| SSAP | Specifies an Ethernet 802.2 LLC DSAP value or range for an ingress SAP QoS policy match. |
| FC | Specifies the entry's forwarding class. |
| Priority | Specifies the default enqueueing priority overrides for all packets received on an ingress SAP using this policy. |
| Service Association | |
| Service-Id | The unique service ID number that identifies the service in the service domain. |
| Customer-Id | Specifies the customer ID that identifies the customer to the service. |
| SAP | Specifies the Service Access Point (SAP) within the service where the SAP ingress policy is applied. |

22.8 sap-template

sap-template

Syntax

sap-template *template-name* **idle-saps**

Context

[\[Tree\]](#) (clear>subscr-mgmt sap-template)

Full Context

clear subscriber-mgmt sap-template

Description

This command deletes any SAPs created with the specified SAP template that are no longer in use by any subscriber sessions.

Parameters

template-name

Specifies the name of a template, up to 256 characters, configured under **configure subscriber-mgmt sap-template**.

idle-saps

Keyword that specifies to delete any idle SAPs associated with this template.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

22.9 sap-using

sap-using

Syntax

sap-using [ingress | egress] **atm-td-profile** *td-profile-id*

Context

[\[Tree\]](#) (show>service sap-using)

Full Context

show service sap-using

Description

Displays **atm-td-profile** SAP information.

If no optional parameters are specified, the command displays a summary of all defined SAPs.

The optional parameters restrict output to only SAPs matching the specified properties.

Parameters

ingress

Specifies matching an ingress policy.

egress

Specifies matching an egress policy.

qos-policy *qos-policy-id*

The ingress or egress QoS Policy ID for which to display matching SAPs.

Values 1 to 65535

filter *filter-id*

The ingress or egress Filter Policy ID for which to display matching SAPs.

Values 1 to 65535

sap-id

Specifies the physical port identifier portion of the SAP definition.

Values The following values apply to the 7750 SR and 7950 XRS:

| | |
|------------|---|
| null | <i>[port-id bundle-id bpgrp-id lag-id aps-id]</i> |
| dot1q | <i>[port-id bundle-id bpgrp-id lag-id aps-id]:qtag1</i> |
| qinq | <i>[port-id bundle-id bpgrp-id lag-id]:qtag1.qtag2</i> |
| atm | <i>[port-id aps-id][:vpi/vci vpi vpi1.vpi2]</i> |
| frame | <i>[port-id aps-id]:dlci</i> |
| cisco-hdlc | <i>slot/mda/port.channel</i> |
| cem | <i>slot/mda/port.channel</i> |
| ima-grp | <i>bundle-id[:vpi/vci vpi vpi1.vpi2]</i> |
| port-id | <i>slot/mda/port[.channel]</i> |
| bundle-id | <i>bundle-type-slot/mda.bundle-num</i> |
| | bundle keyword |
| | type ima, ppp |
| | <i>bundle-num</i> 1 to 256 |
| bpgrp-id | <i>bpgrp-type-bpgrp-num</i> |

| | | |
|---------|---|--------------------|
| | <i>bpgrp</i> | keyword |
| | <i>type</i> | ima, ppp |
| | <i>bpgrp-num</i> | 1 to 1280 |
| aps-id | <i>aps-group-id</i> [<i>.channel</i>] | |
| | <i>aps</i> | keyword |
| | <i>group-id</i> | 1 to 64 |
| ccag-id | <i>ccag-id.path-id</i> [<i>cc-type</i>]: <i>cc-id</i> | |
| | <i>ccag</i> | keyword |
| | <i>id</i> | 1 to 8 |
| | <i>path-id</i> | a, b |
| | <i>cc-type</i> | .sap-net, .net-sap |
| | <i>cc-id</i> | 0 to 4094 |
| lag-id | <i>lag-id</i> | |
| | <i>lag</i> | keyword |
| | <i>id</i> | 1 to 800 |
| qtag1 | 0 to 4094 | |
| qtag2 | *, 0 to 4094 | |
| vpi | NNI: 0 to 4095 | |
| | UNI: 0 to 255 | |
| vci | 1, 2, 5 to 65535 | |
| dlci | 16 to 1022 | |

The following values apply to the 7450 ESS:

| Values | | |
|---------|---|--|
| | null | [<i>port-id</i> <i>lag-id</i>] |
| | dot1q | [<i>port-id</i> <i>lag-id</i>]: <i>qtag1</i> |
| | qinq | [<i>port-id</i> <i>lag-id</i>]: <i>qtag1.qtag2</i> |
| | frame | [<i>port-id</i>]: <i>dlci</i> |
| | port-id | slot/mda/port[<i>.channel</i>] |
| ccag-id | <i>ccag-id.path-id</i> [<i>cc-type</i>]: <i>cc-id</i> | |
| | <i>ccag</i> | keyword |
| | <i>id</i> | 1 to 8 |

| | | |
|--------|----------------|--------------------|
| | <i>path-id</i> | a, b |
| | <i>cc-type</i> | .sap-net, .net-sap |
| | <i>cc-id</i> | 0 to 4094 |
| lag-id | <i>lag-id</i> | |
| | lag | keyword |
| | <i>id</i> | 1 to 800 |
| qtag1 | | 0. to 4094 |
| qtag2 | | *, 0 to 4094 |
| dlci | | 16 to 1022 |

interface

Specifies matching SAPs with the specified IP interface.

ip-addr

The IP address of the interface for which to display matching SAPs.

Values 1.0.0.0 to 223.255.255.255

ip-int-name

The IP interface name for which to display matching SAPs.

td-profile-id

Profile ID that identifies a specific profile to display.

```
show service sap-using
```

Description

This command displays SAP information.

If no optional parameters are specified, the command displays a summary of all defined SAPs.

The optional parameters restrict output to only SAPs matching the specified properties.

Parameters

ingress

Specifies matching an ingress policy.

egress

Specifies matching an egress policy.

qos-policy-id

The ingress or egress QoS Policy ID for which to display matching SAPs.

Values 1 to 65535

td-profile-id

Displays SAPs using this traffic description for the 7750 SR only.

filter-id

The ingress or egress filter policy ID for which to display matching SAPs.

Values 1 to 65535

sap-id

Specifies the physical port identifier portion of the SAP definition.

dyn-script

Displays dynamic service SAPs information.

msap

Displays MSAPs.

vlan-translation

Displays VLAN translation information.

anti-spoof

Displays anti-spoof information.

squelch-ingress-level

Displays ETH-CFM squelching information of the type matching the service delimited configuration.

all

Displays all squelch ingress levels information regardless of type.

ctag-space

Displays all squelch-ingress-levels information that is skipping additional VLAN space.

Platforms

All

Output

The following output is an example of sap-using using information, and [Table 435: Show Service SAP Output Fields](#) describes the output fields.

Sample Output

sap-using

Syntax

sap-using [ingress | egress] atm-td-profile *td-profile-id*

Context

[\[Tree\]](#) (show>service sap-using)

Full Context

show service sap-using

Description

Displays **atm-td-profile** SAP information.

If no optional parameters are specified, the command displays a summary of all defined SAPs.

The optional parameters restrict output to only SAPs matching the specified properties.

Parameters

ingress

Specifies matching an ingress policy.

egress

Specifies matching an egress policy.

qos-policy *qos-policy-id*

The ingress or egress QoS Policy ID for which to display matching SAPs.

Values 1 to 65535

filter *filter-id*

The ingress or egress Filter Policy ID for which to display matching SAPs.

Values 1 to 65535

sap-id

Specifies the physical port identifier portion of the SAP definition.

Values The following values apply to the 7750 SR and 7950 XRS:

| | |
|------------|---|
| null | <i>[port-id bundle-id bpgrp-id lag-id aps-id]</i> |
| dot1q | <i>[port-id bundle-id bpgrp-id lag-id aps-id]:qtag1</i> |
| qinq | <i>[port-id bundle-id bpgrp-id lag-id]:qtag1.qtag2</i> |
| atm | <i>[port-id aps-id][:vpi/vci vpi vpi1.vpi2]</i> |

The following values apply to the 7450 ESS:

| | | |
|---------------|---------|---------------------------------------|
| Values | null | <i>[port-id lag-id]</i> |
| | dot1q | <i>[port-id lag-id]:qtag1</i> |
| | qinq | <i>[port-id lag-id]:qtag1.qtag2</i> |
| | frame | <i>[port-id]:dlci</i> |
| | port-id | slot/mda/port[.channel] |
| | ccag-id | <i>ccag-id.path-id[cc-type]:cc-id</i> |
| | | ccag keyword |
| | | <i>id</i> 1 to 8 |
| | | <i>path-id</i> a, b |
| | | <i>cc-type</i> .sap-net, .net-sap |
| | | <i>cc-id</i> 0 to 4094 |
| | lag-id | <i>lag-id</i> |
| | | lag keyword |
| | | <i>id</i> 1 to 800 |

| | |
|-------|--------------|
| qtag1 | 0. to 4094 |
| qtag2 | *, 0 to 4094 |
| dlci | 16 to 1022 |

interface

Specifies matching SAPs with the specified IP interface.

ip-addr

The IP address of the interface for which to display matching SAPs.

Values 1.0.0.0 to 223.255.255.255

ip-int-name

The IP interface name for which to display matching SAPs.

td-profile-id

Profile ID that identifies a specific profile to display.

show service dynamic-services saps

Description

This command displays Dynamic Services SAPs (instances) details.

Note:

This command is not available in the MD-CLI.

Parameters

summary

Displays a summary view only.

acct-session-id

Specifies control session accounting session id.

port-id

Specifies Ethernet port.

policy-name

Specifies dynamic services policy.

sap sap-id

Specifies dynamic services SAP id.

service-id

The service ID of the dynamic service.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of dynamic service SAP information.

Sample Output

Table 437: Dynamic Services SAP Field Descriptions describes Dynamic Services SAP fields.

Table 437: Dynamic Services SAP Field Descriptions

| Output field | Description |
|-----------------------------|---|
| SAP | The dynamic service SAP ID. |
| Acct session-ID | The dynamic service accounting session ID. |
| Acct session-ID control | The control channel accounting session ID. |
| Service | The dynamic service ID. |
| Dynamic Services policy | The policy referenced to setup the dynamic service. |
| Number of scripts executed | The number of times the script was executed for this dynamic service (setup, modify, revert or teardown). |
| Number of scripts w success | The number of times the script was executed successfully for this dynamic service. |
| Last script action | The setup, modify, revert, teardown. |
| Time of last script action | The timestamp of the last script action. |
| Parameters of last action | The content of the Dynamic Services Script Parameters attribute corresponding with the last action. |
| Status | RADIUS accounting is enabled or disabled. |
| Stats type | The type of statistics reported in accounting. |
| Update interval (minutes) | The time, in minutes, between Accounting Interim Update messages. |

22.14 satellite

satellite

Syntax

satellite

Context

[\[Tree\]](#) (clear>system satellite)

Full Context

clear system satellite

Description

Commands in this context clear satellite information.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

satellite

Syntax

satellite

Context

[\[Tree\]](#) (show>system satellite)

Full Context

show system satellite

Description

This command displays a list of configured satellites including information about the satellite's esat-ID or tsat-ID, satellite type, and state.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following output is an example of satellite information.

Sample Output

```
A:Dut-A# show system satellite

=====
Satellite Information
=====
SatID      Provisioned Type          Admin   Oper
           Equipped Type (if different) State   State
-----
esat-1     es48-lgb-sfp             up      provisioned
           (not equipped)
esat-20    es48-lgb-sfp             up      up
tsat-2     ts4-choc3-sfp            up      up

22.15 schedule

schedule

Syntax

schedule [*schedule-name*] [**owner** *owner-name*]

Context

[\[Tree\]](#) (show>system>cron schedule)

Full Context

show system cron schedule

Description

This command displays cron schedule parameters.

Parameters

schedule-name

Specifies the scheduler name, up to 32 characters.

owner-name

Specifies the scheduler owner name, up to 32 characters.

Platforms

All

Output

The following is an example of cron schedule information. The following table describes the output fields.

Sample Output

```
A:sim1>show>cron schedule test
=====
CRON Schedule Information

```

Table 438: Cron Schedule Field Descriptions

| Label | Description |
|--------------------------|--|
| Schedule | Displays the schedule name. |
| Schedule owner | Displays the owner name of the action. |
| Description | Displays the schedule's description. |
| Administrative status | Enabled — The administrative status is enabled. Disabled — Administratively disabled. |
| Operational status | Enabled — The operational status is enabled. Disabled — Operationally disabled. |
| Action | Displays the action name. |
| Action owner | Displays the name of action owner. |
| Script | Displays the name of the script. |
| Script owner | Displays the name of the script. |
| Script owner | Displays the name of the of script owner. |
| Script source location | Displays the location of scheduled script. |
| Script results location | Displays the location where the script results have been sent. |
| Schedule type | Periodic — Displays a schedule which ran at a given interval. Calendar — Displays a schedule which ran based on a calendar. Oneshot — Displays a schedule which ran one time only. |
| Interval | Displays the interval between runs of an event. |
| Next scheduled run | Displays the time for the next scheduled run. |
| Weekday | Displays the configured weekday. |
| Month | Displays the configured month. |
| Day of Month | Displays the configured day of month. |
| Hour | Displays the configured hour. |
| Minute | Displays the configured minute. |
| Number of scheduled runs | Displays the number of scheduled sessions. |

| Label | Description |
|------------------------------|---|
| Last scheduled run | Displays the last scheduled session. |
| Number of scheduled failures | Displays the number of scheduled sessions that failed to execute. |
| Last scheduled failure | Displays the last scheduled session that failed to execute. |
| Last failure time | Displays the system time of the last failure. |

22.16 scheduler-hierarchy

scheduler-hierarchy

Syntax

scheduler-hierarchy

Context

[\[Tree\]](#) (show>qos scheduler-hierarchy)

Full Context

show qos scheduler-hierarchy

Description

This command displays scheduler-hierarchy information.

Platforms

All

22.17 scheduler-name

scheduler-name

Syntax

scheduler-name *scheduler-name*

Context

[\[Tree\]](#) (show>qos scheduler-name)

Full Context

show qos scheduler-name

Description

This command displays the scheduler policies using the specified scheduler.

Parameters

scheduler-name

The name of a scheduler configured in the **config>qos>scheduler-policy>tier** context.

Platforms

All

Output

The following output is an example of scheduler name information.

Sample Output

```
A:ALA-12# show qos scheduler-name NetworkControl
=====
Scheduler : NetworkControl
=====
Scheduler Policy   : SLA1
Scheduler Policy   : alpha
Scheduler Policy   : beta
=====
A:ALA-12#
```

22.18 scheduler-policy

scheduler-policy

Syntax

scheduler-policy [*scheduler-policy-name*] [**association** | **sap-ingress** *policy-id* | **sap-egress** *policy-id*]
scheduler-policy *scheduler-policy-name* { **ingress** | **egress** } **queue-group** *queue-grp-name*

Context

[\[Tree\]](#) (show>qos scheduler-policy)

Full Context

show qos scheduler-policy

Description

Use this command to display scheduler policy information.

Parameters

scheduler-policy-name

The name of a scheduler policy configured in the **config>qos>scheduler-policy** context.

association

Displays the associations related to the specified scheduler name.

sap-ingress policy-id

Specifies the SAP ingress QoS policy information.

sap-egress policy-id

Specifies the SAP egress QoS policy information.

{ingress | egress}

Specifies the direction to display and are mutually exclusive.

queue-grp-name

Displays information for the specified queue group.

Platforms

All

Output

The following output is an example of scheduler policy information, and [Table 439: Show QoS Scheduler-Policy Output Fields](#) describes the customer scheduler hierarchy fields.

Sample Output

```
A:ALA-12# show qos scheduler-policy SLA1

Table 439: Show QoS Scheduler-Policy Output Fields

| Label | Description |
|--------------------|--|
| Policy-Name | Specifies the scheduler policy name. |
| Description | Specifies a text string that helps identify the policy context in the configuration file. |
| Tier | Specifies the level of hierarchy that a group of schedulers are associated with. |
| Scheduler | Specifies the scheduler name. |
| Lvl/Wt | Specifies the priority level of the scheduler when compared to other child schedulers and queues vying for bandwidth on the parent schedulers during the above-CIR distribution phase of bandwidth allocation. Weight defines the relative weight of this scheduler in comparison to other child schedulers and queues at the same level. |
| Cir Lvl/Wt | Specifies the level of hierarchy when compared to other schedulers and queues when vying for bandwidth on the parent scheduler. Weight defines the relative weight of this queue in comparison to other child schedulers and queues while vying for bandwidth on the parent scheduler. |
| PIR | Specifies the PIR rate. |
| CIR | Specifies the CIR rate. |
| Parent | Specifies the parent scheduler that governs the available bandwidth given the queue aside from the PIR setting of the queue. |
| Service-Id | Specifies the ID that uniquely identifies the policy. |
| Customer-Id | Specifies the ID that uniquely identifies the customer. |
| SAP | Specifies the Service Access Point (SAP) within the service where the policy is applied. |
| Multi Service Site | Specifies the multiservice site name. |
| Orphan Queues | Specifies the number of queues in an orphaned state. |
| Hierarchy | Displays the scheduler policy tree structure. |

| Script policy | Displays the name of the script policy. |
| Script policy owner | Displays the name of the script policy owner. |
| Administrative status | Enabled — Administrative status is enabled. Disabled — Administrative status is disabled. |
| Script | Displays the name of the script. |
| Script owner | Displays the name of the script owner. |
| Script source location | Displays the location of scheduled script. |

| Label | Description |
|-----------------------------|--|
| Max running allowed | Displays the maximum number of allowed sessions. |
| Max completed run histories | Displays the maximum number of sessions previously run. |
| Max lifetime allowed | Displays the maximum amount of time the script may run. |
| Completed run histories | Displays the number of completed sessions. |
| Executing run histories | Displays the number of sessions in the process of executing. |
| Initializing run histories | Displays the number of sessions ready to run/queued but not executed. |
| Max time tun history saved | Displays the maximum amount of time to keep the results from a script run. |
| Last change | Displays the system time a change was made to the configuration. |
| Script start error | Displays the error found while executing the script. |
| Max row empire time | Reserved for SNMP. |
| Last application | Displays the last application used to execute the script. |
| Last auth. user account | Displays the last user used to execute the script. If no user is specified in "configure system cli-script authorization event-handler/cron" then the user is not specified. |

script-policy

Syntax

script-policy

Context

[\[Tree\]](#) (tools>perform>system>script-control script-policy)

Full Context

tools perform system script-control script-policy

Description

This command performs script-policy operations.

Platforms

All

script-policy

Syntax

script-policy

Context

[\[Tree\]](#) (clear>system>script-control script-policy)

Full Context

clear system script-control script-policy

Description

Commands in this context clear script policy information.

Platforms

All

22.24 scripts

scripts

Syntax

scripts

Context

[\[Tree\]](#) (show>log>event-handling scripts)

Full Context

show log event-handling scripts

Description

This command displays handler configuration and script run queue information.

Platforms

All

Output

The following is an example of log event handling script information.

Sample output

```

=====
Event Handling System - Script Policy Association
=====
-----
No Matching Entries Found
=====
Event Handling System - Script Association
=====
-----
No Matching Entries Found
=====
Event Handling System - Script Launched List
=====
Run #      Script owner          Script name            Script state
-----
No Matching Entries
=====
  
```

22.25 sctp-filter

sctp-filter

Syntax

sctp-filter *sctp-filter-name*

Context

[\[Tree\]](#) (show>app-assure>group sctp-filter)

Full Context

show application-assurance group sctp-filter

Description

This command displays Stream Control Transmission Protocol (SCTP) filter information

Parameters

sctp-filter-name

Specifies an SCTP filter, up to 256 characters. When a filter is specified, all traffic is examined as described in the tmnxBsxSctpFltrTable.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

22.26 sdp

sdp

Syntax

sdp all | *sdp-id:vc-id*

Context

[\[Tree\]](#) (show>subscr-mgmt>errors sdp)

Full Context

show subscriber-mgmt errors sdp

Description

This command sorts all the subscriber errors by SDP.

Parameters

all

Shows all errors beginning with the lowest SDP index.

sdp-id:vc-id

Shows only the error of a specific SDP index.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

[Table 442: Subscriber Management SDP Error Field Descriptions](#) describes subscriber management SDP error output fields.

Table 442: Subscriber Management SDP Error Field Descriptions

| Field | Description |
|---------|--|
| SDP | The SDP ID associated with the error |
| Time | The time this error was reported to the subscriber management errors subsystem |
| Service | The service ID associated with the error |
| MAC | The MAC address associated with the error |
| Error | The error that occurred on the SDP |
| Extra | Extra information about the error that occurred |

sdp

Syntax

```
sdp [sdp-id [:vc-id]] [detail]  
sdp far-end {ip-address | ipv6-address} [detail]  
sdp sdp-id [vc-id] l2tpv3  
sdp sdp-id [:vc-id] static-isids [ range-id range-id]  
sdp sdp-id [:vc-id] static-isids mfib  
sdp sdp-id [:vc-id] [ detail] vccv-bfd [session]  
sdp sdp-id [:vc-id] mrp
```

Context

[\[Tree\]](#) (show>service>id sdp)

Full Context

```
show service id sdp
```

Description

Displays information for the SDPs associated with the service. If no optional parameters are specified, a summary of all associated SDPs is displayed.

Parameters

***sdp-id* [:*vc-id*]**

Displays only information for the specified SDP ID.

Values sdp-id: 1 to 17407
vc-id: 1 to 4294967295

Default all SDPs

detail

Displays detailed SDP information.

ip-address* | *ipv6-address

Displays only SDPs matching with the specified far-end IP address. 64 characters maximum.

Default SDPs with any far-end IP address

l2tpv3

Indicates that the user wants to display l2tpv3 specific information for SDPs that are of type l2tpv3.

static-isids

Specifies the I-Component service IDs created on the SDP.

range-id

Displays the service using the specified I-component Service ID (ISID).

Values 1 to 4294967295

mfib

Display MFIB related information. This parameter applies to the 7450 ESS or 7750 SR only.

vccv-bfd

Displays detailed information about the VCCV BFD session for a spoke SDP.

session

displays a summary of all VCCV sessions.

mrp

Displays detailed MRP information.

Platforms

All

Output

The following output is an example of SDP information, and [Table 443: Show Service-ID SDP Field Descriptions](#) describes the output fields.

Sample Output

```
# show service id 1 sdp detail

Table 443: Show Service-ID SDP Field Descriptions

| Label | Description |
|---------------------|--|
| Sdp Id | The SDP identifier. |
| Type | Indicates whether the SDP is a spoke or a mesh. |
| Split Horizon Group | Name of the split horizon group that the SDP belongs to. |
| VC Type | Displays the VC type: ether or vlan. |
| VC Tag | Displays the explicit dot1Q value used when encapsulating to the SDP far end. |
| I. Lbl | The VC label used by the far-end device to send packets to this device in this service by the SDP. |
| Admin Path MTU | The operating path MTU of the SDP is equal to the admin path MTU (when one is set) or the dynamically computed tunnel MTU, when no admin path MTU is set (the default case). |
| Oper Path MTU | The actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented. |
| Far End | Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP. |
| Delivery | Specifies the type of delivery used by the SDP: GRE or MPLS. |
| Admin State | The administrative state of this SDP. |
| Adv Service MTU | Displays the configured advertise service MTU value (for Epipe services only). |
| Oper State | The operational state of this SDP. |

| Label | Description |
|---------------------|---|
| Ingress Label | The label used by the far-end device to send packets to this device in this service by this SDP. |
| Egress Label | The label used by this device to send packets to the far-end device in this service by the SDP. |
| BFD Template | The BFD template name. |
| BFD-Enabled | The BFD enabled status. |
| BFD-Encap | The BFD encapsulation type. |
| BFD Fail Action | The BFD fail action. |
| BFD Oper State | The BFD operational state. |
| BFD WaitFor UpTimer | The BFD wait for up timer value. |
| Last Changed | The date and time of the most recent change to the SDP. |
| Signaling | Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on this SDP. |
| Admin State | The administrative state of the keepalive process. |
| Oper State | The operational state of the keepalive process. |
| Hello Time | Specifies how often the SDP echo request messages are transmitted on this SDP. |
| Max Drop Count | Specifies the maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault. |
| Hello Msg Len | Specifies the length of the SDP echo request messages transmitted on this SDP. |
| Hold Down Time | Specifies the amount of time to wait before the keepalive operating status is eligible to enter the alive state. |
| I. Fwd. Pkts. | Specifies the number of forwarded ingress packets. |
| I. Dro. Pkts. | Specifies the number of dropped ingress packets. |
| E. Fwd. Pkts. | Specifies the number of forwarded egress packets. |
| Associated LSP List | When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the far end field. If the SDP type is GRE, then the following message displays: SDP delivery mechanism is not MPLS. |

sdp

Context

[\[Tree\]](#) (show>service sdp)

Full Context

show service sdp

Description

This command displays SDP information.

If no optional parameters are specified, a summary SDP output for all SDPs is displayed.

Parameters

sdp-id

The SDP ID for which to display information.

Values 1 to 17407

Default All SDPs

pw-port-id

Displays the SAP identifier for PW-SAPs.

Values 1 to 10239

ip-address

Displays only SDPs matching with the specified far-end IP address.

Default SDPs with any far-end IP address

detail

Displays detailed SDP information.

Default SDP summary output

keep-alive-history

Displays the last fifty SDP keepalive events for the SDP.

Default SDP summary output

Platforms

All

Output

The following output displays service SDP information.

Sample Output

```

Full Context

show service sdp

Description

This command displays information for the SDPs associated with the service.
 If no optional parameters are specified, a summary of all associated SDPs is displayed.

Parameters

sdp-id

Specifies the SDP ID for which to display information.

Values 1 to 17407

pw-port-id

Specifies the pseudowire port identifier.

Values 1 to 10239

ip-address

Displays only SDPs with the specified far-end IPv4 address. 64 characters maximum.

ipv6-address

Displays only SDPs with the specified far-end IPv6 address. 64 characters maximum.

detail

Displays detailed SDP information.

Default SDP summary output

keep-alive-history

Displays the last fifty SDP keepalive events for the SDP.

Default SDP summary output

Platforms

All

Output

The following outputs are examples of SDP information.

Context

[\[Tree\]](#) (show>service sdp)

Full Context

show service sdp

Description

This command displays information for the SDPs associated with the service.
 If no optional parameters are specified, a summary of all associated SDPs is displayed.

Parameters

sdp-id

Specifies the SDP ID for which to display information.

Values 1 to 17407

Default All SDPs.

pw-port-id

Specifies the pseudo-wire port identifier.

Values 1 to 10239

statistics

Displays SDP statistics information.

consistent

Indicates that the network-domains for all the egress network interfaces that can carry traffic on this SDP are consistent.

inconsistent

Indicates that the network-domain for one or more egress network interfaces that can carry traffic on this SDP are inconsistent.

na

Indicates that there is no egress network interface that can carry traffic on this SDP.

egressifs

Indicates whether all the egress network interfaces that can carry traffic on this SDP are associated with the network-domain configured on this SDP.

ip-address | ipv6-address

Displays only SDPs matching with the specified far-end IP address up to 64 characters.

Default SDPs with any far-end IP address.

keep-alive-history

Displays the last fifty SDP keepalive events for the SDP.

Default SDP summary output.

detail

Displays detailed SDP information.

Default SDP summary output.

Platforms

All

Output

The following output is an example of SDP information, and [Table 444: Show Service SDP Field Descriptions](#) describes the output fields.

Sample Output

```

Table 444: Show Service SDP Field Descriptions

| Label | Description |
|------------|---|
| SDP Id | The SDP identifier. |
| Adm MTU | Specifies the desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented. |
| Opr MTU | Specifies the actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented. |
| IP address | Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP. |
| Adm | Admin State — Specifies the administrative state of the SDP. |
| Opr | Oper State — Specifies the operational state of the SDP. |
| Deliver | Specifies the type of delivery used by the SDP: GRE or MPLS. |
| Flags | Specifies the conditions that affect the operating status of this SDP. |

| Label | Description |
|--------------------|---|
| Signal Signaling | Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on the SDP. |
| Last Status Change | Specifies the time of the most recent operating status change to this SDP. |

```

Description

This command displays information for the SDPs associated with the service.
 If no optional parameters are specified, a summary of all associated SDPs is displayed.

Parameters

sdp-id

Specifies the SDP ID for which to display information.

Values 1 to 17407

Default All SDPs.

pw-port-id

Specifies the pseudo-wire port identifier.

Values 1 to 10239

statistics

Displays SDP statistics information.

consistent

Indicates that the network-domains for all the egress network interfaces that can carry traffic on this SDP are consistent.

inconsistent

Indicates that the network-domain for one or more egress network interfaces that can carry traffic on this SDP are inconsistent.

na

Indicates that there is no egress network interface that can carry traffic on this SDP.

egressifs

Indicates whether all the egress network interfaces that can carry traffic on this SDP are associated with the network-domain configured on this SDP.

ip-address | ipv6-address

Displays only SDPs matching with the specified far-end IP address. 64 characters maximum.

Default SDPs with any far-end IP address.

keep-alive-history

Displays the last fifty SDP keepalive events for the SDP.

Default SDP summary output.

detail

Displays detailed SDP information.

Default SDP summary output.

Table 445: Show Service SDP Field Descriptions

| Label | Description |
|--------------------|--|
| SDP Id | The SDP identifier. |
| Adm MTU | Specifies the largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented. |
| Opr MTU | Specifies the actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented. |
| IP address | Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP. |
| Adm | Admin State — Specifies the state of the SDP. |
| Opr | Oper State — Specifies the operating state of the SDP. |
| Flags | Specifies all the conditions that affect the operating status of this SDP. |
| Signal | Signaling — Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on the SDP. |
| Last Status Change | Specifies the time of the most recent operating status change to this SDP. |
| Last Mgmt Change | Specifies the time of the most recent management-initiated change to this SDP. |
| Number of SDPs | Specifies the total number of SDPs displayed according to the criteria specified. |
| Hello Time | Specifies how often the SDP echo request messages are transmitted on this SDP. |
| Deliver | Delivered — Specifies the type of delivery used by the SDP: GRE or MPLS. |
| Number of SDPs | Specifies the total number of SDPs displayed according to the criteria specified. |
| Hello Time | Specifies how often the SDP echo request messages are transmitted on this SDP. |
| Hello Msg Len | Specifies the length of the SDP echo request messages transmitted on this SDP. |

| Label | Description |
|---------------------|---|
| Hello Timeout | Specifies the number of seconds to wait for an SDP echo response message before declaring a timeout. |
| Unmatched Replies | Specifies the number of SDP unmatched message replies. |
| Max Drop Count | Specifies the maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault. |
| Hold Down Time | Specifies the maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault. |
| TX Hello Msgs | Specifies the number of SDP echo request messages transmitted since the keepalive was administratively enabled or the counter was cleared. |
| Rx Hello Msgs | Specifies the number of SDP echo request messages received since the keepalive was administratively enabled or the counter was cleared. |
| Associated LSP List | When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the far end field. If the SDP type is GRE, then the following message displays: SDP delivery mechanism is not MPLS. |

sdp

Syntax

```

sdp sdp-id pw-port [pw-port-id] [statistics]
sdp [consistent | inconsistent | na] egressifs
sdp sdp-id keep-alive-history
sdp far-end ip-address keep-alive-history
sdp [sdp-id] [detail]
sdp far-end ip-address [detail]
    
```

Context

[\[Tree\]](#) (show>service sdp)

Full Context

```
show service sdp
```

Description

This command displays SDP information.

If no optional parameters are specified, a summary SDP output for all SDPs is displayed.

Parameters

sdp-id

The SDP ID for which to display information.

Default All SDPs.

Values 1 to 17407

far-end ip-address

Displays only SDPs matching with the specified far-end IP address.

detail

Displays detailed SDP information.

keep-alive-history

Displays the last fifty SDP keepalive events for the SDP.

pw-port pw-port-id

Displays the SAP identifier for PW-SAPs.

Platforms

All

Output

The following example displays SDP information.

[Table 446: Service Commands SDP Field Descriptions](#) describes the **show service SDP** output fields.

Sample Output

```

Table 446: Service Commands SDP Field Descriptions

| Label | Description |
|-----------------------|---|
| SDP Id | Displays the SDP identifier. |
| Description | Displays a text string describing the SDP. |
| Admin Path MTU | Displays the desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end ESR, without requiring the packet to be fragmented. The default value of zero indicates that the path MTU should be computed dynamically from the corresponding MTU of the tunnel. |
| Opr Path MTU | Displays the actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end ESR, without requiring the packet to be fragmented. In order to be able to bind this SDP to a given service, the value of this object minus the control word size (if applicable) must be equal to or larger than the MTU of the service, as defined by its service MTU. |
| Far End | Displays the far end IP address. |
| Local End | Displays the local end IP address. |
| Delivery | Displays the type of delivery used by the SDP: GRE or MPLS. |
| IP address | Displays the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP. |
| Adm Admin State | Displays the desired state of the SDP. |
| Opr Oper State | Displays the operating state of the SDP. |
| Flags | Displays all the conditions that affect the operating status of this SDP. |
| Signal Signaling | Displays the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on the SDP. |
| Last Status Change | Displays the time of the most recent operating status change to this SDP. |
| Adv. MTU Over | Specifies whether the advertised MTU of a VLL spoke SDP bind includes the 14-byte Layer 2 header. |
| Last Mgmt Change | Displays the time of the most recent management-initiated change to this SDP. |
| KeepAlive Information | Displays Keepalive information. |
| Hello Time | Displays how often the SDP echo request messages are transmitted on this SDP. |

| Label | Description |
|-----------------------------|---|
| Hello Msg Len | Displays the length of the SDP echo request messages transmitted on this SDP. |
| Hello Timeout | Displays the number of seconds to wait for an SDP echo response message before declaring a timeout. |
| Unmatched Replies | Displays the number of SDP unmatched message replies timer expired. |
| Max Drop Count | The maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault. |
| Hold Down Time | The amount of time to wait before the keepalive operating status is eligible to enter the alive state. |
| TX Hello Msgs | The number of SDP echo request messages transmitted since the keepalive was administratively enabled or the counter was cleared. |
| Rx Hello Msgs | The number of SDP echo request messages received since the keepalive was administratively enabled or the counter was cleared. |
| Associated LSP List | When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the far end field. If the SDP type is GRE, the following message displays: SDP Delivery Mechanism is not MPLS. |
| Lsp Name | Displays the LSP name. |
| Time Since Last Transaction | Displays the time of the last transaction. |
| Signaling | Displays the signaling type. |
| Collect Stats | Specifies whether the agent collects accounting statistics for this SDP. When the value is true the agent collects accounting statistics on this SDP. |
| VLAN VC Etype | Displays the VLAN VC type. |
| BW Booking Factor | Displays the value used to calculate the max SDP available bandwidth. The value specifies the percentage of the SDP max available bandwidth for VLL call admission. When the value of is set to zero (0), no new VLL spoke SDP bindings with non-zero bandwidth are permitted with this SDP. Overbooking, >100% is allowed. |
| PBB Etype | Displays the Ethertype used in frames sent out on this SDP when specified as vlan for Provider Backbone Bridging frames. |
| Oper Max BW (kb/s) | Displays the operational bandwidth in kilobits per seconds (kb/s) available for this SDP. The value is determined by the sum of the bandwidth of all the RSVP LSPs used by the SDP. |

| Label | Description |
|-------------------|---|
| Avail BW (kb/s) | Displays the bandwidth that is still free for booking by the SDP bindings on the SDP. |
| Net-Domain | Displays the network-domain name configured on this SDP. The default value of this object is the default network-domain. |
| Egr Interface | Indicates whether all the egress network interfaces that can carry traffic on this SDP are associated with the network-domain configured on this SDP. not applicable: Indicates that there is no egress network interface that can carry traffic on this SDP. consistent: Indicates that the network-domains for all the egress network interfaces that can carry traffic on this SDP are consistent. inconsistent: Indicates that the network-domain for one or more egress network interfaces that can carry traffic on this SDP are inconsistent. |
| Revert Time | Specifies the time to wait before reverting back from LDP to the configured LSPs, after having failed over to LDP. |
| Revert Count Down | Indicates the timer countdown before reverting back from LDP on this SDP. The timer countdown begins after the first configured LSP becomes active. |
| Flags | Displays all the conditions that affect the operating status of this SDP. |
| Class Forwarding | Indicates the admin state of class-based forwarding on this SDP. When the value is true, class-based forwarding is enabled. |
| EnforceDSTELspFc | Specifies whether service manager must validate with RSVP the support of the FC by the LSP. |
| Default LSP | Specifies the LSP ID that is used as a default when class-based forwarding is enabled on this SDP. This object must be set when enabling class-based forwarding. |
| Multicast LSP | Displays the LSP ID that all multicast traffic will be forwarded on when class-based forwarding is enabled on this SDP. When this object has its default value, multicast traffic will be forwarded on an LSP according to its forwarding class mapping. |
| Number of SDPs | Displays the metric to be used within the Tunnel Table Manager for decision making purposes. When multiple SDPs going to the same destination exist, this value is used as a tie-breaker by Tunnel Table Manager users like MP-BGP to select route with lower value. |

sdp

Syntax

sdp *sdp-id* **keep-alive**

```
sdp sdp-id pw-port sdp-id
```

Context

[\[Tree\]](#) (clear>service>statistics sdp)

Full Context

```
clear service statistics sdp
```

Description

This command clears keep-alive statistics associated with the SDP ID.

Parameters

sdp-id

The SDP ID for which to clear keepalive statistics.

Values 1 to 32767

keep-alive

Clears keep-alive information associated with the SDP ID. The keep-alive history is not cleared.

Platforms

All

```
sdp
```

Syntax

```
sdp [sdp-id[:vc-id]] [ level leve] [primary-vlan-enabled vlan-id]
```

Context

[\[Tree\]](#) (show>eth-cfm>mip-instantiation sdp)

Full Context

```
show eth-cfm mip-instantiation sdp
```

Description

This command displays MIP creation information for SDP bindings.

Parameters

sdp-id

Specifies the value identifying the SDP.

Values 1 to 32767

vc-id

Specifies the value identifying the virtual circuit identifier.

Values 1 to 4294967295

level

Displays the MD level of the maintenance point.

Values 0 to 7

vlan-id

Specifies the Dot1Q VLAN ID.

Values T0 to 4095, all

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

sdp

Syntax

sdp *sdp-id:vc-id* [**test-service-id** *service-id*] **start**

sdp *sdp-id:vc-id* **stop**

Context

[\[Tree\]](#) (tools>perform>service>id>admin-lock>pw sdp)

Full Context

tools perform service id admin-lock pw sdp

Description

This command specifies the spoke SDP binding to which an administrative lock will be applied for the MPLS-TP pseudowire. The administrative lock can be placed on a spoke SDP that is bound to a VLL SAP, another spoke SDP or a VPLS interface. Once the pseudowire is locked it may be put into loopback mode. The command must be executed at both ends of the pseudowire or MS-PW represented by the spoke SDP. Test traffic can then be injected using a configured test SAP on an Epipe, Apipe or Cpipe.

Parameters

sdp-id:vc-id

Specifies the SDP-ID and VC-ID.

Values sdp-id 1 to 17407]
vc-id1 to 4294967295]

test-service-id

Keyword that specifies the ID of a test service (SAP) to which the SDP is bound.

Platforms

All

sdp

Syntax

sdp *sdp-id:vc-id* **start** *mode* [**mac-swap**] [**mac ieee-address**] [**all**]

sdp *sdp-id:vc-id* **stop**

Context

[\[Tree\]](#) (tools>perform>service>id>loopback>eth sdp)

Full Context

tools perform service id loopback eth sdp

Description

This command places the specific MPLS SDP binding in loopback mode for reflecting Ethernet traffic back in the direction of the received stream. This is only applicable to MPLS SDP Bindings.

Parameters

sdp-id:vc-id

Specifies the SDP ID and VC-ID.

Values sdp-id 1 to 17407
vc-id1 to 4294967295

start mode

Specifies the loopback in relation to the MPLS SDP Binding.

Values **ingress** — Traffic arriving at the sap-ingress will be reflected back out the same **sap**.
egress — Traffic arriving at the sap-egress will be reflected back into the service in the direction of the original source.

stop

Keyword that removes the MPLS SD-binding from loopback mode.

mac-swap

Enable source address and destination address swapping for the reflected packets when the arriving packet is unicast. Any broadcast and multicast packets arriving on a looped point will be dropped.

mac ieee-address

Optionally configure the source MAC address used in the reflected packet when the arriving packet is a broadcast or multicast. This does not apply to arriving unicast packets.

Values 6-byte unicast mac-address in the form

XX:XX:XX:XX:XX:XX or XX-XX-XX-XX-XX-XX

all

Configured `ieee-address` is used as the source address for all reflected packets regardless of the arriving destination.

mac-swap

No swapping of MAC addresses are performed without specifying this option and any non-unicast destined packets will not be reflected back to the source.

Platforms

All

sdp

Syntax

sdp *sdp-id:vc-id* {**start** | **stop**}

Context

[\[Tree\]](#) (tools>perform>service>id>loopback>pw sdp)

Full Context

tools perform service id loopback pw sdp

Description

This command places or removes the specified MPLS-TP SDP binding in loopback mode for the purpose of an MPLS-TP pseudowire test service.

Note:

The loopback is created at the PW level so everything under the PW label is looped back. It is recommended to configure an administrative lock for the MPLS-TP pseudowire for the specified test service prior to configuring the loopback.

Parameters

sdp-id:vc-id

Specifies the SDP-ID and VC-ID.

Values sdp-id 1 to 17407
 vc-id1 to 4294967295

start

Keyword that places the specified MPLS-TP PW in loopback mode for the purpose of an MPLS_TP PW test service.

stop

Keyword that removes the SDP binding from the loopback mode for the MPLS-TP pseudowire test service.

Platforms

All

sdp

Syntax

```
sdp {sdp-id [:vc-id] | far-end ip-address} [interval seconds] [repeat repeat] [absolute | rate]
```

Context

[\[Tree\]](#) (monitor>service>id sdp)

Full Context

monitor service id sdp

Description

This command monitors statistics for an SDP binding associated with this service.

Parameters

sdp-id

Specifies the SDP identifier.

Values sdp-id: 1 to 17407
vc-id: 1 to 4294967295

ip-address

Specifies the system address of the far-end router for the SDP in dotted decimal notation. The string may be up to 32 characters.

seconds

Configures the interval for each display, in seconds.

Values 11 to 60

Default 11

repeat

Configures how many times the command is repeated.

Values 1 to 999

Default 10

absolute

Displays absolute rate-per-second value for each statistic.

rate

Displays rate-per-second for each statistic instead of the delta.

Platforms

All

Output

The following output is an example of SDP information.

Description

This command displays SRv6 service information.

Parameters

instance

Specifies the instance ID for display.

Values 1 to 2

locator-name

Specifies the locator name for display, up to 64 characters.

end-dt4

Displays the End.DT4 function associated with the SRv6 instance in the service.

end-dt6

Displays the End.DT6 function associated with the SRv6 instance in the service.

end-dt46

Displays the End.DT46 function associated with the SRv6 instance in the service.

end-dx2

Displays the End.DX2 function associated with the SRv6 instance in the service.

end-dt2u

Displays the End.DT2U function associated with the SRv6 instance in the service.

end-dt2m

Displays the End.DT2M function associated with the SRv6 instance in the service.

destinations

Specifies that all destinations for display are included.

esi

Specifies a 10-byte ESI by which to filter the displayed information. For example, ESI-0 | ESI-MAX or 00-11-22-33-44-55-66-77-88-99 with any of these separators ('-',':',';',' ').

ms-locator-name

Specifies the micro-segment locator name for display, up to 64 characters.

udt4

Displays the uDT4 function associated with the SRv6 instance in the service.

udt6

Displays the uDT6 function associated with the SRv6 instance in the service.

udt46

Displays the uDT46 function associated with the SRv6 instance in the service.

udx2

Displays the uDX2 function associated with the SRv6 instance in the service.

udt2u

Displays the uDT2U function associated with the SRv6 instance in the service.

udt2m

Displays the uDT2M function associated with the SRv6 instance in the service.

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

Output

[Table 448: SRv6 instance Field Descriptions](#) describes the SRv6 instance field descriptions.

Use the following command to display SRv6 instance information.

```
show service id 1 segment-routing-v6 instance 1
```

Sample Output

```

22.36 selective-fib-log

selective-fib-log

Syntax

selective-fib-log

Context

[Tree] (tools>dump>router selective-fib-log)

Full Context

tools dump router selective-fib-log

Description

This command configures the dump tools for selective FIB log information for a specific IOM.

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

Output

The following output is an example of selective FIB log information.

Sample Output

```
*A:Dut-C# /tools dump router selective-fib-log
 1 : 2020/01/08 13:32:59.100 : Creating Base router
 2 : 2020/01/08 13:32:59.101 : Adding port system to if=system Base router
 2 : 2020/01/08 13:32:59.103 : Creating management router
 3 : 2020/01/08 13:32:59.103 : Creating vpls-management instance
 4 : 2020/01/08 13:32:59.103 : Adding port A/1 to if=management management router
 4 : 2020/01/08 13:40:55.404 : Adding port 1/1/5 to if=ip-10.10.5.5 Base router
 4 : 2020/01/08 13:40:55.407 : Adding port 2/1/6 to if=ip-10.10.7.7 Base router
 4 : 2020/01/08 13:40:55.411 : Adding port 2/1/2 to if=ip-10.10.11.11 Base router
 4 : 2020/01/08 13:40:55.414 : Adding port 2/1/2 to if=ip-10.10.13.13 Base router
 4 : 2020/01/08 13:40:55.417 : Adding port 2/1/2 to if=ip-10.10.15.15 Base router
 4 : 2020/01/08 13:40:55.420 : Adding port 1/1/1 to if=ip-10.10.17.18 Base router
 4 : 2020/01/08 13:40:55.423 : Adding port 1/1/3 to if=ip-10.10.21.22 Base router

22.37 send-force-renew

send-force-renew

Syntax

send-force-renew *ip-address*

Context

[\[Tree\]](#) (tools>perform>router>dhcp>server send-force-renew)

Full Context

tools perform router dhcp local-dhcp-server send-force-renew

Description

This command sends a DHCP FORCERENEW message on behalf of the DHCP server to the DHCP client with specified IP address. A DHCP lease with the specified IP address must exist in the DHCP server.

Parameters

ip-address

Specifies the DHCP client's IP address in dotted notation a.b.c.d.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

22.38 sensor-group

sensor-group

Syntax

sensor-group *name*

sensor-group

Context

[\[Tree\]](#) (show>system>telemetry sensor-group)

Full Context

show system telemetry sensor-group

Description

This command displays the sensor group information.

Parameters

name

Specifies the sensor group name, up to 32 characters.

Platforms

All

Output

The following output is an example of telemetry sensor group information and [Table 449: Show Sensor Group Field Descriptions](#) describes the output fields.

Sample Output

```
# show system telemetry sensor-group
=====
Telemetry sensor-groups
=====
Name                                     Valid  Invalid
paths                                     paths
-----
miro                                     1      0
-----
No. of Telemetry sensor-groups: 1
=====
```

Table 449: Show Sensor Group Field Descriptions

| Label | Description |
|---------------|---|
| Name | Displays the name of the telemetry sensor group name. |
| Valid paths | Displays the number of valid sensor group paths. |
| Invalid paths | Displays the number of invalid sensor group paths. |

| Label | Description |
|--------------------------------|---|
| No. of Telemetry sensor-groups | Displays the total number of telemetry sensor groups. |

22.39 server

server

Syntax

server [*name*]

Context

[\[Tree\]](#) (show>system>xmpp server)

Full Context

show system xmpp server

Description

This command shows the connectivity to the XMPP server, including the configured parameters and statistics. When the user provides the name of the server, a detailed view is shown.

Parameters

name

Specifies the name of the XMPP server. 32 characters maximum.

Platforms

All

Output

Sample Output

```
:sr12U-46-PE2# show system xmpp server

Context

[\[Tree\]](#) (show>test-oam>twamp server)

Full Context

show test-oam twamp server

Description

This command displays TWAMP server information.

Parameters

all

Displays all server information.

ip-prefix/prefix-length

Specifies the IP address prefix of the TWAMP server.

Values

| | |
|--------------------|-----------------------------------|
| ipv4-address: | a.b.c.d (host bits must be 0) |
| ipv4-prefix-length | 0 to 32 |
| ipv6-address: | x:x:x:x:x:x (eight 16-bit pieces) |

x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

capability

Displays the modes referenced or supported by the TWAMP server, with an RFC reference where those modes are defined.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following sample output shows TWAMP server information.

[Table 450: Server Stats Field Descriptions](#) describes server stats show command output fields.

Table 450: Server Stats Field Descriptions

| Field | Description |
|-----------------------|---|
| RX Discover Packets | The number of discover packets received by the DHCP server instance |
| Rx Request Packets | The number of request packets received by the DHCP server instance. |
| Rx Release Packets | The number of released packets received by the DHCP server instance |
| Rx Decline Packets | The number of declined packets received by the DHCP server instance |
| Rx Inform Packets | The number of inform packets received by the DHCP server instance |
| Tx Offer Packets | The number of offer packets sent by the DHCP server instance |
| Tx Ack Packets | The number of DHCP ACK packets sent by the DHCP server instance |
| Tx Nak Packets | The number of DHCP NAK packets sent by the DHCP server instance |
| Tx Forcerenew Packets | The number of DHCP force renew packets sent by the server instance |

| Field | Description |
|------------------------------|---|
| Client Ignored Offers | The number of DHCP offer packets sent by the DHCP server instance that were ignored by clients |
| Leases Timed Out | The number of leases timed out |
| Dropped Bad Packet | The number of dropped of DHCP packets received that were corrupt |
| Dropped Invalid Type | The number of DHCP packets received that had an invalid message type |
| Dropped No User Database | The number of DHCP packets dropped because the value of this server instance is not equal to the default value and a local user database with that name could not be found |
| Dropped Unknown Host | The number of DHCP packets dropped from hosts which were not found in the user database |
| Dropped User Not Allowed | The number of DHCP packets dropped from hosts which are found in the user database, but which have no address or pool specified |
| Dropped Lease Not Ready | The number of DHCP packets dropped by the server instance before the lease database was ready |
| Dropped Lease Not Found | The number of DHCP packets dropped by the server instance because no (valid) lease was found |
| Dropped Not Serving Pool | The number of DHCP packets dropped by the server instance because there were no more free addresses in the pool |
| Dropped Invalid User | The number of DHCP packets dropped by the server instance because the MAC address of the sender or the option 82 didn't match the host lease state |
| Dropped Overload | The number of DHCP packets dropped by the server instance because they were received more than the server instance can handle |
| Dropped Persistence Overload | The number of DHCP packets dropped by the server instance because they were received in more than the DHCP persistence system can handle. If this occurs, only releases and declines are still processed. |
| Dropped Generic Error | The number of DHCP packets dropped by the server instance because of a generic error |
| Dropped Destined To Other | The number of DHCP requests dropped by the server instance because the (broadcast) request was not destined to this server |

| Field | Description |
|--------------------------------|--|
| Dropped Address Unavailable | The number of DHCP requests dropped by the server instance because the requested address is not available |
| Dropped Max Leases Reached | The number of DHCP packets dropped by the server instance because the maximum number of leases was reached |
| Dropped Server Shutdown | The number of DHCP packets dropped by the server instance during server instance shutdown |
| Dropped No Subnet for Fixed IP | The number of DHCP packets dropped by the server instance for user-db hosts with a fixed address because the subnet to which the address belongs is not configured |

server-stats

Syntax

server-stats

Context

[\[Tree\]](#) (clear>router>dhcp>server server-stats)

[\[Tree\]](#) (clear>router>dhcp6>server server-stats)

Full Context

clear router dhcp local-dhcp-server server-stats

clear router dhcp6 local-dhcp-server server-stats

Description

This command clears all local DHCP or DHCPv6server statistics.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

22.41 server-tls-profile

server-tls-profile

Syntax

server-tls-profile [*server-tls-profile*]

server-tls-profile *server-tls-profile* **association**

Context

[\[Tree\]](#) (show>system>security>tls server-tls-profile)

Full Context

```
show system security tls server-tls-profile
```

Description

This command displays TLS server profile information.

Parameters

server-tls-profile

Specifies the name of a TLS server profile for which to display information, up to 32 characters.

Platforms

All

22.42 servers

servers

Syntax

```

[\[Tree\]](#) (show>router>dhcp servers)

Full Context

```
show router dhcp6 servers
```

```
show router dhcp servers
```

Description

This command lists the local DHCP or DHCP6 servers.

Parameters

all

Displays a complete list of local DHCP or DHCP6 servers.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of local DHCP or DHCP6 server information.

Sample Output

```
*A:ALA-49>show>router>dhcp# servers
=====
Overview of DHCP Servers
=====
Active Leases:      0
Maximum Leases:    159744

22.45 service-using

service-using

Syntax

service-using [epipe] [ies] [vpls] [vprn] [mirror] [apipe] [fpipe] [ipipe] [cpipe] [etree] [vsd] [b-vpls] [i-vpls] [m-vpls] [sdp *sdp-id*] [customer *customer-id*] [creation *creation-origin*]

Context

[Tree] (show>service service-using)

Full Context

```
show service service-using
```

Description

This command displays the services matching certain usage properties. Not all syntax options are available for each router type.

If no optional parameters are specified, all services defined on the system are displayed.

Parameters

epipe

Displays Epipe services.

ies

Displays IES services.

vpls

Displays VPLS services.

vprn

Displays VPRN services.

mirror

Displays mirror services.

apipe

Displays Apipe services.

fpipe

Displays Fpipe services.

ipipe

Displays Ipipe services.

cpipe

Displays Cpipe services.

etree

Displays etree services.

vsd

Displays VSD services.

b-vpls

Specifies the B-component instance of the Provider Backbone Bridging (PBB/IEEE 802.1ah) feature. It represents the multi-point tunneling component that multiplexes multiple customer VPNs (ISIDs) together. It is similar to a regular VPLS instance that operates on the backbone MAC addresses.

i-vpls

Specifies the I-component instance of the Provider Backbone Bridging (PBB/IEEE 802.1ah) feature. It identifies the specific VPN entity associated to a customer multipoint (E-LAN) service. It is similar to a regular VPLS instance that operates on the customer MAC addresses.

m-vpls

Specifies the M-component (managed VPLS) instance of the Provider Backbone Bridging (PBB/IEEE 802.1ah) feature.

sdp-id

Displays only services bound to the specified SDP ID.

Values 1 to 17407

Default Services bound to any SDP ID.

customer-id

Displays services only associated with the specified customer ID.

Values 1 to 2147483647

Default Services associated with any customer.

creation-origin

Specifies the method by which the service was created.

Values manual, multi-segment-p-w, dyn-script, vsd

Platforms

All

Output

The following output is an example of service using information, and [Table 452: Show Service-Using Output Fields](#) describes the output fields.

Sample Output

```

Context

[Tree] (show>router>ldp>bindings services)

Full Context

show router ldp bindings services

Description

This command displays LDP service FEC bindings.

Parameters

vc-type *vc-type*

Displays information about the VC type associated with this service FEC.

ethernet, vlan, mirror, frdlci, atmsdu, atmcell, atmvc, atmvcpc, ipipe, satop-e1, satop-t1, cesopn, cesopn-cas

vc-id *vc-id*

Displays information about the VC ID associated with this service FEC.

saii *global-id:prefix:ac-id*

Specifies the a SAII (Source Attachment Individual Identifier).

Values <number>:<number> | <a.b.c.d>:<number>

taii

Specifies the TAIID, up to 256 characters, associated with this service FEC.

svc-fec-type

Specifies the FEC type.

Values fec128, fec129

agi *agi*

Specifies the Attachment Group identifier TLV associated with this service FEC.

Values <ip-addr:comm-val> | <2byte-asnumber:ext-comm-val> | <4byte-asnumber:comm-val> ip-addr - a.b.c.d comm-val - [0 to 65535] 2byte-asnumber - [1 to 65535] ext-comm-val - [0 to 4294967295] 4byte-asnumber - [1 to 4294967295] null - means all value is 0

detail

Displays detailed information.

service-id

Specifies the service ID number to display.

Values 1 to 2147483647

svc-fec-type

Specifies the FEC type.

Values fec128, fec129

session ip-addr

displays configuration information about LDP sessions.

label-space

Specifies the label space identifier that the router is advertising on the interface.

Values 0 to 65535

Platforms

Context

[\[Tree\]](#) (show>service>id>ppp session)

Full Context

show service id ppp session

Description

This command displays PPP session information.

Parameters

user-name

Displays session information about the PPP user name.

sub-ppp-type

Displays session information about the sub PPP type.

Values oe, ol2tp

ip-int-name

Displays session information about the specified interface.

ip-address

Displays session information about the IP address.

intermediate-destination-id

Displays session information about the intermediate destination identifier, up to 32 characters, which is encoded in the identification strings.

no-inter-dest-id

Displays session information about no intermediate destination ID.

ip-prefix/prefix-length

Displays session information about the specified IP address and mask.

port-id

Displays session information about the specified port.

sap-id

Displays session information about the specified SAP.

ppp-session-type

Displays session information about the specified PPP session type.

Values local, wholesale-local, retail-local, l2tp

mlppp

Displays session information about MLPPP.

steering-profile

Displays session information about the specified steering profile, up to 32 characters.

circuit-id

Displays session information about the specified circuit ID, up to 256 characters.

remote-id

Displays session information about the specified remote ID, up to 256 characters.

detail

Displays detailed session information.

statistics

Displays PPP session statistics.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following is an example of service PPP session information.

Sample Output

```
# show service id 1000 ppp session detail
=====
PPP sessions for service 1000
=====
User-Name           : sub-2@domain-12.com

[Table 453: Service PPP Session Field Descriptions](#) describes PPP session field information.

Table 453: Service PPP Session Field Descriptions

| Field | Description |
|----------------------|--|
| User-Name | The user name |
| Description | The description |
| Up Time | The time of the last modification |
| Type | The PPP type |
| Termination | The termination type |
| IP/L2TP-Id/If-Id | The IP/L2TP or IF ID |
| MC-Standby | The MC standby |
| Session Time Left | The time remaining for the session timeout |
| LCP State | The LCP open/closed state |
| IPCP State | The IP CP open/closed state |
| IPv6CP State | The IPv6 CP open/closed state |
| PPP MTU | The PPP MTU value |
| PPP Auth-Protocol | The PPP authentication protocol |
| PPP User-Name | The PPP user name |
| Subscriber-interface | The subscriber interface name |
| Group-interface | The group interface name |
| IP Origin | The IP origin |

| Field | Description |
|----------------------|---|
| DNS Origin | The DNS origin |
| NBNS Origin | The NBNS origin |
| Subscriber | The subscriber identification string |
| Sub-Profile-String | The subscriber profile name |
| SLA-Profile-String | The SLA profile name |
| SPI group ID | The SPI group ID |
| ANCP-String | The value of the ancp-string received from either the DHCP or the RADIUS server |
| Int-Dest-Id | Intermediate destination identifier received from the RADIUS server |
| App-Profile-String | The application profile string |
| Category-Map-Name | The value of the category map name received from the RADIUS server |
| Acct-Session-Id | The accounting session ID |
| Sap-Session-Index | The sap session index of the PPP session |
| IP Address | The IP address |
| Primary DNS | The primary DNS server |
| Secondary DNS | The secondary DNS server |
| Primary NBNS | The primary NBNS server |
| Secondary NBNS | The secondary NBNS server |
| Address-Pool | The IP address pool used to search for an IP address for this session |
| IPv6 Prefix | The IPv6 prefix |
| IPv6 Prefix Origin | The origin of the IPv6 prefix |
| IPv6 Prefix Pool | The DHCP server pool from which the IPv6 prefix is allocated |
| IPv6 Del.Pfx. | The IPv6 delegated prefix |
| IPv6 Del.Pfx. Origin | The origin of the IPv6 delegated prefix |
| IPv6 Del.Pfx. Pool | The DHCP server pool from which the delegated prefix is allocated |

| Field | Description |
|--|---|
| IPv6 Address | The IPv6 address |
| IPv6 Address Origin | The origin of the IPv6 address |
| IPv6 Address Pool | The DHCP server pool from which the address is allocated |
| Primary IPv6 DNS | The primary IPv6 DNS server |
| Secondary IPv6 DNS | The secondary IPv6 DNS server |
| Router adv. policy | The router advertisement policy |
| Ignoring DF bit | The true/false status of ignoring DF bit |
| Radius sub-if prefix | The RADIUS subscriber interface prefix |
| Circuit-Id | The circuit ID of the PPP session |
| Remote-Id | The remote ID of the PPP session |
| Radius Session-TO | The value to interpret the session timeout VSA from RADIUS |
| Radius Class 1 | The Class attribute returned by the RADIUS server in an Access-Accept message |
| Radius User-Name | The User-Name attribute returned by the RADIUS server in an Access-Accept message |
| Logical-Line-Id | The logical line ID |
| Subscriber Host Limit Overrides and SLA Profile Instance Host Limit Overrides: (only shown when overrides are active) | |
| ipv4-arp | The total number of IPv4 ARP hosts limit |
| ipv4-dhcp | The total number of IPv4 DHCP hosts limit |
| ipv4-ppp | The total number of IPv4 PPP hosts limit |
| ipv4-overall | The total number of IPv4 hosts limit |
| ipv6-pd-ipoe-dhcp | The total number of IPv6 IPoE DHCP Prefix Delegation hosts (IA-PD) limit |
| ipv6-pd-ppp-dhcp | The total number of IPv6 PPPoE DHCP Prefix Delegation hosts (IA-PD) limit |
| ipv6-pd-overall | The total number of IPv6 DHCP Prefix Delegation hosts (IA-PD) limit |
| ipv6-wan-ipoe-dhcp | The total number of IPv6 IPoE DHCP WAN hosts (IA-NA) limit |

| Field | Description |
|--|---|
| ipv6-wan-ipoe-slaac | The total number of IPv6 IPoE SLAAC WAN hosts limit |
| ipv6-wan-ppp-dhcp | The total number of IPv6 PPPoE DHCP WAN hosts (IANA) limit |
| ipv6-wan-ppp-slaac | The total number of IPv6 IPoE SLAAC WAN hosts limit |
| ipv6-wan-overall | The total number of IPv6 WAN hosts limit |
| ipv6-overall | The total number of IPv6 hosts limit |
| lac-overall | The total number of L2TP LAC hosts limit |
| overall | The total number of subscriber hosts limit |
| Subscriber Session Limit Overrides and SLA Profile Instance Session Limit Overrides: (only shown when overrides are active) | |
| ipoe | The total number of IPoE sessions limit |
| ppoe-local | The total number of PPPoE local terminated sessions (PTA) limit |
| ppoe-lac | The total number of PPPoE L2TP LAC sessions limit |
| ppoe-overall | The total number of PPPoE sessions limit |
| l2tp-lns | The total number of L2TP LNS sessions limit |
| l2tp-lts | The total number of L2TP LTS sessions limit |
| l2tp-overall | The total number of L2TP sessions limit |
| overall | The total number of subscriber sessions limit |
| Managed Routes | |
| Status | The installation status |
| Metric | The metric value |
| Tag | The tag value |
| Pref | The preference value |
| Number of session | The number of sessions returned from the search criteria |

session

Syntax

session connection-id *connection-id* [{**detail** | **ppp-statistics**}]

session [{**detail** | **ppp-statistics**}] [**session-id** *session-id*] [**state** *session-state*] [**peer** *ip-address*] [**group** *group-name*] [**assignment-id** *assignment-id*] [**local-name** *local-host-name*] [**remote-name** *remote-host-name*] [**tunnel-id** *tunnel-id*] [**service** *service-id*] [**interface** {*ip-int-name* | *ip-address*}] [**ip-prefix** *ip-prefix/mask*]

session [{**detail** | **ppp-statistics**}] [**state** *session-state*] [**peer** *ip-address*] [**group** *group-name*] [**assignment-id** *assignment-id*] [**local-name** *local-host-name*] [**remote-name** *remote-host-name*] [**control-connection-id** *connection-id*] [**service** *service-id*] [**interface** {*ip-int-name* | *ip-address*}]

Context

[Tree] (show>router>l2tp session)

Full Context

show router l2tp session

Description

This command displays L2TP session operational information.

Parameters

connection-id

Specifies the identification number for a Layer Two Tunneling Protocol connection.

Values 1 to 429496729

detail

Displays detailed L2TP session information.

ppp-statistics

Displays PPP statistics for the session.

session-id

Specifies the identification number for a Layer Two Tunneling Protocol session.

Values 1 to 65535

session-state

Specifies the values to identify the operational state of the L2TP session.

Values closed, closed-by-peer, established, idle, wait-reply, wait-tunnel

ip-address

Specifies the IP address of the peer.

Values The following values apply to the 7750 SR:

ipv4-address a.b.c.d (host bits must be 0)

ipv6-address x:x:x:x:x:x:[-interface]
 x:x:x:x:x:d.d.d.d[-interface]
 x: [0 to FFFF]H
 d: [0 to 255]D
 interface: 32 characters maximum, mandatory for
 link local addresses

Values The following values apply to the 7450 ESS:
 ipv4-address: a.b.c.d (host bits must be 0)

group-name

Specifies a string to identify a Layer Two Tunneling Protocol Tunnel group.

assignment-id

Specifies a string that distinguishes this Layer Two Tunneling Protocol tunnel.

local-host-name

Specifies the host name used by this system during the authentication phase of tunnel establishment.

remote-host-name

Specifies a string that is compared to the host name used by the tunnel peer during the authentication phase of tunnel establishment.

tunnel-id

Specifies the local identifier of this Layer Two Tunneling Protocol tunnel, when L2TP version 2 is used.

Values 1 to 65535

service-id

Specifies the service identification number.

ip-int-name

Specifies the IP interface name.

ip-address

Specifies the IPv4 or IPv6 addresses.

ip-prefix/mask

Specifies information for the specified IP prefix and mask length.

connection-id

Specifies an identification number for a Layer Two Tunneling Protocol session.

Values 1 to 429496729

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of L2TP session operational information.

Sample Output

```
*A:Dut-C# show router l2tp session

show service id pppoe session
```

Description

This command displays PPPoE session information.

Parameters

ip-int-name

Specifies the IP interface name.

ip-address

Specifies the IP address of the PPPoE session.

sap-id

Specifies the SAP ID.

session-id

Specifies the ID of the PPPoE session.

ieee-address

Specifies the MAC address of the PPPoE session.

port-id

Specifies the port ID.

no-inter-dest-id

Displays the information of PPPoE sessions that do not have an intermediate destination ID associated.

intermediate-destination-id

Specifies the intermediate destination ID.

steering-profile

Specifies the name of the steering profile, up to a maximum of 32 characters.

policy-name

Specifies the name of the router advertisement policy, up to a maximum of 32 characters.

detail

Displays detailed information.

statistics

Displays statistics about the PPPoE session.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output displays PPPoE session information.

Sample Output

```

session

Syntax

session connection-id *connection-id* **eth-tunnel-statistics**

Context

[\[Tree\]](#) (clear>router>l2tp session)

Full Context

clear router l2tp session

Description

This command clears L2TP session data.

Parameters

connection-id

Specifies the L2TPv3 connection ID.

eth-tunnel-statistics

Clears the Ethernet tunnel statistics associated with the specified session.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session

Syntax

session stop *connection-id*

Context

[\[Tree\]](#) (tools>perform>router>l2tp session)

Full Context

tools perform router l2tp session

Description

This command configures performance tools for a specified L2TP session.

Parameters

stop

Stops the performance tools for a specified L2TP session.

connection-id

Specifies the L2TPv3 connection ID.

Values 1 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session

Syntax

```
session [sap sap-id] [mac ieee-address] [circuit-id circuit-id] [remote-id remote-id] [interface ip-int-name | ip-address] [inter-dest-id intermediate-destination-id] [no-inter-dest-id] [ip-address ip-prefix[/prefix-length]] [port port-id] [subscriber sub-ident-string] [sap-session-id sap-session-index] [detail] [wholesaler service-id] [router-advertisement-policy policy-name]
```

Context

[\[Tree\]](#) (show>service>id>ipoe session)

Full Context

```
show service id ipoe session
```

Description

This command displays the identified IPoE session details active on the specified service instance.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

ieee-address

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

circuit-id

Specifies the circuit ID, up to 127 characters.

remote-id

Specifies that information that goes into the remote-id sub-option in the DHCP relay packet, up to 255 characters.

ip-int-name

Specifies the name of the IP interface, up to 32 characters.

ip-address[/prefix-length]

Specifies information for the specified IP address and mask.

no-inter-dest-id

Displays the information about no intermediate destination ID.

port-id

Displays information about the specified port ID.

sap-session-index

Displays sap-session-index information.

service-id

Specifies the service ID of the wholesaler.

| | | |
|---------------|--------------------|-----------------|
| Values | <i>service-id:</i> | 1 to 2147483647 |
|---------------|--------------------|-----------------|

intermediate-destination-id

Specifies the intermediate destination identifier which is encoded in the identification strings up to 32 characters.

sub-ident-string

Specifies an existing subscriber identification profile.

detail

Displays all IPoE session details.

policy-name

Specifies the name of the router advertisement policy, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following is an example of service IPoE session information.

Sample Output

```

[Table 454: Service IPoE Session Field Descriptions](#) describes IPoE session field information.

Table 454: Service IPoE Session Field Descriptions

| Field | Description |
|-----------------------|---|
| SAP Id | The SAP ID of the IPoE session |
| Mac Address | The MAC address of the IPoE session |
| Up Time | The time of the last modification |
| MC-Stdby | The number of SAPs defined on this service on a port which is in multi-chassis standby mode |
| SAP | The SAP ID of the IPoE session |
| Circuit-Id | The circuit ID of the IPoE session |
| Remote-Id | The remote ID of the IPoE session |
| Session Key | The session key used for this IPoE session to group subscriber hosts |
| MC-Standby | The number of SAPs defined on this service on a port which is in multi-chassis standby mode |
| Subscriber-interface | The subscriber interface name |
| Group-interface | The group interface name |
| Up Time | The time of the last modification |
| Session Time Left | The time remaining for the session timeout |
| Last Auth Time | The date and time of the last authentication |
| Min Auth Intvl (left) | The minimum interval between two consecutive authentication attempts for the same ARP host |
| Persistence Key | The key value that is used to track this in the persistence file |
| Subscriber | The subscriber identification string |
| Sub-Profile-String | The subscriber profile name |
| SLA-Profile-String | The SLA profile name |
| ANCP-String | The value of the ancp-string received from either the DHCP or the RADIUS server |

| Field | Description |
|----------------------|--|
| Int-Dest-Id | Intermediate destination identifier received from the RADIUS server |
| App-Profile-String | The application profile string |
| Category-Map-Name | The value of the category map name received from the RADIUS server |
| Acct-Session-Id | The accounting session ID |
| Sap-Session-Index | The sap session index of the PPP session |
| IP Address | The IP address |
| IP Origin | The origin of the source IP address used for connectivity verification |
| Primary DNS | The primary DNS server |
| Secondary DNS | The secondary DNS server |
| Primary NBNS | The primary NBNS server |
| Secondary NBNS | The secondary NBNS server |
| Address-Pool | The IP address pool used to search for an IP address for this session |
| IPv6 Prefix | The IPv6 prefix |
| IPv6 Prefix Origin | The origin of the IPv6 prefix |
| IPv6 Prefix Pool | The DHCP server pool from which the SLAAC prefix is allocated |
| IPv6 Del.Pfx. | The IPv6 delegated prefix |
| IPv6 Del.Pfx. Origin | The origin of the IPv6 delegated prefix |
| IPv6 Del.Pfx. Pool | The DHCP server pool from which the delegated prefix is allocated |
| IPv6 Address | The IPv6 address |
| IPv6 Address Origin | The origin of the IPv6 address |
| IPv6 Address Pool | The DHCP server pool from which the address is allocated |
| Primary IPv6 DNS | The primary DNS server |
| Secondary IPv6 DNS | The secondary DNS server |
| Radius Session-TO | The value to interpret the session timeout VSA from RADIUS |

| Field | Description |
|--|---|
| Radius Class | The Class attribute returned by the RADIUS server in an Access-Accept message |
| Radius User-Name | The User-Name attribute returned by the RADIUS server in an Access-Accept message |
| Subscriber Host Limit Overrides and SLA Profile Instance Host Limit Overrides: | |
| ipv4-arp | The total number of IPv4 ARP hosts limit |
| ipv4-dhcp | The total number of IPv4 DHCP hosts limit |
| ipv4-ppp | The total number of IPv4 PPP hosts limit |
| ipv4-overall | The total number of IPv4 hosts limit |
| ipv6-pd-ipoe-dhcp | The total number of IPv6 IPoE DHCP Prefix Delegation hosts (IA-PD) limit |
| ipv6-pd-ppp-dhcp | The total number of IPv6 PPPoE DHCP Prefix Delegation hosts (IA-PD) limit |
| ipv6-pd-overall | The total number of IPv6 DHCP Prefix Delegation hosts (IA-PD) limit |
| ipv6-wan-ipoe-dhcp | The total number of IPv6 IPoE DHCP WAN hosts (IA-NA) limit |
| ipv6-wan-ipoe-slaac | The total number of IPv6 IPoE SLAAC WAN hosts limit |
| ipv6-wan-ppp-dhcp | The total number of IPv6 PPPoE DHCP WAN hosts (IA-NA) limit |
| ipv6-wan-ppp-slaac | The total number of IPv6 PPPoE SLAAC WAN hosts limit |
| ipv6-wan-overall | The total number of IPv6 WAN hosts limit |
| ipv6-overall | The total number of IPv6 hosts limit |
| lac-overall | The total number of L2TP LAC hosts limit |
| overall | The total number of subscriber hosts limit |
| Subscriber Session Limit Overrides and SLA Profile Instance Session Limit Overrides: | |
| ipoe | The total number of IPoE sessions limit |
| ppoe-local | The total number of PPPoE local terminated sessions (PTA) limit |
| ppoe-lac | The total number of PPPoE L2TP LAC sessions limit |

| Field | Description |
|-------------------|--|
| ppoe-overall | The total number of PPPoE sessions limit |
| l2tp-lns | The total number of L2TP LNS sessions limit |
| l2tp-lts | The total number of L2TP LTS sessions limit |
| l2tp-overall | The total number of L2TP sessions limit |
| overall | The total number of subscriber sessions limit |
| Number of session | The number of sessions returned from the search criteria |

session

Syntax

session [*name trace-name*] [*detail*]

session sap *sap-id* **mac** *ieee-address* [**circuit-id** *circuit-id*] [**remote-id** *remote-id*] [**username** *user-name*] [*detail*]

Context

[\[Tree\]](#) (show>call-trace>ipoe session)

[\[Tree\]](#) (show>call-trace>ppp session)

Full Context

show call-trace ipoe session

show call-trace ppp session

Description

This command displays call trace information for the active session.

Configuring this command with specified session filters, displays information for the specified trace job only.

Parameters

detail

Displays detailed information.

sap-id

Specifies the SAP ID that identifies a session.

ieee-address

Specifies a MAC address that identifies a session.

circuit-id

Specifies a circuit ID that identifies a session, up to 255 characters.

remote-id

Specifies a remote ID that identifies a session, up to 255 characters.

trace-name

Specifies the name of the trace, up to 32 characters, that triggered the job.

user-name

Specifies the user name, up to 32 characters, that identifies a PPPoE session.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output displays call trace information for the active IPoE session.

Sample Output

```

Node # show call-trace ipoe session
=====
Call trace IPoE session
=====
IEEE address          Status          No. of messages
  Trace name
-----
00:02:00:00:00:19    running        10
  default
-----
No. of call trace IPoE debug jobs: 1
=====

Node# show call-trace ipoe session detail

[Table 455: Call Trace IPoE Session Field Descriptions](#) describes call trace IPoE session output fields.

Table 455: Call Trace IPoE Session Field Descriptions

| Field | Description |
|--------------|--|
| IEEE address | The IEEE address of the equipment to match by this trace |
| Status | The status of the trace session |

| Field | Description |
|-----------------------|--|
| No. of messages | The number of messages from the trace session |
| Trace name | The name of the trace profile |
| Size limit | The maximum data volume generated by a single call trace job to the output, in megabytes |
| Time limit | The maximum duration of a single call trace job, in seconds |
| Live output | The live output destination for trace logs |
| Destination | The destination address of the trace logs |
| Started | The date and time the trace began |
| No. of captured msgs | The number of captured messages |
| Size of captured msgs | The size of the captured messages |

session

Syntax

session sap *sap-id* **mac** *ieee-address*

session sap *sap-id* **mac** *ieee-address* **circuit-id** *circuit-id* [**remote-id** *remote-id*] [**user-name** *user-name*]

session sap *sap-id* **mac** *ieee-address* [**circuit-id** *circuit-id*] **remote-id** *remote-id* [**user-name** *user-name*]

session sap *sap-id* **mac** *ieee-address* [**circuit-id** *circuit-id*] [**remote-id** *remote-id*] **user-name** *user-name*

Context

[\[Tree\]](#) (clear>call-trace>ipoe session)

[\[Tree\]](#) (clear>call-trace>pppoe session)

Full Context

clear call-trace ipoe session

clear call-trace pppoe session

Description

This command clears the trace job identified by this session.

This command does not affect any of the debug trace commands, and new jobs can still be executed for other sessions.

After a session is cleared, tracing for the session will not be restarted by any configured trace. Only explicitly starting a new trace with the **trace-existing-sessions** parameter can restart tracing for the session.

Parameters

circuit-id

Specifies a circuit ID, up to 255 characters, that identifies a session.

ieee-address

Specifies a MAC address that identifies a session.

remote-id

Specifies a remote ID, up to 255 characters, that identifies a session

sap-id

Specifies the SAP ID that identifies a session.

user-name

Specifies the user name, up to 32 characters, that identifies a session.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session

Syntax

session [**session-type**] [**!sp-name***session-name*] [**detail**]

Context

[\[Tree\]](#) (show>router>gmpls session)

Full Context

show router gmpls session

Description

This command displays GMPLS session information.

Parameters

session-type

Keyword to display information about the session type.

session-name

Specifies the name of the GMPLS session. The name can be a maximum of 80 characters in length and accepts * as a wildcard character.

detail

Keyword to request more detailed output.

Platforms

7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

session

Syntax

session [**family**] [**summary** | **detail**] *ip-addr*[*label-space*]

Context

[\[Tree\]](#) (show>router>ldp>bindings session)

Full Context

show router ldp bindings session

Description

This command displays LDP FEC bindings by matching peer LSR ID.

Parameters

detail

Displays detailed information.

summary

Displays information in a summarized format.

family

Displays either IPv4 or IPv6 LDP session information.

ip-addr

displays configuration information about LDP sessions.

label-space

Specifies the label space identifier that the router is advertising on the interface.

Values 0 to 65535

Platforms

All

session

Syntax

session [*ip-addr*[*label-space*]] **local-addresses** [**sent** | **recv**] **ip-addr** *ip-address*

session [*ip-addr*[*label-space*]] [*session-type*] [**state** *state*] [**summary** | **detail**] [**community** *community*]

session statistics [packet-type] [session-type] [ family]  
session [session-type] [state state] [ summary | detail] [family] [community community]
```

Context

[\[Tree\]](#) (show>router>ldp session)

Full Context

```
show router ldp session
```

Description

This command displays configuration information about LDP sessions.

Parameters

ip-addr

Specifies the IP address of the LDP peer.

label-space

Specifies the label space identifier that the router is advertising on the interface.

Values 0 to 65535

statistics

Specifies the statistics for a targeted peer.

packet-type

Specifies the packet type.

Values hello, keepalive, init, label, notification, address, capability

session-type

Specifies to display the session type.

Values link, targeted, both

state

Specifies to display the current operational state of the adjacency.

Values up - Established down - Initialized, OpenRecv, OpenSent, Nonexistent

summary

Displays information in a summarized format.

detail

Displays detailed information including the community and if a local LSR ID is advertised.

local-addresses

Specifies the local address information.

ip-address

Specifies the IPv4 or IPv6 address.

Values <ip-address> : ipv4-address - a.b.c.d ipv6-address - x:x:x:x:x:x
 (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x - [0 to FFFF]H d - [0 to 255]D

overload

Specifies the overload information.

fec-type

Specifies the specified FEC type.

Values ipv4-prefixes, ipv6-prefixes, ipv4-p2mp, ipv6-p2mp, svc-fec128, svc-fec129

family

Displays either IPv4 or IPv6 active LDP information.

Values ipv4, ipv6

community

The string defining the LDP community assigned to the session. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains spaces, use double quotes to delimit the start and end of the string.

Platforms

All

Output

[Table 456: LDP Session Output Fields](#) describes the LDP session output fields.

Table 456: LDP Session Output Fields

| Label | Description |
|-----------------------|--|
| Peer LDP Id | The IP address of the LDP peer. |
| Adj Type | The adjacency type between the LDP peer and LDP session is targeted. |
| | Link — Specifies that this adjacency is a result of a link hello. Targeted — Specifies that this adjacency is a result of a targeted hello. |
| State | Established — Specifies that the adjacency is established. |
| | Trying — Specifies that the adjacency is not yet established. |
| Msg Sent Mesg Sent | The number of messages sent. |
| Msg Rcvd Mesg Rcvd | The number of messages received. |
| Up Time | The amount of time the adjacency has been enabled. |

| Label | Description |
|-------------------------|--|
| Session Community | Specifies the LDP community associated with a session. |
| Local LSR ID Advertised | Specifies if a local LSR ID is advertised. |

Sample Output

```

session

Syntax

session *ip-addr*[*label-space*] [**statistics**]

session *ip-addr*[*label-space*] **overload** [**fec-type** p2mp | **prefixes** *sub-type* *sub-type*]

session *ip-addr*[*label-space*] **overload** [**fec-type** svc-fec128 | **svc-fec129**]

Context

[\[Tree\]](#) (clear>router>ldp session)

Full Context

clear router ldp session

Description

This command restarts or clears statistics for LDP sessions.

Parameters

ip-address

Clears the IP address of the session

label-space

Specifies the label space identifier that the router is advertising on the interface.

Values 0 to 65535

statistics

Clears only the statistics for a session.

overload

Clears overload information.

fec-type

Clears the specified FEC type.

Values p2mp, svc-fec128, svc-fec129

session ip-addr[*label-space*]

Specifies the IP address and label space identifier.

Values <ip-addr[*label-spa**> : ipv4-address:label-space

ipv6-address [label-space]
label-space — [0 to 65535]

Platforms

All

session

Syntax

session *ip-addr*[*label-space*] [**connection** | **peer** | **adjacency**]

Context

[\[Tree\]](#) (tools>dump>router>ldp session)

Full Context

tools dump router ldp session

Description

This command dumps information for an LDP session.

Parameters

ip-addr[*label-space*]

Dumps information for the specified IP address and label space identifier.

Values *ip-addr*[*label-spa**]: ipv4-address:label-space ipv6-address[*label-space*]
label-space - [0 to 65535]

connection

Filters output for connection information.

peer

Filters output for peering information.

adjacency

Filters output for adjacency information.

Platforms

All

session

Syntax

session *lsp-index* *lsp-index* [**path-lspid** *path-lspid*] [**detail**]

session *lsp-name* *lsp-name* [**path-lspid** *path-lspid*] [**detail**]

session lsp-path [detail]

session lsp-path prefix *ip-prefix* *prefix-length* [src *ip-address* *llocal-link address*] [detail]

session sr-policy [detail]

session sr-policy prefix *ip-prefix* *prefix-length* [src *ip-address* *llocal-link address*] [detail]

Context

[\[Tree\]](#) (show>router>bfd>seamless-bfd session)

Full Context

show router bfd seamless-bfd session

Description

This command displays Seamless-BFD session information.

Parameters

lsp-index *lsp-index*

Specifies the LSP index.

Values 0 to 4294967295

path-lspid *path-lspid*

Specifies the path LSP ID.

Values 0 to 4294967295

detail

Displays detailed information.

lsp-name *lsp-name*

Displays information about the specified LSP name, up to 64 characters.

lsp-path

Keyword to display information by LSP path.

prefix

Keyword to display information by far-end prefix.

sr-policy

Keyword to display information by SR policy.

ip-prefix/prefix-length

Specifies an IP prefix for which to display Seamless-BFD session information, and the length of the prefix.

Values *ipv4-prefix* — a.b.c.d (host bits must be zero)

ipv4-prefix-length — 0 to 32

ipv6-prefix — x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x — 0 to FFFF (hexadecimal)

d — 0 to 255 (decimal)
 ipv6-prefix-length — 0 to 128

ip-address/link-local-address

Specifies the source IP address for which to display Seamless-BFD session information.

Values *ipv4-address* — a.b.c.d
ipv6-address — x:x:x:x:x:x[-interface]
 x:x:x:x:x:d.d.d.d[-interface]
 x — 0 to FFFF (hexadecimal)
 d — 0 to 255 (decimal)
 interface — mandatory for link local address, up to 32 characters

Output

The following output shows an example of BFD session information and [Table 457: MPLS Seamless-BFD Session Output Fields](#) describes Seamless-BFD session output fields.

Sample Output

```
# show router bfd seamless-bfd session lsp-index 70000
=====
Legend:
  Session Id = Interface Name | LSP Name | Prefix | RSVP Sess Name | Service Id
  wp = Working path  pp = Protecting path
=====
BFD Session
=====
Session Id          State      Tx Pkts   Rx Pkts
Rem Addr/Info/SdpId:VcId  Multipl   Tx Intvl  Rx Intvl
Protocols           Type      LAG Port   LAG ID
-----
10.20.1.6/32        Up         N/A       N/A
10.20.1.6           3          10        10

Table 457: MPLS Seamless-BFD Session Output Fields

| Label | Description |
|------------|--------------------------|
| Session Id | Specifies the session ID |

| Label | Description |
|------------------------------|---|
| State | Specifies the session state (Up/Down) |
| Tx Pkts | Specifies the number of packets transmitted |
| Rx Pkts | Specifies the number of packets received |
| Rem Addr/Info/ SdpId:VcId | Specifies the session remote endpoint address information |
| Multipl | Specifies the multiplier |
| Tx Intvl | Specifies the transmit interval |
| Rx Intvl | Specifies the receive interval |
| Protocols | Specifies the protocol that the session is bound to |
| Type | Specifies the BFD type cpm-np — Specifies to use CPM network processor |
| LAG Port | Specifies the LAG Port |
| LAG ID | Specifies the LAG ID |
| No. of BFD sessions | Specifies the number of BFD sessions |
| Prefix | Specifies the prefix |
| Local Address | Specifies the local address |
| LSP Name | Specifies the LSP name |
| LSP Index | Specifies the LSP index |
| Path LSP ID | Specifies the path LSP ID |
| Fec Type | Specifies the FEC type |
| Return Path | Specifies the return path label for the S-BFD packet |
| Oper State | Specifies the operational state (Up/Down) |
| Protocols | Specifies the protocol used |
| Up Time | Specifies the up time |
| Up Transitions | Specifies the number of up transitions |
| Down Time | Specifies the down time |
| Down Transitions | Specifies the number of down transitions |

| Label | Description |
|------------------|--|
| Version Mismatch | Specifies the number of version mismatches |
| Local Discr | Specifies the local Discr information |
| Local State | Specifies the local state (Up/Down) |
| Local Diag | Specifies the local diag information |
| Local Mode | Specifies the local mode |
| Local Min Tx | Specifies the local Min Tx value |
| Local Mult | Specifies the local Mult value |
| Last Sent (ms) | Specifies the last sent forwarding information |
| Local Min Rx | Specifies the local Min Rx value |
| Type | Specifies the session endpoint type |
| Remote Discr | Specifies the remote Discr value |
| Remote State | Specifies the remote state (Up/Down) |
| Remote Diag | Specifies the remote diagnostic value |
| Remote Mode | Specifies the remote mode |
| Remote Min Tx | Specifies the remote minimum transmit value |
| Remote Mult | Specifies the remote multiplier |
| Remote C-flag | Specifies the remote C-flag value |
| Last Recv (ms) | Specifies the last received value |
| Remote Min Rx | Specifies the remote minimum receive value |

session

Syntax

session {*ipv4* | *ipv6*} **detail** [**lag** *lag-id*] **lag-port** *port-id*

```

Context

[\[Tree\]](#) (show>router>bfd session)

Full Context

```
show router bfd session
```

Description

This command display BFD session information.

Parameters

ipv4 | **ipv6**

Displays session information for IPv4 or IPv6.

dest *ip-address* | *link-local address*

Displays information about the specified destination IP address or link local address.

detail

Displays detailed information.

dst-ip *ip-address*

When used with the **lsp-ldp** parameter, filters BFD session information by the destination IP address.

ip-prefix/*ip-prefix-length*

Specifies an IP prefix for which to display BFD session information, and the length of the prefix.

Values *ipv4-prefix* — a.b.c.d
 ipv4-prefix-length — 0 to 32
 ipv6-prefix — x:x:x:x:x:x:x (eight 16-bit pieces)
 x:x:x:x:x.d.d.d.d
 x — 0 to FFFF (hexadecimal)

d — 0 to 255 (decimal)

ipv6-prefix-length — 0 to 128

lag *lag-id*

Displays information about the specified LAG ID.

lag-port *port-id*

Displays information about the specified LAG port ID.

lsp-id *lsp-id*

Displays information about the specified LSP.

lsp-ldp head

Displays a count of head-end LSP BFD sessions, cpm-np sessions, central sessions, and IOM sessions.

lsp-ldp tail

Displays a count of tail-end LSP BFD sessions, cpm-np sessions, central sessions, and IOM sessions.

lsp-name *lsp-name*

Displays information about the specified LSP name.

lsp-rsvp {head | tail}

Displays a summary of all head or tail RSVP LSP BFD sessions. The information in this **show** command should be the same as the **show>router>bfd>session** commands, but filtered for sessions associated with RSVP LSPs. The protocol field of the output should indicate **lsp-rsvp**.

p2mp-interface *interface-name*

Displays information about the specified P2MP interface

rsvp-session-name [256 chars max]

Displays a summary of all head or tail RSVP LSP BFD sessions. The information in this **show** command should be the same as the **show>router>bfd>session** commands, but filtered for sessions associated with RSVP LSPs. The protocol field of the output should indicate **lsp-rsvp**.

src *ip-address/link-local address*

Displays information about the specified source IP address or link local address.

src-ip *ip-address*

When used with the **lsp-ldp** parameter, filters BFD session information by the source IP address.

summary

Displays summarized information.

tunnel-id *tunnel-id*

Displays information about the specified tunnel.

type *type*

Specifies the type.

Values **iom, central, cpm-np**

Platforms

All

Output

The following output shows an example of BFD session information.

Sample Output

Context

[\[Tree\]](#) (show>router>bfd session)

Full Context

show router bfd session

Description

This command displays information for existing BFD sessions.

Parameters

detail

Displays detailed session information.

lsp-rsvp

Displays BFD sessions on an RSVP LSPs.

head

This optional keyword limits the output to BFD sessions at the head end of LSPs.

tail

This optional keyword limits the output to BFD sessions at the tail end of LSPs.

ipv4

This optional keyword limits the output to IPv4-based BFD sessions.

ipv6

This optional keyword limits the output to IPv6-based BFD sessions.

lag-id

Limits the output to micro-BFD sessions associated with the specified LAG ID.

port-id

Limits the output to micro-BFD sessions associated with the specified port ID.

lsp-ldp

Displays BFD sessions on an LDP LSPs.

ip-address

Limits the output to BFD sessions with the specified IPv4 or IPv6 addresses.

link-local-address

Limits the output to BFD sessions with the specified IPv6 link-local addresses.

ip-prefix/prefix-length

Displays IPv4 or IPv6 addresses of the BFD sessions.

Values The following values apply to the 7750 SR and 7950 XRS:

| | | |
|--------------------|-------------------------------------|--------------|
| ipv4-prefix | a.b.c.d (host bits must be 0) | |
| ipv4-prefix-length | 0 to 32 | |
| ipv6-prefix | x:x:x:x:x:x:x (eight 16-bit pieces) | |
| | x:x:x:x:x:d.d.d.d | |
| | x: | [0 to FFFF]H |
| | d: | [0 to 255]D |
| ipv6-prefix-length | 0 to 128 | |

lsp-name

Limits the output to BFD sessions associated with the specified LSP.

tunnel-id

Limits the output to BFD sessions associated with the specified tunnel ID.

lsp-id

Limits the output to BFD sessions associated with the specified LSP ID.

mpls-tp

This optional keyword limits the output to BFD sessions on MPLS-TP LSPs.

cc-only

This optional keyword limits the output to CC BFD sessions on MPLS-TP LSPs.

cc-cv

This optional keyword limits the output to CV BFD sessions on MPLS-TP LSPs.

interface-name

Limits the output to the BFD session for the specified interface.

rsvp-session-name

Limits the output to the BFD session for the specified RSVP session.

summary

Displays summary session information for the router.

type

Limits the output to BFD sessions associated with the specified type.

Values iom, central, cpm-np

Platforms

All

Output

The following output is an example of BFD session information, and [Table 458: BFD Session Field Descriptions](#) describes the fields.

Sample Output

```

Table 458: BFD Session Field Descriptions

| Label | Description |
|----------|--|
| State | Displays the administrative state for this BFD session |
| Protocol | Displays the active protocol |
| Tx Intvl | Displays the interval, in milliseconds, between the transmitted BFD messages to maintain the session |
| Tx Pkts | Displays the number of transmitted BFD packets |
| Rx Intvl | Displays the expected interval, in milliseconds, between the received BFD messages to maintain the session |
| Rx Pkts | Displays the number of received packets |
| Mult | Displays the integer used by BFD to declare when the neighbor is down |

session

Syntax

```
session [session-type] [from ip-address [ to ip-address] [lsp-name session-name] [status {up | down}] [detail] [interface ip-int-name]
```

Context

[Tree] (show>router>rsvp session)

Full Context

```
show router rsvp session
```

Description

This command shows RSVP session information.

Parameters

session-type

Specifies the session type.

Values originate, transit, terminate, detour, detour-transit, detour-terminate, bypass-tunnel

from ip-address

Specifies the IP address of the originating router.

to ip-address

Specifies the IP address of the egress router.

session-name

Specifies the name, up to 160 characters in length, of the LSP used in the path. "*" can be used as a wildcard character.

status up

Specifies to display a session that is operationally up.

status down

Specifies to display a session that is operationally down.

detail

Displays detailed information.

ip-int-name

Specifies the name of an existing MPLS interface.

If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

The **interface** option filters the display to include all RSVP sessions that use this interface name as "In Interface" or as "Out Interface".

Platforms

All

Output

The following output is an example of RSVP session information.

[Table 459: RSVP Session Output Fields](#) describes RSVP session output fields.

Table 459: RSVP Session Output Fields

| Label | Description |
|-----------|--|
| From | The IP address of the originating router. |
| To | The IP address of the egress router. |
| Tunnel ID | The IP address of the tunnel's ingress node supporting this RSVP session. |
| LSP ID | The ID assigned by the agent to this RSVP session. |
| Name | The administrative name assigned to the RSVP session by the agent. |
| State | Down — The operational state of this RSVP session is down. Up — The operational state of this RSVP session is up. |

Sample Output

```
*A:SRU4>show>router>rsvp# session

```

session

Syntax

session *src-ip ip-address* **dst-ip** *ip-address*

Context

[\[Tree\]](#) (clear>router>bfd session)

Full Context

clear router bfd session

Description

This command clears BFD sessions.

Parameters

src-ip *ip-address*

Specifies the address of the local endpoint of this BFD session.

dst-ip *ip-address*

Specifies the address of the remote endpoint of this BFD session.

Platforms

All

session

Syntax

```
session [service service-id] [interface ip-int-name] [address mcast-address] [source ip-address]
```

Context

[\[Tree\]](#) (show>video>adi session)

Full Context

```
show video adi session
```

Description

This command displays ADI video session information.

Parameters

service *service-id*

Displays video session information pertaining to the specified service ID.

Values 1 to 2147483648

svc-name — a string up to 64 characters in length.

interface *ip-int-name*

Displays session information for the specified interface.

address *mcast-address*

Displays session information for the specified multicast address.

source *ip-address*

Displays session information for the specified IP address.

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

Output

The following is an example output for this command.

Sample Output

```
*B:IPTV-SR7# show video adi session

Context

[\[Tree\]](#) (clear>video>id session)

Full Context

clear video id session

Description

This command clears session information.

Parameters

all

Clears all sessions.

client *srcAddr*

Clears information for the client source address.

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

session

Syntax

```
session all [rt-server] [fcc-server]  
session client srcAddr [rt-server] [fcc-server]
```

Context

[\[Tree\]](#) (clear>video>statistics>id session)

Full Context

```
clear video statistics id session
```

Description

This command clears video statistics for a particular channel.

Parameters

- all**
Clears statistics for all sessions.
- rt-server**
Clears all RET server related statistics.
- fcc-server**
Clears all FCC server related statistics.
- client srcAddr**
Clears statistics for the specified source address.

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

session

Syntax

session session-name [{all | base | bin-group | event-mon | meas-interval}]
```

Context

[\[Tree\]](#) (show>oam-pm session)

Full Context

```
show oam-pm session
```

Description

Show the configuration and status information for an OAM Performance Monitoring session.

Parameters

session-name

Specifies the session name up to 32 characters.

all

Displays all attributes.

base

Specifies the base configuration option for the session.

bin-group

Specifies the associated bin group and its attributes.

event-mon

Configures event monitoring and last TCA.

meas-interval

Configures event monitoring and last TCA.

Platforms

All

Output

The following is an example of OAM-PM configuration information.

Sample Output

```

```

session all

Context

[\[Tree\]](#) (clear>service>id>ipoe session)

Full Context

clear service id ipoe session

Description

This commands clears all identified IPoE sessions for the specified service instance. All associated subscriber hosts are deleted from the system.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

ip-int-name

Specifies the name of the IP interface up to 32 characters.

ieee-address

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

circuit-id

Specifies the circuit ID up to 127 characters.

remote-id

Specifies that information that goes into the remote-id sub-option in the DHCP relay packet, up to 255 characters.

ip-address[/prefix-length]

Specifies information for the specified IP address and mask.

no-inter-dest-id

Displays the information about no intermediate destination ID.

intermediate-destination-id

Specifies the intermediate destination identifier which is encoded in the identification strings up to 32 characters.

port-id

Displays information about the specified port ID.

sap-session-index

Displays sap-session-index information.

service-id

Specifies the service ID of the wholesaler.

| Values | | |
|--------|---------------------|-----------------------|
| | <i>service-id</i> : | 1 to 2147483647 |
| | <i>svc-name</i> : | 64 characters maximum |

sub-ident-string

Specifies an existing subscriber identification profile.

service-id

Specifies information for the specified service ID.

| Values | | |
|--------|---------------------|-----------------------|
| | <i>service-id</i> : | 1 to 2147483647 |
| | <i>svc-name</i> : | 64 characters maximum |

detail

Displays all IPoE session details.

all

clears all active IPoE sessions for the specified service instance.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session

Syntax

session default-tunnel

```
session [sap sap-id] [mac mac-address] [local-session-id local-id] [remote-session-id remote-id] [detail]
```

Context

[\[Tree\]](#) (show>subscr-mgmt>pfcsp session)

Full Context

```
show subscriber-mgmt pfcsp session
```

Description

This command displays information on PFCSP sessions, including the default session. By default, all sessions are shown; filters can be applied to reduce the number of sessions or select a specific session.

Parameters

default-tunnel

Specifies that session information for the default tunnel is displayed.

detail

Specifies that associated forwarding information is displayed.

local-id

Specifies a local PFCP Session ID, up to 20 characters, which displays information for that local session ID.

remote-id

Specifies a remote PFCP session ID, up to 20 characters, which displays information for that remote session ID.

mac-address

Specifies the MAC address associated with the session, in the form xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx, which displays information associated with the specified MAC address.

sap-id

Specifies the SAP ID associated with the session.

session

Syntax

session lsp-path [**lsp-index** *lsp-index*] [**path-lspid** *path-lspid*] [**prefix** *ip-prefix* *lprefix-length*] [**src** *ip-address* | *ipv6 address*]

session lsp-path all

session sr-policy [**lsp-index** *lsp-index*] [**path-lspid** *path-lspid*] [**prefix** *ip-prefix* *lprefix-length*] [**src** *ip-address* | *ipv6 address*]

session sr-policy all

Context

[Tree] (clear>router>bfd>seamless-bfd session)

Full Context

clear router bfd seamless-bfd session

Description

This command clears Seamless-BFD (S-BFD) session information.

Parameters

lsp-path

Keyword to clear the S-BFD sessions for the LSP path.

sr-policy

Keyword to clear the S-BFD sessions for the SR policy.

all

Keyword to clear all S-BFD sessions.

lsp-index *lsp-index*

Specifies the LSP index.

Values 0 to 4294967295

path-lspid *path-lspid*

Specifies the path LSP ID.

Values 0 to 4294967295

prefix

Keyword to clear information by far-end prefix.

ip-prefix/prefix-length

Specifies an IP prefix for which to clear S-BFD session information, and the length of the prefix.

Values *ipv4-prefix* — a.b.c.d (host bits must be zero)
ipv4-prefix-length — 0 to 32
ipv6-prefix — x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:d.d.d.d
x — 0 to FFFF (hexadecimal)
d — 0 to 255 (decimal)
ipv6-prefix-length — 0 to 128

ip-address | *ipv6-address*

Specifies the IP address for which to clear S-BFD session information.

Values *ipv4-address* — a.b.c.d
ipv6-address — x:x:x:x:x:x:x[-interface]

x:x:x:x:d.d.d.d[-interface]
 x — 0 to FFFF (hexadecimal)
 d — 0 to 255 (decimal)
 interface — mandatory for link local address, up to 32 characters

session

Syntax

session *ldp-id* [*ldp-id*] [*interval seconds*] [*repeat repeat*] [*absolute* | *rate*]

Context

[\[Tree\]](#) (monitor>router>ldp session)

Full Context

monitor router ldp session

Description

This command displays statistical information for LDP sessions at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified LDP session(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

Parameters

ldp-id

Specifies the IP address of the LDP session to display. Up to five IP addresses can be specified in a single statement.

Values

ipv4-address label-space

ipv6-address [label-space]

label-space 0 to 65535
 ipv4-address a.b.c.d
 ipv6-address x:x:x:x:x:x (16 eight-bit pieces)
 x:x:x:x:x:d.d.d.d
 x: [0 to FFFF] H
 d: [0 to 255] D

seconds

Configures the interval for each display, in seconds.

Values 3 to 60
Default 10 seconds

repeat

Configures how many times the command is repeated.

Values 1 to 999
Default 10

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic instead of the delta.

Platforms

All

Output

The following output is an example of LDP session information.

Sample Output

A:ALA-12>monitor>router>ldp#
```

session

Syntax

```
session [sap-id sap-id] [interface ip-int-name | ip-address] [mac ieee-address] [session-id session-id] [type pppoe-session-type] [ip-address ip-prefix [/ prefix-length]] [port port-id] [inter-dest-id intermediate-destination-id] [no-inter-dest-id] [user-name user-name] [sub-ppp-type {oa | oe | oeo | ol2tp}] [no-padt]
session all [no-padt]
```

Context

[Tree] (clear>service>id>ppp session)

Full Context

clear service id ppp session

Description

This command clears PPP sessions with the specified attributes causing the session to reset.

Parameters

all

Clears all PPP sessions.

sap-id

Specifies the SAP ID.

Values

| | |
|---------------------|---|
| null | <i>port-id</i> <i>bundle-id</i> <i>bpgrp-id</i> <i>lag-id</i> <i>aps-id</i> eth-sat-id |
| dot1q | <i>port-id</i> <i>bundle-id</i> <i>bpgrp-id</i> <i>lag-id</i> <i>aps-id</i> <i>pw-id</i> eth-sat-id:[<i>qtag1</i>] cp-conn-prof-id] |

| pxc-id | pxc-id.sub-port | |
| | pxc | keyword |
| | <i>id</i> | 1 to 64 |
| | <i>sub-port</i> | a, b |

ip-int-name

Specifies the IP interface name, up to 32 characters.

ip-address

Specifies the IP address.

Values *ipv4-address* — a.b.c.d
ipv6-address — x:x:x:x:x:x:x (eight 16-bit pieces)
 x:x:x:x:x:d.d.d.d
 x - [0 to FFFF]H
 d - [0 to 255]D
 length: 0 to 128

ieee-address

Specifies the MAC address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

session-id

Specifies the session ID.

Values 1 to 65535

pppoe-session-type

Specifies type of PPPoE session used.

Values local | wholesale-local | retail-local | l2tp

ip-prefix[/prefix-length]

Specifies the IP prefix and length.

Values *ipv4-prefix* — a.b.c.d (host bits must be 0)
ipv4-prefix-length — 0 to 32
ipv6-prefix — x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d
 x: [0 to FFFF] H
 d: [0 to 255] D
 ipv6-prefix-length — 0 to 128

port-id

Specifies the port ID.

Values *slot/mda/port [.channel]*

| | | |
|------------|---|--------------------|
| bundle-id | bundle-type-slot/mda.-bundle-num | |
| | bundle | keyword |
| | <i>type</i> | ima fr ppp |
| | <i>bundle-num</i> | 1 to 336 |
| bpgrp-id | bpgrp-type-bpgrp-num | |
| | brgp | keyword |
| | <i>type</i> | ima ppp |
| | <i>brgp-num</i> | 1 to 2000 |
| aps-id | aps-group-id[.channel] | |
| | aps | keyword |
| | <i>group-id</i> | 1 to 128 |
| eth-tunnel | eth-tunnel-id | |
| | eth-tunnel | keyword |
| | <i>id</i> | 1 to 1024 |
| lag-id | lag-id lag-string | |
| | lag | keyword |
| | <i>id</i> | 1 to 800 |
| | <i>string</i> | 23 characters max. |
| gtg-id | gmpls-tun-grp-id | |
| | gmpls-tun-grp | keyword |
| | <i>id</i> | 1 to 1024 |
| eth-sat-id | esat-id/slot[<i>u</i>] port | |
| | esat | keyword |
| | <i>id</i> | 1 to 20 |

| | | |
|------------|--|--------------------------|
| | u | keyword for up-link port |
| tdm-sat-id | tsat-id/slot [u] <i>port.channel</i> | |
| | tsat | keyword |
| | <i>id</i> | 1 to 20 |
| | u | keyword for up-link port |
| pxc-id | pxc-id.sub-port | |
| | pxc | keyword |
| | <i>id</i> | 1 to 64 |
| | <i>sub-port</i> | a, b |

intermediate-destination-id

Specifies the intermediate destination ID, up to 32 characters.

no-inter-dest-id

Clears information for PPP sessions that do not have an associated intermediate destination ID.

user-name

Specifies the username, up to 110 characters.

no-padt

Clears session information for the PADT packets transmitted by the PPP client.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

session

Syntax

session imsi *imsi* **apn** *apn-string*

session [**peer-address** *ip-address*] [**router** *router-instance*] [**remote-control-teid** *teid*] [**local-control-teid** *teid*] [**detail**]

session imsi *imsi*

Context

[\[Tree\]](#) (show>subscr-mgmt>gtp>s11 session)

Full Context

show subscriber-mgmt gtp s11 session

Description

This command displays GTP S11 session information.

Parameters

imsi

Specifies the IMSI (International Mobile Subscriber Identity) of this UE.

apn-string

Specifies the APN (Access Point Name), up to 100 characters.

ip-address

Specifies the IP address.

Values *ipv4-address* — a.b.c.d
ipv6-address — x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:d.d.d.d
x - [0 to FFFF]H
d - [0 to 255]D
length: 0 to 128

router-instance

Specifies the identifier of the virtual router instance where the GTP tunnel is terminated.

Values *router-name* | *vprn-svc-id*
router-name — "Base"
vprn-svc-id — 1 to 2147483647

remote-control-teid teid

Specifies the remote control plane Tunnel Endpoint Identifier (TEID).

Values 1 to 4294967295

local-control-teid teid

Specifies the local control plane TEID.

Values 1 to 4294967295

detail

Displays detailed information.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following is an example of GTP S11 session information.

Sample Output

```
Node# show subscriber-mgmt gtp s11 session
```

```

=====
GTP S11 sessions
=====
IMSI                : 001020000000001

session

Syntax

session *session-name*

Context

[\[Tree\]](#) (show>oam-pm>stats session)

Full Context

show oam-pm statistics session

Description

This command selects the session for the statistical display.

Parameters

session-name

Specifies the session name, up to 32 characters.

Platforms

All

22.48 session-filter

session-filter

Syntax

session-filter

session-filter *session-filter-name*

Context

[\[Tree\]](#) (show>app-assure>group session-filter)

Full Context

show application-assurance group session-filter

Description

This command displays session filter information.

Parameters

session-filter-name

Specifies a session-filter-name up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following is an example show output for the **session-filter** command.

Sample Output

```
show application-assurance group <aa-group-id>[:<partition>] session-filter <filter-  
name>  
# session-filter<filter-id>  
=====  
AA Session Filter  
=====

22.49 session-parameters

session-parameters

Syntax

session-parameters [*family*] [**community** *community*]

session-parameters *peer-ip-address*

Context

[\[Tree\]](#) (show>router>ldp session-parameters)

Full Context

show router ldp session-parameters

Description

This command displays LDP peer information.

Parameters

peer-ip-address

Specify the peer IP address.

family

Displays either IPv4 or IPv6 active LDP information.

Values ipv4, ipv6

community

The string defining the LDP community assigned to the session. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains spaces, use double quotes to delimit the start and end of the string.

Platforms

All

Output

[Table 460: LDP Session Parameters Output Fields](#) describes the LDP session-parameters output.

Table 460: LDP Session Parameters Output Fields

| Label | Description |
|--------------|---|
| Peer | The IP address of the peer. |
| TTL security | Enabled — LDP peering sessions protected. |

| Label | Description |
|---------------|---|
| | Disabled — LDP peering sessions unprotected. |
| Min-TTL-Value | Displays the minimum TTL value for an incoming packet. |
| Auth | Enabled — Authentication using MD5 message based digest protocol is enabled. Disabled — No authentication is used. |

Sample Output

Example with community RED:

```

22.50 sessions

sessions

Syntax

sessions [**group** *name*] **neighbor** *ip-address*] [**port** *port-number*] [**association**] [**statistics**]

Context

[\[Tree\]](#) (show>service>id>gsmp sessions)

Full Context

show service id gsmp sessions

Description

This command displays GSMP sessions information.

Parameters

group

A GSMP group defines a set of GSMP neighbors which have the same properties.

name

Specifies a GSMP group name is unique only within the scope of the service in which it is defined.

ip-address

Specifies the ip-address of the neighbor.

port

Specifies the neighbor TCP port number use for this ANCP session.

Values 0 to 65535

association

Displays to what object the ANCP-string is associated.

statistics

Displays statistics information about an ANCP session known to the system.

Platforms

All

Output

The following output displays GSMP sessions information.

Sample Output

This show command gives information about the open TCP connections with DSLAMs.

```

The following table describes service ID GSMP sessions output fields:

Table 461: Service-ID GSMP Sessions Field Descriptions

| Label | Description |
|-------------------|--|
| Port | The port ID number |
| Ngbr-IpAddr | The neighbor IP address |
| Gsmp-Group | The GSMP group ID |
| State | The GSMP state of this TCP connection |
| Peer Instance | The unique GSMP ID for each end of the GSMP connection |
| Peer Port | The unique GSMP ID for each end of the GSMP connection |
| Peer Name | The unique GSMP ID for each end of the GSMP connection |
| timeouts | The number of successive timeouts for this session |
| Peer Timer | The GSMP keepalive timer |
| Capabilities | The ANCP capabilities negotiated for this session |
| Conf Capabilities | The ANCP capabilities configured for this session |
| Priority Marking | The priority marking configured for this session |
| Local Addr | The IP address used by the box's side of the TCP connection |
| Conf. Local Addr. | The configured IP address used by the box's side of the TCP connection |
| Sender Instance | The instance sent to the neighbor in this session |
| Sender Port | The port sent to the neighbor in this session |
| Sender Name | The name sent to the neighbor in this session |
| Max. Timeouts | The maximum number of successive timeouts configured for this session |

| Label | Description |
|--------------|---|
| Sender Timer | The timeout value that is announced toward the neighbor. The neighbor uses this timeout value while waiting for an acknowledgment from this system. |

Note:

The association command gives an overview of each ANCP string received from this session.

Context

[\[Tree\]](#) (tools>dump>nat sessions)

Full Context

tools dump nat sessions

Description

This command dumps ISA sessions.

Parameters

icmp

Specifies to dump only ICMP information.

ieee-address

Specifies a MAC address, using the format xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx.

ip-address

Specifies an IPv4 or IPv6 address.

Values *ipv4-address* — a.b.c.d
ipv6-address — x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:d.d.d.d
x — 0 to FFFF (in hexadecimal)
d — 0 to 255 (in decimal)

ipv4-address

Specifies an IPv4 address.

Values a.b.c.d

ipv6-address

Specifies an IPv6 address.

Values x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:d.d.d.d
x — 0 to FFFF (in hexadecimal)
d — 0 to 255 (in decimal)

mda-id

Specifies an MDA ID.

Values *slot/mda*

nat-group-id

Specifies a NAT group ID.

Values 1 to 4

policy-name

Specifies a policy name, up to 32 characters maximum.

port-number

Specifies a port number.

Values 0 to 65535

router-instance

Specifies a router name or service ID.

tcp

Specifies to dump only TCP information.

udp

Specifies to dump only UDP information.

upnp

Specifies to dump only UPNP information.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following is sample output for this command.

Sample Output

Context

[Tree] (show>oam-pm sessions)

Full Context

show oam-pm sessions

Description

This command shows a summary of the OAM Performance Monitoring sessions.

Parameters

test-family

Shows all sessions that match the specified test family type when an optional filter is included.

ethernet

Specifies Ethernet session types.

ip

Specifies IP session types.

mpls

Specifies MPLS session types.

event-mon

Specifies a summary of all event monitoring and current state for each session.

detectable-rx-errors

Specifies to display all MPLS sessions with a reported non-successful return code. The results of all return codes, other than "success", are included. When a return code is not available it is reported as "none". Sessions with a successful return code are filtered and not displayed in the list. This is specific to **test-family mpls** only.

detectable-tx-errors

Specifies to provide a summary of tests with detectable transmission errors that prevent the test from sending packets. Not all errors are detectable.

streaming delay

Displays all sessions with an assigned delay template.

Platforms

All

Output

The following is an example of OAM-PM session summary information.

Sample Output

```
show oam-pm sessions

22.51 set-epoch-value

set-epoch-value

Syntax

set-epoch-value *value*

Context

[\[Tree\]](#) (tools>perform>router>pcp-server set-epoch-value)

Full Context

tools perform router pcp-server set-epoch-value

Description

This command sets the epoch value for a specified PCP server.

Parameters

value

Specifies the epoch value.

Values 0 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

22.52 set-fabric-speed

set-fabric-speed

Syntax

set-fabric-speed *fabric-speed*

Context

[\[Tree\]](#) (tools>perform>system set-fabric-speed)

Full Context

tools perform system set-fabric-speed

Description

This command configures the fabric speed. This command is necessary to define the mode of operation for the system.

Default

set-fabric-speed fabric-speed-a (for the 7750 SR and 7450 ESS systems)

set-fabric-speed none (for the 7950 XRS systems)

Parameters

fabric-speed

Specifies the fabric speed of the system.

Values fabric-speed-a — Sets the chassis to operate at the following speeds using N+1 switch fabric redundancy:

- up to 100 Gb/s per slot for the 7450 ESS-7/12 and the 7750 SR-7/12
- up to 200 Gb/s per slot for the 7750 SR-12e

This permits a mixture of FP2- and FP3-based cards to co-exist.

fabric-speed-b — Sets the chassis to operate at the following speeds using N+1 switch fabric redundancy:

- up to 200 Gb/s per slot for the 7450 ESS-7/12 and the 7750 SR-7/12
- up to 400 Gb/s per slot for the 7750 SR-12e

All cards in the system are required to be FP3-based (FP3 IMM or newer). The system does not support any FP2-based cards when the chassis is set to **fabric-speed-b**.

fabric-speed-c — Sets the use of both FP3- and FP4-based cards and is compatible with SFM6 for the 7750 SR-7/12/12e and 7450 ESS-7/12. This speed is mandatory if FP4 cards are used. The performance of FP3 cards is the same as **fabric-speed-b**. For the 7950 XRS 20/20e this parameter enables the use of both FP3- and FP4-based cards and is compatible with **sfm2-x20s**. The performance of FP3 cards is the same as the **none** parameter.

none — Sets the 7950 XRS-20/20e to use only FP3 cards. If no fabric speed has previously been set on the chassis, this parameter is set as the default.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7950 XRS

22.53 set-role

set-role

Syntax

set-role {**extension** | **master** | **standalone**}

Context

[\[Tree\]](#) (tools>perform>chassis set-role)

Full Context

tools perform chassis set-role

Description

This command sets the role of the 7950 XRS chassis from which the command is invoked.

- When run on a standalone chassis this will update the EEPROM on the (one) Chassis backplane.
- Master and Extension chassis are blocked if any SFMs are configured as type **sfm-x20** (must be **sfm-x20-b**). The following message displays:
- When the **extension** option is specified, the chassis will immediately reboot as part of the command. The following warning and prompt will be provided:

```
WARNING: You are about to provision the chassis as an XRS-40 Extension chassis.
This chassis will immediately reboot after the command is executed. No CLI shell is
available directly on an Extension chassis. An Extension chassis will not completely
boot up unless it is properly cabled to and controlled by an XRS-40 Master
chassis. Do you wish to proceed (yes/no) ?
```

- When the **master** option is specified, the chassis will immediately reboot as part of the command. The Operational mode is not changed until a reboot is performed. The following warning and prompt will be provided:

```
WARNING: You are about to provision the chassis as an XRS-
40 Master chassis. This chassis will immediately reboot after the command is
execute

Do you wish to proceed (yes/no) ?
```

- When the **master** or **extension** options are specified and the chassis has any SFM slots with a configured type of sfm-x20, then the command will fail with the following message:

```
Configured sfm-type of sfm-x20 is not compatible with XRS-40 mode operation.
```

If you want to change the role of the chassis anyways, you can deconfigure the SFMs and then change the role.

Platforms

7950 XRS

22.54 set-trim-mode

set-trim-mode

Syntax

set-trim-mode *set-trim-mode*

Context

[\[Tree\]](#) (tools>perform>system set-trim-mode)

Full Context

tools perform system set-trim-mode

Description

This command should only be used with authorized direction of Nokia technical support.

Parameters

set-trim-mode

Specifies the trim operating mode for the system.

Values trim-mode-a, trim-mode-b

Platforms

7450 ESS, 7750 SR-7/12/12e

22.55 sflow

show sflow

Description

This command displays the primary and backup receiver statistics, the mapping configuration and a summary of how many ports and SAPs have sFlow enabled.

[Table 462: Show sFlow Output Fields](#) describes the show sFlow output fields.

Platforms

7750 SR, 7750 SR-s, 7950 XRS

Output

The following is an example of sFlow information.

Sample Output

```
*B:bkvm10# show sflow
=====
sFlow Status
=====
Receiver          : pat
Max Data Size     : 312

IP Addr Primary   : 10.120.142.163:6343
Packets Sent      : 2572
Packet Errors     : 2
Last Packet Sent  : 07/08/2014 22:23:57nt

IP Addr Backup    : N/A

egress           queue 8       broadcast
ingress          policer 1     unicast
ingress          policer 6     multicast
ingress          policer 12    broadcast
-----
No. of sFlow counter mappings: 6
=====
```

Table 462: Show sFlow Output Fields

| Label | Description |
|-------------------------------|---|
| sFlow Status | |
| Receiver | Displays the configured name for the sFlow receiver. |
| Max Data Size | The configured maximum data size for sFlow UDP packets. |
| IP Addr Primary | The primary IP address and destination port for sFlow receiver. |
| IP Addr Backup | The backup IP address and destination port for sFlow receiver. |
| Packets Sent | The number of packets sent successfully to the primary or backup receiver destination, since the destination was configured, CPM card HA switchover, or system reboot. |
| Packet Errors | The number of packets that could not be sent to the primary or backup receiver destination because of an error, since the destination was configured, CPM card HA switchover, or system reboot. An example of an error is destination IP not reachable. |
| Last Packet Sent | Displays the date and time of the last packet sent. |
| Counter Pollers | |
| Port | Displays the port on which sFlow is enabled. |
| No. of SAPs | The number of SAPs on the port with sFlow enabled. |
| No. of sFlow counter pollers | The number of sFlow counter pollers. |
| Counter Mappings | |
| Direction | Displays the direction of traffic (ingress or egress) the map entry applies to. |
| Policer/Queue | Displays the policer or queue instance being mapped by sFlow map. |
| Traffic type | Displays the type of sFlow traffic statistics (unicast, multicast or broadcast) that the policer/queue maps to. |
| No. of sFlow counter mappings | The number of entries in the sFlow ingress and egress counter map. |

22.56 sfm

sfm

Syntax

sfm *sfm-name* [**force**]

Context

[\[Tree\]](#) (clear sfm)

Full Context

clear sfm

Description

This command resets the SFM.

Parameters

sfm-name

Specifies the SFM identifier.

| | |
|---------------|----------------------------|
| Values | 1 to 16 (7950 XRS) |
| | 1 to 8 (7750-SR-14s) |
| | 1, 2 (all other platforms) |

force

Performs the reset without a confirmation prompt.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s, 7950 XRS

sfm

Syntax

sfm [*sfm-name*] [**detail**]

sfm [*sfm-name*] **icport** [**down**] [**degraded**]

Context

[\[Tree\]](#) (show sfm)

show sfm

Description

This command displays SFM status information.

Parameters

sfm-name

Specifies the SFM identifier.

Values 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16

icport

Displays interconnect port information.

down

Displays interconnect ports that are not operational.

degraded

Displays interconnect ports that are associated with fabric degradation.

detail

Displays detailed information about the SFM.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s, 7950 XRS

Output Fields: show sfm

Table 463: Output Fields: show sfm describes output fields for the **show sfm** command.

Table 463: Output Fields: show sfm

| Label | Description |
|---|---|
| Slot | The number of the slot in which the SFM is installed. |
| Provisioned Type Equipped Type (if different) | The SFM type provisioned. |
| Admin State | The administrative state. |
| Operational State | The operational state. |
| Hardware Data | |
| Part number | The SFM part number. |
| CLEI code | The SFM CLEI code. |
| Serial number | The SFM serial number. |
| Manufacture date | The date the SFM was manufactured. |
| Manufacturing deviations | Specifies any manufacturing deviations. |
| Manufacturing assembly number | The SFM assembly number. |
| Administrative state | Specifies the administrative state of the SFM. |
| Operational state | Specifies the operational state of the SFM. |
| Time of last boot | Indicates the time stamp of the last system restart. |
| Current alarm state | Indicates the current alarm state. |
| Inter Chassis SFM Interconnect | |
| SFM Interconnect Port | Port number of the interconnect port. |
| oper state | Up — The SFM is administratively up. |

| Label | Description |
|----------------------|---|
| | Down — The SFM is administratively down. |
| Misconnect Info | Only displayed if the oper state is invalid-connection . |
| SFF Status | The SFF status |
| fabric degrade state | Indicates state. |

22.57 sfm-interco-test

sfm-interco-test

Syntax

sfm-interco-test [sfm x]

Context

[\[Tree\]](#) (tools>perform>system>inter-chassis sfm-interco-test)

Full Context

tools perform system inter-chassis sfm-interco-test

Description

Use this command to run inter-chassis SFM loopback tests for the 7950 XRS.

Run on an out-of-service standalone chassis that will later become the Extension chassis of an XRS-40 system. The out of service chassis (Chassis 1 – future Master chassis) must be connected by means of SFM interconnect links (cable bundles) before this test is run. This test operates without requiring any XCMs in either chassis, but they can be present.

The test should not be initiated from Chassis 1.

The following conditions must be satisfied for the test to be permitted:

- The system must be in standalone mode; error message:

The test can only be performed on a standalone system

- The system must have only XRS-40 compatible SFMs provisioned; error message:

The chassis can not have SFMs with a configured type of sfm-x20s-b when performing the test

- All provisioned SFMs must be operational; error message:

All provisioned SFMs must be operational before performing the test

- The same test cannot be running in another session (that is, only one test can be executed at a time); error message:

```
The test is already in-progress in another session
```

Other notes (which are also relayed to the operator when the test is attempted):

- All provisioned XCMs will be reset at the start of the test and will be held in the *booting* state until the test has completed.
- All SFMs will be cleared when the operator exits the test. This will trigger a reset of the XCMs and the standby CPM.

Platforms

7950 XRS

Output

The following output is an example of SFM interconnection test information.

Sample Output

```
*A:Dut-A# tools perform system inter-chassis sfm-interco-test
WARNING: This test is intended for an out-of-service standalone chassis that is
going to later become the extension chassis of an XRS-40 system.

At the start of the test, all provisioned IOMs will be reset and will be held
in the 'booting' state until the test has completed.

While the test is running avoid altering this system or the attached system
(e.g. do not shutdown, clear, or remove the CPMs/SFMs/IOMs and do not issue
CPM switchovers)

Once testing has completed all SFMs in this system will be cleared.

Do you wish to proceed (y/n)? y
Clearing provisioned IOMs ...

Displays only the sham-link neighbor identified by this interface name, up to 32 characters.

remote

Displays sham-link neighbor information for the neighbor identified by the specified remote IP address.

ip-address

Displays only the sham-link neighbor identified by this IP address.

Platforms

All

22.61 shared-queue

shared-queue

Syntax

shared-queue [*shared-queue-policy-name*] [**detail**]

Context

[\[Tree\]](#) (show>qos shared-queue)

Full Context

show qos shared-queue

Description

This command displays shared-queue policy information.

Parameters

shared-queue-policy-name

The shared-queue policy name.

detail

Displays detailed information about the shared-queue policy.

Platforms

All

Output

The following output is an example of shared-queue QoS policy information, and [Table 465: Show QoS Shared Queue Output Fields](#) describes shared-queue QoS policy output fields.

Sample Output

```
*A:PE# show qos shared-queue

=====
Shared Queue Policies
=====
Policy-Id          Description
-----

shcv-policy

Syntax

shcv-policy [*policy-name*]

Context

[\[Tree\]](#) (show>subscr-mgmt shcv-policy)

Full Context

show subscriber-mgmt shcv-policy

Description

This command displays the SHCV policy parameters.

Parameters

policy-name

Specifies the SHCV policy name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following is an example of SHCV policy information. [Table 466: SHCV Policy Field Descriptions](#) describes the output fields.

Sample Output

```
# show subscriber-mgmt shcv-policy "shcv-1"
=====
SHCV policy "shcv-1"

Table 466: SHCV Policy Field Descriptions

| Label | Description |
|------------------------------|---|
| Description | Displays the SHCV policy description |
| Last management change | Displays the date and time when the policy was last changed |
| VPLS | SHCV parameters applicable for VPLS services |
| IPv4 source address | Displays the IPv4 source address (sender IP address) used in SHCV ARP requests sent to host addresses learned using DHCP snooping in a VPLS service |
| Source MAC address | Displays the source MAC address used in SHCV ARP requests sent to host addresses learned using DHCP snooping in a VPLS service |
| Layer 3 | SHCV parameters applicable for Layer 3 services |
| Source IP address origin | Displays the source IP address origin: <ul style="list-style-type: none"> interface = use the interface MAC and IP address as source addresses for SHCV ARP requests on regular IES or VPRN interfaces vrrp = use the VRRP MAC and IP address as source addresses for SHCV ARP requests on regular IES or VPRN interfaces when in SRRP master state |
| Unnumbered source IP address | Displays the IPv4 source address (sender IP address) used in SHCV ARP requests for unnumbered hosts |
| Periodic | SHCV parameters applicable for periodic and OAM checks |
| Administrative state | Displays the administrative state for periodic and OAM checks (enabled, disabled) |
| Action | Displays the action for unsuccessful checks: <ul style="list-style-type: none"> alarm = raise an event remove = raise an event and delete the subscriber host from the system |
| Interval (minutes) | Displays the interval between subsequent periodic checks |

| Label | Description |
|----------------------------|---|
| Retry count | Displays the number of SHCV check retries when no response is received within the retry timeout interval |
| Retry timeout (s) | Displays the time to wait for an SHCV check response before the next retry or execution of the SHCV unsuccessful check action |
| Triggered | SHCV parameters applicable for triggered checks |
| <i>ip-conflict</i> | SHCV parameters applicable for checks triggered by an IP conflict: a new host with different MAC address and same IP address as an existing host active on the same SAP |
| Administrative state | Displays the administrative state for ip-conflict triggered checks (enabled, disabled) |
| Retry count | Displays the number of SHCV check retries when no response is received within the retry timeout interval |
| Retry timeout (s) | Displays the time to wait for an SHCV check response before the next retry or deletion of the existing host from the system |
| <i>host-limit-exceeded</i> | SHCV parameters applicable for checks triggered by a host limit exceeded event |
| Administrative state | Displays the administrative state for host-limit-exceeded triggered checks (enabled, disabled) |
| Retry count | Displays the number of SHCV check retries when no response is received within the retry timeout interval |
| Retry timeout (s) | Displays the time to wait for an SHCV check response before the next retry or deletion of the unresponsive existing host from the system |
| <i>inactivity</i> | SHCV parameters applicable for checks triggered by an inactivity detection |
| Administrative state | Displays the administrative state for host-limit-exceeded triggered checks (enabled, disabled) |
| Retry count | Displays the number of SHCV check retries when no response is received within the retry timeout interval |
| Retry timeout (s) | Displays the time to wait for an SHCV check response before the next retry or deletion of the unresponsive inactive host from the system |
| <i>mobility</i> | SHCV parameters applicable for checks triggered by a mobility event: a new host with same MAC address and same IP address as an existing host active on a different SAP |
| Administrative state | Displays the administrative state for mobility triggered checks (enabled, disabled) |

| Label | Description |
|----------------------|---|
| Retry count | Displays the number of SHCV check retries when no response is received withing the retry timeout interval |
| Retry timeout (s) | Displays the time to wait for an SHCV check response before the next retry or deletion of the existing host from the system |
| mac-learning | SHCV parameters applicable for checks triggered for mac learning of IP only static hosts |
| Administrative state | Displays the administrative state for mac-learning triggered checks (enabled, disabled) |
| Retry count | Displays the number of SHCV check retries when no response is received withing the retry timeout interval |
| Retry timeout (s) | Displays the time to wait for an SHCV check response before the next retry |

22.64 sid-egress-stats

sid-egress-stats

Syntax

sid-egress-stats adj [*interface-name*]
sid-egress-stats adj-set [*id*]
sid-egress-stats all
sid-egress-stats node [*ip-prefix*[/ *prefix-length*]]

Context

[Tree] (clear>router>isis sid-egress-stats)
[Tree] (clear>router>ospf sid-egress-stats)

Full Context

clear router isis sid-egress-stats
clear router ospf sid-egress-stats

Description

This command clears the IS-IS or OSPF egress SID statistics.

Parameters

adj

Clears the egress statistics of the adjacency SID specified by the corresponding interface name. Clears all adjacency SIDs egress statistics if no adjacency SID is specified.

interface-name

Clears the SID egress statistics for the interface specified by this interface name up to 32 characters.

adj-set

Clears the egress statistics of the adjacency set specified by the corresponding ID. Clears all adjacency sets egress statistics if no adjacency set is specified.

id

Clears the SID egress statistics for the identifier specified for this adjacency set.

Values 0 to 4294967295

all

Clears all the SID egress statistics.

node

Clears the egress statistics for the node SID specified by the corresponding prefix. Clears all node SIDs egress statistics if no node SID is specified.

ip-prefix[/*prefix-length*]

Clears the IP prefix and prefix length of the node SID.

Values ipv4-prefix:

- a.b.c.d (host bits must be 0)
- ipv4-prefix-length: [0 to 32]

Platforms

All

sid-egress-stats

Syntax

sid-egress-stats adj [*interface-name*]

sid-egress-stats node [*ip-prefix*[/ *prefix-length*]]

Context

[\[Tree\]](#) (clear>router>ospf3 sid-egress-stats)

Full Context

clear router ospf3 sid-egress-stats

Description

This command clears the OSPF3 egress SID statistics.

Parameters

adj

Clears the egress statistics of the adjacency SID specified by the corresponding interface name. Clears all adjacency SIDs egress statistics if no adjacency SID is specified.

interface-name

Clears the SID egress statistics for the interface specified by this interface name up to 32 characters.

all

Clears all the SID egress statistics.

node

Clears the egress statistics for the node SID specified by the corresponding prefix. Clears all node SIDs egress statistics if no node SID is specified.

ip-prefix[/*prefix-length*]

Clears the IP prefix and prefix length of the node SID.

Values ipv4-prefix:

- a.b.c.d (host bits must be 0)

ipv4-prefix-length: [0 to 32]

ipv6-prefix:

- x:x:x:x:x:x:x (eight 16-bit pieces)
 - x:x:x:x:x:d.d.d.d
 - x: [0 to FFFF]H
 - d: [0 to 255]D
- ipv6-prefix-length: [0 to 128]

[Tree] (clear>router>isis sid-ingress-stats)

Full Context

clear router ospf sid-ingress-stats

clear router isis sid-ingress-stats

Description

This command clears the IS-IS or OSPF ingress SID statistics.

Parameters

adj

Clears the ingress statistics of the adjacency SID specified by the corresponding interface name. Clears all adjacency SIDs ingress statistics if no adjacency SID is specified.

interface-name

Clears the SID ingress statistics for the interface specified by this interface name up to 32 characters.

adj-set

Clears the ingress statistics of the adjacency set specified by the corresponding ID. Clears all adjacency sets ingress statistics if no adjacency set is specified.

id

Clears the SID ingress statistics for the identifier specified for this adjacency set.

Values 0 to 4294967295

all

Clears all the SID ingress statistics.

node

Clears the ingress statistics for the node SID specified by the corresponding prefix. Clears all node SIDs ingress statistics if no node SID is specified.

ip-prefix[/prefix-length]

Clears the IP prefix and prefix length of the node SID.

Description

This command displays information about IGP SIDs statistics.

Parameters

interface-name

Displays only the SID statistics identified by this interface name up to 32 characters.

id

Displays the adjacency set ID.

Values 0 to 4294967295

ip-prefix[/prefix-length]

Displays information for the specified IP prefix and prefix length.

Values ipv4-prefix:
• a.b.c.d (host bits must be 0)
ipv4-prefix-length: [0 to 32]

algo-id

Displays the algorithm identifier.

Values 0 to 255

adj

Displays the ingress and egress statistics, if any, of the adjacency SID specified by the corresponding interface name. Displays statistics for all adjacency SIDs if none is specified.

adj-set

Displays the ingress and egress statistics, if any, of the adjacency set specified by its associated ID. Displays statistics for all adjacency sets if none is specified.

node

Displays the ingress and egress statistics, if any, of the node SID specified by the corresponding prefix. Displays statistics for all node SIDs if none is specified.

algo

Displays statistics for the specified algorithm identifier.

summary

Displays statistics indices usage for SID statistics.

[Table 468: SLA Profile Field Descriptions](#) describes subscriber management SLA profile output fields.

Table 468: SLA Profile Field Descriptions

| Field | Description |
|------------------------|---|
| Name | The Service Level Agreement (SLA) profile name |
| Description | The user provided description of this policy |
| Number of SLA Profiles | The total number of SLA profiles configured on this node |
| Control plane(s) | The SLA profile controlled by local control plane or CUPS control plane |
| Host Limits | The configured maximum number of hosts per SLA profile instance |
| Session Limits | The configured maximum number of sessions per SLA profile instance |
| Ingress Qos-Policy | The ingress QoS policy ID |
| Egress Qos-Policy | The egress QoS policy ID |
| Ingress Queuing Type | The queuing type |
| Ingress Filter-Id | The ingress IP filter |
| Egress Filter-Id | The egress IP filter |
| Last Mgmt Change | The time and date of the most recent management-initiated change |

| Field | Description |
|--------|---|
| Queue | The ingress queue ID |
| Rate | The SLA profile queue rate |
| CIR | The CIR rate |
| HiPrio | The number of high priority packets as determined by the SLA profile ingress QoS policy |
| CBS | The amount of reserved buffer space (in bytes) for the policer |
| MBS | The amount of buffer space (in bytes) allowed for the policer |

22.71 slm

slm

Syntax

slm *imm* [*interval seconds*] [*repeat repeat*] [*absolute | rate*]

Context

[\[Tree\]](#) (monitor>oam-pm>session slm)

Full Context

monitor oam-pm session slm

Description

This command monitors the Ethernet Synthetic Loss Measurement (SLM) statistics for the specified test's raw measurement interval.

Parameters

seconds

Specifies the time interval, in seconds.

Values 3 to 60

Default 10

repeat

Specifies the number of times the command is repeated.

Values 1 to 999

Default 10

absolute

Specifies that the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

rate

Specifies that the rate-per-second is displayed.

Default delta

Platforms

Table 469: Show QoS Slope Policy Output Fields

| Label | Description |
|------------------|--|
| Policy | The ID that uniquely identifies the policy. |
| Description | A string that identifies the policy context in the configuration file. |
| Time Avg | The weighting between the previous shared buffer average utilization result and the new shared buffer utilization. |
| Slope Parameters | |

| Label | Description |
|-------------|--|
| Start Avg | Specifies the RED slope position for the shared buffer average utilization value where the packet discard probability starts to increase above zero. |
| Max Avg | Specifies the percentage of the shared buffer space for the buffer pool at which point the drop probability becomes one, expressed as a decimal integer. |
| Admin State | Enabled The administrative status of the RED slope is enabled. Disabled The administrative status of the RED slope is disabled. |
| Max Prob. | Specifies the RED slope position for the maximum non-one packet discard probability value before the packet discard probability rises directly to one. |

22.73 smet

smet

Syntax

smet [hunt | detail] [rd *rd*] [community *comm-id*] [tag *tag*] [next-hop *next-hop*] [aspath-regex *reg-exp*] [originator-ip *ip-address* | *ipv6-address*]

Context

[Tree] (show>router>bgp>routes>evpn smet)

Full Context

show router bgp routes evpn smet

Description

This command displays BGP-EVPN SMET routes.

Parameters

hunt

Displays entries for the specified route.

detail

Displays detailed information.

rd

Displays information for the route distinguisher.

Values *ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val*

comm-id

Specifies the community ID, up to 72 characters.

Values [*as-num:comm-val | ext-comm | well-known-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as the following:
type:{ ip-address:comm-val1 | as-number1:comm-val2 | as-number2:comm-val1 }
 where:
 - *as-number1* — 0 to 65535
 - *comm-val1* — 0 to 65535
 - **type** — target, origin
 - *ip-address* — a.b.c.d
 - *comm-val2* — 0 to 4294967295
 - *as-number2* — 0 to 4294967295
- *well-known-comm* — **null | no-export | no-export-subconfed | no-advertise |**

tag

Specifies the SMET route tag.

Values 0to 4294967295 | MAX-ET

next-hop

Specifies the IPv4 or IPv6 BGP next-hop address.

Values

| | |
|---------------|-------------------------------------|
| ipv4-address: | a.b.c.d |
| ipv6-address: | x:x:x:x:x:x:x (eight 16-bit pieces) |
| | x:x:x:x:x:d.d.d.d |
| | x: [0 to FFFF]H |
| | d: [0 to 255]D |

reg-exp

Displays routes matching the specified regular expression, up to 80 characters.

ip-address | ipv6-address

Specifies the originator IPv4 or IPv6 address, up to 64 characters.

22.74 snippets

snippets

Syntax

snippets [**detail**]

snippets name *snippet-name* [**instance** *snippet-instance*] [**detail**]

Context

[\[Tree\]](#) (show>service>dynsvc>script snippets)

Full Context

show service dynamic-services script snippets

Description

This command displays the dynamic services snippets information. A snippet is the name of a set of Python functions to create, modify or destroy configuration; for example: a snippet called 'vprn' to create, modify, or destroy VPRN services.

The CLI output generated by a single dynamic service python function call is a snippet instance.

Note:

This command is not available in the MD-CLI.

Parameters

detail

Displays dynamic services snippet information.

snippet-name

Specifies the snippet name.

snippet-instance

Specifies the snippet instance.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output show examples of dynamic service snippets.

Sample Output

```
# show service dynamic-services script snippets

Displays only SNMP trap group information for the specified trap group log ID.

Values 1 to 100

Platforms

All

Output

SNMP Trap Group Output

[Table 471: SNMP Trap Group Field Descriptions](#) describes SNMP trap group output fields.

Table 471: SNMP Trap Group Field Descriptions

| Label | Description |
|----------------|---|
| Log-ID | The log destination ID for an event stream. |
| Address | The IP address of the trap receiver. |
| Port | The destination UDP port used for sending traps to the destination, expressed as a decimal integer. |
| Version | Specifies the SNMP version format to use for traps sent to the trap receiver. Valid values are <code>snmpv1</code> , <code>snmpv2c</code> , <code>snmpv3</code> . |
| Community | The community string required by snmpv1 or snmpv2c trap receivers. |
| Security-Level | The required authentication and privacy levels required to access the views on this node. |
| Replay | Indicates whether or not the replay parameter has been configured, enabled or disabled, for the trap-target address. |
| Replay from | Indicates the sequence ID of the first missed notification that will be replayed when a route is added to the routing table by which trap-target address can be reached. If no notifications are waiting to be replayed this field shows n/a. |
| Last Replay | Indicates the last time missed events were replayed to the trap-target address. If no events have ever been replayed this field shows never. |

snmp-trap-group

Table 474: MSDP Source-Active Fields

| Label | Description |
|--------------|---|
| Grp Address | The IP address of the group. |
| Src Address | The IP address of the source. |
| Origin RP | The origination rendezvous point (RP) address. |
| Peer Address | The address of the peer. |
| State Timer | The time-out value. If the value reaches zero, the SA is removed. |

22.82 source-active-rejected

source-active-rejected

Syntax

source-active-rejected [**peer-group** *name*] [**group** *ip-address*] [**source** *ip-address*] [**originator** *ip-address*] [**peer** *ip-address*]

Context

[\[Tree\]](#) (show>router>msdp source-active-rejected)

Full Context

show router msdp source-active-rejected

Description

This command displays source-active messages rejected by MSDP.

Parameters

peer-group *name*

Displays information about rejected source-active messages for the specified peer group.

group *ip-address*

Displays information about the specified group IP address.

source ip-address

Displays information about the source address of the source active entry that is rejected.

originator ip-address

Displays information about the specified originator IP address.

peer ip-address

Displays information about the peer from which this rejected source active entry was last received.

Platforms

All

Output

The following is an example of MSDP rejected source active information. [Table 475: MSDP Source-Active Fields](#) provides MSDP source active field descriptions.

Sample Output

```
*A:ALA-48# show router msdp source-active-rejected

spf

Syntax

spf [*lfa*]

Context

[\[Tree\]](#) (show>router>ospf3 spf)

[\[Tree\]](#) (show>router>ospf spf)

Full Context

show router ospf3 spf

show router ospf spf

Description

This command displays statistics of shortest-path-first (SPF) calculations.

Parameters

lfa

Displays Loop-Free Alternate (LFA) next-hop information.

Platforms

All

Output

SPF Output Fields

[Table 477: SPF Output Fields](#) describes SPF output fields.

Table 477: SPF Output Fields

| Label | Description |
|---------------------|---|
| Total SPF Runs | The total number of SPF runs triggered by new or updated LSAs. |
| Last Full SPF run @ | The date and time when the last full SPF was run. |
| Last Full SPF Time | The duration, in seconds, of the last full SPF calculation. Last Full SPF Time = Intra SPF Time + Inter SPF Time + Extern SPF Time + RTM Updt Time. |
| Intra SPF Time | The duration, in seconds, of the Intra-area phase of the last SPF calculation. |
| Inter SPF Time | The duration, in seconds, of the Inter-area phase of the last SPF calculation. |

| Label | Description |
|---------------------------|--|
| Extern SPF Time | The duration, in seconds, of the External phase of the last SPF calculation. |
| RTM Updt Time | The duration, in seconds, of the RTM update phase of the last SPF calculation. |
| Min/Avg/Max Full SPF Time | Min The minimum time, in seconds, used to perform a full SPF calculation. Avg The average time, in seconds, of all the full SPF calculations performed by this OSPF router. Max The maximum time, in seconds, used to perform a full SPF calculation. |
| Total Sum Incr SPF Runs | The total number of incremental SPF runs triggered by new or updated type-3 and type-4 summary LSAs. |
| Total Ext Incr SPF Runs | The total number of incremental SPF runs triggered by new or updated type-5 external LSAs. |

Sample Output

```

Table 478: IS-IS SPF Log Output Fields describes the IS-IS SPF log output fields.

Table 478: IS-IS SPF Log Output Fields

| Label | Description |
|----------|---|
| When | Displays the timestamp when the SPF run started on the system. |
| Duration | Displays the time (in hundredths of a second) required to complete the SPF run. |
| L1 Nodes | Displays the number of Level 1 nodes involved in the SPF run. |

| Label | Description |
|-------------|---|
| L2 Nodes | Displays the number of Level 2 nodes involved in the SPF run. |
| Event Count | Displays the number of SPF events that triggered the SPF calculation. |
| Type | Displays the SPF type, Reg (regular) or Lfa (loop free alternative). |
| Trigger LSP | Displays the LSP that triggered the SPF run. |
| Reason | <p>Displays the reason(s) for the SPF run.</p> <p>NEWADJ: An adjacency changed.</p> <p>NEWLSP: A new LSP was received.</p> <p>NEWAREA: An area changed.</p> <p>NEWREACH: A prefix changed.</p> <p>ECMPCHANGED: An ECMP path changed.</p> <p>NEWMETRIC: A prefix metric changed.</p> <p>RESTART: The graceful restart exited.</p> <p>LSPEXPIRED: An LSP expired.</p> <p>DBCHANGED: The LSP database was cleared by an administrator.</p> <p>LSPCONTENT: The content of an LSP changed.</p> <p>NEWPREF: The external route preference changed.</p> <p>NEWNLPID: The routed protocols (IPv4 or IPv6) changed.</p> <p>MANUALREQ: An SPF calculation was requested by an administrator.</p> <p>ADMINTAGCHANGED: An administrative tag changed.</p> <p>TUNNELCHANGED: An MPLS tunnel changed.</p> |

spf-log

Syntax

spf-log

Context

[\[Tree\]](#) (clear>router>isis spf-log)

[\[Tree\]](#) (clear>service>id>spb spf-log)

Full Context

clear router isis spf-log

```
clear service id spb spf-log
```

Description

This command clears the SPF log.

Platforms

All

22.87 splice-status

splice-status

Syntax

```
splice-status [service service-id] [interface ip-int-name][address mcast-address] [source ip-address]  
[start-time start-time [interval time-interval]]
```

Context

[\[Tree\]](#) (show>video>adi splice-status)

Full Context

```
show video adi splice-status
```

Description

This command displays ADI slice information.

Parameters

service *service-id*

Displays splice status information pertaining to the specified service ID.

Values 1 to 2148278317

svc-name — a string up to 64 characters.

interface *ip-int-name*

Displays splice status information for the specified interface.

address *mcast-address*

Displays splice status information for the specified multicast address.

source *ip-address*

Displays splice status information for the specified IP address.

start-time *start-time*

Enter the start time.

Values 1 to 4294967295 minutes earlier

interval *time-interval*

Enter the interval time.

Values 1 to 4294967295 minutes

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

Output

The following is an example output for this command.

Sample Output

```

22.89 spmsi-ad

spmsi-ad

Syntax

spmsi-ad [**hunt** | **detail**] [**rd** *rd*] [**community** *comm-id*] [**tag** *tag*] [**next-hop** *next-hop*] [**aspath-regex** *reg-exp*] [**originator-ip** *ip-address* | *ipv6-address*]

Context

[\[Tree\]](#) (show>router>bgp>routes>evpn spmsi-ad)

Full Context

show router bgp routes evpn spmsi-ad

Description

This command displays BGP-EVPN SPMSI AD routes.

Parameters

hunt

Displays entries for the specified route.

detail

Displays detailed information.

rd

Displays information for the route distinguisher.

Values *ip-addr:comm-val* | *2byte-asnumber:ext-comm-val* | *4byte-asnumber:comm-val*

comm-id

Specifies the community ID, up to 72 characters.

Values [*as-num:comm-val* | *ext-comm* | *well-known-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as the following:
type:{ ip-address:comm-val1 | as-number1:comm-val2 | as-number2:comm-val1 }

where:

- *as-number1* — 0 to 65535
- *comm-val1* — 0 to 65535

- **type** — target, origin
- *ip-address* — a.b.c.d
- *comm-val2* — 0 to 4294967295
- *as-number2* — 0 to 4294967295
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** |

tag

Specifies the SPMSI AD route tag.

Values 0to 4294967295 | MAX-ET

next-hop

Specifies the IPv4 or IPv6 BGP next-hop address.

Values

| | |
|---------------|-------------------------------------|
| ipv4-address: | a.b.c.d |
| ipv6-address: | x:x:x:x:x:x:x (eight 16-bit pieces) |
| | x:x:x:x:x:d.d.d.d |
| | x: [0 to FFFF]H |
| | d: [0 to 255]D |

reg-exp

Displays routes matching the specified regular expression, up to 80 characters.

ip-address | ipv6-address

Specifies the originator IPv4 or IPv6 address, up to 64 characters.

All

22.90 spoke-sdp

spoke-sdp

Syntax

spoke-sdp *sdp-id[:vc-id]* {**all** | **counters** | **stp**| **l2pt** | **mrp**}

Context

[\[Tree\]](#) (clear>service>statistics>id spoke-sdp)

Full Context

```
clear service statistics id spoke-sdp
```

Description

This command clears statistics for the spoke-SDP bound to the service.

Parameters

sdp-id

The spoke-SDP ID for which to clear statistics

Values 1 to 17407

vc-id

The virtual circuit ID on the SDP ID to be reset

Values 1 to 4294967295

all

Clears all queue statistics and STP statistics associated with the SDP

counters

Clears all queue statistics associated with the SDP

stp

Clears all STP statistics associated with the SDP

l2pt

Clears all L2PT statistics associated with the SDP

mrp

Clears all MRP statistics associated with the SDP

Platforms

All

spoke-sdp

Syntax

```
spoke-sdp sdp-id:vc-id ingress-vc-label
```

```
spoke-sdp sdp-id:vc-id l2tpv3
```

```
spoke-sdp sdp-id:vc-id vccv-bfd {session | statistics}
```

Context

```
\[Tree\] (clear>service>id spoke-sdp)
```

Full Context

```
clear service id spoke-sdp
```

Description

This command clears and resets the spoke SDP bindings for the service.

Parameters

sdp-id

The spoke SDP ID to be reset.

Values 1 to 17407

vc-id

The virtual circuit ID on the SDP ID to be reset.

Values 1 to 4294967295

ingress-vc-label

Specifies to clear the ingress VC label.

l2tpv3

Specifies to clear the session mismatch flag on the spoke-SDP binding after the flag was set to true by a detected mismatch between the configured parameters and the received parameters.

vccv-bfd

Specifies to clear the following information related to VCCV BFD on the spoke-sdp.

session

Clears session information.

statistics

Clears spoke SDP statistics.

Platforms

All

22.91 spoke-sdp-fec

spoke-sdp-fec

Syntax

spoke-sdp-fec [1 to 4294967295]

Context

[\[Tree\]](#) (show>service>id spoke-sdp-fec)

Full Context

22.92 spoke-sdp-fec-using

spoke-sdp-fec-using

Syntax

spoke-sdp-fec-using [**spoke-sdp-fec-id** *spoke-sdp-fec-id*] [**saii-type2** *global-id:prefix:ac-id*] [**taii-type2** *global-id:prefix:ac-id*] [**path name**] [**expired**]

Context

[Tree] (show>service spoke-sdp-fec-using)

Full Context

show service spoke-sdp-fec-using

Description

Displays the SDPs used by spoke-sdp-fecs at this node.

Parameters

spoke-sdp-fec-id

Specifies the spoke-SDP FEC ID for which to show SDP information.

Values 1 to 4294967295

global-id

Specifies the SAll or TAll global ID.

Values 1 to 4294967295

prefix

Specifies the SAll or TAll prefix.

Values a.b.c.d, 1 to 4294967295

ac-id

Specifies the SAll or TAll AC ID.

Values 1 to 4294967295

name

Specifies the path name. 32 characters maximum.

expired

Displays information for expired SDPs.

Platforms

[Table 479: IS-IS SR Adjacency Set Output Fields](#) describes the IS-IS **sr-adj-sets** output fields.

Table 479: IS-IS SR Adjacency Set Output Fields

| Label | Description |
|--------------------------|--|
| ID | Displays the ID |
| State | Displays the state (active or inactive) |
| Label Value | Displays the label value |
| Label Type | Displays the label type, Dynamic Local (DL) or Static Local (SL) |
| Members Total | Displays the number of total members |
| Members Active | Displays the number of active members |
| Neighbor System Id | Displays the neighbor system ID |
| No. of SR Adjacency Sets | Displays the number of SR adjacency sets |

sr-adj-sets

Syntax

sr-adj-sets [*adjacency-set-id*] [**detail**]

Context

[\[Tree\]](#) (show>router>ospf sr-adj-sets)

Full Context

show router ospf sr-adj-sets

Description

This command displays OSPF SR adjacency set log information.

Parameters

adjacency-set-id

Displays SR adjacency set ID information.

Values 1 to 4294967295

detail

Displays detailed SR adjacency set information.

Platforms

All

Output

The following output is an example of **sr-adj-sets** log information.

Sample Output

```
*A:Dut-C# show router ospf sr-adj-sets

22.95 sr-adjacencies

sr-adjacencies

Syntax

sr-adjacencies [*ip-int-name* | *ip-address*] [**detail**]

Context

[\[Tree\]](#) (tools>dump>router>isis sr-adjacencies)

Full Context

tools dump router isis sr-adjacencies

Description

This command displays ISIS SR adjacency information.

Parameters

ip-int-name

Specifies the IP interface name. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

ip-address

Specifies the interface's IP address.

Values a.b.c.d

sr-database

Syntax

```

sr-database [sid sid] [prefix ip-address] [nh-type {sr | bgp | rsvp}] [ipv4-unicast | ipv6-unicast] [algo algo-id] [detail]
  
```

Context

[\[Tree\]](#) (tools>dump>router>isis sr-database)

Full Context

tools dump router isis sr-database

Description

This command displays IS-IS SR database information.

Parameters

sid

Displays information for the specific segment identifier.

Values 0 to 524287

ip-address

Specifies the IP address in dotted decimal notation.

- Values**
- ipv4-address:
 - a.b.c.d
 - ipv6-address:
 - x:x:x:x:x:x [eight 16-bit pieces]
 - x:x:x:x:x:d.d.d.d
 - x: [0 to FFFF]H
 - d: [0 to 255]D

sr

Displays information for SR next-hop route.

bgp

Displays information for BGP next-hop route.

rsvp

Displays information for RSVP next-hop route.

ipv4-unicast

Displays IPv4 unicast parameters.

ipv6-unicast

Displays IPv6 unicast parameters.

algo algo-id

Filters information based on the specific algorithm only.

Values 0 to 255

detail

Displays detailed IS-IS SR database information.

Platforms

All

Output

The following outputs are examples of IS-IS SR database information, and [Table 481: IS-IS SR Database Output Fields](#) describes the output fields.

Sample Output

```

sr-database

Syntax

sr-database [*sid sid*] [*prefix ip-address*] [*nh-type {sr | ldp | rsvp}*] [*algo algo-id*] [*detail*]

Context

[\[Tree\]](#) (tools>dump>router>ospf sr-database)

Full Context

tools dump router ospf sr-database

Description

This command displays OSPFv2 SR database information.

Parameters

sid

Displays information for the specific segment identifier.

Values 0 to 524287

ip-address

Specifies the IP address in dotted decimal notation.

Values ipv4-address:
 • a.b.c.d
 ipv6-address:

- x:x:x:x:x:x [eight 16-bit pieces]
- x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

algo-id

Displays the OSPFv2 database information for the specified algorithm identifier.

Values 0 to 255

Platforms

All

Output

The following output is an example of OSPFv2 SR database information.

Sample Output

```
*A:Dut-C# tools dump router ospf sr-database

show router isis sr-lfa-coverage

Description

This command displays IS-IS SR LFA coverage information. This corresponds to the coverage provided by the various LFA algorithms for SR-ISIS tunnel, SR-TE LSP, and LDP FEC if the **fast-reroute backup-**

sr-tunnel option is enabled. The LFA algorithms activate the backup next hops in the following preference order:

1. TI-LFA
2. LFA
3. R-LFA

Parameters

flex-algo *flex-algo-id*

Displays SR LFA coverage information for the specified algorithm.

Values 128 to 255

all

Displays all the flexible algorithms that are configured.

Values 128 to 255, all

Platforms

All

Output

The following output is an example of SR LFA coverage information, and [Table 482: IS-IS SR LFA Coverage Output Fields](#) describes the output fields.

Sample Output

```

sr-lfa-coverage

Syntax

sr-lfa-coverage [**area** *area-id*] [**flex-algo** { *flex-algo-id* | **all**}]

Context

[Tree] (show>router>ospf sr-lfa-coverage)

Full Context

show router ospf sr-lfa-coverage

Description

This command displays the details of the OSPF SR LFA coverage. This corresponds to the coverage provided by the various LFA algorithms for SR-OSPF tunnel, SR-TE LSP, and LDP FEC if **fast-reroute backup-sr-tunnel** option is enabled. The LFA algorithms activate the backup next hops using the preference order:

1. TI-LFA
2. LFA
3. R-LFA

Parameters

area *area-id*

Displays all interfaces configured in this area.

Values ip-address — a.b.c.d
 area — 0 to 4294967295

flex-algo flex-algo-id

Displays the OSPF SR LFA coverage details for the specified segment routing algorithm.

Values 128 to 255

flex-algo all

Displays the OSPF SR LFA coverage details for all segment routing algorithms.

Platforms

All

Output

The following output is an example of OSPF SR LFA coverage, and [Table 483: OSPF SR LFA Coverage Output Fields](#) describes the output fields.

Sample Output

```
*A:Dut-C# show router ospf sr-lfa-coverage flex-algo 128
=====
Rtr Base OSPFv2 Instance 0 Flex-Algo 128 SR LFA Coverage

```

Context

[\[Tree\]](#) (tools>perform>router>mpls sr-te-cspf)

Full Context

tools perform router mpls sr-te-cspf

Description

This command computes and returns one or more SR-TE paths and corresponding label stack to a given destination router and with the specified constraints.

By default, or when the user specifies the value of **ip-to-label** for the **path-computation-method** parameter, MPLS passes the **to** path and the **from** parameters to TE-DB, which converts the list of hops into a label stack by scanning the TE database for adjacency and node SID information that belongs to the router or link identified by each hop address. If the conversion is successful, the TE database returns the actual selected hop SIDs plus labels, as well as the configured path hop addresses that were used as the input for this conversion. None of the TE constraint parameters are used in this path computation method.

When the user specifies the value of **local-cspf** for the **path-computation-method** parameter, MPLS passes all parameters of the **tools** command, including the TE constraint parameters. In this case, a full CSPF is run using these parameters.

When the user runs this **tools** command without specifying a path name, CSPF returns the set of candidate ECMP paths. When the user specifies a path name, CSPF returns a single path, which is selected randomly similar to a configured SR-TE LSP, with the **path-computation-method local-cspf** command enabled.

Parameters

to ip-address

Specifies the destination address.

Values a.b.c.d

path path-name

Specifies the path name, up to 64 characters.

from ip-address

Specifies the originating IP address.

Values a.b.c.d

path-computation-method path-computation-method

Specifies the path computation method of the LSP path.

Values ip-to-label, local-cspf

hop-limit limit

Specifies the maximum number of hops for the path.

Values 0 to 255

exclude-bitmap bitmap

Specifies a bit-map of the admin groups that should be excluded in the path computation. Accepted in decimal, hex, or binary.

Values 0 to 4294967295

include-bitmap *bitmap*

Specifies a bit-map of the admin groups that should be included in the path. Accepted in decimal, hex, or binary.

Values 0 to 4294967295

metric-type-te

Specifies the use of the traffic engineering metric to optimize the path. By default, the link IGP metric is used.

local-sr-protection

Specifies the local LFA protection desired for the CSPF computed explicit path with adjacency SIDs.

Values none, preferred, mandatory

label-stack-reduction

Specifies to apply label stack reduction to the CSPF computed explicit path with adjacency SIDs.

max-sr-labels *label-stack-size*

Specifies the maximum label stack size of the CSPF computed path with or without label stack reduction.

Values 1 to 11

exclude-address *ip-addr*

Specifies a list of up to eight IP addresses that should be excluded in the path computation.

Values a.b.c.d

exclude-node *excl-node-id*

Specifies a list of up to eight addresses that should be excluded during the path computation.

Values a.b.c.d

skip-interface *interface-name*

Specifies an interface name, up to 32 characters, that should be skipped during the path computation.

Full Context

show router mpls sr-te-lsp

Description

This command displays SR-TE LSP information.

Parameters

lsp-name

Specifies the SR-TE LSP name, up to 64 characters.

status

Allows filtering of the output based on the status of the SR-TE LSP.

Values up, down

detail

Displays detailed information.

path-name

Specifies the SR-TE LSP path name, up to 64 characters.

auto-lsp

Displays the type of automatic LSP.

Values all, mesh-p2p-srte, one-hop-p2p-srte, on-demand-p2p-srte

family

Displays the family of IP addresses.

Values ipv4, ipv6

count

Displays the total number of SR-TE LSPs.

to {ip-address | ipv6-address}

Displays the IPv4 or IPv6 address of the egress router for the LSP.

egress-stats

Displays the traffic statistics for the specified SR-TE LSP or for all SR-TE LSPs if none is explicitly specified. Traffic statistics are provided for primary path, secondary path if any, and secondary standby paths, if any. Statistics are preserved across switchover only for primary and secondary standby paths.

mbb

Displays make-before-break (MBB) information.

activepath

Displays the SR-TE active paths, which are candidate paths selected as the best paths by the SR policy.make-before-break (MBB) information.

Platforms

All

Output

The following outputs are examples of MPLS SR-TE LSP information. The associated tables describe the output fields.

Sample Output

The following outputs apply to an SR-TE LSP for which the path is computed using the local SR-TE CSPF method.

Table 485: Show Router MPLS SR-TE-LSP Detail Output Fields

| Label | Description |
|----------------|--|
| LSP Name | The name of the LSP |
| LSP Type | The type of the LSP |
| LSP Tunnel ID | The tunnel ID number for the LSP used in the interaction with PCC/PCE |
| LSP Index | The LSP index used for indexing the LSP in the MIB table shared with the RSVP-TE LSP |
| TTM Tunnel Id | The tunnel ID number for the tunnel representing the LSP in the tunnel table |
| From | The IP address for the ingress router for the LSP |
| To | The IP address for the egress router for the LSP |
| Admin State | The administrative state of the LSP |
| Oper State | The operational state of the LSP |
| LSP Up Time | The length of time the LSP has been operational |
| LSP Down Time | The amount of time the LSP has been down |
| Transitions | The number of transitions that have occurred for the LSP |
| Path Changes | The number of times the path has changed |
| Retry Limit | The number of attempts that the software makes to reestablish the LSP after it has failed |
| Retry Timer | The time, in seconds, for LSP reestablishment attempts after LSP failure |
| Hop Limit | The maximum number of hops that an LSP can traverse, including the ingress and egress routers |
| Negotiated MTU | The size of the maximum transmission unit (MTU) that is negotiated during establishment of the LSP |
| PathCompMethod | pce — PCE path computation method is configured local-cspf — Local CSPF path computation method is configured |

| Label | Description |
|-----------------------|--|
| | none — No computation method is configured |
| FallbkPathComp | none — No fallback method is configured local-cspf — Local CSPF fallback is configured |
| Metric | The cost of the TE path for the LSP |
| Local Sr Protection | The local LFA protection wanted for the CSPF computed explicit path with adjacency SIDs |
| Label Stack Reduction | The label stack reduction applied to the CSPF computed explicit path with adjacency SIDs |
| Load Bal Wt | The load balance weight value |
| Include Grps | The included groups. None indicates that no groups are included |
| Exclude Grps | The excluded groups. None indicates that no groups are excluded |
| Egress Stats | The traffic statistics for the specified SR-TE LSP or for all SR-TE LSPs if none is explicitly specified. Traffic statistics are provided for primary path, secondary path, if any, and secondary standby paths, if any. Statistics are preserved across switch over for primary and secondary standby paths |
| BFD Template | The BFD template name |
| BFD Ping Intvl | The BFD ping interval |
| BFD Enable | The operational state of the BFD on the LSP |
| BFD Failure-action | The failure action that is configured for the BFD LSP |
| WaitForUpTimer | The BFD wait for up timer value |
| ReturnPathLabel | The return path label added to the MPLS label to the bottom of the label stack for S-BFD. With this configured, the S-BFD packet returns to the initiator through the MPLS return path |
| Revert Timer | The length of time before a named LSP using the secondary path to revert to the primary path |
| Next Revert In | The next revert interval |
| Entropy Label | The enabled or disabled status for the entropy label |
| Oper Entropy Label | Indicates that the entropy label is in use |
| Negotiated EL | Indicates if the entropy label is negotiated for the LSP |

| Label | Description |
|-----------------------|--|
| Override Tunnel ELC | The enabled or disabled status of the override tunnel ELC |
| VPRNAutoBind | The enabled or disabled status for VRPN autobind |
| IGP Shortcut | The enabled or disabled status for IGP shortcut |
| BGP Shortcut | The enabled or disabled status for BGP shortcut |
| IGP LFA | The enabled or disabled status for IGP LFA |
| BGPTransTun | The enabled or disabled status for BGP transport tunnels |
| Oper Metric | The enabled or disabled status of the operational metric |
| PCE Report | The enabled or disabled status of PCE report |
| PCE Control | The enabled or disabled status of PCE control |
| Max SR Labels | The maximum label stack size of the computed path with or without label stack reduction |
| Additional FRR Labels | The additional FRR labels value that the router is configured to take into account during TI-LFA |
| Path Profile | The path profile value for the LSP |
| Admin Tags | The administrative tag names. None indicates that there are no tags. |
| Primary (a) | The preferred path for the LSP |
| Up Time | The total time in increments that the LSP path has been operational |
| Bandwidth | The amount of bandwidth in Mb/s reserved for the LSP path |
| Secondary | The alternate path that the LSP uses if the primary path is not available |
| Downtime | The time that the LSP has been down |
| Bandwidth | The amount of bandwidth in Mb/s reserved for the LSP path |

Table 486: Show Router MPLS SR-TE-LSP Detail Output Fields

| Label | Description |
|-------------|---|
| LSP Name | The name of the LSP |
| Path LSP ID | The path LSP ID |
| From | The IP address for the ingress router for the LSP |
| To | The IP address for the egress router for the LSP |
| Admin State | The administrative state of the LSP |
| Oper State | The operational state of the LSP |

| Label | Description |
|--------------------|--|
| Path Name | The name of the LSP path |
| Path Type | The type of LSP path |
| Path Admin | The administrative state of the LSP path |
| Path Oper | The operational state of the LSP path |
| Path Up Time | The length of time the LSP path has been operational |
| Path Down Time | The length of time the LSP path has been down |
| Retry Limit | The number of attempts that the software makes to reestablish the path after it has failed |
| Retry Timer | The time, in seconds, for path reestablishment attempts after LSP failure |
| Retry Attempt | The number of retry attempts |
| Next Retry In | The next retry value |
| PathCompMethod | The path computation method for the specific LSP pce — PCE path computation method is configured local-cspf — Local CSPF path computation method is configured none — No computation method is configured |
| OperPathCompMethod | The operational state of the path computation method pce — PCE path computation method is configured local-cspf — Local CSPF path computation method is configured none — No computation method is configured |
| MetricType | The cost of the TE path for the specific LSP |
| Oper MetricType | The operational state of cost of the TE path |
| LocalSrProt | The local LFA protection for the CSPF computed explicit path with adjacency SIDs |
| Oper LocalSrProt | The operational state of LFA protection for the CSPF computed explicit path with adjacency SIDs |
| LabelStackRed | The label stack reduction applied to the CSPF computed explicit path with adjacency SIDs |
| Oper LabelStackRed | The operational state of the label stack reduction applied to the CSPF computed explicit path with adjacency SIDs |

| Label | Description |
|--------------------|--|
| Bandwidth | The amount of bandwidth in Mb/s to be reserved |
| Oper Bandwidth | The operational state of the bandwidth |
| Hop Limit | The maximum number of hops for the path |
| Oper HopLimit | The operational state of the maximum number of hops for the path |
| Setup Priority | The setup priority value to use for the path |
| Oper SetupPriority | The operational state of the setup priority value for the path |
| Hold Priority | The hold priority to use for the path |
| Oper HoldPriority | The operational state of the hold priority for the path |
| PCE Report | The enabled or disabled status of PCE report |
| Oper PCE Report | The operational state of the PCE report |
| PCE Control | The enabled or disabled status of PCE control |
| Oper PCE Control | The operational state of PCE control |
| Include Groups | The included groups. None indicates that no groups are included |
| Oper IncludeGroups | The operational state of the included groups |
| Exclude Groups | The excluded groups. None indicates that no groups are included |
| Oper ExcludeGroups | The operational state of the excluded groups |
| Oper MTU | The largest service frame size that can be transmitted to the far-end router without requiring the packet to be fragmented |
| Failure Code | The reason code for in-progress MBB value. A value of none indicates that no failure has occurred. |
| Failure Node | The IP address of the node in the LSP path at which the in-progress MBB failed. When no failure has occurred this value is none. |
| Explicit Hops | The explicit configured hops for an LSP path |
| Actual Hops | The actual hops an LSP path takes |
| Record Label | The record label value |
| Template | Indicates if the BFD template configured |

| Label | Description |
|--------------------|---|
| Ping Interval | The BFD ping interval value |
| Enable | Indicates if BFD is enabled |
| State | The state of BFD |
| ReturnPathLabel | The return path label to add to the MPLS label on the bottom of the label stack for S-BFD. When configured, the S-BFD packet returns to the initiator through the MPLS return path. |
| WaitForUpTimer | The BFD wait for up timer value |
| OperWaitForUpTimer | The operational state of the wait for up timer value |
| WaitForUpTmLeft | The length of time remaining for the wait for up timer |

Sample Output

The following outputs apply to an SR-TE auto-LSP for which the path is computed by the hop-to-label translation method.

```

```

[Table 487: MPLS SR-TE LSP Output Fields](#) describes the MPLS SR-TE LSP count statistics output fields.

Table 487: MPLS SR-TE LSP Output Fields

| Label | Description |
|----------------|---|
| LSP Name | The name of the LSP used in the path. |
| Adm State | Down — The path is administratively disabled. Up — The path is administratively enabled. |
| PathCompMethod | pce — PCE path computation method is configured. |

| Label | Description |
|------------------------|--|
| | local-cspf — Local CSPF path computation method is configured. |
| FallbkPathComp | none — No fallback method is configured. local-cspf — Local CSPF fallback is configured. |
| Retry Limit | The number of attempts that the software should make to reestablish the LSP after it has failed. |
| Hop Limit | The maximum number of hops that an LSP can traverse, including the ingress and egress routers. |
| Retry Timer | The time in seconds, for LSP re-establishment attempts after an LSP failure. |
| LSP Up Time | The total time in increments that the LSP path has been operational. |
| LSP Down Time | The total time in increments that the LSP path has not been operational. |
| SR-TE LSPs | Displays the number of SR-TE LSPs |
| Mesh SR-TE LSPs | Displays the number of mesh SR-TE LSPs |
| One Hop-P2P SR-TE LSPs | Displays the number of one-hop SR-TE LSPs |
| PCE Init SR-TE LSPs | Displays the number of PCE initiated SR-TE LSPs |

Sample Output

The following outputs apply to a router-controlled or to a PCC-controlled SR-TE LSP for which the path is computed using the hop-to-label transition method.

```

[Table 488: Output Fields: MPLS SR-TE LSP Egress Statistics](#) describes the MPLS SR-TE LSP egress statistics output fields.

Table 488: Output Fields: MPLS SR-TE LSP Egress Statistics

| Label | Description |
|------------------|---|
| LSP Name | The name of the LSP for which the statistics are provided |
| Admin State | The administrative state of the LSP |
| Path Name | The path name of the LSP |
| StatsOperState | Indicates whether the system is able to allocate a statistical index to that specific path |
| Aggregate Pkts | The number of packets recorded by the statistical index for that path |
| Aggregate Octets | The number of octets recorded by the statistical index for that path |
| Tot.Aggr Pkts | The sum of packets over all paths of the LSP |
| Tot.Aggr Octets | The sum of octets over all paths of the LSP |
| Packet Rate | The packet rate for the LSP (across all paths, for all FCs in/out-of profile) expressed in packets per second |
| Bit Rate | The bit rate for the LSP (across all paths, for all FCs in/out-of profile) expressed in Mb/s |

22.105 sr-te-lsp-egress-stats

sr-te-lsp-egress-stats

Syntax

sr-te-lsp-egress-stats *lsp-name*

Context

[\[Tree\]](#) (clear>router>mpls sr-te-lsp-egress-stats)

Full Context

clear router mpls sr-te-lsp-egress-stats

Description

This command clears or resets the egress statistics for MPLS SR-TE LSP.

Parameters

lsp-name

Specifies the LSP to clear, up to 64 characters.

Platforms

All

sr-te-lsp-egress-stats

Syntax

sr-te-lsp-egress-stats lsp *lsp-name* [**interval** *seconds*] [**repeat** *repeat*] [**absolute**| **rate**]

Context

[\[Tree\]](#) (monitor>router>mpls sr-te-lsp-egress-stats)

Full Context

monitor router mpls sr-te-lsp-egress-stats

Description

This command monitors MPLS SR-TE LSP Egress Statistics.

Parameters

lsp-name

Specifies the LSP name.

Values 64 characters maximum

seconds

Configures the interval for each display in seconds.

Values 3 to 60

repeat

Configures how many times the command is repeated.

Values 1 to 999

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic instead of the delta.

Platforms

All

22.106 src-access-list

src-access-list

Syntax

src-access-list [*list-name*]

Context

[\[Tree\]](#) (show>system>security>snmp src-access-list)

Full Context

show system security snmp src-access-list

Description

This command displays source access lists and the hosts for each. Including the *list-name* parameter modifies the output show only the specified **src-access-list**.

Platforms

All

Output

The following is an example of SR access list information.

[Table 489: Show Source Access List Output Fields](#) describes the source access list output fields.

Sample Output

| Total Access Lists | Displays the total number of source access lists. |

22.107 src-bmac-lsb

src-bmac-lsb

Syntax

src-bmac-lsb

Context

[\[Tree\]](#) (tools>dump>redundancy src-bmac-lsb)

Full Context

tools dump redundancy src-bmac-lsb

Description

This command dumps PBB source Backbone MAC address LSB information.

Platforms

All

22.108 srlg-database

srlg-database

Syntax

srlg-database [**router-id** *ip-address*] [**interface** *ip-address*]

Context

[\[Tree\]](#) (show>router>mpls srlg-database)

Full Context

show router mpls srlg-database

Description

This command displays MPLS SRLG database information.

Parameters

router-id *ip-address*

Specifies a 32-bit integer uniquely identifying the router in the Autonomous System. By convention to ensure uniqueness, this may default to the value of one of the router's IPv4 host addresses, represented as a 32-bit unsigned integer, if IPv4 is configured on the router. The **router-id** can be either the local one or some remote router.

interface *ip-address*

Specifies the IP address of the interface.

Platforms

All

22.109 srlg-group

srlg-group

Syntax

srlg-group [*name*]

Context

[\[Tree\]](#) (show>router>if-attribute srlg-group)

Full Context

show router if-attribute srlg-group

Description

This command displays SRLG statistics.

Parameters

name

Displays entries that are associated with the specified SRLG name, up to 32 characters.

Platforms

All

Output

The following output is an example of SRLG statistics, and [Table 490: SRLG Fields](#) describes the fields.

Sample Output

```
B:CORE2# show router if-attribute srlg-group
=====
Interface Srlg Groups
=====

-----
No. of Groups: 3
=====
B:CORE2#
```

Table 490: SRLG Fields

| Label | Description |
|----------------|---|
| Group Name | The name of the SRLG |
| Group Value | The integer value of the SRLG |
| Penalty Weight | The penalty weight that is assigned to the SRLG |
| No. of Groups | The total number of displayed SRLGs |

22.110 srrp

srrp

Syntax

srrp

Context

[\[Tree\]](#) (clear>router srrp)

Full Context

clear router srrp

Description

Commands in this context clear and reset SRRP virtual router instances.

Platforms

All

srrp

Syntax

srrp [*srrp-id* [*detail*]]

Context

[\[Tree\]](#) (show srrp)

Full Context

show srrp

Description

This command displays information related to the SRRP.

Parameters

srrp-id

Specifies the SRRP ID.

Values 1 to 4294967295

detail

Displays detailed information.

Platforms

All

22.111 srrp-sync-database

srrp-sync-database

Syntax

srrp-sync-database [**instance** *instance-id*] [**peer** *ip-address*]

Context

[\[Tree\]](#) (tools>dump>redundancy>multi-chassis srrp-sync-database)

Full Context

tools dump redundancy multi-chassis srrp-sync-database

Description

This command dumps SRRP database information and applies to the 7450 ESS.

Parameters

ip-address

Specifies the peer's IP address.

Values ipv4-address: a.b.c.d

ipv6-address:

- x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x – [0 to FFFF] H
- d – [0 to 255] D

instance-id

Dumps information for the specified Subscriber Router Redundancy Protocol instance configured on this system.

Values 1 to 4294967295

Platforms

All

22.112 ssh

ssh

Syntax

ssh

Context

[\[Tree\]](#) (show>system>security ssh)

Full Context

show system security ssh

Description

This command displays all the SSH sessions as well as the SSH status and fingerprint. The type of SSH application (CLI, SCP, SFTP, or NETCONF) is indicated for each SSH connection.

Platforms

All

Output

The following is an example of SSH output information.

Table 491: Show System Security SSH Options Output Fields

| Label | Description |
|--------------------------|--|
| Administrative State | Enabled: The SSH server is enabled. Disabled: The SSH server is disabled. |
| Operational State | Up: The SSH server is up. Down: The SSH server is down. |
| Preserve Key | Enabled: The preserve-key is enabled. Disabled: The preserve-key is disabled. |
| Key-re-exchange | Displays the maximum time elapsed and maximum mbytes transmitted before a key re-exchange is initiated. All new sessions will be created with this value. |
| SSH protocol version 1 | Enabled: SSH1 is enabled. Disabled: SSH1 is disabled. |
| SSH protocol version 2 | Enabled: SSH2 is enabled. Disabled: SSH2 is disabled. |
| DSA Host Key Fingerprint | The key fingerprint is the server's identity. Clients trying to connect to the server verify the server's fingerprint. If the server fingerprint is not known, the client may not continue with the SSH session since the server might be spoofed. |
| RSA Host Key Fingerprint | The key fingerprint is the server's identity. Clients trying to connect to the server verify the server's fingerprint. If the server fingerprint is not known, the client cannot continue with the SSH session since the server might be spoofed. |

| Label | Description |
|-------------|--|
| Connection | The IP address of the connected routers (remote client). |
| Username | The name of the user. |
| Version | The SSH version number. |
| Cipher | <p>3des: A SSHv1 encryption method that allows proprietary information to be transmitted over untrusted networks.</p> <p>3des-cbc: A SSHv2 encryption method.</p> <p>aes128-cbc: A SSHv2 128-bit encryption method.</p> <p>aes128-ctr: A SSHv2 128-bit encryption method.</p> <p>aes192-cbc: A SSHv2 192-bit encryption method.</p> <p>aes192-ctr: A SSHv2 192-bit encryption method.</p> <p>aes256-cbc: A SSHv2 256-bit encryption method.</p> <p>aes256-ctr: A SSHv2 256-bit encryption method.</p> <p>arcfour: A SSHv2 encryption method.</p> <p>des: A SSHv1 encryption method using a private (secret) key.</p> <p>blowfish: A SSHv1 encryption method.</p> <p>blowfish-cbc: A SSHv2 encryption method.</p> <p>cast128-cbc: A SSHv2 1280-bit encryption method.</p> <p>rijndael-cbc: A SSHv2 encryption method.</p> |
| Server Name | The server name. |
| Status | <p>connected: The SSH connection is connected.</p> <p>disconnected: The SSH connection is disconnected.</p> |
| Router Ins | SSH server router instance. Can be the router name ("Base" or "management") or the VPRN Id (1 to 2147483647). |
| MAC | <p>hmac-sha2-512: The SSH MAC algorithm used is hmac-sha2-512.</p> <p>hmac-sha2-256: The SSH MAC algorithm used is hmac-sha2-256.</p> <p>hmac-sha1: The SSH MAC algorithm used is hmac-sha1.</p> <p>hmac-sha1-96: The SSH MAC algorithm used is hmac-sha1-96.</p> <p>hmac-md5: The SSH MAC algorithm used is hmac-md5.</p> <p>hmac-ripemd160: The SSH MAC algorithm used is hmac-ripemd160.</p> <p>hmac-sha2-512: The SSH MAC algorithm used is hmac-sha2-512.</p> |

| Label | Description |
|------------------------|---|
| | hmac-ripemd160-openssh-com: The SSH MAC algorithm used is hmac-ripemd160-openssh-com. |
| KEX | diffie-hellman-group1-sha1: The SSH KEX algorithm used is diffie-hellman-group1-sha1. diffie-hellman-group14-sha1: The SSH KEX algorithm used is diffie-hellman-group14-sha1. diffie-hellman-group14-sha256: The SSH KEX algorithm used is diffie-hellman-group14-sha256. diffie-hellman-group16-sha512: The SSH KEX algorithm used is diffie-hellman-group16-sha512. diffie-hellman-group-exchange-sha1: The SSH KEX algorithm used is diffie-hellman-group-exchange-sha1. |
| Key-re-exchange | Maximum time elapsed and maximum mbytes transmitted before a key re-exchange is initiated for this session. |
| Number of SSH sessions | The total number of SSH sessions. |

The following is an example of SSH detail output information.

22.116 standby-ip-addresses

standby-ip-addresses

Syntax

standby-ip-addresses

Context

[Tree] (show>subscr-mgmt>vrgw>brg>gateway standby-ip-addresses)

Full Context

show subscriber-mgmt vrgw brg gateway standby-ip-addresses

Description

This command shows associated home-aware pool standby IP addresses.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

22.117 start

```
start
```

Syntax

```
start
```

Context

[\[Tree\]](#) (tools>perform>router>l2tp>group>tunnel start)

Full Context

```
tools perform router l2tp group tunnel start
```

Description

This command triggers an attempt to start the control connection for a specified L2TP tunnel.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
start
```

Syntax

```
start route-downloader-name [force]
```

Context

[\[Tree\]](#) (tools>perform>aaa>route-downloader start)

Full Context

```
tools perform aaa route-downloader start
```

Description

This command causes the download process to start immediately. If an ongoing download is already in progress then no further action is needed, except if the **force** keyword is added. In case the **force** keyword is added, then the current download is aborted and a new one is immediately restarted. If aborting the current download, the internal route table should not be emptied or cleared.

Parameters

route-downloader-name

Specifies the route downloader name, up to 32 characters.

force

Causes the current download to be aborted and a new one is immediately restarted.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Syntax

static [**sap** *sap-id* | **sdp** *sdp-id:vc-id*]

Context

[Tree] (show>service>id>igmp-snooping static)

Full Context

show service id igmp-snooping static

Description

This command displays information on static IGMP snooping source groups for the VPLS service.

Parameters

sap *sap-id*

Displays static IGMP snooping source groups for a specific SAP.

sdp *sdp-id*

Displays the IGMP snooping source groups for a specific spoke or mesh SDP.

Values 1 to 17407

vc-id

The virtual circuit ID on the SDP ID for which to display information.

Default For mesh SDPs only, all VC IDs.

Values 1 to 4294967295

Platforms

Syntax

static [**head-end** {**local** | *ip-address*}] [**color** *color*] [**end-point** { *ipv4-address* | *ipv6-address*}] [**preference** *preference-id*] [**distinguisher** *distinguisher-id*]

static summary

Context

[\[Tree\]](#) (show>router>seg-rt>sr-policies static)

Full Context

show router segment-routing sr-policies static

Description

This command displays the traffic statistics of all or a filtered set of the static policies, or displays summary parameters.

Parameters

head-end local

Filters on local head end.

head-end ip-address

Filters on the head end IP address value.

Values a.b.c.d

color

Filters on the color.

Values 0 to 4294967295

ipv4-address | ipv6-address

Filters on the end-point IPv4 or IPv6 address.

Values ipv4-address — a.b.c.d
 ipv6-address — x:x:x:x:x:x:x (eight 16-bit pieces) or x:x:x:x:x:d:d:d:d
 x — [0 to FFFF]H
 d — [0 to 255]D

preference-id

Filters on the preference ID.

Values 0 to 4294967295

distinguisher-id

Filters on the distinguisher ID.

Values 0 to 4294967295

summary

Displays the summary information of the static policies.

Platforms

All

Output

The following output is an example of traffic statistics for the static policies.

Sample Output Information for Static Policies

```
*A:Dut-C# show router segment-routing sr-policies static

22.119 static-arp

static-arp

Syntax

static-arp [*ip-int-name* | *ip-address* | **mac** *ieee-mac-address*]

Context

[\[Tree\]](#) (show>router static-arp)

Full Context

show router static-arp

Description

This command displays the router static ARP table sorted by IP address. If no options are present, all ARP entries are displayed.

Parameters

ip-int-name

Only displays static ARP entries associated with the specified IP interface name.

ip-address

Only displays static ARP entries associated with the specified IP address.

ieee-mac-address

Only displays static ARP entries associated with the specified MAC address.

Platforms

All

Output

Static ARP Table Output — The following output is an example of static AARP table information, and [Table 498: Static ARP Table Fields](#) describes the output fields.

Sample Output

```
A:ALA-A# show router static-arp
=====
ARP Table
=====

Table 498: Static ARP Table Fields

| Label | Description |
|-------------|---|
| IP Address | The IP address of the static ARP entry |
| MAC Address | The MAC address of the static ARP entry |

| Label | Description |
|--------------------|--|
| Age | The age of the ARP entry. Static ARPs always have 00:00:00 for the age |
| Type | Inv — the ARP entry is an inactive static ARP entry (invalid) Sta — the ARP entry is an active static ARP entry |
| Interface | The IP interface name associated with the ARP entry |
| No. of ARP Entries | The number of ARP entries displayed in the list |

22.120 static-host

static-host

Syntax

static-host [**sap** *sap-id*] [**wholesaler** *service-id*] [**port** *port-id*][**inter-dest-id** *intermediate-destination-id*]
 [**detail**] [**mac** *ieee-address*] [**ip-address** *ip-prefix* /*prefix-length*]

static-host [**sap** *sap-id*][**wholesaler** *service-id*][**port** *port-id*] **no-inter-dest-id** [**detail**]

static-host summary

Context

[\[Tree\]](#) (show>service>id static-host)

Full Context

show service id static-host

Description

This command displays static hosts configured on this service.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

intermediate-destination-id

Specifies the intermediate destination identifier which is encoded in the identification strings up to 32 characters.

summary

Displays summary static host information.

detail

Displays detailed static host information.

service-id

The service ID of the wholesaler.

Values 1 to 2147483647

ieee-address

Specifies the MAC address.

ip-prefix[/prefix-length]

Specifies the IP address.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output displays an example of service static host information.

Sample Output

```
*A:ALA-48# show service id 88 static-host

22.121 static-lsp

static-lsp

Syntax

static-lsp [/sp-name]

static-lsp {transit | terminate}

static-lsp count

Context

[Tree] (show>router>mpls static-lsp)

Full Context

```
show router mpls static-lsp
```

Description

This command displays MPLS static LSP information.

Platforms

All

Output

The following output is an example of MPLS static LSP information.

[Table 499: MPLS Static LSP Output Fields](#) describes the MPLS static LSP output fields.

Table 499: MPLS Static LSP Output Fields

| Label | Description |
|-----------|---|
| Lsp Name | The name of the LSP used in the path up to 64 characters in length. |
| To | The system IP address of the egress router for the LSP. |
| Next Hop | The system IP address of the next hop in the LSP path. |
| In I/F | The ingress interface. |
| Out Label | The egress interface. |
| Out I/F | The egress interface. |
| Adm | Down — The path is administratively disabled. Up — The path is administratively enabled. |
| Opr | Down — The path is operationally down. Up — The path is operationally up. |
| LSPs | The total number of static LSPs. |

Sample Output

22.123 static-route

static-route

Syntax

static-route [*family*] [{*ip-prefix/prefix-length* | **preference** *preference* | [**next-hop** *ip-address* | **tag** *tag*]}] [**detail**]

Context

[\[Tree\]](#) (show>router static-route)

Full Context

show router static-route

Description

This command displays the static entries in the routing table. If no options are present, all static routes are displayed sorted by prefix.

Parameters

family

Specifies the type of routing information to be distributed by this peer group.

- Values**
- ipv4** — Displays only those BGP peers that have the IPv4 family enabled and not those capable of exchanging IP-VPN routes.
 - ipv6** — Displays the BGP peers that are IPv6 capable.
 - mcast-ipv4** — Displays the BGP peers that are IPv4 multicast capable.
 - mcast-ipv6** — Displays the BGP peers that are IPv6 multicast capable.

ip-prefix/prefix-length

Displays static routes only matching the specified *ip-prefix* and *mask*.

Values The following values apply to the 7750 SR and 7950 XRS:

| | |
|---------------------|-------------------------------------|
| ipv4-prefix: | a.b.c.d (host bits must be 0) |
| ipv4-prefix-length: | 0 to 32 |
| ipv6-prefix: | x:x:x:x:x:x:x (eight 16-bit pieces) |
| | x:x:x:x:x:d.d.d.d |
| x: | [0 to FFFF]H |
| d: | [0 to 255]D |
| ipv6-prefix-length: | 0 to 128 |

Values The following values apply to the 7450 ESS:

| | |
|---------------------|-------------------------------|
| ipv4-prefix: | a.b.c.d (host bits must be 0) |
| ipv4-prefix-length: | 0 to 32 |

preference

Only displays static routes with the specified route preference.

Values 0 to 65535

ip-address

Only displays static routes with the specified next hop IP address.

Values The following values apply to the 7750 SR and 7950 XRS:

| | |
|---------------|-------------------------------------|
| ipv4-address: | a.b.c.d (host bits must be 0) |
| ipv6-address: | x:x:x:x:x:x:x (eight 16-bit pieces) |
| | x:x:x:x:x:d.d.d.d |
| x: | [0 to FFFF]H |
| d: | [0 to 255]D |

Values The following values apply to the 7450 ESS:

| | |
|---------------|-------------------------------|
| ipv4-address: | a.b.c.d (host bits must be 0) |
|---------------|-------------------------------|

tag

Displays the tag used to add a 32-bit integer tag to the static route. The tag is used in route policies to control distribution of the route into other protocols.

Values 1 to 4294967295

detail

Displays detailed static routes information.

Platforms

All

Output

Static Route Output — The following output is an example of static route information, and [Table 500: Static Route Fields](#) describes the fields.

Sample Output

```

Table 500: Static Route Fields

| Label | Description |
|--------------|--|
| IP Addr/mask | The static route destination address and mask |
| Pref | The route preference value for the static route |
| Metric | The route metric value for the static route |
| Type | <p>BH — the static route is a black hole route; the nexthop for this type of route is black-hole</p> <p>ID — the static route is an indirect route, where the nexthop for this type of route is the non-directly connected next hop</p> <p>NH — the route is a static route with a directly connected next-hop; the next-hop for this type of route is either the next-hop IP address or an egress IP interface name</p> |

| Label | Description |
|----------------|--|
| NextHop | The next hop for the static route destination |
| Protocol | The protocol through which the route was learned |
| Interface | The egress IP interface name for the static route n/a — indicates there is no current egress interface because the static route is inactive or a black hole route |
| Active | N — the static route is inactive; for example, the static route is disabled or the next hop IP interface is down Y — the static route is active |
| No. of Routes | The number of routes displayed in the list |
| Backup NextHop | The backup next hop for the static route destination |
| Backup Tag | The tag value used for the static route when the primary next hop fails and the backup next hop is active |
| Backup Status | The status of the backup next hop |

static-route

Syntax

static-route ldp-sync-status

Context

[\[Tree\]](#) (tools>dump>router static-route)

Full Context

tools dump router static-route

Description

This command enables the synchronization status that static route keeps track of LDP interfaces.

Parameters

ldp-sync-status

Specifies the LDP synchronization status.

Platforms

All

Output

The following output is an example of static route information.

Sample Output

```
*A:Dut-C# tools dump router static-route ldp-sync-status
=====
Sync Status of LDP interfaces

show service dynamic-services script statistics

Description

This command displays dynamic service script statistics. Only non-zero values are shown.

The script statistics can be cleared with the "clear service statistics dynamic-services" command.

Note:

This command is not available in the MD-CLI.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of Dynamic Services script statistics information.

Sample Output

```
# show service dynamic-services script statistics
=====
Dynamic Services Script Statistics

[Table 504](#): describes Dynamic Services script statistics fields.

Table 504:

| Output field | Description |
|--|---|
| Description | The name of the script. |
| Counter | The number of times the script executed. |
| python scripts with 0 retries due to timeout | The number of retries due to timeouts. |
| setup | The setup script action. jobs launched — The number of times the setup jobs launched. jobs handled — The number of times the setup jobs were handled. success — The number of times the setup jobs were successful. syntax error — The number of setup syntax errors. execution failed — The number of times the setup failed. |
| teardown | The teardown script action. jobs launched — The number of times the teardown jobs launched. jobs handled — The number of times the teardown jobs were handled. success — The number of times the teardown jobs were successful. syntax error — The number of teardown syntax errors. |

Full Context

show subscriber-mgmt statistics

Description

This command displays enhanced subscriber management statistics per port, PW port, MDA, IOM, system, service, subscriber interface, or group interface.

For each statistic, a current value and peak value is displayed. The peak value is the highest generated value since the last reset as a result of a system boot or the **clear subscriber-mgmt peakvalue-stats** command.

Note:

The user can execute the **clear subscriber-mgmt peakvalue-stats** command to reset the peak values.

Parameters

iom slot

Displays specified IOM slot information.

mda mda

Displays specified slot and mda information.

port port-id

Specifies to display information for both the physical port ID and LAG.

pw-port pw-port

Specifies to display information for a pseudowire port ID.

Values 1 to 10239

all

Displays statistics of all IOM or MDA or port or pseudowire port in the system

host

Displays v4/v6 host statistics only.

session

Displays PPPoX/LAC/LNS session statistics only.

sla-profiles

Displays the current and historical statistics for SLA profiles.

service *svc-id*

Displays the current and historical statistics for service level profiles.

Values 1 to 2148278386 | *svc-name*: up to 64 characters

sub-profiles

Displays the current and historical statistics for subscriber profiles.

subscriber

Displays subscriber statistics only.

subscriber-interface *sub-ift*

Displays specified subscriber interface level statistics, up to 32 characters.

group-interface *grp-ift*

Displays specified group-interface level statistics, up to 32 characters.

summary

Displays summary statistics only.

non-zero-value-only

Displays only non-zero value counters.

The following tables describe the counters available in the **show subscriber management statistics** command output.

The following terminology is used to indicate applicability of the stats:

- ESM — Enhanced Subscriber Management. Subscriber traffic forwarded via subscriber queues. Enabled with SAP **sub-sla-mgmt** in no shutdown state
- BSM — Basic Subscriber Management. Subscriber traffic forwarded via SAP queues. SAP sub-sla-mgmt must be in shutdown state. For DHCP, dhcp lease-populate or dhcp6-relay lease-populate must be enabled to count the leases. For IPv4, if anti-spoof is enabled on the SAP, a subscriber host is instantiated.
- Routed CO — IES or VPRN service with subscriber interface and group interface constructs
- Bridged CO — VPLS service with DHCPv4 lease management enabled (lease-populate)
- regular interface — IES or VPRN interface (none subscriber-interface or group-interface)
- Host (also subscriber host) — A resource in the system that is used for traffic forwarding and security related actions. The creation of a subscriber host entry is linked to anti-spoof being enabled on a SAP. For ESM, anti-spoof is mandatory and hence every connected {IP/MAC} consumes by default a subscriber host entry. A DHCP6 IA-PD can also be modeled as a managed route. In this case, no subscriber host is instantiated. For BSM, anti-spoof is optional on regular interfaces. An IPv4 static-host and DHCPv4 lease do not result in a subscriber host instantiation when anti-spoof is disabled on the SAP.

Table 505: Host and Protocol Statistics

| Section | Counter | Counts | Applies to |
|-------------------|-----------------------------------|---|---|
| IPv4 | PPP Hosts - IPCP | IPv4 local terminated PPP hosts (PTA, LNS) | ESM, Routed CO |
| | IPOE Hosts - DHCP | DHCPv4 hosts (lease states) | ESM, Routed CO, Bridged CO |
| | IPOE Hosts - ARP | ARP hosts | ESM, Routed CO, Bridged CO |
| | IPOE Hosts – Static | IPv4 static hosts | ESM, Routed CO, Bridged CO |
| | IPOE Mngd Hosts – Data-trig | Data triggered IPv4 hosts | ESM, Routed CO |
| | IPOE Mngd Hosts – AAA | vRGW managed static IPv4 addresses: IPv4 static hosts created via RADIUS (Alc-Reserved-Addresses) | ESM, Routed CO |
| | IPOE Mngd Hosts – GTP | IPv4 GTP access host | ESM, Routed CO |
| | IPOE Mngd Hosts – Bonding | IPv4 hosts associated with an internal IPoE session of a connection bonding subscriber context | ESM, Routed CO |
| | IPOE Hosts BSM - DHCP | DHCPv4 hosts (lease states: anti-spoof and lease-populate enabled) | BSM, Routed CO, Bridged CO, regular interface |
| | IPOE Hosts BSM – Static | IPv4 static hosts (with anti-spoof enabled) | BSM, Routed CO, Bridged CO, regular interface |
| | IPOE BSM - DHCP | DHCPv4 lease states (with lease-populate enabled, no anti-spoof) | BSM, Routed CO, Bridged CO, regular interface |
| IPOE BSM – Static | IPv4 static hosts (no anti-spoof) | BSM, Routed CO, Bridged CO, regular interface | |
| IPv6 | PPP Hosts – SLAAC | Local terminated IPv6 wan-host – SLAAC (PTA, LNS) | ESM, Routed CO |
| | PPP Hosts - DHCP6 (NA) | Local terminated IPv6 wan-host (PTA, LNS) – DHCP6 IA-NA leases over PPP | ESM, Routed CO |

| Section | Counter | Counts | Applies to |
|-------------|------------------------------------|--|------------------------|
| | PPP Hosts - DHCP6 (PD) | Local terminated IPv6 pd-host (PTA, LNS) – DHCP6 IA-PD leases over PPP (excluding PD as managed route) | ESM, Routed CO |
| | PPP Mngd Routes - DHCP6 (PD) | IPv6 (PTA, LNS) – DHCP6 IA-PD leases over PPP (PD as managed route only) | ESM, Routed CO |
| | IPOE Hosts – SLAAC | IPv6 wan-host – SLAAC | ESM, Routed CO |
| | IPOE Hosts - DHCP6 (NA) | IPv6 wan-host – DHCP6 IA-NA leases | ESM, Routed CO |
| | IPOE Hosts - DHCP6 (PD) | IPv6 pd-host – DHCP6 IA-PD leases (excluding PD as managed route) | ESM, Routed CO |
| | IPOE Mngd Routes - DHCP6 (PD) | IPv6 – DHCP6 IA-PD leases (PD as managed route only) | ESM, Routed CO |
| | IPOE Hosts – Static (WAN) | IPv6 static hosts with prefix-length equal to /128 | ESM, Routed CO |
| | IPOE Hosts – Static (Pfx) | IPv6 static hosts with prefix-length shorter than /128 | ESM, Routed CO |
| | IPOE Mngd Hosts – Data-trig (Pfx) | Data triggered IPv6 Prefix host (prefix length shorter than /128) | ESM, Routed CO |
| | IPOE Mngd Hosts – Data-trig (Pfx) | Data triggered IPv6 Prefix host (prefix length shorter than /128) | ESM, Routed CO |
| IPv6 (Cont) | IPOE Mngd Routes – Data-trig (Pfx) | Data triggered IPv6 Prefix (prefix length shorter than /128) modeled as a managed route | ESM, Routed CO |
| | IPOE Mngd Hosts - AAA | (currently unused) | Not applicable |
| | IPOE Mngd Hosts – GTP (SLAAC) | IPv6 (SLAAC) GTP Access host | ESM, Routed CO |
| | IPOE Mngd Hosts - Bonding | IPv6 hosts associated with an internal IPoE session of a connection bonding subscriber context.. | ESM, Routed CO |
| | IPOE BSM - DHCP6 (NA) | IPv6 – DHCP6 IA-NA leases (lease-populate) | BSM, regular interface |
| | IPOE BSM - DHCP6 (PD) | IPv6 – DHCP6 IA-PD leases (lease-populate) | BSM, regular interface |

| Section | Counter | Counts | Applies to |
|--------------|--------------------------|--|----------------------------|
| Total | PPP Hosts | Local terminated PPP hosts (PTA, LNS) | ESM |
| | IPOE Hosts | Total IPv4 and IPv6 IPOE hosts | ESM |
| | IPv4 Hosts | Total IPv4 hosts, PPP (PTA, LNS) and IPOE | ESM |
| | IPv6 Hosts | Total IPv6 hosts, PPP (PTA, LNS) and IPOE | ESM |
| | IPv6 PD Mngd Routes | Total DHCP6 IA-PD leases modeled as a managed route. PPP (PTA, LNS) and IPOE | ESM |
| | L2TP LAC Hosts | L2TP LAC hosts – single host per single or dual stack PPP session Counter also increases for outgoing LTS sessions. | ESM, Routed CO |
| | L2TP LNS Hosts | L2TP LNS hosts – single host per single or dual stack PPP session | ESM, Routed CO |
| Total (Cont) | Internal Hosts | Subscriber hosts for internal use. For example, LNS redirect hosts (for LTS, an LNS redirect host is also instantiated). The internal LNS redirect host only counts against the system limit and not against the per line card limit. | ESM |
| | Non-Sub-Traffic L2-Hosts | A host on a single subscriber SAP in a VPLS service that enables non-IP traffic to be forwarded using the specified SLA profile instance queues. Host on a single subscriber SAP attached to an IES or VPRN group-interface that enables traffic normally forwarded using the SAP queues to flow using the specified SLA profile instance queues. configure>service>vpls service-id>sap sap-id>sub-sla-mgmt single-sub-parameters>non-sub-traffic sub-profile sub-profile-name sla-profile sla-profile-name [subscriber sub-ident-string] [app-profile app-profile-name] | ESM, Routed CO, Bridged CO |

| Section | Counter | Counts | Applies to |
|---------|--------------------|--|------------|
| | DHCP leases | Total number of DHCPv4 lease states | ESM, BSM |
| | DHCPv6 leases | Total number of DHCPv6 lease states | ESM, BSM |
| | Subscriber Hosts | Counter displayed in the output of show>subscriber-mgmt>statistics [iom mda port pw-port] | ESM |
| | System Hosts Scale | Counter displayed in the output of show>subscriber-mgmt>statistics system This counter matches the number of hosts accounted for in the system wide limit. | ESM |

Table 506: PPP Session Statistics

| Section | Counter | Counts | Applies to |
|---------|----------------------------|---|----------------|
| Local | PPP Sessions - PPPoE | Local terminated PPPoE sessions (PTA) | ESM, Routed CO |
| | PPP Sessions - PPPoEoA | Local terminated PPPoEoA sessions (PTA) | ESM, Routed CO |
| | PPP Sessions - PPPoA | Local terminated PPPoA sessions (PTA) | ESM, Routed CO |
| | PPP Sessions - L2TP (LNS) | Local terminated PPP sessions (L2TP LNS) | ESM, Routed CO |
| LAC | PPP Sessions - PPPoE | Tunneled PPPoE session (L2TP LAC) | ESM, Routed CO |
| | PPP Sessions - PPPoEoA | Tunneled PPPoEoA session (L2TP LAC) | ESM, Routed CO |
| | PPP Sessions - PPPoA | Tunneled PPPoA session (L2TP LAC) | ESM, Routed CO |
| | PPP Sessions - L2TP (LTS) | Tunneled PPP session (L2TP LTS) | ESM, Routed CO |
| Total | PPP Sessions - established | PPP sessions that are established (at least one active host attached) – PTA/LAC/LTS/LNS | ESM, Routed CO |
| | PPP Sessions - in setup | PPP sessions in setup (session created, host setup in progress) – PTA/LAC/LTS/LNS | ESM, Routed CO |
| | PPP Sessions - local | Local terminated PPPoX sessions (PTA, L2TP LNS) | ESM, Routed CO |

| Section | Counter | Counts | Applies to |
|---------|---------------------------|---|----------------|
| | PPP Sessions - LAC | Tunneled PPPoX session (L2TP LAC, L2TP LTS) | ESM, Routed CO |
| L2TP | L2TP Tunnels - originator | Number of L2TP Tunnels originated on this node. (LAC/LTS) | ESM, Routed CO |
| | .L2TP Tunnels - receiver | Number of L2TP Tunnels terminated on this node. (LNS/LTS) | ESM, Routed CO |
| | Total L2TP Tunnels | Number of L2TP Tunnels originated or terminated on this node. | ESM, Routed CO |

Table 507: IPoE Session Statistics

| Section | Counter | Counts | Applies to |
|---------|-----------------------------|---|----------------|
| Total | IPOE Sessions - established | IPoE sessions that are established (at least one active host attached). | ESM, Routed CO |
| | IPOE Sessions- in setup | IPoE sessions in setup (session created, host setup in progress). | ESM, Routed CO |

Table 508: Subscriber Statistics

| Section | Counter | Counts | Applies to |
|---------|-------------|-------------------------------------|----------------------------|
| Total | Subscribers | Total number of active subscribers. | ESM, Routed CO, Bridged CO |

Table 509: SubMgmt Statistics Summary

| Section | Counter | Counts |
|-------------|---------|------------------------------------|
| Hosts | IPv4 | Total IPv4 hosts |
| | IPv6 | Total IPv6 hosts |
| Sessions | PPP | Total PPP sessions established |
| | IPOE | Total IPOE sessions established |
| Subscribers | | Total number of active subscribers |

statistics

Syntax

statistics sub-profile {*sub-profile-name* | all}

statistics sla-profile {*sla-profile-name* | **all**}

Context

[\[Tree\]](#) (clear>subscriber-mgmt statistics)

Full Context

clear subscriber-mgmt statistics

Description

This command clears the current and historical statistics.

Parameters

sub-profile-name

Clears the statistics for a specific subscriber profile, limited to 32 characters.

sub-profile all

Clears all subscriber profile statistics.

sla-profile-name

Clears the statistics for a specific SLA profile, limited to 32 characters.

sla-profile all

Clears all SLA profile statistics.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

statistics

Syntax

statistics interface *subscriber-interface* [**id** *srrp-id*]

Context

[\[Tree\]](#) (clear>router>srrp statistics)

Full Context

clear router srrp statistics

Description

This command clears statistics for SRRP instances.

Parameters

subscriber-interface

Specifies an existing subscriber interface name up to 32 characters.

srrp-id

Specifies an existing SRRP ID.

Values 1 to 4294967295

Platforms

All

statistics

Syntax

statistics

Context

[\[Tree\]](#) (clear>service statistics)

Full Context

clear service statistics

Description

This command clears the statistics for a service.

Platforms

All

statistics

Syntax

statistics [*policy name*] [*sap sap-id*]

Context

[\[Tree\]](#) (show>service>id>auth statistics)

Full Context

show service id authentication statistics

Description

This command displays session authentication statistics for this service.

Parameters

policy name

Specifies an existing authentication policy name.

sap-id

Specifies the physical port identifier portion of the SAP definition.

Platforms

All

Output

The following output displays an example of service authentication statistics information

Sample Output

```
*A:ALA-48# show service id 700 authentication statistics
=====
Authentication Statistics for service 700

statistics

Syntax

statistics [**evpn-mpls** | **sap** *sap-id* | **sdp** *sdp-id:vc-id* | **vxlan vtep** *ip-address vni vni*]

Context

[\[Tree\]](#) (show>service>id>igmp-snooping statistics)

Full Context

show service id igmp-snooping statistics

Description

This command displays IGMP snooping statistics for the VPLS service.

Parameters

evpn-mpls

Displays IGMP snooping statistics for EVPN-MPLS destinations

sap-id

Displays IGMP snooping statistics for a specific SAP

sdp-id

Displays the IGMP snooping statistics for a specific spoke or mesh SDP

Values 1 to 17407

vc-id

The virtual circuit ID on the SDP ID for which to display information

Default For mesh SDPs only, all VC IDs.

Values 1 to 4294967295

vxlan vtep ip-address vni <1..16777215>

Displays the IGMP snooping entries associated with a specific VXLAN binding, given by the VXLAN Termination Endpoint (VTEP) and VXLAN Network Identifier (VNI). This parameter only applies to the 7450 ESS or 7750 SR.

vni

The VXLAN Network Identifier (VNI) for which to display information. This parameter only applies to the 7450 ESS or 7750 SR.

Values 1 to 16777215

Table 510: IGMP Statistics Fields

| Label | Description |
|---------------------------|--|
| IGMP Interface Statistics | Lists the IGMP statistics for a particular interface. |
| Message Type | Queries — The number of IGMP general queries transmitted or received on this interface. |
| | Report — The total number of IGMP V1, V2, or V3 reports transmitted or received on this interface. |

| Label | Description |
|------------------------------|---|
| | Leaves — The total number of IGMP leaves transmitted on this interface. |
| Received | The total number of IGMP packets received on this interface. |
| Transmitted | The total number of IGMP packets transmitted from this interface. |
| General Interface Statistics | The general IGMP statistics. |
| Bad Length | The total number of IGMP packets with bad length received on this interface. |
| Bad Checksum | The total number of IGMP packets with bad checksum received on this interface. |
| Unknown Type | The total number of IGMP packets with unknown type received on this interface. |
| Drops | The total number of IGMP packets dropped on this interface. |
| Rx Non Local | The total number of IGMP packets received from a non-local sender. |
| Rx Wrong Version | The total number of IGMP packets with wrong versions received on this interface. |
| Policy Drops | The total number of IGMP packets dropped by import policies on this interface. |
| No Router Alert | The total number of IGMPv3 packets received on this interface which did not have the router alert flag set. |
| Rx Bad Encodings | The total number of IGMP packets with bad encodings received on this interface. |
| Rx Pkt Drops | The total number of IGMP receive packet drops on this interface. |
| Local Scope Pkts | The total number of IGMP packets with local scope received on this interface. |
| Resvd Scope Pkts | The total number of IGMP packets with reserved scope received on this interface. |
| MCAC Policy Drops | The total number of IGMP packets dropped by MCAC policies on this interface. |

clear service id mld-snooping statistics

Description

This command clears MLD snooping statistics.

Parameters

sap-id

Clears MLD snooping statistics for the specified SAP.

sdp-id

Clears MLD snooping statistics associated with the specified SDP. For a spoke-SDP, the VC ID must be specified; for a mesh SDP, the VC ID is optional.

Values 1 to 17407

vni-id

Clears the MLD snooping statistics for the specified VXLAN VNI id.

Values 1 to 16777215

ip-address

Specifies a specific configured static egress VTEP to clear the MLD snooping statistics associated only with the VTEP.

clear service id igmp-snooping statistics

Description

This command clears IGMP snooping statistics for the VPLS service.

Parameters

all

Clears the IGMP snooping information for all port objects in the service

evpn-mpls

Clears IGMP snooping statistics for EVPN-MPLS destinations

sap-id

Clears the IGMP snooping information on the specified SAP

sdp-id

Clears only IGMP snooping entries associated with the specified mesh SDP or spoke-SDP. For a spoke-SDP, the VC ID must be specified, for a mesh SDP, the VC ID is optional.

Values 1 to 17407

vc-id

Clears statistics for the specified virtual circuit ID on the SDP ID

Default For mesh SDPs only, all VC IDs

Values 1 to 4294967295

vxlan vtep ip-address vni <1..16777215>

Clears the IGMP snooping statistics associated with a specific VXLAN destination given by the VXLAN Termination Endpoint (VTEP) and VXLAN Network Identifier (VNI). This parameter only applies to the 7450 ESS or 7750 SR.

vni-id

Displays information for the specified VXLAN Network Identifier (VNI). This parameter only applies to the 7450 ESS or 7750 SR.

clear router bfd statistics

Description

This command clears BFD statistics.

Parameters

all

Clears all statistics for the BFD instance.

dst-ip *ip-address*

Clears statistics about the specified destination IPv4 or IPv6 address.

ip-prefix/prefix-length

Clears statistics for the specified IP prefix.

Values *ipv4-prefix* — a.b.c.d
ipv4-prefix-length — 0 to 32
ipv6-prefix — x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:d.d.d.d
x — 0 to FFFF (hexadecimal)
d — 0 to 255 (decimal)
ipv6-prefix-length — 0 to 128

Isp-id [0..4294967295]

Clears statistics about the specified LSP ID.

Isp-ldp head

Clears statistics for the head of the LSP LDP link.

Isp-ldp tail

Clears statistics for the tail of the LSP LDP link.

Isp-rsvp {head | tail}

Clears statistics about the specified link type.

mpls-tp *isp-name*

Clears statistics about the specified MPLS TP LSP.

p2mp-interface *interface-name*

Clears statistics about the specified P2MP interface.

path {working | protect}

Clears statistics about the working or protect path.

rsvp-session-name [256 chars max]

Clears statistics about the specified RSVP session.

src-ip *ip-address*

Clears statistics about the specified source IPv4 or IPv6 address.

tunnel-id [0..4294967295]

Clears statistics about the specified tunnel ID.

clear router igmp statistics

Description

This command clears IGMP statistics on a specified interface or IP address.

Note:

An interface, group, and source cannot be specified at the same time.

Parameters

group-interface *interface-name*

Clears the IGMP statistics on the specified group interface.

group-interface all

Clears the IGMP statistics on all group interfaces.

service-id

Specifies the service ID.

Values service-id: 1 to 2148278386
 svc-name: up to 64 characters.

host *ip-address*

Clears the IGMP statistics on the specified host.

host all

Clears the IGMP statistics on all hosts.

interface *ip-int-name*

Clears the IGMP statistics on the specified interface.

interface *ip-address*

Clears the IGMP statistics on the specified IP address.

Table 517: PIM Statistics Output Fields

| Label | Description |
|----------------|--|
| PIM Statistics | The section listing the PIM statistics for a particular interface |
| Message Type | <p>The type of message.</p> <p>Hello — The number of PIM hello messages received or transmitted</p> <p>Join Prune — The number of PIM join prune messages received or transmitted</p> <p>Asserts — The number of PIM assert messages received or transmitted</p> <p>Register — The number of register messages received or transmitted</p> <p>Null Register — The number of PIM null register messages received or transmitted</p> <p>Register Stop — The number of PIM register stop messages received or transmitted</p> <p>BSM — The number of PIM Bootstrap messages (BSM) received or transmitted</p> <p>Candidate RP Adv — The number of candidate RP advertisements</p> <p>Auto-RP Announce — The number of auto-RP announce (224.0.1.39) messages received or transmitted</p> <p>Auto-RP Mapping — The number of auto-RP mapping (224.0.1.40) messages received or transmitted</p> |
| Message Type | <p>PIM DM Grafts — The number of PIM graft messages received or transmitted</p> <p>PIM DM Graft Acks — The number of PIM graft acknowledgment messages received or transmitted</p> <p>Total Packets — The total number of packets transmitted and received.</p> |
| Received | The number of messages received |
| Transmitted | The number of multicast data packets transmitted |
| Rx Errors | The total number of receive errors |

| Label | Description |
|-------------------------------|---|
| General Interface Statistics | The section listing the general PIM interface statistics |
| Register TTL Drop | The number of multicast data packets which could not be encapsulated in Register messages because the time to live (TTL) was zero |
| Tx Register MTU Drop | The number of Bootstrap messages received on this interface but were dropped |
| Rx Invalid Register | The number of invalid PIM register messages received |
| Rx Neighbor Unknown | The number of PIM messages (other than hello messages) which were received and were rejected because the adjacency with the neighbor router was not already established |
| Rx Bad Checksum Discard | The number of PIM messages received, and which were discarded because of bad checksum |
| Rx Bad Encoding | The number of PIM messages with bad encodings received |
| Rx Bad Version Discard | The number of PIM messages with bad versions received |
| Rx CRP No Router Alert | The number of candidate-rp advertisements (C-RP-Adv) received, and which had no router alert option set |
| Rx Invalid Join Prune | The number of invalid PIM join prune messages received |
| Rx Unknown PDU Type | The number of packets received with an unsupported PIM type |
| Join Policy Drops | The number of times the join policy match resulted in dropping PIM join-prune message or one of the source group contained in the message |
| Register Policy Drops | The number of times the register policy match resulted in dropping PIM register message |
| Bootstrap Import Policy Drops | The number of Bootstrap messages received that were dropped because of Bootstrap import policy |
| Bootstrap Export Policy Drops | The number of Bootstrap messages that were not transmitted because of Bootstrap export policy. |
| Source Group Statistics | The section listing the source group statistics |
| (S,G) | The number of entries in which the type is (S,G) |
| (* ,G) | The number of entries in which the type is (* ,G) |

| Label | Description |
|-----------|---|
| (*,* ,RP) | The number of entries in which the type is (*, *, rp) |

statistics

Syntax

statistics [*family*]

statistics [**interface** *ip-int-name* | **mt-int-name** | **int-ip-address**] [*family*]

statistics [**group** *grp-ip-address*] [**source** *ip-address*] [*family*]

Context

[\[Tree\]](#) (clear>router>pim statistics)

Full Context

clear router pim statistics

Description

This command clears PIM statistics on a specified interface or IP address.

Note:

An interface and group or source cannot be specified at the same time.

Parameters

ip-int-name

Clears PIM statistics on the specified interface.

ip-address

Clears PIM statistics on the specified IP address.

mt-int-name

Clears the default core group address of the Multicast Distribution Tree (MDT) for the VPRN instance. The Multicast Tunnel (MT) interface for a VPRN is created when this object is set to a valid group address.

syntax: *vprn-id-mt-grp-ip-address*

grp-ip-address

When only the group address is specified and no source is specified, (*,G) statistics are cleared. When the group address is specified along with the source address, then the (S,G) statistics are reset to zero.

ip-address

When the source address is specified along with the group address, then the (S,G) statistics are reset to zero.

family

Clears statistics family information.

Values ipv4, ipv6

Platforms

All

statistics

Syntax

statistics

Context

[\[Tree\]](#) (show>router>p2mp-sr-tree statistics)

Full Context

show router p2mp-sr-tree statistics

Description

This command displays P2MP SR tree statistics.

Platforms

All

Output

The following output is an example of P2MP SR tree statistics information.

Note:

The "Programming failures" count in tree SID statistics are not High Availability (HA) compatible and are reset upon an activity switch of the CPMs.

Sample Output

```
A:swsim103>show>router>p2mp-sr-tree# statistics

| Discard Error | The number of ETH-CFM packets that did not pass validation |

statistics

Syntax

statistics session *session-name* **dm meas-interval** { **5-mins** | **15-mins** | **1-hour** | **1-day** | **raw** } **interval-number** *interval-number* [**all** | **bins** | **summary**]

statistics session *session-name* **dmm** **meas-interval** { 5-mins | 15-mins | 1-hour | 1-day | raw } **interval-number** *interval-number* [all | bins | summary]

statistics session *session-name* **lmm** **meas-interval** { 5-mins | 15-mins | 1-hour | 1-day | raw } **interval-number** *interval-number*

statistics session *session-name* **slm** **meas-interval** { 5-mins | 15-mins | 1-hour | 1-day | raw } **interval-number** *interval-number*

statistics session *session-name* **twamp-light** **meas-interval** { 5-mins | 15-mins | 1-hour | 1-day | raw } **interval-number** *interval-number* **delay** [all | bins | summary]

Context

[Tree] (show>oam-pm statistics)

Full Context

show oam-pm statistics

Description

This command shows the delay statistics for the specified test using the parameters specified.

Parameters

session-name

Identifies the session to be queried.

dm

Specifies that the delay test is from the MPLS test family and is using dm style measurements for the delay.

dmm

Specifies that the delay test is from the Ethernet test family and is using dmm style measurements for the delay.

lmm

Specifies the loss test is from the Ethernet test family and is using lmm style measurements for the loss.

slm

Specifies that the loss test is from the Ethernet test family and is using slm style measurements for the loss.

twamp-light

Specifies that the delay test is from the IP test family and is using twamp-light style measurements for the delay.

meas-interval

Identifies the measurement interval to query for the statistics. When **raw** is specified, the interval number is not to be included because there is only one raw cumulative bin.

Values 5-mins, 15-mins, 1-hour, 1-day, raw

interval-number

Specifies the numerical reference that indicates the position from the latest sample window. The number 1 is the most recent with all higher numbers being that position in the past from current.

Values 1 to 97

[all | bins | summary]

Specifies a keyword to filter the output.

delay

Indicates that the statistics being queried are for delay. TWAMP-Light PDUs carry both delay and loss informational elements and it is not clear from only the test type name which statistic the operator requires.

loss

Indicates the statistics being queried are for loss. TWAMP-Light PDUs carry both delay and loss informational elements and it is not clear from only the test type name which statistic the operator requires. This keyword is specific to twamp-light.

|-----------------|--|
| Purge Initiated | The number of times purges have been initiated. |
| SPF Runs | The number of times shortest path first calculations have been made. |

| Label | Description |
|---------------|---|
| LSP Regens | The count of LSP regenerations. |
| Requests | The number of CSPF requests made to the protocol. |
| Paths Found | The number of responses to CSPF requests for which paths satisfying the constraints were found. |
| PDU Type | The PDU type. |
| Received | The count of link state PDUs received by this instance of the protocol. |
| Processed | The count of link state PDUs processed by this instance of the protocol. |
| Dropped | The count of link state PDUs dropped by this instance of the protocol. |
| Sent | The count of link state PDUs sent out by this instance of the protocol. |
| Retransmitted | The count of link state PDUs that had to be retransmitted by this instance of the protocol. |

Table 522: OSPF Statistics Output Fields

| Label | Description |
|------------|--|
| Rx Packets | The total number of OSPF packets received on all OSPF enabled interfaces. |
| Tx Packets | The total number of OSPF packets transmitted on all OSPF enabled interfaces. |
| Rx Hellos | The total number of OSPF Hello packets received on all OSPF enabled interfaces. |
| Tx Hellos | The total number of OSPF Hello packets transmitted on all OSPF enabled interfaces. |
| Rx DBDs | The total number of OSPF database description packets received on all OSPF enabled interfaces. |
| Tx DBDs | The total number of OSPF database description packets transmitted on all OSPF enabled interfaces |
| Rx LSRs | The total number of OSPF Link State Requests (LSRs) received on all OSPF enabled interfaces. |
| Tx LSRs | The total number of OSPF Link State Requests (LSRs) transmitted on all OSPF enabled interfaces. |

| Label | Description |
|----------------|---|
| Rx LSUs | The total number of OSPF Link State Update (LSUs) received on all OSPF enabled interfaces. |
| Tx LSUs | The total number of OSPF Link State Update (LSUs) transmitted on all OSPF enabled interfaces. |
| Rx LS Acks | The total number of OSPF Link State Acknowledgments (LSAs) received on all OSPF enabled interfaces. |
| New LSAs Recvd | The total number of new OSPF Link State Advertisements received on all OSPF enabled interfaces. |
| New LSAs Orig | The total number of new OSPF Link State Advertisements originated on all OSPF enabled interfaces. |
| Ext LSAs Count | The total number of OSPF External Link State Advertisements. |
| No of Areas | The number of areas configured for this OSPF instance. |
| Total SPF Runs | The total number of incremental SPF runs triggered by new or updated LSAs. |
| Ext SPF Runs | The total number of incremental SPF runs triggered by new or updated type-5 external LSAs. |
| Retransmits | The total number of OSPF Retransmits transmitted on all OSPF enabled interfaces. |
| Discards | The total number of OSPF packets discarded on all OSPF enabled interfaces. |
| Bad Networks | The total number of OSPF packets received on all OSPF enabled interfaces with invalid network or mask. |
| Bad Virt Links | The total number of OSPF packets received on all OSPF enabled interfaces that are destined to a virtual link that does not exist. |
| Bad Areas | The total number of OSPF packets received on all OSPF enabled interfaces with an area mismatch. |
| Bad Dest Addr | The total number of OSPF packets received on all OSPF enabled interfaces with the incorrect IP destination address. |
| Bad Auth Types | The total number of OSPF packets received on all OSPF enabled interfaces with an invalid authorization type. |
| Auth Failures | The total number of OSPF packets received on all OSPF enabled interfaces with an invalid authorization key. |

| Label | Description |
|----------------|---|
| Bad Neighbors | The total number of OSPF packets received on all OSPF enabled interfaces where the neighbor information does not match the information this router has for the neighbor. |
| Bad Pkt Types | The total number of OSPF packets received on all OSPF enabled interfaces with an invalid OSPF packet type. |
| Bad Lengths | The total number of OSPF packets received on all OSPF enabled interfaces with a total length not equal to the length given in the packet itself. |
| Bad Hello Int. | The total number of OSPF packets received on all OSPF enabled interfaces where the hello interval given in packet was not equal to that configured for the respective interface. |
| Bad Dead Int. | The total number of OSPF packets received on all OSPF enabled interfaces where the dead interval given in the packet was not equal to that configured for the respective interface. |
| Bad Options | The total number of OSPF packets received on all OSPF enabled interfaces with an option that does not match those configured for the respective interface or area. |
| Bad Versions | The total number of OSPF packets received on all OSPF enabled interfaces with bad OSPF version numbers. |
| Tx Failures | Transmitted OSPF packets that are dropped due to resource shortage. |

[Tree] (clear>router>ospf statistics)

Full Context

clear router ospf3 statistics

clear router ospf statistics

Description

This command clears all neighbor, router, interface, SPF and global statistics of this OSPF instance.

Platforms

All

statistics

Syntax

statistics [*ipv6-address* | *ip-int-name*]

Context

[Tree] (show>router>ripng statistics)

Full Context

show router ripng statistics

Description

This command displays the interface level statistics for the RIPng protocol.

If no IPv6 address or interface name is specified, then all configured RIPng interfaces are displayed.

If an IPv6 address or interface name is specified, then only data regarding the specified RIPng interface is displayed.

Parameters

ipv6-address* | *ip-int-name

Displays statistics for the specified IPv6 interface.

Platforms

All

Output

The following output are examples of RIPng statistics information.

Sample Output

```
*A:Dut-C>config>router>if# show router ripng statistics

statistics

Syntax

statistics

statistics manager all

statistics manager *manager-name*

Context

[\[Tree\]](#) (clear>system>management-interface>remote-management statistics)

Full Context

clear system management-interface remote-management statistics

Description

This command clears the statistics for remote management managers. If the command is run without specifying the **manager**, the statistics for all remote managers are cleared.

Parameters

manager

Keyword to specify that clears statistics only for a specific manager.

manager-name

Specifies the configured name of the manager, up to 64 characters, for which the statistics are cleared.

all

Clears statistics for all managers.

Platforms

All

statistics

Syntax

statistics

Context

[Tree] (show>subscr-mgmt>pfcp statistics)

Full Context

show subscriber-mgmt pfcp statistics

Description

This command displays the packet counters for each PFCP message and upstream IBCP message.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of PFCP statistics information.

statistics sr-policy all

Context

[Tree] (clear>router>bfd>seamless-bfd statistics)

Full Context

clear router bfd seamless-bfd statistics

Description

This command clears BFD statistics.

Parameters

lsp-path

Keyword to clear the S-BFD statistics for LSP path.

sr-policy

Keyword to clear the S-BFD statistics for SR policy.

all

Keyword to clear all S-BFD statistics.

lsp-index *lsp-index*

Specifies the LSP index.

Values 0 to 4294967295

path-lspid *path-lspid*

Specifies the path LSP ID.

Values 0 to 4294967295

prefix

Keyword to clear information by far-end prefix.

ip-prefix/prefix-length

Specifies an IP prefix for which to clear S-BFD statistics, and the length of the prefix.

Values *ipv4-prefix* — a.b.c.d (host bits must be zero)
ipv4-prefix-length — 0 to 32
ipv6-prefix — x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:d.d.d.d
x — 0 to FFFF (hexadecimal)
d — 0 to 255 (decimal)
ipv6-prefix-length — 0 to 128

ip-address | *ipv6-address*

Specifies the IP address for which to clear S-BFD statistics.

Values *ipv4-address* — a.b.c.d
ipv6-address — x:x:x:x:x:x:x[-interface]
x:x:x:x:x:d.d.d.d[-interface]
x — 0 to FFFF (hexadecimal)
d — 0 to 255 (decimal)

interface — mandatory for link local address, up to 32 characters

Syntax

statistics [*interval seconds*] [*repeat repeat*] [*absolute* | *rate*]

Context

[\[Tree\]](#) (monitor>router>isis statistics)

Full Context

monitor router isis statistics

Description

This command displays statistical IS-IS traffic information at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified router statistics. The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

Parameters

seconds

Configures the interval for each display in seconds.

Values 3 to 60

Default 10 seconds

repeat

Configures how many times the command is repeated.

Values 1 to 999

Default 10

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic instead of the delta.

statistics

Syntax

statistics [*interval seconds*] [*repeat repeat*] [*absolute | rate*]

Context

[\[Tree\]](#) (monitor>router>ldp statistics)

Full Context

monitor router ldp statistics

Description

Monitor statistics for LDP instance at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the LDP statistics. The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

Parameters

seconds

Configures the interval for each display in seconds.

Values 3 to 60

Default 10 seconds

repeat

Configures how many times the command is repeated.

Values 1 to 999

Default 10

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic instead of the delta.

Description

This command gives a router-wide overview of call-trace operational data, such as number of configured profile, number of jobs and status of the compact flash.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output displays call trace status information.

Sample Output

```

=====
Call trace status
=====
No. of trace profiles: 1
No. of trace jobs    : 0
-----
Primary CF          : CF1           Max files number    : 200
CF1 state           : enabled        CF1 volume limit    : 1000 MB
CF2 state           : enabled        CF2 volume limit    : 1000 MB

```

[Table 523: Call Trace Status Field Descriptions](#) describes call trace status output field information.

Table 523: Call Trace Status Field Descriptions

| Field | Descriptions |
|-----------------------|---|
| No. of trace profiles | The number of profiles configured in the system |
| No. of trace jobs | The number of trace jobs |
| Primary CF | The compact flash card to be used as the primary local storage location to save the generated call trace log files |
| Max files number | The cumulative number of call trace log files present on all cflash cards on the active CPM that are being used for local storage has reached the limit |

| Field | Descriptions |
|------------------|--|
| CF1 state | The status of a call trace job on CF2. "running" indicates the job is active and is tracing events triggered by the host being monitored. "finished" indicates the job has already finished and is not tracing events generated by the host anymore. |
| CF1 volume limit | The data volume limit for the CF1 call trace job |
| CF2 state | The status of a call trace job on CF2. "running" indicates the job is active and is tracing events triggered by the host being monitored. "finished" indicates the job has already finished and is not tracing events generated by the host anymore. |
| CF2 volume limit | The data volume limit for the CF2 call trace job |

```

Table 524: IGMP Status Fields

| Label | Description |
|----------------------------|--|
| Admin State | The administrative status of IGMP. |
| Oper State | The current operating state of this IGMP protocol instance on this router. |
| Query Interval | The frequency at which IGMP query packets are transmitted. |
| Last Member Query Interval | The maximum response time inserted into group-specific queries sent in response to leave group messages, and is also the amount of time between group-specific query messages. |
| Query Response Interval | The maximum query response time advertised in IGMPv2 queries. |
| Robust Count | The number of times the router will retry a query. |

Table 525: LDP Status Output Fields

| Label | Description |
|------------------|---|
| Created at | The date and time when the LDP instance was created. |
| Last Change | The date and time when the LDP instance was last modified. |
| Admin State | Up — The LDP is administratively enabled. Down — The LDP is administratively disabled. |
| Oper State | Up — The LDP is operationally enabled. Down — The LDP is operationally disabled. |
| Up Time | The time, in hundredths of seconds, that the LDP instance has been operationally up. |
| Oper Down Reason | The reason for the operational down status. |

| Label | Description |
|---------------------|--|
| Oper Down Events | The number of times the LDP instance has gone operationally down since the instance was created. |
| Tunn Down Damp Time | Indicates the value configured by tunnel-down-damp-time . |
| Weighted ECMP | Indicates whether weighted ecmp is enabled or not. |
| Label Withdraw Del* | Indicates the value configured by label-withdrawal-delay . |
| Implicit Null Label | Indicates whether implicit null is supported. |
| Short. TTL Local | Indicates whether shortcut-local-ttl-propagate is enabled or not. |
| Short. TTL Transit | Indicates whether shortcut-transit-ttl-propagate is enabled or not. |
| ConsiderSysIPByPol* | Whether consider-system-ip-in-gep is enabled. |
| Imp Ucast Policies | Lists the applied import unicast policies, if any. Up to five import policies can be specified. |
| Exp Ucast Policies | Lists the applied export unicast policies, if any. Up to five import policies can be specified. |
| Imp Mcast Policies | Lists the applied import multicast policies, if any. Up to five import policies can be specified. |
| Tunl Exp Policies | Lists the applied tunnel export policies, if any. Up to five import policies can be specified. |
| FRR | Indicates whether Fast ReRoute is enabled or not. |
| Mcast Upstream FRR | Indicates whether multicast upstream fast reroute has been enabled or not. |
| Mcast Upst ASBR FRR | Indicates whether multicast upstream fast reroute has been enabled or not at ASBR. |
| MP MBB Time | Indicates the value configured by mp-mbb-time . |
| Aggregate Prefix | Indicates whether aggregate-prefix-match has been enabled or not. |
| Agg Prefix Policies | Lists the policies for the aggregate prefix match, if any. Up to five aggregate prefix policies can be specified. |
| Class Forwarding | Indicates whether class forwarding is in the enabled or disabled mode. Enabled modes are (lsr, ler, or lsr-and-ler). |
| Legacy LSR Interop | Indicates whether legacy LSR interoperability has been enabled or not. |
| Entropy Label Capa* | Indicates whether the support for entropy label is enabled or not. |
| Generate Basic FEC | Indicates whether generate-basic-fec-only has been enabled or not. |

| Label | Description |
|---------------------|--|
| Resolve Via Mcast * | Indicates whether the route for the root address of P2MP FECs will be resolved using the unicast routing table or the multicast routing table. |
| Capabilities | |
| Dynamic | Indicates whether LDP supports changing capabilities dynamically using the LDP Capability message, or only in the Initialization message. |
| P2MP | Indicates whether LDP supports exchanging P2MP FECs. |
| IPv4 Prefix Fec | Indicates whether LDP supports exchanging IPv4 Prefix FECs. |
| IPv6 Prefix Fec | Indicates whether LDP supports exchanging IPv6 Prefix FECs. |
| Service Fec128 | Indicates whether LDP supports exchanging basic pseudowire service FECs. |
| Service Fec129 | Indicates whether LDP supports exchanging generalized pseudowire (PWE3) service FECs. |
| MP MBB | Indicates whether MP MBB is enabled or not. |
| Overload | Indicates whether LDP supports sending and receiving overload notification messages (Nokia vendor extension). |
| Unrecognized Notif* | Indicates whether LDP supports receiving notification messages with an unrecognized status; required for the end-of-lib feature (RFC 5919). |

Table 526: MPLS Status Output Fields

| Label | Description |
|----------------------|---|
| Admin Status | Down — MPLS is administratively disabled. Up — MPLS is administratively enabled. |
| Oper Status | Down — MPLS is operationally down. Up — MPLS is operationally up. |
| Oper Down Reason | Specifies the operational down cause. |
| FRR Object | Enabled — Specifies that Fast reroute object is signaled for the LSP. Disabled — Specifies that Fast reroute object is not signaled for the LSP. |
| Resignal Timer | Enabled — Specifies that the resignal timer is enabled for the LSP. Disabled — Specifies that the resignal timer is disabled for the LSP. |
| Hold Timer | Displays the amount of time that the ingress node holds before programming its data plane and declaring the LSP up to the service module. |
| Next Resignal | Specifies the next resignal value. |
| Srlg Frr | Enabled — Specifies that SRLG Fast reroute is signaled for the LSP. Disabled — Specifies that SRLG Fast reroute is not signaled for the LSP. |
| Srlg Frr Strict | Enabled — Specifies that SRLG Fast reroute strict is signaled for the LSP. Disabled — Specifies that SRLG Fast reroute strict is not signaled for the LSP. |
| Admin Group Frr | Enabled — Specifies that the administrative group Fast reroute is signaled for the LSP. Disabled — Specifies that the administrative group Fast reroute is not signaled for the LSP. |
| Dynamic Bypass | Enabled — Specifies that dynamic bypass is enabled. Disabled — Specifies that dynamic bypass is disabled. |
| User Srlg Database | Enabled — Specifies that user SRLG databases are enabled. Disabled — Specifies that user SRLG databases are disabled. |
| BypassResignalTimer | Enabled — Specifies that the bypass resignal timer is enabled. Disabled — Specifies that the bypass resignal timer is disabled. |
| BypassNextResignal | Specifies the bypass next resignal value. |
| LeastFill Min Thd | Specifies the least fill minimum threshold percentage value. |
| LeastFill Reopti Thd | Specifies the least fill re-optimization threshold percentage value. |

| Label | Description |
|----------------------------|--|
| Local TTL Prop | Enabled — Specifies that local TTL property is enabled. Disabled — Specifies that local TTL property is disabled. |
| Transit TTL Prop | Enabled — Specifies that transit TTL property is enabled. Disabled — Specifies that transit TTL property is disabled. |
| AB Sample Multiplier | Specifies the AB sample multiplier value. |
| AB Adjust Multiplier | Specifies the AB adjust multiplier value. |
| Exp Backoff Retry | Enabled — Specifies that Exp Backoff retry is enabled. Disabled — Specifies that Exp Backoff is disabled. |
| CSPF On Loose Hop | Enabled — Specifies that CSPF On Loose Hop is enabled. Disabled — Specifies that CSPF On Loose Hop is disabled. |
| Lsp Init RetryTimeout | Specifies the LSP Init RetryTimeout seconds value. |
| MBB Pref Current Hops | Enabled — Specifies that MBB Pref Current Hops is enabled. Disabled — Specifies that MBB Pref Current Hops is disabled. |
| Logger Event Bundling | Enabled — Specifies that Logger Event Bundling is enabled. Disabled — Specifies that Logger Event Bundling is disabled. |
| Retry on IGP Overload | Enabled — Specifies that Retry on IGP Overload is enabled. Disabled — Specifies that Retry on IGP Overload is disabled. |
| Resignal on IGP Overload | Enabled — Specifies that Resignal on IGP Overload is enabled. Disabled — Specifies that Resignal on IGP Overload is disabled. |
| P2mp Resignal Timer | Enabled — Specifies that the P2MP Resignal Timer is enabled. Disabled — Specifies that the P2MP Resignal Timer is disabled. |
| P2mp Next Resignal | Specifies the P2MP Next Resignal Timer value. |
| Sec FastRetryTimer | Enabled — Specifies that the Sec Fast RetryTimer is enabled. Disabled — Specifies that the Sec Fast RetryTimer is disabled. |
| Static LSP FR Timer | Specifies the Static LSP FR Timer seconds value. |
| P2P Max Bypass Association | Specifies the P2P Max Bypass Association value. |
| P2PActPathFastRetry | Enabled — Specifies that the P2P ActPath Fast Retry is enabled. Disabled — Specifies that the P2P ActPath Fast Retry is disabled. |
| P2MP S2L Fast Retry | Enabled — Specifies that the P2MP S2L Fast Retry is enabled. |

| Label | Description |
|----------------------------|--|
| | Disabled — Specifies that the P2MP S2L Fast Retry is disabled. |
| In Maintenance Mode | No — Specifies that the system is not in maintenance mode. Yes — Specifies that the system is in maintenance mode. |
| MplsTp | Enabled — Specifies that MPLS TP is enabled. Disabled — Specifies that MPLS TP is disabled. |
| Next Available Lsp Index | Specifies the next available LSP index value. |
| Entropy Label RSVP-TE | Enabled — Specifies that Entropy Label RSVP-TE is enabled. Disabled — Specifies that Entropy Label RSVP-TE is disabled. |
| Entropy Label SR-TE | Enabled — Specifies that Entropy Label SR-TE is enabled. Disabled — Specifies that Entropy Label SR-TE is disabled. |
| PCE Report RSVP-TE | Enabled — Specifies that PCE Report RSVP-TE is enabled. Disabled — Specifies that PCE Report RSVP-TE is disabled. |
| PCE Report SR-TE | Enabled — Specifies that PCE Report SR-TE is enabled. Disabled — Specifies that PCE Report SR-TE is disabled. |
| PCE Init LSP | Enabled — Specifies that PCE Init LSP is enabled. Disabled — Specifies that PCE Init LSP is disabled. |
| PCE Init SR-TE | Enabled — Specifies that PCE Init LSP SR-TE is enabled. Disabled — Specifies that PCE Init LSP SR-TE is disabled. |
| PCE Init SR-TE Admin State | Up — Specifies that the PCE Init SR-TE Admin State is up. Down — Specifies that the PCE Init SR-TE Admin State is down. |
| PCE Init SR-TE Oper State | Up — Specifies that the PCE Init SR-TE Operational State is up. Down — Specifies that the PCE Init SR-TE Operational State is down. |
| PCE Init SR-TE Oper Dn Rsn | Specifies the reason for the PCE Init SR-TE Operationally down. |
| LSP Self Ping Timeout | Specifies the LSP Self Ping timeout value. |
| LSP Self Ping Interval | Specifies the LSP Self Ping interval value. |
| LSP Self Ping RSVP TE | Specifies the status of LSP Self Ping RSVP TE. |
| Originate | Specifies the number of originations for the various LSP types. |
| Transit | Specifies the number of transits for the various LSP types. |

| Label | Description |
|-----------|---|
| Terminate | Specifies the number of terminations for the various LSP types. |

Output

The following output is an example of RSVP status information.

[Table 527: RSVP Status Output Fields](#) describes RSVP status output fields.

Table 527: RSVP Status Output Fields

| Label | Description |
|-----------------------|--|
| Admin Status | Down — RSVP is administratively disabled. Up — RSVP is administratively enabled. |
| Oper Status | Down — RSVP is operationally down. Up — RSVP is operationally up. |
| Keep Multiplier | Displays the keep-multiplier <i>number</i> used by RSVP to declare that a reservation is down or the neighbor is down. |
| Refresh Time | Displays the refresh-time interval (in s), between the successive Path and Resv refresh messages. |
| Message Pacing | Enabled — RSVP messages, specified in the max-burst command, are sent in a configured interval, specified in the period command. Disabled — Message pacing is disabled. RSVP message transmission is not regulated. |
| Pacing Period | Displays the time interval (in ms), when the router can send the specified number of RSVP messages specified in the rsvp max-burst command. |
| Max Packet Burst | Displays the maximum number of RSVP messages that are sent in the specified period under normal operating conditions. |
| Soft Preemption Timer | Displays the time (in s), a node holds on to a reservation for which it has triggered the soft preemption procedure. |
| Rapid Retransmit | Displays the value of the rapid retransmission interval. |
| Rapid Retry Limit | Displays the rapid retry limit. |
| Graceful Shutdown | Specifies whether graceful shutdown of the RSVP node is enabled. |

| Label | Description |
|--------------------|--|
| Dark Bandwidth | Indicates the status of the dark bandwidth accounting application. |
| DBw Sample Intv | Displays the configured dark bandwidth sampling interval. |
| DBw Up Threshold | Displays the configured dark bandwidth up threshold. |
| DBw Down Threshold | Displays the configured dark bandwidth down threshold. |
| DBw Multiplier | Displays the configured dark bandwidth multiplier. |
| DBw Sample Multp | Displays the configured dark bandwidth sample multiplier. |

Sample Output

```

Context

[\[Tree\]](#) (show>app-assure>group status)

Full Context

show application-assurance group status

Description

This command displays system statistics.

Parameters

isa mda-id

Displays information about the specified AA ISA.

Values mda-id: slot/mda: slot: 1 to 10, mda: 1 or 2

cflowd

Displays cflowd status information.

detail

Displays detailed status information.

cpu [*sample-period seconds*]

Displays DPU utilization info about the specified AA ISA. The **isa mda-id** must be specified. The sample period can be specified within a range of 1 5 seconds (default 1s).

Values 1 to 5

overload

Displays the overload status.

qos count

Displays information about queue statistics. The **isa mda-id** must be specified.

qos pools

Displays information about AA related pool utilization. The **isa mda-id** must be specified.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following is an example show output for the **status** command.

Sample Output

```
*A:Dut-C# show application-assurance group 1 status

Full Context

show router mld status

Description

This command displays MLD status information.

If MLD is not enabled, the following message appears:

```
A:NYC# show router mld status
MINOR: CLI MLD is not configured.
A:NYC#
```

Platforms

All

Output

The following is an example of MLD status information [Table 529: MLD Status Fields](#) provides MLD status field descriptions.

Sample Output

```
*A:ALA-BA# show router mld status
=====
MLD Status
=====
Admin State           : Up
Oper State            : Up
Query Interval        : 125
Last Listener Query Interval : 1
Query Response Interval : 10
Robust Count          : 2
=====
*A:ALA-BA#
```

Table 529: MLD Status Fields

| Label | Description |
|------------------------------|--|
| Admin State | The administrative status of MLD. |
| Oper State | The current operating state of this MLD protocol instance on this router. |
| Query Interval | The frequency at which MLD query packets are transmitted. |
| Last Listener Query Interval | The maximum response time inserted into group-specific queries sent in response to leave group messages, and is also the amount of time between group-specific query messages. |
| Query Response Interval | The maximum query response time advertised in MLDv2 queries. |
| Robust Count | The number of times the router will retry a query. |

status

Syntax

status

Context

[\[Tree\]](#) (show>router>msdp status)

Full Context

show router msdp status

Description

This command displays MSDP status information.

Platforms

All

Output

The following is an example of MSDP status information. [Table 530: MSDP Status Fields](#) provides MSDP status field descriptions.

Table 530: MSDP Status Fields

| Label | Description |
|--------------------|---|
| Admin State | The administrative state. |
| Local Address | The local IP address. |
| Active Src Limit | The active source limit. |
| Act Src Lim Excd | The active source limit which has been exceeded. |
| Num. Peers | The number of peers. |
| Num. Peers Estab | The number of peers established. |
| Num. Source Active | The number of active sources. |
| Policies | The policy to export source active state from the source active list into MSDP. |
| Data Encapsulation | The rendezvous point (RP) using MSDP to encapsulate multicast data received in MSDP register messages inside forwarded MSDP source-active messages - enabled or disabled. |
| Rate | The receive message rate. |
| Time | The receive message time. |

| Label | Description |
|-------------------|--|
| Threshold | The number of MSDP messages that can be processed before the MSDP message rate limiting function is activated. |
| RPF Table | The name of the reverse path forwarding table. |
| Last msdp Enabled | The time the last MSDP was triggered. |

Sample Output

```
A:ALA-48# show router msdp status

```

status

Syntax

status [**detail**] [*family*]

Context

[\[Tree\]](#) (show>router>pim status)

Full Context

show router pim status

Description

This command displays PIM status. The Oper Status reflects the combined operational status of IPv4 or IPv6 PIM protocol status. If both are down, then Oper Status is reflected as down. If IPv4 or IPv6 reflects up, the Oper Status reflects up.

If PIM is not enabled, the following message appears:

```
A:NYC# show router pim status
```

```
MINOR: CLI PIM is not configured.
A:NYC#
```

Parameters

detail

Displays detailed status information.

family

Displays status information for the specified family.

Values ipv4, ipv6

Platforms

All

Output

The following displays an example of a PIM status configuration. [Table 531: PIM Status Output Fields](#) provides PIM status output field descriptions.

Sample Output

```
A:dut-d# show router pim status

Table 531: PIM Status Output Fields

| Label | Description |
|------------------|---|
| Admin State | The administrative status of PIM. |
| Oper State | The current operating state of this PIM protocol instance. |
| BSR State | The state of the router with respect to the Bootstrap mechanism. |
| Address | The address of the elected Bootstrap router. |
| Expiry Time | The time remaining before the router sends the next Bootstrap message. |
| Priority | The priority of the elected Bootstrap router. The higher the value, the higher the priority. |
| Hash Mask Length | The hash mask length of the Bootstrap router. |
| Up Time | The time since the current E-BSR became the Bootstrap router. |
| RPF Intf towards | The RPF interface towards the elected BSR. The value is zero if there is no elected BSR in the network. |
| Address | The address of the candidate BSR OS. |
| Expiry Time | The time remaining before the router sends the next Bootstrap message. |
| Auto-RP | Displays if auto-RP functionality is enabled or disabled. |
| Priority | The priority of the Bootstrap router. The higher the value, the higher the priority. |
| Hash Mask Length | The hash mask length of the candidate Bootstrap router. |
| Up Time | The time since becoming the Bootstrap router. |
| Admin State | The administrative status of CRP. |
| Oper State | The current operating state of the C-RP mechanism. |
| Address | The local RP address. |
| Priority | The CRP's priority for becoming a rendezvous point (RP). A 0 value is the highest priority. |

| Label | Description |
|------------------------------|---|
| Holdtime | The hold time of the candidate RP. It is used by the Bootstrap router to time out the RP entries if it does not listen to another CRP advertisement within the holdtime period. |
| Policy | The PIM policies for a particular PIM instance. |
| Default Group | The default core group address. |
| RPF Table | The route table used for RPF check. |
| MC-ECMP-Hashing | Displays whether hash-based multicast balancing of traffic over ECMP links is enabled or disabled. |
| SSM S,G Scaling (up to 256K) | The status of PIM SSM scaling. |

Table 532: Show cflowd Status Fields

| Label | Description |
|-----------------------|---|
| Cflowd Admin Status | The desired administrative state for this cflowd remote collector host |
| Cflowd Oper Status | The current operational status of this cflowd remote collector host |
| Active Flow Timeout | The maximum amount of time, in minutes, before an active flow will be exported; if an individual flow is active for this amount of time, the flow is exported and a new flow is created |
| Inactive Flow Timeout | Inactive flow timeout in seconds |
| Template Retransmit | The time in seconds before template definitions are sent |
| Cache Size | The maximum number of active flows to be maintained in the flow cache table |
| Overflow | The percentage number of flows to be flushed when the flow cache size has been exceeded |
| Analyze GRE | Displays whether cflowd analysis of the inner IP packet in a sampled GRE packet that is transiting the local router is enabled or disabled |
| Analyze L2TPv2 | Displays whether cflowd looking for and analyzing the inner IP header of an L2TPv2 frame is enabled or disabled |
| Analyze IPV4overV6 | Displays whether cflowd looking for and analyze the inner IPv4 header of IPv4overIPv6 frames that include MAP-E as well as DS-Lite and SAM traffic is enabled or disabled |
| Sample Rate | The rate at which traffic is sampled and forwarded for cflowd analysis: one (1) — all packets are analyzed 1000 (default) — every 1000th packet is analyzed |
| Active Flows | The current number of active flows being collected |
| Total Pkts Rcvd | The total number of packets sampled and forwarded for cflowd analysis |
| Total Pkts Dropped | The total number of packets dropped |
| Aggregation Info: | |
| Type | The type of data to be aggregated and to the collector |
| Status | enabled — specifies that the aggregation type is enabled |

| Label | Description |
|-----------------|---|
| | disabled — specifies that the aggregation type is disabled |
| Sent | The number of packets with flow data sent to the associated collector |
| Open | This counter shows the number of partially filled packets which have some flow data but are not yet filled or have been timed out (60 seconds maximum) |
| Error | This counter increments when there was an error during exporting of the collector packet; the most common reason will be a UDP unreachable destination for the configured collector |
| Overflow events | The number of times the active cache overflowed |
| Dropped Flows | Total number of flows dropped due to cache overflow events |

Table 533: IS-IS Status Output Fields

| Label | Description |
|----------------------|---|
| System Id | The configured and operational IS-IS system ID. |
| Router Id | The configured and operational IS-IS router ID. |
| Admin State | Up — IS-IS is administratively up. |
| Oper State | Down — IS-IS is administratively down. |
| Ipv4 Routing | Enabled — IPv4 routing is enabled. Disabled — IPv4 routing is disabled. |
| Ipv6 Routing | Disabled — IPv6 routing is disabled. Enabled, Native — IPv6 routing is enabled. Enabled, Multi-topology — Multi-topology TLVs for IPv6 routing is enabled. |
| Multi-topology | Disabled — Multi-topology TLVs for IPv6 routing is disabled. Enabled — Multi-topology TLVs for IPv6 routing is enabled. |
| Last Enabled | The date and time when IS-IS was last enabled in the router. |
| Level Capability | The routing level for the IS-IS routing process. |
| Authentication Check | True — All IS-IS mismatched protocol packets are rejected. False — Authentication is performed on received IS-IS protocol packets but mismatched packets are not rejected. |
| Authentication Type | The method of authentication used to verify the authenticity of packets sent by neighboring routers on an IS-IS interface. |
| Traffic Engineering | Enabled — TE is enabled for the router. Disabled — TE is disabled so that TE metrics are not generated and are ignored when received by this node. |
| Graceful Restart | Enabled — Graceful restart is enabled for this instance of IS-IS on the router. Disabled — Graceful restart capability is disabled for this instance of IS-IS on the router. |
| Ldp Sync Admin State | Indicates whether the IGP-LDP synchronization feature is enabled or disabled on all interfaces participating in the OSPF routing protocol. |

| Label | Description |
|--------------------|---|
| LFA NH Template | Indicates the LFA template that is applied for the configured LFA policies. |
| LFA Policies | Indicates the configured LFA policies. |
| Loopfree-Alternate | Indicates if Loop-Free Alternate (LFA) is enabled or disabled in this IS-IS instance. |

Output

OSPF Status Output Fields

[Table 534: OSPF Status Output Fields](#) describes the command output fields for OSPF status.

Table 534: OSPF Status Output Fields

| Label | Description |
|-------------------|---|
| OSPF Router Id | A 32-bit integer uniquely identifying the router in the Autonomous System. The SR OS system defaults to the System IP address or if not configured the 32 least significant bits of the system MAC address. |
| OSPF Version | The current version number of the OSPF protocol is 2. |
| OSPF Admin Status | Disabled — Denotes that the OSPF process is disabled on all interfaces. |

| Label | Description |
|----------------------------|---|
| | Enabled — Denotes that the OSPF process is active on at least one interface. |
| OSPF Oper Status | Disabled — Denotes that the OSPF process is not operational on all interfaces. Enabled — Denotes that the OSPF process is operational on at least one interface. |
| Preference | The route preference for OSPF internal routes. |
| External Preference | The route preference for OSPF external routes. |
| Backbone Router | False — This variable indicates that this router is not configured as an OSPF back bone router. True — This variable indicates that this router is configured as an OSPF back bone router. |
| Area Border Router | False — This router is not an area border router. True — This router is an area border router. |
| AS Border Router | False — This router is not configured as an Autonomous System border router. True — This router is configured as an Autonomous System border router. |
| OSPF Ldp Sync Admin Status | Indicates whether the IGP-LDP synchronization feature is enabled or disabled on all interfaces participating in the OSPF routing protocol. |

Syntax

status

Context

[\[Tree\]](#) (show>router>gmpls status)

Full Context

show router gmpls status

Description

This command displays GMPLS operation information.

Platforms

7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

22.130 steering-profile

steering-profile

Syntax

steering-profile *steering-profile-name*

Context

[\[Tree\]](#) (show>subscr-mgmt steering-profile)

Full Context

show subscriber-mgmt steering-profile

Description

This command displays steering profile information.

Parameters

steering-profile-name

Specifies an existing steering profile name.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

22.131 sticky-dest

sticky-dest

Syntax

sticky-dest

Context

[\[Tree\]](#) (tools>dump>filter>resources sticky-dest)

Full Context

tools dump filter resources sticky-dest

Description

This command displays information about resources pertaining to sticky destinations timers.

Platforms

All

Output

The following output is an example of sticky destination filter action information.

Sample Output

```
=====
Filter action - Sticky-dest resources
=====
Used   : 1
Free   : 2047
Total  : 2048
=====
```

22.132 sticky-leases

sticky-leases

Syntax

sticky-leases [*hostname*]

Context

[\[Tree\]](#) (show>router>dhcp>server sticky-leases)

Full Context

show router dhcp local-dhcp-server sticky-leases

Description

This command shows either all sticky leases or a single specific sticky lease created under the specified DHCP server.

Parameters

hostname

Specifies the name of the host for which an entry is created.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of sticky lease information

Sample Output

```
Node# show router dhcp local-dhcp-server "dhcp_server" sticky-leases
=====
DHCP Server Sticky Leases
=====
Hostname                               IP address
-----
test_lease                             10.0.0.1
-----
No. of Matching Entries: 1
=====
```

[Table 535: Sticky Leases Field Descriptions](#) describes the sticky leases field descriptions.

Table 535: Sticky Leases Field Descriptions

| Field | Description |
|-------------------------|--|
| Hostname | The name of the sticky host |
| IP address | The IP address of the sticky host |
| No. of Matching Entries | The total numbers of entries matching the command criteria |

sticky-leases

Syntax

sticky-leases hostname [*hostname*]

sticky-leases hostname-prefix [*hostname-prefix*]

Context

[\[Tree\]](#) (clear>router>dhcp>server sticky-leases)

Full Context

clear router dhcp local-dhcp-server sticky-leases

Description

This command clears sticky leases.

Parameters

hostname

Clears information about the name of the host for which an entry is cleared.

hostname-prefix

Clears information about the sub-string of all host names starting with that sub-string.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

22.133 stop

stop

Syntax

stop

Context

[\[Tree\]](#) (tools>perform>router>l2tp>group stop)

Full Context

tools perform router l2tp group stop

Description

This command triggers an attempt to immediately stop all the L2TP connections within the specified L2TP tunnel group.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

stop

Syntax

stop

Context

[\[Tree\]](#) (tools>perform>router>l2tp>tunnel stop)

[\[Tree\]](#) (tools>perform>router>l2tp>group>tunnel stop)

Full Context

tools perform router l2tp tunnel stop

tools perform router l2tp group tunnel stop

Description

This command triggers an attempt to immediately stop all the L2TP connections within the specified L2TP tunnel.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

stop

Syntax

stop [*script-policy-name*] [**owner** *script-policy-owner*] [**all**]

Context

[\[Tree\]](#) (tools>perform>system>script-control>script-policy stop)

Full Context

tools perform system script-control script-policy stop

Description

This command stops the execution of scripts.

Parameters

script-policy-name

Specifies to only stop scripts with the specified script-policy, up to 32 characters.

script-policy-owner

Specifies to only stop scripts that are associated with script-policies with the specified owner, up to 32 characters.

Default TiMOS CLI

all

Specifies to stop all running scripts.

Platforms

All

22.134 stp

stp

Syntax

stp [**detail**]

Context

[\[Tree\]](#) (show>service>id stp)

Full Context

Table 536: [Service-ID STP Field Descriptions](#) describes show service-id STP output fields:

Table 536: Service-ID STP Field Descriptions

| Label | Description |
|--------------------|--|
| RSTP Admin State | The administrative state of the Rapid Spanning Tree Protocol instance associated with this service |
| Core Connectivity | The connectivity status to the core |
| RSTP Oper State | The operational state of the Rapid Spanning Tree Protocol instance associated with this service. This field is applicable only when STP is enabled on the router. |
| Bridge-id | The MAC address used to identify this bridge in the network. |
| Hold Time | The interval length during which no more than two Configuration BPDUs shall be transmitted by this bridge |
| Bridge fwd delay | The speed of bridge state changes when moving toward the forwarding state |
| Bridge Hello time | The amount of time between the transmission of Configuration BPDUs |
| Bridge max age | The maximum age of spanning tree protocol information learned from the network on any port before it is discarded. This is the actual value that this bridge is currently using. |
| Bridge priority | The priority of the spanning tree protocol instance associated with this service |
| Topology change | Topology change is currently in progress. |
| Last Top. change | The time (in hundredths of a second) since the last time a topology change was detected by the Spanning Tree Protocol instance associated with this service |
| Top. change count | The total number of topology changes detected by the Spanning Tree Protocol instance associated with this service since the management entity was last reset or initialized |
| Root bridge-id | The Root bridge-id |
| Root path cost | The Root path cost |
| Root forward delay | The Root forward delay |
| Root hello time | The Root hello time |

| Label | Description |
|--------------------------|--------------------------|
| Root max age | The Root maximum age |
| Root priority | The Root priority level |
| Root port | The Root port number |
| SAP Identifier | The SAP identifier |
| RSTP State | The RSTP state |
| STP Port State | The STP port state |
| BPDU encap | The BPDU encapsulation |
| Port Number | The port number |
| Priority | The priority level |
| Cost | The cost |
| Fast Start | The fast start state |
| Designated Port | The designated port |
| Designated Bridge | The designated bridge |
| Sap/Spoke Id | The SAP or spoke ID |
| Oper-State | The operational state |
| Prune-State | The prune state |
| Port-State | The port state |
| Managed by Service | The managed service |
| Managed by Sap/ spoke | The managed SAP or spoke |

[Table 537: Subscriber Identification Policy Field Descriptions](#) describes subscriber identification policy output fields.

Table 537: Subscriber Identification Policy Field Descriptions

| Field | Description |
|--|---|
| Name | The subscriber identification policy name |
| Description | The user provided description of this policy |
| Number of Subscriber Identification Policies | The total number of subscriber identification policies configured on the node |
| Sub Profile Map | The subscriber profile used to define the aggregate QoS for all hosts within a subscriber context |
| Key | The key that defines the auto-generated subscriber identification key for PPP hosts. |
| Sub profile | A list of subscriber identification profiles |
| SLA profile | A list of SLA profiles |
| Admin State | The administrative state of the Python scripts |
| Oper State | The operational state of the Python scripts |
| Script Name | The Python policy script name |
| SAP Associations | The subscriber identification policy SAP associations |
| Service-Id | The service ID associated with the subscriber identification policy |
| SAP | The SAP ID associated with the subscriber identification policy |
| URL | The URL of the script to change the Python message |
| Admin State | The admin state of the script |

| Field | Description |
|------------------|---|
| Oper State | The operational state of the script |
| Primary Script | Information about the primary Python script |
| Secondary Script | Information about the secondary Python script |

sub-mcac

Syntax

sub-mcac [**subscriber** *sub-ident-string*] [**policy** *sub-mcac-policy-name*]

Context

[\[Tree\]](#) (show>service>active-subscribers sub-mcac)

Full Context

show service active-subscribers sub-mcac

Description

This command displays active subscriber MCAC information.

Parameters

sub-ident-string

Specifies the subscriber identification string, up to 32 characters.

sub-mac-policy-name

Specifies the subscriber MAC policy name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following is an example of active subscriber MCAC information.

Sample Output

```
*A:eng-BNG-2# show service active-subscribers sub-mcac
=====
Active Subscribers Sub-MCAC
=====
Subscriber                : user_1

| | pxc | keyword |
| | <i>id</i> | 1 to 64 |
| | <i>sub-port</i> | a, b |

ip-prefix/ip-prefix-length

Specifies information for the specified IP prefix and mask length.

- Values**
- ipv4-prefix* — a.b.c.d
 - ipv4-prefix-length* — 0 to 32
 - ipv6-prefix* — x:x:x:x:x:x:x (eight 16-bit pieces)
 - x:x:x:x:x:d.d.d.d
 - x — [0..FFFF]H

d — [0..255]D
ipv6-prefix-length — 0 to 128

ieee-address

Specifies the MAC address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx (cannot be all zeros)

pppoe-session-id

Specifies the PPPoE session ID.

Values 0 to 65535

sub-service-name

Specifies the subscriber service name, up to 255 characters.

sub-service-type

Specifies the subscriber service type, up to 255 characters.

summary

Displays summary information.

associations

Displays information associated with the subscriber service.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

22.141 subnet-ext-stats

subnet-ext-stats

Syntax

subnet-ext-stats *ip-address*[/*mask*]

subnet-ext-stats pool *pool-name*

Context

[\[Tree\]](#) (show>router>dhcp>server subnet-ext-stats)

Full Context

show router dhcp local-dhcp-server subnet-ext-stats

Description

This command displays extended statistics per DHCPv4 subnet in local DHCPv4 server.

The following statistics are included in output:

- The number of stable leases in the subnet
- The number of provisioned address in the subnet
- The number of used address in the subnet
- The number of free address in the subnet
- The percentage of used address
- The percentage of free address

For each statistic (except for Provisioned Addresses), there is current value and peak value, peak value is the highest value since subnet creation or last reset via the **clear router *rt-id* dhcp local-dhcp-server *svr-name* subnet-ext-stats** command.

When parameter pool is used, the statistics of each subnet in the pool are displayed.

Parameters

ip-address[/mask]

Specifies the subnet and mask.

pool-name

Specifies the name of local DHCPv4 server pool.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of subnet extended statistics information.

Sample Output

```
show router 500 dhcp local-dhcp-server "d4" subnet-ext-stats 239.10.10.0/24
=====
Extended statistics for subnet 239.10.10.0/24

[Table 539: Extended Subnet Statistics Field Descriptions](#) describes extended subnet statistics output field descriptions.

Table 539: Extended Subnet Statistics Field Descriptions

| Field | Descriptions |
|---------------------|---|
| Current | The current statistics for the subnet |
| Peak | The peak statistics for the subnet |
| TimeStamp | The timestamp for the last reset |
| Stable Leases | The number of stable leases |
| Provision Addresses | The number of provisioned addresses in this subnet |
| Used Addresses | The number of used addresses in this subnet |
| Free Address | The number of free addresses in this subnet |
| Used Pct | The percentage of addresses in this subnet in use |
| Free Pct | The percentage of addresses in this subnet currently unused |
| Last Reset Time | The time of the last reset |
| Number of entries | The total number of entries |

subnet-ext-stats

Syntax

subnet-ext-stats *ip-address[/mask]*

subnet-ext-stats *pool pool-name*

Context

[Tree] (clear>router>dhcp>server subnet-ext-stats)

Full Context

clear router dhcp local-dhcp-server subnet-ext-stats

Description

This command clears extended subnet statistics.

Parameters

ip-address[/mask]

Clears the specified IP address and mask.

pool-name

Clears statistics for the specified pool name.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

22.142 subnet-stats

22.143 subscribe-to

subscribe-to

Syntax

subscribe-to *log-id log-id*

Context

[\[Tree\]](#) (tools>perform>log subscribe-to)

Full Context

tools perform log subscribe-to

Description

This command subscribes the current CLI session to the specified CLI log. Log events for the specified log will be output in the current CLI session until the CLI session closes or an unsubscribe-from command is used.

Parameters

log-id

Specifies the log ID for which subscription is requested.

Values 1 to 101

Platforms

All

22.144 subscriber

subscriber

Syntax

subscriber *sub-ident-string* **sap** *sap-id* **sla-profile** *sla-profile-name* [**scheduler** *scheduler-name*] [**spi-sharing-type** *spi-sharing-type*] [**spi-sharing-id** *spi-sharing-id*]

subscriber *sub-ident-string* [**scheduler** *scheduler-name*] [**ingress** | **egress**]

Context

[\[Tree\]](#) (clear>qos>scheduler-stats subscriber)

Full Context

clear qos scheduler-stats subscriber

Description

This command clears scheduler stats by subscriber.

Parameters

sub-ident-string

Clears information for the specified subscriber name.

sap-id

Clears information for the specified SAP.

sla-profile-name

Clears information for the specified SLA profile name.

scheduler-name

Clears information for the specified scheduler.

spi-sharing-type

Clears information for sessions with the specified SPI sharing type.

Values per-group, per-session-ipoe, per-session-ppp

spi-sharing-id

Clears information for sessions with the specified SPI sharing type and sharing identifier.
The SPI group identifier is:

- an identifier when the sharing type is per-group
- an internal PPP or IPoE sharing identifier when the sharing type is a per-PPP or per-IPoE session

Values 0 to 4294967295

egress

Clears egress information for the subscriber.

ingress

Clears ingress information for the subscriber.

Platforms

All

subscriber

Syntax

subscriber *sub-ident-string*

Context

[\[Tree\]](#) (clear>service>statistics subscriber)

Full Context

clear service statistics subscriber

Description

This command clears the statistics for a particular subscriber.

Parameters

sub-ident-string

Clears statistics for the specified subscriber identification string.

Platforms

All

subscriber

Syntax

subscriber *sub-ident-string*

subscriber *sub-ident-string* **detail**

subscriber *sub-ident-string* **mirror**

subscriber *sub-ident-string* **sap** *sap-id* **sla-profile** *sla-profile-name* [**spi-sharing-type** *spi-sharing-type*]
[**spi-sharing-id** *spi-sharing-id*]

subscriber *sub-ident-string* **sap** *sap-id* **sla-profile** *sla-profile-name* [**spi-sharing-type** *spi-sharing-type*]
[**spi-sharing-id** *spi-sharing-id*] **detail**

[**spi-sharing-id** *spi-sharing-id*] **mirror**

Context

[Tree] (show>service>active-subscribers subscriber)

Full Context

show service active-subscribers subscriber

Description

This command displays active subscriber information for a subscriber.

Parameters

sub-ident-string

Displays the subscriber ID of the active subscriber, up to 32 characters.

sap-id

Displays the physical port identifier portion of the SAP definition.

sla-profile-name

Displays the existing SLA profile name, up to 32 characters.

spi-sharing-type

Displays subscriber information for sessions with the specified SPI sharing type.

Values per-group, per-session-ipoe, per-session-ppp

spi-sharing-id

Displays subscriber information for sessions with the specified SPI sharing type and sharing identifier. The SPI group ID is:

- a group id when sharing type is per-group
- an internal PPP or IPoE sharing id when the sharing type is per-PPP or per-IPoE session

Values 0 to 4294967295

detail

Displays detailed output.

mirror

Displays mirrored output.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of subscriber information for active subscribers.

```
show qos policer-hierarchy subscriber
```

Description

This command displays information about the policer hierarchy per subscriber.

Parameters

sub-ident-string

Displays information about the specified subscriber.

ingress

Displays ingress information about the specified subscriber.

egress

Displays egress information about the specified subscriber.

detail

Displays detailed information.

root-detail

Displays detailed information about the arbiter root.

thresholds

Displays threshold, parenting, rate, and traffic information related to a policer.

priority-info

Displays threshold information related to the root arbiter.

depth

Displays bucket depth, parenting, rate, and traffic information related to a policer.

port-id

Displays information about the specified port.

Values *slot/mda/port[.channel]*

name

Displays information about the named QoS arbiter.

root

Displays information about the arbiter root.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

subscriber

Syntax

subscriber *sub-ident-string* [**scheduler** *scheduler-name*] [{**ingress** | **egress**}] [**detail**]

subscriber *sub-ident-string* **sla-profile** *sla-profile-name* **sap** *sap-id* [**scheduler** *scheduler-name*] [**detail**]

Full Context

show qos scheduler-hierarchy subscriber

Description

This command displays the scheduler hierarchy per subscriber.

Parameters

sub-ident-string

Displays the subscriber identification policy name.

scheduler-name

Displays the scheduler name.

ingress

Displays ingress SAP subscriber scheduler stats.

egress

Displays egress SAP subscriber scheduler stats.

detail

Displays detailed information.

sla-profile-name

Displays information for the specified sla-profile-name.

spi-sharing-type

Displays subscriber scheduler hierarchy information for sessions with the specified SLA Profile Instance sharing type.

Values per-group, per-session-ipoe, per-session-ppp

spi-sharing-id

Displays subscriber scheduler hierarchy information for sessions with the specified SLA Profile Instance sharing type and sharing identifier. The spi-sharing-id is:

- a group id when sharing type is per-group
- an internal PPP or IPoE sharing id when the grouping type is per-PPP or per-IPoE-session

Context

[\[Tree\]](#) (show>qos>scheduler-stats subscriber)

Full Context

show qos scheduler-stats subscriber

Description

This command displays scheduler statistics information.

Parameters

sub-ident-string

Specifies an existing SLA profile string.

scheduler-name

Specifies an existing scheduler name.

ingress

Display only the policy displayed on ingress.

egress

Display only the policy displayed on egress.

sla-profile-name

Displays information for the specified sla-profile-name.

spi-sharing-type

Displays subscriber scheduler hierarchy information for sessions with the specified SLA Profile Instance sharing type.

Values per-group, per-session-ipoe, per-session-ppp

spi-sharing-id

Displays subscriber scheduler hierarchy information for sessions with the specified SLA Profile Instance sharing type and sharing identifier. The spi-sharing-id is:

- a group id when sharing type is per-group

- an internal PPP or IPoE sharing id when the sharing type is per-PPP or per-IPoE-session

sla-profile-name

Specifies an existing SLA profile. The name can be a maximum of 32 characters long.

seconds

Configures the interval for each display, in seconds.

Values 11 to 60

Default 11

repeat

Configures how many times the command is repeated.

Values 1 to 999

Default 10

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

Default mode delta

rate

Displays rate-per-second for each statistic instead of the delta.

base

Monitor base statistics.

egress-policer-id

Monitors statistics for the policer.

Values 1 to 63

egress-queue-id

Monitors statistics for this queue.

Values 1 to 8

ingress-policer-id

Monitors statistics for this policer.

Values 1 to 63

ingress-queue-id

Monitors statistics for this queue.

Values 1 to 32

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of subscriber-information.

Sample Output

```

subscriber

Syntax

subscriber *sub-ident-string* [**arbiter** {**root** | *name*}] [**ingress** | **egress**] [**interval** *seconds*] [**repeat** *repeat*]
 [**absolute** | **rate**]

Context

[\[Tree\]](#) (monitor>qos>arbiter-stats subscriber)

Full Context

monitor qos arbiter-stats subscriber

Description

This command monitors arbiter statistics for a subscriber.

Parameters

sub-ident-string

Specifies an existing subscriber identification policy name, up to 32 characters.

name

Specifies the name of the policer control policy arbiter.

root

Specifies the arbiter to which this queue would be feeding.

ingress

Displays arbiter name statistics applied on the ingress SAP.

egress

Displays arbiter name statistics applied on the egress SAP.

seconds

Configures the interval for each display in seconds.

Values 11 to 60

Default 11 seconds

repeat

Configures how many times the command is repeated.

Values 1 to 999

Default 10

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic instead of the delta.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

subscriber

Syntax

subscriber *sub-ident-string* [**scheduler** *scheduler-name*] [**ingress** | **egress**] [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

subscriber *sub-ident-string* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**] **sap** *sap-id* **sla-profile** *sla-profile-name*

Context

[\[Tree\]](#) (monitor>qos>scheduler-stats subscriber)

Full Context

monitor qos scheduler-stats subscriber

Description

This command monitors scheduler statistics for a subscriber.

Parameters

sub-ident-string

Specifies an existing subscriber identification policy name, up to 32 characters.

scheduler-name

Specifies an existing QoS scheduler policy name, up to 32 characters. Scheduler names are configured in the **config>qos>scheduler-policy>tier** level context.

ingress

Displays *scheduler-name* statistics applied on the ingress SAP.

egress

Displays *scheduler-name* statistics applied on the egress SAP.

seconds

Configures the interval for each display in seconds.

Values 11 to 60

Default 11 seconds

repeat

Configures how many times the command is repeated.

Values 1 to 999

Default 10

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic instead of the delta.

sap-id

Specifies the physical port identifier portion of the SAP definition.

sla-profile-name

Specifies the SLA profile belonging to the subscriber host, up to 32 characters.

Platforms

All

subscriber

Syntax

subscriber *sub-ident-string* [**arbiter** {*name* | *root?*}] [**ingress** | **egress**]

Context

[\[Tree\]](#) (clear>qos>arbiter-stats subscriber)

Full Context

clear qos arbiter-stats subscriber

Description

This command clears the arbiter statistics per subscriber.

Parameters

sub-ident-string

Specifies the subscriber identification policy name, up to 32 characters.

name

Specifies the arbiter name, up to 32 characters.

root

Specifies the arbiter root, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

subscriber

Syntax

subscriber id *subscriber-id* [**statistics**]

subscriber all [**statistics**]

Context

[\[Tree\]](#) (clear>subscr-mgmt>host-tracking subscriber)

Full Context

clear subscriber-mgmt host-tracking subscriber

Description

This command clears the host tracking data for a subscriber.

Parameters

subscriber-id

Specifies subscriber ID, up to 32 characters.

all

Clears all host tracking data.

statistics

Clears statistical host tracking information for the specified subscriber ID.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

subscriber

Syntax

subscriber *sub-ident-string* [**arbiter** *name* | *root*] [**ingress** | **egress**]

Context

[\[Tree\]](#) (show>qos>arbiter-stats subscriber)

Full Context

show qos arbiter-stats subscriber

Description

This command displays the arbiter statistics per subscriber.

Parameters

sub-ident-string

Displays information about the specified subscriber, up to 32 characters for the 7950 XRS and VSR platforms and up to 64 characters for all other platforms.

name

Specifies the arbiter name, up to 32 characters.

root

Specifies the arbiter root, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

subscriber

Syntax

subscriber *sub-ident-string* [**sla-profile** *sla-profile-name*] [**ingress** | **egress**] [**detail**] [**port** *port-id*]

Context

[\[Tree\]](#) (show>qos>policer subscriber)

Full Context

show qos policer subscriber

Description

This command displays the policer statistics per port.

Parameters

sub-ident-string

Displays information about the specified subscriber, up to 32 characters for the 7950 XRS and VSR platforms and up to 64 characters for all other platforms.

sla-profile-name

Specifies the queue group name, up to 32 characters.

port-id

Displays information about the specified port.

| Values | <i>slot/mda/port</i> | | |
|---------------|----------------------|--------------------------|---------|
| | eth-sat-id | esat-id/slot/port | |
| | | esat | keyword |
| | | <i>id</i> | 1 to 20 |
| | pxc-id | pxc-id.sub-port | |
| | | pxc | keyword |
| | | <i>id</i> | 1 to 64 |
| | | <i>sub-port</i> | a, b |

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

22.145 subscriber-hosts

subscriber-hosts

Syntax

subscriber-hosts

Context

[\[Tree\]](#) (clear>service>id subscriber-hosts)

Full Context

clear service id subscriber-hosts

Description

Commands in this context clear information for a particular subscriber host.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

subscriber-hosts

Syntax

subscriber-hosts [**sap** *sap-id*] [**ip** *ip-prefix/prefix-length*] [**mac** *ieee-address*] [**sub-profile** *sub-profile-name*] [**sla-profile** *sla-profile-name*] [**app-profile** *app-profile-name*] [**wholesaler** *service-id*] [**address-origin** *address-origin*] [**detail**] [**statistics**] [**spi-sharing-type** *spi-sharing-type*] [**spi-sharing-id** *spi-sharing-id*]

Context

[Tree] (show>service>id subscriber-hosts)

Full Context

show service id subscriber-hosts

Description

This command displays subscriber host information.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

ip-prefix/prefix-length

Shows information for the specified IP address and mask.

Values *ipv4-prefix* — a.b.c.d (host bits must be 0)
 ipv4-prefix-length — 0 to 32
 ipv6-prefix — x:x:x:x:x:x:x (eight 16-bit pieces)
 x:x:x:x:x:d.d.d.d
 x — [0..FFFF]H
 d — [0..255]D
 ipv6-prefix-length — 0 to 128

ieee-address

Displays information only for the specified 48-bit MAC address. The MAC address can be expressed in the form *aa:bb:cc:dd:ee:ff* or *aa-bb-cc-dd-ee-ff* where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers.

sub-profile-name

Displays an existing subscriber profile name to be associated with the static subscriber host. The subscriber profile is configured in the **config>subscr-mgmt>sub-profile** context.

sla-profile-name

Displays subscriber host information for hosts with the specified SLA profile name.

app-profile-name

Specifies an existing SLA app profile name, up to 32 characters.

service-id

Specifies the ID that uniquely identifies a service.

Values service-id: 1 to 214748364
 svc-name: string, up to 64 characters.

address-origin

Specifies an address origin.

Values aaa, dynamic, static, bonding

detail

Displays detailed information.

statistics

Displays the HTTP redirect statistics for the host. The redirect statistics are divided into HTTP GET and HTTP response for redirection.

spi-sharing-type

Displays subscriber host information for hosts with the specified SPI sharing type.

Values per-group, per-session-ipoe, per-session-ppp

spi-sharing-id

Displays subscriber host information for hosts with the specified SPI sharing type and sharing identifier. The SPI group ID is:

- a sharing ID when the sharing type is per-group
- an internal PPP or IPoE sharing ID when the sharing type is per-PPP or per-IPoE session

Values 0 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output displays an example of subscriber host information.

22.148 subscriber-using

subscriber-using

Syntax

subscriber-using [**service-id** *service-id*] [**sap-id** *sap-id*] [**interface** *ip-int-name*] [**ip** *ip-address*[/*mask*]]
[**mac** *ieee-address*] [**sub-profile** *sub-profile-name*] [**sla-profile** *sla-profile-name*] [**app-profile** *app-profile-name*] [**port** *port-id*] [**no-inter-dest-id** | **inter-dest-id** *intermediate-destination-id*]

Context

[\[Tree\]](#) (show>service subscriber-using)

Full Context

show service subscriber-using

Description

This command displays selective subscriber information using specific options.

Parameters

service-id

Specifies the ID that uniquely identifies a service.

sap-id

Displays the physical port identifier portion of the SAP definition.

ip-int-name

Shows DHCP statistics on the specified interface.

port-id

Indicates the SAP or SDP for which this entry contains information.

ip-address[/mask]

Shows information for the specified IP address and mask.

ieee-address

Displays information only for the specified 48-bit MAC address. The MAC address can be expressed in the form *aa:bb:cc:dd:ee:ff* or *aa-bb-cc-dd-ee-ff* where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers.

sub-profile-name

Displays an existing subscriber profile name to be associated with the static subscriber host. The subscriber profile is configured in the **config>subscr-mgmt>sub-profile** context.

sla-profile-name

Specifies an existing SLA profile name.

app-profile-name

Displays the profile of the specified application.

intermediate-destination-id

Indicates the intermediate destination identifier received from either the DHCP or RADIUS server, or the local user database.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output displays an example of selective subscriber information.

Sample Output

```

Full Context

show system telemetry grpc subscription

Description

This command displays the active telemetry gRPC subscriptions.

Parameters

subscription-id

A unique subscription ID or number that is assigned by the SR OS gRPC server to each active telemetry subscription.

paths

Indicates that the **show** command output includes all paths with the respective subscription ID information.

Platforms

All

Output

The following output describes the telemetry gRPC subscription fields.

Sample Output

```

show service id dhcp summary

Description

This command displays DHCP configuration summary information.

Parameters

interface-name

Displays information for the specified IP interface.

Values 32 characters maximum.

saps

Displays SAPs per interface.

Platforms

All

Output

The following output is an example of DHCP summary information, and [Table 551: Show Service-ID DHCP Summary Field Descriptions](#) describes the output fields.

Sample Output

```
A:ALA-49# show service id 1 dhcp summary
=====
DHCP Summary, service 1
=====
Interface Name      Arp      Used/      Info      Admin
SapId/Sdp           Populate Provided      Option    State
-----
SpokeSDP            No        0/0        Keep      Up

```

Table 551: Show Service-ID DHCP Summary Field Descriptions

| Label | Description |
|-----------------|---|
| Sap/Sdp | The configuration identification, expressed by a string containing "card/mda/port:/logical-id". |
| Snoop | Yes — The packets received from the DHCP clients were snooped. No — The packets received from the DHCP clients were not snooped. |
| Used/Provided | Used — The number of lease-states that are currently in use on a specific interface, that is, the number of clients on that interface got an IP address by DHCP. This value is always less than or equal to the 'Provided' field. Provided — The lease-populate value that is configured for a specific interface. |
| Arp Reply Agent | Displays whether or not there is proper handling of received ARP requests from subscribers. |
| Info Option | Keep — The existing information is kept on the packet and the router does not add any additional information. Replace — On ingress, the existing information-option is replaced with the information-option from the router. Drop —The packet is dropped and an error is logged. |

| Label | Description |
|-------------|-------------------------------------|
| Admin State | Indicates the administrative state. |

show router bgp summary

Description

This command displays a summary of BGP neighbor information.

If confederations are not configured, that information is not displayed in the command output.

The "State" field displays the global BGP operational state. The valid values are:

- Up — BGP global process is configured and running.
- Down — BGP global process is administratively shutdown and not running.
- Disabled — BGP global process is operationally disabled. The process must be restarted by the operator. For example, if a BGP peer is operationally disabled, the state in the summary table shows the state 'Disabled'.

Parameters

all

Displays BGP peers in all instances.

family

Specifies the type of routing information to be distributed by the BGP instance.

Values pv4, vpn-ipv4, ipv6, mcast-ipv4, vpn-ipv6, l2-vpn, mdt-safi, ms-pw, mvpn-ipv4, flow-ipv4, route-target, mcast-vpn-ipv4, mvpn-ipv6, flow-ipv6, evpn, mcast-ipv6, label-ipv4, label-ipv6, bgp-ls

name

Specifies the group name up to 32 characters.

Platforms

All

Output

The following output is an example of BGP summary information, and [Table 553: Show BGP Summary Field Descriptions](#) describes the output fields.

Sample Output

```
A:Dut-B>config>router>bgp# show router bgp summary
=====

Table 553: Show BGP Summary Field Descriptions

| Label | Description |
|-------------------------|--|
| BGP Router ID | The local BGP router ID |
| AS | The configured autonomous system number |
| Local AS | The configured local AS setting, if not configured it is the same as the system AS |
| BGP Admin State | Down — BGP is administratively disabled Up — BGP is administratively enabled |
| BGP Oper State | Down — BGP is operationally disabled Up — BGP is operationally enabled |
| Confederation AS | The configured confederation AS |
| Current Internal Groups | The current number of internal BGP peer groups. BGP peers are grouped within the BGP software to optimize the building of UPDATE messages towards peers with a similar configuration. An internal group is not the same as a configured BGP peer group. |

| Label | Description |
|-------------------------|--|
| Max Internal Groups | The maximum number of internal BGP peer groups that existed at any point since the last restart of BGP. BGP peers are grouped within the BGP software to optimize the building of UPDATE messages towards peers with a similar configuration. An internal group is not the same as a configured BGP peer group. |
| Member Confederations | The configured members of the BGP confederation |
| Number of Peer Groups | The total number of configured BGP peer groups |
| Number of Peers | The total number of configured BGP peers |
| Total BGP Active Routes | The total number of BGP routes used in the forwarding table |
| Total BGP Routes | The total number of BGP routes learned from BGP peers |
| Total BGP Paths | The total number of unique sets of BGP path attributes learned from BGP peers |
| Total Path Memory | Total amount of memory used to store the path attributes |
| Total Suppressed Routes | Total number of suppressed routes due to route damping |
| Total History Routes | Total number of routes with history due to route damping |
| Total Decayed Routes | Total number of decayed routes due to route damping |
| Neighbor | BGP neighbor address |
| AS (Neighbor) | BGP neighbor autonomous system number |
| PktRcvd | Total number of packets received from the BGP neighbor |
| PktSent | Total number of packets sent to the BGP neighbor |
| InQ | The number of BGP messages to be processed |
| OutQ | The number of BGP messages to be transmitted |
| Up/Down | The amount of time that the BGP neighbor has either been established or not established depending on its current state |
| State Recv/Actv/Sent | The BGP neighbor's current state (if not established) or the number of received routes, active routes and sent routes (if established) |

svlan-statistics

Syntax

```
svlan-statistics port port-id all-svlans
svlan-statistics port port-id svlan tag
```

Context

[\[Tree\]](#) (show>subscr-mgmt svlan-statistics)

Full Context

```
show subscriber-mgmt svlan-statistics
```

Description

This command displays S-VLAN statistics.

Parameters

port-id

Specifies the physical port ID in the *slot/mda/port* format of the S-VLAN.

| | | | |
|---------------|----------------------|--------|------------|
| Values | <i>slot/mda/port</i> | | |
| | lag-id | lag-id | |
| | | lag | keyword |
| | | id | 1 to 800 |
| | pw-id | pw-id | |
| | | id | 1 to 32767 |

all-svlans

Displays statistics for all S-VLANs on the port.

svlan

Displays information about the S-VLAN.

tag

Specifies a valid S-VLAN identifier.

Values 0 to 4095

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following is an example of S-VLAN statistics information.

The collected statistics per outer VLAN tag, including the number of subscriber hosts is captured in the output.

Sample Output

```
*A:Dut-C# show subscriber-mgmt svlan-statistics port 1/1/2 all-svlans

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

22.154 switch-fabric

switch-fabric

Syntax

switch-fabric [**exclude-sfm** *sfm-list*]

switch-fabric high-bandwidth-multicast

switch-fabric failure-recovery

Context

[\[Tree\]](#) (show>system switch-fabric)

Full Context

show system switch-fabric

Description

This command displays switch fabric information. When an MDA is not provisioned in an XCM, no information is displayed relating to that MDA. To display the forwarding capacity and multicast planes corresponding to that MDA, regardless of whether an XMA is equipped, an **mda-type** must be provisioned for that MDA.

Parameters

sfm-list

Specifies the SFMs to exclude from the displayed switch fabric information, in the format of a comma separated list of SFM numbers from 1 to 16, depending on the platform.

Values *sfm-name* [,*sfm-name*...]
 where *sfm-name* can be 1 to 16

high-bandwidth-multicast

Specifies that MDA information about the switch-fabric plane's high bandwidth multicast traffic tap allocation is displayed.

failure-recovery

Specifies to display information about the automatic switch fabric recovery process. The SFMs are listed in numerical order and are only shown when the recovery process is in progress or it has completed.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s, 7950 XRS

Output

The following outputs are examples of switch fabric information, and the tables describe the output fields.

- [Sample Output show system switch-fabric](#); [Table 557: Switch Fabric Output Field Descriptions](#)
- [Sample Output show system switch-fabric exclude-sfm](#); [Table 557: Switch Fabric Output Field Descriptions](#)

tools perform system switch-fabric

Description

This command performs switch fabric operations.

Platforms

7450 ESS, 7750 SR-7, 7950 XRS-20, 7950 XRS-40

22.155 switch-path

switch-path

Syntax

switch-path [**lsp** *lsp-name*] [**path** *path-name*]

Context

[\[Tree\]](#) (tools>perform>router>mpls switch-path)

Full Context

tools perform router mpls switch-path

Description

Use this command to move from a standby (or an active secondary) to another standby of the same priority. If a new standby path with a higher priority or a primary path comes up after the **tools perform** command is executed, the path re-evaluation command runs and the path is moved to the path specified by the outcome of the re-evaluation.

Parameters

lsp-name

Specifies an existing LSP name, up to 64 characters in length.

path-name

Specifies the path name to which to move the specified LSP.

Platforms

All

22.157 sync-database

sync-database

Syntax

sync-database [**peer** *ip-address*] [**port** *port-id* | *lag-id*] [**sync-tag** *sync-tag*] [**application** *application*]
[**detail**] [**type** *type*]

Context

[\[Tree\]](#) (tools>dump>redundancy>multi-chassis sync-database)

Full Context

tools dump redundancy multi-chassis sync-database

Description

This command dumps MCS database information.

Parameters

ip-address

Specifies the peer's IP address.

port-id | lag-id

Indicates the port or LAG ID to be synchronized with the multi-chassis peer.

Values *slot/mda/port or lag-lag-id*

sync-tag

Specifies a synchronization tag to be used while synchronizing this port with the multi-chassis peer.

application

Specifies a particular multi-chassis peer synchronization protocol application.

Values

| | |
|----------------|---|
| dhcp-server: | local dhcp server (7450 ESS and 7750 SR only) |
| igmp: | Internet group management protocol |
| igmp-snooping: | igmp-snooping |
| mc-ring: | multi-chassis ring |
| mld-snooping: | multicast listener discovery-snooping |
| srrp: | simple router redundancy protocol (7450 ESS and 7750 SR only) |
| sub-host-trk: | subscriber host tracking (7450 ESS and 7750 SR only) |
| sub-mgmt: | subscriber management (7450 ESS and 7750 SR only) |

type

Indicates the locally deleted or alarmed deleted entries in the MCS database per multi-chassis peer.

Values *alarm-deleted, local-deleted*

detail

Displays detailed information.

Platforms

All

sync-database

Syntax

sync-database [**peer** *ip-address*] [**port** *port-id* | *lag-id*] [**sync-tag** *sync-tag*] [**application** *application*]
 [**detail**] [**type** *type*]

sync-database [**peer** *ip-address*] [**sdp** *sdp-id*] [**sync-tag** *sync-tag*] [**application** *application*] [**detail**] [**type**
type]

Context

[Tree] (tools>dump>redundancy>multi-chassis sync-database)

Full Context

tools dump redundancy multi-chassis sync-database

Description

This command dumps multi-chassis sync database information.

Parameters

ip-address

Dumps the specified address of the multi-chassis peer.

- Values**
- ipv4-address: a.b.c.d
 - ipv6-address:
 - x:x:x:x:x:x (eight 16-bit pieces)
 - x:x:x:x:x:d.d.d.d
 - x: [0 to FFFF]H
 - d: [0 to 255]D

port-id

Dumps the specified port ID of the multi-chassis peer.

Values

| | | | |
|------------------------|---------------|--------|------------|
| <i>port-id, lag-id</i> | slot/mda/port | | |
| | lag-id | lag-id | |
| | lag | | keyword |
| | id | | 1 to 800 |
| | pw-id | pw-id | |
| | pw | | keyword |
| | id | | 1 to 32767 |

lag-id

Dumps the specified Link Aggregation Group (LAG) on this system.

Values

| | | |
|------------------------|---------------|------------|
| <i>port-id, lag-id</i> | slot/mda/port | |
| | lag-id | lag-id |
| | lag | keyword |
| | id | 1 to 800 |
| | pw-id | pw-id |
| | pw | keyword |
| | id | 1 to 32767 |

sync-tag

Dumps the synchronization tag used while synchronizing this port with the multi-chassis peer up to 32 characters in length.

application

Dumps the specified application information that was synchronized with the multi-chassis peer.

Values

| | |
|----------------|---|
| dhcp-server | local DHCP server |
| igmp | internet group management protocol |
| igmp-snooping | IGMP snooping |
| mc-ring | multi-chassis ring |
| l2tp | L2TP |
| mld | multicast listener discovery |
| mld-snooping | multicast listener discovery snooping |
| srrp | simple router redundancy protocol |
| sub-host-trk | subscriber host tracking |
| sub-mgmt-ipoe | subscriber management for IPoE |
| sub-mgmt-pppoe | subscriber management for PPPoE |
| mc-ipsec | multi-chassis IPsec |
| python | Python cache |
| diameter-proxy | diameter proxy |
| pim-snpg-sap | protocol independent multicast snooping for SAP |
| pim-snpg-sdp | protocol independent multicast snooping for SDP |

detail

Displays detailed information.

type

Displays information for the specified type.

Values alarm-deleted, local-deleted, global-deleted, omcr-standby, omcr-alarmed

sdp-id

Displays information for the specified SDP ID.

Values 1 to 32767

Platforms

All

Output

The following output is an example of sync database information.

Sample Output

```
A:Dut-C# tools dump redundancy multi-chassis sync-database application
<ip-address>           : a.b.c.d
<port-id|lag-id>       : slot/mda/port or lag-<lag-id>
<sync-tag>             : [32 chars max]
<application>         : dhcp-server - local dhcp server
                       igmp - internet group management protocol
                       igmp-snooping - igmp-snooping
                       mc-ring - multi-chassis ring
                       mld - multicast listener discovery
                       mld-snooping - multicast listener discovery-snooping
                       srrp - simple router redundancy protocol
                       sub-host-trk - subscriber host tracking
                       sub-mgmt-ipoe - subscriber management for IPoE
                       sub-mgmt-pppoe - subscriber management for PPPoE
                       mc-ipsec - multi-chassis IPsec
<detail>               : - displays detailed information
<type>                 : alarm-deleted|local-deleted|global-deleted|
                       omcr-standby|omcr-alarmed
```

sync-database

Syntax

```
sync-database peer ip-address all application application
sync-database peer ip-address port { port-id | lag-id} [sync-tag sync-tag] application application
sync-database peer ip-address sdp sdp-id [sync-tag sync-tag] application application
sync-database peer ip-address sync-tag sync-tag application application
```

Context

[Tree] (clear>redundancy>multi-chassis sync-database)

Full Context

clear redundancy multi-chassis sync-database

Description

This command clears multi-chassis sync database information.

Parameters

ip-address

Clears the specified address of the multi-chassis peer.

- Values** ipv4-address: a.b.c.d
 ipv6-address:
- x:x:x:x:x:x (eight 16-bit pieces)
 - x:x:x:x:x:d.d.d.d
 - x – [0 to FFFF] H
 - d – [0 to 255] D

port-id

Clears the specified port ID of the multi-chassis peer.

- Values** *slot/mda/port*

lag-id

Clears the specified Link Aggregation Group (LAG) on this system.

- Values** *lag-lag-id*

all

Clears all ports and synchronization tags.

sync-tag

Clears the synchronization tag used while synchronizing this port with the multi-chassis peer. The synchronization tag can be up to 32 characters.

sdp-id

Specifies the SDP identifier.

- Values** 1 to 32767

application

Clears the specified application information that was synchronized with the multi-chassis peer.

- Values** The following are values for the 7750 SR and 7950 XRS:
- | | |
|--------------|----------------------------|
| all: | All supported applications |
| dhcp-server: | local dhcp server |

| | |
|----------------|---------------------------------------|
| igmp: | internet group management protocol |
| igmp-snooping: | igmp-snooping |
| mc-ring: | multi-chassis ring |
| mld-snooping: | multicast listener discovery-snooping |
| srrp: | simple router redundancy protocol |
| sub-host-trk | subscriber host tracking |
| sub-mgmt: | subscriber management |

Values The following are values for the 7450 ESS:

| | |
|---------------|---------------------------------------|
| all | All supported applications |
| igmp-snooping | igmp-snooping |
| mc-ring | multi-chassis ring |
| mld-snooping | multicast listener discovery-snooping |
| sub-host-trk | subscriber host tracking |
| sub-mgmt | subscriber management |

Platforms

All

22.158 sync-database-reconcile

sync-database-reconcile

Syntax

sync-database-reconcile [**peer** *ip-address*] [**port** *port-id* | *lag-id* [**sync-tag** *sync-tag*]] [**application** *application*]

sync-database-reconcile [**peer** *ip-address*] [**sdp** *sdp-id* [**sync-tag** *sync-tag*]] [**application** *application*]

Context

[Tree] (tools>perform>redundancy>multi-chassis sync-database-reconcile)

Full Context

tools perform redundancy multi-chassis sync-database-reconcile

Description

This command provides the parameters to reconcile MCS database entries.

Parameters

ip-address

Specifies the IP address (in the form of a.b.c.d).

port-id

Specifies the port ID in the slot/MDA/port format.

lag-id

Specifies the LAG ID.

Values lag-id: *lag-id*
lag: keyword
id: 1 to 200

syn-tag

Specifies the syn tag up to 32 characters.

application

Specifies the application.

Values dhcp-server — Specifies the local DHCP server
igmp — Specifies the Internet group management protocol
igmp-snooping — Specifies igmp-snooping
mc-ring — Specifies multi-chassis ring
l2tp — Specifies L2TP
mld — Specifies multicast listener discovery
mld-snooping — Specifies multicast listener discovery-snooping
srrp — Specifies simple router redundancy protocol
sub-host-trk — Specifies subscriber host tracking
sub-mgmt-ipoe — Specifies subscriber management for IPoE
sub-mgmt-pppoe — Specifies subscriber management for PPPoE
mc-ipsec — Specifies multi-chassis IPsec
python — Specifies Python cache
diameter-proxy — Specifies diameter proxy
pim-snpg-sap — Specifies protocol independent multicast snooping for SAPs
pim-snpg-sdp — Specifies protocol independent multicast snooping for SDPs

sdp-id

Specifies the SDP ID.

Values 1 to 17407

sync-if-timing

Syntax

sync-if-timing [*cpm-slot*]

Context

[\[Tree\]](#) (show>system sync-if-timing)

Full Context

show system sync-if-timing

Description

This command displays synchronous interface timing operational information.

Parameters

cpm-slot

Specifies the system CPM slot.

Values standby, A, B

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following output is an example of sync-if-timing information, and [Table 563: System Timing Output](#) describes the output fields.

Sample Output

The following system example shows:

- **sync-if timing**, or
- **sync-if-timing "A"** when the SETS reference on the active CPM-A locks to BITS A, or

- **sync-if-timing "B"** when the SETS reference on the active CPM-B locks to BITS A

Note:

The following output applies only to the 7750 SR-1e/2e/3e and 7950 XRS-16/20/40 platforms.

```

Table 563: System Timing Output

| Label | Description |
|-------------------------|---|
| System Status CPM A/B | <p>Indicates the present status of the synchronous timing equipment subsystem (SETS).</p> <p>Not Present — Only shown on systems without central clocks</p> <p>Master Freerun — The clock is in free-run because it hasn't had a qualified input reference to lock to</p> <p>Master Holdover — The clock was locked to an input reference but has lost all qualified input references and is in holdover.</p> <p>Master Locked — The clock is locked to an input reference</p> <p>Acquiring — The clock is training to a qualified input reference.</p> |
| Reference Input Mode | <p>Revertive — Indicates that for a re-validated or a newly validated reference source which has a higher priority than the currently selected reference has reverted to the new reference source.</p> <p>Non-revertive — The clock cannot revert to a higher priority clock if the current clock goes offline.</p> |
| Quality Level Selection | <p>Indicates whether the ql-selection command has been enabled or disabled. If this command is enabled, then the reference is selected first using the QL value, then by the priority reference order. If this command is not enabled, then the reference is selected by the priority reference order.</p> |
| Reference Selected | <p>Indicates which reference has been selected:</p> <ul style="list-style-type: none"> • ref1, ref2 — (for all chassis) • BITS A, BITS B: <ul style="list-style-type: none"> – 7450 ESS-7/12 – 7750 SR-7/12 – 7750 SR-12e – 7750 SR-1e/2e/3e |

| Label | Description |
|--------------------------|---|
| | <ul style="list-style-type: none"> - 7750 SR-a4/8 - 7950 XRS-16/20 - 7950 XRS-40 • BITS C, BITS D - (7950 XRS-40) |
| | <ul style="list-style-type: none"> • Mate CPM (BITS A), Mate CPM (BITS B) — show>system>sync-if-timing> standby: <ul style="list-style-type: none"> - 7450 ESS-7/12 - 7750 SR-7/12 - 7750 SR-12e - 7750 SR-1e/2e/3e - 7750 SR-a4/8 - 7950 XRS-16/20 - 7950 XRS-40 • Mate CPM (BITS A), Mate CPM (BITS B) — show>system>sync-if-timing: <ul style="list-style-type: none"> - 7450 ESS-7/12 - 7750 SR-7/12 - 7750 SR-12e - 7750 SR-a4/8 • Mate CPM (none) - show>system>sync-if-timing>standby when standby locked to active which is freerun or holdover - (for all chassis) • Mate CPM (ref1), Mate CPM (ref2) - show>system>sync-if-timing>standby when standby locked to active which is locked to ref1 or ref2: <ul style="list-style-type: none"> - 7750 SR-7/12 - 7450 ESS-7/12 - 7750 SR-12e - 7750 SR-1e/2e/3e - 7750 SR-a4/8 - 7950 XRS-16/20/40 |
| System Quality Level | Indicates the quality level being generated by the system clock. |
| Current Frequency Offset | This value indicates the offset that is applied within the central clock to align the local oscillator to the frequency of the selected input reference. The units for this value are parts per million (ppm). |

| Label | Description |
|-----------------------------|---|
| | <p>This value should not be misinterpreted as an indicator of the frequency accuracy of the output of the central clock.</p> <p>If the central clock is locked to a true Primary Reference Clock or Stratum 1 frequency reference, this value should report a number within the range [-5, +5] ppm.</p> |
| Input Minimum Quality Level | The configured minimum acceptable QL to consider for use by the central clock. |
| Wait to Restore Timer | The configured timeout to use for the Wait to Restore timer. |
| Reference Order | ref1, ref2, bits — Indicates that the priority order of the timing references. |
| Reference Mate CPM | Data within this block represents the status of the timing reference provided by the Mate CPM. This will be the BITS input from the standby CPM. |
| Admin Status | <p>down — The ref1 or ref2 configuration is administratively shutdown.</p> <p>up — The ref1 or ref2 configuration is administratively enabled.</p> <p>diag — Indicates the reference has been forced using the force-reference command.</p> |
| Quality Level Override | Indicates whether the QL value used to determine the reference was configured directly by the user. |
| Rx Quality Level | <p>Indicates the QL value received on the interface.</p> <ul style="list-style-type: none"> inv — SSM received on the interface indicates an invalid code for the interface type. unknown — No QL value was received on the interface. |
| Qualified for Use | Indicates whether the reference has been qualified to be used as a source of timing for the node. |
| Not Qualified Due To | <p>Indicates the reason why the reference has not been qualified:</p> <ul style="list-style-type: none"> disabled LOS OOPIR OOF |
| Selected for Use | Indicates whether the method is presently selected. |
| Not Selected Due To | <p>Indicates the reason why the method is not selected:</p> <ul style="list-style-type: none"> disabled not qualified |

| Label | Description |
|------------------------------|---|
| | <ul style="list-style-type: none"> • previous failure • LOF • AIS-L • validating • on standby • ssm quality |
| Source Port | Identifies the Source port for the reference. |
| Interface Type | The interface type configured for the BITS port. |
| Framing | The framing configured for the BITS port. |
| Line Coding | The line coding configured for the BITS port. |
| Line Length | The line length value of the BITS output. |
| Output Admin Status | down — The BITS output is administratively shutdown. up — The BITS output is administratively enabled. |
| Output Minimum Quality Level | The configured minimum acceptable QL to use for the BITSout signal. |
| Output Source | The source to be used to provide the signal on the BITS output port. line reference — unfiltered recovered line reference. internal clock — filtered node clock output. |
| Output Reference Selected | The reference selected as the source for the BITS output signal (ref1, ref2, or PTP). |
| Output Squelch | Indicates whether the squelch function for BITSout is enabled or disabled. |
| TX Quality Level | QL value for BITS output signal. |

sync-if-timing

Syntax

sync-if-timing {ref1 | ref2 | bits}

Context

[\[Tree\]](#) (clear>system sync-if-timing)

Full Context

clear system sync-if-timing

Description

This command allows an operator to individually clear (re-enable) a previously failed reference. As long as the reference is one of the valid options, this command is always executed. An inherent behavior enables the revertive mode which causes a re-evaluation of all available references.

This command also clears the Wait-to-Restore state of the reference so that it can be selected.

Parameters

ref1

Clears the first timing reference.

ref2

Clears the second timing reference.

bits

Clears the bits timing reference.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

sync-if-timing

Syntax

sync-if-timing *reference*

Context

[\[Tree\]](#) (clear>system>satellite>eth-sat sync-if-timing)

Full Context

clear system satellite eth-sat sync-if-timing

Description

This command clears (re-enables) a previously failed reference on the Ethernet satellite.

Parameters

reference

Specifies to clear the first or second timing reference.

Values ref1, ref2

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

sync-if-timing

Syntax

`sync-if-timing` *reference*

Context

[\[Tree\]](#) (clear>system>satellite>tdm-sat sync-if-timing)

Full Context

clear system satellite tdm-sat sync-if-timing

Description

This command clears (re-enables) a previously failed reference on the TDM satellite.

Parameters

reference

Specifies to clear the first or second timing reference.

Values ref1, ref2

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

22.160 synchronization

synchronization

Syntax

`synchronization`

Context

[\[Tree\]](#) (show>redundancy synchronization)

Full Context

show redundancy synchronization

Description

This command displays redundancy synchronization times.

Platforms

All

Output

The following output is an example of redundancy synchronization information, and [Table 564: Synchronization Output](#) describes the output fields.

Sample Output

```
A:ALA-1>show>redundancy# synchronization
=====
Synchronization Information
=====
Standby Status           : disabled
Last Standby Failure     : N/A
Standby Up Time          : N/A
Failover Time            : N/A
Failover Reason          : N/A
Boot/Config Sync Mode    : None
Boot/Config Sync Status  : No synchronization
Last Config File Sync Time : Never
Last Boot Env Sync Time  : Never
=====
A:ALA-1>show>redundancy#
```

Table 564: Synchronization Output

| Label | Description |
|----------------------------|--|
| Standby Status | Displays the status of the standby CPM. |
| Last Standby Failure | Displays the timestamp of the last standby failure. |
| Standby Up Time | Displays the length of time the standby CPM has been up. |
| Failover Time | Displays the timestamp when the last redundancy failover occurred causing a switchover from active to standby CPM. If there is no redundant CPM card in this system or no failover has occurred since the system last booted, the value will be 0. |
| Failover Reason | Displays a text string giving an explanation of the cause of the last redundancy failover. If no failover has occurred, an empty string displays. |
| Boot/Config Sync Mode | Displays the type of synchronization operation to perform between the primary and secondary CPMs after a change has been made to the configuration files or the boot environment information contained in the boot options file (BOF). |
| Boot/Config Sync Status | Displays the results of the last synchronization operation between the primary and secondary CPMs. |
| Last Config File Sync Time | Displays the timestamp of the last successful synchronization of the configuration files. |

| Label | Description |
|-------------------------|--|
| Last Boot Env Sync Time | Displays the timestamp of the last successful synchronization of the boot environment files. |

22.161 syslog

syslog

Syntax

syslog [*syslog-id*]

Context

[\[Tree\]](#) (show>service>id>log syslog)

Full Context

show service id log syslog

Description

This command displays syslog event log destination summary information or detailed information on a specific syslog destination.

Parameters

syslog-id

Displays detailed information on the specified syslog event log destination.

Values 1 to 10

Platforms

All

Output

Syslog Event Log Destination Summary Output

[Table 565: Show Log Syslog Field Descriptions](#) describes the syslog output fields.

Table 565: Show Log Syslog Field Descriptions

| Label | Description |
|------------|--|
| Syslog ID | The syslog ID number for the syslog destination. |
| IP Address | The IP address of the syslog target host. |

| Label | Description |
|---------------------|--|
| Port | The configured UDP port number used when sending syslog messages. |
| Facility | The facility code for messages sent to the syslog target host. |
| Severity Level | The syslog message severity level threshold. |
| Below Level Dropped | A count of messages not sent to the syslog collector target because the severity level of the message was above the configured severity. The higher the level, the lower the severity. |
| Prefix Present | Yes — A log prefix was prepended to the syslog message sent to the syslog host. No — A log prefix was not prepended to the syslog message sent to the syslog host. |
| Description | A text description stored in the configuration file for a configuration context. |
| LogPrefix | The prefix string prepended to the syslog message. |
| Log-id | Events are directed to this <i>destination</i> . |

syslog

Syntax

syslog

Context

[\[Tree\]](#) (show>service>nat syslog)

Full Context

show service nat syslog

Description

This command enters the conect to display NAT syslog information

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

syslog

Syntax

syslog [*syslog-id*]

Context

[\[Tree\]](#) (show>log syslog)

Full Context

show log syslog

Description

This command displays Syslog event log destination summary information or detailed information on a specific Syslog destination.

Parameters

syslog-id

Displays detailed information on the specified Syslog event log destination.

Values 1 to 10

Platforms

All

Output

The following is an example of Syslog information.

[Table 566: Show Log Syslog Output Fields](#) describes the Syslog output fields.

Sample Output

```

22.162 syslog-export-policy

syslog-export-policy

Syntax

syslog-export-policy *name* **associations**

syslog-export-policy *name*

syslog-export-policy

Context

[\[Tree\]](#) (show>service>nat>syslog syslog-export-policy)

Full Context

```
show service nat syslog syslog-export-policy
```

Description

This command displays information about syslog export policies.

Parameters

name

Displays information about the specified NAT syslog export policy.

associations

Displays where the **syslog-export-policy** is configured.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following is an example of syslog export policy information.

Sample Output

```
*SR-0S-NODE-1# show service nat syslog syslog-export-policy <name>
=====

[Table 567: syslog-export-policy Fields](#) displays syslog export policy field descriptions.

Table 567: *syslog-export-policy* Fields

| Field | Description |
|-------------------------------|---|
| Description | Displays the description for the syslog export policy. |
| Facility | Displays information about the facility. Valid values: kernel, user, mail, systemd, auth, syslogd, printer, netnews, uucp, cron, authpriv, ftp, ntp, logaudit, logalert, cron2, local0, local1, local2, local3, local4, local5, local6, local7 |
| Log prefix | Displays information about the log prefix. |
| Max tx delay (deciseconds) | Displays the time waited to aggregate multiple events into a single log message (event aggregation). |
| MTU | Displays information about the IP MTU of the syslog frame. |
| Rate limit (pps) | Displays the rate limit imposed on syslog frames sent toward the collector. |
| Severity level | Displays the syslog severity level. Valid values: emergency, alert, critical, error, warning, notice, info, debug |
| Includes | Displays the optional fields related to the flow that can be included in the flow log message. |
| Last management change | Displays the time and date of the last configuration change. |
| Router | Displays the routing instance from which the collector is reachable. |
| Source IP address | Displays the source IP address of the syslog frame. |
| Administrative state | Displays the administrative state of the collector. |
| Destination port | Displays the destination port of the collector. |
| IP address | Displays the IP address of the collector. |
| Syslog export policy | Displays the syslog export policy associated with this NAT policy. |
| No. of syslog export policies | Displays the number of syslog export policies configured in the system. |

22.165 system-filter

system-filter

Syntax

system-filter [chained-to]

Context

[\[Tree\]](#) (show>filter system-filter)

Full Context

show filter system-filter

Description

This command shows system filter information.

Parameters

chained-to

Displays filters that chain to a given system filter.

Platforms

All

Output

No Parameters Specified — When no parameters are specified, the output is grouped for IPv4 and IPv6, and displays information about the active system filter and all filters with scope **system**.

The following output is an example of system filter information when no parameters are specified.

Sample Output

```
*A:Dut-C>show>filter# system-filter
```

```
=====
IP system filters
```

```

=====
Filter-Id                Active

22.166 system-info

system-info

Syntax

system-info

Context

[\[Tree\]](#) (show>eth-cfm system-info)

Full Context

show eth-cfm system-info

Description

This command displays system-level ETH-CFM information states.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following is an example of system-level ETH-CFM information.

Sample Output

```
show eth-cfm system-info
=====
CFM System State Information
=====
ETH-CCM Grace-Period      : Inactive
=====
```

22.167 system-statistics

system-statistics

Syntax

system-statistics data-trigger

Context

[\[Tree\]](#) (clear>subscr-mgmt system-statistics)

Full Context

clear subscriber-mgmt system-statistics

Description

This command clears subscriber statistics at the system level.

Parameters

data-trigger

Clears data trigger statistics for all data trigger enabled SAPs in the system.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

system-statistics

Syntax

system-statistics

Context

[\[Tree\]](#) (clear>nat system-statistics)

Full Context

clear nat system-statistics

Description

This command clears NAT statistics at the system level.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23 t Commands

23.1 tacplus

tacplus

Syntax

tacplus *server-index*

Context

[Tree] (clear tacplus)

Full Context

clear tacplus

Description

This command clears the TACACS+ server state.

Parameters

server-index

Specifies the index for the TACACS+ server.

Values 1 to 5

Platforms

All

23.2 taii-type2-using

taii-type2-using

Syntax

taii-type2-using *global-id[:prefix[:ac-id]]*

Context

[Tree] (show>service taii-type2-using)

Full Context

```
show service taii-type2-using
```

Description

This command displays switch-point information using TAI.

Parameters

global-id[:prefix[:ac-id]]

Specifies the switch-point information using SAll-Type2.

Values

| | |
|---|---------------------------|
| <global-id[:prefix*> : <global-id>[:<prefix>[:<ac-id>]] | |
| global-id | 1 to 4294967295 |
| prefix | a.b.c.d 1 to 4294967295 |
| ac-id | 1 to 4294967295 |

Platforms

All

Output

The following is an example of service switch-point information using TAI information.

Sample Output

```
*A:Dut-E# show service taii-type2-using 6:10.20.1.6:1

23.3 tail

tail

Syntax

tail [*lsp-id lsp-id*] [*tunnel-id tunnel-id*] [**source-address** *ip-address*]

tail ldp prefix *ip-prefix/prefix-length* [**source-address** *ip-address*]

tail statistics

Context

[Tree] (tools>dump>test-oam>lsp-bfd tail)

Full Context

tools dump test-oam lsp-bfd tail

Description

This command dumps information for BFD sessions on LSPs.

Parameters

lsp-id

Specifies an LSP for which to dump information.

Values 1 to 65535

tunnel-id

Specifies a tunnel for which to dump information.

Values 1 to 65535

ip-address

Specifies an IP address for which to dump information.

Values *ipv4-address* — a.b.c.d
ipv6-address — x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:d.d.d.d
x — 0 to FFFF (hexadecimal)
d — 0 to 255 (decimal)

ldp

Dumps LDP information.

ip-prefix/prefix-length

Specifies a source IP prefix for which to dump information, and the prefix length.

Values <*ipv4-prefix*>/32 | <*ipv6-prefix*>/128
ipv4-prefix — a.b.c.d
ipv4-prefix-length — 0 to 32
ipv6-prefix — x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:d.d.d.d
x — 0 to FFFF (hexadecimal)
d — 0 to 255 (decimal)
ipv6-prefix-length — 0 to 128

statistics

Displays global statistics for BFD-on-LSP sessions terminated by LSP tail-ends.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following output is an example of tail information.

23.4 targ-peer

targ-peer

Syntax

targ-peer [*ip-address*] [*detail*]

targ-peer [*detail*] *family*

targ-peer resource-failures [*family*]

Context

[\[Tree\]](#) (show>router>ldp targ-peer)

Full Context

show router ldp targ-peer

Description

This command displays configuration information for the targeted LDP peers.

Parameters

ip-address

Specifies the IP address of a targeted LDP peer for which to display information.

Values

ipv4-address -a.b.c.d

ipv6-address: x:x:x:x:x:x:x
 x:x:x:x:x:d.d.d.d
 x: [0 to FFFF]H
 d: [0 to 255]D

detail

Displays detailed configuration information.

family

Specifies a peer family for which to display information.

Values ipv4 or ipv6

resource-failures

Displays resource failure information for targeted LDP peers.

Platforms

All

Output

The following outputs are examples of LDP targeted peer information, and [Table 568: LDP Targeted Peer Output Fields](#) describes the output fields.

```

The following table describes the LDP targeted peer output fields.

Table 568: LDP Targeted Peer Output Fields

| Label | Description |
|------------|--|
| Peer | The IP address of the peer. |
| Adm | Up — The LDP is administratively enabled. Down — The LDP is administratively disabled. |
| Opr | Up — The LDP is operationally enabled. Down — The LDP is operationally disabled. |
| Hello Fctr | The value by which the hello timeout should be divided to give the hello time, for example, the time interval (in s), between LDP hello messages. LDP uses |

| Label | Description |
|--------------------|--|
| | hello messages to discover neighbors and to detect loss of connectivity with its neighbors. |
| Hold Time | The hello time or hold time. The time interval (in seconds) that LDP waits before declaring a neighbor to be down. Hello timeout is local to the system and is sent in the hello messages to a neighbor. |
| KA Fctr | The value by which the keepalive timeout is divided to calculate the keepalive time, for example, the time interval (in seconds) between LDP keepalive messages. LDP keepalive messages are sent to keep the LDP session from timing out when no other LDP traffic is being sent between the neighbors. |
| KA Time | The time interval (in seconds) that LDP waits before tearing down a session. If no LDP messages are exchanged during this time interval, the LDP session is torn down. Generally, the value is configured to be 3 times the keepalive time (the time interval between successive LDP keepalive messages). |
| Active Adjacencies | The number of active adjacencies (established sessions) associated with the LDP instance. |
| Auth | Enabled — Authentication using MD5 message-based digest protocol is enabled. Disabled — No authentication is used. |
| Passive Mode | The mode used to set up LDP sessions. This value is only applicable to targeted sessions and not to LDP interfaces. True — LDP responds only when it gets a connect request from a peer and will not attempt to actively connect to its neighbors. False — LDP actively tries to connect to its peers. |
| Auto Created | Specifies that a targeted peer was automatically created through service manager. For an LDP interface, this value is always false. |
| Creator | autorx — The autorx is the creator. autotx — The autotx is the creator. |
| No. of Peers | The total number of LDP peers. |
| Tunneling | Enabled — Tunneling is enabled. Disabled — No tunneling is used. |
| LSP | The LSP name. |

23.5 targ-peer-template

targ-peer-template

Syntax

targ-peer-template [*peer-template*] [**community** *community*]

Context

[Tree] (show>router>ldp targ-peer-template)

Full Context

show router ldp targ-peer-template

Description

This command displays the configured parameters of a targeted peer-template.

Parameters

peer-template

Specifies a targeted peer template on this virtual router that participates in the LDP protocol up to 32 characters.

community

The string defining the LDP community assigned to the session. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains spaces, use double quotes to delimit the start and end of the string.

Platforms

All

Output

Sample Output

23.7 targeted-auto-rx

targeted-auto-rx

Syntax

targeted-auto-rx hold-time *seconds*

Context

[Tree] (clear>router>ldp targeted-auto-rx)

Full Context

```
clear router ldp targeted-auto-rx
```

Description

This command clears unneeded automatic T-LDP sessions on all applicable nodes. The operator must run this command during a specific time window on all nodes on which **auto-rx** is configured. The operator must also ensure that the configured **hold-time** value should be longer than the hello-timer value plus the time required to run the **clear** command on all applicable nodes. The configured **hold-time** value must be a non-zero value.

When the hold timer for this command is in progress, the operator can display the remaining timeout value by using the **tools dump router ldp timers** command.

This **clear** command is not synchronized to the standby CPM. Consequently, if the operator configures this command with a large **hold-time** value and a CPM switchover occurs during this time, the operator must reconfigure this **clear** command on the newly active CPM.

Parameters

hold-time

Specifies the time window during which this command must be run on all applicable nodes.

seconds

Specifies the hold timer value in seconds.

Platforms

All

23.8 tcp

tcp

Syntax

tcp sessions

tcp settings

tcp statistics

Context

[\[Tree\]](#) (tools>dump>system>cpm-http-redirect tcp)

Full Context

```
tools dump system cpm-http-redirect tcp
```

Description

This command displays the system level TCP session state information of the **cpm-http-redirect optimized-mode** for currently opened sessions. Specifically, the following are displayed:

- New: Syn received and Syn-Ack not sent
- SYN: Syn-Ack sent and waiting for Ack
- ESTABLISHED: Ack received and waiting for data
- FIN: FIN sent and waiting for Fin-Ack
- Delete: Sum of all currently open connections at this time, representing the connections to be deleted
- HTTP Response dropped: communication error; the redirect failed to be sent to the TCP layer

All current sessions are counted both in the state where they belong, such as 'New', 'Syn', 'Established', 'Fin', and in the sum 'Delete' count.

Parameters

sessions

Specifies system level TCP session state information of the **cpm-http-redirect in optimized-mode**.

settings

Specifies system level TCP session settings of the **cpm-http-redirect in optimized-mode**. These settings can be further controlled using **tools perform** commands.

statistics

Specifies system level TCP statistics of the **cpm-http-redirect optimized-mode** for all sessions.

Platforms

All

Output

The following output shows an example of the sessions information.

Sample Output

```
A# tools dump system cpm-http-redirect tcp sessions
=====

Table 569: AA Group TCP Optimizer Policy and ISA MDA Output Fields

| Label | Description |
|-------------------------------|--|
| Description | The description of the TCPO |
| TCP Stack | The stack of the TCP |
| Initial CWND Size | The initial congestion window size |
| Initial SS Thresh | The initial Slow Start threshold |
| DACK Timeout | The delayed acknowledgment timeout |
| Session Filter Ref | The session filter reference |
| Network RTT Threshold | The network Round Trip Time threshold |
| Buffer Utilization | The number of the buffers used |
| Session Filter Ref | The name of session filter that contains a reference to this TCPO policy |
| Cumulative Session Statistics | The summary of total stats related to TCPO |
| Active Sessions | The number of TCP sessions currently being optimized |

| Label | Description |
|----------------------|---|
| Optimized Sessions | The number of TCP sessions that were optimized |
| Unoptimized Sessions | The number of TCP sessions that were not optimized due to various reasons (for example, unsupported options) |
| Abandoned Sessions | The number of TCP sessions that TCPO was started and later stopped before the session was terminated |
| Unsupported Packet | The number of TCP sessions that contained unsupported packets such as Fragmented SYN, a SYN that contains data, IPv6 extension headers, unsupported TCP options (fast-open and MP-TCP) |
| Packet Error | The number of TCP sessions that had packet errors |
| Inactivity | The number of TCP sessions that timed out due to inactivity |
| Existing Sessions | The number of TCP sessions that were not optimized since AA did not see the initial TCP handshake |
| No Buffers | The number of TCP packets that were not optimized due to lack of buffers |
| Low Network | The number of TCP packets that were not optimized due to low network RTT |
| Other | The number of TCP packets that were not optimized due other reasons such as Simultaneous open (both sides send a SYN), Ack-number mismatch in the SYN/ACK, additional traffic following the SYN, before the SYN/ACK, configuration change between SYN and SYN/ACK, received a RST after sending the SYN |
| Octets Received | The number of TCP octets /bytes received by TCPO policy |
| Packets Received | The number of TCP packets received by TCPO policy |
| Octets Transmitted | The number of TCP octets /bytes received by TCPO policy |
| Retransmitted | The number of TCP octets /bytes transmitted by TCPO policy |
| Packets Transmitted | The number of TCP packets transmitted by TCPO policy |
| Retransmitted | The number of TCP packets retransmitted by TCPO policy |

23.11 tcp-validate

tcp-validate

Syntax

tcp-validate *tcp-validate-name* [**isa** *mda-id*]

Context

[Tree] (show>app-assure>group tcp-validate)

Full Context

show application-assurance group tcp-validate

Description

This command displays TCP validation policy information.

When the *mda-id* parameter is included, only TCP validation policy information for the specified adapter card is displayed.

Parameters

tcp-validate-name

Specifies the name of the TCP validation policy. 32 characters maximum.

mda-id

Specifies the slot number of an adapter card, in the format *slot/mda*.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of TCP validation policy information.

Sample Output

```
A:NOK# show application-assurance group 1 tcp-validate "test" isa 1/1
=====
Application Assurance Group 1 tcp-validate "test"

tdm-sat

Syntax

tdm-sat [*sat-id*]

Context

[\[Tree\]](#) (show>system>satellite tdm-sat)

Full Context

show system satellite tdm-sat

Description

This command displays information about configured TDM satellites. If a sat-id is specified, this command displays information only about the specified TDM satellite.

Parameters

sat-id

Specifies the TDM satellite chassis.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

Output

The following output is an example of TDM satellite information.

Sample Output

```
*A:Dut-A# show system satellite tdm-sat 1

te-database

Syntax

te-database [**adv-router** *adv-router*] [**neighbor** *neighbor*] [**detail**]

Context

[\[Tree\]](#) (tools>dump>router te-database)

Full Context

tools dump router te-database

Description

Commands in this context dump the traffic engineering database.

Parameters

adv-router

Dumps the attributes of a specified traffic engineering database advertising router.

Values ip-address, isis-system-id

neighbor

Dumps the neighbor of a traffic engineering database advertising router.

Values ip-address, isis-system-id

detail

Specifies additional detailed traffic engineering database information.

Platforms

All

Output

The following output is an example of traffic engineering database information.

Sample Output

```
*A:Dut-F# tools dump router te-database

23.14 te-link

te-link

Syntax

te-link [*te-link-id*] [**detail**]

te-link *te-link-id* **statistics**

Context

[\[Tree\]](#) (show>router>Imp te-link)

Full Context

show router Imp te-link

Description

This command displays Traffic Engineering (TE) link information.

Parameters

te-link-id

Specifies the ID of a TE Link.

Values 1 to 4294967295 | *te-link-name te-link-name*: 32 character (max) name of the TE Link

detail

Keyword to display more detailed output.

statistics

Keyword to display TE Link statistics.

Platforms

7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following output is an example of TE link information, and [Table 570: TE Link Output Fields](#) describes the output fields.

Sample Output

```

Context

[\[Tree\]](#) (show>oam-pm tests)

Full Context

show oam-pm tests

Description

This command displays a list of OAM-PM test types and associated test IDs. The output provides an ordered list by type and ID to help locate available test IDs that may be configured within a specific type. Filters are available to refine the output to the operational need. Multiple filters can be included to further refine the output. The combination of the filters is an AND function. All filters must be true to provide tests output.

Parameters

session-name

Filters output by session name, up to 32 characters.

test-id

Filters output by test ID.

Values 0 to 2147483647

test-type

Filters output by test type.

Values dm, dmm, lmm, slm, twamp-light

Platforms

All

Output

The following is an example of OAM-PM test type and test ID information. [Table 572: OAM-PM Test](#) describes test fields.

Table 573: System Thresholds Field Descriptions

| Label | Description |
|------------------|---|
| Variable | Displays the variable OID. |
| Alarm Id | Displays the numerical identifier for the alarm. |
| Last Value | Displays the last threshold value. |
| Rising Event Id | Displays the identifier of the RMON rising event. |
| Threshold | Displays the identifier of the RMON rising threshold. |
| Falling Event Id | Displays the identifier of the RMON falling event. |
| Threshold | Displays the identifier of the RMON falling threshold. |
| Sample Interval | Displays the polling interval, in seconds, over which the data is sampled and compared with the rising and falling thresholds. |
| SampleType | Displays the method of sampling the selected variable and calculating the value to be compared against the thresholds. |
| Startup Alarm | Displays the alarm that may be sent when this alarm is first created. |
| Owner | Displays the owner of this alarm. |
| Description | Displays the event cause. |
| Event Id | Displays the identifier of the threshold event. |
| Last Sent | Displays the date and time the alarm was sent. |
| Action Type | log — An entry is made in the RMON-MIB log table for each event occurrence. trap — An SR OS logger event is generated. The SR OS logger utility then distributes the notification of this event to its configured log destinations, which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs. |

| Label | Description |
|-------|--|
| | both — Both an entry in the RMON-MIB logTable and an SR OS logger event are generated. none — No action is taken. |
| Owner | Displays the owner of the event. |

Context

[\[Tree\]](#) (show>isa>stats>ip-tunnel-stats throughput)

Full Context

show isa statistics ip-tunnel-stats throughput

Description

This command displays throughput statistics for the specified tunnel types and scope.

The following scopes are supported:

- per ISA
- per tunnel group

- per system

The statistics include the following information:

- total packet per second (encapsulated and decapsulated)
- encapsulated packets per second
- decapsulated packets per second
- total bits per second (encapsulated and decapsulated) in Mibits/s
- encapsulated bits per second in Mibits/s
- decapsulated bits per second in Mibits/s

Syntax notes:

- 1 Mibits/s, equals 2^{20} bits per second
- The bits per second counter is an integer which is a rounded down value from the measured value.

The system collects stats every 10 minutes for last the 24 hour per the wall clock. A current value is also included in the output. The value is an average derived value of 10 minutes. The start time indicates the starting timestamp of measurement. The sampling duration indicates the duration of measurement.

Parameters

tunnel-type

Displays the type of tunnel.

Values gre, ip-in-ip, l2tpv3

mda

Displays the ISA ID.

Values slot/mda

tunnel-group-id

Displays the ID of the tunnel group.

Values 1 to 16

type

Displays the type of breakdown counter.

Values bidir-pps, bidir-bps, encap-pps, encap-bps, decap-pps, decap-bps

count

Displays the number historical values to be included in the output.

Values 1 to 24

minutes

Displays the number of minutes of historical values to be included in output.

Values 1 to 1440

current

Displays only the current values.

esa-vm

Displays the ID of the configured ESA and ESA VM.

| Values | esa-vm: | esa-id/vm-id |
|--------|---------|---------------------------|
| | | esa-id 1 to 16 |
| | | vm-id 1 to 4 |

show-oid

Specifies to include the SNMP object identifier (OID) and the instance ID for the latest historical value in the output.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following is an example output of the **show isa statistics throughput ip-tunnel-stats** command.

Sample Output

```
show>isa>stats>ip-tunnel-stats# throughput tunnel-type gre tunnel-group 1

Full Context

```
show isa statistics ipsec-stats throughput
```

Description

This command displays IPsec throughput statistics for the specified scope.

The system collects statistics every 10 minutes for the last 24 hours per wall clock. A current value is included in the output.

This command supports following the scopes:

- per system
- per ISA
- per tunnel group
- per IPsec GW

The statistics include:

- The number of bidirectional encrypted and decrypted per second
- The number of encrypted packets per second
- The number of decrypted packets per second

- The number of bidirectional (encrypted and decrypted) bits per second (in Mibits/s)
- The number of bidirectional encrypted bits per second (in Mibits/s)
- The number of bidirectional decrypted bits per second (in Mibits/s)

Syntax notes:

- 1 Mibits/s equals 2^{20} bits per second
- The bits per second counter is an integer, which is a value rounded down from the measured value.

Parameters

mda

Displays information about the specified ISA.

Values slot/mda

tunnel-group-id

Displays information about the specified tunnel group ID.

Values 1 to 16

name

Displays information about the name of the IPsec GW up to 32 characters in length.

count

Displays information about the number of historical values to be included in the output.

Values 1 to 24

min

Displays information about the number of minutes of historical values to be included in output.

Values 1 to 1440

current

Displays information about the current value.

show-oid

Displays information about include SNMP OID and instance ID for the latest historical value in the output, for a specified type of counter.

esa-vm

Displays the ID of the configured ESA and ESA VM.

| | | | |
|---------------|---------|---------------------|---------|
| Values | esa-vm: | <i>esa-id/vm-id</i> | |
| | | <i>esa-id</i> | 1 to 16 |
| | | <i>vm-id</i> | 1 to 4 |

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of the **show isa statistics ipsec-stats throughput** command.

Sample Output

```
show>isa>stats>ipsec-stats# throughput tunnel-group 1

Table 574: System Time Field Descriptions

| Label | Description |
|---------------------|--|
| Date & Time | The system date and time using the current time zone. |
| DST Active | Yes — Daylight Savings Time is currently in effect. No — Daylight Savings Time is not currently in effect. |
| Zone | The zone names for the current zone, the non-DST zone, and the DST zone if configured. |
| Current Time Zone | Indicates the process currently controlling the system time. SNTP, NTP, PTP or NONE. |
| Zone type | Non-standard — The zone is user-defined. Standard — The zone is system defined. |
| Offset from UTC | The number of hours and minutes added to universal time for the zone, including the DST offset for a DST zone. |
| Offset from Non-DST | The number of hours (always 0 to 1) and minutes (0 to 59) added to the time at the beginning of Daylight Saving Time and subtracted at the end Daylight Saving Time. |
| Starts | The date and time Daylight Saving Time begins. |
| Ends | The date and time Daylight Saving Time ends. |

time

Syntax

time

Context

[Tree] (show time)

Full Context

show time

Description

This command displays the current day, date, time and time zone.

The time is displayed either in the local time zone or in UTC depending on the setting of the root level **time-display** command for the console session.

Platforms

All

Output

The following output is an example of time information.

Sample Output

```
A:ALA-49# show time  
Tue Oct 31 12:17:15 GMT 2006
```

23.25 timers

timers

Syntax

timers [**session** *ip-addr*[*label-space*]]

Context

[Tree] (tools>dump>router>ldp timers)

Full Context

tools dump router ldp timers

Description

This command dumps information for LDP timers.

Platforms

All

23.26 tls

tls

Syntax

tls

Context

[\[Tree\]](#) (show>system>security tls)

Full Context

show system security tls

Description

Commands in this context display TLS-related information.

Platforms

All

23.27 tools

tools

Syntax

tools

Context

[\[Tree\]](#) (tools)

Full Context

tools

Description

Commands in this context enable useful tools for troubleshooting.

Parameters

dump

Shows troubleshooting information.

perform

Performs troubleshooting operations.

Platforms

All

23.28 top-active-meps

top-active-meps

Syntax

```
top-active-meps [{rx-sort | tx-sort}] [clear]
```

Context

[\[Tree\]](#) (tools>dump>eth-cfm top-active-meps)

Full Context

```
tools dump eth-cfm top-active-meps
```

Description

This command displays and optionally clears the most active MEPs on the system.

Default

```
top-active-meps
```

Parameters

rx-sort

Sorts in the RX direction.

tx-sort

Sorts in the TX direction.

clear

Clears the current counters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.29 top-flows

top-flows

Syntax

top-flows *protocols* [**clear**]

Context

[**Tree**] (tools>dump>cflowd top-flows)

Full Context

tools dump cflowd top-flows

Description

This command displays the top 20 (highest traffic volume) flows for IPv4, IPv6 or MPLS traffic types collected since the cflowd top-flow table was last cleared or initialized.

Platforms

All

Output

The following output is an example of cflowd top flow information, and [Table 575: Tools Dump cflowd Top-flows Output Fields](#) describes the output fields.

Sample Output

```

1          2          3          4          5          6          7          8

Table 575: Tools Dump cflowd Top-flows Out put Fields

| Label | Description |
|--------------------|---|
| Ingress | Displays the ingress interface ID |
| Src IP | Displays the source IP address of the flow (IPv4 or IPv6) |
| Egress | Displays the egress interface ID |
| Dest IP | Displays the destination IP address of the flow (IPv4 or IPv6) |
| Pr Proto | Displays the protocol type for flow |
| TOS | Displays the Type-of-Service/DSCP butts filed markings |
| Flgs | Displays the protocol flag markings |
| Pkts | Displays the total number of packets sampled for this flow (since stats were last cleared) |
| vRtr-ID | Displays the vRouter context the flow was sample in |
| S-Port Src Port | Displays the source protocol port number |
| Msk | Displays the route prefix length for route to source IP address |
| AS | Displays the Autonomous Systems number for the source route (the AS is either originating AS or peer AS depending on cflowd configuration) |
| D-Port Dst Port | Displays the destination protocol port number |
| Msk | Displays the route prefix length for route to destination IP address (Forwarding route) |
| AS | Displays the Autonomous Systems number for the destination route (the AS is either originating AS or peer AS depending on cflowd configuration) |
| Nexthop | Displays the next-hop address used to forward traffic associated with the flow |

| Label | Description |
|--------------|---|
| Avg pkt size | Displays the average packet size of a sampled traffic associated with this flow (total number of packets sampled/total number of packets sampled) |
| Active | Displays the number of seconds the flow has been active |

23.30 top-protocols

top-protocols

Syntax

top-protocols *protocols* [**clear**]

Context

[**Tree**] (tools>dump>cflowd top-protocols)

Full Context

tools dump cflowd top-protocols

Description

This command displays the summary information for the top 20 protocol traffic seen in the cflowd cache. All statistics are calculated based on the data collected since the last clearing of the cflowd stats with clear keyword for this command.

If the **clear** optional keyword is given, then the top-flows are displayed, and then this cache is cleared.

Platforms

All

Output

The following output is an example of cflowd top protocol traffic information, and [Table 576: Tools Dump cflowd Top-protocols Fields](#) describes the output fields.

Sample Output

```
SR# tools dump cflowd top-protocols

The top 20 IPv4 protocols seen by cflowd are:
  Current Time: 08/29/2011 15:36:15
Last Cleared Time: 08/29/2011 15:35:08
Protocol ID      Total  Flows  Packets  Bytes  Packets  Duration  % Total
-----      Flows  /Sec   /Flow   /Pkt   /Sec     /Flow    Bandwidth
-----
UDP              2       0       6     100       0         6        75%
pr1              1       0       6      64       0         6        24%
```

| | | | | | | | |
|--------|---|---|---|----|---|---|------|
| TOTALS | 3 | 0 | 6 | 88 | 0 | 6 | 100% |
|--------|---|---|---|----|---|---|------|

Table 576: Tools Dump cflowd Top-protocols Fields

| Label | Description |
|---------------------|--|
| Protocol ID | Displays the IPv4 or IPv6 protocol type; this will either print the well-known protocol name or the decimal protocol number |
| Total Flows | Displays the total number of flows recorded since the last clearing of cflowd statistics with this protocol type. |
| Flows/Sec | Displays the average number of flows detected for the associated protocol type (Total flows/number of seconds since last clear) |
| Packets/Flow | Displays the average number of packets per flow (Total number of packets/total flows) |
| Bytes/Pkts | Displays the average number of bytes per packet for the associated protocol type (Total number of bytes for the associated protocol/total number of packets seen for the associated protocol) |
| Packets/Sec | Displays the average number of packets seen for the associated protocol type (Number of packets/time since last clear) |
| Duration/Flow | Displays the average lifetime of a flow for the associated protocol type (Number of seconds since last clear/total flows) |
| Bandwidth Total (%) | Displays the percentage of bandwidth consumed by the associated protocol type (Total protocol bytes/total bytes of all flows) |

23.31 topology

topology

Syntax

topology [ipv4-unicast | ipv6-unicast | ipv4-multicast | ipv6-multicast | mt *mt-id-number*] [lfa] [detail]
 [flex-algo {flex-algo-id | all}]

Context

[\[Tree\]](#) (show>router>isis topology)

Full Context

```
show router isis topology
```

Description

This command shows IS-IS topology information.

Parameters

ipv4-unicast

Displays IPv4 unicast parameters.

ipv6-unicast

Displays IPv6 unicast parameters.

ipv4-multicast

Displays IPv4 multicast parameters.

ipv6-multicast

Displays IPv6 multicast parameters.

mt *mt-id-number*

Displays multi-topology parameters.

Values 0, 2, 3, 4

lfa

Displays loop free alternative (LFA) information. This information corresponds to the backup next hops for IP links and nodes written in RTM by the base LFA feature.

detail

Displays detailed topology information.

flex-algo *flex-algo-id*

Displays information about the specified algorithm only based on the *flex-algo-id* filter.

Values 128 to 255

all

Displays topology information for all the flexible algorithms.

Platforms

All

Output

The following output is an example of router IS-IS topology output, and [Table 577: IS-IS Topology Output Fields](#) describes the output fields.

23.32 tp-interface

tp-interface

Syntax

tp-interface *interface-num* [**clear**]

Context

[[Tree](#)] (tools>dump>router>mpls tp-interface)

Full Context

tools dump router mpls tp-interface

Description

This command displays MPLS-TP interface information.

Parameters

interface-num

specifies the MPLS-TP interface

Values 1 to 4294967295

clear

clears statistics after reading

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following output is an example of MPLS TP interface information.

Sample Output

```

23.33 tp-lsp

tp-lsp

Syntax

tp-lsp [*lsp-name*] [**status** { **up** | **down**}] [**from** *ip-address* | **to** *ip-address*] [**detail**]

tp-lsp [*lsp-name*] **path** [**protecting** | **working**] [**detail**]

tp-lsp [*lsp-name*] **protection**

Context

[\[Tree\]](#) (show>router>mpls tp-lsp)

Full Context

show router mpls tp-lsp

Description

This command displays TP LSP information.

Parameters

lsp-name

Specifies the LSP name up to 64 characters in length. '*' is accepted as a wild card character.

path

Displays LSP path information.

protection

Displays LSP protection information.

up | down

Specifies the state of the LSP.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following output is an example of MPLS TP LSP information.

Sample Output

```
*A:mlstp-dutA# show router mpls tp-lsp
path
protection
to <a.b.c.d>
<lsp-name>
  "lsp-32" "lsp-33" "lsp-34" "lsp-35" "lsp-36" "lsp-37" "lsp-38" "lsp-39"
  "lsp-40" "lsp-41"
status {up | down}
from <ip-address>
detail

*A:mlstp-dutA# show router mpls tp-lsp "lsp-
"lsp-32" "lsp-33" "lsp-34" "lsp-35" "lsp-36" "lsp-37" "lsp-38" "lsp-39"
"lsp-40" "lsp-41"
*A:mlstp-dutA# show router mpls tp-lsp "lsp-32"

23.34 tp-lsp-egress-stats

tp-lsp-egress-stats

Syntax

tp-lsp-egress-stats **lsp** *lsp-name* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

Context

[\[Tree\]](#) (monitor>router>mpls tp-lsp-egress-stats)

Full Context

monitor router mpls tp-lsp-egress-stats

Description

This command monitors MPLS TP LSP egress statistics.

Parameters

lsp-name

Specifies the LSP name, up to 64 characters.

repeat

Specifies how many times the command is repeated.

Values 1 to 999

Default 10

seconds

Specifies the interval for each display, in seconds.

Values 3 to 60

Default 10

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic instead of the delta.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.35 tp-lsp-ingress-stats

tp-lsp-ingress-stats

Syntax

tp-lsp-ingress-stats *lsp* *lsp-name* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

Context

[\[Tree\]](#) (monitor>router>mpls tp-lsp-ingress-stats)

Full Context

monitor router mpls tp-lsp-ingress-stats

Description

This command monitors MPLS TP LSP ingress statistics.

Parameters

lsp-name

Specifies the LSP name, up to 64 characters.

repeat

Specifies how many times the command is repeated.

Values 1 to 999

Default 10

seconds

Specifies the interval for each display, in seconds.

Values 3 to 60

Default 10

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic instead of the delta.

Platforms

All

23.36 tp-tunnel

tp-tunnel

Syntax

tp-tunnel *lsp-name* [**clear**]

tp-tunnel id *tunnel-id* [**clear**]

Context

[\[Tree\]](#) (tools>dump>router>mpls tp-tunnel)

Full Context

tools dump router mpls tp-tunnel

Description

This command displays MPLS-TP tunnel information.

Parameters

lsp-name

specifies the LSP name, up to 64 characters

id tunnel-id

specifies the tunnel ID

Values 1 to 61440

clear

clears statistics after reading

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following output is an example of MPLS TP interface information.

Sample Output

```

tp-tunnel

Syntax

tp-tunnel

Context

[\[Tree\]](#) (tools>perform>router>mpls tp-tunnel)

Full Context

tools perform router mpls tp-tunnel

Description

Commands in this context perform Linear Protection operations on an MPLS-TP LSP.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

23.37 trace

trace

Syntax

trace [**name** *trace-name*]

Context

[\[Tree\]](#) (show>call-trace>ipoe trace)

[\[Tree\]](#) (show>call-trace trace)

Full Context

show call-trace ipoe trace

show call-trace trace

Description

This command displays information about all traces and associated parameters that are currently enabled on the system. Including the *trace-name* parameter limits the output to the specified trace only.

Parameters

trace-name

Specifies the name of the trace to be displayed.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output displays call trace information.

Sample Output

```
Node# show call-trace ipoe trace
=====
Call trace trace
=====
Trace name   : default                               Type        : ipoe
SAP ID      :
IEEE address: 00:02:00:00:00:19
Maximum jobs: 1
=====
```

[Table 578: Call Trace IPoE Trace Field Descriptions](#) describes call trace IPoE trace output fields.

Table 578: Call Trace IPoE Trace Field Descriptions

| Field | Description |
|--------------|--|
| Trace name | The name of the trace profile |
| Type | The type of the call trace |
| SAP ID | The SAP ID of the session to match by this trace |
| IEEE address | The IEEE address of the session that matches this trace |
| Maximum jobs | The maximum number of call trace jobs that are started by this trace |

trace

Syntax

trace *trace-name*

Context

[Tree] (clear>call-trace>ipoe trace)

[Tree] (clear>call-trace trace)

Full Context

clear call-trace ipoe trace

clear call-trace trace

Description

This command clears all trace jobs started by the specified trace. This command does not affect the trace command itself, and new jobs can still be executed for new sessions.

After a session is cleared, tracing for the session will not be restarted by any configured trace. Only explicitly starting a new trace with the **trace-existing-sessions** parameter can restart tracing for the session.

Parameters

trace-name

Specifies the configured name, up to 32 characters, of the trace.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

23.38 trace-profile

trace-profile

Syntax

trace-profile [detail]

trace-profile *profile-name*

Context

[Tree] (show>call-trace trace-profile)

Full Context

show call-trace trace-profile

Description

This command provides an overview of all configured profiles or details of a specific profile. If the detail option is specified the full information for all configured profiles are displayed.

Parameters

detail

Displays detailed trace profile information.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output displays call-trace trace-profile information.

Sample Output

```
Node# show call-trace trace-profile "default"
=====
Call-trace trace profile
=====
Profile name           : default
Description            : none
Live output           : none
Format                : pcap
Size limit             : 10 MB
Time limit            : 86400 secs
-----
Number of profiles : 1

```

23.39 traffic-capture

traffic-capture

Syntax

traffic-capture detail url *file-url*

traffic-capture status

Context

[\[Tree\]](#) (tools>dump>app-assure>group traffic-capture)

Full Context

tools dump application-assurance group traffic-capture

Description

This command displays application-assurance traffic-capture information.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.40 traffic-forward

traffic-forward

Syntax

traffic-forward tunnel-type *tunnel-type* [**type** *type*] **isa** *mda*

traffic-forward tunnel-type *tunnel-type* [**type** *type*] **esa-vm** *esa-id/vm-id*

Context

[Tree] (show>isa>stats>ip-tunnel-stats traffic-forward)

Full Context

show isa statistics ip-tunnel-stats traffic-forward

Description

This command displays traffic forward statistics for the specified tunnel-type on the specified ISA.

The statistics includes the following information:

- The number of bidirectional (encapsulated and decapsulated) packets
- The number of encapsulated packets
- The number of decapsulated packets
- The number of bidirectional (encapsulated and decapsulated) kilobytes
- The number of kilobytes for encapsulated traffic
- The number of kilobytes for decapsulated traffic

In the output, 1 kilobyte equals 210 bytes.

Parameters

tunnel-type

Displays the type of the tunnel.

Values gre, ip-in-ip, l2tpv3

mda

Displays the ISA ID.

Values slot/mda

type

Displays the type of breakdown counter.

Values bidir-pkts, bidir-kbs, encap-pkts, encap-kbs, decap-pkts, decap-kbs

esa-vm

Displays the ID of the configured ESA and ESA VM.

| Values | esa-vm: | esa-id/vm-id | |
|--------|---------|--------------|---------|
| | | esa-id | 1 to 16 |
| | | vm-id | 1 to 4 |

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following is an example output of the **show router statistics ip-tunnel-stats traffic-forward** command.

Output Sample

```
show>isa>stats>ip-tunnel-stats# traffic-forward tunnel-type gre isa 1/2

traffic-forward

Syntax

```
traffic-forward [type type] esa-vm esa-id/vm-id
traffic-forward [type type] gateway name
traffic-forward [type type] isa mda
traffic-forward [type type] gateway name dynamic-tunnel ip-address:port
traffic-forward [type type] tunnel ipsec-tunnel-name
```

Context

[Tree] (show>isa>stats>ipsec-stats traffic-forward)

Full Context

```
show isa statistics ipsec-stats traffic-forward
```

Description

This command displays traffic forward statistics of the specified scope.

This command supports following scopes:

- per system
- per ISA
- per tunnel group
- per IPsec GW

The statistics include:

- The number of bidirectional encrypted and decrypted packets
- The number of encrypted packets
- The number of decrypted packets per second
- The number of bidirectional (encrypted and decrypted) in kilobytes
- The number of bidirectional encrypted bits in kilobytes
- The number of bidirectional decrypted bits in kilobytes

1 kilobyte equals 2^{10} bytes

The start time indicates the starting timestamp of the measurement. The sampling duration indicates the duration of the measurement.

Parameters

esa-vm

Displays the ID of the configured ESA and ESA VM.

Values

| | | |
|---------|---------------------|---------|
| esa-vm: | <i>esa-id/vm-id</i> | |
| | <i>esa-id</i> | 1 to 16 |
| | <i>vm-id</i> | 1 to 4 |

name

Displays information about the name of the IPsec GW up to 32 characters in length.

mda

Displays information about the specified ISA.

Values slot/mda

tunnel-group-id

Displays information about the specified tunnel group ID.

Values 1 to 16

ip-address:port

Displays information about the IP address and port of the peer for dynamic tunneling.

ipsec-tunnel-name

Specifies the name of the static LAN-to-LAN tunnel up to 32 characters in length.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of the **show isa stats ipsec-stats traffic forward isa** command.

Sample Output

```
show>isa>stats>ipsec-stats# traffic-forward isa 1/2

23.41 traffic-statistics

traffic-statistics

Syntax

traffic-statistics prefix *ip-prefix/ip-prefix-length*

traffic-statistics family *family*

traffic-statistics

Context

[\[Tree\]](#) (show>router>bgp traffic-statistics)

Full Context

show router bgp traffic-statistics

Description

This command displays BGP-LU traffic statistics.

Parameters

prefix *ip-prefix/ip-prefix-length*

Displays statistics for the specified prefix.

- Values**
- ipv4-prefix:
 - a.b.c.d
 - ipv4-prefix-length:
 - 0 to 32
 - ipv6-prefix:
 - x:x:x:x:x:x:x (eight 16-bit pieces)
 - x:x:x:x:x:d.d.d.d
 - x - [0 to FFFF]H
 - d - [0 to 255]D
 - ipv6-prefix-length:
 - 0 to 128

family *family*

Displays statistics for the specified address family.

Values label-ipv4, label-ipv6

Platforms

All

Output

The following is an example of traffic statistics information.

Sample Output

```

=====
BGP Router ID:10.20.1.2      AS:100      Local AS:100
=====

Egress Oper State : Unknown
Egress packets : 0      Egress Octets : 0
-----
-----

```

traffic-statistics

Syntax

```

traffic-statistics prefix ip-prefix/ip-prefix-length [ingress | egress]
traffic-statistics family {label-ipv4 | label-ipv6} [ingress | egress]
traffic-statistics [ingress | egress]

```

Context

[\[Tree\]](#) (clear>router>bgp traffic-statistics)

Full Context

```
clear router bgp traffic-statistics
```

Description

This command clears BGP-LU traffic statistics.

Parameters

prefix *ip-prefix/ip-prefix-length*
Clears statistics for the specified prefix.

- Values**
- ipv4-prefix:
 - a.b.c.d
 - ipv4-prefix-length:
 - 0 to 32

ipv6-prefix:

- x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x - [0 to FFFF]H
- d - [0 to 255]D

ipv6-prefix-length:

- 0 to 128

ingress

Clears statistics on ingress data-path.

egress

Clears statistics on egress data-path.

family label-ipv4 | label-ipv6

Clears statistics for the specified address family.

Platforms

All

traffic-statistics

Syntax

traffic-statistics prefix *ip-prefix/ip-prefix-length* [**interval** *seconds*] [**repeat** *repeat*] [**absolute**| **rate**]

Context

[\[Tree\]](#) (monitor>router>bgp traffic-statistics)

Full Context

monitor router bgp traffic-statistics

Description

This command monitors BGP traffic statistics.

Parameters

prefix *ip-prefix/ip-prefix-length*

Clears statistics for the specified prefix.

Values ipv4-prefix:

- a.b.c.d

ipv4-prefix-length:

- 0 to 32

ipv6-prefix:

- x:x:x:x:x:x:x (eight 16-bit pieces)
 - x:x:x:x:x:d.d.d
 - x - [0 to FFFF]H
 - d - [0 to 255]D
- ipv6-prefix-length:
- 0 to 128

seconds

Configures the interval for each display in seconds.

Values 3 to 60

Default 10

repeat

Configures how many times the command is repeated.

Values 1 to 999

Default 10

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic instead of the delta.

23.43 transform

transform

Syntax

transform [*transform-id*]

Context

[\[Tree\]](#) (show>ipsec transform)

Full Context

show ipsec transform

Description

This command displays information of the specified IPsec transform or lists all configured IKE transform information when the IKE transform ID is not specified.

Parameters

transform-id

Specifies an IPsec transform entry.

Values 1 to 2048

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following is an example output for the **show ipsec transform** command.

Sample Output

```

NODE# show ipsec transform

```

transport-mode tunnel-type {gre} tunnel-name *tunnel-name* [saved-key]

Context

[\[Tree\]](#) (clear>ipsec transport-mode)

Full Context

clear ipsec transport-mode

Description

This command clears transport-mode tunnels data.

Parameters

tunnel-name

Clears data associated with the specified tunnel, up to 32 characters.

mda

Clears all static tunnels terminated on the specified ISA.

saved-key

Clears the saved IKE and ESP keys for the specified tunnel.

esa-vm

Displays the ID of the configured ESA and ESA VM.

Values

| | | |
|---------|---------------------|---------|
| esa-vm: | <i>esa-id/vm-id</i> | |
| | <i>esa-id</i> | 1 to 16 |
| | <i>vm-id</i> | 1 to 4 |

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.48 trap-suppress

trap-suppress

Syntax

trap-suppress *number-of-traps time-interval*

Context

[\[Tree\]](#) (tools>perform>router>mpls trap-suppress)

Full Context

tools perform router mpls trap-suppress

Description

This command modifies thresholds for trap suppression. The *time-interval* parameter is used to suppress traps after a certain number of traps have been raised within the *time-interval* period of time. By executing this command, there will be no more than *number-of-traps* within *time-interval*.

Parameters

number-of-traps

Specifies to the number of traps raised within a period of time before suppression occurs.

Values 100 to 1000, in multiples of 100

time-interval

Specifies the period of time before trap-suppression can occur, depending upon the number of traps received in that period of time.

Values 1 to 300

Platforms

All

Context

[\[Tree\]](#) (show>ipsec ts-list)

Full Context

show ipsec ts-list

Description

This command displays IPsec traffic-selector list (TS-list) information.

Entering this command without a parameter will list all configured TS-lists.

Entering this command with the **association** parameter will list all IPsec gateways that use the specified TS-list.

Entering this command with the **local** or **local-entry** parameter will list all or specified local entries of the specified TS-list.

Entering this command with the **remote** or **remote-entry** parameter will list all or specified remote entries of the specified TS-list.

Parameters

list-name

The traffic-selector list name.

association

Displays all associations of the TS-list.

local-entry [1 to 32]

The entry ID of a local entry.

remote-entry [1 to 32]

The entry ID of a remote entry.

local

Displays all local entries.

remote

Displays all remote entries.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of TS-list information.

Sample Output

```

Context

[[Tree](#)] (show>router>l2tp tunnel)

Full Context

show router l2tp tunnel

Description

This command displays L2TP tunnel operational information.

Parameters

statistics

Displays L2TP tunnel statistics.

detail

Displays detailed L2TP tunnel information.

ip-address

Displays information for the specified peer IP address.

Values The following values apply to the 7750 SR:

ipv4-address a.b.c.d (host bits must be 0)

ipv6-address x:x:x:x:x:x:x[-interface]

x:x:x:x:x.d.d.d[-interface]

x: [0 to FFFF]H

d: [0 to 255]D

interface: 32 characters maximum, mandatory for link local addresses

Values The following values apply to the 7450 ESS:

ipv4-address: a.b.c.d (host bits must be 0)

tunnel-state

Displays the operational state of the L2TP session.

Values closed, closed-by-peer, draining, drained, established, established-idle, idle, wait-reply, wait-conn

remote-tunnel-id

Displays information for the specified remote tunnel ID.

group-name

Displays L2TP tunnel information for the specified tunnel group.

assignment-id

Specifies a string that distinguishes this Layer Two Tunneling Protocol tunnel.

local-host-name

Specifies a local host name used by this system.

remote-host-name

Specifies a remote host name used by this system.

policy-name

Displays the RADIUS accounting policy.

bl-state

Displays the denylist state of the L2TP session.

fo-state

Displays the failover state of the L2TP session.

recovery-state

Displays the recovery state of the L2TP session.

recovery-method

Displays the recovery method of the L2TP session.

srrp-instance

Specifies the SRRP instance identification.

Values 0 to 4294967295

behavior

Specifies the control message behavior.

Values handle, forward-to-mcs-peer

transport-type

Specifies that IP or UDP should be used as the transport type for the L2TP session.

Values ip, udp

remote-connection-id

Displays information for the specified remote connection ID.

tunnel-id

Displays information for the specified ID of a L2TP tunnel. In L2TP version 2, it is the 16-bit tunnel ID.

Values 1 to 65535

connection-id

Specifies the identification number for a Layer Two Tunneling Protocol connection.

Values 1 to 429496729

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of L2TP tunnel operational information.

Sample Output

```
*A:Dut-C# show router l2tp tunnel
=====
Conn ID          Loc-Tu-ID Rem-Tu-ID State          Ses Active
  Group                               Ses Total
  Assignment
-----
143523840        2190      17525   established     2

tunnel

Syntax

tunnel *tunnel-name*

Context

[\[Tree\]](#) (clear>router>l2tp>group tunnel)

Full Context

clear router l2tp group tunnel

Description

This command clears L2TP tunnel data.

Parameters

tunnel-name

Clears L2TP tunnel data associated with the specified tunnel, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tunnel

Syntax

tunnel *connection-id*

Context

[\[Tree\]](#) (clear>router>l2tp tunnel)

Full Context

clear router l2tp tunnel

Description

This command clears L2TP data.

Parameters

connection-id

Specifies the L2TP tunnel connection ID.

Values 1 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tunnel

Syntax

tunnel *tunnel-name*

Context

[\[Tree\]](#) (tools>perform>router>l2tp tunnel)

[\[Tree\]](#) (tools>perform>router>l2tp>group tunnel)

Full Context

tools perform router l2tp tunnel

tools perform router l2tp group tunnel

Description

Commands in this context configure performance tools for a specified L2TP tunnel.

Parameters

tunnel-name

Specifies the L2TP tunnel name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

tunnel

Syntax

tunnel *ipsec-tunnel-name*

tunnel

tunnel count

tunnel state *state*

Context

[\[Tree\]](#) (show>ipsec tunnel)

Full Context

show ipsec tunnel

Description

This command displays IPsec tunnel information.

Parameters

ipsec-tunnel-name

Specifies the name of the tunnel up to 32 characters.

state

Specifies one of up, down, or limited

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tunnel

Syntax

tunnel *ipsec-tunnel-name* [**temp-mtu**]

tunnel *esa-vm* *esa-id/vm-id* [**saved-key**]

tunnel *isa* *mda* [**saved-key**]

tunnel *ipsec-tunnel-name* [**saved-key**]

tunnel *ipsec-tunnel-name* [**stats**] [**saved-key**]

Context

[\[Tree\]](#) (clear>ipsec tunnel)

Full Context

clear ipsec tunnel

Description

This command clears static IPsec tunnel states.

Parameters

ipsec-tunnel-name

Specifies the name of the IPsec tunnel, up to 32 characters. If the **stats**, **saved-key** or **temp-mdu** parameters are not specified, the IPsec tunnel is cleared.

saved-key

Clears the saved IKE and ESP keys for the specified tunnel.

temp-mtu

Clears the temporary MTU from MTU propagation for the specified tunnel.

stats

Clears the statistics counter for the specified tunnel.

mda

Clears all static tunnels terminated on the specified ISA.

esa-vm

Displays the ID of the configured ESA and ESA VM.

| Values | | |
|---------|---------------------|---------|
| esa-vm: | <i>esa-id/vm-id</i> | |
| | <i>esa-id</i> | 1 to 16 |
| | <i>vm-id</i> | 1 to 4 |

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tunnel

Syntax

tunnel [**type** {rx | tx}] [**prefix** *ip-address*] [**tunnel-id** *tunnel-id*]

tunnel [**prefix** *ip-address*] [**tunnel-id** *tunnel-id*] **leaf**

Context

[\[Tree\]](#) (show>router>bier tunnel)

Full Context

show router bier tunnel

Description

This command shows the BIER tunnel table used for MVPN.

Parameters

ip-address

Specifies a prefix in IP address format.

tunnel-id

Specifies a tunnel identifier.

Values 0 to 4294967295

leaf

Specifies that the tunnel leaves are displayed.

Platforms

All

Output

The following is an example of a BIER tunnel table. [Table 579: BIER Tunnel Fields](#) provides BIER tunnel table descriptions.

Sample Output

```
*A:Dut-A# show router bier tunnel prefix 10.20.1.3

Table 579: BIER Tunnel Fields

| Label | Description |
|-----------|--|
| Tunnel-id | The tunnel ID allocated for this tunnel |
| Type | The tunnel type, indicated if it is a terminating tunnel or an originating one |

| Label | Description |
|---------------|--|
| Oper | The operational status of the tunnel |
| No. of Leaves | The number of leaves associated with the tunnel if the tunnel type is tx or BFIR. This field represents the number of leafs associated with it. If the tunnel type is rx or BFER, this field is zero. |
| BFR Prefix | The BFR prefix associated with the root of the tunnel |
| Bfr-ID | The BFR ID associated with the root of the tunnel |
| Mpls Label | If the tunnel type is tx or BFIR, this field represents the egress VPRN label allocated. If the tunnel type is rx or BFER, this field represents the ingress VPRN label allocated by the root. |
| Sub-domain | The sub-domain associated with the root of the tunnel |

tunnel

Syntax

tunnel [**tunnel-id tunnel-id**] [**type** { **rx** | **tx**}]

tunnel [**tunnel-id tunnel-id**] **leaf** [**root-addr root-addr**] [**tree-id tree-id**]

Context

[\[Tree\]](#) (show>router>p2mp-sr-tree tunnel)

Full Context

show router p2mp-sr-tree tunnel

Description

This command displays details about the P2MP tunnel.

Parameters

tunnel-id

Specifies a tunnel identifier.

Values 0 to 4294967295

type

Specifies a tunnel type.

Values rx, tx

root-addr

Displays the root address.

Values a.b.c.d

tree-id

Specifies a tree identifier.

Values 0 to 4294967295

leaf

Specifies that the tunnel leaves are displayed.

Platforms

All

Output

The following is an example of a P2MP SR tree tunnel table. [Table 580: P2MP SR Tree Tunnel Fields](#) provides the P2MP SR tree tunnel table descriptions.

Sample Output

```
A:swsim100>file cf3:\ # show router p2mp-sr-tree tunnel

Table 580: P2MP SR Tree Tunnel Fields

| Label | Description |
|------------|--|
| Tunnel-Id | The tunnel ID allocated for this tunnel |
| Type | The tunnel type, indicated if it is a terminating tunnel or an originating one |
| Oper | The operational status of the tunnel |
| Num Leaves | The number of leaves associated with the tunnel |
| Treeld | The tree ID associated with the root of the tunnel |
| RootAddr | The address associated with the root of the tunnel |
| Svcld | The service identifier |

tunnel

Syntax

tunnel [**in-label** *in-label*]

Context

[Tree] (tools>dump>router>sr tunnel)

Full Context

tools dump router segment-routing tunnel

Description

This command displays segment routing tunnel information.

Parameters

in-label

Specifies the filter to match against the ingress label.

Values 0 to 4294967295

Platforms

All

Output

The following outputs are examples of segment routing tunnel operational information, and the following table describes the output fields.

Sample Output

```
*A:Dut-F# tools dump router segment-routing tunnel

Table 581: Tunnel Group Fields

| Label | Description |
|---------------------|---|
| ISA Group | The ISA group ID |
| Admin State | The administrative state of the tunnel group |
| Oper state | The operational state of the tunnel group |
| Responder-Only | The tunnel setup under the specified tunnel group |
| Non-Active Members | The non-active ESA and ESA VM |
| Required Active Qty | The number of the required active members |
| Active Members | The active ESA and ESA VM |
| Reassembly (msecs) | The time of reassembly |
| ISA Chassis | The number of ISA chassis |
| Oper Flags | The operational status flag of the tunnel |
| Grp IPsec Tnls | The number of group IPsec tunnels |
| Grp IPsec Max Tnls | The maximum number of group IPsec tunnels |

| Label | Description |
|-----------------------|---|
| Grp IP Tunnels | The number of group IP tunnels |
| Grp IP Max Tunnels | The maximum number of group IP tunnels |
| ISA Scale Mode | The number of tunnels on each ISA of the tunnel group |
| Statistics Collection | Specifies whether statistics collection is enabled |
| CPU Usage | Specifies whether the CPU usage of all the processes and protocols is enabled |
| Gw Traffic Forward | Specifies whether the traffic forwarded on the GW is enabled |
| IGP-Shared | Identifies a local node as a shared SID and is programmed in an ILM as such. An ILM can only be programmed once and has a single owner. When a node SID is shared, a local duplicate may exist between instances and the ISIS, OSPF, and OSPF3 protocols. |

tunnel

Syntax

tunnel [{*ip-address* | *ipv6-address*}] [**detail**]

tunnel [{*ip-address* | *ipv6-address*}] **egress-stats**

Context

[\[Tree\]](#) (show>router>rib-api tunnel)

Full Context

show router rib-api tunnel

Description

This command displays RIB-API tunnel information.

Parameters

ip-address

Specifies the IPv4 address of the RIB-API tunnel up to 64 characters.

ipv6-address

Specifies the IPv6 address of the RIB-API tunnel up to 64 characters.

detail

Displays detailed RIB-API tunnel information.

egress-stats

Displays egress statistics of all instances for the specified RIB-API tunnel.

Platforms

All

Output

The following output is an example of RIB-API tunnel information.

Sample Output

```
show router rib-api tunnel 10.20.1.5 egress-stats
=====

tunnel

Syntax

tunnel {*ip-address* | *ipv6-address*} **preference** *preference* **client-tag** *client-tag* **egress-stats**

Context

[\[Tree\]](#) (clear>router>rib-api tunnel)

Full Context

```
clear router rib-api tunnel
```

Description

Clears the egress statistics of the specified RIB-API tunnel.

Parameters

ip-address

Specifies the IPv4 address of the RIB-API tunnel up to 64 characters.

ipv6-address

Specifies the IPv6 address of the RIB-API tunnel up to 64 characters.

preference

Specifies the preference of the specified RIB-API entry.

Values 0 to 4294967295

client-tag

Specifies the client tag of the specified RIB-API entry.

Values 0 to 4294967295

egress

Specifies to clear the egress statistics.

tunnel

Syntax

tunnel *gre-tunnel-name* **stats**

tunnel *gre-tunnel-name* **temp-mtu**

Context

[\[Tree\]](#) (clear>ip tunnel)

Full Context

clear ip tunnel

Description

This command clears IP tunnel statistics.

Parameters

gre-tunnel-name

Specifies the GRE tunnel name, up to 32 characters.

stats

Clears the statistics counter for the specified tunnel.

temp-mtu

Clears temporary MTU values from the MTU propagation for the specified tunnel.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

tunnel

Syntax

tunnel {*ip-address* | *ipv6-address*} **preference** *preference* **client-tag** *client-tag* **egress-stats** [**interval** *seconds*] [**repeat** *repeat*] [{**absolute** | **rate**}]

Context

[\[Tree\]](#) (monitor>router>rib-api tunnel)

Full Context

monitor router rib-api tunnel

Description

This command monitors the egress statistics of the specified RIB-API tunnel.

Parameters

ip-address

Specifies the IPv4 address of the RIB-API tunnel up to 64 characters.

ipv6-address

Specifies the IPv6 address of the RIB-API tunnel up to 64 characters.

preference

Specifies the preference of the specified RIB-API entry.

Values 0 to 4294967295

client-tag

Specifies the client tag of the specified RIB-API entry.

Values 0 to 4294967295

egress-stats

Specifies to monitor the egress statistics of the specified RIB-API tunnel.

seconds

Configures the interval for each display in seconds.

Values 3 to 60

repeat

Configures how many times the command is repeated.

Values 1 to 999

absolute

Displays the absolute statistics of the specified RIB-API tunnel.

rate

Displays the rate-per-second statistics of the specified RIB-API tunnel.

Platforms

All

tunnel

tunnel-group *tunnel-group-id* [**detail**]

tunnel-group **tunnel-group-id**

Context

[\[Tree\]](#) (show>isa tunnel-group)

Full Context

show isa tunnel-group

Description

Commands in this context display tunnel information.

Parameters

association

Displays association applicable to the specified tunnel group.

esa-vm

Specifies the configured ESA and ESA VM.

Values

| | | |
|----------------|---------------------|---------|
| <i>esa-vm:</i> | <i>esa-id/vm-id</i> | |
| | <i>esa-id</i> | 1 to 16 |
| | <i>vm-id</i> | 1 to 4 |

mda-id

Displays information about the specified ISA.

Values slot/mda

detail

Specifies the detailed ESA VM information.

tunnel-group-id

Displays information about the specified tunnel group ID.

Values 1 to 16

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following is an example of the tunnel group information. [Table 582: Tunnel group Fields](#) provides tunnel group descriptions.

show router pim tunnel-interface

Description

This command displays PIM tunnel interface information.

Parameters

ip-int-name

Displays information about the specified IP interface name, up to 32 characters.

mt-int-name

Displays information about the Multicast Tunnel (MT) interface for a VPRN.

Values *vprn-id-mt-grp-ip-address*

int-ip-address

Displays information about the interface IPv4 or IPv6 address.

grp-ip-address

Displays information about the IP multicast group address, or 0.

ip-address

Displays information about the source or RP IPv4 or IPv6 address.

type

Displays information about the type of entry.

Values *starstarrp, starg, sg*

detail

Displays detailed interface information.

family

Displays family information.

Values *ipv4, ipv6*

tunnel-qos

Syntax

tunnel-qos [**detail**]

tunnel-qos remote-ip *ip-address* [**local-ip** *ip-address*] [**detail**]

Context

[\[Tree\]](#) (show>router>wlan-gw tunnel-qos)

Full Context

show router wlan-gw tunnel-qos

Description

This command displays tunnel-QoS resource information.

Parameters

ip-address

Specifies the IPv4 address of the access point that is the source IPv4 address in the tunnel header of received packets.

Values

ipv4-address: a.b.c.d

ipv6-address : x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

ip-address

Specifies the IPv4 address of this system that is the destination IPv4 address in the tunnel header of received packets.

Values

ipv4-address: a.b.c.d

ipv6-address : x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

detail

Displays detailed information.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

Context

[\[Tree\]](#) (show>isa>stats>ipsec-stats tunnel-setup-rate)

Full Context

show isa statistics ipsec-stats tunnel-setup-rate

Description

This command displays IPsec tunnel setup rate statistics of the specified scope.

The system collects statistics every hour for the last 24 hour period per wall clock. A current value is also included in the output.

This command supports following scopes:

- per system
- per ISA

- per tunnel group
- per IPsec GW

The statistics include the following setup rates:

- static tunnel
- dynamic LAN-to-LAN tunnel
- remote access tunnel
- all types of tunnel

The start time indicates the starting timestamp of measurement. The sampling duration indicates the duration of measurement.

Parameters

name

Displays information about the name of the IPsec GW up to 32 characters in length.

mda

Displays information about the specified ISA.

Values slot/mda

tunnel-group-id

Displays information about the specified tunnel group ID.

Values 1 to 16

count

Displays information for the number of statistics intervals to be displayed (starting with the most recent).

Values 1 to 24

minutes

Displays information about the specified period covered by the statistics to be displayed (starting with the most recent).

Values 1 to 1440

type

Displays information about the specified tunnel type associated with this IPsec GW.

Values all, sl2l, dl2l, ra

current

Displays information about the current statistic value. The values of count and minutes are ignored by the system once this parameter is specified.

show-oid

Displays information about the OID of the current statistical value.

esa-vm

Displays the ID of the configured ESA and ESA VM.

| Values | esa-vm: | esa-id/vm-id | |
|--------|---------|--------------|---------|
| | | esa-id | 1 to 16 |
| | | vm-id | 1 to 4 |

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

23.59 tunnel-table

tunnel-table

Syntax

tunnel-table summary [**ipv4** | **ipv6**]

tunnel-table [*ip-prefix/mask*] [**protocol** *protocol*] [**alternative**] [**ipv4** | **ipv6**] [**detail**] [**instance** *instance-id*]

tunnel-table mpls-tp

tunnel-table [*ip-prefix/mask*] **sdp** *sdp-id*

Context

[\[Tree\]](#) (show>router tunnel-table)

Full Context

show router tunnel-table

Description

This command displays tunnel table information.

Auto-bind GRE tunnels are not displayed in the **show** command output. GRE tunnels are not the same as SDP tunnels that use the GRE encapsulation type. When the **auto-bind-tunnel** command is used when configuring a VPRN service, it means the MP-BGP NH resolution is referring to a core routing instance for IP reachability. For a VPRN service this object specifies the lookup to be used by the routing instance if no SDP to the destination exists.

Parameters

summary

Displays summary tunnel table information.

ip-prefix/mask

Displays the specified destination IP address and mask of the table tunnel.

Values for ipv4-prefix: a.b.c.d (host bits must be 0)

for ipv4-prefix-le: 0 to 32

for ipv6-prefix:

- x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x: [0 to FFFF] H
- d: [0 to 255] D

for ipv6-prefix-le: 0 to 128

ipv4

Displays only tunnel table information for IPv4 addresses.

ipv6

Displays only tunnel table information for IPv6 addresses.

protocol

Displays LDP protocol information.

Values bgp, bgp-epe, fpe, isis, ldp, mpls-fwd-policy, ospf, ospf3, rib-api, rsvp, sdp, sr-policy, sr-te, srv6-isis, srv6-policy, udp

Note:

It is possible that a specific platform only supports a subset of the above protocol values.

alternative

Displays backup route details.

detail

Displays detailed information.

instance-id

Specifies the IGP instance of the tunnel table

Values For isis — 0 to 127
For ospf — 0 to 31
For ospfv3 —
• 0 to 31 (when ospfv3 is used for IPv6)
• 64 to 95 (when ospfv3 is used for IPv4)

Note:

It is possible that a specific platform only supports a subset of the above values.

mpls-tp

Displays MPLS TP tunnel table information.

sdp-id

Displays information pertaining to the specified SDP.

Values 1 to 17407

Platforms

All

Output

The following outputs are examples of tunnel table information, and [Table 584: Show Tunnel Table Field Descriptions](#) describes the output fields.

Context

[\[Tree\]](#) (show>router>wlan-gw tunnels)

Full Context

show router wlan-gw tunnels

Description

This command displays tunnel operation information.

Parameters

ip-address

Specifies the local IP address of this system that is the destination IP address in the tunnel header of received packets.

Values

ip-address: ipv4-address - a.b.c.d
 ipv6-address : x:x:x:x:x:x:x (eight 16-bit pieces)
 x:x:x:x:x:d.d.d.d
 x - [0 to FFFF]H
 d - [0 to 255]D

ip-address

Specifies the remote IP address of the access point that is the source IP address in the tunnel header of received packets.

Values

ip-address: ipv4-address - a.b.c.d
 ipv6-address : x:x:x:x:x:x:x (eight 16-bit pieces)
 x:x:x:x:x:d.d.d.d
 x - [0 to FFFF]H
 d - [0 to 255]D

wlan-gw-group-id

Specifies the identifier of the WLAN gateway ISA group that terminates GRE for this group interface.

Values 1 to 4

member

Specifies the identifier of this WLAN gateway ISA group member.

Values 1 to 255

summary

Displays a summary of the specified parameter.

detail

Displays detailed information.

ue

Displays information for the specified User Equipment.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of WLAN-GW tunnel information.

Sample Output

Note:

The remote/local IP addresses are locally generated for VLAN tunnels.

tunnels

Syntax

tunnels [router *router-name*] [**remote-ip** *ip-address*] [**local-ip** *ip-address*] [**encapsulation** *encap* [*encap*]
 [**qtag1** *qtag*] [**qtag2** *qtag*] [**ap-sap** *sap-id*] [**min-num-ue** *minimum*] [**max-num-ue** *maximum*] [**ap-**
mac-learn-failed { **true** | **false**}] [**get-num-results**] [**addr-family** *family*] [**ue-type** *ue-type* [*ue-type*]]

Context

[\[Tree\]](#) (show>subscr-mgmt>wlan-gw tunnels)

Full Context

```
show subscriber-mgmt wlan-gw tunnels
```

Description

This command displays all the WLAN-GW tunnels matching the specified criteria. Unlike the similar command in the **show>router>vprn** context, this command also includes information on tunnels containing ISA-only UEs such as migrant, DSM and I2-wholesale.

Parameters

router-name

Specifies the name or ID of the router where the tunnel terminates.

ip-address

Specifies the IPv4 or IPv6 address indicating one, or both, of the tunnel endpoint IP addresses.

encap

Specifies up to three tunnel encapsulation types, for example GRE, L2TP, or VLAN.

qtag

Specifies the Q-tags specifying the I2-ap-delimiting tags.

sap-id

Specifies the SAP-ID of the I2-ap SAP.

minimum

Specifies the minimum number of UEs on the tunnel, after applying the UE type filter.

maximum

Specifies the maximum number of UEs on the tunnel, after applying the UE type filter.

ap-mac-learn-failed true | false

Filters the results to display only tunnels that have learned the AP-MAC (**false**) or have not learned the AP-MAC (**true**).

get-num-results

Displays the total number of tunnels at the end of each tunnel record.

family

Specifies the tunnel's IP family type (IPv4 or IPv6).

ue-type

Filters up to five display based on the presence of specified UE types and is used in conjunction with **min-num-ue** and **max-num-ue**.

Values migrant, dsm, l2w, esm, or xcon

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following is an example of WLAN-GW tunnels.

Sample Output

```
Node# show subscriber-mgmt wlan-gw tunnels

Table 586: Output Fields: TWAMP Light

| Label | Description |
|-----------------------|---|
| TWAMP Light Reflector | |
| Admin State | The administrative state of the reflector Up — The server or prefix is administratively enabled (no shutdown) in configuration Down — The server or prefix is administratively disabled (shutdown) in configuration |
| UDP Port | The UDP port that the reflector is listening on for test packets |
| IPv6 UDP Checksum 0 | The processing of received IPv6 UDP checksum 0 packets is either allowed or disallowed |

| Label | Description |
|----------------------|--|
| Up Time | The time since the server process was started, measured in days (d), hours, minutes, and seconds |
| Test Frames Received | The total number of TWAMP Light test packets received from session senders on the reflector |
| Test Frames Sent | The total number of TWAMP Light test packets transmitted by the reflector to session senders |
| Prefix | A list of prefixes from which the reflector allows TWAMP Light tests |
| Description | The configured description for the prefix |

twamp-light

Syntax

twamp-light [*interval seconds*] [*repeat repeat*] [*absolute | rate*] [*delay | loss*]

Context

[\[Tree\]](#) (monitor>oam-pm>session twamp-light)

Full Context

monitor oam-pm session twamp-light

Description

This command monitors the IP Two Way Active Measurement Protocol Light (TWAMP Light) statistics for the specified test's raw measurement interval.

Parameters

seconds

Specifies the time interval, in seconds.

Values 3 to 60

Default 10

repeat

Specifies the number of times the command is repeated.

Values 1 to 999

Default 10

absolute

Specifies that the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

rate

Specifies that the rate-per-second is displayed.

Default delta

delay

Specifies the delay metrics are displayed.

Default delay

loss

Specifies the loss metrics are displayed.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

twamp-light

Syntax

twamp-light

Context

[\[Tree\]](#) (show>oam-pm>stats>session twamp-light)

Full Context

show oam-pm statistics session twamp-light

Description

This command selects the session's TWAMP-light test for the statistical display.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

ue

Syntax

ue [*ieee-address*] [**detail**]

Context

[\[Tree\]](#) (show>call-trace>wlan-gw ue)

Full Context

show call-trace wlan-gw ue

Description

This command gives an overview of either all traces or a specific trace on the WLAN-GW.

Parameters

ieee-address

Displays information about the MAC address of this UE.

detail

Displays detailed information about the job.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of traces of the UE being monitored.

Sample Output

```

ue

Syntax

ue [*vlan qtag*] [*mpls-label label*] [*retail-svc-id service-id*] [*ssid service-set-id*] [*previous-access-point ip-address*] [*bd bridge-id*]

ue mac *ieee-address* [*bd bridge-id*]

Context

[\[Tree\]](#) (show>subscr-mgmt>wlan-gw ue)

Full Context

show subscriber-mgmt wlan-gw ue

Description

This command displays User Equipment (UE) information.

Parameters

qtag

Displays information about the VLAN Q-tag present in the traffic received from this UE.

Values 1 to 4095

label

Displays information about the MPLS label present in the traffic received from this UE.

service-id

Specifies an existing service ID. If no *svc-id* is specified then it indicates that the interface is a network interface in the Base router instance.

Values {*id* | *svc-name*}

id: 1 to 2147483647

svc-name: Specifies an existing service name, up to 64 characters (*svc-name* is an alias for input only. The *svc-name*

gets replaced with an id automatically by SR OS in the configuration)

service-set-id

Displays information about the Service Set ID (SSID) of this UE.

ip-address

Displays information about the IP address of the previous Access Point (AP) of this UE.

bridge-id

Displays specified HLE bridge domain information of this UE.

Values 1 to 4294967295

ieee-address

Displays information about the MAC address of this UE.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following displays WLAN-GW information.

Sample Output

```
System# show subscriber-mgmt wlan-gw ue

24.2 un-sid

un-sid

Syntax

un-sid [mt {0 | 2}] [**prefix** *ipv6-prefix*[/*prefix-length*]] [**adv-router** *system-id* | *hostname*] [**algo** *algo-id*]

Context

[Tree] (show>router>isis>srv6 un-sid)

Full Context

show router isis segment-routing-v6 un-sid

Description

This command displays IS-IS SRv6 uN SIDs.

Parameters

***ipv6-prefix*[/*prefix-length*]**

Displays routes only matching the specified IP address and length.

Values *ipv6-prefix*[/*prefix*]: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

prefix-length: 1 to 128

system-id | hostname

Displays information for the specific IS-IS advertising router. The host name can be up to 38 characters.

algo-id

Displays information for the specified algorithm.

Values 0 to 255

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

Output

[Table 587: uN SID Output](#) describes the uN SID output fields.

Use the following command to display uN SID information.

```
show router isis segment-routing-v6 un-sid
```

Sample Output

```

24.5 unknown-origin

unknown-origin

Syntax

unknown-origin

Context

[\[Tree\]](#) (show>subscr-mgmt>errors unknown-origin)

Full Context

show subscriber-mgmt errors unknown-origin

Description

This command lists errors of an unknown origin. Errors shown do have a corresponding SAP ID or a SDP ID.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

24.6 unsubscribe-from

unsubscribe-from

Syntax

unsubscribe-from log-id *log-id*

Context

[\[Tree\]](#) (tools>perform>log unsubscribe-from)

Full Context

tools perform log unsubscribe-from

Description

This command cancels the subscription of the current CLI session to the specified CLI log.

Parameters

log-id

Specifies the log ID from which cancellation is requested.

Values 1 to 101

Platforms

All

24.7 update-path

update-path

Syntax

update-path {**lsp** *lsp-name* **path** *current-path-name* **new-path** *new-path-name*}

Context

[\[Tree\]](#) (tools>perform>router>mpls update-path)

Full Context

tools perform router mpls update-path

Description

This command enables you to instruct MPLS to replace the path of a primary or secondary LSP. The primary or secondary LSP path is indirectly identified via the *current-path-name* value. The same path name cannot be used more than once in a given LSP name.

This command applies to both CSPF LSP and to a non-CSPF LSP. This command will only work when the specified *current-path-name* has the adaptive option enabled. The adaptive option can be enabled at the LSP level or the path level.

The new path must have been configured in the CLI or provided via SNMP. The CLI command for entering the path is

configure router mpls path *path-name*

The command fails if any of the following conditions exist:

- The specified *current-path-name* of this LSP does not have the adaptive option enabled.
- The specified *new-path-name* value does not correspond to a previously defined path.
- The specified *new-path-name* value exists but is being used by any path of the same LSP, including this one.

When you execute this command, MPLS performs the following procedures:

- MPLS performs a single MBB attempt to move the LSP path to the new path.
- If the MBB is successful, MPLS updates the new path
 - MPLS writes the corresponding NHLFE in the data path if this path is the current backup path for the primary.

- If the current path is the active LSP path, it will update the path, write the new NHLFE in the data path that will cause traffic to switch to the new path.
- If the MBB is not successful, the path retains its current value.
- The update-path MBB has the same priority as the manual re-signal MBB.

24.8 uplink

uplink

Syntax

uplink

uplink mgw-address-cache [arec] [snaptr] [srv]

uplink mgw-address-cache apn *apn-domain-string*

Context

[\[Tree\]](#) (show>router>gtp uplink)

Full Context

show router gtp uplink

Description

This command displays operational information related to the usage of GTP uplink interfaces (Gn, S2a, S2b) in this routing context.

Parameters

arec

Displays A-records.

snaptr

Displays Straightforward-NAPTR information.

srv

Displays SRV records.

apn-domain-string

Specifies the Access Point Name (APN) of this DNS cache entry.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following is an example of GTP uplink information.

Sample Output

```
Node# show router 10 gtp uplink mgw-address-cache
=====
Mobile Gateway address cache
=====
APN : full.dotted.apn.apn.epc.mnc010.mcc206.3gppnetwork.org

uplink

uplink session imsi *imsi* *apn* *apn-string*

uplink session [**peer-address** *ip-address*] [**router** *router-instance*] [**remote-control-teid** *teid*] [**local-control-teid** *teid*] [**detail**]

uplink session imsi *imsi*

Context

[\[Tree\]](#) (show>subscr-mgmt>gtp uplink)

Full Context

show subscriber-mgmt gtp uplink

Description

This command displays box-wide operational information related to the GTP uplink interfaces (Gn, S2a, S2b).

Parameters

imsi

Specifies the IMSI (International Mobile Subscriber Identity) of this UE.

apn-string

Specifies the APN (Access Point Name).

ip-address

Specifies the IP address of the Mobile Gateway (PGW or GGSN).

router-instance

Specifies the identifier of the virtual router instance where the GTP tunnel is terminated.

remote-control-teid *teid*

Specifies the remote control plane Tunnel Endpoint Identifier (TEID).

local-control-teid *teid*

Specifies the local control plane TEID.

detail

Displays detailed information.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following is an example of GTP uplink information

Sample Output

```
Node# show subscriber-mgmt gtp uplink session detail
=====
GTP sessions
=====

24.10 upnp-mappings

upnp-mappings

Syntax

upnp-mappings subscriber *sub-ident-string* **protocol** {tcp | udp} **outside-port** *port-number*

upnp-mappings subscriber *sub-ident-string*

Context

[\[Tree\]](#) (clear>nat upnp-mappings)

Full Context

clear nat upnp-mappings

Description

This command remove UPnP mappings for the specified subscriber. If **protocol** and **outside-port** are not specified, then all UPnP mappings of subscriber will be removed.

Parameters

subscriber *sub-ident-string*

clears mappings for the specified subscriber.

protocol {tcp | udp}

Clears the mappings for the specified protocol.

outside-port *port-number*

Clears mappings for the specified outside-port.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

upnp-policy

Syntax

upnp-policy *policy-name*

upnp-policy *policy-name* **statistics**

upnp-policy

Context

[\[Tree\]](#) (show>service>upnp upnp-policy)

Full Context

show service upnp upnp-policy

Description

This commands displays upnp-policy related information.

Without any parameters the system outputs a list of configured UPnP policies.

Parameters

policy-name

The system displays the configuration of the specified policy.

statistics

The system displays statistics for the specified policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following is sample output for this command.

Sample Output

```

24.14 url-filter

url-filter

Syntax

url-filter [*url-filter-name*]

url-filter *url-filter-name* **isa** *mda-id/esa-vm-id* [**detail**]

url-filter *url-filter-name* **web-service** [**profile** *profile-name*]

Context

[\[Tree\]](#) (show>app-assure>group url-filter)

Full Context

show application-assurance group url-filter

Description

This command displays information about the configured url-filter policy along with some associated raw statistics. These output statistics are:

- Vlan Id: Vlan id used by the aa interfaces

- Admin Status: Up / Down
- Oper Status: Up / Down
- Oper Flags: adminDown, no-aa-if, aa-if-down, icap-server-down
- Default Action: default policy action taken by the url-filter
- ICAP HTTP Redirect: HTTP redirect Policy
- AQP Referenced: Yes/No
- HTTP Request: Number of subscriber HTTP requests
- HTTP Errors: Impossible to send an ICAP request, this can be caused by either no TCP connection available, associated flow with a drop action due to another aqp policy, system resource exhausted
- ICAP Request: Number of ICAP request sent
- ICAP Errors: ICAP request timeout, unexpected ICAP response, internal TCP errors.
- Custom-x-header: Name of the custom-x-header, if configured. If it is not configured, the value is "Not Specified".

In addition to these counters the system will count the type of action taken by the url-filter policy (allow, block, redirect, default) as well as the type of responses received from the icap server (allow, block, redirect, late).

Parameters

url-filter-name

Specifies the name of the url-filter policy.

mda-id/esa-vm-id

Specifies the mda-id/esa-vm-id reference of the ISA card.

detail

Specifies detailed statistics related to the ISA card.

profile-name

Specifies the name of a configured profile for web service, up to 256characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following is an example show output for the **url-filter** command.

[Table 589: Web-service URL Filter Show Command Field Descriptions](#) describes the output fields.

| File Deployed to ISA | [Yes No] - This flag describes if the file located in the compact flash is the one deployed in the ISA, in the event the file is overwritten and before the admin upgrade command is used this flag will display "No". |
| Upgrade Statistics | |
| Last Success | Last time the list was successfully upgraded |
| File Name | File name for the last successful upgrade |
| URL Entries | Number of URLs loaded at the last success and percentage to full |
| URL Characters | Number of characters loaded at the last success and percentage to full |
| URL Host Expr Entries | URL host expression entries |
| Blank/CommentLines | Number of blank or commented out lines |
| Last Attempt | Last time the operator tried to upgrade the list |
| Result | [Success Failure]. Result of the last upgrade |
| File Name | File name for the last upgrade attempt |

24.16 usage-monitor

usage-monitor

Syntax

usage-monitor app-group [*app-group-name*] **count**
usage-monitor application [*application-name*] **count**
usage-monitor charging-group [*charging-group-name*] **count**
usage-monitor count
usage-monitor status

Context

[\[Tree\]](#) (show>app-assure>group>aa-sub usage-monitor)

Full Context

show application-assurance group aa-sub usage-monitor

Description

This command displays per-subscriber usage-monitoring statistics.

Parameters

app-group-name

Specifies an application group name, up to 32 characters.

application-name

Specifies an application name, up to 32 characters.

charging-group-name

Specifies a charging group name, up to 32 characters.

count

Displays counters.

status

Displays the status.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

24.17 user

user

Syntax

user [*user-id*] [**detail**]

user [*user-id*] **lockout**

Context

[\[Tree\]](#) (show>system>security user)

Full Context

show system security user

Description

This command displays user registration information.

If no command line options are specified, summary information for all users displays.

Parameters

user-id

Displays information for the specified user.

Default All users

detail

Displays detailed user information to the summary output.

lockout

Displays information about any users who are currently locked out.

Platforms

All

Output

The following are examples of user output information.

[Table 591: Show System Security User Output Fields](#) describes user output fields.

Sample Output

```

Table 591: Show System Security User Output Fields

| Label | Description |
|------------------|--|
| User ID | The name of a system user. |
| Users | |
| New Pwd | y — The user must change their password at the next login. n — The user does not need to change their password at the next login. |
| User Permissions | console: y — The user is authorized for console access. n — The user is not authorized for console access. ftp: |

| Label | Description |
|----------------------------------|--|
| | <p>y — The user is authorized for FTP access. n — The user is not authorized for FTP access.</p> <p>li: y — The user is authorized for LI access. n — The user is not authorized for LI access.</p> <p>snmp: y — The user is authorized for SNMP access. n — The user is not authorized for SNMP access.</p> <p>netconf: y — The user is authorized for NETCONF access. n — The user is not authorized for NETCONF access.</p> <p>grpc: y — The user is authorized for gRPC access. n — The user is not authorized for gRPC access.</p> |
| Password Expires | The number of days after which the user must change their password. |
| Login Attempts | The number of times that the user has attempted to log in, irrespective of whether the login succeeded or failed. |
| Failed Logins | The number of unsuccessful login attempts. |
| Local Conf | <p>y — Password authentication is based on the local password database. n — Password authentication is not based on the local password database.</p> |
| Number of users | The total number of listed users. |
| User Configuration Detail | |
| new pw required | <p>yes — The user must change their password at the next login. no — The user does not need to change their password at the next login.</p> |
| cannot change pw | <p>yes — The user does not have the ability to change their password. no — The user has the ability to change their password.</p> |
| home directory | The local home directory for the user for both console and FTP access. |
| restricted to home | yes — The user is not allowed to navigate to a directory higher in the directory tree on the home directory device. |

| Label | Description |
|--|--|
| | no — The user is allowed to navigate to a directory higher in the directory tree on the home directory device. |
| save when restricted | Whether configuration save operations are allowed when the user is restricted to home. |
| login exec file | The user's login exec file which executes whenever the user successfully logs in to a console session. |
| profile | The security profiles associated with the user. |
| locked-out | Whether the user is currently locked out, and, if they are locked out, how much time remains before the user can attempt to log into the node again. |
| SNMP Parameters | |
| auth protocol | The SNMPv3 authentication protocol. |
| auth key | The SNMPv3 authentication key. |
| privacy protocol | The SNMPv3 privacy protocol. |
| privacy protocol | The SNMPv3 privacy key. |
| group | The group for which the protocols apply. |
| Currently Failed Login Attempts | |
| Remaining Login Attempts | The number of login attempts remaining before the user is locked out. |
| Remaining Lockout Time (min:sec) | The number of minutes and seconds remaining until the lockout expires and the user can attempt to log in again. |

With the introduction of the PKI on an SR (SSH Server) the authentication process can be done via PKI or password. SSH client usually authenticate via PKI and password if PKI is configured on the client. In this case PKI takes precedence over password in most clients.

All client authentications are logged and display in the **show>system>security>user detail**. [Table 592: Pass/Fail Login Attempts](#) shows the rules where pass and fail attempts are logged.

Table 592: Pass/Fail Login Attempts

| Authentication Order | Client (such as, putty) | Server (such as, SR) | | CLI Show System Security Attempts (SR) | |
|----------------------|-------------------------|-----------------------|---------------------|--|---------------|
| | Private Key Programmed | Public Key Configured | Password Configured | Logins Attempts | Failed Logins |
| 1. Public Key | Yes | Yes | N/A | Increment | |

| Authentication Order | Client (such as, putty) | Server (such as, SR) | | CLI Show System Security Attempts (SR) | |
|----------------------|-------------------------|---|---------------------|--|---------------|
| | Private Key Programmed | Public Key Configured | Password Configured | Logins Attempts | Failed Logins |
| 2. Password | Yes | Yes (No match between client and server. Go to password.) | Yes | Increment | |
| | Yes | No | Yes | Increment | |
| | No | N/A | Yes | Increment | |
| | No | N/A | No | | Increment |
| 1. Public Key (only) | Yes | Yes | N/A | Increment | |
| | Yes | Yes (No match between client and server. Go to password.) | | | Increment |

Table 594: Output Fields: show chassis power-management utilization

| Label | Description |
|----------------|--|
| SUPPLY | |
| Power Capacity | Indicates the total amount of power available to the chassis. |
| Safety Level | Specifies the configured Power Safety Level, which is a percentage of the worst case power consumption level. |
| Alert Level | Specifies the configured power level in watts, which causes the system to raise an alarm if the available power level drops below a set level. |
| DEMAND | |

| Label | Description |
|---------------|---|
| Fan | Specifies the amount of power used for the fan tray indicated. |
| IO Module | Specifies the amount of power used for the IO Module indicated. |
| CPM Module | Specifies the amount of power used for the CPM indicated. |
| Fabric Module | Specifies the amount of power used for the SFM indicated. |
| MDA Module | Specifies the amount of power used for the line card indicated. |
| Current Util. | Specifies the total amount of power used for all system elements. |
| Peak Util. | Specifies peak utilization starting from bootup. |

vas-filter

Context

[\[Tree\]](#) (show>subscr-mgmt>isa-svc-chain vas-filter)

Full Context

show subscriber-mgmt isa-service-chaining vas-filter

Description

This command displays VAS filter information.

Parameters

name

Displays information about the specified name of the VAS filter.

entry

Displays information about the specified VAS filter entry

Values 0 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following is an example of VAS filter information.

Sample Output

```
show subscriber-mgmt isa-service-chaining vas-filter "foo"
=====
ISA Service Chaining - VAS Filter "vas-filter"
=====
Description           : (Not Specified)
-----
```

Table 595: Service Chaining VAS Filter Field Descriptions

| Label | Description |
|-------------|---|
| Description | The text string describing the VAS filter |
| Entry | The ID of the entry in the VAS filter |
| Admin State | The administrative state of the entry in the VAS filter |
| Match | Protocol — The IP protocol to match in this entry of the VAS filter Foreign IP — The foreign IP address to match in this entry of the VAS filter Foreign Port — The foreign port to match in this entry of the VAS filter |
| Action | upstream — Indicates the upstream direction for the action in the VAS filter entry downstream — Indicates the downstream direction for the action in the VAS filter entry |
| Fail Action | Forwarding IP — The forwarding Service Function IP address for the action in a VAS filter entry Service — The forwarding service for the action in a VAS filter entry |

| Label | Description |
|------------------------|--|
| | ESA — The ESI for the action in a VAS filter entry |
| Network Service Header | Service Path — The path ID used to construct an NSH (Network Service Header) for the action in a VAS filter entry |
| | Service Index — The service ID used to construct an NSH for the action in a VAS filter entry |
| | Insert Sub-ID disabled — The subscriber ID is not inserted with meta data to construct an NSH for the action in a VAS filter entry enabled — The subscriber ID is inserted with meta data to construct an NSH for the action in a VAS filter entry |
| | Meta Data — The opaque metadata used to construct an NSH (Network Service Header) for the action in a VAS filter entry |

25.2 vas-tunnel

vas-tunnel

Syntax

vas-tunnel [*connection-id*]

Context

[\[Tree\]](#) (show>router>l2tp vas-tunnel)

Full Context

show router l2tp vas-tunnel

Description

This command displays L2TP VAS tunnel operational information.

Parameters

connection-id

Specifies the identification number for an L2TP VAS tunnel connection.

Values 14294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output displays L2TP VAS tunnel information.

Sample Output

```

25.3 vccv-bfd

vccv-bfd

Syntax

vccv-bfd [session]

Context

[\[Tree\]](#) (show>service>id vccv-bfd)

Full Context

show service id vccv-bfd

Description

This command shows whether VCCV BFD is configured for a particular service and information about the VCCV session state.

The **show>service>id>vccv-bfd session** command gives a summary of all the VCCV sessions. Using both the sdp-id and the vc-id parameters gives VCCV BFD session information about a specific spoke-SDP.

For services where auto-discovery and signaling are used (for example, BGP VPWS, VPLS, and BGP-AD VPLS), use the **show>service>id>detail** command to determine the sdp-id and vc-id parameters allocated by the system.

Parameters

session

Displays a summary of all VCCV sessions.

Platforms

All

Output

The following output is an example of VCCV BFD information.

Sample Output

```
*A:Dut-C# show service id 1000 vccv-bfd session
=====
BFD Session

clear router igmp version

Description

This command clears the IGMP version on a specified interface or IP address.

Parameters

group-interface *interface-name*

Clears the IGMP version on the specified group interface.

group-interface all

Clears the IGMP version on all group interfaces.

service-id

Specifies the service ID.

Values service-id: 1 to 2148278386
svc-name: up to 64 characters.

host *ip-address*

Clears the IGMP version on the specified host.

host all

Clears the IGMP version on all hosts.

Table 596: Show System Security View Output Fields

| Label | Description |
|--------------|---|
| View name | Displays the name of the view. Views control the accessibility of a MIB object within the configured MIB view and subtree. |
| OID tree | Displays the Object Identifier (OID) value. OIDs uniquely identify MIB objects in the subtree. |
| Mask | Displays the mask value and the mask type, along with the <i>oid-value</i> configured in the view command, determines the access of each sub-identifier of an object identifier (MIB subtree) in the view. |
| Permission | Included — Specifies to include MIB subtree objects. Excluded — Specifies to exclude MIB subtree objects. |
| No. of Views | Displays the total number of configured views. |
| Group name | Displays the access group name. |

25.8 violators

violators

Syntax

violators [**port**] [**interface**] [**sap**] [**video**] [**sdp**]

Context

[Tree] (show>system>security>cpu-protection violators)

Full Context

show system security cpu-protection violators

Description

This command displays all interfaces, ports or SAPs with CPU protection policy violators. It also includes objects (SAPs, interfaces) that exceed the out-profile-rate and have the log-events keyword enabled for the out-profile-rate in the cpu-protection policy associated with the object.

Parameters

port

Displays violators associated with the port.

interface

Displays violators associated with the interface.

sap

Displays violators associated with the SAP.

video

Displays violators associated with the video entity.

sdp

Displays violators associated with the SDP.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

Output

The following is an example of CPU protection violators information.

violators

Syntax

violators [**port**] [**interface**] [**sap**]

Context

[Tree] (clear>cpu-protection violators)

Full Context

clear cpu-protection violators

Description

This command clears the rate limit violator record.

Parameters

port

Clears entries for ports.

interface

Clears entries for interfaces.

sap

Clears entries for SAPs.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

violators

Syntax

violators enforcement {**sap** | **interface**} **card** *slot-number* [**fp** *fp-number*]

violators local-monitor {**sap** | **interface**} **card** *slot-number* [**fp** *fp-number*]

Context

[Tree] (tools>dump>security>dist-cpu-protection violators)

Full Context

tools dump security dist-cpu-protection violators

Description

This command shows the nonconforming enforcement policers and local monitors.

Parameters

sap

-Indicates to display the violators associated with SAPs

interface

- Indicates to display the violators associated with router interfaces.

enforcement

Shows exceed and hold-down for Static and Dynamic Policers.

local-monitor

Shows state of dynamic policer allocation for Local Monitoring Policers.

card slot-number

The physical slot number for the card.

Values 1 to n (n is platform dependent)

fp fp-number

Identifies the instance of the FP (FastPath) chipset. Some cards have a single FP and some cards can contain multiple FPs (for example, an XCM can house multiple FPs via its two XMAAs).

Values 1 to 8

Platforms

All

Output

Users Output

[Table 597: Output Parameters](#) describes show users output fields.

Sample Output

Table 598: OSPF Virtual Link Output Fields

| Label | Description |
|-----------------|--|
| Nbr Rtr ID | The router ID(s) of neighboring routers. |
| Area Id | A 32-bit integer which identifies an area. |
| Local Interface | The IP address of the local egress interface used to maintain the adjacency to reach this virtual neighbor. |
| Metric | The metric value associated with the route. This value is used when importing this static route into other protocols. When the metric is configured as zero, the metric configured in OSPF, default-import-metric, applies. This value is also used to determine the static route installed in the forwarding table. |
| State | The operational state of the virtual link to the neighboring router. |
| Authentication | Specifies whether authentication is enabled for the interface or virtual link. |

| Label | Description |
|-----------------|---|
| Hello Intrval | Specifies the length of time, in seconds, between the Hello packets that the router sends on the interface. |
| Rtr Dead Intrvl | Specifies the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this interface since the OSPF admin status was enabled. |
| Tot Rx Packets | Specifies the total number of OSPF packets received on this interface since the OSPF admin status was enabled. |
| Rx Hellos | Specifies the total number of OSPF Hello packets received on this interface since the OSPF admin status was enabled. |
| Rx DBDs | Specifies the total number of OSPF Database Description packets received on this interface since the OSPF administrative status was enabled. |
| Rx LSRs | Specifies the total number of Link State Requests (LSRs) received on this interface since the OSPF admin status was enabled. |
| Rx LSUs | Specifies the total number of Link State Updates (LSUs) received on this interface since the OSPF admin status was enabled. |
| Rx LS Acks | Specifies the total number of Link State Acknowledgments received on this interface since the OSPF admin status was enabled. |
| Tot Tx Packets | Specifies the total number of OSPF packets transmitted on this virtual interface since it was created. |
| Tx Hellos | Specifies the total number of OSPF Hello packets transmitted on this virtual interface since it was created. |
| Tx DBDs | Specifies the total number of OSPF database description packets transmitted on this virtual interface. |
| Tx LSRs | Specifies the total number of OSPF Link State Requests (LSRs) transmitted on this virtual interface. |
| Tx LSUs | Specifies the total number of OSPF Hello packets transmitted on this interface since the OSPF admin status was enabled. |
| Tx LS Acks | Specifies the total number of OSPF Link State Acknowledgments (LSA) transmitted on this virtual interface. |
| Retransmits | Specifies the total number of OSPF retransmits sent on this interface since the OSPF admin status was last enabled. |

| Label | Description |
|----------------|--|
| Discards | Specifies the total number of OSPF packets discarded on this interface since the OSPF admin status was last enabled. |
| Bad Networks | Specifies the total number of OSPF packets received with invalid network or mask since the OSPF admin status was last enabled. |
| Bad Versions | Specifies the total number of OSPF packets received with bad OSPF version numbers since the OSPF admin status was last enabled. |
| Bad Areas | Specifies the total number of OSPF packets received with an area mismatch since the OSPF admin status was last enabled. |
| Bad Dest Addr | Specifies the total number of OSPF packets received with the incorrect IP destination address since the OSPF admin status was last enabled. |
| Bad Auth Types | Specifies the total number of OSPF packets received with an invalid authorization type since the OSPF admin status was last enabled. |
| Auth Failures | Specifies the total number of OSPF packets received with an invalid authorization key since the OSPF admin status was last enabled. |
| Bad Neighbors | Specifies the total number of OSPF packets received where the neighbor information does not match the information this router has for the neighbor since the OSPF admin status was last enabled. |
| Bad Pkt Types | Specifies the total number of OSPF packets received with an invalid OSPF packet type since the OSPF admin status was last enabled. |
| Bad Lengths | Specifies the total number of OSPF packets received on this interface with a total length not equal to the length given in the packet itself since the OSPF admin status was last enabled. |
| Bad Hello Int. | Specifies the total number of OSPF packets received where the hello interval given in packet was not equal to that configured on this interface since the OSPF admin status was last enabled. |
| Bad Dead Int. | Specifies the total number of OSPF packets received where the dead interval given in the packet was not equal to that configured on this interface since the OSPF admin status was last enabled. |
| Bad Options | Specifies the total number of OSPF packets received with an option that does not match those configured for this interface or area since the OSPF admin status was last enabled. |

| Label | Description |
|----------------|---|
| Retrans Intrvl | Specifies the length of time, in seconds, that OSPF waits before retransmitting an unacknowledged link state advertisement (LSA) to an OSPF neighbor. |
| Transit Delay | Specifies the time, in seconds, it takes to transmit a link state advertisement (LSA) on the interface or virtual link. |
| Last Event | Specifies the date and time when an event was last associated with this OSPF interface. |
| Tx Failures | Transmitted OSPF packets that are dropped due to resource shortage. |

virtual-link

Syntax

virtual-link *nbr-rtr-id* **area** *area-id* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

Context

[\[Tree\]](#) (monitor>router>ospf3 virtual-link)

[\[Tree\]](#) (monitor>router>ospf virtual-link)

Full Context

monitor router ospf3 virtual-link

monitor router ospf virtual-link

Description

This command displays statistical OSPF virtual link information at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified neighbor(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

Parameters

nbr-rtr-id

Specifies the IP address to uniquely identify a neighboring router in the autonomous system.

Values a.b.c.d

area-id

Specifies the OSPF area ID, expressed in dotted decimal notation or as a 32-bit decimal integer.

Values *ip-address*, 0 to 4294967295

seconds

Configures the interval for each display, in seconds.

Values 3 to 60

Default 10

repeat

Configures how many times the command is repeated.

Values 1 to 999

Default 10

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic instead of the delta.

Platforms

All

25.11 virtual-neighbor

virtual-neighbor

Syntax

virtual-neighbor [**remote** *ip-address*] [**detail**]

Context

[\[Tree\]](#) (show>router>ospf3 virtual-neighbor)

[\[Tree\]](#) (show>router>ospf virtual-neighbor)

Full Context

show router ospf3 virtual-neighbor

show router ospf virtual-neighbor

Description

This command displays virtual neighbor information.

Parameters

remote *ip-address*

Displays the specified IPv4 or IPv6 address. This reduces the amount of output displayed.

- Values**
- ipv4-address:
 - a.b.c.d
 - ipv6-address:
 - x:x:x:x:x:x:x (eight 16-bit pieces)
 - x:x:x:x:x:d.d.d.d
 - x: [0 to FFFF]H
 - d: [0 to 255]D

detail

Produces detailed information on the virtual neighbor. This option produces a large amount of data. It is recommended to use **detail** only when requesting information for a specific neighbor.

Platforms

All

Output

OSPF Virtual Neighbor Output

[Table 600: OSPF Virtual Neighbor Output Fields](#) describes OSPF virtual neighbor output fields.

Table 600: OSPF Virtual Neighbor Output Fields

| Label | Description |
|------------------|--|
| Nbr IP Addr | The IP address this neighbor is using in its IP source address. On addressless links, this will not be 0.0.0.0, but the address of another of the neighbor's interfaces. |
| Nbr Rtr ID | Specifies the router ID(s) of neighboring routers. |
| Transit Area | Specifies the transit area ID that links the backbone area with the area that has no physical connection with the backbone. |
| Retrans Q Length | The current length of the retransmission queue. |
| No. of Neighbors | Specifies the total number of OSPF neighbors adjacent on this interface, in a state of INIT or greater, since the OSPF admin status was enabled. |

| Label | Description |
|-------------------|--|
| Nbr State | Specifies the operational state of the virtual link to the neighboring router. |
| Options | Specifies the total number of OSPF packets received with an option that does not match those configured for this virtual interface or transit area since the OSPF admin status was enabled. |
| Events | Specifies the total number of events that have occurred since the OSPF admin status was enabled. |
| Last Event Time | Specifies the date and time when an event was last associated with this OSPF interface. |
| Up Time | Specifies the uninterrupted time, in hundredths of seconds, the adjacency to this neighbor has been up. |
| Time Before Dead | Specifies the amount of time, in seconds, until the dead router interval expires. |
| Bad Nbr States | Specifies the total number of OSPF packets received where the neighbor information does not match the information this router has for the neighbor since the OSPF admin status was last enabled. |
| LSA Inst fails | Specifies the total number of times an LSA could not be installed into the LSDB due to a resource allocation issue since the OSPF admin status was last enabled. |
| Bad Seq Nums | Specifies the total number of times when a database description packet was received with a sequence number mismatch since the OSPF admin status was last enabled. |
| Bad MTUs | Specifies the total number of times when the MTU in a received database description packet was larger than the MTU of the receiving interface since the OSPF admin status was enabled. |
| Bad Packets | Specifies the total number of times when an LS update was received with an illegal LS type or an option mismatch since the OSPF admin status was enabled. |
| LSA not in LSDB | Specifies the total number of times when an LS request was received for an LSA not installed in the LSDB of this router since the OSPF admin status was enabled. |
| Option Mismatches | Specifies the total number of times when a LS update was received with an option mismatch since the OSPF admin status was enabled. |

| Label | Description |
|----------------|--|
| Nbr Duplicates | Specifies the total number of times when a duplicate database description packet was received during the Exchange state since the OSPF admin status was enabled. |

virtual-neighbor

Syntax

virtual-neighbor *nbr-rtr-id* **area** *area-id* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

Context

[Tree] (monitor>router>ospf virtual-neighbor)

[Tree] (monitor>router>ospf3 virtual-neighbor)

Full Context

monitor router ospf virtual-neighbor

monitor router ospf3 virtual-neighbor

Description

This command displays statistical OSPF virtual neighbor information at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified OSPF virtual neighbor router. The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

Parameters

nbr-rtr-id

Specifies the IP address to uniquely identify a neighboring router in the autonomous system.

Values a.b.c.d

area-id

Specifies the OSPF area ID, expressed in dotted decimal notation or as a 32-bit decimal integer.

Values *ip-address*, 0 to 4294967295

seconds

Configures the interval for each display, in seconds.

Values 3 to 60

Default 10

repeat

Configures how many times the command is repeated.

Values 1 to 999

Default 10

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic instead of the delta.

Platforms

Syntax

virtual-subnet subscriber *sub-ident*

virtual-subnet [**sap** *sap-id*]

Context

[\[Tree\]](#) (show>service>id virtual-subnet)

Full Context

show service id virtual-subnet

Description

This command displays currently recorded default gateway and subnets for all virtual subnets enabled for DHCPv4 hosts in the specified service.

Parameters

sub-ident

Displays information relating to the specified subscriber ID.

sap-id

Displays information relating to the specified SAP ID.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of virtual subnet information.

Sample Output

```
show service id 500 virtual-subnet
=====
Virtual subnets in service 500
=====
Subscriber                : 00:20:fc:1e:cd:52|1/1/9:200

=====
    
```

[Table 601: Virtual Subnet Field Descriptions](#) describes virtual subnet output fields.

Table 601: Virtual Subnet Field Descriptions

| Field | Descriptions |
|----------------|---|
| Subscriber | The service identification that identifies the service in the service domain |
| Default router | The IP address of the default router received from either the DHCP or the RADIUS server |
| Subnet | The IP address of the subnet |
| SAP | The SAP associated with the service |
| No. of subnets | The total number of subnets for the service |

show router bgp routes vpn-ipv4

Description

This command displays BGP VPN IPv4 routes.

Parameters

reg-exp

Displays routes matching the specified regular expression, up to 80 characters.

hunt

Displays entries for the specified route.

comm-id

Specifies the community ID, up to 72 characters.

Values [*as-num:comm-val* | *ext-comm* | *well-known-comm* | *large-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:
 - *{target | origin}:ip-address:comm-val*
 - *{target | origin}:asnum:ext-comm-val*
 - *{target | origin}:ext-asnum:comm-val*
 - **bandwidth:asnum:val-in-mbps**
 - **ext:4300:ovstate**
 - **ext:value1:value2**
 - **flowspec-set:ext-asnum:group-id**

where:

- *target* — route target
- *origin* — route origin
- *ip-address* — a.b.c.d
- *ext-comm-val* — 0 to 4294967295
- *ext-asnum* — 0 to 4294967295
- **bandwidth** — bandwidth
- *val-in-mbps* — 0 to 16777215
- **ext** — extended
- **ext:4300** — origin verification
- *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
- *value1* — 0000 to FFFF
- *value2* — 0 to FFFFFFFFFF
- **flowspec-set** — flow-spec set
- *group-id* — 0 to 16383
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**
- *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

rd

Displays information for the route distinguisher.

Values *ip-addr:comm-val* | *2byte-asnumber:ext-comm-val* | *4byte-asnumber:comm-val*

Context

[\[Tree\]](#) (show>router vrf-export-test)

Full Context

show router vrf-export-test

Description

This command tests an existing route policy, a chain of route policies, or a route policy logical expression in order to assess its effects as a VRF export policy. This is determined by identifying the routes that would be accepted or rejected after the complete evaluation.

Parameters

plcy-or-long-expr

Specifies up to 14 policy names or a long expression.

Values policy-name: a policy name, up to 64 characters
long-expr: a long expression, up to 255 characters.

plcy-or-expr

Specifies the policy name or expression.

Values policy-name: a policy name, up to 64 characters
expr: an expression, up to 64 characters

policy-name

Specifies the policy name of an existing configured and committed policy, up to 64 characters.

longer

Matches prefixes with a longer prefix-length.

ip-prefix/ip-prefix-length

Specifies an IPv4 or IPv6 prefix/mask to be evaluated. The keyword **longer** may be specified to evaluate longer prefix matches (optional).

display-rejects

Displays routes that were rejected by the policy. If not specified, only a count of rejected routes is displayed.

display-rejects-only

Displays only routes rejected by the policy test.

protocol

Displays routes by the protocol type.

Platforms

All

Output

Sample Output

vxlan detail

Context

[Tree] (show>service>id vxlan)

Full Context

show service id vxlan

Description

This command displays the VXLAN instance parameters. With **destinations** added, the command shows the VXLAN bindings auto-created or configured in a specified service. The service command can be filtered by VXLAN instance, if the service has more than one instance. A VXLAN binding is composed of the remote (VTEP) and the corresponding egress (VNI) to identify the service at the egress node. The command shows the number of MACs associated to each binding as well as the operational status and

if the binding is part of the multicast list. The binding will be operationally down when the VTEP address is not found in the base routing table (the VTEP address cannot be reached). A binding will be part of a multicast list if a valid BGP EVPN inclusive multicast route exists for it.

A VXLAN binding can be associated with the following types of multicast values.

- **BM** — Refers to the capability of the binding to send broadcast or multicast to the remote VTEP. This binding type is setup to AR replicator nodes from a leaf node.
- **BUM** — Refers to the capability of the binding to send broadcast or multicast to the remote VTEP. This binding type is setup to AR replicator nodes from a leaf node.
- **U** — Refers to the capability of the binding to send unknown unicast to the VTEP. This binding type is setup from leaf nodes to other leaf and RNVE nodes.
- **"-"** — Specifies that the binding can only be used for known unicast traffic.

Parameters

assisted-replication replicator

Displays all the discovered candidate AR replicators for the service and the replicator that has been selected by the leaf to send the BM traffic. The list of replicators is ordered by VTEP address and VNI. This command is only supported on the nodes configured as leaf.

The "In Use" column indicates whether the replicator has been selected for the service. When selecting a replicator for the service, the candidate list is ordered by VTEP IP (lowest IP is ordinal 0) and VNI. A modulo function of the service ID and the number of candidate PEs will give the selected replicator for a specified service.

The "Pending Time" column shows the remaining seconds until the node starts sending the BM traffic to the replicator. This time is configurable by the *replicator-activation-time* parameter.

For services supporting EVPN multi-homing, the command can also show ES destinations as well as VXLAN bindings. In this case, the output can be filtered by the ESI in order to see the VXLAN destinations that the ES is comprised of.

instance

Specifies the VXLAN instance.

| Mcast | Displays the Mcast value. |
| Oper State | Displays the operational state. |
| L2 PBR | Displays the Layer 2 PBR value. |
| Sup BCast Domain | Displays the Sup BCast Domain value. |

vxlan

Syntax

vxlan [*ip-address*]

Context

[\[Tree\]](#) (show>service vxlan)

Full Context

```
show service vxlan
```

Description

This command displays the VXLAN bindings auto-created in a specified service. A VXLAN binding is composed of the remote VTEP (VXLAN Termination Endpoint) and the corresponding egress VNI (VXLAN Network Identifier) to identify the service at the egress node. The command shows the number of MACs associated to each binding as well as the operational status and if the binding is part of the multicast list. The binding will be operationally down when the VTEP address is not found in the base routing table (the VTEP address cannot be reached). A binding will be part of the multicast list if a valid BGP EVPN inclusive multicast route exists for it.

A VXLAN binding can be associated with the following types of Mcast values.

- **BM** — Refers to the capability of the binding to send Broadcast or Multicast to the remote VTEP. This binding type is setup to AR Replicator nodes from a Leaf node.
- **BUM** — Refers to the capability of the binding to send Broadcast or Multicast to the remote VTEP. This binding type is setup to AR Replicator nodes from a Leaf node.
- **U** — Refers to the capability of the binding to send Unknown Unicast to the VTEP. This binding type is setup from Leaf nodes to other Leaf and RNVE nodes.
- **"-"** — Specifies that the binding can only be used for known unicast traffic.

Parameters

ip-address

Specifies the remote VTEP address for the VXLAN binding.

Values ipv4-address: a.b.c.d
 ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)
 x:x:x:x:x:d.d.d.d

wlan-gw-group

Context

[\[Tree\]](#) (show>isa wlan-gw-group)

Full Context

show isa wlan-gw-group

Description

This command displays WLAN-GW group information, including WLAN-GW tunnels.

Parameters

wlan-gw-group-id

Displays information about the specified WLAN-GW group ID.

Values 1 to 4

associations

Displays information about associations for the specified WLAN-GW group ID.

member member-id

Displays information about the WLAN-GW-specific status and basic statistics information about the specified member.

Values 1 to 255

type type

Displays a reduced output to only show statistics of the specified type.

Values packet-errors, host-errors, bd-errors, forwarding, reassembly, aa, radius, arp, dhcp, dhcp6, icmp, icmp6

non-zero-value-only

Displays a reduced output to only show statistics whose value is bigger than zero.

resource-statistics

Displays the resource usage on the specified group member.

statistics

Displays statistics information about the members of the specified WLAN-GW group.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of ISA WLAN-GW group information.

Sample Output

```
*A:Dut-B>config>isa>wlan-gw-group$ show isa wlan-gw-group 4

wlan-gw-group

Syntax

wlan-gw-group *group-id* **member** *member-id* **resource-peak-values**

wlan-gw-group *group-id* **member** *member-id* **statistics**

Context

[\[Tree\]](#) (clear>wlan-gw>isa wlan-gw-group)

Full Context

clear wlan-gw isa wlan-gw-group

Description

This command resets wlan-gw statistics per group member.

Parameters

group-id

Specifies the WLAN-GW group ID.

Values 1 to 4

member member-id

Specifies the member ID.

Values 1 to 255

statistics

Resets the statistics measurements to zero.

resource-peak-values

Resets the resource peak values to the current resource measurements.

```

```
wpp [portal-group name] [host ip-address] hosts
```

Context

```
[Tree] (show>aaa wpp)
```

Full Context

```
show aaa wpp
```

Description

This command displays information about the specified WPP portal group or the WPP hosts controlled by the WPP portal group.

Parameters

name

Specifies the name of the WPP portal group up to 32 characters.

ip-address

Specifies the IP address of the WPP host.

hosts

Shows the status of triggered hosts.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following is an example of WPP portal group or WPP host information.

Sample Output

```
show aaa wpp portal-group "test"

[Table 605: Router WPP Field Descriptions](#) describes router WPP output fields.

Table 605: Router WPP Field Descriptions

| Label | Description |
|------------------------------|---|
| Portal | The web portal server name that the system communicates to for the hosts on the group interface |
| Address | The portal IP address |
| Controlled-Rtr | The identifier of the virtual router instance being controlled by this portal |
| Num-Itf | The number of interfaces associated with this portal |
| Number of enabled interfaces | The number of interfaces associated with this portal that are administratively enabled |
| Triggered hosts | Triggered hosts are enabled or disabled on this portal |
| Last management change | The time of the most recent management-initiated change to this WPP portal |

wpp

Syntax

wpp peer [*ip-address*] **statistics**

Context

[\[Tree\]](#) (show>redundancy>multi-chassis wpp)

Full Context

show redundancy multi-chassis wpp

Description

This command displays multi-chassis WPP information.

Parameters

ip-address

Specifies the IP address.

- Values**
- ipv4-address: a.b.c.d
 - ipv6-address:
 - x:x:x:x:x:x:x (eight 16-bit pieces)
 - x:x:x:x:x:d.d.d.d
 - x: [0 to FFFF] H

- d: [0 to 255] D

statistics

Displays statistics.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

wpp

Syntax

wpp peer [*ip-address*] **statistics**

Context

[\[Tree\]](#) (clear>redundancy>multi-chassis wpp)

Full Context

clear redundancy multi-chassis wpp

Description

This command clears multi-chassis WPP information.

Parameters

ip-address

Specifies the WPP IP address.

- Values**
- ipv4-address: a.b.c.d
 - ipv6-address:
 - x:x:x:x:x:x:x (eight 16-bit pieces)
 - x:x:x:x:x:d.d.d.d
 - x: [0 to FFFF] H
 - d: [0 to 255] D

statistics

Clears the multi-chassis WPP statistics.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Description

Commands in this context display information about the LI X1, X2, and X3 interfaces.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

27.2 x1

x1

Syntax

x1 lic *lic-name*

Context

[Tree] (show>li>x-interfaces>statistics x1)

Full Context

show li x-interfaces statistics x1

Description

This command displays X1 statistics.

Parameters

lic-name

Specifies the LIC name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

27.3 x2

x2

Syntax

x2 lic *lic-name*

Context

[\[Tree\]](#) (show>li>x-interfaces>statistics x2)

Full Context

show li x-interfaces statistics x2

Description

This command displays X2 statistics.

Parameters

lic-name

Specifies the LIC name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

27.4 x3

x3

Syntax

x3 lic *lic-name*

Context

[\[Tree\]](#) (show>li>x-interfaces>statistics x3)

Full Context

show li x-interfaces statistics x3

Description

This command displays X3 statistics.

Parameters

lic-name

Specifies the LIC name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

27.5 xiom

xiom

Syntax

xiom [*xiom*] [*detail*]

Context

[\[Tree\]](#) (show xiom)

Full Context

show xiom

Description

This command lists the XIOM modules in the chassis along with their administrative and operational states.

Parameters

xiom

Specifies the slot and XIOM module identifier.

Values

slot[/*xiom*]

slot: 1 to 7

xiom: "x1" or "x2"

detail

Displays detailed information.

Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

Output

The following output shows XIOM information and [Table 606: Output Fields: show xiom](#) describes the output fields.

Sample Output: show xiom

```
A:Dut-0# show xiom
=====
Xiom Information
=====
Slot  Xiom    Provisioned Type           Admin   Operational
      Xiom    Equipped Type (if different) State   State
-----
1     x2      iom-s-3.0t:he3000g+      up      up
2     x1      iom-s-3.0t:he3000g+      up      up
=====
```

Table 606: Output Fields: show xiom

| Label | Description |
|-------------------|--|
| Slot | The chassis slot number. |
| Xiom | The XIOM module number. |
| Provisioned Type | The XIOM type provisioned. |
| Equipped Type | The XIOM type actually installed. |
| Admin State | up - Administratively up. down - Administratively down (for example, shutdown). |
| Operational State | up - Operationally up. down - Operationally down. |

xiom

Syntax

xiom *xiom*

Context

[\[Tree\]](#) (clear xiom)

Full Context

clear xiom

Description

This command re-initializes the specified XIOM in a particular slot.

Parameters

xiom

Clears the specified XIOM.

Values

slot/xiom

slot: 1 to 6

xiom: x1 or x2

Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s
