Context	**configure** service vprn *service-name* ospf3 *number* graceful-restart strict-lsa-checking *boolean*
Tree	strict-lsa-checking
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

ignore-dn-bit *boolean*

Synopsis	Ignore the DN bit for OSPF LSA packets for the instance

Platforms	SAR Gen 2

loopfree-alternate

Synopsis	Enable the **loopfree-alternate** context
Context	**configure** service vprn *service-name* ospf3 *number* loopfree-alternate
Tree	loopfree-alternate
Description	Commands in this context enable Loop-Free Alternate (LFA) computation by SPF under the IS-IS routing protocol level or under the OSPF routing protocol instance. When this command is enabled, it instructs the IGP SPF to attempt to pre-compute both a primary next hop and an LFA next hop for every learned prefix. IS-IS computes the primary SPF first and then computes the LFA SPF. The LFA backup next hop is only available after the LFA SPF is completed. When found, the LFA next hop is populated into the routing table along with the primary next hop for the prefix.
Introduced	25.3.R2
Platforms	SAR Gen 2

exclude

Synopsis	Enter the **exclude** context
Context	**configure** service vprn *service-name* ospf3 *number* loopfree-alternate exclude
Tree	exclude
Introduced	25.3.R2
Platforms	SAR Gen 2

prefix-policy *reference*

Synopsis	Policy to exclude prefixes from LFA SPF calculation
Context	**configure** service vprn *service-name* ospf3 *number* loopfree-alternate exclude prefix-policy *reference*
Tree	prefix-policy
Description	This command specifies the name of the policy for the prefixes to exclude from the LFA SPF calculation. An excluded prefix is not included in LFA calculation regardless of its priority. The prefix tag is, however, used in the main SPF.
Reference	**configure** policy-options policy-statement *named-item-64*

lsa-accumulate *number*

Synopsis	Delay to gather LSAs before advertising to neighbors
Context	**configure** service vprn *service-name* ospf3 *number* timers lsa-accumulate *number*
Tree	lsa-accumulate
Range	0 to 1000
Units	milliseconds
Default	1000
Introduced	25.3.R2
Platforms	SAR Gen 2

lsa-arrival *number*

Synopsis	Min delay between receipt of same LSAs from neighbors
Context	**configure** service vprn *service-name* ospf3 *number* timers lsa-arrival *number*
Tree	lsa-arrival
Range	0 to 600000
Units	milliseconds
Default	1000
Introduced	25.3.R2
Platforms	SAR Gen 2

lsa-generate

Synopsis	Enter the **lsa-generate** context
Context	**configure** service vprn *service-name* ospf3 *number* timers lsa-generate
Tree	lsa-generate
Introduced	25.3.R2
Platforms	SAR Gen 2

lsa-initial-wait *number*

Synopsis	First wait period between OSPF LSA generation
Context	**configure** service vprn *service-name* ospf3 *number* timers lsa-generate lsa-initial-wait *number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	lsa-initial-wait
Range	10 to 600000
Units	milliseconds
Default	5000
Introduced	25.3.R2
Platforms	SAR Gen 2

lsa-second-wait *number*

Synopsis	Hold time between the first and second LSA generation
Context	**configure** service vprn *service-name* ospf3 *number* timers lsa-generate lsa-second-wait *number*
Tree	lsa-second-wait
Range	10 to 600000
Units	milliseconds
Default	5000
Introduced	25.3.R2
Platforms	SAR Gen 2

max-lsa-wait *number*

Synopsis	Max time between two LSAs being generated
Context	**configure** service vprn *service-name* ospf3 *number* timers lsa-generate max-lsa-wait *number*
Tree	max-lsa-wait
Range	10 to 600000
Units	milliseconds
Default	5000
Introduced	25.3.R2
Platforms	SAR Gen 2

redistribute-delay *number*

Synopsis	Hold down timer for external routes into OSPF
Context	**configure** service vprn *service-name* ospf3 *number* timers redistribute-delay *number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	redistribute-delay
Range	0 to 1000
Units	milliseconds
Default	1000
Introduced	25.3.R2
Platforms	SAR Gen 2

spf-wait

Synopsis	Enter the **spf-wait** context
Context	**configure** service vprn *service-name* ospf3 *number* timers spf-wait
Tree	spf-wait
Introduced	25.3.R2
Platforms	SAR Gen 2

spf-initial-wait *number*

Synopsis	Initial SPF calculation delay after a topology change
Context	**configure** service vprn *service-name* ospf3 *number* timers spf-wait spf-initial-wait *number*
Tree	spf-initial-wait
Range	10 to 100000
Units	milliseconds
Default	1000
Introduced	25.3.R2
Platforms	SAR Gen 2

spf-max-wait *number*

Synopsis	Max interval between two consecutive SPF calculations
Context	**configure** service vprn *service-name* ospf3 *number* timers spf-wait spf-max-wait *number*
Tree	spf-max-wait
Range	10 to 120000
Units	milliseconds

Platforms	SAR Gen 2

hello-interval *number*

Synopsis	Frequency at which PIM Hello messages are sent over this interface
Context	**configure** service vprn *service-name* pim interface *interface-name* hello-interval *number*
Tree	hello-interval
Range	0 to 255
Default	30
Introduced	25.3.R2
Platforms	SAR Gen 2

hello-multiplier *number*

Synopsis	Multiplier to determine the hold time for PIM neighbor
Context	**configure** service vprn *service-name* pim interface *interface-name* hello-multiplier *number*
Tree	hello-multiplier
Range	20 to 100
Default	35
Introduced	25.3.R2
Platforms	SAR Gen 2

improved-assert *boolean*

Synopsis	Allow improved assert processing on interface
Context	**configure** service vprn *service-name* pim interface *interface-name* improved-assert *boolean*
Tree	improved-assert
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

instant-prune-echo *boolean*

Synopsis	Allow PIM to send an instant prune echo when router starts the prune pending timer for PIM interface
Context	**configure** service vprn *service-name* pim interface *interface-name* instant-prune-echo *boolean*
Tree	instant-prune-echo
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ipv4

Synopsis	Enter the **ipv4** context
Context	**configure** service vprn *service-name* pim interface *interface-name* ipv4
Tree	ipv4
Introduced	25.3.R2
Platforms	SAR Gen 2

monitor-oper-group

Synopsis	Enter the **monitor-oper-group** context
Context	**configure** service vprn *service-name* pim interface *interface-name* ipv4 monitor-oper-group
Tree	monitor-oper-group
Introduced	25.3.R2
Platforms	SAR Gen 2

name *reference*

Synopsis	Operational group identifier
Context	**configure** service vprn *service-name* pim interface *interface-name* ipv4 monitor-oper-group name *reference*
Tree	name
Reference	**configure** service oper-group *named-item*
Introduced	25.3.R2

Platforms	SAR Gen 2

priority *number*

Synopsis	DR election priority for this interface
Context	**configure** service vprn *service-name* pim interface *interface-name* priority *number*
Tree	priority
Description	This command sets the priority value to elect the DR. The DR election priority is a 32-bit unsigned number and the numerically larger priority is always preferred.
Range	1 to 4294967295
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

sticky-dr

Synopsis	Enable the **sticky-dr** context
Context	**configure** service vprn *service-name* pim interface *interface-name* sticky-dr
Tree	sticky-dr
Introduced	25.3.R2
Platforms	SAR Gen 2

priority *number*

Synopsis	DR election priority for this interface
Context	**configure** service vprn *service-name* pim interface *interface-name* sticky-dr priority *number*
Tree	priority
Range	1 to 4294967295
Default	1024
Introduced	25.3.R2
Platforms	SAR Gen 2

three-way-hello *boolean*

Synopsis	Allow three-way hello compatibility mode

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vprn *service-name* pim interface *interface-name* three-way-hello *boolean*
Tree	three-way-hello
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

tracking-support *boolean*

Synopsis	Allow upstream routers to explicitly track join membership
Context	**configure** service vprn *service-name* pim interface *interface-name* tracking-support *boolean*
Tree	tracking-support
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ipv4

Synopsis	Enter the **ipv4** context
Context	**configure** service vprn *service-name* pim ipv4
Tree	ipv4
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

rpf-table *keyword*

Synopsis	Route table for RPF lookup
Context	**configure** service vprn *service-name* pim ipv4 rpf-table *keyword*
Tree	rpf-table
Options	rtable-m, rtable-u, both
Default	rtable-u
Introduced	25.3.R2
Platforms	SAR Gen 2

source-address

Synopsis	Enter the **source-address** context
Context	**configure** service vprn *service-name* pim ipv4 source-address
Tree	source-address
Description	Commands in this context configure the source IP address for PIM messages.
Introduced	25.3.R2
Platforms	SAR Gen 2

register-message *ipv4-unicast-address*

Synopsis	Source IPv4 address for PIM register messages
Context	**configure** service vprn *service-name* pim ipv4 source-address register-message *ipv4-unicast-address*
Tree	register-message
Description	This command configures the source IPv4 address for register messages in this PIM instance. The IP address can be set to any unicast address, regardless of whether it resides on the node. Ensure that the specified IP address is configured on the router as a loopback or interface IP address. When unconfigured, the source IP address for register messages is selected by choosing the smallest IP address from available interfaces on the node.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ssm-assert-compatible-mode *boolean*

Synopsis	Enable SSM assert compatible mode
Context	**configure** service vprn *service-name* pim ipv4 ssm-assert-compatible-mode *boolean*
Tree	ssm-assert-compatible-mode
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

Synopsis	Length for bootstrap hash mask
Context	**configure** service vprn *service-name* pim rp ipv4 bsr-candidate hash-mask-len *number*
Tree	hash-mask-len
Range	0 to 32
Default	30
Introduced	25.3.R2
Platforms	SAR Gen 2

priority *number*

Synopsis	Bootstrap priority of the router
Context	**configure** service vprn *service-name* pim rp ipv4 bsr-candidate priority *number*
Tree	priority
Range	0 to 255
Default	0
Introduced	25.3.R2
Platforms	SAR Gen 2

candidate *boolean*

Synopsis	Enable auto-RP to advertise candidate RP information
Context	**configure** service vprn *service-name* pim rp ipv4 candidate *boolean*
Tree	candidate

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the auto-RP is enabled to advertise the candidate RP information. The auto-RP candidate RP announces the candidate RP messages on the 224.0.1.39 multicast address. This functionality is in addition to the listener functionality enabled by the auto RP discovery. When configured to **false**, the candidate RP information is not specified.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

mapping-agent *boolean*

Synopsis	Enable the mapping agent on the node
Context	**configure** service vprn *service-name* pim rp ipv4 mapping-agent *boolean*
Tree	mapping-agent
Description	When configured to **true**, the mapping agent is enabled on the node. The auto-RP MA observes the **auto-rp-announcement** messages, selects the RP and generates the RP discovery 224.0.1.40 messages. This functionality is in addition to the auto-RP discovery functionality.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

rp-candidate

Synopsis	Enter the **rp-candidate** context
Context	**configure** service vprn *service-name* pim rp ipv4 rp-candidate
Tree	rp-candidate
Introduced	25.3.R2
Platforms	SAR Gen 2

address *ipv4-unicast-address*

Synopsis	Local RP address
Context	**configure** service vprn *service-name* pim rp ipv4 rp-candidate address *ipv4-unicast-address*
Tree	address

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command specifies the local RP address that is sent in the RP candidate advertisements to the Bootstrap Router.
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of the Candidate RP
Context	**configure** service vprn *service-name* pim rp ipv4 rp-candidate admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	25.3.R2
Platforms	SAR Gen 2

group-range [ipv4-prefix] *ipv4-multicast-prefix*

Synopsis	Add a list entry for **group-range**
Context	**configure** service vprn *service-name* pim rp ipv4 rp-candidate group-range *ipv4-multicast-prefix*
Tree	group-range
Introduced	25.3.R2
Platforms	SAR Gen 2

[**ipv4-prefix**] *ipv4-multicast-prefix*

Synopsis	IPv4 address and prefix length

authentication-key *encrypted-leaf*

Synopsis	Authentication password passed between RIP neighbors

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** service vprn *service-name* rip authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command sets the authentication password to be passed between RIP neighbors. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. The authentication type and authentication key must match exactly for the RIP message to be considered authentic and processed. When unconfigured, this command removes the authentication password from the configuration and disables authentication. This command uses a protected format where the specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7705 SAR Gen 2 System Management Guide* for more information.
String length	1 to 102
Introduced	25.3.R2
Platforms	SAR Gen 2

authentication-type *keyword*

Synopsis	Authentication type used between RIP neighbors
Context	**configure** service vprn *service-name* rip authentication-type *keyword*
Tree	authentication-type
Description	This command sets the type of authentication to be used between RIP neighbors. The authentication type and authentication key must match exactly for the RIP message to be considered authentic and processed. When unconfigured, this command removes the authentication type from the configuration and effectively disables authentication.
Options	none, password, md5, md20
Default	none
Introduced	25.3.R2
Platforms	SAR Gen 2

bfd-liveness *boolean*

Synopsis	Enable BFD to control the state of protocol adjacency
Context	**configure** service vprn *service-name* rip bfd-liveness *boolean*
Tree	bfd-liveness
Description	When configured to **true**, this command enables BFD to control the state of the associated protocol adjacency.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	When configured to **false**, this command removes BFD from the associated protocol adjacency.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

check-zero *boolean*

Synopsis	Enable checking of mandatory zero fields
Context	**configure** service vprn *service-name* rip check-zero *boolean*
Tree	check-zero
Description	When configured to **true**, this command enables checking of the mandatory zero fields in the RIPv1 and RIPv2 specifications and rejecting non-compliant RIP messages. When configured to **false**, this command disables the check and allows the receipt of RIP messages even if the mandatory zero fields are non-zero.
Default	false
Introduced	25.3.R2

check-zero *boolean*

Synopsis	Enable checking of mandatory zero fields
Context	**configure** service vprn *service-name* rip group *named-item* check-zero *boolean*
Tree	check-zero
Description	When configured to **true**, this command enables checking of the mandatory zero fields in the RIPv1 and RIPv2 specifications and rejecting non-compliant RIP messages. When configured to **false**, this command disables the check and allows the receipt of RIP messages even if the mandatory zero fields are non-zero.
Introduced	25.3.R2
Platforms	SAR Gen 2

description *description*

authentication-key *encrypted-leaf*

Synopsis	Authentication password passed between RIP neighbors
Context	**configure** service vprn *service-name* rip group *named-item* neighbor *interface-name* authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command sets the authentication password to be passed between RIP neighbors. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. The authentication type and authentication key must match exactly for the RIP message to be considered authentic and processed. When unconfigured, this command removes the authentication password from the configuration and disables authentication. This command uses a protected format where the specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7705 SAR Gen 2 System Management Guide* for more information.
String length	1 to 102
Introduced	25.3.R2
Platforms	SAR Gen 2

authentication-type *keyword*

Synopsis	Authentication type
Context	**configure** service vprn *service-name* rip group *named-item* neighbor *interface-name* authentication-type *keyword*
Tree	authentication-type
Description	This command configures the type of authentication to be used. The authentication type and authentication key must match exactly for the RIP message to be considered authentic and processed. When unconfigured, this command removes the authentication type from the configuration and effectively disables authentication.
Options	none, password, md5, md20

receive *keyword*

Synopsis	Accepted version on received packets
Context	**configure** service vprn *service-name* rip group *named-item* neighbor *interface-name* receive *keyword*
Tree	receive
Options	version-1, version-2, both, none
Introduced	25.3.R2
Platforms	SAR Gen 2

send *keyword*

Synopsis	RIP version and method used to send RIP updates
Context	**configure** service vprn *service-name* rip group *named-item* neighbor *interface-name* send *keyword*
Tree	send
Options	none, version-1, broadcast, multicast, unicast
Introduced	25.3.R2
Platforms	SAR Gen 2

split-horizon *boolean*

Synopsis	Enable split horizon and poison reverse
Context	**configure** service vprn *service-name* rip group *named-item* neighbor *interface-name* split-horizon *boolean*
Tree	split-horizon
Description	When configured to **true**, this command enables the use of split horizon with poison reverse. Split-horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity). When configured to **false**. this command enables split horizon without poison reverse. This allows the routes to be re-advertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.
Introduced	25.3.R2
Platforms	SAR Gen 2

split-horizon *boolean*

Synopsis	Enable split horizon and poison reverse
Context	**configure** service vprn *service-name* ripng group *named-item* neighbor *reference* split-horizon *boolean*
Tree	split-horizon
Description	When configured to **true**, this command enables the use of split horizon with poison reverse. Split-horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity). When configured to **false**. this command enables split horizon without poison reverse. This allows the routes to be re-advertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.
Introduced	25.3.R2
Platforms	SAR Gen 2

community [community-string] *encrypted-leaf*

Synopsis Enter the **community** list instance

Context **configure** service vprn *service-name* snmp community *encrypted-leaf*

Tree community

Description Commands in this context set the SNMP community names to be used with the associated VPRN instance. These VPRN community names are used to associate SNMP v1/v2c requests with a particular VPRN context and to return a reply that contains VPRN-specific data or limit SNMP access to data in a specific VPRN instance.

VPRN SNMP communities configured with an access permission of 'r' are automatically associated with the default access group "snmp-vprn-ro" and the “vprn-view” view (read only). VPRN SNMP communities configured with an access permission of 'rw' are

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

automatically associated with the default access group "snmp-vprn" and the "vprn-view" view (read/write).

The community in an SNMP v1/v2 request determines the SNMP context (that is, the VPRN number for accessing SNMP tables) and not the VPRN of the incoming interface on which the request was received. For example, when an SNMP request arrives on VPRN 5 interface "ringo" with a destination IP address equal to the "ringo" interface, but the community in the SNMP request is the community configured against VPRN 101, the SNMP request is processed using the VPRN 101 context. (the response contains information about VPRN 101). Nokia recommends avoiding the use of a simple series of VPRN SNMP community values that are similar to each other (for example, avoid my-vprncomm-1, my-vprn-comm-2, and so on).

Introduced 25.3.R2

Tree community

Description This command specifies the SNMP v1/v2c community name associated with the VPRN in a protected format.

The specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7705 SAR Gen 2 System Management Guide* for more information.

Tree	static-routes
Introduced	25.3.R2
Platforms	SAR Gen 2

hold-down

Synopsis	Enable the **hold-down** context
Context	**configure** service vprn *service-name* static-routes hold-down
Tree	hold-down
Description	Commands in this context enable the hold-down time feature globally for static routes in the system. The static route hold-down time is a mechanism to protect from rapid, fluctuating state changes of static routes resulting from issues with reachability because of link flap. The commands in this context apply to all static routes in the VPRN and the base router instance in which this hold-down time is configured in.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

initial *number*

Synopsis	Value for the initial hold-down time
Context	**configure** service vprn *service-name* static-routes hold-down initial *number*
Tree	initial
Description	This command specifies the initial value of the hold-down time globally for static routes in the system. When a static route is ready to become active, it remains inactive for the hold-down time before activating the static-route. If, during this hold-down period, the static route becomes inactive again because of factors such as interface failure, the hold-down timer is reset, effectively postponing the activation of the route until the next opportunity.
Range	1 to 65535
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

max-value *number*

Synopsis	Maximum value of the hold-down time
Context	**configure** service vprn *service-name* static-routes hold-down max-value *number*
Tree	max-value
Description	This command specifies the maximum value of the hold-down time globally for static routes in the system.
Range	1 to 65535
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

multiplier *number*

Synopsis	Multiplier of the previous hold-down time
Context	**configure** service vprn *service-name* static-routes hold-down multiplier *number*
Tree	multiplier
Description	This command specifies the multiplier value by which the previous hold-down time is multiplied to calculate the new one. This value applies globally for static routes in the system.
Range	1 to 10

router-instance *string*

Synopsis	Router instance used for matching prefix list
Context	**configure** service vprn *service-name* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* blackhole prefix-list router-instance *string*
Tree	router-instance
Description	This command configures the router instance used for matching against the prefix list. If the conditional static route is configured in a VPRN and the router instance is configured as "Base", the activation of the static route is dependent on the existence of routes in the Base router and the evaluation of the prefix list and flag is done in that context. By default there is no configured value for this command option, and the conditional static route is dependent on the existence of routes in the same router instance as the static route itself, subject to the details of the prefix list and the flag setting. Entries in a referenced prefix list that are not match type 'exact' are interpreted as though they are 'exact'.
Introduced	25.3.R2
Platforms	SAR Gen 2

tag *number*

Synopsis	Static route tag
Context	**configure** service vprn *service-name* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* blackhole tag *number*
Tree	tag
Description	This command associates a 4-byte route-tag with the static route. The tag value can be used in route policies to control distribution of the static route into other protocols. If a tag is specified at the prefix level of the static route entry, this command is ignored.
Range	1 to 4294967295

Tree	cpe-check

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured, this command enables the Customer Premises Equipment (CPE) check feature and specifies the IP address of the target CPE device. This option initiates a background ICMP ping test to the configured target IP address. The IP address can either be an IPv4 address for IPv4 static routes or an IPv6 address for IPv6 static routes. To avoid possible circular references, the target IP address cannot exist in the same subnet as the static route subnet. This command is mutually exclusive with BFD support on a specific static route. **Note**: A node that is sourcing CPE-check packets waits an additional full interval before taking action, which gives the CPE time to respond. For example, with a drop-count of 3 and an interval of 1s, three CPE-check packets are sent out and the node waits for the duration of another interval before acting on the loss. Failure declaration may take extra time depending on the load, interval, and other factors. In line with multitasking, multi-priority operating principles of the node, and the relative priority of **cpe-ping**, the node paces these minor events.
Max. instances	1

router-instance *string*

Synopsis	Router instance used for matching prefix list
Context	**configure** service vprn *service-name* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* indirect *(ipv4-address-no-zone | ipv6-address-no-zone)* prefix-list router-instance *string*
Tree	router-instance
Description	This command configures the router instance used for matching against the prefix list. If the conditional static route is configured in a VPRN and the router instance is configured as "Base", the activation of the static route is dependent on the existence of routes in the Base router and the evaluation of the prefix list and flag is done in that context. By default there is no configured value for this command option, and the conditional static route is dependent on the existence of routes in the same router instance as the static route itself, subject to the details of the prefix list and the flag setting. Entries in a referenced prefix list that are not match type 'exact' are interpreted as though they are 'exact'.
Introduced	25.3.R2
Platforms	SAR Gen 2

tag *number*

Synopsis	Static route tag
Context	**configure** service vprn *service-name* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* indirect *(ipv4-address-no-zone | ipv6-address-no-zone)* tag *number*
Tree	tag
Description	This command associates a 4-byte route-tag with the static route. The tag value can be used in route policies to control distribution of the static route into other protocols. If a tag is specified at the prefix level of the static route entry, this command is ignored.
Range	1 to 4294967295
Introduced	25.3.R2
Platforms	SAR Gen 2

interface [interface-name] *interface-name*

Synopsis	Enter the **interface** list instance
Context	**configure** service vprn *service-name* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* interface *interface-name*

Introduced	25.3.R2
Platforms	SAR Gen 2

[**interface-name**] *interface-name*

Synopsis	Router interface name
Context	**configure** service vprn *service-name* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* interface *interface-name*
Tree	interface
String length	1 to 32
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of the static route operation
Context	**configure** service vprn *service-name* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* interface *interface-name* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Introduced	25.3.R2
Platforms	SAR Gen 2

community *community*

Synopsis	Community ID associated with the static route
Context	**configure** service vprn *service-name* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* interface *interface-name* community *community*
Tree	community
Description	This command associates one BGP community (standard, extended, or large) with a next hop of the static route. This community can be matched in route policies and automatically added to BGP routes that are created from the static route. If at least one community is specified at the prefix level of the static route entry, this command is ignored.
String length	1 to 72
Introduced	25.3.R2

Platforms	SAR Gen 2

cpe-check [address] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	Enter the **cpe-check** list instance
Context	**configure** service vprn *service-name* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* interface *interface-name* cpe-check *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	cpe-check
Description	When configured, this command enables the Customer Premises Equipment (CPE) check feature and specifies the IP address of the target CPE device. This option initiates a background ICMP ping test to the configured target IP address. The IP address can either be an IPv4 address for IPv4 static routes or an IPv6 address for IPv6 static routes. To avoid possible circular references, the target IP address cannot exist in the same subnet as the static route subnet. This command is mutually exclusive with BFD support on a specific static route. **Note**: A node that is sourcing CPE-check packets waits an additional full interval before taking action, which gives the CPE time to respond. For example, with a drop-count of 3 and an interval of 1s, three CPE-check packets are sent out and the node waits for the duration of another interval before acting on the loss. Failure declaration may take extra time depending on the load, interval, and other factors. In line with multitasking, multi-priority operating principles of the node, and the relative priority of **cpe-ping**, the node paces these minor events.
Max. instances	1
Introduced	25.3.R2
Platforms	SAR Gen 2

[**address**] *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	IP address of the target CPE device

router-instance *string*

Synopsis	Router instance used for matching prefix list
Context	**configure** service vprn *service-name* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* next-hop *(ipv4-address-with-zone | ipv6-address-with-zone)* prefix-list router-instance *string*
Tree	router-instance
Description	This command configures the router instance used for matching against the prefix list. If the conditional static route is configured in a VPRN and the router instance is configured as "Base", the activation of the static route is dependent on the existence of routes in the Base router and the evaluation of the prefix list and flag is done in that context. By default there is no configured value for this command option, and the conditional static route is dependent on the existence of routes in the same router instance as the static route itself, subject to the details of the prefix list and the flag setting. Entries in a referenced prefix list that are not match type 'exact' are interpreted as though they are 'exact'.
Introduced	25.3.R2
Platforms	SAR Gen 2

tag *number*

Synopsis	Static route tag
Context	**configure** service vprn *service-name* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* next-hop *(ipv4-address-with-zone | ipv6-address-with-zone)* tag *number*
Tree	tag
Description	This command associates a 4-byte route-tag with the static route. The tag value can be used in route policies to control distribution of the static route into other protocols. If a tag is specified at the prefix level of the static route entry, this command is ignored.
Range	1 to 4294967295
Introduced	25.3.R2
Platforms	SAR Gen 2

validate-next-hop *boolean*

Synopsis	Track the state of the next hop in the IPv4 ARP Cache or the IPv6 Neighbor Cache
Context	**configure** service vprn *service-name* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* next-hop *(ipv4-address-with-zone | ipv6-address-with-zone)* validate-next-hop *boolean*
Tree	validate-next-hop

Synopsis	Static route tag
Context	**configure** service vprn *service-name* static-routes route *(ipv4-prefix | ipv6-prefix)* route-type *keyword* tag *number*
Tree	tag
Range	1 to 4294967295
Introduced	25.3.R2
Platforms	SAR Gen 2

ttl-propagate

Synopsis	Enter the **ttl-propagate** context
Context	**configure** service vprn *service-name* ttl-propagate
Tree	ttl-propagate
Introduced	25.3.R2
Platforms	SAR Gen 2

local *keyword*

Synopsis	Local TTL propagation control for the VPRN
Context	**configure** service vprn *service-name* ttl-propagate local *keyword*
Tree	local
Description	This command specifies the local TTL propagation control for the VPRN and overrides the global configuration of the TTL propagation for locally generated packets that are forwarded over MPLS LSPs in a given VPRN service context.
Options	none, all, vc-only, use-base
Default	use-base
Introduced	25.3.R2
Platforms	SAR Gen 2

transit *keyword*

Synopsis	Transit TTL propagation control for the VPRN
Context	**configure** service vprn *service-name* ttl-propagate transit *keyword*
Tree	transit
Description	This command overrides the global configuration of the TTL propagation for in transit packets that are forwarded over MPLS LSPs in a given VPRN service context.
Options	none, all, vc-only, use-base
Default	use-base
Introduced	25.3.R2
Platforms	SAR Gen 2

twamp-light

Synopsis	Enter the **twamp-light** context
Context	**configure** service vprn *service-name* twamp-light
Tree	twamp-light
Description	Commands in this context configure TWAMP Light parameters.
Introduced	25.3.R2
Platforms	SAR Gen 2

reflector

Synopsis	Enable the **reflector** context
Context	**configure** service vprn *service-name* twamp-light reflector
Tree	reflector
Description	Commands in this context configure TWAMP Light session reflector options and enable TWAMP Light functionality.
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of the TWAMP Light reflector
Context	**configure** service vprn *service-name* twamp-light reflector admin-state *keyword*

Tree	admin-state
Options	enable, disable
Default	disable
Introduced	25.3.R2
Platforms	SAR Gen 2

allow-ipv6-udp-checksum-zero *boolean*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Process IPv6 packets with a zero UDP checksum
Context	**configure** service vprn *service-name* twamp-light reflector allow-ipv6-udp-checksum-zero *boolean*
Tree	allow-ipv6-udp-checksum-zero
Description	When configured to **true**, the router processes IPv6 packets that arrive with a UDP checksum of zero. The destination UDP ports that are registered as TWAMP Test packets as part of this template allow this behavior. When configured to **false**, the router discards IPv6 packets that arrive with a UDP checksum of zero.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

description *description*

type *keyword*

Synopsis	Processing behavior type for the reflector
Context	**configure** service vprn *service-name* twamp-light reflector type *keyword*
Tree	type
Description	This command configures the processing behavior of the TWAMP Light reflector. When the value is **twamp-light** the reflector does not check the received PDU as a traditional base TWAMP Light packet without TLV processing. When the value is **stamp**, the reflector attempts to find and process supported STAMP TLVs that follow the base STAMP packet. In mixed environments where different types of Session-Senders may be targeting a common TWAMP Light reflector, set the value to **stamp**. When the reflector is operating in **stamp** mode, the primary parsing is based on STAMP, checking and processing known TLVs, or determining if the arriving PDU is a TWAMP Light PDU. A Session-Sender launching a TWAMP Light-based packet must use all zeros padding pattern when the pad size is non zero.
Options	stamp – Reflector finds and processes supported STAMP TLVs twamp-light – Reflector does not check received PDU
Default	twamp-light
Introduced	25.3.R2
Platforms	SAR Gen 2

udp-port *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	UDP port on which the specified TWAMP-Light reflector listens for TWAMP PDUs

address

Synopsis	Enter the **address** context
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe host *named-item* ipv4 address
Tree	address
Introduced	25.3.R2
Platforms	SAR Gen 2

gi-address *keyword*

Synopsis	Use gi-address to select a pool with the given scope
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe host *named-item* ipv4 address gi-address *keyword*
Tree	gi-address
Options	subnet-scope, pool-scope
Notes	The following elements are part of a choice: **gi-address**, **ip-address**, **pool**, or **use-pool-from-client**.
Introduced	25.3.R2
Platforms	SAR Gen 2

ip-address *ipv4-unicast-address*

Synopsis	Fixed IPv4 address of the host
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe host *named-item* ipv4 address ip-address *ipv4-unicast-address*
Tree	ip-address
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Notes	The following elements are part of a choice: **gi-address**, **ip-address**, **pool**, or **use-pool-from-client**.
Introduced	25.3.R2
Platforms	SAR Gen 2

pool

Synopsis	Enable the **pool** context

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe host *named-item* ipv4 address pool
Tree	pool
Notes	The following elements are part of a choice: **gi-address**, **ip-address**, **pool**, or **use-pool-from-client**.
Introduced	25.3.R2
Platforms	SAR Gen 2

delimiter *string*

Synopsis	Delimiter separating primary and secondary pool names
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe host *named-item* ipv4 address pool delimiter *string*
Tree	delimiter
String length	1
Introduced	25.3.R2
Platforms	SAR Gen 2

primary *named-item*

Synopsis	Primary pool name
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe host *named-item* ipv4 address pool primary *named-item*
Tree	primary
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

secondary *named-item*

Synopsis	Secondary pool name
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe host *named-item* ipv4 address pool secondary *named-item*
Tree	secondary

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.3.R2
Platforms	SAR Gen 2

use-pool-from-client

Synopsis	Enable the **use-pool-from-client** context
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe host *named-item* ipv4 address use-pool-from-client
Tree	use-pool-from-client
Notes	The following elements are part of a choice: **gi-address**, **ip-address**, **pool**, or **use-pool-from-client**.
Introduced	25.3.R2
Platforms	SAR Gen 2

delimiter *string*

Synopsis	Delimiter character to combine primary and secondary pool names
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe host *named-item* ipv4 address use-pool-from-client delimiter *string*
Tree	delimiter
String length	1
Introduced	25.3.R2
Platforms	SAR Gen 2

gi-address *ipv4-unicast-address*

Synopsis	GI addresses based on the host entry in the LUDB
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe host *named-item* ipv4 gi-address *ipv4-unicast-address*
Tree	gi-address
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Introduced	25.3.R2
Platforms	SAR Gen 2

option [number] *(number | keyword)*

Synopsis	Enter the **option** list instance
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe host *named-item* ipv4 option *(number | keyword)*
Tree	option
Introduced	25.3.R2
Platforms	SAR Gen 2

[**number**] *(number | keyword)*

Synopsis	DHCP option to send identification strings to client
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe host *named-item* ipv4 option *(number | keyword)*
Tree	option
Range	1 to 254
Options	subnet-mask, default-router, dns-server, domain-name, netbios-name-server, netbios-node-type, lease-time, lease-renew-time, lease-rebind-time
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

ascii-string *string-not-all-spaces*

Synopsis	DHCP option specified as an ASCII string
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe host *named-item* ipv4 option *(number | keyword)* ascii-string *string-not-all-spaces*
Tree	ascii-string
String length	1 to 127
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	The following elements are part of a mandatory choice: **ascii-string**, **duration**, **empty**, **hex-string**, **ipv4-address**, or **netbios-node-type**.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

duration *number*

Synopsis	DHCP option as time duration
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe host *named-item* ipv4 option *(number | keyword)* duration *number*
Tree	duration
Range	10 to 315446399
Units	seconds
Notes	The following elements are part of a mandatory choice: **ascii-string**, **duration**, **empty**, **hex-string**, **ipv4-address**, or **netbios-node-type**.
Introduced	25.3.R2
Platforms	SAR Gen 2

empty

Synopsis	Remove DHCP option configuration
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe host *named-item* ipv4 option *(number | keyword)* empty
Tree	empty
Notes	The following elements are part of a mandatory choice: **ascii-string**, **duration**, **empty**, **hex-string**, **ipv4-address**, or **netbios-node-type**.
Introduced	25.3.R2
Platforms	SAR Gen 2

hex-string *hex-string*

Synopsis	DHCP option specified as hexadecimal string
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe host *named-item* ipv4 option *(number | keyword)* hex-string *hex-string*
Tree	hex-string
String length	1 to 256
String format	'hex-string' must be hexadecimal with prefix 0x (e.g. 0x1a2b)
Notes	The following elements are part of a mandatory choice: **ascii-string**, **duration**, **empty**, **hex-string**, **ipv4-address**, or **netbios-node-type**.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ipv4-address *ipv4-address*

Synopsis	DHCP option as a list of IPv4 addresses
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe host *named-item* ipv4 option *(number | keyword)* ipv4-address *ipv4-address*
Tree	ipv4-address
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Max. instances	4
Notes	The following elements are part of a mandatory choice: **ascii-string**, **duration**, **empty**, **hex-string**, **ipv4-address**, or **netbios-node-type**. This element is ordered by the user.
Introduced	25.3.R2
Platforms	SAR Gen 2

netbios-node-type *keyword*

Synopsis	DHCP option as NetBIOS node type
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe host *named-item* ipv4 option *(number | keyword)* netbios-node-type *keyword*
Tree	netbios-node-type
Options	b-node, p-node, m-node, h-node
Notes	The following elements are part of a mandatory choice: **ascii-string**, **duration**, **empty**, **hex-string**, **ipv4-address**, or **netbios-node-type**.
Introduced	25.3.R2
Platforms	SAR Gen 2

mask type *keyword*

Synopsis	Enter the **mask** list instance
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe mask type *keyword*
Tree	mask
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

type *keyword*

Synopsis	Matching type to identify a host
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe mask type *keyword*
Tree	mask
Description	This command configures the data type that represents the type of matching performed to identify a DHCP host.
Options	circuit-id, remote-id, sap-id, string, system-id, option60, duid-en, duid-ll-llt
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

prefix

Synopsis	Enable the **prefix** context
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe mask type *keyword* prefix
Tree	prefix
Introduced	25.3.R2
Platforms	SAR Gen 2

length *number*

Synopsis	PPP mask prefix length
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe mask type *keyword* prefix length *number*
Tree	length
Range	1 to 127
Notes	The following elements are part of a mandatory choice: **length** or **string**.
Introduced	25.3.R2
Platforms	SAR Gen 2

string *string*

Synopsis	Prefix string
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe mask type *keyword* prefix string *string*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	string
String length	1 to 127
Notes	The following elements are part of a mandatory choice: **length** or **string**.
Introduced	25.3.R2
Platforms	SAR Gen 2

suffix

Synopsis	Enable the **suffix** context
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe mask type *keyword* suffix
Tree	suffix
Introduced	25.3.R2
Platforms	SAR Gen 2

length *number*

Synopsis	PPP mask suffix length
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe mask type *keyword* suffix length *number*
Tree	length
Range	1 to 127
Notes	The following elements are part of a mandatory choice: **length** or **string**.
Introduced	25.3.R2
Platforms	SAR Gen 2

string *string*

Synopsis	Suffix substring
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe mask type *keyword* suffix string *string*
Tree	string
Description	This command specifies a substring that is stripped off the end of the incoming circuit ID before it is matched against the value configured in the circuit ID.
String length	1 to 127
String format	'string' must not start with * (suffix length 1..127)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Notes	The following elements are part of a mandatory choice: **length** or **string**.
Introduced	25.3.R2
Platforms	SAR Gen 2

match-list *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	IPoE host match type
Context	**configure** subscriber-mgmt local-user-db *named-item* ipoe match-list *keyword*
Tree	match-list
Description	This command specifies the type of matching done to identify a host. There are different match-types for IPoE hosts.
Options	circuit-id, mac, remote-id, sap-id, service-id, string, system-id, option60, encap-tag-range, dual-stack-remote-id, derived-id, ip, encap-tag-separate-range, duid-en, duid-ll-llt
Max. instances	4
Notes	This element is ordered by the user.
Introduced	25.3.R2
Platforms	SAR Gen 2

rip-policy [name] *named-item*

Synopsis	Enter the **rip-policy** list instance
Context	**configure** subscriber-mgmt rip-policy *named-item*
Tree	rip-policy
Max. instances	255
Introduced	25.3.R2
Platforms	SAR Gen 2

[**name**] *named-item*

Synopsis	RIP policy name

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** subscriber-mgmt rip-policy *named-item*
Tree	rip-policy
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

authentication-key *encrypted-leaf*

Synopsis	Authentication key
Context	**configure** subscriber-mgmt rip-policy *named-item* authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command specifies the authentication key in a protected format. The specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7705 SAR Gen 2 System Management Guide* for more information.
String length	1 to 102
Introduced	25.3.R2
Platforms	SAR Gen 2

authentication-type *keyword*

Synopsis	Authentication type used between RIP neighbors
Context	**configure** subscriber-mgmt rip-policy *named-item* authentication-type *keyword*
Tree	authentication-type
Options	password, message-digest, message-digest-20
Introduced	25.3.R2
Platforms	SAR Gen 2

description *description*

4.29.1 system command descriptions

system

Synopsis	Enter the **system** context
Context	**configure** system
Tree	system
Description	Commands in this context enable the configuration of general system level functions and router management protocols.
Introduced	25.3.R2
Platforms	SAR Gen 2

alarm-contact-input [input-pin-number] *number*

Synopsis	Enter the **alarm-contact-input** list instance
Context	**configure** system alarm-contact-input *number*
Tree	alarm-contact-input
Introduced	25.3.R2
Platforms	7705 SAR-Hx, 7705 SAR-Mx

[**input-pin-number**] *number*

Synopsis	Alarm contact input number
Context	**configure** system alarm-contact-input *number*
Tree	alarm-contact-input
Range	1 to 4
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	7705 SAR-Hx, 7705 SAR-Mx

admin-state *keyword*

Synopsis	Administrative state of the alarm contact input
Context	**configure** system alarm-contact-input *number* admin-state *keyword*
Tree	admin-state

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Options	enable, disable
Default	disable
Introduced	25.3.R2
Platforms	7705 SAR-Hx, 7705 SAR-Mx

clear-message *description*

Synopsis	Text message sent in the log event when an alarm clears
Context	**configure** system alarm-contact-input *number* clear-message *description*
Tree	clear-message
Description	This command configures a text message to be included in the log event that is sent when the system clears an alarm. The system generates the default "Alarm Input Cleared" message if no message is configured. The **clear-message** string is included in the log event when the pin changes to the normal state.
String length	1 to 80
Default	Alarm Input Cleared
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.3.R2
Platforms	7705 SAR-Hx, 7705 SAR-Mx

description *long-description*

Introduced	25.3.R2
Platforms	SAR Gen 2

max-cleared *number*

Synopsis	Maximum number of cleared alarms
Context	**configure** system alarms max-cleared *number*
Tree	max-cleared
Range	0 to 500
Default	500
Introduced	25.3.R2
Platforms	SAR Gen 2

allow-boot-license-violations *boolean*

Synopsis	Allow boot license violations in boot-up configuration
Context	**configure** system allow-boot-license-violations *boolean*
Tree	allow-boot-license-violations
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

boot-bad-exec *url*

Synopsis	CLI script file to execute following a failed boot
Context	**configure** system boot-bad-exec *url*
Tree	boot-bad-exec
Description	This command configures the name of the CLI script file to be run following the failure of a boot configuration. **Note**: This command has no effect in model-driven mode.
String length	1 to 180
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

boot-good-exec *url*

Synopsis	CLI script file to execute following successful boot
Context	**configure** system boot-good-exec *url*
Tree	boot-good-exec
Description	This command configures a URL for a CLI script to **exec** following the success of a boot configuration. **Related Commands** **exec** - This command executes the contents of a text file as if they were CLI commands entered at the console.
String length	1 to 180
Introduced	25.3.R2
Platforms	SAR Gen 2

central-frequency-clock

Synopsis	Enter the **central-frequency-clock** context
Context	**configure** system central-frequency-clock
Tree	central-frequency-clock
Description	Commands in this context configure synchronous interface timing.
Introduced	25.3.R2
Platforms	7705 SAR-Hx, 7705 SAR-Mx

gnss

Synopsis	Enter the **gnss** context
Context	**configure** system central-frequency-clock gnss
Tree	gnss
Description	Commands in this context configure system timing using GNSS on platforms that support one or more embedded GNSS receivers.
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

admin-state *keyword*

Synopsis	Administrative state of the GNSS timing reference

Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

ql-minimum *keyword*

Synopsis	Minimum signal QL for system timing module
Context	**configure** system central-frequency-clock ql-minimum *keyword*
Tree	ql-minimum

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the minimum acceptable QL value for a signal to be considered for selection by the system timing module.
Options	unused – Not used prs – SONET Primary Reference Source traceable stu – SONET Synchronous Traceability Unknown st2 – SONET Stratum 2 traceable tnc – SONET Transit Node Clock traceable st3e – SONET Stratum 3E traceable st3 – SONET Stratum 3 traceable prc – SDH Primary Reference Clock traceable ssua – SDH primary level Synchronization Supply Unit traceable ssub – SDH second Level Synchronization Supply Unit traceable sec – SDH Synchronous Equipment Clock traceable eec1 – SDH Ethernet Equipment Clock eec2 – SONET Ethernet Equipment Clock eprtc – Enhanced Primary Reference Time Clock prtc – Primary Reference Time Clock eprc – Enhanced Primary Reference Clock eeec – Enhanced Ethernet Equipment Clock
Default	unused
Introduced	25.3.R2
Platforms	7705 SAR-Hx, 7705 SAR-Mx

ql-selection *boolean*

Synopsis	Consider QL in system and BITS output timing
Context	**configure** system central-frequency-clock ql-selection *boolean*
Tree	ql-selection
Description	When configured to **true**, the router considers the QL when selecting the system timing reference and BITS output timing reference. The QL is conveyed via the SSM or forced using the **ql-override** command.
Default	false
Introduced	25.3.R2
Platforms	7705 SAR-Hx, 7705 SAR-Mx

ref-order

Synopsis	Enter the **ref-order** context
Context	**configure** system central-frequency-clock ref-order
Tree	ref-order

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context specify the priority order of the synchronous equipment timing subsystem**.** If a reference source is disabled, this command defines the next reference source for the clock. If all reference sources are disabled, clocking is derived from a local oscillator. If a timing reference is linked to a source port that is operationally down, the port is no longer a qualified, valid reference.
Introduced	25.3.R2
Platforms	7705 SAR-Hx, 7705 SAR-Mx

first *keyword*

Synopsis	First preferred timing reference source
Context	**configure** system central-frequency-clock ref-order first *keyword*
Tree	first
Options	ref1, ref2, bits, ptp, none, synce, gnss

Introduced	25.3.R2
Platforms	7705 SAR-Hx, 7705 SAR-Mx

ql-override *keyword*

Synopsis	Quality level override of a timing reference
Context	**configure** system central-frequency-clock ref1 ql-override *keyword*
Tree	ql-override

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the QL value used for the reference for SETS input selection. This value overrides any value received by the referenced SSM process.
Options	unused – Not used prs – SONET Primary Reference Source traceable stu – SONET Synchronous Traceability Unknown st2 – SONET Stratum 2 traceable tnc – SONET Transit Node Clock traceable st3e – SONET Stratum 3E traceable st3 – SONET Stratum 3 traceable prc – SDH Primary Reference Clock traceable ssua – SDH primary level Synchronization Supply Unit traceable ssub – SDH second Level Synchronization Supply Unit traceable sec – SDH Synchronous Equipment Clock traceable eec1 – SDH Ethernet Equipment Clock eec2 – SONET Ethernet Equipment Clock eprtc – Enhanced Primary Reference Time Clock prtc – Primary Reference Time Clock eprc – Enhanced Primary Reference Clock eeec – Enhanced Ethernet Equipment Clock
Default	unused
Introduced	25.3.R2
Platforms	7705 SAR-Hx, 7705 SAR-Mx

source-port *port*

Synopsis	Source port for the first timing reference
Context	**configure** system central-frequency-clock ref1 source-port *port*
Tree	source-port
Description	This command configures the source port for timing reference **ref1**. If the port is unavailable or the link is down, the reference sources are reevaluated according to the reference order configured in the **ref-order** command. There are platform-based restrictions on the location for the source port locations for **ref1**. See the *7705 SAR Gen 2 Basic System Configuration Guide* for more information.
Introduced	25.3.R2
Platforms	7705 SAR-Hx, 7705 SAR-Mx

ref2

Synopsis	Enter the **ref2** context
Context	**configure** system central-frequency-clock ref2
Tree	ref2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context configure the second timing reference.
Introduced	25.3.R2
Platforms	7705 SAR-Hx, 7705 SAR-Mx

admin-state *keyword*

Synopsis	Administrative state of the second timing reference
Context	**configure** system central-frequency-clock ref2 admin-state *keyword*
Tree	admin-state
Options	enable, disable

Platforms	7705 SAR-Hx, 7705 SAR-Mx

source-port *port*

Synopsis	Source port for the second timing reference
Context	**configure** system central-frequency-clock ref2 source-port *port*
Tree	source-port
Description	This command configures the source port for timing reference **ref2**. If the port is unavailable or the link is down, the reference sources are reevaluated according to the reference order configured in the **ref-order** command. There are platform-based restrictions on the location for the source port locations for **ref2**. See the *7705 SAR Gen 2 Basic System Configuration Guide* for more information.
Introduced	25.3.R2
Platforms	7705 SAR-Hx, 7705 SAR-Mx

revert *boolean*

Synopsis	Revert to higher-priority reference source
Context	**configure** system central-frequency-clock revert *boolean*
Tree	revert
Description	When configured to **true**, the router operates in revertive mode, allowing the clock to revert to a higher priority reference if the current reference goes offline or becomes unstable. When the failed reference becomes operational, it is eligible for selection. When configured to **false**, the router does not allow a failed clocked source to be selected again.
Default	false
Introduced	25.3.R2
Platforms	7705 SAR-Hx, 7705 SAR-Mx

wait-to-restore *number*

Synopsis	Time to revalidate a previously failed input reference
Context	**configure** system central-frequency-clock wait-to-restore *number*
Tree	wait-to-restore
Description	This command configures the time for the Wait to Restore timer. A previously failed input reference must be valid for the specified time before it can be used for either the BITS output or the central clock input reference.

start *number*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Lower bound of the range
Context	**configure** system eth-cfm md-auto-id md-index-range start *number*
Tree	start
Range	1 to 4294967295
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

named-display *boolean*

Synopsis	Enable administrative name display in CLI show outputs
Context	**configure** system eth-cfm named-display *boolean*
Tree	named-display
Description	When configured to **true**, the system displays the administrative names for domains, associations, and bridge-identifiers in **show eth-cfm** command outputs in addition to the numerical maintenance domain (MD) index, maintenance association (MA) index, and bridge ID values. The administrative names are displayed underneath the numerical values, each on a separate row. When configured to **false**, the system only displays the numerical MD index, MA index, and bridge ID values in **show eth-cfm** command outputs.
Default	false
Introduced	25.10.R1
Platforms	SAR Gen 2

redundancy

Synopsis	Enter the **redundancy** context
Context	**configure** system eth-cfm redundancy
Tree	redundancy

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	25.3.R2
Platforms	SAR Gen 2

mc-lag

Synopsis	Enter the **mc-lag** context
Context	**configure** system eth-cfm redundancy mc-lag
Tree	mc-lag
Description	Commands in this context configure the MC-LAG specific ETH-CFM redundancy options.
Introduced	25.3.R2
Platforms	SAR Gen 2

propagate-hold-time *(number | keyword)*

Synopsis	Delay timer value for the fault propagation
Context	**configure** system eth-cfm redundancy mc-lag propagate-hold-time *(number | keyword)*
Tree	propagate-hold-time
Description	This command configures the delay for fault propagation because of port or MC-LAG state changes. This provides the amount of time for system stabilization during a port state change that may be protected by MC-LAG.
Range	1 to 60
Units	seconds
Options	none
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

standby-mep *boolean*

Synopsis	Allow standby MC-LAG MEPs to act administratively down
Context	**configure** system eth-cfm redundancy mc-lag standby-mep *boolean*
Tree	standby-mep
Description	This command, which is system wide, configures MEPs to track the state of MC-LAG. This allows MEPs on the standby MC-LAG to act administratively down.
Default	false

Introduced	25.3.R2
Platforms	SAR Gen 2

slm

Synopsis	Enter the **slm** context
Context	**configure** system eth-cfm slm
Tree	slm
Introduced	25.3.R2
Platforms	SAR Gen 2

inactivity-timer *number*

Synopsis	SLR inactivity timer to maintain the stale test data
Context	**configure** system eth-cfm slm inactivity-timer *number*
Tree	inactivity-timer
Description	This command configures the time that the responder keeps a test active. If the time between packets exceeds this value within a test, the responder marks the previous test as complete. It treats any new packets from a peer with the same test ID, source MAC, and MEP-ID as a new test responding with the sequence number one.
Range	10 to 100
Units	seconds
Default	100
Introduced	25.3.R2
Platforms	SAR Gen 2

grpc

Synopsis	Enter the **grpc** context
Context	**configure** system grpc
Tree	grpc
Introduced	25.3.R2
Platforms	SAR Gen 2

urls *cflash-url*

Synopsis	Locations of compiled proto file
Context	**configure** system grpc custom-proto *named-item* urls *cflash-url*
Tree	urls
String length	1 to 200
String format	'cflash-url' must start with cf1-4, optional slot A-D, then path (e.g. cf1:/path or cf1-A:/path) 'cflash-url' must have each path segment at most 99 characters
Max. instances	3
Notes	This element is ordered by the user.
Introduced	26.7.R1
Platforms	SAR Gen 2

delay-on-boot *number*

Synopsis	Delay for gRPC connections after system boot
Context	**configure** system grpc delay-on-boot *number*
Tree	delay-on-boot
Description	This command configures the delay timer for gRPC connections. When the timer expires, gRPC becomes operational and connections are accepted. This delay prevents automation from managing the system while it is still converging. When no delay is configured, connections are accepted after the system boots and gRPC becomes operational.
Range	1 to 3600
Units	seconds
Introduced	25.3.R2
Platforms	SAR Gen 2

gnmi

Synopsis	Enter the **gnmi** context
Context	**configure** system grpc gnmi
Tree	gnmi

Platforms	SAR Gen 2

target-type

Synopsis	Enter the **target-type** context
Context	**configure** system grpc-tunnel tunnel *named-item* handler *named-item* target-type
Tree	target-type
Introduced	25.3.R2
Platforms	SAR Gen 2

custom-type *string*

Synopsis	Custom string for target type
Context	**configure** system grpc-tunnel tunnel *named-item* handler *named-item* target-type custom-type *string*
Tree	custom-type
Description	This command configures a custom string for the target type. This string can correspond to specific values used by the gRPC tunnel protocol, such as GNMI_GNOI or SSH. If a custom string is defined, the gRPC tunnel client must specify the string to request a session for that handler. The string must be unique within a tunnel.
String length	1 to 64
String format	'custom-type' must contain only uppercase letters, digits or underscores
Notes	The following elements are part of a choice: **custom-type**, **grpc-server**, or **ssh-server**.
Introduced	25.3.R2
Platforms	SAR Gen 2

grpc-server

Synopsis	Target type set to GNMI_GNOI
Context	**configure** system grpc-tunnel tunnel *named-item* handler *named-item* target-type grpc-server
Tree	grpc-server
Description	When configured, this command assigns the gRPC server as a handler for all tunnels sessions. At the gRPC tunnel protocol level, this corresponds to a value of GNMI_GNOI.
Notes	The following elements are part of a choice: **custom-type**, **grpc-server**, or **ssh-server**.
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

ssh-server

Synopsis	Target type is SSH
Context	**configure** system grpc-tunnel tunnel *named-item* handler *named-item* target-type ssh-server
Tree	ssh-server
Description	When configured, this command assigns the SSH server as a handler for all tunnels sessions. At the gRPC tunnel protocol level, this corresponds to a value of SSH.
Notes	The following elements are part of a choice: **custom-type**, **grpc-server**, or **ssh-server**.
Introduced	25.3.R2
Platforms	SAR Gen 2

target-name

Context	**configure** system ip
Tree	ip
Description	Commands in this context configure system-wide IP router options.
Introduced	25.3.R2
Platforms	SAR Gen 2

buffer-unresolved-packets *boolean*

Synopsis	Buffer unresolved packets during ARP
Context	**configure** system ip buffer-unresolved-packets *boolean*
Tree	buffer-unresolved-packets
Description	When configured to **true**, the system buffers IPv4 and IPv6 packets waiting for the address resolution process (ARP) or neighbor discovery (ND) reply. When configured to **false**, the system discards packets during the address resolution process. The system discards IPv4 and IPv6 traffic needing a destination resolution that is buffered while waiting for a response to avoid any potential of out-of-order delivery of packets to the resolved destination. As a result, after the ARP or ND entry is populated, the system delivers only newly received packets in order.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

enforce-unique-if-index *boolean*

Synopsis	Force creation of globally unique IP interface indexes
Context	**configure** system ip enforce-unique-if-index *boolean*
Tree	enforce-unique-if-index
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

forward-6in4 *boolean*

Synopsis	Allow forwarding of IPv6 over IPv4 to system IP address
Context	**configure** system ip forward-6in4 *boolean*
Tree	forward-6in4

Units	seconds
Default	30
Introduced	25.3.R2
Platforms	SAR Gen 2

load-balancing

Synopsis	Enter the **load-balancing** context
Context	**configure** system load-balancing

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	load-balancing
Description	Commands in this context configure the interface per-flow load-balancing options that apply to traffic entering this interface and egressing over a LAG or ECMP on system egress. This setting is per interface. Load-balancing options configured at the interface level overwrite load-balancing options configured at the system level.
Introduced	25.3.R2
Platforms	SAR Gen 2

l4-load-balancing *boolean*

Synopsis	Use load balancing based on Layer 4 fields
Context	**configure** system load-balancing l4-load-balancing *boolean*
Tree	l4-load-balancing
Introduced	25.3.R2
Platforms	SAR Gen 2

lsr-load-balancing *keyword*

Synopsis	Algorithm for system-wide LSR load balancing
Context	**configure** system load-balancing lsr-load-balancing *keyword*
Tree	lsr-load-balancing
Description	This command configures system-wide LSR load balancing. Hashing can be enabled on the label stack, IP header, or both. The hashing can be at an LSR for spraying labeled IP packets over multiple equal-cost paths, or over multiple links of a LAG group. The LSR hash routine operates on the label stack and the IP header, if a packet is IPv4. An LSR considers a packet to be IPv4 if the first nibble following the bottom of the label stack is 4. The hash on the label stack and IPv4 and IPv6 headers can be enabled or disabled at the system level or incoming network IP interface level. **lbl-ip-l4-teid** - Specifies that the hashing applies as follows for Layer 2 and Layer 3 encapsulated traffic: • If an IPv4 or IPv6 header is found immediately after the MPLS label stack, the hashing includes label stack, source and destination IP addresses, TCP/UDP port numbers, and, if present, TEID values. • If an IPv4 or IPv6 header is not found immediately after the MPLS label stack, the data plane searches for a valid Ethertype value for the IPv4 and IPv6 payload. If a valid Ethertype value is found and an IP header follows the Ethernet header, hashing includes the source and destination IP addresses, TCP/UDP port numbers, and, if present, TEID values.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

eth-encap-ip - Specifies that the hash algorithm parses down the label stack and after it reaches the bottom, the stack assumes the Ethernet II non-tagged, dot1q, or QinQ header follows. At the expected Ethertype offset location, the algorithm checks whether the value present is IPv4/IPv6 (0x0800/0x86DD). If the check passes, the hash algorithm checks the first nibble at the expected IP header location for IPv4/IPv6 (0x0100/0x0110). If the secondary check passes, the algorithm performs the hash using the IP SA/DA fields in the expected IP header. If any of the checks fail, the label-stack hash is performed.

Options	lbl-only, lbl-ip, ip-only, eth-encap-ip, lbl-ip-l4-teid, lbl-eth-ip-l4-teid, lbl-ip-or-teid
Introduced	25.3.R2
Platforms	SAR Gen 2

service-id-lag-hashing *boolean*

Synopsis	Enable enhanced VLL LAG service ID hashing
Context	**configure** system load-balancing service-id-lag-hashing *boolean*
Tree	service-id-lag-hashing
Default	false
Introduced	25.3.R2

Tree ftp

Description Commands in this context configure FTP login control command options.

(none)

Introduced 25.3.R2

Platforms SAR Gen 2

inbound-max-sessions *number*

Synopsis Maximum number of concurrent inbound FTP sessions

Context **configure** system login-control ftp inbound-max-sessions *number*

Tree inbound-max-sessions

Description This command configures the maximum number of concurrent inbound FTP sessions.

This value is the combined total of inbound and outbound sessions.

(none)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Range	0 to 5
Default	3
Introduced	25.3.R2
Platforms	SAR Gen 2

idle-timeout *(keyword | number)*

Synopsis	Idle timeout for console, FTP, Telnet, and SSH sessions
Context	**configure** system login-control idle-timeout *(keyword | number)*
Tree	idle-timeout
Range	1 to 1440
Units	minutes
Options	none
Default	30
Introduced	25.3.R2
Platforms	SAR Gen 2

login-banner *boolean*

Synopsis	Display the SR OS login banner
Context	**configure** system login-control login-banner *boolean*
Tree	login-banner
Description	When configured to **true**, the system displays the SR OS login banner. The login banner contains the SR OS copyright and build date information. **false**, the system only displays the configured pre-login message and the login prompt. (none)
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

login-scripts

Synopsis	Enter the **login-scripts** context
Context	**configure** system login-control login-scripts
Tree	login-scripts

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context configure CLI scripts that execute when a user (authenticated via any method including local user database, TACACS+, or RADIUS) first logs into a CLI session. (none)
Introduced	25.3.R2
Platforms	SAR Gen 2

global-script *string-not-all-spaces*

Synopsis	URL of the global CLI login script
Context	**configure** system login-control login-scripts global-script *string-not-all-spaces*
Tree	global-script
Description	This command specifies a common CLI script that executes when any user logs into a CLI session. This login exec script is executed when any user (authenticated by any means including local user database, TACACS+, or RADIUS) opens a CLI session. This allows a user, for example, to define a common set of CLI aliases that are made available on the router for all users. This global login exec script is executed before any user-specific login exec files that may be configured. This CLI script executes in the context of the user who opens the CLI session. Any commands in the script that the user is not authorized to execute will fail. (none)
String length	1 to 180
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.3.R2
Platforms	SAR Gen 2

per-user-script

Synopsis	Enter the **per-user-script** context
Context	**configure** system login-control login-scripts per-user-script
Tree	per-user-script
Description	Commands in this context allow users to define their own login scripts that can be executed each time they first login to a CLI session. The command executes the script "*file-url / username / file-name*" when the user *username* logs into a CLI session (authenticated by any means including local user database, TACACS+, or RADIUS). For example: per-user user-directory "cf1:/local/users" file-name "login-script.txt" would search for the following script when user "admin" logs in and authenticates via RADIUS:

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

cf1:/local/users/admin/login-script.txt

The per user login script is executed after any global script executes and before any login-exec script configured against a local user is executed. This allows users, for example, who are authenticated via TACACS+ or RADIUS to define their own login scripts.

This CLI script executes in the context of the user who opens the CLI session. Any commands in the script that the user is not authorized to execute will fail.

(none)

Introduced 25.3.R2

Platforms SAR Gen 2

file-name *filename*

Synopsis File name of the per-user login script

Context **configure** system login-control login-scripts per-user-script file-name *filename*

Tree file-name

Description This command specifies the name of the file (located in the **configure system login-control login-scripts per-user-script user-directory** directory) including the extension.

(none)

String length 1 to 180

String format 'filename' must not contain / or \\ (no path separators)
'filename' must not be all spaces

Introduced 25.3.R2

Platforms SAR Gen 2

user-directory *string-not-all-spaces*

Synopsis Directory name of user-defined login script

Context **configure** system login-control login-scripts per-user-script user-directory *string-not-all-spaces*

Tree user-directory

String length 1 to 180

String format 'string-not-all-spaces' must contain at least one non-space character

Introduced 25.3.R2

Platforms SAR Gen 2

Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

pre-login-message

Synopsis	Enter the **pre-login-message** context
Context	**configure** system login-control pre-login-message
Tree	pre-login-message
Description	Commands in this context configure a message to display before logging in to the router. Only one message can be configured. If a new pre-login message is configured, the new message overwrites the previous message. The pre-login message is displayed on both active and standby CPMs.
Introduced	25.3.R2
Platforms	SAR Gen 2

message *string-not-all-spaces*

Synopsis	Pre-login message displayed before the login prompt
Context	**configure** system login-control pre-login-message message *string-not-all-spaces*
Tree	message
Description	This command configures the pre-login message. Any printable, 7-bit ASCII characters can be used. If the string contains special characters (#, $, spaces, and so on), the entire string must be enclosed within double quotes. Some special characters can be used to format the message text. Use the newline () character to create multiline messages. A newline () character in the message moves to the beginning of the next line by sending ASCII/UTF-8 characters 0xA (LF) and 0xD (CR) to the client terminal. A carriage return (\r) character in the message sends the ASCII/UTF-8 character 0xD (CR) to the client terminal.
String length	1 to 900
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.3.R2
Platforms	SAR Gen 2

name *boolean*

Synopsis	Display the system name after the pre-login message
Context	**configure** system login-control pre-login-message name *boolean*
Tree	name
Description	When configured to **true**, the system displays a space followed by the system name after the pre-login message before the login prompt.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, the system only displays the configured pre-login message and the login prompt.

Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ssh

Synopsis	Enter the **ssh** context
Context	**configure** system login-control ssh
Tree	ssh
Description	Commands in this context configure the SSH command options. (none)
Introduced	25.3.R2

Description	This command configures the maximum number of outbound Telnet and SSH sessions. The local serial port cannot be disabled. (none)
Range	0 to 15
Default	5
Introduced	25.3.R2
Platforms	SAR Gen 2

ttl-security *number*

Synopsis	Minimum TTL value for incoming packets
Context	**configure** system login-control telnet ttl-security *number*
Tree	ttl-security
Description	This command configures TTL security command options for incoming packets. When the feature is enabled, LDP accepts incoming IP packets from a peer only if the TTL value in the packet is greater than or equal to the minimum TTL value configured for that peer. Per-peer-queueing must be enabled in order for TTL protection to operate. (none)
Range	1 to 255
Introduced	25.3.R2
Platforms	SAR Gen 2

management-interface

Synopsis	Enter the **management-interface** context
Context	**configure** system management-interface
Tree	management-interface
Description	Commands in this context configure the capabilities of router management interfaces such as the CLI and NETCONF.
Introduced	25.3.R2
Platforms	SAR Gen 2

cli

Synopsis	Enter the **cli** context
Context	**configure** system management-interface cli

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	cli
Description	Commands in this context configure the CLI management interfaces.
Introduced	25.3.R2
Platforms	SAR Gen 2

classic-cli

Synopsis	Enter the **classic-cli** context
Context	**configure** system management-interface cli classic-cli
Tree	classic-cli
Description	Commands in this context configure the classic CLI management interface.
Introduced	25.3.R2
Platforms	SAR Gen 2

allow-immediate *boolean*

Synopsis	Allow writable access in classic CLI configure branch
Context	**configure** system management-interface cli classic-cli allow-immediate *boolean*
Tree	allow-immediate
Description	When configured to **true**, this command enables write access in the classic CLI configuration branch without having to use the classic CLI **candidate edit** functionality. When configured to **false**, this command blocks write access and configuration changes in the classic CLI configuration branch, and the classic CLI configuration branch is read-only. This enforces using the classic CLI **candidate edit** functionality, including **candidate commit**, to modify the router configuration, instead of allowing immediate line-by-line configuration changes.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

rollback

Synopsis	Enter the **rollback** context
Context	**configure** system management-interface cli classic-cli rollback
Tree	rollback
Description	Commands in this context control classic CLI configuration rollback functionality, such as the maximum number of rollback checkpoints the system maintains. Configuration

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

rollback allows the operator to revert to previous router configuration states while minimizing impacts to services.

Introduced	25.3.R2
Platforms	SAR Gen 2

local-checkpoints *number*

Synopsis	Maximum number of rollback files on local storage
Context	**configure** system management-interface cli classic-cli rollback local-checkpoints *number*
Tree	local-checkpoints
Range	1 to 50
Default	10
Introduced	25.3.R2
Platforms	SAR Gen 2

location *url*

Synopsis	Path and filename prefix for rollback checkpoint files
Context	**configure** system management-interface cli classic-cli rollback location *url*
Tree	location
Description	This command configures the local (for example, compact flash) or remote location and name of the classic CLI rollback checkpoint files. The filename must not contain a suffix. The suffixes for rollback checkpoint files are, for example, .rb, .rb.1, .rb.2, and so on. The suffixes are automatically appended to rollback checkpoint files.
String length	1 to 180
Introduced	25.3.R2
Platforms	SAR Gen 2

remote-checkpoints *number*

Synopsis	Maximum rollback files saved at a remote location
Context	**configure** system management-interface cli classic-cli rollback remote-checkpoints *number*
Tree	remote-checkpoints
Range	1 to 200
Default	10

Platforms	SAR Gen 2

alias [alias-name] *string*

Synopsis	Enter the **alias** list instance
Context	**configure** system management-interface cli md-cli environment command-alias alias *string*
Tree	alias
Description	Commands in this context create aliases to existing MD-CLI commands or to Python applications. Aliases may be mounted for use globally or for selected context paths. Arguments and output modifiers may be provided to aliases at configuration or run time.
Introduced	25.3.R2
Platforms	SAR Gen 2

[**alias-name**] *string*

Synopsis	Alias name
Context	**configure** system management-interface cli md-cli environment command-alias alias *string*
Tree	alias
String length	1 to 64
String format	must only contain alpha-numeric characters, underscore or hyphen (not as the first character)
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of the alias
Context	**configure** system management-interface cli md-cli environment command-alias alias *string* admin-state *keyword*
Tree	admin-state
Description	This command controls the administrative state of the MD-CLI alias.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

MD-CLI aliases that are administratively disabled cannot be executed, are not displayed in command completion, and do not appear in **?** help.

Options	enable, disable
Default	disable
Introduced	25.3.R2
Platforms	SAR Gen 2

cli-command *string*

Synopsis	CLI command to run when executing the alias
Context	**configure** system management-interface cli md-cli environment command-alias alias *string* cli-command *string*
Tree	cli-command
String length	1 to 255
Notes	The following elements are part of a mandatory choice: **cli-command** or **python-script**.
Introduced	25.3.R2
Platforms	SAR Gen 2

description *string-not-all-spaces*

Synopsis	Alias description
Context	**configure** system management-interface cli md-cli environment command-alias alias *string* description *string-not-all-spaces*
Tree	description
String length	1 to 110
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.3.R2
Platforms	SAR Gen 2

mount-point [path] *(keyword | string)*

Synopsis	Add a list entry for **mount-point**
Context	**configure** system management-interface cli md-cli environment command-alias alias *string* mount-point *(keyword | string)*
Tree	mount-point

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Min. instances	1
Introduced	25.3.R2
Platforms	SAR Gen 2

[**path**] *(keyword | string)*

Synopsis	Mount point where the alias is available
Context	**configure** system management-interface cli md-cli environment command-alias alias *string* mount-point *(keyword | string)*
Tree	mount-point
String length	1 to 255
Options	global
String format	must start with forward slash
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

python-script *reference*

Synopsis	Python script to run when executing the alias
Context	**configure** system management-interface cli md-cli environment command-alias alias *string* python-script *reference*
Tree	python-script
Reference	**configure** python python-script *named-item*
Notes	The following elements are part of a mandatory choice: **cli-command** or **python-script**.
Introduced	26.7.R1
Platforms	SAR Gen 2

command-completion

Synopsis	Enter the **command-completion** context
Context	**configure** system management-interface cli md-cli environment command-completion
Tree	command-completion
Introduced	25.3.R2

Platforms	SAR Gen 2

enter *boolean*

Synopsis	Complete the command when the Enter key is pressed
Context	**configure** system management-interface cli md-cli environment command-completion enter *boolean*
Tree	enter
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

space *boolean*

Synopsis	Complete the command when the Space key is pressed
Context	**configure** system management-interface cli md-cli environment command-completion space *boolean*
Tree	space
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

tab *boolean*

Synopsis	Complete the command when the Tab key is pressed
Context	**configure** system management-interface cli md-cli environment command-completion tab *boolean*
Tree	tab
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

commit-options

Synopsis	Enter the **commit-options** context
Context	**configure** system management-interface cli md-cli environment commit-options

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	commit-options
Introduced	25.3.R2
Platforms	SAR Gen 2

comment *boolean*

Synopsis	Require a commit comment when committing configuration
Context	**configure** system management-interface cli md-cli environment commit-options comment *boolean*
Tree	comment
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

confirm *boolean*

Synopsis	Require confirmed commit when committing configuration
Context	**configure** system management-interface cli md-cli environment commit-options confirm *boolean*
Tree	confirm
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

console

Synopsis	Enter the **console** context
Context	**configure** system management-interface cli md-cli environment console
Tree	console
Introduced	25.3.R2
Platforms	SAR Gen 2

length *number*

Synopsis	Number of lines displayed on the console
Context	**configure** system management-interface cli md-cli environment console length *number*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	length
Range	24 to 512
Default	24
Introduced	25.3.R2
Platforms	SAR Gen 2

width *number*

Synopsis	Number of columns displayed on the console
Context	**configure** system management-interface cli md-cli environment console width *number*
Tree	width
Range	80 to 512
Default	80
Introduced	25.3.R2
Platforms	SAR Gen 2

history

Synopsis	Enter the **history** context
Context	**configure** system management-interface cli md-cli environment history
Tree	history
Introduced	25.3.R2
Platforms	SAR Gen 2

recall *boolean*

Synopsis	Allow command history recall and search execution
Context	**configure** system management-interface cli md-cli environment history recall *boolean*
Tree	recall
Description	When configured to **true**, the command history recall (**!**), substitution (**!$**), display (**:p**, **Esc+.**), and backward search (**Ctrl-R**) are enabled. When configured to **false**, the command history can be displayed using the **history** command, but commands in the history cannot be executed.
Default	true
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

size *number*

Synopsis	Command history size
Context	**configure** system management-interface cli md-cli environment history size *number*
Tree	size
Description	This command specifies the maximum size of the command history. A value of 0 disables the command history.
Range	0 to 1000
Default	50
Introduced	25.3.R2
Platforms	SAR Gen 2

info-output

Synopsis	Enter the **info-output** context
Context	**configure** system management-interface cli md-cli environment info-output
Tree	info-output
Introduced	25.3.R2
Platforms	SAR Gen 2

always-display

Synopsis	Enter the **always-display** context
Context	**configure** system management-interface cli md-cli environment info-output always-display
Tree	always-display
Description	Commands in this context specify elements that are always displayed in the **info** output, regardless of whether the **detail** option is used.
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *boolean*

Synopsis	Always display admin-state elements

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** system management-interface cli md-cli environment info-output always-display admin-state *boolean*
Tree	admin-state
Description	When configured to **true**, the values of the **admin-state** elements in **info** output (without the **detail** option) are always displayed, even if they are the default values.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

match-highlight

Synopsis	Enter the **match-highlight** context
Context	**configure** system management-interface cli md-cli environment match-highlight
Tree	match-highlight
Introduced	26.3.R1
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of match highlighting
Context	**configure** system management-interface cli md-cli environment match-highlight admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	26.3.R1
Platforms	SAR Gen 2

style *keyword*

Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

uncommitted-changes-indicator *boolean*

Synopsis	Show an asterisk (*) when uncommitted changes exist
Context	**configure** system management-interface cli md-cli environment prompt uncommitted-changes-indicator *boolean*
Tree	uncommitted-changes-indicator
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

python

Synopsis	Enter the **python** context
Context	**configure** system management-interface cli md-cli environment python
Tree	python
Description	Commands in this context customize Python settings used with the Python 3 interpreter in MD-CLI applications such as pyexec, command aliases, EHS, and CRON.
Introduced	25.3.R2
Platforms	SAR Gen 2

memory-reservation *number*

Synopsis	Memory reserved per Python interpreter
Context	**configure** system management-interface cli md-cli environment python memory-reservation *number*
Tree	memory-reservation
Range	1 to 500
Units	megabytes
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

minimum-available-memory *number*

Synopsis	Minimum memory requirement to run a Python interpreter
Context	**configure** system management-interface cli md-cli environment python minimum-available-memory *number*
Tree	minimum-available-memory
Range	5 to 50
Units	percent
Introduced	25.3.R2
Platforms	SAR Gen 2

timeout *number*

Synopsis	Maximum run time before a Python application is stopped
Context	**configure** system management-interface cli md-cli environment python timeout *number*
Tree	timeout
Range	30 to 86400
Units	seconds
Default	3600
Introduced	25.3.R2
Platforms	SAR Gen 2

time-display *keyword*

Synopsis	Time zone to display time
Context	**configure** system management-interface cli md-cli environment time-display *keyword*
Tree	time-display
Description	This command configures the time zone for a timestamp displayed in outputs, such as event logs and **show** commands for the current CLI session. In event logs, the selected time is used to control the timestamps in the CLI output of **show log log-id** and in YANG state in the /state/log/log-id branch (for logs such as session, cli, memory, SNMP, and NETCONF). Also see the **configure log log-id time-format** command.
Options	local, utc
Default	local
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

time-format *keyword*

Synopsis	Format to display the date and time
Context	**configure** system management-interface cli md-cli environment time-format *keyword*
Tree	time-format
Description	This command specifies the format of the time display in the prompt, configuration, state, and certain **show** command output in the current CLI session.
Options	iso-8601, rfc-1123, rfc-3339
Default	rfc-3339
Introduced	25.3.R2
Platforms	SAR Gen 2

commit-history *number*

Synopsis	Number of commit history IDs to store
Context	**configure** system management-interface commit-history *number*
Tree	commit-history
Description	This command sets the number of IDs to store in the commit history. Setting the value to 0 disables the commit history.
Range	0 to 200
Default	50
Introduced	25.3.R2
Platforms	SAR Gen 2

commit-management

Synopsis	Enter the **commit-management** context
Context	**configure** system management-interface commit-management
Tree	commit-management
Introduced	25.10.R1
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

python-scripts

Synopsis	Enter the **python-scripts** context
Context	**configure** system management-interface commit-management python-scripts
Tree	python-scripts
Introduced	25.10.R1
Platforms	SAR Gen 2

gnmi-trigger *boolean*

Synopsis	Trigger commit scripts from gNMI
Context	**configure** system management-interface commit-management python-scripts gnmi-trigger *boolean*
Tree	gnmi-trigger
Default	true
Introduced	25.10.R1
Platforms	SAR Gen 2

md-cli-trigger *boolean*

Synopsis	Trigger commit scripts from the MD-CLI
Context	**configure** system management-interface commit-management python-scripts md-cli-trigger *boolean*
Tree	md-cli-trigger
Default	true
Introduced	25.10.R1
Platforms	SAR Gen 2

netconf-trigger *boolean*

Synopsis	Trigger commit scripts from NETCONF
Context	**configure** system management-interface commit-management python-scripts netconf-trigger *boolean*
Tree	netconf-trigger
Default	true
Introduced	25.10.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

post-commit-python-script *reference*

Synopsis	Python script to use for the post-commit script
Context	**configure** system management-interface commit-management python-scripts post-commit-python-script *reference*
Tree	post-commit-python-script
Reference	**configure** python python-script *named-item*
Introduced	26.7.R1
Platforms	SAR Gen 2

pre-commit-python-script *reference*

Synopsis	Python script to use for the pre-commit script
Context	**configure** system management-interface commit-management python-scripts pre-commit-python-script *reference*
Tree	pre-commit-python-script
Reference	**configure** python python-script *named-item*
Introduced	26.7.R1
Platforms	SAR Gen 2

configuration-mode *keyword*

Synopsis	Management interfaces allowed to edit the configuration
Context	**configure** system management-interface configuration-mode *keyword*
Tree	configuration-mode
Description	This command controls which of the classic or model-driven management interfaces can modify the configuration of the router. Any management interface can be used in any configuration mode (to gather state information or perform operations, for example), but only specific management interfaces (CLI, NETCONF, and so on) are allowed to edit the configuration of the router in different modes. For example, only classic CLI and SNMP can be used to edit the configuration when in classic mode.
Options	classic, model-driven, mixed
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

configuration-save

Synopsis	Enter the **configuration-save** context
Context	**configure** system management-interface configuration-save
Tree	configuration-save
Description	Commands in this context configure the attributes for saved configuration files.
Introduced	25.3.R2
Platforms	SAR Gen 2

configuration-backups *number*

Synopsis	Maximum number of configuration versions maintained
Context	**configure** system management-interface configuration-save configuration-backups *number*
Tree	configuration-backups
Description	This command configures the maximum number of saved configuration file versions the router maintains. When the configuration is saved, configuration file names are appended with a numeric extension. Each subsequent configuration save creates a new configuration file version with an incremented numeric extension until the maximum count is reached, after which the next configuration save overwrites the oldest file version. Each persistent index file is updated at the same time as the associated configuration file. The system synchronizes the active and standby CPM for all configurations and their associated persistent index files.
Range	1 to 200
Default	50
Introduced	25.3.R2
Platforms	SAR Gen 2

incremental-saves *boolean*

Synopsis	Use incremental saved configuration files
Context	**configure** system management-interface configuration-save incremental-saves *boolean*
Tree	incremental-saves
Description	When configured to **true**, the system saves each commit to the **configure** configuration region in a separate incremental saved configuration file, which allows for faster commits, instead of saving a complete saved configuration file each time.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

netconf

Synopsis	Enter the **netconf** context
Context	**configure** system management-interface netconf
Tree	netconf
Introduced	25.3.R2
Platforms	SAR Gen 2

auto-config-save *boolean*

Synopsis	Automatically save configuration as part of commit
Context	**configure** system management-interface netconf auto-config-save *boolean*
Tree	auto-config-save
Description	When configured to **true**, the system automatically writes the running configuration to the saved configuration file as part of a successful commit operation.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

call-home

Synopsis	Enter the **call-home** context
Context	**configure** system management-interface netconf call-home
Tree	call-home
Description	Commands in this context configure NETCONF Call Home, which enables an SR OS node to trigger a NETCONF client to start a connection.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

device-labels

Synopsis	Enter the **device-labels** context
Context	**configure** system management-interface netconf call-home device-labels
Tree	device-labels
Introduced	25.3.R2
Platforms	SAR Gen 2

advertise-operating-system *boolean*

Synopsis	Advertise the network operating system
Context	**configure** system management-interface netconf call-home device-labels advertise-operating-system *boolean*
Tree	advertise-operating-system
Description	When configured to **true**, the network operating system is encoded as a NETCONF capability.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

advertise-software-version *boolean*

Synopsis	Advertise the software version
Context	**configure** system management-interface netconf call-home device-labels advertise-software-version *boolean*
Tree	advertise-software-version
Description	When configured to **true**, the software version is encoded as a NETCONF capability.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

advertise-system-name *boolean*

Synopsis	Advertise the system name
Context	**configure** system management-interface netconf call-home device-labels advertise-system-name *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	advertise-system-name
Description	When configured to **true**, the system name is encoded as a NETCONF capability.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

device-label *string*

Synopsis	Device label
Context	**configure** system management-interface netconf call-home device-labels device-label *string*
Tree	device-label
Description	This command encodes the device label as a NETCONF capability.
String length	1 to 16
String format	'device-label' must contain only letters, digits or underscores
Introduced	25.3.R2
Platforms	SAR Gen 2

netconf-client [name] *named-item*

Synopsis	Enter the **netconf-client** list instance
Context	**configure** system management-interface netconf call-home netconf-client *named-item*
Tree	netconf-client
Description	Commands in this context configure the list of NETCONF clients with which the NETCONF server maintains simultaneous Call Home connections.
Max. instances	10
Introduced	25.3.R2
Platforms	SAR Gen 2

[**name**] *named-item*

Synopsis	Remote NETCONF client name
Context	**configure** system management-interface netconf call-home netconf-client *named-item*
Tree	netconf-client

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of the NETCONF Call Home endpoint
Context	**configure** system management-interface netconf call-home netconf-client *named-item* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	25.3.R2

Default	ssh
Introduced	25.3.R2
Platforms	SAR Gen 2

capabilities

Synopsis	Enter the **capabilities** context
Context	**configure** system management-interface netconf capabilities
Tree	capabilities
Description	Commands in this context configure explicit capabilities for the NETCONF server.
Introduced	25.3.R2
Platforms	SAR Gen 2

candidate *boolean*

Synopsis	Allow the NETCONF server to access candidate datastore
Context	**configure** system management-interface netconf capabilities candidate *boolean*
Tree	candidate
Description	When configured to **true**, this command allows the SR OS NETCONF server to access the candidate configuration datastore. Configuring this command to **true** also enables using **commit** and **discard-changes**. When **configure system management-interface configuration-mode** is set to **classic**, the candidate capability is disabled, even if this command is configured to **true**. When configured to **false**, this command disables the SR OS NETCONF server from accessing the candidate datastore. If the candidate is disabled, requests that reference the candidate datastore return an error, and when a NETCONF client establishes a new session, the candidate capability is not advertised in the SR OS NETCONF Hello message.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

listen

Synopsis	Enter the **listen** context
Context	**configure** system management-interface netconf listen

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	listen
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of NETCONF server in listen mode
Context	**configure** system management-interface netconf listen admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	25.3.R2
Platforms	SAR Gen 2

delay-on-boot *number*

Synopsis	Delay before NETCONF server is operational after boot
Context	**configure** system management-interface netconf listen delay-on-boot *number*
Tree	delay-on-boot
Description	This command configures the delay timer for NETCONF connections. When the timer expires, NETCONF becomes operational and connections are accepted. This delay prevents automation from managing the system while it is still converging. When no delay is configured, connections are accepted after the system boots and NETCONF becomes operational.
Range	1 to 3600
Units	seconds
Introduced	25.3.R2
Platforms	SAR Gen 2

idle-timeout *number*

Synopsis	NETCONF idle timeout for sessions
Context	**configure** system management-interface netconf listen idle-timeout *number*
Tree	idle-timeout
Description	This command configures the idle timeout for sessions. If no messages are received during the configured idle timeout period, the session is terminated.

Use subject to Terms available at: www.nokia.com/terms.

Range	1 to 10080
Units	minutes
Introduced	26.3.R1
Platforms	SAR Gen 2

port *number*

Synopsis	Port on which NETCONF server listens for connections
Context	**configure** system management-interface netconf listen port *number*
Tree	port
Description	This command specifies the port on which the SR OS NETCONF server listens for new connections. One port can be configured for NETCONF management. The configured port applies to both non-VPRN and VPRN management. New NETCONF connections are able to use the configured port. For NETCONF connections not using VPRN management, active NETCONF connections are not disconnected if the connection port changes. For NETCONF connections are not disconnected if the connection port changes. For NETCONF connections using VPRN management, active NETCONF connections are disconnected if the connection port changes.
Range	22 | 830 | 1024 to 49151
Introduced	25.3.R2
Platforms	SAR Gen 2

tls-server-profile *reference*

Synopsis	TLS server profile used for NETCONF listen sessions
Context	**configure** system management-interface netconf listen tls-server-profile *reference*
Tree	tls-server-profile
Reference	**configure** system security tls server-tls-profile *named-item*
Introduced	26.7.R1
Platforms	SAR Gen 2

transport *keyword*

Synopsis	Transport type
Context	**configure** system management-interface netconf listen transport *keyword*
Tree	transport

Use subject to Terms available at: www.nokia.com/terms.

Options	ssh – SSH transport type tls – TLS transport type
Default	ssh
Introduced	26.7.R1
Platforms	SAR Gen 2

tls-client-identity

Synopsis	Enter the **tls-client-identity** context
Context	**configure** system management-interface netconf tls-client-identity
Tree	tls-client-identity
Description	Commands in this context configure NETCONF client identities used to authenticate client connections over TLS.
Introduced	26.7.R1
Platforms	SAR Gen 2

client [id] *number*

Synopsis	Enter the **client** list instance
Context	**configure** system management-interface netconf tls-client-identity client *number*
Tree	client
Description	Commands in this context configure client identities for NETCONF access, which consist of TLS client certificates mapped to local users in the SR OS database.
Max. instances	16
Introduced	26.7.R1
Platforms	SAR Gen 2

[id] *number*

Synopsis	Client ID
Context	**configure** system management-interface netconf tls-client-identity client *number*
Tree	client
Range	1 to 4294967295
Notes	This element is part of a list key.
Introduced	26.7.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

fingerprint *key-fingerprint-sha256*

Synopsis	Certificate fingerprint
Context	**configure** system management-interface netconf tls-client-identity client *number* fingerprint *key-fingerprint-sha256*
Tree	fingerprint
Description	This command configures the client certificate fingerprint. The fingerprint string is hashed using SHA-256 and encoded using Base64.
String length	43
String format	'fingerprint' must be Base64 with trimmed padding (43 chars)
Notes	This element is mandatory.
Introduced	26.7.R1
Platforms	SAR Gen 2

map-type *keyword*

Synopsis	Mapping method for TLS certificate to username
Context	**configure** system management-interface netconf tls-client-identity client *number* map-type *keyword*
Tree	map-type
Description	This command configures the method used by the router to determine the username in the SR OS database that matches to the client fingerprint in the TLS certificate.
Options	specified – Use the username explicitly configured in the database san-ip-address – Use the client IP address to derive the username
Notes	This element is mandatory.
Introduced	26.7.R1
Platforms	SAR Gen 2

user-name *reference*

Synopsis	Username for the provided fingerprint
Context	**configure** system management-interface netconf tls-client-identity client *number* user-name *reference*
Tree	user-name

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command assigns a username to the fingerprint for NETCONF client identity. This command applies only to client identities configured to use an explicitly configured username in the database.
Reference	**configure** system security user-params local-user user *named-item*
Notes	This element is mandatory.
Introduced	26.7.R1
Platforms	SAR Gen 2

default-client

Synopsis	Enter the **default-client** context
Context	**configure** system management-interface netconf tls-client-identity default-client
Tree	default-client
Description	Commands in this context configure the default NETCONF client identity used when the client fingerprint does not match any entry in the database.
Introduced	26.7.R1
Platforms	SAR Gen 2

user-name *reference*

Synopsis	Default username to use when no fingerprint matches
Context	**configure** system management-interface netconf tls-client-identity default-client user-name *reference*
Tree	user-name
Reference	**configure** system security user-params local-user user *named-item*
Introduced	26.7.R1
Platforms	SAR Gen 2

operations

Synopsis	Enter the **operations** context
Context	**configure** system management-interface operations
Tree	operations
Description	Commands in this context configure parameters associated with operational commands in model-driven interfaces.
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

global-timeouts

Synopsis	Enter the **global-timeouts** context
Context	**configure** system management-interface operations global-timeouts
Tree	global-timeouts
Description	Commands in this context configure system timeout parameters for operational commands. Timeout parameters provide default system-level control for various types of operational commands in model-driven interfaces. The timeout values are used when specific execution and retention timeouts are not requested for a specific operation.
Introduced	25.3.R2
Platforms	SAR Gen 2

asynchronous-execution *(number | keyword)*

Synopsis	Timeout for asynchronous operation execution
Context	**configure** system management-interface operations global-timeouts asynchronous-execution *(number | keyword)*
Tree	asynchronous-execution
Description	This command configures the period of time that operations launched as “asynchronous” are allowed to execute before being automatically stopped by the SR OS. An asynchronous operation is not deleted from the system when it is stopped. See the **asynchronous-retention** command. If a specific execution timeout is not included in the request for a particular asynchronous operation, this system-level timeout applies. **Note**: This execution timeout is part of the general global operations infrastructure and is separate and independent from any operation-specific timeouts (for example, the **ping** operation also has its own timeout parameter).
Range	1 to 604800
Units	seconds
Options	never
Default	3600
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

asynchronous-retention *(number | keyword)*

Synopsis	Timeout for asynchronous operation data retention
Context	**configure** system management-interface operations global-timeouts asynchronous-retention *(number | keyword)*
Tree	asynchronous-retention
Description	This command configures the period of time that data related to operations launched as “asynchronous” is retained in the system. After the retention timeout expires, all information related to the operation is deleted, including any status information and result data. If a specific retention timeout is not included in the request for a particular asynchronous operation, this system-level timeout applies.
Range	1 to 604800
Units	seconds
Options	never
Default	86400
Introduced	25.3.R2
Platforms	SAR Gen 2

synchronous-execution *(number | keyword)*

Synopsis	Timeout for synchronous operation execution
Context	**configure** system management-interface operations global-timeouts synchronous-execution *(number | keyword)*
Tree	synchronous-execution
Description	This command configures the period of time that operations launched as “'synchronous” (the default method for all operations) are allowed to execute before they are automatically stopped, and their associated data is deleted. If a specific execution timeout is not included in the request for a particular synchronous operation, this system-level timeout applies. **Note**: This execution timeout is part of the general global operations infrastructure and is separate and independent from any operation-specific timeouts (for example, the **ping** operation also has its own timeout parameter). **Caution**: If this command is set with a specific time value, MD-CLI operations are subject to the timeout and are interrupted if they execute longer than the time value. This situation can arise because the timeout also applies to operations requested in the MD-CLI interface (for example, **ping**, **file dir**, and so on).
Range	1 to 604800
Units	seconds

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Options	never
Default	never
Introduced	25.3.R2
Platforms	SAR Gen 2

schema-path *url*

Synopsis	Schema path URL
Context	**configure** system management-interface schema-path *url*
Tree	schema-path
Description	This command specifies the schema path where the SR OS YANG modules can be placed by the user before using a <get-schema> request. Nokia recommends that the URL string not exceed 135 characters for the <get-schema> request to work correctly with all schema files. If this command is not configured, the software upgrade process manages the YANG schema files to ensure the schema files are synchronized with the software image on both the primary and standby CPM.
String length	1 to 180
Introduced	25.3.R2
Platforms	SAR Gen 2

snmp

Synopsis	Enter the **snmp** context
Context	**configure** system management-interface snmp
Tree	snmp
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of the SNMP agent
Context	**configure** system management-interface snmp admin-state *keyword*
Tree	admin-state
Description	This command administratively enables or disables SNMP agent operations. Disabling SNMP does not prevent the agent from sending SNMP notifications to configured SNMP trap destinations.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

In classic and mixed configuration mode, the agent is administratively disabled in the event of a reboot when the processing of the configuration file fails to complete or when an SNMP persistent index file fails while the **bof system persistent-indices** command is set to **true**. This prevents an SNMP-based management system from accessing and possibly synchronizing with a partially booted or incomplete network element. This auto-disable behavior is not applicable to model-driven configuration mode.

Options	enable, disable
Default	enable
Introduced	25.3.R2
Platforms	SAR Gen 2

engine-id *engine-id-as-string*

Synopsis	SNMP engine ID that identifies the SNMPv3 node
Context	**configure** system management-interface snmp engine-id *engine-id-as-string*
Tree	engine-id
Description	This command sets the SNMP engine ID that uniquely identifies the SNMPv3 node. If unconfigured, the system uses an engine ID based on the information from the system backplane. If the SNMP engine ID is changed, the current configuration must be saved and a reboot must be executed. Otherwise, the previously configured SNMP communities and logger trap-target notify communities will not be valid for the new engine ID. **Note:** Changing the SNMP engine ID invalidates all SNMPv3 MD5 and SHA security digest keys, which may render the node unmanageable. When replacing a chassis, configure the new router to use the same engine ID as the previous router. This preserves SNMPv3 security keys and allows management stations to use their existing authentication keys for the new router. Ensure that the engine ID of each router is unique. A management domain can only maintain one instance of a specific engine ID.
String length	10 to 64
String format	'engine-id-as-string' must be hexadecimal digits only (length 10..64)
Introduced	25.3.R2
Platforms	SAR Gen 2

general-port *number*

Synopsis	Port number used to send general SNMP messages
Context	**configure** system management-interface snmp general-port *number*
Tree	general-port

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the port number used to receive SNMP request messages and send replies. For the port used for SNMP notifications, configure the **configure log snmp-trap-group trap-target port** command.
Range	0 | 1 to 65535
Default	161
Introduced	25.3.R2
Platforms	SAR Gen 2

max-bulk-duration *number*

Synopsis	Maximum process duration before responses are returned
Context	**configure** system management-interface snmp max-bulk-duration *number*
Tree	max-bulk-duration
Description	This command sets the maximum duration to process an SNMP request before bulk responses are returned to avoid a timeout on the management system when a lot of information is returned in the response.
Range	100 to 5000
Units	milliseconds
Introduced	25.3.R2
Platforms	SAR Gen 2

packet-size *number*

Synopsis	Maximum SNMP packet size generated by the node
Context	**configure** system management-interface snmp packet-size *number*
Tree	packet-size
Range	484 to 9216
Default	1500
Introduced	25.3.R2
Platforms	SAR Gen 2

streaming

Synopsis	Enter the **streaming** context
Context	**configure** system management-interface snmp streaming

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	streaming
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of SNMP streaming
Context	**configure** system management-interface snmp streaming admin-state *keyword*
Tree	admin-state
Description	This command enables or disables the proprietary SNMP request and response bundling as well as the TCP-based transport mechanism for optimizing network management of the router nodes. In higher latency networks, synchronizing router MIBs from network management using streaming takes less time than synchronizing using classic SNMP UDP requests. Streaming operates on TCP port 1491 and runs over IPv4 or IPv6.
Options	enable, disable
Default	disable
Introduced	25.3.R2
Platforms	SAR Gen 2

transport *keyword*

Synopsis	Transport protocol used by the SNMP agent
Context	**configure** system management-interface snmp transport *keyword*
Tree	transport
Options	udp – UDP only tcp – TCP only both – TCP and UDP
Default	udp
Introduced	25.3.R2
Platforms	SAR Gen 2

yang-modules

Synopsis	Enter the **yang-modules** context
Context	**configure** system management-interface yang-modules
Tree	yang-modules

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context determine the system support of the Nokia YANG models. The settings affect the data sent in a NETCONF <hello>, data populated in the RFC 6022 /netconf-state/schemas list, data returned in a <get-schema> request, and data populated in the RFC 8525 /yang-library. See "NETCONF monitoring" and "YANG library" in the *7705 SAR Gen 2 System Management Guide* for more information.
Introduced	25.3.R2
Platforms	SAR Gen 2

nmda

Synopsis	Enter the **nmda** context
Context	**configure** system management-interface yang-modules nmda
Tree	nmda
Description	Commands in this context configure the attributes for the Network Management Datastores Architecture (NMDA).
Introduced	25.3.R2
Platforms	SAR Gen 2

nmda-support *boolean*

Synopsis	Advertise NMDA support over NETCONF
Context	**configure** system management-interface yang-modules nmda nmda-support *boolean*
Tree	nmda-support
Description	When configured to **true**, this command enables the advertisement of NMDA support over NETCONF through the use of YANG library 1.1. When configured to **false**, this command disables NMDA advertisement over NETCONF and YANG library 1.0 is used.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

nokia-combined-modules *boolean*

Synopsis	Support access to combined Nokia YANG models
Context	**configure** system management-interface yang-modules nokia-combined-modules *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	nokia-combined-modules
Description	When configured to **true**, the system supports the combined Nokia YANG files for both configuration and state data in the NETCONF server. When the system is operating in classic configuration mode, attempts to access (read or write) the configuration using the Nokia configuration modules or namespace via NETCONF result in errors, even if this command is set to **true**. When configured to **false**, access to the combined Nokia YANG files is not supported. This command and the **nokia-submodules** command cannot both be set to **true** at the same time.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

nokia-submodules *boolean*

Synopsis	Support submodule-based packaging of Nokia YANG models
Context	**configure** system management-interface yang-modules nokia-submodules *boolean*
Tree	nokia-submodules
Description	When configured to **true**, the system supports the alternative submodule-based packaging of the Nokia YANG files for both configuration and state data in the NETCONF server. When the system is operating in classic configuration mode, attempts to access (read or write) the configuration using the Nokia configuration modules or namespace via NETCONF result in errors, even if this command is set to **true**. When configured to **false**, access to the submodule-based packaging of the Nokia YANG files is not supported. This command and the **nokia-combined-module**s command cannot both be set to **true** at the same time.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

name *named-item-64*

ospf-dynamic-hostnames *boolean*

Synopsis	Process received OSPF dynamic hostname information
Context	**configure** system ospf-dynamic-hostnames *boolean*
Tree	ospf-dynamic-hostnames
Description	When configured to **true**, OSPF dynamic hostnames are enabled. The router receiving the new dynamic hostname within the OSPF Router Information (RI) LSA is instructed to process the received dynamic hostname information. When configured to **false**, dynamic hostname information is not processed.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

persistence

Synopsis	Enter the **persistence** context
Context	**configure** system persistence
Tree	persistence
Description	Commands in this context configure persistence on the system.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

The persistence feature enables the system to retain state information learned through DHCP snooping across reboots. This information includes data such as the IP address and MAC binding information, lease-length information, and ingress SAP information (required for VPLS snooping to identify the ingress interface).

If persistence is enabled when there are no DHCP relay or snooping commands enabled, the system creates an empty file.

Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

log-announce-interval *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	PTP announce message interval in log form
Context	**configure** system ptp alternate-profile *named-item-64* log-announce-interval *number*
Tree	log-announce-interval
Description	This command configures the announce message interval used for multicast messages within the alternate profile. For multicast messages used on PTP Ethernet ports, this command configures the message interval used for announce messages transmitted by the local node. This value has no impact on the interval used for the BTCA, which is controlled by the value defined for the primary profile.
Range	-3 to 4

Default	-3
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

profile *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Standard based profile used within an alternate profile
Context	**configure** system ptp alternate-profile *named-item-64* profile *keyword*
Tree	profile
Description	This command specifies the standard based profile that is used as the basis for the alternate profile. This setting controls the contents of PTP messages sent on ports and peers using this alternate profile.
Options	g8265dot1-2010 – ITU-T G.8265.1 specification ieee1588-2008 – 2008 version of IEEE 1588 standard g8275dot1-2014 – 2014 version of ITU-T G.8275.1 specification g8275dot2-2016 – 2016 version of ITU-T G.8275.2 specification iec-61850-9-3-2016 – 2016 version of IEC/IEEE 61850-9-3 standard c37dot238-2017 – 2017 version of C37.238 specification
Default	g8275dot1-2014
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

announce-receipt-timeout *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Expired intervals count before timeout event declared
Context	**configure** system ptp announce-receipt-timeout *number*
Tree	announce-receipt-timeout
Description	This command configures the number of Announce message intervals that must expire with no received Announce messages before declaring an ANNOUNCE_RECEIPT_ TIMEOUT event.

- C37.238 - domain range of 0 to 255 (default 254)

Range	0 to 255
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

initial-time-inaccuracy *number*

Synopsis	Total time inaccuracy from grandmaster to local clock
Context	**configure** system ptp initial-time-inaccuracy *number*
Tree	initial-time-inaccuracy
Description	This command configures the time inaccuracy value, representing the total time inaccuracy from the grandmaster clock to the parent clock. This value is added to the mandatory IEEE_C37_238 TLV. This command is applicable only when the alternate profile is configured as **c37dot238-2017**.
Range	0 to 10000000
Units	nanoseconds
Default	0
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

local-priority *number*

Synopsis	PTP clock local priority
Context	**configure** system ptp local-priority *number*
Tree	local-priority
Description	This command configures the local priority used to choose between PTP time Transmitters in the best timeTransmitter clock algorithm (BTCA). This setting applies when the PTP profile is either configured for G.8275.1 or G.8275.2 and is ignored for any other profile. For G.8275.1 or G.8275.2, this command configures the localPriority command option associated with the local clock (**ptp** context). See the ITU-T G.8275.1 or G.8275.2 standard for detailed information.
Range	1 to 255
Default	128
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

Use subject to Terms available at: www.nokia.com/terms.

log-announce-interval *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Announce message interval in log form
Context	**configure** system ptp log-announce-interval *number*
Tree	log-announce-interval
Description	This command configures the Announce message interval used for both unicast and multicast messages. For unicast messages, the Announce message interval is requested during unicast negotiation to any peer. This controls the Announce message rate sent from remote peers to the local node. It does not affect the announce message rate that may be sent from the local node to remote peers. Remote peers may request an Announce message rate within the acceptable grant range. For multicast messages used on PTP Ethernet ports, this command specifies the message interval used for Announce messages transmitted by the local node. This value also defines the interval between executions of the BTCA within the node. To minimize BTCA-driven reconfigurations, IEEE recommends that the Announce interval should be consistent across the entire 1588 network.
Range	-3 to 4
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

max-steps-removed *number*

Synopsis	Threshold for steps removed in Announce messages
Context	**configure** system ptp max-steps-removed *number*
Tree	max-steps-removed
Description	This command configures a maximum limit for the stepsRemoved field in PTP Announce messages. When a user configures a value for the maximum steps removed, the PTP clock disqualifies and drops any incoming Announce messages where the stepsRemoved field in the PTP header is equal to or greater than the configured maximum steps removed value. This command effectively limits the maximum number of hops a potential parent clock can be from the GM clock. This command is crucial for maintaining the integrity and performance of the PTP synchronized network by preventing clocks that are too far removed from the GM from being selected as parent clocks.
Range	1 to 255

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	255
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

network-type *keyword*

Synopsis	PTP network type
Context	**configure** system ptp network-type *keyword*
Tree	network-type
Description	This command configures the codeset to be used for the encoding of QL values into PTP clockClass values and vice versa when the profile is configured for G.8265.1 or G.8275.2. This setting only applies to the range of values observed in the clockClass values transmitted out of the node in Announce messages. The router supports the reception of any valid value in Table 1/G.8265.1 and Table2/G.8275.2.
Options	sonet, sdh
Default	sdh
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

port [port-id] *reference*

Synopsis	Enter the **port** list instance
Context	**configure** system ptp port *reference*
Tree	port
Description	Commands in this context configure PTP over Ethernet on the physical port. The PTP process transmits and receives PTP messages through the port using Ethernet encapsulation (as opposed to UDP/IPv4 encapsulation). Frames are transmitted with no VLAN tags, even if the port is configured for dot1q or qinq modes for encap-type. The received frames from the external PTP clock must also be untagged. Two reserved multicast addresses are allocated for PTP messages (see Annex F IEEE Std 1588-2008). Either address can be configured for the PTP messages sent through the port. A PTP port cannot be created if the PTP profile is configured for G.8265.1. If the port supports 1588 port-based timestamping, Synchronous Ethernet must be enabled on the MDA when PTP over Ethernet is enabled. De-provisioning of the card or MDA containing the specified port is not permitted while the port is configured within PTP.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Changing the encapsulation or the port type of the Ethernet port is not permitted when PTP Ethernet Multicast operation is configured on the port.

To allocate an Ethernet satellite client port as a PTP port, the Ethernet satellite must first be enabled for the transparent clock function. For more information, see the **configure satellite ethernet-satellite ptp-tc** command.

The SyncE/1588 ports of the CPM and CCMs can be specified as PTP ports. These use the ‘A/3’ and ‘B/3’ designation and both must be specified as two PTP ports if both are used. The active CPM sends and receives messages on both ports if they are specified and enabled.

Introduced 26.3.R1

Platforms 7705 SAR-Hx, 7705 SAR-Mx

[**port-id**] *reference*

Synopsis Ethernet PTP port ID

Context **configure** system ptp port *reference*

Tree port

Reference **configure** port *port*

Notes This element is part of a list key.

Introduced 26.3.R1

Platforms 7705 SAR-Hx, 7705 SAR-Mx

address *mac-address*

Synopsis Destination MAC address of the transmitted PTP messages

Context **configure** system ptp port *reference* address *mac-address*

Tree address

Description This command specifies the destination MAC address of the transmitted PTP messages. IEEE Std 1588-2008 Annex F defines two reserved addresses for 1588 messages, which include:

- **01-1B-19-00-00-00** — all except the peer delay mechanism messages
- **01-80-C2-00-00-0E** — peer delay mechanism messages

Both addresses are supported for reception, independent of the address configured by this command.

Default 01:1B:19:00:00:00

Introduced 26.3.R1

Platforms 7705 SAR-Hx, 7705 SAR-Mx

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

admin-state *keyword*

Synopsis	Administrative state of the PTP port
Context	**configure** system ptp port *reference* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

alternate-profile *reference*

Synopsis	Alternate profile for the PTP port
Context	**configure** system ptp port *reference* alternate-profile *reference*
Tree	alternate-profile
Description	This command creates the alternate profile that is used in communications with the port or peer. If no alternate profile is specified, the primary profile is used.
Reference	**configure** system ptp alternate-profile *named-item-64*
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

local-priority *number*

Synopsis	PTP port local priority
Context	**configure** system ptp port *reference* local-priority *number*
Tree	local-priority
Description	This command configures the local priority used to choose between PTP time Transmitters in the best timeTransmitter clock algorithm (BTCA). This setting applies when the PTP profile is either configured for G.8275.1 or G.8275.2 and is ignored for any other profile. For G.8275.1 or G.8275.2, this command configures the localPriority parameter associated with the Announce messages received from the external clocks (**ptp port** context). See G.8275.1 or G.8275.2 for detailed information.
Range	1 to 255
Default	128
Introduced	26.3.R1

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	7705 SAR-Hx, 7705 SAR-Mx

log-delay-interval *number*

Synopsis	Minimum interval for Delay_Req messages in log form
Context	**configure** system ptp port *reference* log-delay-interval *number*
Tree	log-delay-interval
Description	This command configures the minimum interval used for multicast Delay_Req messages for the port. For ports in a slave state, the interval is used, unless the parent port indicates a longer interval. For a port in master state, the interval is advertised to external slave ports as the minimum acceptable interval for Delay_Req messages from the slave ports. The router supports the 1588 standard requirement for a port in slave state to check the logMessageInterval field of received multicast Delay_Resp messages. If the value of the logMessageInterval field of the messages is greater than the value configured locally for the generation of Delay_Req messages, the slave must use the longer interval for the generation of Delay_Req messages. The interval value is specified as the logarithm to the base 2.
Range	-6 to 0
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

log-sync-interval *number*

Synopsis	Interval for transmission of Sync messages in log form
Context	**configure** system ptp port *reference* log-sync-interval *number*
Tree	log-sync-interval
Description	This command configures the interval used for Sync messages transmitted by the local node when the port is in master state. The interval value is specified as the logarithm to the base 2.
Range	-6 to 0
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

master-only *boolean*

Synopsis	Restrict the local port to master state
Context	**configure** system ptp port *reference* master-only *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	master-only
Description	When configured to **true**, the local port is restricted to master state only, ensuring that the system does not obtain synchronization from attached external devices. This command is supported only when the PTP profile is set for G.8275.1 or G.8275.2.
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

monitor-receiver *boolean*

Synopsis	Enable the PTP port as a monitor-receiver
Context	**configure** system ptp port *reference* monitor-receiver *boolean*
Tree	monitor-receiver
Description	When configured to **true**, the router enables the PTP port as a monitorReceiver for PTP. When not in TimeReceiver mode, the PTP port runs a time-recovery engine for PTP monitoring. This object is supported only when the PTP profile is set to G.8275.1 or G.8275.2. When configured to **false**, monitoring is disabled.
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

monitor-sender *boolean*

Synopsis	Enable the PTP port as a monitor-sender
Context	**configure** system ptp port *reference* monitor-sender *boolean*
Tree	monitor-sender
Description	When configured to **true**, the router enables the PTP port as a monitorSender for PTP. When not in TimeTransmitter mode, the PTP port sends Announce, Sync, and Delay_ Resp messages with the alternateMasterFlag set to TRUE for PTP monitoring at the remote clock. This object is supported only when the PTP profile is set to G.8275.1 or G.8275.2. When configured to **false**, monitoring is disabled.
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

not-master *boolean*

Synopsis	Block PTP port from entering the timeTransmitter state

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** system ptp port *reference* not-master *boolean*
Tree	not-master
Description	When configured to **true**, the router blocks the port from entering the timeTransmitter state.
Default	false
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

priority1 *number*

Synopsis	Priority1 of the local clock
Context	**configure** system ptp priority1 *number*
Tree	priority1
Description	This command configures the priority1 parameter of the local clock. The setting is used when the profile is configured for IEEE 1588-2008. This value is used by the Best Master Clock Algorithm to determine which clock should provide timing for the network and is advertised in Announce messages.
Range	0 to 255
Default	128
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

priority2 *number*

Synopsis	Priority2 of the local clock
Context	**configure** system ptp priority2 *number*
Tree	priority2
Description	This command configures the priority2 parameter of the local clock. The setting is used when the profile is configured for IEEE 1588-2008, G.8275.1, or G.8275.2. This value is used by the Best Master Clock algorithm to determine which clock should provide timing for the network and is advertised in Announce messages.
Range	0 to 255
Default	128
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

profile *keyword*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	PTP profile
Context	**configure** system ptp profile *keyword*
Tree	profile
Description	This command configures the profile to be used for the internal PTP clock. It defines the Best timeTransmitter Clock Algorithm (BTCA) behavior. Profile changes may affect the settings of other configuration elements, such as the clock type and default settings for the delay interval, announce interval, and the Sync interval. The following clock types are supported for the indicated profiles: • G.8265.1: slave only, master only • IEEE 1588 2008: slave only, master only, boundary • G.8275.1: slave only, boundary, master only (master only, only if the platform includes an embedded GNSS receiver) • G.8275.2: slave only, boundary, master only (master only, only if the platform includes an embedded GNSS receiver) • IEC/IEEE 61850-9-3: slave only, master only, boundary • C37.238: slave only, master only, boundary
Options	g8265dot1-2010 – ITU-T G.8265.1 specification ieee1588-2008 – 2008 version of IEEE 1588 standard g8275dot1-2014 – 2014 version of ITU-T G.8275.1 specification g8275dot2-2016 – 2016 version of ITU-T G.8275.2 specification iec-61850-9-3-2016 – 2016 version of IEC/IEEE 61850-9-3 standard c37dot238-2017 – 2017 version of C37.238 specification
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

ptsf

Synopsis	Enter the **ptsf** context
Context	**configure** system ptp ptsf

Use subject to Terms available at: www.nokia.com/terms.

Tree	ptsf
Description	Commands in this context configure the attributes of Packet Timing Signal Fail (PTSF).
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

monitor-ptsf-unusable

Synopsis	Enter the **monitor-ptsf-unusable** context
Context	**configure** system ptp ptsf monitor-ptsf-unusable
Tree	monitor-ptsf-unusable
Description	Commands in this context configure monitoring of neighbor clocks for the PTSF-unusable state (condition) when the profile is set to g8275dot1-2014. When administratively enabled, the local clock monitors the noise level of PTP event messages between external neighbor PTP ports and the local clock. If it detects a high variation in the network path between the external neighbor port and the local port, it considers the neighbor port unusable. Announce messages from the neighbor are discarded and excluded from the BTCA and the port cannot be selected as the parent clock. The unusable condition must be manually cleared. When administratively disabled, the monitor PTSF function of the PTP clock clears PTSF-unusable states from all neighbor PTP ports. If no PTP messages are received from a neighbor for 15 minutes, the neighbor information is purged and the PTSF-unusable state is cleared.
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

admin-state *keyword*

Synopsis	Administrative state of PTSF unusable monitoring
Context	**configure** system ptp ptsf monitor-ptsf-unusable admin-state *keyword*

Default	enable
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

local-priority *number*

Synopsis	PTP peer local priority
Context	**configure** system ptp router *string* peer *(ipv4-address-no-zone | ipv6-address-no-zone)* local-priority *number*
Tree	local-priority
Description	This command configures the local priority for the peer, which is used to choose between PTP timeTransmitters in the best timeTransmitter clock algorithm (BTCA). This setting applies when the PTP profile is configured for G.8265.1, G.8275.1, or G.8275.2 and is ignored for any other profile. For G.8265.1, this command configures the priority used to choose between time Transmitter clocks with the same quality (see G.8265.1 for more details). For G.8275.1 or G.8275.2, this command configures the localPriority parameter associated with the Announce messages received from the external clocks (**ptp router peer** context). See G.8275.1 or G.8275.2 for detailed information.
Range	1 to 255

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	128
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

log-sync-interval *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	PTP peer interval for Sync messages in log form
Context	**configure** system ptp router *string* peer *(ipv4-address-no-zone | ipv6-address-no-zone)* log-sync-interval *number*
Tree	log-sync-interval
Description	This command configures the message interval used for Sync and Delay_Resp messages that are requested during unicast negotiation to the peer. The setting controls messages sent from remote peers to the local node but the packet rate from the local node to remote peers is not affected. Remote peers may request a packet rate within the acceptable range. The interval value is specified as the logarithm to the base 2.
Range	-6 to 0
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

monitor-receiver *boolean*

Synopsis	Enable the PTP peer as a monitor-receiver
Context	**configure** system ptp router *string* peer *(ipv4-address-no-zone | ipv6-address-no-zone)* monitor-receiver *boolean*
Tree	monitor-receiver
Description	When configured to **true**, the router enables the PTP peer as a monitorReceiver for PTP. When not in TimeReceiver mode, the PTP port runs a time-recovery engine for PTP monitoring. This object is only supported when the PTP profile is set to G.8275.1 or G.8275.2. When configured to **false**, monitoring is disabled.
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

not-master *boolean*

Synopsis	Block PTP port from entering the timeTransmitter state
Context	**configure** system ptp router *string* peer *(ipv4-address-no-zone | ipv6-address-no-zone)* not-master *boolean*
Tree	not-master
Description	When configured to **true**, the router blocks the port associated with the peer from entering the timeTransmitter state.
Default	false
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

peer-limit *number*

Synopsis	Number of discovered peers allowed for routing instance
Context	**configure** system ptp router *string* peer-limit *number*
Tree	peer-limit
Description	This command specifies the maximum number of discovered peers permitted within the routing instance. This ensures that a routing instance does not consume all the possible discovered peers and prevents the routing instance from blocking discovered peers in other routing instances. The sum of all peer limit values for all routing instances cannot exceed the maximum number of discovered peers supported by the system.
Range	0 to 1600
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

time-inaccuracy *number*

Synopsis	Time inaccuracy value override
Context	**configure** system ptp time-inaccuracy *number*
Tree	time-inaccuracy
Description	This command overrides the system-generated time inaccuracy value for the PTP clock with a specified value. The clock's time inaccuracy value is added to the total time inaccuracy value in IEEE_C37_238 TLVs sent to downstream clocks in Announce messages. This command is applicable only for boundary clocks and only when the profile is configured as **c37dot238-2017**.

Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

tx-path-trace *boolean*

Synopsis	Include PATH TRACE TLV in Announce messages
Context	**configure** system ptp tx-path-trace *boolean*
Tree	tx-path-trace
Default	false
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

tx-while-sync-uncertain *boolean*

Synopsis	Send Announce messages while clock is unsynchronized
Context	**configure** system ptp tx-while-sync-uncertain *boolean*
Tree	tx-while-sync-uncertain
Description	When configured to **true**, the local PTP clock transmits Announce messages to downstream clocks to indicate it has not yet stabilized on the recovered synchronization source (upstream clocks or GM clock). While the PTP clock is unsynchronized, the Sync Uncertain state is true. When configured to **false**, the local PTP clock does not send Announce messages to downstream clocks to indicate it is not synchronized to a valid timing source. If the Sync Uncertain state of the clock is true while this command is configured to **false**, unicast negotiation grant requests are not granted and current grants are canceled.
Default	true
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

within-holdover-spec-timer *number*

Synopsis	Duration for local clock to specify the holdover state
Context	**configure** system ptp within-holdover-spec-timer *number*
Tree	within-holdover-spec-timer

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the duration for which the local clock sets its clock class to a value that indicates it is in holdover, within specification, following the loss of the primary reference time source.
Range	0 to 3600
Units	seconds
Default	600
Introduced	26.3.R1
Platforms	7705 SAR-Hx, 7705 SAR-Mx

script-control

Synopsis	Enter the **script-control** context
Context	**configure** system script-control
Tree	script-control
Introduced	25.3.R2
Platforms	SAR Gen 2

script [script-name] *named-item* owner *named-item*

Synopsis	Enter the **script** list instance
Context	**configure** system script-control script *named-item* owner *named-item*
Tree	script
Max. instances	1500
Introduced	25.3.R2
Platforms	SAR Gen 2

Platforms	SAR Gen 2

owner *named-item*

Synopsis	Script owner
Context	**configure** system script-control script *named-item* owner *named-item*
Tree	script
Description	This command configures the owner to be associated with the script. The owner is optional and "TiMOS CLI" is used if an owner is not specified. The owner is an arbitrary name and not necessarily a user name. Commands in the scripts are not authorized against the owner. The **configure system security cli-script authorization** x **cli-user** command determines the user context against which commands in the scripts are authorized.
String length	1 to 32
MD-CLI default	TiMOS CLI
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of the script

Platforms	SAR Gen 2

health-check *(number | keyword)*

Synopsis	Polling interval of LDAP, RADIUS, and TACACS+ servers
Context	**configure** system security aaa health-check *(number | keyword)*
Tree	health-check
Description	This command configures the polling interval for health check monitoring of the LDAP, RADIUS, and TACACS+ servers. The servers send requests at regular intervals. If a response is not received, the operational status of the server is changed to down. The operational status is changed to up when responses are received. When RADIUS over TLS is configured, Status-Server packets are sent at 30-second intervals as specified in RFC 3539, regardless of whether health checks are enabled. When this command is configured to **none**, health check monitoring of LDAP, RADIUS, and TACACS+ servers is disabled and the operational status for the server is up if a response to the last request was received.
Range	6 to 1500
Units	seconds
Options	none
Default	30
Introduced	25.3.R2
Platforms	SAR Gen 2

default-action *keyword*

Synopsis	Action for non-matching entry
Context	**configure** system security aaa local-profiles profile *named-item* default-action *keyword*
Tree	default-action
Description	This command specifies the default action to be applied when no match conditions are met in the list of **profile entry match** commands. It does not apply to other parts of the profile such as **grpc rpc-authorization** or **netconf base-op-authorization**. When a user is a member of multiple profiles, profiles are evaluated in the order that they are configured. Evaluation stops if there is a match, or when the default action of the profile is **deny-all**, **permit-all**, or **read-only-all**. When the profile default action is none and if no match conditions are met in the profile, the next profile is evaluated. When the default action of the last profile is none and no explicit match is found, the command is denied.
Options	deny-all – Deny access to all commands permit-all – Allow access to all commands none – No action; evaluate the next profile read-only-all – Allow read-only access to all commands
Default	none
Introduced	25.3.R2
Platforms	SAR Gen 2

netconf

Synopsis	Enter the **netconf** context
Context	**configure** system security aaa local-profiles profile *named-item* netconf
Tree	netconf
Introduced	25.3.R2
Platforms	SAR Gen 2

base-op-authorization

Synopsis	Enter the **base-op-authorization** context
Context	**configure** system security aaa local-profiles profile *named-item* netconf base-op-authorization
Tree	base-op-authorization
Description	Commands in this context configure the permission to use NETCONF operations at the base operation level for the specified profile. The NETCONF operations are authorized by default in the built-in system-generated administrative profile.
Introduced	25.3.R2
Platforms	SAR Gen 2

action *boolean*

Synopsis	Allow the NETCONF <action> RPC
Context	**configure** system security aaa local-profiles profile *named-item* netconf base-op-authorization action *boolean*
Tree	action
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

cancel-commit *boolean*

Synopsis	Allow the NETCONF <cancel-commit> RPC
Context	**configure** system security aaa local-profiles profile *named-item* netconf base-op-authorization cancel-commit *boolean*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	cancel-commit
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

close-session *boolean*

Synopsis	Allow the NETCONF <close-session> RPC
Context	**configure** system security aaa local-profiles profile *named-item* netconf base-op-authorization close-session *boolean*
Tree	close-session
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

commit *boolean*

Synopsis	Allow the NETCONF <commit> RPC
Context	**configure** system security aaa local-profiles profile *named-item* netconf base-op-authorization commit *boolean*
Tree	commit
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

copy-config *boolean*

Synopsis	Allow the NETCONF <copy-config> RPC
Context	**configure** system security aaa local-profiles profile *named-item* netconf base-op-authorization copy-config *boolean*
Tree	copy-config
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

Use subject to Terms available at: www.nokia.com/terms.

create-subscription *boolean*

Synopsis	Allow the NETCONF <create-subscription> RPC
Context	**configure** system security aaa local-profiles profile *named-item* netconf base-op-authorization create-subscription *boolean*
Tree	create-subscription
Description	When configured to **true**, the system enables the NETCONF create-subscription operation in the default profile. The configuration of this command is checked only at the time of the initial subscription. Configuration changes to this command do not cancel any in-progress subscriptions, and users who successfully subscribed initially continue to receive messages. The operation is enabled by default in the built-in system-generated administrative profile.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

delete-config *boolean*

Synopsis	Allow the NETCONF <delete-config> RPC
Context	**configure** system security aaa local-profiles profile *named-item* netconf base-op-authorization delete-config *boolean*
Tree	delete-config
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

discard-changes *boolean*

Synopsis	Allow the NETCONF <discard-changes> RPC
Context	**configure** system security aaa local-profiles profile *named-item* netconf base-op-authorization discard-changes *boolean*
Tree	discard-changes
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

grpc

Synopsis	Enter the **grpc** context
Context	**configure** system security aaa management-interface grpc
Tree	grpc
Description	Commands in this context configure gRPC TLS authentication options.
Introduced	25.7.R1
Platforms	SAR Gen 2

tls-authentication

Synopsis	Enter the **tls-authentication** context
Context	**configure** system security aaa management-interface grpc tls-authentication
Tree	tls-authentication
Introduced	25.7.R1
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of mTLS authentication
Context	**configure** system security aaa management-interface grpc tls-authentication admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	25.7.R1
Platforms	SAR Gen 2

default-user *reference*

Synopsis	Local user to display with mTLS authentication
Context	**configure** system security aaa management-interface grpc tls-authentication default-user *reference*
Tree	default-user

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the local user to display for gRPC sessions authenticated using mTLS when the username metadata is not sent during authentication. The configured local user is associated with every session that authenticates with mTLS without a username. This username is displayed in several places, for example, in the command output for the **show users** command, YANG state, log messages, and debug messages. The local user must be configured but is not used in mTLS authentication.
Reference	**configure** system security user-params local-user user *named-item*
Introduced	25.7.R1
Platforms	SAR Gen 2

md-cli

Synopsis	Enter the **md-cli** context
Context	**configure** system security aaa management-interface md-cli
Tree	md-cli
Introduced	25.3.R2
Platforms	SAR Gen 2

command-accounting-during-load *boolean*

Synopsis	Perform file command accounting for load or rollback
Context	**configure** system security aaa management-interface md-cli command-accounting-during-load *boolean*
Tree	command-accounting-during-load
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

output-authorization

Synopsis	Enter the **output-authorization** context
Context	**configure** system security aaa management-interface output-authorization
Tree	output-authorization
Description	Commands in this context configure output authorization for model-driven interfaces and telemetry. When output authorization is performed, commands that display configuration or state output must authorize every element in the output. If a remote AAA server is configured,

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

there may be delays in displaying output while the output is authorized. The remote AAA server may receive a large volume of authorization requests when substantial output displays are needed, such as for system configuration details.

Input to edit the configuration is always authorized, and is not affected by commands in this context.

Introduced 25.3.R2

Platforms SAR Gen 2

md-interfaces *boolean*

Synopsis Authorize output in model-driven interfaces

Context **configure** system security aaa management-interface output-authorization md-interfaces *boolean*

Tree md-interfaces

Description When configured to **true**, output is authorized for the following:

- MD-CLI **info** and **compare** commands
- MD-CLI command completion of list key values
- NETCONF <get> and <get-config> RPC
- gRPC/gNMI Get RPCs

Default true

Introduced 25.3.R2

Platforms SAR Gen 2

telemetry-data *boolean*

Synopsis Authorize dial-in telemetry output

Context **configure** system security aaa management-interface output-authorization telemetry-data *boolean*

Tree telemetry-data

Description When configured to **true**, the system authorizes telemetry data in gNMI Subscriber RPC responses for dial-in telemetry.

When configured to **false**, telemetry data is not authorized.

Default false

Introduced 25.3.R2

Platforms SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

telemetry-default-user *reference*

Synopsis	Local user for dial-out telemetry output authorization
Context	**configure** system security aaa management-interface output-authorization telemetry-default-user *reference*
Tree	telemetry-default-user
Description	This command specifies the local user for telemetry data authorization in gNMI Publish RPCs for dial-out telemetry. The administrator must configure the local user to ensure the subscription is operational.
Reference	**configure** system security user-params local-user user *named-item*
Introduced	25.3.R2
Platforms	SAR Gen 2

remote-servers

Synopsis	Enter the **remote-servers** context
Context	**configure** system security aaa remote-servers
Tree	remote-servers
Introduced	25.3.R2
Platforms	SAR Gen 2

ldap

Synopsis	Enter the **ldap** context
Context	**configure** system security aaa remote-servers ldap
Tree	ldap
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of the LDAP operation protocol
Context	**configure** system security aaa remote-servers ldap admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable

Introduced	25.3.R2
Platforms	SAR Gen 2

public-key-authentication *boolean*

Synopsis	Allow SSH public key authentication from LDAP server
Context	**configure** system security aaa remote-servers ldap public-key-authentication *boolean*
Tree	public-key-authentication
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

route-preference *keyword*

Synopsis	Route preference to reach the AAA server
Context	**configure** system security aaa remote-servers ldap route-preference *keyword*
Tree	route-preference
Description	This command specifies the routing preference to reach the AAA server. If the configured option is to use both in-band and out-of-band routes, the out-of-band routes in the Base routing instance are used to reach the server before the in-band routes in the management routing instance.
Options	both, inband, outband
Default	both
Introduced	25.3.R2
Platforms	SAR Gen 2

server [index] *number*

Synopsis	Enter the **server** list instance
Context	**configure** system security aaa remote-servers ldap server *number*
Tree	server
Max. instances	5
Introduced	25.3.R2

accounting

Synopsis	Enable the **accounting** context
Context	**configure** system security aaa remote-servers tacplus accounting
Tree	accounting
Introduced	25.3.R2
Platforms	SAR Gen 2

record-type *keyword*

Synopsis	Type of accounting record packet sent to TACACS+ server
Context	**configure** system security aaa remote-servers tacplus accounting record-type *keyword*
Tree	record-type
Options	start-stop, stop-only
Default	stop-only
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-control

Synopsis	Enter the **admin-control** context
Context	**configure** system security aaa remote-servers tacplus admin-control
Tree	admin-control
Introduced	25.3.R2
Platforms	SAR Gen 2

tacplus-map-to-priv-lvl *number*

Synopsis	Interactive authentication from node to TACACS+ server
Context	**configure** system security aaa remote-servers tacplus admin-control tacplus-map-to-priv-lvl *number*
Tree	tacplus-map-to-priv-lvl
Range	0 to 15
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

admin-state *keyword*

Synopsis	Administrative state of the TACACS+ protocol
Context	**configure** system security aaa remote-servers tacplus admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	25.3.R2
Platforms	SAR Gen 2

authorization

Synopsis	Enable the **authorization** context
Context	**configure** system security aaa remote-servers tacplus authorization
Tree	authorization
Introduced	25.3.R2
Platforms	SAR Gen 2

request-format

Synopsis	Enter the **request-format** context
Context	**configure** system security aaa remote-servers tacplus authorization request-format
Tree	request-format
Description	Commands in this context configure access operations that are sent to the TACACS+ server during authorization.
Introduced	25.3.R2
Platforms	SAR Gen 2

access-operation-cmd *keyword*

Synopsis	Access operations sent in authorization requests
Context	**configure** system security aaa remote-servers tacplus authorization request-format access-operation-cmd *keyword*
Tree	access-operation-cmd
Description	This command sends an operation argument in authorization requests.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	In model-driven interfaces, this command configures the system to send the operation in the cmd argument, and the path in the cmd-args argument, in TACACS+ authorization requests. This command does not apply to authorization requests in classic interfaces.
Options	delete
Max. instances	1
Introduced	25.3.R2
Platforms	SAR Gen 2

use-priv-lvl *boolean*

Synopsis	Allow privilege level mapping
Context	**configure** system security aaa remote-servers tacplus authorization use-priv-lvl *boolean*
Tree	use-priv-lvl
Description	When configured to **true**, this command automatically performs a single authorization request to the TACACS+ server for cmd* (all commands) immediately after login, and then uses the local profile associated (via the **priv-lvl-map**) with the priv-lvl returned by the TACACS+ server for all subsequent authorization (except **enable-admin**). After the initial authorization for cmd*, no further authorization requests are sent to the TACACS+ server (except **enable-admin**). When configured to **false**, each command is sent to the TACACS+ server for authorization (this is true regardless of whether the **tacplus use-default-template** setting is enabled).
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

ignore-unknown-mandatory-vsas *boolean*

Synopsis	Ignore unknown mandatory VSAs and fail authentication
Context	**configure** system security aaa remote-servers tacplus ignore-unknown-mandatory-vsas *boolean*
Tree	ignore-unknown-mandatory-vsas
Description	When configured to **true**, the system ignores unknown mandatory VSAs and authentication succeeds. When configured to **false**, the system ignores unknown mandatory VSAs received in a reply from the TACACS+ server. Authentication fails and the user is disconnected because the system cannot process a mandatory VSA that is unknown.
Default	false

secret *encrypted-leaf*

Synopsis	Secret key to access the TACACS+ server
Context	**configure** system security aaa remote-servers tacplus server *number* secret *encrypted-leaf*
Tree	secret
Description	This command specifies the secret key to access the TACACS+ server in a protected format. The specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7705 SAR Gen 2 System Management Guide* for more information.
String length	1 to 254
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

server-retry-timeout *(number | keyword)*

Synopsis	Time before retrying requests when health checks are disabled
Context	**configure** system security aaa remote-servers tacplus server-retry-timeout *(number | keyword)*
Tree	server-retry-timeout
Description	This command configures the maximum timeout before retrying requests when health checks are disabled and all TACACS+ servers are operationally down. Set the value of this timer to a lower value or disable it to increase the interactive responsiveness of AAA requests after the servers become unreachable.
Range	1 to 300
Units	seconds
Options	none – Disable retry timeout and send requests immediately
Default	300
Introduced	25.3.R2
Platforms	SAR Gen 2

server-timeout *number*

Synopsis	Time to wait for a response from the TACACS+ server

Synopsis	Enter the **console** context
Context	**configure** system security aaa user-template *keyword* console
Tree	console
Introduced	25.3.R2
Platforms	SAR Gen 2

login-exec *string-not-all-spaces*

Synopsis	File to execute when the user logs in
Context	**configure** system security aaa user-template *keyword* console login-exec *string-not-all-spaces*
Tree	login-exec
String length	1 to 200
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.3.R2
Platforms	SAR Gen 2

home-directory *cflash-without-slot-url*

Synopsis	User local home directory based on the template
Context	**configure** system security aaa user-template *keyword* home-directory *cflash-without-slot-url*
Tree	home-directory

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the home directory of the user for file access. Files can be accessed locally by CLI **file** commands and output modifiers such as **>** (file redirect), or remotely via FTP and SCP. If the home directory does not exist, a warning message is displayed when the user logs in. When **restricted-to-home** is configured, file access is denied unless the **home-directory** is configured and the directory is created by an administrator.
String length	1 to 200
String format	'cflash-without-slot-url' must be cf1-4: followed by path (e.g. cf1:/path)
Introduced	25.3.R2
Platforms	SAR Gen 2

profile *named-item*

Synopsis	User profile based on the template
Context	**configure** system security aaa user-template *keyword* profile *named-item*
Tree	profile
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character 'profile' must not contain spaces
Introduced	25.3.R2
Platforms	SAR Gen 2

restricted-to-home *boolean*

Synopsis	Restrict file access to the home directory of the user
Context	**configure** system security aaa user-template *keyword* restricted-to-home *boolean*
Tree	restricted-to-home
Description	When configured to **true**, the router denies the user from accessing files outside of their local home directory. Files can be accessed locally by CLI file commands and output modifiers such as **>** (file redirect). The system denies all configuration save operations (such as **admin save**) via any management interface (such as CLI and NETCONF) unless **save-when-restricted** is enabled. File access is denied unless a home directory is configured and the directory is created by an administrator. When configured to **false**, the router permits the user to access all files on the system and to remote files.
Default	true
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

save-when-restricted *boolean*

Synopsis	Save configurations when the user is restricted to home
Context	**configure** system security aaa user-template *keyword* save-when-restricted *boolean*
Tree	save-when-restricted
Description	When configured to **true**, the system permits configuration save operations for all configuration regions (such as bof and configure) via any management interface (such as CLI and NETCONF) even if **restricted-to-home** is enabled. The configuration for each region can be saved with **admin save** CLI commands or when committed over NETCONF and gRPC. When configured to **false**, the system denies saving the configuration when **restricted-to-home** is enabled, unless the home directory of the user includes the location of the saved configuration file.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

cli-script

Synopsis	Enter the **cli-script** context

hold-down *(keyword | number)*

Synopsis	Hold down behavior
Context	**configure** system security dist-cpu-protection policy *named-item* protocol *keyword* dynamic-parameters exceed-action hold-down *(keyword | number)*
Tree	hold-down
Description	This command specifies the behavior when the system detects that an enforcement policer has marked or discarded one or more packets and there is no action specified for the scenario when the rates are exceeded. The hold time condition is cleared after the specified time has expired. The detection time (the minimum time that the policer remains allocated) begins after the hold down is complete. The hold down behavior is not applicable to a local monitoring policer. An indefinite hold down behavior must be cleared using the **tools perform security dist-cpu-protection release-hold-down** command.
Range	1 to 10080
Units	seconds
Options	indefinite, none
Default	none
Introduced	25.3.R2
Platforms	SAR Gen 2

read-algorithm *keyword*

Synopsis	Input encryption algorithm for configuration secrets
Context	**configure** system security hash-control management-interface classic-cli read-algorithm *keyword*
Tree	read-algorithm
Description	This command specifies how the protected configuration shared secrets are interpreted and which protected formats are accepted when shared secrets are input into the system or read from a configuration file (for example, at system bootup time). The **all-hash** option specifies that the system accepts any protected format. See "Configuration secrets" in the *7705 SAR Gen 2 System Management Guide* for more information.
Options	all-hash, hash, hash2, custom, hash3
Default	all-hash
Introduced	25.3.R2
Platforms	SAR Gen 2

write-algorithm *keyword*

Synopsis	Output encryption algorithm for configuration secrets
Context	**configure** system security hash-control management-interface classic-cli write-algorithm *keyword*
Tree	write-algorithm
Description	This command specifies the format of the output for configuration shared secrets (for example, in the saved configuration file, or in the output of the **info** or **show** commands). The **cleartext** keyword specifies that shared secrets are output in cleartext. Nokia does not recommend this option unless access to configuration is strictly controlled. If a primary secret is configured, the default of this command is **hash3**. Otherwise the default is **hash2**. See "Configuration secrets" in the *7705 SAR Gen 2 System Management Guide* for more information.
Options	cleartext, hash, hash2, custom, hash3
Introduced	25.3.R2

Synopsis	Authentication key used by the encryption algorithm

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** system security keychains keychain *named-item* bidirectional entry *number* authentication-key *encrypted-leaf*
Tree	authentication-key
Description	This command configures the authentication key used by the encryption algorithm to sign and authenticate the protocol packet. If the algorithm is based on AES and the specified key is not the exact length required by the associated algorithm, the following steps are taken, depending on the protocol: • For protocols using TCP-AO (BGP, LDP, and PCEP), the key is processed as described in RFC 4615. All key lengths are valid. • For all other protocols (OSPF, IS-IS, RSVP, NTP, and MACsec), if the key is shorter than the required length, the key is padded with zeros; if it is longer, it is truncated. For algorithms based on AES-128, the required key length is 16 bytes. For algorithms based on AES-256, the required key length is 32 bytes. In all other cases, all key lengths are valid and the specified key is not padded nor truncated. This command uses a protected format where the specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7705 SAR Gen 2 System Management Guide* for more information.
String length	1 to 110
Introduced	25.3.R2
Platforms	SAR Gen 2

begin-time *date-and-time*

Synopsis	Calendar date and time to start using the key
Context	**configure** system security keychains keychain *named-item* bidirectional entry *number* begin-time *date-and-time*
Tree	begin-time
Description	This command specifies the calendar date and time which this specific key entry becomes active and creates an MKA session. If no date and time is set, the **begin-time** is represented by a date and time string with all NULLs and the key is not valid.
Introduced	25.3.R2
Platforms	SAR Gen 2

option *keyword*

Tree	macsec
Description	Commands in this context configure the key entries for the MACsec keychain.
Introduced	25.10.R1
Platforms	SAR Gen 2

entry [keychain-entry-index] *number*

Synopsis	Enter the **entry** list instance
Context	**configure** system security keychains keychain *named-item* macsec entry *number*
Tree	entry
Description	Commands in this context configure a specific key entry in the keychain. Entries are defined by an entry ID. Each MACsec key entry creates a dedicated MKA for that key entry. MKA uses the key entry's CAK and its encryption algorithm to secure the SAK between peers. The MACsec key entry with an ID of 0 can be configured with a tolerance of forever and can be used as a backup key entry. If at the begin time of any key entry there is a problem with establishing MKA, the keychain may fallback to the backup key entry.
Introduced	25.10.R1
Platforms	SAR Gen 2

[**keychain-entry-index**] *number*

management

Synopsis	Enter the **management** context
Context	**configure** system security management
Tree	management
Description	Commands in this context control which management protocols can be used to access the SR OS router via the 'Base' and 'management' router instances.
Introduced	25.3.R2
Platforms	SAR Gen 2

allow-ftp *boolean*

Synopsis	Allow access to the FTP server
Context	**configure** system security management allow-ftp *boolean*
Tree	allow-ftp
Description	When configured to **true**, this command allows FTP access to the SR OS router via the 'Base' and 'management' router instances. When configured to **false**, this command disallows access to the SR OS FTP server.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

allow-grpc *boolean*

Synopsis	Allow access to the gRPC server
Context	**configure** system security management allow-grpc *boolean*
Tree	allow-grpc

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	When configured to **true**, the system allows access to the gRPC server via the 'Base' and 'management' router instances.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

allow-netconf *boolean*

Synopsis	Allow access to the NETCONF server
Context	**configure** system security management allow-netconf *boolean*
Tree	allow-netconf
Description	When configured to **true**, the system allows NETCONF server access to the SR OS router via the 'Base' and 'management' router instances.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

allow-ssh *boolean*

Synopsis	Allow access to the SSH server
Context	**configure** system security management allow-ssh *boolean*
Tree	allow-ssh
Description	When configured to **true**, this command allows SSH server access to the SR OS router via the 'Base' and 'management' router instances. When configured to **false**, this command disallows SSH server access.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

allow-telnet *boolean*

Synopsis	Allow access to the IPv4 Telnet server
Context	**configure** system security management allow-telnet *boolean*
Tree	allow-telnet
Description	When configured to **true**, the system allows IPv4 Telnet server access to the SR OS router via the 'Base' and 'management' router instances.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, access to the IPv4 Telnet server is not allowed.

Default true

Introduced 25.3.R2

Platforms SAR Gen 2

allow-telnet6 *boolean*

Synopsis Allow access to the Telnet IPv6 server

Context **configure** system security management allow-telnet6 *boolean*

Tree allow-telnet6

Description When configured to **true**, the system allows IPv6 Telnet server access to the SR OS router via the 'Base' and 'management' router instances.

When configured to **false**, the system prevents access to the IPv6 Telnet server.

Default true

Introduced 25.3.R2

Platforms SAR Gen 2

management-access-filter

Synopsis Enter the **management-access-filter** context

Context **configure** system security management-access-filter

Tree management-access-filter

Description Commands in this context configure the attributes for management access filters.

Management access filters control all traffic in and out of the CPM. The filters can be used to restrict management of the router by other nodes outside of specific networks (or sub-networks) or through designated ports.

Management filters are enforced by the system software.

Introduced 25.3.R2

Platforms SAR Gen 2

ip-filter

Synopsis Enter the **ip-filter** context

Context **configure** system security management-access-filter ip-filter

Tree ip-filter

Introduced 25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of management-access filters
Context	**configure** system security management-access-filter ip-filter admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	25.3.R2
Platforms	SAR Gen 2

default-action *keyword*

Synopsis	Default action for the management access filter
Context	**configure** system security management-access-filter ip-filter default-action *keyword*
Tree	default-action
Description	This command specifies the default action for management access in the absence of a specific management access filter match.
Options	ignore-match, accept, drop, reject
Default	ignore-match
Introduced	25.3.R2
Platforms	SAR Gen 2

entry [entry-id] *number*

Synopsis	Enter the **entry** list instance
Context	**configure** system security management-access-filter ip-filter entry *number*
Tree	entry
Introduced	25.3.R2
Platforms	SAR Gen 2

[**entry-id**] *number*

Synopsis	Entry ID to identify the match criteria and the action

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** system security management-access-filter ip-filter entry *number*
Tree	entry
Description	This command specifies the entry ID to identify the match criteria and the corresponding action. It is recommended that entries are numbered in staggered increments. This allows users to insert a new entry in an existing policy without having to renumber the existing entries.
Range	1 to 9999
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

action *keyword*

Synopsis	Action associated with the management access filter
Context	**configure** system security management-access-filter ip-filter entry *number* action *keyword*
Tree	action
Description	This command specifies the action associated with the management access filter match criteria entry. If the packet does not meet any of the match criteria, the configured default action is applied.
Options	ignore-match, accept, drop, reject
Default	ignore-match
Introduced	25.3.R2
Platforms	SAR Gen 2

router-instance *string*

Synopsis	Router instance as the match criterion
Context	**configure** system security management-access-filter ip-filter entry *number* match router-instance *string*
Tree	router-instance
Introduced	25.3.R2
Platforms	SAR Gen 2

src-ip

Synopsis	Enter the **src-ip** context
Context	**configure** system security management-access-filter ip-filter entry *number* match src-ip
Tree	src-ip
Description	Commands in this context specify match criteria based on the source IP address.
Introduced	25.3.R2
Platforms	SAR Gen 2

address *(ipv4-prefix | ipv4-address)*

Synopsis	IP address or IP prefix as the match criterion
Context	**configure** system security management-access-filter ip-filter entry *number* match src-ip address *(ipv4-prefix | ipv4-address)*
Tree	address
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Notes	The following elements are part of a choice: (**address** and **mask**) or **ip-prefix-list**.
Introduced	25.3.R2
Platforms	SAR Gen 2

ip-prefix-list *reference*

Synopsis	IP prefix list as the match criterion
Context	**configure** system security management-access-filter ip-filter entry *number* match src-ip ip-prefix-list *reference*
Tree	ip-prefix-list

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Reference	**configure** filter match-list ip-prefix-list *named-item*
Notes	The following elements are part of a choice: (**address** and **mask**) or **ip-prefix-list**.
Introduced	25.3.R2
Platforms	SAR Gen 2

mask *ipv4-address*

Synopsis	IP address mask as the match criterion
Context	**configure** system security management-access-filter ip-filter entry *number* match src-ip mask *ipv4-address*
Tree	mask
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Notes	The following elements are part of a choice: (**address** and **mask**) or **ip-prefix-list**.
Introduced	25.3.R2
Platforms	SAR Gen 2

src-port

Synopsis	Enable the **src-port** context
Context	**configure** system security management-access-filter ip-filter entry *number* match src-port
Tree	src-port
Introduced	25.3.R2
Platforms	SAR Gen 2

mask *number*

Synopsis	IP address mask as the match criterion
Context	**configure** system security management-access-filter ip-filter entry *number* match src-port mask *number*
Tree	mask
Range	1 to 65535
Default	65535
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

port *number*

Synopsis	TCP or UDP port number as the match criterion
Context	**configure** system security management-access-filter ip-filter entry *number* match src-port port *number*
Tree	port
Range	1 to 65535
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

ipv6-filter

Synopsis	Enter the **ipv6-filter** context
Context	**configure** system security management-access-filter ipv6-filter
Tree	ipv6-filter
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of management-access filters
Context	**configure** system security management-access-filter ipv6-filter admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	25.3.R2
Platforms	SAR Gen 2

default-action *keyword*

Synopsis	Default action for the management access filter
Context	**configure** system security management-access-filter ipv6-filter default-action *keyword*
Tree	default-action

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command specifies the default action for management access in the absence of a specific management access filter match.
Options	ignore-match, accept, drop, reject
Default	ignore-match
Introduced	25.3.R2
Platforms	SAR Gen 2

entry [entry-id] *number*

Synopsis	Enter the **entry** list instance
Context	**configure** system security management-access-filter ipv6-filter entry *number*
Tree	entry
Introduced	25.3.R2
Platforms	SAR Gen 2

[**entry-id**] *number*

Synopsis	Entry ID to identify the match criteria and the action
Context	**configure** system security management-access-filter ipv6-filter entry *number*
Tree	entry
Description	This command specifies the entry ID to identify the match criteria and the corresponding action. It is recommended that entries are numbered in staggered increments. This allows users to insert a new entry in an existing policy without having to renumber the existing entries.
Range	1 to 9999
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

action *keyword*

Synopsis	Action associated with the management access filter
Context	**configure** system security management-access-filter ipv6-filter entry *number* action *keyword*
Tree	action
Description	This command specifies the action associated with the management access filter match criteria entry.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

If the packet does not meet any of the match criteria, the configured default action is applied.

Options	ignore-match, accept, drop, reject
Default	ignore-match
Introduced	25.3.R2
Platforms	SAR Gen 2

description *description*

Synopsis	Text description
Context	**configure** system security management-access-filter ipv6-filter entry *number* description *description*
Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.3.R2
Platforms	SAR Gen 2

log-events *boolean*

Synopsis	Enable match logging
Context	**configure** system security management-access-filter ipv6-filter entry *number* log-events *boolean*
Tree	log-events
Description	When configured to **true**, this command enables match logging. When enabled, matches on the entry cause the Security event mafEntryMatch to be raised. When configured to **false**, match logging is disabled.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

match

Synopsis	Enter the **match** context
Context	**configure** system security management-access-filter ipv6-filter entry *number* match
Tree	match

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context specify match criteria for the entry.
Introduced	25.3.R2
Platforms	SAR Gen 2

dst-port

Synopsis	Enable the **dst-port** context
Context	**configure** system security management-access-filter ipv6-filter entry *number* match dst-port
Tree	dst-port
Description	Commands in this context specify match criteria based on the destination port.
Introduced	25.3.R2
Platforms	SAR Gen 2

mask *number*

Synopsis	IP address mask as the match criterion
Context	**configure** system security management-access-filter ipv6-filter entry *number* match dst-port mask *number*
Tree	mask
Range	1 to 65535
Default	65535
Introduced	25.3.R2
Platforms	SAR Gen 2

port *number*

Synopsis	TCP or UDP port number as the match criterion
Context	**configure** system security management-access-filter ipv6-filter entry *number* match dst-port port *number*
Tree	port
Range	1 to 65535
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

flow-label *number*

Synopsis	Flow identifier used to discriminate traffic flows
Context	**configure** system security management-access-filter ipv6-filter entry *number* match flow-label *number*
Tree	flow-label
Range	0 to 1048575
Introduced	25.3.R2
Platforms	SAR Gen 2

mgmt-port

Synopsis	Enter the **mgmt-port** context
Context	**configure** system security management-access-filter ipv6-filter entry *number* match mgmt-port
Tree	mgmt-port
Description	Commands in this context specify match criteria based on the Ethernet port.
Introduced	25.3.R2
Platforms	SAR Gen 2

cpm

Synopsis	Match any traffic received on any Ethernet port
Context	**configure** system security management-access-filter ipv6-filter entry *number* match mgmt-port cpm
Tree	cpm
Notes	The following elements are part of a choice: **cpm**, (**lag** and **lag-id**), or **port-id**.
Introduced	25.3.R2
Platforms	SAR Gen 2

lag *lag-interface*

Synopsis	LAG ID as the match criterion
Context	**configure** system security management-access-filter ipv6-filter entry *number* match mgmt-port lag *lag-interface*
Tree	lag

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

String length	1 to 27
String format	'lag-interface' must be lag- followed by number 1-800 or up to 23 chars (e.g. lag-1 or lag-my-lag)
Notes	The following elements are part of a choice: **cpm**, (**lag** and **lag-id**), or **port-id**.
Introduced	25.3.R2
Platforms	SAR Gen 2

port-id *port*

Synopsis	Port ID as the match criterion
Context	**configure** system security management-access-filter ipv6-filter entry *number* match mgmt-port port-id *port*
Tree	port-id
Notes	The following elements are part of a choice: **cpm**, (**lag** and **lag-id**), or **port-id**.
Introduced	25.3.R2
Platforms	SAR Gen 2

next-header *(number | keyword)*

Synopsis	IP protocol to match
Context	**configure** system security management-access-filter ipv6-filter entry *number* match next-header *(number | keyword)*
Tree	next-header
Range	0 to 255
Options	tcp-udp, icmp, igmp, ip, tcp, egp, igp, udp, rdp, ipv6, ipv6-route, ipv6-frag, idrp, rsvp, gre, ipv6-icmp, ipv6-no-nxt, ipv6-opts, iso-ip, eigrp, ospf-igp, ether-ip, encap, pnni, pim, vrrp, l2tp, stp, ptp, isis, crtp, crudp, sctp
Introduced	25.3.R2
Platforms	SAR Gen 2

router-instance *string*

Synopsis	Router instance as the match criterion
Context	**configure** system security management-access-filter ipv6-filter entry *number* match router-instance *string*
Tree	router-instance
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

src-ip

Synopsis	Enter the **src-ip** context
Context	**configure** system security management-access-filter ipv6-filter entry *number* match src-ip
Tree	src-ip
Description	Commands in this context specify match criteria based on the source port.
Introduced	25.3.R2
Platforms	SAR Gen 2

address *(ipv6-prefix | ipv6-address)*

Synopsis	IPv6 address or IPv6 prefix to match
Context	**configure** system security management-access-filter ipv6-filter entry *number* match src-ip address *(ipv6-prefix | ipv6-address)*
Tree	address
Notes	The following elements are part of a choice: (**address** and **mask**) or **ipv6-prefix-list**.
Introduced	25.3.R2
Platforms	SAR Gen 2

ipv6-prefix-list *reference*

Synopsis	IPv6 prefix list as the match criterion
Context	**configure** system security management-access-filter ipv6-filter entry *number* match src-ip ipv6-prefix-list *reference*
Tree	ipv6-prefix-list
Reference	**configure** filter match-list ipv6-prefix-list *named-item*
Notes	The following elements are part of a choice: (**address** and **mask**) or **ipv6-prefix-list**.
Introduced	25.3.R2
Platforms	SAR Gen 2

mask *ipv6-address*

Synopsis	IP address mask as the match criterion

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** system security management-access-filter ipv6-filter entry *number* match src-ip mask *ipv6-address*
Tree	mask
Notes	The following elements are part of a choice: (**address** and **mask**) or **ipv6-prefix-list**.
Introduced	25.3.R2
Platforms	SAR Gen 2

src-port

Synopsis	Enable the **src-port** context
Context	**configure** system security management-access-filter ipv6-filter entry *number* match src-port
Tree	src-port
Description	Commands in this context specify match criteria based on the source port.
Introduced	25.3.R2
Platforms	SAR Gen 2

mask *number*

Synopsis	IP address mask as the match criterion
Context	**configure** system security management-access-filter ipv6-filter entry *number* match src-port mask *number*
Tree	mask
Range	1 to 65535
Default	65535
Introduced	25.3.R2
Platforms	SAR Gen 2

port *number*

Synopsis	TCP or UDP port number as the match criterion
Context	**configure** system security management-access-filter ipv6-filter entry *number* match src-port port *number*
Tree	port
Range	1 to 65535
Notes	This element is mandatory.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	25.3.R2
Platforms	SAR Gen 2

mac-filter

Synopsis	Enter the **mac-filter** context
Context	**configure** system security management-access-filter mac-filter
Tree	mac-filter
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of management access MAC filter
Context	**configure** system security management-access-filter mac-filter admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	enable
Introduced	25.3.R2
Platforms	SAR Gen 2

default-action *keyword*

Synopsis	Default action for the management access filter
Context	**configure** system security management-access-filter mac-filter default-action *keyword*
Tree	default-action
Description	This command specifies the default action for management access in the absence of a specific management access filter match.
Options	ignore-match, accept, drop
Default	ignore-match
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

entry [entry-id] *number*

Synopsis	Enter the **entry** list instance
Context	**configure** system security management-access-filter mac-filter entry *number*
Tree	entry
Introduced	25.3.R2
Platforms	SAR Gen 2

[**entry-id**] *number*

Synopsis	Entry ID to identify the match criteria and the action
Context	**configure** system security management-access-filter mac-filter entry *number*
Tree	entry
Description	This command specifies the entry ID to identify the match criteria and the corresponding action. It is recommended that entries are numbered in staggered increments. This allows users to insert a new entry in an existing policy without having to renumber the existing entries.
Range	1 to 9999
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

action *keyword*

Synopsis	Action associated with the management access filter
Context	**configure** system security management-access-filter mac-filter entry *number* action *keyword*
Tree	action
Description	This command specifies the action associated with the management access filter match criteria entry. If the packet does not meet any of the match criteria, the configured default action is applied.
Options	ignore-match, accept, drop
Default	ignore-match
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

description *description*

Synopsis	Text description
Context	**configure** system security management-access-filter mac-filter entry *number* description *description*
Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.3.R2
Platforms	SAR Gen 2

log-events *boolean*

Synopsis	Enable match logging
Context	**configure** system security management-access-filter mac-filter entry *number* log-events *boolean*
Tree	log-events
Description	When configured to **true**, this command enables match logging. When enabled, matches on the entry cause the Security event mafEntryMatch to be raised. When configured to **false**, match logging is disabled.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

match

Synopsis	Enter the **match** context
Context	**configure** system security management-access-filter mac-filter entry *number* match
Tree	match
Description	Commands in this context specify match criteria for the entry.
Introduced	25.3.R2
Platforms	SAR Gen 2

cfm-opcode

Synopsis	Enter the **cfm-opcode** context

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** system security management-access-filter mac-filter entry *number* match cfm-opcode
Tree	cfm-opcode
Description	Commands in this context specify match criteria based on the CFM opcode.
Introduced	25.3.R2
Platforms	SAR Gen 2

eq *number*

Synopsis	Equal to comparison operator for the CFM opcode
Context	**configure** system security management-access-filter mac-filter entry *number* match cfm-opcode eq *number*
Tree	eq
Range	0 to 255
Notes	The following elements are part of a choice: **eq**, **gt**, **lt**, or **range**.
Introduced	25.3.R2
Platforms	SAR Gen 2

gt *number*

Synopsis	Greater than comparison operator for the CFM opcode
Context	**configure** system security management-access-filter mac-filter entry *number* match cfm-opcode gt *number*
Tree	gt
Range	0 to 254
Notes	The following elements are part of a choice: **eq**, **gt**, **lt**, or **range**.
Introduced	25.3.R2
Platforms	SAR Gen 2

lt *number*

Synopsis	Less than comparison operator for the CFM opcode
Context	**configure** system security management-access-filter mac-filter entry *number* match cfm-opcode lt *number*
Tree	lt
Range	1 to 255

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Notes	The following elements are part of a choice: **eq**, **gt**, **lt**, or **range**.
Introduced	25.3.R2
Platforms	SAR Gen 2

range

Synopsis	Enable the **range** context
Context	**configure** system security management-access-filter mac-filter entry *number* match cfm-opcode range
Tree	range
Notes	The following elements are part of a choice: **eq**, **gt**, **lt**, or **range**.
Introduced	25.3.R2
Platforms	SAR Gen 2

end *number*

Synopsis	Upper bound of the range for the OpCode to match
Context	**configure** system security management-access-filter mac-filter entry *number* match cfm-opcode range end *number*
Tree	end
Range	1 to 255
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

start *number*

Synopsis	Lower bound of the range for the OpCode to match
Context	**configure** system security management-access-filter mac-filter entry *number* match cfm-opcode range start *number*
Tree	start
Range	0 to 254
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.

dot1p

Synopsis	Enable the **dot1p** context
Context	**configure** system security management-access-filter mac-filter entry *number* match dot1p
Tree	dot1p
Description	Commands in this context specify match criteria based on the IEEE 802.1p value.
Introduced	25.3.R2
Platforms	SAR Gen 2

mask *number*

Synopsis	3-bit mask as the match criterion
Context	**configure** system security management-access-filter mac-filter entry *number* match dot1p mask *number*
Tree	mask
Range	1 to 7
Default	7
Introduced	25.3.R2
Platforms	SAR Gen 2

priority *number*

Synopsis	IEEE 802.1p value as the match criterion
Context	**configure** system security management-access-filter mac-filter entry *number* match dot1p priority *number*
Tree	priority
Range	0 to 7
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

dst-mac

Synopsis	Enable the **dst-mac** context

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** system security management-access-filter mac-filter entry *number* match dst-mac
Tree	dst-mac
Description	Commands in this context specify match criteria based on the destination MAC.
Introduced	25.3.R2
Platforms	SAR Gen 2

address *mac-address*

Synopsis	MAC address used as the match criterion
Context	**configure** system security management-access-filter mac-filter entry *number* match dst-mac address *mac-address*
Tree	address
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

mask *mac-address*

Synopsis	MAC address mask as the match criterion
Context	**configure** system security management-access-filter mac-filter entry *number* match dst-mac mask *mac-address*
Tree	mask
Default	ff:ff:ff:ff:ff:ff
Introduced	25.3.R2
Platforms	SAR Gen 2

etype *etype-value*

Synopsis	Ethernet type II Ethertype value as the match criterion
Context	**configure** system security management-access-filter mac-filter entry *number* match etype *etype-value*
Tree	etype
Description	This command specifies an Ethernet type II Ethertype value to be used as a MAC filter match criterion. The Ethernet type field is used by the Ethernet version-II frames and does not apply to IEEE 802.3 Ethernet frames.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

String length	5 to 6
String format	'etype-value' must be 0x0600-0xFFFF (e-type range)
Introduced	25.3.R2
Platforms	SAR Gen 2

frame-type *keyword*

Synopsis	MAC frame type as the match criterion
Context	**configure** system security management-access-filter mac-filter entry *number* match frame-type *keyword*
Tree	frame-type
Options	802dot3, 802dot2-llc, 802dot2-snap, ethernet-ii, 802dot1-ag
Default	802dot3
Introduced	25.3.R2
Platforms	SAR Gen 2

llc-dsap

Synopsis	Enable the **llc-dsap** context
Context	**configure** system security management-access-filter mac-filter entry *number* match llc-dsap
Tree	llc-dsap
Description	Commands in this context specify match criteria based on the Destination Service Access Point (DSAP).
Introduced	25.3.R2
Platforms	SAR Gen 2

dsap *number*

Synopsis	8-bit DSAP as the match criterion
Context	**configure** system security management-access-filter mac-filter entry *number* match llc-dsap dsap *number*
Tree	dsap
Range	0 to 255
Notes	This element is mandatory.
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

mask *number*

Synopsis	Mask for DSAP value as the match criterion
Context	**configure** system security management-access-filter mac-filter entry *number* match llc-dsap mask *number*
Tree	mask
Range	1 to 255
Default	255
Introduced	25.3.R2
Platforms	SAR Gen 2

llc-ssap

Synopsis	Enable the **llc-ssap** context
Context	**configure** system security management-access-filter mac-filter entry *number* match llc-ssap
Tree	llc-ssap
Description	Commands in this context specify match criteria based on the Source Service Access Point (SSAP).
Introduced	25.3.R2
Platforms	SAR Gen 2

mask *number*

Synopsis	Mask for SSAP value as the match criterion
Context	**configure** system security management-access-filter mac-filter entry *number* match llc-ssap mask *number*
Tree	mask
Range	1 to 255
Default	255
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

ssap *number*

Synopsis	8-bit SSAP as the match criterion
Context	**configure** system security management-access-filter mac-filter entry *number* match llc-ssap ssap *number*
Tree	ssap
Range	0 to 255
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

service *service-name*

Synopsis	Service ID used as the match condition
Context	**configure** system security management-access-filter mac-filter entry *number* match service *service-name*
Tree	service
String length	1 to 64
String format	'service-name' must contain at least one non-space character
Introduced	25.3.R2
Platforms	SAR Gen 2

snap-oui *keyword*

Synopsis	IEEE 802.3 LLC SNAP Ethernet Frame OUI value for match
Context	**configure** system security management-access-filter mac-filter entry *number* match snap-oui *keyword*
Tree	snap-oui
Description	This command specifies the IEEE 802.3 LLC SNAP Ethernet Frame OUI value as the MAC filter match criterion.
Options	zero, non-zero
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

snap-pid *number*

Synopsis	IEEE 802.3 LLC SNAP Ethernet Frame PID as the match
Context	**configure** system security management-access-filter mac-filter entry *number* match snap-pid *number*
Tree	snap-pid
Description	This command specifies an IEEE 802.3 LLC SNAP Ethernet Frame PID value used as the MAC filter match criterion. The SNAP PID match criterion is independent of the OUI field within the SNAP header. Two packets with different 3-byte OUI fields but the same PID field match the same filter entry based on a SNAP PID match criterion.
Range	0 to 65535
Introduced	25.3.R2
Platforms	SAR Gen 2

src-mac

Synopsis	Enable the **src-mac** context
Context	**configure** system security management-access-filter mac-filter entry *number* match src-mac
Tree	src-mac
Description	Commands in this context specify match criteria based on the source MAC.
Introduced	25.3.R2
Platforms	SAR Gen 2

address *mac-address*

Synopsis	MAC address used as the match criterion
Context	**configure** system security management-access-filter mac-filter entry *number* match src-mac address *mac-address*
Tree	address
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

mask *mac-address*

Synopsis	MAC address mask as the match criterion
Context	**configure** system security management-access-filter mac-filter entry *number* match src-mac mask *mac-address*
Tree	mask
Default	ff:ff:ff:ff:ff:ff
Introduced	25.3.R2
Platforms	SAR Gen 2

pki

Synopsis	Enter the **pki** context
Context	**configure** system security pki
Tree	pki
Introduced	25.3.R2
Platforms	SAR Gen 2

ca-profile [ca-profile-name] *named-item*

Synopsis	Enter the **ca-profile** list instance
Context	**configure** system security pki ca-profile *named-item*
Tree	ca-profile
Max. instances	128
Introduced	25.3.R2
Platforms	SAR Gen 2

[**ca-profile-name**] *named-item*

Synopsis	CA profile name
Context	**configure** system security pki ca-profile *named-item*
Tree	ca-profile
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of the CA profile
Context	**configure** system security pki ca-profile *named-item* admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	25.3.R2
Platforms	SAR Gen 2

auto-crl-update

Synopsis	Enable the **auto-crl-update** context
Context	**configure** system security pki ca-profile *named-item* auto-crl-update
Tree	auto-crl-update
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of the automatic CRL update
Context	**configure** system security pki ca-profile *named-item* auto-crl-update admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	25.3.R2
Platforms	SAR Gen 2

dynamic-ca *boolean*

Synopsis	Enable the dynamic sub-CA support for IPsec
Context	**configure** system security pki dynamic-ca *boolean*
Tree	dynamic-ca
Description	When configured to **true**, the system may authenticate the IPsec peer using a certificate without provisioning the peer's sub-CAs locally, if the peer sends sub-CA certificates during IKEv2 exchanges.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

est-profile [name] *named-item*

Synopsis	Enter the **est-profile** list instance
Context	**configure** system security pki est-profile *named-item*
Tree	est-profile
Description	Commands in this context configure an Enrollment over Secure Transport (EST) profile.
Max. instances	128
Introduced	25.3.R2
Platforms	SAR Gen 2

[**name**] *named-item*

Synopsis	Enrollment over Secured Transport profile name
Context	**configure** system security pki est-profile *named-item*
Tree	est-profile
Description	This command configures the EST profile name.
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.

check-id-kp-cmcra-only *boolean*

Synopsis	Check id-kp-cmcra in the EST certificate
Context	**configure** system security pki est-profile *named-item* check-id-kp-cmcra-only *boolean*
Tree	check-id-kp-cmcra-only
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

client-tls-profile *named-item*

Synopsis	TLS client profile assigned to applications
Context	**configure** system security pki est-profile *named-item* client-tls-profile *named-item*
Tree	client-tls-profile
Description	This command specifies the TLS client profile to be assigned to applications for encryption. The profile creates the TLS connection to the EST server.
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.3.R2
Platforms	SAR Gen 2

http-authentication

Synopsis	Enter the **http-authentication** context
Context	**configure** system security pki est-profile *named-item* http-authentication
Tree	http-authentication
Introduced	25.3.R2
Platforms	SAR Gen 2

password *encrypted-leaf*

Synopsis	Password for EST authentication
Context	**configure** system security pki est-profile *named-item* http-authentication password *encrypted-leaf*
Tree	password

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command specifies the password for EST authentication in a protected format. The specific format is indicated by the **hash**, **hash2**, **hash3**, or **custom** suffix. See "Configuration secrets" in the *7705 SAR Gen 2 System Management Guide* for more information.
String length	1 to 166
Introduced	25.3.R2
Platforms	SAR Gen 2

username *string*

Synopsis	Username for the EST authentication
Context	**configure** system security pki est-profile *named-item* http-authentication username *string*
Tree	username
String length	1 to 32
Introduced	25.3.R2
Platforms	SAR Gen 2

server

Synopsis	Enter the **server** context
Context	**configure** system security pki est-profile *named-item* server
Tree	server
Description	Commands in this context configure EST server parameters.
Introduced	25.3.R2
Platforms	SAR Gen 2

fqdn *fully-qualified-domain-name*

Synopsis	Fully Qualified Domain Name (FQDN) of the EST server
Context	**configure** system security pki est-profile *named-item* server fqdn *fully-qualified-domain-name*
Tree	fqdn
Description	This command specifies to use the FQDN of the EST server.
String length	1 to 255
Notes	The following elements are part of a choice: **fqdn**, **ipv4**, or **ipv6**.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	25.3.R2
Platforms	SAR Gen 2

ipv4 *ipv4-unicast-address*

Synopsis	IPv4 address of the EST server
Context	**configure** system security pki est-profile *named-item* server ipv4 *ipv4-unicast-address*
Tree	ipv4
String format	'ipv4-address' must use only digits and dots (no %zone) 'ipv4-address' must be a.b.c.d with each octet 0-255 (no zone-id)
Notes	The following elements are part of a choice: **fqdn**, **ipv4**, or **ipv6**.
Introduced	25.3.R2
Platforms	SAR Gen 2

ipv6 *(ipv4-address-no-zone | ipv6-address-no-zone)*

Synopsis	IPv6 address of the EST server
Context	**configure** system security pki est-profile *named-item* server ipv6 *(ipv4-address-no-zone | ipv6-address-no-zone)*
Tree	ipv6
Notes	The following elements are part of a choice: **fqdn**, **ipv4**, or **ipv6**.
Introduced	25.3.R2
Platforms	SAR Gen 2

path

Synopsis	Enter the **path** context
Context	**configure** system security pki est-profile *named-item* server path
Tree	path
Description	Commands in this context configure URL paths for EST request messages.
Introduced	26.3.R1
Platforms	SAR Gen 2

cacerts *string*

Synopsis	Server path to request CA certificates

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** system security pki est-profile *named-item* server path cacerts *string*
Tree	cacerts
String length	1 to 255
String format	'cacerts' must start with / (e.g. /path)
Introduced	26.3.R1
Platforms	SAR Gen 2

simpleenroll *string*

Synopsis	Server path to request simple certificate enrollment
Context	**configure** system security pki est-profile *named-item* server path simpleenroll *string*
Tree	simpleenroll
String length	1 to 255
String format	'simpleenroll' must start with / (e.g. /path)
Introduced	26.3.R1
Platforms	SAR Gen 2

simplereenroll *string*

Synopsis	Server path for the reenrollment of clients
Context	**configure** system security pki est-profile *named-item* server path simplereenroll *string*
Tree	simplereenroll
String length	1 to 255
String format	'simplereenroll' must start with / (e.g. /path)
Introduced	26.3.R1
Platforms	SAR Gen 2

port *number*

Synopsis	Port number of the EST server
Context	**configure** system security pki est-profile *named-item* server port *number*
Tree	port
Range	1 to 65535
Default	443
Introduced	25.3.R2

© 2026 Nokia.

Platforms	SAR Gen 2

transmission-profile *named-item*

Synopsis	Transmission profile name for EST
Context	**configure** system security pki est-profile *named-item* transmission-profile *named-item*
Tree	transmission-profile
Description	This command associates a file transmission profile to the EST profile. The transmission profile defines transport parameters for protocol such as HTTP, include routing instance, source address, timeout value, and so on.
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.3.R2
Platforms	SAR Gen 2

imported-format *keyword*

Synopsis	The supported encrypted file formats
Context	**configure** system security pki imported-format *keyword*
Tree	imported-format
Options	any, secure
Default	any
Introduced	25.3.R2
Platforms	SAR Gen 2

maximum-cert-chain-depth *number*

Synopsis	Maximum depth of certificate chain verification
Context	**configure** system security pki maximum-cert-chain-depth *number*
Tree	maximum-cert-chain-depth
Range	1 to 7
Default	7
Introduced	25.3.R2
Platforms	SAR Gen 2

Tree	type
Options	included, excluded
Introduced	25.3.R2
Platforms	SAR Gen 2

source-address

Synopsis	Enter the **source-address** context
Context	**configure** system security source-address
Tree	source-address
Description	Commands in this context configure the IP source address that is used in all unsolicited packets sent by the specified applications. This configuration applies to packets transmitted in-band (for example, a network port on an IOM) and does not apply to packets transmitted out-of-band on the management interface on the CPM Ethernet port. Packets transmitted using the CPM Ethernet port use the address of the CPM Ethernet port as the IP source address in the packet. When a source address is specified for the PTP application, the port-based 1588 hardware timestamping assist function is applied to PTP packets matching the IPv4 address of the router interface used to ingress the IP address specified in this command. If the IP address is removed, the port-based 1588 hardware timestamping assist function is only applied to PTP packets matching the IPv4 address of the router interface.
Introduced	25.3.R2
Platforms	SAR Gen 2

ipv4 [application] *keyword*

Synopsis	Enter the **ipv4** list instance
Context	**configure** system security source-address ipv4 *keyword*

admin-password *hashed-leaf*

Synopsis	Administrative password for the enable command
Context	**configure** system security system-passwords admin-password *hashed-leaf*
Tree	admin-password
Description	This command allows a user with administrative permissions to configure a password that enables a user to become an administrator. This password is valid only for one session. When enabled, no authorization to TACACS + or RADIUS is performed and the user is locally regarded as an administrative user. If the **admin-password** is configured in the **configure system security system-passwords admin-password** context, any user can enter the special mode by entering the **enable** command. **enable** is in the default profile. By default, all users are given access to this command. After the **enable** command is entered, the user is prompted for a password. If the password matches, the user is given unrestricted access to all commands.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

	The minimum length of the password is determined by the **minimum-length** command. The complexity requirements for the password are determined by the **complexity** command. **Note:** This command applies to a local user, in addition to users on RADIUS, TACACS, and LDAP. (none)

Introduced	25.3.R2
Platforms	SAR Gen 2

client-cipher-list [client-cipher-list-name] *named-item*

Synopsis	Enter the **client-cipher-list** list instance
Context	**configure** system security tls client-cipher-list *named-item*
Tree	client-cipher-list
Description	Commands in this context create a cipher list the client sends to the server in the client Hello message. It consists of a list of ciphers supported and preferred by SR OS for use in the TLS session. The server matches this client list against the server cipher list. The most preferred cipher found in both lists is chosen.
Max. instances	16
Introduced	25.3.R2
Platforms	SAR Gen 2

[**client-cipher-list-name**] *named-item*

Synopsis	Client cipher list name
Context	**configure** system security tls client-cipher-list *named-item*
Tree	client-cipher-list
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

tls12-cipher [index] *number*

Synopsis	Enter the **tls12-cipher** list instance
Context	**configure** system security tls client-cipher-list *named-item* tls12-cipher *number*
Tree	tls12-cipher
Description	Commands in this context configure the cipher suite that is negotiated by the server and client.
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

[**index**] *number*

Synopsis	Index of the cipher
Context	**configure** system security tls client-cipher-list *named-item* tls12-cipher *number*
Tree	tls12-cipher
Description	This command configures the index number of the cipher. The index number provides the location of the cipher in the negotiation list; the lower index numbers are higher in the list, and the higher index numbers are lower in the list.
Range	1 to 255
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

status-verify

Synopsis	Enter the **status-verify** context
Context	**configure** system security tls client-tls-profile *named-item* status-verify
Tree	status-verify
Description	Commands in this context configure certificate revocation status verification options for the end-entity certificate in a TLS client.
Introduced	25.3.R2
Platforms	SAR Gen 2

default-result *keyword*

Synopsis	Default result of certificate status verification
Context	**configure** system security tls client-tls-profile *named-item* status-verify default-result *keyword*
Tree	default-result
Description	This command configures the default result of the entity certificate verification in the TLS client profile. This command overwrites the EE certificate revocation verification for the TLS client profile. By default the router checks the certification revocation status, but if this command is set to **good**, the end-entity certificate revocation status is overwritten and a good revocation status is returned for the EE certificate. If this command is set to **revoked**, the router returns the actual revocation status of the end-entity certificate.
Options	revoked, good
Default	revoked
Introduced	25.3.R2
Platforms	SAR Gen 2

ee-revocation

Synopsis	Enter the **ee-revocation** context

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

status-verify

Synopsis	Enter the **status-verify** context
Context	**configure** system security tls server-tls-profile *named-item* status-verify
Tree	status-verify
Description	Commands in this context configure certificate revocation status verification options for the end-entity certificate in a TLS server.
Introduced	25.3.R2
Platforms	SAR Gen 2

default-result *keyword*

Synopsis	Default result of certificate status verification
Context	**configure** system security tls server-tls-profile *named-item* status-verify default-result *keyword*
Tree	default-result
Description	This command configures the default result of the entity certificate verification in the TLS server profile. This command overwrites the EE certificate revocation verification for the TLS server profile. By default the router checks the certification revocation status, but if this command is set to **good**, the end-entity certificate revocation status is overwritten and a good revocation status is returned for the EE certificate. If this command is set to **revoked**, the router returns the actual revocation status of the end-entity certificate.
Options	revoked, good
Default	revoked
Introduced	25.3.R2
Platforms	SAR Gen 2

ee-revocation

Synopsis	Enter the **ee-revocation** context
Context	**configure** system security tls server-tls-profile *named-item* status-verify ee-revocation
Tree	ee-revocation
Description	Commands in this context configure the methods used to verify the end entity certificate revocation status for the TLS server profile.
Introduced	25.3.R2

use-pqc-only *boolean*

Synopsis	Negotiate only PQC ciphers, groups, and signatures
Context	**configure** system security tls use-pqc-only *boolean*
Tree	use-pqc-only
Description	When configured to **true**, the router only uses PQC algorithms. When configured to **true**, the system requires that the signature, cipher, and group lists must each have at least one PQC algorithm configured. If this condition is not met, the system does not allow the list to be assigned to an administratively enabled server or client TLS profile. In addition, with this command enabled, TLS 1.3 only advertises PQC algorithms within each list in the TLS handshake and ignores any non-PQC algorithms, if they are present in the list. This is a system-wide token and, when enabled, it affects all TLS sessions. Consequently, it cannot be enabled if any server or client TLS profiles contain existing lists that do not support PQC algorithms. To enable this command, the user must first add a PQC algorithm to all lists that are assigned to administratively enabled profiles. When configured to **false**, the router allows both non-PQC and PQC algorithms to be negotiated.
Default	false
Introduced	26.7.R1
Platforms	SAR Gen 2

Platforms SAR Gen 2

authentication-order

Synopsis Enter the **authentication-order** context

Context **configure** system security user-params authentication-order

Tree authentication-order

Description Commands in this context configure the sequence in which the system attempts authentication and authorization among the local user database, RADIUS servers, TACACS+ servers, and LDAP servers.

Configure the order from the most preferred method to the least preferred. The presence of all methods in the command line does not guarantee they are all operational. Specifying options that are not available delays user authentication.

If all operational methods are attempted and no authentication for a particular login has been granted, an entry in the security log records the failed attempt. Both the attempted login identification and originating IP address are logged with a timestamp.

The default order is [**radius tacplus ldap local**].

The order is not applicable to SNMPv3. SNMPv3 messages ignore the configured order and are authorized using the locally configured users only. TACACS+, RADIUS, and LDAP are not supported for SNMPv3 authentication.

Note: This command applies to a local user, in addition to users on RADIUS, TACACS+, and LDAP.

Introduced 25.3.R2

Platforms SAR Gen 2

exit-on-reject *boolean*

Synopsis Ignore subsequent AAA methods after a reject

Context **configure** system security user-params authentication-order exit-on-reject *boolean*

Tree exit-on-reject

Description When configured to **true**, the router stops authentication if one of the AAA methods configured in the authentication order sends a rejection.

When configured to **false**, the router attempts the next AAA method if a AAA method sends a rejection. If all AAA methods are exhausted, authentication and authorization is rejected.

If the order specifies **local** as the first method, the following actions apply:

- If this command is set to **true** and the user does not exist, the user is not authenticated.
- If the user can be authenticated locally, other methods, if configured, are used for authorization and accounting.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- If the user is configured locally but without console access, login is denied.

Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

Platforms	SAR Gen 2

disallow-sequence-keys *number*

Synopsis	Minimum length of disallowed sequential characters
Context	**configure** system security user-params local-user password complexity-rules disallow-sequence-keys *number*
Tree	disallow-sequence-keys
Description	This command configures the number of consecutive characters that are not allowed to be entered as part of the password on a U.S. English or Korean keyboard. These characters can be lowercase or uppercase letters, or numbers. Special characters are not taken into account. These consecutive characters can be horizontal (left to right) or (right to left) or diagonal (up to bottom or bottom to top). If the number of consecutive characters is equal to or larger than the configured value, the password is disallowed. For example, if the user attempts to use the password "dsalkjhgfdsa", with this command configured to 8, the system rejects the password because the first consecutive sequence "dsa" is 3 lowercase letters, which passes the check, but the second consecutive sequence is "lkjhgfdsa", which consists of 9 consecutive lowercase letters and this does not pass the check.
Range	2 to 8
Introduced	25.3.R2
Platforms	SAR Gen 2

minimum-classes *number*

Synopsis	Minimum number of different character classes to use
Context	**configure** system security user-params local-user password complexity-rules minimum-classes *number*

restricted-to-home *boolean*

Synopsis	Restrict file access to the home directory of the user
Context	**configure** system security user-params local-user user *named-item* restricted-to-home *boolean*
Tree	restricted-to-home
Description	When configured to **true**, the router denies the user from accessing files outside of their local home directory. Files can be accessed locally by CLI file commands and output modifiers such as **>** (file redirect). The system denies all configuration save operations (such as **admin save**) via any management interface (such as CLI and NETCONF) unless **save-when-restricted** is enabled. File access is denied unless a home directory is configured and the directory is created by an administrator. When configured to **false**, the router permits the user to access all files on the system and to remote files.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

save-when-restricted *boolean*

Synopsis	Save configurations when the user is restricted to home
Context	**configure** system security user-params local-user user *named-item* save-when-restricted *boolean*
Tree	save-when-restricted
Description	When configured to **true**, the system permits configuration save operations for all configuration regions (such as bof and configure) via any management interface (such as CLI and NETCONF) even if **restricted-to-home** is enabled. The configuration for each region can be saved with **admin save** CLI commands or when committed over NETCONF and gRPC.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

When configured to **false**, the system denies saving the configuration when **restricted-to-home** is enabled, unless the home directory of the user includes the location of the saved configuration file.

Default true

authentication

Synopsis Enable the **authentication** context

Context **configure** system security user-params local-user user *named-item* snmp authentication

Tree authentication

Description Commands in this context configure the SNMPv3 authentication and privacy protocols for the user to communicate with the router. The keys are stored in an encrypted format in the configuration.

The keys configured with these commands must be localized keys, which are a hash of the SNMP engine ID and a password. The password is not entered directly in this command. Use the **tools perform system management-interface snmp generate-key** command to generate localized authentication and privacy keys.

If authentication is not configured, only the username is required to allow and authenticate SNMPv3 operations.

Introduced 25.3.R2

Platforms SAR Gen 2

authentication-key *encrypted-leaf-hex-without-prefix*

Synopsis Localized authentication key

Platforms	SAR Gen 2

vprn-network-exceptions

Synopsis	Enable the **vprn-network-exceptions** context
Context	**configure** system security vprn-network-exceptions
Tree	vprn-network-exceptions

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	Commands in this context configure the rate limiting attributes for processing packets with label TTL expiry received within an LSP shortcut or VPRN instances in the system and from all network IP interfaces. This includes labeled user and control plan packets, ping, and traceroute packets within GRT and VPRN, and ICMP replies. These commands do not rate limit MPLS or service OAM packets.
Introduced	25.3.R2
Platforms	SAR Gen 2

count *number*

Synopsis	Limit of exception messages received
Context	**configure** system security vprn-network-exceptions count *number*
Tree	count
Description	This command specifies the threshold limit of exception messages. If the threshold value is exceeded within the configured time interval, packets are dropped.
Range	10 to 1000
Default	100
Introduced	25.3.R2
Platforms	SAR Gen 2

window *number*

Synopsis	Time interval to measure exception messages
Context	**configure** system security vprn-network-exceptions window *number*
Tree	window
Description	This command configures the time interval within which exception messages are counted. If the threshold value is exceeded within the configured time interval, packets are dropped.
Range	1 to 60
Units	seconds
Default	10

retries *number*

Synopsis	Number of probe retries before closing the connection
Context	**configure** system telemetry destination-group *named-item* tcp-keepalive retries *number*
Tree	retries
Description	This command configures the number of missed TCP keepalive probes before closing the TCP connection and attempting to reach the other destinations within the same destination group.
Range	3 to 100
Default	4
Introduced	25.3.R2
Platforms	SAR Gen 2

tls-client-profile *reference*

Synopsis	TLS client profile assigned to the destination group
Context	**configure** system telemetry destination-group *named-item* tls-client-profile *reference*
Tree	tls-client-profile
Reference	**configure** system security tls client-tls-profile *named-item*
Notes	The following elements are part of a choice: **allow-unsecure-connection** or **tls-client-profile**.
Introduced	25.3.R2
Platforms	SAR Gen 2

notification-bundling

Synopsis	Enter the **notification-bundling** context
Context	**configure** system telemetry notification-bundling
Tree	notification-bundling
Description	Commands in this context configure the bundling of multiple notifications into one telemetry message.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

admin-state *keyword*

Synopsis	Administrative state of notification bundling
Context	**configure** system telemetry notification-bundling admin-state *keyword*
Tree	admin-state
Options	enable, disable
Default	disable
Introduced	25.3.R2
Platforms	SAR Gen 2

max-msg-count *number*

Synopsis	Maximum notifications count in telemetry message bundle
Context	**configure** system telemetry notification-bundling max-msg-count *number*
Tree	max-msg-count
Range	2 to 1000
Default	100
Introduced	25.3.R2
Platforms	SAR Gen 2

max-time-granularity *number*

Synopsis	Maximum interval when bundling of notifications occurs
Context	**configure** system telemetry notification-bundling max-time-granularity *number*
Tree	max-time-granularity
Description	This command sets the maximum time interval during which telemetry notifications are bundled. All bundled notifications have the same timestamp, which is the timestamp of the bundle.
Range	1 to 1000
Units	milliseconds
Default	100
Introduced	25.3.R2
Platforms	SAR Gen 2

persistent-subscriptions

Synopsis	Enter the **persistent-subscriptions** context
Context	**configure** system telemetry persistent-subscriptions
Tree	persistent-subscriptions
Introduced	25.3.R2
Platforms	SAR Gen 2

delay-on-boot *number*

Synopsis	Delay for persistent subscriptions after system boot
Context	**configure** system telemetry persistent-subscriptions delay-on-boot *number*
Tree	delay-on-boot
Description	This command configures the delay timer for gRPC telemetry persistent subscriptions. When the timer expires, gRPC telemetry persistent subscriptions become operational and connections are initiated. This delay prevents the system from trying to establish gRPC persistent subscriptions while it is still converging. When no delay is configured, gRPC telemetry persistent subscriptions are initiated after the system boots and gRPC becomes operational.
Range	1 to 3600
Units	seconds
Introduced	25.3.R2
Platforms	SAR Gen 2

subscription [name] *named-item*

Options	target-defined, on-change, sample
Introduced	25.3.R2
Platforms	SAR Gen 2

originated-qos-marking *keyword*

Synopsis	QoS marking used for telemetry notification packets
Context	**configure** system telemetry persistent-subscriptions subscription *named-item* originated-qos-marking *keyword*
Tree	originated-qos-marking
Options	be, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cs1, cp9, af11, cp11, af12, cp13, af13, cp15, cs2, cp17, af21, cp19, af22, cp21, af23, cp23, cs3, cp25, af31, cp27, af32, cp29, af33, cp31, cs4, cp33, af41, cp35, af42, cp37, af43, cp39, cs5, cp41, cp42, cp43, cp44, cp45, ef, cp47, nc1, cp49, cp50, cp51, cp52, cp53, cp54, cp55, nc2, cp57, cp58, cp59, cp60, cp61, cp62, cp63
Introduced	25.3.R2
Platforms	SAR Gen 2

sample-interval *number*

Synopsis	Sampling interval for the persistent subscription
Context	**configure** system telemetry persistent-subscriptions subscription *named-item* sample-interval *number*
Tree	sample-interval
Description	This command configures the sampling interval for the persistent subscription. The interval applies only in sampling or target-defined modes.
Range	1000 to 18446744073709551615
Units	milliseconds
Default	10000
Introduced	25.3.R2
Platforms	SAR Gen 2

sensor-group *reference*

Synopsis	Sensor group used in the persistent subscription
Context	**configure** system telemetry persistent-subscriptions subscription *named-item* sensor-group *reference*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	sensor-group
Description	This command specifies the sensor group to be used in the persistent subscription. If no valid paths exist in the sensor group, the configuration is accepted, however, no gRPC connection is established when persistent subscription is activated.
Reference	**configure** system telemetry sensor-groups sensor-group *named-item*
Introduced	25.3.R2
Platforms	SAR Gen 2

sensor-groups

Synopsis	Enter the **sensor-groups** context
Context	**configure** system telemetry sensor-groups
Tree	sensor-groups
Introduced	25.3.R2
Platforms	SAR Gen 2

sensor-group [name] *named-item*

Synopsis	Enter the **sensor-group** list instance
Context	**configure** system telemetry sensor-groups sensor-group *named-item*
Tree	sensor-group
Max. instances	225
Introduced	25.3.R2
Platforms	SAR Gen 2

[**name**] *named-item*

Synopsis	Sensor group name
Context	**configure** system telemetry sensor-groups sensor-group *named-item*
Tree	sensor-group
String length	1 to 32
String format	'string-not-all-spaces' must contain at least one non-space character
Notes	This element is part of a list key.
Introduced	25.3.R2

Platforms	SAR Gen 2

description *description*

Synopsis	Text description
Context	**configure** system telemetry sensor-groups sensor-group *named-item* description *description*
Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.3.R2
Platforms	SAR Gen 2

path [xpath] *string*

Synopsis	Add a list entry for **path**
Context	**configure** system telemetry sensor-groups sensor-group *named-item* path *string*
Tree	path
Max. instances	4500
Introduced	25.3.R2
Platforms	SAR Gen 2

[**xpath**] *string*

Synopsis	gNMI path to be streamed
Context	**configure** system telemetry sensor-groups sensor-group *named-item* path *string*
Tree	path
Description	This command configures a path for the specified sensor group. Multiple paths can be defined for a single sensor group. Streamed data includes all descendants of the tree indicated by the path. The path is defined in the form of an XML Path (XPath) syntax that refers to single or multiple objects within the YANG model. The path must be enclosed in quotation marks (") when it includes a list key, for example, "/state/router[router-name=Base]".
String length	1 to 512
Notes	This element is part of a list key.

Tree	cflash-cap-alarm-percent
Introduced	25.3.R2
Platforms	SAR Gen 2

[**cflash-id**] *thresholds-cflash-url*

Synopsis	cflash device name monitored for capacity
Context	**configure** system thresholds cflash-cap-alarm-percent *thresholds-cflash-url*
Tree	cflash-cap-alarm-percent
String length	1 to 200
String format	'thresholds-cflash-url' must be cf1-4 with slot A-D (e.g. cf1-A:)
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

falling-threshold *number*

Synopsis	Falling threshold for the sampled statistic
Context	**configure** system thresholds cflash-cap-alarm-percent *thresholds-cflash-url* falling-threshold *number*
Tree	falling-threshold

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command specifies a falling threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, a single threshold-crossing event is generated. A single threshold-crossing event is also generated if the first sample taken is less than or equal to this threshold and the associated **startup-alarm** command is equal to the **falling** or **either** values. After a falling threshold-crossing event is generated, another such event is not generated until the sampled value rises above this threshold and reaches greater than or equal to the **rising-threshold** command.
Range	0 to 100
Units	percent
Introduced	25.3.R2
Platforms	SAR Gen 2

interval *number*

Synopsis	Polling period over which data is sampled and compared
Context	**configure** system thresholds cflash-cap-alarm-percent *thresholds-cflash-url* interval *number*
Tree	interval
Description	This command specifies the polling interval over which the data is sampled and compared with the rising and falling thresholds.
Range	1 to 2147483647
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

rising-threshold *number*

Synopsis	Rising threshold for the sampled statistic
Context	**configure** system thresholds cflash-cap-alarm-percent *thresholds-cflash-url* rising-threshold *number*
Tree	rising-threshold
Description	This command specifies a rising threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single threshold-crossing event is generated. A single threshold crossing event is also generated if the first sample taken is greater than or equal to this threshold and the associated **startup-alarm** command is equal to the **rising** or **either** values.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

After a rising threshold-crossing event is generated, another such event is not generated until the sampled value falls below this threshold and reaches less than or equal the **falling-threshold** command.

Range	0 to 100
Units	percent
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

rmon-event-type *keyword*

Synopsis	Notification type specifying action when event occurs
Context	**configure** system thresholds cflash-cap-alarm-percent *thresholds-cflash-url* rmon-event-type *keyword*
Tree	rmon-event-type
Options	none, log, trap, both
Default	both
Introduced	25.3.R2
Platforms	SAR Gen 2

startup-alarm *keyword*

Synopsis	Alarm type when the alarm is first created
Context	**configure** system thresholds cflash-cap-alarm-percent *thresholds-cflash-url* startup-alarm *keyword*
Tree	startup-alarm
Description	This command specifies the alarm type that may be sent when this alarm is first created. If the first sample is greater than or equal to the rising threshold value and **startup-alarm** is equal to **rising** or **either**, a single rising threshold crossing event is generated. If the first sample is less than or equal to the falling threshold value and **startup-alarm** is equal to **falling** or **either**, a single falling threshold crossing event is generated.
Options	rising – Raise TCA if threshold is crossed in upward direction falling – Raise TCA if threshold is crossed in downward direction either – Raise TCA if threshold is crossed from either direction
Default	either
Introduced	25.3.R2
Platforms	SAR Gen 2

Introduced	25.3.R2
Platforms	SAR Gen 2

alarm [rmon-alarm-id] *number*

Synopsis	Enter the **alarm** list instance
Context	**configure** system thresholds rmon alarm *number*
Tree	alarm
Description	Commands in this context configure an entry in the RMON-MIB alarmTable and controls the monitoring and triggering of threshold crossing events. At least one associated **configure system thresholds rmon event** command must be configured to trigger the notification or logging of a threshold crossing event. The agent periodically takes statistical sample values from the MIB variable specified for monitoring and compares them to thresholds configured with this command. This command configures the MIB variable for monitoring, the polling period (interval), the sampling type (absolute or delta value), and the rising and falling threshold commands. If a sample has crossed a threshold value, the associated event is generated.
Max. instances	1200
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

[**rmon-alarm-id**] *number*

Synopsis	RMON alarm identifier

interval *number*

Synopsis	Polling period over which data is sampled and compared
Context	**configure** system thresholds rmon alarm *number* interval *number*
Tree	interval
Description	This command specifies the polling interval over which the data is sampled and compared with the rising and falling thresholds. When setting this interval value, take care in the case of **delta** type sampling, set the interval short enough that the sampled variable is very unlikely to increase or decrease by more than 2147483647 - 1 during a single sampling interval. Take care to avoid setting the interval value too low, to avoid creating unnecessary processing overhead.
Range	1 to 2147483647
Units	seconds
Notes	This element is mandatory.
Introduced	25.3.R2
Platforms	SAR Gen 2

owner *string*

Synopsis	Owner that created this entry and uses the resources
Context	**configure** system thresholds rmon alarm *number* owner *string*
Tree	owner
Description	This command configures the owner of the alarm. This command allows entries created in the RMON-MIB alarmTable by remote SNMP managers to save and reload in a CLI configuration file. CLI users do not normally configure the owner.
String length	1 to 80
Default	TiMOS CLI
Introduced	25.3.R2
Platforms	SAR Gen 2

rising-event *number*

Tree	owner
Description	This command configures the owner of the alarm.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

This command allows entries created in the RMON-MIB alarmTable by remote SNMP managers to save and reload in a CLI configuration file. CLI users do not normally configure the owner.

String length	1 to 80
Default	TiMOS CLI
Introduced	25.3.R2
Platforms	SAR Gen 2

hc-alarm [rmon-hc-alarm-id] *number*

Synopsis	Enter the **hc-alarm** list instance
Context	**configure** system thresholds rmon hc-alarm *number*
Tree	hc-alarm
Description	Commands in this context configure an entry in the HC-ALARM-MIB hcAlarmTable and controls the monitoring and triggering of threshold crossing events. At least one associated **configure system thresholds rmon event** command must be configured to trigger the notification or logging of a threshold crossing event. The agent periodically takes statistical sample values from the MIB variable specified for monitoring and compares them to thresholds configured with this command. This command configures the MIB variable for monitoring, the polling period (interval), the sampling type (absolute or delta value), and the rising and falling threshold commands. If a sample has crossed a threshold value, the associated event is generated.
Max. instances	1200
Introduced	25.10.R1
Platforms	SAR Gen 2

[**rmon-hc-alarm-id**] *number*

Synopsis	RMON high capacity alarm identifier
Context	**configure** system thresholds rmon hc-alarm *number*
Tree	hc-alarm
Range	1 to 65400
Notes	This element is part of a list key.
Introduced	25.10.R1
Platforms	SAR Gen 2

falling-event *number*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	RMON event ID for falling threshold crossing event
Context	**configure** system thresholds rmon hc-alarm *number* falling-event *number*
Tree	falling-event
Range	1 to 65400
Introduced	25.10.R1
Platforms	SAR Gen 2

falling-threshold *number*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Threshold for the falling sampled statistic
Context	**configure** system thresholds rmon hc-alarm *number* falling-threshold *number*
Tree	falling-threshold
Description	This command configures the router to create a threshold event when the current sampled value is less than or equal to this threshold value, and the value at the last sampling interval was greater than this threshold. A single threshold crossing event is also generated if the first sample taken is less than or equal to this threshold and the associated **startup-alarm** is equal to **falling** or **either**. After a falling threshold crossing event is generated, another such event is not generated until the sampled value rises above this threshold and reaches greater than or equal to the **rising-threshold** value.
Range	-9223372036854775806 to 9223372036854775807
Introduced	25.10.R1
Platforms	SAR Gen 2

interval *number*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Polling period over which data is sampled and compared
Context	**configure** system thresholds rmon hc-alarm *number* interval *number*
Tree	interval
Description	This command specifies the polling interval over which the data is sampled and compared with the rising and falling thresholds.
Range	1 to 2147483647
Units	seconds
Notes	This element is mandatory.
Introduced	25.10.R1
Platforms	SAR Gen 2

owner *string-not-all-spaces*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Owner that created this entry and uses the resources
Context	**configure** system thresholds rmon hc-alarm *number* owner *string-not-all-spaces*
Tree	owner
Description	This command configures the owner of the entry. This command allows entries created in the HC-ALARM-MIB hcAlarmTable by a remote SNMP or YANG manager to be tagged as belonging to a set of entries defined by the manager.
String length	1 to 127
Default	TiMOS CLI
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.10.R1
Platforms	SAR Gen 2

rising-event *number*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	RMON event ID for rising threshold crossing event
Context	**configure** system thresholds rmon hc-alarm *number* rising-event *number*
Tree	rising-event
Range	1 to 65400
Introduced	25.10.R1
Platforms	SAR Gen 2

rising-threshold *number*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Threshold for the rising sampled statistic
Context	**configure** system thresholds rmon hc-alarm *number* rising-threshold *number*
Tree	rising-threshold
Description	This command configures the router to create a single threshold crossing event when the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold. A single threshold crossing event is also generated if the first sample taken is greater than or equal to this threshold and the associated **startup-alarm** is equal to **rising** or **either**. After a rising threshold crossing event is generated, another such event is not generated until the sampled value falls below this threshold and reaches less than or equal the **falling-threshold** value.
Range	-9223372036854775806 to 9223372036854775807
Introduced	25.10.R1
Platforms	SAR Gen 2

sample-type *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Sampling type for value comparison with thresholds
Context	**configure** system thresholds rmon hc-alarm *number* sample-type *keyword*
Tree	sample-type
Options	absolute – Value compared with end sampling interval thresholds delta – Selected minus current and compared with thresholds
Default	absolute
Introduced	25.10.R1
Platforms	SAR Gen 2

startup-alarm *keyword*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	TCA type eligible to be raised on the test's first poll
Context	**configure** system thresholds rmon hc-alarm *number* startup-alarm *keyword*
Tree	startup-alarm
Options	rising – Raise TCA if threshold is crossed in upward direction falling – Raise TCA if threshold is crossed in downward direction either – Raise TCA if threshold is crossed from either direction
Default	either
Introduced	25.10.R1
Platforms	SAR Gen 2

variable-oid *string*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Object identifier to sample the specific variable

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** system thresholds rmon hc-alarm *number* variable-oid *string*
Tree	variable-oid
Description	This command configures the SNMP object identifier of the particular variable for sampling. Only SNMP variables that resolve to an ASN.1 primitive type of integer (Integer32, Counter32, Counter64, Gauge, or TimeTicks) may be sampled. The *oid-string* may be expressed using either the dotted string notation or as object name plus dotted instance identifier. For example, "1.3.6.1.2.1.2.2.1.10.184582144" or "ifInOctets.184582144".
String length	1 to 255
Notes	This element is mandatory.
Introduced	25.10.R1
Platforms	SAR Gen 2

time

Synopsis	Enter the **time** context
Context	**configure** system time
Tree	time
Introduced	25.3.R2
Platforms	SAR Gen 2

daylight-saving-time-zone

Synopsis	Enter the **daylight-saving-time-zone** context
Context	**configure** system time daylight-saving-time-zone
Tree	daylight-saving-time-zone
Description	Commands in this context configure the start and end dates and offset for summer time (or Daylight Savings Time [DST]). A daylight savings time zone can be specified using a standard name or a non-standard name. The parameters (start day, end day, and offset) for a standard name zone are well defined and not configurable. The parameters for a nonstandard name zone are configurable. The time is adjusted by adding the offset when summer time starts and subtracting the offset when summer time ends. If no summer (daylight savings) time is supplied, the system assumes no summer time adjustment is required.
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

non-standard

Synopsis	Enter the **non-standard** context
Context	**configure** system time daylight-saving-time-zone non-standard
Tree	non-standard
Notes	The following elements are part of a choice: **non-standard** or **standard**.
Introduced	25.3.R2
Platforms	SAR Gen 2

end

Synopsis	Enter the **end** context
Context	**configure** system time daylight-saving-time-zone non-standard end
Tree	end
Description	Commands in this context configure the end of summer time settings.
Introduced	25.3.R2
Platforms	SAR Gen 2

day *keyword*

Synopsis	Day of the week when summer time ends
Context	**configure** system time daylight-saving-time-zone non-standard end day *keyword*
Tree	day
Options	sunday, monday, tuesday, wednesday, thursday, friday, saturday
Default	sunday
Introduced	25.3.R2
Platforms	SAR Gen 2

hours-minutes *hours-minutes-twenty-four*

Synopsis	Time when summer time ends, in hh:mm format
Context	**configure** system time daylight-saving-time-zone non-standard end hours-minutes *hours-minutes-twenty-four*
Tree	hours-minutes
String length	5

authentication-keychain *reference*

Synopsis	Keychain used to authenticate broadcast messages

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** system time ntp broadcast *reference* interface-name *interface-name* authentication-keychain *reference*
Tree	authentication-keychain
Description	This command configures the keychain used to authenticate messages sent by this node. The keychain infrastructure is queried using this keychain name to get the youngest key used for generating the authentication value for the message. When an NTP packet is received by this node, the keychain infrastructure is queried using the keychain name and the key ID extracted from the received message to get the key used to perform the authentication check. If authentication does not pass, the packet is rejected. Keychain entries also have a direction. The key ID and authentication keychain are mutually exclusive. When neither one is set, for example, the key ID has a value of '0' and the value of this command is empty, no authentication is performed.
Reference	**configure** system security keychains keychain *named-item*
Notes	The following elements are part of a choice: **authentication-keychain** or **key-id**.
Introduced	25.3.R2
Platforms	SAR Gen 2

Tree	authenticate
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

max-poll *number*

Synopsis	Value for the maximum polling interval as a power of 2
Context	**configure** system time ntp max-poll *number*
Tree	max-poll
Description	This command configures the value used to calculate the maximum polling interval set for the server. The poll interval set by NTP may be as high as the configured number to the power of 2. For example, if 6 is configured, 2 to the power of 6 (2^6) equals 64. If the value is set to a number lower than the **configure system time ntp min-poll** value, the system rejects the change request.
Range	4 to 10
Default	6
Introduced	26.7.R1
Platforms	SAR Gen 2

min-poll *number*

Synopsis	Value for the minimum polling interval as a power of 2
Context	**configure** system time ntp min-poll *number*
Tree	min-poll

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Description	This command configures the value used to calculate the minimum polling interval set for the server. The poll interval set by NTP may be as low as the configured number to the power of 2. For example, if 6 is configured, 2 to the power of 6 (2^6) equals 64. If the value is set to a number higher than the **configure system time ntp max-poll**, the system rejects the change request.
Range	4 to 10
Default	6
Introduced	26.7.R1
Platforms	SAR Gen 2

server [ip-address] *(ipv4-address-no-zone | ipv6-address-no-zone | keyword)* router-instance *string*

Synopsis	Enter the **server** list instance
Context	**configure** system time ntp server *(ipv4-address-no-zone | ipv6-address-no-zone | keyword)* router-instance *string*
Tree	server
Introduced	25.3.R2
Platforms	SAR Gen 2

[**ip-address**] *(ipv4-address-no-zone | ipv6-address-no-zone | keyword)*

Synopsis	IP address of an external NTP server
Context	**configure** system time ntp server *(ipv4-address-no-zone | ipv6-address-no-zone | keyword)* router-instance *string*
Tree	server
Options	ptp
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

router-instance *string*

Synopsis	Router name or VPRN service name
Context	**configure** system time ntp server *(ipv4-address-no-zone | ipv6-address-no-zone | keyword)* router-instance *string*
Tree	server
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

authentication-keychain *reference*

Synopsis	Keychain used to authenticate broadcast messages
Context	**configure** system time ntp server *(ipv4-address-no-zone | ipv6-address-no-zone | keyword)* router-instance *string* authentication-keychain *reference*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	authentication-keychain
Description	This command configures the keychain used to authenticate messages sent by this node. The keychain infrastructure is queried using this keychain name to get the youngest key used for generating the authentication value for the message. When an NTP packet is received by this node, the keychain infrastructure is queried using the keychain name and the key ID extracted from the received message to get the key used to perform the authentication check. If authentication does not pass, the packet is rejected. Keychain entries also have a direction. The key ID and authentication keychain are mutually exclusive. When neither one is set, for example, the key ID has a value of '0' and the value of this command is empty, no authentication is performed.
Reference	**configure** system security keychains keychain *named-item*
Notes	The following elements are part of a choice: **authentication-keychain** or **key-id**.
Introduced	25.3.R2
Platforms	SAR Gen 2

key-id *reference*

Synopsis	Authentication key and type used by the node
Context	**configure** system time ntp server *(ipv4-address-no-zone* | *ipv6-address-no-zone* | *keyword)* router-instance *string* key-id *reference*
Tree	key-id
Reference	**configure** system time ntp authentication-key *number*
Notes	The following elements are part of a choice: **authentication-keychain** or **key-id**.
Introduced	25.3.R2
Platforms	SAR Gen 2

prefer *boolean*

Synopsis	Set NTP server as preferred to receive time
Context	**configure** system time ntp server *(ipv4-address-no-zone* | *ipv6-address-no-zone* | *keyword)* router-instance *string* prefer *boolean*
Tree	prefer
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

version *number*

Synopsis	NTP version number generated by the node
Context	**configure** system time ntp server *(ipv4-address-no-zone | ipv6-address-no-zone | keyword)* router-instance *string* version *number*
Tree	version
Description	This command specifies the NTP version number that is generated by the node. This command does not need to be configured when in client mode, in which case all three versions are accepted.
Range	2 to 4
Default	4
Introduced	25.3.R2
Platforms	SAR Gen 2

prefer-local-time *boolean*

Synopsis	Use local time over UTC time in the system
Context	**configure** system time prefer-local-time *boolean*
Tree	prefer-local-time
Description	When configured to **true**, the system uses local time. This preference is applied to objects such as log file names, created and completed times reported in log files, NETCONF and gRPC date-and-time leafs, and rollback times displayed in **show** command outputs. When configured to **false**, the system uses UTC time. **Note**: The timezone used for **show** command outputs during a CLI session can be controlled using the **environment time-display** command. **Note**: The format used for the date-time strings may change, depending on the command setting. For example, when this command is set to **true**, all date-time strings include a suffix of three to five characters that indicates the timezone used. **Note**: The time format for timestamps on log events is controlled on a per-log basis, using the **configure log log-id time-format** command.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

sntp

Synopsis	Enter the **sntp** context

4.30.1 test-oam command descriptions

test-oam

Synopsis	Enter the **test-oam** context
Context	**configure** test-oam
Tree	test-oam
Introduced	25.3.R2
Platforms	SAR Gen 2

icmp

Synopsis	Enter the **icmp** context
Context	**configure** test-oam icmp
Tree	icmp
Introduced	25.3.R2
Platforms	SAR Gen 2

ipv6

Synopsis	Enter the **ipv6** context
Context	**configure** test-oam icmp ipv6
Tree	ipv6
Introduced	25.3.R2
Platforms	SAR Gen 2

length-field *boolean*

Synopsis	Use length field in ICMPv6 responses
Context	**configure** test-oam icmp ipv6 length-field *boolean*
Tree	length-field
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

maximum-original-datagram *boolean*

Synopsis	ICMPv6 traceroute responses with largest datagram
Context	**configure** test-oam icmp ipv6 maximum-original-datagram *boolean*
Tree	maximum-original-datagram
Description	When configured to **true**, this command enables the original datagram field of the ICMPv6 error message to be a maximum of 1232 bytes. When configured to **false**, the original datagram field of the ICMPv6 error message smaller than 1232 bytes be built smaller.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

mpls

Synopsis	Enter the **mpls** context
Context	**configure** test-oam mpls
Tree	mpls
Introduced	25.3.R2
Platforms	SAR Gen 2

echo-request-downstream-map *keyword*

Synopsis	Format of the downstream mapping TLV
Context	**configure** test-oam mpls echo-request-downstream-map *keyword*
Tree	echo-request-downstream-map
Description	This command specifies the format of the downstream mapping TLV to use in all LSP trace packets and LDP tree trace packets originated on this node. The following downstream mapping TLVs are supported: the original Downstream Mapping (DSMAP) TLV, defined in RFC 4379 (obsoleted by RFC 8029) and the Downstream Detailed Mapping (DDMAP) TLV, defined in RFC 6424. See the "DDMAP TLV" section in the *7705 SAR Gen 2 OAM and Diagnostics Guide* for more information.
Options	dsmap – Downstream Mapping TLV ddmap – Downstream Detailed Mapping TLV
Default	dsmap
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

timestamp-format *keyword*

Synopsis	Timestamp format for MPLS ping request and reply PDUs
Context	**configure** test-oam mpls timestamp-format *keyword*
Tree	timestamp-format
Options	rfc4379 – 1900-based timestamp (standard) unix – 1970-based timestamp
Default	unix
Introduced	25.3.R2
Platforms	SAR Gen 2

twamp

Synopsis	Enter the **twamp** context
Context	**configure** test-oam twamp
Tree	twamp
Description	Commands in this context configure the TWAMP functionality.
Introduced	25.3.R2
Platforms	SAR Gen 2

server

Synopsis	Enter the **server** context
Context	**configure** test-oam twamp server
Tree	server
Description	Commands in this context configure the node for TWAMP server functionality.
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of the TWAMP server
Context	**configure** test-oam twamp server admin-state *keyword*

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Tree	admin-state
Options	enable, disable
Default	disable
Introduced	25.3.R2
Platforms	SAR Gen 2

allow-ipv6-udp-checksum-zero *boolean*

Synopsis	Process IPv6 packets with a zero UDP checksum
Context	**configure** test-oam twamp server allow-ipv6-udp-checksum-zero *boolean*
Tree	allow-ipv6-udp-checksum-zero
Description	When configured to **true**, the router accepts IPv6 packets with UDP checksums of 0. This optional configuration allows the router to process arriving IPv6 TWAMP Test packets that contain IPv6 UDP checksum of 0x0000. The UDP port specific to this TWAMP Light test bypasses the default discard IPv6 UDP checksum 0x0000. If this optional command is not configured, IPv6 UDP checksum 0x000 arriving packets are discarded. When configured to **false**, the router discards packets that arrive with an IPv6 UDP checksum of 0x0000.
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

enforce-test-session-start-time *boolean*

Synopsis	Discard TWAMP packets before test-session start time
Context	**configure** test-oam twamp server enforce-test-session-start-time *boolean*
Tree	enforce-test-session-start-time
Description	When configured to **true**, the router checks the signalled test-session start time against the server time and discards TWAMP test packets that arrive before the negotiated test-session start time. When configured to **false**, the router processes all TWAMP test packets without checking the test-session start time against the server time.
Default	true
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

inactivity-timeout *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Inactivity time-out for TWAMP control connections
Context	**configure** test-oam twamp server inactivity-timeout *number*
Tree	inactivity-timeout
Description	This command configures the inactivity time-out for all TWAMP-control connections. If no TWAMP control message is exchanged over the TCP connection for this duration of time the connection is closed and all in-progress tests are terminated.
Range	60 to 3600
Units	seconds
Default	900
Introduced	25.3.R2
Platforms	SAR Gen 2

max-connections *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	TWAMP server control connections limit
Context	**configure** test-oam twamp server max-connections *number*
Tree	max-connections
Description	This command configures the maximum number of TWAMP control connections from all TWAMP clients. The system rejects a new control connection if accepting it causes either this limit or a prefix limit (**prefix max-connections**) to be exceeded.
Range	0 to 64
Default	32
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

max-sessions *number*

WARNING:
Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Maximum number of concurrent TWAMP server test sessions
Context	**configure** test-oam twamp server max-sessions *number*
Tree	max-sessions
Description	This command configures the maximum number of concurrent TWAMP-Test sessions across all allowed clients. The system rejects a new test session (described by a Request-TW-Session message) if accepting it causes either the limit defined by this command or a prefix limit (**prefix max-sessions**) to be exceeded.
Range	0 to 128
Default	32
Introduced	25.3.R2
Platforms	SAR Gen 2

prefix [ip-prefix] *(ipv4-prefix | ipv6-prefix)*

Synopsis	Enter the **prefix** list instance
Context	**configure** test-oam twamp server prefix *(ipv4-prefix | ipv6-prefix)*
Tree	prefix
Description	Commands in this context configure an IP address prefix containing one or more TWAMP clients. For a TWAMP client to connect to the TWAMP server (and subsequently conduct tests) it must establish the control connection using an IP address that is part of a configured prefix.
Max. instances	100
Introduced	25.3.R2
Platforms	SAR Gen 2

[**ip-prefix**] *(ipv4-prefix | ipv6-prefix)*

Synopsis	Prefix to match against TWAMP client address
Context	**configure** test-oam twamp server prefix *(ipv4-prefix | ipv6-prefix)*
Tree	prefix

4.31.1 vrrp command descriptions

vrrp

Synopsis	Enter the **vrrp** context
Context	**configure** vrrp
Tree	vrrp
Introduced	25.3.R2
Platforms	SAR Gen 2

policy [policy-id] *number*

Synopsis	Enter the **policy** list instance
Context	**configure** vrrp policy *number*
Tree	policy
Introduced	25.3.R2
Platforms	SAR Gen 2

[**policy-id**] *number*

Synopsis	Policy ID
Context	**configure** vrrp policy *number*
Tree	policy
Range	1 to 9999
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

admin-state *keyword*

Synopsis	Administrative state of VRRP priority control policy
Context	**configure** vrrp policy *number* admin-state *keyword*
Tree	admin-state
Options	enable, disable

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Default	enable
Introduced	25.3.R2
Platforms	SAR Gen 2

context *service-name*

WARNING:
Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Service name to which this policy applies
Context	**configure** vrrp policy *number* context *service-name*
Tree	context
String length	1 to 64
String format	'service-name' must contain at least one non-space character
Introduced	25.3.R2
Platforms	SAR Gen 2

delta-in-use-limit *number*

Synopsis	Limit on the delta priority control events
Context	**configure** vrrp policy *number* delta-in-use-limit *number*
Tree	delta-in-use-limit
Range	1 to 254
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

description *description*

Synopsis	Text description
Context	**configure** vrrp policy *number* description *description*
Tree	description
String length	1 to 80
String format	'string-not-all-spaces' must contain at least one non-space character
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

priority-event

Synopsis	Enter the **priority-event** context
Context	**configure** vrrp policy *number* priority-event
Tree	priority-event
Introduced	25.3.R2
Platforms	SAR Gen 2

host-unreachable [ip-address] *(ipv4-address-with-zone | ipv6-address-with-zone)*

Synopsis	Enter the **host-unreachable** list instance
Context	**configure** vrrp policy *number* priority-event host-unreachable *(ipv4-address-with-zone | ipv6-address-with-zone)*
Tree	host-unreachable
Introduced	25.3.R2
Platforms	SAR Gen 2

[ip-address] *(ipv4-address-with-zone | ipv6-address-with-zone)*

Synopsis	Host IP address that receives a constant ping probe
Context	**configure** vrrp policy *number* priority-event host-unreachable *(ipv4-address-with-zone | ipv6-address-with-zone)*
Tree	host-unreachable
Description	This command configures the host IP address for which the specific host unreachable priority event monitors connectivity with a continuous ICMP echo request (ping) probe.
String format	'ipv4-address-with-zone' must be a.b.c.d with optional %zone-id 'ipv6-address-with-zone' must be valid IPv6 with optional %zone-id 'ipv6-address-with-zone' must be valid IPv6 with optional %zone-id
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

drop-count *number*

Synopsis	Threshold for consecutive message send attempts

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** vrrp policy *number* priority-event host-unreachable *(ipv4-address-with-zone | ipv6-address-with-zone)* drop-count *number*
Tree	drop-count
Range	1 to 60
Default	3
Introduced	25.3.R2
Platforms	SAR Gen 2

hold-clear *number*

Synopsis	Delay time for a cleared event on the router instance
Context	**configure** vrrp policy *number* priority-event host-unreachable *(ipv4-address-with-zone | ipv6-address-with-zone)* hold-clear *number*
Tree	hold-clear
Range	1 to 86400
Units	seconds
Introduced	25.3.R2
Platforms	SAR Gen 2

hold-set *number*

Synopsis	Hold time before transitioning to cleared state
Context	**configure** vrrp policy *number* priority-event host-unreachable *(ipv4-address-with-zone | ipv6-address-with-zone)* hold-set *number*
Tree	hold-set
Range	1 to 86400
Units	seconds
Introduced	25.3.R2
Platforms	SAR Gen 2

padding-size *number*

Synopsis	Packet length padding of the ICMP packet
Context	**configure** vrrp policy *number* priority-event host-unreachable *(ipv4-address-with-zone | ipv6-address-with-zone)* padding-size *number*
Tree	padding-size

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Range	0 to 16384
Units	bytes
Default	56
Introduced	25.3.R2
Platforms	SAR Gen 2

priority

Synopsis	Enter the **priority** context
Context	**configure** vrrp policy *number* priority-event host-unreachable *(ipv4-address-with-zone | ipv6-address-with-zone)* priority
Tree	priority
Introduced	25.3.R2
Platforms	SAR Gen 2

event-type *keyword*

Synopsis	Effect of priority-level value on base priority value
Context	**configure** vrrp policy *number* priority-event host-unreachable *(ipv4-address-with-zone | ipv6-address-with-zone)* priority event-type *keyword*
Tree	event-type
Options	delta, explicit
Default	delta
Introduced	25.3.R2
Platforms	SAR Gen 2

priority-level *number*

Synopsis	Priority level associated with this event
Context	**configure** vrrp policy *number* priority-event host-unreachable *(ipv4-address-with-zone | ipv6-address-with-zone)* priority priority-level *number*
Tree	priority-level
Range	1 to 254
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

request-interval *number*

Synopsis	Time interval between consecutive ICMP echo requests
Context	**configure** vrrp policy *number* priority-event host-unreachable *(ipv4-address-with-zone | ipv6-address-with-zone)* request-interval *number*
Tree	request-interval
Range	1 to 60
Units	seconds
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

timeout *number*

Synopsis	Timeout for ICMP echo request messages
Context	**configure** vrrp policy *number* priority-event host-unreachable *(ipv4-address-with-zone | ipv6-address-with-zone)* timeout *number*
Tree	timeout
Range	1 to 60
Units	seconds
Default	1
Introduced	25.3.R2
Platforms	SAR Gen 2

lag-port-down [lag-name] *lag-interface*

Synopsis	Enter the **lag-port-down** list instance
Context	**configure** vrrp policy *number* priority-event lag-port-down *lag-interface*
Tree	lag-port-down
Introduced	25.3.R2
Platforms	SAR Gen 2

[**lag-name**] *lag-interface*

Synopsis	LAG name

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Context	**configure** vrrp policy *number* priority-event lag-port-down *lag-interface*
Tree	lag-port-down
String length	1 to 27
String format	'lag-interface' must be lag- followed by number 1-800 or up to 23 chars (e.g. lag-1 or lag-my-lag)
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

hold-clear *number*

Synopsis	Delay time for a cleared event on the router instance
Context	**configure** vrrp policy *number* priority-event lag-port-down *lag-interface* hold-clear *number*
Tree	hold-clear
Range	1 to 86400
Units	seconds
Introduced	25.3.R2
Platforms	SAR Gen 2

hold-set *number*

Synopsis	Hold time before transitioning to cleared state
Context	**configure** vrrp policy *number* priority-event lag-port-down *lag-interface* hold-set *number*
Tree	hold-set
Range	1 to 86400
Units	seconds
Introduced	25.3.R2
Platforms	SAR Gen 2

number-down [number-of-lag-ports-down] *number*

Synopsis	Enter the **number-down** list instance
Context	**configure** vrrp policy *number* priority-event lag-port-down *lag-interface* number-down *number*
Tree	number-down

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Introduced	25.3.R2
Platforms	SAR Gen 2

[**number-of-lag-ports-down**] *number*

Synopsis	Threshold of down LAG ports that create a set event
Context	**configure** vrrp policy *number* priority-event lag-port-down *lag-interface* number-down *number*
Tree	number-down
Range	1 to 64
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

priority

Synopsis	Enter the **priority** context
Context	**configure** vrrp policy *number* priority-event lag-port-down *lag-interface* number-down *number* priority
Tree	priority
Introduced	25.3.R2
Platforms	SAR Gen 2

event-type *keyword*

Synopsis	Effect of priority-level value on base priority value
Context	**configure** vrrp policy *number* priority-event lag-port-down *lag-interface* number-down *number* priority event-type *keyword*
Tree	event-type
Options	delta, explicit
Default	delta
Introduced	25.3.R2
Platforms	SAR Gen 2

© 2026 Nokia.

Tree	allow-default
Default	false
Introduced	25.3.R2
Platforms	SAR Gen 2

next-hop [ip-address] *(ipv4-address-with-zone | ipv6-address-with-zone)*

Synopsis	Add a list entry for **next-hop**
Context	**configure** vrrp policy *number* priority-event route-unknown *(ipv4-prefix | ipv6-prefix)* next-hop *(ipv4-address-with-zone | ipv6-address-with-zone)*
Tree	next-hop
Introduced	25.3.R2
Platforms	SAR Gen 2

[**ip-address**] *(ipv4-address-with-zone | ipv6-address-with-zone)*

Synopsis	Next-hop IP address for a returned route prefix
Context	**configure** vrrp policy *number* priority-event route-unknown *(ipv4-prefix | ipv6-prefix)* next-hop *(ipv4-address-with-zone | ipv6-address-with-zone)*
Tree	next-hop
Description	This command configures the next-hop IP address used to match the route prefix being monitored by the priority control event with the results of a route table lookup.
String format	'ipv4-address-with-zone' must be a.b.c.d with optional %zone-id 'ipv6-address-with-zone' must be valid IPv6 with optional %zone-id 'ipv6-address-with-zone' must be valid IPv6 with optional %zone-id
Notes	This element is part of a list key.
Introduced	25.3.R2
Platforms	SAR Gen 2

priority

Synopsis	Enter the **priority** context
Context	**configure** vrrp policy *number* priority-event route-unknown *(ipv4-prefix | ipv6-prefix)* priority
Tree	priority
Introduced	25.3.R2

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

Platforms	SAR Gen 2

event-type *keyword*

Synopsis	Effect of priority-level value on base priority value
Context	**configure** vrrp policy *number* priority-event route-unknown *(ipv4-prefix | ipv6-prefix)* priority event-type *keyword*
Tree	event-type
Options	delta, explicit
Default	delta
Introduced	25.3.R2
Platforms	SAR Gen 2

priority-level *number*

Synopsis	Priority level associated with this event
Context	**configure** vrrp policy *number* priority-event route-unknown *(ipv4-prefix | ipv6-prefix)* priority priority-level *number*
Tree	priority-level
Range	1 to 254
Introduced	25.3.R2
Platforms	SAR Gen 2

protocol *keyword*

Synopsis	Routing protocol as match criterion
Context	**configure** vrrp policy *number* priority-event route-unknown *(ipv4-prefix | ipv6-prefix)* protocol *keyword*
Tree	protocol
Options	bgp, ospf, isis, rip, static, bgp-vpn
Max. instances	6
Introduced	25.3.R2
Platforms	SAR Gen 2

5 Deprecated and obsolete commands

This section lists the deprecated and obsolete commands in this major release.

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

5.1 Deprecated commands

This chapter provides a list of commands that are marked as “status deprecated” in the Nokia YANG models and the MD-CLI and should no longer be used. Only releases in which commands are initially deprecated are included in this section. If applicable, the equivalent configuration groups command is also deprecated (but not explicitly listed).

See the SR OS Software Release Notes for more information.

(No entries for this section.)

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

5.2 Obsolete commands

This chapter provides a list of commands that are marked as “status obsolete” in the Nokia YANG models and the MD-CLI. These commands can no longer be used and are considered invalid. Only releases in which commands are initially obsoleted are included in this section. If applicable, the equivalent configuration groups command is also obsoleted (but not explicitly listed).

See the SR OS Software Release Notes for more information.

5.2.1 26.3.R1

filter commands:

- configure filter ip-filter embed openflow
- configure filter ip-filter embed openflow admin-state
- configure filter ip-filter embed openflow apply-groups
- configure filter ip-filter embed openflow grt
- configure filter ip-filter embed openflow of-switch
- configure filter ip-filter embed openflow offset
- configure filter ip-filter embed openflow sap
- configure filter ip-filter embed openflow system
- configure filter ip-filter embed openflow vpls
- configure filter ip-filter embed openflow vprn
- configure filter ip-filter entry action forward esi-l2
- configure filter ip-filter entry action forward esi-l2 esi-value
- configure filter ip-filter entry action forward esi-l2 vpls
- configure filter ip-filter entry action forward esi-l3
- configure filter ip-filter entry action forward esi-l3 esi-value
- configure filter ip-filter entry action forward esi-l3 sf-ip
- configure filter ip-filter entry action forward esi-l3 vas-interface
- configure filter ip-filter entry action forward esi-l3 vprn
- configure filter ipv6-filter embed openflow
- configure filter ipv6-filter embed openflow admin-state
- configure filter ipv6-filter embed openflow apply-groups
- configure filter ipv6-filter embed openflow grt
- configure filter ipv6-filter embed openflow of-switch
- configure filter ipv6-filter embed openflow offset
- configure filter ipv6-filter embed openflow sap
- configure filter ipv6-filter embed openflow system

© 2026 Nokia.
Use subject to Terms available at: www.nokia.com/terms.

- configure filter ipv6-filter embed openflow vpls
- configure filter ipv6-filter embed openflow vprn
- configure filter ipv6-filter entry action forward esi-l2
- configure filter ipv6-filter entry action forward esi-l2 esi-value
- configure filter ipv6-filter entry action forward esi-l2 vpls
- configure filter ipv6-filter entry action forward esi-l3
- configure filter ipv6-filter entry action forward esi-l3 esi-value
- configure filter ipv6-filter entry action forward esi-l3 sf-ip
- configure filter ipv6-filter entry action forward esi-l3 vas-interface
- configure filter ipv6-filter entry action forward esi-l3 vprn
- configure filter mac-filter entry action forward esi-l2
- configure filter mac-filter entry action forward esi-l2 esi-value
- configure filter mac-filter entry action forward esi-l2 vpls

macsec commands:

- configure macsec connectivity-association static-cak mka-hello-interval
- configure macsec connectivity-association static-cak mka-key-server-priority

router commands:

- configure router interface gre-termination
- configure router nat outside dnat-only
- configure router nat outside dnat-only route-limit
