[\[Tree\]](#) (config>service>vprn>if>vrrp ping-reply)

[\[Tree\]](#) (config>service>vprn>if>ipv6>vrrp ping-reply)

## Full Context

configure service vprn interface vrrp ping-reply

configure service vprn interface ipv6 vrrp ping-reply

## Description

This command enables the non-owner master to reply to ICMP Echo Requests directed at the virtual router instances IP addresses. The ping request can be received on any routed interface.

Ping must not have been disabled at the management security level (either on the parental IP interface or based on the Ping source host address). When ping-reply is not enabled, ICMP Echo Requests to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to ICMP Echo Requests regardless of the setting of ping-reply configuration.

The ping-reply command is only available in non-owner **vrrp** *virtual-router-id* nodal context. If the ping-reply command is not executed, ICMP Echo Requests to the virtual router instance IP addresses will be silently discarded.

The **no** form of this command restores the default operation of discarding all ICMP Echo Request messages destined to the non-owner virtual router instance IP addresses.

## Default

no ping-reply

## Platforms

All

## ping-reply

## Syntax

[no] ping-reply

## Context

[\[Tree\]](#) (config>router>if>vrrp ping-reply)

[\[Tree\]](#) (config>router>if>ipv6>vrrp ping-reply)

## Full Context

configure router interface vrrp ping-reply

configure router interface ipv6 vrrp ping-reply

## Description

This command enables the non-owner master to reply to ICMP echo requests directed at the virtual router instances IP addresses.

Non-owner virtual router instances are limited by the VRRP specifications to responding to ARP requests destined to the virtual router IP addresses and routing IP packets not addressed to the virtual router IP addresses. Many network administrators find this limitation frustrating when troubleshooting VRRP connectivity issues.

SR OS allows this access limitation to be selectively lifted for certain applications. Ping, Telnet and SSH can be individually enabled or disabled on a per-virtual-router-instance basis.

The **ping-reply** command enables the non-owner master to reply to ICMP echo requests directed at the virtual router instances IP addresses. The Ping request can be received on any routed interface. Ping must not have been disabled at the management security level (either on the parental IP interface or based on the Ping source host address).

When **ping-reply** is not enabled, ICMP echo requests to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to ICMP echo requests regardless of the **ping-reply** setting.

The **ping-reply** command is only available in non-owner **vrrp** nodal context.

By default, ICMP echo requests to the virtual router instance IP addresses are silently discarded.

The **no** form of the command configures discarding all ICMP echo request messages destined to the non-owner virtual router instance IP addresses.

## Default

no ping-reply — ICMP echo requests to the virtual router instance IP addresses are discarded.

## 20.170 ping-template

### ping-template

#### Syntax

**ping-template** *template-name* [**create**]

**no ping-template** *template-name*

#### Context

**[Tree]** (config>test-oam>icmp ping-template)

#### Full Context

configure test-oam icmp ping-template

## Description

This command creates a ping-template that can be assigned to a VPRN or IES service IP interface. The **no** form of this command removes the template name from the configuration.

## Parameters

### *template-name*

Specifies the name of the ping template, up to 64 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## ping-template

## Syntax

**ping-template** *template-name*

**no ping-template**

## Context

[\[Tree\]](#) (config>service>ies>if ping-template)

[\[Tree\]](#) (config>service>vprn>if ping-template)

## Full Context

configure service ies interface ping-template

configure service vprn interface ping-template

## Description

This command maps a **ping-template** name to the service IP interface. The **ping-template** *template-name* is configured in the **config>test-oam>icmp** context and assigned to the service IP interface using this command.

The **config>service>ies|vprn>if>ping-template** must be shut down to remove or change the **destination-address** value.

The **no** form of this command removes the template name from the configuration.

## Parameters

### *template-name*

Specifies the name of the ping template to be assigned to the IP interface, up to 64 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.171 ping-test

ping-test

### Syntax

[no] ping-test

### Context

[\[Tree\]](#) (config>filter>redirect-policy>dest ping-test)

### Full Context

configure filter redirect-policy destination ping-test

### Description

This command configures parameters to perform connectivity ping tests to validate the ability for the destination to receive redirected traffic.

### Default

no ping-test

### Platforms

All

configure subscriber-mgmt category-map category exhausted-credit-service-level pir

### Description

This command configures the PIR which is enforced for all queues pertaining to this category.

The **no** form of this command reverts to the default.

### Parameters

*pir-rate*

Specifies the amount of bandwidth in kilobits per second.

**Values** 1 to 100000000

**max**

Specifies to use the maximum amount of bandwidth.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

pir

### Syntax

pir *congested-pir*

no pir

## Context

[\[Tree\]](#) (config>app-assure>group>policer>congestion-override pir)

## Full Context

configure application-assurance group policer congestion-override pir

## Description

This command provides a mechanism to configure the PIR for the congestion override policer. It is recommended that the PIR is configured larger than twice the maximum MTU for the traffic handled by the policer to allow for some burstiness of the traffic.

The **no** form of this command resets the PIR value to its default.

## Default

pir max

## Parameters

### *congested-pir*

Specifies an integer value defining size, in kbytes, for the PIR of the policer.

**Values** 0 to 100000000, max

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

pir-threshold

**Syntax**

pir-threshold *kbps*

no pir-threshold

**Context**

[\[Tree\]](#) (config>test-oam>sath>accept-crit-tmpl pir-threshold)

**Full Context**

configure test-oam service-activation-testhead acceptance-criteria-template pir-threshold

**Description**

This command configures a PIR value that is compared to the measured results for the **cir-pir**, **policing**, and **performance** test types. If the measured value is greater than or equal to the configured value, the test passes; otherwise, it fails. For more information, see the **m-factor** command.

The **no** form of this command disables the comparison of the parameter with the measured value; the threshold value is ignored while declaring the test result.

**Default**

no pir-threshold

**Parameters*****kbps***

Specifies the value, in kb/s, for comparison with the measured value.

**Values** 1 to 400,000,000

**Platforms**

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

configure service vprn interface ipsec ipsec-tunnel icmp6-generation pkt-too-big

```

configure ipsec tunnel-template icmp6-generation pkt-too-big
configure service vprn interface sap ipsec-tunnel icmp6-generation pkt-too-big
configure service ies interface ipsec ipsec-tunnel icmp6-generation pkt-too-big
configure router interface ipsec-tunnel icmp-gen pkt-too-big

```

### Description

This command enables the system to send ICMPv6 PTB (Packet Too Big) messages on the private side and optionally specifies the rate.

With this command configured, the system sends PTB back if it received an IPv6 packet on the private side that is bigger than 1280 bytes and also exceeds the private MTU of the tunnel.

The **ip-mtu** command (under **ipsec-tunnel** or **tunnel-template**) specifies the private MTU for the ipsec-tunnel or dynamic tunnel.

The **no** form of this command reverts **interval** and **message-count** values to their default values.

### Platforms

VSR

- configure service ies interface ipsec ipsec-tunnel icmp6-generation pkt-too-big
  - configure service vprn interface ipsec ipsec-tunnel icmp6-generation pkt-too-big
- 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Full Context

configure mcast-management multicast-info-policy bundle video analyzer alarms pmt-repetition

configure mcast-management multicast-info-policy bundle channel source-override video analyzer alarms pmt-repetition

configure mcast-management multicast-info-policy bundle channel video analyzer alarms pmt-repetition

## Description

This command configures the analyzer to check for the program map table (PMT). It is expected that the PMT arrives periodically within a certain interval range. It is possible to configure the type of alarm that is raised when the PMT fails to arrive within the specified interval. As the delay increases between two consecutive PMTs, the type of alarm raised becomes more critical, from TNC to POA.

## Default

no pmt-repetition

## Parameters

### *tnc-milli-seconds*

Specifies the time, in milliseconds, for which a TNC alarm is raised if the interval between two consecutive PMTs is greater than or equal to this configured value.

**Values** 100 to 4800 in multiples of 100 only

**Default** 400

### *qos-milli-seconds*

Specifies the time, in milliseconds, for which a QoS alarm is raised if the interval between two consecutive PMTs is greater than or equal to this configured value.

**Values** 200 to 4900 in multiples of 100 only and higher than the *tnc-milli-seconds* value

**Default** 800

### *poa-milli-seconds*

Specifies the time, in milliseconds, for which a POA alarm is raised if the interval between two consecutive PMTs is greater than or equal to this configured value.

**Values** 300 to 5000 in multiples of 100 only and higher than the *qos-milli-seconds* value

**Default** 2000

## Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

**[Tree]** (config>subscr-mgmt>sla-prof>ingress>qos policer)

## Full Context

configure subscriber-mgmt sla-profile egress qos policer

configure subscriber-mgmt sla-profile ingress qos policer

## Description

This command is used in the sap-ingress and sap-egress QoS policies to create, modify or delete a policer. Policers are created and used in a similar manner to queues. The policer ID space is separate from the queue ID space, allowing both a queue and a policer to share the same ID. The sap-ingress policy may have up to 32 policers (numbered 1 through 32) may be defined while the sap-egress QoS policy supports a maximum of 8 (numbered 1 through 8). While a policer may be defined within a QoS policy, it is not actually created on SAPs or subscribers associated with the policy until a forwarding class is mapped to the policer's ID.

All policers must be created within the QoS policies. A default policer is not created when a sap-ingress or sap-egress QoS policy is created.

Once a policer is created, the policer's metering rate and profiling rates may be defined as well as the policer's maximum and committed burst sizes (MBS and CBS respectively). Unlike queues which have dedicated counters, policers allow various stat-mode settings that define the counters that is associated with the policer. Another supported feature—packet-byte-offset—provides a policer with the ability to modify the size of each packet based on a defined number of bytes.

Once a policer is created, it cannot be deleted from the QoS policy unless any forwarding classes that are mapped to the policer are first moved to other policers or queues.

The system will allow a policer to be created on a SAP QoS policy regardless of the ability to support policers on objects where the policy is currently applied. The system only scans the current objects for policer support and sufficient resources to create the policer when a forwarding class is first mapped to the policer ID. If the policer cannot be created due to one or more instances of the policy not supporting policing or having insufficient resources to create the policer, the forwarding class mapping will fail.

The **no** form of this command is used to delete a policer from a sap-ingress or sap-egress QoS policy. The specified policer cannot currently have any forwarding class mappings for the removal of the policer to succeed. It is not necessary to actually delete the policer ID for the policer instances to be removed from SAPs or subscribers associated with the QoS policy once all forwarding classes have been moved away

from the policer. It is automatically deleted from each policing instance although it still appears in the QoS policy.

## Parameters

### *policer-id*

Specifies the policer ID. The policer-id must be specified when executing the policer command. If the specified ID already exists, the system enters that policer's context to allow the policer's parameters to be modified. If the ID does not exist and is within the allowed range for the QoS policy type, a context for the policer ID is created (depending on the system's current create keyword requirements which may require the create keyword to actually add the new policer ID to the QoS policy) and the system will enter that new policer's context for possible parameter modification.

**Values** 1 to 63

## Platforms

### Description

This command creates, modifies or deletes a policer. Policers are created and used in a similar manner to queues. The policer ID space is separate from the queue ID space, allowing both a queue and a policer to share the same ID. The sap-ingress policy may have up to 32 policers (numbered 1 through 32) may be defined while the sap-egress QoS policy supports a maximum of 8 (numbered 1 through 8). While a policer

may be defined within a QoS policy, it is not actually created on SAPs or subscribers associated with the policy until a forwarding class is mapped to the policer's ID.

All policers must be created within the QoS policies. A default policer is not created when a sap-ingress or sap-egress QoS policy is created.

Once a policer is created, the policer's metering rate and profiling rates may be defined as well as the policer's maximum and committed burst sizes (MBS and CBS respectively). Unlike queues which have dedicated counters, policers allow various stat-mode settings that define the counters that will be associated with the policer. Another supported feature—packet-byte-offset—provides a policer with the ability to modify the size of each packet based on a defined number of bytes.

Once a policer is created, it cannot be deleted from the QoS policy unless any forwarding classes that are mapped to the policer are first moved to other policers or queues.

The system will allow a policer to be created on a SAP QoS policy regardless of the ability to support policers on objects where the policy is currently applied. The system only scans the current objects for policer support and sufficient resources to create the policer when a forwarding class is first mapped to the policer ID. If the policer cannot be created due to one or more instances of the policy not supporting policing or having insufficient resources to create the policer, the forwarding class mapping fails.

The **no** form of this command deletes a policer from a sap-ingress or sap-egress QoS policy. The specified policer cannot currently have any forwarding class mappings for the removal of the policer to succeed. It is not necessary to actually delete the policer ID for the policer instances to be removed from SAPs or subscribers associated with the QoS policy once all forwarding classes have been moved away from the policer. It is automatically deleted from each policing instance although it still appears in the QoS policy.

## Parameters

### *policer-id*

Specifies that the *policer-id* must be specified when executing the policer command. If the specified ID already exists, the system enters that policer's context to allow the policer's parameters to be modified. If the ID does not exist and is within the allowed range for the QoS policy type, a context for the policer ID will be created (depending on the system's current create keyword requirements which may require the create keyword to actually add the new policer ID to the QoS policy) and the system will enter that new policer's context for possible parameter modification.

**Values** 1 to 32

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## policer

## Syntax

configure service cpipe sap egress policer-override policer
configure service ipipe sap egress policer-override policer
```

### Description

This command, within the SAP ingress or egress contexts, is used to create a CLI node for specific overrides to a specific policer created on the SAP through a sap-ingress or sap-egress QoS policy.

The **no** form of this command is used to remove any existing overrides for the specified policer-id.

### Parameters

#### *policer-id*

The *policer-id* parameter is required when executing the policer command within the policer-overrides context. The specified *policer-id* must exist within the sap-ingress or sap-egress QoS policy applied to the SAP. If the policer is not currently used by any forwarding class or forwarding type mappings, the policer will not actually exist on the SAP. This does not preclude creating an override context for the policer-id.

#### **create**

The create keyword is required when a **policer** policer-id override node is being created and the system is configured to expect explicit confirmation that a new object is being created. When the system is not configured to expect explicit confirmation, the create keyword is not required.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

- configure service ipipe sap ingress policer-override policer
- configure service epipe sap egress policer-override policer
- configure service ipipe sap egress policer-override policer

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS

configure service vpls sap egress policer-override policer

### Description

This command, within the SAP ingress or egress contexts, is used to create a CLI node for specific overrides to a specific policer created on the SAP through a sap-ingress or sap-egress QoS policy.

The **no** form of this command is used to remove any existing overrides for the specified policer-id.

### Parameters

#### *policer-id*

The *policer-id* parameter is required when executing the **policer** command within the **policer-overrides** context. The specified *policer-id* must exist within the sap-ingress or sap-egress QoS policy applied to the SAP. If the policer is not currently used by any forwarding class or forwarding type mappings, the policer will not actually exist on the SAP. This does not preclude creating an override context for the *policer-id*.

#### **create**

The **create** keyword is required when a **policer** *policer-id* override node is being created and the system is configured to expect explicit confirmation that a new object is being created. When the system is not configured to expect explicit confirmation, the **create** keyword is not required.

## Context

[\[Tree\]](#) (config>app-assure>group policer)

## Full Context

configure application-assurance group policer

## Description

This command creates application assurance policer profile of a specified type. Policers can be bandwidth or flow limiting and can have a system scope (limits traffic entering AA ISA for all or a subset of AA subscribers), subscriber scope or granularity (limits apply to each AA subscriber traffic).

The policer type and granularity can only be configured during creation. They cannot be modified. The policer profile must be removed from all AQPs in order to be removed. Changes to policer profile parameters take effect immediately for policers instantiated as result of AQP actions using this profile.

The **no** form of this command deletes the specified policer from the configuration.

## Parameters

### ***policer-name***

Specifies a string of up to 32 characters that identifies the policer.

### ***type***

Specifies the policer type.

- Values**
- single-bucket-bandwidth** — Creates a profile for a single bucket (PIR) bandwidth limiting policer.
  - dual-bucket-bandwidth** — Creates profile for a dual bucket (PIR, CIR) bandwidth limiting policer.
  - flow-rate-limit** — Creates profile for a policer limiting rate of flow set-ups.
  - flow-count-limit** — Creates profile for a policer limiting total flow count.

### ***granularity***

Specifies the granularity type.

- Values**
- system** — Creates a system policer profile for a policer that limits the traffic in the scope of all or a subset of AA subscribers on a given AA ISA.
  - subscriber** — Creates a policer profile for a policer for each AA subscriber that limits the traffic in the scope of that subscriber.
  - access-network-location** — Creates a policer profile for a policer instance for each ANL that limits traffic bandwidth in the scope of that ANL. For ANL, only single-bucket bandwidth policers can be configured.

### **create**

Keyword used to create the policer name and parameters.

## Platforms

## Description

This command configures a TCA for the counter capturing drops or admit events due to the specified flow policer. A policer TCA can be created for traffic generated from the subscriber side of AA ( **from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a policer TCA.

## Parameters

### *policer-name*

Specifies the name of the flow policer, up to 32 characters

### *direction*

Specifies the traffic direction.

**Values** from-sub, to-sub

### **create**

Keyword used to create the TCA.

## Context

[\[Tree\]](#) (config>qos>sap-ingress>fc policer)

## Full Context

```
configure qos sap-ingress fc policer
```

## Description

Within a sap-ingress QoS policy forwarding class context, the **policer** command is used to map packets that match the forwarding class and are considered unicast in nature to the specified policer-id. The specified policer-id must already exist within the **sap-ingress** QoS policy. While the system is determining the forwarding class of a packet, it is also looking up its forwarding destination. If ingress forwarding logic has resolved a unicast destination (the packet does not need to be sent to multiple destinations), it is considered to be a unicast packet and will be mapped to either an ingress queue (using the **queue queue-id** or **queue queue-id group ingress-queue-group** commands) or an ingress policer ( **policer policer-id**). The **queue** and **policer** commands within the forwarding class context are mutually exclusive. By default, the unicast forwarding type is mapped to the SAP ingress default queue (queue 1). If the **policer policer-id** command is executed, any previous policer mapping or queue mapping for the unicast forwarding type within the forwarding class is overridden if the policer mapping is successful.

A policer defined within the **sap-ingress** policy is not actually created on an ingress SAP or a subscriber using an **sla-profile** where the policy is applied until at least one forwarding type (unicast, broadcast, unknown, or multicast) from one of the forwarding classes is mapped to the policer. If insufficient policer resources exist to create the policer for a SAP or subscriber or multiservice site or ingress policing is not supported on the port associated with the SAP or subscriber or multiservice site, the initial forwarding class forwarding type mapping will fail.

When the unicast forwarding type within a forwarding class is mapped to a policer, the unicast packets classified to the subclasses within the forwarding class are also mapped to the policer.

The **no** form of this command is used to restore the mapping of the unicast forwarding type within the forwarding class to the default queue. If all forwarding class forwarding types had been removed from the default queue, the queue will not exist on the SAPs or subscriber or multiservice sites associated with the QoS policy and the **no policer** command will cause the system to attempt to create the default queue on each object. If the system cannot create the default queue in each instance, the **no policer** command will fail and the unicast forwarding type within the forwarding class will continue its mapping to the existing *policer-id*. If the **no policer** command results in a policer without any current mappings, the policer will be removed from the SAPs and subscribers associated with the QoS policy. All statistics associated with the policer on each SAP and subscriber will be lost.

## Parameters

### *policer-id*

When the forwarding class **policer** command is executed, a valid *policer-id* must be specified. The parameter *policer-id* references a *policer-id* that has already been created within the **sap-ingress** QoS policy.

**Values** 1 to 63

### **fp-redirect-group**

Redirects a forwarding class to a forwarding plane queue-group as specified in a SAP QoS policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## policer

## Syntax

**policer** *policer-id* [**create**]

**no policer** *policer-id*

## Context

**[Tree]** (config>qos>sap-ingress policer)

## Full Context

configure qos sap-ingress policer

## Description

This command is used in the sap-ingress and sap-egress QoS policies to create, modify, or delete a policer. Policers are created and used in a similar manner to queues. The policer ID space is separate from the queue ID space, allowing both a queue and a policer to share the same ID. The sap-ingress policy may be defined to have up to 63 policers (numbered 1 through 63) while the sap-egress QoS policy supports a maximum of 8 (numbered 1 through 8). While a policer may be defined within a QoS policy, it is not actually created on SAPs or subscribers or multiservice sites associated with the policy until a forwarding class is mapped to the policer's ID.

All policers must be created within the QoS policies. A default policer is not created when a sap-ingress or sap-egress QoS policy is created.

When a policer is created, the policer's metering rate and profiling rates may be defined as well as the policer's maximum and committed burst sizes (MBS and CBS, respectively). Unlike queues that have dedicated counters, policers allow various stat-mode settings that define the counters that will be associated with the policer. Another supported feature—packet-byte-offset—provides a policer with the ability to modify the size of each packet, based on a defined number of bytes.

When a policer is created, it cannot be deleted from the QoS policy unless any forwarding classes that are mapped to the policer are first moved to other policers or queues.

The system will allow a policer to be created on a SAP QoS policy regardless of the ability to support policers on objects where the policy is currently applied. The system only scans the current objects for policer support and sufficient resources to create the policer when a forwarding class is first mapped to the policer ID. If the policer cannot be created due to one or more instances of the policy not supporting policing or having insufficient resources to create the policer, the forwarding class mapping will fail.

The **no** form of this command is used to delete a policer from a sap-ingress or sap-egress QoS policy. The specified policer cannot currently have any forwarding class mappings for the removal of the policer to succeed. It is not necessary to actually delete the policer ID for the policer instances to be removed from SAPs or subscriber or multiservice sites associated with the QoS policy when all forwarding classes have been moved away from the policer. It is automatically deleted from each policing instance although it still appears in the QoS policy.

## Parameters

### *policer-id*

The *policer-id* must be specified when executing the policer command. If the specified ID already exists, the system enters that policer's context to allow the policer's parameters to be modified. If the ID does not exist and is within the allowed range for the QoS policy type, a context for the policer ID will be created (depending on the system's current create keyword requirements, which may require the create keyword to actually add the new policer ID to the QoS policy) and the system will enter that new policer's context for possible parameter modification.

**Values** 1 to 63

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## policer

### Syntax

```
policer policer-id {{{port-redirect-group-queue [queue queue-id] | group group-name [instance instance-id] [queue queue-id]}}
```

```
no policer
```

### Context

**[Tree]** (config>qos>sap-egress>fc policer)

### Full Context

```
configure qos sap-egress fc policer
```

### Description

Within a sap-egress QoS policy forwarding class context, the policer command is used to map packets that match the forwarding class to the specified policer-id. The specified policer-id must already exist within the sap-egress QoS policy. The forwarding class of the packet is first discovered at ingress, based on the ingress classification rules. When the packet arrives at egress, the sap-egress QoS policy may match a forwarding class reclassification rule that overrides the ingress derived forwarding class. The forwarding class context within the sap-egress QoS policy is then used to map the packet to an egress queue (using the queue *queue-id*, or port-redirect-group queue *queue-id*, or group *queue-group-name* instance *instance-id* queue *queue-id* commands) or an egress policer (**policer** *policer-id*). The queue and policer commands within the forwarding class context are mutually exclusive. By default, the forwarding class is mapped to the SAP egress default queue (queue 1). If the **policer** *policer-id* command is executed, any previous policer mapping or queue mapping for the forwarding class is overridden if the policer mapping is successful.

A policer defined within the sap-egress policy is not actually created on an egress SAP, or a subscriber using an SLA profile where the policy is applied, until at least one forwarding class is mapped to the policer. If insufficient policer resources exist to create the policer for a SAP or subscriber, or egress policing is not supported on the port associated with the SAP or subscriber, the initial forwarding class mapping will fail.

Packets that are mapped to an egress policer that are not discarded by the policer must be placed into a default queue on the packet's destination port. The system uses egress port queue groups for this purpose. An egress queue group named policer-output-queues is automatically created on each port that supports egress policers. By default, the system uses the forwarding class mappings within this queue group to decide which queue within the group will receive each packet output from the policer. This default policer output queuing behavior may be overridden for non-subscriber packets by redirection to a queue group. The name and instance of the queue group to redirect to is either specified in the QoS policy, or the fact that a forwarding class must be redirected is identified in the QoS policy and the specific queue group instance is only identified at the time the QoS policy is applied:

- If the **policer** *policer-id* command is successfully executed, the default egress queuing is performed for the forwarding class using the policer-output-queues queue group and the *queue-id* within the group based on the forwarding class map from the group template.
- If the **policer** *policer-id* **queue** *queue-id* command is successfully executed, the specified SAP *queue-id* within the egress QoS policy is used instead of the default policer output queues.

- If the **policer** *policer-id* **port-redirect-group-queue** keyword is successfully executed, the system will map the forwarding class to the queue within the egress queue group instance specified at the time the QoS policy is applied to the SAP, using the forwarding class map from the queue group template.
- If the **policer** *policer-id* **port-redirect-group queue** *queue-id* command is successfully executed, the system will map the forwarding class to the configured *queue-id* within the egress queue group instance that is specified at the time the QoS policy is applied to the SAP (ignoring using the forwarding class map from the queue group template).
- If the **policer** *policer-id* **group** *queue-group-name* **instance** *instance-id* command is successfully executed, the system will map the forwarding class to the queue within the specified egress queue group instance using the forwarding class map from the group template.
- If the **policer** *policer-id* **group** *queue-group-name* **instance** *instance-id* **queue** *queue-id* command is successfully executed, the system will map the forwarding class to the specified *queue-id* within the specified egress queue group instance (ignoring the forwarding class map in the group template).

If the specified **group** *group-name* is not defined as an egress queue-group-template, the **policer** command will fail. Also, if the specified group does not exist on the port for the SAPs or subscribers associated with the **sap-egress** QoS policy, the policer command will fail. While a group *queue-group-name* is specified in a **sap-egress** QoS policy, the groups corresponding egress template cannot be deleted. While a port egress queue group is associated with a policer instance, the port queue group cannot be deleted.

If the specified **queue** *queue-id* is not defined in the egress queue-group-template *queue-group-name*, the policer command will fail. While a *queue-id* within an egress queue group template is referenced by a **sap-egress** QoS policy forwarding class policer command, the queue cannot be deleted from the queue group template.

If an egress policed packet is discarded by the egress port queue group queue, the source policer discard stats are incremented. This means that the discard counters for the policer represent both the policer discard events and the destination queue drop tail events associated with the policer.

The **no** form of this command is used to restore the mapping of the forwarding class to the default queue. If all forwarding classes have been removed from the default queue, the queue will not exist on the SAPs or subscribers associated with the QoS policy and the **no policer** command will cause the system to attempt to create the default queue on each object. If the system cannot create the default queue in each instance, the **no policer** command will fail and the forwarding class will continue its mapping to the existing *policer-id*. If the **no policer** command results in a policer without any current mappings, the policer will be removed from the SAPs and subscribers associated with the QoS policy. All statistics associated with the policer on each SAP and subscribers will be lost.

## Default

no policer

## Parameters

### *policer-id*

When the forwarding class **policer** command is executed, a valid *policer-id* must be specified. The parameter *policer-id* references a *policer-id* that has already been created within the **sap-egress** QoS policy.

**Values** 1 to 63

### **port-redirect-group-queue**

Used to override the forwarding class default egress queue destination to an egress port queue group. The specific egress queue group instance to use is specified at the time the QoS policy is applied to the SAP. Therefore, this parameter is only valid if SAP-based redirection is required.

**queue *queue-id***

This parameter overrides the forwarding class default egress queue destination to a specified *queue-id*. If `port-redirect-group` is not configured, this will be a local SAP queue of that *queue-id*. A queue of ID *queue-id* must exist within the egress QoS policy. If **port-redirect-group-queue** is configured, the **queue *queue-id*** in the egress port queue group instance is used.

**Values** 1 to 8

**Default** Derived from forwarding class assignment in queue-group definition.

**group *group-name***

The **group *queue-group-name*** is optional and is used to override the forwarding class's default egress queue destination. If the queue group-queue-id parameter is not specified, the forwarding class map within the specified group's template is used to derive which queue within the group will receive the forwarding class's packets. An egress queue group template must exist for the specified queue-group-name or the policer command will fail. The specified queue-group-name must also exist as an egress queue group on the ports where SAPs and subscribers associated with the sap-egress policy are applied or the policer command will fail.

**Values** Any qualifying egress queue group name

**Default** policer-output-queues

**queue *queue-id***

The **queue *group-queue-id*** is optional when the group queue-group-name parameter is specified and is used to override the forwarding class mapping within the group's egress queue group template. The specified group-queue-id must exist within the group's egress queue group template or the policer command will fail.

**Values** 1 to 8

**Default** Derived from forwarding class assignment in queue-group definition

**instance *instance-id***

This parameter is used to specify the specific instance of a queue group with template queue-group-name to which this queue should be redirected. This parameter is only valid for queue groups on egress ports where policy-based redirection is required.

**Values** 1 to 40960

**Default** 1

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## policer

### Syntax

**policer** *policer-id* [**create**]

**no policer**

### Context

**[Tree]** (config>qos>sap-egress policer)

### Full Context

configure qos sap-egress policer

### Description

A policer defined within the sap-egress policy is not actually created on an egress SAP, or a subscriber using an SLA profile where the policy is applied, until at least one forwarding class is mapped to the policer. If insufficient policer resources exist to create the policer for a SAP or subscriber, or egress policing is not supported on the port associated with the SAP or subscriber, the initial forwarding class mapping will fail.

Packets that are mapped to an egress policer that are not discarded by the policer must be placed into a default queue on the packet's destination port. The system uses egress port queue groups for this purpose. An egress queue group named policer-output-queues is automatically created on each port that supports egress policers. By default, the system uses the forwarding class mappings within this queue group to decide which queue within the group will receive each packet output from the policer. This default policer output queuing behavior may be overridden for non-subscriber packets by redirection to a queue group. The name and instance of the queue group to redirect to is either specified in the QoS policy, or the fact that a forwarding class must be redirected is identified in the QoS policy and the specific queue group instance is only identified at the time the QoS policy is applied:

- If the **policer** *policer-id* command is successfully executed, the default egress queuing is performed for the forwarding class using the policer-output-queues queue group and the *queue-id* within the group based on the forwarding class map from the group template.
- If the **policer** *policer-id* **queue** *queue-id* command is successfully executed, the specified SAP *queue-id* within the egress QoS policy is used instead of the default policer output queues.
- If the **policer** *policer-id* **port-redirect-group-queue** keyword is successfully executed, the system will map the forwarding class to the queue within the egress queue group instance specified at the time the QoS policy is applied to the SAP, using the forwarding class map from the queue group template.
- If the **policer** *policer-id* **port-redirect-group queue** *queue-id* command is successfully executed, the system will map the forwarding class to the configured *queue-id* within the egress queue group instance that is specified at the time the QoS policy is applied to the SAP (ignoring using the forwarding class map from the queue group template).
- If the **policer** *policer-id* **group** *queue-group-name* **instance** *instance-id* command is successfully executed, the system will map the forwarding class to the queue within the specified egress queue group instance using the forwarding class map from the group template.

- If the **policer** *policer-id* **group** *queue-group-name* **instance** *instance-id* **queue** *queue-id* command is successfully executed, the system will map the forwarding class to the specified *queue-id* within the specified egress queue group instance (ignoring the forwarding class map in the group template).

If the specified **group** *group-name* is not defined as an egress queue-group-template, the **policer** command will fail. Also, if the specified group does not exist on the port for the SAPs or subscribers associated with the **sap-egress** QoS policy, the policer command will fail. While a group *queue-group-name* is specified in a **sap-egress** QoS policy, the groups corresponding egress template cannot be deleted. While a port egress queue group is associated with a policer instance, the port queue group cannot be deleted.

If the specified **queue** *queue-id* is not defined in the egress queue-group-template *queue-group-name*, the policer command will fail. While a *queue-id* within an egress queue group template is referenced by a **sap-egress** QoS policy forwarding class policer command, the queue cannot be deleted from the queue group template.

If an egress policed packet is discarded by the egress port queue group queue, the source policer discard stats are incremented. This means that the discard counters for the policer represent both the policer discard events and the destination queue drop tail events associated with the policer.

The **no** form of this command is used to restore the mapping of the forwarding class to the default queue. If all forwarding classes have been removed from the default queue, the queue will not exist on the SAPs or subscribers associated with the QoS policy and the **no policer** command will cause the system to attempt to create the default queue on each object. If the system cannot create the default queue in each instance, the **no policer** command will fail and the forwarding class will continue its mapping to the existing *policer-id*. If the **no policer** command results in a policer without any current mappings, the policer will be removed from the SAPs and subscribers associated with the QoS policy. All statistics associated with the policer on each SAP and subscribers will be lost.

## Default

no policer

## Parameters

### *policer-id*

When the forwarding class **policer** command is executed, a valid *policer-id* must be specified. The parameter *policer-id* references a *policer-id* that has already been created within the **sap-egress** QoS policy.

**Values** 1 to 63

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## policer

## Syntax

**policer** *policer-id* [**create**]

**no policer** *policer-id*

## Context

[\[Tree\]](#) (cfg>qos>qgrps>egr>queue-group policer)

[\[Tree\]](#) (config>qos>qgrps>ing>queue-group policer)

## Full Context

configure qos queue-group-templates egress queue-group policer

configure qos queue-group-templates ingress queue-group policer

## Description

This command is used in ingress and egress queue-group templates to create, modify, or delete a policer.

Policers are created and used in a similar manner to queues. The policer ID space is separate from the queue ID space, allowing both a queue and a policer to share the same ID. While a policer may be defined in a queue-group template, it is not actually created until the queue-group template is instantiated on the ingress context of a forwarding plane or on the egress context of a port.

When a policer is created, the policer's metering rate and profiling rates may be defined, as well as the policer's maximum and committed burst sizes (MBS and CBS, respectively). Unlike queues that have dedicated counters, policers allow various stat-mode settings that define the counters that will be associated with the policer. Another supported feature—packet-byte-offset—provides a policer with the ability to modify the size of each packet based on a defined number of bytes.

When a policer is created, it cannot be deleted from the queue-group template unless any forwarding classes that are redirected to the policer are first removed.

The **no** version of this command deletes the policer.

## Parameters

### *policer-id*

The *policer-id* must be specified when executing the policer command. If the specified ID already exists, the system enters that policer's context to allow the policer's parameters to be modified. If the ID does not exist and is within the allowed range for the QoS policy type, a context for the policer ID will be created (depending on the system's current create keyword requirements, which may require the **create** keyword to actually add the new policer ID to the QoS policy) and the system enters that new policer's context for possible parameter modification.

| Values |         |                     |         |
|--------|---------|---------------------|---------|
|        | ingress | all platforms       | 1 to 32 |
|        | egress  | VSR                 | 1 to 8  |
|        | egress  | all other platforms | 1 to 16 |

configure service cpipe sap egress policer-control-override

configure service cpipe sap ingress policer-control-override

configure service ipipe sap ingress policer-control-override

## Description

This command, within the SAP ingress or egress contexts, creates a CLI node for specific overrides to the applied policer-control-policy. A policy must be applied for a policer-control-overrides node to be created. If the policer-control-policy is removed or changed, the policer-control-overrides node is automatically deleted from the SAP.

The **no** form of this command removes any existing policer-control-policy overrides and the policer-control-overrides node from the SAP.

## Default

no policer-control-override

## Parameters

### create

The create keyword is required when the policer-control-overrides node is being created and the system is configured to expect explicit confirmation that a new object is being created. When the system is not configured to expect explicit confirmation, the create keyword is not required.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

```
configure subscriber-mgmt sub-profile ingress policer-control-policy
```

```
configure subscriber-mgmt sub-profile egress policer-control-policy
```

### Description

This command is used to create, delete, or modify policer control policies. The **policer-control-policy** controls the aggregate bandwidth available to a set of child policers. Once created, the policy can be

applied to ingress or egress SAPs. The policy can also be applied to the ingress or egress context of a sub-profile.

The **no** form of this command reverts to the default.

## Parameters

### *policy-name*

Specifies the policer control policy name. Each policer-control-policy must be created with a unique policy name. The name given as policy-name must adhere to the system policy ASCII naming requirements. If the defined policy-name already exists, the system will enter that policy's context for editing purposes. If policy-name does not exist, the system will attempt to create a policy with the specified name. Creating a policy may require use of the create parameter when the system is configured for explicit object creation mode.

### **create**

The **create** keyword is required when a new policy is being created and the system is configured for explicit object creation mode.

## Platforms

configure service epipe sap egress policer-control-policy
```

## Description

This command, within the QoS CLI node, is used to create, delete or modify policer control policies. A policer control policy is very similar to the scheduler-policy which is used to manage a set of queues by defining a hierarchy of virtual schedulers and specifying how the virtual schedulers interact to provide an aggregate SLA. In a similar fashion, the policer-control-policy controls the aggregate bandwidth available to a set of child policers. Once created, the policy can be applied to ingress or egress SAPs.

### Policer Control Policy Instances

On the SAP side, an instance of a policy is created each time a policy is applied.

When applied to a sub-profile on a 7450 ESS and 7750 SR, an instance of the policy is created each time a subscriber successfully maps one or more hosts to the profile per ingress SAP.

Each instance of the policer-control-policy manages the policers associated with the object that owns the policy instance (SAP or subscriber). If a policer on the object is parented to an appropriate arbiter name that exists within the policy, the policer will be managed by the instance. If a policer is not parented or is parented to a non-existent arbiter, the policer will be orphaned and will not be subject to bandwidth control by the policy instance.

### Maximum Rate and Root Arbiter

The policer-control-policy supports an overall maximum rate (max-rate) that defines the total amount of bandwidth that may be distributed to all associated child policers. By default, that rate is set to max which provides an unlimited amount of bandwidth to the policers. Once the policy is created, an actual rate should be configured in order for the policy instances to be effective. At the SAP level, the maximum rate may be overridden on a per instance basis.

For subscribers, the maximum rate may only be overridden on the subscriber profile which will then be applied to all instances associated with the profile.

The maximum rate is defined within the context of the root arbiter which is always present in a policer-control-policy. The system creates a parent policer which polices the output of all child policers attached to the policy instance to the configured rate. Child policers may be parented directly to the root arbiter (parent root) or parented to one of the tiered arbiters (parent arbiter-name). Since each tiered arbiter must be parented to either another tiered arbiter or the root arbiter (default), every parented child policer is associated with the root arbiter and therefore the root arbiter's parent policer.

### Parent Policer PIR Leaky Bucket Operation

The parent policer is a single leaky bucket that monitors the aggregate throughput rate of the associated child policers. Forwarded packets increment the bucket by the size of each packet. The rate of the parent policer is implemented as a bucket decrement function which attempts to drain the bucket. If the rate of the packets flowing through the bucket is less than the decrement rate, the bucket does not accumulate depth. Each packet that flows through the bucket is accompanied by a derived discard threshold. If the current depth of the bucket is less than the discard threshold, the packet is allowed to pass through, retaining the colors derived from the packet's child policer. If the current depth is equal to or greater than the threshold value, the packet is colored red and the bucket depth is not incremented by the packet size. Also, any increased bucket depths in the child policer are canceled making any discard event an atomic function between the child and the parent.

Due to the fact that multiple thresholds are supported by the parent policer, the policer control policy is able to protect the throughput of higher priority child policers from the throughput of the lower priority child policers within the aggregate rate.

### **Tier 1 and Tier 2 Arbiters**

As previously stated, each child is attached either to the always available root arbiter or to an explicitly created tier 1 or tier 2 arbiter. Unlike the hardware parent policer based root arbiter, the arbiters at tier 1 and tier 2 are only represented in software and are meant to provide an arbitrary hierarchical bandwidth distribution capability. An arbiter created on tier 2 must parent to either to an arbiter on tier 1 or to the root arbiter. Arbiters created on tier 1 always parent to the root arbiter. In this manner, every arbiter ultimately is parented or grand-parented by the root arbiter.

Each tiered arbiter supports an optional rate parameter that defines a rate limit for all child arbiters or child policers associated with the arbiter. Child arbiters and policers attached to the arbiter have a level attribute that defines the strict level at which the child is given bandwidth by the arbiter. Level 8 is the highest and 1 is the lowest. Also a weight attribute defines each child's weight at that strict level in order to determine how bandwidth is distributed to multiple children at that level when insufficient bandwidth is available to meet each child's required bandwidth.

### **Fair and Unfair Bandwidth Control**

Each child policer supports three leaky buckets. The PIR bucket manages the policer's peak rate and maximum burst size, the CIR leaky bucket manages the policer's committed rate and committed burst size. The third leaky bucket is used by the policer control policy instance to manage the child policer's fair rate (FIR). When multiple child policers are attached to the root arbiter at the same priority level, the policy instance uses each child's FIR bucket rate to control how much of the traffic forwarded by the policer is fair and how much is unfair.

In the simplest case where all the child policers in the same priority level are directly attached to the root arbiter, each child's FIR rate is set according to the child's weight divided by the sum of the active children's weights multiplied by the available bandwidth at the priority level. The result is that the FIR bucket will mark the appropriate amount of traffic for each child as fair-based on the weighted fair output of the policy instance.

The fair/unfair forwarding control in the root parent policer is accomplished by implementing two different discard thresholds for the priority. The first threshold is discard-unfair and the second is discard-all for packet associated with the priority level. As the parent policer PIR bucket fills (due the aggregate forwarded rate being greater than the parent policers PIR decrement rate) and the bucket depth reaches the first threshold, all unfair packets within the priority are discarded. This leaves room in the bucket for the fair packets to be forwarded.

In the more complex case where one or more tiered arbiters are attached at the priority level, the policer control policy instance must consider more than just the child policer weights associated with the attached arbiter. If the arbiter is configured with an aggregate rate limit that its children cannot exceed, the policer control policy instance will switch to calculating the rate each child serviced by the arbiter should receive and enforces that rate using each child policers PIR leaky bucket.

When the child policer PIR leaky bucket is used to limit the bandwidth for the child policer and the child's PIR bucket discard threshold is reached, packets associated with the child policer are discarded. The child policer's discarded packets do not consume depth in the child policer's CIR or FIR buckets. The child policers discarded packets are also prevented from impacting the parent policer and will not consume the aggregate bandwidth managed by the parent policer.

### **Parent Policer Priority Level Thresholds**

As stated in the Tier 1 and Tier 2 Arbiter subsection, each child policer is attached either to the root arbiter or explicitly to one of the tier 1 or tier 2 arbiters. When attached directly to the root arbiter, its priority

relative to all other child policers is indicated by the parenting level parameter. When attached through one of the tiered arbiters, the parenting hierarchy of the arbiters must be traced through to the ultimate attachment to the root arbiter. The parenting level parameter of the arbiter parented to the root arbiter defines the child policer's priority level within the parent policer.

The priority level is important since it defines the parent policer discard thresholds that will be applied at the parent policer. The parent policer has 8 levels of strict priority and each priority level has its own discard-unfair and discard-all thresholds. Each priority's thresholds are larger than the thresholds of the lower priority levels. This ensures that when the parent policer is discarding, it will be priority sensitive.

To visualize the behavior of the parent policer, picture that when the aggregate forwarding rate of all child policers is currently above the decrement rate of the parent PIR leaky bucket, the bucket depth will increase over time. As the bucket depth increases, it will eventually cross the lowest priority's discard-unfair threshold. If this amount of discard sufficiently lowers the remaining aggregate child policer rate, the parent PIR bucket will hover around this bucket depth. If however, the remaining aggregate child rate is still greater than the decrement rate, the bucket will continue to rise and eventually reach the lowest priority's discard-all threshold which will cause all packets associated with the priority level to be discarded (fair and unfair). Again, if the remaining aggregate child rate is less than or equal to the bucket decrement rate, the parent PIR bucket will hover around this higher bucket depth. If the remaining aggregate child rate is still higher than the decrement rate, the bucket will continue to rise through the remaining priority level discards until equilibrium is achieved.

Each child's rate feeding into the parent policer is governed by the child policer's PIR bucket decrement rate. The amount of bandwidth the child policer offers to the parent policer will not exceed the child policer's configured maximum rate.

### **Root Arbiter's Parent Policers' Priority Aggregate Thresholds**

Each policer-control-policy root arbiter supports configurable aggregate priority thresholds which are used to control burst tolerance within each priority level. Two values are maintained per priority level; the shared-portion and the fair-portion. The shared-portion represents the amount of parent PIR bucket depth that is allowed to be consumed by both fair and unfair child packets at the priority level. The fair-portion represents the amount of parent PIR bucket depth that only the fair child policer packets may consume within the priority level. It should be noted that the fair and unfair child packets associated with a higher parent policer priority level may also consume the bucket depth set aside for this priority.

While the policy maintains a parent policer default or explicit configurable values for shared-portion and fair-portion within each priority level, it is possible that some priority levels will not be used within the parent policer. Most parent policer use cases require fewer than eight strict priority levels.

To derive the actual priority level discard-unfair and discard-all thresholds while only accounting for the actual in-use priority levels, the system maintains a child policer to parent policer association counter per priority level for each policer control policy instance. As a child policer is parented to either the root or a tiered arbiter, the system determines the parent policer priority level for the child policer and increments the association counter for that priority level on the parent policer instance.

The shared-portion for each priority level is affected by the parent policer global min-thresh-separation parameter that defines the minimum separation between any in-use discard thresholds. When more than one child policer is associated with a parent policer priority level, the shared-portion for that priority level will be the current value of min-thresh-separation. When only a single child policer is associated, the priority level's shared-portion is zero since all packets from the child will be marked fair and the discard-unfair threshold is meaningless. When the association counter is zero, both the shared-portion and the fair-portion for that priority level are zero since neither discard thresholds will be used. Whenever the association counter is greater than 0, the fair-portion for that priority level will be derived from the current value of the priority's mbs-contribution parameter and the global min-thresh-separation parameter.

Each priority level's discard-unfair and discard-all thresholds are calculated based on an accumulation of lower priorities shared-portions and fair-portions and the priority level's own shared-portion and fair-portion. The base threshold value for each priority level is equal to the sum of all lower priority level's shared-portions and fair-portions. The discard-unfair threshold is the priority level's base threshold plus the priority level's shared-portion. The discard-all threshold for the priority level is the priority level's base threshold plus both the shared-portion and fair-portion values of the priority. As can be seen, an in-use priority level's thresholds are always greater than the thresholds of lower priority levels.

### **Policer Control Policy Application**

A policer-control-policy may be applied on any Ethernet ingress or egress SAP that is associated with a port (or ports in the case of LAG).

The **no** form of this command removes a non-associated policer control policy from the system. The command will not execute when policer-name is currently associated with any SAP context.

### **Parameters**

#### ***policy-name***

Each policer-control-policy must be created with a unique policy name. The name given as policy-name must adhere to the system policy ASCII naming requirements. If the defined policy-name already exists, the system will enter that policy's context for editing purposes. If policy-name does not exist, the system will attempt to create a policy with the specified name. Creating a policy may require use of the create parameter when the system is configured for explicit object creation mode.

#### **create**

The keyword is required when a new policy is being created and the system is configured for explicit object creation mode.

### **Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure service cpipe sap ingress policer-control-policy
- configure service cpipe sap egress policer-control-policy

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

- configure service ipipe sap ingress policer-control-policy
- configure service ipipe sap egress policer-control-policy
- configure service epipe sap egress policer-control-policy
- configure service epipe sap ingress policer-control-policy

## **policer-control-policy**

### **Syntax**

**policer-control-policy** *policy-name*

**no policer-control-policy**

## Context

## Full Context

configure service vpls sap ingress policer-control-policy

configure service vpls sap egress policer-control-policy

configure service template vpls-sap-template ingress policer-control-policy

configure service template vpls-sap-template egress policer-control-policy

## Description

This command, within the qos CLI node, is used to create, delete or modify policer control policies. A policer control policy is very similar to the scheduler-policy which is used to manage a set of queues by defining a hierarchy of virtual schedulers and specifying how the virtual schedulers interact to provide an aggregate SLA. In a similar fashion, the policer-control-policy controls the aggregate bandwidth available to a set of child policers. Once created, the policy can be applied to ingress or egress SAPs. The policy may also be applied to the ingress or egress context of a sub-profile.

### Policer Control Policy Instances

On the SAP side, an instance of a policy is created each time a policy is applied. When applied to a sub-profile, an instance of the policy is created each time a subscriber successfully maps one or more hosts to the profile per ingress SAP.

Each instance of the policer-control-policy manages the policers associated with the object that owns the policy instance (SAP or subscriber). If a policer on the object is parented to an appropriate arbiter name that exists within the policy, the policer will be managed by the instance. If a policer is not parented or is parented to a non-existent arbiter, the policer will be orphaned and will not be subject to bandwidth control by the policy instance.

### Maximum Rate and Root Arbiter

The policer-control-policy supports an overall maximum rate (max-rate) that defines the total amount of bandwidth that may be distributed to all associated child policers. By default, that rate is set to max which provides an unlimited amount of bandwidth to the policers. Once the policy is created, an actual rate should be configured in order for the policy instances to be effective. At the SAP level, the maximum rate may be overridden on a per instance basis. For subscribers, the maximum rate may only be overridden on the subscriber profile which will then be applied to all instances associated with the profile.

The maximum rate is defined within the context of the root arbiter which is always present in a policer-control-policy. The system creates a parent policer which polices the output of all child policers attached to the policy instance to the configured rate. Child policers may be parented directly to the root arbiter (parent root) or parented to one of the tiered arbiters (parent arbiter-name). Since each tiered arbiter must be parented to either another tiered arbiter or the root arbiter (default), every parented child policer is associated with the root arbiter and therefore the root arbiter's parent policer.

### Parent Policer PIR Leaky Bucket Operation

The parent policer is a single leaky bucket that monitors the aggregate throughput rate of the associated child policers. Forwarded packets increment the bucket by the size of each packet. The rate of the parent

policer is implemented as a bucket decrement function which attempts to drain the bucket. If the rate of the packets flowing through the bucket is less than the decrement rate, the bucket does not accumulate depth. Each packet that flows through the bucket is accompanied by a derived discard threshold. If the current depth of the bucket is less than the discard threshold, the packet is allowed to pass through, retaining the colors derived from the packet's child policer. If the current depth is equal to or greater than the threshold value, the packet is colored red and the bucket depth is not incremented by the packet size. Also, any increased bucket depths in the child policer are canceled making any discard event an atomic function between the child and the parent.

Due to the fact that multiple thresholds are supported by the parent policer, the policer control policy is able to protect the throughput of higher priority child policers from the throughput of the lower priority child policers within the aggregate rate.

### **Tier 1 and Tier 2 Arbiters**

As stated above, each child is attached either to the always available root arbiter or to an explicitly created tier 1 or tier 2 arbiter. Unlike the hardware parent policer based root arbiter, the arbiters at tier 1 and tier 2 are only represented in software and are meant to provide an arbitrary hierarchical bandwidth distribution capability. An arbiter created on tier 2 must parent to either to an arbiter on tier 1 or to the root arbiter. Arbiters created on tier 1 always parent to the root arbiter. In this manner, every arbiter ultimately is parented or grand-parented by the root arbiter.

Each tiered arbiter supports an optional rate parameter that defines a rate limit for all child arbiters or child policers associated with the arbiter. Child arbiters and policers attached to the arbiter have a level attribute that defines the strict level at which the child is given bandwidth by the arbiter. Level 8 is the highest and 1 is the lowest. Also a weight attribute defines each child's weight at that strict level in order to determine how bandwidth is distributed to multiple children at that level when insufficient bandwidth is available to meet each child's required bandwidth.

### **Fair and Unfair Bandwidth Control**

Each child policer supports three leaky buckets. The PIR bucket manages the policer's peak rate and maximum burst size, the CIR leaky bucket manages the policer's committed rate and committed burst size. The third leaky bucket is used by the policer control policy instance to manage the child policer's fair rate (FIR). When multiple child policers are attached to the root arbiter at the same priority level, the policy instance uses each child's FIR bucket rate to control how much of the traffic forwarded by the policer is fair and how much is unfair.

In the simplest case where all the child policers in the same priority level are directly attached to the root arbiter, each child's FIR rate is set according to the child's weight divided by the sum of the active children's weights multiplied by the available bandwidth at the priority level. The result is that the FIR bucket will mark the appropriate amount of traffic for each child as fair-based on the weighted fair output of the policy instance.

The fair/unfair forwarding control in the root parent policer is accomplished by implementing two different discard thresholds for the priority. The first threshold is discard-unfair and the second is discard-all for packet associated with the priority level. As the parent policer PIR bucket fills (due the aggregate forwarded rate being greater than the parent policers PIR decrement rate) and the bucket depth reaches the first threshold, all unfair packets within the priority are discarded. This leaves room in the bucket for the fair packets to be forwarded.

In the more complex case where one or more tiered arbiters are attached at the priority level, the policer control policy instance must consider more than just the child policer weights associated with the attached arbiter. If the arbiter is configured with an aggregate rate limit that its children cannot exceed, the policer control policy instance will switch to calculating the rate each child serviced by the arbiter should receive and enforces that rate using each child policers PIR leaky bucket.

When the child policer PIR leaky bucket is used to limit the bandwidth for the child policer and the child's PIR bucket discard threshold is reached, packets associated with the child policer are discarded. The child policer's discarded packets do not consume depth in the child policer's CIR or FIR buckets. The child policer's discarded packets are also prevented from impacting the parent policer and will not consume the aggregate bandwidth managed by the parent policer.

### **Parent Policer Priority Level Thresholds**

As stated above, each child policer is attached either to the root arbiter or explicitly to one of the tier 1 or tier 2 arbiters. When attached directly to the root arbiter, its priority relative to all other child policers is indicated by the parenting level parameter. When attached through one of the tiered arbiters, the parenting hierarchy of the arbiters must be traced through to the ultimate attachment to the root arbiter. The parenting level parameter of the arbiter parented to the root arbiter defines the child policer's priority level within the parent policer.

The priority level is important since it defines the parent policer discard thresholds that will be applied at the parent policer. The parent policer has 8 levels of strict priority and each priority level has its own discard-unfair and discard-all thresholds. Each priority's thresholds are larger than the thresholds of the lower priority levels. This ensures that when the parent policer is discarding, it will be priority sensitive.

To visualize the behavior of the parent policer, picture that when the aggregate forwarding rate of all child policers is currently above the decrement rate of the parent PIR leaky bucket, the bucket depth will increase over time. As the bucket depth increases, it will eventually cross the lowest priority's discard-unfair threshold. If this amount of discard sufficiently lowers the remaining aggregate child policer rate, the parent PIR bucket will hover around this bucket depth. If however, the remaining aggregate child rate is still greater than the decrement rate, the bucket will continue to rise and eventually reach the lowest priority's discard-all threshold which will cause all packets associated with the priority level to be discarded (fair and unfair). Again, if the remaining aggregate child rate is less than or equal to the bucket decrement rate, the parent PIR bucket will hover around this higher bucket depth. If the remaining aggregate child rate is still higher than the decrement rate, the bucket will continue to rise through the remaining priority level discards until equilibrium is achieved.

As noted above, each child's rate feeding into the parent policer is governed by the child policer's PIR bucket decrement rate. The amount of bandwidth the child policer offers to the parent policer will not exceed the child policer's configured maximum rate.

### **Root Arbiter's Parent Policer's Priority Aggregate Thresholds**

Each policer-control-policy root arbiter supports configurable aggregate priority thresholds which are used to control burst tolerance within each priority level. Two values are maintained per priority level; the shared-portion and the fair-portion. The shared-portion represents the amount of parent PIR bucket depth that is allowed to be consumed by both fair and unfair child packets at the priority level. The fair-portion represents the amount of parent PIR bucket depth that only the fair child policer packets may consume within the priority level. It should be noted that the fair and unfair child packets associated with a higher parent policer priority level may also consume the bucket depth set aside for this priority.

While the policy maintains a parent policer default or explicit configurable values for shared-portion and fair-portion within each priority level, it is possible that some priority levels will not be used within the parent policer. Most parent policer use cases require fewer than eight strict priority levels.

To derive the actual priority level discard-unfair and discard-all thresholds while only accounting for the actual in-use priority levels, the system maintains a child policer to parent policer association counter per priority level for each policer control policy instance. As a child policer is parented to either the root or a tiered arbiter, the system determines the parent policer priority level for the child policer and increments the association counter for that priority level on the parent policer instance.

The shared-portion for each priority level is affected by the parent policer global min-thresh-separation parameter that defines the minimum separation between any in-use discard thresholds. When more than one child policer is associated with a parent policer priority level, the shared-portion for that priority level will be the current value of min-thresh-separation. When only a single child policer is associated, the priority level's shared-portion is zero since all packets from the child will be marked fair and the discard-unfair threshold is meaningless. When the association counter is zero, both the shared-portion and the fair-portion for that priority level are zero since neither discard thresholds will be used. Whenever the association counter is greater than 0, the fair-portion for that priority level will be derived from the current value of the priority's mbs-contribution parameter and the global min-thresh-separation parameter.

Each priority level's discard-unfair and discard-all thresholds are calculated based on an accumulation of lower priorities shared-portions and fair-portions and the priority level's own shared-portion and fair-portion. The base threshold value for each priority level is equal to the sum of all lower priority level's shared-portions and fair-portions. The discard-unfair threshold is the priority level's base threshold plus the priority level's shared-portion. The discard-all threshold for the priority level is the priority level's base threshold plus both the shared-portion and fair-portion values of the priority. As can be seen, an in-use priority level's thresholds are always greater than the thresholds of lower priority levels.

### **Policer Control Policy Application**

A policer-control-policy may be applied on any Ethernet ingress or egress SAP that is associated with a port (or ports in the case of LAG).

The **no** form of this command removes a non-associated policer control policy from the system. The command will not execute when policer-name is currently associated with any SAP or subscriber management sub-profile context.

### **Parameters**

#### ***policy-name***

Specifies the policy name. Each policer-control-policy must be created with a unique policy name. The name must be given as policy-name must adhere to the system policy ASCII naming requirements. If the defined policy-name already exists, the system will enter that policy's context for editing purposes. If policy-name does not exist, the system will attempt to create a policy with the specified name. Creating a policy may require use of the create parameter when the system is configured for explicit object creation mode.

#### **create**

The keyword is required when a new policy is being created and the system is configured for explicit object creation mode.

### **Platforms**

**[Tree]** (config>service>ies>if>sap>egress policer-control-policy)

## Full Context

configure service ies interface sap ingress policer-control-policy

configure service ies interface sap egress policer-control-policy

## Description

This command, within the qos CLI node, is used to create, delete or modify policer control policies. A policer control policy is very similar to the scheduler-policy which is used to manage a set of queues by defining a hierarchy of virtual schedulers and specifying how the virtual schedulers interact to provide an aggregate SLA. In a similar fashion, the policer-control-policy controls the aggregate bandwidth available to a set of child policers. Once created, the policy can be applied to ingress or egress SAPs. The policy may also be applied to the ingress or egress context of a sub-profile.

### Policer Control Policy Instances

On the SAP side, an instance of a policy is created each time a policy is applied. When applied to a sub-profile, an instance of the policy is created each time a subscriber successfully maps one or more hosts to the profile per ingress SAP.

Each instance of the policer-control-policy manages the policers associated with the object that owns the policy instance (SAP or subscriber). If a policer on the object is parented to an appropriate arbiter name that exists within the policy, the policer will be managed by the instance. If a policer is not parented or is parented to a non-existent arbiter, the policer will be orphaned and will not be subject to bandwidth control by the policy instance.

### Maximum Rate and Root Arbiter

The policer-control-policy supports an overall maximum rate (max-rate) that defines the total amount of bandwidth that may be distributed to all associated child policers. By default, that rate is set to max which provides an unlimited amount of bandwidth to the policers. Once the policy is created, an actual rate should be configured in order for the policy instances to be effective. At the SAP level, the maximum rate may be overridden on a per instance basis. For subscribers, the maximum rate may only be overridden on the subscriber profile which will then be applied to all instances associated with the profile.

The maximum rate is defined within the context of the root arbiter which is always present in a policer-control-policy. The system creates a parent policer which polices the output of all child policers attached to the policy instance to the configured rate. Child policers may be parented directly to the root arbiter (parent root) or parented to one of the tiered arbiters (parent arbiter-name). Since each tiered arbiter must be parented to either another tiered arbiter or the root arbiter (default), every parented child policer is associated with the root arbiter and therefore the root arbiter's parent policer.

### Parent Policer PIR Leaky Bucket Operation

The parent policer is a single leaky bucket that monitors the aggregate throughput rate of the associated child policers. Forwarded packets increment the bucket by the size of each packet. The rate of the parent policer is implemented as a bucket decrement function which attempts to drain the bucket. If the rate of the packets flowing through the bucket is less than the decrement rate, the bucket does not accumulate depth. Each packet that flows through the bucket is accompanied by a derived discard threshold. If the current depth of the bucket is less than the discard threshold, the packet is allowed to pass through, retaining the colors derived from the packet's child policer. If the current depth is equal to or greater than the threshold value, the packet is colored red and the bucket depth is not incremented by the packet size. Also, any

increased bucket depths in the child policer are canceled making any discard event an atomic function between the child and the parent.

Due to the fact that multiple thresholds are supported by the parent policer, the policer control policy is able to protect the throughput of higher priority child policers from the throughput of the lower priority child policers within the aggregate rate.

### **Tier 1 and Tier 2 Arbiters**

As stated above, each child is attached either to the always available root arbiter or to an explicitly created tier 1 or tier 2 arbiter. Unlike the hardware parent policer based root arbiter, the arbiters at tier 1 and tier 2 are only represented in software and are meant to provide an arbitrary hierarchical bandwidth distribution capability. An arbiter created on tier 2 must parent to either to an arbiter on tier 1 or to the root arbiter. Arbiters created on tier 1 always parent to the root arbiter. In this manner, every arbiter ultimately is parented or grand-parented by the root arbiter.

Each tiered arbiter supports an optional rate parameter that defines a rate limit for all child arbiters or child policers associated with the arbiter. Child arbiters and policers attached to the arbiter have a level attribute that defines the strict level at which the child is given bandwidth by the arbiter. Level 8 is the highest and 1 is the lowest. Also a weight attribute defines each child's weight at that strict level in order to determine how bandwidth is distributed to multiple children at that level when insufficient bandwidth is available to meet each child's required bandwidth.

### **Fair and Unfair Bandwidth Control**

Each child policer supports three leaky buckets. The PIR bucket manages the policer's peak rate and maximum burst size, the CIR leaky bucket manages the policer's committed rate and committed burst size. The third leaky bucket is used by the policer control policy instance to manage the child policer's fair rate (FIR). When multiple child policers are attached to the root arbiter at the same priority level, the policy instance uses each child's FIR bucket rate to control how much of the traffic forwarded by the policer is fair and how much is unfair.

In the simplest case where all the child policers in the same priority level are directly attached to the root arbiter, each child's FIR rate is set according to the child's weight divided by the sum of the active children's weights multiplied by the available bandwidth at the priority level. The result is that the FIR bucket will mark the appropriate amount of traffic for each child as fair-based on the weighted fair output of the policy instance.

The fair/unfair forwarding control in the root parent policer is accomplished by implementing two different discard thresholds for the priority. The first threshold is discard-unfair and the second is discard-all for packet associated with the priority level. As the parent policer PIR bucket fills (due the aggregate forwarded rate being greater than the parent policers PIR decrement rate) and the bucket depth reaches the first threshold, all unfair packets within the priority are discarded. This leaves room in the bucket for the fair packets to be forwarded.

In the more complex case where one or more tiered arbiters are attached at the priority level, the policer control policy instance must consider more than just the child policer weights associated with the attached arbiter. If the arbiter is configured with an aggregate rate limit that its children cannot exceed, the policer control policy instance will switch to calculating the rate each child serviced by the arbiter should receive and enforces that rate using each child policers PIR leaky bucket.

When the child policer PIR leaky bucket is used to limit the bandwidth for the child policer and the child's PIR bucket discard threshold is reached, packets associated with the child policer are discarded. The child policer's discarded packets do not consume depth in the child policer's CIR or FIR buckets. The child policers discarded packets are also prevented from impacting the parent policer and will not consume the aggregate bandwidth managed by the parent policer.

### **Parent Policar Priority Level Thresholds**

As stated above, each child policer is attached either to the root arbiter or explicitly to one of the tier 1 or tier 2 arbiters. When attached directly to the root arbiter, its priority relative to all other child policers is indicated by the parenting level parameter. When attached through one of the tiered arbiters, the parenting hierarchy of the arbiters must be traced through to the ultimate attachment to the root arbiter. The parenting level parameter of the arbiter parented to the root arbiter defines the child policer's priority level within the parent policer.

The priority level is important since it defines the parent policer discard thresholds that will be applied at the parent policer. The parent policer has 8 levels of strict priority and each priority level has its own discard-unfair and discard-all thresholds. Each priority's thresholds are larger than the thresholds of the lower priority levels. This ensures that when the parent policer is discarding, it will be priority sensitive.

To visualize the behavior of the parent policer, picture that when the aggregate forwarding rate of all child policers is currently above the decrement rate of the parent PIR leaky bucket, the bucket depth will increase over time. As the bucket depth increases, it will eventually cross the lowest priority's discard-unfair threshold. If this amount of discard sufficiently lowers the remaining aggregate child policer rate, the parent PIR bucket will hover around this bucket depth. If however, the remaining aggregate child rate is still greater than the decrement rate, the bucket will continue to rise and eventually reach the lowest priority's discard-all threshold which will cause all packets associated with the priority level to be discarded (fair and unfair). Again, if the remaining aggregate child rate is less than or equal to the bucket decrement rate, the parent PIR bucket will hover around this higher bucket depth. If the remaining aggregate child rate is still higher than the decrement rate, the bucket will continue to rise through the remaining priority level discards until equilibrium is achieved.

As noted above, each child's rate feeding into the parent policer is governed by the child policer's PIR bucket decrement rate. The amount of bandwidth the child policer offers to the parent policer will not exceed the child policer's configured maximum rate.

### **Root Arbiter's Parent Policers' Priority Aggregate Thresholds**

Each policer-control-policy root arbiter supports configurable aggregate priority thresholds which are used to control burst tolerance within each priority level. Two values are maintained per priority level; the shared-portion and the fair-portion. The shared-portion represents the amount of parent PIR bucket depth that is allowed to be consumed by both fair and unfair child packets at the priority level. The fair-portion represents the amount of parent PIR bucket depth that only the fair child policer packets may consume within the priority level. It should be noted that the fair and unfair child packets associated with a higher parent policer priority level may also consume the bucket depth set aside for this priority.

While the policy maintains a parent policer default or explicit configurable values for shared-portion and fair-portion within each priority level, it is possible that some priority levels will not be used within the parent policer. Most parent policer use cases require fewer than eight strict priority levels.

To derive the actual priority level discard-unfair and discard-all thresholds while only accounting for the actual in-use priority levels, the system maintains a child policer to parent policer association counter per priority level for each policer control policy instance. As a child policer is parented to either the root or a tiered arbiter, the system determines the parent policer priority level for the child policer and increments the association counter for that priority level on the parent policer instance.

The shared-portion for each priority level is affected by the parent policer global min-thresh-separation parameter that defines the minimum separation between any in-use discard thresholds. When more than one child policer is associated with a parent policer priority level, the shared-portion for that priority level will be the current value of min-thresh-separation. When only a single child policer is associated, the priority level's shared-portion is zero since all packets from the child will be marked fair and the discard-unfair threshold is meaningless. When the association counter is zero, both the shared-portion and the fair-portion for that priority level are zero since neither discard thresholds will be used. Whenever the

association counter is greater than 0, the fair-portion for that priority level will be derived from the current value of the priority's mbs-contribution parameter and the global min-thresh-separation parameter.

Each priority level's discard-unfair and discard-all thresholds are calculated based on an accumulation of lower priorities shared-portions and fair-portions and the priority level's own shared-portion and fair-portion. The base threshold value for each priority level is equal to the sum of all lower priority level's shared-portions and fair-portions. The discard-unfair threshold is the priority level's base threshold plus the priority level's shared-portion. The discard-all threshold for the priority level is the priority level's base threshold plus both the shared-portion and fair-portion values of the priority. As can be seen, an in-use priority level's thresholds are always greater than the thresholds of lower priority levels.

### **Policer Control Policy Application**

A policer-control-policy may be applied on any Ethernet ingress or egress SAP that is associated with a port (or ports in the case of LAG).

The **no** form of this command removes a non-associated policer control policy from the system. The command will not execute when policer-name is currently associated with any SAP or subscriber management sub-profile context.

### **Parameters**

#### ***policy-name***

Specifies the policy name. Each policer-control-policy must be created with a unique policy name. The name must be given as policy-name must adhere to the system policy ASCII naming requirements. If the defined policy-name already exists, the system will enter that policy's context for editing purposes. If policy-name does not exist, the system will attempt to create a policy with the specified name. Creating a policy may require use of the create parameter when the system is configured for explicit object creation mode.

### **Platforms**

**[Tree]** (config>service>vprn>if>sap>egress policer-control-policy)

### **Full Context**

configure service vprn interface sap ingress policer-control-policy

configure service vprn interface sap egress policer-control-policy

## Description

This command, within the qos CLI node, is used to create, delete or modify policer control policies. A policer control policy is very similar to the scheduler-policy which is used to manage a set of queues by defining a hierarchy of virtual schedulers and specifying how the virtual schedulers interact to provide an aggregate SLA. In a similar fashion, the policer-control-policy controls the aggregate bandwidth available to a set of child policers. Once created, the policy can be applied to ingress or egress SAPs. The policy may also be applied to the ingress or egress context of a sub-profile.

### Policer Control Policy Instances

On the SAP side, an instance of a policy is created each time a policy is applied. When applied to a sub-profile, an instance of the policy is created each time a subscriber successfully maps one or more hosts to the profile per ingress SAP.

Each instance of the policer-control-policy manages the policers associated with the object that owns the policy instance (SAP or subscriber). If a policer on the object is parented to an appropriate arbiter name that exists within the policy, the policer will be managed by the instance. If a policer is not parented or is parented to a non-existent arbiter, the policer will be orphaned and will not be subject to bandwidth control by the policy instance.

### Maximum Rate and Root Arbiter

The policer-control-policy supports an overall maximum rate (max-rate) that defines the total amount of bandwidth that may be distributed to all associated child policers. By default, that rate is set to max which provides an unlimited amount of bandwidth to the policers. Once the policy is created, an actual rate should be configured in order for the policy instances to be effective. At the SAP level, the maximum rate may be overridden on a per instance basis. For subscribers, the maximum rate may only be overridden on the subscriber profile which will then be applied to all instances associated with the profile.

The maximum rate is defined within the context of the root arbiter which is always present in a policer-control-policy. The system creates a parent policer which polices the output of all child policers attached to the policy instance to the configured rate. Child policers may be parented directly to the root arbiter (parent root) or parented to one of the tiered arbiters (parent arbiter-name). Since each tiered arbiter must be parented to either another tiered arbiter or the root arbiter (default), every parented child policer is associated with the root arbiter and therefore the root arbiter's parent policer.

### Parent Policer PIR Leaky Bucket Operation

The parent policer is a single leaky bucket that monitors the aggregate throughput rate of the associated child policers. Forwarded packets increment the bucket by the size of each packet. The rate of the parent policer is implemented as a bucket decrement function which attempts to drain the bucket. If the rate of the packets flowing through the bucket is less than the decrement rate, the bucket does not accumulate depth. Each packet that flows through the bucket is accompanied by a derived discard threshold. If the current depth of the bucket is less than the discard threshold, the packet is allowed to pass through, retaining the colors derived from the packet's child policer. If the current depth is equal to or greater than the threshold value, the packet is colored red and the bucket depth is not incremented by the packet size. Also, any increased bucket depths in the child policer are canceled making any discard event an atomic function between the child and the parent.

Due to the fact that multiple thresholds are supported by the parent policer, the policer control policy is able to protect the throughput of higher priority child policers from the throughput of the lower priority child policers within the aggregate rate.

### Tier 1 and Tier 2 Arbiters

As stated above, each child is attached either to the always available root arbiter or to an explicitly created tier 1 or tier 2 arbiter. Unlike the hardware parent policer based root arbiter, the arbiters at tier 1 and tier 2

are only represented in software and are meant to provide an arbitrary hierarchical bandwidth distribution capability. An arbiter created on tier 2 must parent to either to an arbiter on tier 1 or to the root arbiter. Arbiters created on tier 1 always parent to the root arbiter. In this manner, every arbiter ultimately is parented or grand-parented by the root arbiter.

Each tiered arbiter supports an optional rate parameter that defines a rate limit for all child arbiters or child policers associated with the arbiter. Child arbiters and policers attached to the arbiter have a level attribute that defines the strict level at which the child is given bandwidth by the arbiter. Level 8 is the highest and 1 is the lowest. Also a weight attribute defines each child's weight at that strict level in order to determine how bandwidth is distributed to multiple children at that level when insufficient bandwidth is available to meet each child's required bandwidth.

### **Fair and Unfair Bandwidth Control**

Each child policer supports three leaky buckets. The PIR bucket manages the policer's peak rate and maximum burst size, the CIR leaky bucket manages the policer's committed rate and committed burst size. The third leaky bucket is used by the policer control policy instance to manage the child policer's fair rate (FIR). When multiple child policers are attached to the root arbiter at the same priority level, the policy instance uses each child's FIR bucket rate to control how much of the traffic forwarded by the policer is fair and how much is unfair.

In the simplest case where all the child policers in the same priority level are directly attached to the root arbiter, each child's FIR rate is set according to the child's weight divided by the sum of the active children's weights multiplied by the available bandwidth at the priority level. The result is that the FIR bucket will mark the appropriate amount of traffic for each child as fair-based on the weighted fair output of the policy instance.

The fair/unfair forwarding control in the root parent policer is accomplished by implementing two different discard thresholds for the priority. The first threshold is discard-unfair and the second is discard-all for packet associated with the priority level. As the parent policer PIR bucket fills (due the aggregate forwarded rate being greater than the parent policers PIR decrement rate) and the bucket depth reaches the first threshold, all unfair packets within the priority are discarded. This leaves room in the bucket for the fair packets to be forwarded.

In the more complex case where one or more tiered arbiters are attached at the priority level, the policer control policy instance must consider more than just the child policer weights associated with the attached arbiter. If the arbiter is configured with an aggregate rate limit that its children cannot exceed, the policer control policy instance will switch to calculating the rate each child serviced by the arbiter should receive and enforces that rate using each child policers PIR leaky bucket.

When the child policer PIR leaky bucket is used to limit the bandwidth for the child policer and the child's PIR bucket discard threshold is reached, packets associated with the child policer are discarded. The child policer's discarded packets do not consume depth in the child policer's CIR or FIR buckets. The child policers discarded packets are also prevented from impacting the parent policer and will not consume the aggregate bandwidth managed by the parent policer.

### **Parent Policer Priority Level Thresholds**

As stated above, each child policer is attached either to the root arbiter or explicitly to one of the tier 1 or tier 2 arbiters. When attached directly to the root arbiter, its priority relative to all other child policers is indicated by the parenting level parameter. When attached through one of the tiered arbiters, the parenting hierarchy of the arbiters must be traced through to the ultimate attachment to the root arbiter. The parenting level parameter of the arbiter parented to the root arbiter defines the child policer's priority level within the parent policer.

The priority level is important since it defines the parent policer discard thresholds that will be applied at the parent policer. The parent policer has 8 levels of strict priority and each priority level has its own discard-

unfair and discard-all thresholds. Each priority's thresholds are larger than the thresholds of the lower priority levels. This ensures that when the parent policer is discarding, it will be priority sensitive.

To visualize the behavior of the parent policer, picture that when the aggregate forwarding rate of all child policers is currently above the decrement rate of the parent PIR leaky bucket, the bucket depth will increase over time. As the bucket depth increases, it will eventually cross the lowest priority's discard-unfair threshold. If this amount of discard sufficiently lowers the remaining aggregate child policer rate, the parent PIR bucket will hover around this bucket depth. If however, the remaining aggregate child rate is still greater than the decrement rate, the bucket will continue to rise and eventually reach the lowest priority's discard-all threshold which will cause all packets associated with the priority level to be discarded (fair and unfair). Again, if the remaining aggregate child rate is less than or equal to the bucket decrement rate, the parent PIR bucket will hover around this higher bucket depth. If the remaining aggregate child rate is still higher than the decrement rate, the bucket will continue to rise through the remaining priority level discards until equilibrium is achieved.

As noted above, each child's rate feeding into the parent policer is governed by the child policer's PIR bucket decrement rate. The amount of bandwidth the child policer offers to the parent policer will not exceed the child policer's configured maximum rate.

### **Root Arbiter's Parent Policers' Priority Aggregate Thresholds**

Each policer-control-policy root arbiter supports configurable aggregate priority thresholds which are used to control burst tolerance within each priority level. Two values are maintained per priority level; the shared-portion and the fair-portion. The shared-portion represents the amount of parent PIR bucket depth that is allowed to be consumed by both fair and unfair child packets at the priority level. The fair-portion represents the amount of parent PIR bucket depth that only the fair child policer packets may consume within the priority level. It should be noted that the fair and unfair child packets associated with a higher parent policer priority level may also consume the bucket depth set aside for this priority.

While the policy maintains a parent policer default or explicit configurable values for shared-portion and fair-portion within each priority level, it is possible that some priority levels will not be used within the parent policer. Most parent policer use cases require fewer than eight strict priority levels.

To derive the actual priority level discard-unfair and discard-all thresholds while only accounting for the actual in-use priority levels, the system maintains a child policer to parent policer association counter per priority level for each policer control policy instance. As a child policer is parented to either the root or a tiered arbiter, the system determines the parent policer priority level for the child policer and increments the association counter for that priority level on the parent policer instance.

The shared-portion for each priority level is affected by the parent policer global min-thresh-separation parameter that defines the minimum separation between any in-use discard thresholds. When more than one child policer is associated with a parent policer priority level, the shared-portion for that priority level will be the current value of min-thresh-separation. When only a single child policer is associated, the priority level's shared-portion is zero since all packets from the child will be marked fair and the discard-unfair threshold is meaningless. When the association counter is zero, both the shared-portion and the fair-portion for that priority level are zero since neither discard thresholds will be used. Whenever the association counter is greater than 0, the fair-portion for that priority level will be derived from the current value of the priority's mbs-contribution parameter and the global min-thresh-separation parameter.

Each priority level's discard-unfair and discard-all thresholds are calculated based on an accumulation of lower priorities shared-portions and fair-portions and the priority level's own shared-portion and fair-portion. The base threshold value for each priority level is equal to the sum of all lower priority level's shared-portions and fair-portions. The discard-unfair threshold is the priority level's base threshold plus the priority level's shared-portion. The discard-all threshold for the priority level is the priority level's base threshold plus both the shared-portion and fair-portion values of the priority. As can be seen, an in-use priority level's thresholds are always greater than the thresholds of lower priority levels.

## Policer Control Policy Application

A policer-control-policy may be applied on any Ethernet ingress or egress SAP that is associated with a port (or ports in the case of LAG).

The **no** form of this command removes a non-associated policer control policy from the system. The command will not execute when policer-name is currently associated with any SAP or subscriber management sub-profile context.

## Parameters

### *policy-name*

Specifies the policy name. Each policer-control-policy must be created with a unique policy name. The name must be given as policy-name must adhere to the system policy ASCII naming requirements. If the defined policy-name already exists, the system will enter that policy's context for editing purposes. If policy-name does not exist, the system will attempt to create a policy with the specified name. Creating a policy may require use of the create parameter when the system is configured for explicit object creation mode.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## policer-control-policy

## Syntax

**policer-control-policy** *policy-name* [create]

**no policer-control-policy** *policy-name*

## Context

[\[Tree\]](#) (config>qos policer-control-policy)

## Full Context

configure qos policer-control-policy

## Description

This command is used to create, delete, or modify policer control policies. The **policer-control-policy** controls the aggregate bandwidth available to a set of child policers. When created, the policy can be applied to ingress or egress SAPs. The policy can also be applied to the ingress or egress context of a sub-profile.

## Parameters

### *policy-name*

Each policer-control-policy must be created with a unique policy name. The *policy-name* must adhere to the system policy ASCII naming requirements. If the defined policy-name already exists, the system enters that policy's context for editing purposes. If policy-name does not exist, the system attempts to create a policy with the specified name. Creating a

policy may require use of the `create` parameter when the system is configured for explicit object creation mode.

### **create**

The **create** keyword is required when a new policy is being created and the system is configured for explicit object creation mode.

## **Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## **policer-control-policy**

### **Syntax**

**policer-control-policy** *policy-name*

**no policer-control-policy**

### **Context**

**[Tree]** (config>service>cust>multi-service-site>ingress policer-control-policy)

**[Tree]** (config>service>cust>multi-service-site>egress policer-control-policy)

### **Full Context**

configure service customer multi-service-site ingress policer-control-policy

configure service customer multi-service-site egress policer-control-policy

### **Description**

This command, within the QoS CLI node, is used to create, delete or modify policer control policies. A policer control policy is very similar to the scheduler-policy which is used to manage a set of queues by defining a hierarchy of virtual schedulers and specifying how the virtual schedulers interact to provide an aggregate SLA. In a similar fashion, the policer-control-policy controls the aggregate bandwidth available to a set of child policers. Once created, the policy can be applied to ingress or egress SAPs.

#### **Policer Control Policy Instances**

On the SAP side, an instance of a policy is created each time a policy is applied. When applied to a 7750 SR or 7450 ESS sub-profile, an instance of the policy is created each time a subscriber successfully maps one or more hosts to the profile per ingress SAP.

Each instance of the policer-control-policy manages the policers associated with the object that owns the policy instance (SAP or subscriber). If a policer on the object is parented to an appropriate arbiter name that exists within the policy, the policer will be managed by the instance. If a policer is not parented or is parented to a non-existent arbiter, the policer will be orphaned and not subject to bandwidth control by the policy instance.

#### **Maximum Rate and Root Arbiter**

The policer-control-policy supports an overall maximum rate (`max-rate`) that defines the total amount of bandwidth that may be distributed to all associated child policers. By default, that rate is set to `max` which provides an unlimited amount of bandwidth to the policers. Once the policy is created, an actual rate should be configured in order for the policy instances to be effective. At the SAP level, the maximum rate

may be overridden on a per instance basis. For 7750 SR or 7450 ESS subscribers, the maximum rate may only be overridden on the subscriber profile which will then be applied to all instances associated with the profile.

The maximum rate is defined within the context of the root arbiter which is always present in a policer-control-policy. The system creates a parent policer which polices the output of all child policers attached to the policy instance to the configured rate. Child policers may be parented directly to the root arbiter (parent root) or parented to one of the tiered arbiters (parent arbiter-name). Since each tiered arbiter must be parented to either another tiered arbiter or the root arbiter (default), every parented child policer is associated with the root arbiter and thus the root arbiter's parent policer.

### **Parent Policer PIR Leaky Bucket Operation**

The parent policer is a single leaky bucket that monitors the aggregate throughput rate of the associated child policers. Forwarded packets increment the bucket by the size of each packet. The rate of the parent policer is implemented as a bucket decrement function which attempts to drain the bucket. If the rate of the packets flowing through the bucket is less than the decrement rate, the bucket does not accumulate depth. Each packet that flows through the bucket is accompanied by a derived discard threshold. If the current depth of the bucket is less than the discard threshold, the packet is allowed to pass through, retaining the colors derived from the packet's child policer. If the current depth is equal to or greater than the threshold value, the packet is colored red and the bucket depth is not incremented by the packet size. Also, any increased bucket depths in the child policer are canceled making any discard event an atomic function between the child and the parent.

Due to the fact that multiple thresholds are supported by the parent policer, the policer control policy is able to protect the throughput of higher priority child policers from the throughput of the lower priority child policers within the aggregate rate.

### **Tier 1 and Tier 2 Arbiters**

As stated above, each child is attached either to the always available root arbiter or to an explicitly created tier 1 or tier 2 arbiter. Unlike the hardware parent policer based root arbiter, the arbiters at tier 1 and tier 2 are only represented in software and are meant to provide an arbitrary hierarchical bandwidth distribution capability. An arbiter created on tier 2 must parent to either to an arbiter on tier 1 or to the root arbiter. Arbiters created on tier 1 always parent to the root arbiter. In this manner, every arbiter ultimately is parented or grand-parented by the root arbiter.

Each tiered arbiter supports an optional rate parameter that defines a rate limit for all child arbiters or child policers associated with the arbiter. Child arbiters and policers attached to the arbiter have a level attribute that defines the strict level at which the child is given bandwidth by the arbiter. Level 8 is the highest and 1 is the lowest. Also a weight attribute defines each child's weight at that strict level in order to determine how bandwidth is distributed to multiple children at that level when insufficient bandwidth is available to meet each child's required bandwidth.

### **Fair and Unfair Bandwidth Control**

Each child policer supports three leaky buckets. The PIR bucket manages the policer's peak rate and maximum burst size, the CIR leaky bucket manages the policer's committed rate and committed burst size. The third leaky bucket is used by the policer control policy instance to manage the child policer's fair rate (FIR). When multiple child policers are attached to the root arbiter at the same priority level, the policy instance uses each child's FIR bucket rate to control how much of the traffic forwarded by the policer is fair and how much is unfair.

In the simplest case where all the child policers in the same priority level are directly attached to the root arbiter, each child's FIR rate is set according to the child's weight divided by the sum of the active children's weights multiplied by the available bandwidth at the priority level. The result is that the FIR

bucket will mark the appropriate amount of traffic for each child as fair based on the weighted fair output of the policy instance.

The fair/unfair forwarding control in the root parent policer is accomplished by implementing two different discard thresholds for the priority. The first threshold is discard-unfair and the second is discard-all for packet associated with the priority level. As the parent policer PIR bucket fills (due the aggregate forwarded rate being greater than the parent policers PIR decrement rate) and the bucket depth reaches the first threshold, all unfair packets within the priority are discarded. This leaves room in the bucket for the fair packets to be forwarded.

In the more complex case where one or more tiered arbiters are attached at the priority level, the policer control policy instance must consider more than just the child policer weights associated with the attached arbiter. If the arbiter is configured with an aggregate rate limit that its children cannot exceed, the policer control policy instance will switch to calculating the rate each child serviced by the arbiter should receive and enforces that rate using each child policers PIR leaky bucket.

When the child policer PIR leaky bucket is used to limit the bandwidth for the child policer and the child's PIR bucket discard threshold is reached, packets associated with the child policer are discarded. The child policer's discarded packets do not consume depth in the child policer's CIR or FIR buckets. The child policers discarded packets are also prevented from impacting the parent policer and will not consume the aggregate bandwidth managed by the parent policer.

### **Parent Policer Priority Level Thresholds**

As stated above, each child policer is attached either to the root arbiter or explicitly to one of the tier 1 or tier 2 arbiters. When attached directly to the root arbiter, its priority relative to all other child policers is indicated by the parenting level parameter. When attached through one of the tiered arbiters, the parenting hierarchy of the arbiters must be traced through to the ultimate attachment to the root arbiter. The parenting level parameter of the arbiter parented to the root arbiter defines the child policer's priority level within the parent policer.

The priority level is important since it defines the parent policer discard thresholds that will be applied at the parent policer. The parent policer has 8 levels of strict priority and each priority level has its own discard-unfair and discard-all thresholds. Each priority's thresholds are larger than the thresholds of the lower priority levels. This ensures that when the parent policer is discarding, it will be priority sensitive.

To visualize the behavior of the parent policer, picture that when the aggregate forwarding rate of all child policers is currently above the decrement rate of the parent PIR leaky bucket, the bucket depth will increase over time. As the bucket depth increases, it will eventually cross the lowest priority's discard-unfair threshold. If this amount of discard sufficiently lowers the remaining aggregate child policer rate, the parent PIR bucket will hover around this bucket depth. If however, the remaining aggregate child rate is still greater than the decrement rate, the bucket will continue to rise and eventually reach the lowest priority's discard-all threshold which will cause all packets associated with the priority level to be discarded (fair and unfair). Again, if the remaining aggregate child rate is less than or equal to the bucket decrement rate, the parent PIR bucket will hover around this higher bucket depth. If the remaining aggregate child rate is still higher than the decrement rate, the bucket will continue to rise through the remaining priority level discards until equilibrium is achieved.

As noted above, each child's rate feeding into the parent policer is governed by the child policer's PIR bucket decrement rate. The amount of bandwidth the child policer offers to the parent policer will not exceed the child policer's configured maximum rate.

### **Root Arbiter's Parent Policer's Priority Aggregate Thresholds**

Each policer-control-policy root arbiter supports configurable aggregate priority thresholds which are used to control burst tolerance within each priority level. Two values are maintained per priority level; the shared-portion and the fair-portion. The shared-portion represents the amount of parent PIR bucket depth

that is allowed to be consumed by both fair and unfair child packets at the priority level. The fair-portion represents the amount of parent PIR bucket depth that only the fair child policer packets may consume within the priority level. It should be noted that the fair and unfair child packets associated with a higher parent policer priority level may also consume the bucket depth set aside for this priority.

While the policy maintains a parent policer default or explicit configurable values for shared-portion and fair-portion within each priority level, it is possible that some priority levels will not be used within the parent policer. Most parent policer use cases require fewer than eight strict priority levels.

In order to derive the actual priority level discard-unfair and discard-all thresholds while only accounting for the actual in-use priority levels, the system maintains a child policer to parent policer association counter per priority level for each policer control policy instance. As a child policer is parented to either the root or a tiered arbiter, the system determines the parent policer priority level for the child policer and increments the association counter for that priority level on the parent policer instance.

The shared-portion for each priority level is affected by the parent policer global min-thresh-separation parameter that defines the minimum separation between any in-use discard thresholds. When more than one child policer is associated with a parent policer priority level, the shared-portion for that priority level will be the current value of min-thresh-separation. When only a single child policer is associated, the priority level's shared-portion is zero since all packets from the child will be marked fair and the discard-unfair threshold is meaningless. When the association counter is zero, both the shared-portion and the fair-portion for that priority level are zero since neither discard thresholds will be used. Whenever the association counter is greater than 0, the fair-portion for that priority level will be derived from the current value of the priority's mbs-contribution parameter and the global min-thresh-separation parameter.

Each priority level's discard-unfair and discard-all thresholds are calculated based on an accumulation of lower priorities shared-portions and fair-portions and the priority level's own shared-portion and fair-portion. The base threshold value for each priority level is equal to the sum of all lower priority level's shared-portions and fair-portions. The discard-unfair threshold is the priority level's base threshold plus the priority level's shared-portion. The discard-all threshold for the priority level is the priority level's base threshold plus both the shared-portion and fair-portion values of the priority. As can be seen, an in-use priority level's thresholds are always greater than the thresholds of lower priority levels.

### **Policer Control Policy Application**

A policer-control-policy may be applied on any Ethernet ingress or egress SAP that is associated with a port (or ports in the case of LAG).

The **no** form of the command removes a non-associated policer control policy from the system. The command will not execute when policer-name is currently associated with any SAP context.

### **Parameters**

#### ***policy-name***

Specifies the policy name up to 32 characters in length. Each policer-control-policy must be created with a unique policy name. The name must adhere to the system policy ASCII naming requirements. If the defined policy name already exists, the system will enter that policy's context for editing purposes. If policy name does not exist, the system will attempt to create a policy with the specified name.

### **Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## policer-control-policy

### Syntax

**policer-control-policy** *src-name dst-name* [ **overwrite**]

### Context

[\[Tree\]](#) (config>qos>copy **policer-control-policy**)

### Full Context

configure qos copy **policer-control-policy**

### Description

This command copies an existing **policer-control-policy** to another **policer-control-policy**. The **copy** command is a configuration level maintenance tool used to create new entries using an existing profile ID. If **overwrite** is not specified, an error occurs if the destination policy exists.

### Parameters

#### **src-name**

Specifies the existing source **policer-control-policy**, up to 32 characters, from which the **copy** command attempts to copy.

#### **dst-name**

Specifies the destination **policer-control-policy** *dst-name*, up to 32 characters, to which the copy command attempts to copy.

#### **overwrite**

Use this parameter when the **policer-control-policy** *dst-name* already exists. If it does, everything in the existing destination **policer-control-policy** *dst-name* is completely overwritten with the contents of the **policer-control-policy** *src-name*. The **overwrite** parameter must be specified or else the following error message is returned:

MINOR: CLI Destination "pcp-name2" exists - use {overwrite}.

If **overwrite** is specified, the function of copying from source to destination occurs in a "break before make" manner and therefore should be handled with care.

### Description

This command configures the number of policer resources for an policy accounting. Policy accounting can be used to collect statistics about the amount of traffic matching particular routes and, on FP4 cards and systems only, it can also be used to police traffic associated with certain routes as destinations of the traffic.

Using only statistics (policing is not performed) requires the reservation of policer statistics index resources on each FP receiving the traffic to be counted. Every **policy-accounting** interface on a card or FP uses one of these resources for every source and destination class index listed in the template referenced by the interface. The total reservation at the FP level is set using the **configure card slot-number fp fp-number policy-accounting** command.

Using FP4 policing requires the above resource, and in addition, policer index resources. Every **policy-accounting** interface on a card or FP uses one of these resources for every destination class associated with a policer in the template referenced by the interface. The total reservation of this second resource at the FP level is set using the **configure card slot-number fp fp-number ingress policy-accounting policers** command.

The total number of the above resources, per FP, must be less than or equal to 128000. In addition, the second resource pool size must be less than or equal to the size of the first resource pool.

It is possible to increase or decrease the size of either resource sub pool at any time. A decrease can cause some interfaces (randomly selected) to immediately lose their resources and stop counting or policing some traffic that was previously being counted or policed.

If the policy accounting is enabled on a spoke SDP or R-VPLS interface all FPs in the system should have a reservation for each of the above resources, otherwise the **show router interface policy-accounting** command output reports that statistics are possibly incomplete.

### Default

no policers

### Parameters

#### *policy-limit*

Specifies the number of policer resources for policy accounting.

**Values** 1 to 64000

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 20.190 policers-hqos-manageable

### policers-hqos-manageable

### Syntax

[no] **policers-hqos-manageable**

### Context

**[Tree]** (config>qos>sap-egress policers-hqos-manageable)

### Full Context

configure qos sap-egress policers-hqos-manageable

## Description

This command enables Hierarchical QoS (HQoS) management of the policers within the SAP egress policy, when the policy is applied to either the egress SAP configuration or the egress SLA profile, with multiservice sites (MSS) supported for SAPs. When enabled, the system can manage egress policers and queues together in the same HQoS hierarchy.

To be managed by HQoS, egress policers within a SAP egress QoS policy must be configured with either a **scheduler-parent** or **port-parent** command or be orphaned to an egress port scheduler applied on a Vport or port.

The **policers-hqos-manageable** command and **parent-location sla** or policers with **enable-exceed-pir** or **stat-mode no-stats** within a SAP egress QoS policy are mutually exclusive.

To prevent HQoS from measuring the traffic through both a policer managed by HQoS, then again through a post-policer access egress queue group queue, configure post-policer access egress queue groups with **no queues-hqos-manageable** so their queues are not managed by HQoS.

A post-policer local queue is not supported with HQoS managed policers, nor are those mapped by the **use-fc-mapped-queue** parameter in a criteria action statement. The **policers-hqos-manageable** command is not supported for SAP egress dynamic policers or on a 7950 XRS.

The **no** form of this command disables HQoS management of policers within the SAP QoS egress policy.

## Default

no policers-hqos-manageable

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-1s, 7750 SR-1se, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, VSR

## policers-hqos-manageable

## Syntax

[no] **policers-hqos-manageable**

## Context

**[Tree]** (config>qos>sap-ingress policers-hqos-manageable)

## Full Context

configure qos sap-ingress policers-hqos-manageable

## Description

This command specifies that the policers within this SAP ingress policy are to be managed by the Hierarchical QoS (HQoS) process when the policy is applied to either the ingress part of a SAP configuration or the ingress part of an SLA profile, with multiservice sites (MSS) supported for SAPs. When enabled, ingress policers and queues can be managed together in the same HQoS hierarchy.

To be managed by HQoS, ingress policers within a SAP ingress QoS policy must be configured with either a **scheduler-parent** or **parent** command or be orphaned to an ingress port scheduler applied on a Vport or port. The **scheduler-parent** and **parent** commands are mutually exclusive.

The **policers-hqos-manageable** command and the **stat-mode no-stats** command within a SAP ingress QoS policy are mutually exclusive.

The **no** form of this command results in policers within this SAP QoS ingress policy being non-HQoS-manageable.

**Default**

no policers-hqos-manageable

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-1s, 7750 SR-1se, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s

configure subscriber-mgmt sub-profile radius-accounting policy
```

## Description

This command specifies the RADIUS accounting policy for the subscriber that is using this subscriber profile. This command allows the configuration of up to five RADIUS accounting policies. The RADIUS accounting policies function according to their respective configuration, including the individual accounting mode, their own included attributes, and the update interval.

## Parameters

### *name1*

Specifies the name of the RADIUS accounting policy, up to 32 characters, to be used for the subscriber profile.

### *name2*

Specifies the name of the second RADIUS accounting policy, up to 32 characters, to be used for the subscriber profile.

### *name3*

Specifies the name of the third RADIUS accounting policy, up to 32 characters, to be used for the subscriber profile.

### *name4*

Specifies the name of the fourth RADIUS accounting policy, up to 32 characters, to be used for the subscriber profile.

**name5**

Specifies the name of the fifth RADIUS accounting policy, up to 32 characters, to be used for the subscriber profile.

**Platforms**

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>srrp policy)

**Full Context**

configure service vprn subscriber-interface group-interface srrp policy

configure service ies subscriber-interface group-interface srrp policy

**Description**

This command associates one or more VRRP policies with the SRRP instance. A VRRP policy is a collection of connectivity and verification tests used to manipulate the in-use priorities of VRRP and SRRP instances. A VRRP policy can test the link state of ports, ping IP hosts, discover the existence of routes in the routing table or the ability to reach Layer 2 hosts. When one or more of these tests fail, the VRRP policy has the option of decrementing or setting an explicit value for the in-use priority of an SRRP instance.

More than one VRRP policy may be associated with an SRRP instance. When more than one VRRP policy is associated with an SRRP instance the delta decrement of the in-use priority is cumulative unless one or more test fail that have explicit priority values. When one or more explicit tests fail, the lowest priority value event takes effect for the SRRP instance. When the highest delta-in-use-limit is used to manage the lowest delta derived in-use priority for the SRRP instance.

VRRP policy associations may be added and removed at any time. A maximum of two VRRP policies can be associated with a single SRRP instance.

The **no** form of this command removes the association with the *vrp-policy-id* from the SRRP instance.

**Parameters*****vrp-policy-id***

Specifies one or more VRRP policies with the SRRP instance.

**Values** 1 to 9999

**no policy**

## Context

[\[Tree\]](#) (config>service>ies>if>ipv6>vrrp policy)

## Full Context

configure service ies interface ipv6 vrrp policy

## Description

This command creates VRRP control policies. The VRRP policy ID must be created by the policy command prior to association with the virtual router instance.

The policy command provides the ability to associate a VRRP priority control policy to a virtual router instance. The policy may be associated with more than one virtual router instance. The priority events within the policy either override or diminish the base-priority dynamically affecting the in-use priority. As priority events clear in the policy, the in-use priority may eventually be restored to the base-priority value.

The policy command is only available in the non-owner **vrrp** *virtual-router-id* nodal context. The priority of owner virtual router instances is permanently set to 255 and cannot be changed by VRRP priority control policies. For non-owner virtual router instances, if the policy command is not executed, the base-priority will be used as the in-use priority.

The **no** form of this command removes any existing VRRP priority control policy association from the virtual router instance. All such associations must be removed prior to the policy being deleted from the system.

## Parameters

### *vrrp-policy-id*

The vrrp-policy-id parameter associated the corresponding VRRP priority control policy-id with the virtual router instance. The vrrp-policy-id must already exist in the system for the policy command to be successful.

**Values** 1 to 9999

## Platforms

All

## policy

## Syntax

**no policy**

## Context

[\[Tree\]](#) (config>service>ies>if>vrrip policy)

## Full Context

configure service ies interface vrrip policy

## Description

This command creates VRRP control policies. The VRRP policy ID must be created by the `policy` command prior to association with the virtual router instance.

The `policy` command provides the ability to associate a VRRP priority control policy to a virtual router instance. The policy may be associated with more than one virtual router instance. The priority events within the policy either override or diminish the base-priority dynamically affecting the in-use priority. As priority events clear in the policy, the in-use priority may eventually be restored to the base-priority value.

The `policy` command is only available in the non-owner **vrrip** *virtual-router-id* nodal context. The priority of owner virtual router instances is permanently set to 255 and cannot be changed by VRRP priority control policies. For non-owner virtual router instances, if the `policy` command is not executed, the base-priority will be used as the in-use priority.

The **no** form of this command removes any existing VRRP priority control policy association from the virtual router instance. All such associations must be removed prior to the policy being deleted from the system.

## Parameters

### *vrrip-policy-id*

The *vrrip-policy-id* parameter associated the corresponding VRRP priority control policy-id with the virtual router instance. The *vrrip-policy-id* must already exist in the system for the `policy` command to be successful.

**Values** 1 to 9999

## Platforms

All

## policy

### Syntax

**policy** *policy-name*

**no policy**

### Context

**[Tree]** (config>service>vprn>bgp>next-hop-res policy)

### Full Context

configure service vprn bgp next-hop-resolution policy

### Description

This command specifies the name of a policy statement to use with the BGP next-hop resolution process. The policy controls which IP routes in RTM are eligible to resolve the BGP next-hop addresses of IPv4 and IPv6 routes. The policy has no effect on the resolution of BGP next-hops to MPLS tunnels. If a BGP next-hop of an IPv4 or IPv6 route R is resolved in RTM and the longest matching route for the next-hop address is an IP route N that is rejected by the policy then route R is unresolved; if the route N is accepted by the policy then it becomes the resolving route for R.

The default next-hop resolution policy (when the **no policy** command is configured) is to use the longest matching active route in RTM that is not a BGP route (unless **use-bgp-routes** is configured), an aggregate route or a subscriber management route.

### Default

no policy

### Parameters

#### *policy-name*

Specifies the route policy name. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed between double quotes. Route policies are configured in the **config>router>policy-options** context.

## Description

This command references the global channel bandwidth definition policy that is used for HMCAC and HQoS Adjust.

HQoS Adjustment is supported with redirection enabled or per-host-replication disabled. In other words, the policy from the redirected interface is used for HQoS Adjustment.

Hierarchical MCAC (HMCAC) is supported with redirection enabled or per-host-replication disabled. In HMCAC, the subscriber is checked first against its bandwidth limits followed by the check on the redirected interface against the bandwidth limits defined under the redirected interface. In the HMCAC case, the channel definition policy must be referenced under the redirected interface level.

## Parameters

### *policy-name*

Specifies the name of the global MCAC channel definition policy defined under the hierarchy **config>router>mcac>policy**. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed between double quotes.

## Full Context

configure router pim interface policy

configure router igmp interface mcac policy

configure router mld interface policy

configure router igmp group-interface mcac policy

configure router mld group-interface policy

configure router mcac policy

## Description

This command references the global channel bandwidth definition policy that is used for (H)MCAC and HQoS adjustment.

Within the scope of HQoS adjustment, the channel definition policy under the group-interface is used if redirection is disabled. In this case, the HQoS adjustment can be applied to IPoE subscribers in per-SAP replication mode.

If redirection is enabled, the channel bandwidth definition policy applied under the Layer 3 redirected interface is in effect.

Hierarchical MCAC (HMCAC) is supported on two levels simultaneously:

- subscriber level and redirected interface in case that redirection is enabled
- subscriber level and group-interface level in case that redirection is disabled

In HMCAC, the subscriber is first checked against its bandwidth limits followed by the check on the redirected interface (or group-interface) against the bandwidth limits there.

In the case that the redirection is enabled but the policy is referenced only under the group-interface, no admission control will be executed (HMCAC or MCAC).

## Parameters

### *policy-name*

Specifies the name of the global MCAC channel definition policy, up to 32 characters, defined under the hierarchy **config>router>mcac>policy**.

## Platforms

All

- configure router pim interface policy

**no policy**

### Context

[\[Tree\]](#) (config>router>if>ipv6>vrrp policy)

[\[Tree\]](#) (config>router>if>vrrp policy)

### Full Context

configure router interface ipv6 vrrp policy

configure router interface vrrp policy

### Description

This command adds a VRRP priority control policy association with the virtual router instance.

To further augment the virtual router instance base priority, VRRP priority control policies can be used to override or adjust the base priority value depending on events or conditions within the chassis.

The policy can be associated with more than one virtual router instance. The priority events within the policy either override or diminish the base priority set with the **priority** command dynamically affecting the in-use priority. As priority events clear in the policy, the in-use priority can eventually be restored to the base **priority** value.

The **policy** command is only available in the non-owner **vrrp** nodal context. The priority of **owner** virtual router instances is permanently set to 255 and cannot be changed by VRRP priority control policies. For non-owner virtual router instances, if the **policy** command is not executed, the base **priority** is used as the in-use priority.

The **no** form of the command removes existing VRRP priority control policy associations from the virtual router instance. All associations must be removed prior to deleting the policy from the system.

### Default

no policy — No VRRP priority control policy is associated with the virtual router instance.

### Parameters

#### *vrrp-policy-id*

The policy ID of the VRRP priority control expressed as a decimal integer. The *vrrp-policy-id* must already exist for the command to function.

**Values** 1 to 9999

## Platforms

All

## policy

## Syntax

**policy** *policy-id* **context** *context-value*

**policy** *policy-id* **context name** *name*

**no policy** *policy-id*

## Context

[\[Tree\]](#) (config>vrrp policy)

## Full Context

configure vrrp policy

## Description

This command creates the context to configure a VRRP priority control policy which is used to control the VRRP in-use priority based on priority control events. It is a parental node for the various VRRP priority control policy commands that define the policy parameters and priority event conditions.

The virtual router instance **priority** command defines the initial or base value to be used by non-owner virtual routers. This value can be modified by assigning a VRRP priority control policy to the virtual router instance. The VRRP priority control policy can override or diminish the base priority setting to establish the actual in-use priority of the virtual router instance.

The **policy** *policy-id* command must be created first, before it can be associated with a virtual router instance.

Because VRRP priority control policies define conditions and events that must be maintained, they can be resource intensive. The number of policies is limited to 1000.

The *policy-id* do not have to be consecutive integers. The range of available policy identifiers is from 1 to 9999.

The **no** form of the command deletes the specific *policy-id* from the system. The *policy-id* must be removed first from all virtual router instances before the **no policy** command can be issued. If the *policy-id* is associated with a virtual router instance, the command will fail.

## Parameters

### *policy-id*

The VRRP priority control ID expressed as a decimal integer that uniquely identifies this policy from any other VRRP priority control policy defined on the system. Up to 1000 policies can be defined.

**Values** 1 to 9999

### *context-value*

Specifies the service ID to which this policy applies. A value of zero (0) means that this policy does not apply to a service but applies to the base router instance.

**Values** 1 to 2147483647

configure system security cpu-protection policy

## Description

This command configures CPU protection policies.

The **no** form of this command deletes the specified policy from the configuration.

Policies 254 and 255 are reserved as the default access and network interface policies, and cannot be deleted. The parameters within these policies can be modified. An event will be logged (warning) when the default policies are modified.

## Default

Policy 254 (default access interface policy):

- per-source-rate: max (no limit)
- overall-rate: 6000
- out-profile-rate: 6000
- alarm

Policy 255 (default network interface policy):

- per-source-rate: max (no limit)
- overall-rate: max (no limit)
- out-profile-rate: 3000
- alarm

## Parameters

*cpu-protection-policy-id*

Assigns a policy ID to the specific CPU protection policy.

**Values** 1 to 255

### **create**

Keyword used to create CPU protection policy. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

### **Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## policy

### **Syntax**

**policy** *policy-name* [**create**] [**type** {**access-network** | **port**}]

**no policy** *policy-name*

### **Context**

[\[Tree\]](#) (config>sys>security>dist-cpu-protection policy)

### **Full Context**

configure system security dist-cpu-protection policy

### **Description**

This command configures one of the maximum 18 Distributed CPU Protection (DCP) policies. These policies can be applied to objects such as SAPs, network interfaces or ports.

### **Parameters**

#### ***policy-name***

Specifies the name of the policy, up to 32 characters.

#### **create**

Keyword used to create a new policy.

#### **type**

Specifies the Distributed CPU protection type for the policy.

**Values** access-network — Specifies this is a distributed CPU protection policy for access or network interfaces.

port — Specifies this is a distributed CPU protection policy for ports.

**Default** access-network

### **Platforms**

All

## policy

### Syntax

**policy** *policy-name*

**no policy**

### Context

[\[Tree\]](#) (config>router>bgp>next-hop-resolution policy)

### Full Context

configure router bgp next-hop-resolution policy

### Description

This command specifies the policy statement name to use with the BGP next-hop resolution process. The policy determines the eligibility of IP routes in the RTM to resolve the BGP next-hop addresses of IPv4 and IPv6 routes. The policy has no effect on the resolution of BGP next hops to MPLS tunnels.

For example, if a BGP next hop of an IPv4 or IPv6 route R is resolved in RTM and the longest matching route for the next-hop address is an IP route N that is rejected by the policy then route R is unresolved. If the route N is accepted by the policy, it becomes the resolving route for R.

The **no** form of this command reverts to the default next-hop resolution policy, which uses the longest matching active route in RTM that is not a BGP route (unless **use-bgp-routes** is configured), an aggregate route or a subscriber management route.

### Default

no policy

### Parameters

#### *policy-name*

Specifies the route policy name. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. Route policies are configured in the **config>router>policy-options** context.

### Platforms

All

## policy

### Syntax

**policy** *plcy-or-long-expr*

**no policy**

## Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from policy)

## Full Context

configure router policy-options policy-statement entry from policy

## Description

This command is used to call another policy by name and evaluate it as a subroutine, or to evaluate a logical expression of subroutine policies.

If the result of the subroutine evaluation is an 'accept', then the route is considered to match the entry in the parent policy that called the subroutine. If the result of the subroutine evaluation is a 'reject', then the route is considered a non-match of the entry in the parent policy that called the subroutine.

Up to 3 levels of subroutine calls are supported. If a subroutine at maximum depth has this command, it is automatically considered a non-match of all routes.

The **no** form of this command removes the policy statement as a match criterion.

## Default

no policy

## Parameters

### *plcy-or-long-expr*

Specifies the name of a single **policy-statement** (up to 64 characters in length) or a policy logical expression (up to 255 characters in length) consisting of **policy-statement** names (enclosed in square brackets), logical operations ('and', 'or', 'not'), and parentheses for grouping.

## Platforms

All

policy

## Syntax

**policy** *plcy-or-long-expr*

**no policy**

## Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>action policy)

## Full Context

configure router policy-options policy-statement entry action policy

## Description

This command configures a nested policy statement as a match criterion for the route policy entry.

Policy statements are configured at the global route policy level (**config>router>policy-options policy-statement**).

The command is used to call another policy by name and evaluate it as a subroutine. If the result of the subroutine evaluation is an 'accept', then the route is considered to match the entry in the parent policy that called the subroutine. If the result of the subroutine evaluation is a 'reject', then the route is considered a non-match of the entry in the parent policy that called the subroutine. Up to 3 levels of subroutine calls are supported. If a subroutine at maximum depth has this command, it is automatically considered a non-match of all routes.

The **no** form of this command removes the policy statement as a match criterion.

## Default

no policy

## Parameters

### *plcy-or-long-expr*

Specifies the route policy name (up to 64 characters long) or a policy logical expression (up to 255 characters). Allowed values are any string up to 255 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

## Platforms

All

## policy

## Syntax

**[no] policy** *association-name*

## Context

**[Tree]** (config>router>pcep>pcc>pce-assoc policy)

## Full Context

configure router pcep pcc pce-associations policy

## Description

This command creates a named PCE policy association from which the parameters for specified policy association are configured.

The **no** form of the command deletes the specified policy association.

## Parameters

### *association-name*

Specifies the name of the policy association, up to 32 characters.

## Platforms

All

policy

## Syntax

**[no]** **policy** *policy-assoc-name*

## Context

**[Tree]** (config>router>mpls>lsp>pce-assoc policy)

**[Tree]** (config>router>mpls>lsp-template>pce-assoc policy)

## Full Context

configure router mpls lsp pce-associations policy

configure router mpls lsp-template pce-associations policy

## Description

This command binds the LSP to a named policy association. The policy association name must exist under the PCC. Up to five policy associations can be configured per LSP.

The **no** form of the command removes the LSP binding from the specified policy association.

## Parameters

*policy-assoc-name*

Specifies the name of an existing policy association, up to 32 characters.

configure service vprn subscriber-interface group-interface ingress policy-accounting

## Description

This command configures the specified policy accounting template.

The **no** form of this command disables the policy accounting template.

## Parameters

*template-name*

Specifies the template name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-s

policy-accounting

## Syntax

**policy-accounting** <*template-name*>

**no policy-accounting**

## Context

[\[Tree\]](#) (config>service>vprn>if>ingress policy-accounting)

## Full Context

configure service vprn interface ingress policy-accounting

## Description

This command configures the service VPRN interface ingress policy accounting

## Parameters

### *template-name*

Specifies the template name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

```
policy-accounting
```

## Syntax

```
policy-accounting <template-name>
```

```
no policy-accounting
```

## Context

[\[Tree\]](#) (config>service>ies>if>ingress policy-accounting)

## Full Context

```
configure service ies interface ingress policy-accounting
```

## Description

This command configures the service IES interface ingress policy accounting

## Parameters

### *template-name*

Specifies the template name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

```
policy-accounting
```

## Syntax

```
policy-accounting template-name
```

```
no policy-accounting
```

## Context

[\[Tree\]](#) (config>router>if>ingress policy-accounting)

**Full Context**

configure router interface ingress policy-accounting

**Description**

This command applies a policy accounting template to the associated interface.

The **no** form of this command removes the policy accounting template.

**Parameters*****template-name***

Specifies the template name, up to 32 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 20.194 policy-acct-template

### policy-acct-template

**Syntax**

[no] **policy-acct-template** *template-name*

**Context**

[\[Tree\]](#) (config>router policy-acct-template)

**Full Context**

configure router policy-acct-template

**Description**

This command configures a policy accounting template.

The **no** form of this command deletes the specified policy accounting template.

**Parameters*****template-name***

Specifies the template name, up to 32 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 20.195 policy-control

```
policy-control
```

### Syntax

```

### Full Context

```
configure service ies subscriber-interface group-interface policy-control
```

```
configure service vprn subscriber-interface group-interface policy-control
```

### Description

This command configures a policy-control policy for the interface.

The **no** form of this command reverts to the default.

### Parameters

***diameter-policy-name***

Specifies the name of an existing diameter policy, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.196 policy-options

```
policy-options
```

### Syntax

```
[no] policy-options
```

### Context

```
[Tree] (config>router policy-options)
```

### Full Context

```
configure router policy-options
```

**Description**

Commands in this context configure route policies. Route policies are applied to the routing protocol. The **no** form of this command deletes the route policy configuration.

**Platforms**

All

## 20.197 policy-override

policy-override

**Syntax**

policy-override

**Context**

[\[Tree\]](#) (config>app-assure>group policy-override)

**Full Context**

configure application-assurance group policy-override

**Description**

Commands in this context configure policy override parameters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.198 policy-reference-checks

policy-reference-checks

**Syntax**

[no] policy-reference-checks

**Context**

[\[Tree\]](#) (config>router policy-reference-checks)

**Full Context**

configure router policy-reference-checks

## Description

This command checks policy references to ensure that a policy exists and displays a CLI error if the policy does not exist. Enabling this option protects against accidentally referencing a missing or misspelled policy, that can lead to unexpected results when the policy is evaluated.

The **no** version of this command disables policy reference checks and allows policies that do not exist to be referenced.

## Default

no policy-reference-checks

## Platforms

All

## 20.199 policy-statement

### policy-statement

## Syntax

**policy-statement** *policy-name* [*policy-name*]

**no policy-statement**

## Context

**[Tree]** (config>test-oam>ldp-treetrace>path-discovery policy-statement)

## Full Context

configure test-oam ldp-treetrace path-discovery policy-statement

## Description

This command configures the FEC policy to determine which routes are imported from the LDP FEC database to discover its paths and probing them.

If no policy is specified, the ingress LER imports the full list of FECs from the LDP FEC database. New FECs are added to the discovery list at the next path discovery and not when they are learned and added into the FEC database. The maximum number of FECs to be discovered with path discovery is limited to 500.

The user can configure FECs to **include** or **exclude**.

Policies are configured in the **config>router>policy-options** context. A maximum of five policy names can be specified.

The **no** form of this command removes the policy from the configuration.

## Default

no policy-statement

## Parameters

### *policy-name*

Specifies up to five route policy names to filter LDP imported address FECs. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. The specified policy name(s) must already be defined.

## Platforms

All

## policy-statement

## Syntax

[no] **policy-statement** *name*

## Context

[\[Tree\]](#) (config>router>policy-options policy-statement)

## Full Context

configure router policy-options policy-statement

## Description

This command creates the context to configure a route policy statement.

Route policy statements control the flow of routing information to and from a specific protocol, set of protocols, or to a specific BGP neighbor.

The **policy-statement** is a logical grouping of match and action criteria. A single **policy-statement** can affect routing in one or more protocols and/or one or more protocols peers/neighbors. A single **policy-statement** can also affect both the import and export of routing information.

The **no** form of this command deletes the policy statement.

## Default

no policy-statement

## Parameters

### *name*

Specifies the route policy statement name. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

## Platforms

All

## 20.200 policy-variables

### policy-variables

#### Syntax

**policy-variables**

#### Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from policy-variables)

#### Full Context

configure router policy-options policy-statement entry from policy-variables

#### Description

Commands in this context configure **policy-variables** parameters.

The **no** form of this command removes all policy variables.

#### Platforms

All

## 20.201 poll

### poll

#### Syntax

**poll ca** *ca-profile-name*

#### Context

[\[Tree\]](#) (admin>certificate>cmpv2 poll)

#### Full Context

admin certificate cmpv2 poll

#### Description

This command polls the status of the pending CMPv2 request toward the specified CA.

If the response is ready, this command will resume the CMPv2 protocol exchange with server as the original command would do. The requests could be also still be pending as a result, then this command could be used again to poll the status.

SR OS allows only one pending CMP request per CA, which means no new request is allowed when a pending request is present.

### Parameters

#### *ca-profile-name*

Specifies a ca-profile name up to 32 characters.

### Platforms

All

## 20.202 poll-interval

### poll-interval

### Syntax

**poll-interval** *seconds*

**no poll-interval**

### Context

[\[Tree\]](#) (config>service>vprn>ospf>area>if poll-interval)

[\[Tree\]](#) (config>service>vprn>ospf3>area>if poll-interval)

### Full Context

configure service vprn ospf area interface poll-interval

configure service vprn ospf3 area interface poll-interval

### Description

This command configures the poll interval, in seconds. The poll interval is the time between two Hello packets to a dead (non-adjacent) OSPF NBMA neighbor. The default value of the poll interval timer is higher than the hello interval timer to avoid wasting bandwidth on non-broadcast networks, since OSPF messages are unicast to each configured neighbor. The poll interval timer is used only on **non-broadcast** interface types and has no effect if configured on other interface types.

The **no** form of this command removes the **poll-interval** configuration.

### Default

120

### Parameters

#### *seconds*

Specifies the poll interval, in seconds.

**Values** 0 to 4294967295

## Platforms

All

## poll-interval

## Syntax

**poll-interval** *seconds*

**no poll-interval**

## Context

[\[Tree\]](#) (config>router>ospf>area>interface poll-interval)

[\[Tree\]](#) (config>router>ospf3>area>interface poll-interval)

## Full Context

configure router ospf area interface poll-interval

configure router ospf3 area interface poll-interval

## Description

This command configures the poll interval, in seconds. The poll interval is the time between two Hello packets to a dead (non-adjacent) OSPF NBMA neighbor. The default value of the poll interval timer is higher than the hello interval timer to avoid wasting bandwidth on non-broadcast networks, since OSPF messages are unicast to each configured neighbor. The poll interval timer is used only on **non-broadcast** interface types and has no effect if configured on other interface types.

The **no** form of this command removes the **poll-interval** configuration.

## Default

120

## Parameters

**seconds**

Specifies the poll interval, in seconds.

**Values** 0 to 4294967295

## Platforms

All

## 20.203 pool

pool

### Syntax

**pool** *pool-name* [**create**]

**no pool** *pool-name*

### Context

**[Tree]** (config>service>vprn>dhcp>server pool)

**[Tree]** (config>service>vprn>dhcp6>server pool)

**[Tree]** (config>router>dhcp>server pool)

**[Tree]** (config>router>dhcp6>server pool)

### Full Context

configure service vprn dhcp local-dhcp-server pool

configure service vprn dhcp6 local-dhcp-server pool

configure router dhcp local-dhcp-server pool

configure router dhcp6 local-dhcp-server pool

### Description

This command configures a DHCP address pool on the router.

The **no** form of this command removes the pool name from the configuration.

### Parameters

#### *pool name*

Specifies the name of this IP address pool. Allowed values are any string, up to 32 characters.

#### **create**

Keyword used to create the pool. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

pool

### Syntax

**pool** *pool-name* **router** *router-instance* [**create**]

**no pool** *pool-name* **router** *router-instance*

## Context

[\[Tree\]](#) (config>subscr-mgmt>isa-svc-chain>evpn>export>ip-advertise-routes pool)

## Full Context

configure subscriber-mgmt isa-service-chaining evpn export ip-advertise-routes pool

## Description

This command configures NAT pools that are advertised in EVPN type 5 routes to the peer participating in service chaining.

The **no** form of this command removes the parameters from the configuration.

## Parameters

### *pool-name*

Specifies the name of the NAT pool up, to 32 characters.

### *router-instance*

Specifies the router instance belonging to the pool.

**Values** *router-name* | *vprn-svc-id*

router-name: Base, management, *cpm-vr-name*, vpls-management  
Default - Base

vprn-svc-id: [1 to 2147483647]

cpm-vr-name: [up to 32 characters]

service-name: [up to 64 characters]

### **create**

Keyword used to create a pool instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

pool

## Syntax

**pool** [*name*]

pool

## Syntax

pool [*name*]

## Context

[\[Tree\]](#) (config>card>fp>ingress>network pool)

## Full Context

configure card fp ingress network pool

## Description

This command configures the per-FP network ingress pool.

## Default

pool default

## Parameters

*name*

If specified, the name must be **default**.

## Platforms

All

## pool

## Syntax

```
pool nat-pool-name [nat-group nat-group-id type pool-type [applications applications]] [create]
no pool nat-pool-name
```

## Context

[\[Tree\]](#) (config>service>vprn>nat>outside pool)

## Full Context

configure service vprn nat outside pool

## Description

This command configures a NAT pool.

## Parameters

### *nat-pool-name*

Specifies the NAT pool name.

**Values** 32 chars max

### *nat-group-id*

Specifies the NAT group ID.

**Values** 1 to 4

### **create**

This parameter must be specified to create the instance.

### *pool-type*

Specifies the pool type.

**Values** large-scale, l2-aware, wlan-gw-anchor

### *applications*

Specifies the application.

**Values** agnostic  
flexible-port-allocation

### **create**

Keyword used to create the pool.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## pool

## Syntax

```
pool nat-pool-name nat-group nat-group-id type pool-type [applications applications] [create]
no pool nat-pool-name
```

## Context

[\[Tree\]](#) (config>router>nat>outside pool)

## Full Context

configure router nat outside pool

## Description

This command creates a NAT pool in the outside routing context. The NAT pool defines the parameters that will be used for IP address and port translation within the pool.

## Parameters

### *nat-pool-name*

Specifies the NAT pool name, up to 32 characters.

### *nat-group-id*

Specifies the NAT group ID.

**Values** 1 to 4

### **create**

Creates the instance.

### *pool-type*

Species the pool type.

**Values** large-scale, l2-aware, wlan-gw-anchor

### *applications*

This creation-time parameter configures the NAT pool for protocol agnostic operation. The IP addresses are translated in 1:1 fashion regardless of the protocol. No ports are translated for TCP or UDP traffic. Traffic through the pool can be initiated from inside or outside. When nat-pool is configured in agnostic mode, certain parameters in the pool are pre-set and cannot be changed:

- mode one-to-one
- port-forwarding-range 0
- port-reservation blocks 1
- subscriber-limit 1

- deterministic port-reservation 65536.

This pool is used to configure static 1:1 NAT, where the operator have the control of the mapping between the inside and outside IP addresses. The static IP address mapping is using CLI constructs used in deterministic NAT (prefix and map deterministic NAT commands in the inside routing context).

ALG for TCP/UDP is supported in the protocol agnostic pool.

**Values** agnostic

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

pool

## Syntax

pool [*name*]

no pool

## Context

[\[Tree\]](#) (config>isa>aa-grp>qos>egress>to-subscriber pool)

**pool** *nat-pool-name* **router** *router-instance*

**no pool**

### Context

[\[Tree\]](#) (config>service>nat>nat-policy pool)

### Full Context

configure service nat nat-policy pool

### Description

This command configures the NAT pool of this policy.

### Parameters

#### ***nat-pool-name***

Specifies the name of the NAT pool, up to 32 characters.

#### ***router-instance***

Specifies the router instance the pool belongs to, either by router name or service ID.

**Values** 1 to 2147483647 svc-name — a string up to 64 characters.

**Values** *router-name*: "Base" | "management"

**Default** Base

#### ***service-name***

Specifies the name of the service, up to 64 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.204 pool-manager

## pool-manager

### Syntax

**pool-manager**

**Context**

[\[Tree\]](#) (config>service>ies>sub-if>wlan-gw pool-manager)

[\[Tree\]](#) (config>service>vprn>sub-if>wlan-gw pool-manager)

**Full Context**

configure service ies subscriber-interface wlan-gw pool-manager

configure service vprn subscriber-interface wlan-gw pool-manager

**Description**

Commands in this context configure pool manager data for a WLAN GW subscriber interface.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.205 pool-name

pool-name

configure service vprn subscriber-interface wlan-gw pool-manager dhcpv6-client slaac pool-name

configure service ies subscriber-interface wlan-gw pool-manager dhcpv6-client slaac pool-name

### Description

This command specifies the pool name that should be sent in the DHCPv6 messages. This is reflected in the Nokia vendor specific pool option (vendor-id 6527, option-id 0x02).

The **no** form of this command removes pool-name and the option will not be sent in DHCPv6.

### Parameters

***name***

Specifies the pool name up with 32 characters.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## pool-name

### Syntax

[no] pool-name

### Context

[\[Tree\]](#) (config>router>if>dhcp>option>vendor-specific-option pool-name)

### Full Context

configure router interface dhcp option vendor-specific-option pool-name

### Description

This command enables the sending of the pool name in the Nokia vendor-specific suboption of the DHCP relay packet.

The **no** form of this command disables the feature.

### Default

no pool-name

### Platforms

All

## 20.206 pool-type

## pool-type

### Syntax

**pool-type** *pool-type*

### Context

[\[Tree\]](#) (config>test-oam>twamp>twl>src-udp-pools>port pool-type)

### Full Context

configure test-oam twamp twamp-light source-udp-port-pools port pool-type

### Description

This command maps the specified source UDP port to the TWAMP Light application allowed to configure the source UDP port. The OAM-PM IP family of tests can only configure the source UDP port when the port pool UDP source port is configured with a **pool-type oam-pm**. The **test-oam link-measurement measurement-template** can only configure the **src-udp-port** when the port pool UDP source port is

configured with **pool-type link-measurement**. A pool type cannot be changed if its current application (either an **oam-pm** session or **link-measurement** template) is configured to use the specified port, regardless of the administrative or operational state. The configuration reference linking to the source UDP prevents the change.

### Default

pool-type oam-pm

### Parameters

#### **pool-type**

Specifies the port to an application pool.

**Values** oam-pm, link-measurement

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.207 pop

```
pop
```

### Syntax

[no] pop

### Context

[\[Tree\]](#) (config>router>mpls>if>label-map pop)

### Full Context

configure router mpls interface label-map pop

### Description

This command specifies that the incoming label must be popped (removed). No label stacking is supported for a static LSP. The service header follows the top label. Once the label is popped, the packet is forwarded based on the service header.

The **no** form of this command removes the **pop** action for the *in-label*.

#### Full Context

configure service vprn interface ipv6 nd-host-route populate

configure service vprn interface arp-host-route populate

configure service ies interface arp-host-route populate

#### Description

This command enables the creation of ARP/ND host-route entries in the route-table out of a certain ARP/ND entry type.

The **no** form of this command reverts to the default.

#### Default

no populate

#### Parameters

##### evpn

Enables the creation of ARP-ND host routes in the route table out of EVPN ARP/ND entries (entries learned from EVPN MAC/IP routes).

##### dynamic

Enables the creation of ARP-ND host routes in the route table out of dynamic ARP/ND entries (learned from received ARP/ND messages from the hosts).

##### static

Enables the creation of ARP-ND host routes in the route table out of configured static ARP/ND entries.

##### route-tag [1..255]

Specifies the route tag that is added in the route table for ARP-ND host routes of type **evpn**, **dynamic**, or **static**. This tag can be matched on BGP VRF export and BGP peer export policies.

configure redundancy multi-chassis peer sync port

**Description**

This command specifies the port to be synchronized with the multi-chassis peer and a synchronization tag to be used while synchronizing this port with the multi-chassis peer.

**Parameters*****port-id***

Specifies the port to be synchronized with the multi-chassis peer.

**Values**

|                |               |  |            |
|----------------|---------------|--|------------|
| <i>port-id</i> | slot/mda/port |  |            |
| lag-id         | lag-id        |  |            |
|                | lag           |  | keyword    |
|                | id            |  | 1 to 200   |
| pw-id          | pw-id         |  |            |
|                | pw            |  | keyword    |
|                | id            |  | 1 to 10239 |

***sync-tag***

Specifies a synchronization tag, up to 32 characters in length, to be used while synchronizing this port with the multi-chassis peer.

***create***

Creates an entry; mandatory while creating an entry.

## Platforms

All

## port

## Syntax

[no] port {*port-id* | *aps-id* | *connector-port-id*}

## Context

[\[Tree\]](#) (config port)

## Full Context

configure port

## Description

This command enables access to the context to configure ports, multilink bundles, and bundle protection groups (BPGs). Before a port can be configured, the chassis slot must be provisioned with a valid card type and the MDA parameter must be provisioned with a valid MDA type.

## Default

No ports are configured. All ports must be explicitly configured and enabled.

## Parameters

### *port-id*

Specifies the physical port ID in the following format:

**Values** *slot/mda/port* [.channel]

for GNSS RF ports:

**A/gnss** or **B/gnss**

### *eth-sat-id*

Specifies the Ethernet satellite ID to be associated with this IP interface. This parameter applies to the 7950 XRS only.

#### **Values**

eth-sat-id    *esat-id/slot/port*

esat                    keyword

*id*                     1 to 20

### *pxc-id*

Specifies the PXC ID to be associated with this IP interface. This parameter applies to the 7950 XRS only.

#### **Values**

pxc-id    *pxc-id.sub-port*

|                 |         |
|-----------------|---------|
| <i>pxc</i>      | keyword |
| <i>id</i>       | 1 to 64 |
| <i>sub-port</i> | a, b    |

***aps-id***

This option configures APS on unbundled SONET/SDH ports. All SONET-SDH port parameters, with certain exceptions, for the working and protection circuit ports must be configured in the **config>port>aps-id** context. The working and protection circuit ports inherit all those parameters configured. The exception parameters for the working and protect circuits can be configured in the **config>port>sonet-sdh** context. Exception list commands include:

- clock-source
- [no] loopback
- [no] report-alarm
- section-trace
- [no] threshold

When an **configure port aps-id** is created all applicable parameters under the port CLI tree (including parameters under any submenus) assume **aps-id** defaults, or when those are not explicitly specified, default to SONET/SDH port defaults for any SONET port.

All but a few exception SONET/SDH parameters for the working channel port must be configured in the **configure port sonet-sdh** context. The protection channel inherits all the configured parameters. The exception parameters for the protection channel can be configured in the **configure port sonet-sdh** context.

Signal failure (SF) and signal degrade (SD) alarms are not enabled by default on POS interfaces. It is recommended to change the default alarm notification configuration for POS ports that belong to APS groups in order to be notified of SF/SD occurrences to be able to interpret the cause for an APS group to switch the active line.

For path alarms, modify the logical line *aps-id* in the **configure port aps-id <sonet-sdh>path report-alarm** context. For example:

```
configure port aps-1 sonet-sdh path report-alarm p-ais
```

For line alarms, separately, modify the 2 physical ports that are members of the logical *aps-id* port (the working and protect lines). APS reacts only to line alarms, not path alarms. For example:

```
configure port 1/2/3 sonet-sdh report-alarm lb2er-sd
```

```
configure port 4/5/6 sonet-sdh report-alarm lb2er-sd
```

If the SD and SF threshold rates must be modified, the changes must be performed at the line level on both the working and protect APS port member.

The **no** form of this command deletes an *aps-group-id* or *bundle-aps-group-id*. In order for an *aps-group-id* to be deleted,

The same rules apply for physical ports, bundles deletions apply to APS ports/bundles deletions (for example an *aps-group-id* must be shutdown, have no service configuration

on it, and no path configuration on it). In addition working and protection circuits must be removed before an `aps-group-id` may be removed.

**Values** `port aps-group-id aps`: keyword where `group-id`: 1 to 64

Example: `port aps-64`

### ***connector-port-id***

Specifies the physical port of a connector in the following format.

**Values** `slot/mda/connector/port`

## **Platforms**

All

port

## **Syntax**

`port port-id`

`no port`

## **Context**

[\[Tree\]](#) (config>port-xc>pxc port)

## **Full Context**

configure port-xc pxc port

## **Description**

This command configures the referenced Ethernet port as a loopback or a cross-connect port (PXC). When this command is executed, the system automatically creates two PXC subports under this Ethernet port.

The physical PXC port does not require any external connectivity or optical transceivers to function properly. Consequently, all optic-related alarms are disabled on the port.

The physical PXC port is automatically configured as a hybrid port. The MTU is preset to 9212 bytes, the encapsulation type is set to dot1q, and dot1x tunneling is turned on.

A single physical port can be associated with more than one PXC. In other words, multiple PXCs are supported per physical port. Because PXC subports use a single physical port to transmit traffic in both directions, the nominal port bandwidth is asymmetrically divided between the two directions. For example, a 10 Gb/s Ethernet port in PXC mode can accommodate 9 Gb/s of traffic in one direction and 1 Gb/s in the other. Any other ratio can be achieved as long as the sum of the bandwidth of the two PXC subports does not exceed the bandwidth capacity of the physical port (10 Gb/s in this case).

Since the PXC uses a single physical port to transmit traffic in both directions, the nominal port bandwidth is asymmetrically divided between the two directions. For example, a 10 Gb/s Ethernet port in PXC mode can accommodate 9 Gb/s of traffic in one direction and 1 Gb/s in the other. Any other ratio can be achieved as long as the sum of the bandwidth of the two PXC subports does not exceed the bandwidth capacity of the physical port (10 Gb/s in this case).

The following rules apply to PXC port configurations:

- Only unused physical ports (not associated with an interface or SAP) can be referenced inside of a PXC ID configuration.
- The physical port cannot be removed from a PXC ID configuration if the corresponding PXC subports are currently in use.
- A physical port cannot be used outside the configured PXC context. For example, a regular IP interface cannot use this physical port, or a SAP on that port cannot be associated with a service.

The **no** form of this command removes the port ID from the configuration.

## Parameters

***port-id***

Specifies the physical port in the *slot/mda/port* format.

## Platforms

All

port

## Syntax

**port** *port-id* [*port-id*] [**priority** *priority*] [**sub-group** *sub-group-id*] [**hash-weight** *weight*]

**no port** *port-id* [*port-id*]

## Context

[\[Tree\]](#) (config>lag port)

## Full Context

configure lag port

## Description

This command adds ports to a Link Aggregation Group (LAG).

The port configuration of the first port added to the LAG is used as a basis to compare to subsequently added ports. If a discrepancy is found with a newly added port, that port will not be added to the LAG.

Multiple (space separated) ports can be added or removed from the LAG link assuming the maximum of number of ports is not exceeded.

Ports that are part of a LAG must be configured with auto-negotiate limited or disabled.

The **no** form of this command removes ports from the LAG.

## Default

No ports are defined as members of a LAG.

## Parameters

***port-id***

Specifies the port ID.

The maximum number of ports in a LAG depends on the platform type, the hardware deployment, and the SR OS software release. Adding a port over the maximum allowed per given router or switch is blocked. Some platforms support double port scale for specific port types on LAGs with LAG ID in the range of 1 to 64 inclusive. Up to 16 ports can be specified in a single statement, up to 64 ports total.

**Values** These values apply to the 7950 XRS only.

*slot/mda/port*

|            |                          |         |  |
|------------|--------------------------|---------|--|
| eth-sat-id | <i>esat-id/slot/port</i> |         |  |
|            | esat                     | keyword |  |
|            | id                       | 1 to 20 |  |
| pxc-id     | <i>pxc-id.sub-port</i>   |         |  |
|            | pxc                      | keyword |  |
|            | id                       | 1 to 64 |  |
|            | sub-port                 | a to b  |  |

### **priority**

Specifies the port priority used by LACP. The port priority is also used to determine the primary port. The port with the lowest priority is the primary port. In the event of a tie, the smallest port ID becomes the primary port.

**Values** 1 to 65535

### **sub-group-id**

Identifies a LAG subgroup. When using subgroups in a LAG, they should only be configured on one side of the LAG, not both. Only having one side perform the active/standby selection guarantees a consistent selection and fast convergence. The active or standby selection is signaled through LACP to the other side. The hold time should be configured when using subgroups to prevent the LAG going down when switching between active and standby subgroup since momentarily all ports are down in a LAG (break-before-make).

**Values** 1 to 8 identifies a LAG subgroup The **auto-iom** subgroup is defined based on the IOM (all ports of the same IOM are assigned to the same subgroup). The **auto-mds** subgroup is defined based on the MDA. (all ports of the same MDA are assigned to the same subgroup).

### **weight**

Specifies the flow hashing distribution between LAG ports.

**Values** 1 to 100000, port-speed

## **Platforms**

## port

### Syntax

**port** *port-id*

**no port**

### Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg port)

### Full Context

configure service system bgp-evpn ethernet-segment port

### Description

This command configures a port-id associated with the Ethernet-Segment. If the Ethernet-Segment is configured as **all-active**, then only a lag or a PW port can be associated to the Ethernet-Segment. If the Ethernet-Segment is configured as **single-active**, then a lag, port or sdp can be associated to the Ethernet-Segment. In any case, only one of the four objects can be configured in the Ethernet-Segment. A specified port can be part of only one Ethernet-Segment. Only Ethernet ports can be added to an Ethernet-Segment.

### Default

no port

### Parameters

#### *port-id*

Specifies the port ID associated to the Ethernet-Segment.

|                |                                          |                          |         |

## port

### Syntax

[no] port *port-id*

### Context

[\[Tree\]](#) (config>service>pw-port-list port)

### Full Context

configure service pw-port-list port

### Description

This command is only applicable for VSR configurations. This command is used to select ports eligible for use with Flex PW port. Physical ports used by Flex PW port can be shared with any other Layer 2 or Layer 3 service. In other words, a Layer 3 interface using a regular SAP can be associated with a VPRN service, while the port is used by a Flex PW port. Another regular SAP from the same port can be associated with a VPLS or Epipe service at the same time.

The following rules should be followed when populating a pw-port-list:

- A port must be in hybrid mode before it is added to a pw-port-list.
- Before a port is removed from or added to a pw-port-list, all PW ports must be dissociated from the corresponding Epipe services (PW ports must be unconfigured). This implies that all PW SAPs must be deleted.
- Network interfaces (configured in the Base routing context) can be configured only on ports that are in the pw-port-list.
- A port mode (access, network, or hybrid) cannot be changed while the port is in the pw-port-list.

From this, the operator can consider adding all ports that are in hybrid mode to a pw-port-list at the beginning of the system configuration. This ensures that those ports can be used by a Flex PW port at any later time, independently of their current use.

The **no** form of this command removes the port ID from the configuration.

### Parameters

#### *port-id*

Specifies the IP of the port.

**Values** slot/mda/port: 1 to 16

## port

### Syntax

port *port*

no port

## Context

[\[Tree\]](#) (config>service>vprn>aaa>remote-servers>radius port)

## Full Context

configure service vprn aaa remote-servers radius port

## Description

This command configures the UDP port number to contact the RADIUS server.

The **no** form of this command reverts to the default value.

## Default

port 1812 (as specified in RFC 2865, *Remote Authentication Dial In User Service (RADIUS)*)

## Parameters

### *port*

Specifies the UDP port number to contact the RADIUS server.

**Values** 1 to 65535

## Platforms

All

port

## Syntax

**port** *value*

**no port**

## Context

[\[Tree\]](#) (config>service>vprn>log>syslog port)

## Full Context

configure service vprn log syslog port

## Description

This command configures the UDP port that will be used to send syslog messages to the syslog target host.

The port configuration is needed if the syslog target host uses a port other than the standard UDP syslog port 514.

Only one port can be configured. If multiple **port** commands are entered, the last entered port overwrites the previously entered ports.

The **no** form of this command reverts to default value.

**Default**

no port

**Parameters**

*value*

The value is the configured UDP port number used when sending syslog messages.

**Values** 1 to 65535

**Platforms**

All

port

**Syntax**

port *port*

**Context**

[\[Tree\]](#) (config>app-assure>group>event-log>syslog port)

**Full Context**

configure application-assurance group event-log syslog port

**Description**

This command specifies the UDP port used by application assurance to inject the syslog events inband.

**Default**

port 514

**Parameters**

*port*

Specifies the UDP port number.

**Values** 0 to 65535

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

port

**Syntax**

[no] port *port-number*

[no] **port range** *start-port-num end-port-num*

### Context

[\[Tree\]](#) (config>app-assure>group>port-list port)

### Full Context

configure application-assurance group port-list port

### Description

This command specifies the server TCP or UDP port number to use in the port list definition. The **no** form of this command restores the default by removing port number from the port list.

### Default

no port

### Parameters

#### ***port-number***

Specifies the port number.

**Values** 0 to 65535

#### ***start-port-number***

Specifies the start port number.

**Values** 0 to 65535

#### ***end-port-number***

Specifies the end port number.

**Values** 0 to 65535

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

port

### Syntax

**port** {*port-id* | **lag** *lag-id*} [**egress**] [**ingress**]

**no port** {*port-id* | **lag** *lag-id*} {[**egress**] [**ingress**]}

### Context

[\[Tree\]](#) (config>mirror>mirror-source port)

### Full Context

configure mirror mirror-source port

## Description

This command enables mirroring of traffic ingressing or egressing a port (Ethernet port, SONET/SDH channel, TDM channel, or Link Aggregation Group (LAG)).

The **port** command associates a port or LAG to a mirror source. The port is identified by the *port-id*. The defined port may be Ethernet, Access or network, SONET/SDH, or TDM channel access. A network port may be a single port or a Link Aggregation Group (LAG) ID. When a LAG ID is given as the *port-id*, mirroring is enabled on all ports making up the LAG. If the port is a SONET/SDH interface, the *channel-id* must be specified to identify which channel is being mirrored (applies to the 7450 ESS and 7750 SR). Either a LAG port member or the LAG port can be mirrored.

The port is only referenced in the mirror source for mirroring purposes. The mirror source association does not need to be removed before deleting the card to which the port belongs. If the port is removed from the system, the mirroring association will be removed from the mirror source.

The same port may not be associated with multiple mirror source definitions with the **ingress** parameter defined. The same port may not be associated with multiple mirror source definitions with the **egress** parameter defined.

If a SAP is mirrored on an access port, the SAP mirroring will have precedence over the access port mirroring when a packet matches the SAP mirroring criteria. Filter and label mirroring destinations will also precedence over a port-mirroring destination.

If the port is not associated with a **mirror-source**, packets on that port will not be mirrored. Mirroring may still be defined for a SAP, label or filter entry, which will mirror based on a more specific criteria.

The encapsulation type on an access port or channel cannot be changed to Frame Relay if it is being mirrored (applies to the 7750 SR and 7450 ESS).

The **no port** command disables port mirroring for the specified port. Mirroring of packets on the port may continue due to more specific mirror criteria. If the **egress** or **ingress** parameter keywords are specified in the **no** command, only the ingress or egress mirroring condition will be removed.

## Parameters

### *port-id*

Specifies the port ID of the 7750 SR or 7950 XRS.

The following syntax applies to the 7750 SR:

|                |                                  |         |
|----------------|----------------------------------|---------|
| <i>port-id</i> | <i>slot/mdal/port [.channel]</i> |         |
| eth-sat-id     | <i>esat-id/slot/port</i>         |         |
|                | esat                             | keyword |
|                | <i>id</i>                        | 1 to 20 |
| pxc-id         | <i>pxc-id.sub-port</i>           |         |
|                | pxc                              | keyword |
|                | <i>id</i>                        | 1 to 64 |
|                | <i>sub-port</i>                  | a, b    |
| bgrp-id        | <i>bpgrp-type-bpgrp-num</i>      |         |
|                | bgrp                             | keyword |

|         |                                      |                   |
|---------|--------------------------------------|-------------------|
|         | <i>type</i>                          | ima, ppp          |
|         | <i>bgrp-num</i>                      | 1 to 2000         |
| ccag-id | <i>ccag-id.path-id cc-type:cc-id</i> |                   |
|         | ccag                                 | keyword           |
|         | <i>id</i>                            | 1 to 8            |
|         | <i>path-id</i>                       | a, b              |
|         | <i>cc-type</i>                       | sap-net, .net-sap |
|         | <i>cc-id</i>                         | 0 to 4094         |

The following syntax applies to the 7950 XRS:

|                |                                 |         |
|----------------|---------------------------------|---------|
| <i>port-id</i> | <i>slot/mda/port [.channel]</i> |         |
| eth-sat-id     | <i>esat-id/slot/port</i>        |         |
|                | esat                            | keyword |
|                | <i>id</i>                       | 1 to 20 |
| pxc-id         | <i>pxc-id.sub-port</i>          |         |
|                | pxc                             | keyword |
|                | <i>id</i>                       | 1 to 64 |
|                | <i>sub-port</i>                 | a, b    |

### **lag-id**

The LAG identifier, expressed as a decimal integer.

#### **Note:**

On the 7950 XRS, the XMA ID takes the place of the MDA.

**Values** 1 to 800

### **egress**

Specifies that packets egressing the port should be mirrored. Egress packets are mirrored to the mirror destination after egress packet modification.

### **ingress**

Specifies that packets ingressing the port should be mirrored. Ingress packets are mirrored to the mirror destination prior to ingress packet modification.

## **Platforms**

All

## port

### Syntax

```
port {port-id | lag lag-id} {[egress] [ingress]}
no port {port-id | lag lag-id} [egress] [ingress]
```

### Context

[\[Tree\]](#) (config>li>li-source port)

### Full Context

configure li li-source port

### Description

This command specifies the port to perform lawful intercept. It is recommended when configuring **li-source>port** criteria, the li-source should only contain ports. All other criteria such as SAPs and subscribers should use a different li-source.

The **no** form of this command reverts to the default.

### Parameters

#### *port-id*

Specifies the port ID to perform lawful intercept.

|                |                                          |                          |  |
|----------------|------------------------------------------|--------------------------|--|
| <i>port-id</i> | <i>slot/mda/port</i> [ <i>.channel</i> ] |                          |  |
| aps-id         | aps-<group-id>[.channel]                 |                          |  |
|                | aps                                      | keyword                  |  |
|                | group-id                                 | 1 to 128                 |  |
| eth-sat-id     | esat-<id>/<slot>/[u]<port>               |                          |  |
|                | esat                                     | keyword                  |  |
|                | id                                       | 1 to 20                  |  |
|                | u                                        | keyword for up-link port |  |
| tdm-sat-id     | tsat-<id>/<slot>/[<u>]<port>.<channel>   |                          |  |
|                | tsat                                     | keyword                  |  |
|                | id                                       | 1 to 20                  |  |
|                | u                                        | keyword for up-link port |  |
| pxc-id         | pxc-<id>.<sub-port>                      |                          |  |
|                | pxc                                      | keyword                  |  |
|                | id                                       | 1 to 64                  |  |

sub-port a, b

**lag-id**

The LAG identifier, expressed as a decimal integer.

**Note:**

On the 7950 XRS, the XMA ID takes the place of the MDA.

**Values** 1 to 800

**egress**

Performs lawful intercept on egress traffic.

**ingress**

Performs lawful intercept on ingress traffic.

### Full Context

debug mirror-source port

### Description

This command enables mirroring of traffic ingressing or egressing a port (Ethernet port, SONET/SDH channel, TDM channel, or Link Aggregation Group (LAG)).

The **port** command associates a port or LAG to a mirror source. The port is identified by the *port-id*. The defined port may be Ethernet, Access or network, SONET/SDH, or TDM channel access. A network port may be a single port or a Link Aggregation Group (LAG) ID. When a LAG ID is given as the *port-id*, mirroring is enabled on all ports making up the LAG. If the port is a SONET/SDH interface, the *channel-id* must be specified to identify which channel is being mirrored (applies to the 7450 ESS and 7750 SR). Either a LAG port member or the LAG port can be mirrored.

The port is only referenced in the mirror source for mirroring purposes. The mirror source association does not need to be removed before deleting the card to which the port belongs. If the port is removed from the system, the mirroring association will be removed from the mirror source.

The same port may not be associated with multiple mirror source definitions with the **ingress** parameter defined. The same port may not be associated with multiple mirror source definitions with the **egress** parameter defined.

If a SAP is mirrored on an access port, the SAP mirroring will have precedence over the access port mirroring when a packet matches the SAP mirroring criteria. Filter and label mirroring destinations will also precedence over a port-mirroring destination.

If the port is not associated with a **mirror-source**, packets on that port will not be mirrored. Mirroring may still be defined for a SAP, label or filter entry, which will mirror based on a more specific criteria.

The encapsulation type on an access port or channel cannot be changed to Frame Relay if it is being mirrored (applies to the 7750 SR and 7450 ESS).

The **no port** command disables port mirroring for the specified port. Mirroring of packets on the port may continue due to more specific mirror criteria. If the **egress** or **ingress** parameter keywords are specified in the **no** command, only the ingress or egress mirroring condition will be removed.

## Parameters

### *port-id*

Specifies the port ID of the 7750 SR or 7950 XRS.

The following syntax applies to the 7750 SR:

|                |                                      |  |         |
|----------------|--------------------------------------|--|---------|
| <i>port-id</i> | <i>slot/mda/port [.channel]</i>      |  |         |
| eth-sat-id     | <i>esat-id/slot/port</i>             |  |         |
|                | <i>esat</i>                          |  | keyword |
|                | <i>id</i>                            |  | 1 to 20 |
| pxc-id         | <i>pxc-id.sub-port</i>               |  |         |
|                | <i>pxc</i>                           |  | keyword |
|                | <i>id</i>                            |  | 1 to 64 |
|                | <i>sub-port</i>                      |  | a, b    |
| ccag-id        | <i>ccag-id.path-id cc-type:cc-id</i> |  |         |
|                | <i>ccag</i>                          |  | keyword |
|                | <i>id</i>                            |  | 1 to 8  |
|                | <i>path-id</i>                       |  | a,b     |

|                |                  |
|----------------|------------------|
| <i>cc-type</i> | sap-net, net-sap |
| <i>cc-id</i>   | 0 to 4094        |

The following syntax applies to the 7950 XRS:

|                   |                                 |         |
|-------------------|---------------------------------|---------|
| <i>port-id</i>    | <i>slot/mda/port [.channel]</i> |         |
| <i>eth-sat-id</i> | <i>esat-id/slot/port</i>        |         |
|                   | <i>esat</i>                     | keyword |
|                   | <i>id</i>                       | 1 to 20 |
| <i>pxc-id</i>     | <i>pxc-id.sub-port</i>          |         |
|                   | <i>pxc</i>                      | keyword |
|                   | <i>id</i>                       | 1 to 64 |
|                   | <i>sub-port</i>                 | a, b    |

### **lag-id**

Specifies the LAG identifier, expressed as a decimal integer.

#### **Note:**

On the 7950 XRS, the XMA ID takes the place of the MDA.

**Values** 1 to 800

### **egress**

Specifies that packets egressing the port should be mirrored. Egress packets are mirrored to the mirror destination after egress packet modification.

### **ingress**

Specifies that packets ingressing the port should be mirrored. Ingress packets are mirrored to the mirror destination prior to ingress packet modification.

**port** {lt | gt | eq} *port-number*

**port** *port-list* *port-list-name*

**port** *range* *port-number* *port-number*

**no port**

## Context

**[Tree]** (config>filter>ipv6-exception>entry>match port)

**[Tree]** (config>filter>ip-filter>entry>match port)

**[Tree]** (config>filter>ipv6-filter>entry>match port)

## Full Context

configure filter ipv6-exception entry match port

configure filter ip-filter entry match port

configure filter ipv6-filter entry match port

## Description

This command configures a TCP/UDP/SCTP source or destination port match criterion in IPv4 and IPv6 CPM (SCTP not supported) and/or ACL filter policies. A packet matches this criterion if the packet TCP/UDP/SCTP (as configured by protocol/next-header match) source OR destination port matches either the specified port value or a port in the specified port range or port-list.

**Operational Note:** This command is mutually exclusive with src-port and dst-port commands. Configuring "port eq 0", may match non-initial fragments where the source/destination port values are not present in a packet fragment if other match criteria are also met.

The **no** form of this command deletes the specified port match criterion.

## Default

no port

## Parameters

### lt | gt | eq

Specifies the operator to use relative to *port-number* for specifying the port number match criteria.

### lt

Specifies that all port numbers less than *port-number* match.

### gt

Specifies that all port numbers greater than *port-number* match.

### eq

Specifies that the *port-number* must be an exact match.

### *port-number*

Specifies a source or destination port to be used as a match criterion. The port number can be expressed as a decimal integer, as well as in hexadecimal or binary format. The following value shows a decimal integer only.

**Values** 0 to 65535

### port-list *port-list-name*

Specifies an inclusive range of source or destination port values to be used as match criteria.

**range *port-number port-number***

Specifies an inclusive range of source or destination port values to be used as match criteria.

**Platforms**

VSR

- configure filter ipv6-exception entry match port

All

- configure filter ip-filter entry match port
- configure filter ipv6-filter entry match port

**port****Syntax**

[no] port *port-number*

[no] port range *start end*

**Context**

[\[Tree\]](#) (config>filter>match-list>port-list port)

**Full Context**

configure filter match-list port-list port

**Description**

This command adds a port or a range of ports to an existing port match list. The **no** form of this command deletes the specified port or range of ports from the list.

**Parameters*****port-number***

Specifies the port number to add to the list. The port number can be expressed as a decimal integer, as well as in hexadecimal or binary format. Below shows decimal integer only.

**Values** 0 to 65535

***start end***

Specifies an inclusive port range between two port numbers values. The *start* of the range and *end* of the range can be expressed as decimal integers, as well as in hexadecimal or binary format. The following value shows decimal integer only.

**Values** 0 to 65535

## Platforms

All

## Full Context

configure router origin-validation rpki-session port

## Description

This command configures the destination port number to use when contacting the cache server. The default port number is 323. The port cannot be changed without first shutting down the session.

## Default

no port

## Parameters

*port-id*

Specifies a port ID.

**Values** 0 to 65535

## Platforms

All

port

## Syntax

**port** *port-name*

**no port**

## Context

[\[Tree\]](#) (config>router>if port)

## Full Context

configure router interface port

## Description

This command creates an association with a logical IP interface and a physical port.

An interface can also be associated with the system (loopback address).

The command returns an error if the interface is already associated with another port or the system. In this case, the association must be deleted before the command is re-attempted. The *port-id* or *port-id* for Ethernet ports can be in one of the following forms:

Ethernet interfaces

If the card in the slot has MDAs/XMAs, *port-id* is in the *slot\_number/MDA* or *XMA\_number/port\_number* format; for example, **1/1/3** specifies port 3 of the MDA/XMA installed in MDA/XMA slot 1 on the card installed in chassis slot 1.

SONET/SDH interfaces

When the *port-id* represents a POS interface, the *port-id* must include the *channel-id*. The POS interface must be configured as a **network** port.

The **no** form of this command deletes the association with the port. The **no** form of this command can only be performed when the interface is administratively down.

## Default

no port

## Parameters

### *port-name*

The physical port identifier to associate with the IP interface.

**Values** The following values apply to the 7750 SR and 7450 ESS:

Table 101: Port Names

| port-name | port-id[:encap-val]     |                                                  |

All

## port

## Syntax

**port** *port-id* **to** *port-id* [**create**]

**no port** *port-id*

## Context

[\[Tree\]](#) (config>system>port-topology port)

## Full Context

configure system port-topology port

## Description

This command is used for satellites. It identifies to the SR OS that there is an internal connection between two ports.

Permitted pairings of the two ports are:

| First port            | Second port           |
|-----------------------|-----------------------|
| Router port           | Satellite uplink port |
| Satellite uplink port | Router port           |

For satellites, this command configures the binding between a host port ID and the satellite uplink from the satellite chassis. The port topology can be configured with the host connected to a satellite uplink or the

satellite uplink port connected to the specified host port. Both configurations are supported, as shown in the following examples:

```
*A:Dut-A# configure system port-topology port esat-1/1/u4 to 1/2/2 create
*A:Dut-A# configure system port-topology no port esat-1/1/u4
*A:Dut-A# configure system port-topology port 1/2/2 to esat-1/1/u4 create
*A:Dut-A# configure system port-topology no port 1/2/2
```

The **no** form of the command removes the internal connection.

## Default

no port port-id

## Parameters

### *port-id*

Specifies one port of an internal port connection. These ports can be router ports or Ethernet satellite uplink ports. Acceptable pairings are defined in the command description.

#### Values

(Router port)

*slot/mda/port*

|             |                                                                                                                                                            |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>slot</i> | The slot number of the card in the chassis. The maximum slot number is platform dependent. Refer to the hardware installation guides for more information. |
| <i>mda</i>  | [1 to 2]                                                                                                                                                   |
| <i>port</i> | [1 to 160] (depending on the MDA type)                                                                                                                     |

(Ethernet satellite uplink port)

*esat-id/slot/uport*

|             |                          |
|-------------|--------------------------|
| <b>esat</b> | keyword                  |
| <i>id</i>   | [1 to 20]                |
| <i>slot</i> | [1]                      |
| <b>u</b>    | keyword for up-link port |
| <i>port</i> | [1 to 4]                 |

### **create**

Specifies the keyword required to create the binding between the two ports.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## port

### Syntax

**port** *port-id*

### Context

[\[Tree\]](#) (config>system>satellite>port-template port)

### Full Context

configure system satellite port-template port

### Description

This command specifies the satellite port to be reconfigured.

The **no** form of this command deletes the specified port configuration.

### Parameters

***port-id***

Specifies the satellite physical port ID. This must use the format *slot/mda/port*. Currently, all satellites have a single slot and a single MDA, so these values will always be 1. For example, port 10 would be specified as 1/1/10.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## port

### Syntax

**port** *port-id* [**create**]

**no port** *port-id*

### Context

[\[Tree\]](#) (config>system>ptp port)

### Full Context

configure system ptp port

### Description

This command configures PTP over Ethernet on the physical port. The PTP process shall transmit and receive PTP messages through the port using Ethernet encapsulation (as opposed to UDP/IPv4 encapsulation).

The frames are transmitted with no VLAN tags even if the port is configured for dot1q or qinq modes for encap-type. In addition, the received frames from the external PTP clock must also be untagged.

There are two reserved multicast addresses allocated for PTP messages (see *Annex F IEEE Std 1588™-2008*). Either address can be configured for the PTP messages sent through this port.

A PTP port may not be created if the PTP profile is set g8265dot1-2010.

If the port specified in the port-id supports 1588 port based timestamping, then a side effect of enabling PTP over Ethernet on the port shall be the enabling of Synchronous Ethernet on that port.

De-provisioning of the card or MDA containing the specified port is not permitted while the port is configured within PTP.

Changing the encapsulation or the port type of the Ethernet port is not permitted when PTP Ethernet Multicast operation is configured on the port.

To allocate an ethernet satellite client port as a PTP port, the ethernet satellite must first be enabled for the transparent clock function. For more information, see the **config>system>satellite>eth-sat ptp-tc** command.

The SyncE/1588 ports of the CPM and CCMs can be specified as a PTP port. These use the 'A/3' and 'B/3' designation and they both must be specified as two PTP ports if both are to be used. The active CPM sends and receives messages on both ports if they are specified and enabled.

## Parameters

### *port-id*

Specifies a specific physical port.

**Values** *slot/mda/port*

### **create**

Creates the PTP port. This keyword is required when first creating the PTP port, if the system is configured to require it (enabled in the environment create command). Once the PTP port is created, it is possible to navigate into the context without the create keyword.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## port

## Syntax

**port** *value*

**no port**

## Context

**[Tree]** (config>log>syslog port)

## Full Context

configure log syslog port

## Description

This command configures the UDP port that will be used to send syslog messages to the syslog target host.

The port configuration is needed if the syslog target host uses a port other than the standard UDP syslog port 514.

Only one port can be configured. If multiple **port** commands are entered, the last entered port overwrites the previously entered ports.

The **no** form of this command removes the value from the configuration.

## Parameters

### *value*

Specifies the value that is the configured UDP port number used when sending syslog messages.

**Values** 1 to 65535

## Platforms

All

port

## Syntax

**port** *port*

**no port**

## Context

[\[Tree\]](#) (config>system>netconf port)

## Full Context

configure system netconf port

## Description

This command specifies the port on which the SR OS NETCONF server listens for new connections. Only one port can be configured for NETCONF management.

The configured port applies to both non-VPRN and VPRN management. New NETCONF connections are able to use the configured port. The SR OS NETCONF server errors if a port, different from the configured port, is used to SSH to the SR OS NETCONF server. For NETCONF connections not using VPRN management, active NETCONF connections are not disconnected if the port used to establish the connections is changed. For NETCONF connections using VPRN management, active NETCONF connections are disconnected if the port used to establish the connections is changed.

The **no** form of this command resets the port on which the SR OS NETCONF server listens to the default port of 830.

## Parameters

### *port*

Specifies the port on which NETCONF listens for new connections.

**Values** 22, 830

**Default** 830

## Platforms

All

## port

## Syntax

**port** *tcp/udp port-number [mask]*

**port** *port-list port-list-name*

## Full Context

configure system security cpm-filter ip-filter entry match port

configure system security cpm-filter ipv6-filter entry match port

## Description

This command configures a TCP/UDP source or destination port match criterion in IPv4 and IPv6 CPM filter policies. A packet matches this criterion if packet's TCP/UDP (as configured by protocol/next-header match) source OR destination port matches either the specified port value or a port in the specified port range or port list.

This command is mutually exclusive with **src-port** and **dst-port** commands.

The **no** form of this command deletes the specified port match criterion.

## Default

no port

## Parameters

### *tcp/udp port-number*

Specifies the source or destination port to be used as a match criterion specified as a decimal integer.

**Values** 0 to 65535

**mask**

Specifies the 16 bit mask to be applied when matching the port.

**Values** [0x0000 to 0xFFFF] | [0 to 65535] | [0b0000000000000000. to 0b1111111111111111]

**range tcp/udp port-number**

Specifies an inclusive range of source or destination port values to be used as match criteria. *start* of the range and *end* of the range are expressed as decimal integers.

**Values** start, end, port-number: 1 to 65535

**port-list port-list-name**

Specifies a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure qos match-list port-list port

## Description

This command adds a port or a range of ports to an existing port match list.

The **no** form of this command deletes the specified port or range of ports from the list.

## Parameters

### *port-number*

Specifies the port number to add to the list. The port number can be expressed as a decimal integer, as well as in hexadecimal or binary format. Below shows decimal integer only.

**Values** 0 to 65535

### *range*

Keyword specifying a range of port values.

### *start*

Specifies the start of the port range, expressed as decimal integers, as well as in hexadecimal or binary format. The following value shows decimal integer only.

**Values** 0 to 65534

### *end*

Specifies the end of the port range, expressed as decimal integers, as well as in hexadecimal or binary format. The following value shows decimal integer only.

**Values** 1 to 65535

[\[Tree\]](#) (config>qos>hs-pool-policy>mid-tier>mid-pool port-bw-oversub-factor)

### Full Context

configure qos hs-pool-policy mid-tier mid-pool port-bw-oversub-factor

### Description

This command modifies the size of the mid-pool when calculating the port-class pool sizes based on port bandwidth ratios. The command does not actually change the size of the mid-pool, only the size reported to the port-class pool sizing function.

Port-class pools can be sized in one of two ways: dynamically (proportionate to the bandwidth of each port) or explicitly (based on a percentage of the parent mid-pool). Explicit percentages require careful determination of the amount to give each pool. The dynamic sizing function attempts to automatically size each pool based on the relative amount of bandwidth each port-class pool is supporting compared to other port's port-class pools. This is accomplished by determining a dynamic weight for each port with port-class pools mapped to a given mid-pool. As true with any weighted behavior, the mid-pool buffer allocation resource is distributed in a non-oversubscribed manner to its child port-class pools. The **port-bw-oversub-factor** *oversubscription-factor* allows this distribution mechanism to become proportionally oversubscribed based on the defined factor. An oversubscription-factor of 1.5 causes the port-class pool dynamic sizes to be 1.5 times bigger, allowing for a potentially more efficient utilization of the buffers represented by mid-pool.

The **port-bw-oversub-factor** *oversubscription-factor* for a mid-pool can be modified at any time, causing the corresponding port-class pool dynamic sizes to be recalculated.

A similar behavior can be obtained by increasing the mid-pool's allocation-percent of its parent root-pool. However, the major difference in using **port-bw-oversub-factor** is that it provides larger port-class pools without allowing the mid-pool to use a higher number of buffers in the root pool.

The **no** form of the command reverts to the default.

### Default

port-bw-oversub-factor 1

### Parameters

#### **oversubscription-factor**

Specifies the factor by which the dynamically-sized port-class pools associated with the mid-pool may oversubscribe the mid-pool. This parameter is required when the **port-bw-oversub-factor** command is executed.

**Values** 1 to 10

### Platforms

## 20.212 port-control

```
port-control
```

### Syntax

```
port-control [auto | force-auth | force-unauth]
```

### Context

[\[Tree\]](#) (config>port>ethernet>dot1x port-control)

## Full Context

```
configure port ethernet dot1x port-control
```

## Description

This command configures the 802.1x authentication mode.

The **no** form of this command returns the value to the default.

## Default

```
port-control force-auth
```

## Parameters

### force-auth

Disables 802.1x authentication and causes the port to transition to the authorized state without requiring any authentication exchange. The port transmits and receives normal traffic without requiring 802.1x-based host authentication.

### force-unauth

Causes the port to remain in the unauthorized state, ignoring all attempts by the hosts to authenticate. The switch cannot provide authentication services to the host through the interface.

### auto

Enables 802.1x authentication. The port starts in the unauthorized state, allowing only EAPoL frames to be sent and received through the port. Both the router and the host can initiate an authentication procedure. The port will remain in unauthorized state (no traffic except EAPoL frames is allowed) until the first client is authenticated successfully. After this, traffic is allowed on the port for all connected hosts.

## port-down

## Syntax

[no] **port-down** *port-id*

## Context

[\[Tree\]](#) (config>vrrp>policy>priority-event port-down)

## Full Context

configure vrrp policy priority-event port-down

## Description

This command configures a port down priority control event that monitors the operational state of a port or SONET/SDH channel. When the port or channel enters the operational down state, the event is considered set. When the port or channel enters the operational up state, the event is considered cleared.

Multiple unique **port-down** event nodes can be configured within the **priority-event** context up to the overall limit of 32 events. Up to 32 events can be defined in any combination of types.

The **port-down** command can reference an arbitrary port or channel. The port or channel does not need to be preprovisioned or populated within the system. The operational state of the **port-down** event is set as follows:

- Set – non-provisioned
- Set – not populated
- Set – down
- Cleared – up

When the port or channel is provisioned, populated, or enters the operationally up or down state, the event operational state is updated appropriately.

When the event enters the operationally down, non-provisioned, or non-populated state, the event is considered to be set. When an event transitions from clear to set, the set is processed immediately and must be reflected in the associated virtual router instances in-use priority value. As the event transitions from cleared to set, a hold-set timer is loaded with the value configured by the events **hold-set** command. This timer prevents the event from clearing until it expires, damping the effect of event flapping. If the event clears and becomes set again before the hold-set timer expires, the timer is reset to the **hold-set** value, extending the time before another clear can take effect.

When the event enters the operationally up state, the event is considered to be cleared. Once the events **hold-set** expires, the effects of the events **priority** value are immediately removed from the in-use priority of all associated virtual router instances.

The actual effect on the virtual router instance in-use priority value depends on the defined event priority and its delta or explicit nature.

The **no** form of the command deletes the specific port or channel monitoring event. The event may be removed at anytime. When the event is removed, the in-use priority of all associated virtual router instances will be re-evaluated. The events **hold-set** timer has no effect on the removal procedure.

## Default

no port-down — No port down priority control events are defined.

## Parameters

### *port-id*

The port ID of the port monitored by the VRRP priority control event.

The *port-id* can only be monitored by a single event in this policy. The port can be monitored by multiple VRRP priority control policies. A port and a specific channel on the port are considered to be separate entities. A port and a channel on the port can be monitored by separate events in the same policy.

**Values** The following values apply to the 7750 SR:

|            |                                 |                    |  |

| ccag-id    | <i>ccag-id.path-id[cc-type]</i> |                    |  |
|            | <i>ccag</i>                     | keyword            |  |
|            | <i>id</i>                       | 1 to 8             |  |
|            | <i>path-id</i>                  | a, b               |  |
|            | <i>cc-type</i>                  | .sap-net, .net-sap |  |

**Values** The following values apply to the 7450 ESS:

|             |                                    |                                       |                        |
|-------------|------------------------------------|---------------------------------------|------------------------|
| port-<br>id | <i>slot/mda/<br/>port[channel]</i> |                                       |                        |
|             | eth-sat-id                         | <i>esat-id/slot/port</i>              |                        |
|             |                                    | esat                                  | keyword                |
|             |                                    | <i>id</i>                             | 1 to 20                |
|             | pxc-id                             | <i>pxc-id.sub-port</i>                |                        |
|             |                                    | pxc                                   | keyword                |
|             |                                    | <i>id</i>                             | 1 to 64                |
|             |                                    | <i>sub-port</i>                       | a, b                   |
|             | ccag-id                            | <i>ccag-id. path-id[cc-<br/>type]</i> |                        |
|             |                                    | ccag                                  | keyword                |
|             |                                    | id                                    | 1 to 8                 |
|             |                                    | path-id                               | a, b                   |
|             |                                    | cc-type                               | .sap-net, .net-<br>sap |

The POS channel on the port monitored by the VRRP priority control event. The *port-id. channel-id* can only be monitored by a single event in this policy. The channel can be monitored by multiple VRRP priority control policies. A port and a specific channel on the port are considered to be separate entities. A port and a channel on the port can be monitored by separate events in the same policy.

If the port is provisioned, but the *channel* does not exist or the port has not been populated, the appropriate event operational state is Set – non-populated.

If the port is not provisioned, the event operational state is Set – non-provisioned.

If the POS interface is configured as a clear-channel, the *channel-id* is 1 and the channel bandwidth is the full bandwidth of the port.

## 20.214 port-format

## port-format

### Syntax

**port-format** *formatting*

**no port-format**

### Context

**[Tree]** (config>service>vprn>wpp>portals>portal port-format)

**[Tree]** (config>router>wpp>portals>portal port-format)

### Full Context

configure service vprn wpp portals portal port-format

configure router wpp portals portal port-format

### Description

This command specifies the encoding format of WPP port attribute.

The standard format is as follows:

<0 to 20 character system-name><1 character separator><2-digit slot><1-digit mda><2-digit port><4-digit top><5-digit bottom>

As a general rule, if a value is not present or is too large to fit in the field, is the field set to all zeros. The following rules apply to standard formats.

- With a standard port, when the separator is a "-" character, the slot is the *slot-id*, mda is the *mda-id*, and the port is the *port-id*.
- With an ESAT port, when the separator is a "." character, the slot is the *satellite-id*, MDA is satellite *slot-id*, and the port is satellite *port-id*.
- With a PXC port, when separator is a "#" character, the MDA is the PXC *subport-id*, and the port is the PXC *port-id*.
- With a LAG port, the port is the *lag-id*.
- With a connector port, the slot is the *slot-id*, the MDA is the *mda-id*, and the port is the *connector-id*.

The vendor-specific format is as follows:

With dot1q, append "%u" with the top *vlan-id*.

With qinq, append "%u.%u" with the top *vlan-id* and the bottom *vlan-id*.

As a general rule, there can be no trailing zeros. The string truncates if it becomes too long. 0 to 16 characters are allowed for the system name. The following rules apply to vendor-specific formats.

- With a standard port, append "%s-%u/%u/%u" with the *system-name*, *slot-id*, *mda-id*, and *port-id*.
- With an ESAT port, append "%s-S%u/%u/%u" with the *system-name*, *satellite-id*, *satellite-slot-id*, and *satellite-port-id*.
- With a PXC port, append "%s-P%u%c" with the *system-name*, PXC *port-id*, and PXC *subport-id* ? 'a' : 'b'.
- With a LAG port, append "%s-L%u" with the *system-name* and *lag-id*.

- With a connector port append "%s-%u%uc%u/%u" with the *system-name*, *slot-id*, *mda-id*, *connector-id*, and *connector-port-id*.

The **no** form of this command reverts to the default.

### Default

port-format standard

### Parameters

#### *formatting*

Specifies the encoding format of the WPP port attribute.

**Values** standard, vendor-specific

**[Tree]** (config>router>nat>outside>pool port-forwarding-dyn-block-reservation)

### Full Context

configure service vprn nat outside pool port-forwarding-dyn-block-reservation

configure router nat outside pool port-forwarding-dyn-block-reservation

### Description

This command will enable the reservation of the dynamic port blocks when the first port forward for the subscriber is created. The dynamic port block allocation is logged only if the block is being utilized (mapping are created). In other words, dynamic port block reservation due to the port forward creation but without any dynamic mapping, will not be logged.

The reserved port block will be released only when the last mapping in the block expires and there is not port forward associated with the subscriber. The de-allocation log (syslog or Radius) will be generated when the dynamic port block is completely released.

Dynamic port block reservation can be enabled only if the configured maximum number of subscriber per outside IP address is less or equal then the maximum number of configured port blocks per outside IP address.

### Default

no port-forwarding-dyn-block-reservation

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.217 port-forwarding-range

## port-forwarding-range

### Syntax

**port-forwarding-range** [*range-start*] *range-end*

**no port-forwarding-range**

### Context

**[Tree]** (config>service>vprn>nat>outside>pool port-forwarding-range)

[\[Tree\]](#) (config>router>nat>outside>pool port-forwarding-range)

## Full Context

```
configure service vprn nat outside pool port-forwarding-range
configure router nat outside pool port-forwarding-range
```

## Description

This command configures the lower and upper limit for port forwards in the ephemeral port space (wildcard port space) of all IP addresses in a NAT pool. A well-known port range (ports 1 to 1023) is always enabled for port forwards, and it cannot be disabled for pools in NAPT mode.

Pools in 1:1 mode do not support configured port forwards. These pools do not perform port translation and they automatically forward traffic initiated on the outside toward the inside.

Port 0 is always excluded from the port forwarding range.

The upper bound of the wildcard port range is reserved for port forwards. If the value for the *range-start* is not provided, the wildcard port range implicitly starts at 1024.

*range-start 0* cannot be configured by an operator because it is reserved for 1:1 pools that do not support configured port forwards.

If you configure *port-forwarding-range 3000*, configures ports 1 to 3000 as port forwards. This implies that the well-known ports and wildcard ports are contiguous. If you configure *port-forwarding-range 2000 3000*, the router implicitly includes ports 1 to 1023, plus enables the wildcard port range 2000 to 3000, which is now disjointed from the well-known ports.

The *range-start* parameter has additional values that are configurable in the CLI. 0 is reserved for pools that do not support configured port forwards (those are 1:1 pools).

*range-start 1* means that well-known ports and wildcard port forwards are contiguous. This is configured by omitting the *range-start* parameter and only configuring the *range-end* parameter.

The **no** form of this command disables the port forwards capability in the wildcard port range of all IP addresses in a NAT pool.

Default ranges in the *range-start* and *range-end* parameters in the MIB for the NAT pools that support port forwarding ranges are set to include only well-known ports, *range-start 1* and *range-end 1023*.

## Parameters

### *range-start*

Specifies the lower boundary of the wildcard port range reserved for port forwards. When configured, the value must be less than the *range-end* value.

**Values** 0, 1, 1025 to 65535

**Default** 1

### *range-end*

Specifies the upper boundary of the wildcard port range reserved for port forwards.

**Values** 0, 1023 to 65535

**Default** 1023

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## port-forwarding-range

### Syntax

**port-forwarding-range** *range-end*

**no port-forwarding-range**

### Context

**[Tree]** (config>service>nat>firewall-policy port-forwarding-range)

**[Tree]** (config>service>nat>nat-policy port-forwarding-range)

### Full Context

configure service nat firewall-policy port-forwarding-range

configure service nat nat-policy port-forwarding-range

### Description

This command configures the end of the port range available for port forwarding. The start of the range is always equal to one.

The number of ports that can be configured is half of the available block =>  $64512 : 2 = 32256$

In combination with port-forwarding-range the formulas are:

"max port-reservation blocks" =  $65535 - \text{"port-forwarding-range"}$

"max port-reservation ports" =  $(65535 - \text{"port-forwarding-range"}) / 2$

with:

the default min value for "port-forwarding-range" = 1023

Also, the same applies for max port-forwarding-range if the port-reservation is already configured:

"max port-forwarding-range" =  $65535 - \text{"port-reservation blocks"}$

"max port-forwarding-range" =  $65535 - (\text{"port-reservation ports"} * 2)$

The **no** form of the command reverts to the default.

### Default

port-forwarding-range 1023

### Parameters

***range-end***

Specifies the end of the port range available for port forwarding.

**Values** 1023 to 65535

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat firewall-policy port-forwarding-range

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### Syntax

```
port-id-subtype {tx-if-alias | tx-if-name | tx-local}
```

## Context

[\[Tree\]](#) (config>port>ethernet>lldp>dstmac port-id-subtype)

## Full Context

configure port ethernet lldp dest-mac port-id-subtype

## Description

This command specifies how to encode the PortID TLV transmit to the peer. The default setting **tx-local** (ifindex value) is required by some versions of the NSP NSM-P to properly build the Layer 2 topology map using LLDP. Changing this value to transmit the ifname ( **tx-if-name**) or ifAlias (**tx-if-alias**) in place of the ifindex (**tx-local**) may affect the ability of the NSP NFM-P to build the Layer 2 topology map using LLDP.

## Default

port-id-subtype tx-local

## Parameters

### tx-if-alias

Transmits the ifAlias String (subtype 1) that describes the port as stored in the IF-MIB, either user configured or the default entry (i.e. 10/100/Gig Ethernet SFP).

### tx-if-name

Transmits the ifName string (subtype 5) that describes the port as stored in the IF-MIB ifName info.

### tx-local

The interface ifIndex value (subtype 7) as the PortID.

## 20.221 port-list

port-list

### Syntax

**port-list** *port-list-name* [create]  
**no port-list** *port-list-name*

### Context

[\[Tree\]](#) (config>app-assure>group port-list)

### Full Context

configure application-assurance group port-list

### Description

This command defines an AA group or partition named port-list, which contains a list of port numbers or port ranges. The port list is then referenced in AA policy app-filters, allowing increased flexibility in the use of server ports or HTTP proxy ports for application definition.

The **no** form of this command removes the list.

### Parameters

***port-list-name***

Specifies the name of the port list.

**Default** default

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## port-list

### Syntax

**port-list** *port-list-name* [create]

**no port-list** *port-list-name*

### Context

[\[Tree\]](#) (config>filter>match-list port-list)

### Full Context

configure filter match-list port-list

### Description

This command creates a list of TCP/UDP/SCTP port values or ranges for match criteria in IPv4 and IPv6 ACL and CPM filter policies.

The **no** form of this command deletes the specified list.

#### Operational notes:

SCTP port match is supported in ACL filter policies only.

A port-list must contain only TCP/UDP/SCTP port values or ranges.

A TCP/UDP/SCTP port match list cannot be deleted if it is referenced by a filter policy.

See general description related to match-list usage in filter policies.

### Parameters

#### *port-list-name*

Specifies a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

## Platforms

All

## port-list

### Syntax

**port-list** *port-list-name* [create]

**no port-list** *port-list-name*

## Context

[\[Tree\]](#) (config>qos>match-list port-list)

## Full Context

configure qos match-list port-list

## Description

This command creates a list of port values or ranges for match criteria in QoS policies.

The **no** form of this command deletes the specified list.

## Parameters

### *port-list-name*

Specifies a port list name, up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.222 port-map

### port-map

## Syntax

**port-map** *client-port-id* **primary** *primary-uplink-port-id* [**secondary** *secondary-uplink-port-id*]

**port-map** *client-port-id* **system-default**

## Context

[\[Tree\]](#) (config>system>satellite>eth-sat port-map)

## Full Context

configure system satellite eth-sat port-map

## Description

This command configures the mapping between a satellite client port and its associated uplink. This command allows both a primary and an optional secondary uplink to be configured.

If a secondary uplink is configured, it is used to forward traffic if the primary uplink is down for any reason.

Before an uplink can be used as either a primary or secondary uplink, it must be configured using the **port-topology** configuration command.

To return the uplink association to its default the **port-map** *client-port-id* **system-default** command should be used.

## Parameters

### *client-port-id*

Specifies the satellite client port associated with the port mapping, in the format **esat-id/slot/port**.

### *primary-uplink-port-id*

Specifies the primary satellite uplink to be associated with the associate client port, in the format **esat-id/slot/uport** where *id* is 1 to 20.

### *secondary-uplink-port-id*

Specifies the secondary satellite uplink to be associated with the associate client port, in the format **esat-id/slot/uport** where *id* is 1 to 20.

### **system-default**

Specifies to set the port map to the system default.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.223 port-num

port-num

### Syntax

**port-num** *virtual-port-number*

**no port-num** [*virtual-port-number*]

### Context

[\[Tree\]](#) (config>service>vpls>spoke-sdp>stp port-num)

[\[Tree\]](#) (config>service>vpls>sap>stp port-num)

### Full Context

configure service vpls spoke-sdp stp port-num

configure service vpls sap stp port-num

### Description

This command configures the virtual port number which uniquely identifies a SAP within configuration bridge protocol data units (BPDUs). The internal representation of a SAP is unique to a system and has a reference space much bigger than the 12 bits definable in a configuration BPDU. STP takes the internal representation value of a SAP and identifies it with its own virtual port number that is unique to every other SAP defined on the TLS. The virtual port number is assigned at the time that the SAP is added to the TLS. Since the order that the SAP was added to the TLS is not preserved between reboots of the system, the virtual port number may change between restarts of the STP instance.

The virtual port number cannot be administratively modified.

## Platforms

All

## 20.224 port-overall-rate

port-overall-rate

### Syntax

**port-overall-rate** *packet-rate-limit* [**low-action-priority**]

**no port-overall-rate**

### Context

[\[Tree\]](#) (config>sys>security>cpu-protection port-overall-rate)

### Full Context

configure system security cpu-protection port-overall-rate

### Description

This command configures a per-port overall rate limit for CPU protection.

### Default

port-overall-rate max

### Parameters

#### *packet-rate-limit*

Specifies an overall per-port packet arrival rate limit in packets per second.

**Values** 1 to 65535, max (indicates no limit)

#### **action-low-priority**

Marks packets that exceed the rate as low-priority (for preferential discard later if there is congestion in the control plane) instead of discarding them immediately.

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## 20.225 port-parent

## port-parent

### Syntax

**parent** [**weight** *weight*] [**level** *level*] [**cir-weight** *cir-weight*] [**cir-level** *cir-level*]

**no parent**

### Context

**[Tree]** (config>qos>sap-egress>dynamic-queue port-parent)

### Full Context

configure qos sap-egress dynamic-queue port-parent

### Description

This command configures the queue treatment by the port parent that governs the available bandwidth for the queue. When multiple queues share a child status with the parent port, the **weight** and **level** options define how this queue contends with the other children for the above-CIR parent bandwidth. The **cir-weight** and **cir-level** options specify the weight the queue uses for the within-CIR port priority.

### Parameters

#### *weight*

Specifies the relative weight of this queue in comparison to other child queues while vying for above-CIR priority level bandwidth on the parent scheduler. Any queues defined as weighted receive no parental bandwidth, until all strict queues and schedulers on the parent have reached their maximum bandwidth or are idle. In this manner, weighted children are considered to be the lowest priority.

**Values** 1 to 100

**Default** 1

#### *level*

Specifies the priority level of the queue (as compared to other competing schedulers and queues) used to feed to the parent, for above-CIR offered load bandwidth passes.

**Values** 1 to 8

**Default** 1

#### *cir-weight*

Specifies the weight the queue uses at the within-CIR port priority level. This applies to any charging statistics also. The weight is specified as an integer value from 0 to 100, with 100 being the highest weight. When the **cir-weight** option is set to 0 (the default), the queue does not receive bandwidth during the port scheduler's within-CIR passes and the **cir-level** option is ignored. If the **cir-weight** is 1 or greater, the **cir-level** option comes into play.

**Values** 0 to 100

**Default** 0

#### *cir-level*

Specifies the priority level of the queue (as compared to other competing schedulers and queues) used to fed to the port parent, for within-CIR offered load bandwidth passes.

**Values** 0 to 8

**Default** 0

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## port-parent

### Syntax

**port-parent** [**weight** *weight*] [**level** *level*] [**cir-weight** *cir-weight*] [**cir-level** *cir-level*]

**no port-parent**

### Context

**[Tree]** (config>qos>sap-egress>policer port-parent)

### Full Context

configure qos sap-egress policer port-parent

### Description

This command specifies whether this SAP egress policer feeds off a port-level scheduler. When configured, the policer is parented by a port-level scheduler. This requires that **policers-hqos-manageable** be configured in the SAP egress QoS policy. This command and the SAP egress policer **scheduler-parent** and the **parent** commands are mutually exclusive.

The **port-parent** command defines a child/parent association between an egress policer and a port-based scheduler or between an intermediate service scheduler and a port-based scheduler. The **port-parent** command allows for a set of within-CIR and above-CIR parameters that define the port priority levels and weights for the policer. If the **port-parent** command is executed without any parameters, the default parameters are used.

In this context, the **port-parent** command and the **scheduler-parent** command (used to create a parent/child association between a queue and an intermediate scheduler) are mutually exclusive. Executing a **port-parent** command when a **scheduler-parent** definition exists causes the current intermediate scheduler association to be removed and replaced by the defined port-parent association. Executing a **scheduler-parent** command when a **port-parent** definition exists causes the port scheduler association to be removed and replaced by the defined intermediate scheduler association.

Changing the parent context on a SAP egress policy policer may cause a SAP or subscriber or a multiservice site context of the policer (policy associated with a SAP or subscriber profile or a multiservice site) to enter an orphaned state. If an instance of a policer is created on a port or channel that does not have a port scheduler enabled, and the SAP egress policy creating the policer has a port parent association, the policer will be allowed to run according to its own rate parameters and will not be controlled by a virtual scheduling context. If an instance of a policer is on a port or channel that has a port scheduler configured and the SAP egress policy defines the policer as having a non-existent intermediate

scheduler parent, the policer will be treated as an orphan and will be handled according to the current orphan behavior on the port scheduler.

The **no** form of this command removes a port scheduler parent association for the policer. When removed, if a port scheduler is defined on the port on which the policer instance exists, the policer will be treated as orphaned to the port scheduler.

## Default

no port-parent

## Parameters

### **weight** *weight*

Specifies the weight that the policer will use at the above-CIR port priority level (defined by the **level** parameter).

All weight values from all weighted active policers, queues, and schedulers with a common port parent are added together. Then, each individual active weight is divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit.

The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the **weight** parameter is set to a value of 0, the policer receives bandwidth only after other children with a non-zero weight at this level.

**Values** 0 to 100

**Default** 1

### **level** *level*

Specifies the port priority that the policer uses to receive bandwidth for its above-CIR offered load.

**Values** 1 to 8 (8 is the highest priority)

**Default** 1

### **cir-weight** *cir-weight*

Specifies the weight that the policer uses at the within-CIR port priority level (defined by the **cir-level** parameter).

All **cir-weight** values from all weighted active policers, queues, and schedulers with a common port parent are added together. Then, each individual active weight is divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit.

The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the **cir-weight** parameter is set to a value of 0, the policer receives bandwidth only after the other children with a non-zero weight at this level.

**Values** 0 to 100

**Default** 0

#### **cir-level** *cir-level*

Specifies the port priority that the policer will use to receive bandwidth for its within-CIR offered load. If the **cir-level** parameter is set to a value of 0 (the default value), the policer does not receive bandwidth during the port schedulers within-CIR pass and the **cir-weight** parameter is ignored. If the **cir-level** parameter is 1 or greater, the **cir-weight** parameter is used.

**Values** 0 to 8 (8 is the highest priority)

**Default** 0

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-1s, 7750 SR-1se, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, VSR

## port-parent

### Syntax

**port-parent** [**weight** *weight*] [**level** *level*] [**cir-weight** *cir-weight*] [**cir-level** *cir-level*]

**no port-parent**

### Context

[\[Tree\]](#) (config>qos>sap-egress>queue port-parent)

### Full Context

```
configure qos sap-egress queue port-parent
```

### Description

This command specifies whether this queue feeds off a port-level scheduler. When configured, this SAP egress queue is parented by a port-level scheduler. This object is mutually exclusive with SAP egress queue parent. Only one kind of parent is allowed.

The **port-parent** command defines a child/parent association between an egress queue and a port-based scheduler or between an intermediate service scheduler and a port-based scheduler. The **port-parent** command allows for a set of within-CIR and above-CIR parameters that define the port priority levels and weights for the queue or scheduler. If the **port-parent** command is executed without any parameters, the default parameters are assumed.

In this context, the **port-parent** command is mutually exclusive to the **parent** command (used to create a parent/child association between a queue and an intermediate scheduler). Executing a **port-parent** command when a parent definition is in place causes the current intermediate scheduler association to be removed and replaced by the defined port-parent association. Executing a **parent** command when a port-parent definition exists causes the port scheduler association to be removed and replaced by the defined intermediate scheduler name.

Changing the parent context on a SAP egress policy queue may cause a SAP or subscriber or multiservice site context of the queue (policy associated with a SAP or subscriber profile or multiservice site) to enter an orphaned state. If an instance of a queue is created on a port or channel that does not have a port scheduler enabled and the sap-egress policy creating the queue has a port-parent association, the queue will be allowed to run according to its own rate parameters and will not be controlled by a virtual scheduling context. If an instance of a queue is on a port or channel that has a port scheduler configured and the sap-egress policy defines the queue as having a non-existent intermediate scheduler parent, the queue will be treated as an orphan and will be handled according to the current orphan behavior on the port scheduler.

The **no** form of this command removes a port scheduler parent association for the queue or scheduler. If a port scheduler is defined on the port on which the queue or scheduler instance exists, the queue or scheduler will become orphaned if a port scheduler is configured on the egress port of the queue or scheduler.

## Default

no port-parent

## Parameters

### **weight** *weight*

Specifies the weight the queue or scheduler will use at the above-CIR port priority level (defined by the level parameter).

**Values** 0 to 100

**Default** 1

### **level** *level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its above-CIR offered-load.

**Values** 1 to 8 (8 is the highest priority)

**Default** 1

### **cir-weight** *cir-weight*

Specifies the weight the queue or scheduler will use at the within-CIR port priority level (defined by the cir-level parameter). The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the cir-weight parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port schedulers within-CIR pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

**Values** 0 to 100

**Default** 0

### **cir-level** *cir-level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its within-CIR offered-load. If the cir-weight parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port schedulers within-CIR

pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

**Values** 0 to 8 (8 is the highest priority)

**Default** 0

## Platforms

All

## port-parent

## Syntax

**port-parent** [**weight** *weight*] [**level** *level*] [**cir-weight** *cir-weight*] [**cir-level** *cir-level*]

**no port-parent**

## Context

[\[Tree\]](#) (config>qos>network-queue>queue port-parent)

## Full Context

configure qos network-queue queue port-parent

## Description

This command specifies whether this queue feeds off a port-level scheduler. For the network-queue policy context, only the port-parent command is supported. When a port scheduler exists on the port, network queues without a port-parent association will be treated as an orphan queue on the port scheduler and treated according to the current orphan behavior on the port scheduler. If the port-parent command is defined for a network queue on a port without a port scheduler defined, the network queue will operate as if a parent association does not exist. When a port scheduler policy is associated with the egress port, the port-parent command will come into effect.

When a network-queue policy is associated with an FP for ingress queue definition, the port-parent association of the queues is ignored.

The **no** form of this command removes a port scheduler parent association for the queue or scheduler. If a port scheduler is defined on the port then the queue or scheduler instance exists, the queue or scheduler will become orphaned.

## Default

no port-parent

## Parameters

### **weight** *weight*

Specifies the weight the queue or scheduler will use at the above-CIR port priority level (defined by the level parameter).

**Values** 0 to 100

**Default** 1

#### **level** *level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its above-CIR offered-load.

**Values** 1 to 8 (8 is the highest priority)

**Default** 1

#### **cir-weight** *cir-weight*

Specifies the weight the queue or scheduler will use at the within-CIR port priority level (defined by the *cir-level* parameter). The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the *cir-weight* parameter is set to a value of 0, the queue or scheduler does not receive bandwidth during the port scheduler's within-CIR pass and the *cir-level* parameter is ignored. If the *cir-weight* parameter is 1 or greater, the *cir-level* parameter is used.

**Values** 0 to 100

**Default** 0

#### **cir-level** *cir-level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its within-CIR offered-load. If the *cir-weight* parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port scheduler's within-CIR pass and the *cir-level* parameter is ignored. If the *cir-weight* parameter is 1 or greater, the *cir-level* parameter comes into play.

**Values** 0 to 8 (8 is the highest priority)

**Default** 0

### **Platforms**

### **Context**

[\[Tree\]](#) (config>qos>qgrps>egr>qgrp>queue port-parent)

## Full Context

configure qos queue-group-templates egress queue-group queue port-parent

## Description

This command defines the port scheduling parameters used to control the queue's behavior when a virtual egress port scheduling is enabled where the egress queue group template is applied. The **port-parent** command follows the same behavior and provisioning characteristics as the **parent** command in the SAP egress QoS policy. The **port-parent** command and the **parent** command are mutually exclusive.

The **no** form of this command removes the values from the configuration.

## Parameters

### **weight** *weight*

Specifies the weight the queue or scheduler will use at the above-CIR port priority level (defined by the level parameter).

**Values** 0 to 100

**Default** 1

### **level** *level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its above-CIR offered-load.

**Values** 1 to 8 (8 is the highest priority)

**Default** 1

### **cir-weight** *cir-weight*

Specifies the weight the queue or scheduler will use at the within-CIR port priority level (defined by the **cir-level** parameter). The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the **cir-weight** parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port schedulers within-CIR pass and the **cir-level** parameter is ignored. If the **cir-weight** parameter is 1 or greater, the **cir-level** parameter is used.

**Values** 0 to 100

**Default** 0

### **cir-level** *cir-level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its within-CIR offered-load. If the **cir-weight** parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port schedulers within-CIR pass and the **cir-level** parameter is ignored. If the **cir-weight** parameter is 1 or greater, the **cir-level** parameter is used.

**Values** 0 to 8 (8 is the highest priority)

**Default** 0

## Platforms

All

## port-parent

### Syntax

**port-parent** [**weight** *weight*] [**level** *level*] [**cir-weight** *cir-weight*] [**cir-level** *cir-level*]

**no port-parent**

### Context

[\[Tree\]](#) (config>qos>scheduler-policy>tier>scheduler port-parent)

### Full Context

configure qos scheduler-policy tier scheduler port-parent

### Description

The **port-parent** command defines a child/parent association between an egress scheduler and a port-based scheduler, or between an intermediate service scheduler and a port-based scheduler. The **port-parent** command allows for a set of within-CIR and above-CIR parameters that define the port priority levels and weights for the scheduler. If the **port-parent** command is executed without any parameters, the default parameters are assumed.

In this context, the **port-parent** command and the **parent** command (used to create a parent/child association to an intermediate scheduler) are mutually exclusive. Executing a **port-parent** command when a parent definition is in place causes the current intermediate scheduler association to be removed and replaced by the defined port-parent association. Executing a **parent** command when a port-parent definition exists causes the port scheduler association to be removed and replaced by the defined intermediate scheduler name.

Changing the parent context on a SAP egress policy policer or queue may cause a SAP or subscriber context of the policer or queue (policy associated with a SAP or subscriber profile) to enter an orphaned state. If an instance of a policer or queue is created on a port or channel that does not have a port scheduler enabled and the sap-egress policy creating the policer queue has a port-parent association, the policer or queue will be allowed to run according to its own rate parameters and will not be controlled by a virtual scheduling context. If an instance of a policer or queue is on a port or channel that has a port scheduler configured and the sap-egress policy defines the policer or queue as having a non-existent intermediate scheduler parent, the policer or queue will be treated as an orphan and will be handled according to the current orphan behavior on the port scheduler.

The **no** form of this command removes a port scheduler parent association for the scheduler. If a port scheduler is defined on the port that the scheduler instance exists, the scheduler will become orphaned if an port scheduler is configured on the egress port of the queue or scheduler.

### Default

no port-parent

### Parameters

**weight** *weight*

Specifies the weight the queue or scheduler will use at the above-CIR port priority level (defined by the **level** parameter).

**Values** 0 to 100

**Default** 1

#### **level** *level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its above-CIR offered-load.

**Values** 1 to 8 (8 is the highest priority)

**Default** 1

#### **cir-weight** *cir-weight*

Specifies the weight the queue or scheduler will use at the within-CIR port priority level (defined by the **cir-level** parameter). The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the **cir-weight** parameter is set to a value of 0, the queue or scheduler does not receive bandwidth during the port scheduler's within-CIR pass and the **cir-level** parameter is ignored. If the **cir-weight** parameter is 1 or greater, the **cir-level** parameter comes into play.

**Values** 0 to 100

**Default** 0

#### **cir-level** *cir-level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its within-CIR offered-load. If the **cir-weight** parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port scheduler's within-CIR pass and the **cir-level** parameter is ignored. If the **cir-weight** parameter is 1 or greater, the **cir-level** parameter comes into play.

**Values** 0 to 8 (8 is the highest priority)

**Default** 0

## 20.226 port-policy

port-policy

### **Syntax**

**port-policy** [*port-policy*]

## no port-policy

### Context

[\[Tree\]](#) (config>isa>wlan-gw-group port-policy)

### Full Context

configure isa wlan-gw-group port-policy

### Description

This command configures the port policy of this WLAN Gateway ISA group. If a port policy is associated with a WLAN Gateway ISA group, ports created for this group can take applicable configuration from that port policy. This port policy is applicable to those ports that take part in the per-tunnel QoS processing.

The **no** form of the command removes the **port-policy** name from the configuration.

### Default

no port-policy

### Parameters

#### *port-policy*

Specifies the port policy of this WLAN Gateway ISA group, up to 32 characters.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## port-policy

### Syntax

**port-policy** *port-policy-name* [**create**]

**no port-policy** *port-policy-name*

### Context

[\[Tree\]](#) (config port-policy)

### Full Context

configure port-policy

### Description

This command either creates a new port-policy with create parameter or enters the configuration context of an existing port-policy.

The **no** form of this command removes the port policy name from the configuration.

### Parameters

#### *port-policy-name*

Specifies the name of *port-policy* up to 32 characters.

### **create**

Creates the port-policy instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## **Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## **port-policy**

## **Syntax**

**port-policy** *policy-name*

**no port-policy**

## **Context**

[\[Tree\]](#) (config>isa>Ins-group port-policy)

## **Full Context**

configure isa Ins-group port-policy

## **Description**

This command enables policies referenced in the **config>port-policy** context to be created under **ports**. These are the ports that link the carrier IOM to the ISA, and are hidden within the system (they cannot be created through the CLI). They are created automatically. Use the **show port** command to view information.

Currently only the port scheduler policy is supported. Each Ins-esm port in the Ins-group receives an independent port scheduler instance. The port schedulers are instantiated in the carrier IOM on the Ins-esm ports that carry PPPoE traffic in the downstream direction towards the ISA before the PPPoE traffic is L2TP encapsulated.

The **no** form of the command removes the policy name from the configuration.

## **Default**

no port-policy

## **Parameters**

***policy-name***

Specifies the port policy of this LNS group, up to 32 characters.

## **Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

debug application-assurance group port-recorder

### Description

This commands allows to stop or start the http-host-recorder. To reset the recorded values execute shutdown followed by **no** shutdown.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.229 port-redirect-group

```
port-redirect-group
```

### Syntax

```
port-redirect-group {queue queue-id | policer policer-id [queue queue-id]}
no port-redirect-group
```

### Context

[\[Tree\]](#) (config>qos>network>egress>fc port-redirect-group)

### Full Context

```
configure qos network egress fc port-redirect-group
```

### Description

This command is used to redirect the FC of a packet of a pseudowire (PW) or network IP interface to an egress port queue group.

It defines the mapping of an FC to a queue ID or a policer ID and a queue ID and redirects the lookup of the queue or policer of the same ID in some egress port queue-group instance. However, the queue-group name and instance are explicitly provided only at the time the network QoS policy is applied to egress context of a spoke-sdp or a network IP interface.

The **no** version of this command removes the redirection of the FC.

### Parameters

#### *queue-id*

This parameter must be specified when executing the **port-redirect-group** command. The specified *queue-id* must exist within the egress port queue group on each IP interface where the network QoS policy is applied.

**Values** 1 to 8

#### *policer id*

The specified *policer-id* must exist within the queue-group template applied to the ingress context of the forwarding plane.

**Values** 1 to 8

## Platforms

All

## 20.230 port-reservation

### port-reservation

#### Syntax

**port-reservation blocks** *num-blocks*

**port-reservation ports** *num-ports*

**no port-reservation**

#### Context

**[Tree]** (config>router>nat>outside>pool port-reservation)

**[Tree]** (config>service>vprn>nat>outside>pool port-reservation)

#### Full Context

configure router nat outside pool port-reservation

configure service vprn nat outside pool port-reservation

#### Description

This command configures the size of the port-block that will be assigned to a host that is served by this pool. The number of ports configured are available to UDP, TCP and ICMP (as identifiers).

#### Parameters

##### *num-blocks*

Specifies the number of port-blocks per IP address. Setting this parameter to one (1) for large scale NAT enables 1:1 NAT for IP addresses in this pool.

**Values** 1 to 64512

##### *num-ports*

Specifies the number of ports per block.

**Values** 1 to 32256

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### port-reservation

#### Syntax

**port-reservation** *num-ports*

**no port-reservation**

## Context

**[Tree]** (config>service>vprn>nat>outside>pool>deterministic port-reservation)

**[Tree]** (config>router>nat>outside>pool>deterministic port-reservation)

## Full Context

configure service vprn nat outside pool deterministic port-reservation

configure router nat outside pool deterministic port-reservation

## Description

This command is applicable only to deterministic NAT. It configures the number of deterministic ports per subscriber (for example a subscriber is an inside IP address in LSN44 or IPv6 address or prefix in DS-Lite). Once this command is enabled, the pool will transition into deterministic mode of operation. This means that the subscribers can use dynamic port-blocks in the pool only as a mean to expand the range of originally assigned deterministic ports. A pool with such property is referred to as deterministic pool. However, deterministic NAT and non-deterministic NAT cannot use the same pool simultaneously.

All subscribers in deterministic pool are pre-mapped during the configuration phase to outside IP addresses and deterministic port-blocks. Because of this, the deterministic pool cannot be oversubscribed with subscribers (first-come, first-served).

Once the deterministic pool becomes operational (no shutdown) a log is created. The same applies if the pool is disabled (shutdown). As a result of this one-time logging, there will be no additional logging when a subscriber starts using ports from the pre-assigned deterministic port block. This drastically reduces the logging overhead. However, when a deterministic port block is expanded by a dynamic port block, a log will be created on any allocation/de-allocation of the dynamic port block. The logs are also created for static port forwards (including PCP).

The number of subscribers per outside IP address (subscriber-limit) multiplied by the number of deterministic ports per subscriber (port-reservation) will determine the port range of an outside IP address that will be dedicated to deterministic mappings. The number of subscribers per outside IP address in deterministic NAT must be power of 2 ( $2^n$ ). Once the deterministic ports are allocated, the dynamic ports are carved out of the remaining port space of the same outside IP address according to the existing **port-reservation** command under the same hierarchy,

## Parameters

### *num-ports*

Specifies the number of ports in a deterministic port block that is allocated and dedicated to a single subscribers during the configuration phase.

**Values** 1 to 65536

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## port-reservation

## Syntax

**[no] port-reservation**

**Context**

[\[Tree\]](#) (config>service>nat>pcp-server-policy>option port-reservation)

**Full Context**

configure service nat pcp-server-policy option port-reservation

**Description**

This command enables/disables support for the **port-reservation** option.

**Default**

no port-reservation

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.231 port-role

port-role

**Syntax**

[no] port-role

**Context**

[\[Tree\]](#) (debug>service>id>stp port-role)

**Full Context**

debug service id stp port-role

**Description**

This command enables STP debugging for changes in port roles.

**Platforms**

All

## 20.232 port-scheduler-policy

## port-scheduler-policy

### Syntax

**port-scheduler-policy** *port-scheduler-policy-name*

**no port-scheduler-policy**

### Context

**[Tree]** (config>port>ethernet>access>egress>vport port-scheduler-policy)

### Full Context

configure port ethernet access egress vport port-scheduler-policy

### Description

This command specifies the destination and organization strings to be used for matching subscriber hosts with this Vport.

The parent Vport of a subscriber host queue, which has the port-parent option enabled, is determined by matching the destination string *dest* string associated with the subscriber and the organization string *org* string associated with the subscriber host with the strings defined under a Vport on the port associated with the subscriber.

If a given subscriber host policers or queue does not have the port-parent option enabled, it is foster-parented to the Vport used by this subscriber and which is based on matching the *dest* string and *org* string. If the subscriber could not be matched with a Vport on the egress port, the host policer or queue will not be bandwidth controlled and competes for bandwidth directly based on its own PIR and CIR parameters.

By default, a subscriber host policer or queue with the port-parent option enabled is scheduled within the context of the port's port scheduler policy.

The **agg-rate rate**, **port-scheduler-policy** and **scheduler-policy** commands are mutually exclusive. Changing between the use of a scheduler policy and the use of an **agg-rate** or **port-scheduler-policy** involves removing the existing command and applying the new command. Applying a scheduler policy to a Vport is only applicable to Ethernet interfaces.

The **no** form of this command removes the *port-scheduler-policy-name* from the configuration.

The **agg-rate rate**, **port-scheduler-policy** and **scheduler-policy** commands are mutually exclusive. Changing between the use of a scheduler policy and the use of an **agg-rate/port-scheduler-policy** involves removing the existing command and applying the new command.

The **no** form of this command reverts to the default.

### Parameters

***port-scheduler-policy-name***

Specifies an existing **port-scheduler-policy** configured in the **config>qos** context.

### Platforms

All

## port-scheduler-policy

### Syntax

**port-scheduler-policy** *port-scheduler-policy-name*

**no port-scheduler-policy**

### Context

**[Tree]** (config>isa>aa-grp>qos>egress>to-subscriber port-scheduler-policy)

**[Tree]** (config>isa>aa-grp>qos>egress>from-subscriber port-scheduler-policy)

### Full Context

configure isa application-assurance-group qos egress to-subscriber port-scheduler-policy

configure isa application-assurance-group qos egress from-subscriber port-scheduler-policy

### Description

This command assigns an existing port scheduler policy as applicable to the specific application assurance group traffic.

### Default

no port-scheduler-policy

### Parameters

***port-scheduler-policy-name***

Specifies the name of an existing port scheduler policy.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## port-scheduler-policy

### Syntax

**port-scheduler-policy** *port-scheduler-name* [ **create**]

**no port-scheduler-policy** *port-scheduler-name*

### Context

**[Tree]** (config>qos port-scheduler-policy)

### Full Context

configure qos port-scheduler-policy

## Description

When a port scheduler has been associated with an egress port, it is possible to override the following parameters:

- The max-rate allowed for the scheduler
- The maximum rate for each priority level (1 to 8)
- The cir associated with each priority level (1 to 8)

The orphan priority level (level 0) has no configuration parameters and cannot be overridden.

The **no** form of this command removes a port scheduler policy from the system. If the port scheduler policy is associated with an egress port or channel, the command will fail.

## Parameters

### *port-scheduler-name*

Specifies an existing port scheduler name. Each port scheduler must be uniquely named within the system and can be up to 32 ASCII characters.

## Platforms

All

## port-scheduler-policy

## Syntax

```
port-scheduler-policy src-name dst-name [overwrite]
```

## Context

[\[Tree\]](#) (config>qos>copy port-scheduler-policy)

## Full Context

```
configure qos copy port-scheduler-policy
```

## Description

This command copies existing QoS policy entries for a QoS policy to another QoS policy.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

If **overwrite** is not specified, an error will occur if the destination policy exists.

## Parameters

### *src-name dst-name*

Indicates that the source policy and the destination policy are port scheduler policy IDs. Specify the source policy that the copy command will attempt to copy from and specify the destination policy name to which the command will copy a duplicate of the policy.

### **overwrite**

Forces the destination policy name to be copied as specified. When forced, everything in the existing destination policy will be completely overwritten with the contents of the source policy.

### Platforms

All

## 20.233 port-set

port-set

### Syntax

[no] port-set

### Context

[\[Tree\]](#) (config>service>nat>pcp-server-policy>option port-set)

### Full Context

configure service nat pcp-server-policy option port-set

### Description

This command enables PORT\_SET option support. When this command is disabled, the PCP uses a plain MAP option to allocate a single port at a time. This is default behavior. Instead of asking for each individual port in multiple requests through the MAP option, this **port-set** option allows individual ports to ask the SR OS for a set of ports at once in a single request.

The **no** form of this command disables PORT\_SET option support.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.234 port-state

port-state

### Syntax

[no] port-state

### Context

[\[Tree\]](#) (debug>service>id>stp port-state)

## Full Context

debug service id stp port-state

## Description

This command enables STP debugging for port states.

The **no** form of the command disables debugging.

## Platforms

All

## 20.235 port-template

```
port-template
```

## Syntax

```
port-template template-name sat-type sat-type [create]
```

```
no port-template template-name
```

## Context

[\[Tree\]](#) (config>system>satellite port-template)

## Full Context

```
configure system satellite port-template
```

## Description

This command creates a new port template context to define the port usage for a specific satellite type. A port template is specific to the specified satellite type. Port templates must be configured separately using different template names for each different satellite chassis type.

The **no** form of this command deletes the specified port template.

## Parameters

### *template-name*

Specifies the name for the associated port template. This value must be unique in the network.

### *sat-type*

Specifies the type of satellite chassis associated with the port-template.

**Values** es24-1gb-sfp, es24-1gb-tx, es24-sass-1gb-sfp, es48-1gb-sfp, es48-1gb-tx, es48-sass-1gb-sfp, es64-10gb-sfpp+4-100gb-cfp4, es24-sasmxp-1gb-sfp

### **create**

Creates a new port template.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.236 port-threshold

### port-threshold

#### Syntax

**port-threshold** *value* [**action** { **dynamic-cost** | **static-cost** | **down**}] [**cost** *static-cost*]

**no port-threshold**

#### Context

[\[Tree\]](#) (config>lag port-threshold)

#### Full Context

configure lag port-threshold

#### Description

This command configures the behavior for the Link Aggregation Group (LAG) if the number of operational links is equal to or below a threshold level.

Nokia recommends that operators use the **weight-threshold** or **hash-weight-threshold** command instead of the **port-threshold** command to control LAG operational status. For example, when 10GE and 100GE ports are mixed in a LAG, each 10GE port will have a weight of 1, while each 100GE port will have a weight of 10.

The **weight-threshold** or **hash-weight-threshold** command can also be used for LAGs with all ports of equal speed to allow a common operational model. For example, each port has a weight of 1 to mimic **port-threshold** and its related configuration.

The **no** form of this command reverts to the default values.

#### Default

port-threshold 0 action down

#### Parameters

##### *value*

Specifies the decimal integer threshold number of operational links for the LAG at or below which the configured action is invoked. If the number of operational links exceeds the **port-threshold** value, any action taken for being below the threshold value will cease.

**Values** 0 to 63

##### **action**

Specifies the action to take if the number of active links in the LAG is at or below the threshold value.

**dynamic-cost**

Specifies that dynamic costing is activated. As a result, the LAG remains operationally up with a cost relative to the number of operational links. The link is only regarded as operationally down when all links in the LAG are down.

**static-cost**

Specifies that static costing is activated. As a result, the LAG remains operationally up with the configured cost, regardless of the number of operational links. The link is only regarded as operationally down when all links in the LAG are down.

**down**

Specifies that LAG is brought operationally down if the number of operational links is equal to or less than the configured threshold value. The LAG is only regarded as up once the number of operational links exceeds the configured threshold value.

**static-cost**

Specifies decimal integer static cost of the LAG.

**Values** 1 to 16777215

**Platforms**

All

## 20.237 port-topology

port-topology

**Syntax**

port-topology

**Context**

[\[Tree\]](#) (config>system port-topology)

**Full Context**

configure system port-topology

**Description**

This parameter creates or edits the context to configure intra-node port connections.

**Default**

disabled

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**20.238 port-type**

port-type

**Syntax**

**port-type** *lag-port-type*

**no port-type**

**Context**

[\[Tree\]](#) (config>lag port-type)

**Full Context**

configure lag port-type

**Description**

This command configures the port type for the link aggregation group.

The **no** form of this command reverts to the default.

**Default**

port-type standard

**Parameters**

***lag-port-type***

Specifies the type of ports allowed in this LAG.

**Values**    standard — Allows all non-HS type ports to be added to this LAG  
              hs — Limits the LAG members to be HSQ IOMs (iom4-e-hs) ports

**Platforms**

7750 SR-7/12/12e

### portal-groups

#### Syntax

**portal-groups**

#### Context

[\[Tree\]](#) (config>aaa>wpp portal-groups)

#### Full Context

configure aaa wpp portal-groups

#### Description

Commands in this context configure portal group parameters for WPP.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.245 portal-hold-time

### portal-hold-time

#### Syntax

**portal-hold-time** *seconds*

**no portal-hold-time**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>http-rdr-plcy portal-hold-time)

#### Full Context

configure subscriber-mgmt http-redirect-policy portal-hold-time

#### Description

This command configures the time for which the forwarding state applicable during redirect phase is held in the system, after the user has been authenticated on the portal. This allows the HTTP response from the portal to be forwarded back on the existing connection.

**Parameters*****seconds***

Specifies how long the system holds on to re-direct forwarding resources of a subscriber, after it has left the re-direct portal.

**Values** 1 to 60

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.246 portals

portals

**Syntax**

portals

**Context**

[\[Tree\]](#) (config>service>vprn>wpp portals)

[\[Tree\]](#) (config>router>wpp portals)

**Full Context**

configure service vprn wpp portals

configure router wpp portals

**Description**

Commands in this context configure WPP portal server parameters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.247 ports

ports

**Syntax**

ports

**Context**

[\[Tree\]](#) (config>qos>fp-resource-policy ports)

**Full Context**

configure qos fp-resource-policy ports

**Description**

This command enters the ports context.

**Platforms**

7750 SR-1, 7750 SR-s

ports

**Syntax**

**ports** *num-ports*

**no ports**

**Context**

[\[Tree\]](#) (config>service>nat>up-nat-policy>port-block-extensions ports)

**Full Context**

configure service nat up-nat-policy port-block-extensions ports

**Description**

This command configures the number of ports in extended port blocks for the NAT subscriber.

**Parameters**

*num-ports*

Specifies the number of ports per extended port block.

**Values** 10 to 5000

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.248 positive-app-id

## positive-app-id

### Syntax

**positive-app-id**

### Context

[\[Tree\]](#) (config>app-assure>group>ip-id-asst positive-app-id)

### Full Context

configure application-assurance group ip-identification-assist positive-app-id

### Description

Commands in this context implement the positive application identification mechanism, which monitors the correlations between IP addresses and applications identified with a high degree of confidence independently of any IP identification assist mechanism.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.249 post-policer-mapping

## post-policer-mapping

### Syntax

**post-policer-mapping** *mapping-policy-name* [ **create**]

**no post-policer-mapping** *mapping-policy-name*

### Context

[\[Tree\]](#) (config>qos post-policer-mapping)

### Full Context

configure qos post-policer-mapping

### Description

This command configures a post-policer mapping policy which is used to remap a packet's forwarding class and profile state to another forwarding class and profile state for post-policer traffic.

A post-policer mapping policy is created without any forwarding class or profile remapping statements. If an empty policy is applied to a SAP-egress QoS policy, no remapping occurs.

The **no** form of this command deletes the post-policer mapping policy. A post-policer mapping policy can only be deleted if there are no references to it.

## Parameters

### *mapping-policy-name*

Specifies the name of the post-policer mapping policy, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## post-policer-mapping

## Syntax

**post-policer-mapping** *src-name* *dst-name* [ **overwrite**]

## Context

[\[Tree\]](#) (config>qos>copy post-policer-mapping)

## Full Context

configure qos copy post-policer-mapping

## Description

This command copies an existing post-policer mapping policy to another policy name.

The copy command is used to create new policies using existing policies and also allows bulk modifications to an existing policy with the use of the overwrite keyword.

## Parameters

### *src-name*

Specifies the source policy name that the copy command attempts to copy from.

### *dst-name*

Specifies the destination policy name to which the command copies a duplicate of the policy.

### **overwrite**

Specifies that the existing destination policy is to be replaced. Everything in the existing destination policy is overwritten with the contents of the source policy. If overwrite is not specified, an error occurs if the destination policy name exists.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## post-policer-mapping

## Syntax

**post-policer-mapping** *mapping-policy-name*

## no post-policer-mapping

### Context

[Tree] (config>qos>sap-egress post-policer-mapping)

### Full Context

configure qos sap-egress post-policer-mapping

### Description

This command applies a post-policer mapping policy in a SAP egress QoS policy. The policy contains forwarding class and profile remapping statements, which remap the forwarding class and profile state of an egress policed packet (the profile being the resulting profile after the packet has been processed by the egress policer) to another forwarding class and profile.

The remapping applies to all policers within the SAP egress QoS policy, including regular child policers and policers configured in an IP/IPv6 criteria action statement, except for dynamic policers.

Post-policer mapping is supported on FP3- and higher-based hardware, with the exception of the 7750 SR-a4/a8, which does not support egress policers resulting in the policy being ignored.

The **no** form of this command deletes the post-policer mapping policy from the SAP egress QoS policy.

### Parameters

#### *mapping-policy-name*

Specifies the name of the post-policer mapping policy, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## 20.250 power

power

### Syntax

**power** *power-state*

### Context

[Tree] (config>system>bluetooth power)

### Full Context

configure system bluetooth power

### Description

This command sets the operating mode of the Bluetooth module. This can be powered off or powered on but requires the pairing button to initiate the pairing operation, or powered on and continuously pairing.

The **pairing-button** setting also impacts how pairing operations work.

**Default**

power off

**Parameters*****power-state***

Specifies the power state.

- Values**
- off — Bluetooth radio disabled.
  - enabled-manual — Bluetooth is enabled (pairing requires the use of the pairing button).
  - enabled-automatic — Bluetooth is enabled and continuously attempts to pair whenever it is not actively paired to a device.

**Platforms**

7750 SR-1, 7750 SR-s, 7950 XRS-20e

## 20.251 power-priority-level

### power-priority-level

**Syntax**

**power-priority-level** *priority*

**no power-priority-level**

**Context**

[\[Tree\]](#) (config>card>mda power-priority-level)

[\[Tree\]](#) (config>card>xiom>mda power-priority-level)

**Full Context**

configure card mda power-priority-level

configure card xiom mda power-priority-level

**Description**

This command sets the power priority value for an XMA or MDA-s on platforms that support intelligent power management.

**Default**

power-priority-level 150

**Parameters*****priority***

Specifies the power priority level. An operator must assign a priority value to each XMA or MDA-s using a range of number from 1 to 200. The lowest number has the highest priority. The priority number range from 1 to 100 should be used for modules considered essential for system operation. Lower priority values of 101 to 200 should be used for non-essential modules.

**Values** 1 to 200

**Platforms**

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

- `configure card mda power-priority-level`

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

- `configure card xiom mda power-priority-level`

**20.252 power-safety-alert****power-safety-alert****Syntax**

**power-safety-alert** *wattage*

**Context**

[\[Tree\]](#) (config>system>pwr-mgmt power-safety-alert)

**Full Context**

configure system power-management power-safety-alert

**Description**

This command sets a value in watts for the Power Safety Alert. The Power Safety Alert minor alarm is generated when the system power capacity drops below the Power Safety Level (in watts) plus the Power Safety Alert. This is a critical level, which when breached the system starts shutting down IO cards based on card priority.

**Parameters*****wattage***

Specifies the number of watts for the power safety alert level.

**Values** 0 to 102600

**Default** 0

## Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## 20.253 power-safety-level

power-safety-level

### Syntax

**power-safety-level** *percent*

### Context

[\[Tree\]](#) (config>system>pwr-mgmt power-safety-level)

### Full Context

configure system power-management power-safety-level

### Description

This command sets the Power Safety Level, which is a percentage of the calculated worst case power draw value. Once a Power Safety Level is configured by the operator, both the Basic and Advanced modes use the Power Safety Level as a reference for calculating the power redundancy using N+1 algorithm during startup and recovery from power depression.

### Default

power-safety-level 100

### Parameters

*percent*

Specifies the Power Safety Level as a percentage of the calculated worst case power draw value.

**Values** 0 to 100

### Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## 20.254 power-save

## power-save

### Syntax

[no] power-save

### Context

[\[Tree\]](#) (config>card power-save)

### Full Context

configure card power-save

### Description

This command enables power-save mode on a specific card when it is not in use. Power-save mode allows a card to be installed and configured in a platform for future use, while having minimal impact on the overall power consumption. The card placed in power-save mode is forced into an idle state to consume minimal power. This command resets the card and then disallows the download of a software image when the card comes back up. To enable power-save mode, the desired card must first be shut down, then placed into power-save mode. In this mode, the card is not counted in the intelligent power management budget. Cards set to power-save mode do not pass traffic.

The **no** form of this command removes the card from power-save mode.

### Default

no power-save

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a8, 7750 SR-2e, 7750 SR-3e, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## 20.255 power-supply

## power-supply

### Syntax

power-supply *power-supply-id type*

### Context

[\[Tree\]](#) (config>system power-supply)

### Full Context

configure system power-supply

## Description

This command configures information about the type of power supply used for each power feed connection on the router chassis. The information is used to populate queries made using the **show>chassis detail** and **show>chassis power-supply** commands.

## Parameters

### *power-supply-id*

Specifies the power feed connection.

**Values** 1, 2

### *type*

Specifies the type of power source that is connected to the power feed connection.

**Values** dc — Specifies that a single DC power source is connected to the power feed connector.

ac single — Specifies that a single AC power source is connected to the power feed connector.

ac multiple — Specifies that multiple AC power sources are connected to the power feed connector.

default — Reverts the configured information to the default power source type for the chassis.

none — Specifies that no power source is connected to the power feed connector.

## Platforms

7450 ESS, 7750 SR-7/12

## 20.256 ppid

ppid

## Syntax

ppid

## Context

[\[Tree\]](#) (config>app-assure>group>statistics>tca>sctp-filter ppid)

## Full Context

configure application-assurance group statistics threshold-crossing-alert sctp-filter ppid

## Description

This command configures a TCA for the counter capturing PPID hits for the specified SCTP filter.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## ppid

## Syntax

ppid

## Context

[\[Tree\]](#) (config>app-assure>group>sctp-filter ppid)

## Full Context

configure application-assurance group sctp-filter ppid

## Description

Commands in this context configure actions for specific or default Payload Protocol Identifiers (PPIDs).

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.257 ppid-range

## ppid-range

## Syntax

no ppid-range direction *direction*

## Context

[\[Tree\]](#) (config>app-assure>group>statistics>tca>sctp-filter ppid-range)

## Full Context

configure application-assurance group statistics threshold-crossing-alert sctp-filter ppid-range

## Description

This command configures a TCA for the counter capturing hits for the specified SCTP filter PPID range command. An PPIPD range TCA can be created for traffic generated from the subscriber side of AA ( **from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a TCA.

## Parameters

### *direction*

Specifies the traffic direction.

**Values** from-sub, to-sub

### **create**

Keyword used to create the TCA.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## ppid-range

## Syntax

**ppid-range** min *min-ppid* max *max-ppid*

**no ppid-range**

## Context

[\[Tree\]](#) (config>app-assure>group>sctp-filter ppid-range)

## Full Context

configure application-assurance group sctp-filter ppid-range

## Description

This command specifies the range of PPID values that are allowed by AA SCTP filter firewall.

The **no** form of this command removes this PPID range.

## Default

no ppid-range

## Parameters

### *min-ppid*

Specifies the minimum SCTP Payload Protocol Identifier (PPID) to be permitted by the SCTP filter. The value must be less than or equal to the **max** *max-ppid* value.

**Values** 0 to 4294967295

### *max-ppid*

Specifies the minimum SCTP Payload Protocol Identifier (PPID) to be permitted by the SCTP filter. The value must be greater or equal to the **min** *min-ppid* value.

**Values** 0 to 4294967295

**Platforms**

## Description

This command selects protocol for PPP packet debugging.

The **no** form of this command disables the protocols selection for PPP packet debugging.

## Parameters

### lcp

Specifies the LCP protocol.

### pap

Specifies the PAP protocol.

### chap

Specifies the CHAP protocol.

### ipcp

Specifies the IPCP protocol.

### ipv6cp

Specifies the IPv6CP protocol.

### other

Specifies any other protocol.

debug subscriber-mgmt vrgw brg pppoe-client brg-id ppp
```

## Description

This command specifies which messages in PPP setup are tracked by debugging. If no messages are specified, they are all tracked. LCP Echo Request and Echo Response are never shown during debugging.

## Parameters

### **lcp**

Tracks lcp messages during debugging.

### **pap**

Tracks pap messages during debugging.

### **chap**

Tracks chap messages during debugging.

### **ipcp**

Tracks ipcp messages during debugging.

### **ipv6cp**

Tracks ipv6cp messages during debugging.

### **ipv6**

Tracks ipv6 messages during debugging.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.259 ppp-authentication

### ppp-authentication

#### Syntax

```
ppp-authentication {pap | chap | pref-chap | pref-pap}
no ppp-authentication
```

#### Context

[\[Tree\]](#) (config>subscr-mgmt>ppp-policy ppp-authentication)

#### Full Context

```
configure subscriber-mgmt ppp-policy ppp-authentication
```

#### Description

This command configures the PPP protocol used to authenticate the PPP session.

#### Default

```
ppp-authentication pref-chap
```

#### Parameters

##### **pap**

Specifies to always use PAP to authenticate the sessions.

##### **chap**

Specifies to always use CHAP to authenticate the sessions.

##### **pref-chap**

Specifies to attempt to use CHAP and if it fails, use PAP.

##### **pref-pap**

Specifies to attempt to use PAP and if it fails, use CHAP.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.260 ppp-chap-challenge-length

### ppp-chap-challenge-length

#### Syntax

```
ppp-chap-challenge-length min minimum-length max maximum-length
```

## no ppp-chap-challenge-length

### Context

[\[Tree\]](#) (config>subscr-mgmt>ppp-policy ppp-chap-challenge-length)

### Full Context

configure subscriber-mgmt ppp-policy ppp-chap-challenge-length

### Description

This command configures the minimum and maximum length of a PPP Chap Challenge.

When the Chap Challenge is exactly 16 bytes, it is send in the [60] CHAP-Challenge RADIUS attribute and copied in the RADIUS Authenticator field from the RADIUS Access Request.

### Default

ppp-chap-challenge-length min 32 max 64

### Parameters

#### min *minimum-length*

Specifies the minimum PPP CHAP challenge length.

**Values** 8 to 64

#### max *maximum-length*

Specifies the maximum PPP CHAP challenge length.

**Values** 8 to 64

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.261 ppp-initial-delay

### ppp-initial-delay

### Syntax

[no] ppp-initial-delay

### Context

[\[Tree\]](#) (config>subscr-mgmt>ppp-policy ppp-initial-delay)

### Full Context

configure subscriber-mgmt ppp-policy ppp-initial-delay

**Description**

This command delays the sending of an LCP-configure request after the discovery phase by 40 – 60 milliseconds.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.262 ppp-mtu

```
ppp-mtu
```

**Syntax**

```
ppp-mtu mtu-bytes
```

```
no ppp-mtu
```

**Context**

[\[Tree\]](#) (config>subscr-mgmt>ppp-policy ppp-mtu)

**Full Context**

```
configure subscriber-mgmt ppp-policy ppp-mtu
```

**Description**

This command configures the maximum PPP MTU size.

**Parameters**

*mtu-bytes*

Specifies the maximum PPP MTU size.

**Values** 512 to 9212

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.263 ppp-options

```
ppp-options
```

**Syntax**

```
ppp-options
```

**Context**

[\[Tree\]](#) (config>subscr-mgmt>ppp-policy ppp-options)

**Full Context**

configure subscriber-mgmt ppp-policy ppp-options

**Description**

Commands in this context configure PPP options.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.264 ppp-policy

### ppp-policy

**Syntax**

**ppp-policy** *ppp-policy-name* [**create**]

**no ppp-policy** *ppp-policy-name*

**Context**

[\[Tree\]](#) (config>subscr-mgmt ppp-policy)

**Full Context**

configure subscriber-mgmt ppp-policy

**Description**

This command configures a PPP policy. These policies are referenced from interfaces configured for PPP. Multiple PPP policies may be configured.

The default policy cannot be modified or deleted.

**Default**

ppp-policy default

**Parameters*****ppp-policy-name***

Specifies the PPP policy name, up to 32 characters.

**create**

Keyword used to create the entity. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.265 ppp-policy-parameters

### ppp-policy-parameters

**Syntax**

**ppp-policy-parameters**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp>host ppp-policy-parameters)

**Full Context**

configure subscriber-mgmt local-user-db ppp host ppp-policy-parameters

**Description**

This command enables the context to configure PPP policy parameters to override the values from the host associated with the PPP policy.

The PPP host uses the values configured in the PPP policy under the group interface. It is possible to use this command to override the values from the host associated with the PPP policy. Matching a pattern on the subscriber MAC address to limit the number of sessions per MAC address is possible.

When a value is configured, the system overrides that particular PPP policy parameter. The absence of specific parameters means no overriding is performed.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.266 ppp-sub-id-key

### ppp-sub-id-key

**Syntax**

**ppp-sub-id-key** *sub-id-key* [*sub-id-key*]

**no ppp-sub-id-key**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>auto-sub-id-key ppp-sub-id-key)

## Full Context

```
configure subscriber-mgmt auto-sub-id-key ppp-sub-id-key
```

## Description

This command enables certain fields to become the base for auto-generation of default sub-id name. The sub-id name is auto-generated if there is not a more specific method available. Examples of these specific methods would be a default sub-id name as a sap-id, a preconfigured static string or explicit mappings based on RADIUS/LUDB returned strings.

In case that a more specific sub-id name generation method is not available and the **auto-id** keyword is defined under the def-sub-id hierarchy, the sub-id name is generated by concatenating fields defined in this command separated by a "|" character.

The maximum length of the auto-generated sub-id name is 64 characters while the concatenation of subscriber identification fields can exceed 64 characters. Subscriber host instantiation fails if the sub-id name is based on subscriber identification fields whose concatenated length exceeds 64 characters. Failing the host creation rather than truncating the sub-id name on a 64 character boundary prevents collision of sub-ids (subscriber name duplication).

In case that a more specific sub-id name generation method is not available and the **auto-id** keyword is not defined under the def-sub-id hierarchy, the sub-id name is a random 10 character encoded string based on the fields defined under this command.

There is only one set of identification fields allowed per host type (IPoE or PPP) per chassis.

The **no** form of this command reverts to the default.

## Default

```
ppp-sub-id-key mac sap-id session-id
```

## Parameters

### *sub-id-key*

Specifies the auto-generated sub-id keys for PPP hosts.

**Values** **mac** — Specifies that the MAC address can be combined with other subscriber host identification fields (circuit-id, remote-id, session-id or sap-id) to form a sub-id name in a user readable format or as a random 10 character encoded value.

In case that the mac address is used as a concatenation field in the sub-id name, then its format becomes a string xx:xx:xx:xx:xx:xx with the length 17B.

The MAC address as the subscriber host identification field is not applicable to static hosts.

**circuit-id** — Specifies that the circuit-id can be combined with other subscriber host identification fields (mac, remote-id, session-id or sap-id) to form a sub-id name in a user readable format or as a random 10 character encoded value.

If the circuit-id is used as a concatenation field in the sub-id name, then its format becomes access-node-id eth slot/port:[vlan-id] or access-node-id atm slot/port:vpi.vci with a variable length.

**Note:**

If circuit-id contains any non-printable ASCII characters, the entire circuit-id string is formatted in hex in the sub-id name output. Otherwise all characters in circuit-id is converted to ASCII. ASCII printable characters contain bytes in range 0x20 to 0x7E.

If the circuit-id is used as the subscriber identification field is not applicable to ARP hosts or static hosts.

**remote-id** — Specifies that the remote-id can be combined with other subscriber host identification fields (mac, circuit-id, session-id or sap-id) to form a sub-id name in a user readable format or as a random 10 character encoded value.

If the remote-id is used as a concatenation field in the sub-id name, then its format becomes a remote-id string with a variable length.

**Note:**

If the remote ID contains any non-printable ASCII characters, the entire remote-id string is formatted in hex in the sub-id name output. Otherwise all characters in remote-id is converted to ASCII. ASCII printable characters contain bytes in range 0x20 to 0x7E.

The remote ID as the subscriber identification field is not applicable to ARP hosts or static hosts.

**sap-id** — The SAP ID can be combined with other subscriber host identification fields (mac, circuit-id, remote-id, or session-id) to form a sub-id name in a user readable format or as a random 10 character encoded value.

In case that the circuit-id is used as a concatenation field in the sub-id name, then its format becomes: slot/mda:[outer-vlan].[inner-vlan] with a variable length.

The SAP ID as the subscriber identification field is applicable to all hosts types with exception of static hosts.

**session-id** — The session ID can be combined with other subscriber host identification fields (mac, circuit-id, remote-id, or sap-id) to form a sub-id name in a user readable format or as a random 10 character encoded value.

In case that the circuit ID is used as a concatenation field in the sub-id name, then its format becomes a decimal number with variable length.

The session ID as the subscriber identification field is applicable only to PPPoE/PPPoEoA type hosts.

## Platforms

## 20.267 ppp-user-db

```
ppp-user-db
```

### Syntax

```
ppp-user-db local-user-db-name
no ppp-user-db
```

### Context

[\[Tree\]](#) (config>service>vpls ppp-user-db)

### Full Context

```
configure service vpls ppp-user-db
```

### Description

This command enabled access to LUDB for PPPoE and PPPoEoA v4 and v6 hosts under the capture SAP. The name of this local user database must match the name of local user database configured under the **config>service>vprn/ies>sub-if>grp-if>pppoe** hierarchy.

The **no** form of this command reverts to the default.

### Parameters

***local-user-db***

Specifies the name of the local-user-database, up to 256 characters.

### Platforms

All

## 20.268 ppp-user-name

```
ppp-user-name
```

### Syntax

```
ppp-user-name append domain-name
ppp-user-name default-domain domain-name
ppp-user-name replace domain-name
ppp-user-name strip
no ppp-user-name
```

## Context

[\[Tree\]](#) (config>subscr-mgmt>auth-plcy ppp-user-name)

## Full Context

configure subscriber-mgmt authentication-policy ppp-user-name

## Description

This command specifies the domain name manipulation action to perform on the PAP/CHAP user name prior to authentication.

The **no** form of this command reverts to the default.

## Default

The PAP/CHAP user name is not changed.

## Parameters

### append *domain-name*

Appends an "@" delimiter followed by the specified *domain-name* to the PAP/CHAP user name, independent if a domain name is already present.

### default-domain *domain-name*

Appends an "@" delimiter followed by the specified *domain-name* to the PAP/CHAP user name only if a domain name is not already present.

### replace *domain-name*

Replaces the string after the "@" delimiter in the PAP/CHAP user name with the specified *domain-name*.

### strip

Removes the "@" delimiter and all subsequent characters from the PAP/CHAP user name.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.269 pppoe

```
pppoe
```

## Syntax

[no] pppoe

## Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if pppoe)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if pppoe)

**Full Context**

```
configure service vprn subscriber-interface group-interface pppoe
configure service ies subscriber-interface group-interface pppoe
```

**Description**

Commands in this context configure PPPoE parameters.

The **no** form of this command reverts all PPPoE parameters from the PPPoE context to their defaults.

**Default**

```
pppoe
```

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**pppoe****Syntax**

```
pppoe type direction {ingress | egress} script name
no pppoe type direction {ingress | egress}
```

**Context**

[\[Tree\]](#) (config>python>py-policy pppoe)

**Full Context**

```
configure python python-policy pppoe
```

**Description**

This command specifies the python-script for the specified PPPoE message type in the specified direction. Multiple **pppoe** command configuration are allowed in the same Python policy.

The **no** form of this command reverts to the default.

**Parameters*****type***

Specifies the message type.

**Values** session-lcp, session-pap, session-chap, session-ipcp, session-ip6cp, pado, padi, padr, pads, padt

***direction* {*ingress* | *egress*}**

Specifies whether the event is incoming or outgoing. The system only invokes the configured script for the specified packet type in the specified direction.

***script***

Specifies the name of the Python script, up to 32 characters, that is used to handle the specified message.

## Platforms

All

```
pppoe
```

## Syntax

```
pppoe service-id
```

```
no pppoe
```

## Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>sap>fwd-wholesale pppoe)

[\[Tree\]](#) (config>service>vprn>if>sap>fwd-wholesale pppoe)

## Full Context

```
configure service vprn subscriber-interface group-interface sap fwd-wholesale pppoe
```

```
configure service vprn interface sap fwd-wholesale pppoe
```

## Description

This command specifies that PPPoE packets on ingress on Ethertypes 0x8863 and 0x8864 are redirected to the specified service. The service referred to by *svc-id* must be an Epipe service. Redirection to VC-switching Epipe services is not supported.

The **no** form of this command removes the redirect.

## Parameters

*service-id*

Specifies the service ID of the Epipe to which packets are redirected.

**Values** 1 to 2147483647 | *svc-name* up to 64 characters

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
pppoe
```

## Syntax

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>sap>fwd-wholesale pppoe)

## Full Context

configure service ies interface sap fwd-wholesale pppoe

configure service ies subscriber-interface group-interface sap fwd-wholesale pppoe

## Description

This command specifies that PPPoE packets on ingress on Ethertypes 0x8863 and 0x8864 will be redirected to the specified service. The service referred to by *svc-id* must be an Epipe service. Redirection to VC-switching Epipe services is not supported.

The **no** form of this command removes the redirect.

## Parameters

### *service-id*

Specifies the service ID of the Epipe to which packets are redirected.

**Values** 1 to 2147483647 | *svc-name* up to 64 characters

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## pppoe

## Syntax

**pppoe** *origin*

## Context

[\[Tree\]](#) (config>li>x-interfaces>correlation-id pppoe)

## Full Context

configure li x-interfaces correlation-id pppoe

## Description

This command specifies the type of RADIUS accounting session ID to use for PPPoE subscriber correlation.

## Default

host

## Parameters

### *origin*

Specifies the correlation identifiers origin for PPPoE.

**Values** host, queue, session

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.270 pppoe-access-method

### pppoe-access-method

#### Syntax

**pppoe-access-method** {none | padi | pap-chap}

**no pppoe-access-method**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>auth-plcy pppoe-access-method)

#### Full Context

configure subscriber-mgmt authentication-policy pppoe-access-method

#### Description

This command indicates the authentication method used towards the RADIUS server in case the policy is used for PPPoE.

The **no** form of this command reverts to the default.

#### Parameters

##### none

Indicates that the client is authenticated by the local user database defined under the group interface and not through RADIUS.

##### padi

Indicates that the client is authenticated by RADIUS as soon as the PADI packet comes in (there is no PPP authentication done in the session in this case).

##### pap-chap

Indicates that the RADIUS authentication of the client is delayed until the authentication protocol phase in the PPP session (PAP or CHAP) and authentication is performed with the user name and PAP password / CHAP response supplied by the client.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.271 pppoe-client

pppoe-client

### Syntax

pppoe-client

### Context

[\[Tree\]](#) (debug>subscr-mgmt>vrgw>brg pppoe-client)

### Full Context

debug subscriber-mgmt vrgw brg pppoe-client

### Description

Commands in this context debug pppoe-client information.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.272 pppoe-client-policy

pppoe-client-policy

### Syntax

pppoe-client-policy *pppoe-client-policy-name* [create]

no pppoe-client-policy *pppoe-client-policy-name*

### Context

[\[Tree\]](#) (config>subscr-mgmt pppoe-client-policy)

### Full Context

configure subscriber-mgmt pppoe-client-policy

### Description

This command provisions a policy containing a set of parameters to be used to configure a PPPoE client.

The **no** form of this command removes the policy from the system. The policy can only be removed when it is not in use.

## Parameters

### *pppoe-client-policy-name*

Specifies a unique name for the policy.

### **create**

Mandatory keyword when creating a new policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.273 pppoe-lac

### pppoe-lac

## Syntax

**pppoe-lac** *max-nr-of-sessions*

**no pppoe-lac**

## Context

[\[Tree\]](#) (config>subscr-mgmt>sub-profile>session-limits pppoe-lac)

[\[Tree\]](#) (config>subscr-mgmt>sla-profile>session-limits pppoe-lac)

## Full Context

configure subscriber-mgmt sub-profile session-limits pppoe-lac

configure subscriber-mgmt sla-profile session-limits pppoe-lac

## Description

This command configures the maximum number of PPPoE L2TP LAC sessions per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of PPPoE L2TP LAC sessions limit.

## Parameters

### *max-nr-of-sessions*

Specifies the maximum number of PPPoE L2TP LAC sessions.

**Values** 0 to 131071

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.274 pppoe-local

```
pppoe-local
```

### Syntax

```
pppoe-local max-nr-of-sessions
```

```
no pppoe-local
```

### Context

```
[Tree] (config>subscr-mgmt>sla-profile>session-limits pppoe-local)
```

```
[Tree] (config>subscr-mgmt>sub-profile>session-limits pppoe-local)
```

### Full Context

```
configure subscriber-mgmt sla-profile session-limits pppoe-local
```

```
configure subscriber-mgmt sub-profile session-limits pppoe-local
```

### Description

This command configures the maximum number of PPPoE local-terminated sessions (PTA) per SLA profile instance or per subscriber.

The **no** form of this command removes maximum number of PPPoE local-terminated sessions (PTA) limit.

### Parameters

***max-nr-of-sessions***

Specifies the maximum number of PPPoE local-terminated sessions (PTA).

**Values** 0 to 131071

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.275 pppoe-overall

```
pppoe-overall
```

### Syntax

```
pppoe-overall max-nr-of-sessions
```

```
no pppoe-overall
```

## Context

[\[Tree\]](#) (config>subscr-mgmt>sla-profile>session-limits pppoe-overall)

[\[Tree\]](#) (config>subscr-mgmt>sub-profile>session-limits pppoe-overall)

## Full Context

configure subscriber-mgmt sla-profile session-limits pppoe-overall

configure subscriber-mgmt sub-profile session-limits pppoe-overall

## Description

This command configures the maximum number of PPPoE sessions per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of PPPoE sessions limit.

## Parameters

### *max-nr-of-sessions*

Specifies the maximum number of PPPoE sessions.

**Values** 0 to 131071

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.276 pppoe-policy

pppoe-policy

## Syntax

**pppoe-policy** *pppoe-policy-name*

**no pppoe-policy**

## Context

[\[Tree\]](#) (config>service>vpls>sap pppoe-policy)

## Full Context

configure service vpls sap pppoe-policy

## Description

This command references a pppoe-policy that defines session parameters (ppp-mtu, authentication options, and so on) during the session initiation phase. Normally, the PPPoE policy is referenced under the **group-interface** hierarchy. But with capture SAP is it not known at the session initiation phase to which group-interface the session belongs. This is why, with the capture SAP, the ppp-policy must be referenced

directly under the capture SAP. The pppoe-policy referenced under the group-interface must be the same as the pppoe-policy referenced under the capture SAP. Otherwise the session will not come up.

The **no** form of this command reverts to the default.

### Parameters

#### *pppoe-policy-name*

Specifies the pppoe-policy name up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.277 pppoe-python-policy

### pppoe-python-policy

### Syntax

**pppoe-python-policy** *policy-name*

**no pppoe-python-policy**

### Context

[\[Tree\]](#) (config>service>vpls>sap pppoe-python-policy)

### Full Context

configure service vpls sap pppoe-python-policy

### Description

This command specified the Python policy for PPPoE packets sent/received on the capture SAP.

The **no** form of this command removes the policy name from the configuration.

### Parameters

#### *policy-name*

Specifies an existing Python policy name, up to 32 characters.

### Platforms

All

## 20.278 pppoe-service-name

## pppoe-service-name

### Syntax

[no] pppoe-service-name

### Context

[\[Tree\]](#) (config>subscr-mgmt>auth-policy>include-radius-attribute pppoe-service-name)

### Full Context

configure subscriber-mgmt authentication-policy include-radius-attribute pppoe-service-name

### Description

This command enables the generation of the pppoe-service-name RADIUS attribute.

The **no** form of this command reverts to the default.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.279 pppoe-trace

### pppoe-trace

#### Syntax

pppoe-trace [sap *sap-id*] [ mac *ieee-address*] circuit-id *circuit-id* [remote-id *remote-id*] [username *user-name*] [profile *trace-profile-name*] [trace-existing-sessions] [ max-jobs *num*] [name *trace-name*]

pppoe-trace [sap *sap-id*] mac *ieee-address* [circuit-id *circuit-id*] [remote-id *remote-id*] [username *user-name*] [profile *trace-profile-name*] [ trace-existing-sessions] [max-jobs *num*] [name *trace-name*]

pppoe-trace sap *sap-id* [mac *ieee-address*] [ circuit-id *circuit-id*] [remote-id *remote-id*] [username *user-name*] [profile *trace-profile-name*] [trace-existing-sessions] [max-jobs *num*] [name *trace-name*]

pppoe-trace [sap *sap-id*] [mac *ieee-address*] [circuit-id *circuit-id*] remote-id *remote-id* [username *user-name*] [ profile *trace-profile-name*] [trace-existing-sessions] [max-jobs *num*] [name *trace-name*]

pppoe-trace [sap *sap-id*] [ mac *ieee-address*] [circuit-id *circuit-id*] [remote-id *remote-id*] username *user-name* [profile *trace-profile-name*] [trace-existing-sessions] [max-jobs *num*] [name *trace-name*]

no pppoe-trace name *trace-name*

no pppoe-trace [sap *sap-id*] [ mac *ieee-address*] [circuit-id *circuit-id*] [remote-id *remote-id*] [username *user-name*]

#### Context

[\[Tree\]](#) (debug>call-trace>ppp pppoe-trace)

## Full Context

debug call-trace ppp pppoe-trace

## Description

This command enables tracing locally terminated or LAC PPPoE sessions specified by the configured parameters. At least one filter rule must be provisioned. This command can trace a single session or multiple sessions, and can use wildcard characters.

This command can be executed multiple times to start multiple traces. When rules overlap, such as for a wildcard SAP and a specific SAP, the rule that a specific trace is associated with cannot be guaranteed.

The **no** form of this command prevents new traces from being configured and terminates all trace jobs that were previously started using the **trace** command.

## Parameters

### *circuit-id*

Specifies a circuit ID, up to 255 characters, that is used to filter sessions to trace.

### *ieee-address*

Specifies a MAC address that is used to identify a session to trace, in the format "ab:cd:ef:01:23:45". A wildcard character can be used to match all remaining octets; for example, the format "ab:cd:ef:\*" can be used to filter by OUI.

### *user-name*

Specifies a username, up to 32 characters, that is used to filter sessions to trace. A wildcard character (\*) can be used at the beginning and at the end of the filter.

### *num*

Specifies the maximum number of jobs that may be started with this rule.

**Values** 1 to 50

**Default** 1

### *remote-id*

Specifies a remote ID, up to 255 characters, that is used to filter sessions to trace.

### *sap-id*

Specifies a SAP to trace. The following formats are accepted:

- *port/lag/pw-port:svlan.cvlan*
- *port/lag/pw-port:vlan*
- *port/lag/pw-port*
- *port/lag/pw-port:vlan.\**
- *port/lag/pw-port:\** (also matches \*.\*)

### *trace-existing-sessions*

Specifies that existing PPPoE sessions are traced. If this parameter is not included, only new PPPoE sessions are traced.

### *trace-name*

Specifies the name, up to 32 characters, by which the trace is referenced.

***trace-profile-name***

Specifies the name of the trace profile to be applied, up to 32 characters. The default parameters are used if a trace profile is not specified.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.280 pppoe-user-db

### pppoe-user-db

**Syntax**

**pppoe-user-db** *local-user-db-name*

**no pppoe-user-db**

**Context**

[\[Tree\]](#) (config>service>vpls pppoe-user-db)

**Full Context**

configure service vpls pppoe-user-db

**Description**

This command enabled access to LUDB for PPPoE and PPPoEoA v4 and v6 hosts under the capture SAP. The name of this LUDB must match the name of the LUDB configured under the **config>service>vprn/ies>sub-if>grp-if>pppoe** hierarchy.

The **no** form of this command reverts to the default.

**Parameters*****local-user-db***

Specifies the name of the local user database, up to 256 characters.

**Platforms**

All

### pppoe-user-db

**Syntax**

**pppoe-user-db** *ludb-name*

**no pppoe-user-db**

## Context

[\[Tree\]](#) (config>service>vpls>sap pppoe-user-db)

## Full Context

```
configure service vpls sap pppoe-user-db
```

## Description

This command enables LUDB authentication on capture SAPs for PPPoE(oA) clients. If this command is configured along with the **authentication-policy** command (RADIUS authentication), then the authentication-policy command takes precedence.

The **no** form of this command reverts to the default.

## Parameters

### *ludb-name*

Specifies the name of the local user database up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.281 pptp

pptp

## Syntax

```
[no] pptp
```

## Context

[\[Tree\]](#) (config>service>nat>nat-policy>alg pptp)

[\[Tree\]](#) (config>service>nat>up-nat-policy>alg pptp)

## Full Context

```
configure service nat nat-policy alg pptp
```

```
configure service nat up-nat-policy alg pptp
```

## Description

This command enables PPTP ALG.

The call-id is captured in the outgoing call management messages and along with the source IP address and the source TCP, is translated by NAT. Once the PPTP call is established, the call-id in the associated GRE packet in the incoming direction (from outside to inside) is correspondingly translated so that it matches the call-id mapping established during the call establishment phase. The call IDs used in the mappings are selected randomly and they try to honor parity (odds/even).

A PPTP session can be initiated only from the inside of NAT.

GRE traffic is allowed through NAT only if the corresponding mapping exists. This mapping is created during the call negotiation phase.

There can be seven calls (GRE tunnels) per control session.

### Default

no pptp

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.282 pre-auth-policy

### pre-auth-policy

#### Syntax

**pre-auth-policy** *policy-name*

**no pre-auth-policy**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp>host pre-auth-policy)

#### Full Context

configure subscriber-mgmt local-user-db ppp host pre-auth-policy

#### Description

This command configures the RADIUS pre-authentication policy to use to authenticate the PPP host.

The **no** form of this command reverts to the default.

#### Parameters

***policy-name***

Specifies the pre-authentication policy of the host, up to 32 characters.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.283 pre-login-message

## pre-login-message

### Syntax

**pre-login-message** *login-text-string* [**name**]

**no pre-login-message**

### Context

**[Tree]** (config>system>login-control pre-login-message)

### Full Context

configure system login-control pre-login-message

### Description

This command configures a message to display before logging in to the router using Telnet, SSH, or the console port.

Only one message can be configured. If a new pre-login message is configured, the new message overwrites the previous message.

**Note:** The pre-login message is displayed on both active and standby systems.

The **no** form of this command removes the pre-login message.

### Default

no pre-login-message

### Parameters

#### *login-text-string*

Specifies the pre-login message text, up to 900 characters. Any printable, 7-bit ASCII characters can be used. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. Some special characters can be used to format the message text. Use the newline (\n) character to create multiline messages. A newline (\n) character in the message moves to the beginning of the next line by sending ASCII/UTF-8 characters 0xA (LF) and 0xD (CR) to the client terminal. A carriage return (\r) character in the message sends the ASCII/UTF-8 character 0xD (CR) to the client terminal.

#### **name**

Displays the configured system name before the pre-login message. To remove the system name from the pre-login message, remove the current message and configure a new message without using the **name** parameter.

### Platforms

All

## 20.284 pre-shared-key

### pre-shared-key

#### Syntax

**pre-shared-key** *pre-shared-key-index* [**encryption-type** *encryption-type*] [**create**]

**no pre-shared-key** *pre-shared-key-index*

#### Context

[\[Tree\]](#) (config>macsec>conn-assoc>static-cak pre-shared-key)

#### Full Context

configure macsec connectivity-association static-cak pre-shared-key

#### Description

This command specifies the pre-shared key used to enable MACsec using static connectivity association key (CAK) security mode. This command also specifies the encryption algorithm used for encrypting the SAK.

A pre-shared key includes a connectivity association key name (CKN) and a connectivity association key (CAK). The pre-shared key-the CKN and CAK-must match on both ends of a link.

A pre-shared key is configured on both devices at each end of point-to-point link to enable MACsec using static CAK security mode. The MACsec Key Agreement (MKA) protocol is enabled after the successful MKA liveness negotiation.

The encryption-type is used for encrypting the SAK and authenticating the MKA packet. The symmetric encryption key SAK (Security Association Key) needs to be encrypted (wrapped) via the MKA protocols. The AES key is derived via pre-shared-key.

The **no** form of this command removes the index.

#### Parameters

##### ***pre-shared-key-index***

Specifies the index of this pre-shared-key.

**Values** 1, 2

##### ***encryption-type***

Specifies the type of encryption.

**Values** **aes-128-cmac**, **aes-256-cmac**

##### **create**

Mandatory to create an entry.

#### Platforms

All

## pre-shared-key

### Syntax

**pre-shared-key** *key* [**hash** | **hash2** | **custom**]

**no pre-shared-key**

### Context

[\[Tree\]](#) (config>ipsec>client-db>client>credential pre-shared-key)

### Full Context

configure ipsec client-db client credential pre-shared-key

### Description

This command specifies a pre-shared key used to authenticate peers.

The **no** form of this command reverts to the default.

### Default

no pre-shared-key

### Parameters

#### *key*

An ASCII string to use as the pre-shared key for dynamic keying. When the **hash** or **hash2** parameters are not used, the key is a clear text key; otherwise, the key text is encrypted.

#### **hash**

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

#### **hash2**

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

#### **custom**

Specifies the custom encryption to management interface.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure service vprn interface ipsec ipsec-tunnel dynamic-keying pre-shared-key

configure router interface ipsec ipsec-tunnel dynamic-keying pre-shared-key

configure service vprn interface sap ipsec-gw pre-shared-key

configure service ies interface ipsec ipsec-tunnel dynamic-keying pre-shared-key

### Description

This command configures the pre-shared key for authentication.

The **no** form of this command reverts to the default.

### Default

no pre-shared-key

### Parameters

#### *key*

Specifies an ASCII string to use as the pre-shared key for dynamic keying. When the **hash** or **hash2** parameters are not used, the key is a clear text key; otherwise, the key text is encrypted.

#### **hash**

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**hash2**

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**custom**

Specifies the custom encryption to management interface.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn interface sap ipsec-tunnel dynamic-keying pre-shared-key
- configure service vprn interface sap ipsec-gw pre-shared-key
- configure ipsec ipsec-transport-mode-profile dynamic-keying pre-shared-key
- configure service ies interface sap ipsec-gw pre-shared-key

VSR

- configure router interface ipsec ipsec-tunnel dynamic-keying pre-shared-key
- configure service vprn interface ipsec ipsec-tunnel dynamic-keying pre-shared-key
- configure service ies interface ipsec ipsec-tunnel dynamic-keying pre-shared-key

## 20.285 pre-update-time

### pre-update-time

**Syntax**

**pre-update-time** [*days days*] [*hrs hours*] [*min minutes*] [*sec seconds*]

**Context**

**[Tree]** (config>system>security>pki>ca-prof>auto-crl-update pre-update-time)

**Full Context**

configure system security pki ca-profile auto-crl-update pre-update-time

**Description**

This command specifies the pre-download time for next-update-based update.

**Default**

pre-update-time hrs 1

## Parameters

### *days*

Specifies the time period, in days, prior to the next update time of the current CRL.

**Values** 0 to 366

### *hours*

Specifies the time period, in hours, prior to the next update time of the current CRL.

**Values** 0 to 23

### *minutes*

Specifies the time period, in minutes, prior to the next update time of the current CRL.

**Values** 0 to 59

### *seconds*

Specifies the time period, in seconds, prior to the next update time of the current CRL.

**Values** 0 to 59

## 20.286 prec

```
prec
```

### Syntax

```
prec ip-prec-value [fc fc-name] [priority {high | low}]
no prec ip-prec-value
```

### Context

[\[Tree\]](#) (config>qos>sap-ingress prec)

### Full Context

```
configure qos sap-ingress prec
```

### Description

This command explicitly sets the forwarding class or enqueueing priority when a packet is marked with an IP precedence value ( *ip-prec-value* ). Adding an IP precedence rule on the policy forces packets that match the specified *ip-prec-value* to override the forwarding class and enqueueing priority based on the parameters included in the IP precedence rule.

When the forwarding class is not specified in the rule, a matching packet preserves (or inherits) the existing forwarding class derived from earlier matches in the classification hierarchy.

When the enqueueing priority is not specified in the rule, a matching packet preserves (or inherits) the existing enqueueing priority derived from earlier matches in the classification hierarchy.

The *ip-prec-value* is derived from the most significant three bits in the IP header ToS byte field (precedence bits). The three precedence bits define eight Class-of-Service (CoS) values commonly used to map packets to per-hop Quality of Service (QoS) behavior. The precedence bits are also part of the DiffServ Code Point (DSCP) method of mapping packets to QoS behavior. The DSCP uses the most significant six bits in the IP header ToS byte and so overlaps with the precedence bits. Both IP precedence and DSCP classification rules are supported. DSCP rules have a higher match priority than IP precedence rules and where a *dscp-name* DSCP value overlaps an *ip-prec-value*, the DSCP rule takes precedence.

The **no** form of this command removes the explicit IP precedence classification rule from the SAP ingress policy. Removing the rule on the policy immediately removes the rule on all ingress SAPs using the policy.

## Parameters

### *ip-prec-value*

The *ip-prec-value* is a required parameter that specifies the unique IP header ToS byte precedence bits value that will match the IP precedence rule. If the command is executed more than once with the same *ip-prec-value*, the previous forwarding class and enqueueing priority is completely overridden by the new parameters or defined to be inherited when a forwarding class or enqueueing priority parameter is missing.

A maximum of eight IP precedence rules are allowed on a single policy.

The precedence is evaluated from the lowest to highest value.

**Values** 0 to 7

### **fc** *fc-name*

The value given for the *fc-name* parameter must be one of the predefined forwarding classes in the system. Specifying the *fc-name* is optional. When a packet matches the rule, the forwarding class is only overridden when the **fc** *fc-name* parameter is defined on the rule. If the packet matches and the forwarding class is not explicitly defined in the rule, the forwarding class is inherited based on previous rule matches.

The *subclass-name* parameter is optional and used with the *fc-name* parameter to define a pre-existing subclass. The *fc-name* and *subclass-name* parameters must be separated by a period (.). If *subclass-name* does not exist in the context of *fc-name*, an error will occur. If *subclass-name* is removed using the **no fc** *fc-name.subclass-name* **force** command, the **default-fc** command will automatically drop the *subclass-name* and only use *fc-name* (the parent forwarding class for the subclass) as the forwarding class.

#### **Values**

fc: *class[.subclass]*

*class*: be, l2, af, l1, h2, ef, h1, nc

*subclass*: 29 characters max

**Default** Inherit (When **fc** is not defined, the rule preserves the previous forwarding class of the packet.)

## priority

The priority parameter overrides the default enqueueing priority for all packets received on an ingress SAP using this policy that match this rule. Specifying the priority is optional. When a packet matches the rule, the enqueueing priority is only overridden when the priority parameter is defined on the rule. If the packet matches and priority is not explicitly defined in the rule, the enqueueing priority is inherited based on previous rule matches.

**Values** high, low

**Default** Inherits the priority defined by the default-priority statement.

## high

This parameter is used in conjunction with the **priority** parameter. Setting the enqueueing parameter to **high** for a packet increases the likelihood of enqueueing the packet when the ingress queue is congested. Ingress enqueueing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueueing priority is lost.

## low

This parameter is used in conjunction with the **priority** parameter. Setting the enqueueing parameter to **low** for a packet decreases the likelihood of enqueueing the packet when the ingress queue is congested. Ingress enqueueing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueueing priority is lost.

prec {ip-prec-value | in-profile ip-prec-value out-profile ip-prec-value [exceed-profile ip-prec-value]}
no prec
```

## Context

[\[Tree\]](#) (config>qos>sap-egress>fc prec)

## Full Context

```
configure qos sap-egress fc prec
```

## Description

This command defines a value to be used for remarking packets for the specified FC. If the optional in/out/exceed-profile is specified, the command will remark different IP precedence values depending on whether the packet was classified to be in, exceed, or out-of-profile. All in-profile traffic is marked with the same value as in-profile traffic.

## Parameters

### *ip-prec-value*

This parameter specifies the IP precedence to be used to remark all traffic.

**Values** 0 to 7

### *exceed-profile ip-prec-value*

This optional parameter specifies the IP precedence to be used to remark traffic that is exceed-profile. If not specified, this defaults to the same value configured for the **out-profile** parameter.

**Values** 0 to 7

### *in-profile ip-prec-value*

This parameter specifies the IP precedence to be used to remark traffic that is in-profile.

**Values** 0 to 7

### *out-profile ip-prec-value*

This parameter specifies the IP precedence to be used to remark traffic that is out-of-profile.

**Values** 0 to 7

## Platforms

prec

## Syntax

```
prec ip-prec-value [fc fc-name] [profile {in | out | exceed | inplus}]
```

```
no prec ip-prec-value
```

## Context

[\[Tree\]](#) (config>qos>sap-egress prec)

## Full Context

```
configure qos sap-egress prec
```

## Description

This command defines a specific IP precedence value that must be matched to perform the associated reclassification actions. If an egress packet on the SAP matches the specified IP precedence value, the forwarding class, or profile behavior may be overridden. By default, the forwarding class and profile of the packet is derived from ingress classification and profiling functions.

The IP precedence bits used to match against precedence reclassification rules come from the Type of Service (ToS) field within the IPv4 header. If the packet does not have an IPv4 header, precedence-based matching is not performed.

The reclassification actions from a precedence reclassification rule may be overridden by a DSCP or IP flow matching event.

The **fc** keyword is optional. When specified, the egress classification rule will overwrite the forwarding class derived from ingress. The new forwarding class is used for egress remarking and queue mapping decisions. If a DSCP, ipv6-criteria, or ip-criteria match occurs after the IP precedence match, the new forwarding class may be overridden by the higher priority match actions. If the higher priority match actions do not specify a new fc, the fc from the IP precedence match will be used.

The **profile** keyword is optional. When specified, the egress classification rule will overwrite the profile of the packet derived from ingress. The new profile value is used for egress remarking and queue congestion behavior. If a DSCP, IPv6 criteria, or IP criteria match occurs after the IP precedence match, the new profile may be overridden by the higher priority match actions. If the higher priority match actions do not specify a new profile, the profile from the IP precedence match will be used.

The **no** form of this command removes the reclassification rule from the SAP egress QoS policy.

## Parameters

### **fc** *fc-name*

This keyword is optional. When specified, packets matching the IP precedence value will be explicitly reclassified to the forwarding class specified as *fc-name* regardless of the ingress classification decision. The explicit forwarding class reclassification may be overwritten by a higher priority DSCP, IPv6 criteria, or IP criteria reclassification match. The FC name defined must be one of the eight forwarding classes supported by the system. To remove the forwarding class reclassification action for the specified precedence value, the **prec** command must be re-executed without the **fc** parameter defined.

**Values** be, l1, af, l2, h1, ef, h2 or nc

### **profile** {in | out | exceed | inplus}

This keyword is optional. When specified, packets matching the IP precedence value will be explicitly reclassified to the specified profile regardless of the ingress profiling decision. The explicit profile reclassification may be overwritten by a higher priority DSCP, IPv6 criteria, or IP criteria reclassification match. To remove the profile reclassification action for the specified precedence value, the **prec** command must be re-executed without the **profile** parameter defined.

#### **in**

Specifies that any packets matching the reclassification rule will be treated as in-profile by the egress forwarding plane.

#### **out**

Specifies that any packets matching the reclassification rule will be treated as out-of-profile by the egress forwarding plane.

#### **exceed**

Specifies that any packets matching the reclassification rule will be treated as exceed-profile by the egress forwarding plane.

#### **inplus**

Specifies that any packets matching the reclassification rule will be treated as inplus-profile by the egress forwarding plane.

## Platforms

All

## prec

## Syntax

**prec** *ip-prec-value* **fc** *fc-name* **profile** {**in** | **out** | **exceed** | **inplus**}

**no prec** *ip-prec-value*

## Context

[\[Tree\]](#) (config>qos>network>egress prec)

## Full Context

configure qos network egress prec

## Description

This command defines a specific IP precedence value that must be matched in order to perform the associated reclassification actions. If an egress packet on an IES/VP RN interface spoke SDP, on a CSC network interface in a VPRN, or network interface that the network QoS policy is applied to, matches the specified IP precedence value, the forwarding class and profile may be overridden.

By default, the forwarding class and profile of the packet is derived from ingress classification and profiling functions.

The IP precedence bits used to match against the reclassification rules come from the Type of Service (ToS) field within the IPv4 header or the Traffic Class field from the IPv6 header. If the packet does not have an IP header, IP precedence-based matching is not performed.

The configuration of egress prec classification and the configuration of an egress IP criteria or IPv6 criteria entry statement within a network QoS policy are mutually exclusive.

The IP precedence-based and DSCP-based reclassification are supported on a network interface, on a CSC network interface in a VPRN, and on a PW used in an IES or VPRN spoke interface.

This command will block the application of a network QoS policy with the egress reclassification commands to a spoke SDP part of a Layer 2 service. Conversely, this command will not allow the user to add the egress reclassification commands to a network QoS policy if it is being used by a Layer 2 spoke SDP.

The egress reclassification commands will only take effect if the redirection of the spoke SDP or CSC interface to use an egress port queue-group succeeds. For example, the following commands will succeed:

```
-
 config>service>vprn>if>
 spoke-sdp>egress>qos network-policy-id port-redirect-
 group
 queue-group-name instance instance-id
 - config>service>ies>if>spoke-
 sdp>
 egress>qos network-policy-id port-redirect-group queue-group-
 name
 instance instance-id
```

```
- config>service>vprn>nw-if> qos network-policy-id port-redirect-
group
queue-group-name instance instance-id
```

When the redirection command fails in CLI, the PW will use the network QoS policy assigned to the network IP interface; however, any reclassification in the network QoS policy applied to the network interface will be ignored.

The **no** form of this command removes the egress reclassification rule.

## Parameters

### ***ip-prec-value***

0 to 7

### ***fc fc-name***

be, l2, af, l1, h2, ef, h1, nc

### ***profile {in | out | exceed | inplus}***

The profile reclassification action is mandatory. When specified, packets matching the IP precedence value will be explicitly reclassified to the profile specified regardless of the ingress profiling decision. To remove the profile reclassification action for the specified IP precedence value, the **no prec** command must be executed.

This value may be overwritten by an explicit profile action in an DSCP reclassification match.

**in** - Specifies that any packets matching the reclassification rule will be treated as in-profile by the egress forwarding plane.

**out** - Specifies that any packets matching the reclassification rule will be treated as out-of-profile by the egress forwarding plane.

**exceed** - Specifies that any packets matching the reclassification rule will be treated as exceed-profile by the egress forwarding plane.

**inplus** - Specifies that any packets matching the reclassification rule will be treated as inplus-profile by the egress forwarding plane.

## Description

This command configures the precedence of this SDP bind when there are multiple SDP binds attached to one service endpoint. When an SDP bind goes down, the next highest precedence SDP bind begins forwarding traffic.

## Parameters

### *precedence-value*

Specifies the precedence of this SDP bind

**Values** 1 to 4

### *primary*

Assigns this as the primary spoke-SDP

## Platforms

All

## precedence

### Syntax

**precedence** {*precedence-value* | **primary**}

**no precedence**

### Context

**[Tree]** (config>mirror>mirror-dest>spoke-sdp precedence)

### Full Context

configure mirror mirror-dest spoke-sdp precedence

### Description

This command indicates that the SDP is of type secondary with a specific precedence value or of type primary.

The mirror or LI service always uses the primary type as the active pseudowire and only switches to a secondary pseudowire when the primary is down. The mirror service switches the path back to the primary pseudowire when it is back up. The user can configure a timer to delay reverting back to primary or to never revert back.

If the active pseudowire goes down, the mirror service switches the path to a secondary sdp with the lowest precedence value. That is, secondary SDPs which are operationally up are considered in the order of their precedence value, 1 being the lowest value and 4 being the highest value. If the precedence value is the same, then the SDP with the lowest SDP ID is selected.

An explicitly named endpoint can have a maximum of one SAP and one ICB. Once a SAP is added to the endpoint, only one more object of type ICB SDP is allowed. An explicitly named endpoint, which does not have a SAP object, can have a maximum of four SDPs, which can include any of the following: a single primary SDP, one or many secondary SDPs with precedence, and a single ICB SDP.

An SDP is created with type secondary and with the lowest precedence value of 4.

### Parameters

#### *precedence-value*

Specifies the precedence of the SDP.

**Values** 1 to 4

#### **primary**

Specified that a special value of the precedence which assigns the SDP the lowest precedence and enables the revertive behavior.

```

### Context

```
[Tree] (config>service>ies>if>ipv6>vrrp preempt)
```

### Full Context

```
configure service ies interface ipv6 vrrp preempt
```

### Description

The preempt mode value controls whether a specific backup virtual router preempts a lower priority master.

When preempt is enabled, the virtual router instance overrides any non-owner master with an "in use" message priority value less than the virtual router instance in-use priority value. If preempt is disabled, the virtual router only becomes master if the master down timer expires before a VRRP advertisement message is received from another virtual router.

The IP address owner will always become master when available. Preempt mode cannot be disabled on the owner virtual router.

The **no** form of this command disables preempt mode.

## Default

preempt

## Platforms

All

## preempt

## Syntax

[no] preempt

## Context

[\[Tree\]](#) (config>service>ies>if>vrrp preempt)

## Full Context

configure service ies interface vrrp preempt

## Description

The preempt command provides the ability of overriding an existing non-owner master to the virtual router instance. Enabling preempt mode is almost required for proper operation of the base-priority and vrrp-policy-id definitions on the virtual router instance. If the virtual router cannot preempt an existing non-owner master, the effect of the dynamic changing of the in-use priority is greatly diminished.

The preempt command is only available in the non-owner vrrp virtual-router-id nodal context. The owner may not be preempted due to the fact that the priority of non-owners can never be higher than the owner. The owner will always preempt all other virtual routers when it is available.

Non-owner virtual router instances will only preempt when preempt is set and the current master has an in-use message priority value less than the virtual router instances in-use priority.

A master non-owner virtual router will only allow itself to be preempted when the incoming VRRP Advertisement message Priority field value is one of the following:

- Greater than the virtual router in-use priority value
- Equal to the in-use priority value and the source IP address (primary IP address) is greater than the virtual router instance primary IP address

The **no** form of this command prevents a non-owner virtual router instance from preempting another, less desirable virtual router. Use the preempt command to restore the default mode.

**Default**

preempt

**Platforms**

## 20.289 preemption-timer

preemption-timer

## Syntax

**preemption-timer** *seconds*

**no preemption-timer**

## Context

[\[Tree\]](#) (config>router>rsvp preemption-timer)

## Full Context

configure router rsvp preemption-timer

## Description

This parameter configures the time in seconds a node holds to a reservation for which it triggered the soft preemption procedure.

The preempting node starts a separate preemption timer for each preempted LSP path. While this timer is on, the node should continue to refresh the Path and Resv for the preempted LSP paths. When the preemption timer expires, the node tears down the reservation if the head-end node has not already done so.

A value of zero means the LSP should be preempted immediately; hard preempted.

The **no** form of this command reverts to the default value.

### Default

preemption-timer 300

### Parameters

#### *seconds*

Specifies the time (in s), of the preemption timer.

**Values** 0 to 1800 seconds

### prefer-local-time

#### Syntax

[no] prefer-local-time

#### Context

[\[Tree\]](#) (config>system>time prefer-local-time)

#### Full Context

configure system time prefer-local-time

#### Description

This command sets the preference to use local or UTC time in the system. This preference is applied to objects such as log file names, created and completed times reported in log files, NETCONF and gRPC date-and-time leafs, and rollback times displayed in **show** routines.

**Note:**

The operator may force the timezone used for **show** outputs during a CLI session using an environment variable in the **environment>time-display {utc | local}** command.

**Note:**

The preference for CLI output is set with the **environment time-display** command.

**Note:**

The format used for the date-time strings may change when the **prefer-local-time** option is enabled. For example, when enabled, all date-time strings include a suffix of three to five characters that indicates the timezone used for the presentation. This suffix may not be present if the option is not enabled.

**Note:**

The time format for timestamps on log events is controlled on a per-log basis using the **config>log>log-id>time-format {utc | local}** CLI command and not via **prefer-local-time**.

The **no** form of this command indicates preference for UTC time.

#### Default

no prefer-local-time

## Full Context

```
configure router ldp prefer-tunnel-in-tunnel
```

## Description

This command specifies to use tunnel-in-tunnel over a simple LDP tunnel. Specifically, the user packets for LDP FECs learned over this targeted LDP session can be sent inside an RSVP LSP which terminates on the same egress router as the destination of the targeted LDP session. The user can specify an explicit list of RSVP LSP tunnels under the Targeted LDP session or LDP will perform a lookup in the Tunnel Table Manager (TTM) for the best RSVP LSP. In the former case, only the specified LSPs will be considered to tunnel LDP user packets. In the latter case, all LSPs available to the TTM and which terminate on the same egress router as this targeted LDP session will be considered. In both cases, the metric specified under the LSP configuration is used to control this selection.

The lookup in the TTM will prefer a LDP tunnel over an LDP-over-RSVP tunnel if both are available. Also, the tunneling operates on the dataplane only. Control packets of this targeted LDP session are sent over the IGP path.

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>channel>source-override preference)

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>channel preference)

## Full Context

configure mcast-management multicast-info-policy bundle preference

configure mcast-management multicast-info-policy bundle channel source-override preference

configure mcast-management multicast-info-policy bundle channel preference

## Description

This command sets the relative preference level for multicast channels. The preference of a channel specifies its relative importance over other multicast channels. Eight levels of preference are supported; 0 through 7. Preference value 7 indicates the highest preference level.

When the multicast ingress path manager is congested on one or more of the switch fabric multicast paths, it uses the preference values associated with each multicast record to determine which records are allowed on the path and which records be placed in a black-hole state.

The preference value is also compared to the bundles **cong-priority-threshold** setting to determine the congestion priority of the channel. The result also dictates the channels multicast CAC class level (high or low). When the channels preference value is less than the congestion priority threshold, it is considered to have a congestion priority and CAC class value equal to low. When the channels preference value is equal to or greater than the threshold, it is considered to have a congestion priority and a CAC class value equal to high.

The preference value is also compared to the bundles **ecmp-opt-threshold** setting to determine whether the channel is eligible for ECMP path dynamic optimization. If the preference value is equal to or less than the threshold, the channel may be optimized. If the preference value is greater than the threshold, the channel will not be dynamically optimized.

The preference command may be executed in three contexts; bundle, channel and source-override. The bundle default preference value is 0. The channel and **source-override** preference settings are considered overrides to the bundle setting and have a default value of null (undefined).

The **no** form of this command restores the default preference value (0 or null depending on the context).

## Parameters

### *preference-level*

The preference-level parameter is required and defines the preference value of the channel.

**Values** 1 to 7

Bundle default: 0

Channel default: Null (undefined)

Source-override default: Null (undefined)

Override sequence — The channel setting overrides the bundle setting. The **source-override** setting overrides the channel and bundle settings.

## Platforms

configure aaa diameter node peer route preference

## Description

This command configures the preference of the static route. The lower value is preferred during route selection.

The **no** form of this command reverts to the default.

## Default

preference 50

## Parameters

### *preference*

Specifies the static route preference.

**Values** 1 to 100

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## preference

## Syntax

**preference** *preference*

**no preference**

## Context

[\[Tree\]](#) (config>subscr-mgmt>sub-prof preference)

## Full Context

configure subscriber-mgmt sub-profile preference

## Description

This command sets the relative preference value for a subscriber profile. When multiple subscriber hosts/sessions of the same subscriber point to a different subscriber profile, the profile with the highest preference value is used. With equal preference, the subscriber profile of the last instantiated subscriber host/session is used.

### **Note:**

Nokia recommends not to configure a subscriber profile preference value unless explicitly required for the targeted design.

The **no** form of this command reverts to the default value.

## Default

preference 5

## Parameters

### *preference*

Specifies the preference value. A lower number means a lower preference.

**Values** 1 to 10

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**no preference**

### Context

**[Tree]** (config>service>vprn>isis>level preference)

### Full Context

configure service vprn isis level preference

### Description

This command configures the preference level of either IS-IS Level 1 or IS-IS Level 2 internal routes. By default, the preferences are listed in the table below.

A route can be learned by the router by different protocols, in which case, the costs are not comparable. When this occurs, the preference is used to decide to which route will be used.

Different protocols should not be configured with the same preference, if this occurs the tiebreaker is per the default preference table as defined in the table below. If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used. If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision what route to use is determined by the configuration of the **ecmp** in the config>router context.

### Default

Default preferences are listed in [Table 104: Default Preferences](#).

Table 104: Default Preferences

| Route Type             | Preference | Configurable     |
|------------------------|------------|------------------|
| Direct attached        | 0          | No               |
| Static route           | 5          | Yes              |
| MPLS                   | 7          | —                |
| OSPF internal routes   | 10         | No               |
| IS-IS level 1 internal | 15         | Yes              |
| IS-IS level 2 internal | 18         | Yes              |
| OSPF external          | 150        | Yes              |
| IS-IS level 1 external | 160        | Yes <sup>5</sup> |

<sup>5</sup> External preferences are changed using the **external-preference** command in the **config>router>isis>level *level-number*** context.

| Route Type             | Preference | Configurable     |
|------------------------|------------|------------------|
| IS-IS level 2 external | 165        | Yes <sup>5</sup> |
| BGP                    | 170        | Yes              |

## Parameters

### *preference*

The preference for external routes at this level expressed as a decimal integer.

**Values** 1 to 255

## Platforms

All

## preference

## Syntax

**preference** *preference*

**no preference**

## Context

**[Tree]** (config>service>vprn>ospf3 preference)

**[Tree]** (config>service>vprn>ospf preference)

## Full Context

configure service vprn ospf3 preference

configure service vprn ospf preference

## Description

This command configures the preference for OSPF internal routes.

A route can be learned by the router from different protocols in which case the costs are not comparable, when this occurs the preference is used to decide to which route will be used.

Different protocols should not be configured with the same preference. If the same preference is configured, the tiebreaker is per the default preference table as defined in [Table 105: Default Route Preferences](#) . If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used.

If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision of what route to use is determined by the configuration of the **ecmp** in the **config>router** context.

The **no** form of this command reverts to the default value.

Table 105: Default Route Preferences

| Route Type             | Preference | Configurable     |
|------------------------|------------|------------------|
| Direct attached        | 0          | No               |
| Static routes          | 5          | Yes              |
| OSPF internal          | 10         | Yes <sup>6</sup> |
| IS-IS level 1 internal | 15         | Yes              |
| IS-IS level 2 internal | 18         | Yes              |
| RIP                    | 100        | Yes              |
| OSPF external          | 150        | Yes              |
| IS-IS level 1 external | 160        | Yes              |
| IS-IS level 2 external | 165        | Yes              |

**Default**

preference 10 — OSPF internal routes have a preference of 10.

**Parameters*****preference***

The preference for internal routes expressed as a decimal integer. Defaults for different route types are listed in the following table.

[\[Tree\]](#) (config>router>ospf preference)

## Full Context

```
configure router ospf3 preference
```

```
configure router ospf preference
```

## Description

This command configures the preference for OSPF internal routes.

A route can be learned by the router from different protocols, in which case, the costs are not comparable. When this occurs, the preference is used to decide which route will be used.

Different protocols should not be configured with the same preference, if this occurs the tiebreaker is per the default preference table as defined in [Table 108: Route Preference Defaults by Route Type](#) . If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used.

If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision of what route to use is determined by the configuration of the **ecmp** in the **config>router** context.

The **no** form of this command reverts to the default value.

## Default

```
preference 10
```

## Parameters

### *preference*

Specifies the preference for internal routes expressed as a decimal integer. Defaults for different route types are listed in [Table 108: Route Preference Defaults by Route Type](#) .

*Table 108: Route Preference Defaults by Route Type*

| Route Type             | Preference | Configurable     |
|------------------------|------------|------------------|
| Direct attached        | 0          | No               |
| Static routes          | 5          | Yes              |
| OSPF internal          | 10         | Yes <sup>8</sup> |
| IS-IS level 1 internal | 15         | Yes              |
| IS-IS level 2 internal | 18         | Yes              |
| RIP                    | 100        | Yes              |
| OSPF external          | 150        | Yes              |

<sup>8</sup> Preference for OSPF internal routes is configured with the **preference** command.

| Route Type             | Preference | Configurable |
|------------------------|------------|--------------|
| IS-IS level 1 external | 160        | Yes          |
| IS-IS level 2 external | 165        | Yes          |
| BGP                    | 170        | Yes          |

[\[Tree\]](#) (config>router>isis>lfa>mhp preference)

## Full Context

configure router ospf loopfree-alternates multi-homed-prefix preference

configure router isis loopfree-alternates multi-homed-prefix preference

## Description

This command configures the preference for the multihomed prefix LFA backup path. This knob can be enabled at a LFA computing node to force the programming of the multihomed prefix LFA backup path which, in some topologies, can avoid transiting using the best ABR or ASBR.

The **no** form of this command reverts to the default value.

## Default

preference none

## Parameters

**none**

Specifies the preference for an LFA, TI-LFA, or RLFA backup path over the multihomed prefix LFA backup path. The multihomed prefix LFA is only programmed in cases where the prefix is not protected by LFA, RLFA, or TI-LFA.

**all**

Specifies the forced programming of the multihomed prefix LFA backup path regardless of the outcome of the LFA, TI-LFA, or RLFA backup path computation.

All

preference

**Syntax**

**preference** *preference*

**Context**

[\[Tree\]](#) (conf>router>segment-routing>sr-policies>policy preference)

**Full Context**

configure router segment-routing sr-policies static-policy preference

## Description

This command associates a preference value with a statically defined-segment routing policy. This is an optional parameter.

When there are multiple policies for the same (color, endpoint) combination that are targeted for local installation, only one is selected as the active path for the (color, endpoint). In this selection process (which considers both static local policies and BGP signaled policies), the policy with the highest preference value is preferred over all policies with a lower preference value.

The **no** form of this command reverts to the default value.

## Default

preference 100

## Parameters

### *preference*

Specifies the preference ID.

**Values** 0 to 4294967295

## Platforms

All

## preference

## Syntax

**preference** *preference*

**no preference**

## Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>name>default-action preference)

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>action preference)

## Full Context

configure router policy-options policy-statement name default-action preference

configure router policy-options policy-statement entry action preference

## Description

This command assigns a route preference to routes matching the route policy statement entry.

If no preference is specified, the default Route Table Manager (RTM) preference for the protocol is used.

The **no** form of this command disables setting an RTM preference in the route policy entry.

**Note:**

This command is supported with the following protocols: RIP import, BGP import, VPRN VRF import ( **vrf-import**), and VPRN GRT lookup export (**export-grt**).

**Default**

no preference

**Parameters*****preference***

Specifies the route preference expressed as a decimal integer.

**Values** 1 to 255 (0 represents unset - MIB only)

*name* — The preference parameter variable name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@".

## 20.297 preferred

```
preferred
```

### Syntax

```
[no] preferred
```

### Context

[\[Tree\]](#) (config>isa>nat-group>inter-chassis-redundancy preferred)

### Full Context

```
configure isa nat-group inter-chassis-redundancy preferred
```

### Description

This command sets the preference for activity of a **nat-group** in stateful inter-chassis redundancy configuration if both nodes have equal health. An example of where this can be useful is in a load balancing environment where the activity of NAT groups can be distributed between the two redundant nodes.

A **nat-group** with **preferred** command configured on a node that freshly became part of multi-chassis redundancy, takes over activity from an existing and traffic-serving node with equal health that does not have the **preferred** command configured. This causes a switchover and a brief interruption in traffic flow.

By default the preferred status is not set for the node.

The **no** form of this command reverts to the default.

### Default

```
no preferred
```

## Full Context

```
configure service vprn dhcp6 local-dhcp-server pool prefix
configure router dhcp6 local-dhcp-server pool prefix
```

## Description

This command allocates a prefix to a pool from which Prefix Delegation prefixes and or WAN addresses can be assigned for DHCP6.

The **no** form of this command removes the prefix parameters from the configuration.

## Default

```
prefix failover local
```

## Parameters

### *prefix ipv6-addr/prefix-length*

Specifies the prefix.

| Values | ipv6-address  | x:x:x:x:x:x:x (eight 16-bit pieces) |
|--------|---------------|-------------------------------------|
|        |               | x:x:x:x:x:d.d.d.d                   |
|        |               | x [0 to FFFF]H                      |
|        |               | d [0 to 255]D                       |
|        | prefix-length | 1 to 128                            |

### **failover {local | remote | access-driven}**

This command designates a prefix as local, remote, or access-driven. This is used when multi-chassis synchronization is enabled.

**Values** **local** — An IPv6 prefix designated as local is used for new lease grants or to renew the existing lease grants. Local prefix designation should be always paired with the remote designation of the same prefix on the peering node.

The IPv6 prefix configured as local on one node can only be configured as remote on the other node. No other combination is allowed between the two nodes for an IPv6 prefix that is configured as local.

The DHCPv6 relay could point to both IPv6 DHCP server addresses — the one hosting the local IPv6 prefix and the one hosting the corresponding remote IPv6 prefix. Under normal circumstances the new lease will always be allocated from the local IPv6 prefix while the leases can be renewed from either IPv6 prefix (local or remote). Under network failure, the remote IPv6 prefix can be taken over according to the intercommunication link state transitions and associated timers.

**remote** — A prefix designated as remote is used only to renew the existing DHCP leases. The new leases are assigned from it only after the **maximum-client-lead-time** and **partner-down-delay time** elapses.

To ensure faster takeover, the partner-down-delay can be set to 0 and the MCLT time can be ignored. Extra caution should be exercised when enabling this mode of operation, as described in the configuration guides.

The IPv6 prefix configured as remote on one node can only be configured as local on the other node. No other combination is allowed between the two nodes for an IP address ranges that is configured as remote.

**access-driven** — A prefix designated as access-driven is like local (a new prefix assignment as well as a renewal). However, as the prefix is shared between the redundant server pair, the following additional conditions should be met to avoid duplicate address allocations:

- A dual home access protection mechanism such as SRRP or MC-LAG must ensure a single active path from the DHCP client to the server.
- The DHCP relay should point to the local server only.

### ***pd***

Specifies that this aggregate is used by IPv6 ESM hosts for DHCPv6 prefix-delegation.

### **wan-host**

Specifies that this aggregate is used by IPv6 ESM hosts for local addressing or by a routing gateway's WAN interface.

### **create**

Keyword used to create the prefix configuration. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## **Platforms**

### **Full Context**

configure service ies interface ipv6 dhcp6-server prefix-delegation prefix

### **Description**

This command specifies the IPv6 prefix that is delegated by this system.

The **no** form of this command reverts to the default.

## Parameters

### *ipv6-address/prefix-length*

Specifies the IPv6 address on the interface

| Values | ipv6-address/<br>prefix: | ipv6-address | x:x:x:x:x:x:x (eight 16-bit pieces) |
|--------|--------------------------|--------------|-------------------------------------|
|        |                          |              | x:x:x:x:x:d.d.d.d                   |
|        |                          |              | x [0 to FFFF]H                      |
|        |                          |              | d [0 to 255]D                       |
|        | prefix-length            |              | 1 to 128                            |

## Platforms

All

## prefix

## Syntax

**prefix** *ipv6-address/prefix-length* [**pd**] [**wan-host**]

**no prefix** *ipv6-address/prefix-length*

## Context

[\[Tree\]](#) (config>service>ies>sub-if>ipv6>sub-pfx prefix)

[\[Tree\]](#) (config>service>vprn>sub-if>ipv6>sub-pfx prefix)

## Full Context

configure service ies subscriber-interface ipv6 subscriber-prefixes prefix

configure service vprn subscriber-interface ipv6 subscriber-prefixes prefix

## Description

This command allows a list of prefixes (using the prefix command multiple times) to be routed to hosts associated with this subscriber interface. Each prefix is represented in the associated FDB with a reference to the subscriber interface. Prefixes are defined as being for prefix delegation (pd) or use on a WAN interface or host (wan-host).

The **no** form of this command reverts to the default.

## Parameters

### *ipv6-address*

Specifies the 128-bit IPv6 address.

|               |                                                     |
|---------------|-----------------------------------------------------|
| <b>Values</b> | 128-bit hexadecimal IPv6 address in compressed form |
|---------------|-----------------------------------------------------|

***prefix-length***

Specifies the length of any associated aggregate prefix.

**Values** 32 to 63

**pd**

Specifies that this aggregate is used by IPv6 ESM hosts for DHCPv6 prefix-delegation.

**wan-host**

Specifies that this aggregate is used by IPv6 ESM hosts for local addressing or by a routing gateway's WAN interface.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**prefix****Syntax**

**prefix** *low-order-vsi-id*

**no prefix**

**Context**

[\[Tree\]](#) (config>service>vpls>bgp-ad>vsi-id prefix)

**Full Context**

configure service vpls bgp-ad vsi-id prefix

**Description**

This command specifies the low-order 4 bytes used to compose the Virtual Switch Instance Identifier (VSI-ID) to use for NLRI in BGP auto-discovery in this VPLS service.

If no value is set, the system IP address will be used.

**Default**

no prefix

**Parameters*****low-order-vsi-id***

Specifies a unique VSI ID

**Values** 0— 4294967295

**Platforms**

All

## prefix

### Syntax

**[no] prefix** *ip-prefix/prefix-length*

### Context

**[Tree]** (config>service>vprn>bgp>group>dynamic-neighbor>match prefix)

### Full Context

configure service vprn bgp group dynamic-neighbor match prefix

### Description

This command configures a prefix to accept dynamic BGP sessions (sessions from source IP addresses not matching any configured neighbor addresses). A dynamic session is associated with the group having the longest match prefix entry for the source IP address of the peer. The group association determines local parameters that apply to the session, including the local AS, the local IP address, the MP-BGP families, the import and export policies, and so on.

The **no** form of this command removes a prefix entry.

### Parameters

#### *ip-prefix/prefix-length*

Specifies a prefix from which to accept dynamic BGP sessions.

**Values** *ipv4-prefix* — a.b.c.d (host bits must be 0)  
*ipv4-prefix-length* — 0 to 32  
*ipv6-prefix* — x:x:x:x:x:x:x (eight 16-bit pieces)  
 x:x:x:x:x:d.d.d.d  
 x — [0 to FFFF]H  
 d — [0 to 255]D  
*ipv6-prefix-length* — 0 to 128

### Platforms

All

## prefix

### Syntax

**[no] prefix** *ipv6-prefix/prefix-length*

### Context

**[Tree]** (config>service>vprn>router-advert>if prefix)

## Full Context

configure service vprn router-advertisement interface prefix

## Description

This command configures an IPv6 prefix in the router advertisement messages. To support multiple IPv6 prefixes, use multiple prefix statements. No prefix is advertised until explicitly configured using prefix statements.

## Parameters

### *ipv6-prefix*

Specifies the IP prefix for prefix list entry in dotted decimal notation.

| Values             |                   |                       |
|--------------------|-------------------|-----------------------|
| ipv4-prefix        | a.b.c.d           | (host bits must be 0) |
| ipv4-prefix-length | 0 to 32           |                       |
| ipv6-prefix        | x:x:x:x:x:x:x     | (eight 16-bit pieces) |
|                    | x:x:x:x:x:d.d.d.d |                       |
|                    | x: [0 to FFFF]H   |                       |
|                    | d: [0 to 255]D    |                       |
| ipv6-prefix-length | 0 to 128          |                       |

### *prefix-length*

Specifies a route must match the most significant bits and have a prefix length.

**Values** 1 to 128

## Platforms

All

## prefix

## Syntax

**prefix** *prefix-string*

**no prefix**

## Context

[\[Tree\]](#) (config>app-assure>group>cflowd>export-override prefix)

## Full Context

configure application-assurance group cflowd export-override prefix

## Description

This command specifies the *prefix-string* associated with the **export-override**.

## Parameters

### *prefix-string*

Specifies a prefix string, up to eight characters. If the eight-character prefix is "ABCDEFG\_" for a particular node, the cflowd export override would generate IPv4 interface names such as ABCDEF\_255.255.255.255 or IPv6 as ABCDEF\_2001:DB8:EF01:2345::/64. By default the prefix will be left blank.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## prefix

## Syntax

**prefix** *ip-prefix/ip-prefix-length* [**name** *prefix-name*]

**no prefix** *ip-prefix/ip-prefix-length*

## Context

[\[Tree\]](#) (config>app-assure>group>ip-prefix-list prefix)

## Full Context

configure application-assurance group ip-prefix-list prefix

## Description

This command configures an IP prefix within the list.

The **no** form of this command removes the IP prefix from the configuration.

## Parameters

### *ip-prefix/ip-prefix-length*

The IP address in dotted decimal notation.

### Values

|                           |                                            |
|---------------------------|--------------------------------------------|
| <i>ipv4-prefix</i>        | <i>a.b.c.d</i> (host bits must be 0)       |
| <i>ipv4-prefix-length</i> | 0 to 32                                    |
| <i>ipv6-prefix</i>        | <i>x:x:x:x:x:x:x</i> (eight 16-bit pieces) |
|                           | <i>x:x:x:x:x.d.d.d</i>                     |
|                           | <i>x:</i> [0 to FFFF]H                     |
|                           | <i>d:</i> [0 to 255]D                      |

*prefix-name* up to 32 characters

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## prefix

## Syntax

**prefix** *ipv6-prefix/prefix-length*

**no prefix**

## Context

**[Tree]** (config>service>vprn>nat>inside>nat64 prefix)

**[Tree]** (config>router>nat>inside>nat64 prefix)

## Full Context

configure service vprn nat inside nat64 prefix

configure router nat inside nat64 prefix

## Description

This command configures the IPv6 prefix used to derive the IPv6 address from the IPv4 address, and is same as the prefix used by DNS64 to generate AAAA record returned for IPv4 endpoint resolution. NAT64 node announces this prefix in routing to attract traffic from IPv6 hosts. If the prefix is not configured, then a well-known prefix, 64:FF9B::/96, is used.

The **no** form of the command removes the prefix from the NAT64 configuration.

## Parameters

### *ipv6-prefix/prefix-length*

Specifies the NAT64 destination prefix.

#### Values

|               |                                     |
|---------------|-------------------------------------|
| ipv6-prefix:  | x:x:x:x:x:x:x (eight 16-bit pieces) |
|               | x:x:x:x:x:d.d.d.d                   |
|               | x - [0..FFFF]H                      |
|               | d - [0..255]D                       |
| prefix-length | 32, 40, 48, 56, 64, 96              |

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## prefix

### Syntax

**prefix** *ip-prefix/length* [**nat-policy** *nat-policy-name*]

**no prefix** *ip-prefix/length*

### Context

[\[Tree\]](#) (config>service>nat>nat-prefix-list prefix)

### Full Context

configure service nat nat-prefix-list prefix

### Description

This command creates a prefix entry in the nat-prefix-list.

This prefix can be used to identify traffic with specific destination IP that needs to be associated with corresponding nat-policy (and implicitly the NAT pool) for L2-aware subscribers. In this fashion, a single L2-aware subscriber can direct traffic to multiple NAT pools, depending on the traffic destination.

Another use for a prefix is in DNAT-only application (DNAT without SNAPT). In this case the prefix identifies the inside source IP range that will be explicitly configured to ensure proper downstream routing in dNAT-only case.

The nat-prefix-list cannot reference the default nat-policy (the one that is referenced in the subscriber-profile).

The **no** form of the command reverts to the default.

### Parameters

#### ***ip-prefix/length***

Specifies the IP prefix for nat prefix list entry in dotted decimal notation.

**Values** *ip-prefix*: a.b.c.d (host bits must be 0) *ipv4-prefix-length*: 0 to 32

#### ***nat-policy nat-policy-name***

Specifies the NAT policy name. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes..

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## prefix

### Syntax

**prefix** *prefix|prefix-length* [ **create**]

**no prefix** *prefix/prefix-length*

### Context

[\[Tree\]](#) (config>service>vprn>firewall>domain prefix)

[\[Tree\]](#) (config>router>firewall>domain prefix)

### Full Context

configure service vprn firewall domain prefix

configure router firewall domain prefix

### Description

This command specifies a prefix for which firewall functionality will apply within the domain. Prefixes cannot be shared or duplicated across multiple domains in the same routing context. A domain can contain multiple prefixes.

The **no** form of the command removes the prefix from the domain.

### Parameters

#### create

Mandatory keyword used when creating a prefix entry.

#### *prefix/prefix-length*

Specifies the prefix.

**Values** *prefix* — x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x — 0 to FFFF (in hexadecimal)

d — 0 to 255 (in decimal)

*prefix-length* — 1 to 64

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## prefix

### Syntax

**prefix** *ip-address*

**no prefix**

### Context

[\[Tree\]](#) (config>router>bier>template>sub-domain prefix)

## Full Context

configure router bier template sub-domain prefix

## Description

This command specifies the prefix used for BFR. The prefix should be an IPv4 /32 address. The prefix can be a loopback interface or system IP address.

The **no** form of this command removes the prefix.

## Parameters

### *ip-address*

Specifies the IP address to be used as the BFR prefix in dotted decimal format.

## Platforms

All

prefix

## Syntax

**prefix** *ip-prefix/prefix-length* [**create**]

**no prefix** *ip-prefix/prefix-length*

## Context

[\[Tree\]](#) (config>test-oam>twamp>server prefix)

## Full Context

configure test-oam twamp server prefix

## Description

This command configures an IP address prefix containing one or more TWAMP clients. For a TWAMP client to connect to the TWAMP server (and subsequently conduct tests) it must establish the control connection using an IP address that is part of a configured prefix.

## Parameters

### *ip-prefix/prefix-length*

Specifies an IPv4 or IPv6 address prefix.

#### Values

|                 |                                   |
|-----------------|-----------------------------------|
| ipv4-prefix:    | a.b.c.d (host bits must be 0)     |
| ipv4-prefix-le: | 0 to 32                           |
| ipv6-prefix:    | x:x:x:x:x:x (eight 16-bit pieces) |
|                 | x:x:x:x:x:d.d.d.d                 |
| x:              | [0 to FFFF]H                      |

d: [0 to 255]D  
 ipv6-prefix-le: 0 to 128

**prefix length**

Specifies the prefix length.

**Values** 0 to 128

**create**

Creates a prefix instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**prefix****Syntax**

**prefix** *ip-prefix/prefix-length* [**create**]

**no prefix** *ip-prefix/prefix-length*

**Context**

**[Tree]** (config>router>twamp-light>reflector prefix)

**[Tree]** (config>service>vprn>twamp-light>reflector prefix)

**Full Context**

configure router twamp-light reflector prefix

configure service vprn twamp-light reflector prefix

**Description**

This command defines which TWAMP Light packet prefixes the reflector processes.

The **no** form of this command with the specific prefix removes the accepted source.

**Parameters*****ip-prefix/prefix-length***

Specifies the IPv4 or IPv6 address and length.

**Values**

ipv4-prefix: a.b.c.d (host bits must be 0)

ipv4-prefix-le: 0 to 32

ipv6-prefix: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x.d.d.d.d

x: [0 to FFFF]H  
 d: [0 to 255]D  
 ipv6-prefix-le: 0 to 128

**create**

Creates a prefix instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**prefix****Syntax**

[no] **prefix** *ip-prefix/prefix-length*

**Context**

[\[Tree\]](#) (config>qos>match-list>ip-prefix-list prefix)

**Full Context**

configure qos match-list ip-prefix-list prefix

**Description**

This command adds an IPv4 address prefix to an existing IPv4 address prefix match list.

To add a set of unique prefixes, execute the command with all unique prefixes. The prefixes are allowed to overlap IPv4 address space.

An IPv4 prefix addition will be blocked, if resource exhaustion is detected anywhere in the system because of QoS Policies that use this IPv4 address prefix list.

The **no** form of this command deletes the specified prefix from the list.

**Parameters*****ip-prefix***

A valid IPv4 address prefix in dotted decimal notation.

**Values** 0.0.0.0 to 255.255.255.255 (host bit must be 0)

***prefix-length***

Length of the entered IP prefix

**Values** 1 to 32

## Platforms

All

## prefix

## Syntax

[no] **prefix** *ipv6-prefix/prefix-length*

## Context

**[Tree]** (config>qos>match-list>ipv6-prefix-list prefix)

## Full Context

configure qos match-list ipv6-prefix-list prefix

## Description

This command adds an IPv6 address prefix to an existing IPv6 address prefix match list.

To add set of unique prefixes, execute the command with all unique prefixes. The prefixes are allowed to overlap IPv6 address space.

An IPv6 prefix addition will be blocked if resource exhaustion is detected anywhere in the system because of QoS Policies that use this IPv6 address prefix list.

The **no** form of this command deletes the specified prefix from the list.

## Parameters

### *ipv6-prefix*

Specifies the IPv6 prefix for the IP match criterion in hex digits.

**Values** ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x: [0 to FFFF]H  
d: [0 to 255]D

### *prefix-length*

Specifies the IPv6 prefix length for the IPv6 address expressed as a decimal integer.

**Values** 1 to 128

## Platforms

All

## prefix

### Syntax

**[no] prefix** *ip-prefix/prefix-length*

### Context

**[Tree]** (config>filter>match-list>ip-prefix-list prefix)

### Full Context

configure filter match-list ip-prefix-list prefix

### Description

This command adds an IPv4 address prefix to an existing IPv4 address prefix match list.

The **no** form of this command deletes the specified prefix from the list.

#### Operational Notes:

To add set of unique prefixes, execute the command with all unique prefixes. The prefixes are allowed to overlap IPv4 address space.

An IPv4 prefix addition will be blocked, if resource exhaustion is detected anywhere in the system because of filter policies that use this IPv4 address prefix list.

### Parameters

#### *ip-prefix*

Specifies a valid IPv4 address prefix in dotted decimal notation.

**Values** 0.0.0.0 to 255.255.255.255 (host bit must be 0)

#### *prefix-length*

Specifies the length of the entered IPv4 prefix.

**Values** 0 to 32

### Platforms

All

## prefix

### Syntax

**[no] prefix** *ipv6-prefix/prefix-length*

### Context

**[Tree]** (config>filter>match-list>ipv6-prefix-list prefix)

## Full Context

configure filter match-list ipv6-prefix-list prefix

## Description

This command adds an IPv6 address prefix to an existing IPv6 address prefix match list.

The **no** form of this command deletes the specified prefix from the list.

### Operational Notes:

To add set of different prefixes, execute the command with all unique prefixes. The prefixes are allowed to overlap IPv6 address space.

An IPv6 prefix addition will be blocked, if resource exhaustion is detected anywhere in the system because of filter policies that use this IPv6 address prefix list.

## Parameters

### *ipv6-prefix/prefix-length*

Specifies an IPv6 address prefix written as hexadecimal numbers separated by colons with host bits set to 0. One string of zeros can be omitted, so 2001:db8::700:0:217A is equivalent to 2001:db8:0:0:0:700:0:217A.

**Values** x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x: [0..FFFF]H  
d: [0..255]D

### *prefix-length*

Specifies the length of the entered IPv6 prefix.

**Values** 1 to 128

## Platforms

All

prefix

## Syntax

[no] prefix *ipv6-prefix/prefix-length*

## Context

[\[Tree\]](#) (config>router>router-advert>if prefix)

## Full Context

configure router router-advertisement interface prefix

## Description

This command configures an IPv6 prefix in the router advertisement messages. To support multiple IPv6 prefixes, use multiple prefix statements. No prefix is advertised until explicitly configured using prefix statements.

## Parameters

### *ipv6-prefix*

The IP prefix for prefix list entry in dotted decimal notation.

#### Values

|                    |                                   |              |
|--------------------|-----------------------------------|--------------|
| ipv6-prefix        | x:x:x:x:x:x (eight 16-bit pieces) |              |
|                    | x:x:x:x:x:d.d.d                   |              |
|                    | x:                                | [0 to FFFF]H |
|                    | d:                                | [0 to 255]D  |
| ipv6-prefix-length | 0 to 128                          |              |

### *prefix-length*

Specifies a route must match the most significant bits and have a prefix length.

**Values** 1 to 128

## Platforms

All

## prefix

## Syntax

**[no] prefix** *ip-prefix/ip-prefix-length*

## Context

**[Tree]** (config>router>bgp>group>dynamic-neighbor>match prefix)

## Full Context

configure router bgp group dynamic-neighbor match prefix

## Description

This command configures a prefix to accept dynamic BGP sessions (sessions from source IP addresses not matching any configured neighbor addresses). A dynamic session is associated with the group having the longest match prefix entry for the source IP address of the peer. The group association determines local parameters that apply to the session, including the local AS, the local IP address, the MP-BGP families, the import and export policies, and so on.

The **no** form of this command removes a prefix entry.

## Parameters

### *ip-prefix/ip-prefix-length*

Specifies a prefix from which to accept dynamic BGP sessions.

**Values** *ipv4-prefix* — a.b.c.d (host bits must be 0)  
*ipv4-prefix-length* — 0 to 32  
*ipv6-prefix* — x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x — [0 to FFFF]H  
d — [0 to 255]D  
*ipv6-prefix-length* — 0 to 128

## Platforms

All

## prefix

## Syntax

[no] **prefix** *ip-prefix/prefix-length* [**exact** | **longer** | **through** *length* | **prefix-length-range** *length1-length2* | **to** *ip-prefix/prefix-length* | **address-mask** *mask-pattern*]

## Context

[\[Tree\]](#) (config>router>policy-options>prefix-list prefix)

## Full Context

configure router policy-options prefix-list prefix

## Description

This command creates a prefix entry in the route policy prefix list.

The **no** form of this command deletes the prefix entry from the prefix list.

## Parameters

### *ip-prefix/prefix-length*

Specifies the IP prefix and length for the prefix list entry in dotted decimal notation.

**Values** *ipv4-prefix*:

- a.b.c.d (host bits must be 0)

*ipv4-prefix-length*: [0 to 32]

*ipv6-prefix*:

- x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d

- x: [0 to FFFF]H
  - d: [0 to 255]D
- ipv6-prefix-length: [0 to 128]

**exact**

Specifies the prefix list entry only matches the route with the specified *ip-prefix* and prefix *mask* (*length*) values.

**longer**

Specifies the prefix list entry matches any route that matches the specified *ip-prefix* and prefix *mask* length values equal to or greater than the specified mask.

**through *length***

Specifies the prefix list entry matches any route that matches the specified *ip-prefix* and has a prefix length between the specified *length* values inclusive.

**Values** 0 to 32

**prefix-length-range *length1* - *length2***

Specifies a route must match the most significant bits and have a prefix length with the given range. The range is inclusive of start and end values.

**Values** 0 to 32, *length2* > *length1*

**to *ip-prefix/prefix-length***

Specifies a second IP prefix and length used in route policy prefix lists. A route matches *prefix1* to *prefix2* if it matches *prefix1* and *prefix2* according to their respective prefix lengths and if the route's own prefix length is between the prefix lengths of *prefix1* and *prefix2*. It could take many individual 'exact' match prefix entries to reproduce the same logic.

***mask-pattern***

Specifies the address mask to use for matching entries to this prefix entry. A route matches a prefix and address mask combination if the bitwise logical AND of this prefix and the mask equals the bitwise logical AND of the route's address and the same mask and, additionally, the prefix length of the route matches the prefix length of the prefix entry.

**Values** ipv4-address:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

## 20.301 prefix-delegation

prefix-delegation

### Syntax

[no] prefix-delegation

### Context

[\[Tree\]](#) (config>service>ies>if>ipv6>dhcp6-server prefix-delegation)

### Full Context

configure service ies interface ipv6 dhcp6-server prefix-delegation

### Description

This command enables the prefix delegation options for delegating a long-lived prefix from a delegating router to a requesting router, where the delegating router does not require knowledge about the topology of the links in the network to which the prefixes are assigned.

The **no** form of this command disables prefix-delegation.

## Platforms

All

## 20.302 prefix-exclude

prefix-exclude

### Syntax

prefix-exclude *policy-name* [*policy-name*]

no prefix-exclude

### Context

[\[Tree\]](#) (config>router>ldp>aggregate-prefix-match prefix-exclude)

### Full Context

configure router ldp aggregate-prefix-match prefix-exclude

## Description

This command specifies the policy name containing the prefixes to be excluded from the aggregate prefix match procedures. In this case, LDP will perform an exact match of a specific FEC element prefix as opposed to a longest match of one or more LDP FEC element prefixes, against this prefix when it receives a FEC-label binding or when a change to this prefix occurs in the routing table.

The **no** form of this command removes all policies from the configuration.

## Default

no prefix-exclude

## Parameters

### *policy-name*

Specifies the route policy name, up to five. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

The specified name(s) must already be defined.

## Platforms

All

## prefix-exclude

## Syntax

[no] **prefix-exclude** *ip-prefix/prefix-length*

## Context

[\[Tree\]](#) (config>filter>match-list>ip-pfx-list prefix-exclude)

## Full Context

configure filter match-list ip-prefix-list prefix-exclude

## Description

This command excludes IPv4 prefix(es) from an **ip-prefix-list**. The **prefix-exclude** command is mutually exclusive with **apply-path**.

The **no** form of this command deletes the specified excluded prefixes from the **ip-prefix-list**.

## Parameters

### *ip-prefix*

Specifies a valid IPv4 address prefix in dotted decimal notation.

**Values** 0.0.0.0 to 255.255.255.255 (host bit must be 0)

### *prefix-length*

Specifies the length of the entered IPv4 prefix.

**Values** 0 to 32

## Platforms

All

## prefix-exclude

## Syntax

[no] **prefix** *ipv6-prefix/prefix-length*

## Context

[\[Tree\]](#) (config>filter>match-list>ipv6-pfx-list prefix-exclude)

## Full Context

configure filter match-list ipv6-prefix-list prefix-exclude

## Description

This command excludes IPv6 prefix(es) from an **ipv6-prefix-list**. The **prefix-exclude** command is mutually exclusive with **apply-path**.

The **no** form of this command deletes the specified excluded prefixes from the **ipv6-prefix-list**.

## Parameters

### *ipv6-prefix/prefix-length*

Specifies an IPv6 address prefix written as hexadecimal numbers separated by colons with host bits set to 0. One string of zeros can be omitted, so 2001:db8::700:0:217A is equivalent to 2001:db8:0:0:0:700:0:217A.

**Values** x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x: [0..FFFF]H

d: [0..255]D

### *prefix-length*

Specifies the length of the entered IPv6 prefix.

**Values** 1 to 128

## 20.305 prefix-limit

### prefix-limit

### Syntax

```
prefix-limit family limit [threshold percentage] [idle-timeout {minutes | forever}] | log-only | hold-excess
percentage] [post-import]
no prefix-limit family
```

### Context

**[Tree]** (config>service>vprn>bgp>group>neighbor prefix-limit)

**[Tree]** (config>service>vprn>bgp>group prefix-limit)

### Full Context

```
configure service vprn bgp group neighbor prefix-limit
```

```
configure service vprn bgp group prefix-limit
```

### Description

This command configures the maximum number of BGP routes received from a peer before administrative action is taken. The administrative action can include generating a log or taking the session down. If a session is taken down, configure the **idle-timeout** parameter to bring it back up automatically after a specific duration. Alternatively, it can be configured to stay down indefinitely, until the user performs a reset.

No prefix limits for any address family are configured by default.

This command allows the user to apply a separate limit to each address family. A set of address family limits can be applied to one neighbor or to all neighbors in a group.

The **no** form of this command removes the **prefix-limit**.

### Parameters

#### **threshold** *percentage*

Specifies the threshold value (as a percentage) that triggers a warning message to be sent.

**Values** 1 to 100

**family**

Specifies the address family to which the limit applies.

**Values** ipv4, label-ipv4, ipv6, mcast-ipv4, flow-ipv4, flow-ipv6, mcast-ipv6

**limit**

Specifies the number of routes that can be learned from a peer expressed as a decimal integer.

**Values** 1 to 4294967295

**idle-timeout minutes**

Specifies the duration in minutes before automatically re-establishing a session.

**Values** 1 to 1024

**idle-timeout forever**

Specifies that the session is re-established only after the **clear router bgp** command is executed.

**log-only**

Enables the warning message to be sent at the specified threshold percentage, and also when the limit is reached. However, the BGP session is not taken down.

**post-import**

Specifies that the limit should be applied only to the number of routes that are accepted by import policies.

**hold-excess percentage**

Specifies the percentage of maximum routes that are allowed to be installed in the route table. If a peer within scope of the configuration exceeds the limit, the overflow routes are held in the BGP RIB as inactive routes and are ineligible for forwarding or advertisement to other peers. If the **post-import** parameter is configured, only routes not rejected by import policies count toward the limit. A BGP route in the overflow state is reconsidered for activation and reinstallation when an UPDATE message is received for the route. This parameter is mutually exclusive with the **idle-timeout** and **log-only** parameters.

**Platforms**

All

## prefix-limit

**Syntax**

**prefix-limit** *limit* [**log-only**] [**threshold percent**] [**overload-timeout** { *seconds* | **forever**}]

**no prefix-limit**

## Context

**[Tree]** (config>service>vprn>isis prefix-limit)

## Full Context

configure service vprn isis prefix-limit

## Description

This command configures the maximum number of prefixes that IS-IS can learn, and use to protect the system from a router that has accidentally advertised a large number of prefixes. If the number of prefixes reaches the configured percentage of this limit, an SNMP trap is sent. If the limit is exceeded, IS-IS will go into overload.

The **overload-timeout** option controls the length of time that IS-IS is in the overload state when the prefix limit is reached. The system automatically attempts to restart IS-IS at the end of this duration. If the **overload-timeout forever** option is used, IS-IS is not restarted automatically and stays in overload until the condition is manually cleared by the administrator. This is also the default behavior when the **overload-timeout** option is not configured.

The **no** form of this command removes the **prefix-limit**.

## Default

prefix-limit overload-timeout forever

## Parameters

### *limit*

Specifies the number of prefixes that can be learned, expressed as a decimal integer.

**Values** 1 to 4294967296

### *log-only*

Enables a warning message to be sent at the specified threshold percentage and also when the limit is exceeded. However, overload is not set when this parameter is configured.

### *percent*

Specifies the threshold value (as a percentage) that triggers a warning message to be sent.

**Values** 0 to 100

### *overload-timeout*

Keyword used to control the length of time that IS-IS is in the overload state when the prefix limit is reached.

### *seconds*

Specifies the time in minutes before IS-IS is restarted.

**Values** 1 to 1800

### *forever*

Specifies that IS-IS should be restarted only after the execution of the **clear router isis overload prefix-limit** command.

## Platforms

All

## prefix-limit

## Syntax

**prefix-limit** *family limit* [**threshold** *percentage*] [**idle-timeout** {*minutes* | **forever**} | **log-only** | **hold-excess** *percentage*] [**post-import**]

**no prefix-limit** *family*

**no prefix-limits** *family*

### Context

[\[Tree\]](#) (config>subscr-mgmt>bgp-prng-plcy prefix-limits)

### Full Context

configure subscriber-mgmt bgp-peering-policy prefix-limits

### Description

This command configures the maximum number of BGP routes per address family that can be received from an ESM dynamic BGP peer before an administrative action is taken. Administrative actions include the generation of a log event and taking down the session. If a session is taken down, it can be brought back up automatically after an idle-timeout period. With no idle timeout configured, the session stays down until the user performs a reset.

The **no** form of this command removes the prefix limits for the specified family.

### Default

prefix-limits threshold 90

### Parameters

#### *family*

Specifies the IP address family for prefix limits.

**Values** ipv4, ipv6

#### *limit*

Specifies the prefix limit.

**Values** 1 to 4294967295

#### *percentage*

Specifies the percentage at which a warning log message is sent.

**Values** 1 to 100

#### *minutes*

Specifies the time, in minutes, before a BGP peer is automatically reestablished on reaching the prefix limit.

**Values** 1 to 1024

#### *log-only*

Keyword used to specify if the maximum limit is reached, only a log event is generated. This parameter does not disable the BGP session upon reaching the prefix limit.

**post-import**

Keyword used to specify that limits are only applied to the number of routes accepted by the import policy.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**Default**

no prefix-list

**Parameters*****prefix-list-name***

Specifies the name of a currently configured prefix-list.

**all**

Specifies that the static route condition is met if all prefixes in the prefix-list must be present in the active route-table.

**none**

Specifies that the static route condition is met if none of the prefixes in the named prefix-list can be present in the active route-table.

## Platforms

All

## prefix-list

## Syntax

[no] **prefix-list** *name*

## Context

**[Tree]** (config>router>policy-options prefix-list)

## Full Context

configure router policy-options prefix-list

## Description

This command creates a context to configure a prefix list to use in route policy entries.

The **no** form of this command deletes the named prefix list.

## Parameters

### *name*

Specifies the prefix list name. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must be enclosed by at-signs (@) and may be midstring; for example, "@variable@", "start@variable@end", "@variable@end", or "start@variable@".

An empty prefix list can be configured for pre-provisioning. This empty prefix list will not find a match when referred to by a policy. When removing member prefixes from a prefix list, the prefix list will not be automatically removed when the last member is removed. If required, an empty prefix list must be explicitly removed using the **no** form of this command.

## Platforms

## Context

**[Tree]** (config>router>policy-options>policy-statement>entry>from prefix-list)

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>to prefix-list)

### Full Context

configure router policy-options policy-statement entry from prefix-list

configure router policy-options policy-statement entry to prefix-list

### Description

This command configures a prefix list as a match criterion for a route policy statement entry.

If no prefix list is specified, any network prefix is considered a match.

An empty prefix list will evaluate as if 'no match' was found.

The prefix lists specify the network prefix (this includes the prefix and length) a specific policy entry applies.

A maximum of 28 prefix names can be specified.

The **no** form of this command removes the prefix list match criterion.

### Default

no prefix-list

### Parameters

#### *name*

Specifies the prefix list name. Allowed values are any string up to 64 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must be enclosed by at-signs (@) and may be midstring; for example, "@variable@," "start@variable@end", "@variable@end", or "start@variable@".

### Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from prefix-list-override)

## Full Context

configure router policy-options policy-statement entry from prefix-list-override

## Description

This command converts a prefix list to a specific match type. The routing policy uses the converted list as a match condition.

The prefix list to be converted can be specified by its name, as an expression containing the name of a global variable that holds the name of the prefix list, or as an expression containing the name of a subroutine variable that holds the name of the prefix list.

## Parameters

*name*

Specifies the prefix list to be converted, up to 64 characters.

**exact**

Keyword to convert all entries in the specified prefix list to the exact match type.

**longer**

Keyword to convert all entries in the specified prefix list to the longer match type.

*length1-length2*

Specifies the start and end length of the prefix range.

**Values** 0 to 128

**Note:** *length2* (end length) must be equal to or greater than *length1* (start length).

*length*

Specifies the through length of the prefix.

**Values** 0 to 128

**Note:** Configure the through length of the prefix to a value higher than the prefix length configured in the **configure router policy-options prefix-list prefix** command.

**[Tree]** (config>service>vprn>nat>inside>deterministic prefix-map)

## Full Context

configure router nat inside deterministic prefix-map

configure service vprn nat inside deterministic prefix-map

## Description

This command is applicable to deterministic NAT and static 1:1 NAT. It is used to configure source IP prefixes on the inside and their association with outside deterministic NAT pools via the NAT policy. Hosts within the source IP prefix are deterministically mapped to outside IP addresses and port ranges in the associated deterministic NAT pool.

Multiple source IP prefixes within an inside routing instance can be defined and they can reference different NAT policies (and therefore, outside deterministic NAT pools and routing instances). Source IP prefixes from multiple routing instances can share the same deterministic NAT pool.

With this command, multiple NAT policies based on a destination prefix or filter criteria can be used together with deterministic NAT.

Non-deterministic NAT can be used simultaneously with deterministic NAT within the same inside routing instance. However, they cannot share the same NAT pool.

Source IP prefixes can be added or removed as long as the associated deterministic NAT pool is in a **no shutdown** mode.

Removing a prefix or modifying the map statement under it requires that the source IP prefix be in a **shutdown** mode.

## Parameters

### *ip-prefix/length*

Specifies source IP prefix on the inside whose hosts is deterministically mapped to an outside IP address and port block in the corresponding deterministic NAT pool.

| Values               |                                     |                                    |

## prefix-policy

## Syntax

**prefix-policy** *prefix-policy* [*prefix-policy*]

**no prefix-policy**

## Context

**[Tree]** (config>router>isis>loopfree-alternates>exclude prefix-policy)

## Full Context

```
configure router isis loopfree-alternates exclude prefix-policy
```

## Description

This command excludes from LFA SPF calculation prefixes that match a prefix entry or a tag entry in a prefix policy.

The implementation already allows the user to exclude an interface in IS-IS or OSPF, an OSPF area, or an IS-IS level from the LFA SPF.

If a prefix is excluded from LFA, then it will not be included in LFA calculation regardless of its priority. The prefix tag will, however, be used in the main SPF.

This command specifies the name of the policy for the prefixes to exclude from the LFA SPF calculation in this IS-IS instance.

### Note:

Prefix tags are defined for the IS-IS protocol but not for the OSPF protocol.

The default action, when not explicitly specified by the user in the prefix policy, is a "reject". Thus, regardless if the user did or did not explicitly add the statement "default-action reject" to the prefix policy, a prefix that did not match any entry in the policy will be accepted into LFA SPF.

The **no** form of this command deletes the exclude prefix policy.

## Default

```
no prefix-policy
```

## Parameters

### *prefix-policy prefix-policy*

Specifies the name of the prefix policy, up to 32 characters. Up to five prefix policies can be specified. The specified name must have been already defined.

prefix-sid-range global
```

```
prefix-sid-range start-label start-label max-index max-index
```

```
no prefix-sid-range
```

## Context

[\[Tree\]](#) (config>router>bgp>segment-routing prefix-sid-range)

## Full Context

configure router bgp segment-routing prefix-sid-range

## Description

This command configures the label block that BGP segment routing is allowed to use.

The **start-label** and **max-index** parameters specify that BGP should be restricted to a subrange of the SRGB, with the subrange starting at **start-label** and ending at **max-index**.

It is not possible to enable segment routing (perform a **no shutdown**) unless the **prefix-sid-range** is configured using the **global** keyword or using the **start-label** and **max-index** parameters.

The **no** form of the command allocates no labels for BGP segment-routing.

## Default

no prefix-sid-range

## Parameters

### global

Specifies that BGP is allowed to allocate labels from the entire space of the SRGB, as defined under **config>router>mpls-labels>sr-labels**.

### start-label

Specifies the first label value that is available to BGP in a contiguous range of labels.

**Values** 0 to 524287

### max-index

Specifies the last label value that is available to BGP in a contiguous range of labels.

**Values** 1 to 524287

## Platforms

All

## prefix-sid-range

## Syntax

**prefix-sid-range** {**global** | **start-label** *label-value* **max-index** *index-value*}

**no prefix-sid-range**

## Context

## Full Context

```
configure router isis segment-routing prefix-sid-range
```

## Description

This command configures the prefix SID index range and offset label value for a given IGP instance.

The key parameter is the configuration of the prefix SID index range and the offset label value which this IGP instance will use. Since each prefix SID represents a network global IP address, the SID index for a prefix must be network-wide unique. Thus, all routers in the network are expected to configure and advertise the same prefix SID index range for a given IGP instance. However, the label value used by each router to represent this prefix; that is, the label programmed in the ILM can be local to that router by the use of an offset label, referred to as a start label:

*Local Label (Prefix SID) = start-label + {SID index}*

The label operation in the network becomes thus very similar to LDP when operating in the independent label distribution mode (RFC 5036, *LDP Specification*) with the difference that the label value used to forward a packet to each downstream router is computed by the upstream router based on advertised prefix SID index using the above formula.

There are two mutually exclusive modes of operation for the prefix SID range on the router. In the **global** mode of operation, the user configures the global value and this IGP instance will assume the start label value is the lowest label value in the SRGB and the prefix SID index range size equal to the range size of the SRGB. Once one IGP instance selected the global option for the prefix SID range, all IGP instances on the system will be restricted to do the same. The user must shutdown the segment routing context and delete the **prefix-sid-range** command in all IGP instances in order to change the SRGB. Once the SRGB is changed, the user must re-enter the **prefix-sid-range** command again. The SRGB range change will be failed if an already allocated SID index/label goes out of range.

In the per-instance mode of operation, the user partitions the SRGB into non-overlapping sub-ranges among the IGP instances. The user thus configures a subset of the SRGB by specifying the start label value and the prefix SID index range size. All resulting net label values (start-label + index) must be within the SRGB or the configuration will be failed. Furthermore, the code checks for overlaps of the resulting net label value range across IGP instances and will strictly enforce that these ranges do not overlap. The user must shutdown the segment routing context of an IGP instance in order to change the SID index/label range of that IGP instance using the **prefix-sid-range** command. In addition, any range change will be failed if an already allocated SID index/label goes out of range. The user can however change the SRGB on the fly as long as it does not reduce the current per IGP instance SID index/label range defined with the **prefix-sid-range**. Otherwise, the user must shutdown the segment routing context of the IGP instance and delete and re-configure the **prefix-sid-range** command.

## Default

no prefix-sid-range

## Parameters

### *label-value*

Specifies the label offset for the SR label range of this IGP instance.

**Values** 0 to 524287

### *index-value*

Specifies the maximum value of the prefix SID index range for this IGP instance.

**Values** 1 to 524287

## Platforms

## Full Context

configure router ospf segment-routing prefix-sid-range

configure router ospf3 segment-routing prefix-sid-range

## Description

This command configures the prefix SID index range and offset label value for an IGP instance.

The key parameter is the configuration of the prefix SID index range and the offset label value that this IGP instance will use. Because each prefix SID represents a network global IP address, the SID index for a prefix must be unique network-wide. Therefore, all routers in the network are expected to configure and advertise the same prefix SID index range for an IGP instance. However, the label value used by each router to represent this prefix, that is, the label programmed in the ILM, can be local to that router by the use of an offset label, referred to as a start label:

*Local Label (Prefix SID) = start-label + {SID index}*

The label operation in the network is very similar to LDP when operating in independent label distribution mode (RFC 5036, *LDP Specification*), with the difference being that the label value used to forward a packet to each downstream router is computed by the upstream router based on the advertised prefix SID index using the above formula.

There are two mutually exclusive modes of operation for the prefix SID range on the router. In the **global** mode of operation, the user configures the global value and this IGP instance will assume the start label value is the lowest label value in the SRGB and the prefix SID index range size equal to the range size of the SRGB. After one IGP instance selected the global option for the prefix SID range, all IGP instances on the system will be restricted to do the same. The user must shutdown the segment routing context and delete the **prefix-sid-range** command in all IGP instances in order to change the SRGB. After the SRGB is changed, the user must re-enter the **prefix-sid-range** command again. The SRGB range change will be failed if an already allocated SID index/label goes out of range.

In per-instance mode, the user partitions the SRGB into non-overlapping sub-ranges among the IGP instances. The user configures a subset of the SRGB by specifying the start label value and the prefix

SID index range size. All resulting net label values (start-label + index) must be within the SRGB or the configuration will fail. The 7750 SR checks for overlaps of the resulting net label value range across IGP instances and will strictly enforce no overlapping of these ranges. The user must shut down the segment routing context of an IGP instance in order to change the SID index/label range of that IGP instance using the **prefix-sid-range** command. A range change will fail if an already allocated SID index/label goes out of range. The user can change the SRGB without shutting down the segment routing context as long as it does not reduce the current per-IGP instance SID index/label range defined with the **prefix-sid-range** command. Otherwise, shut down the segment routing context of the IGP instance, and disable and re-enable the **prefix-sid-range** command.

### Default

no prefix-sid-range

### Parameters

#### *label-value*

Specifies the label offset for the SR label range of this IGP instance.

**Values** 0 to 524287

#### *index-value*

Specifies the maximum value of the prefix SID index range for this IGP.

**Values** 1 to 524287

primary

### Syntax

primary *path-name*

## no primary

### Context

[\[Tree\]](#) (config>router>mpls>lsp primary)

### Full Context

configure router mpls lsp primary

### Description

This command specifies a preferred path for the LSP. This command is optional only if the **secondary** *path-name* is included in the LSP definition. Only one primary path can be defined for an LSP.

Some of the attributes of the LSP such as the bandwidth, and hop-limit can be optionally specified as the attributes of the primary path. The attributes specified in the **primary path** *path-name* command, override the LSP attributes.

The **no** form of this command deletes the association of this *path-name* from the LSP *lsp-name*. All configurations specific to this primary path, such as record, bandwidth, and hop limit, are deleted. The primary path must be shutdown first in order to delete it. The **no primary** command will not result in any action except a warning message on the console indicating that the primary path is administratively up.

### Parameters

#### *path-name*

Specifies the case-sensitive alphanumeric name label for the LSP path up to 64 characters in length.

### Platforms

All

## primary

### Syntax

**[no] primary** [*mda-id* | *esa-vm-id*]

### Context

[\[Tree\]](#) (config>isa>aa-grp primary)

### Full Context

configure isa application-assurance-group primary

### Description

This command assigns an AA ISA or ESA-VM configured in the specified location to this application assurance group. Primary and backup ISAs have equal operational status and when both ISAs are coming up, the one that becomes operational first becomes the active ISA.

On an activity switch from the primary ISA, all configurations are already on the backup ISA but flow state information must be re-learned. Any statistics not yet spooled will be lost. Auto-switching from the backup to primary, once the primary becomes available again, is not supported.

Operator is notified through SNMP events when:

- When AA service goes down (all ISAs in the group are down) or comes back up (an ISA in the group becomes active)
- When AA redundancy fails (one of the ISAs in the group is down) or recovers (the failed MDA comes back up)
- When an AA activity switch occurred.

The **no** form of this command removes the specified ISA from the application assurance group.

## Parameters

### *mda-id*

Specifies the slot/mda or esa/vm, identifying a provisioned AA ISA.

| Values          |                                     |
|-----------------|-------------------------------------|
| <i>slot/mda</i> |                                     |
| <i>slot</i>     | 1 to 10, depending on chassis model |
| <i>mda</i>      | 1 to 2                              |

### *esa-vm-id*

Specifies the ESA and VM, identifying a provisioned ESA-VM. The value of the *esa-vm-id* for application assurance is used as the *esa-id* plus 128. For example, an ESA 1 with VM2 would be referred to as *esa-129/2*.

| Values                  |         |
|-------------------------|---------|
| <i>esa-id+128/vm-id</i> |         |
| <i>esa-id</i>           | 1 to 16 |
| <i>vm-id</i>            | 1 to 4  |

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## primary

## Syntax

**primary** *mda-id*

**no primary**

## Context

**[Tree]** (config>isa>tunnel-grp primary)

## Full Context

configure isa tunnel-group primary

## Description

This command assigns an ISA IPsec module configured in the specified slot to this IPsec group. The backup ISA IPsec provides the IPsec group with warm redundancy when the primary ISA IPsec in the group is configured. Primary and backup ISA IPsec have equal operational status and when both MDAs are coming up, the one that becomes operational first becomes the active ISA IPsec.

All configuration information is pushed down to the backup MDA from the CPM once the CPM gets notice that the primary module has gone down. This allows multiple IPsec groups to use the same backup module. Any statistics not yet spooled will be lost. Auto-switching from the backup to primary, once the primary becomes available again, is supported.

The operator is notified through SNMP events when:

- When the ISA IPsec service goes down (all modules in the group are down) or comes back up (a module in the group becomes active).
- When ISA IPsec redundancy fails (one of the modules in the group is down) or recovers (the failed module comes back up).
- When an ISA IPsec activity switch took place.

The **no** form of this command removes the specified primary ID from the group's configuration.

## Default

no primary

## Parameters

***mda-id***

Specifies the card/slot identifying a provisioned IPsec ISA.

### Description

This command specifies the primary and secondary CVS methods used to verify the revocation status of the peer's certificate.

OCSP or CRL uses the corresponding configuration in the CA profile of the issuer of the certificate in question.

### Default

primary crl

### Parameters

#### *primary*

Specifies the primary CSV method used to verify the revocation status of the peer's certificate.

**Values**    **ocsp** — Specifies that the OCSP protocol should be used. The OCSP server is configured in the corresponding CA profile.

**crl** — Specifies that the local CRL file should be used. The CRL file is configured in the corresponding CA profile.

**Default**    crl

#### *secondary*

Specifies the secondary CSV method used to verify the revocation status of the peer's certificate.

**Values**    **ocsp** — Specifies that the OCSP protocol should be used. The OCSP server is configured in the corresponding CA profile.

**crl** — Specifies that the local CRL file should be used. The CRL file is configured in the corresponding CA profile.

**none** — Specifies that no secondary method of CSV is used.

**Default**    none

## primary

### Syntax

[no] primary *mda-id*

### Context

[\[Tree\]](#) (config>isa>video-group primary)

### Full Context

configure isa video-group primary

### Description

This command configures the primary video group ISA. Only one primary can be configured per video group when ad insertion is enabled. The maximum number of primaries per video-group for FCC and RD is 4.

### Parameters

***mda-id***

Specifies the slot and MDA number for the primary video group ISA.

#### Values

slot/mda

slot 1 to 10 (depending on the chassis model)

mda 1 to 2

## Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 20.316 primary-cf

```
primary-cf
```

### Syntax

```
primary-cf cflash-id
```

### Context

```
[Tree] (config>call-trace primary-cf)
```

### Full Context

```
configure call-trace primary-cf
```

### Description

This command specifies which compact-flash is used as the primary CF for call-trace operation.

### Default

```
primary-cf cf1
```

### Parameters

***cflash-id***

Specifies the compact flash card to be used as the primary local storage location to save the generated call trace log files.

**Values** cf1, cf2

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.317 primary-config

```
primary-config
```

### Syntax

```
primary-config file-url
```

```
no primary-config
```

### Context

```
[Tree] (bof primary-config)
```

## Full Context

bof primary-config

## Description

This command specifies the name and location of the primary configuration file.

The system attempts to use the configuration specified in **primary-config**. If the specified file cannot be located, the system automatically attempts to obtain the configuration from the location specified in **secondary-config** and then the **tertiary-config**.

If an error in the configuration file is encountered, the boot process aborts.

The **no** form of this command removes the **primary-config** configuration.

## Parameters

### *file-url*

Specifies the primary configuration file location, expressed as a file URL.

### Values

|                   |                                                                          |
|-------------------|--------------------------------------------------------------------------|
| <i>file-url</i>   | { <i>local-url</i>   <i>remote-url</i> } (up to 180 characters)          |

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range dhcp primary-dns

```
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range dhcp primary-dns
```

### Description

This command configures the primary DNS address to be returned via DHCP on WLAN-GW ISA.

The **no** form of this command reverts to the default.

### Parameters

#### *ip-address*

Specifies the primary DNS address.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## primary-dns

### Syntax

```
primary-dns ip-address
```

```
no primary-dns
```

### Context

[\[Tree\]](#) (config>service>vprn>dns primary-dns)

### Full Context

```
configure service vprn dns primary-dns
```

### Description

This command configures the primary DNS server used for DNS name resolution. DNS name resolution can be used when executing ping, traceroute, and service-ping, and also when defining file URLs. DNS name resolution is not supported when DNS names are embedded in configuration files.

The **no** form of this command removes the primary DNS server from the configuration.

### Default

no primary-dns — No primary DNS server is configured.

### Parameters

#### *ip-address*

The IP or IPv6 address of the primary DNS server.

#### Values

ipv4-address -a.b.c.d

ipv6-address: x:x:x:x:x:x:x[-interface]

x:x:x:x:x:d.d.d.d[-interface]

x: [0..FFFF]H

d: [0..255]D

interface - 32 characters max, for link local addresses.

**Platforms**

**20.319 primary-image****primary-image****Syntax****primary-image** *file-url***no primary image****Context**[\[Tree\]](#) (bof primary-image)**Full Context**

bof primary-image

**Description**

This command specifies the primary directory location for runtime image file loading.

The system attempts to load all runtime image files configured in the **primary-image** first. If this fails, the system attempts to load the runtime images from the location configured in the **secondary-image**. If the secondary image load fails, the tertiary image specified in **tertiary-image** is used.

All runtime image files (\*.tim files) must be located in the same directory.

The **no** form of this command removes the **primary-image** configuration.

**Parameters*****file-url***

Specifies the *file-url* can be either local (this CPM) or a remote FTP server.

**Values**

|                   |                                                                          |

## 20.320 primary-ip-address

```
primary-ip-address
```

### Syntax

```
primary-ip-address ipv4-address
```

```
no primary-ip-address
```

### Context

[\[Tree\]](#) (config>router>bgp>orr>location primary-ip-address)

### Full Context

```
configure router bgp optimal-route-reflection location primary-ip-address
```

### Description

This command specifies the primary IP address of a reference location used for BGP optimal route reflection. Up to three IPv4 addresses and three IPv6 addresses can be specified per location.

If the TE DB is unable find a node in its topology database that matches a primary address of the location, then it tries to find a node matching a secondary address. If this attempt also fails, the TE DB tries to find a node matching a tertiary address.

The IP addresses specified for a location should be topologically "close" to a set of clients that should all receive the same optimal path for that location.

The **no** form of this command removes the primary IP address information.

### Default

```
no primary-ip-address
```

### Parameters

***ipv4-address***

Specifies the primary IPv4 address of a location expressed in dotted decimal notation.

**Values** a.b.c.d

## Platforms

All

primary-p2mp-instance
```

### Syntax

```
[no] primary-p2mp-instance instance-name
```

### Context

```
[Tree] (config>router>mpls>lsp primary-p2mp-instance)
```

### Full Context

```
configure router mpls lsp primary-p2mp-instance
```

### Description

This command creates the primary instance of a P2MP LSP. The primary instance of a P2MP LSP is modeled as a set of root-to-leaf (S2L) sub-LSPs. The root, for example a head-end node triggers signaling using one path message per S2L path. The leaf sub-LSP paths are merged at branching points.

This command is not supported on the 7450 ESS.

## Parameters

### *instance-name*

Specifies a name that identifies the P2MP LSP instance. The instance name can be up to 32 characters long and must be unique.

```

**Full Context**

```
configure mcast-management multicast-info-policy bundle channel primary-tunnel-interface
configure mcast-management multicast-info-policy bundle primary-tunnel-interface
configure mcast-management multicast-info-policy bundle channel source-override primary-tunnel-interface
```

**Description**

This command allows the user to define a bundle in the multicast-info-policy and specify channels in the bundle that must be received from the primary tunnel interface associated with an RSVP P2MP LSP. The multicast info policy is applied to the base router instance.

The egress LER can accept multicast packets via two different methods. The regular RPF check on unlabeled IP multicast packets, which is based on routing table lookup. The static assignment which specifies the receiving of a multicast group <\*,G> or a specific <S,G> from a primary tunnel-interface associated with an RSVP P2MP LSP.

One or more primary tunnel interfaces in the base router instance can be configured. That is, the user can specify to receive different multicast groups, <\*,G> or specific <S,G>, from different P2MP LSPs. This assumes that there are static joins configured for the same multicast groups at the ingress LER to forward over a tunnel interface associated with the same P2MP LSP.

At any given time, packets of the same multicast group can be accepted from either the primary tunnel interface associated with a P2MP LSP or from a PIM interface. These are mutually exclusive options. As soon as a multicast group is configured against a primary tunnel interface in the multicast info policy, it is blocked from other PIM interfaces.

A multicast packet received on a tunnel interface associated with a P2MP LSP can be forwarded over a PIM or IGMP interface which can be an IES interface, a spoke SDP terminated IES interface, or a network interface.

The **no** form of this command removes the static RPF check.

### Parameters

#### *isp-name*

Specifies a string of up to 32 characters identifying the LSP name as configured at the ingress LER.

#### *ip-address*

Specifies a string of 15 characters representing the IP address of the ingress LER for the LSP.

#### *p2mp-id*

Identifier used for signaling mLDP P2MP LSP (applies only to the 7750 SR).

**Values** 1 to 4294967296

## Full Context

configure subscriber-mgmt sub-profile ingress policer-control-policy priority-mbs-thresholds priority

configure subscriber-mgmt sub-profile egress policer-control-policy priority-mbs-thresholds priority

## Description

The **priority** level command contains the **mbs-contribution** configuration command for a given strict priority level. Eight levels are supported numbered 1 through 8 with 8 being the highest strict priority.

Each of the eight priority CLI nodes always exists and do not need to be created. While parameters exist for each priority level, the parameters are only applied when the priority level within a parent policer instance is currently supporting child policers.

## Parameters

### *level*

Specifies the priority level override.

**Values** 1 to 8

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## priority

## Syntax

**priority** *priority* **source** {python | diameter-gx | luidb | radius | diameter-nasreq | gtp | dhcp | local-address-assignment}

**no priority** *priority*

## Context

[\[Tree\]](#) (config>subscr-mgmt>auth-orig priority)

## Full Context

configure subscriber-mgmt authentication-origin priority

## Description

This command allows the relative order of authentication priorities to be swapped between RADIUS and LUDB by configuring the RADIUS source priority to value 3. By moving RADIUS to the third position, LUDB, and all the origins below LUDB, are pushed down. The active order of priorities can be displayed in the output of the **show subscriber-mgmt authentication-origin** command.

The **no** form of this command deletes the priority value. To restore defaults, the priority configuration must be deleted.

## Parameters

### **priority**

Specifies the authentication origin priority override.

**Values** 1 to 7

### **source**

Specifies the source of authentication priority. Only **radius** can be configured. RADIUS as the authentication origin can be assigned priority 3 which places it above LUDB.

**Values** python, diameter-gx, luidb, radius, diameter-nasreq, gtp, dhcp, local-address-assignment

## Platforms

configure service ies subscriber-interface group-interface srrp priority

## Description

This command overrides the default base priority for the SRRP instance. The SRRP instance priority is advertised by the SRRP instance to its neighbor router and is compared to the priority received from the neighbor router. The router with the best (highest) priority enters the master state while the other router enters the backup state. If the priority of each router is the same, the router with the lowest source IP address in the SRRP advertisement message assumes the master state.

The base priority of an SRRP instance can be managed by VRRP policies. A VRRP policy defines a set of connectivity or verification tests which, when they fail, may lower an SRRP instances base priority (creating an in-use priority for the instance). Every time an SRRP instances in-use priority changes when in master state, it sends an SRRP advertisement message with the new priority. If the dynamic priority drops to zero or receives an SRRP Advertisement message with a better priority, the SRRP instance transitions to the *becoming backup* state.

When the priority command is not specified, or the no priority command is executed, the system uses a default base priority of 100. The priority command may be executed at any time.

The **no** form of this command restores the default base priority to the SRRP instance. If a VRRP policy is associated with the SRRP instance, it will use the default base priority as the basis for any modifications to the SRRP instances in-use priority.

## Default

priority 100

## Parameters

### *priority*

Specifies a base priority for the SRRP instance to override the default.

**Values** 1 to 254

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure card fp ingress network queue-group policer-control-override priority-mbs-thresholds priority

## Description

The **priority** level command contains the **mbs-contribution** configuration command for a given strict priority level. Eight levels are supported numbered 1 through 8 with 8 being the highest strict priority.

Each of the eight priority CLI nodes always exists and do not need to be created. While parameters exist for each priority level, the parameters are only applied when the priority level within a parent policer instance is currently supporting child policers.

## Parameters

### *level*

Specifies the priority level.

**Values** 1 to 8

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

priority

## Syntax

configure service vpls stp priority

configure service template vpls-template stp priority

### Description

The bridge-priority command is used to populate the priority portion of the bridge ID field within outbound BPDUs (the most significant 4 bits of the bridge ID). It is also used as part of the decision process when determining the best BPDU between messages received and sent. All values are truncated to multiples of 4096, conforming with IEEE 802.1t and 802.1D-2004.

The **no** form of this command returns the bridge priority to the default value.

### Default

priority 4096

## Parameters

### *bridge-priority*

Specifies the bridge priority for the STP instance

**Values** Allowed values are integers in the range of 4096 to 65535 with 4096 being the highest priority. The actual bridge priority value stored/used is the number entered with the lowest 12 bits masked off which means the actual range of values is 4096 to 61440 in increments of 4096.

## Full Context

configure service vpls spoke-sdp stp priority

configure service vpls spoke-sdp priority

configure service vpls sap stp priority

## Description

This command configures the Nokia Spanning Tree Protocol (STP) priority for the SAP or spoke SDP.

STP priority is a configurable parameter associated with a SAP or spoke SDP. When configuration BPDUs are received, the priority is used in some circumstances as a tie breaking mechanism to determine whether the SAP or spoke SDP be designated or blocked.

In traditional STP implementations (802.1D-1998), this field is called the port priority and has a value of 0 to 255. This field is coupled with the port number (0 to 255 also) to create a 16 bit value. In the latest STP standard (802.1D-2004) only the upper 4 bits of the port priority field are used to encode the SAP or spoke SDP priority. The remaining 4 bits are used to extend the port ID field into a 12 bit virtual port number field. The virtual port number uniquely references a SAP or spoke SDP within the STP instance.

STP computes the actual priority by taking the input value and masking out the lower four bits. The result is the value that is stored in the SDP priority parameter. For instance, if a value of 0 is entered, masking out the lower 4 bits results in a parameter value of 0. If a value of 255 is entered, the result is 240.

The **no** form of this command returns the STP priority to the default value.

## Default

priority 128

## Parameters

### *stp-priority*

Specifies the STP priority value for the SAP or spoke SDP. 0 is the highest priority. The actual value used for STP priority (and stored in the configuration) is the result of masking out the lower 4 bits, therefore the actual value range is 0 to 240 in increments of 16.

**Values** 0 to 255

### Full Context

configure service vprn static-route-entry ipsec-tunnel forwarding-class priority

configure service vprn static-route-entry indirect forwarding-class priority

configure service vprn static-route-entry next-hop forwarding-class priority

### Description

This optional command associates an enqueueing priority with the static route. The options are either high or low, with low being the default. This parameter has the ability to affect the likelihood that a packet will be enqueued at SAP ingress in the face of ingress congestion.

Once a packet is enqueued into an ingress buffer, the significance of this parameter is lost.

### Default

priority low

### Parameters

#### low

Setting the enqueueing parameter for a packet to **low** decreases the likelihood of enqueueing the packet when the ingress queue is congested. Ingress enqueueing priority only affects ingress SAP queuing. Once the packet is placed in a buffer on the ingress queue, the significance of the enqueueing priority is lost.

#### high

Setting the enqueueing parameter for a packet to **high** increases the likelihood of enqueueing the packet when the ingress queue is congested. Ingress enqueueing priority only affects ingress SAP queuing. Once the packet is placed in a buffer on the ingress queue, the significance of the enqueueing priority is lost.

## Full Context

configure service vprn ospf area interface priority

configure service vprn ospf3 area interface priority

## Description

This command configures the priority of the OSPF interface that is used to elect the designated router (DR) on the subnet.

This parameter is only used if the interface is of type **broadcast**. The router with the highest priority interface becomes the DR. A router with priority 0 is not eligible to be the designated router or backup designated router.

The **no** form of this command resets the interface priority to the default value.

## Default

priority 1

## Parameters

*number*

The interface priority expressed as a decimal integer. A value of 0 indicates the router is not eligible to be the Designated Router or Backup Designated Router on the interface subnet.

**Values** 0 to 255

## Platforms

All

priority

## Syntax

**priority** *dr-priority*

**no priority**

## Context

[\[Tree\]](#) (config>service>vprn>pim>if priority)

## Full Context

configure service vprn pim interface priority

## Description

This command sets the priority value to become the rendezvous point (RP) that is included in bootstrap messages sent by the router. The RP is sometimes called the bootstrap router. The **priority** command indicates whether the router is eligible to be a bootstrap router.

The **no** form of this command disqualifies the router to participate in the bootstrap election.

## Default

priority 1 (The router is the least likely to become the designated router.)

## Parameters

***dr-priority***

Specifies the priority to become the designated router. The higher the value, the higher the priority.

**Values** 1 to 4294967295

## Platforms

All

priority

## Syntax

**priority** *bootstrap-priority*

## Context

[\[Tree\]](#) (config>service>vprn>pim>rp>ipv6>bsr-candidate priority)

## Full Context

```
configure service vprn pim rp ipv6 bsr-candidate priority
```

```
configure service vprn pim rp bsr-candidate priority
```

## Description

This command defines the priority used to become the rendezvous point (RP). The higher the priority value the more likely that this router becomes the RP. If there is a tie, the router with the highest IP address is elected.

## Parameters

### *bootstrap-priority*

The priority to become the bootstrap router.

**Values** 0 to 255

**Default** 0 (the router is not eligible to be the bootstrap router)

## Platforms

All

## priority

## Syntax

**priority** *priority*

**no priority**

## Context

**[Tree]** (config>router>mpls>lsp>primary priority)

### Full Context

configure router mpls lsp-template priority

configure router mpls lsp secondary priority

configure router mpls lsp primary priority

### Description

This command enables the soft preemption procedures for this LSP path. The operator enables the soft preemption mechanism on a specific LSP name by explicitly configuring the setup and holding priorities for the primary path at the head-end node. The operator can similarly configure priority values for a secondary path for this LSP name. Different values could be used for the primary and for any of the secondary paths. In the absence of explicit user configuration, the setup priority is internally set to the default value of 7 and the holding priority is set to the default value of 0.

#### Note:

Valid user-entered values for these two parameters require that the holding priority be numerically lower than or equal to the setup priority, otherwise preemption loops can occur.

preemption is effected when a router preempting node processes a new RSVP session reservation and there is not enough available bandwidth on the RSVP interface, or the Class Type (CT) when Diff-Serv is enabled, to satisfy the bandwidth in the FlowSpec object while there exist other session reservations for LSP paths with a strictly lower holding priority (numerically higher holding priority value) than the setup priority of the new LSP reservation. If enough available bandwidth is freed on the link or CT to accommodate the new reservation by preempting one or more lower priority LSP paths, the preempting node allows temporary overbooking of the RSVP interface and honors the new reservation.

The preempting node will immediately set the 'Preemption pending' flag (0x10) in the IPv4 Sub-Object in the RRO object in the Resv refresh for each of the preempted LSP paths. The IPv4 Sub-Object corresponds to the outgoing interface being used by the preempting and preempted LSP paths; however, the bandwidth value in the FlowSpec object is not changed. The Resv flag must also be set if the preempting node is a merge point for the primary LSP path and the backup bypass LSP or detour LSP and the backup LSP is activated.

When evaluating if enough available bandwidth will be freed, the preempting node considers the reservations in order from the lowest holding priority (numerically higher holding priority value) to the holding priority just below the setup priority of the new reservation. A new reservation cannot preempt a reservation which has a value of the holding priority equal to the new reservation setup priority.

When Diff-Serv is enabled on the preempting node and the MAM bandwidth allocation model is used, a new reservation can only preempt a reservation in the same Class Type (CT).

LSP paths which were not flagged at the head-end for soft preemption will be hard preempted. LSP paths with the default holding priority of 0 cannot be preempted. LSP paths with zero bandwidth do not preempt other LSP paths regardless of the values of the path setup priority and the path holding priority. They can also not be preempted.

When evaluating if enough available bandwidth will be freed, the preempting node considers the reservations in order from the lowest holding priority (numerically higher holding priority) to the holding priority just below the setup priority of the new reservation. There is no specific order in which the reservations in the same holding priority are considered.

The preempting node starts a preemption timer for each of the preempted LSP paths. While this timer is on, the node should continue to refresh the Path and Resv for the preempted LSP paths. When the preemption timer expires, the node tears down the reservation if the head-end node has not already done so.

A head-end node upon receipt of the Resv refresh message with the 'Preemption pending' flag must immediately perform a make-before-break on the affected adaptive CSPF LSP. Both IGP metric and TE metric based CSPF LSPs are included. If an alternative path that excludes the flagged interface is not found, then the LSP is put on a retry in a similar way to the Global Revertive procedure at a head-end node. However, the number of retries and the retry timer are governed by the values of the **retry-limit** and **retry-timer** parameters: **config>router>mpls>lsp>retry-limit**; **config>router>mpls>lsp>retry-timer**.

MPLS will keep the address list of flagged interfaces for a maximum of 60 s (not user-configurable) from the time the first Resv message with the 'Preemption pending' flag is received. This actually means that MPLS will request CSPF to find a path that excludes the flagged interfaces in the first few retries until success or until 60 s have elapsed. Subsequent retries after the 60 s will not exclude the flagged interfaces as it is assumed IGP has converged by then and the Unreserved Bandwidth sub-TLV for that priority, or TE Class, in the TE database will show the updated value taking into account the preempting LSP path reservation or a value of zero if overbooked.

If the LSP has a configured secondary standby which is operationally UP, the router will switch the path of the LSP to it and then start the MBB. If no standby path is available and a secondary non-standby is configured, the router will start the MBB and signal the path of the secondary. The LSP path will be switched to either the secondary or the new primary, whichever comes up first.

The **no** form of this command reverts the LSP path priority to the default values and results in setting the setup priority to 7, in setting the hold priority to 0, and in clearing the 'soft preemption desired' flag in the RRO in the Resv refresh message.

## Default

no priority

## Parameters

### **setup-priority**

Specifies the priority of the reservation for this session at setup time.

**Values** 0 to 7 (0 is the highest priority and 7 is the lowest priority.)

**Default** 7 — This session does not preempt any other session.

### **holding-priority**

Specifies the priority of the reservation for this session at preemption action.

**Values** 0 to 7 (0 is the highest priority and 7 is the lowest priority.)

**Default** 0 — This session does not get preempted by any other session.

### Full Context

configure router static-route-entry next-hop forwarding-class priority

configure router static-route-entry indirect forwarding-class priority

### Description

This optional command associates an enqueueing priority with the static route. The options are either high or low, with low being the default. This parameter has the ability to affect the likelihood that a packet will be enqueued at SAP ingress in the face of ingress congestion.

Once a packet is enqueued into an ingress buffer, the significance of this parameter is lost.

### Default

priority low

### Parameters

#### low

Setting the enqueueing parameter for a packet to **low** decreases the likelihood of enqueueing the packet when the ingress queue is congested. Ingress enqueueing priority only affects ingress SAP queuing. Once the packet is placed in a buffer on the ingress queue, the significance of the enqueueing priority is lost.

#### high

Setting the enqueueing parameter for a packet to **high** increases the likelihood of enqueueing the packet when the ingress queue is congested. Ingress enqueueing priority only affects ingress SAP queuing. Once the packet is placed in a buffer on the ingress queue, the significance of the enqueueing priority is lost.

### Platforms

### Description

This command sets the priority bits and determines the forwarding class based on the mapping of priority to FC.

The **no** form of this command disables the local priority configuration and sets the priority to the **ccm-ltm-priority** associated with this MEP.

**Default**

no priority

**Parameters*****priority***

Specifies the priority bit.

**Values** 0 to 7

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**priority****Syntax**

**priority** *priority*

**no priority**

**Context**

[\[Tree\]](#) (config>router>fad>flex-algo priority)

**Full Context**

configure router flexible-algorithm-definitions flex-algo priority

**Description**

This command configures the priority of the FAD. This priority is used as a tie-breaker when the router has received multiple FADs for the same flexible algorithm.

Every router that is configured to participate in a particular flexible algorithm uses the same tie-breaker logic to select the winning FAD. This allows for consistent FAD definition selection in cases where routers advertise different definitions for a specific flexible algorithm. The following rules apply to the breaker mechanism.

- From the advertisements of the FAD in the area (including both locally generated advertisements and received advertisements), select the one with the highest priority value.
- If there are multiple advertisements of the FAD with the same highest priority, select the one that is originated from the router with either the highest system ID or router ID.

The **no** form of this command sets the priority to the default value.

**Default**

priority 100

**Parameters*****priority***

Configures the priority of this FAD.

**Values** 0 to 255

**Default** 100

## Full Context

configure router interface ipv6 vrrp priority

configure router interface vrrp priority

## Description

This command configures the base router priority for the virtual router instance used in the master election process.

The priority is the most important parameter set on a non-owner virtual router instance. The priority defines a virtual router's selection order in the master election process. Together, the priority value and the **preempt** mode allow the virtual router with the best priority to become the master virtual router.

The *base-priority* is used to derive the in-use priority of the virtual router instance as modified by any optional VRRP priority control policy. VRRP priority control policies can be used to either override or adjust the base priority value depending on events or conditions within the chassis.

The **priority** command is only available in the non-owner **vrrp** nodal context. The priority of **owner** virtual router instances is permanently set to 255 and cannot be changed.

For non-owner virtual router instances, the default base priority value is 100.

The **no** form of the command reverts to the default value.

## Default

priority 100

## Parameters

*priority*

The base priority used by the virtual router instance expressed as a decimal integer. If no VRRP priority control policy is defined, the *base-priority* is the in-use priority for the virtual router instance.

**Values** 1 to 254

## Platforms

configure vrrp policy priority-event port-down priority

configure vrrp policy priority-event lag-port-down number-down priority

## Description

This command controls the effect the set event has on the virtual router instance in-use priority.

When the event is set, the *priority-level* is either subtracted from the base priority of each virtual router instance or it defines the explicit in-use priority value of the virtual router instance depending on whether the **delta** or **explicit** keywords are specified.

Multiple set events in the same policy have interaction constraints:

- If any set events have an explicit **priority** value, all the delta **priority** values are ignored.
- The set event with the lowest explicit **priority** value defines the in-use priority that are used by all virtual router instances associated with the policy.
- If no set events have an explicit **priority** value, all the set events delta **priority** values are added and subtracted from the base priority value defined on each virtual router instance associated with the policy.

- If the delta priorities sum exceeds the **delta-in-use-limit** parameter, then the **delta-in-use-limit** parameter is used as the value subtracted from the base priority value defined on each virtual router instance associated with the policy.

If the **priority** command is not configured on the priority event, the *priority-value* defaults to 0 and the qualifier keyword defaults to **delta**, therefore, there is no impact on the in-use priority.

The **no** form of the command configures the set event to subtract 0 from the base priority (no effect).

## Default

no priority

## Parameters

### *priority-level*

The priority level adjustment value expressed as a decimal integer.

**Values** 0 to 254

### **delta**

Configures what effect the *priority-level* will have on the base priority value. The default base priority value is **delta**.

When **delta** is specified, the *priority-level* value is subtracted from the associated virtual router instance's base priority when the event is set and no explicit events are set. The sum of the priority event *priority-level* values on all set delta priority events are subtracted from the virtual router base priority to derive the virtual router instance in-use priority value. If the **delta** priority event is cleared, the *priority-level* is no longer used in the in-use priority calculation.

### **explicit**

Configures what effect the *priority-level* will have on the base priority value.

When **explicit** is specified, the *priority-level* value is used to override the base priority of the virtual router instance if the priority event is set and no other **explicit** priority event is set with a lower *priority-level*. The set **explicit** priority value with the lowest *priority-level* determines the actual in-use protocol value for all virtual router instances associated with the policy.

## Platforms

All

## priority

## Syntax

**priority** *priority-level* **explicit**

**no priority**

## Context

**[Tree]** (config>vrp>policy>priority-event>mc-ipsec-non-forwarding priority)

## Full Context

```
configure vrrp policy priority-event mc-ipsec-non-forwarding priority
```

## Description

This command controls the effect the set event has on the virtual router instance in-use priority.

When the event is set, the *priority-level* is either subtracted from the base priority of each virtual router instance or it defines the explicit in-use priority value of the virtual router instance depending on whether the **delta** or **explicit** keywords are specified.

Multiple set events in the same policy have interaction constraints:

- If any set events have an explicit **priority** value, all the delta **priority** values are ignored.
- The set event with the lowest explicit **priority** value defines the in-use priority that are used by all virtual router instances associated with the policy.
- If no set events have an explicit **priority** value, all the set events delta **priority** values are added and subtracted from the base priority value defined on each virtual router instance associated with the policy.
- If the delta priorities sum exceeds the **delta-in-use-limit** parameter, then the **delta-in-use-limit** parameter is used as the value subtracted from the base priority value defined on each virtual router instance associated with the policy.

If the **priority** command is not configured on the priority event, the *priority-value* defaults to 0 and the qualifier keyword defaults to **delta**, therefore, there is no impact on the in-use priority.

The **no** form of the command configures the set event to subtract 0 from the base priority (no effect).

## Default

no priority

## Parameters

### *priority-level*

The priority level adjustment value expressed as a decimal integer.

**Values** 0 to 254

### **explicit**

When **explicit** is specified, the *priority-level* value is used to override the base priority of the virtual router instance if the priority event is set and no other **explicit** priority event is set with a lower *priority-level*. The set **explicit** priority value with the lowest *priority-level* determines the actual in-use protocol value for all virtual router instances associated with the policy.

## priority

### Syntax

**priority** *bridge-priority*

**no priority**

### Context

[\[Tree\]](#) (config>service>pw-template>stp priority)

### Full Context

configure service pw-template stp priority

### Description

The **bridge-priority** command is used to populate the priority portion of the bridge ID field within outbound BPDUs (the most significant 4 bits of the bridge ID). It is also used as part of the decision process when determining the best BPDU between messages received and sent. All values will be truncated to multiples of 4096, conforming with IEEE 802.1t and 802.1D-2004.

The **no** form of this command returns the bridge priority to the default value.

### Default

priority 4096

### Parameters

#### *bridge-priority*

Specifies the bridge priority for the STP instance.

**Values** Allowed values are integers in the range of 4096 to 65535 with 4096 being the highest priority. The actual bridge priority value stored/used is the number entered with the lowest 12 bits masked off which means the actual range of values is 4096 to 61440 in increments of 4096.

configure subscriber-mgmt sub-profile ingress policer-control-policy priority-mbs-thresholds  
 configure subscriber-mgmt sub-profile egress policer-control-policy priority-mbs-thresholds

## Description

The **priority-mbs-thresholds** command contains the root arbiter parent policer's **min-thresh-separation** command and each priority level's **mbs-contribution** command that is used to internally derive each priority level's shared-portion and fair-portion values. The system uses each priority level's shared-portion and fair-portion value to calculate each priority level's discard-unfair and discard-all MBS thresholds that enforce priority sensitive rate-based discards within the root arbiter's parent policer.

The **priority-mbs-thresholds** CLI node always exists and does not need to be created.

## Platforms

## 20.336 priority1

```
priority1
```

### Syntax

```
priority1 priority-value
no priority1
```

### Context

[\[Tree\]](#) (config>system>ptp priority1)

### Full Context

```
configure system ptp priority1
```

### Description

This command configures the priority1 value of the local clock. This parameter is only used when the profile is set to ieee1588-2008. This value is used by the Best Master Clock Algorithm to determine which clock should provide timing for the network.

This value is used for the value to advertise in the Announce messages and for the local clock value in data set comparisons.

The **no** form of the command reverts to the default configuration.

### Default

```
priority1 128
```

## Parameters

### *priority-value*

Specifies the value of the priority1 field.

**Values** 0 to 255

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.337 priority2

### priority2

## Syntax

**priority2** *priority-value*

**no priority2**

## Context

[\[Tree\]](#) (config>system>ptp priority2)

## Full Context

configure system ptp priority2

## Description

This command configures the priority2 value of the local clock. This parameter is only used when the **profile** is set to **ieee1588-2008**, **g8275dot1-2014**, or **g8275dot2-2016**. The parameter is ignored when any other profile is selected.

This value is used by the Best timeTransmitter Clock algorithm to determine which clock should provide timing for the network.

### **Note:**

This value is used for the value to advertise in the Announce messages and for local clock value in data set comparisons.

The **no** form of the command reverts to the default configuration.

## Default

priority2 128

## Parameters

### *priority-value*

Specifies the value of the priority2 field.

**Values** 0 to 255

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**Full Context**

configure li x-interfaces lics lic authentication private-ki

**Description**

This command configures the private key for the X1 and X2 interfaces.

The **no** form of this command reverts to the default.

**Parameters**

*hex-string*

Specifies the password. Must contain exactly 32 hex nibbles.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.342 private-retail-subnets

```
private-retail-subnets
```

### Syntax

**[no] private-retail-subnets**

### Context

**[Tree]** (config>service>vprn>sub-if private-retail-subnets)

### Full Context

```
configure service vprn subscriber-interface private-retail-subnets
```

### Description

This command controls the export of retail subnets and prefixes to the wholesale forwarding service. When this attribute is configured, subnets and prefixes configured on the retail subscriber interface are no longer exported to the associated wholesale VPRN and remain private to the retail VPRN. This is useful in a IPoE or PPPoE business service context, as it allows retail services to use overlapping IP address spaces even if those services are associated with the same wholesale service. IPoE and PPPoE sessions are actually terminated in the retail service although their traffic transits on a SAP belonging to the wholesale service.

Configuring private retail subnets is not supported for IPv4 static hosts and ARP hosts. If PPPoE sessions need to coexist with IPv4 static hosts or ARP hosts, then this attribute should not be configured on the retail subscriber interface.

This command fails if the subscriber interface is not associated with a wholesale service.

If the retail VPRN is of the type **hub**, this attribute is mandatory. In this case, private retail subnets are enabled by default and cannot be unconfigured.

The **no** form of this command disables overlapping IP addresses between different retailers referring to this interface.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.343 private-service

## private-service

### Syntax

**private-service** *service-id*

**private-service name** *service-name*

**no private-service**

### Context

[\[Tree\]](#) (config>ipsec>client-db>client private-service)

### Full Context

configure ipsec client-db client private-service

### Description

This command specifies the private service ID that is used for tunnel setup.

The **no** form of this command reverts to the default.

### Default

no private-service

### Parameters

#### *service-id*

Specifies the service ID of the tunnel delivery service.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **private-service name** *service-name* variant can be used in all configuration modes.

**Values** {*id* | *svc-name*}

*id*: 1 to 2147483647

*svc-name*: up to 64 characters (*svc-name* is an alias for input only. The *svc-name* gets replaced with an id automatically by SR OS in the configuration).

#### *name service-name*

Identifies the service, up to 64 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.344 private-tcp-mss-adjust

### private-tcp-mss-adjust

#### Syntax

```
private-tcp-mss-adjust octets
private-tcp-mss-adjust default
no private-tcp-mss-adjust
```

#### Context

```
[Tree] (config>service>vprn>l2tp>group>l2tpv3 private-tcp-mss-adjust)
[Tree] (config>service>vprn>l2tp>group>tunnel>l2tpv3 private-tcp-mss-adjust)

[Tree] (config>service>vprn>l2tp>l2tpv3 private-tcp-mss-adjust)
[Tree] (config>router>l2tp>group>l2tpv3 private-tcp-mss-adjust)
```

#### Full Context

```
configure service vprn l2tp group l2tpv3 private-tcp-mss-adjust
configure service vprn l2tp group tunnel l2tpv3 private-tcp-mss-adjust
configure router l2tp group tunnel l2tpv3 private-tcp-mss-adjust
configure service vprn l2tp l2tpv3 private-tcp-mss-adjust
configure router l2tp group l2tpv3 private-tcp-mss-adjust
```

#### Description

This command enables TCP MSS adjust for L2TPv3 tunnels on the private side of the group or tunnel level. When this command is configured, the system updates the TCP MSS option value of the received TCP SYN packet on the private side.

Note that this command can be overridden by the corresponding configuration on the group or tunnel level.

With the **default** parameter, the system uses the upper-level configuration. With the non-default parameter, the system uses this configuration instead of the upper level configuration.

The **no** form of this command disables TCP MSS adjust on the private side.

#### Default

```
no private-tcp-mss-adjust
```

#### Parameters

**octets**

Specifies the new TCP MSS value in octets.

**Values** 512 to 9000

**default**

Specifies to use the upper-level configuration

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.345 probe-count

### probe-count

#### Syntax

**probe-count** *probes-per-hop*

**no probe-count**

#### Context

**[Tree]** (config>saa>test>type-multi-line>lsp-trace>sr-policy probe-count)

#### Full Context

configure saa test type-multi-line lsp-trace sr-policy probe-count

#### Description

This command configures the number of probes per hop.

The **no** form of this command reverts to the default value.

**Default**

probe-count 1

**Parameters*****probes-per-hop***

Specifies the probes-per-hop count, expressed as number of packets.

**Values** 1 to 10

**Default** 1

**Platforms**

All

## 20.346 probe-fail-enable

```
probe-fail-enable
```

**Syntax**

[no] probe-fail-enable

**Context**

[\[Tree\]](#) (config>saa>test>trap-gen probe-fail-enable)

**Full Context**

```
configure saa test trap-gen probe-fail-enable
```

**Description**

This command enables the generation of an SNMP trap when the consecutive probe failure threshold (configured using the **probe-fail-threshold** command) is reached during the execution of the SAA ping test. This command is not applicable to SAA trace route tests.

The **no** form of this command disables the generation of an SNMP trap.

**Platforms**

All

## 20.347 probe-fail-threshold

## probe-fail-threshold

### Syntax

**probe-fail-threshold** *threshold*

**no probe-fail-threshold**

### Context

**[Tree]** (config>saa>test>trap-gen probe-fail-threshold)

### Full Context

configure saa test trap-gen probe-fail-threshold

### Description

This command configures the threshold for trap generation after ping probe failure.

This command has no effect when **probe-fail-enable** is disabled. This command is not applicable to SAA trace route tests.

The **no** form of this command returns the threshold value to the default.

### Default

probe-fail-threshold 1

### Parameters

***threshold***

Specifies the number of consecutive ping probe failures required to generate a trap.

**Values** 0 to 15

### Platforms

All

## 20.348 probe-history

## probe-history

### Syntax

**probe-history** {**keep** | **drop** | **auto**}

### Context

**[Tree]** (config>saa>test probe-history)

## Full Context

```
configure saa test probe-history
```

## Description

Specifies history probe behavior. Defaults are associated with various configured parameters within the SAA test. Auto (keep) is used for test with probe counts of 100 or less, and intervals of 1 second and above. Auto (drop) only maintains summary information for tests marked as continuous with file functions, probe counts more than 100 and intervals of less than 1 second. SAA tests that are not continuous with a write to file defaults to Auto (keep). The operator is free to change the default behaviors for each type. Each test that maintains per probe history consumes more system memory. When per probe entries are required, the probe history is available at the completion of the test.

## Default

```
probe-history auto
```

## Parameters

### auto

An auto selector that determines the storage of the history information.

### drop

Stores summarized min/max/avg data not per probe information for test runs. This may be configured for all tests to conserve memory.

### keep

Stores per probe information for tests. This consumes significantly more memory than summary information and should only be used if necessary.

## Platforms

All

## 20.349 process-arp-probes

```
process-arp-probes
```

## Syntax

```
[no] process-arp-probes
```

## Context

```
[Tree] (config>service>vpls>proxy-arp process-arp-probes)
```

## Full Context

```
configure service vpls proxy-arp process-arp-probes
```

## Description

This command enables router proxy ARP function replies to Duplicate Address Detection (DAD) ARP probes upon a successful proxy ARP table lookup.

The **no** form of this command disables the router from replying to DAD ARP probes.

## Default

process-arp-probes

## Platforms

## 20.350 process-cpm-traffic-on-sap-down

```
process-cpm-traffic-on-sap-down
```

## Syntax

```
[no] process-cpm-traffic-on-sap-down
```

## Context

[\[Tree\]](#) (config>service>vpls>sap process-cpm-traffic-on-sap-down)

## Full Context

```
configure service vpls sap process-cpm-traffic-on-sap-down
```

## Description

This command is applicable to simple SAPs configured on LAGs that are not part of any "endpoint" configurations or complicated resiliency schemes like MC-LAG with inter-chassis-backup (ICB) configurations. When configured, a simple LAG SAP is not removed from the forwarding plane and flooded traffic (unknown unicast, broadcast and multicast) is dropped on egress. This allows applicable control traffic that is extracted at the egress interface to be processed by the CPM. This command will not prevent a VPLS service from entering an operationally down state if it is the last active connection to enter a nonoperational state. By default, without this command, when a SAP on a LAG enters a nonoperational state, it is removed from the forwarding plane and no forwarding occurs to the egress.

The **no** form of this command removes a SAP over a LAG that is not operational from the forwarding process.

## Description

This command configures the category profiles of the web service.

The **no** form of this command removes the category profiles configuration.

## Parameters

### *profile-name*

Specifies the name of the category profile, up to 256 characters.

### **create**

Keyword that specifies to create a category profile.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## profile

## Syntax

[no] **profile** *user-profile-name*

## Context

[\[Tree\]](#) (config system security profile)

## Full Context

configure system security profile

## Description

This command creates a context to create user profiles for command authorization and other functions associated with a user.

Profiles can be used to deny or permit user access to entire command branches or to specific commands.

Once the profiles are created, the **user** command assigns users to one or more profiles. You can define up to 16 user profiles but a maximum of 8 profiles can be assigned to a user.

The **no** form of this command deletes a user profile.

## Parameters

### *user-profile-name*

Specifies the user profile name entered as a character string. The string is case sensitive and limited to 32 ASCII 7-bit printable characters with no spaces.

**profile****Syntax**

**profile** {in | out}

**no profile**

**Context**

[\[Tree\]](#) (config qos sap-ingress fc profile)

**Full Context**

configure qos sap-ingress fc profile

**Description**

This command places a forwarding class or subclass into a color aware profile mode. Normally, packets associated with a class are considered in-profile or out-of-profile solely based on the dynamic rate of the ingress queue relative to its CIR. Explicitly defining a class as in-profile or out-of-profile overrides this function by handling each packet with the defined profile state.

The profile command may only be executed when the forwarding class or the parent forwarding class (for a subclass) is mapped to a queue that has been enabled to support color aware profile packets. The queue may only be configured for profile-mode at the time the queue is created in the SAP ingress QoS policy.

A queue operating in profile-mode may support in-profile, out-of-profile, and non-profiled packets simultaneously. However, the high- and low-priority classification actions are ignored when the queue is in profile-mode.

The **no** form of this command removes an explicit in-profile or out-of-profile configuration on a forwarding class or subclass.

**Default**

**no profile** — The default profile state of a forwarding class or subclass is not to treat ingress packets as color aware. An explicit definition for in-profile or out-of-profile must be specified on the forwarding class or subclass.

**Parameters****in**

The **in** keyword is mutually exclusive to the **out** keyword. When the profile in command is executed, all packets associated with the class will be handled as in-profile. Packets explicitly handled as in-profile or out-of-profile still flow through the ingress service queue

associated with the class to preserve order within flows. In-profile packets will count against the CIR of the queue, diminishing the amount of CIR available to other classes using the queue that are not configured with an explicit profile.

### out

The **out** keyword is mutually exclusive to the **in** keyword. When the profile out command is executed, all packets associated with the class will be handled as out-of-profile. Packets explicitly handled as in-profile or out-of-profile still flow through the ingress service queue associated with the class to preserve order within flows. Out-of-profile packets will not count against the CIR of the queue, allowing other classes using the queue that are not configured with an explicit profile to be measured against the full CIR.

## Platforms

All

## profile

## Syntax

```
profile {g8265dot1-2010 | ieee1588-2008 | g8275dot1-2014 | g8275dot2-2016}
```

## Context

[\[Tree\]](#) (config system ptp profile)

## Full Context

```
configure system ptp profile
```

## Description

This command configures the profile for the internal PTP clock, which defines the Best timeTransmitter Clock Algorithm (BTCA) behavior.

The profile setting for the clock cannot be changed unless PTP is shutdown.

The **clock-type** is restricted based on the PTP profile setting.

- If the profile is **ieee1588-2008**, the **clock-type** is not restricted.
- If the profile is **g8265dot1-2010**, the **clock type** may only be **ordinary slave** or **ordinary master**; boundary clock is not allowed.
- If the profile is **g8275dot1-2014** or **g8275dot2-2016**, the **clock-type** may only be boundary clock or **ordinary slave**; **ordinary master** is not allowed.

When the profile is changed, the domain changes to the default value for the new profile. Any command parameters that are set to default for the original profile are changed to the default for the new profile. This applies to the following:

- **log-anno-interval** set for the clock
- **log-sync-interval** set for a peer or a port
- **log-delay-interval** set for a port

Non-default parameter values for the original profile remain unchanged.

## Default

profile g8265dot1-2010

## Parameters

### **g8265dot1-2010**

Conforms to the ITU-T G.8265.1 specification.

### **ieee1588-2008**

Conforms to the 2008 version of the IEEE1588 standard.

### **g8275dot1-2014**

Conforms to the ITU-T G.8275.1 specification.

### **g8275dot2-2016**

Conforms to the ITU-T G.8275.2 specification.

configure qos sap-ingress policer profile-capped

configure qos queue-group-templates egress queue-group profile-capped

configure qos queue-group-templates ingress queue-group profile-capped

configure qos sap-egress policer profile-capped

## Description

Profile-capped mode enforces an overall in-profile burst limit to the CIR bucket for ingress undefined, ingress explicit in-profile, egress soft-in-profile, and egress explicit in-profile packets. The default behavior when profile-capped mode is not enabled is to ignore the CIR output state when an explicit in-profile packet is handled by an ingress or egress policer.

The profile-capped mode makes two changes:

- At egress, soft-in-profile packets (packets received from ingress as in-profile) are treated the same as explicit in-profile (unless explicitly reclassified as out-of-profile) and have an initial policer state of in-profile.
- At both ingress and egress, any packet output from the policer with a non-conforming CIR state are treated as out-of-profile (out-of-profile state is ignored for initial in-profile packets when profile-capped mode is not enabled).

## Default

no profile-capped

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

configure service vpls sap sub-sla-mgmt single-sub-parameters profiled-traffic-only

configure service ies subscriber-interface group-interface sap sub-sla-mgmt single-sub-parameters profiled-traffic-only

configure service vprn subscriber-interface group-interface sap sub-sla-mgmt single-sub-parameters profiled-traffic-only

configure service vprn interface sap sub-sla-mgmt single-sub profiled-traffic-only

**Description**

This command specifies whether only profiled traffic is applicable for this SAP. The profiled traffic refers to single subscriber traffic on a dedicated SAP (in the VLAN-per-subscriber model). When enabled, subscriber queues are instantiated through the QOS policy defined in the sla-profile and the associated SAP queues are deleted. This can increase subscriber scaling by reducing the number of queues instantiated per subscriber (in the VLAN-per-subscriber model). In order for this to be achieved, any configured multi-sub-sap limit must be removed (leaving the default of 1).

The **no** form of this command disables the command.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**20.357 progress-indicator**

### Context

[\[Tree\]](#) (config>router>mpls>lsp>fast-reroute propagate-admin-group)

[\[Tree\]](#) (config>router>mpls>lsp-template>fast-reroute propagate-admin-group)

### Full Context

configure router mpls lsp fast-reroute propagate-admin-group

configure router mpls lsp-template fast-reroute propagate-admin-group

### Description

The command enables the signaling of the primary LSP path admin-group constraints in the FRR object at the ingress.

When this command is executed, the admin-group constraints configured in the context of the P2P LSP primary path, or the ones configured in the context of the LSP and inherited by the primary path, are copied into the FAST\_REROUTE object. The admin-group constraints are copied into the 'include-any' or 'exclude-any' fields.

The ingress LER thus propagates these constraints to the downstream nodes during the signaling of the LSP to allow them to include the admin-group constraints in the selection of the FRR backup LSP for protecting the LSP primary path.

The ingress LER inserts the FAST\_REROUTE object by default in a primary LSP path message. If the user disables the object using the following command, the admin-group constraints will not be propagated: **config>router>mpls>no frr-object**.

Note that the same admin-group constraints can be copied into the Session Attribute object. They are intended for the use of an LSR, typically an ABR, to expand the ERO of an inter-area LSP path. They are also used by any LSR node in the path of a CSPF or non-CSPF LSP to check the admin-group constraints against the ERO regardless if the hop is strict or loose. These are governed strictly by the command:

**config>router>mpls>lsp>propagate-admin-group**

In other words, the user may decide to copy the primary path admin-group constraints into the FAST\_REROUTE object only, or into the Session Attribute object only, or into both. Note, however, that the PLR rules for processing the admin-group constraints can make use of either of the two object admin-group constraints.

This feature is supported with the following LSP types and in both intra-area and inter-area TE where applicable:

- Primary path of a RSVP P2P LSP.
- S2L path of an RSVP P2MP LSP instance
- LSP template for an S2L path of an RSVP P2MP LSP instance.

The **no** form of this command disables the signaling of administrative group constraints in the FRR object.

## Default

no propagate-admin-group

## Platforms

All

## propagate-admin-group

## Syntax

[no] propagate-admin-group

## Context

**[Tree]** (config>router>mpls>lsp-template propagate-admin-group)

**[Tree]** (config>router>mpls>lsp propagate-admin-group)

## Full Context

configure router mpls lsp-template propagate-admin-group

configure router mpls lsp propagate-admin-group

## Description

This command enables propagation of session attribute object with resource affinity (C-type 1) in PATH message. If an LSR receives a session attribute with resource affinity, then it will check the compatibility of admin-groups received in PATH message against configured admin-groups on the egress interface of LSP.

To support admin-group for inter-area LSP, the ingress node must configure propagating admin-groups within the session attribute object. If a PATH message is received by an LSR node that has the **cspf-on-loose-hop** option enabled and the message includes admin-groups, then the ERO expansion by CSPF to calculate the path to the next loose hop includes the admin-group constraints received from ingress node.

If this option is disabled, then the session attribute object without resource affinity (C-Type 7) is propagated in PATH message and CSPF at the LSR node does not include admin-group constraints.

This admin group propagation is supported with a P2P LSP, a P2MP LSP instance, and an LSP template.

The user can change the value of the **propagate-admin-group** option on the fly. A RSVP P2P LSP performs a Make-Before-Break (MBB) on changing the configuration. A S2L path of an RSVP P2MP LSP performs a Break-Before-Make on changing the configuration.

The **no** form of this command reverts to the default value.

## Default

no propagate-admin-group

## 20.361 propagate-hold-time

```
propagate-hold-time
```

### Syntax

```
propagate-hold-time second
```

```
no propagate-hold-time
```

### Context

```
[Tree] (config>eth-cfm>redundancy>mc-lag propagate-hold-time)
```

### Full Context

```
configure eth-cfm redundancy mc-lag propagate-hold-time
```

### Description

This command configures the delay, in seconds, that fault propagation is delayed because of port or MC-LAG state changes. This provides the amount of time for system stabilization during a port state changes that may be protected by MC-LAG. This command requires the standby-mep-shutdown command in order to take effect.

The **no** form of the command reverts to the default.

**Default**

propagate-hold-time 1

**Parameters****seconds**

Specifies the amount of time in seconds. Zero means no delay.

**Values** 0 to 60

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.362 propagate-mac-flush

```
propagate-mac-flush
```

**Syntax**

[no] propagate-mac-flush

**Context**

[\[Tree\]](#) (config>service>vpls propagate-mac-flush)

**Full Context**

```
configure service vpls propagate-mac-flush
```

**Description**

This command enabled propagation of mac-flush messages received from the specified T-LDP on all spoke and mesh-SDPs within the context of the VPLS service. The propagation will follow split-horizon principles and any data-path blocking in order to avoid looping of these messages.

**Default**

no propagate-mac-flush

**Platforms**

All

## 20.363 propagate-mac-flush-from-bvpls

## propagate-mac-flush-from-bvpls

### Syntax

[no] propagate-mac-flush-from-bvpls

### Context

[\[Tree\]](#) (config>service>vpls>pbb propagate-mac-flush-from-bvpls)

### Full Context

configure service vpls pbb propagate-mac-flush-from-bvpls

### Description

This command enables the propagation in the local PBB of any regular LDP MAC Flush received in the related B-VPLS. If an LDP MAC flush-all-but-mine is received in the B-VPLS context, the command controls also whether a flush is performed for all the customer MACs in the associated FDB. The command does not have any effect on a PBB MAC Flush (LDP MAC flush with PBB TLV) received in the related B-VPLS context.

The **no** form of this command disables the propagation of LDP MAC Flush i from the related B-VPLS.

### Default

no propagate-mac-flush-from-bvpls

### Platforms

## 20.364 propagate-metric

## propagate-metric

### Syntax

[no] propagate-metric

### Context

[\[Tree\]](#) (config>service>vprn>rip propagate-metric)

### Full Context

configure service vprn rip propagate-metric

### Description

This command enables the BGP MED to be used to configure the RIP metric at the BGP to RIP transition on egress routers. BGP always configures the BGP MED to the RIP metric at the ingress router. When

**propagate-metric** is configured, the RIP metric at egress routers is configured as the BGP MED attribute added to the optional value configured with the **metric-out** command.

The **no** version of this command sets the RIP metric to the optional value configured with the **metric-out** command plus 1.

### Default

no propagate-metric

## 20.367 propagate-topology-change

propagate-topology-change

### Syntax

[no] propagate-topology-change

### Context

**[Tree]** (config>eth-ring>sub-ring>interconnect propagate-topology-change)

### Full Context

configure eth-ring sub-ring interconnect propagate-topology-change

### Description

This command configures the G.8032 sub-ring to propagate topology changes. From the sub-ring to the major ring as specified in the G.8032 interconnection flush logic. This command is only valid on the sub-

ring and on the interconnection node. Since this command is only valid on a Sub-ring, a virtual link or non-virtual link must be specified to configure this command. The command is blocked on major rings (when both path a and b are specified on a ring).

The **no** form of this command reverts propagate to the default value.

### Default

no propagate-topology-change

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.368 protect-circuit

### protect-circuit

#### Syntax

**protect-circuit** *port-id*

**no protect-circuit**

#### Context

[\[Tree\]](#) (config>port>aps protect-circuit)

#### Full Context

configure port aps protect-circuit

#### Description

This command configures a physical port that will act as the protection circuit for this APS group. The protect circuit port must contain only the default configuration and cannot belong to another APS group. The protect circuit port must be of the same type as the working circuit for the APS group, for the port to be added to an APS group port. If that's not the case, the command will return an error.

A protection circuit can only be added if the working circuit already exists; the protection circuit must be removed from the configuration before the working circuit is removed.

When a port is a protect-circuit of an APS group, the configuration options available in the **config>port** *port-id*>**sonet-sdh** context is not allowed for that port unless it is part of the noted exceptions. The exception list includes these SONET/SDH commands:

- clock-source
- [no] loopback
- [no] report-alarm
- section-trace
- [no] threshold

When is port configured as a protection circuit of an APS group, the configurations described above and all service configurations related to APS port are operationally inherited by the protect circuit. If the protect circuit cannot inherit the configurations (due to resource limitations), the configuration attempt fails and an error is returned to the user.

The protect circuit must be shutdown before it can be removed from the APS group port. The inherited configuration for the circuit and APS operational commands for that circuit are not preserved when the circuit is removed from the APS group.

The **no** form of this command removes the protect-circuit.

## Parameters

### *port-id*

Specifies the physical port that will act as the protection circuit for this APS group in the following format.

|                |                      |                          |         |
|----------------|----------------------|--------------------------|---------|
| <i>port-id</i> | <i>slot/mda/port</i> |                          |         |
|                | <i>eth-sat-id</i>    | <i>esat-id/slot/port</i> |         |
|                |                      | <i>esat</i>              | keyword |
|                |                      | <i>id</i>                | 1 to 20 |
|                | <i>pxc-id</i>        | <i>pxc-id.sub-port</i>   |         |
|                |                      | <i>pxc</i>               | keyword |
|                |                      | <i>id</i>                | 1 to 64 |
|                |                      | <i>sub-port</i>          | a, b    |

Refer to "Modifying Hold-Down Timer Values" in the **config>port>aps working-circuit** command description for information about modifying the timer defaults in the event of communication delays between the APS controllers.

## 20.369 protect-tp-path

### protect-tp-path

#### Syntax

[no] protect-tp-path

#### Context

**[Tree]** (config>router>mpls>lsp protect-tp-path)

## Full Context

```
configure router mpls lsp protect-tp-path
```

## Description

This command creates or edits the protect path for an MPLS-TP LSP. At least one working path must exist before a protect path can be created for an MPLS-TP LSP. If MPLS-TP linear protection is also configured, then this is the path that is used as the default protect path for the LSP. The protect path must be deleted before the working path. Only one protect path can be created for each MPLS-TP LSP.

The following commands are applicable to the working-tp-path: **lsp-num**, **in-label**, **out-label**, **mep**, **shutdown**.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.370 protecting-next-hop-id

```
protecting-next-hop-id
```

## Syntax

```
protecting-next-hop-id next-hop-index
no protecting-next-hop-id
```

## Context

**[Tree]** (config>router>p2mp-sr-tree>replication-segment>next-hop-id protecting-next-hop-id)

## Full Context

```
configure router p2mp-sr-tree replication-segment next-hop-id protecting-next-hop-id
```

## Description

This command provides the ID of the protection next-hop used for FRR.

The protection next-hop outgoing SID is pushed on top of the next-hop SID list.

The **no** form of this command removes the protection next-hop.

## Parameters

***next-hop-index***

Specifies the ID of the protection next-hop.

**Values** 1 to 4096

## Platforms

All

## 20.371 protection

### protection

#### Syntax

**protection none**

**protection hmac-sha256 key** *key* [**hash** | **hash2** | **custom**]

**no protection**

#### Context

[\[Tree\]](#) (config>python>py-script protection)

#### Full Context

configure python python-script protection

#### Description

This command specifies the format of the Python script file(s) in this python-script. Unintentional changing of Python script file could be prevented by using protected format.

The **no** form of this command equals to **protection none**.

#### Parameters

##### **none**

Indicates the Python script is stored in plain text, without any mechanism in place to ensure the integrity nor the confidentiality of the content of the Python script.

##### **hmac-sha256**

Indicates the first line of the Python script must consist of the hash value obtained by hashing the rest of the Python script using the **hmac-sha256** hashing algorithm.

##### **key**

The specified key along with original Python script file content are used to compute the hash. The computed hash will be compared to the hash in the Python script file. If there is no match, then system will fail to load the script.

##### **hash**

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

##### **hash2**

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be

in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**custom**

Specifies the key entered is a customized hashing scheme.

configure router segment-routing segment-routing-v6 base-routing-instance micro-segment-locator function ua protection

**Description**

This command configures the protection type of the SID.

The **no** form of this command reverts to the default value of **protected**.

**Default**

protection protected

**Parameters**

**protection**

Specifies whether the adjacency SID is protected.

**Values** protected, unprotected

**Platforms**

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 20.372 protection-template

### protection-template

#### Syntax

**protection-template** *name*

**no protection-template**

#### Context

[\[Tree\]](#) (config>router>mpls>mpls-tp protection-template)

#### Full Context

configure router mpls mpls-tp protection-template

#### Description

Protection templates are used to define generally applicable protection parameters for MPLS-TP tunnels. Only linear protection is supported, and so the application of a named template to an MPLS-TP LSP implies that linear protection is used. A protection template is applied under the MEP context of the protect-path of an MPLS-TP LSP.

The protection-template command creates or edits a named protection template.

#### Default

no protection-template

#### Parameters

*name*

Specifies the protection template name as a text string of up to 32 characters in printable 7-bit ASCII, enclosed in double quotes.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### protection-template

#### Syntax

**protection-template** *name*

**no protection-template**

#### Context

[\[Tree\]](#) (config>router>mpls>lsp>protect-tp-path>mep protection-template)

## Full Context

```
configure router mpls lsp protect-tp-path mep protection-template
```

## Description

This command applies a protection template name to an MPLS-TP LSP that the protect path is configured under. If the template is applied, then MPLS-TP 1:1 linear protection is enabled on the LSP, using the parameters specified in the named template.

A named protection template can only be applied to the protect path context of an MPLS-TP LSP.

The no form of this command removes the template and thus disables mpls-tp linear protection on the LSP.

## Default

```
no protection-template
```

## Parameters

*name*

Specifies a text string for the template up to 32 characters in printable 7-bit ASCII, enclosed in double quotes.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.373 protection-type

### protection-type

## Syntax

```
protection-type {g8031-1to1 | loadsharing}
```

## Context

[\[Tree\]](#) (config>eth-tunnel protection-type)

## Full Context

```
configure eth-tunnel protection-type
```

## Description

This command configures the model used for determining which members are actively receiving and transmitting data.

When the value is set to "g8031-1to1 (1)", as per the G.8031 specification, only two members are allowed, and only one of them can be active at one point in time.

When the value is set to "loadsharing (2)", multiple members can be active at one point in time.

## Default

protection-type g8031-1to1

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## protection-type

## Syntax

**protection-type** {link | node}

**no protection-type**

## Context

[\[Tree\]](#) (config>router>route-next-hop-policy>template protection-type)

## Full Context

configure router route-next-hop-policy template protection-type

## Description

This command configures the protection type constraint into the route next-hop policy template.

The user can select if link protection or node protection is preferred in the selection of an LFA next-hop for all IP prefixes and LDP FEC prefixes to which a route next-hop policy template is applied. The default in SR OS implementation is node protection. The implementation will fall back to the other type if no LFA next-hop of the preferred type is found.

When the route next-hop policy template is applied to an IP interface, all prefixes using this interface as a primary next-hop will follow the protection type preference specified in the template.

The **no** form deletes the protection type constraint from the route next-hop policy template.

## Default

protection-type node

## Parameters

{link | node}

Specifies the two possible values for the protection type.

**Default** node

## Platforms

All

## 20.374 proto-version

proto-version

### Syntax

**proto-version** {v070 | latest}

### Context

[\[Tree\]](#) (config>system>grpc>gnmi proto-version)

### Full Context

configure system grpc gnmi proto-version

### Description

This command sets the gnmi.proto version that the GRPC server should use for all gNMI RPCs.

### Default

proto-version latest

### Parameters

#### v070

Specifies to use v0.7.0 for gNMI RPCs. Only use this option for backward compatibility with legacy collectors.

#### latest

Specifies to use the latest gnmi.proto version for gNMI RPCs. The latest version is v0.8.0.

## Full Context

configure ipsec ts-list remote entry protocol

configure ipsec ts-list local entry protocol

## Description

This command specifies the protocol and port range in the IKEv2 traffic selector.

The SR OS supports OPAQUE ports and port ranges for the following protocols:

- TCP
- UDP
- SCTP
- ICMP
- ICMPv6
- MIPv6

For ICMP and ICMPv6, the *port* value takes the form *icmp-type/icmp-code*. For MIPv6, the *port* value is the mobility header type. For other protocols, only the **port any** configuration can be used.

## Default

no protocol

## Parameters

### *protocol-id*

Specifies the protocol ID. The value can be a number, a protocol name, or **any**.

### *begin-port-id*

Specifies the beginning of the port range.

**Values** For TCP, UDP, and SCTP, the value is the port number.  
For ICMP and ICMPv6, the value takes the form *icmp-type/icmp-code*; for example, 0/0.  
For MIPv6, the value is the mobility header type.

### *end-port-id*

Specifies the end of the port range

**Values** For TCP, UDP, and SCTP, the value is the port number.  
For ICMP and ICMPv6, the value takes the form *icmp-type/icmp-code*; for example, 0/0.  
For MIPv6, the value is the mobility header type.

### **opaque**

Specifies OPAQUE ports.

### **any**

Specifies any port.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## protocol

## Syntax

[no] protocol {*number* | **any**}

## Context

[\[Tree\]](#) (config>service>nat>firewall-policy>unknown-protocols protocol)

## Full Context

configure service nat firewall-policy unknown-protocols protocol

## Description

This command configures the protocol numbers that are allowed to create unknown flows.

Protocol or IPv6 extension header values that are explicitly supported by SR OS can be configured but will not be treated as unknown protocols.

The **no** form of the command removes the allowance for the specified protocol to create unknown flows.

## Parameters

### **any**

Specifies that unknown flows can be created by any protocol.

### **number**

Specifies the IANA number of a protocol that needs to be allowed to create unknown flows.

**Values** 0 to 255

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## protocol

## Syntax

[no] protocol *protocol-id*

## Context

[\[Tree\]](#) (config>filter>match-list>protocol-list protocol)

## Full Context

configure filter match-list protocol-list protocol

## Description

This command adds a protocol to the match protocol list.

The **no** form of this command removes the protocol from the **protocol-list**.

## Parameters

### **protocol-id**

*protocol-number, protocol-name*

### **protocol-number**

Specifies the protocol number value to be added or removed from the protocol list. The value can be expressed as a decimal integer, or in hexadecimal or binary format.

**Values** [0 to 255]D  
[0x0 to 0xFF]H  
[0b0 to 0b11111111]B

### **protocol-name**

Specifies the protocol name to be added or removed from the protocol list.

**Values** icmp, igmp, ip, tcp, egp, igp, udp, rdp, ipv6, ipv6-route, ipv6-frag, idrp, rsvp, gre, ipv6-icmp, ipv6-no-nxt, ipv6-opts, iso-ip, eigrp, ospf-igp, ether-ip, encaps, pnni, pim, vrrp, l2tp, stp, ptp, isis, crtp, crudp, sctp.

## Platforms

All

## protocol

## Syntax

**protocol** *protocol*

**no protocol** [*protocol*]

## Context

[\[Tree\]](#) (config>vrrp>policy>priority-event>route-unknown protocol)

## Full Context

configure vrrp policy priority-event route-unknown protocol

## Description

This command adds one or more route sources to match the route unknown IP route prefix for a route unknown priority control event.

If the route source does not match one of the defined protocols, the match is considered unsuccessful and the **route-unknown** event transitions to the set state.

The **protocol** command is optional. If the **protocol** command is not executed, the comparison between the RTM prefix return and the **route-unknown** IP route prefix will not include the source of the prefix. The **protocol** command cannot be executed without at least one associated route source parameter. All parameters are reset each time the **protocol** command is executed and only the explicitly defined protocols are allowed to match.

The **no** form of the command removes protocol route source as a match criteria for returned RTM route prefixes.

To remove specific existing route source match criteria, execute the **protocol** command and include only the specific route source criteria. Any unspecified route source criteria is removed.

## Default

no protocol — No route source for the route unknown priority event is defined.

## Parameters

**protocol**

Explicitly defined protocols

**Values** **bgp** - This parameter defines BGP as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **bgp** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **bgp** parameter, a returned route prefix with a source of BGP will not be considered a match and will cause the event to enter the set state. This parameter only applies to the 7750 SR and 7950 XRS.

**bgp-vpn** - This parameter defines **bgp-vpn** as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **bgp-vpn** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **bgp-vpn** parameter, a returned route prefix with a source of **bgp-vpn** will not be considered a match and will cause the event to enter the set state. This parameter only applies to the 7750 SR and 7950 XRS.

**ospf** - This parameter defines OSPF as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **ospf** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **ospf** parameter, a returned route prefix with a source of OSPF will not be considered a match and will cause the event to enter the set state.

**is-is** - This parameter defines IS-IS as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **is-is** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **is-is** parameter, a returned route prefix with a source of IS-IS will not be considered a match and will cause the event to enter the set state.

**rip** - This parameter defines RIP as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **rip** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **rip** parameter, a returned route prefix with a source of RIP will not be considered a match and will cause the event to enter the set state.

**static** - This parameter defines a static route as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **static** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **static** parameter, a returned route prefix with a source of static route will not be considered a match and will cause the event to enter the set state.

## Platforms

All

**protocol**

## Syntax

**protocol** *protocol-id*

**no protocol**

## Context

[\[Tree\]](#) (config>system>security>mgmt-access-filter>ip-filter>entry protocol)

## Full Context

configure system security management-access-filter ip-filter entry protocol

## Description

This command configures an IP protocol type to be used as a management access filter match criterion.

The protocol type, such as TCP, UDP, and OSPF, is identified by its respective protocol number. Well-known protocol numbers include ICMP (1), TCP (6), and UDP (17).

The **no** form the command removes the protocol from the match criteria.

## Parameters

### *protocol*

Specifies the protocol number for the match criterion.

**Values** 1 to 255 (decimal)

## Platforms

All

protocol

## Syntax

**[no] protocol *name* [create]**

## Context

[\[Tree\]](#) (config>sys>security>dist-cpu-protection>policy protocol)

## Full Context

configure system security dist-cpu-protection policy protocol

## Description

This command creates the protocol for control in the policy.

Explanatory notes for some of the protocols:

- **bfd-cpm**: includes all bfd handled on the CPM including cpm-np type, single hop and multi-hop, and MPLS-TP CC and CV bfd
- **dhcp**: includes dhcp for IPv4 and IPv6
- **eth-cfm**: 802.1ag and includes Y.1731. Eth-cfm packets on port and LAG based facility MEPs are not included (but packets on Tunnel MEPs are).
- **icmp**: includes IPv4 and IPv6 ICMP (including RS/RA/Redirect) except NS/NA Neighbor Discovery packets which are classified as a separate protocol "ndis"

- icmp-ping-check: includes those packets associated with ping-template functions
- isis: includes isis used for SPBM
- ldp: includes ldp and t-ldp
- mpls-ttl: MPLS packets that are extracted due to an expired mpls ttl field
- ndis: IPv6 NS/NA Neighbor Discovery (not including RS/RA/Redirect which are classified as part of the protocol "icmp")
- ospf: includes all OSPFv2 and OSPFv3 packets
- pppoe-pppoe: includes PADx, LCP, PAP/CHAP and NCPs
- vrrp: includes VRRP and SRRP packets
- multi-chassis: includes SR OS Multi-Chassis UDP port 1025 packets
- multi-chassis-sync: includes SR OS Multi-Chassis Sync TCP port 45067 packets
- all-undefined: a special "protocol". When configured, this treats all extracted control packets that are not explicitly created in the dist-cpu-protection policy as a single aggregate flow (or "virtual protocol"). It lumps together "all the rest of the control traffic" to allow it to be rate limited as one flow. It includes all control traffic of all protocols that are extracted and sent to the CPM (even protocols that cannot be explicitly configured with the distributed CPU protection feature). Control packets that are both forwarded and copied for extraction are not included. If a user later explicitly configures a protocol, that protocol is suddenly no longer part of the "all-undefined" flow. The "all-undefined" protocol must be explicitly configured in order to operate.

"no protocol x" means packets of protocol x are not monitored and not enforced (although they do count in the fp protocol queue) on the objects to which this dist-cpu-protection policy is assigned, although the packets will be treated as part of the all-undefined protocol if the all-undefined protocol is created in the policy.

## Parameters

### *names*

Signifies the protocol name.

**Values** arp, dhcp, http-redirect, icmp, icmp-ping-check, igmp, mld, ndis, pppoe-pppoe, all-undefined, mpls-ttl, multi-chassis, multi-chassis-sync, vrrp, bfd-cpm, bgp, eth-cfm, isis, ldp, ospf, pim, rsvp.

## Platforms

All

## protocol

## Syntax

**protocol** *protocol* [**all** | { **instance** *instance*}]

**protocol** *protocol2* [*protocol2* (up to 5 max)]

**no protocol**

## Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from protocol)

## Full Context

configure router policy-options policy-statement entry from protocol

## Description

This command configures a routing protocol as a match criterion for a route policy statement entry. This command is used for both import and export policies depending how it is used.

The **protocol direct-interface** route type matches the specific direct interface host IPv4 /32 and IPv6 /128 routes. The **protocol direct** route type matches direct routes and does not match the specific /32 or /128 interface route itself.

### Note:

The **instance** command cannot be used if multiple protocol names are specified for the *protocol2* parameter.

The **no** form of this command removes the protocol match criterion.

## Default

no protocol

## Parameters

### *protocol*

Specifies the protocol name for the match criterion.

**Values** direct, static, bgp, isis, ospf, rip, aggregate, bgp-vpn, igmp, pim, ospf3, ldp, sub-mgmt, mld, managed, vpn-leak, nat, periodic, ipsec, dhcpv6-pd, dhcpv6-na, dhcpv6-ta, dhcpv6-pd-excl, ripng, bgp-label, direct-interface, arp-nd, rib-api, evpn-ifl, evpn-iff, srv6

### *instance*

Specifies the OSPF, OSPFv3, or IS-IS protocol instance.

**Values** isis-inst — 0 to 127  
ospf-inst — 0 to 31  
ospf3-inst — 0 to 31, 64 to 95

### *protocol2*

Specifies up to five protocol names to match on.

**Values** direct, static, isis, aggregate, bgp, bgp-label, direct-interface

### **all**

Keyword that specifies to match on any OSPF, OSPFv3, or IS-IS protocol instance.

## Platforms

All

## protocol

### Syntax

**protocol** *protocol* [**all** | **instance** *instance*]

**protocol** **bgp** **bgp-label**

**no protocol**

### Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>to protocol)

### Full Context

configure router policy-options policy-statement entry to protocol

### Description

This command configures a routing protocol as a match criterion for a route policy statement entry. This command is used for both import and export policies depending on how it is used.

The **no** form of this command removes the protocol match criterion.

### Default

no protocol

### Parameters

#### *protocol*

Specifies the protocol name to match on.

**Values** bgp, isis, ospf, rip, bgp-vpn, ospf3, vpn-leak, ldp, ripng, bgp-label

#### *instance*

Specifies the OSPF, OSPFv3, or IS-IS instance.

**Values** isis-inst — 0 to 127  
ospf-inst — 0 to 31  
ospf3-inst — 0 to 31, 64 to 95

#### **all**

Keyword that specifies to match on any OSPF, OSPFv3, or IS-IS protocol instance.

### Platforms

All

## protocol

### Syntax

`protocol protocol`

### Context

[\[Tree\]](#) (config>anysec>tnl-enc>enc-grp>peer-tnl-attrs protocol)

### Full Context

configure anysec tunnel-encryption encryption-group peer-tunnel-attributes protocol

### Description

This command configures a routing protocol as a match criterion for the outgoing tunnel.

**Note:** Because the LSP is unidirectional, the incoming tunnel protocol may be different from the outgoing tunnel protocol.

### Default

protocol sr-isis

### Parameters

*protocol*

Specifies the protocol name.

**Values** sr-isis, sr-ospf, sr-ospf3

### Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se

### Description

This command configures a routing protocol that is used to advertise the node SID of the incoming tunnel.

**Default**

protocol sr-isis

**Parameters*****protocol***

Specifies the protocol name to match on.

**Values** sr-isis, sr-ospf, sr-ospf3

**Platforms**

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se

## 20.376 protocol-configuration-options

### protocol-configuration-options

**Syntax**

**protocol-configuration-options** {apco | pco}

**no protocol-configuration-options**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>gtp>peer-profile protocol-configuration-options)

**Full Context**

configure subscriber-mgmt gtp peer-profile protocol-configuration-options

**Description**

This command configures the Information Element to use for the Protocol Configuration Options.

The **no** form of this command reverts to the default value.

**Default**

protocol-configuration-options pco

**Parameters****apco**

Specifies that the system uses the Protocol Configuration Options Information Element.

**pco**

Specifies that the system uses the Additional Protocol Configuration Options Information Element.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.377 protocol-list

### protocol-list

#### Syntax

**protocol-list** *protocol-list-name* [**create**]

**no protocol-list** *protocol-list-name*

#### Context

[\[Tree\]](#) (config>filter>match-list protocol-list)

#### Full Context

configure filter match-list protocol-list

#### Description

This command creates a list of IP protocols that can be used in line card IP and IPv6 filters.

The **no** form of this command removes the IP protocol list.

#### Default

no protocol-list

#### Parameters

##### *protocol-list-name*

Specifies the name of the protocol list.

##### **create**

This keyword is required to create the protocol list. After it is created, the protocol list can be enabled with or without the **create** keyword.

#### Platforms

All

## 20.378 protocol-port

## protocol-port

### Syntax

[no] protocol-port

### Context

[\[Tree\]](#) (config>cflowd>collector>aggregation protocol-port)

### Full Context

configure cflowd collector aggregation protocol-port

### Description

This command specifies that flows be aggregated based on the IP protocol, source port number, and destination port number.

The **no** form of this command removes this type of aggregation from the collector configuration.

### Platforms

All

## 20.379 protocol-protection

## protocol-protection

### Syntax

protocol-protection [allow-sham-links] [block-pim-tunneled]  
no protocol-protection

### Context

[\[Tree\]](#) (config>sys>security>cpu-protection protocol-protection)

### Full Context

configure system security cpu-protection protocol-protection

### Description

This command causes the network processor on the CPM to discard all packets received for protocols that are not configured on the particular interface. This helps mitigate DoS attacks by filtering invalid control traffic before it hits the CPU. For example, if an interface does not have IS-IS configured, then protocol protection will discard any IS-IS packets received on that interface.

### Default

no protocol-protection

## Parameters

### **allow-sham-links**

Allows sham links. As OSPF sham links form an adjacency over the MPLS-VPRN backbone network, when protocol-protection is enabled, the tunneled OSPF packets to be received over the backbone network must be explicitly allowed.

### **block-pim-tunneled**

Blocks extraction and processing of PIM packets arriving at the SR OS node inside a tunnel (for example, MPLS or GRE) on a network interface. With protocol-protection enabled and tunneled pim blocked, PIM in an mVPN on the egress DR will not switch traffic from the (\*,G) to the (S,G) tree.

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## 20.380 protocol-version

### protocol-version

## Syntax

**protocol-version** *TLS version*

**no protocol-version**

## Context

[\[Tree\]](#) (config>system>security>tls>client-tls-profile protocol-version)

## Full Context

configure system security tls client-tls-profile protocol-version

## Description

This command configures the TLS version to be negotiated between the client and server.

When configured, the client adds the specified version as a supported version in its Hello message to the server. If **tls-version-all** is specified, the client adds both TLS 1.2 and TLS 1.3 as supported versions in its Hello message.

The **no** form of this command reverts to the default TLS version.

## Default

protocol-version tls-version12

## Parameters

*TLS version*

Specifies the TLS version to include in the client Hello message.

**Values**                   tls-version12, tls-version13, tls-version-all

## Platforms

All

## protocol-version

## Syntax

**protocol-version** *TLS version*

**no protocol-version**

## Context

[\[Tree\]](#) (config>system>security>tls>server-tls-profile protocol-version)

## Full Context

configure system security tls server-tls-profile protocol-version

## Description

This command configures the TLS version to be negotiated between the server and client.

When configured, the server adds the specified version as a supported version in its Hello message to the client. If **tls-version-all** is specified, the server adds both TLS 1.2 and TLS 1.3 as supported versions in its Hello message.

The **no** form of this command reverts to the default TLS version.

## Default

protocol-version tls-version12

## Parameters

*TLS version*

Specifies the TLS version to include in the server Hello message.

**Values**                   tls-version12, tls-version13, tls-version-all

## Platforms

```

```
configure service vprn subscriber-interface group-interface proxy-arp-policy
```

```
configure service ies subscriber-interface group-interface proxy-arp-policy
```

```
configure service ies interface proxy-arp-policy
```

## Description

This command specifies an existing policy-statement to analyze match and action criteria that controls the flow of routing information to and from a given protocol, set of protocols, or a neighbor.

The **no** form of this command disables the proxy ARP capability.

## Parameters

### *policy-name*

Specifies the export route policy name. Allowed values are any string, up to 32 characters, composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

The specified name must already be defined.

## Platforms

All

- configure service vprn interface proxy-arp-policy
- configure service ies interface proxy-arp-policy

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface proxy-arp-policy
- configure service vprn subscriber-interface group-interface proxy-arp-policy

## proxy-arp-policy

### Syntax

**proxy-arp-policy** *policy-name* [*policy-name*]

**no proxy-arp-policy**

### Context

[\[Tree\]](#) (config>subscr-mgmt>git>ipv4 proxy-arp-policy)

### Full Context

configure subscriber-mgmt group-interface-template ipv4 proxy-arp-policy

### Description

This command configures a proxy ARP policy for the interface.

The **no** form of this command disables the proxy ARP capability.

### Default

no proxy-arp-policy

### Parameters

#### *policy-name*

Specifies the export route policy name. Allowed values are any string, up to 32 characters, composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains special characters (**#**, **\$**, spaces, and so on), the entire string must be enclosed within double quotes. A maximum of five policy names can be specified.

#### **Note:**

The specified policy name must already be defined.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## proxy-arp-policy

### Syntax

**proxy-arp-policy** *policy-name* [*policy-name*]

**no proxy-arp-policy**

### Context

[\[Tree\]](#) (config>router>if proxy-arp-policy)

### Full Context

configure router interface proxy-arp-policy

### Description

This command enables and configure proxy ARP on the interface and specifies an existing policy-statement to analyze match and action criteria that controls the flow of routing information to and from a given protocol, set of protocols, or a specific neighbor. The policy-name is configured in the **config>router>policy-options** context.

Use proxy ARP so the router responds to ARP requests on behalf of another device. Static ARP is used when a router needs to know about a device on an interface that cannot or does not respond to ARP requests. Therefore, the router configuration can state that if it has a packet that has a certain IP address to send it to the corresponding ARP address.

### Default

no proxy-arp-policy

### Parameters

#### *policy-name*

Specifies the export route policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. A maximum of five policy names can be specified in a single statement. The specified policy names must already be defined.

configure service vpls sap dhcp proxy-server

configure service ies interface dhcp proxy-server

configure service vprn subscriber-interface group-interface dhcp proxy-server

configure service ies subscriber-interface group-interface dhcp proxy-server

configure subscriber-mgmt msap-policy vpls-only-sap-parameters dhcp proxy-server

#### Description

Commands in this context configure DHCP proxy server parameters.

#### Platforms

All

- configure service vpls sap dhcp proxy-server
- configure service ies interface dhcp proxy-server

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn subscriber-interface group-interface dhcp proxy-server
- configure service ies subscriber-interface group-interface dhcp proxy-server

- configure subscriber-mgmt msap-policy vpls-only-sap-parameters dhcp proxy-server

## proxy-server

### Syntax

[no] proxy-server

### Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>ipv6>dhcp6 proxy-server)

### Full Context

configure service vprn subscriber-interface group-interface ipv6 dhcp6 proxy-server

### Description

This command allows access to the DHCP6 proxy server context. Within this context, DHCP6 proxy server parameters of the group interface can be configured.

### Default

no proxy-server

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## proxy-server

### Syntax

[no] proxy-server

### Context

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>ipv6>dhcp6 proxy-server)

### Full Context

configure service ies subscriber-interface group-interface ipv6 dhcp6 proxy-server

### Description

This command allows access to the DHCP6 proxy server context. Within this context, DHCP6 proxy server parameters of the group interface can be configured.

### Default

no proxy-server

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.390 ps-information

### ps-information

#### Syntax

[no] ps-information

#### Context

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>gy>avp ps-information)

#### Full Context

configure subscriber-mgmt diameter-application-policy gy include-avp ps-information

#### Description

This command includes the following AVPs in Diameter DCCA CCR messages encapsulated in [3GPP-873] Service-Information or [3GPP-874] PS-Information grouped AVPs:

- [8] Framed-IP-Address
- [30] Called-Station-Id
- [97] Framed-IPv6-Prefix
- [123] Delegated-IPv6-Prefix
- [6527-99] Alc-IPv6-Address
- [10415-1] 3GPP-IMSI
- [10415-2] 3GPP-Charging-Id
- [10415-5] 3GPP-GPRS-Negotiated-QoS-Profile
- [10415-7] 3GPP-GGSN-Address
- [10415-10] GGSN-NSAPI
- [10415-11] 3GPP-Session-Stop-Indicator
- [10415-12] 3GPP-Selection-Mode
- [10415-13] 3GPP-Charging-Characteristics
- [10415-16] 3GPP-GGSN-IPv6-Address
- [10415-21] 3GPP-RAT-Type
- [10415-847] GGSN-Address
- [10415-1004] Charging-Rule-Base-Name
- [10415-1247] PDP-Context-Type

The AVPs are included when configured in the **include-avp** context.  
By default, these AVPs are included at the command level.  
The **no** form of this command resets to the default setting.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.391 psi-payload

psi-payload

### Syntax

**psi-payload**

### Context

[\[Tree\]](#) (config>port>otu psi-payload)

### Full Context

configure port otu psi-payload

### Description

Commands in this context configure payload structure identifier payload parameters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.392 psid-offset

psid-offset

### Syntax

**psid-offset** *psid-offset-length*

**no psid-offset**

### Context

[\[Tree\]](#) (config>service>nat>map-domain>mapping-rule psid-offset)

## Full Context

```
configure service nat map-domain mapping-rule psid-offset
```

## Description

This command configures the length of the high order bits in the protocol port field whose aggregate value should always be greater than 0. This automatically excludes certain ports (such as well-known ports) from the translation.

It is a function of the CE to make sure that the psid-offset bits are always greater than 0. The VSR does not check whether those bits are 0.

## Default

```
psid-offset 6
```

## Parameters

### *psid-offset-length*

Specifies the length of the psid-offset bits in the protocol port field.

**Values** 0 to 16

## Platforms

VSR

## 20.393 psnp-authentication

### psnp-authentication

## Syntax

```
[no] psnp-authentication
```

## Context

[\[Tree\]](#) (config>service>vprn>isis psnp-authentication)

[\[Tree\]](#) (config>service>vprn>isis>level psnp-authentication)

## Full Context

```
configure service vprn isis psnp-authentication
```

```
configure service vprn isis level psnp-authentication
```

## Description

This command enables authentication of individual ISIS packets of partial sequence number PDU (PSNP) type.

The **no** form of this command suppresses authentication of PSNP packets.

**Platforms**

All

**psnp-authentication****Syntax**`[no] psnp-authentication`**Context**[\[Tree\]](#) (config>router>isis>level psnp-authentication)[\[Tree\]](#) (config>router>isis psnp-authentication)**Full Context**

configure router isis level psnp-authentication

configure router isis psnp-authentication

**Description**

This command enables authentication of individual IS-IS packets of partial sequence number PDU (PSNP) type.

The **no** form of this command suppresses authentication of PSNP packets.

**Default**

psnp-authentication

**Platforms**

All

**20.394 ptp****ptp****Syntax**`[no] ptp`**Context**[\[Tree\]](#) (config>service>vprn ptp)**Full Context**

configure service vprn ptp

**Description**

Commands in this context configure PTP parameters for the VPRN service.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

```
ptp
```

**Syntax**

```
ptp
```

**Context**

[\[Tree\]](#) (config>system ptp)

**Full Context**

```
configure system ptp
```

**Description**

Commands in this context configure parameters for IEEE 1588-2008, *Precision Time Protocol*.

This command is only available on the control assemblies that support 1588.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

```
ptp
```

**Syntax**

```
ptp
```

**Context**

[\[Tree\]](#) (config>system>sync-if-timing ptp)

**Full Context**

```
configure system sync-if-timing ptp
```

**Description**

Commands in this context configure parameters for system timing via IEEE 1588-2008, Precision Time Protocol.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.395 ptp-asymmetry

```
ptp-asymmetry
```

### Syntax

```
ptp-asymmetry nanoseconds
```

```
no ptp-asymmetry
```

### Context

```
[Tree] (config>port>ethernet ptp-asymmetry)
```

### Full Context

```
configure port ethernet ptp-asymmetry
```

### Description

This command configures the PTP asymmetry delay on an Ethernet port. The command is used to correct for known asymmetry as part of time of day or phase recovery using PTP packets on both local and downstream PTP clocks.

### Default

```
no ptp-asymmetry
```

### Parameters

*nanoseconds*

Specifies the value, in nanoseconds, that the forward path delay varies from the mean path delay; the value can be a negative number.

**Values** -2147483648 to 2147483647

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.396 ptp-hw-assist

```
ptp-hw-assist
```

### Syntax

```
[no] ptp-hw-assist
```

## Context

**[Tree]** (config>service>ies>if ptp-hw-assist)

## Full Context

configure service ies interface ptp-hw-assist

## Description

This command configures the 1588 port based timestamping assist function for the interface. This capability is supported on a specific set of hardware. The command may be blocked if not all hardware has the required level of support.

Only one interface per physical port can have ptp-hw-assist enabled.

no ptp-hw-assist

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## ptp-hw-assist

## Syntax

[no] ptp-hw-assist

## Context

**[Tree]** (config>service>vprn>if ptp-hw-assist)

## Full Context

configure service vprn interface ptp-hw-assist

## Description

This command configures the 1588 port based timestamping assist function for the interface. This capability is supported on a specific set of hardware. The command may be blocked if not all hardware has the required level of support.

If the SAP configuration of the interface is removed, the ptp-hw-assist configuration will be removed.

If the IPv4 address configuration of the interface is removed, the ptp-hw-assist configuration will be removed.

Only one interface per physical port can have ptp-hw-assist enabled.

## Default

no ptp-hw-assist

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## ptp-hw-assist

### Syntax

[no] ptp-hw-assist

### Context

[\[Tree\]](#) (config>router>if ptp-hw-assist)

### Full Context

configure router interface ptp-hw-assist

### Description

This command configures the 1588 port based timestamping assist function for the interface. Various checks are performed to ensure that this feature can be enabled. If a check fails:

- The command is blocked/rejected with an appropriate error message.
- If the SAP configuration of the interface is removed, the ptp-hw-assist configuration will be removed.
- If the IPv4 address configuration of the interface is removed, the ptp-hw-assist configuration will be removed.

The port will validate the destination IP address on received 1588 messages. If the 1588 messages are sent to a loopback address within the node rather than the address of the interface, then the loopback address must be configured in the **config>system>security>source-address application ptp** context.

### Default

no ptp-hw-assist

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.397 ptp-tc

## ptp-tc

### Syntax

[no] ptp-tc

### Context

[\[Tree\]](#) (config>system>satellite>eth-sat ptp-tc)

### Full Context

configure system satellite eth-sat ptp-tc

## Description

This command enables the ethernet satellite IEEE1588 transparent clock function. This function works with the SR OS host router configured as a PTP ordinary clock or boundary clock. This provides increased accuracy on the PTP event messages transiting the satellite. When a IEEE1588 event message transits the ethernet satellite, the correction field of the message is updated with the residence time of that message. This is used in PTP time calculations. All ports of the satellite are enabled for this capability with the one setting. This feature must be enabled to allow the assignment of one of the satellite's client ports as a PTP port under **config>system>ptp>port**. This feature is only valid when using PTP over Ethernet encapsulation; it is not valid for PTP over IP encapsulation.

To enable this command, the satellite must have first been configured to support the feature using the **config>system>satellite>eth-sat>feature transparent-clock-eth** and must have been enabled for synchronous ethernet with **config>system>satellite>eth-sat>sync-e**.

All host ports connecting to this satellite must support 1588 port-based timestamping.

The **no** version of this command disables the specific satellite functionality.

## Default

no ptp-tc

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.398 ptsf

ptsf

## Syntax

ptsf

## Context

[\[Tree\]](#) (config>system>ptp ptsf)

## Full Context

configure system ptp ptsf

## Description

Commands in this context configure PTSF-unusable configuration.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.399 public-key-authentication

public-key-authentication

### Syntax

[no] public-key-authentication

### Context

[\[Tree\]](#) (config>system>security>ldap public-key-authentication)

### Full Context

configure system security ldap public-key-authentication

### Description

This command enables public key retrieval from the LDAP server. If disabled (**no public-key-authentication**), password authentication is attempted via LDAP.

### Default

no public-key-authentication

### Platforms

All

## 20.400 public-key-min-bits

public-key-min-bits

### Syntax

public-key-min-bits *bits*

no public-key-min-bits

### Context

[\[Tree\]](#) (config>service>ies>if>ipv6>secure-nd public-key-min-bits)

### Full Context

configure service ies interface ipv6 secure-nd public-key-min-bits

### Description

This command configures the minimum acceptable key length for public keys used in the generation of a Cryptographically Generated Address (CGA).

## Parameters

### *bits*

Specifies the number of bits.

**Values** 512 to 1024

## Platforms

All

## public-key-min-bits

## Syntax

**public-key-min-bits** *bits*

**[no] public-key-min-bits**

## Context

[\[Tree\]](#) (config>service>vprn>if>secure-nd public-key-min-bits)

## Full Context

configure service vprn interface secure-nd public-key-min-bits

## Description

This command configures the minimum acceptable key length for public keys used in the generation of a Cryptographically Generated Address (CGA).

## Parameters

### *bits*

Specifies the number of bits.

**Values** 512 to 1024

## public-key-min-bits

## Syntax

**public-key-min-bits** *bits*

**no public-key-min-bits**

## Context

[\[Tree\]](#) (config>router>if>ipv6>secure-nd public-key-min-bits)

## Full Context

configure router interface ipv6 secure-nd public-key-min-bits

## Description

This command configures the minimum acceptable key length for public keys used in the generation of a Cryptographically Generated Address (CGA).

## Parameters

### *bits*

Specifies the number of bits.

**Values** 512 to 1024

## Platforms

All

## 20.401 public-key-only

### public-key-only

## Syntax

## Context

[\[Tree\]](#) (config>system>security>ssh>auth-method>server public-key-only)

## Full Context

configure system security ssh authentication-method server public-key-only

## Description

This command configures the SSH server to accept only the public-key authentication method.

The **no** form of this command configures the SSH server to accept public-key or password client authentication. If **interactive-authentication** is enabled in the **configure system security aaa remote-servers radius** or **configure system security aaa remote-servers tacplus** contexts, the SSH server also accepts interactive keyboard authentication.

## Default

no public-key-only

## Platforms

All

## public-key-only

### Syntax

**public-key-only** {false|true|system}

### Context

[\[Tree\]](#) (config>system>security>user>ssh-auth-method>server public-key-only)

### Full Context

configure system security user ssh-authentication-method server public-key-only

### Description

This command configures the accepted SSH authentication method for the user connection.

### Default

system

### Parameters

#### false

Specifies the use of public-key only, or public-key and password for client authentication. If **interactive-authentication** is enabled in the **configure system security aaa remote-servers radius** or **configure system security aaa remote-servers tacplus** contexts, the SSH server also accepts interactive keyboard authentication.

#### true

Specifies the use of public-key authentication only.

#### system

Specifies the use of the SSH authentication method configured at the system level.

```

```
configure service vprn l2tp group l2tpv3 public-tcp-mss-adjust
```

```
configure service vprn l2tp group tunnel l2tpv3 public-tcp-mss-adjust
```

## Description

This command enables TCP MSS adjust for L2TPv3 tunnels on the public side on the group or tunnel level. When the command is configured, the system updates the TCP MSS option value of the received TCP SYN packet on the public side that is encapsulated in the L2TPv3 tunnel.

Note that this command can be overridden by the corresponding configuration on the group or tunnel level.

With the **default** parameter, the system uses the upper level configuration. With the non-default parameter, the system uses this configuration instead of the upper level configuration.

The **no** form of this command disables TCP MSS adjust on the public side.

**Default**

no public-tcp-mss-adjust

**Parameters****octets**

Specifies the new TCP MSS value in octets

**Values** 512 to 9000

**default**

Specifies to use the upper-level configuration

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**public-tcp-mss-adjust****Syntax**

**public-tcp-mss-adjust** *bytes*

**public-tcp-mss-adjust** *octets*

**public-tcp-mss-adjust** *auto*

**no public-tcp-mss-adjust**

**Context**

**[Tree]** (config>ipsec>tnl-temp public-tcp-mss-adjust)

**[Tree]** (config>service>vprn>if>ip-tunnel public-tcp-mss-adjust)

**[Tree]** (config>service>vprn>if>ipsec>ipsec-tunnel public-tcp-mss-adjust)

**[Tree]** (config>router>if>ipsec>ipsec-tunnel public-tcp-mss-adjust)

**[Tree]** (config>service>ies>if>ipsec>ipsec-tunnel public-tcp-mss-adjust)

**Full Context**

configure ipsec tunnel-template public-tcp-mss-adjust

configure service vprn interface ip-tunnel public-tcp-mss-adjust

configure service vprn interface sap ipsec-tunnel public-tcp-mss-adjust

configure service ies interface sap ip-tunnel public-tcp-mss-adjust

configure service vprn interface ipsec ipsec-tunnel public-tcp-mss-adjust

configure router interface ipsec ipsec-tunnel public-tcp-mss-adjust

configure service ies interface ipsec ipsec-tunnel public-tcp-mss-adjust

## Description

This command enables the Maximum Segment Size (MSS) for the TCP traffic in an IPsec tunnel which is sent from the public network to the private network. The system may use this value to adjust or insert the MSS option in TCP SYN packet.

If the **auto** parameter is specified, the system derives the new MSS value based on the public MTU and IPsec overhead.

The **no** form of this command disables TCP MSS adjust on the public side.

## Default

no public-tcp-mss-adjust

## Parameters

### **auto**

Derive the new MSS value based on the public MTU and IPsec overhead.

### **bytes**

Specifies the new TCP MSS value in bytes.

**Values** 512 to 9000

### **octets**

Specifies the new TCP MSS value in octets

**Values** 512 to 9000

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure ipsec tunnel-template public-tcp-mss-adjust
- configure service vprn interface sap ipsec-tunnel public-tcp-mss-adjust
- configure service ies interface sap ip-tunnel public-tcp-mss-adjust

VSR

- configure service ies interface ipsec ipsec-tunnel public-tcp-mss-adjust
- configure service vprn interface ipsec ipsec-tunnel public-tcp-mss-adjust
- configure router interface ipsec ipsec-tunnel public-tcp-mss-adjust

## 20.404 purge-timeout

### purge-timeout

## Syntax

**purge-timeout** *seconds*

## no purge-timeout

### Context

[Tree] (config>system>grpc>rib-api purge-timeout)

### Full Context

configure system grpc rib-api purge-timeout

### Description

This command configures the purge timeout associated with the RibApi gRPC service.

If a gRPC client used the RibApi gRPC service to program RIB entries into the router, and then the TCP connection drops for any reason, the associated RIB entries are immediately marked as stale and a timer with the **purge-timeout** value is started. Upon timer expiration, all of the stale entries are removed. While the timer is running, the stale entries remain valid and usable for forwarding but are less preferred than any non-stale entry. The **purge-timeout** gives an opportunity for the disconnected client, or some other client, to re-program the necessary RIB entries so that forwarding can continue uninterrupted.

The **no** form of this command resets to the default value of 0. Entries are immediately deleted when the TCP connection drops.

### Default

no purge-timeout

### Parameters

#### *seconds*

Specifies the number of seconds until the stale entries are purged.

**Values** 1 to 100 000

**Default** 0

### Platforms

All

## 20.405 purge-timer

### purge-timer

### Syntax

**purge-timer** *minutes*

**no purge-timer**

**Context**

[\[Tree\]](#) (config>router>bgp purge-timer)

**Full Context**

configure router bgp purge-timer

**Description**

When the system sends a VPN-IP Route-Refresh to a peer it sets all the VPN-IP routes received from that peer (in the RIB-IN) to stale and starts the purge-timer. If the routes are not updated (refreshed) before the purge-timer has expired then the routes are removed.

The BGP purge timer configures the time before stale routes are purged.

The **no** form of this command reverts to the default.

**Default**

purge-timer 10

**Parameters**

*minutes*

Specifies the maximum time before stale routes are purged.

**Values** 1 to 60

**Platforms**

All

## 20.406 push

push

**Syntax**

**push** {*label* | **implicit-null-label**} **nexthop** *ip-address*

**no push** {*out-label* | **implicit-null-label**}

**Context**

[\[Tree\]](#) (config>router>mpls>static-lsp push)

**Full Context**

configure router mpls static-lsp push

## Description

This command specifies the label to be pushed on the label stack and the next hop IP address for the static LSP.

The **no** form of this command removes the association of the label to push for the static LSP.

## Parameters

### *implicit-null-label*

Specifies the use of the implicit label value for the push operation.

### *label*

The label to push on the label stack. Label values 16 through 1,048,575 are defined as follows:

- label values 16 through 31 are reserved
- label values 32 through 1,023 are available for static assignment
- label values 1,024 through 2,047 are reserved for future use
- label values 2,048 through 18,431 are statically assigned for services
- label values 28,672 through 131,071 are dynamically assigned for both MPLS and services
- label values 131,072 through 1,048,575 are reserved for future use

**Values** 16 to 1048575

### *nexthop ip-address*

Specifies the IP address of the next hop towards the LSP egress router. If an ARP entry for the next hop exists, then the static LSP is marked operational. If ARP entry does not exist, software sets the operational status of the static LSP to down and continues to ARP for the configured nexthop. Software continuously tries to ARP for the configured nexthop at a fixed interval.

## Platforms

All

## 20.407 pushed-labels

### pushed-labels

## Syntax

**pushed-labels** *label* [*label*]

**no pushed-labels**

## Context

[\[Tree\]](#) (config>router>mpls>fwd-policies>fwd-policy>nh-grp>bkup pushed-labels)

[\[Tree\]](#) (config>router>mpls>fwd-policies>fwd-policy>nh-grp>pri pushed-labels)

### Full Context

configure router mpls forwarding-policies forwarding-policy next-hop-group backup-next-hop pushed-labels  
configure router mpls forwarding-policies forwarding-policy next-hop-group primary-next-hop pushed-labels

### Description

This command configures the pushed label stack for the primary or backup next hop of a next-hop group of an MPLS forwarding policy.

The **no** form of this command removes the pushed label stack.

### Parameters

#### *label*

Specifies the label value; up to a maximum of 10 labels.

**Values** 0 to 1048575

### Platforms

All

## 20.408 pw-cap-list

pw-cap-list

### Syntax

pw-cap-list {ethernet | ethernet-vlan} [{ ethernet | ethernet-vlan}]  
no pw-cap-list

### Context

[\[Tree\]](#) (config>service>vprn>l2tp>group>l2tpv3 pw-cap-list)

### Full Context

configure service vprn l2tp group l2tpv3 pw-cap-list

### Description

This command configures the allowable pseudowire capability list that is advertised to the far end. An empty list results in both pseudowire capabilities being advertised. Up to two capabilities are allowed to be advertised.

The **no** form of this command removes the list and advertises both pseudowire capabilities to the far end.

**Default**

no pw-cap-list

**Parameters****ethernet**

Specifies that the Ethernet pseudo-wire type is advertised.

**ethernet-vlan**

Specifies that the Ethernet-VLAN pseudo-wire type is advertised.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.409 pw-path-id

pw-path-id

**Syntax**

[no] pw-path-id

**Context**

**[Tree]** (config>service>vpls>spoke-sdp pw-path-id)

**[Tree]** (config>service>cpipe>spoke-sdp pw-path-id)

**[Tree]** (config>service>epipe>spoke-sdp pw-path-id)

**[Tree]** (config>service>vprn>if>spoke-sdp pw-path-id)

**[Tree]** (config>service>vprn>red-if>spoke-sdp pw-path-id)

**[Tree]** (config>service>ies>if>spoke-sdp pw-path-id)

**Full Context**

configure service vpls spoke-sdp pw-path-id

configure service cpipe spoke-sdp pw-path-id

configure service epipe spoke-sdp pw-path-id

configure service vprn interface spoke-sdp pw-path-id

configure service vprn redundant-interface spoke-sdp pw-path-id

configure service ies interface spoke-sdp pw-path-id

**Description**

Commands in this context configure an MPLS-TP Pseudowire Path Identifier for a spoke-sdp. All elements of the PW path ID must be configured in order to enable a spoke-sdp with a PW path ID.

For an IES or VPRN spoke-sdp, the pw-path-id is only valid for ethernet spoke-sdps.

The **pw-path-id** is only configurable if all of the following is true:

- SDP signaling is off
- control-word is enabled (control-word is disabled by default)
- the service type is Epipe, VPLS, Cpipe, or IES/VRN interface
- mate SDP signaling is off for vc-switched services

The **no** form of this command deletes the PW path ID.

### Default

no pw-path-id

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure service vpls spoke-sdp pw-path-id
- configure service epipe spoke-sdp pw-path-id
- configure service vprn interface spoke-sdp pw-path-id
- configure service cpipe spoke-sdp pw-path-id
- configure service ies interface spoke-sdp pw-path-id

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

- configure service vprn redundant-interface spoke-sdp pw-path-id

## pw-path-id

### Syntax

[no] pw-path-id

### Context

[\[Tree\]](#) (config>mirror>mirror-dest>spoke-sdp pw-path-id)

[\[Tree\]](#) (config>mirror>mirror-dest>remote-src>spoke-sdp pw-path-id)

### Full Context

configure mirror mirror-dest spoke-sdp pw-path-id

configure mirror mirror-dest remote-source spoke-sdp pw-path-id

### Description

Commands in this context configure an MPLS-TP Pseudowire Path Identifier for a spoke SDP. All elements of the PW path ID must be configured in order to enable a spoke SDP with a PW path ID.

For an IES or VPRN spoke SDP, the *pw-path-id* is only valid for Ethernet spoke SDPs.

The **pw-path-id** is only configurable if all of the following is true:

- SDP signaling is off

- control-word is enabled (control-word is disabled by default)
- the service type is Epipe, Cpipe, Apipe, IES, VPLS, or VPRN interface
- mate SDP signaling is off for VC-switched services

The **no** form of this command deletes the PW path ID.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.410 pw-port

pw-port

### Syntax

**pw-port** *pw-port-id* [**pw-headend**]

**no pw-port**

### Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg pw-port)

### Full Context

configure service system bgp-evpn ethernet-segment pw-port

### Description

This command configures a PW port associated to the Ethernet Segment. When the Ethernet Segment is configured as **all-active**, only a LAG or a PW port can be associated to the Ethernet Segment. When the Ethernet Segment is configured as **single-active**, then a LAG, port or SDP can be associated to the Ethernet Segment, but not a PW port unless the **pw-headend** parameter is configured. In either case, only one of the four objects can be configured in the Ethernet Segment. A specified PW port can be part of only one Ethernet Segment.

The **no** version of this command removes the PW port from the Ethernet Segment.

### Default

no pw-port

### Parameters

***pw-port-id***

Specifies the PW port identifier.

**Values** 1 to 32767

***pw-headend***

Keyword used to specify multihoming procedures are run in the PW port stitching Epipe and the routes advertised in the context of the stitching Epipe contain the ESI of the Ethernet Segment.

## Platforms

All

## pw-port

## Syntax

**pw-port** *id* [**create**]

**no pw-port** *id*

## Context

[\[Tree\]](#) (config pw-port)

## Full Context

configure pw-port

## Description

This command creates a PW port that can be bound to a physical port or associated with an FPE (anchored PW port). A PW port's purpose is to provide, through a PW SAP, access level (or SAP level) capability to customer traffic that is tunneled to the SR OS node through an IP/MPLS network.

The **no** form of this command removes the **pw-port** ID.

## Default

no pw-port

## Parameters

*id*

Specifies the ID of the PW port.

**Values** 1 to 32767

**create**

Keyword required to create the configuration context.

## Platforms

All

## pw-port

### Syntax

**pw-port** *pw-port-id* [**vc-id** *vc-id*] [**create**]

**no pw-port** *pw-port-id*

### Context

[\[Tree\]](#) (config>service>sdp>binding pw-port)

### Full Context

configure service sdp binding pw-port

### Description

This command creates a pseudowire port.

The **no** form of the command removes the pseudowire port ID from the configuration.

### Parameters

#### *pw-port-id*

Specifies a unique identifier of the pseudowire port.

**Values** 1 to 10239

#### *vc-id*

Specifies a virtual circuit identifier signaled to the peer.

**Values** 1 to 4294967295

#### **create**

This keyword is required when a new pseudowire is being created.

### Platforms

All

## pw-port

### Syntax

**pw-port** *pw-port-id* [**fpe** *fpe-id*] [**create**]

**no pw-port**

### Context

[\[Tree\]](#) (config>service>epipe pw-port)

### Full Context

configure service epipe pw-port

## Description

This command is used to associate the PW-port with the PXC ports or PXC based LAGs referenced in the FPE. That is, the PW-port becomes anchored by the PXC. This enables an external PW that is mapped to the anchored PW-port to be seamlessly rerouted between the I/O ports without interruption of service on the PW-port. This mapping between the external PW (spoke SDP) and the PXC based PXC-port is performed via an Epipe operating in vc-switching mode (creation time parameter).

## Default

no pw-port

## Parameters

### *pw-port-id*

Specifies the PW-port associated with this service.

**Values** 1 to 10239

### *fpe fpe-id*

Specifies the FPE object which contains the PXC-based ports or PXC-based LAGs.

**Values** 1 to 64

## Platforms

All

## pw-port

## Syntax

**pw-port** *pw-port-id* [**fpe** *fpe-id*] [**create**]

**no pw-port**

## Context

[\[Tree\]](#) (config>service>epipe pw-port)

## Full Context

configure service epipe pw-port

## Description

This command is only applicable for VSR configurations. This command associates a Flex PW port with any of the following constructs:

- an MPLS-based spoke SDP (PW)
- L2oGRE tunnel using IPv4 or IPv6 transport

With this configuration, a PW that is terminated on a Flex PW port can be seamlessly rerouted between I/O ports.

The payload from the PW is extracted from the Flex PW port and processed in accordance with the configured application (a capture SAP in ESM, a PW SAP for business services, and so on). The Epipe that associates the Flex PW port with the spoke SDP or with the tunnel is a regular Epipe service (not of type *vc-switching*).

This command must be configured before a spoke SDP is added to the Epipe.

The **no** form of this command removes the *pw-port-id* from the configuration.

## Parameters

### *pw-port-id*

Specifies the PW port associated with the PW.

**Values** 1 to 32767

### *fpe-id*

Specifies the FPE object.

**Values** 1 to 64

### **create**

Keyword required to create the configuration context.

## Platforms

All

## 20.411 pw-port-extension

### pw-port-extension

#### Syntax

[no] pw-port-extension

#### Context

[\[Tree\]](#) (config>fwd-path-ext>fpe pw-port-extension)

#### Full Context

configure fwd-path-ext fpe pw-port-extension

#### Description

Commands in this context configure the type of the cross-connect required to terminate an external tunnel to an anchored PW port. The system automatically builds the internal infrastructure required to perform the tunnel termination on a PW port.

PW ports support the following types of tunnels:

- GRE/MPLS PW with SDP of type MPLS or GRE

- L2oGRE bridged Ethernet over GRE, where GRE protocol number is 0x6558
- The **no** form of this command removes the cross-connect type from the configuration.

**Default**

no pw-port-extension

**Platforms**

## 20.412 pw-port-list

```
pw-port-list
```

**Syntax**

```
pw-port-list
```

**Context**

[\[Tree\]](#) (config>service>system pw-port-list)

**Full Context**

```
configure service system pw-port-list
```

**Description**

Commands in this context configure a port list to bind to Flex PW ports.

**Platforms**

VSR

## 20.413 pw-routing

```
pw-routing
```

**Syntax**

```
pw-routing
```

**Context**

[\[Tree\]](#) (config>service pw-routing)

**Full Context**

configure service pw-routing

**Description**

Commands in this context configure dynamic multi-segment pseudowire (MS-PW) routing. Pseudowire routing must be configured on each node that will be a T-PE or an S-PE.

**Platforms**

All

## 20.414 pw-sap-secondary-shaper

```
pw-sap-secondary-shaper
```

**Syntax**

**pw-sap-secondary-shaper** *pw-sap-sec-shaper-name*

**no pw-sap-secondary-shaper**

**Context**

[\[Tree\]](#) (config>service>sdp>binding>pw-port>egress>shaper pw-sap-secondary-shaper)

**Full Context**

configure service sdp binding pw-port egress shaper pw-sap-secondary-shaper

**Description**

This command configures a default secondary shaper applicable to pw-saps under normal interfaces. The **no** form of the command removes the shaper name from the configuration.

**Platforms**

All

## 20.415 pw-status-signaling

```
pw-status-signaling
```

**Syntax**

**[no] pw-status-signaling**

## Context

[\[Tree\]](#) (config>service>epipe>spoke-sdp pw-status-signaling)

## Full Context

configure service epipe spoke-sdp pw-status-signaling

## Description

This command enables pseudowire status signaling for this spoke SDP binding.

The **no** form of this command disables the status signaling.

## Default

pw-status-signaling

## Platforms

All

## pw-status-signaling

## Syntax

[no] pw-status-signaling

## Context

[\[Tree\]](#) (config>service>vpls>spoke-sdp pw-status-signaling)

## Full Context

configure service vpls spoke-sdp pw-status-signaling

## Description

This command specifies the type of signaling used by this multi-segment pseudowire provider-edge for this service.

When no pw-status-signaling is enabled, a 7450 ESS, 7750 SR, and 7950 XRS will not include the pseudowire status TLV in the initial label mapping message of the pseudowire used for a spoke-SDP. This will force both 7450 ESS, 7750 SR, and 7950 XRS PEs to use the pseudowire label withdrawal method for signaling pseudowire status.

If pw-status-signaling is configured, the node will include the use of the pseudowire status TLV in the initial label mapping message for the pseudowire.

All

## 20.416 pw-template

### pw-template

#### Syntax

**pw-template** *policy-id* [**use-provisioned-sdp** | [**prefer-provisioned-sdp**] [**auto-gre-sdp**] ] [**create**] [ *name* ]

**no pw-template** *policy-id*

#### Context

[\[Tree\]](#) (config>service pw-template)

#### Full Context

configure service pw-template

#### Description

This command configures an SDP template.

#### Parameters

##### *policy-id*

Specifies a number that uniquely identifies a template for the creation of an SDP.

**Values** *policy-id*: 1 to 2147483647

##### **use-provisioned-sdp**

Specifies whether to use an already provisioned SDP. When specified, the tunnel manager is consulted for an existing active SDP (with a matching far-end address), and the SDP with the lowest metric is chosen. If there are multiple SDPs with the same metric, then the highest SDP identifier that is oper-up is chosen. The choice of SDP can be configured by applying **sdp-include/exclude** in the PW template together with an **sdp-group** in the provisioned SDPs. This option, and the **auto-gre-sdp** option, are mutually exclusive.

##### **prefer-provisioned-sdp**

Specifies that if an existing matching SDP that conforms to any restrictions defined in the **pw-template** is found (for example, **sdp-include/exclude group**), then it will be used, following the same logic as for the **use-provisioned-sdp** parameter. Otherwise, the command will automatically create an SDP in the same manner as if the user did not specify any option. This option and the **use-provisioned-sdp** option are mutually exclusive.

##### **auto-gre-sdp**

Specifies that an SDP should automatically be created using a GRE tunnel. This option and the **use-provisioned-sdp** option are mutually exclusive. The PW template parameters **hash-label**, **entropy-label** and **sdp-include/exclude** are ignored when an GRE SDP is auto-created.

##### **auto-mpis-sdp**

Specifies that an SDP should automatically be created using an MPLS tunnel. This is the default.

**create**

This keyword is required when first creating the configuration context. Once the context is created, it is possible to navigate into the context without the **create** keyword.

**name name**

A name of the operator's choice, up to 64 characters. The name is saved as part of the configuration.

If a name is not specified at creation time, then SR OS assigns a string version of the policy-id as the name.

**Values** *name*: 64 characters maximum

**Platforms**

All

## 20.417 pw-template-bind

### pw-template-bind

**Syntax**

**pw-template-bind** *policy-id*

**no pw-template-bind**

**Context**

[\[Tree\]](#) (config>service>epipe>spoke-sdp-fec pw-template-bind)

**Full Context**

configure service epipe spoke-sdp-fec pw-template-bind

**Description**

This command binds includes the parameters included in a specific PW template to a spoke SDP.

The **no** form of this command removes the values from the configuration.

**Parameters**

*policy-id*

Specifies the existing policy ID.

**Values** 1 to 2147483647

## Platforms

All

## 20.418 pw-template-binding

### pw-template-binding

#### Syntax

```
pw-template-binding policy-id [import-rt { ext-community [ext-community]}] [endpoint endpoint-name]
no pw-template-binding policy-id
```

#### Context

[\[Tree\]](#) (config>service>epipe>bgp pw-template-binding)

#### Full Context

```
configure service epipe bgp pw-template-binding
```

#### Description

This command binds the advertisements received with the route targets (RT) that match the configured list (either the generic or the specified import) to a specific pw-template. If the RT list is not present, or if multiple matches are found, the numerically lowest pw-template is used.

The pw-template-binding applies to BGP-VPWS when enabled in the Epipe.

For BGP VPWS, the following additional rules govern the use of pseudowire-template:

- On transmission, the settings for the L2-Info extended community in the BGP updates are derived from the pseudowire template attributes. If multiple pseudowire template bindings (with or without import-rt) are specified for the same VPWS instance the first pw-template entry will be used for the information in the BGP update sent.
- On reception, the values of the parameters in the L2-Info extended community of the BGP updates are compared with the settings from the corresponding pseudowire template bindings. The following steps are used to determine the local pw-template:
  - The RT values are matched to determine the pw-template. The route targets configured for each pw-template-binding are compared to the route targets within the BGP update. The PW template corresponding to **pw-template-binding** with the first matching route target is used to for the SDP. The matching is performed from the lowest PW template binding identifier to the highest.
  - If no pw-template-binding matches are found from the previous step, the first (numerically lowest) configured pw-template entry without any route-target configured will be used.

If the value used for Layer 2 MTU (unless the value zero is received), or control word does not match, the pseudowire is created but with the operationally down state.

If the value used for the S (sequenced delivery) flag is not zero the pseudowire is not created.

The **tools perform** commands can be used to control the application of changes in pw-template for BGP-VPWS.

The **no** form of this command removes the values from the configuration.

## Parameters

### *policy-id*

Specifies an existing policy ID.

**Values** 1 to 2147483647

### *import-rt ext-comm*

Specifies the communities, up to five, allowed to be accepted from remote PE neighbors. An extended BGP community in the type:x:y format. The value x can be an integer or IP address. The type can be the target or origin.

**Values** target:{*ip-addr:comm-val* | *2byte-asnumber:ext-comm-val*| *4byte-snumber:comm-val*}

|                |                 |
|----------------|-----------------|
| ip-addr        | a.b.c.d         |
| comm-val       | 0 to 65535      |
| 2byte-asnumber | 0 to 65535      |
| ext-comm-val   | 0 to 4294967295 |
| 4byte-asnumber | 0 to 4294967295 |

### *endpoint-name*

Specifies the name of the endpoint the BGP PW template is associated with, up to 32 characters. When the configured endpoint is associated to the **pw-template-binding** of a BGP VPWS service, EVPN MPLS can also be configured and associated to the same endpoint in the same Epipe service. Modifying this element causes the parent element to be recreated automatically in order for the new value to take effect.

## Platforms

All

## pw-template-binding

## Syntax

**pw-template-binding** *policy-id* [**split-horizon-group** *group-name*] [**import-rt** {*ext-community*}]

**no pw-template-bind** *policy-id*

## Context

**[Tree]** (config>service>vpls>bgp pw-template-binding)

**[Tree]** (config>service>vpls>bgp-ad pw-template-binding)

## Full Context

```
configure service vpls bgp pw-template-binding
configure service vpls bgp-ad pw-template-binding
```

## Description

This command binds the advertisements received with the route target (RT) that matches the configured list (either the generic or the specified import) to a specific PW template. If the RT list is not present the pw-template is used for all of them.

The **pw-template-binding** applies to both BGP-AD and BGP-VPLS if these features are enabled in the VPLS.

For BGP VPLS the following additional rules govern the use of pseudowire-template.

- On transmission, the settings for the L2-Info extended community in the BGP update are derived from the pseudowire template attributes. If multiple pseudowire template bindings (with or without import-rt) are specified, the first pw-template entry will be used for the information in the BGP update sent.
- On reception, the values of the parameters in the L2-Info extended community of the BGP update are compared with the settings from the corresponding pw-template. The following steps are used to determine the local pw-template.
  - The RT values are matched to determine the pw-template. The route targets configured for each pw-template-binding are compared to the route targets within the BGP update. The PW template corresponding to pw-template-binding with the first matching route target is used to for the SDP. The matching is performed from the lowest PW template binding identifier to the highest
  - If no pw-templates matches are found from the previous step, the first (numerically lowest) configured pw-template entry without any route-target configured will be used.

If the values used for Layer 2 MTU (unless the value zero is received) or control word flag do not match, the pseudowire is created but with the operationally down state.

If the value used for the S (sequenced delivery) flags is not zero, the pseudowire is not created.

The tools perform commands can be used to control the application of changes in pw-template for both BGP-AD and BGP-VPLS.

The **no** form of this command removes the values from the configuration.

## Parameters

### *policy-id*

Specifies an existing policy ID

**Values** 1 to 2147483647

### *group-name*

The specified group-name overrides the split horizon group template settings

### *import-rt ext-comm*

Specifies communities allowed to be accepted from remote PE neighbors. An extended BGP community in the **type:x:y** format. The value **x** can be an integer or IP address. The **type** can be the target or origin. **x** and **y** are 16-bit integers. A maximum of five *import-rt ext-com* can be specified.

**Values** target:{*ip-addr:comm-val*| *2byte-asnumber:ext-comm-val*| *4byte-asnumber:comm-val*}  
*ip-addr*: a.b.c.d  
*comm-val*: [0 to 65535]  
*2byte-as-number*: [0 to 65535]  
*ext-comm-val*: [0 to 4294967295]  
*4byte-asnumber*: [0 to 4294967295]

## 20.419 pw-template-id-range

### pw-template-id-range

#### Syntax

**pw-template-id-range** start *pw-template-id* end *pw-template-id*  
**no pw-template-id-range**

#### Context

[\[Tree\]](#) (config>service>md-auto-id pw-template-id-range)

#### Full Context

configure service md-auto-id pw-template-id-range

#### Description

This command specifies the range of IDs used by SR OS to automatically assign an ID to PW templates that are created in model-driven interfaces without an ID explicitly specified by the user or client.

A PW template created with an explicitly-specified ID cannot use an ID in this range. In the classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD-CLI interfaces, the range can be changed, which causes any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **config>service md-auto-id** command for further details.

#### Default

no pw-template-id-range

#### Parameters

**start** *pw-template-id*

Specifies the lower value of the ID range. The value must be less than or equal to the **end** value.

**Values** 1 to 2147483647

#### **end pw-template-id**

Specifies the upper value of the ID range. The value must be greater than or equal to the **start** value.

**Values** 1 to 2147483647

### **Platforms**

## 20.421 pwc

pwc

### Syntax

**pwc** [**previous**]

### Context

[\[Tree\]](#) (pwc)

### Full Context

pwc

### Description

This command displays the present or previous working context of the CLI session. The **pwc** command provides a user who is in the process of dynamically configuring a chassis a way to display the current or previous working context of the CLI session. The **pwc** command displays a list of the CLI nodes that hierarchically define the current context of the CLI instance of the user.

The following example is from a 7750 SR:

```
A:ALA-1>config>router>bgp>group# pwc

Present Working Context :

<root>
 configure
 router Base
 bgp
 group test
 ospf
 area 1

A:ALA-1>config>router>bgp>group#
```

When the **previous** keyword is specified, the previous context displays. This is the context entered by the CLI parser upon execution of the **exit** command. The current context of the CLI is not affected by the **pwc** command.

The following example is from a 7450 ESS:

```
*A:ALA-1>config>router>ospf>area>if# pwc previous

Previous Working Context :

<root>
 configure
```

```
router "Base"
ospf
area "0.0.0.0"

*A:ALA-1config>router>ospf>area>if#
```

## Parameters

### previous

Displays the previous present working context.

## Platforms

All

## 20.422 pxc

pxc

## Syntax

**pxc** *pxc-id* [create]

**no pxc** *pxc-id*

## Context

[\[Tree\]](#) (config>port-xc pxc)

## Full Context

configure port-xc pxc

## Description

This command creates a port cross-connect (PXC) object. Referencing an Ethernet port within the PXC object will automatically configure this Ethernet port as a loopback port. The node will automatically create two PXC sub-ports under this Ethernet port. The configuration of PXC sub-ports can be accessed through the CLI.

## Parameters

### *pxc-id*

Specifies the port cross-connect identifier.

**Values** 1 to 64

## Platforms

All

## 20.423 pxc-pxc-id.sub-port-id

```
pxc-pxc-id.sub-port-id
```

### Syntax

```
pxc-pxc-id.sub-port-id
```

### Context

[\[Tree\]](#) (config>port pxc-pxc-id.sub-port-id)

### Full Context

```
configure port pxc-pxc-id.sub-port-id
```

### Description

This command enables access to PXC sub-port level parameters. The PXC sub-ports are automatically created once the external Ethernet port is configured inside of an PXC object. The PXC sub-ports are by default administratively disabled (shutdown). In order for PXC sub-ports to become operational, both, the underlying external Ethernet port and the PXC object must be operationally up.

### Parameters

#### *pxc-id*

Specifies the unique identifier of this PXC.

**Values** 1 to 64

#### *sub-port-id*

When this the *pxc-id* is configured, two logical sub-ports are automatically created. These logical sub-ports are used to create two paths within the loop; one upstream path, and one downstream path. These sub-ports are destroyed when either this PXC row is destroyed, this object is de-provisioned.

**Values** a, b

## python-policy

## Syntax

**python-policy** *policy-name*

**no python-policy**

## Context

**[Tree]** (config>service>ies>sub-if>grp-if>pppoe python-policy)

**[Tree]** (config>service>vprn>sub-if>grp-if>pppoe python-policy)

## Full Context

configure service ies subscriber-interface group-interface pppoe python-policy

configure service vprn subscriber-interface group-interface pppoe python-policy

## Description

This command specifies the Python policy for PPPoE packets sent/received on the group interface. The **no** form of this command removes the policy name from the configuration.

## Parameters

### *policy-name*

Specifies an existing Python policy name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
python-policy
```

## Syntax

```
python-policy name
```

```
no python-policy
```

## Context

```
[Tree] (config>subscr-mgmt>gtp>peer-profile python-policy)
```

## Full Context

```
configure subscriber-mgmt gtp peer-profile python-policy
```

## Description

This command specifies the Python policy for MGW profile packets sent/received on the group interface. The **no** form of this command removes the policy name from the configuration.

## Default

```
no python-policy
```

## Parameters

### *name*

Specifies an existing Python policy name up to 32 characters.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

```
python-policy
```

## Syntax

```
python-policy [policy-name]
```

## no python-policy

### Context

[\[Tree\]](#) (config>aaa>diam>node python-policy)

### Full Context

configure aaa diameter node python-policy

### Description

This command specified the python-policy for Diameter messages received or transmitted.

The **no** form of this command reverts to the default.

### Parameters

#### *policy-name*

Specifies the name of the Python policy, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## python-policy

### Syntax

**python-policy** *name* [**create**] [**wlan-gw-group** *wlan-gw-group-id*] [**nat-group** *nat-group-id*]

**no python-policy** *name*

### Context

[\[Tree\]](#) (config>python python-policy)

### Full Context

configure python python-policy

### Description

This command creates a new Python policy or enables an existing Python policy configuration context.

There are two types of Python policies: centralized and distributed. A centralized Python policy runs on a CPM, while a distributed Python policy runs on an ISA. With the distributed Python policy, a **wlan-gw-group** *wlan-gw-group-id* or a **nat-group** *nat-group-id* command must be specified.

The **no** form of this command removes the Python policy from the configuration.

### Parameters

#### *name*

Specifies the Python policy name up to 32 characters.

#### **create**

This keyword is required when first creating the Python policy. Once the context is created, it is possible to navigate into the context without the **create** keyword.

**wlan-gw-group** *wlan-gw-group-id*

Specifies the ID of the WLAN GW group that the distributed python-policy installs.

**nat-group** *nat-group-id*

Specifies the ID of the NAT group that the distributed python-policy installs.

**Platforms**

All

**python-policy****Syntax**

**python-policy** *policy-name*

**no python-policy**

**Context**

**[Tree]** (config>aaa>isa-radius-policy python-policy)

**Full Context**

configure aaa isa-radius-policy python-policy

**Description**

This command specifies the Python policy for the ISA RADIUS proxy server. This is the python policy for RADIUS packets to/from the client.

The **no** form of this command removes the Python policy from the configuration.

**Parameters*****name***

Specifies the Python policy name, up to 32 characters

***create***

This keyword is required when first creating the Python policy. Once the context is created, it is possible to navigate into the context without the **create** keyword.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

**python-policy****Syntax**

**python-policy** *name*

## no python-policy

### Context

**[Tree]** (config>service>ies>sub-if>grp-if>ipv4>dhcp4 python-policy)

**[Tree]** (config>service>vprn>sub-if>grp-if>ipv4>dhcp4 python-policy)

### Full Context

configure service ies subscriber-interface group-interface ipv4 dhcp4 python-policy

configure service vprn subscriber-interface group-interface ipv4 dhcp4 python-policy

### Description

This command specified the Python policy for DHCPv4 packets sent/received on the group interface.

The **no** form of this command removes the policy name from the configuration.

### Parameters

*name*

Specifies an existing Python policy name, up to 32 characters.

## python-policy

### Syntax

**python-policy** *name*

**no python-policy**

### Context

**[Tree]** (config>service>ies>sub-if>grp-if>ipv6>dhcp6 python-policy)

**[Tree]** (config>service>vprn>sub-if>grp-if>ipv6>dhcp6 python-policy)

### Full Context

configure service ies subscriber-interface group-interface ipv6 dhcp6 python-policy

configure service vprn subscriber-interface group-interface ipv6 dhcp6 python-policy

### Description

This command specified the Python policy for DHCPv6 packets sent/received on the group interface.

The **no** form of this command removes the policy name from the configuration.

### Parameters

*name*

Specifies an existing Python policy name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## python-policy

### Syntax

**python-policy** *name*

**no python-policy**

### Context

[\[Tree\]](#) (config>aaa>radius-srv-plcy python-policy)

### Full Context

configure aaa radius-server-policy python-policy

### Description

This command specifies the Python policy for RADIUS packets to/from the RADIUS servers defined in the specified **radius-server-policy**.

The **no** form of this command removes the policy name from the configuration.

### Parameters

*name*

Specifies the name of the Python policy, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## python-policy

### Syntax

**python-policy** *name*

**no python-policy**

### Context

[\[Tree\]](#) (config>router>radius-proxy>server python-policy)

[\[Tree\]](#) (config>service>vprn>radius-proxy>server python-policy)

### Full Context

configure router radius-proxy server python-policy

configure service vprn radius-proxy server python-policy

## Description

This command specifies the Python policy for RADIUS packets sent/received on the client side of the RADIUS proxy server.

This command supports RADIUS proxy on both CPMs and ISAs.

The **no** form of this command removes the policy name from the configuration.

## Parameters

*name*

Specifies the name of the Python policy, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
python-policy
```

## Syntax

```
python-policy name
```

```
no python-policy
```

## Context

[\[Tree\]](#) (config>subscr-mgmt>pppoe-client-policy python-policy)

## Full Context

```
configure subscriber-mgmt pppoe-client-policy python-policy
```

## Description

This command applies a Python policy to all messages sent and received by the PPPoE client.

The **no** form of this command removes the associated Python policy from the PPPoE client.

## Parameters

*name*

The name of a preconfigured Python policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
python-policy
```

## Syntax

```
python-policy name
```

```
no python-policy
```

## Context

[\[Tree\]](#) (config>service>vprn>if>ipv6 python-policy)

## Full Context

configure service vprn interface ipv6 python-policy

## Description

This command specifies a python policy. Python policies are configured in the **config>python>python-policy *name*** context.

## Parameters

***name***

Specifies the name of an existing python script, up to 32 characters in length.

## Platforms

All

## python-policy

## Syntax

**python-policy *python-policy-name***

**no python-policy**

## Context

[\[Tree\]](#) (config>router>if>dhcp python-policy)

## Full Context

configure router interface dhcp python-policy

## Description

This command specifies a python policy. Python policies are configured in the **config>python>python-policy *name*** context.

## Default

no python-policy

## Parameters

***python-policy-name***

Specifies the name of an existing python script, up to 32 characters in length.

## Platforms

All

## python-policy

### Syntax

**python-policy** *policy-name*  
**no python-policy**

### Context

[\[Tree\]](#) (config>log>log-id python-policy)

### Full Context

configure log log-id python-policy

### Description

This command associates the Python script with the events sent to this log ID. The Python policy can be associated with the log only if the destination in the log ID is set **to syslog**.

For information about Python policy configuration, refer to the Python Script Support for ESM in the *7450 ESS, 7750 SR, and VSR Triple Play Service Delivery Architecture Guide*.

The **no** form of this command disables Python processing of the events in this log ID.

### Default

no python-policy

### Parameters

***policy-name***

Specifies a Python policy name, up to 32 characters.

### Platforms

All

## 20.426 python-policy-cache

## python-policy-cache

### Syntax

**python-policy-cache**

### Context

[\[Tree\]](#) (config>system>persistence python-policy-cache)

**Full Context**

configure system persistence python-policy-cache

**Description**

This command configures Python policy cache persistency parameters.

**Platforms**

All

## 20.427 python-script

python-script

**Syntax**

**python-script** *name* [**create**]

**no python-script** *name*

**Context**

[\[Tree\]](#) (config>python python-script)

**Full Context**

configure python python-script

**Description**

Commands in this context configure Python scripts to modify messages of different protocols.

The **no** form of this command removes the Python script name from the configuration.

**Parameters****name**

Specifies the name of this Python script policy.

**create**

This keyword is required when first creating the Python script. Once the context is created, it is possible to navigate into the context without the **create** keyword.

**Platforms**

All

## python-script

### Syntax

**python-script** *script-name*

### Context

[\[Tree\]](#) (debug>python python-script)

### Full Context

debug python python-script

### Description

Commands in this context debug the specified Python script.

### Parameters

***policy-name***

Specifies the Python script name, up to 32 characters.

### Platforms

All

## 21 q Commands

### 21.1 q-tag-range

#### q-tag-range

##### Syntax

**q-tag-range** *qtag1* [to *qtag1*]

**no q-tag-range** *qtag1*

##### Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg>dot1q q-tag-range)

##### Full Context

configure service system bgp-evpn ethernet-segment dot1q q-tag-range

##### Description

This command determines the VIDs associated with the virtual Ethernet Segment on a specific dot1q port or LAG based on the following considerations:

- Values \*, 0 to 4094 are allowed.
- Any SAP for which the service-delimiting qtag matches the range is associated with the virtual ES, and only those, for example, SAP 1/1/1:0 will not match port 1/1/1, qtag-range 100.
- Maximum 8 ranges are allowed in the dot1q context.
- A range can be comprised of a single qtag.
- Shutting down the ES is not required prior to changing the q-tag-range.

The **no** form of the command removes the configured range. Only the first qtag1 value is required to remove the range.

##### Parameters

###### *qtag1*

Specifies the VID. When configuring a range of qtags (and not a single value), the second qtag1 value must be greater than the first qtag1.

**Values** \*, 0 to 4094

##### Platforms

All

## 21.2 qci

```
qci
```

### Syntax

```
qci qci-value
```

```
no qci
```

### Context

```
[Tree] (config>subscr-mgmt>gtp>peer-profile>mme>qos qci)
```

```
[Tree] (config>subscr-mgmt>gtp>peer-profile>pgw>qos qci)
```

### Full Context

```
configure subscriber-mgmt gtp peer-profile mme qos qci
```

```
configure subscriber-mgmt gtp peer-profile pgw qos qci
```

### Description

This command configures the QoS Class Identifier (QCI) to send in the Bearer Level QoS IE in GTPv2 messages.

The **no** form of this command reverts to the default.

### Default

```
qci 8
```

### Parameters

*qci-value*

Specifies the QCI value to send.

**Values** 1 to 9

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 21.3 qinq

## qinq

### Syntax

qinq

### Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg qinq)

### Full Context

configure service system bgp-evpn ethernet-segment qinq

### Description

Commands in this context configure q-tag and s-tag additions to the port or LAG virtual Ethernet Segments.

### Platforms

All

## 21.4 qinq-etype

### qinq-etype

### Syntax

**qinq-etype** *qinq-etype-value*

**no qinq-etype**

### Context

[\[Tree\]](#) (config>port>ethernet qinq-etype)

### Full Context

configure port ethernet qinq-etype

### Description

This command configures the Ethertype used for Q-in-Q encapsulation.  
The **no** form of this command reverts the qinq-etype value to the default.

### Default

no qinq-etype

### Parameters

*qinq-etype-value*

Specifies the qinq-etype to expect in the form of 0x600 to 0xfff.

**Values** 1536 to 65535 in decimal or hex formats

## Platforms

All

## qinq-etype

## Syntax

**qinq-etype** *qinq-etype*

**no qinq-etype**

## Context

[\[Tree\]](#) (config>pw-port qinq-etype)

## Full Context

configure pw-port qinq-etype

## Description

This command configures the QinQ Ethertype on the PW port. The PW port is used to extract a customer's Ethernet traffic that is transported in a tunnel over an IP/MPLS network. The **qinq-etype** represents the first two bytes (TPID) in the outer 801.1Q header of the double-tagged Ethernet frame inside the tunnel.

The **no** form of this command removes the configuration.

## Parameters

### *qinq-etype*

The value for the **qinq-etype** field, in hexadecimal format.

**Values** 0x0600..0xFFFF

**Default** 0x8100

## Platforms

All

## 21.5 qinq-mark-top-only

## qinq-mark-top-only

### Syntax

[no] qinq-mark-top-only

### Context

**[Tree]** (config>service>vprn>sub-if>grp-if>sap>egress qinq-mark-top-only)

**[Tree]** (config>service>ies>sub-if>grp-if>sap>egress qinq-mark-top-only)

**[Tree]** (config>service>vprn>if>sap>egress qinq-mark-top-only)

### Full Context

configure service vprn subscriber-interface group-interface sap egress qinq-mark-top-only

configure service ies subscriber-interface group-interface sap egress qinq-mark-top-only

configure service vprn interface sap egress qinq-mark-top-only

### Description

When the encapsulation type is qinq for the access port for the specified SAP, enabling this command specifies which P-bits or DEI bit to mark during packet egress. Only the P-bits or DEI bit in the top Q tag are marked. When this command is disabled, both sets of P-bits and the DEI bit are marked.

### Default

no qinq-mark-top-only

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn subscriber-interface group-interface sap egress qinq-mark-top-only
- configure service ies subscriber-interface group-interface sap egress qinq-mark-top-only

All

- configure service vprn interface sap egress qinq-mark-top-only

## qinq-mark-top-only

### Syntax

[no] qinq-mark-top-only

### Context

**[Tree]** (config>service>ipipe>sap>egress qinq-mark-top-only)

**[Tree]** (config>service>epipe>sap>egress qinq-mark-top-only)

### Full Context

configure service ipipe sap egress qinq-mark-top-only

```
configure service epipe sap egress qinq-mark-top-only
```

### Description

When enabled (the encapsulation type of the access port where this SAP is defined as qinq), the **qinq-mark-top-only** command specifies which P-bits/DEI bit to mark during packet egress. When disabled, both set of P-bits/DEI bit are marked. When the enabled, only the P-bits/DEI bit in the top Q-tag are marked.

### Default

```
no qinq-mark-top-only
```

### Platforms

All

```
qinq-mark-top-only
```

### Syntax

```
[no] qinq-mark-top-only
```

### Context

```
[Tree] (config>service>vpls>sap>egress qinq-mark-top-only)
```

### Full Context

```
configure service vpls sap egress qinq-mark-top-only
```

### Description

When enabled (the encapsulation type of the access port where this SAP is defined as qinq), the **qinq-mark-top-only** command specifies which P-bits/DEI bit to mark during packet egress. When disabled, both set of P-bits/DEI bit are marked. When enabled, only the P-bits/DEI bit in the top Q-tag are marked.

The **no** form of this command disables the command.

### Default

```
no qinq-mark-top-only
```

### Platforms

All

```
qinq-mark-top-only
```

### Syntax

```
[no] qinq-mark-top-only
```

## Context

[\[Tree\]](#) (config>service>ies>if>sap>egress qinq-mark-top-only)

## Full Context

configure service ies interface sap egress qinq-mark-top-only

## Description

When enabled (the encapsulation type of the access port where this SAP is defined as qinq), the **qinq-mark-top-only** command specifies which P-bits/DEI bit to mark during packet egress. When disabled, both set of P-bits/DEI bit are marked. When the enabled, only the P-bits/DEI bit in the top Q-tag are marked.

## Default

no qinq-mark-top-only

## Platforms

All

## 21.6 qinq-vlan-translation

### qinq-vlan-translation

## Syntax

**qinq-vlan-translation** *s-tag.c-tag*

**no qinq-vlan-translation**

## Context

[\[Tree\]](#) (config>service>epipe>sap>ingress qinq-vlan-translation)

## Full Context

configure service epipe sap ingress qinq-vlan-translation

## Description

This command provides ingress VLAN translation for two service-delimiting VLAN values, as opposed to the **vlan-translation** command that provides translation for only one service-delimiting VLAN value. This command is used with the **force-qinq-vc-forwarding** command so that the VLAN values that are pushed on SDP bindings or EVPN-MPLS can be normalized (translated).

The **no** form of the command disables QinQ VLAN translation.

## Default

no qinq-vlan-translation

## Parameters

### *s-tag.c-tag*

Specifies that the VLAN tag values are pushed on SDP bindings and EVPN-MPLS destinations when **force-qinq-vc-forwarding s-tag-c-tag** is configured. When **force-qinq-vc-forwarding c-tag-c-tag** is configured, only the C-tag value in **qinq-vlan-translation s-tag.c-tag** is pushed. When the asterisk (\*) value is used for the C-tag, no translation is made on the C-tag.

**Values**    *s-tag*: 0 to 4094  
               *c-tag*: 0 to 4094, \*

## Platforms

All

## 21.7 ql-minimum

### ql-minimum

#### Syntax

**ql-minimum** {*prs* | *stu* | *st2* | *tnc* | *st3e* | *st3* | *prc* | *ssua* | *ssub* | *sec* | *eec1* | *eec2*}  
**no ql-minimum**

#### Context

[\[Tree\]](#) (config>system>sync-if-timing>bits>output ql-minimum)

#### Full Context

configure system sync-if-timing bits output ql-minimum

#### Description

This command configures the minimum acceptable QL value that a signal must have in order to be selected for the BITSout port. This ensures that the signal has traceability to a source with at least this quality level so that attached equipment can function properly.

The **no** form of this command disables this check.

#### Default

no ql-minimum

#### Parameters

##### **prs**

Specifies the SONET Primary Reference Source.

##### **stu**

	Specifies the SONET Synchronous Traceability Unknown.
<b>st2</b>	Specifies the SONET Stratum 2.
<b>tnc</b>	Specifies the SONET Transit Node Clock.
<b>st3e</b>	Specifies the SONET Stratum 3E.
<b>st3</b>	Specifies the SONET Stratum 3.
<b>prc</b>	Specifies the SDH Primary Reference Clock.
<b>ssua</b>	Specifies the SDH Primary Level Synchronization Supply Unit.
<b>ssub</b>	Specifies the SDH Second Level Synchronization Supply Unit.
<b>sec</b>	Specifies the SDH Synchronous Equipment Clock.
<b>eec1</b>	Specifies the Ethernet Equipment Clock Option 1 (sdh).
<b>eec2</b>	Specifies the Ethernet Equipment Clock Option 2 (sonet).

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## ql-minimum

### Syntax

**ql-minimum** {prs | stu | **st2** | tnc | st3e | st3 | prc | ssua | ssub | sec | eec1 | eec2}

**no ql-minimum**

### Context

[\[Tree\]](#) (config>system>sync-if-timing ql-minimum)

### Full Context

configure system sync-if-timing ql-minimum

### Description

This command configures the minimum acceptable QL value that a signal must have in order to be considered for selection by the system timing module.

The **no** form of this command disables this check.

### Default

no ql-minimum

### Parameters

**prs**

Specifies the SONET Primary Reference Source.

**stu**

Specifies the SONET Synchronous Traceability Unknown.

**st2**

Specifies the SONET Stratum 2.

**tnc**

Specifies the SONET Transit Node Clock.

**st3e**

Specifies the SONET Stratum 3E.

**st3**

Specifies the SONET Stratum 3.

**prc**

Specifies the SDH Primary Reference Clock.

**ssua**

Specifies the SDH Primary Level Synchronization Supply Unit.

**ssub**

Specifies the SDH Second Level Synchronization Supply Unit.

**sec**

Specifies the SDH Synchronous Equipment Clock.

**eec1**

Specifies the Ethernet Equipment Clock Option 1 (sdh).

**eec2**

Specifies the Ethernet Equipment Clock Option 2 (sonet).

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure system sync-if-timing sync ql-override

configure system sync-if-timing bits ql-override

configure system sync-if-timing ptp ql-override

configure system sync-if-timing gnss ql-override

### Description

This command configures the QL value to be used for the reference for SETS input selection and BITS output selection. This value overrides any value received by that reference's SSM process.

### Default

no ql-override

### Parameters

#### prs

Specifies the SONET Primary Reference Source Traceable.

#### stu

Specifies the SONET Synchronous Traceability Unknown.

#### st2

Specifies the SONET Stratum 2 Traceable.

#### tnc

Specifies the SONET Transit Node Clock Traceable.

#### st3e

Specifies the SONET Stratum 3E Traceable.

#### st3

Specifies the SONET Stratum 3 Traceable.

#### prc

Specifies the SDH Primary Reference Clock Traceable.

**ssua**

Specifies the SDH Primary Level Synchronization Supply Unit Traceable.

**ssub**

Specifies the SDH Second Level Synchronization Supply Unit Traceable.

**sec**

Specifies the SDH Synchronous Equipment Clock Traceable.

**Platforms**

configure subscriber-mgmt msap-policy vpls-only-sap-parameters ingress qos

configure subscriber-mgmt msap-policy vpls-only-sap-parameters egress qos

configure subscriber-mgmt msap-policy ies-vprn-only-sap-parameters ingress qos

### Description

This command specifies the ingress or egress Quality of Service (QoS) policy that is associated with a Managed SAP (MSAP). Only QoS policies with scope template can be associated with MSAPs.

The **no** form of this command resets the default value. The system default QoS policy is used in that case.

### Default

qos 1 — For egress parameters.

qos 1 multipoint-shared — For ingress vpls-only-sap-parameters.

qos 1 shared-queuing — For ingress ies-vprn-only-sap-parameters.

### Parameters

#### *policy-id*

Specifies the QoS policy ID or name to associate with the MSAPs. The policy ID or name must already exist.

**Values** id: 1 to 65535

name: policy name up to 64 characters.

### multipoint-shared

Ingress unicast MSAP queues are mapped one-for-one with hardware queues. Multipoint MSAP queues are not instantiated. Unicast and BUM packets traverse the ingress forwarding plane twice: in the first pass, both unicast and BUM traffic use the unicast MSAP queues, while in the second pass shared unicast and multipoint queues are used towards the egress line card. Multipoint-shared queuing greatly reduces ingress queue consumption. This keyword can only be specified for ingress **vpls-only-sap-parameters**.

### shared-queuing

Ingress unicast MSAP queues are mapped one-for-one with hardware queues. Unicast packets traverse the ingress forwarding plane twice: in the first pass the MSAP queues are used, while in the second pass shared queues are used towards the egress line card. Shared-queuing greatly reduces ingress queue consumption. This keyword can only be specified for ingress **ies-vprn-only-sap-parameters**.

### service-queuing

Ingress MSAP queues are mapped to multiple hardware queues, per egress line card destination. For scaled environments such as in subscriber management, this could lead to a high number of queue resources being used. Therefore, service-queuing for MSAPs should only be enabled for specific use cases. This keyword can only be specified for ingress parameters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## qos

### Syntax

**qos** *policy-id* [**vport-scheduler** | **port-scheduler**] [**force**]

**no qos**

### Context

[\[Tree\]](#) (config>subscr-mgmt>sla-prof>egress qos)

### Full Context

configure subscriber-mgmt sla-profile egress qos

### Description

This command specifies the egress QoS policy applicable to this SLA profile. The policy must already be defined in the **config>qos>sap-egress** context.

The **no** form of this command reverts to the default.

### Default

qos 1 port-scheduler

## Parameters

### *policy-id*

Specifies the egress policy to be applied to the egress SLA profile.

**Values** 1 to 65535

### **vport-scheduler | port-scheduler**

Specifies if a host queue with the port-parent option enabled should be scheduled within the context of a Vport port scheduler policy or at the port's port scheduler policy.

### **force**

Forces a policy change

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## qos

## Syntax

**qos** *policy-id* [**shared-queuing | multipoint-shared | service-queuing**] [**force**]

**no qos**

## Context

[\[Tree\]](#) (config>subscr-mgmt>sla-prof>ingress qos)

## Full Context

configure subscriber-mgmt sla-profile ingress qos

## Description

This command specifies the ingress QoS policy applicable to this SLA profile. The policy must already be defined in the **config>qos>sap-ingress** context.

The **no** form of this command reverts to the default.

## Default

qos 1

## Parameters

### *policy-id*

Specifies the policy to be applied to the ingress SLA profile.

**Values** 1 to 65535

### **shared-queuing**

Specifies the policy used by this SAP. When the value of this object is null it means that the SAP will use individual ingress QoS queues, instead of the shared ones.

### multipoint-shared

This keyword is mutually exclusive with the **shared-queuing** and **service-queuing** keywords. When multipoint-shared is specified, the ingress forwarding plane will conserve hardware queues by performing two tier queuing on ingress unicast and multipoint packets through the SAP. Unicast service queues defined in the SAP ingress QoS policy are created for the SAP on the ingress forwarding plane without regard for the switch fabric destinations to which the SAP may need to forward (other destinations in the VPLS context). The multipoint queues defined in the SAP ingress QoS policy are not created for the SAP. Instead, all multipoint traffic is mapped to the unicast queues based on forwarding class in the first pass. In the second pass the unicast packets is mapped to the unicast shared queues while the multipoint traffic is mapped to the multipoint shared queues.

### service-queuing

This keyword is mutually exclusive with the **multipoint-shared** and **shared-queuing** keywords to state that service queuing is needed.

### force

Forces a policy change.

## Platforms

## Description

This command associates a Quality of Service (QoS) policy with an egress Service Access Point (SAP) or IP interface.

QoS egress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP or IP interface. If the policy ID does not exist, an error is returned.

The **qos** command associates both ingress and egress QoS policies. The **qos** command only allows ingress policies to be associated on SAP or IP interface ingress and egress policies on SAP or IP interface egress. Attempts to associate a QoS policy of the wrong type returns an error.

Only one ingress and one egress QoS policy can be associated with a SAP or IP interface at one time. Attempts to associate a second QoS policy of a given type returns an error.

By default, no specific QoS policy is associated with the SAP or IP interface for ingress or egress, so the default QoS policy is used.

The **no** form of this command removes the QoS policy association from the SAP or IP interface, and the QoS policy reverts to the default.

## Parameters

### *policy-id*

The ingress/egress policy ID to associate with SAP or IP interface on ingress/egress. The policy ID must already exist.

**Values** 1 to 65535

### *port-redirect-group*

This keyword associates a SAP egress with an instance of a named queue group template on the egress port of a given IOM/IMM/XMA. The queue-group-name and instance instance-id are mandatory parameters when executing the command.

### *queue-group-name*

Specifies the name of the egress port queue group of the IOM/IMM/XMA, up to 32 characters in length. The queue-group-name must correspond to a valid egress queue group, created under config>port>ethernet>access>egress.

### *instance instance-id*

Specifies the instance of the named egress port queue group on the IOM/IMM/XMA.

**Values** 1 to 40960

**Default** 1

## Platforms

**no** **qos**

## Context

[\[Tree\]](#) (config>service>vpls>sap>egress qos)

## Full Context

```
configure service vpls sap egress qos
```

## Description

This command associates a Quality of Service (QoS) policy with an egress Service Access Point (SAP). QoS ingress and egress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP. If the policy-id does not exist, an error will be returned.

The qos command is used to associate both ingress and egress QoS policies. The qos command only allows ingress policies to be associated on SAP ingress and egress policies on SAP egress. Attempts to associate a QoS policy of the wrong type returns an error.

Only one ingress and one egress QoS policy can be associated with a SAP at one time. Attempts to associate a second QoS policy of a specified type will return an error.

When an egress QoS policy is associated with an IES IP interface that has been bound to a VPLS, the policy becomes associated with every SAP on the VPLS and augments the egress QoS policy that is defined on each SAP. Packets that are bridged will be processed using the policy defined on the VPLS SAP; packets that are routed will be processed using the policy defined in the IES IP interface- binding context.

By default, if no specific QoS policy is associated with the SAP for ingress or egress, so the default QoS policy is used.

The **no** form of this command removes the QoS policy association from the SAP, and the QoS policy reverts to the default.

## Parameters

### ***port-redirect-group***

Associates a SAP egress with an instance of a named queue group template on the egress port of a specified IOM/IMM/XMA. The queue-group-name and instance instance-id are mandatory parameters when executing the command.

### ***queue-group-name***

Specifies the name of the egress port queue group of the IOM/IMM/XMA, up to 32 characters in length. The queue-group-name must correspond to a valid egress queue group, created under *config>port>ethernet>access>egress*.

### ***instance instance-id***

Specifies the instance of the named egress port queue group on the IOM/IMM/XMA

**Values** 1 to 40960

**Default** 1

**no qos**

### Context

**[Tree]** (config>service>ies>sub-if>grp-if>sap>ingress qos)

### Full Context

configure service ies subscriber-interface group-interface sap ingress qos

### Description

Associates a Quality of Service (QoS) policy with an ingress Service Access Point (SAP) or IP interface.

QoS ingress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP or IP interface. If the *policy-id* does not exist, an error is returned.

This **qos** command is used to associate ingress QoS policies. The **qos** command only allows ingress policies to be associated on SAP or IP interface ingress.

Only one ingress and one egress QoS policy can be associated with a SAP or IP interface at one time. Attempts to associate a second QoS policy of a given type returns an error.

By default, no specific QoS policy is associated with the SAP or IP interface for ingress so the default QoS policy is used.

The normal behavior is for queues to be created per destination. Shared and multipoint shared change this behavior creating either unicast or unicast and mcast shared queues.

The **no** form of this command removes the QoS policy association from the SAP or IP interface, and the QoS policy reverts to the default.

### Parameters

#### *policy-id*

The ingress policy ID to associate with SAP or IP interface on ingress. The policy ID must already exist.

**Values** 1 to 65535

#### **shared-queuing**

Specifies the ingress shared queue policy a SAP uses. When the value of this object is null, the SAP uses individual ingress QoS queues, instead of the shared ones. This keyword only applies on the SAP ingress.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## qos

### Syntax

**qos** *policy-id* [**shared-queuing** | **multipoint-shared**] [**fp-redirect-group** *queue-group-name* **instance** *instance-id*]

**qos** *policy-id* [**shared-queuing** | **multipoint-shared**]

**[Tree]** (config>service>ies>if>sap>ingress qos)

### Full Context

configure service vprn interface sap ingress qos

configure service ies interface sap ingress qos

### Description

This command associates a Quality of Service (QoS) policy with an ingress Service Access Point (SAP).

QoS ingress and egress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP. If the policy ID does not exist, an error is returned.

The **qos** command is used to associate both ingress and egress QoS policies. The qos command only allows ingress policies to be associated on SAP ingress and egress policies on SAP egress. Attempts to associate a QoS policy of the wrong type returns an error.

Only one ingress and one egress QoS policy can be associated with a SAP or IP interface at one time. Attempts to associate a second QoS policy of a given type returns an error.

By default, no specific QoS policy is associated with the SAP for ingress or egress, so the default QoS policy is used.

The no form of this command removes the QoS policy association from the SAP, and the QoS policy reverts to the default.

The **no** form of this command removes the QoS policy association from the SAP or IP interface, and the QoS policy reverts to the default.

### Parameters

#### ***policy-id***

The ingress/egress policy ID to associate with SAP or IP interface on ingress/egress. The policy ID must already exist.

1 to 65535

#### **shared-queuing**

Specifies the ingress shared queue policy used by this SAP. When the value of this object is null it means that the SAP uses individual ingress QoS queues instead of the shared ones.

#### **multipoint-shared**

Specifies that this queue-id is for multipoint forwarded traffic only. This queue-id can only be explicitly mapped to the forwarding class multicast, broadcast, or unknown unicast ingress traffic. Attempting to map forwarding class unicast traffic to a multipoint queue generates an error; no changes are made to the current unicast traffic queue mapping.

A queue must be created as multipoint. The multipoint designator cannot be defined after the queue is created. If an attempt is made to modify the command to include the multipoint keyword, an error is generated and the command is not executed.

The multipoint keyword can be entered in the command line on a preexisting multipoint queue to edit queue ID parameters.

**Default** Present (the queue is created as non-multipoint).

**Values** **Multipoint** or not present.

### **fp-redirect-group**

Creates an instance of a named queue group template on the ingress forwarding plane of a given IOM/IMM/XMA. The queue-group-name and instance instance-id are mandatory parameters when executing the command. The named queue group template can contain only policers. If it contains queues, then the command fails.

#### **queue-group-name**

Specifies the name of the queue group template to be instantiated on the forwarding plane of the IOM/IMM/XMA, up to 32 characters. The queue-group-name must correspond to a valid ingress queue group template name, configured in the **config>qos>queue-group-templates** context.

#### **instance-id**

Specifies the instance of the named queue group to be created on the IOM/IMM/XMA ingress forwarding plane.

## **Platforms**

## Description

This command associates a Quality of Service (QoS) policy with an ingress Service Access Point (SAP).

QoS ingress and egress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP. If the policy-id does not exist, an error will be returned.

The **qos** command, when used under the ingress context, is used to associate ingress QoS policies. The **qos** command only allows ingress policies to be associated on SAP ingress and egress policies on SAP egress. Attempts to associate a QoS policy of the wrong type returns an error.

Only one ingress and one egress QoS policy can be associated with a SAP at one time. Attempts to associate a second QoS policy of a specified type will return an error.

By default, if no specific QoS policy is associated with the SAP for ingress or egress, so the default QoS policy is used.

The **no** form of this command removes the QoS policy association from the SAP, and the QoS policy reverts to the default.

## Parameters

### *policy-id*

The ingress policy ID to associate with SAP or IP interface on ingress. The policy ID must already exist.

**Values** 1 to 65535

### **shared-queuing**

This keyword can only be specified on SAP ingress. The shared-queuing keyword specifies the shared queue policy will be used by this SAP. When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

### **fp-redirect-group**

This keyword can only be used on SAP ingress and associates a SAP ingress with an instance of a named queue group template on the ingress forwarding plane of a specified IOM/IMM/XMA. The queue-group-name and **instance** *instance-id* are mandatory parameters when executing the command.

### *queue-group-name*

Specifies the name of the queue group to be instance on the forwarding plane of the IOM/IMM/XMA, up to 32 characters in length. The *queue-group-name* must correspond to a valid ingress forwarding plane queue group, created under **config>card>fp>ingress>access**.

### *instance-id*

Specifies the instance of the named queue group on the IOM/IMM/XMA ingress forwarding plane.

## Description

This command is used to redirect pseudowire (PW) packets to an egress port queue-group for the purpose of shaping.

The egress PW shaping provisioning model allows the mapping of one or more PWs to the same instance of queues, or policers and queues, that are defined in the queue-group template.

Operationally, the provisioning model consists of the following steps:

1. Create an egress queue-group template and configure queues only, or policers and queues for each FC that needs to be redirected.

2. Apply the queue-group template to the network egress context of all ports where there exists a network IP interface that the PW packets can be forwarded on. This creates one instance of the template on the egress of the port. One or more instances of the same template can be created.
3. Configure FC-to-policer or FC-to-queue mappings together with the redirect to a queue-group in the egress context of a network QoS policy. No queue-group name is specified in this step, which means the same network QoS policy can redirect different PWs to different queue-group templates.
4. Apply this network QoS policy to the egress context of a spoke-sdp inside a service, or to the egress context of a PW template and specify the redirect queue-group name.

One or more spoke-sdps can have their FCs redirected to use queues only, or queues and policers in the same queue-group instance.

The following are the constraints and rules of this provisioning model:

1. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name does not exist, the association is failed at the time the user associates the egress context of a spoke-sdp to the named queue-group. In such a case, the PW packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface the PW packet is forwarded on. This queue can be a queue-group queue or the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port. This is the existing implementation and default behavior for a PW packet.
2. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name exists but the policer-id and/or the queue-id is not defined in the queue-group template, the association is failed at the time the user associates the egress context of a spoke-sdp to the named queue-group. In such a case, the PW packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface the PW packet is forwarded on.
3. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name exists and the policer-id or policer-id plus queue-id exist, it is not required to check that an instance of that queue-group exists in all egress network ports that have network IP interfaces. The handling of this is dealt with in the data path as follows:
  - When a PW packet for that FC is forwarded and an instance of the referenced queue-group name exists on that egress port, the packet is processed by the queue-group policer and will then be fed to the queue-group queue.
  - When a PW packet for that FC is forwarded and an instance of the referenced queue-group name does not exist on that egress port, the PW packet will be fed directly to the corresponding egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.
4. If a network QoS policy is applied to the egress context of a PW, any PW FC that is not explicitly redirected in the network QoS policy will have the corresponding packets feed directly the corresponding the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.

When the queue-group name the PW is redirected to exists and the redirection succeeds, the marking of the packet's DEI/dot1p/DSCP and the tunnel's DEI/dot1p/DSCP/EXP is performed according to the relevant mappings of the {FC, profile} in the egress context of the network QoS policy applied to the PW. This is true regardless of whether an instance of the queue-group exists or not on the egress port the PW packet is forwarded to. If the packet's profile value changed due to egress child policer CIR profiling, the new profile value is used to mark the packet's DEI/dot1p and the tunnel's DEI/dot1p/EXP, and the DSCP/prec will be remarked if **enable-dscp-prec-marking** is enabled under the policer.

When the queue-group name the PW is redirected does not exist, the redirection command is failed. In this case, the marking of the packet's DEI/dot1p/DSCP and the tunnel's DEI/dot1p/DSCP/EXP fields is

performed according to the relevant commands in the egress context of the network QoS policy applied to the network IP interface to which the PW packet is forwarded.

The **no** version of this command removes the redirection of the PW to the queue-group.

## Parameters

### *network-policy-id*

Specifies the network policy identification. The value uniquely identifies the policy on the system.

**Values** 1 to 65535

### *queue-group-name*

Specifies the name of the queue group template up to 32 characters in length.

### *instance-id*

Specifies the optional identification of a specific instance of the queue-group.

**Values** 1 to 65535

## Description

This command is used to redirect pseudowire packets to an egress port queue-group for the purpose of shaping.

The egress pseudowire shaping provisioning model allows the mapping of one or more pseudowires to the same instance of queues, or policers and queues, which are defined in the queue-group template.

Operationally, the provisioning model consists of the following steps:

1. Create an egress queue-group template and configure queues only or policers and queues for each FC that needs to be redirected.
2. Apply the queue-group template to the network egress context of all ports where there exists a network IP interface on which the pseudowire packets can be forwarded. This creates one instance of the template on the egress of the port. One or more instances of the same template can be created.
3. Configure FC-to-policer or FC-to-queue mappings together with the redirect to a queue-group in the egress context of a network QoS policy. No queue-group name is specified in this step, which means the same network QoS policy can redirect different pseudowires to different queue-group templates.
4. Apply this network QoS policy to the egress context of a spoke-SDP inside a service or to the egress context of a pseudowire template and specify the redirect queue-group name.

One or more spoke-SDPs can have their FCs redirected to use queues only or queues and policers in the same queue-group instance.

The following are the constraints and rules of this provisioning model:

1. When a pseudowire FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name does not exist, the association is failed at the time the user associates the egress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface on which the pseudowire packet is forwarded. This queue can be a queue-group queue, or the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port. This is the existing implementation and default behavior for a pseudowire packet.
2. When a pseudowire FC is redirected to use a queue or a policer, and a queue in a queue-group and the queue-group name exists, but the policer-id and/or the queue-id is not defined in the queue-group template, the association is failed at the time the user associates the egress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface the pseudowire packet is forwarded on.
3. When a pseudowire FC is redirected to use a queue, or a policer and a queue in a queue-group, and the queue-group name exists and the policer-id or policer-id plus queue-id exist, it is not required to check that an instance of that queue-group exists in all egress network ports which have network IP interfaces. The handling of this is dealt with in the data path as follows:
  - a. When a pseudowire packet for that FC is forwarded and an instance of the referenced queue-group name exists on that egress port, the packet is processed by the queue-group policer and will then be fed to the queue-group queue.
  - b. When a pseudowire packet for that FC is forwarded and an instance of the referenced queue-group name does not exist on that egress port, the pseudowire packet will be fed directly to the corresponding egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.
4. If a network QoS policy is applied to the egress context of a pseudowire, any pseudowire FC, which is not explicitly redirected in the network QoS policy, will have the corresponding packets feed directly the

corresponding the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.

When the queue-group name the pseudowire is redirected to exists and the redirection succeeds, the marking of the packet DEI/dot1p/DSCP and the tunnel DEI/dot1p/DSCP/EXP is performed; according to the relevant mappings of the (FC, profile) in the egress context of the network QoS policy applied to the pseudowire. This is true regardless, whether an instance of the queue-group exists or not on the egress port to which the pseudowire packet is forwarded. If the packet profile value changed due to egress child policer CIR profiling, the new profile value is used to mark the packet DEI/dot1p and the tunnel DEI/dot1p/EXP, and the DSCP/prec will be remarked if **enable-dscp-prec-marking** is enabled under the policer.

When the queue-group name the pseudowire is redirected does not exist, the redirection command is failed. In this case, the marking of the packet DEI/dot1p/DSCP and the tunnel DEI/dot1p/DSCP/EXP fields is performed according to the relevant commands in the egress context of the network QoS policy applied to the network IP interface to which the pseudowire packet is forwarded.

The **no** version of this command removes the redirection of the pseudowire to the queue-group.

## Parameters

### *network-policy-id*

Specifies the network policy identification. The value uniquely identifies the policy on the system.

**Values** 1 to 65535

### *port-redirect-group queue-group-name*

This optional parameter specifies that the *queue-group-name* will be used for all egress forwarding class redirections within the network QoS policy ID. The specified *queue-group-name* must exist as a port egress queue group on the port associated with the IP interface.

### *egress-instance instance-id*

Specifies the identification of a specific instance of the queue-group.

**Values** 1 to 16384

## Description

This command is used to redirect pseudowire packets to an ingress forwarding plane queue-group for the purpose of rate-limiting.

The ingress pseudowire rate-limiting feature uses a policer in queue-group provisioning model. This model allows the mapping of one or more pseudowires to the same instance of policers, which are defined in a queue-group template.

Operationally, the provisioning model in the case of the ingress pseudowire shaping feature consists of the following steps:

1. Create an ingress queue-group template and configure policers for each FC that needs to be redirected and optionally, for each traffic type (unicast, broadcast, unknown, or multicast).
2. Apply the queue-group template to the network ingress forwarding plane where there exists a network IP interface to which the pseudowire packets can be received. This creates one instance of the template on the ingress of the FP. One or more instances of the same template can be created.
3. Configure FC-to-policer mappings together with the policer redirect to a queue-group in the ingress context of a network QoS policy. No queue-group name is specified in this step, which means the same network QoS policy can redirect different pseudowires to different queue-group templates.
4. Apply this network QoS policy to the ingress context of a spoke-SDP inside a service, or to the ingress context of a pseudowire template, and specify the redirect queue-group name.
5. One or more spoke-SDPs can have their FCs redirected to use policers in the same policer queue-group instance.

The following are the constraints and rules of this provisioning model when used in the ingress pseudowire rate-limiting feature:

1. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name does not exist, the association is failed at the time the user associates the ingress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
2. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists but the policer-id is not defined in the queue-group template, the association is failed at the time the user associates the ingress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
3. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists and the policer-id is defined in the queue-group template, it is not required to check that an instance of that queue-group exists in all ingress FPs which have network IP interfaces. The handling of this is dealt with in the data path as follows:

When a pseudowire packet for that FC is received and an instance of the referenced queue-group name exists on that FP, the packet is processed by the policer and will then feed the per-FP ingress shared queues referred to as *policer-output-queues*.

When a pseudowire packet for that FC is received and an instance of the referenced queue-group name does not exist on that FP, the pseudowire packets will be fed directly into the corresponding ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.

- If a network QoS policy is applied to the ingress context of a pseudowire, any pseudowire FC which is not explicitly redirected in the network QoS policy will have the corresponding packets feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
- If no network QoS policy is applied to the ingress context of the pseudowire, then all packets of the pseudowire will feed:

the ingress network shared queue for the packet FC defined in the network-queue policy applied to the ingress of the FP. This is the default behavior.

a queue-group policer followed by the per-FP ingress shared queues referred to as *policer-output-queues* if the ingress context of the network IP interface from which the packet is received is redirected to a queue-group (csc-policing). The only exceptions to this behavior are for packets received from a IES/VPRN spoke interface and from an R-VPLS spoke-SDP, which is forwarded to the R-VPLS IP interface. In these two cases, the ingress network shared queue for the packet FC defined in the network-queue policy applied to the ingress of the FP is used.

When a pseudowire is redirected to use a policer queue-group, the classification of the packet for the purpose of FC and profile determination is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the pseudowire. This is true regardless of whether an instance of the named policer queue-group exists on the ingress FP on which the pseudowire packet is received. The user can apply a QoS filter matching the dot1.p in the VLAN tag corresponding to the Ethernet port encapsulation, the EXP in the outer label when the tunnel is an LSP, the DSCP in the IP header if the tunnel encapsulation is GRE, and the DSCP in the payload IP header if the user enabled the **ler-use-dscp** option and the pseudowire terminates in IES or VPRN service (spoke-interface).

When the policer queue-group name the pseudowire is redirected does not exist, the redirection command is failed. In this case, the packet classification is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the network IP interface on which the pseudowire packet is received.

The **no** version of this command removes the redirection of the pseudowire to the queue-group.

### Description

This command is used to redirect PW packets to an egress port queue-group for the purpose of shaping.

The egress PW shaping provisioning model allows the mapping of one or more PWs to the same instance of queues, or policers and queues, that are defined in the queue-group template.

Operationally, the provisioning model consists of the following steps:

1. Create an egress queue-group template and configure queues only, or policers and queues for each FC that needs to be redirected.
2. Apply the queue-group template to the network egress context of all ports where there exists a network IP interface that the PW packets can be forwarded on. This creates one instance of the template on the egress of the port. One or more instances of the same template can be created.
3. Configure FC-to-policer or FC-to-queue mappings together with the redirect to a queue- group in the egress context of a network QoS policy. No queue-group name is specified in this step, which means the same network QoS policy can redirect different PWs to different queue-group templates.
4. Apply this network QoS policy to the egress context of a spoke-SDP inside a service, or to the egress context of a PW template and specify the redirect queue-group name.

One or more spoke-SDPs can have their FCs redirected to use queues only, or queues and policers in the same queue-group instance.

The following are the constraints and rules of this provisioning model.

1. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name does not exist, the association is failed at the time the user associates the egress context of a spoke-SDP to the named queue-group. In such a case, the PW packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface the PW packet is forwarded on. This queue can be a queue-group queue or the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port. This is the existing implementation and default behavior for a PW packet.

2. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name exists but the policer-id and/or the queue-id is not defined in the queue-group template, the association is failed at the time the user associates the egress context of a spoke-SDP to the named queue-group. In such a case, the PW packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface the PW packet is forwarded on.
3. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name exists and the policer-id or policer-id plus queue-id exist, it is not required to check that an instance of that queue-group exists in all egress network ports that have network IP interfaces. The handling of this is dealt with in the data path as follows:
  - When a PW packet for that FC is forwarded and an instance of the referenced queue-group name exists on that egress port, the packet is processed by the queue-group policer and will then be fed to the queue-group queue.
  - When a PW packet for that FC is forwarded and an instance of the referenced queue-group name does not exist on that egress port, the PW packet will be fed directly to the corresponding egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.
4. If a network QoS policy is applied to the egress context of a PW, any PW FC that is not explicitly redirected in the network QoS policy will have the corresponding packets feed directly the corresponding the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.

When the queue-group name the PW is redirected to exists and the redirection succeeds, the marking of the packet's DEI/dot1p/DSCP and the tunnel's DEI/dot1p/DSCP/EXP is performed according to the relevant mappings of the {FC, profile} in the egress context of the network QoS policy applied to the PW. This is true regardless of whether an instance of the queue-group exists or not on the egress port the PW packet is forwarded to. If the packet's profile value changed due to egress child policer CIR profiling, the new profile value is used to mark the packet's DEI/dot1p and the tunnel's DEI/dot1p/EXP, and the DSCP/prec will be remarked if **enable-dscp-prec-marking** is enabled under the policer.

When the queue-group name the PW is redirected does not exist, the redirection command is failed. In this case, the marking of the packet's DEI/dot1p/DSCP and the tunnel's DEI/ dot1p/DSCP/EXP fields is performed according to the relevant commands in the egress context of the network QoS policy applied to the network IP interface the PW packet is forwarded to.

The **no** version of this command removes the redirection of the PW to the queue-group.

## Parameters

### *network-policy-id*

Specifies the network policy identification. The value uniquely identifies the policy on the system.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **qos name network-policy-name** variant can be used in all configuration modes.

**Values** 1 to 65535

### *queue-group-name*

Specifies the name of the queue group template up to 32 characters in length.

### *instance-id*

Specifies the identification of a specific instance of the queue-group.

**Values** 1 to 65535

***name network-policy-name***

Specifies the network policy name. The value uniquely identifies the policy on the system, up to 64 characters.

**Description**

This command is used to redirect pseudowire packets to an ingress forwarding plane queue-group for the purpose of rate-limiting.

The ingress pseudowire rate-limiting feature uses a policer in queue-group provisioning model. This model allows the mapping of one or more pseudowires to the same instance of policers, which are defined in a queue-group template.

Operationally, the provisioning model in the case of the ingress pseudowire shaping feature consists of the following steps:

1. Create an ingress queue-group template and configure policers for each FC that needs to be redirected and optionally, for each traffic type (unicast or multicast).
2. Apply the queue-group template to the network ingress forwarding plane where there exists a network IP interface to which the pseudowire packets can be received. This creates one instance of the template on the ingress of the FP. One or more instances of the same template can be created.

3. Configure FC-to-policer mappings together with the policer redirect to a queue-group in the ingress context of a network QoS policy. No queue-group name is specified in this step, which means the same network QoS policy can redirect different pseudowires to different queue-group templates.
4. Apply this network QoS policy to the ingress context of a spoke-SDP inside a service, or to the ingress context of a pseudowire template, and specify the redirect queue-group name.
5. One or more spoke-SDPs can have their FCs redirected to use policers in the same policer queue-group instance.

The following are the constraints and rules of this provisioning model when used in the ingress pseudowire rate-limiting feature:

1. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name does not exist, the association is failed at the time the user associates the ingress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
2. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists but the policer-id is not defined in the queue-group template, the association is failed at the time the user associates the ingress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
3. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists and the policer-id is defined in the queue-group template, it is not required to check that an instance of that queue-group exists in all ingress FPs which have network IP interfaces. The handling of this is dealt with in the data path as follows:

When a pseudowire packet for that FC is received and an instance of the referenced queue-group name exists on that FP, the packet is processed by the policer and will then feed the per-FP ingress shared queues referred to as *policer-output-queues*.

When a pseudowire packet for that FC is received and an instance of the referenced queue-group name does not exist on that FP, the pseudowire packets will be fed directly into the corresponding ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.

- If a network QoS policy is applied to the ingress context of a pseudowire, any pseudowire FC which is not explicitly redirected in the network QoS policy will have the corresponding packets feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
- If no network QoS policy is applied to the ingress context of the pseudowire, then all packets of the pseudowire will feed:
  - the ingress network shared queue for the packet FC defined in the network-queue policy applied to the ingress of the FP. This is the default behavior.
  - a queue-group policer followed by the per-FP ingress shared queues referred to as *policer-output-queues* if the ingress context of the network IP interface from which the packet is received is redirected to a queue-group. The only exceptions to this behavior are for packets received from a IES/VP RN spoke interface and from an R-VPLS spoke-SDP, which is forwarded to the R-VPLS IP interface. In these two cases, the ingress network shared queue for the packet FC defined in the network-queue policy applied to the ingress of the FP is used.

When a pseudowire is redirected to use a policer queue-group, the classification of the packet for the purpose of FC and profile determination is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the pseudowire. This is true

regardless of whether an instance of the named policer queue-group exists on the ingress FP on which the pseudowire packet is received. The user can apply a QoS filter matching the dot1-p in the VLAN tag corresponding to the Ethernet port encapsulation, the EXP in the outer label when the tunnel is an LSP, the DSCP in the IP header if the tunnel encapsulation is GRE, and the DSCP in the payload IP header if the user enabled the **ler-use-dscp** option and the pseudowire terminates in IES or VPRN service (spoke-interface).

When the policer queue-group name the pseudowire is redirected does not exist, the redirection command is failed. In this case, the packet classification is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the network IP interface on which the pseudowire packet is received.

The **no** version of this command removes the redirection of the pseudowire to the queue-group.

## Parameters

### *network-policy-id*

Specifies the network policy identification. The value uniquely identifies the policy on the system.

**Values** 1 to 65535

### *queue-group-name*

Specifies the name of the queue group template up to 32 characters in length

### *instance-id*

Specifies the identification of a specific instance of the queue-group

**Values** 1 to 16384

## Description

This command is used to redirect pseudowire packets to an ingress forwarding plane queue-group for the purpose of rate-limiting.

The ingress pseudowire rate-limiting feature uses a policer in queue-group provisioning model. This model allows the mapping of one or more pseudowires to the same instance of policers which are defined in a queue-group template.

Operationally, the provisioning model in the case of the ingress pseudowire shaping feature consists of the following steps:

1. Create an ingress queue-group template and configure policers for each FC which needs to be redirected and optionally for each traffic type (unicast or multicast).
2. Apply the queue-group template to the network ingress forwarding plane where there exists a network IP interface which the pseudowire packets can be received on. This creates one instance of the template on the ingress of the FP. One or more instances of the same template can be created.
3. Configure FC-to-policer mappings together with the policer redirect to a queue-group in the ingress context of a network QoS policy. No queue-group name is specified in this step which means the same network QoS policy can redirect different pseudowires to different queue-group templates.
4. Apply this network QoS policy to the ingress context of a spoke-sdp inside a service or to the ingress context of a pseudowire template and specify the redirect queue-group name.

One or more spoke-sdps can have their FCs redirected to use policers in the same policer queue-group instance.

The following are the constraints and rules of this provisioning model when used in the ingress pseudowire rate-limiting feature:

1. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name does not exist, the association is failed at the time the user associates the ingress context of a spoke-sdp to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
2. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists but the policer-id is not defined in the queue-group template, the association is failed at the time the user associates the ingress context of a spoke-sdp to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
3. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists and the policer-id is defined in the queue-group template, it is not required to check that an instance of that queue-group exists in all ingress FPs which have network IP interfaces. The handling of this is dealt with in the data path as follows:
  - When a pseudowire packet for that FC is received and an instance of the referenced queue-group name exists on that FP, the packet is processed by the policer and will then feed the per-FP ingress shared queues referred to as "policer-output-queues".

- When a pseudowire packet for that FC is received and an instance of the referenced queue-group name does not exist on that FP, the pseudowire packets will be fed directly into the corresponding ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
4. If a network QoS policy is applied to the ingress context of a pseudowire, any pseudowire FC which is not explicitly redirected in the network QoS policy will have the corresponding packets feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
  5. If no network QoS policy is applied to the ingress context of the pseudowire, then all packets of the pseudowire will feed:
    - the ingress network shared queue for the packet's FC defined in the network-queue policy applied to the ingress of the FP. This is the default behavior.
    - a queue-group policer followed by the per-FP ingress shared queues referred to as "policer-output-queues" Good received is redirected to a queue-group. The only exceptions to this behavior are for packets received from a IES/VRPN spoke interface and from a R-VPLS spoke-sdp which is forwarded to the R-VPLS IP interface. In these two cases, the ingress network shared queue for the packet's FC defined in the network-queue policy applied to the ingress of the FP is used. When a pseudowire is redirected to use a policer queue-group, the classification of the packet for the purpose of FC and profile determination is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the pseudowire. This is true regardless if an instance of the named policer queue-group exists on the ingress FP the pseudowire packet is received on. The user can apply a QoS filter matching the dot1p in the VLAN tag corresponding to the Ethernet port encapsulation, the EXP in the outer label when the tunnel is an LSP, the DSCP in the IP header if the tunnel encapsulation is GRE, and the DSCP in the payload's IP header if the user enabled the ler-use-dscp option and the pseudowire terminates in IES or VRPN service (spoke-interface).

When the policer queue-group name the pseudowire is redirected does not exist, the redirection command is failed. In this case, the packet classification is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the network IP interface the pseudowire packet is received on.

The no version of this command removes the redirection of the pseudowire to the queue-group.

## Parameters

### *network-policy-id*

Specifies the network policy identification. The value uniquely identifies the policy on the system.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **qos name network-policy-name** variant can be used in all configuration modes.

**Values** 1 to 65535

### *queue-group-name*

Specifies the name of the queue group template up to 32 characters in length.

### *instance-id*

Specifies the identification of a specific instance of the queue-group.

**Values** 1 to 65535

***name network-policy-name***

Specifies the network policy name. The value uniquely identifies the policy on the system, up to 64 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## qos

**Syntax**

**qos** *policy-id*

**qos name** *sap-egress-policy-name*

**no qos**

**Context**

[\[Tree\]](#) (config>service>template>epipe-sap-template>egress qos)

**Full Context**

configure service template epipe-sap-template egress qos

**Description**

This command associates an existing QoS policy with the template.

**Parameters**

***policy-id***

The egress policy ID to associate with SAP or IP interface on egress. The policy ID must already exist.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **qos name sap-egress-policy-name** variant can be used in all configuration modes.

**Values** 1 to 65535

***sap-egress-policy-name***

The SAP egress QoS policy name to associate with the SAP on egress, up to 64 characters.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## qos

### Syntax

**qos name** *sap-ingress-policy-name* [ **shared-queuing**]

**qos** *policy-id* [**shared-queuing**]

**no qos**

### Context

**[Tree]** (config>service>template>epipe-sap-template>ingress qos)

### Full Context

configure service template epipe-sap-template ingress qos

### Description

This command associates a Quality of Service (QoS) policy with an ingress Service Access Point (SAP) for the Epipe SAP template.

### Parameters

#### **sap-ingress-policy-name**

The SAP ingress QoS policy name to associate with the SAP on ingress.

#### **policy-id**

The ingress policy ID to associate with SAP or IP interface on ingress. The policy ID must already exist.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **qos name sap-ingress-policy-name** variant can be used in all configuration modes.

**Values** 1 to 65535

#### **shared-queuing**

This keyword can only be specified on SAP ingress. Specify the ingress shared queue policy used by this SAP. When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## qos

### Syntax

**qos** *network-policy-id* **fp-redirect-group** *queue-group-name* **instance** *instance-id*

**no qos**

## Context

[\[Tree\]](#) (config>service>vpls>vxlan>network>ingress qos)

## Full Context

configure service vpls vxlan network ingress qos

## Description

This command is used to redirect traffic arriving on VXLAN tunnels in an EVPN VXLAN service as a single entity (per forwarding class) to policers in an ingress forwarding plane queue group for the purpose of rate-limiting.

For the policer to be used, the following must be true:

- The configured queue group template name must be applied to the forwarding plane on which the ingress traffic arrives using the instance id specified.
- The policer referenced in the FC-to-policer mappings in the ingress context of a network QoS policy must be present in the specified queue group template.

The command will fail if the queue group template name does not exist or if the policer specified in the network QoS policy does not exist in the queue group template. If the queue group template name with the specified instance is not applied to the forwarding plane on which the VXLAN traffic arrives, then this traffic will use the ingress network queues related to the network interface; however, the ingress classification is still based on the applied network QoS policy.

The unicast traffic can be redirected to a policer under the forwarding class **fp-redirect-group** command in the ingress section of a network QoS policy. Similarly, broadcast, unknown and multicast traffic can be redirected to a **broadcast-policer**, **unknown-policer** or **mcast-policer**, respectively, also under the forwarding class **fp-redirect-group** command in the ingress section of a network QoS policy.

Ingress classification is based on the configuration of the ingress section of the specified network QoS policy, noting that the dot1p and DSCP classification is based on the outer Ethernet header and IP header, and the use of **ler-use-dscp**, **ip-criteria** and **ipv6-criteria** statements are ignored.

When this command is applied, it overrides the QoS applied to the related network interfaces for traffic arriving on VXLAN tunnels in that service but does not affect traffic received on a spoke-SDP in the same service.

The **no** version of this command removes the redirection of VXLAN tunnel traffic from the queue group policers.

## Parameters

### *network-policy-id*

Specifies the network policy identification. The value uniquely identifies the policy on the system.

**Values** 1 to 65535

### *queue-group-name*

Specifies the name of the queue group template up to 32 characters in length

### *instance-id*

Specifies the identification of a specific instance of the queue-group

**Values** 1 to 65535

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

qos

**no qos** [*policy-id*]

### Context

[\[Tree\]](#) (config>service>template>vpls-sap-template>ingress qos)

### Full Context

configure service template vpls-sap-template ingress qos

### Description

This command associates a Quality of Service (QoS) policy with an ingress Service Access Point (SAP) for the Epipe SAP template.

## Parameters

### *policy-id*

The ingress policy ID to associate with SAP or IP interface on ingress. The policy ID must already exist.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **qos name sap-ingress-policy-name** variant can be used in all configuration modes.

**Values** 1 to 65535

### **shared-queuing**

This keyword can only be specified on SAP ingress. Specify the ingress shared queue policy used by this SAP. When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

### **multipoint-shared**

This keyword can only be specified on SAP ingress. Multipoint shared queuing is a superset of shared queuing. When multipoint shared queuing keyword is set, as well as the unicast packets, multipoint packets also used shared queues.

Ingress unicast service queues are mapped one-for-one with hardware queues and unicast packets traverse the ingress forwarding plane twice, similar to the shared-queuing option. In addition, the multipoint queues defined in the ingress SAP QoS policy are not created. Instead, multipoint packets (broadcast, multicast and unknown unicast destined) are treated to the same dual pass ingress forwarding plane processing as unicast packets.

When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

**Values** Multipoint or not present

**Default** Present (the queue is created as non-multipoint)

### **sap-ingress-policy-name**

The SAP ingress QoS policy name to associate with the SAP on ingress, up to 64 characters.

## Platforms

All

## qos

## Syntax

**qos** *sap-egress-policy-id*

**qos name** *sap-egress-policy-name*

**no qos**

## Description

This command associates an existing QoS policy with the template.

## Parameters

### ***sap-egress-policy-id***

The egress policy ID to associate with SAP or IP interface on egress. The policy ID must already exist.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The qos name *sap-egress-policy-name* variant can be used in all configuration modes.

**Values** 1 to 65535

### ***sap-egress-policy-name***

The SAP egress QoS policy name to associate with the SAP on egress, up to 64 characters.

## Platforms

All

qos

## Syntax

**qos** *policy-id* [**shared-queuing** | **multipoint-shared**] [**fp-redirect-group** *queue-group-name* **instance** *instance-id*]

**no qos**

## Context

[\[Tree\]](#) (config>service>vpls>sap>ingress qos)

## Full Context

configure service vpls sap ingress qos

## Description

This command associates a Quality of Service (QoS) policy with an ingress Service Access Point (SAP).

QoS ingress and egress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP or IP interface. If the policy-id does not exist, an error will be returned.

The qos command is used to associate both ingress and egress QoS policies. The qos command only allows ingress policies to be associated on SAP ingress and egress policies on SAP egress. Attempts to associate a QoS policy of the wrong type returns an error.

Only one ingress and one egress QoS policy can be associated with a SAP at one time. Attempts to associate a second QoS policy of a specified type will return an error.

When an ingress QoS policy is defined on IES ingress IP interface that is bound to a VPLS, the policy becomes associated with every SAP on the VPLS and augments the QoS policy that is defined on each SAP. Packets that are bridged will be processed using the policy defined on the VPLS SAP; packets that are routed will be processed using the policy defined in the IES IP interface-binding context.

By default, if no specific QoS policy is associated with the SAP for ingress or egress, the default QoS policy is used.

The no form of this command removes the QoS policy association from the SAP, and the QoS policy reverts to the default.

## Parameters

### *policy-id*

The ingress policy ID to associate with SAP or IP interface on ingress. The policy ID must already exist.

**Values** 1 to 65535

### **shared-queuing**

This keyword can only be specified on SAP ingress. Specify the ingress shared queue policy used by this SAP. When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

### **multipoint-shared**

This keyword can only be specified on SAP ingress. Multipoint shared queuing is a superset of shared queuing. When multipoint shared queuing keyword is set, as well as the unicast packets, multipoint packets also used shared queues.

Ingress unicast service queues are mapped one-for-one with hardware queues and unicast packets traverse the ingress forwarding plane twice, similar to the shared-queuing option. In addition, the multipoint queues defined in the ingress SAP QoS policy are not created. Instead, multipoint packets (broadcast, multicast and unknown unicast destined) are treated to the same dual pass ingress forwarding plane processing as unicast packets.

When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

**Values** Multipoint or not present

**Default** Present (the queue is created as non-multipoint)

### **fp-redirect-group**

Creates an instance of a named queue group template on the ingress forwarding plane of a specified IOM/IMM/XMA. The queue-group-name and instance instance-id are

mandatory parameters when executing the command. The named queue group template can contain only policers. If it contains queues, then the command will fail.

***queue-group-name***

Specifies the name of the queue group template to be instantiated on the forwarding plane of the IOM/IMM/XMA, up to 32 characters in length. The queue-group-name must correspond to a valid ingress queue group template name, configured under `config>qos>queue-group-templates`.

***instance-id***

Specifies the instance of the named queue group to be created on the IOM/IMM/XMA ingress forwarding plane.

## Platforms

**no qos**

## Context

[\[Tree\]](#) (config>service>vprn>nw-if qos)

## Full Context

configure service vprn network-interface qos

## Description

This command associates a network Quality of Service (QoS) policy with a network IP interface. Only one network QoS policy can be associated with an IP interface at one time. Attempts to associate a second QoS policy return an error.

Associating a network QoS policy with a network interface is useful for the following purposes:

- To apply classification rules for determining the forwarding-class and profile of ingress packets on the interface.
- To associate ingress packets on the interface with a queue-group instance applied to the ingress context of the interface's forwarding plane (FP). (This is only applicable to interfaces on IOM4 and later cards.) The referenced ingress queue-group instance may have policers defined in order to rate limit ingress traffic on a per-forwarding class (and forwarding type: unicast vs. multicast) basis.
- To perform 802.1p, DSCP, IP precedence and/or MPLS EXP re-marking of egress packets on the interface.

- To associate egress packets on the interface with a queue-group instance applied to the egress context of the interface's port. The referenced egress queue-group instance may have policers and/or queues defined in order to rate limit egress traffic on a per-forwarding class basis.

The **no** form of this command removes the network QoS policy association from the network IP interface, and the QoS policy reverts to the default.

## Default

no qos

## Parameters

### ***network-policy-id***

An existing network policy ID to associate with the IP interface.

**Values** 1 to 65535

### ***port-redirect-group queue-group-name***

This optional parameter specifies the egress queue-group used for all egress forwarding-class redirections specified within the network QoS policy ID. The specified *queue-group-name* must exist as an egress queue group applied to the egress context of the port associated with the IP interface.

### ***egress-instance instance-id***

Since multiple instances of the same egress queue-group can be applied to the same port this optional parameter is used to specify which particular instance to associate with this particular network IP interface.

**Values** 1 to 16384

### ***fp-redirect-group queue-group-name***

This optional parameter specifies the ingress queue-group used for all ingress forwarding-class redirections specified within the network QoS policy ID. The specified *queue-group-name* must exist as an ingress queue group applied to the ingress context of the forwarding plane associated with the IP interface.

### ***ingress-instance instance-id***

Since multiple instances of the same ingress queue-group can be applied to the same forwarding plane this parameter is required to specify which particular instance to associate with this particular network IP interface.

**Values** 1 to 16384

## Platforms

All

qos

## Syntax

**qos** *network-policy-id* **fp-redirect-group** *queue-group-name* *instance* *instance-id*

**no qos**

## Context

[Tree] (config>service>vprn>network>ingress qos)

## Full Context

configure service vprn network ingress qos

## Description

This command is used to redirect unicast packets arriving on an automatically (using the **auto-bind-tunnel** command) or manually configured (using a **spoke-sdp** command, but not the **spoke-sdp** command under the VPRN IP interface) binding in a VPRN to a policer in an ingress forwarding plane queue-group for the purpose of rate-limiting.

For the policer to be used, the following must be true:

1. The configured queue group template name must be applied to the forwarding plane on which the ingress traffic arrives using the instance id specified.
2. The policer referenced in the FC-to-policer mappings in the ingress context of a network QoS policy must be present in the specified queue group template.

The command fails if the queue group template name does not exist or if the policer specified in the network QoS policy does not exist in the queue group template. If the queue group template name with the specified instance is not applied to the forwarding plane on which the VPRN binding unicast traffic arrives then this traffic uses the ingress network queues related to the network interface, however, the ingress classification is still based on the applied network QoS policy.

The unicast traffic can be redirected to a policer under the forwarding class **fp-redirect-group** command in the ingress section of a network QoS policy; any **fp-redirect-group multicast-policer**, **broadcast-policer** or **unknown-policer** commands are ignored for this traffic. Multicast traffic would use the ingress network queues or queue group related to the network interface.

Ingress classification is based on the configuration of the ingress section of the specified network QoS policy, noting that the dot1p and exp classification is based on the outer Ethernet header and MPLS label whereas the DSCP applies to the outer IP header if the tunnel encapsulation is GRE, or the DSCP in the first IP header in the payload if **ler-use-dscp** is enabled in the ingress section of the referenced network QoS policy.

When this command is applied, it overrides the QoS applied to the related network interfaces for unicast traffic arriving on bindings in that VPRN.

The **no** version of this command removes the redirection of VPRN binding traffic to the queue-group policers.

## Parameters

### *network-policy-id*

Specifies the network policy identification. The value uniquely identifies the policy on the system.

**Values** 1 to 65535

### **fp-redirect-group** *queue-group-name*

**no qos**

## Context

[\[Tree\]](#) (config>router>if qos)

## Full Context

configure router interface qos

## Description

This command associates a network Quality of Service (QoS) policy with a network IP interface. Only one network QoS policy can be associated with an IP interface at one time. Attempts to associate a second QoS policy return an error.

Associating a network QoS policy with a network interface is useful for the following purposes:

- To apply classification rules for determining the forwarding-class and profile of ingress packets on the interface.
- To associate ingress packets on the interface with a queue-group instance applied to the ingress context of the interface's forwarding plane (FP). The referenced ingress queue-group instance may have policers defined in order to rate limit ingress traffic on a per-forwarding class (and forwarding type: unicast vs. multicast) basis.
- To perform 802.1p, DSCP, IP precedence and/or MPLS EXP re-marking of egress packets on the interface.

- To associate egress packets on the interface with a queue-group instance applied to the egress context of the interface's port. The referenced egress queue-group instance may have policers and/or queues defined in order to rate limit egress traffic on a per-forwarding class basis.

The **no** form of this command removes the network QoS policy association from the network IP interface, and the QoS policy reverts to the default.

## Default

no qos

## Parameters

### ***network-policy-id***

Specifies an existing network policy ID to associate with the IP interface.

**Values** 1 to 65535

### ***egress-port-redirect-group queue-group-name***

This optional parameter specifies the egress queue-group used for all egress forwarding-class redirections specified within the network QoS policy ID. The specified *queue-group-name* must exist as an egress queue group applied to the egress context of the port associated with the IP interface.

### ***egress-instance instance-id***

Since multiple instances of the same egress queue-group can be applied to the same port this optional parameter is used to specify which instance to associate with this specific network IP interface.

**Values** 1 to 16384

### ***ingress-fp-redirect-group queue-group-name***

This optional parameter specifies the ingress queue-group used for all ingress forwarding-class redirections specified within the network QoS policy ID. The specified *queue-group-name* must exist as an ingress queue group applied to the ingress context of the forwarding plane associated with the IP interface.

### ***ingress-instance instance-id***

Since multiple instances of the same ingress queue-group can be applied to the same forwarding plane this parameter is required to specify which instance to associate with this specific network IP interface.

**Values** 1 to 16384

## 21.11 qos-marking-from-sap

## qos-marking-from-sap

### Syntax

[no] qos-marking-from-sap

### Context

[\[Tree\]](#) (config>subscr-mgmt>sla-profile>egress qos-marking-from-sap)

### Full Context

configure subscriber-mgmt sla-profile egress qos-marking-from-sap

### Description

This command sets the QoS policy from which the egress QoS marking rules are applied.

#### Note:

If applied to a managed SAP, the default s-egress qos-policy (sap-egress 1) cannot be changed.

The **no** form of this command reverts to the egress QoS marking defined in SAP-egress policy defined at sla-profile level.

### Default

qos-marking-from-sap

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 21.12 qos-policy-id-range

### qos-policy-id-range

### Syntax

qos-policy-id-range start *policy-id* end *policy-id*  
no qos-policy-id-range

### Context

[\[Tree\]](#) (config>qos>md-auto-id qos-policy-id-range)

### Full Context

configure qos md-auto-id qos-policy-id-range

## Description

This command specifies the range of IDs used by SR OS to automatically assign an ID to QoS policies that are created in model-driven interfaces without an ID explicitly specified by the user or client.

A QoS policy created with an explicitly-specified ID cannot use an ID in this range. In classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD interfaces, the range can be changed which will cause any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **config>eth-cfm md-auto-id** command for further details.

## Default

no qos-policy-id-range

## Parameters

### **start policy-id**

Specifies the lower value of the ID range. The value must be less than or equal to the **end** value.

**Values** 1 to 65535

### **end policy-id**

Specifies the upper value of the ID range. The value must be greater than or equal to the **start** value.

**Values** 1 to 65535

configure service vprn subscriber-interface group-interface ipv6 qos-route-lookup
configure service ies subscriber-interface group-interface qos-route-lookup
configure service ies subscriber-interface group-interface ipv6 qos-route-lookup
```

## Description

This command enables QoS classification of the ingress IP packets on an interface based on the QoS information associated with routes in the forwarding table.

If the optional **destination** parameter is specified and the destination address of an incoming IP packet matches a route with QoS information the packet is classified to the fc and priority associated with that route, overriding the fc and priority/profile determined from the sap-ingress or network qos policy associated with the IP interface. If the destination address of the incoming packet matches a route with no QoS information the fc and priority of the packet remain as determined by the sap-ingress or network QoS policy.

If the optional **source** parameter is specified and the source address of an incoming IP packet matches a route with QoS information the packet is classified to the fc and priority associated with that route, overriding the fc and priority/profile determined from the sap-ingress or network qos policy associated with the IP interface. If the source address of the incoming packet matches a route with no QoS information the fc and priority of the packet remain as determined by the sap-ingress or network QoS policy.

If neither the optional **source** or **destination** parameter is present, then the default is **destination** address matching.

The functionality enabled by the qos-route-lookup command can be applied to IPv4 packets or IPv6 packets on an interface, depending on whether it is present at the interface context (applies to IPv4) or the interface>ipv6 context (applies to IPv6). The ability to specify source address based QoS lookup is not supported for IPv6. For the 7740 ESS, subscriber management group interfaces also do not support the source QPPB option.

The **no** form of this command reverts to the default.

## Default

destination

## Parameters

### source

Enables QoS classification of incoming IP packets based on the source address matching a route with QoS information.

### destination

Enables QoS classification of incoming IP packets based on the destination address matching a route with QoS information.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

## qos-route-lookup

**[Tree]** (config>service>ies>if qos-route-lookup)

### Full Context

configure service ies interface ipv6 qos-route-lookup

configure router interface qos-route-lookup

configure router interface ipv6 qos-route-lookup

configure service vprn interface qos-route-lookup

configure service vprn interface ipv6 qos-route-lookup

configure service ies interface qos-route-lookup

### Description

This command specifies the IP address type used for QPPB-enabled per-packet QoS handling (in terms of FC and priority). When using QPPB, routes are associated with a QoS treatment (FC and optionally priority) through either explicit configuration or the route policy. If an IPv4 or IPv6 packet arrives on an interface where the configuration of this command applies to the packet, the QoS treatment of the packet is based on the route that matched the destination IP address or the route that matched the source IP address.

See "Enabling QPPB on an interface" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for more information about QPPB.

The **no** form of this command configures the router to use the default destination address matching mode.

### Default

no qos-route-lookup

### Parameters

#### source

Keyword to enable QoS classification of incoming IP packets based on the source address. If the route matching the source address does not have QPPB information, the QoS classification of the packet remains as determined by the SAP ingress or network QoS policy.

**destination**

Keyword to enable QoS classification of incoming IP packets based on the destination address. If the route matching the destination address does not have QPPB information, the QoS classification of the packet remains as determined by the SAP ingress or network QoS policy.

**source-and-dest**

Keyword to enable QoS classification of incoming IP packets based on the destination address. If the route matching the destination address does not have QPPB information, QoS classification of incoming IP packets is based on the lookup of the source IP address. If neither the destination nor the source lookups find a route with QPPB information, the QoS classification of the packet remains as determined by the SAP ingress or network QoS policy.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 21.14 query-interval

**[Tree]** (config>service>vpls>mesh-sdp>mld-snooping query-interval)

**[Tree]** (config>service>vpls>igmp-snooping query-interval)

**Full Context**

configure service vpls sap igmp-snooping query-interval

configure service vpls mesh-sdp igmp-snooping query-interval

configure service vpls spoke-sdp igmp-snooping query-interval

configure service vpls spoke-sdp mld-snooping query-interval

configure service vpls mld-snooping query-interval

```
configure service vpls sap mld-snooping query-interval
configure service vpls mesh-sdp mld-snooping query-interval
configure service vpls igmp-snooping query-interval
```

## Description

This command configures the IGMP query interval. If the **send-queries** command is enabled, this parameter specifies the interval between two consecutive general queries sent by the system on this SAP or SDP.

The configured query-interval must be greater than the configured query-response-interval.

If send-queries is not enabled on this SAP or SDP, the configured query-interval value is ignored.

## Default

```
query-interval 125
```

## Parameters

### *seconds*

Specifies the time interval, in seconds, that the router transmits general host-query messages

**Values** 2 to 1024

**Values** **config>service>vpls>igmp-snooping:** 1 - 65535  
**config>service>vpls>sap>igmp-snooping:** 2 - 1024

## Platforms

```
configure service vprn igmp group-interface query-interval
configure router mld group-interface query-interval
```

```
configure router igmp group-interface query-interval
configure service vprn mld group-interface query-interval
```

### Description

This command configures the query interval when the group interface is configured with **no sub-hosts-only**. If nothing is configured, by default, the **query-interval** takes the value defined in the **config>router>igmp** (or **mld**) context or in the **config>service>vprn>igmp** (or **mld**) context.

The **no** form of this command reverts to the default value.

### Default

```
query-interval 125
```

### Parameters

#### *seconds*

Specifies the frequency, in seconds, at which the router transmits general host-query messages.

**Values** 2 to 1024

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

The shorter the interval, the faster a loss of the last member of a group can be detected. If nothing is configured, by default, the **query-last-member-interval** takes the value defined in the **config>router>igmp** context or the **config>service>vprn>igmp** context. It is highly recommended that all three query intervals be configured together on each IGMP policy.

The **no** form of this command reverts to the default value.

## Parameters

### *seconds*

Specifies the frequency, in seconds, at which query messages are sent.

**Values** 1 to 1023

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## query-last-member-interval

## Syntax

**query-last-member-interval** *seconds*

## Context

**[Tree]** (config>service>vprn>igmp>grp-if query-last-member-interval)

**[Tree]** (config>service>vprn>igmp query-last-member-interval)

## Full Context

configure service vprn igmp group-interface query-last-member-interval

configure service vprn igmp query-last-member-interval

## Description

This command configures the frequency at which the querier sends group-specific query messages including messages sent in response to leave-group messages. The lower the interval, the faster the detection of the loss of the last member of a group.

## Default

query-last-member-interval 1

## Parameters

### *seconds*

Specifies the frequency, in seconds, at which query messages are sent.

**Values** 1 to 1023

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn igmp group-interface query-last-member-interval

All

- configure service vprn igmp query-last-member-interval

## query-last-member-interval

### Full Context

```
configure service vpls mesh-sdp igmp-snooping query-response-interval
configure service vpls spoke-sdp igmp-snooping query-response-interval
configure service vpls sap mld-snooping query-response-interval
configure service vpls mesh-sdp mld-snooping query-response-interval
configure service vpls sap igmp-snooping query-response-interval
configure service vpls spoke-sdp mld-snooping query-response-interval
```

### Description

This command configures the IGMP query response interval. If the **send-queries** command is enabled, this parameter specifies the maximum response time advertised in IGMPv2 or IGMPv3 queries.

The configured query response interval must be smaller than the configured query interval.

If **send-queries** is not enabled on this SAP or SDP, the configured query response interval value is ignored.

The **no** form of this command reverts to the default value.

### Default

query-response-interval 10

### Parameters

#### *seconds*

Specifies the length of time to wait to receive a response to the host-query message from the host.

**Values** 1 to 1023

### Platforms

All

query-response-interval

### Syntax

**query-response-interval** *seconds*

**no query-response-interval**

## 21.19 queue

### queue

## Syntax

```
queue queue-id {ingress-only | egress-only | ingress-egress}
```

```
no queue queue-id
```

## Context

[\[Tree\]](#) (config>subscr-mgmt>cat-map>category queue)

## Full Context

```
configure subscriber-mgmt category-map category queue
```

## Description

This command configures a queue in this category.

The **no** form of this command reverts to the default.

## Parameters

### *queue-id*

Specifies the queue ID for this instances. Each queue nominated in the category map is monitored for activity (over a period of approximately 60 seconds), should the activity fall below the threshold value then a timer is started. Whenever this timer exceeds the configured timeout under the idle-timeout the action (currently disconnect) is executed for that subscriber and all hosts under that given SLA-profile-instance.

**Values** 1 to 32

**ingress-only**

Specifies that ingress queues are defined in this category.

**egress-only**

Specifies that egress queues are defined in this category.

**ingress-egress**

Specifies that ingress and egress queues are defined in this category.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## queue

**Syntax**

**queue** *queue-id* [**create**]

**no queue** *queue-id*

**Context**

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>cr queue)

**Full Context**

configure subscriber-mgmt radius-accounting-policy custom-record queue

**Description**

This command specifies the *queue-id* for which counters are collected in this custom record. The counters that are collected are defined in egress and ingress counters.

The **no** form of this command reverts to the default value.

**Parameters**

***queue-id***

Specifies the *queue-id* for which counters are collected in this custom record.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## queue

**Syntax**

[**no**] **queue** *queue-id*

## Context

[\[Tree\]](#) (config>subscr-mgmt>sla-prof>ingress>qos queue)

[\[Tree\]](#) (config>subscr-mgmt>sla-prof>egress>qos queue)

## Full Context

configure subscriber-mgmt sla-profile ingress qos queue

configure subscriber-mgmt sla-profile egress qos queue

## Description

Commands in this context configure egress or ingress queue parameters. Parameters defined in the **config>qos>sap-egress** *policy-id* or the **config>qos>sap-ingress** *policy-id* context are overridden by parameters specified in the subscriber management SLA profile context.

The classification and the queue mapping are shared by all the hosts on the same complex that use the same QoS policy (specified in the **sla-profile** SAP egress and SAP ingress policy IDs).

The queues are shared by all the hosts (of the same subscriber) on the same SAP that are using the same SLA profile. Queues are instantiated when, on a given SAP, a host of a subscriber is the first to use a certain SLA profile. This instantiation is referred to as an SLA profile instance.

The **no** form of this command removes the *queue-id* from the SLA profile.

## Parameters

### *queue-id*

Specifies the queue ID for the SAP egress or ingress queue, expressed as a decimal integer. The ID uniquely identifies the queue within the profile.

**Values** 1 to 0

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## queue

## Syntax

**queue** *queue-id* [create]

**no queue** *queue-id*

## Context

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>sap>egress>queue-override queue)

[\[Tree\]](#) (config>service>vpls>sap>egress>queue-override queue)

[\[Tree\]](#) (config>service>ies>if>sap>ingress>queue-override queue)

[\[Tree\]](#) (config>service>ies>if>sap>egress>queue-override queue)

## Full Context

```
configure service ies subscriber-interface group-interface sap egress queue-override queue
configure service vpls sap egress queue-override queue
configure service vpls sap ingress queue-override queue
configure service ies interface sap ingress queue-override queue
configure service ies interface sap egress queue-override queue
```

## Description

This command specifies the ID of the queue whose parameters are to be overridden.  
The **no** form of this command removes the queue ID from the configuration.

## Parameters

### *queue-id*

Specifies the queue ID whose parameters are to be overridden.

**Values** 1 to 8 for SAP egress  
1 to 32 for SAP ingress

### **create**

Keyword used to create the queue ID. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## Platforms

All

## queue

## Syntax

```
queue queue-id [create]
no queue queue-id
```

## Context

**[Tree]** (config>port>eth>network>egr>qgrp>qover queue)  
**[Tree]** (config>port>ethernet>access>egr>qgrp>qover queue)

## Full Context

```
configure port ethernet network egress queue-group queue-overrides queue
configure port ethernet access egress queue-group queue-overrides queue
```

## Description

This command associates a queue for use in a queue group template. The defined queue-id acts as a repository for the default parameters for the queue. The template queue is created on each queue-group

object which is created with the queue group template name. Each queue is identified within the template by a queue-id number. The template ensures that all queue groups created with the template's name will have the same queue-ids providing a uniform structure for the forwarding class redirection commands in the SAP egress QoS policies. The parameters within the template queue will be used as the default settings for each queue in the actual queue group. The queue parameters may be individually changed for each queue in each queue group using per queue overrides.

The **no** form of this command removes the queue-id from the configuration.

## Parameters

### *queue-id*

Specifies the queue ID.

**Values** 1 to 8

### **create**

Mandatory when creating an entry.

## Platforms

All

## queue

## Syntax

**queue** *queue-id* [**create**]

**no queue** *queue-id*

[\[Tree\]](#) (config>service>vprn>if>sap>ingress>queue-override queue)

### Full Context

configure service vprn interface sap egress queue-override queue

configure service vprn interface sap ingress queue-override queue

### Description

This command specifies the ID of the queue whose parameters are to be overridden.

### Parameters

**queue-id**

Specifies the queue ID whose parameters are to be overridden.

**Values** 1 to 32

**create**

Keyword used to create the group override instance.

### Platforms

All

## queue

### Syntax

**queue** *queue-id* [**group** *queue-group-name*]

**no queue**

### Context

**[Tree]** (config>qos>sap-ingress>fc queue)

### Full Context

configure qos sap-ingress fc queue

### Description

This command overrides the default queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy before the mapping can be made. When the forwarding class mapping is executed, all traffic classified to *fc-name* on a SAP using this policy.

The **no** form of this command sets the *queue-id* back to the default queue for the forwarding class.

### Default

queue 1

### Parameters

#### *queue-id*

Specifies the SAP egress *queue-id* to be associated with the forwarding class. The *queue-id* must be an existing queue defined in *sap-egress* policy-id.

**Values** 1 — 8

**Default** 1

#### **group** *queue-group-name*

This optional parameter is used to redirect the forwarding type within the forwarding class to the specified *queue-id* within the *queue-group-name*. When the policy is applied, all packets matching the forwarding class and forwarding type will be redirected to the queue within the specified queue group. The *queue-group-name* are configured in the **config>qos>queue-group-templates** egress and ingress contexts. This parameter is used when policy-based queue group redirection is desired. That is, the specific queue group to redirect to is named in the QoS policy.

### Platforms

All

## queue

### Syntax

**queue** *queue-id* [**multipoint**] [*queue-type*] [*queue-mode*] [**create**]

**no queue** *queue-id*

### Context

**[Tree]** (config>qos>sap-ingress queue)

### Full Context

configure qos sap-ingress queue

### Description

This command creates the context to configure an ingress SAP QoS policy queue.

Explicit definition of an ingress queue's type is supported. A single ingress queue allows support for multiple forwarding classes. The default behavior automatically chooses the expedited or best effort nature of the queue based on the forwarding classes mapped to it. As long as all forwarding classes mapped to the queue are expedited (nc, ef, h1, or h2), the queue is treated as an expedited queue by the hardware schedulers. When any best effort forwarding classes are mapped to the queue (be, af, l1, or l2), the queue is treated as best effort (be) by the hardware schedulers. The queue type must be defined at the time of queue creation within the policy.

The **queue** command allows the creation of multipoint queues. Only multipoint queues can receive ingress packets that need flooding to multiple destinations. By separating the unicast for multipoint traffic at service ingress and handling the traffic on separate multipoint queues, special handling of the multipoint traffic is possible. Each queue acts as an accounting and (optionally) shaping device offering precise control over potentially expensive multicast, broadcast, and unknown unicast traffic. Only the back-end support of multipoint traffic (between the forwarding class and the queue based on forwarding type) needs to be defined. The individual classification rules used to place traffic into forwarding classes are not affected. Queues must be defined as multipoint at the time of creation within the policy.

The multipoint queues are for multipoint-destined service traffic. Within non-multipoint services, such as Epipe services, all traffic is considered unicast due to the nature of the service type. Multicast and broadcast-destined traffic in an Epipe service will not be mapped to a multipoint service queue.

When an ingress SAP QoS policy with multipoint queues is applied to an Epipe SAP, the multipoint queues are not created. When an ingress SAP QoS policy with multipoint queues is applied to an IES SAP, a multipoint queue will be created when PIM is enabled on the IES interface.

Any billing or statistical queries about a multipoint queue on a non-multipoint service returns zero values. Any queue parameter information requested about a multipoint queue on a non-multipoint service returns the queue parameters in the policy. Buffers will not be allocated for multipoint queues on non-multipoint services. Buffer pool queries return zero values for actual buffers allocated and current buffer utilization.

The **no** form of this command removes the *queue-id* from the SAP ingress QoS policy and from any existing SAPs using the policy. If any forwarding class forwarding types are mapped to the queue, they revert to their default queues. When a queue is removed, any pending accounting information for each SAP queue created due to the definition of the queue in the policy is discarded.

## Parameters

### *queue-id*

The *queue-id* for the queue, expressed as an integer. The *queue-id* uniquely identifies the queue within the policy. This is a required parameter each time the queue command is executed.

**Values** 1 to 32

### *queue-type*

The **expedite**, **best-effort**, and **auto-expedite** queue types are mutually exclusive. Each defines the method that the system uses to service the queue from a hardware perspective. A keyword can be specified at the time the queue is created. If an attempt to change the keyword after the queue is initially defined, an error is generated.

**Values** expedite, best-effort, auto-expedite

**expedite** — This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

**best-effort** — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

**auto-expedite** — This keyword allows the system to auto-define the way the queue is serviced by the hardware. When **auto-expedite** is defined on the queue, the queue is treated in an expedited manner when all forwarding classes mapped to the queue are configured as expedited types nc, ef, h1 or h2. When a single non-expedited forwarding class is mapped to the queue (be, af, l1, and l2), the queue automatically falls back to non-expedited status.

**Default** auto-expedite

### *multipoint*

This optional keyword specifies that this *queue-id* is for multipoint forwarded traffic only. This *queue-id* can only be explicitly mapped to the forwarding class multicast, broadcast, or unknown unicast ingress traffic. If forwarding class unicast traffic is mapped to a multipoint queue, an error is generated and no changes are made to the current unicast traffic queue mapping.

A queue must be created as multipoint. The **multipoint** designator cannot be defined after the queue is created. If an attempt is made to modify the command to include the **multipoint** keyword, an error is generated and the command will not execute.

The **multipoint** keyword can be entered in the command line on a preexisting multipoint queue to edit *queue-id* parameters.

**Default** non-multipoint (unicast queue)

### *queue-mode*

Specifies the mode in which the queue is operating. This attribute is associated with the queue at the time of creation and cannot be modified thereafter.

**Values** **profile-mode:** When the queue is operating in the profile mode (or the color aware mode), the queue tries to provide the appropriate bandwidth to the packets with different profiles. The profiles are assigned according to the configuration of the forwarding class or the sub-forwarding class.

**priority-mode:** The queue is capable of handling traffic differently with two distinct priorities. These priorities are assigned by the stages preceding the queueing framework in the system. In priority mode, the queue does not have the functionality to support the profiled traffic and in such cases the queue will have a degraded performance. However, the converse is not valid and a queue in-profile mode should be capable of supporting the different priorities of traffic.

**Default** priority-mode

### create

Keyword creates an ingress SAP QoS policy queue.

## Platforms

All

## queue

## Syntax

**queue** *queue-id* [{**group** *queue-group-name* [**instance** *instance-id*] | **port-redirect-group-queue**}]

**no queue**

## Context

[\[Tree\]](#) (config>qos>sap-egress>fc queue)

## Full Context

```
configure qos sap-egress fc queue
```

## Description

This command overrides the default queue mapping for **fc** *fc-name*. The specified queue ID must exist within the policy before the mapping can be made. When the forwarding class mapping is executed, all traffic is classified to *fc-name* on a SAP using this policy.

The **no** form of this command sets the *queue-id* back to the default queue for the forwarding class (queue 1).

## Default

no queue

## Parameters

*queue-id*

Specifies the SAP egress queue-id to be associated with the forwarding class. The queue-id must be an existing queue defined in sap-egress policy-id.

**Values** 1 to 8

**Default** 1

### ***queue-group-name***

This optional parameter is used to redirect the forwarding type within the forwarding class to the specified *queue-id* within the *queue-group-name*. When the policy is applied, all packets matching the forwarding class and forwarding type will be redirected to the queue within the specified queue group. The queue-group-name are configured in the **config>qos>queue-group-templates** egress and ingress contexts. This parameter is used when policy-based queue group redirection is desired. That is, the specific queue group to redirect to is named in the QoS policy.

### ***instance-id***

This parameter is used to specify the specific instance of a queue group with template queue-group-name to which this queue should be redirected. This parameter is only valid for queue groups on egress ports where policy-based redirection is required.

**Values** 1 to 40960

**Default** 1

### **port-redirect-group-queue**

This keyword is used to mark a given forwarding class queue for redirection to an egress queue group queue. This is only used when the specific queue group instance is assigned at the time the QoS policy is applied to the SAP. This redirection model is known as SAP-based redirection.

## **Platforms**

All

## **queue**

## **Syntax**

**queue** *queue-id* [*queue-type*] [**create**]

**no queue** *queue-id*

## **Context**

**[Tree]** (config>qos>sap-egress queue)

## **Full Context**

configure qos sap-egress queue

## **Description**

This command creates the context to configure an egress service access point (SAP) QoS policy queue.

Explicit definition of an egress queue's type is supported. A single egress queue allows support for multiple forwarding classes. The default behavior automatically chooses the expedited or best effort nature of the queue based on the forwarding classes mapped to it. As long as all forwarding classes mapped to the queue are expedited (nc, ef, h1, or h2), the queue is treated as an expedited queue by the hardware schedulers. When any best effort forwarding classes are mapped to the queue (be, af, l1, or l2), the queue is treated as best effort by the hardware schedulers. The queue type must be defined at the time of queue creation within the policy.

The **no** form of this command removes the *queue-id* from the SAP egress QoS policy and from any existing SAPs using the policy. If any forwarding class forwarding types are mapped to the queue, they revert to their default queues. When a queue is removed, any pending accounting information for each SAP queue created due to the definition of the queue in the policy is discarded.

## Parameters

### *queue-id*

The ID for the queue, expressed as an integer. The *queue-id* uniquely identifies the queue within the policy. This is a required parameter each time the queue command is executed.

**Values** 1 to 32

### *queue-type*

Specifies the method that system uses to service the queue from a hardware perspective. A keyword can be specified at the time the queue is created. If an attempt is made to change the keyword after the queue is initially defined, an error is generated.

**Values** **expedite** - Specifies that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

**best-effort** - Specifies that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

**auto-expedite** - Allows the system to auto-define the way the queue is serviced by the hardware. When **auto-expedite** is defined on the queue, the queue is treated in an expedited manner when all forwarding classes mapped to the queue are configured as expedited types nc, ef, h1, or h2. When a single non-expedited forwarding class is mapped to the queue (be, af, l1, and l2), the queue automatically falls back to non-expedited status.

**Default** auto-expedite

### **create**

Creates an entry for the queue.

## Platforms

All

## queue

### Syntax

**queue** *queue-id* **sched-class** *class-id*

**queue** *queue-id* **unattached**

**queue** *queue-id* **wrr-group** *wrr-group-id*

**no queue** *queue-id*

### Context

[\[Tree\]](#) (config>qos>hs-attachment-policy queue)

### Full Context

configure qos hs-attachment-policy queue

### Description

This command defines how the specified *queue-id* is attached to the scheduler. A queue may have one of four attachment states:

- directly attached to a scheduler class
- attached to a WRR group which is attached to a scheduler class
- attached to a WRR group which is unattached
- unattached

The following items are rules for attachment:

- Only one queue or WRR group can be attached to a given scheduling class. If another queue or a WRR group is currently attached to the specified scheduling class, the queue's attachment command fails and the current attachment for the *queue-id* is unchanged.
- Queues must be attached to scheduler classes (directly or indirectly through a WRR group) in an ascending order.

For example, if queue 3 is attached to scheduler class 2, queues 1 and 2 cannot be attached to scheduling classes 3 through 6 (or attached to a WRR group that is attached to scheduling classes 3 through 6).

- Up to six queues can be placed in any WRR group. These queues can all be in one WRR group or be spread between both WRR groups. Attempting to execute the **wrr-group** keyword on a seventh queue within the attachment policy fails.
- Queues must attach to WRR groups in contiguous order.
- WRR group 1 must have lower queue ID members than WRR group 2. Attempting to attach a queue ID to group 1 that is higher than any queue ID currently attached to group 2 fails with no change to the current attachment state for that queue ID. Attempting to attach a queue ID to group 2 that is lower than any queue ID currently attached to group 1 fails with no change to the current attachment state for that queue ID.
- WRR group 1 must have at least one attached member queue before queues can be attached to WRR group 2.
- Queues and WRR groups can be unattached at any time.

- Unattached queues, or queues attached to an unattached WRR group, discard all received packets. Normal discard accounting is maintained.
- The unattached state for an in-service queue or WRR group is intended for **hs-attachment-policy** editing purposes and is expected to be an intermediate state in this case.

When an **hs-attachment-policy** is initially created, all queues and both WRR groups default to the unattached state. Each queue and WRR group attachment state must be explicitly configured.

The **no** form of the command reverts to the default unattached attachment state for queue ID. The command fails if the specified *queue-id* is currently in a WRR group and removing the queue from that group causes the queue IDs for that group to become discontinuous.

## Default

queue *queue-id* unattached

## Parameters

### *queue-id*

Specifies the queue identifier for the HS attachment policy queue. This parameter is required when executing the command.

**Values** 1 to 8

### **sched-class**

Specifies a direct attachment between the *queue-id* and one of the six scheduling classes. A value of 1 through 6 must accompany the **sched-class** keyword representing the queue's attached scheduling class. The **sched-class**, **group**, and **unattached** keywords are mutually exclusive. One of the keywords must be specified when the **queue** attachment command is executed.

### *class-id*

Specifies the scheduling class that is associated with this *queue-id*.

**Values** 1 to 6

### **wrr-group**

Specifies the inclusion of the *queue-id* in either WRR group 1 or WRR group 2. A value of 1 or 2 must accompany the **wrr-group** keyword representing the queue's attached WRR group number. Queues placed in a WRR group must have contiguous queue IDs. The **sched-class**, **group**, and **unattached** keywords are mutually exclusive. One of the keywords must be specified when the **queue** attachment command is executed.

### *wrr-group-id*

Specifies the WRR group to which the *queue-id* is to be attached.

**Values** 1, 2

### **unattached**

Indicates that the *queue-id* is not attached to any scheduling class or WRR group. An unattached queue does not forward any packets. The **sched-class**, **group**, and **unattached** keywords are mutually exclusive. One of the keywords must be specified when the **queue** attachment command is executed.

## Platforms

7750 SR-7/12/12e

## queue

### Syntax

**queue** *queue-id* [**multipoint**] [*queue-type*] [**create**]

**no queue** *queue-id*

### Context

[\[Tree\]](#) (config>qos>network-queue>fc queue)

### Full Context

configure qos network-queue fc queue

### Description

Commands in this context configure a QoS network-queue policy queue.

Explicit definition of an ingress queue's type status is supported. A single ingress queue allows support for multiple forwarding classes. The default behavior automatically chooses the expedited or best effort nature of the queue based on the forwarding classes mapped to it. As long as all forwarding classes mapped to the queue are expedited (nc, ef, h1, or h2), the queue is treated as an expedited queue by the hardware schedulers. When any best effort forwarding classes are mapped to the queue (be, af, l1, or l2), the queue is treated as best effort (be) by the hardware schedulers. The queue type must be defined at the time of queue creation within the policy.

The **queue** command allows the creation of multipoint queues. Only multipoint queues can receive ingress packets that need flooding to multiple destinations. By separating the unicast for multipoint traffic at service ingress and handling the traffic on separate multipoint queues, special handling of the multipoint traffic is possible. Each queue acts as an accounting and (optionally) shaping device offering precise control over potentially expensive multicast, broadcast, and unknown unicast traffic. Only the back-end support of multipoint traffic (between the forwarding class and the queue based on forwarding type) needs to be defined. The individual classification rules used to place traffic into forwarding classes are not affected. Queues must be defined as multipoint at the time of creation within the policy.

The multipoint queues are for multipoint traffic.

The multipoint queues are for multipoint-destined service traffic. Within non-multipoint services, such as Epipe services, all traffic is considered unicast due to the nature of the service type. Multicast and broadcast-destined traffic in an Epipe service will not be mapped to a multipoint service queue.

When a QoS policy with multipoint queues is applied to an Epipe or IES SAP, the multipoint queues are not created. Any billing or statistical queries about a multipoint queue on a non-multipoint service returns zero values. Any queue parameter information requested about a multipoint queue on a non-multipoint service returns the queue parameters in the policy. Buffers will not be allocated for multipoint queues on non-multipoint services. Buffer pool queries return zero values for actual buffers allocated and current buffer utilization.

The **no** form of this command removes the *queue-id* from the network-queue policy and from any existing SAPs using the policy. If any forwarding class forwarding types are mapped to the queue, they revert to

their default queues. When a queue is removed, any pending accounting information for each SAP queue created due to the definition of the queue in the policy is discarded.

## Parameters

### *queue-id*

The *queue-id* for the queue, expressed as an integer. The *queue-id* uniquely identifies the queue within the policy. This is a required parameter each time the queue command is executed.

**Values** 1 to 32

### **multipoint**

This optional keyword specifies that this *queue-id* is for multipoint forwarded traffic only. This *queue-id* can only be used to forward multicast, broadcast, or unknown unicast ingress traffic.

A queue must be created as multipoint. The **multipoint** designator cannot be defined after the queue is created. If an attempt is made to modify the command to include the **multipoint** keyword, an error is generated, and the command will not execute.

The **multipoint** keyword can be entered in the command line on a preexisting multipoint queue to edit *queue-id* parameters.

**Default** Non-multipoint (unicast queue)

### *queue-type*

The **expedite**, **best-effort**, and **auto-expedite** queue types are mutually exclusive. Each defines the method that the system uses to service the queue from a hardware perspective. While parental virtual schedulers can be defined for the queue, they only enforce how the queue interacts for bandwidth with other queues associated with the same scheduler hierarchy. An internal mechanism that provides access rules when the queue is vying for bandwidth with queues in other virtual schedulers is also needed. A keyword must be specified at the time the queue is created in the network-queue policy. If an attempt is made to change the keyword after the queue is initially defined, an error is generated.

**Values** expedite, best-effort, auto-expedite

**expedite** — This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

**best-effort** — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

**auto-expedite** — This keyword allows the system to auto-define the way the queue is serviced by the hardware. When **auto-expedite** is defined on the queue, the queue is treated in an expedited manner when all forwarding classes mapped to the queue are configured as expedited types nc, ef, h1 or h2. When a single non-expedited forwarding class is mapped to the queue (be, af, l1, and l2), the queue automatically falls back to non-expedited status.

**Default** auto-expedite

## Platforms

**no queue** *queue-id*

## Context

[\[Tree\]](#) (config>qos>qgrps>ing>queue-group queue)

## Full Context

configure qos queue-group-templates ingress queue-group queue

## Description

This command creates a queue for use in a queue group template. When created, the defined queue-id acts as a repository for the default parameters for the queue. The template queue is created on each queue-group object that is created with the queue group template name. Each queue is identified within the template by a queue-id number. The template ensures that all queue groups created with the template name will have the same queue-ids providing a uniform structure for the forwarding class redirection commands in the SAP ingress QoS policies. The parameters within the template queue will be used as the default settings for each queue in the actual queue group. The queue parameters may be individually changed for each queue in each queue group using per queue overrides.

When a queue within a template is mapped by a forwarding class on any object, the queue may be edited, but not deleted.

The **no** form of this command removes a template queue from the queue group template. If the queue is specified as a forwarding class redirection target in any SAP ingress QoS policy, the command will fail.

## Parameters

### *queue-id*

This required parameter identifies the queue that will either be created or edited within the queue group template.

**Values** 1 to 32

### **multipoint**

This optional keyword creates an ingress multipoint queue. Multipoint queues in a queue group may be used by ingress VPLS for forwarding types multicast, broadcast or unknown within a forwarding class. For ingress IES and VPRN access SAPs, only multicast is supported. Multipoint queues are only supported on ingress queue group templates.

**Default** non-multipoint (unicast queue)

**queue-type**

The queue types are mutually exclusive.

- Values**
- expedite** — This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.
  - best-effort** — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.
- Default** best-effort

**queue-mode**

These keywords are optional and mutually exclusive when creating a new template queue. The keywords specify how the queue manages ingress explicitly profiled packets.

- Values**
- profile-mode** — Overrides the default priority mode of the queue and allows the adoption of color aware profiling within the queue. Forwarding classes and subclasses may be explicitly defined as in-profile or out-of-profile. Out-of-profile classified packets bypass the CIR rate associated with the queue, reserving it for the undefined or in-profile classified packets. If the template queue is not defined as profile-mode and the packet redirected to the queue is explicitly out-of-profile based on the classification rules, the queues within-CIR bandwidth may be consumed by the packet.
  - priority-mode** — Defines that the SAP ingress QoS policy priority classification result will be honored by the queue. Priority mode is the default mode of the queue. High-priority packets are allowed into the queue up to the MBS defined for the queue. Low-priority packets are discarded at the low-priority MBS threshold that is derived from applying the low drop-tail percentage to the queue's MBS.

**create**

Keyword used to create the queue ID instance.

**Platforms**

All

**queue****Syntax**

**queue** *queue-id*  
**no queue**

**Context**

[\[Tree\]](#) (config>qos>qgrps>egr>queue-group-template>fc queue)

## Full Context

configure qos queue-group-templates egress queue-group-template fc queue

## Description

This command is used to map the forwarding class to the specified *queue-id*. The specified *queue-id* must exist within the egress queue group template. When a queue is defined in a forwarding class mapping, that queue cannot be deleted unless the forwarding class mapping is moved to another queue within the template. Other criteria may also exist preventing the queue from being deleted from the template such as an applied SAP egress QoS policy mapping to the queue.

## Parameters

### *queue-id*

The specified *queue-id* must exist within the egress queue group template.

**Values** 1 to 8

## queue

## Syntax

**queue** *queue-id* [*queue-type*] [**create**]

**no queue** *queue-id*

## Context

[\[Tree\]](#) (cfg>qos>qgrps>egr>queue-group queue)

## Full Context

configure qos queue-group-templates egress queue-group queue

## Description

This command creates a queue for use in a queue group template. When created, the defined *queue-id* acts as a repository for the default parameters for the queue. The template queue is created on each queue group object that is created with the queue group template name. Each queue is identified within the template by a queue ID. The template ensures that all queue groups created with the template name will have the same queue-ids providing a uniform structure for the forwarding class redirection commands in the SAP egress QoS policies. The parameters within the template queue will be used as the default settings for each queue in the actual queue group. The queue parameters may be individually changed for each queue in each queue group using per queue overrides.

## Parameters

### *queue-id*

Specifies the queue ID. The specified *queue-id* must exist within the egress queue group template.

**Values** 1 to 8

**queue-type**

Specifies the method that the system uses to service the queue from a hardware perspective.

**Values** expedite, best-effort

**expedite** — This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

**best-effort** — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

**Default** best-effort

**queue** *queue-id*

**no queue**

**Context**

[\[Tree\]](#) (config>qos>shared-queue>fc queue)

**Full Context**

configure qos shared-queue fc queue

**Description**

This command overrides the default unicast forwarding type queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy as a non-multipoint queue before the mapping can be made. When the forwarding class mapping is executed, all unicast traffic (this includes all traffic, even broadcast and multicast for services) on a SAP using this policy is forwarded using the *queue-id*.

The **no** form of this command sets the unicast (point-to-point) *queue-id* back to the default queue for the forwarding class (queue 1).

**Parameters*****queue-id***

The *queue-id* parameter specified must be an existing non-multipoint queue defined in the **config>qos>sap-ingress** context. For the 7950 XRS, this is not configurable in the policer-output-queues profile.

**Values** Any valid non-multipoint *queue-id* in the policy including 1 and 3 through 32.

**Default** 1

## Platforms

**no queue** *queue-id*

## Context

[\[Tree\]](#) (config>qos>shared-queue queue)

## Full Context

configure qos shared-queue queue

## Description

This command creates the context to configure a shared queue QoS policy queue.

Explicit definition of an ingress queue's type is supported. A single ingress queue allows support for multiple forwarding classes. The default behavior automatically chooses the expedited or best effort nature of the queue based on the forwarding classes mapped to it. As long as all forwarding classes mapped to the queue are expedited (nc, ef, h1, or h2), the queue is treated as an expedited queue by the hardware schedulers. When any best effort forwarding classes are mapped to the queue (be, af, l1, or l2), the queue is treated as best effort by the hardware schedulers. The queue type can be overridden within the policy.

On the 7450 ESS, the expedited hardware schedulers are used to enforce expedited access to internal switch fabric destinations. The hardware status of the queue must be defined at the time of queue creation within the policy.

## Parameters

### *queue-id*

The *queue-id* for the queue, expressed as an integer. The *queue-id* uniquely identifies the queue within the policy. This is a required parameter each time the queue command is executed.

**Values** 1 to 32

### *queue-type*

The **expedite**, **best-effort**, and **auto-expedite** queue types are mutually exclusive. Each defines the method that the system uses to service the queue from a hardware perspective. While parental virtual schedulers can be defined for the queue, they only enforce how the queue interacts for bandwidth with other queues associated with the same

scheduler hierarchy. An internal mechanism that provides access rules when the queue is vying for bandwidth with queues in other virtual schedulers is also needed. A keyword must be specified at the time the queue is created in the SAP ingress policy. If an attempt to change the keyword after the queue is initially defined, an error is generated.

**expedite** — This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

**best-effort** — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

**auto-expedite** — This keyword allows the system to auto-define the way the queue is serviced by the hardware. When auto-expedite is defined on the queue, the queue is treated in an expedited manner when all forwarding classes mapped to the queue are configured as expedited types nc, ef, h1, or h2. When a single non-expedited forwarding class is mapped to the queue (be, af, l1, and l2) the queue automatically falls back to non-expedited status.

**Default**    **auto-expedite**

### multipoint

This keyword specifies that this *queue-id* is for multipoint forwarded traffic only. This *queue-id* can only be explicitly mapped to the forwarding class multicast, broadcast, or unknown unicast ingress traffic. If forwarding class unicast traffic is mapped to a multipoint queue, an error is generated and no changes are made to the current unicast traffic queue mapping.

A queue must be created as multipoint. The **multipoint** designator cannot be defined after the queue is created. If an attempt is made to modify the command to include the **multipoint** keyword, an error is generated and the command will not execute.

The **multipoint** keyword can be entered in the command line on a preexisting multipoint queue to edit *queue-id* parameters.

## Description

This command enters the context to configure a QoS network-queue policy queue.

Explicit definition of an ingress queue's type status is supported. A single ingress queue allows support for multiple forwarding classes. The default behavior automatically chooses the expedited or best effort nature of the queue based on the forwarding classes mapped to it. As long as all forwarding classes mapped to the queue are expedited (nc, ef, h1, or h2), the queue is treated as an expedited queue by the hardware schedulers. When any best effort forwarding classes are mapped to the queue (be, af, l1, or l2), the queue is treated as best effort (be) by the hardware schedulers. The queue type must be defined at the time of queue creation within the policy.

The **queue** command allows the creation of multipoint queues. Only multipoint queues can receive ingress packets that need flooding to multiple destinations. By separating the unicast for multipoint traffic at service ingress and handling the traffic on separate multipoint queues, special handling of the multipoint traffic is possible. Each queue acts as an accounting and (optionally) shaping device offering precise control

over potentially expensive multicast, broadcast, and unknown unicast traffic. Only the back-end support of multipoint traffic (between the forwarding class and the queue based on forwarding type) needs to be defined. The individual classification rules used to place traffic into forwarding classes are not affected. Queues must be defined as multipoint at the time of creation within the policy.

The multipoint queues are for multipoint traffic.

The multipoint queues are for multipoint-destined service traffic. Within non-multipoint services, such as Epipe services, all traffic is considered unicast due to the nature of the service type. Multicast and broadcast-destined traffic in an Epipe service will not be mapped to a multipoint service queue.

When a QoS policy with multipoint queues is applied to an Epipe or IES SAP, the multipoint queues are not created. Any billing or statistical queries about a multipoint queue on a non-multipoint service returns zero values. Any queue parameter information requested about a multipoint queue on a non-multipoint service returns the queue parameters in the policy. Buffers will not be allocated for multipoint queues on non-multipoint services. Buffer pool queries return zero values for actual buffers allocated and current buffer utilization.

The **no** form of this command removes the *queue-id* from the network-queue policy and from any existing SAPs using the policy. If any forwarding class forwarding types are mapped to the queue, they revert to their default queues. When a queue is removed, any pending accounting information for each SAP queue created due to the definition of the queue in the policy is discarded.

## Parameters

### *queue-id*

The *queue-id* for the queue, expressed as an integer. The *queue-id* uniquely identifies the queue within the policy. This is a required parameter each time the queue command is executed.

**Values** 1 to 32

### **multipoint**

This optional keyword specifies that this *queue-id* is for multipoint forwarded traffic only. This *queue-id* can only be used to forward multicast, broadcast, or unknown unicast ingress traffic.

A queue must be created as multipoint. The **multipoint** designator cannot be defined after the queue is created. If an attempt is made to modify the command to include the **multipoint** keyword, an error is generated, and the command will not execute.

The **multipoint** keyword can be entered in the command line on a preexisting multipoint queue to edit *queue-id* parameters.

**Default** Non-multipoint (unicast queue)

### *queue-type*

The **expedite**, **best-effort**, and **auto-expedite** queue types are mutually exclusive. Each defines the method that the system uses to service the queue from a hardware perspective. While parental virtual schedulers can be defined for the queue, they only enforce how the queue interacts for bandwidth with other queues associated with the same scheduler hierarchy. An internal mechanism that provides access rules when the queue is vying for bandwidth with queues in other virtual schedulers is also needed. A keyword must be specified at the time the queue is created in the network-queue policy. If an attempt is made to change the keyword after the queue is initially defined, an error is generated.

<b>Values</b>	<p>expedite, best-effort, auto-expedite</p> <p><b>expedite</b> — This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.</p> <p><b>best-effort</b> — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.</p> <p><b>auto-expedite</b> — This keyword allows the system to auto-define the way the queue is serviced by the hardware. When <b>auto-expedite</b> is defined on the queue, the queue is treated in an expedited manner when all forwarding classes mapped to the queue are configured as expedited types nc, ef, h1 or h2. When a single non-expedited forwarding class is mapped to the queue (be, af, l1, and l2), the queue automatically falls back to non-expedited status.</p>
<b>Default</b>	auto-expedite

## 21.20 queue-delay

### queue-delay

**Syntax****queue-delay** *delay***no queue-delay****Context**[\[Tree\]](#) (config>qos>qgrps>egr>qgrp>queue queue-delay)**Full Context**

configure qos queue-group-templates egress queue-group queue queue-delay

**Description**

This command configures the target queue delay for packets forwarded through the queue. It is used to determine the related queue parameters based on the administrative PIR of the queue. This command and the **mbs** command are mutually exclusive.

In order to change between the **mbs** and **queue-delay** parameters, the current parameter must be removed before adding the new parameter; that is, changing from **mbs** to **queue-delay** requires a **no mbs** before the **queue-delay** is configured and changing from **queue-delay** to **mbs** requires a **no queue-delay** before the **mbs** is configured.

If **queue-delay** is configured for an egress queue group queue, it is not possible to override the MBS for that queue.

The **no** form of this command disables the determination of the queue parameters based on the queue delay.

### Default

no queue-delay

### Parameters

#### *delay*

Specifies the target queue delay in ms.

**Values** 0 to 5000 (decimal)

## 21.22 queue-group

### queue-group

#### Syntax

**queue-group** *queue-group-name* **instance** *instance-id* [**create**]

**no queue-group** *queue-group-name* **instance** *instance-id*

#### Context

**[Tree]** (config>card>fp>ingress>access queue-group)

#### Full Context

configure card fp ingress access queue-group

#### Description

This command creates an instance of a named queue group template on the ingress forwarding plane of a given IOM/IMM. The *queue-group-name* and **instance** *instance-id* are mandatory parameters when executing the command.

The named queue group template can contain only policers. If it contains queues, then the command will fail.

The **no** form of this command deletes a specific instance of a queue group.

#### Parameters

##### *queue-group-name*

Specifies the name of the queue group template to be instantiated on the forwarding plane of the IOM/IMM, up to 32 characters. The *queue-group-name* must correspond to a valid ingress queue group template name, configured under **config>qos>queue-group-templates**.

##### *instance-id*

Specifies the instance of the named queue group to be created on the IOM/IMM ingress forwarding plane.

**Values** 1 to 65535

##### **create**

Keyword used to associate the queue group. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## queue-group

### Syntax

**queue-group** *queue-group-name* **instance** *instance-id* [**create**]

**no queue-group** *queue-group-name* **instance** *instance-id*

### Context

**[Tree]** (config>card>fp>ingress>network queue-group)

### Full Context

configure card fp ingress network queue-group

### Description

This command creates a queue-group instance in the network ingress context of a forwarding plane.

Only a queue-group containing policers can be instantiated. If the queue-group template contains policers and queues, the queues are not instantiated. If the queue-group contains queues only, the instantiation in the data path is failed.

One or more instances of the same policer queue-group name and/or a different policer queue-group name can be created on the network ingress context of a forwarding plane.

The queue-group-name must be unique within all network ingress and access ingress queue groups in the system. The queue-group instance-id must be unique within the context of the forwarding plane.

The **no** form of this command deletes the queue-group instance from the network ingress context of the forwarding plane.

### Parameters

#### **queue-group-name**

Specifies the name of the queue group template up to 32 characters.

#### **instance-id**

Specifies the identification of a specific instance of the queue-group.

**Values** 1 to 65535

#### **create**

Keyword used to create the queue-group instance.

### Platforms

## queue-group

### Syntax

**queue-group** *queue-group-name* **instance** *instance-id*

**no queue-group**

## Context

[\[Tree\]](#) (config>port>ethernet>network>egress queue-group)

## Full Context

configure port ethernet network egress queue-group

## Description

This command configures a queue-group instance in the network egress context of a port.

Queue-groups containing queues only or policers and queues can be instantiated. When a port is a LAG, one instance of the queue-group is instantiated on each member link.

One or more instances of the same queue-group name and/or a different queue-group name can be created in the network egress context of a port.

The queue-group-name must be unique within all network egress and access egress queue groups in the system. The queue-group instance-id must be unique within the context of the port.

The **no** version of this command deletes the queue-group instance from the network egress context of the port.

## Parameters

### *queue-group-name*

Specifies the name of the queue group template up to 32 characters.

### *instance-id*

Specifies the identification of a specific instance of the queue-group.

**Values** 1 to 65535

All

## queue-group

## Syntax

**[no] queue-group** *queue-group-name* [**instance** *instance-id*] [**create**]

## Context

[\[Tree\]](#) (config>port>ethernet>access>ing queue-group)

[\[Tree\]](#) (config>port>ethernet>access>egr queue-group)

## Full Context

configure port ethernet access ingress queue-group

configure port ethernet access egress queue-group

## Description

This command creates an ingress or egress queue group on an Ethernet port. A queue group is a collection of queues identified by a group name. Queue groups created on access ports are used as an alternative queue destination for SAPs.

Within a SAP, a forwarding class may be redirected from the local SAP queue to a port queue group queue. The forwarding classes from multiple SAPs may be redirected to the same queue group which can be used to minimize the number of per-SAP queues.

Queue groups may be created on both access and network oriented ports. When the port is in access mode, the queue groups must be created within the port access node.

Within the access node, queue groups are also configured as ingress or egress. Access ingress queue groups can only be used by ingress SAP forwarding classes and only a single ingress queue group per port is supported. Multiple access egress queue groups may be created on a single port and are used by egress SAP forwarding classes. The instance-id parameter identifies different instances of the same queue group template. Creating multiple queue groups with a different instance ID but the same queue group name results in separate queue groups being created on the port. The instance-id parameter is only valid for egress queue groups on access ports.

When the queue group is created in an ingress port context, the group-name must be an existing ingress queue group template. Similarly, queue groups created in an egress port context must have a group-name of an existing egress queue group template. Two ingress queue groups with the same name cannot be created on the same port. Two egress queue groups can only be created on the same port with the same queue group template name if they have different instance-id values.

The queues defined in the template are created on the queue group. The queue parameters within the template are used as the default queue parameters for each queue in the queue group. The default queue parameters for each queue may be overridden on the queue group with specific queue parameters.

Each queue group supports the application of a scheduler-policy for the purpose of managing the queues within the group into an aggregate SLA. The queues defined within the template may be configured with parent scheduler defining the mapping of a queue to one of the schedulers within the scheduler policy. Egress queue groups also support the **agg-rate** parameter and the queues in the egress template support the port-parent command. Each command is used for configuring egress port virtual scheduling behavior.

Each queue group allows the application of an accounting policy and the ability to enable and disable collecting statistics. The statistics are derived from the queue counters on each queue within the queue group. The accounting policy defines which queue counters are collected and to which accounting file they will be written.

A queue group does not have an administrative shutdown or no shutdown command. A queue group is considered to be always on once created.

When creating a queue group, the system will attempt to allocate queue resources based on the queues defined in the queue group template. If the appropriate queue resources do not currently exist, the queue group will not be created. Ingress port queue groups do not support the shared-queuing or multipoint-shared queuing behavior.

When the queue group is created on a LAG (Link Aggregation Group), it must be created on the primary port member. The primary port member is the port with the lowest port ID based on the slot, MDA position and port number on the MDA. A queue group created on the primary LAG port will be automatically created on all other port members. If a new port is being added to a LAG with an existing queue group, the queue group must first be created on the port prior to adding the port to the LAG. If the LAG queue group has queue overrides, the queue overrides must also be defined on the port queue group prior to adding the port to the LAG.

A port queue group cannot be removed from the port when a forwarding class is currently redirected to the group. All forwarding class redirections must first be removed prior to removing the queue group.

## Parameters

### *queue-group-name*

The group-name parameter is required when executing the port queue-group command. The specified group-name must exist as an ingress or egress queue group template depending on the ingress or egress context of the port queue group. Only a single queue group may be created on an ingress port. Multiple queue groups may be created on an egress port.

### *instance-id*

Specifies the identification of a specific instance of the queue-group.

**Values** 1 to 65535

### **create**

Keyword used to associate the queue group. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

## Platforms

All

## queue-group

## Syntax

**queue-group** *queue-group-name* [**create**]

**no queue-group** *queue-group-name*

## Context

[\[Tree\]](#) (config>qos>qgrps>ingress queue-group)

[\[Tree\]](#) (config>qos>qgrps>egress queue-group)

## Full Context

configure qos queue-group-templates ingress queue-group

configure qos queue-group-templates egress queue-group

## Description

This command creates a queue group template. The system does not maintain default queue groups or queue group templates. Each queue group template used in the system must be explicitly created.

The **no** form of this command removes the specified queue group template from the system. If the queue group template is currently in use by an ingress port, the command will fail. If *queue-group-name* does not exist, the command has no effect and does not return an error.

## Parameters

### *queue-group-name*

Specifies the name of the queue group template up to 32 characters. Each ingress queue group template must be uniquely named within the system. Multiple ingress queue group templates may not share the same name. An ingress and egress queue group template may share the same name.

### **create**

Keyword used to create the queue group instance. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

## Platforms

All

## 21.23 queue-group-egress

### queue-group-egress

## Syntax

```
queue-group-egress src-name dst-name [overwrite]
```

## Context

[\[Tree\]](#) (config>qos>copy queue-group-egress)

## Full Context

```
configure qos copy queue-group-egress
```

## Description

This command copies an existing **queue-group-egress** *queue-group-name* to another **queue-group-egress** *queue-group-name*. The **copy** command is a configuration level maintenance tool used to create new entries using an existing mapping policy name. If **overwrite** is not specified, an error occurs if the destination policy exists.

## Parameters

### *src-name*

Specifies the existing source **queue-group-egress** *queue-group-name*, up to 32 characters, from which the **copy** command attempts to copy.

### *dst-name*

Specifies the destination **queue-group-ingress** *queue-group-name*, up to 32 characters, to which the copy command attempts to copy.

### **overwrite**

Use this parameter when the **queue-group-egress** *dst-name* already exists. If it does, everything in the existing destination **queue-group-egress** *dst-name* is completely

overwritten with the contents of the **queue-group-egress** *src-name*. The **overwrite** parameter must be specified or else the following error message is returned:

```
MINOR: CLI Destination "qge2" exists - use {overwrite}.
```

If **overwrite** is specified, the function of copying from source to destination occurs in a "break before make" manner and therefore should be handled with care.

## Platforms

All

### queue-instance-accounting

**Syntax**

**queue-instance-accounting [interim-update]**

**no queue-instance-accounting**

**Context**

**[Tree]** (config>subscr-mgmt>acct-plcy queue-instance-accounting)

## Full Context

configure subscriber-mgmt radius-accounting-policy queue-instance-accounting

## Description

This command enables per queue-instance-accounting. A stream of accounting messages (START/INTERIM-UPDATE/STOP) is generated per queuing instance. A queuing instance is equivalent to an sla-profile instance. Accounting session id is generated per queuing instance and this accounting session id cannot be included in RADIUS Access-Request message. Queue instance counters represent volume based aggregation for all hosts sharing the queuing instance.

CoA and LI is supported based on the acct-session-id of the queuing instance.

The **no** form of this command reverts to the default.

## Default

queue-instance-accounting interim-update

## Parameters

### interim-update

Specifies whether accounting messages are sent for the queue-instance. The queue-instance is the SLA profile instance.

## Platforms

## Full Context

```
configure service epipe sap egress queue-override
```

```

configure service ipipe sap ingress queue-override
configure service epipe sap ingress queue-override
configure service cpipe sap egress queue-override
configure service ipipe sap egress queue-override
configure service cpipe sap ingress queue-override

```

### Description

Commands in this context configure override values for the specified SAP egress or ingress QoS queue. These values override the corresponding ones specified in the associated SAP egress or ingress QoS policy. If the policy was created as a template policy, this command overrides the parameter and its description and queue parameters in the policy.

### Platforms

All

- configure service epipe sap egress queue-override
- configure service epipe sap ingress queue-override
- configure service ipipe sap egress queue-override
- configure service ipipe sap ingress queue-override

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure service cpipe sap ingress queue-override
- configure service cpipe sap egress queue-override

## 21.29 queue-overrides

configure port ethernet network egress queue-group queue-overrides

configure port ethernet access ingress queue-group queue-overrides

configure port ethernet access egress queue-group queue-overrides

## Description

Commands in this context define optional queue parameter overrides for each queue within the queue group.

## Platforms

All

## 21.30 queue-parameters

### queue-parameters

## Syntax

**queue-parameters**

## Context

**[Tree]** (config>mcast-mgmt>bw-plcy>t2-paths>primary-path queue-parameters)

**[Tree]** (config>mcast-mgmt>bw-plcy>t2-paths>secondary-path queue-parameters)

## Full Context

configure mcast-management bandwidth-policy t2-paths primary-path queue-parameters

configure mcast-management bandwidth-policy t2-paths secondary-path queue-parameters

## Description

Commands in this context configure queue parameters. This command defines the individual parameters for the queues through which multicast packets are forwarded into the switch fabric on each path.

The individual path queues may be viewed as shared queues. All multicast packets forwarded through the switch fabric associated with one of the paths bypass the normal queuing behavior. Instead of being forwarded through the normal service or network multicast queue, a single queue associated with the multicast path is used. To retain billing and diagnostic information, the forwarding and discard statistics for the service or network queue the packet would have traversed without ingress multicast management is used to account for each packet's behavior.

### Note:

Any ingress scheduling policy functions attempting to manage the service or network multicast queues is only able to read the statistics of the multicast queues and not able to manage the queues dynamic rate since the packets are flowing through different, non-managed queues. Since this is the case, multicast queues parented to a scheduling policy should be parented to the root scheduler at the highest priority without any rate limitation. Any ingress rate limiting for multicast traffic is performed by the multicast path bandwidth manger based on each records priority and a possible "black-hole" rate threshold.

All queues created for ingress multicast path management are automatically created by the system out of the system reserved queue space. Each queue is created as an expedited queue.

When forwarding through the queues, each packets forwarding class is ignored. However, the forwarding class is retained for proper egress processing. The packets expressed or implied profile is also ignored within the ingress path queues. A packets congestion priority is derived from the records cong-priority-threshold evaluation result as indicated by the policy or multicast-info-policy. The **cong-priority-threshold** sets the high or low congestion priority of a record based on the records preference value. Within each multicast information policy bundle the **cong-priority-threshold preference-level** is set with a value from 0 to 7 and defines the threshold at which all records with a preference equal to or higher than the defined preference is treated as congestion priority high. Multicast records with a preference lower than the defined class threshold is treated as congestion priority low. Low-priority packets use the low drop-tail threshold of the queue, while high-priority packets use the standard MBS value. In the event of path congestion, low-priority packets are discarded first, leaving room for the higher priority packets.

For the primary and secondary paths, a single queue exists for each path and every packet forwarded through the path by the bandwidth manager uses that queue.

### Platforms

7450 ESS, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

## 21.31 queue-policy

### queue-policy

#### Syntax

**queue-policy** *name*  
**no queue-policy**

#### Context

[\[Tree\]](#) (config>card>fp>ingress>network queue-policy)

#### Full Context

configure card fp ingress network queue-policy

#### Description

This command specifies the network-queue policy which defines queue parameters such as CBS, high priority only burst size, MBS, CIR and PIR rates, as well as forwarding-class to queue mappings. The network-queue policy is defined in the **config>qos>network-queue** context.

#### Default

queue-policy default

#### Parameters

**name**

Specifies an existing network-queue policy name, up to 32 characters long.

## Platforms

All

## queue-policy

### Syntax

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 21.34 queues-hqos-manageable

## queues-hqos-manageable

### Syntax

[no] queues-hqos-manageable

### Context

[\[Tree\]](#) (config>qos>qgrps>egr>qgrp queues-hqos-manageable)

### Full Context

configure qos queue-group-templates egress queue-group queues-hqos-manageable

### Description

This command specifies that the queues within this egress queue group template are to be managed by the Hierarchical QoS (HQoS) process when the template is applied to an Ethernet access egress or network egress context. It is applicable to all egress queue group templates, including the default **policer-output-queues** template.

The **no queues-hqos-manageable** command must be configured for access egress queue groups that are used for post-policer traffic in order to prevent HQoS from measuring the traffic through a policer managed by HQoS then again through a post-policer access egress queue group queue.

Avoid scenarios that result in traffic being either not being measured or being measured twice by HQoS as they will cause the HQoS result to be inaccurate.

A template configured for **no queues-hqos-manageable** cannot be applied to an Ethernet network egress context. Any egress queue group templates applied to an Ethernet network egress context cannot be configured as **no queues-hqos-manageable**. The configuration of **no queues-hqos-manageable** and the configuration of policers and queue **packet-byte-offset** within the egress queue group template are mutually exclusive.

When a queue group template with **no queues-hqos-manageable** is configured under a port's Ethernet access egress context, the configuration of an aggregate rate or scheduler policy is not permitted under that context, nor are parent overrides for any of the queues in the queue group. If a port scheduler is configured on the port, the queue group queues are not parented to the port scheduler.

The **no** form of this command specifies that queues within this egress queue group are not managed by HQoS.

### Default

queues-hqos-manageable

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-1s, 7750 SR-1se, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, VSR

## 21.35 quiet-period

## quiet-period

### Syntax

`quiet-period seconds`

### Context

[\[Tree\]](#) (config>port>ethernet>dot1x quiet-period)

### Full Context

configure port ethernet dot1x quiet-period

### Description

This command configures the period between two authentication sessions during which no EAPOL frames are sent by the router.

The **no** form of this command returns the value to the default.

### Default

quiet-period 60

### Parameters

**seconds**

Specifies the quiet period in seconds.

**Values** 1 to 3600

### Platforms

All

## 21.36 quit

## quit

### Syntax

`quit`

### Context

[\[Tree\]](#) (candidate quit)

### Full Context

candidate quit

**Description**

This command exits the **edit-cfg** mode. The contents of the current candidate will not be deleted and the operator can continue editing the candidate later.

### 22.1 radius

#### radius

##### Syntax

**radius** *type* **direction** {**ingress** | **egress**} **script** *script*

**no radius** *type* **direction** {**ingress** | **egress**}

##### Context

[\[Tree\]](#) (config>python>py-policy radius)

##### Full Context

configure python python-policy radius

##### Description

This command specifies the Python script for the specified RADIUS packet type in the specified direction.

Multiple **radius** command configurations are allowed in the same Python policy.

The **no** form of this command reverts to the default.

##### Parameters

###### **type**

Specifies the message type of the event.

**Values** access-request, access-accept, access-reject, accounting-request, accounting-response, access-challenge, disconnect-request, change-of-authorization-request

###### **direction {ingress | egress}**

Specifies whether the event is incoming or outgoing.

###### **script**

Specifies the name of the Python script, up to 32 characters, that is used to handle the specified message.

##### Platforms

All

## radius

### Syntax

**[no] radius**

### Context

**[Tree]** (debug>router radius)

### Full Context

debug router radius

### Description

This command enables the debug router RADIUS context.

### Platforms

## Full Context

```
configure router l2tp radius-accounting-policy
configure service vprn l2tp radius-accounting-policy
configure service vprn l2tp group tunnel radius-accounting-policy
configure service vprn l2tp group radius-accounting-policy
configure service vprn interface sap ipsec-gw radius-accounting-policy
configure service ies interface sap ipsec-gw radius-accounting-policy
configure router l2tp group tunnel radius-accounting-policy
configure router l2tp group radius-accounting-policy
```

## Description

This command configures the RADIUS accounting policy.  
The **no** form of this command reverts to the default value.

## Default

```
no radius-accounting-policy
```

## Parameters

### *policy-name*

Specifies the policy name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure router l2tp group tunnel radius-accounting-policy
- configure service vprn l2tp radius-accounting-policy
- configure service vprn l2tp group tunnel radius-accounting-policy
- configure router l2tp group radius-accounting-policy
- configure router l2tp radius-accounting-policy
- configure service vprn l2tp group radius-accounting-policy

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service ies interface sap ipsec-gw radius-accounting-policy
- configure service vprn interface sap ipsec-gw radius-accounting-policy

## radius-accounting-policy

## Syntax

```
radius-accounting-policy name [create]
```

```
no radius-accounting-policy
```

## Context

[\[Tree\]](#) (config>subscr-mgmt radius-accounting-policy)

## Full Context

configure subscriber-mgmt radius-accounting-policy

## Description

This command specifies a subscriber RADIUS based accounting policy.

The **no** form of this command removes the policy name from the configuration.

## Parameters

### *name*

The name of the policy. The string is case-sensitive and limited to 32 ASCII 7-bit printable characters with no spaces.

### **create**

Keyword used to create a RADIUS accounting policy instance. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## radius-accounting-policy

## Syntax

**radius-accounting-policy** *nat-accounting-policy*

**no radius-accounting-policy**

## Context

[\[Tree\]](#) (config>isa>wlan-gw-group>nat radius-accounting-policy)

## Full Context

configure isa wlan-gw-group nat radius-accounting-policy

## Description

This command configures the RADIUS accounting policy to use for each MDA in this ISA group.

The **no** form of this command removes the accounting policy from the configuration.

## Parameters

### *nat-accounting-policy*

Specifies the RADIUS accounting policy up to 32 characters.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## radius-accounting-policy

### Syntax

**radius-accounting-policy** *rad-acct-plcy-name*

**no radius-accounting-policy**

### Context

[\[Tree\]](#) (config>app-assure>group>statistics>aa-sub radius-accounting-policy)

### Full Context

configure application-assurance group statistics aa-sub radius-accounting-policy

### Description

This command specifies an existing subscriber RADIUS based accounting policy to use for AA. RADIUS Accounting policies are configured in the **config>app-assure>radius-accounting-policy** context.

### Default

no radius-accounting-policy

### Parameters

***rad-acct-plcy-name***

Specifies the name of the policy. The string is case sensitive and limited to 32 ASCII 7-bit printable characters with no spaces.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## radius-accounting-policy

### Syntax

**radius-accounting-policy** *rad-acct-plcy-name* **[create]**

**no radius-accounting-policy** *rad-acct-plcy-name*

### Context

[\[Tree\]](#) (config>app-assure radius-accounting-policy)

### Full Context

configure application-assurance radius-accounting-policy

## Description

This command specifies an existing subscriber RADIUS-based accounting policy to use for AA. RADIUS accounting policies are configured in the **config>app-assure>radius-accounting-policy** context.

## Default

no radius-accounting-policy

## Parameters

### *rad-acct-plcy-name*

Specifies the policy name. The string is case sensitive and limited to 32 ASCII 7-bit printable characters with no spaces.

### **create**

Keyword used to create the policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## radius-accounting-policy

## Syntax

**radius-accounting-policy** *name* [**create**]

**no radius-accounting-policy** *name*

## Context

[\[Tree\]](#) (config>ipsec radius-accounting-policy)

## Full Context

configure ipsec radius-accounting-policy

## Description

This command specifies an existing RADIUS accounting policy to use to collect accounting statistics on this subscriber profile by RADIUS. This command is used independently of the **collect-stats** command.

## Parameters

### *name*

Specifies an existing RADIUS based accounting policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## radius-accounting-policy

### Syntax

**radius-accounting-policy** *nat-accounting-policy*  
**no radius-accounting-policy**

### Context

[\[Tree\]](#) (config>isa>nat-group radius-accounting-policy)

### Full Context

configure isa nat-group radius-accounting-policy

### Description

This command specifies the RADIUS accounting policy to use for each MDA in this ISA group. The **no** form of the command removes the policy ID from the configuration.

### Default

no radius-accounting-policy

### Parameters

#### *nat-accounting-policy*

- Reference to the nat-accounting-policy which defines:
- Source IP addresses that are assigned to BB-ISA cards.
- Parameters related to RADIUS server itself.
- List of RADIUS attributes that are included in accounting messages.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.4 radius-accounting-server

## radius-accounting-server

### Syntax

**radius-accounting-server**

### Context

[\[Tree\]](#) (config>aaa>l2tp-acct-plcy>include-radius-attribute radius-accounting-server)

### Full Context

configure aaa l2tp-accounting-policy include-radius-attribute radius-accounting-server

### Description

Commands in this context configure RADIUS accounting server attributes under a specific session authentication policy.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## radius-accounting-server

### Syntax

**radius-accounting-server**

### Context

[\[Tree\]](#) (config>app-assure>rad-acct-plcy radius-accounting-server)

[\[Tree\]](#) (config>aaa>l2tp-acct-plcy radius-accounting-server)

### Full Context

configure application-assurance radius-accounting-policy radius-accounting-server

configure aaa l2tp-accounting-policy radius-accounting-server

### Description

This command creates the context for defining RADIUS accounting server attributes under a specific session authentication policy.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure application-assurance radius-accounting-policy radius-accounting-server

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure aaa l2tp-accounting-policy radius-accounting-server

## 22.5 radius-attr

## radius-attr

### Syntax

**radius-attr type *attribute-type* [extended-type *attribute-ext-type*] [transaction]**

```

radius-attr type attribute-type [transaction] {address | hex | integer | string} value attribute-value
radius-attr vendor vendor-id type attribute-type [extended-type attribute-ext-type] [transaction]
 [encoding encoding-type]
radius-attr vendor vendor-id type attribute-type [extended-type attribute-ext-type] [transaction]
 [encoding encoding-type] {address | hex | integer | string} value attribute-value
no radius-attr type attribute-type [extended-type attribute-ext-type]
no radius-attr type attribute-type [extended-type attribute-ext-type] {address | hex | integer | string}
 value attribute-value
no radius-attr vendor vendor-id type attribute-type [extended-type attribute-ext-type]
no radius-attr vendor vendor-id type attribute-type [extended-type attribute-ext-type] {address | hex |
 integer | string} [value] attribute-value

```

## Context

[\[Tree\]](#) (debug>router>radius radius-attr)

## Full Context

debug router radius radius-attr

## Description

This command specifies the RADIUS attribute filter of command **debug router radius**.

## Parameters

### *attribute-type*

Specifies the RADIUS attribute type.

**Values** 1 to 255

### *attribute-ext-type*

Specifies the RADIUS attribute extended type (RFC 6929).

**Values** 1 to 255

### **address**

Specifies the value is a IPv4 or IPv6 address/prefix/subnet.

### **string**

Specifies the value is a ASCII string.

### **integer**

Specifies the value is a integer.

### **hex**

Specifies the value is a binary string in hex format, such as "0xAB01FE".

### *attribute-value*

Specifies the value of the RADIUS attribute.

**Values** address <ipv4-address> | <ipv6-address> | <ipv6-prefix/prefix-length>

ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces)
ipv6-prefix	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x - [0 to FFFF]H
	d - [0 to 255]D
ipv6-prefix-length [0 to 128]	
hex	[0x0 to 0xFFFFFFFF (up to 506 hex nibbles)]
integer	[0 to 4294967295]
string	ascii-string (up to 253 characters)

**transaction**

Specifies that the system outputs both request and response packets in the same session even if the response packet does not include the filter attribute.

**vendor-id**

Specifies the vendor ID for the vendor specific attribute.

**Values** 0 to 16777215

**encoding-type**

Specifies the size of the vendor-type and vendor-length in bytes. It is a two digitals string: "xy", x is the size of vendor-type, range from 1 to 4; y is the size of vendor-length, range from 0 to 2; it is "11" by default.

**Values** type-size:1 to 4, length-size: 0 to 2

**Platforms**

All

## 22.6 radius-auth-policy

### radius-auth-policy

**Syntax**

**radius-auth-policy** *radius-authentication-policy-name*

**no radius-auth-policy**

## Context

[\[Tree\]](#) (config>subscr-mgmt>gtp>apn-policy>apn radius-auth-policy)

## Full Context

configure subscriber-mgmt gtp apn-policy apn radius-auth-policy

## Description

This command configures the RADIUS authentication policy with which the GTP connection is authenticated.

The **no** form of this command removes the authentication policy. Only new session setups are affected.

## Default

no radius-auth-policy

## Parameters

***radius-authentication-policy-name***

Specifies the name of the authentication policy to be used, up to 32 characters.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.7 radius-authentication

### radius-authentication

## Syntax

**radius-authentication**

## Context

[\[Tree\]](#) (config>subscr-mgmt>vrgw>brg>brg-profile radius-authentication)

## Full Context

configure subscriber-mgmt vrgw brg brg-profile radius-authentication

## Description

Commands in this context configure parameters related to RADIUS authentication performed for the BRG.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.8 radius-authentication-policy

### radius-authentication-policy

#### Syntax

**radius-authentication-policy** *name*

**no radius-authentication-policy**

#### Context

[\[Tree\]](#) (config>service>vprn>if>sap>ipsec-gw radius-authentication-policy)

[\[Tree\]](#) (config>service>ies>if>sap>ipsec-gw radius-authentication-policy)

#### Full Context

configure service vprn interface sap ipsec-gw radius-authentication-policy

configure service ies interface sap ipsec-gw radius-authentication-policy

#### Description

This command configures the policy used for the IKEv2 remote-access tunnels terminated on the IPsec gateway. The **radius-authentication-policy** is defined under **config>ipsec** context.

#### Parameters

*name*

Specifies the name of an existing RADIUS authentication policy.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### radius-authentication-policy

#### Syntax

**radius-authentication-policy** *name* [create]

**no radius-authentication-policy** *name*

#### Context

[\[Tree\]](#) (config>ipsec radius-authentication-policy)

#### Full Context

configure ipsec radius-authentication-policy

#### Description

This command specifies the RADIUS authentication policy associated with this IPsec gateway.

## Parameters

### *name*

Specifies an existing RADIUS authentication policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.9 radius-authentication-server

### radius-authentication-server

## Syntax

**radius-authentication-server**

## Context

[\[Tree\]](#) (config>subscr-mgmt>auth-plcy radius-authentication-server)

## Full Context

configure subscriber-mgmt authentication-policy radius-authentication-server

## Description

Commands in this context define RADIUS authentication server attributes under a specific session authentication policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.10 radius-coa-port

### radius-coa-port

## Syntax

**radius-coa-port** *{port-number}*

**no radius-coa-port**

## Context

[\[Tree\]](#) (config>aaa radius-coa-port)

## Full Context

```
configure aaa radius-coa-port
```

## Description

This command configures the system-wide UDP port number that RADIUS is listening on for CoA and Disconnect messages.

The **no** form of this command reverts to the default.

## Default

```
radius-coa-port 3799
```

## Parameters

### *port-number*

Specifies the UDP port number for RADIUS CoA and disconnect messages.

**Values** 1647, 1700, 1812, 3799

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.11 radius-plcy

### radius-plcy

## Syntax

```
radius-plcy name
```

```
no radius-plcy
```

## Context

[\[Tree\]](#) (config>port>ethernet>dot1x radius-plcy)

## Full Context

```
configure port ethernet dot1x radius-plcy
```

## Description

This command references the RADIUS policy to be used for 802.1x authentication. An 802.1x RADIUS policy must be configured (**config>system>security>dot1x**) before it is associated to a port. If the RADIUS policy ID does not exist, an error is returned. Only one 802.1x RADIUS policy can be associated with a port at a time.

The **no** form of this command removes the RADIUS policy association.

## Default

no radius-plcy

## Parameters

### *name*

Specifies an existing 802.1x RADIUS policy name, up to 32 characters.

## Platforms

All

## radius-plcy

## Syntax

**radius-plcy** *name* [**create**]

## Context

[\[Tree\]](#) (config>system>security>dot1x radius-plcy)

## Full Context

configure system security dot1x radius-plcy

## Description

This command creates the context to configure RADIUS server parameters for 802.1x network access control on the router.

### Note:

The RADIUS server configured under the config>system>security>dot1x>radius-plcy context authenticates clients who get access to the data plane of the router as opposed to the RADIUS server configured under the **config>system>radius** context which authenticates CLI login users who get access to the management plane of the router.

The **no** form of this command removes the RADIUS server configuration for 802.1x.

## Platforms

All

## 22.12 radius-proxy

## radius-proxy

## Syntax

**radius-proxy**

## Context

[\[Tree\]](#) (config>router radius-proxy)

[\[Tree\]](#) (config>service>vprn radius-proxy)

## Full Context

configure router radius-proxy

configure service vprn radius-proxy

## Description

This command context to configure RADIUS proxy parameters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.13 radius-proxy-cache

### radius-proxy-cache

## Syntax

**radius-proxy-cache** *router* *router-instance* **server** *server-name*

**no radius-proxy-cache**

## Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>track-mobility radius-proxy-cache)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>track-mobility radius-proxy-cache)

## Full Context

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range track-mobility radius-proxy-cache

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range track-mobility radius-proxy-cache

## Description

This command specifies the RADIUS-proxy server to allow subscribers created via data-triggered authentication to create an entry. This RADIUS proxy cache entry allows efficient handling of UE mobility.

## Parameters

***router-instance***

Specifies the router instance.

Values	router-name	Base
	service-id	1 to 2147483647

**server-name**

Specifies the server name up to 32 characters.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.14 radius-proxy-server

### radius-proxy-server

**Syntax**

[no] **radius-proxy-server** **router** *router-instance* **name** *server-name*

**Context**

[\[Tree\]](#) (config>subscr-mgmt>vrgw>brg>brg-profile radius-proxy-server)

**Full Context**

configure subscriber-mgmt vrgw brg brg-profile radius-proxy-server

**Description**

This command enables BRG processing on the specified RADIUS proxy server. Whenever an Access-Accept message is received with the attribute Alc-BRG-Id present, this triggers the creation of a BRG. The BRG uses the **brg-profile** specified in the Access-Accept message or fall back to this BRG profile. When the specified **radius-proxy-server** has a cache enabled, no cache entries are created for a transaction identified as BRG. A RADIUS proxy server can only be listed in one BRG profile.

This command can be executed multiple times.

The **no** form of this command removes BRG processing for the specified **radius-proxy server**.

**Parameters****router-instance**

Specifies the ID of the VRF where the proxy server is located.

**server-name**

Specifies the name of the RADIUS proxy server.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## radius-proxy-server

### Syntax

**radius-proxy-server** *router* *router-instance* **name** *server-name*  
**no radius-proxy-server**

### Context

**[Tree]** (config>router>nat>inside>subscriber-identification radius-proxy-server)

**[Tree]** (config>service>vprn>nat>inside>subscriber-identification radius-proxy-server)

### Full Context

configure router nat inside subscriber-identification radius-proxy-server

configure service vprn nat inside subscriber-identification radius-proxy-server

### Description

This command configures RADIUS proxy server parameters. This is a reference to a RADIUS accounting proxy server in Subscriber Aware Large Scale NAT44 application. RADIUS accounting proxy server will cache attributes related to a BNG subscriber as they are received in standard accounting messages (RFC 2866). Radius accounting proxy server can be configured in any routing instance within 7750 SR.

### Parameters

**router** *router-instance*

Specifies the routing instance in which the RADIUS accounting proxy is configured.

**name** *server-name*

Specifies the name reference to the RADIUS accounting proxy server that is instantiated in 7750 SR.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.15 radius-script-policy

### radius-script-policy

### Syntax

**radius-script-policy** *policy-name* [**create**]  
**no radius-script-policy** *policy-name*

## Context

[\[Tree\]](#) (config>aaa radius-script-policy)

## Full Context

configure aaa radius-script-policy

## Description

This command configures a RADIUS script policy.

The **no** form of this command removes the script policy from the configuration.

## Parameters

### *policy-name*

Configures Python scripts to modify RADIUS messages.

### **create**

This keyword is required when first creating the configuration context. Once the context is created, it is possible to navigate into the context without the **create** keyword.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.16 radius-server

### radius-server

## Syntax

**radius-server**

## Context

[\[Tree\]](#) (config>router radius-server)

[\[Tree\]](#) (config>service>vprn radius-server)

## Full Context

configure router radius-server

configure service vprn radius-server

## Description

Commands in this context configure the RADIUS server under router or VPRN service.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.17 radius-server-policy

### radius-server-policy

#### Syntax

**radius-server-policy** *policy-name*

**no radius-server-policy**

#### Context

[\[Tree\]](#) (config>aaa>l2tp-acct-plcy radius-server-policy)

#### Full Context

configure aaa l2tp-accounting-policy radius-server-policy

#### Description

This command references an existing **radius-server-policy** (available under the **config>aaa** context) for use in subscriber management authentication and accounting.

When configured in an authentication-policy, following CLI commands are ignored in the policy to avoid conflicts:

- all commands in the radius-authentication-server context
- accept-authorization-change
- coa-script-policy
- accept-script-policy
- request-script-policy

When configured in a radius-accounting-policy, following CLI commands are ignored in the policy to avoid conflicts:

- all commands in the radius-accounting-server context
- acct-request-script-policy

The **no** form of this command removes the radius-server-policy reference from the configuration.

#### Default

no radius-server-policy

#### Parameters

***policy-name***

Specifies the RADIUS server policy.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## radius-server-policy

### Syntax

**radius-server-policy** *policy-name* [**create**]

**no radius-server-policy** *policy-name*

### Context

[\[Tree\]](#) (config>aaa radius-server-policy)

### Full Context

configure aaa radius-server-policy

### Description

This command creates a radius-server-policy.

A RADIUS server policy can be used in

- radius-proxy, for application like EAP authentication for WIFI access
- authentication policy, for Enhanced Subscriber Management authentication
- RADIUS accounting policy, for Enhanced Subscriber Management accounting
- dynamic data service RADIUS accounting
- AAA route downloader

The **no** form of this command removes the policy name from the configuration.

### Parameters

#### *policy-name*

Specifies the name of the radius-server-policy up to 32 characters.

#### **create**

Keyword used to create a radius-server-policy name. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## radius-server-policy

### Syntax

**radius-server-policy** *radius-server-policy-name*

**no radius-server-policy**

## Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy radius-server-policy)

[\[Tree\]](#) (config>subscr-mgmt>auth-plcy radius-server-policy)

## Full Context

configure subscriber-mgmt radius-accounting-policy radius-server-policy

configure subscriber-mgmt authentication-policy radius-server-policy

## Description

This command references an existing radius-server-policy (available under the config>aaa context) for use in subscriber management authentication and accounting.

When configured in an authentication-policy, following CLI commands are ignored in the policy to avoid conflicts:

- all commands in the radius-authentication-server context
- accept-authorization-change
- coa-script-policy
- accept-script-policy
- request-script-policy

When configured in a radius-accounting-policy, following CLI commands are ignored in the policy to avoid conflicts:

- all commands in the radius-accounting-server context
- acct-request-script-policy

The **no** form of this command removes the radius-server-policy reference from the configuration

## Parameters

***radius-server-policy-name***

Specifies the RADIUS server policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## radius-server-policy

## Syntax

**radius-server-policy** *policy-name*

**no radius-server-policy**

## Context

[\[Tree\]](#) (config>aaa>route-downloader radius-server-policy)

## Full Context

```
configure aaa route-downloader radius-server-policy
```

## Description

This command references an existing radius-server-policy (available under the **config>aaa** context). The server (or servers) referenced by the policy is used as the targets for the access-request message.

The **no** form of this command removes the policy name from the route-downloader configuration.

## Parameters

### *policy-name*

Specifies the RADIUS server policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## radius-server-policy

## Syntax

```
radius-server-policy policy-name
```

```
no radius-server-policy
```

## Context

[\[Tree\]](#) (config>subscr-mgmt>vrgw>brg>brg-profile>radius-authentication radius-server-policy)

## Full Context

```
configure subscriber-mgmt vrgw brg brg-profile radius-authentication radius-server-policy
```

## Description

This command is used if the BRG must be authenticated to the controller/PCMP by the vRGW. This is required if the BRG does not perform RADIUS authentication via the proxy server. The vRGW originates a valid Access Request using the BRG ID as the username.

The **no** form of this command removes the **radius-server-policy** from the configuration. Setup of an unauthenticated BRG fails.

## Parameters

### *policy-name*

Specifies the RADIUS server policy, up to 32 characters, to be applied to this subscriber authentication policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## radius-server-policy

### Syntax

**radius-server-policy** *radius-server-policy-name*

**no radius-server-policy**

### Context

[\[Tree\]](#) (config>ipsec>rad-acct-plcy radius-server-policy)

[\[Tree\]](#) (config>ipsec>rad-auth-plcy radius-server-policy)

### Full Context

configure ipsec radius-accounting-policy radius-server-policy

configure ipsec radius-authentication-policy radius-server-policy

### Description

This command references an existing **radius-server-policy** (available under the **config>aaa** context) for use in subscriber management authentication and accounting.

When configured in an authentication-policy, following CLI commands are ignored in the policy to avoid conflicts:

- all commands in the radius-authentication-server context
- accept-authorization-change
- coa-script-policy
- accept-script-policy
- request-script-policy

When configured in a radius-accounting-policy, following CLI commands are ignored in the policy to avoid conflicts:

- all commands in the radius-accounting-server context
- acct-request-script-policy

The **no** form of this command removes the radius-server-policy reference from the configuration.

### Default

no radius-server-policy

### Parameters

***radius-server-policy-name***

Specifies the RADIUS server policy.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## radius-server-policy

### Syntax

**radius-server-policy** *policy-name*

**no radius-server-policy**

### Context

**[Tree]** (config>subscr-mgmt>vrgw>brg>brg-profile radius-server-policy)

### Full Context

configure subscriber-mgmt vrgw brg brg-profile radius-server-policy

### Description

This command allows the vRGW to authenticate on the BRG's behalf. This is required if the BRG does not perform authentication itself using the radius proxy. The vRGW originates a valid Access Request using the BRG ID as a username.

The **no** form of this command removes the RADIUS server policy from the configuration. Setting up of an unauthenticated BRG will now fail.

### Default

no radius-server-policy

### Parameters

#### *policy-name*

Specifies the RADIUS server policy, up to 32 characters, to apply in this subscriber authentication policy.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## radius-server-policy

### Syntax

**radius-server-policy** *policy-name*

**radius-server-policy auth** *policy-name-auth*

**radius-server-policy acct** *policy-name-acct*

**radius-server-policy auth** *policy-name-auth* **acct** *policy-name-acct*

**no radius-server-policy**

### Context

**[Tree]** (config>port>ethernet>dot1x radius-server-policy)

## Full Context

```
configure port ethernet dot1x radius-server-policy
```

## Description

This command configures the RADIUS policy with IPv4/IPv6 in base routing and VPRN. The current RADIUS policy can be found under the **configure>aaa>radius-server-policy** context.

The RADIUS servers for the policy are configured under **configure>router>radius-server** or **configure>service>vprn>radius-server** context.

The RADIUS policy is assigned under dot1x using the **radius-server-policy** command. When the RADIUS policy is configured, both authorization and accounting are performed via the same server.

The **no** form of this command allows authorization and accounting via different servers.

## Default

```
no radius-server-policy
```

## Parameters

### *policy-name*

Specifies the RADIUS server policy, up to 32 characters.

The policy is configured under **configure>aaa>radius-server-policy**. When the policy name is configured, both authorization and accounting are done via this server.

### *policy-name-auth*

Specifies the AAA RADIUS server policy for dot1x authorization only; up to 32 characters.

The policy is configured under **configure>aaa>radius-server-policy**. The policy name authorization is used if the user needs a different server for authorization.

### *policy-name-acct*

Specifies the AAA RADIUS server policy for dot1x accounting only; up to 32 characters.

The policy is configured under **configure>aaa>radius-server-policy**. The policy name accounting is used if the user needs a different server for accounting.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.18 radius-session-timeout

```
radius-session-timeout
```

## Syntax

```
radius-session-timeout {backwards-compatible | ignore | absolute}
```

```
no radius-session-timeout
```

## Context

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>ipoe-session radius-session-timeout)

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>ipoe-session radius-session-timeout)

## Full Context

configure service ies subscriber-interface group-interface ipoe-session radius-session-timeout

configure service vprn subscriber-interface group-interface ipoe-session radius-session-timeout

## Description

This command specifies how to interpret the session-timeout coming from a RADIUS VSA in an Access-Accept or CoA message.

The value of this command can only be changed on wlan-gw group interfaces.

The **no** form of this command to resets the default behavior.

## Default

radius-session-timeout absolute (backward compatible on wlan-gw group interfaces)

## Parameters

### backwards-compatible

Specifies that the VSA is interpreted as an IPv4 lease time if the Alc-Lease-Time attribute is not present and an absolute timeout otherwise. The VSA is treated the same as for non-ipoe session DHCP hosts.

### ignore

Specifies that the VSA meaning is irrelevant for IPoE session and should be ignored.

### absolute

Specifies that the VSA would be treated as a timeout starting from the moment the IPoE session is set up.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.19 radius-user-name

radius-user-name

## Syntax

[no] radius-user-name

## Context

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>gy>include-avp radius-user-name)

### Full Context

```
configure subscriber-mgmt diameter-application-policy gy include-avp radius-user-name
```

### Description

This command includes the RADIUS user name AVP in the Diameter Gy messages.

The **no** form of this command returns the command to the default setting.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.20 rai

```
rai
```

### Syntax

```
[no] rai
```

### Context

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>gx>include-avp rai)

### Full Context

```
configure subscriber-mgmt diameter-application-policy gx include-avp rai
```

### Description

This command enables the inclusion of the RAI AVP as signaled in the incoming GTP setup message.

The **no** form of this command disables the inclusion of the AVP.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.21 range

```
range
```

### Syntax

```
range start-entry queue-id count count
```

```
no range
```

## Context

[\[Tree\]](#) (config>qos>sap-egress>dynamic-queue range)

## Full Context

configure qos sap-egress dynamic-queue range

## Description

This command configures the range of IDs from which the system allocates dynamic queues. You cannot use the same IDs for static queues within the same policy.

## Default

no range

## Parameters

### *queue-id*

Specifies the ID of the queue for the start entry of the range.

**Values** 2 to 8

### *count*

Specifies the count for the range.

**Values** 1 to 7

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## range

## Syntax

**range** *encap-range* **sync-tag** *sync-tag*

**no range** *encap-range*

## Context

[\[Tree\]](#) (config>redundancy>multi-chassis>peer>sync>port range)

## Full Context

configure redundancy multi-chassis peer sync port range

## Description

This command configures a range of encapsulation values.

## Parameters

### *encap-range*

Specifies a range of encapsulation values on a port to be synchronized with a multi-chassis peer.

Values		
Dot1Q		start-tag-end-tag
	start-tag	0 to 4094
	end-tag	0 to 4094
QinQ		qtag1.start-qtag2-qtag1.end-qtag2-start-qtag1.*-end-qtag1.*
	qtag1	1 to 4094
	start-qtag1	1 to 4094
	en-qtag1	1 to 4094
	start-qtag2	0 to 4094
	end-qtag2	0 to 4094

### ***sync-tag***

Specifies a synchronization tag up to 32 characters to be used while synchronizing this encapsulation value range with the multi-chassis peer.

## **Platforms**

All

## **range**

## **Syntax**

**range** *vc-id-range* [**sync-tag** *sync-tag*]

**no range** *vc-id-range*

## **Context**

**[Tree]** (config>redundancy>multi-chassis>peer>sync>sdp range)

## **Full Context**

configure redundancy multi-chassis peer sync sdp range

## **Description**

This command specifies a range of VC IDs for manually configured spoke SDPs to be synchronized with the multi-chassis peer and a synchronization tag to be used while synchronizing each range with the multi-chassis peer. The **range** command and the configuration of a synchronization tag on the parent **sdp** command are mutually exclusive.

To synchronize a single spoke SDP, the *start-vc-id* should be the same as the *end-vc-id*. If the configured *end-vc-id* is lower than the *start-vc-id*, the **range** command fails.

The synchronization tag can be changed by entering the same command with a different synchronization tag. Changing the synchronization tag removes all states relating to the previous synchronization tag for the SDP and a new synchronization tag state is created.

Multiple **range** commands can be configured, however, overlapping ranges for the same SDP (*sdp-id*) are not permitted.

The synchronization of PIM snooping is only supported for manually configured spoke SDPs but is not supported for spoke SDPs configured within an endpoint. See PIM Snooping for IPv4 Synchronization for service support.

The synchronization of the PIM snooping state is not supported on any of the following when used with the configured *sdp-id*:

- mesh SDPs
- spoke SDPs in non-VPLS services
- BGP-AD/BGP-VPLS (FEC 129) spoke SDPs
- spoke SDPs configured in endpoints
- pseudowire SAPs
- ESM-over-MPLS pseudowires

Non-existent spoke SDPs may be specified. If these spoke SDPs are created at a later time, then all states on the spoke SDPs are synchronized according to the synchronization tag and the synchronization protocols enabled. The **sync-tag** can be changed by entering the same command with a different **sync-tag** value. If the synchronization tag is changed, then all states for the previous **sync-tag** are removed for the SDP configured in the command and the state is then built for the new synchronization tag.

## Parameters

### ***vc-id-range***

Specifies a non-overlapping range of VC IDs for the spoke SDPs of the SDP to be synchronized with the multi-chassis peer.

**Values**    *start-vc-id-end-vc-id*  
*start-vc-id*: 1 to 4294967295  
*end-vc-id*: 1 to 4294967295

### ***sync-tag***

Specifies a synchronization tag, up to 32 characters, to be used when synchronizing with the multi-chassis peer.

## Platforms

All

## range

### Syntax

[no] range *vlan-range*

### Context

[\[Tree\]](#) (config>redundancy>mc>peer>mcr>ring>path-b range)

[\[Tree\]](#) (config>redundancy>mc>peer>mcr>ring>path-excl range)

### Full Context

configure redundancy multi-chassis peer mc-ring ring path-b range

configure redundancy multi-chassis peer mc-ring ring path-excl range

### Description

This command configures a Layer 2 MC-Ring path-b or path-excl VLAN range.

By default, all customer VLANs participating in an L2 MC-Ring are on path-a. For load balancing purposes, a range of customer VLANs can be configured to use path-b which is set up in the opposite direction than path-a. The range of VLANs that are not participating in L2 MC-Ring are configured using the **path-excl** command.

### Parameters

#### *vlan-range*

Specifies the VLAN range.

**Values** [0 to 4094] - [0 to 4094]

[0 to 4094] - \*

\* - \*

[\[Tree\]](#) (config>service>vpls>sap>managed-vlan-list range)

### Full Context

configure service vpls sap managed-vlan-list range

## Description

This command configures a range of VLANs on an access port that are to be managed by an existing management VPLS.

This command is only valid when the VPLS in which it is entered was created as a management VPLS, and when the SAP in which it was entered was created on an Ethernet port with encapsulation type of dot1q or qinq, or on a SONET/SDH port with encapsulation type of bcp-dot1q.

To modify the range of VLANs, first the new range should be entered and afterwards the old range removed.

The **no** form of this command removes the VLAN range from this configuration.

## Parameters

### *vlan-range*

Specifies the VLAN start value and VLAN end value. The end-vlan must be greater than start-vlan. The format is <start-vlan>-<end-vlan>.

**Values** start-vlan: 1 to 4094  
end-vlan: 1 to 4094

## Platforms

## Full Context

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range

## Description

This command creates a VLAN range or enters the context of the specified VLAN ranges for configuration applicable to that range of VLANs.

## Parameters

### **start**

Specifies the start of the VLAN range.

**Values** 0 to 4096

**Default** 200

#### end

Specifies the end of VLAN range.

**Values** 0 to 4096

**Default** 400

#### default

Specifies to use defaults for the interface.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## range

### Syntax

**range** *isid* [**to** *isid*]

**no range**

### Context

[\[Tree\]](#) (config>service>vpls>isid-policy>entry range)

### Full Context

configure service vpls isid-policy entry range

### Description

This command specifies an ISID or a Range of ISIDs in a B-VPLS. One range is allowed per entry.

### Default

no range

### Parameters

#### *isid*

Specifies the ISID value in 24 bits. When singular, ISID identifies a particular ISID to be used for matching

**Values** 0 to 16777215

#### **to isid**

Identifies upper value in a range of ISIDs to be used as matching criteria

## Platforms

## Context

**[Tree]** (config>service>vpls>sap>static-isid range)

**[Tree]** (config>service>vpls>spoke-sdp>static-isid range)

## Full Context

configure service vpls sap static-isid range

configure service vpls spoke-sdp static-isid range

## Description

This command identifies a set of ISIDs for I-VPLS services that are external to SPBM. These ISIDs are advertised as supported locally on this node unless altered by an isid-policy. This allows communication from I-VPLS services external to SPBM through this node. The SAP may be a regular SAP or MC-LAG SAP. The spoke-SDP may be an active/standby spoke. When used with MC-LAG or active/stand-by PWs the conditional static-mac must be configured. ISIDs declared this way become part of the ISID multicast and consume MFIBs. Multiple SPBM static-isid ranges are allowed under a SAP/spoke-SDP.

The static-isids are associated with a remote B-MAC that must be declared as a static-mac for unicast traffic. ISIDs are advertised as if they were attached to the local B-MAC. Only remote I-VPLS ISIDs need to be defined. In the MFIB, the group MACs are then associated with the active SAP or spoke-SDP. An ISID policy may be defined to suppress the advertisement of an ISID if the ISID is primarily used for unicast services. The following rules govern the usage of multiple ISID statements:

- overlapping values are allowed:
  - isid from 301 to 310
  - isid from 305 to 315
  - isid 316
- the minimum and maximum values from overlapping ranges are considered and displayed. The above entries will be equivalent with "ISID from 301 to 316" statement.
- there is no consistency check with the content of ISID statements from other entries. The entries will be evaluated in the order of their IDs and the first match will cause the implementation to execute the associated action for that entry.

The **no** form of this command removes all the previous statements under one interface

**no isid value | from value to higher-value** - removes a specific ISID value or range. Must match a previously used positive statement: for example if the command "isid 316 to 400" was used using "no isid 316 to 350" will not work but "no isid 316 to 400" will be successful.

## Parameters

### *range-id*

Sets context for specified entry ID for the static-isids

**Values** 1— 8191

### *isid-value*

Configures the ISID or the start of an ISID range. Specifies the ISID value in 24 bits. When just one present identifies a particular ISID to be used for matching.

**Values** 0 to 16777215

### *to isid*

Identifies upper value in a range of ISIDs to be used as matching criteria

**Values** 0 to 16777215

### *create*

This keyword is mandatory when creating a range instance.

## 22.22 rapid-psc-timer

### rapid-psc-timer

## Syntax

**rapid-psc-timer** *interval*

**no rapid-psc-timer**

## Context

[\[Tree\]](#) (config>router>mpls>mpls-tp>protection-template rapid-psc-timer)

## Full Context

configure router mpls mpls-tp protection-template rapid-psc-timer

## Description

This command configures the rapid timer value to be used for protection switching coordination (PSC) packets for MPLS-TP linear protection (RFC 6378).

## Default

rapid-psc-timer 10

## Parameters

### *interval*

Specifies the rapid timer interval in milliseconds.

**Values** [10, 100, 1000]

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.23 rapid-retransmit-time

### rapid-retransmit-time

#### Syntax

**rapid-retransmit-time** *hundred-milliseconds*

**no rapid-retransmit-time**

#### Context

[\[Tree\]](#) (config>router>rsvp rapid-retransmit-time)

#### Full Context

configure router rsvp rapid-retransmit-time

#### Description

This command defines the value of the Rapid Retransmission Interval. It is used in the re-transmission mechanism to handle unacknowledged message\_id objects and is based on an exponential back-off timer.

Re-transmission interval of a RSVP message with the same message\_id = 2 \* rapid-retransmit-time interval of time.

The node stops re-transmission of unacknowledged RSVP messages:

- If the updated back-off interval exceeds the value of the regular refresh interval.
- If the number of re-transmissions reaches the value of the **rapid-retry-limit** parameter, whichever comes first.

The Rapid Retransmission Interval must be smaller than the regular refresh interval configured in **config>router>rsvp>refresh-time**.

The **no** form of this command reverts to the default value.

#### Default

rapid-retransmit-time 5

#### Parameters

##### *hundred-milliseconds*

Specifies the rapid retransmission interval, in hundred-milliseconds (for example, enter "6" for a 600 millisecond retransmit time).

**Values** 1 to 100, in units of 100 ms.

## Platforms

All

## 22.24 rapid-retry-limit

### rapid-retry-limit

#### Syntax

**rapid-retry-limit** *number*

**no rapid-retry-limit**

#### Context

[\[Tree\]](#) (config>router>rsvp rapid-retry-limit)

#### Full Context

configure router rsvp rapid-retry-limit

#### Description

This command defines the value of the Rapid Retry Limit. This is used in the retransmission mechanism based on an exponential backoff timer in order to handle unacknowledged message\_id objects. The RSVP message with the same message\_id is retransmitted every 2 \* rapid-retransmit-time interval of time. The node stops retransmission of unacknowledged RSVP messages whenever the updated backoff interval exceeds the value of the regular refresh interval or the number of retransmissions reaches the value of the **rapid-retry-limit** parameter, whichever comes first.

The **no** form of this command reverts to the default value.

#### Default

rapid-retry-limit 3

#### Parameters

***number***

Specifies the value of the Rapid Retry Limit.

**Values** 1 to 6, integer values

#### Platforms

All

## 22.25 rapid-update

### rapid-update

#### Syntax

```
rapid-update [l2-vpn] [mvpn-ipv4] [mvpn-ipv6] [mdt-safi] [evpn] [label-ipv4] [label-ipv6] [vpn-ipv4]
 [vpn-ipv6] [mcast-vpn-ipv4] [mcast-vpn-ipv6]
```

```
no rapid-update
```

#### Context

[\[Tree\]](#) (config>router>bgp rapid-update)

#### Full Context

```
configure router bgp rapid-update
```

#### Description

This command enables and disables BGP rapid update for specified address families.

If rapid update is enabled for a set of address families, and a route belonging to a family in that set is received by the router and chosen for propagation to certain BGP peers, the remaining time on the MRAI timer of these peers is ignored and the route is transmitted immediately, along with all other pending routes for these peers (including routes of address families not specified in the **rapid-update** command).

The **rapid-update** command overrides the peer-level **min-route-advertisement** (**config>router>bgp min-route-advertisement**, **config>router>bgp>group min-route-advertisement**, **config>router>bgp>group>neighbor min-route-advertisement**) time and applies the minimum setting (0 seconds) to routes belonging to specified address families; routes of other address families continue to be advertised according to the session-level MRAI setting.

The **no** form of this command disables rapid update for all address families.

#### Default

```
no rapid-update
```

#### Parameters

##### **l2-vpn**

Specifies the BGP rapid update for the 12-byte Virtual Switch Instance identifier (VSI-ID) value consisting of the 8-byte route distinguisher (RD) followed by a 4-byte value.

##### **mvpn-ipv4**

Specifies BGP rapid update for the mvpn-ipv4 address family. The mvpn-ipv4 address is a variable size value consisting of the 1-byte route type, 1-byte length and variable size that is route type specific. Route type defines encoding for the route type specific field. Length indicates the length in octets of the route type specific field.

##### **mdt-safi**

Specifies BGP rapid update for the mdt-safi address family. The address is a 16-byte value consisting of 12-byte route distinguisher (RD) followed by a 4-byte group address.

**mvpn-ipv6**

Specifies BGP rapid update for the mvpn-ipv6 address family.

**evpn**

Specifies BGP rapid update for the evpn address family by including or removing EVPN routes from the set of routes that can trigger rapid update.

**label-ipv4**

Includes or removes label-ipv4 routes from the set of routes that can trigger rapid update.

**label-ipv6**

Includes or removes label-ipv6 routes from the set of routes that can trigger rapid update.

**vpn-ipv4**

Includes or removes vpn-ipv4 routes from the set of routes that can trigger rapid update.

**vpn-ipv6**

Includes or removes vpn-ipv6 routes from the set of routes that can trigger rapid update.

**mcast-vpn-ipv4**

Includes or removes mcast-vpn-ipv4 routes from the set of routes that can trigger rapid update.

**mcast-vpn-ipv6**

Includes or removes mcast-vpn-ipv6 routes from the set of routes that can trigger rapid update.

## 22.27 rat-type

**rat-type****Syntax**

rat-type {utran | geran | wlan | gan | hspa | eutran | virtual | id}

no rat-type

## Context

**[Tree]** (config>subscr-mgmt>gtp>peer-profile rat-type)

## Full Context

configure subscriber-mgmt gtp peer-profile rat-type

## Description

This command configures the default Radio Access Type (RAT) signaled during GTP setup. RAT is the underlying physical connection method for a radio-based communication network. This can be overridden by RADIUS.

The **no** form of this command reverts to the default value.

## Default

rat-type wlan

## Parameters

### **utran**

Specifies the signaled RAT type is UTRAN (1).

### **geran**

Specifies the signaled RAT type is GERAN (2).

### **wlan**

Specifies the signaled RAT type is WLAN (3).

### **gan**

Specifies the signaled RAT type is GAN (4).

### **hspa**

Specifies the signaled RAT type is HSPA Evolution (5).

### **eutran**

Specifies the signaled RAT type is EUTRAN (6).

### **virtual**

Specifies the signaled RAT type is virtual (7).

### **id**

Specifies the numeric RAT type value.

**Values** 0 to 255

### Full Context

```
configure subscriber-mgmt sla-profile egress qos hs-wrr-group rate
```

### Description

This command configures the rate (PIR) override for the WRR group.

The **no** form of this command removes the rate from the configuration.

### Parameters

*rate*

Specifies the PIR expressed as a percentage of line rate in kb/s.

**Values** 1 to 2000000000, max

### Platforms

7750 SR-7/12/12e

```
rate
```

### Syntax

```
rate pir-rate [cir cir-rate]
```

```
no rate
```

### Context

[\[Tree\]](#) (config>subscr-mgmt>sla-prof>egress>qos>queue rate)

### Full Context

```
configure subscriber-mgmt sla-profile egress qos queue rate
```

## Description

This command defines the administrative Peak Information Rate (PIR) and the administrative Committed Information Rate (CIR) parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile then out-of-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent command's *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

## Parameters

### *pir-rate*

Defines the administrative PIR rate, in kb/s, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed. Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queues **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 2000000000, max

**Default** max

### *cir-rate*

Defines the administrative CIR rate, kb/s, for the queue. The **cir** parameter overrides the default administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed. Fractional values are not allowed and must be given as a positive integer.

**Values** 0 to 2000000000, max

**Default** 0

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## rate

### Syntax

**rate** *pir-rate* [**cir** *cir-rate*]

**no rate**

### Context

**[Tree]** (config>subscr-mgmt>sla-prof>ingress>qos>queue rate)

### Full Context

configure subscriber-mgmt sla-profile ingress qos queue rate

### Description

This command defines the administrative Peak Information Rate (PIR) and the administrative Committed Information Rate (CIR) parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets through the switch fabric (for SAP ingress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. For SAP ingress, the CIR also defines the rate that packets are considered in-profile by the system. In-profile then out-of-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent command's *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP ingress or SAP egress QoS policy with the *queue-id*.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

### Parameters

#### *pir-rate*

Defines the administrative PIR rate, in kilobits, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queues **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 2000000000, max

**Default** max

#### *cir-rate*

Specifies the **cir** parameter used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and must be given as a positive integer.

**Values** 0 to 2000000000, max

**Default** 0

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## rate

### Syntax

**rate** {**max** | *rate*} [**cir** {**max** | *rate*}]

### Context

**[Tree]** (config>subscr-mgmt>sla-prof>egress>qos>policer rate)

**[Tree]** (config>subscr-mgmt>sla-prof>ingress>qos>policer rate)

### Full Context

configure subscriber-mgmt sla-profile egress qos policer rate

configure subscriber-mgmt sla-profile ingress qos policer rate

### Description

This command is used to configure the policer's metering and optional profiling rates. The metering rate is used by the system to configure the policer's PIR leaky bucket's decrement rate while the profiling rate configures the policer's CIR leaky bucket's decrement rate. The decrement function empties the bucket while packets applied to the bucket attempt to fill it based on each packets size. If the bucket fills faster than how much is decremented per packet, the bucket's depth eventually reaches its exceed (CIR) or violate (PIR) threshold. The **cbs**, **mbs**, and **high-prio-only** commands are used to configure the policer's PIR and CIR thresholds.

If a packet arrives at the policer while the bucket's depth is less than the threshold associated with the packet, the packet is considered to be conforming to the bucket's rate. If the bucket depth is equal to or greater than the threshold, the packet is considered to be in the exception state. For the CIR bucket, the exception state is exceeding the CIR rate while the PIR bucket's exception state is violating the PIR bucket rate. If the packet is violating the PIR, the packet is marked red and is discarded. If the packet is not red, it may be green or yellow based on the conforming or exceeding state from the CIR bucket.

When a packet is red neither the PIR or CIR bucket depths are incremented by the packets size. When the packet is yellow the PIR bucket is incremented by the packet size, but the CIR bucket is not. When the packet is green, both the PIR and CIR buckets are incremented by the packet size. This ensures that conforming packets impact the bucket depth while exceeding or violating packets do not.

The policer's **adaptation-rule** command settings are used by the system to convert the specified rates into hardware timers and decrement values for the policer's buckets.

By default, the policer's metering rate is **max** and the profiling rate is 0 kb/s (all packets out-of-profile).

The **rate** settings defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied.

The **no** form of this command restores the default metering and profiling rate to a policer.

## Parameters

### {**max** | **rate**}

Specifies the packet byte offset. Specifying the keyword **max** or an explicit **rate** (in kilobits per second) parameter directly following the rate command is required and identifies the policer's metering rate for the PIR leaky bucket. When the policer is first created, the metering rate defaults to max. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used is equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to max.

**Values** max or 1 to 2000000000

### **cir** {**max** | **rate**}

Specifies the packet byte offset. The optional **cir** keyword is used to override the default CIR rate of the policer. Specifying the keyword **max** or an explicit **rate** (in kilobits per second) parameter directly following the cir keyword is required and identifies the policer's profiling rate for the CIR leaky bucket. When the policer is first created, the profiling rate defaults to 0 kb/s. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used is equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to **max**.

**Values** max or 0 to 2000000000

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## rate

```
configure service ies interface sap ingress queue-override queue rate
configure service ies interface sap egress queue-override queue rate
```

```
configure service vpls sap egress queue-override queue rate
configure service vpls sap ingress queue-override queue rate
```

## Description

This command overrides specific attributes of the specified queue's Peak Information Rate (PIR) and the Committed Information Rate (CIR) parameters.

The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile, then out-of-profile, packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (max, 0).

## Default

```
rate max cir 0
```

## Parameters

### *pir-rate*

Defines the administrative PIR rate, in kilobits, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and must be configured as a positive integer.

The actual PIR rate is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 6400000000, **max**

**Default** max

### *cir-rate*

Overrides the default administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and must be configured as a positive integer.

**Values** 0 to 6400000000, **max**

**Default** 0

## Platforms

All

rate

## Syntax

**rate** *pir-rate* [**cir** *cir-rate*]

**no rate**

## Context

[\[Tree\]](#) (config>service>vpls>sap>egress>sched-override>scheduler rate)

## Full Context

configure service vpls sap egress scheduler-override scheduler rate

## Description

This command overrides specific attributes of the specified scheduler rate. The **rate** command defines the maximum bandwidth that the scheduler can offer its policers, child queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's 'within CIR' distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler because of insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler assumes that an infinite amount of bandwidth is available and allow all child queues and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the value configured in the applied scheduler policy.

## Default

rate max cir sum

## Parameters

***pir-rate***

Specifies the PIR rates. The **pir** parameter accepts a step multiplier value that specifies the multiplier used to determine the PIR rate at which the queue operates. A value of 0 to

100000000 or the keyword **max** is accepted. Any other value results in an error without modifying the current PIR rate.

To calculate the actual PIR rate, the rate described by the queue's **rate** is multiplied by the *pir-rate*.

The SAP ingress context for PIR is independent of the defined forwarding class (fc) for the queue. The default **pir** and definable range is identical for each class. The PIR in effect for a queue defines the maximum rate at which the queue is allowed to forward packets in a given second, shaping the queue's output.

The PIR parameter for SAP ingress queues do not have a negate (**no**) function. To return the queue's PIR rate to the default value, that value must be specified as the PIR value.

**Values** 1 to 6400000000, max

**Default** max

### ***cir-rate***

Specifies the CIR rate. The **cir** parameter accepts a step-multiplier value that specifies the multiplier used to determine the CIR rate at which the queue operate. A value of 0 to 250 or the keyword max is accepted. Any other value results in an error without modifying the current CIR rate.

To calculate the actual CIR rate, the rate described by the **rate pir pir-rate** is multiplied by the *cir-rate*. If the **cir** is set to max, then the CIR rate is set to infinity.

The context for CIR is dependent on the defined forwarding class (fc) for the queue. The default CIR and definable range is different for each class. The CIR in effect for a policer or queue defines both its profile (in or out) marking level as well as the relative importance compared to other queues for scheduling purposes during congestion periods.

**Values** 0 to 6400000000, max, sum

**Default** sum

### Full Context

configure card fp ingress access queue-group policer-override policer rate

configure card fp ingress network queue-group policer-override policer rate

### Description

This command configures the policer's metering and optional profiling rates. The metering rate is used by the system to configure the policer's PIR leaky bucket's decrement rate while the profiling rate configures the policer's CIR leaky bucket's decrement rate. The decrement function empties the bucket while packets applied to the bucket attempt to fill it based on its packet size. If the bucket fills faster than how much is decremented per packet, the bucket's depth eventually reaches its exceeded (CIR) or violate (PIR) threshold. The **cbs**, **mbs**, and **high-prio-only** commands are used to configure the policer's PIR and CIR thresholds.

If a packet arrives at the policer while the bucket's depth is less than the threshold associated with the packet, the packet is considered to be conforming to the bucket's rate. If the bucket depth is equal to or greater than the threshold, the packet is considered to be in the exception state. For the CIR bucket, the exception state is exceeding the CIR rate while the PIR bucket's exception state is violating the PIR bucket rate. If the packet is violating the PIR, the packet is marked red and will be discarded. If the packet is not red, it may be green or yellow based on the conforming or exceeding state from the CIR bucket.

When a packet is red neither the PIR nor the CIR bucket depths are incremented by the packets size. When the packet is yellow the PIR bucket is incremented by the packet size, but the CIR bucket is not. When the packet is green, both the PIR and CIR buckets are incremented by the packet size. This ensures that conforming packets impact the bucket depth while exceeding or violating packets do not.

The policer's **adaptation-rule** command settings are used by the system to convert the specified rates into hardware timers and decrement values for the policer's buckets.

By default, the policer's metering rate is **max** and the profiling rate is 0 kb/s (all packets out-of-profile).

The **rate** settings defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied.

The **no** form of this command reverts to the default metering and profiling rate of a policer.

### Parameters

**{*rate* | **max**}**

Specifying the keyword **max** or an explicit *rate* parameter directly following the rate command is required and identifies the policer's metering rate for the PIR leaky bucket.

When the policer is first created, the metering rate defaults to max. The *kilobits-per-second*

value must be expressed as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to **max**.

**Values** **max** or 1 to 2000000000

#### **cir** {**max** | *rate*}

The optional **cir** keyword is used to override the default CIR rate of the policer. Specifying the keyword **max** or an explicit *rate* parameter directly following the **cir** keyword is required and identifies the policer's profiling rate for the CIR leaky bucket. When the policer is first created, the profiling rate defaults to 0 kb/s. The *kilobits-per-second* value must be expressed as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to **max**.

**Values** **max** or 0 to 2000000000

## Full Context

configure port ethernet network egress queue-overrides queue rate

configure port ethernet access ingress queue-group queue-overrides queue rate

configure port ethernet access egress queue-group queue-overrides queue rate

## Description

This command specifies the administrative Peak Information Rate (PIR) and the administrative Committed Information Rate (CIR) parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile then out-of-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the **rate** is performed under the **hs-wrr-group** within the egress queue group template.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

## Default

rate max cir 0 - The max default specifies the amount of bandwidth in kilobits per second (thousand bits per second). The max value is mutually exclusive to the *pir-rate* value.

## Parameters

### *pir-rate*

Defines the administrative PIR rate, in kilobits per second, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed. Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 200000000, max

**Default** max

### ***cir-rate***

The **cir** parameter overrides the default administrative CIR used by the queue, in kilobits per second. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed. Fractional values are not allowed and must be given as a positive integer.

**Values** 0 to 200000000, max

**Default** 0

## **Full Context**

configure port ethernet access ingress queue-group scheduler-override scheduler rate

configure port ethernet access egress queue-group scheduler-override scheduler rate

## **Description**

This command can be used to override specific attributes of the specified scheduler rate. The rate command defines the maximum bandwidth that the scheduler can offer its child queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's 'within CIR' distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler because of insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler assumes that an infinite amount of bandwidth is available and allow all child policers, queues, and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the value configured in the applied scheduler policy.

## Parameters

### *pir-rate*

Specifies the PIR rate, in kilobits per second. Any other value results in an error without modifying the current PIR rate.

**Values** 1 to 6400000000, **max**

### *cir-rate*

Specifies the CIR rate, in kilobits per second. If the CIR is set to **max**, then the CIR rate is set to infinity. The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers, policers, or queues.

**Values** 0 to 6400000000, **sum**, **max**

configure service epipe sap egress policer-override policer rate

configure service ipipe sap ingress policer-override policer rate

configure service cpipe sap ingress policer-override policer rate

configure service ipipe sap egress policer-override policer rate

## Description

This command within the SAP ingress and egress policer-overrides contexts is used to override the sap-ingress and sap-egress QoS policy configured rate parameters for the specified policer-id.

The **no** rate command is used to restore the policy defined metering and profiling rate to a policer.

## Parameters

**rate** *rate*

Specifies the policer instance metering rate for the PIR leaky bucket, in kilobits per second. The integer value is multiplied by 1000 to derive the actual rate in bits per second.

**Values** 1 to 6400000000

#### **cir rate**

Specifies the overriding value for the policy-derived profiling rate of the policer, in kilobits per second. The integer value is multiplied by 1000 to derive the actual rate in bits per second.

**Values** 0 to 6400000000

#### **max**

Uses the maximum policer rate, equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR or CIR used is equivalent to **max**.

### **Platforms**

configure service ipipe sap ingress queue-override queue rate

configure service epipe sap ingress queue-override queue rate

configure service cpipe sap ingress queue-override queue rate

configure service ipipe sap egress queue-override queue rate

configure service cpipe sap egress queue-override queue rate

## Description

This command can be used to override specific attributes of the specified queue's Peak Information Rate (PIR) and the Committed Information Rate (CIR) parameters.

The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile and then out-of-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the **rate** is performed under the **hs-wrr-group** within the SAP egress QoS policy.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

## Default

rate max cir 0

## Parameters

### *pir-rate*

Defines the administrative PIR rate, in kilobits per second, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 6400000000, **max**

**Default** max

### *cir-rate*

The **cir** parameter overrides the default administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and must be given as a positive integer. The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers, policers, or queues.

**Values** 0 to 6400000000, **max**, **sum**

**Default** 0

configure service cpipe sap ingress scheduler-override scheduler rate

configure service ipipe sap egress scheduler-override scheduler rate

configure service cpipe sap egress scheduler-override scheduler rate

configure service epipe sap ingress scheduler-override scheduler rate

configure service ipipe sap ingress scheduler-override scheduler rate

configure service epipe sap egress scheduler-override scheduler rate

### Description

This command can be used to override specific attributes of the specified scheduler rate. The **rate** command defines the maximum bandwidth that the scheduler can offer its child policers, queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's 'within CIR' distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child

policers or queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler due to insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler will assume that an infinite amount of bandwidth is available and allow all child policers, queues, and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the values configured in the applied scheduler policy.

## Parameters

### *pir-rate*

The **pir** parameter accepts the **max** keyword or a value in kilobits per second. Any other value will result in an error without modifying the current PIR rate.

**Values** 1 to 6400000000, **max**

### *cir cir-rate*

The **cir** parameter accepts a value in kilobits per second or the **max** keyword. Any other value will result in an error without modifying the current CIR rate.

If the **cir** parameter is set to **max**, then the CIR rate is set to infinity but bounded by the PIR rate.

The **sum** keyword specifies that the CIR will be used as the summed CIR values of the children schedulers, policers, or queues.

**Values** 0 to 6400000000, **max**, **sum**

## Platforms

configure service vpls sap ingress policer-override policer rate

configure service vpls sap egress policer-override policer rate

## Description

This command within the SAP ingress and egress policer-overrides contexts is used to override the sap-ingress and sap-egress QoS policy configured rate parameters for the specified policer-id.

The **no** form of this command removes the **rate** override so that the **rate** configured for the policer in the applied SAP egress QoS policy is used.

## Parameters

### {*rate* | **max**}

Specifying the keyword **max** or an explicit kilobits per second parameter directly following the rate override command is required and identifies the policer instance's metering rate for the PIR leaky bucket. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to **max**.

**Values** 1 to 6400000000, **max**

### **cir** {*max* | *rate*}

The optional **cir** keyword is used to override the policy derived profiling rate of the policer. Specifying the keyword **max** or an explicit kilobits per second parameter directly following the **cir** keyword is required. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to **max**.

**Values** 0 to 6400000000, **max**

## Platforms

configure service ies interface sap ingress policer-override policer rate

configure service ies interface sap egress policer-override policer rate

## Description

This command within the SAP ingress and egress policer-overrides contexts is used to override the sap-ingress and sap-egress QoS policy configured rate parameters for the specified policer-id.

The **no** form of the command removes the **rate** override so that the **rate** configured for the policer in the applied SAP egress QoS policy is used.

## Parameters

### {*rate* | **max**}

Specifying the keyword **max** or an explicit kilobits per second parameter directly following the rate override command is required and identifies the policer instance's metering rate for the PIR leaky bucket. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to **max**.

**Values** 1 to 6400000000, **max**

### **cir {max | rate}**

The optional **cir** keyword is used to override the policy derived profiling rate of the policer. Specifying the keyword **max** or an explicit kilobits per second parameter directly following the **cir** keyword is required. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to **max**.

**Values** 0 to 6400000000, **max**

### **Platforms**

**[Tree]** (config>service>ies>if>sap>ingress>sched-override>scheduler rate)

### Full Context

configure service ies interface sap egress scheduler-override scheduler rate

configure service ies interface sap ingress scheduler-override scheduler rate

### Description

This command can be used to override specific attributes of the specified scheduler rate. The **rate** command defines the maximum bandwidth that the scheduler can offer its child queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's 'within CIR' distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler due to insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler will assume that an infinite amount of bandwidth is available and allow all child queues and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the value configured in the applied scheduler policy.

### Parameters

#### *pir-rate*

The **pir** parameter accepts a value in kilobits per second, or the keyword **max**. Any other value will result in an error without modifying the current PIR rate.

**Values** 1 to 6400000000, **max**

#### *cir-rate*

This parameter accepts a step-multiplier value that specifies the multiplier used to determine the CIR rate at which the queue will operate. A value in kilobits per second or the keywords **max** or **sum** is accepted. Any other value will result in an error without modifying the current CIR rate.

If the **cir** is set to max, then the CIR rate is set to infinity but is restricted by the PIR rate.

The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers, policers, or queues.

For **egress>sched-override>scheduler** and **ingress>sched-override>scheduler**:

**Values** 0 to 6400000000, **max**, **sum**

configure service vprn interface sap egress policer-override policer rate

configure service vprn interface sap ingress policer-override policer rate

## Description

This command within the SAP ingress and egress policer-overrides contexts is used to override the sap-ingress and sap-egress QoS policy configured rate parameters for the specified policer-id.

The **no** form of this command restores the policy defined metering and profiling rate to a policer.

## Parameters

**{rate | max}**

Specifying the keyword **max** or an explicit kilobits per second parameter directly following the rate override command is required and identifies the policer instance's metering rate for the PIR leaky bucket. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to **max**.

**Values** 1 to 6400000000, **max**

**cir {max | rate}**

The optional **cir** keyword is used to override the policy derived profiling rate of the policer. Specifying the keyword **max** or an explicit kilobits per second parameter directly following the **cir** keyword is required. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to **max**.

**Values** 0 to 6400000000, **max**

[\[Tree\]](#) (config>service>vprn>if>sap>egress>queue-override>queue rate)

### Full Context

configure service vprn interface sap ingress queue-override queue rate

configure service vprn interface sap egress queue-override queue rate

### Description

This command can be used to override specific attributes of the specified queue's Peak Information Rate (PIR) and the Committed Information Rate (CIR) parameters. The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the rate is performed under the **hs-wrr-group** within the SAP egress QoS policy.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

## Default

rate max cir 0

## Parameters

### *pir-rate*

Defines the administrative PIR rate, in kb/s, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 6400000000, **max**

**Default** max

### *cir-rate*

Defines the administrative CIR rate, in kb/s, for the queue. The **cir** parameter overrides the default administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and must be given as a positive integer.

**Values** 0 to 6400000000, **max**

**Default** 0

## Platforms

All

**[Tree]** (config>service>vprn>if>sap>egress>sched-override>scheduler rate)

### Full Context

configure service vprn interface sap ingress scheduler-override scheduler rate

configure service vprn interface sap egress scheduler-override scheduler rate

### Description

This command can be used to override specific attributes of the specified scheduler rate. The **rate** command defines the maximum bandwidth that the scheduler can offer its child queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's 'within CIR' distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child policers and queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler due to insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler will assume that an infinite amount of bandwidth is available and allow all child queues and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the value configured in the applied scheduler policy.

### Parameters

#### *pir-rate*

Specifies the PIR rate for the scheduler. The **pir** parameter accepts a value in kb/s, or the **max** keyword. Any other value will result in an error without modifying the current PIR rate.

**Values** 1 to 6400000000, **max**

#### *cir-rate*

Specifies the CIR rate for the scheduler. The **cir** parameter accepts a value in kb/s, or the **max** or **sum** keywords. Any other value will result in an error without modifying the current CIR rate.

If the **cir** is set to **max**, then the CIR rate is set to infinity, but is limited by the *pir-rate*.

If the **cir** is set to **sum**, then the CIR rate is set to the summed CIR values of the children schedulers, policers, or queues.

**Values** 0 to 6400000000, **max**, **sum**

## Full Context

configure application-assurance group policer rate

configure application-assurance group policer tod-override rate

## Description

This command configures the administrative PIR and CIR for bandwidth policers and flow setup rate limits for flow policers. The actual rate sustained by the flow can be limited by other policers that may be applied to that flow's traffic. This command does not apply to flow-count-limit policers.

The **cir** option is applicable only to dual-bucket bandwidth policers. It is recommended to configure flow setup rate subscriber-level policer for AA subscribers to ensure fair usage of flow resources between AA subscribers.

The **no** form of this command resets the values to defaults.

## Default

rate max cir 0

## Parameters

### *pir-rate*

Specifies an integer for the PIR rate in kb/s for bandwidth policers.

**Values** 1 to 100000000, **max** or flows/sec

### *cir-rate*

Specifies an integer for the CIR rate in kb/s.

**Values** 0 to 100000000, **max**

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

```
debug application-assurance group port-recorder rate
debug application-assurance group http-host-recorder rate
```

## Description

This command configures the sampling rate for the recorded http host, a sampling rate of 10 will sample one out of 10 http-host.

## Parameters

### *sample-rate*

Specifies the sample rate.

**Values** 1 to 10000

**Default** 100

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Output

The following output is an example of a configuration with http-host entries ending with ".com" as a result of the expression filter configuration. It will not record any other HTTP host values since the default-filter-action set to no-record. The http-host entries analyzed by the recorder in the first place are http-host-app-filter-candidates.

### Output Example

```
7750# show debug
debug
 application-assurance
 group 1:1
 http-host-recorder
 filter
 default-filter-action no-record
 expression 1 http-host eq "*.com$" record
 record http-host-app-filter-candidates
 exit
 rate 100
 no shutdown
 exit
 exit
 exit
exit
```

## rate

## Syntax

**rate** *rate*

**no rate**

## Context

[\[Tree\]](#) (config>qos>plcr-ctrl-plcy>tier>arbiter rate)

## Full Context

configure qos policer-control-policy tier arbiter rate

## Description

This command is used to define the maximum bandwidth an instance of the arbiter can receive from its parent tier 1 arbiter or the root arbiter. The arbiter instance enforces this limit by calculating the bandwidth each of its child policers should receive relative to their offered loads, parenting parameters, and individual rate limits, and using that derived rate as a child PIR decrement rate override. The override will not exceed the child policer's administrative rate limit and the aggregate of all the child PIR decrement rates will not exceed the specified arbiter rate limit.

The arbiter's policy defined rate value may be overridden at the SAP or sub-profile where the **policer-control-policy** is applied. Specifying an override prevents the arbiter from being removed from the policer control policy until the override is removed.

The **no** form of this command is used to remove a rate limit from the arbiter at the policer control policy level. The policy level rate limit for the arbiter will return to the default value of **max**. The **no rate** command has no effect on instances of the arbiter where a rate limit override has been defined.

## Default

rate max

## Parameters

### *rate*

Enter an integer representing the rate limit in kilobits per second.

**Values** 1 to 6400000000, **max**

### **max**

When **max** is specified, the arbiter does not enforce a rate limit on its child policers or arbiters other than the individual rate limits enforced at the child level.

[\[Tree\]](#) (config>qos>sap-egress>policer rate)

## Full Context

configure qos sap-ingress policer rate

configure qos sap-egress policer rate

## Description

This command is used to configure the policer's metering and optional profiling rates. The metering rate is used by the system to configure the policer's PIR leaky bucket's decrement rate while the profiling rate configures the policer's CIR leaky bucket's decrement rate. The decrement function empties the bucket while packets applied to the bucket attempt to fill it based on each packet's size. If the bucket fills faster than how much is decremented per packet, the bucket's depth eventually reaches its exceed (CIR) or violate (PIR) threshold. The **cbs**, **mbs**, and **high-prio-only** commands are used to configure the policer's PIR and CIR thresholds.

If a packet arrives at the policer while the bucket's depth is less than the threshold associated with the packet, the packet is considered to be conforming to the bucket's rate. If the bucket depth is equal to or greater than the threshold, the packet is considered to be in the exception state. For the CIR bucket, the exception state is exceeding the CIR rate while the PIR bucket's exception state is violating the PIR bucket rate. If the packet is violating the PIR, the packet is marked red and will be discarded. If the packet is not red, it may be green or yellow, based on the conforming or exceeding state from the CIR bucket.

When a packet is red, neither the PIR nor CIR bucket depths are incremented by the packets size. When the packet is yellow, the PIR bucket is incremented by the packet size, but the CIR bucket is not. When the packet is green, both the PIR and CIR buckets are incremented by the packet size. This ensures that conforming packets impact the bucket depth while exceeding or violating packets do not.

The policer's **adaptation-rule** command settings are used by the system to convert the specified rates into hardware timers and decrement values for the policer's buckets.

By default, the policer's metering rate is **max** and the profiling rate is 0 kb/s (all packets out-of-profile).

The **rate** settings defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied.

The **no** form of this command is used to restore the default metering and profiling rate to a policer.

## Parameters

### {**max** | *pir-rate*}

Specifying the keyword **max** or an explicit *pir-rate* parameter directly following the rate command is required and identifies the policer's metering rate for the PIR leaky bucket. When the policer is first created, the metering rate defaults to max. The *pir-rate* value must be expressed as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When max is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to max.

**Values** 1 to 6400000000, **max**

### **cir** {**max** | *cir-rate*}

The optional **cir** keyword is used to override the default CIR rate of the policer. Specifying the keyword **max** or an explicit *cir-rate* parameter directly following the cir keyword is required and identifies the policer's profiling rate for the CIR leaky bucket. When the policer is first created, the profiling rate defaults to 0 kb/s. The *cir-rate* value must be expressed

as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to max.

**Values** 0 to 6400000000, **max**

**no rate**

### Context

[\[Tree\]](#) (config>qos>sap-ingress>queue rate)

### Full Context

configure qos sap-ingress queue rate

### Description

This command defines the administrative Peak Information Rate (PIR), the administrative Committed Information Rate (CIR), and the administrative Fair Information Rate (FIR) parameters for the queue.

The PIR defines the maximum rate that the queue can transmit packets through the switch fabric (for SAP ingress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. For SAP ingress, the CIR also defines the rate that packets are considered in-profile by the system, unless **cir-non-profiling** is configured. In-profile, then out-of-profile, packets are preferentially queued by the system at egress and at subsequent next-hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The FIR defines an additional rate at which the system prioritizes the queue over other queues competing for the same bandwidth above that used by the CIR.

The **rate** command can be executed at any time, altering the PIR, CIR, and FIR for all queues created through the association of the SAP ingress QoS policy with the *queue-id*.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0, 0).

## Default

rate max cir 0 fir 0

## Parameters

### *pir-rate*

Defines the administrative PIR, in kilobits per second, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and the value must be given as a positive integer.

The actual PIR is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 6400000000, **max**

**Default** max

### *cir-rate*

The **cir** parameter overrides the default administrative CIR, in kilobits per second, used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and the value must be given as a positive integer. The actual CIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 0 to 6400000000, **max**

**Default** 0

### *fir-rate*

The **fir** parameter overrides the default administrative FIR, in kilobits per second, used by the queue. When the **rate** command is executed, an FIR setting is optional. When the **rate** command has not been executed or the **fir** parameter is not explicitly specified, the default FIR (0) is assumed.

Fractional values are not allowed and the value must be given as a positive integer. The actual FIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

FIR is only supported on FP4 hardware and is ignored when the related policy is applied to FP2- or FP3-based hardware.

**Values** 0 to 6400000000, **max**

**Default** 0

## police

Specifies that traffic feeding into the queue instance above the specified PIR rate will be dropped. When the **police** keyword is defined, only the PIR rate may be overridden.

**rate** *pir-rate* [**cir** *cir-rate*]

**no rate**

## Context

[\[Tree\]](#) (config>qos>sap-egress>queue rate)

## Full Context

configure qos sap-egress queue rate

## Description

This command defines the administrative Peak Information Rate (PIR) and the administrative Committed Information Rate (CIR) parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled as in- or out-of-profile throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

When configured on an egress HSQ queue group queue, the **cir** keyword is ignored.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the rate is performed under the **hs-wrr-group** within the SAP egress QoS policy.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

## Default

rate max cir 0

## Parameters

### *pir-rate*

Defines the administrative PIR rate, in kilobits per second, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 6400000000, **max**

**Default** max

### *cir-rate*

The **cir** parameter overrides the default administrative CIR, in kilobits per second, used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and must be given as a positive integer.

**Values** 0 to 6400000000, **max**

**Default** 0

configure qos network-queue queue rate

## Description

This command defines the administrative Peak Information Rate (PIR), the administrative Committed Information Rate (CIR), and the administrative Fair Information Rate (FIR) parameters for the queue.

The PIR defines the percentage that the queue can transmit packets through the switch fabric (for ingress queues) or out of an egress port (for egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available bandwidth.

The CIR defines the percentage at which the system prioritizes the queue over other queues competing for the same bandwidth.

The CIR can be used by the queue's **port-parent** commands **cir-level** and **cir-weight** parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent port scheduler.

The FIR defines an additional percentage at which the system prioritizes the queue over other queues competing for the same bandwidth above that used by the CIR percentage.

The **rate** command can be executed at any time, altering the PIR, CIR, and FIR for all queues created through the association of the network queue policy with the *queue-id*.

When configured on an egress HSQ queue group queue, the **cir** keyword is ignored.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the rate is performed under the **hs-wrr-group** within the network queue policy.

The **no** form of the command returns all queues created with the *queue-id* by association with the network queue policy to the default PIR, CIR, and FIR parameters.

## Default

rate 100 cir 0 fir 0

## Parameters

### *percent*

Defines the percentage of the sum of the capacities of network and hybrid ports on that FP (taking into account any **ingress-rate** configuration) or egress port speed for the rate allowed for the queue. When the **rate** command is executed, a valid *percent* (PIR setting) must be explicitly defined. When the **rate** command has not been executed, the default PIR of **100** is assumed. Fractional values are not allowed, and the value must be given as a positive integer.

The actual PIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 100

**Default** 100

### *cir percent*

Defines the percentage of the sum of the capacities of network and hybrid ports on that FP (taking into account any **ingress-rate** configuration) or egress port speed for the CIR allowed for the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly

specified, the default CIR (0) is assumed. Fractional values are not allowed, and the value must be given as a positive integer. The actual CIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 0 to 100

**Default** 0

### ***fir percent***

Defines the percentage of the sum of the capacities of network and hybrid ports on that FP (taking into account any **ingress-rate** configuration) or egress port speed for the FIR allowed for the queue. When the **rate** command is executed, a FIR setting is optional. When the **rate** command has not been executed or the **fir** parameter is not explicitly specified, the default FIR (0) is assumed. Fractional values are not allowed, and the value must be given as a positive integer. The actual FIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned. FIR is only supported on FP4 hardware and is ignored when the related policy is applied to FP2- or FP3-based hardware.

**Values** 0 to 100

**Default** 0

## **Platforms**

**[Tree]** (config>qos>qgrps>egr>qgrp>policer rate)

## **Full Context**

configure qos queue-group-templates ingress queue-group policer rate

configure qos queue-group-templates egress queue-group policer rate

## **Description**

This command is used to configure the policer's metering and optional profiling rates. The metering rate is used by the system to configure the policer's PIR leaky bucket's decrement rate while the profiling rate configures the policer's CIR leaky bucket's decrement rate. The decrement function empties the bucket while packets applied to the bucket attempt to fill it based on each packet's size. If the bucket fills faster than how much is decremented per packet, the bucket's depth eventually reaches its exceed (CIR) or

violate (PIR) threshold. The **cbs**, **mbs**, and **high-prio-only** commands are used to configure the policer's PIR and CIR thresholds.

If a packet arrives at the policer while the bucket's depth is less than the threshold associated with the packet, the packet is considered to be conforming to the bucket's rate. If the bucket depth is equal to or greater than the threshold, the packet is considered to be in the exception state. For the CIR bucket, the exception state is exceeding the CIR rate while the PIR bucket's exception state is violating the PIR bucket rate. If the packet is violating the PIR, the packet is marked red and will be discarded. If the packet is not red, it may be green or yellow, based on the conforming or exceeding state from the CIR bucket.

When a packet is red, neither the PIR nor CIR bucket depths are incremented by the packets size. When the packet is yellow, the PIR bucket is incremented by the packet size, but the CIR bucket is not. When the packet is green, both the PIR and CIR buckets are incremented by the packet size. This ensures that conforming packets impact the bucket depth while exceeding or violating packets do not.

The policer's **adaptation-rule** command settings are used by the system to convert the specified rates into hardware timers and decrement values for the policer's buckets.

By default, the policer's metering rate is **max** and the profiling rate is 0 kb/s (all packets out-of-profile).

The **no** form of this command is used to restore the default metering and profiling rate to a policer.

## Parameters

### {**max** | *pir-rate*}

Specifying the keyword **max** or an explicit *pir-rate* parameter directly following the rate command is required and identifies the policer's metering rate for the PIR leaky bucket. When the policer is first created, the metering rate defaults to max. The *pir-rate* value must be expressed as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When max is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to max.

**Values** **max**, 1 to 2000000000

### **cir** {**max** | *cir-rate*}

The optional **cir** keyword is used to override the default CIR rate of the policer. Specifying the keyword max or an explicit *cir-rate* parameter directly following the cir keyword is required and identifies the policer's profiling rate for the CIR leaky bucket. When the policer is first created, the profiling rate defaults to 0 kb/s. The *cir-rate* value must be expressed as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to max.

**Values** **max**, 0 to 2000000000

configure qos queue-group-templates ingress queue-group queue rate

### Description

This command defines the administrative Peak Information Rate (PIR), the administrative Committed Information Rate (CIR), and the administrative Fair Information Rate (FIR) parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets through the switch fabric (for SAP ingress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. For SAP ingress, the CIR also defines the rate that packets are considered in-profile by the system, unless **cir-non-profiling** is configured. In-profile, then out-of-profile, packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The FIR defines an additional rate at which the system prioritizes the queue over other queues competing for the same bandwidth above that used by the CIR.

The **rate** command can be executed at any time, altering the PIR, CIR, and FIR for all queues created through the association of the ingress queue group template with the *queue-id*.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR, CIR, and FIR parameters (**max**, 0, 0).

### Default

rate max cir 0 fir 0

### Parameters

#### *pir-rate*

Defines the administrative PIR, in kilobits, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed. Fractional values are not allowed and the value must be given as a positive integer.

The actual PIR is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 2000000000 kb/s, **max**

**Default** max

### ***cir-rate***

The **cir** parameter overrides the default administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed. Fractional values are not allowed and the value must be given as a positive integer. The actual CIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 2000000000 kb/s, **max**

**Default** 0

### ***fir-rate***

The **fir** parameter overrides the default administrative FIR used by the queue. When the **rate** command is executed, an FIR setting is optional. When the **rate** command has not been executed or the **fir** parameter is not explicitly specified, the default FIR (0) is assumed.

Fractional values are not allowed and the value must be given as a positive integer. The actual FIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

FIR is only supported on FP4 hardware and is ignored when the related policy is applied to FP2- or FP3-based hardware.

**Values** 1 to 2000000000 kb/s, **max**

**Default** 0

### **police**

Specifies that traffic feeding into the queue instance above the specified rate is dropped.

## **Context**

**[Tree]** (config>qos>queue-group-templates>egress>queue-group>queue rate)

## Full Context

```
configure qos queue-group-templates egress queue-group queue rate
```

## Description

This command defines the administrative PIR and the administrative CIR parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets out an egress port. Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled as in- or out-of-profile throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR for all queues created through the association of the egress queue group template with the *queue-id*.

When configured on an egress HSQ queue group queue, the **cir** keyword is ignored.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the rate is performed under the **hs-wrr-group** within the SAP egress QoS policy.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

## Default

```
rate max cir 0
```

## Parameters

### *pir-rate*

Defines the administrative PIR rate, in kilobits, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 200000000 kb/s, **max**

**Default** max

### *cir-rate*

The **cir** parameter overrides the default administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and must be given as a positive integer.

**Values** 0 to 200000000 kb/s, **max**

**Default** 0

## Platforms

**no rate**

## Context

[\[Tree\]](#) (config>qos>scheduler-policy>tier>scheduler rate)

## Full Context

configure qos scheduler-policy tier scheduler rate

## Description

The **rate** command defines the maximum bandwidth that the scheduler can offer its child queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's within-CIR distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler due to insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler will assume that an infinite amount of bandwidth is available and allow all child queues and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the value configured in the applied scheduler policy.

## Parameters

**pir** *pir*

Specifies the PIR rate of the scheduler in kb/s or it can be set to the maximum using the **max** keyword.

**Values** 1 to 6400000000, **max**

**Default** max

### **cir** *cir*

Specifies the CIR rate of the scheduler in kb/s or it can be set to the maximum using the max keyword. The sum keyword can also be used, which sets the CIR to the sum of child CIR values.

**Values** 0 to 6400000000, **max**, **sum**

**Default** sum

### Context

[\[Tree\]](#) (config>qos>shared-queue>queue rate)

### Full Context

configure qos shared-queue queue rate

### Description

This command defines the administrative PIR, the administrative CIR, and the administrative FIR parameters for the queue.

The PIR defines the percentage that the queue can transmit packets through the switch fabric (for ingress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by over-subscription factors or available bandwidth.

The CIR defines the percentage at which the system prioritizes the queue over other queues competing for the same bandwidth.

The **rate** command can be executed at any time, altering the PIR, CIR, and FIR for the queue created with the *queue-id*.

### Parameters

#### *percent*

Defines the percentage of the FP ingress capacity for the max rate allowed for the queue. When the **rate** command is executed, a valid percent (PIR) setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed. Fractional values are not allowed and the value must be given as a positive integer.

**Values** 1 to 100, **max**

**Default** 100

#### *cir percent*

Defines the percentage of the FP ingress capacity for the CIR allowed for the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed. Fractional values are not allowed and the value must be given as a positive integer.

**Values** 0 to 100, **max**

**Default** 0

***fir percent***

Defines the percentage of the FP ingress capacity for the FIR allowed for the queue. When the **rate** command is executed, a FIR setting is optional. When the **rate** command has not been executed or the **fir** parameter is not explicitly specified, the default FIR (0) is assumed. Fractional values are not allowed and the value must be given as a positive integer. FIR is only supported on FP4 hardware and is ignored when the related policy is applied to FP2- or FP3-based hardware.

**Values** 0 to 100

**Default** 0

**rate****Syntax**

**rate** *sample-rate*

**no rate**

**Context**

[\[Tree\]](#) (config>cflowd rate)

**Full Context**

configure cflowd rate

**Description**

This command specifies the rate (N) at which traffic is sampled and sent for flow analysis. A packet is sampled every N packets; for example, when **sample-rate** is configured as 1, then all packets are sent to the cache. When **sample-rate** is configured as 100, then every 100th packet is sent to the cache.

The **no** form of this command resets the sample rate to the default value.

**Default**

rate 1000

**Parameters**

***sample-rate***

Specifies the rate at which traffic is sampled.

**Values** 1 to 10000

**Platforms**

All

## rate

### Syntax

**rate** *kilobits-per-second*

**no rate**

### Context

**[Tree]** (config>service>cust>multi-service-site>egress>agg-rate rate)

### Full Context

configure service customer multi-service-site egress agg-rate rate

### Description

This command defines the enforced aggregate rate for all queues associated with the agg-rate context. A rate must be specified for the agg-rate context to be considered to be active on the context's object.

The **no** form of the command reverts to the default.

### Parameters

*kilobits-per-second*

Specifies the rate limit for the multi-service site, in kilobits per second.

**Values** 1 to 6400000000, **max**

### Platforms

All

## rate

### Syntax

**rate** *pir-rate* [**cir** *cir-rate*]

**no rate**

### Context

**[Tree]** (config>service>cust>multi-service-site>egress>sched-override>scheduler rate)

### Full Context

configure service customer multi-service-site ingress scheduler-override scheduler rate

configure service customer multi-service-site egress scheduler-override scheduler rate

## Description

This command overrides specific attributes of the specified scheduler rate.

The **rate** command defines the maximum bandwidth that the scheduler can offer its child policers, queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the scheduler's amount of bandwidth to be considered during the parent schedulers 'within CIR' distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child policers or queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler due to insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler will assume that an infinite amount of bandwidth is available and allow all child queues and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's to the PIR and CIR parameters to the value configured in the applied scheduler policy.

## Parameters

### *pir-rate*

Specifies the PIR rate.

**Values** 1 to 6400000000, **max**

**Default** **max**

### *cir-rate*

Specifies the CIR rate.

If the *cir-rate* is set to **max**, then the CIR rate is set to infinity. The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers, policers or queues.

**Values** 0 to 6400000000, **max**, **sum**

**Default** **sum**

## Platforms

All

## rate

## Syntax

**rate** *rate* [*cir* *cir*]

**no rate**

### Context

[\[Tree\]](#) (config>system>security>cpm-queue>queue rate)

### Full Context

configure system security cpm-queue queue rate

### Description

This command specifies the maximum bandwidth that will be made available to the queue in kilobits per second (kb/s).

### Parameters

**rate**

Specifies the administrative Peak Information Rate (PIR) for the queue.

**cir**

Specifies the amount of bandwidth committed to the queue.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## rate

### Syntax

**rate kbps** {*kilobits-per-second* | **max**} [**mbs size**] [**bytes** | **kilobytes**]

**rate packets** {*ppi* | **max**} **within seconds** [**initial-delay packets**]

**no rate**

### Context

[\[Tree\]](#) (config>sys>security>dist-cpu-protection>policy>local-monitoring-policer rate)

[\[Tree\]](#) (config>sys>security>dist-cpu-protection>policy>protocol>dynamic-parameters rate)

### Full Context

configure system security dist-cpu-protection policy local-monitoring-policer rate

configure system security dist-cpu-protection policy protocol dynamic-parameters rate

### Description

This command configures the rate and burst tolerance for the policer in either a packet rate or a bit rate.

The actual hardware may not be able to perfectly rate limit to the exact configured parameters. In this case, the configured parameters will be adapted to the closest supported rate. The actual (operational) parameters can be seen in CLI, for example, **show service id 33 sap 1/1/3:33 dist-cpu-protection detail**.

If the *kilobits-per-second* parameter value is configured as max, then the policer is effectively disabled (always conforming).

If the *size* parameter value is configured as 0, then all packets are considered as nonconforming.

## Default

rate packets max within 1 initial-delay 0

## Parameters

### packets | kbps

specifies that the rate is either in units of packets per interval or in units of kilobits per second. The packets option would typically be used for lower rates (for example, for per-subscriber DHCP rate limiting) while the kbps option would typically be used for higher rates (for example, per-interface BGP rate limiting).

### *ppi*

Specifies packets per interval.

**Values** 0 to 255, max  
 max = disable the policer (always conforming)  
 packets 0 = all packets considered nonconforming

### *seconds*

Specifies the length of the ppi rate measurement interval.

**Values** 1 to 32767

### *packets*

Specifies the number of packets allowed (even at line rate) in an initial burst (or a burst after the policer bucket has drained to zero) in addition to the normal *ppi*. This would typically be set to a value that is equal to the number of received packets in several full handshakes/negotiations of the particular protocol.

**Values** 0 to 255

### *kilobits-per-second*

Specifies the kilobits per second.

**Values** 1 to 20000000, max

### *size*

Specifies the tolerance for the kbps rate.

**Values** 0 to 4194304

**Default** 10

### bytes | kilobytes

Specifies that the units of the mbs size parameter are either in bytes or kilobytes.

## Platforms

All

## rate

### Syntax

**rate kbps** {*kilobits-per-second* | **max**} [**mbs size**] [**bytes** | **kilobytes**]

**rate packets** {*ppi* | **max**} **within seconds** [**initial-delay packets**]

**no rate**

### Context

**[Tree]** (config>sys>security>dist-cpu-protection>policy>static-policer rate)

### Full Context

configure system security dist-cpu-protection policy static-policer rate

### Description

This command configures the rate and burst tolerance for the policer in either a packet rate or a bit rate.

The actual hardware may not be able to perfectly rate limit to the exact configured parameters. In this case, the configured parameters will be adapted to the closest supported rate. The actual (operational) parameters can be seen in CLI, for example, **show service id 33 sap 1/1/3:33 dist-cpu-protection detail**.

If the *kilobits-per-second* parameter value is configured as max, then the policer is effectively disabled (always conforming).

If the *size* parameter is configured as 0, then all packets are considered as nonconforming.

### Default

rate packets max within 1 initial-delay 0

### Parameters

#### packets | kbps

specifies that the rate is either in units of packets per interval or in units of kilobits per second. The packets option would typically be used for lower rates (for example, for per-subscriber DHCP rate limiting) while the kbps option would typically be used for higher rates (for example, per-interface BGP rate limiting).

#### ppi

Specifies packets per interval.

**Values** 0 to 8000, max  
max = disable the policer (always conforming)  
packets 0 = all packets considered nonconforming

#### seconds

Specifies the length of the ppi rate measurement interval.

**Values** 1 to 32767

### **packets**

Specifies the number of packets allowed (even at line rate) in an initial burst (or a burst after the policer bucket has drained to zero) in addition to the normal *ppi*. This would typically be set to a value that is equal to the number of received packets in several full handshakes/negotiations of the particular protocol.

**Values** 0 to 255

### **kilobits-per-second**

Specifies the kilobits per second.

**Values** 1 to 20000000, max

### **size**

Specifies the tolerance for the kbps rate.

**Values** 0 to 4194304

**Default** 10

### **bytes | kilobytes**

Specifies that the units of the mbs size parameter are either in bytes or kilobytes.

## **Context**

[\[Tree\]](#) (config>test-oam>sath>svc-test>svc-stream rate)

## **Full Context**

configure test-oam service-activation-testhead service-test service-stream rate

## **Description**

This command configures the CIR that must be validated for a specific stream. If configured, the PIR value must be greater than or equal to the CIR value.

The service activation testhead generates traffic up to the specified rate based on the **test-types** command, as follows.

- For **type cir**, traffic is generated at a rate up to the configured CIR.

- For **type cir-pir**, traffic is generated at a rate up to the configured PIR.
- For **type policing**, traffic is generated at a rate up to 125% of the configured PIR.
- For **type performance**, traffic is generated at a rate up to the configured PIR.

The **no** form of this command reverts to the default values.

## Default

no rate

## Parameters

### *cir-rate-in-kbps*

Specifies the CIR rate, in kb/s, which overrides the default CIR value. The configured value must be a positive integer; fractional values are not allowed. If the **rate** command is not executed, or the CIR parameter is not explicitly specified, the default CIR value applies.

**Values** 1 to 400,000,000

### *pir-rate-in-kbps*

Specifies the PIR rate, in kb/s, which overrides the default administrative PIR value. The configured value must be a positive integer; fractional values are not allowed. If the **rate** command is not executed or the PIR parameter is not explicitly specified, the default PIR value applies.

**Values** 1 to 400,000,000

## Syntax

**rate-adjustment** *adjusted-percent*

**no rate-adjustment**

## Context

**[Tree]** (config>subscr-mgmt>ancp>policy>ingress rate-adjustment)

**[Tree]** (config>subscr-mgmt>ancp>policy>egress rate-adjustment)

## Full Context

configure subscriber-mgmt ancp ancp-policy ingress rate-adjustment

configure subscriber-mgmt ancp ancp-policy egress rate-adjustment

## Description

This command configures a rate adjustment for the scheduler. The **rate-adjustment** command should be used when the rate returned by the DSLAM is calculated with different encapsulation than the 7450 ESS or 7750 SR. The node will adjust the rate by the percent specified as:

$DSLAM\_RATE * \text{adjust-rate} / 100$  — rate-reduction.

The **no** form of this command reverts to the default.

## Parameters

### *adjusted-percent*

Specifies a rate adjustment for the scheduler.

**Values** 1 to 200

**Default** 100

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.30 rate-calc-min-int

### rate-calc-min-int

## Syntax

**rate-calc-min-int** [*fast-queue percent-of-default*] [*slow-queue percent-of-default*]

**no rate-calc-min-int**

## Context

[\[Tree\]](#) (config>card>virt-sched-adj rate-calc-min-int)

## Full Context

configure card virtual-scheduler-adjustment rate-calc-min-int

## Description

This command overrides the default minimum time that must elapse before a policer or queue's offered rate may be recalculated. A minimum time between offered rate calculations is enforced to both prevent inaccurate estimation of the offered rate and excessive input to the virtual scheduler process.

In order to smooth out rapidly fluctuating offered rates, the system averages the measured offered rate with a window of previously measured offered traffic statistics and knowledge of the time between the samples.

The window size is defined by the "rate calculation minimum interval" with offered traffic statistics being read at most four times within the window. Any previous measured offered statistics within the window are used in the averaging function. Note that if there are large numbers of samples required, for example when a large number of queues are running HQoS, then it may be that a time greater than the "rate calculation

minimum interval” passes before another sample of the offered statistics can be taken for a queue. In this case, in order to calculate an offered rate, HQoS will always use two samples, the current and the previous. In this case, using a smaller **rate-calc-min-int** will have no effect on the responsiveness of HQoS to queue rate changes.

The system separates policers and queues into fast and slow categories and maintains a separate "rate calculation minimum interval" for each type. The default for each type are as follows:

Slow Queue: 1.0 seconds

Fast Queue: 0.25 seconds

The actual minimum rate calculation interval may be increased or decreased by using the fast-queue and/or slow-queue keywords (which are also applicable for policers managed by HQoS) followed by a percent value which is applied to the default interval. The default slow-queue threshold rate is 1 Mb/s. Once a policer or queue is categorized as slow, its rate must rise to 1.5 Mb/s before being categorized as a fast policer or queue. The categorization threshold may be modified by using the **slow-queue-threshold** command.

The **no** form of this command restores the default fast queue and slow queue minimum rate calculation interval.

## Default

no rate-calc-min-int

## Parameters

### *percent-of-default*

Specifies that the fast-queue percent-of-default parameter is optional and is used to modify the default minimum rate calculation time for "fast" queues. Defining 100.00 percent is equivalent to removing the override (restoring the default) on the fast queue minimum rate calculation time.

**Values** 0.01% to 1000.00%

**Default** 100.00%

### *percent-of-default*

Specifies that the slow-queue percent-of-default parameter is optional and is used to modify the default minimum rate calculation time for "slow" queues. Defining 100.00 percent is equivalent to removing the override (restoring the default) on the slow queue minimum rate calculation time.

**Values** 0.01% to 1000.00%

**Default** 100.00%

## 22.31 rate-down

```
rate-down
```

### Syntax

```
rate-down rate
```

```
no rate-down
```

### Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp>host>access-loop-encapsulation rate-down)

### Full Context

```
configure subscriber-mgmt local-user-db ppp host access-loop-encapsulation rate-down
```

### Description

This command is applicable to LAC and LNS. It provides the last mile link rate in the downstream direction that is needed for proper shaping and calculating the interleaving delay.

The rate information in the last mile will be taken from the following sources in the order of priority:

- Statically provisioned value in local user database (LUDB).
- RADIUS.
- PPPoE tags on LAC or ICRQ message (RFC 5515) /ICCN message (TX Connect Seed) on LNS.

### Default

```
no rate-down
```

### Parameters

*rate*

Specifies the last mile link downstream rate in the access loop

**Values** 1 to 100000 kb/s

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

## 22.32 rate-limit

## rate-limit

### Syntax

**rate-limit** *packets-per-second*

**no rate-limit**

### Context

**[Tree]** (config>service>nat>syslog>syslog-export-policy rate-limit)

### Full Context

configure service nat syslog syslog-export-policy rate-limit

### Description

This command configures the maximum rate limit at which syslog messages are sent. Once the rate limit is exceeded, NAT flow logs will be buffered. Overload condition is characterized by exhaustion of this buffer space. This condition can occur due to imposed rate limit or the software speed limit. Once the buffer space is exhausted, new flow creation will be denied, and the teardown of the existing flows will be delayed until the buffer space becomes available.

The **no** form of the command removes the maximum rate limit from the configuration.

### Parameters

***packets-per-second***

Specifies the packet rate limit in seconds.

**Values** 10 to 2147483647

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## rate-limit

### Syntax

**rate-limit** *value* [**kbps** | **pps**] [**mbs** *mbs-value*]

**rate-limit** *value* [**kbps** | **pps**] **extracted-traffic**

**rate-limit** *value* [**kbps** | **pps**] **packet-length** {**lt** | **gt** | **eq**} *packet-length-value*

**rate-limit** *value* [**kbps** | **pps**] **packet-length range** *packet-length-value* *packet-length-value*

**rate-limit** *value* [**kbps** | **pps**] **tll range** *tll-value* *tll-value*

## Context

[Tree] (config>filter>ip-filter>entry>action rate-limit)

## Full Context

configure filter ip-filter entry action rate-limit

## Description

This command configures the rate-limit value for traffic matching this filter entry. Rate-limit policers are configured with MBS equals CBS equals 10 ms of the rate and high-prio-only equals 0.

Traffic can also be rate limited based on **extracted-traffic**, **packet-length**, **tll**, or a pattern of conditional match criteria.

Packets that match the filter entry match criteria, but do not match the conditional match criteria value, are implicitly forwarded with no further match in the following filter entries.

For pattern match:

- the expression is left-aligned for the odd number bytes, for example, the expression 0xABC is programmed 0x0ABC in the line card
- the 'data' offset requires protocol UDP or TCP to be selected in the filter entry match criteria.

## Parameters

### *value*

Specifies the **rate-limit value** in kb/s (default) or packets per second (pps). A rate of 0 results in all traffic being dropped. A rate of **max** results in all traffic being forwarded.

**Values** 0 to 2000000000 kb/s, max  
0 to 100000000 pps, max

### *mbs-value*

Specifies the maximum burst size in bytes. This parameter can only be specified when the **rate-limit value** unit is **kbps**.

**Values** 0 to 268435456

### **extracted-traffic**

Specifies rate-limit packets both extracted to the CPM and matching the filter entry match criteria.

### **packet-length**

Specifies rate-limit packets matching both the filter entry match criteria and the *packet-length value* defined in the **rate-limit** action statement. Packets matching the filter entry match criteria and not matching the *packet-length* value, as defined in the **rate-limit** action statement, are implicitly forwarded with no further match in the following filter entries.

**Values** **lt** — Specifies "less than". The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.  
**gt** — Specifies "greater than". The **gt** parameter cannot be used with the highest possible numerical value for the parameter.  
**eq** — Specifies "equal to".

**packet-length-value**

Specifies the packet length value for the rate limit action.

**Values** 0 to 65535

**range**

Specifies an inclusive range. When **range** is used, the start of the range (the first value entered) must be smaller than the end of the range (the second value entered).

**expression**

Specifies the hexadecimal pattern to match; up to eight bytes.

**Values** 0x0000000000000001 to 0xffffffffffffff

**mask**

Specifies the mask for the pattern expression, up to eight bytes.

**Values** 0x0000000000000001 to 0xffffffffffffff

**offset-type**

Specifies the starting point reference for the offset-value of this pattern.

**Values** layer-3, layer-4, data, dns-qtype

**offset-value**

Specifies the offset value for the pattern expression. Dns-qtype supports offset value of 0.

**Values** 0 to 255

**ttl-value**

Specifies rate-limit packets matching both the filter entry match criteria and the TTL value defined in the *rate-limit* action statement. Packets matching the filter entry match criteria and not matching the TTL value, as defined in the *rate-limit* action statement, are implicitly forwarded with no further match in the following filter entries.

**Values** 0 to 255

**Platforms**

All

**rate-limit****Syntax**

**rate-limit** *value*

**Context**

[\[Tree\]](#) (config>filter>mac-filter>entry>action rate-limit)

## Full Context

configure filter mac-filter entry action rate-limit

## Description

This command sets the rate limit for the traffic matching both the filter entry match criteria and the *packet-length-value* defined in the **rate-limit action** statement.

Packets matching the filter entry match criteria and not matching the *packet-length-value* defined in the **rate-limit action** statement are implicitly forwarded with no further match in subsequent filter entries.

Rate limit packets matching both the filter entry match criteria and the *tll-value* are defined in the **action rate-limit** statement.

Packets matching the filter entry match criteria and not matching the *tll-value* defined in the **rate-limit action** statement are implicitly forwarded with no further match in the following filter entries.

## Parameters

### *value*

Specifies the **rate-limit value** in kb/s. A rate of 0 results in all traffic being dropped. A rate of **max** results in all traffic being forwarded.

**Values** 0 to 2000000000 kb/s | max

## Context

[\[Tree\]](#) (config>filter>ipv6-filter>entry>action rate-limit)

## Full Context

configure filter ipv6-filter entry action rate-limit

## Description

This command configures the rate-limit value for traffic matching this filter entry.

Traffic can also be rate-limited based on **extracted-traffic**, **payload-length**, **hop-limit**, or a pattern of conditional match criteria.

Packets that match the filter entry match criteria, but do not match the conditional match criteria value, are implicitly forwarded with no further match in the following filter entries.

For pattern match:

- the expression is left-aligned for the odd number bytes, for example, the expression 0xABC is programmed 0x0ABC in the line card.
- the 'data' offset requires protocol UDP or TCP to be selected in the filter entry match criteria.

## Parameters

### *value*

Specifies the **rate-limit value** in kb/s (default) or packets per second (pps). A rate of 0 results in all traffic being dropped. A rate of **max** results in all traffic being forwarded.

**Values** 0 to 2000000000 kb/s, max  
0 to 100000000 pps, max

### *mbs-value*

Specifies the maximum burst size in bytes. This parameter can only be specified when the **rate-limit value** unit is **kbps**.

**Values** 0 to 268435456

### **extracted-traffic**

Specifies packets extracted to the CPM.

### **hop-limit**

Specifies the hop limit value for the rate limit action.

**Values** **lt** — Specifies "less than". The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.  
**gt** — Specifies "greater than". The **gt** parameter cannot be used with the highest possible numerical value for the parameter.  
**eq** — Specifies "equal to".

### *hop-limit-value*

Specifies the hop limit value for the rate limit action.

**Values** 0 to 255

### **range**

Specifies an inclusive range. When the **range** parameter is used, the start of the range (the first value entered) must be smaller than the end of the range (the second value entered).

### *expression*

Specifies the hexadecimal pattern to match; up to eight bytes.

**Values** 0x0000000000000001 to 0xffffffffffffff

**mask**

Specifies the mask for the pattern expression, up to eight bytes.

**Values** 0x0000000000000001 to 0xffffffffffffff

**offset-type**

Specifies the starting point reference for the offset-value of this pattern.

**Values** layer-3, layer-4, data, dns-qtype

**offset-value**

Specifies the offset value for the pattern expression. Dns-qtype supports offset value of 0.

**Values** 0 to 255

**payload-length**

Specifies rate-limit packets matching both the filter entry match criteria and the *payload-length-value* defined in the **rate-limit** action statement. Packets matching the filter entry match criteria and not matching the *payload-length-value*, as defined in the **rate-limit** action statement, are implicitly forwarded with no further match in the following filter entries.

**Values** **lt** — Specifies "less than". The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.

**gt** — Specifies "greater than". The **gt** parameter cannot be used with the highest possible numerical value for the parameter.

**eq** — Specifies "equal to".

**payload-length-value**

Specifies the payload length value for the rate limit action.

**Values** 0 to 65535

**no rate-modify**

## Context

[\[Tree\]](#) (config>subscr-mgmt>ancp>policy>egress rate-modify)

[\[Tree\]](#) (config>subscr-mgmt>ancp>policy>ingress rate-modify)

## Full Context

configure subscriber-mgmt ancp ancp-policy egress rate-modify

configure subscriber-mgmt ancp ancp-policy ingress rate-modify

## Description

This command configures rate modify scheduler parameters.

The **no** form of this command removes the scheduler name from the configuration.

## Parameters

### **agg-rate-limit**

Specifies that the maximum total rate for all subscriber egress queues for each subscriber associated with the policy.

### **scheduler-name**

Specifies a scheduler name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.34 rate-monitor

### rate-monitor

## Syntax

**rate-monitor** *kilobit-per-second* [**alarm**]

**no rate-monitor**

## Context

[\[Tree\]](#) (config>subscr-mgmt>ancp>policy>egress rate-monitor)

[\[Tree\]](#) (config>subscr-mgmt>ancp>policy>ingress rate-monitor)

## Full Context

configure subscriber-mgmt ancp ancp-policy egress rate-monitor

configure subscriber-mgmt ancp ancp-policy ingress rate-monitor

## Description

This command configures the rate monitor level.

The **no** form of this command removes the value from the configuration.

### Parameters

#### *kilobit-per-second*

Specifies the rate below which the system generates an event.

**Values** 0 to 4294967295

#### **alarm**

When the monitored rate is below the configured value the system generates an alarm (trap) to the management system. The trap includes the rate as well as the ANCP policy name and the ANCP string.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.35 rate-percentage

### rate-percentage

#### Syntax

**rate-percentage** *rate-percentage*

**no rate-percentage**

#### Context

[\[Tree\]](#) (config>app-assure>group>policer rate-percentage)

#### Full Context

configure application-assurance group policer rate-percentage

#### Description

This command indirectly configures the rate used by Access-Network-Location (ANL) policers. Because ANL total bandwidth is dynamically measured and estimated by AA, this command allows the operator to configure the ratio of that measured bandwidth to be used by the ANL policer as the policer rate.

The **no** form of this command resets the values to defaults.

#### Default

no rate-percentage

#### Parameters

*rate-percentage*

Specifies an integer value that specifies a percentage that is applied against the ANL estimate maximum bandwidth to produce the actual rate that is used by the policer when ANL congestion occurs.

**Values** 0 to 200 (0: means drop all traffic)

**Default** 0

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.36 rate-percentage-stage2

### rate-percentage-stage2

#### Syntax

**rate-percentage-stage2** *rate-percentage*

**no rate-percentage-stage2**

#### Context

**[Tree]** (config>app-assure>group>policer rate-percentage-stage2)

#### Full Context

configure application-assurance group policer rate-percentage-stage2

#### Description

This command indirectly configures the rate used by Access-Network-Location (ANL) policers. Because ANL stage2 total bandwidth is dynamically measured and estimated by AA, this command allows the operator to configure the ratio of that measured bandwidth to be used by the ANL stage2 policer as the policer rate.

The **no** form of this command reverts to the default.

#### Parameters

##### *rate-percentage*

Specifies an integer value that specifies a percentage that is applied to the ANL estimated maximum bandwidth to produce the actual rate that is used by the policer when ANL stage2 congestion occurs. A value of 0 means that all traffic is dropped.

**Values** 0 to 200

**Default** 0

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.37 rate-reduction

### rate-reduction

#### Syntax

**rate-reduction** *kilobit-per-second*

**no rate-reduction**

#### Context

**[Tree]** (config>subscr-mgmt>ancp>policy>egress rate-reduction)

**[Tree]** (config>subscr-mgmt>ancp>policy>ingress rate-reduction)

#### Full Context

configure subscriber-mgmt ancp ancp-policy egress rate-reduction

configure subscriber-mgmt ancp ancp-policy ingress rate-reduction

#### Description

This command defines a constant rate reduction to the rate specified by the DSLAM. The **rate-reduction** command should be used if the node should adjust the rate to a value that is offset (for example by a fixed multicast dedicated bandwidth) compared to the total available on the DSLAM.

When set, the rate is:

$DSLAM\_RATE * \text{adjust-rate} / 100$  — **rate-reduction**

The **no** form of this command removes the value from the configuration.

#### Parameters

***kilobits-per-second***

Specifies the rate reduction to be applied for this subscriber.

**Values** 0 to 4294967295

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.38 rate-thresholds

## rate-thresholds

### Syntax

**rate-thresholds high** *high-percentage* **low** *low-percentage*

**no rate-thresholds**

### Context

**[Tree]** (config>subscr-mgmt>sla-profile>egress>bonding-selection rate-thresholds)

### Full Context

configure subscriber-mgmt sla-profile egress bonding-selection rate-thresholds

### Description

This command configures the rate thresholds that are required before decreasing or increasing the preferred link's weight with the specified change percentage.

The low threshold value must be lower than the high threshold value.

The **no** form of this command reverts to the default.

### Default

rate-thresholds high 90 low 80

### Parameters

#### ***high-percentage***

Specifies the high threshold, as a percentage of the reference rate.

**Values** 56 to 99

#### ***low-percentage***

Specifies the low threshold, as a percentage of the reference rate.

**Values** 55 to 98

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.39 rating-group

## rating-group

### Syntax

**rating-group** *rating-group-id*

## no rating-group

### Context

[\[Tree\]](#) (config>subscr-mgmt>cat-map>category rating-group)

### Full Context

configure subscriber-mgmt category-map category rating-group

### Description

This command configures the rating group applicable for this category.

The **no** form of this command reverts to the default.

### Parameters

#### *rating-group-id*

Specifies the rating group applicable for this category.

**Values** 0 to 4294967295

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.40 raw

### raw

### Syntax

[no] raw

### Context

[\[Tree\]](#) (config>cflowd>collector>aggregation raw)

### Full Context

configure cflowd collector aggregation raw

### Description

This command configures raw (unaggregated) flow data to be sent in Version 5.

The **no** form of this command removes this type of aggregation from the collector configuration.

### Platforms

All

## 22.41 rd

**rd**

### Syntax

```
rd file-url rf
rd file-url [force]
```

### Context

**[Tree]** (file rd)

### Full Context

file rd

### Description

If the directory is empty, the **rd** command is used to remove it. The **force** option executes the command without prompting the user to confirm the action.

If the directory contains files and/or subdirectories, the **rf** parameter must be used to remove the directory.

Example:

```
A:nE1>file cf1:\ # rd test
Are you sure (y/n)? y
Deleting directory cf1:\test ..MINOR: CLI Cannot delete cf1:\test.
A:nE1>file cf1:\ # rd test force
Deleting directory cf1:\test ..MINOR: CLI Cannot delete cf1:\test.

A:nE1>file cf1:\ # rd testbase rf
Deleting all subdirectories and files in specified directory. y/n ?y
Deleting directory cf1:\testbase\testbase1 ..OK
Deleting directory cf1:\test ..OK
```

### Parameters

#### *file-url*

Specifies the directory to be removed.

#### Values

local-url	[ <i>cflash-id</i> ]/[ <i>file-path</i> ] up to 200 characters, including <i>cflash-id</i> directory length up to 99 each
remote-url	[{ftp://   tftp://}login:pswd@remote-locn/][ <i>file-path</i> ] up to 247 characters directory length up to 99 characters each
<i>remote-locn</i>	[hostname   ipv4-address   [ipv6-address]]

<i>ipv4-address</i>	<i>a.b.c.d</i>
<i>ipv6-address</i>	<i>x:x:x:x:x:x:x[-interface]</i> <i>x:x:x:x:x:x:d.d.d.d[-interface]</i> <i>x</i> - [0 to FFFF]H <i>d</i> - [0 to 255]D interface - up to 32 characters, for link local addresses 255
<i>cflash-id</i>	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

**rf**

Forces a recursive delete.

**force**

Forces an immediate deletion of the specified directory. The **rd file-url force** command executes the command without displaying a user prompt message.

**Platforms**

All

## 22.42 rd-entry

### rd-entry

**Syntax**

**rd-entry** *rd*

**no rd-entry** *rd*

**Context**

[\[Tree\]](#) (config>router>policy-options>route-distinguisher-list rd-entry)

**Full Context**

configure router policy-options route-distinguisher-list rd-entry

**Description**

This command creates a route distinguisher (RD) entry in the RD list, containing an IPv4 address or ASN and the assigned number.

The **no** form of the command deletes the RD entry from the list.

## Parameters

*rd*

Specifies a route distinguisher matching an entry in one of the following formats:

- *a.b.c.d/m:\** – RD in IPv4 format with a wildcard character (such as 10.0.0.0/16:\*)
- *a.b.c.d/m:n* – RD in IPv4 format with a specific number (such as 10.0.0.2/32:535)
- *asn:\** – RD in ASN format with a wildcard character (such as 65000:\*)
- *asn:n* – RD in ASN format with a specific number (such as 65000:535)

See the "Route distinguishers" section of the *7450 ESS, 7750 SR, 7950 XRS, and VSR Layer 3 Services Guide: IES and VPRN* for information about Type values.

## Platforms

## 22.43 rdi-alarms

### rdi-alarms

#### Syntax

**rdi-alarms** [**suppress** | **circuit**]

#### Context

[\[Tree\]](#) (config>port>aps rdi-alarms)

#### Full Context

configure port aps rdi-alarms

#### Description

This command configures how RDI alarms (line, path, section) are generated on physical circuits of an APS ports. The command configuration changes are supported only for switching-mode set to uni\_1plus1. The configuration can be changed only when no working and protecting circuit has been added. Options:

- **circuit**—RDI alarms are H/W-generated independently on each working and protect circuit based on RX failure of that circuit regardless of APS line status.
- **suppress**—RDI H/W generation on working and protect circuits is suppressed. No alarms are generated on RX failure of that circuit.

#### Default

rdi-alarms circuit

#### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 22.44 rdns-lifetime

### rdns-lifetime

#### Syntax

**rdns-lifetime** *seconds*

**rdns-lifetime** *infinite*

**no rdns-lifetime**

#### Context

**[Tree]** (config>service>ies>sub-if>ipv6>rtr-adv rdns-lifetime)

**[Tree]** (config>subscr-mgmt>rtr-adv-plcy>dns-opt rdns-lifetime)

**[Tree]** (config>service>ies>sub-if>grp-if>ipv6 rdns-lifetime)

**[Tree]** (config>service>vprn>sub-if>ipv6>rtr-adv rdns-lifetime)

**[Tree]** (config>service>vprn>sub-if>grp-if>ipv6 rdns-lifetime)

#### Full Context

configure service ies subscriber-interface ipv6 rtr-adv rdns-lifetime

configure subscriber-mgmt router-advertisement-policy dns-options rdns-lifetime

configure service ies subscriber-interface group-interface ipv6 rdns-lifetime

configure service vprn subscriber-interface ipv6 rtr-adv rdns-lifetime

configure service vprn subscriber-interface group-interface ipv6 rdns-lifetime

#### Description

This command configures the maximum time that the RDNS address may be used for name resolution.

The **no** form of this command returns the command to the default setting.

#### Default

rdns-lifetime 3600

#### Parameters

##### *seconds*

Specifies the time, in seconds, that the RDNS address is valid for this route.

**Values** 900 to 3600

##### *infinite*

Specifies that the RDNS address can be used permanently.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## rdnss-lifetime

### Syntax

**rdnss-lifetime** *seconds*

**rdnss-lifetime infinite**

**no rdnss-lifetime**

### Context

**[Tree]** (config>service>ies>sub-if>grp-if>ipv6>rtr-adv>dns-opt rdnss-lifetime)

**[Tree]** (config>service>vprn>sub-if>ipv6>rtr-adv>dns-opt rdnss-lifetime)

**[Tree]** (config>service>vprn>sub-if>grp-if>ipv6>rtr-adv>dns-opt rdnss-lifetime)

**[Tree]** (config>service>ies>sub-if>ipv6>rtr-adv>dns-opt rdnss-lifetime)

### Full Context

configure service ies subscriber-interface group-interface ipv6 router-advertisements dns-options rdnss-lifetime

configure service vprn subscriber-interface ipv6 router-advertisements dns-options rdnss-lifetime

configure service vprn subscriber-interface group-interface ipv6 router-advertisements dns-options rdnss-lifetime

configure service ies subscriber-interface ipv6 router-advertisements dns-options rdnss-lifetime

### Description

This command configures the maximum time that the RDNSS address may be used for name resolution.

The **no** form of this command reverts to the default.

### Default

rdnss-lifetime 3600

### Parameters

#### *seconds*

Specifies the time, in seconds, that the RDNSS address is valid for this route.

**Values** 900 to 3600

#### *infinite*

The RDNSS address can be used permanently.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## rdnss-lifetime

### Syntax

```
rdnss-lifetime {seconds | infinite}
no rdnss-lifetime
```

### Context

```
[Tree] (config>service>vprn>router-advert>dns-options rdnss-lifetime)
[Tree] (config>service>vprn>router-advert>if>dns-options rdnss-lifetime)
```

### Full Context

```
configure service vprn router-advertisement dns-options rdnss-lifetime
configure service vprn router-advertisement interface dns-options rdnss-lifetime
```

### Description

This command specifies the maximum time that the RDNSS address may be used for name resolution by the client. The RDNSS Lifetime must be no more than twice MaxRtrAdvLifetime with a maximum of 3600 seconds.

### Default

```
rdnss-lifetime infinite
```

### Parameters

#### *infinite*

Specifies an infinite RDNSS lifetime.

#### *seconds*

Specifies the time in seconds.

**Values** 4to 3600

### Platforms

All

## rdnss-lifetime

### Syntax

```
rdnss-lifetime seconds
rdnss-lifetime infinite
no rdnss-lifetime
```

## Context

[\[Tree\]](#) (config>router>router-advert>dns-opt rdns-lifetime)

[\[Tree\]](#) (config>router>router-advert>if>dns-opt rdns-lifetime)

## Full Context

configure router router-advertisement dns-options rdns-lifetime

configure router router-advertisement interface dns-options rdns-lifetime

## Description

This command specifies the maximum time that the RDNSS address may be used for name resolution by the client.

## Default

rdns-lifetime infinite

## Parameters

### *seconds*

Specifies the time in seconds.

**Values** 4 to 3600

### *infinite*

Specifies an infinite RDNSS lifetime.

## Platforms

All

## 22.45 re-auth-period

re-auth-period

## Syntax

**re-auth-period** *seconds*

**no re-auth-period**

## Context

[\[Tree\]](#) (config>port>ethernet>dot1x re-auth-period)

## Full Context

configure port ethernet dot1x re-auth-period

## Description

This command configures the period after which re-authentication is performed. This value is only relevant if **re-authentication** is enabled.

The **no** form of this command returns the value to the default.

## Default

re-auth-period 3600

## Parameters

### *seconds*

Specifies the re-authentication delay period in seconds.

**Values** 1 to 9000

## Platforms

All

## 22.46 re-authentication

### re-authentication

## Syntax

[no] re-authentication

## Context

[\[Tree\]](#) (config>subscr-mgmt>auth-policy re-authentication)

## Full Context

configure subscriber-mgmt authentication-policy re-authentication

## Description

This command enables authentication process at every DHCP address lease renewal s only if RADIUS did not reply any special attributes (for example, authentication only, no authorization).

The **no** form of this command reverts to the default value.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## re-authentication

### Syntax

[no] re-authentication

### Context

[\[Tree\]](#) (config>port>ethernet>dot1x re-authentication)

### Full Context

configure port ethernet dot1x re-authentication

### Description

This command enables/disables periodic 802.1x re-authentication.

When **re-authentication** is enabled, the router re-authenticates clients on the port every **re-auth-period**.

The **no** form of this command returns the value to the default.

### Default

no re-authentication

### Platforms

All

## 22.47 re-establish-session

## re-establish-session

### Syntax

re-establish-session padr

no re-establish-session

### Context

[\[Tree\]](#) (config>subscr-mgmt>ppp-policy re-establish-session)

### Full Context

configure subscriber-mgmt ppp-policy re-establish-session

### Description

This command enables host to reconnect and override existing session.

If disabled and a subscriber abruptly terminates a PPP sessions without sending a PADT to the BNG, the BNG denies any reconnect attempts until the stale PPP session has expired. With this, enabled re-establish-session eliminates the waiting period by allowing immediate PPP reconnection attempts.

The **no** form of this command reverts to the default.

### Parameters

#### **padr**

Specifies that the existing session will be deleted upon reception of the PPPoE Active Discovery Request (PADR).

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.48 reachable-time

### reachable-time

#### Syntax

**reachable-time** *milli-seconds*

**no reachable-time**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>rtr-adv-plcy reachable-time)

#### Full Context

configure subscriber-mgmt router-advertisement-policy reachable-time

#### Description

This command configures the reachable time for advertisements.

The **no** form of this command returns the command to the default setting.

#### Default

reachable-time 0

#### Parameters

##### *milli-seconds*

Specifies the time, in milliseconds, for the reachable time.

**Values** 0 to 3600000

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## reachable-time

### Syntax

**reachable-time** *milli-seconds*

**no reachable-time**

### Context

**[Tree]** (config>service>vprn>router-advert>if reachable-time)

**[Tree]** (config>router>router-advert>if reachable-time)

**[Tree]** (config>service>ies>sub-if>grp-if>ipv6>rtr-adv reachable-time)

### Full Context

configure service vprn router-advertisement interface reachable-time

configure service vprn subscriber-interface ipv6 router-advertisements reachable-time

configure service ies subscriber-interface ipv6 router-advertisements reachable-time

configure service vprn subscriber-interface group-interface ipv6 router-advertisements reachable-time

configure router router-advertisement interface reachable-time

configure service ies subscriber-interface group-interface ipv6 router-advertisements reachable-time

### Description

This command configures how long this router should be considered reachable by other nodes on the link after receiving a reachability confirmation.

The configured value is placed in the reachable time field in router advertisement messages sent from this interface.

The **no** form of this command reverts to the default.

### Default

reachable-time 0

### Parameters

***milli-seconds***

Specifies the reachable time, in seconds, for advertisements from this interface.

**Values** 0 to 3600000

## Platforms

All

- configure service vprn router-advertisement interface reachable-time
- configure router router-advertisement interface reachable-time

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface ipv6 router-advertisements reachable-time
- configure service vprn subscriber-interface ipv6 router-advertisements reachable-time
- configure service ies subscriber-interface ipv6 router-advertisements reachable-time

## Description

This command configures the neighbor reachability detection timer.

The **no** form of this command reverts to the default value.

## Default

no reachable-time

## Parameters

*seconds*

Specifies the length of time the router should be considered reachable.

**Values** 30 to 3600

## Platforms

All

## 22.49 reactivation-failure-threshold

## reactivation-failure-threshold

### Syntax

**reactivation-failure-threshold** *number*

**no reactivation-failure-threshold**

### Context

**[Tree]** (config>test-oam>icmp>ping-template reactivation-failure-threshold)

### Full Context

configure test-oam icmp ping-template reactivation-failure-threshold

### Description

This command configures the number of consecutive failures, without previous successes, that must occur transmitting at the reactivation-interval (recovering phase) level before changing to the standard interval and subsequently waiting for the first success.

The **no** form of this command reverts to the default value.

### Default

reactivation-failure-threshold 4

### Parameters

*number*

Specifies the number of consecutive failures without previous successes.

**Values** 1 to 10

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.50 reactivation-interval

## reactivation-interval

### Syntax

**reactivation-interval** *seconds*

**no reactivation-interval**

### Context

**[Tree]** (config>test-oam>icmp>ping-template reactivation-interval)

## Full Context

```
configure test-oam icmp ping-template reactivation-interval
```

## Description

This command configures the packet transmit interval used when the IP interface is operationally down because of a ping template failure and the previous ICMP echo request successfully received a response, recovering phase.

The **no** form of this command reverts to the default value.

## Default

```
reactivation-interval 1
```

## Parameters

### *seconds*

Specifies the packet transmit interval used when IP interface is operational down

**Values** 1 to 60

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.51 reactivation-threshold

### reactivation-threshold

## Syntax

```
reactivation-threshold number
```

```
no reactivation-threshold
```

## Context

[\[Tree\]](#) (config>test-oam>icmp>ping-template reactivation-threshold)

## Full Context

```
configure test-oam icmp ping-template reactivation-threshold
```

## Description

This command configures the count, when reached, that causes the transition of the IP interface from operationally down to operationally up because of a ping template failure. This is used in the recovering phase.

The **no** form of this command reverts to the default value.

## Default

reactivation-threshold 3

## Parameters

### *number*

Specifies a count that causes the transition of the IP interface from operationally up to operationally down because of ping-template failure.

**Values** 1 to 10

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.52 reactivation-timeout

reactivation-timeout

## Syntax

**reactivation-timeout** *seconds*

**no reactivation-timeout**

## Context

[\[Tree\]](#) (config>test-oam>icmp>ping-template reactivation-timeout)

## Full Context

configure test-oam icmp ping-template reactivation-timeout

## Description

This command configures the time that the function waits before declaring the packet as lost. This is the timer used to time out the **reactivation-interval** transmitted packets. The **reactivation-timeout** value can be equal to or lower than the **reactivation-interval** value but not higher.

The **no** form of this command reverts to the default value.

## Default

reactivation-timeout 1

## Parameters

### *seconds*

Specifies the wait time, in seconds, before declaring the packet is lost.

**Values** 1 to 60

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.53 read-algorithm

### read-algorithm

#### Syntax

**read-algorithm** {**hash** | **hash2** | **custom**| **all-hash**}

**no read-algorithm**

#### Context

[\[Tree\]](#) (config>system>security>management-interface>classic-cli read-algorithm)

#### Full Context

configure system security management-interface classic-cli read-algorithm

#### Description

This command specifies how encrypted configuration secrets are interpreted, and which encryption types are accepted, when secrets are input into the system or read from a configuration file (for example at system bootup time).

The **no** form of this command reverts to the default value.

#### Default

read-algorithm all-hash

#### Parameters

##### hash

Specifies hash. Use this option to transport a phrase between modules and nodes. In this case the write-algorithm should be **hash** as well.

##### hash2

Specifies hash2 which is module-specific.

##### custom

Specifies the custom encryption to management interface.

##### all-hash

Specifies that the system accepts hash or hash2.

#### Platforms

All

## 22.54 reassemble

### reassemble

#### Syntax

**reassemble**

#### Context

[\[Tree\]](#) (config>filter>ip-filter>entry>action reassemble)

#### Full Context

configure filter ip-filter entry action reassemble

#### Description

This command sets the filter entry action to reassemble.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.55 reassembly

### reassembly

#### Syntax

**reassembly** [*wait-msecs*]

**no reassembly**

#### Context

[\[Tree\]](#) (config>service>ies>if>sap>ip-tunnel reassembly)

[\[Tree\]](#) (config>service>vprn>if>sap>ip-tunnel reassembly)

#### Full Context

configure service ies interface sap ip-tunnel reassembly

configure service vprn interface sap ip-tunnel reassembly

#### Description

This command configures the maximum number of seconds to wait to receive all fragments of a particular IPsec or GRE packet for reassembly.

The **no** form of this commands removes the wait time from the configuration.

### Default

no reassembly

### Parameters

#### ***wait-msecs***

Specifies the reassembly wait time in 100 increments.

**Values** 1 to 5000 ms

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## reassembly

### Syntax

**reassembly** [*wait-msecs*]

**no reassembly**

### Context

[\[Tree\]](#) (config>service>ies>if>sap>gre-tunnel reassembly)

[\[Tree\]](#) (config>isa>tunnel-group reassembly)

[\[Tree\]](#) (config>service>vprn>if>sap>gre-tunnel reassembly)

### Full Context

configure service ies interface sap gre-tunnel reassembly

configure isa tunnel-group reassembly

configure service vprn interface sap gre-tunnel reassembly

### Description

This command configures IP packet reassembly for IPsec and GRE tunnels supported by an MS-ISA. The **reassembly** command at the tunnel-group level configures IP packet reassembly for all IPsec and GRE tunnels associated with the tunnel-group. The **reassembly** command at the GRE tunnel level configures IP packet reassembly for that one specific GRE tunnel, overriding the tunnel-group configuration.

The **no** form of this command disables IP packet reassembly.

### Default

no reassembly (tunnel-group level)

reassembly (gre-tunnel level)

## Parameters

### *wait*

Specifies the maximum number of milliseconds that the ISA tunnel application will wait to receive all fragments of a particular IPsec or GRE packet. If one or more fragments are still missing when this limit is reached the partially reassembled datagram is discarded and an ICMP time exceeded message is sent to the source host (if allowed by the ICMP configuration of the sending interface). Internally, the configured value is rounded up to the nearest multiple of 100 ms.

**Values** 1 to 5000

**Default** 2000 (tunnel-group level)

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## reassemble

### Syntax

[no] reassemble

### Context

[\[Tree\]](#) (config>router>nat>inside>dual-stack-lit>address reassemble)

### Full Context

configure router nat inside dual-stack-lit address reassemble

### Description

This command enables reassembly of fragmented frames for DS-Lite. Reassembly is enabled in the upstream direction per AFTR address.

The **no** form of the command disables the reassembly.

## 22.56 reassembly-group

## reassemble-group

### Syntax

**reassemble-group** *nat-group-id* [**to-base-network**]

**no reassemble-group**

## Context

[\[Tree\]](#) (config>service>vprn reassembly-group)

[\[Tree\]](#) (config>router reassembly-group)

## Full Context

configure service vprn reassembly-group

configure router reassembly-group

## Description

This command associates a reassembly-group consisting of multiple ISAs with the routing context in which the application requiring reassembly service resides.

## Default

no reassembly-group

## Parameters

### *nat-group-id*

Specifies the NAT group ID; the NAT group contains up to 10 active ISAs.

**Values** 1 to 4

### *to-base-network*

Enables the reassembly context to use network interfaces in the base routing context.

## Platforms

All

## 22.57 reassembly-timeout

reassembly-timeout

## Syntax

**reassembly-timeout** {*timeout*}

**no reassembly-timeout**

## Context

[\[Tree\]](#) (config>service>vprn>l2tp>group>tunnel>mlppp reassembly-timeout)

[\[Tree\]](#) (config>service>vprn>l2tp>group>mlppp reassembly-timeout)

[\[Tree\]](#) (config>router>l2tp>group>tunnel>mlppp reassembly-timeout)

[\[Tree\]](#) (config>router>l2tp>group>mlppp reassembly-timeout)

## Full Context

```
configure service vprn l2tp group tunnel mlppp reassembly-timeout
configure service vprn l2tp group mlppp reassembly-timeout
configure router l2tp group tunnel mlppp reassembly-timeout
configure router l2tp group mlppp reassembly-timeout
```

## Description

This command is applicable only to LNS. It determines the time during which the LNS keeps fragments of the same packet in the buffer before it discards them. The assumption is that if the fragments do not arrive within certain time, the chance is that they were lost somewhere in the network. In this case the partial packet cannot be reassembled and all fragments that has arrived up to this point and are stored in the buffer IS discarded to free up the buffer. Otherwise, a condition arises in which partial packets are held in the buffer until the buffer is exhausted.

The configuration under the tunnel hierarchy overrides the configuration under the group hierarchy.

The **no** form of this command reverts to the default.

## Default

```
reassembly-timeout 1000
```

## Parameters

### *timeout*

Specifies the reassembly timeout value.

**Values** 100, 1000 milliseconds

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

## 22.58 rebind-timer

### rebind-timer

## Syntax

```
rebind-timer [days days] [hrs hours] [min minutes] [sec seconds]
no rebind-timer
```

## Context

**[Tree]** (config>service>vprn>sub-if>grp-if>ipv6>dhcp6>proxy rebind-timer)

**[Tree]** (config>router>dhcp6>server>pool>prefix rebind-timer)

**[Tree]** (config>router>dhcp6>server>defaults rebind-timer)

 configure service ies subscriber-interface group-interface ipv6 dhcp6 proxy-server rebind-timer  
 configure subscriber-mgmt local-user-db ppp host ipv6-lease-times rebind-timer  
 configure service vprn dhcp6 defaults rebind-timer

## Description

This command configures the lease rebind timer (T2) via LUDB.

The T2 time is the time at which the client contacts any available addressing authority to extend the lifetimes of DHCPv6 leases. T2 is a time duration relative to the current time expressed in units of seconds.

The IP addressing authority controls the time at which the client contacts the addressing authority to extend the lifetimes on assigned addresses/prefixes through the T1 and T2 parameters assigned to an IA. At time T1 for an IA, the client initiates a Renew/Reply message exchange to extend the lifetimes on any addresses in the IA. The client includes an IA option with all addresses/prefixes currently assigned to the IA in its Renew message. Recommended values for T1 and T2 are .5 and .8 times the shortest preferred lifetime of the addresses/prefixes in the IA that the addressing authority is willing to extend, respectively.

The configured rebind timer should always be longer than or equal to the renew timer.

The T1 and T2 are carried in the IPv6 address option that is within the IA.

The **no** form of this command reverts to the default.

## Default

rebind-timer min 48

## Parameters

### *rebind-timer*

Specifies the preferred lifetime.

Values		
<b>days</b> <i>days</i>		0 to 14
<b>hrs</b> <i>hours</i>		0 to 23
<b>min</b> <i>minutes</i>		0 to 59

**sec seconds**      0 to 9

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure router dhcp6 local-dhcp-server defaults rebind-timer

## 22.59 reboot

reboot

### Syntax

**reboot** [**active** | **standby** | **upgrade**] [**now**]

### Context

[\[Tree\]](#) (admin reboot)

### Full Context

admin reboot

### Description

This command reboots the router or one CPM and can also be used to force an upgrade of the system boot ROMs.

If no options are specified, the user is prompted to confirm the reboot operation. Answering yes (y) will result in both CPMs and all IOMs rebooting.

```
ALA-1>admin# reboot
Are you sure you want to reboot (y/n)?
```

### Parameters

**active**

Reboots the active CPM.

**Default** active

### standby

Reboots the standby CPM.

**Default** active

### upgrade

Forces card firmware to be upgraded during chassis reboot. This option should only be used if it has been indicated as required in the Release Notes or by Nokia technical support. Normally, the SR-series router OS automatically performs firmware upgrades on CPMs and XCM/IOM cards without the need for the **upgrade** keyword.

When the **upgrade** keyword is specified, a chassis flag is set for the BOOT Loader (boot.ldr) and on the subsequent boot of the OS on the chassis, firmware images on CPMs, XCMs, and IOMs will be upgraded automatically.

Firmware on CPMs, XCMs, or IOMs that are installed in a running chassis will be upgraded automatically. For example, if a card is inserted as the result of a hot swap, and the card has a firmware version that is no longer compatible with the SR OS image running on the chassis, then the firmware on the card will be automatically upgraded before the card is brought online.

If the card firmware is upgraded, a chassis cardUpgraded (event 2032) log event is generated. The corresponding SNMP trap for this log event is tmnxEqCardFirmwareUpgraded.

During any firmware upgrade, automatic or manual, it is imperative that during the upgrade procedure:

- Power must not be switched off or interrupted.
- The system must not be reset.
- No cards are inserted or removed.

Any of the above conditions may render cards inoperable requiring a return of the card for resolution.

The time required to upgrade the firmware on the cards in the chassis depends on the number of cards to be upgraded. The progress of a firmware upgrade can be monitored at the console.

### now

Forces a reboot of the router immediately without an interactive confirmation.

## Platforms

All

## reboot

## Syntax

**reboot** [**now**] **upgrade**

## Context

[\[Tree\]](#) (admin>satellite>eth-sat reboot)

## Full Context

admin satellite eth-sat reboot

## Description

The command initiates an administrative reboot of the specified Ethernet-satellite chassis.

## Parameters

### now

Causes the satellite to reboot immediately without further prompts or interactive confirmation.

### upgrade

Causes the satellite to update its firmware image during chassis reboot.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.60 receive

### receive

## Syntax

[no] receive

## Context

[\[Tree\]](#) (config>port>ethernet>eth-cfm>mep>eth-bn receive)

## Full Context

configure port ethernet eth-cfm mep eth-bn receive

## Description

This command enables the reception and processing of **eth-bn** messages and the retrieval and processing of the current bandwidth field for inclusion in dynamic egress rate adjustments.

The received rate is an Layer 2 rate, and is expected to be in Mb/s. If this rate is a link rate (including preamble, start frame delimiter, and inter-frame gap), this would require the use of network egress queue groups (configured in the **configure qos queue-group-templates egress queue-group "qg1" queue 1 packet-byte-offset add 20**). The **packet-byte-offset** is not supported for default network queues.

## Default

no receive

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## receive

## Syntax

**[Tree]** (config>service>vprn>ripng receive)

**[Tree]** (config>service>vprn>rip>group>neighbor receive)

## Full Context

configure service vprn rip receive

configure service vprn ripng group neighbor receive

configure service vprn rip group receive

configure service vprn ripng group receive

configure service vprn ripng receive

configure service vprn rip group neighbor receive

## Description

This command configures the type(s) of RIP updates that will be accepted and processed.

If **both** or **version-2** is specified, the RIP instance listens for and accepts packets sent to the broadcast and multicast (224.0.0.9) addresses.

If **version-1** is specified, the router only listens for and accepts packets sent to the broadcast address.

This control can be issued at the global, group or interface level. The default behavior accepts and processes both RIPv1 and RIPv2 messages.

The **no** form of this command resets the type of messages accepted to both.

## Default

no receive

## Parameters

### ***both***

Accept RIP updates in either Version 1 or Version 2 format.

### ***none***

Do not accept and RIP updates.

### ***version-1***

Router should only accept RIP updates in Version 1 format.

### ***version-2***

Router should only accept RIP updates in Version 2 format.

## Platforms

configure router ripng group neighbor receive

configure router rip group receive

configure router ripng receive

configure router rip receive

## Description

This command configures the types of RIP updates that will be accepted and processed.

If **both** or **version-2** is specified, the RIP instance listens for and accepts packets sent to the broadcast and multicast (224.0.0.9) addresses.

If **version-1** is specified, the router only listens for and accept packets sent to the broadcast address.

This control can be issued at the global, group or interface level. The default behavior is to accept and process both RIPv1 and RIPv2 messages.

The **no** form of the command reverts to the default value.

## Default

receive both – in the config>router>rip context

receive version-1 – in the config>router>ripng context

## Parameters

### both

Specifies that RIP updates in either version 1 or version 2 format will be accepted.

### none

Specifies that RIP updates will not be accepted.

### version-1

Specifies that RIP updates in version 1 format only will be accepted.

### version-2

Specifies that RIP updates in version 2 format only will be accepted.

## Platforms

## Full Context

configure lag bfd family receive-interval

## Description

This command specifies the receive timer used for micro-BFD session over the associated LAG links. The **no** form of this command removes the receive timer from the configuration.

## Default

receive-interval 100

## Parameters

### *receive-interval*

Specifies the interval value, in milliseconds.

**Values** 10 to 100000

**Default** 100 for CPM3 or later, 1000 for all others

## Platforms

All

## receive-interval

## Syntax

**receive-interval** *receive-interval*

**no receive-interval**

## Context

[\[Tree\]](#) (config>router>bfd>bfd-template receive-interval)

## Full Context

configure router bfd bfd-template receive-interval

## Description

This command specifies the receive timer used for BFD packets. If the template is used for a BFD session on an MPLS-TP LSP, then this timer is used for CC packets.

The **no** form of this command reverts to the default value.

## Default

receive-interval 100

## Parameters

### *receive-interval*

Specifies the receive interval. The minimum interval that can be configured is hardware dependent.

<b>Values</b>	10 ms to 100,000 ms in 1 ms intervals
<b>Default</b>	10 ms for CPM3 or higher; 1 second for other hardware

### Platforms

configure service vprn msdp group receive-msdp-msg-rate

configure service vprn msdp group peer receive-msdp-msg-rate

configure service vprn msdp peer receive-msdp-msg-rate

### Description

This command limits the number of Multicast Source Discovery Protocol (MSDP) messages that are read from the TCP session. It is possible that an MSDP/ RP router may receive a large number of MSDP protocol message packets in a particular source active message.

After the number of MSDP packets (including source active messages) defined in the threshold have been processed, the rate of all other MSDP packets is rate limited by no longer accepting messages from the TCP session until the time (seconds) has elapsed.

The **no** form of this command reverts this active-source limit to default operation.

### Default

no receive-msdp-msg-rate

### Parameters

#### *number*

Defines the number of MSDP messages (including source active messages) that are read from the TCP session per the number of seconds.

**Values** 10 to 10000

**Default** 0

#### *interval seconds*

Defines the time that, together with the *number* parameter, defines the number of MSDP messages (including source active messages) that are read from the TCP session within the configured number of seconds.

**Values** 1 to 600

**Default** 0

#### ***threshold number***

The number of MSDP messages can be processed before the MSDP message rate limiting function described above is activated; this is particularly of use during at system startup and initialization.

**Values** 1 to 1000000

**Default** 0

### **Platforms**

All

configure router msdp peer receive-msdp-msg-rate

configure router msdp group receive-msdp-msg-rate

configure router msdp receive-msdp-msg-rate

### **Description**

This command limits the number of Multicast Source Discovery Protocol (MSDP) messages that are read from the TCP session. It is possible that an MSDP/ RP router may receive a large number of MSDP protocol message packets in a particular source active message.

After the number of MSDP packets (including source active messages) defined in the threshold have been processed, the rate of all other MSDP packets is rate limited by no longer accepting messages from the TCP session until the time (seconds) has elapsed.

The **no** form of this command sets no limit on the number of MSDP and source active limit messages that will be accepted.

## Default

no receive-msdp-msg-rate

## Parameters

### *number*

Specifies the number of MSDP messages (including source active messages) that are read from the TCP session per the number of seconds.

**Values** 10 to 10000

**Default** 0

### *seconds*

Specifies the time that, together with the *number* parameter, defines the number of MSDP messages (including source active messages) that are read from the TCP session within the configured number of seconds.

**Values** 1 to 600

**Default** 0

### *number*

Specifies the number of MSDP messages can be processed before the MSDP message rate limiting function described above is activated; this is particularly of use during at system startup and initialization.

**Values** 1 to 1000000

**Default** 0

receiver

### Syntax

**receiver** *receiver-name* [**create**]

**no receiver**

### Context

[\[Tree\]](#) (config>sflow receiver)

## Full Context

```
configure sflow receiver
```

## Description

This command creates an sFlow receiver context or enters existing sFlow receiver context for the sFlow agent.

The **no** form of this command deletes an existing sFlow receiver context.

## Parameters

### *receiver-names*

String of up to 127 characters.

## Platforms

7750 SR, 7750 SR-s, 7950 XRS

## 22.65 reclassify-using-qos

### reclassify-using-qos

## Syntax

```
reclassify-using-qos policy-id
```

```
no reclassify-using-qos
```

## Context

[\[Tree\]](#) (config>service>ies>if>vpls>egress reclassify-using-qos)

## Full Context

```
configure service ies interface vpls egress reclassify-using-qos
```

## Description

The reclassify-using-qos command is used to specify a sap-egress QoS policy that will be used to reclassify the forwarding class and profile of egress routed packets on the VPLS or I-VPLS service. When routed packets associated with the IP interface egress a VPLS SAP, the reclassification rules within the sap-egress QoS policy applied to the SAP are always ignored (even when reclassify-using-qos is not defined).

Any queues or policers defined within the specified QoS policy are ignored and are not created on the VPLS egress SAPs. Instead, the routed packets continue to use the forwarding class mappings, queues and policers from the sap-egress QoS policy applied to the egress VPLS SAP.

While the specified sap-egress policy ID is applied to an IP interface it cannot be deleted from the system.

The **no** form of this command removes the sap-egress QoS policy used for reclassification from the egress IP interface. When removed, IP routed packets will not be reclassified on the egress SAPs of the VPLS service attached to the IP interface.

## Parameters

### *policy-id*

Specifies the SAP egress QoS policy ID. This parameter is required when executing the reclassify-using-qos command. The specified SAP egress QoS ID must exist within the system or the command fails.

## Platforms

All

## reclassify-using-qos

## Syntax

**reclassify-using-qos** *policy-id*

**no reclassify-using-qos**

## Context

[\[Tree\]](#) (config>service>vprn>if>vpls>egress reclassify-using-qos)

## Full Context

configure service vprn interface vpls egress reclassify-using-qos

## Description

This command specifies a SAP egress QoS policy that is used to reclassify the forwarding class and profile of egress routed packets on the VPLS service. When routed packets associated with the IP interface egress a VPLS SAP, the reclassification rules within the sap-egress QoS policy applied to the SAP are always ignored (even when reclassify-using-qos is not defined).

Any queues or policers defined within the specified QoS policy are ignored and are not created on the VPLS egress SAPs. Instead, the routed packets continue to use the forwarding class mappings, queues and policers from the SAP egress QoS policy applied to the egress VPLS SAP.

While the specified SAP egress policy ID is applied to an IP interface it cannot be deleted from the system.

The **no** form of this command removes the SAP egress QoS policy used for reclassification from the egress IP interface. When removed, IP routed packets is not reclassified on the egress SAPs of the VPLS service attached to the IP interface.

## Parameters

### *policy-id*

Specifies the SAP egress QoS policy ID This parameter is required when executing the **reclassify-using-qos** command. The specified SAP egress QoS ID must exist within the system or the command fails.

## Platforms

All

## 22.66 reconnect-timeout

### reconnect-timeout

#### Syntax

**reconnect-timeout** *reconnect-timeout*

**reconnect-timeout infinite**

**no reconnect-timeout**

#### Context

**[Tree]** (config>service>vprn>l2tp>group reconnect-timeout)

**[Tree]** (config>router>l2tp>eth-tunnel reconnect-timeout)

**[Tree]** (config>service>vprn>l2tp reconnect-timeout)

**[Tree]** (config>router>l2tp>group>eth-tunnel reconnect-timeout)

#### Full Context

configure service vprn l2tp group reconnect-timeout

configure router l2tp eth-tunnel reconnect-timeout

configure service vprn l2tp reconnect-timeout

configure router l2tp group eth-tunnel reconnect-timeout

#### Description

This command configures the number of seconds that the Ethernet tunnel client of L2TPv3 waits before attempting to re-establish a new session after a session setup fails or a session closes.

The **no** form of this command returns **reconnect-timeout** to an infinite timeout value, meaning that reconnection is not attempted by the local client.

#### Default

no reconnect-timeout (infinite timeout)

#### Parameters

##### ***reconnect-timeout***

Specifies the number of seconds before a session reconnection is attempted after a previous session or session setup fails.

**Values** 10 to 3600

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## reconnect-timeout

### Syntax

**reconnect-timeout** *reconnect-timeout*

**no reconnect-timeout**

### Context

[\[Tree\]](#) (config>service>vprn>l2tp>eth-tunnel reconnect-timeout)

### Full Context

configure service vprn l2tp eth-tunnel reconnect-timeout

### Description

This command configures the number of seconds that the Ethernet tunnel client of L2TPv3 waits before attempting to re-establish a new session after a session setup fails or a session closes.

The **no** form of this command returns **reconnect-timeout** to an infinite timeout value, meaning that reconnection is not attempted by the local client.

### Default

no reconnect-timeout (infinite timeout)

### Parameters

***reconnect-timeout***

Specifies the timeout value for the next session setup retry.

**Values** 10 to 3600

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## reconnect-timeout

### Syntax

**reconnect-timeout** *reconnect-timeout*

**reconnect-timeout infinite**

**no reconnect-timeout**

## Context

**[Tree]** (config>service>vprn>l2tp>group>eth-tunnel reconnect-timeout)

## Full Context

configure service vprn l2tp group eth-tunnel reconnect-timeout

## Description

This command configures the number of seconds that the Ethernet tunnel client of L2TPv3 waits before attempting to re-establish a new session after a session setup fails or a session closes.

The **no** form of this command returns **reconnect-timeout** to an infinite timeout value, meaning that reconnection is not attempted by the local client.

## Default

no reconnect-timeout (infinite timeout)

## Parameters

### *reconnect-timeout*

Specifies the timeout value for the next session setup retry.

**Values** 10 to 3600

### *infinite*

Specifies the timeout value for the next session setup retry.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.67 record

record

## Syntax

[no] record

## Context

**[Tree]** (config>router>mpls>lsp>primary record)

**[Tree]** (config>router>mpls>lsp-template record)

**[Tree]** (config>router>mpls>lsp>secondary record)

**[Tree]** (config>router>mpls>lsp>primary-p2mp-instance record)

## Full Context

configure router mpls lsp primary record

```
configure router mpls lsp-template record
configure router mpls lsp secondary record
configure router mpls lsp primary-p2mp-instance record
```

## Description

This command enables recording of all the hops that an LSP path traverses. Enabling **record** increases the size of the PATH and RESV refresh messages for the LSP since this information is carried end-to-end along the path of the LSP. The increase in control traffic per LSP may impact scalability.

The `config>router>mpls>lsp>primary-p2mp-instance>record` command is not supported on the 7450 ESS.

The **no** form of this command disables the recording of all the hops for the given LSP. There are no restrictions as to when the **no** command can be used. The **no** form of this command also disables the **record-label** command.

## Default

record

## Platforms

All

```
record
```

## Syntax

```
record
```

## Context

[\[Tree\]](#) (debug>app-assure>group>traffic-capture record)

## Full Context

```
debug application-assurance group traffic-capture record
```

## Description

This command configures traffic recording options.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

```
record
```

## Syntax

```
record {all-hosts | http-host-app-filter-candidates}
```

## Context

[\[Tree\]](#) (debug>app-assure>group>http-host>filter record)

## Full Context

debug application-assurance group http-host-recorder filter record

## Description

This command configures which http-host are selected for the http-host-recorder. It is either any http-host values going through the AA ISA or the http-host corresponding to flows not matching a string based app-filter.

For the feature to work it is required to configure at least one app-filter to catch the HTTP protocol signature.

## Parameters

### all-hosts | http-host-app-filter-candidates

Specifies which hosts the recorder will record

**Values** all-hosts, http-host-app-filter-candidates

**Default** http-host-app-filter-candidates

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## record

## Syntax

[no] record *record-name*

## Context

[\[Tree\]](#) (config>log>accounting-policy record)

## Full Context

configure log accounting-policy record

## Description

This command adds the accounting record type to the accounting policy that is forwarded to the configured accounting file. A record name can only be used in one accounting policy. To obtain a list of all record types that can be configured, use the **show log accounting-records** command.

### Note:

aa, video, and subscriber records are not applicable to the 7950 XRS.

To configure an accounting policy for access ports, select a service record (for example, `service-ingress-octets`). To change the record name to another service record, enter the **record** command with the new record name and it replaces the old record name.

When configuring an accounting policy for network ports, select a network record. To change the record name to another network record, enter the **record** command with the new record name and it replaces the old record name.

If the change required modifies the record from network to service or from service to network, then the old record name must be removed using the **no** form of this command.

Only one record can be configured in a single accounting policy. For example, if an accounting-policy is configured with an **access-egress-octets** record, to change it to a **service-ingress-octets** record, use the **no record** command under the accounting-policy to remove the old record first, and then enter the **service-ingress-octets** record.

**Note:**

Collecting excessive statistics can adversely affect the CPU utilization and take up large amounts of storage space.

The **no** form of this command removes the record type from the policy.

**Default**

no record

**Parameters*****record-name***

Specifies the accounting record name.

**Platforms**

All

**record****Syntax**

**record** *record-name*

**no record**

**Context**

[\[Tree\]](#) (config>log>acct-policy record)

**Full Context**

configure log accounting-policy record

**Description**

This command enables the collection of rate statistics on egress of SR-MPLS and SRv6 policies.

The **no** form of this command removes the accounting record type to be forwarded to the configured accounting file

### Platforms

All

## 22.68 record-label

```
record-label
```

### Syntax

```
[no] record-label
```

### Context

**[Tree]** (config>router>mpls>lsp>primary record-label)

**[Tree]** (config>router>mpls>lsp>secondary record-label)

**[Tree]** (config>router>mpls>lsp-template record-label)

### Full Context

```
configure router mpls lsp primary record-label
```

```
configure router mpls lsp secondary record-label
```

```
configure router mpls lsp-template record-label
```

### Description

This command enables recording of all the labels at each node that an LSP path traverses. Enabling the **record-label** command will also enable the **record** command if it is not already enabled.

The **no** form of this command disables the recording of the hops that an LSP path traverses.

### Default

```
record-label
```

### Platforms

All

## 22.69 record-stats

## record-stats

### Syntax

**record-stats** {**delay** | **loss** | **delay-and-loss**}

**no record-stats**

### Context

**[Tree]** (config>oam-pm>session>ip>twamp-light record-stats)

### Full Context

configure oam-pm session ip twamp-light record-stats

### Description

This option provides the ability to determine which statistics are recorded. The TWAMP-Light PDU can report on both delay and loss using a single packet. The operator may choose which statistics they would like to report. Only delay recording is on by default. All other metrics are ignored. In order to change what is being recorded and reported, the TWAMP-Light session must be shutdown. This is required because the single packet approach means the base statistics are shared between the various datasets. Issuing a **no shutdown** command clears previous all non-volatile memory for the session and allocate new memory blocks. All the parameters under this context are mutually exclusive.

The **no** version of the command restores the default "delay" only.

### Default

record-stats delay

### Parameters

#### delay

Specifies report on delay using a single packet..

#### loss

Specifies to report on loss using a single packet..

#### delay-and-loss

Specifies to report on both delay and loss using a single packet.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**[Tree]** (debug>router>l2tp>group>event recovery-failed)

### Full Context

```
debug router l2tp event recovery-failed
debug router l2tp assignment-id event recovery-failed
debug router l2tp tunnel event recovery-failed
debug router l2tp peer event recovery-failed
debug router l2tp group event recovery-failed
```

### Description

This command configures L2TP LAC state recovery failed event debugging.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.72 recovery-max-session-lifetime

### recovery-max-session-lifetime

#### Syntax

```
recovery-max-session-lifetime minutes
no recovery-max-session-lifetime
```

#### Context

```
[Tree] (config>router>l2tp>failover recovery-max-session-lifetime)
[Tree] (config>service>vprn>l2tp>failover recovery-max-session-lifetime)
```

#### Full Context

```
configure router l2tp failover recovery-max-session-lifetime
configure service vprn l2tp failover recovery-max-session-lifetime
```

#### Description

This command configures the sub-set of sessions that this system attempts to synchronize in the Session State Synchronization phase as described in RFC 4951, *Fail Over Extensions for Layer 2 Tunneling Protocol (L2TP)*.

The **no** form of this command reverts to the default.

#### Default

```
recovery-max-session-lifetime 2
```

#### Parameters

*minutes*

Specifies the sub-set of sessions to recover.

**Values** 2 to 4294967295

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.73 recovery-method

### recovery-method

#### Syntax

**recovery-method** *method*

**no recovery-method**

#### Context

**[Tree]** (config>service>vprn>l2tp>failover recovery-method)

**[Tree]** (config>router>l2tp>group>tunnel>failover recovery-method)

**[Tree]** (config>service>vprn>l2tp>group>failover recovery-method)

**[Tree]** (config>router>l2tp>failover recovery-method)

**[Tree]** (config>service>vprn>l2tp>group>tunnel>failover recovery-method)

**[Tree]** (config>router>l2tp>group>failover recovery-method)

#### Full Context

configure service vprn l2tp failover recovery-method

configure router l2tp group tunnel failover recovery-method

configure service vprn l2tp group failover recovery-method

configure router l2tp failover recovery-method

configure service vprn l2tp group tunnel failover recovery-method

configure router l2tp group failover recovery-method

#### Description

This command sets the recovery method to be used for newly created tunnels.

The **no** form of this command reverts to the default.

#### Default

recovery-method mcs on config>router>l2tp>failover and config>service>vprn>l2tp>failover

recovery-method default on config>router>l2tp>group>failover

recovery-method default on config>router>l2tp>group>tunnel>failover

recovery-method default on config>service>vprn>l2tp>group>failover

recovery-method default on config>service>vprn>l2tp>group>tunnel>failover

## Parameters

### *method*

Describes how a pair of redundant LAC peers recover tunnel and session state (sequence numbers, for example) immediately after a failover.

#### **Note:**

While failover is enabled, the tunnels and sessions proper are always kept synchronized between the redundant pair, regardless of the recovery method for the sequence numbers when a failover really occurs.

**Values** **mcs** — Specifies that the stateful information is recovered from the failover peer directly, using Multi-Chassis Redundancy Synchronization (MCS).

**recovery-tunnel** — Specifies that the stateful information is recovered as described in RFC 4951, *Fail Over Extensions for Layer 2 Tunneling Protocol (L2TP)*. This method uses a recovery tunnel to the L2TP peer to pass the stateful information.

**default** — Specifies that the actual value must be derived from another object of the same type with a wider scope. Takes the value of the next higher level (not available in **config>router>l2tp>failover** and **config>service>vprn>l2tp>failover**).

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.74 recovery-time

### recovery-time

#### Syntax

**recovery-time** *seconds*

**no recovery-time**

#### Context

**[Tree]** (config>router>l2tp>group>tunnel>failover recovery-time)

**[Tree]** (config>service>vprn>l2tp>group>tunnel>failover recovery-time)

**[Tree]** (config>service>vprn>l2tp>failover recovery-time)

**[Tree]** (config>router>l2tp>failover recovery-time)

**[Tree]** (config>service>vprn>l2tp>group>failover recovery-time)

[\[Tree\]](#) (config>router>l2tp>group>failover recovery-time)

### Full Context

configure router l2tp group tunnel failover recovery-time  
 configure service vprn l2tp group tunnel failover recovery-time  
 configure service vprn l2tp failover recovery-time  
 configure router l2tp failover recovery-time  
 configure service vprn l2tp group failover recovery-time  
 configure router l2tp group failover recovery-time

### Description

This command sets the recovery time to be negotiated via RFC 4951. It represents the extra time this L2TP peer (LAC or LNS) needs to recover all its tunnels.

The **no** form of this command reverts to the default.

### Default

recovery-time 0 on config>router>l2tp>failover and config>service>vprn>l2tp>failover

### Parameters

#### *seconds*

Specifies the period, expressed in seconds, an endpoint asks its peer to wait before assuming the recovery process has failed.

**Values** 0 to 900

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.75 recovery-timer

recovery-timer

### Full Context

```
configure router pcep pcc redelegation-timer
```

### Description

This command configures the redelegation timer for PCE-initiated LSPs.

The **no** form of the command sets this value to the default.

### Default

```
redelegation-timer 90
```

### Parameters

#### *seconds*

Specifies the number of seconds before the redelegation timer expires.

**Values** 1 to 3600

### Platforms

All

## 22.80 redirect-https

### redirect-https

### Syntax

```
redirect-https
no redirect-https
```

### Context

[\[Tree\]](#) (config>app-assure>group>http-redirect redirect-https)

### Full Context

```
configure application-assurance group http-redirect redirect-https
```

### Description

This command configures the http-redirect policy to redirect HTTPS sessions to the configured redirect-url.

The **no** form of this command removes the redirect-https.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.81 redirect-policy

### redirect-policy

#### Syntax

**redirect-policy** *redirect-policy-name* [**create**]

**no redirect-policy** *redirect-policy-name*

#### Context

[\[Tree\]](#) (config>filter redirect-policy)

#### Full Context

configure filter redirect-policy

#### Description

This command, creates a configuration context for the specified redirect policy.

The **no** form of the command removes the redirect policy from the filter configuration only if the policy is not referenced in a filter and the filter is not in use (applied to a service or network interface).

#### Parameters

##### *redirect-policy-name*

Specifies the redirect policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes. There is no limit to the number of redirect policies that can be configured.

##### **create**

This keyword is required to create the configuration context. Once it is created, the context can be enabled with or without the **create** keyword.

#### Platforms

All

### redirect-policy

#### Syntax

**redirect-policy** *redirect-policy-name* **destination** *ip-address*

**no redirect-policy** *redirect-policy-name* [**destination** *ip-address*]

#### Context

[\[Tree\]](#) (config>filter>redirect-policy-binding redirect-policy)

## Full Context

configure filter redirect-policy-binding redirect-policy

## Description

This command adds the destination (specified by its IP address) of a redirect-policy (specified by its name) to the binding. An error is thrown if either the destination does not exist for the specified redirect-policy or if the redirect-policy does not exist.

The **no** form of the command removes from the binding from all the destinations of the specified redirect-policy, or only the specified destination.

## Parameters

### *redirect-policy-name*

Specifies the name of the redirect-policy (up to 32 characters) as the destination that is to be added to the binding.

### *ip-address*

The IP address of the destination. This can be an IPv4 or IPv6 address.

#### Values

ipv4-address:	a.b.c.d.
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

## Platforms

All

## 22.82 redirect-policy-binding

### redirect-policy-binding

#### Syntax

**redirect-policy-binding** *name* [create]

**no redirect-policy-binding** *name*

#### Context

[\[Tree\]](#) (config>filter redirect-policy-binding)

## Full Context

configure filter redirect-policy-binding

## Description

This command creates a redirect-policy binding (specified by its name) in case it does not exist and, enters the context associated with it. When a redirect-policy binding is created, no destination is associated to this binding by default and the binding operator is set to AND.

The **no** form of this command deletes the redirect-policy binding and all the associated configuration information.

## Parameters

### *name*

Specifies the name of the binding. Possible values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotations.

### **create**

This keyword is required to create the binding if it does not exist. This has no effect when used with an existing binding.

## Platforms

All

## 22.83 redirect-url

redirect-url

## Syntax

**redirect-url** *redirect-url*

**no redirect-hurl**

## Context

[\[Tree\]](#) (config>app-assure>group>http-redirect redirect-url)

## Full Context

configure application-assurance group http-redirect redirect-url

## Description

This command configures the http redirect URL which is the URL (page) that the user is redirected to when an HTTP redirect takes effect.

The operator can select the URL arguments to include in the redirect-url using either a specific template-id or by configuring the redirect-url using any of the supported macro substitution keywords. Only ESM and ESM-MAC sub types support \$MAC, \$SAP, \$CID, and \$RID macro substitution.

The **no** form of this command removes the `redirect-url` field from the configuration.

## Parameters

### *redirect-url*

Specifies the URL of the landing page

#### Values macro substitutions:

\$CATID	The category ID.
\$CATNAME	The category name of the URL.
\$URL	The Request-URI in the HTTP GET Request received.
\$SUB	A string that represents the subscriber ID.
\$IP	A string that represents the IP address of the subscriber host.
\$RTRID	A string that represents the router ID.
\$URLPRM	The HTTP URL parameter associated with the subscriber.
\$MAC	A string that represents the MAC address of the subscriber host.
\$SAP	A string that represents a SAP ID.
\$CID	A string that represents the circuit-id or interface-id of the subscriber host (hexadecimal format).
\$RID	A string that represents the remote-id of the subscriber host (hexadecimal format).

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.84 redirect-vprn

`redirect-vprn`

### Syntax

`redirect-vprn`

### Context

[\[Tree\]](#) (config>router>dns redirect-vprn)

### Full Context

configure router dns redirect-vprn

**Description**

This command configures the DNS resolution to be resolved via VPRN. If configured, all packet URL resolution is done through a DNS server that is reachable in a VPRN. This includes packets in the global routing table.

**Default**

redirect-vprn

**Platforms**

All

## 22.85 redirection

### redirection

**Syntax**

**redirection** *level*

**no redirection**

**Context**

[\[Tree\]](#) (config>system>file-trans-prof redirection)

**Full Context**

configure system file-transmission-profile redirection

**Description**

This command enables system to accept HTTP redirection response, along with the max level of redirection. The virtual router may send a new request to another server if the requested resources are not available (temporarily available to another server).

**Default**

no redirection

**Parameters**

*level*

Specifies the maximum level of redirection of the file transmission profile max level of HTTP redirection.

**Values** 1 to 8

**Platforms**

All

## 22.86 redirection-policy

### redirection-policy

#### Syntax

**redirection-policy** *policy-name*

**no redirection-policy**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>igmp-policy redirection-policy)

#### Full Context

configure subscriber-mgmt igmp-policy redirection-policy

#### Description

This command will apply multicast redirection action to the subscriber. The redirection action along with the redirected interface (and possibly service id) is defined in the referenced policy-name. IGMP messages is redirected to an alternate interface if that alternate interface has IGMP enabled. The alternate interface does not have to have any multicast groups registered via IGMP. Currently all IGMP messages are redirected and there is no ability to selectively redirect IGMP messages based on match conditions (multicast-group address, source IP address, and so on). Multicast redirection is supported between VPRN services and also between interfaces within the Global Routing Context. Multicast Redirection is not supported between the VPRN services and the Global Routing Table (GRT).

IGMP state is maintained per subscriber host and per redirected interface. Traffic is however forwarded only on the redirected interface.

The **no** form of this command reverts to the default value.

#### Parameters

***policy-name***

Specifies the redirection policy to be applied to this host IGMP policy up to 32 characters. This is a policy defined in the **config>router>policy-option>policy-statement** context.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### redirection-policy

#### Syntax

**redirection-policy** *policy-name*

**no redirection-policy**

## Context

[\[Tree\]](#) (config>subscr-mgmt>mld-policy redirection-policy)

## Full Context

configure subscriber-mgmt mld-policy redirection-policy

## Description

This command applies multicast redirection action to the subscriber. The redirection action along with the redirected interface (and possibly service id) is defined in the referenced policy-name. MLD messages is redirected to an alternate interface if that alternate interface has MLD enabled. The alternate interface does not have to have any multicast groups registered via MLD. Currently all MLD messages are redirected and there is no ability to selectively redirect MLD messages based on match conditions (multicast-group address, source IP address, and so on). Multicast redirection is supported between VPRN services and also between interfaces within the Global Routing Context. Multicast Redirection is not supported between the VPRN services and the Global Routing Table (GRT).

MLD state is maintained per subscriber host and per redirected interface. Traffic is however forwarded only on the redirected interface.

The **no** form of this command removes the policy name from the configuration.

## Parameters

### *policy-name*

Specifies a redirection policy name up to 32 characters. This is a regular policy defined under the **configure>router>policy-option>policy-statement** context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.87 redirects

### redirects

## Syntax

## Full Context

configure service ies interface icmp redirects

configure service ies subscriber-interface group-interface icmp redirects

configure service ies interface ipv6 icmp6 redirects

configure service vprn network-interface icmp redirects

configure service vprn interface icmp redirects

configure service vprn interface ipv6 icmp6 redirects

configure service vprn interface redirects

## Description

This command configures the rate for Internet Control Message Protocol (ICMP) redirect messages issued on the router interface.

When routes are not optimal on this router and another router on the same subnetwork has a better route, the router can issue an ICMP redirect to alert the sending node that a better route is available.

The **redirects** command enables the generation of ICMP redirects on the router interface. The rate at which ICMP redirects is issued can be controlled with the optional *number* and *seconds* parameters by indicating the maximum number of redirect messages that can be issued on the interface for a given time interval.

The **no** form of this command disables the generation of ICMP redirects on the router interface.

## Default

redirects 100 10

## Parameters

### *number*

Specifies the maximum number of ICMP redirect messages to send. This parameter must be specified with the *second* parameter.

**Values** 10 to 1000

### *seconds*

Specifies the time frame in seconds used to limit the *number* of ICMP redirect messages that can be issued.

**Values** 1 to 60

## Platforms

All

- configure service ies interface ipv6 icmp6 redirects
- configure service vprn network-interface icmp redirects

- configure service vprn interface ipv6 icmp6 redirects
- configure service vprn interface icmp redirects
- configure service vprn interface redirects
- configure service ies interface icmp redirects

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface icmp redirects

## redirects

### Syntax

**redirects** [**number** *number*] [**seconds** *seconds*]

**no redirects**

### Context

[\[Tree\]](#) (config>subscr-mgmt>git>ipv4>icmp redirects)

### Full Context

configure subscriber-mgmt group-interface-template ipv4 icmp redirects

### Description

This command configures the ICMPv4 redirect messages that are generated when routes are not optimal on the router and the node needs to be alerted that another router on the same subnetwork has a better route available.

When disabled, ICMPv4 redirects are not generated.

The **no** form of this command disables generation of redirect messages.

### Default

redirects number 100 seconds 10

### Parameters

#### *number*

Specifies the number of ICMPv4 redirects that are issued in the time frame specified by the *seconds* parameter.

**Values** 10 to 1000

**Default** 100

#### *seconds*

Specifies the time, in seconds, that is used to limit the number of ICMPv4 redirects issued.

**Values** 1 to 60

**Default** 10

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## redirects

## Syntax

**redirects** [*number seconds*]

**no redirects**

## Context

[\[Tree\]](#) (config>router>if>icmp redirects)

## Full Context

configure router interface icmp redirects

## Description

This command enables and configures the rate for ICMP redirect messages issued on the router interface.

When routes are not optimal on this router, and another router on the same subnetwork has a better route, the router can issue an ICMP redirect to alert the sending node that a better route is available.

The **redirects** command enables the generation of ICMP redirects on the router interface. The rate at which ICMP redirects are issued can be controlled with the optional *number* and *time* parameters by indicating the maximum number of redirect messages that can be issued on the interface for a given time interval.

By default, generation of ICMP redirect messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of this command disables the generation of ICMP redirects on the router interface.

## Default

redirects 100 10 — Maximum of 100 redirect messages in 10 seconds.

## Parameters

### *number*

The maximum number of ICMP redirect messages to send, expressed as a decimal integer. This parameter must be specified with the *time* parameter.

**Values** 10 to 1000

### *seconds*

The time frame, in seconds, used to limit the *number* of ICMP redirect messages that can be issued, expressed as a decimal integer.

**Values** 1 to 60

## Platforms

All

## redirects

## Syntax

**redirects** [*number seconds*]

**no redirects**

## Context

[\[Tree\]](#) (config>router>if>ipv6>icmp6 redirects)

## Full Context

configure router interface ipv6 icmp6 redirects

## Description

This command configures the rate for ICMPv6 redirect messages. When configured, ICMPv6 redirects are generated when routes are not optimal on the router and another router on the same subnetwork has a better route to alert that node that a better route is available.

The **no** form of this command disables ICMPv6 redirects.

## Default

redirects 100 10 (when IPv6 is enabled on the interface)

## Parameters

### *number*

Limits the number of redirects issued per the time frame specified in *seconds* parameter.

**Values** 10 to 1000

### *seconds*

Determines the time frame, in seconds, that is used to limit the number of redirects issued per time frame.

**Values** 1 to 60

## Platforms

All

## 22.88 redistribute-delay

### redistribute-delay

#### Syntax

**redistribute-delay** *redistribute-delay*

**no redistribute-delay**

#### Context

[\[Tree\]](#) (config>router>ospf3>timers redistribute-delay)

[\[Tree\]](#) (config>router>ospf>timers redistribute-delay)

#### Full Context

configure router ospf3 timers redistribute-delay

configure router ospf timers redistribute-delay

#### Description

This command sets the internal OSPF hold down timer for external routes being redistributed into OSPF.

Shorting this delay can speed up the advertisement of external routes into OSPF but can result in additional OSPF messages if that source route is not yet stable.

The **no** form of this command resets the timer value back to the default value.

#### Note:

The timer granularity is 10 ms if the value is less than 500 ms, and 100 ms if the value is greater than or equal to 500 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

#### Default

redistribute-delay 1000

#### Parameters

##### *redistribute-delay*

Specifies the OSPF redistribution hold down time in milliseconds for external routes being advertised into OSPF.

**Values** 0 to 1000

#### Platforms

All

## 22.89 redistribute-external

### redistribute-external

#### Syntax

[no] redistribute-external

#### Context

**[Tree]** (config>service>vprn>ospf>area>nssa redistribute-external)

**[Tree]** (config>service>vprn>ospf3>area>nssa redistribute-external)

#### Full Context

configure service vprn ospf area nssa redistribute-external

configure service vprn ospf3 area nssa redistribute-external

#### Description

This command enables the redistribution of external routes into the Not So Stubby Area (NSSA) or an NSSA area border router (ABR) that is exporting the routes into non-NSSA areas.

NSSA or Not So Stubby Areas are similar to stub areas in that no external routes are imported into the area from other OSPF areas. The major difference between a stub area and an NSSA is that the NSSA has the capability to flood external routes that it learns (providing it is an ASBR) throughout its area and via an ABR to the entire OSPF domain.

The **no** form of this command disables the default behavior to automatically redistribute external routes into the NSSA area from the NSSA ABR.

#### Default

redistribute-external — External routes are redistributed into the NSSA.

#### Platforms

All

### redistribute-external

#### Syntax

[no] redistribute-external

#### Context

**[Tree]** (config>router>ospf>area>nssa redistribute-external)

**[Tree]** (config>router>ospf3>area>nssa redistribute-external)

## Full Context

```
configure router ospf area nssa redistribute-external
configure router ospf3 area nssa redistribute-external
```

## Description

This command enables the redistribution of external routes into the Not So Stubby Area (NSSA) or an NSSA area border router (ABR) that is exporting the routes into non-NSSA areas.

NSSA or Not So Stubby Areas are similar to stub areas in that no external routes are imported into the area from other OSPF or OSPF3 areas. The major difference between a stub area and an NSSA is that the NSSA has the capability to flood external routes that it learns (providing it is an ASBR) throughout its area and via an Area Border Router to the entire OSPF or OSPF3 domain.

The **no** form of this command disables the default behavior to automatically redistribute external routes into the NSSA area from the NSSA ABR.

## 22.90 redo

```
redo
```

## Syntax

```
redo [count]
```

## Context

[\[Tree\]](#) (candidate redo)

## Full Context

```
candidate redo
```

## Description

This command reapplies the changes to the candidate that were removed using a previous undo. All undo or redo history is lost when the operator exits **edit-cfg** mode.

A **redo** command is blocked if another user has made changes in the same CLI branches that would be impacted during the redo.

## Parameters

**count**

Specifies the number of previous changes to reapply.

**Values** 1 to 50

**Default** 1

### Platforms

All

## 22.91 reduced-prompt

### reduced-prompt

#### Syntax

**reduced-prompt** [*no-of-nodes-in-prompt*]

**no reduced-prompt**

#### Context

**[Tree]** (environment reduced-prompt)

#### Full Context

environment reduced-prompt

#### Description

This command configures the maximum number of higher CLI context levels to display in the CLI prompt for the current CLI session. This command is useful when configuring features that are several node levels deep, causing the CLI prompt to become too long. By default, the CLI prompt displays the system name and the complete context in the CLI.

The number of *nodes* specified indicates the number of higher-level contexts that can be displayed in the prompt. For example, if reduced prompt is set to 2, the two highest contexts from the present working context are displayed by name with the hidden (reduced) contexts compressed into an ellipsis ("...").

```
A:ALA-1>environment# reduced-prompt 2
A:ALA-1>config>router# interface to-103
A:ALA-1>...router>if#
```

The setting is not saved in the configuration. It must be reset for each CLI session or stored in an **exec** script file.

The **no** form of the command reverts to the default.

#### Default

no reduced-prompt

## Parameters

### *no-of-nodes-in-prompt*

Specifies the maximum number of higher-level nodes displayed by name in the prompt, expressed as a decimal integer.

**Values** 0 to 15

**Default** 2

## Platforms

All

## 22.92 redundancy

### redundancy

## Syntax

**redundancy**

## Context

[\[Tree\]](#) (config redundancy)

## Full Context

configure redundancy

## Description

This command allows the user to perform redundancy operations.

Associated commands include the following in the **admin>redundancy** context:

- **force-switchover** - Forces a switchover to the standby CPM card.
- **now** - Switch to standby CPM.

Switching to the standby displays the following message.

```
WARNING: Configuration and/or Boot options may have changed since the last save.
```

```
Are you sure you want to switchover (y/n)?
```

- **synchronize** - Synchronizes the secondary CPM.

**no redundancy**

### Context

[\[Tree\]](#) (config>isa>nat-group redundancy)

### Full Context

configure isa nat-group redundancy

### Description

This command configures intra-chassis redundancy mode for the NAT group.

### Default

redundancy active-standby

### Parameters

#### **active-active**

Specifies the mode in which all MS-ISAs in a NAT group are active. If one or two MS-ISAs in the system fail, the remaining active MS-ISA accepts the load from the failed MS-ISAs.

#### **active-standby**

Specifies the mode in which one or more MS-ISAs in the NAT group are in standby mode. While in standby mode, MS-ISAs do not process traffic. Traffic is diverted to the standby MS-ISA only when the active MS-ISA fails, at which point the standby becomes active.

#### **I2-aware-bypass**

Specifies that when an ISA MDA fails, NAT reroutes its traffic based on the regular destination address lookup. This resiliency mode is applicable only to L2-Aware NAT. When the MS-ISA fails, its traffic is routed via regular routing (destination-based lookup). The assumption is that traffic is sent to an external NAT device that serves as a backup NAT device.

#### Context

[\[Tree\]](#) (config>service>ies redundant-interface)

[\[Tree\]](#) (config>service>vprn redundant-interface)

#### Full Context

configure service ies redundant-interface

configure service vprn redundant-interface

## Description

This command configures a redundant interface.

## Parameters

### *ip-int-name*

Specifies the name of the IP interface. Interface names can be from 1 to 32 alphanumeric characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### **create**

Keyword used to create a redundant interface.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## redundant-interface

## Syntax

**redundant-interface service *service-id* name *interface-name***

**no redundant-interface**

## Context

[\[Tree\]](#) (config>subscr-mgmt>up-resiliency>fsg-template redundant-interface)

## Full Context

configure subscriber-mgmt up-resiliency fate-sharing-group-template redundant-interface

## Description

This command configures downstream traffic shunting from a standby BNG-UP to an active BNG-UP. Downstream traffic that is received for standby sessions is sent over the redundant interface to the active BNG-UP. This requires the configuration of the **multi-chassis-shunt-id** command in the service that receives the session traffic.

The **no**form of the command removes the configuration.

## Parameters

### *service-id*

Specifies the name of the VPRN or IES service that contains the redundant interface, up to 64 characters. This can be different from the service where session traffic is terminated.

### *interface-name*

Specifies the redundant interface name, up to 32 characters. It must exist within the configured *service-id*.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.94 redundant-mcast-capacity

### redundant-mcast-capacity

#### Syntax

**redundant-mcast-capacity** *primary-percentage* **secondary** *secondary-percentage*

#### Context

[\[Tree\]](#) (config>mcast-mgmt>chassis-level>plane-capacity redundant-mcast-capacity)

#### Full Context

configure mcast-management chassis-level per-mcast-plane-capacity redundant-mcast-capacity

#### Description

This command configures the primary and secondary multicast plane capacities used when the full complement of possible switch fabrics in the system are up. The rates are defined as a percentage of the total multicast plane capacity which is configured using the **total-capacity** command.

The **no** form of this command reverts to the default values.

#### Default

redundant-mcast-capacity 87.50 secondary 87.50

#### Parameters

##### *primary-percentage*

Specifies the percentage of the total multicast plane capacity to be used for primary multicast planes.

**Values** 0.01 to 100

##### *secondary-percentage*

Specifies the percentage of the total multicast plane capacity to be used for secondary multicast planes.

**Values** 0.01 to 100

#### Platforms

7450 ESS, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

## 22.96 ref-aa-specific-counter

### ref-aa-specific-counter

#### Syntax

**ref-aa-specific-counter any**

**no ref-aa-specific-counter**

#### Context

[\[Tree\]](#) (config>log>acct-policy>cr **ref-aa-specific-counter**)

#### Full Context

configure log accounting-policy custom-record **ref-aa-specific-counter**

#### Description

This command enables the use of significant-change so only those aa-specific records which have changed in the last accounting interval are written.

The **no** form of this command disables the use of significant-change so all aa-specific records are written whether or not they have changed within the last accounting interval.

## Parameters

### any

Indicates that a record is collected as long as any field records activity when non-zero significant-change value is configured.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.97 ref-order

### ref-order

## Syntax

**ref-order** *first second [third [fourth][fifth]]*

**no ref-order**

## Context

[\[Tree\]](#) (config>system>sync-if-timing ref-order)

## Full Context

configure system sync-if-timing ref-order

## Description

The synchronous equipment timing subsystem can lock to different timing reference inputs, those specified in the **ref1**, **ref2**, **bits**, **sync**, and **ptp** command configuration. This command organizes the priority order of the timing references.

If a reference source is disabled, then the clock from the next reference source as defined by **ref-order** is used. If all reference sources are disabled, then clocking is derived from a local oscillator.

If a **sync-if-timing** reference is linked to a source port that is operationally down, the port is no longer qualified as a valid reference.

For 7450 ESS and 7750 SR systems with two CPM modules, the system distinguishes between the BITS inputs on the active and standby CPMs. The active CPM will use its BITS input port providing that port is qualified. If the local port is not qualified, then the active CPM will use the BITS input port from the standby CPM as the next priority reference. For example, the normal **ref-order** of **bits ref1 ref2** will actually be **bits** (active CPM), followed by **bits** (standby CPM), followed by **ref1**, followed by **ref2**.

For 7950 XRS systems with two CPMs and two CCMs, the system distinguishes between the BITS inputs on the CCMs associated with the active and standby CPMs. The active CPM will use the BITS input port on the associated CCM, provided that the port is qualified. If the local port is not qualified, then the active CPM will use the BITS input port from the CCM associated with the standby CPM as the next priority reference. For example, the normal **ref-order** of **bits ref1 ref2** will actually be **bits** (active CCM), followed by **bits** (standby CCM), followed by **ref1**, followed by **ref2**.

The **no** form of the command resets the reference order to the default values.

The SyncE/1588 port of the CPM or CCM can be used as a frequency input reference. It shares internal resources with the BITS input ports and so only one can be used at a time. The BITS port shall have priority, if BITS input is enabled, then the SyncE port cannot be enabled.

Similar to the BITS input ports, when the **synce** reference is enabled and in the **ref-order**, the system distinguishes between the **synce** inputs on the active and standby CPM/CCMs. The active CPM/CCM uses its **synce** input port if that port is qualified. If the local port is not qualified, the active CPM uses the synce input port from the standby CPM/CCM as the next priority reference. For example, the **ref-order** of **synce ref1 ref2** will actually be synce (active CPM/CCM), followed by **synce** (standby CPM/CCM), followed by **ref1**, followed by **ref2**.

### Default

bits synce ref1 ref2 ptp (7750 SR-7/12/12e with CPM-5, 7950 XRS-20/20e, SR-7s/14s, and 7450 ESS-7/12)

bits ref1 ref2 ptp (7750 SR-a4/8, SR-1e/2e/3e, SR-1, SR-1s/2s)

### Parameters

#### *first*

Specifies the first timing reference to use in the reference order sequence.

**Values** bits, synce, ref1, ref2, ptp

#### *second*

Specifies the second timing reference to use in the reference order sequence.

**Values** bits, synce, ref1, ref2, ptp

#### *third*

Specifies the third timing reference to use in the reference order sequence.

**Values** bits, synce, ref1, ref2, ptp

#### *fourth*

Specifies the fourth timing reference to use in the reference order sequence.

**Values** bits, synce, ref1, ref2, ptp

#### *fifth*

Specifies the fifth timing reference to use in the reference order sequence.

**Values** bits, synce, ref1, ref2, ptp

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.98 ref-policer

## ref-policer

### Syntax

**ref-policer** *policer-id*

**ref-policer all**

**no ref-policer**

### Context

**[Tree]** (config>log>acct-policy>cr ref-policer)

### Full Context

configure log accounting-policy custom-record ref-policer

### Description

This command creates a policer context to configure reference policer counters for significant change only reporting. The custom record is only generated when the change in the sum of all queue and policer reference counters equals or exceeds the configured (non-zero) significant change value.

The **no** form of this command deletes all policer reference counters.

### Default

no ref-policer

### Parameters

#### *policer-id*

Specifies the policer for which reference counters are configured and to which **significant-change** is applied.

**Values** 1 to 63

#### **all**

Applies the **significant-change** to the specified counters for all policers.

## 22.102 reference-bandwidth

### reference-bandwidth

**Syntax**

**reference-bandwidth** *bandwidth-in-kbps*

**reference-bandwidth** [**zbps** *Zetta-bps*] [**ebps** *Exa-bps*] [**pbps** *Peta-bps*] [**tbps** *Tera-bps*] [**gbps** *Giga-bps*]  
[**mbps** *Mega-bps*] [**kbps** *Kilo-bps*]

**no reference-bandwidth**

**Context**

[\[Tree\]](#) (config>service>vprn>isis reference-bandwidth)

**Full Context**

configure service vprn isis reference-bandwidth

**Description**

This command configures the reference bandwidth that provides the basis of bandwidth relative costing.

In order to calculate the lowest cost to reach a specific destination, each configured level on each interface must have a cost. If the reference bandwidth is defined, then the cost is calculated using the following formula:

$$\text{cost} = \text{reference} - \text{bandwidth} \# \text{bandwidth}$$

If the reference bandwidth is configured as 10 Gigabits (10,000,000,000), a 100 M/bps interface has a default metric of 100. In order for metrics in excess of 63 to be configured, wide metrics must be deployed. (See **wide-metrics-only** in the **config>router>isis** context.)

If the reference bandwidth is not configured, all interfaces have a default metric of 10.

The **no** form of this command reverts to the default value.

## Default

no reference-bandwidth — No reference bandwidth is defined. All interfaces have a metric of 10.

## Parameters

### ***Zetta-bps***

Specifies the reference bandwidth in zettabits per second, expressed as a decimal integer.

**Values** 1 to 18

### ***Exa-bps***

Specifies the reference bandwidth in exabits per second, expressed as a decimal integer.

**Values** 1 to 999

### ***Peta-bps***

Specifies the reference bandwidth in petabits per second, expressed as a decimal integer.

**Values** 1 to 999

### ***bandwidth-in-kbps***

Specifies the reference bandwidth in kilobits per second, expressed as a decimal integer.

**Values** 1 to 18446744073709551615

### ***Tera-bps***

Specifies the reference bandwidth in terabits per second, expressed as a decimal integer.

**Values** 1 to 999

### ***Giga-bps***

Specifies the reference bandwidth in gigabits per second, expressed as a decimal integer.

**Values** 1 to 999

### ***Mega-bps***

Specifies the reference bandwidth in megabits per second, expressed as a decimal integer.

**Values** 1 to 999

### ***Kilo-bps***

Specifies the reference bandwidth in kilobits per second, expressed as a decimal integer.

**Values** 1 to 999

[Tree] (config>service>vprn>ospf reference-bandwidth)

### Full Context

configure service vprn ospf3 reference-bandwidth

configure service vprn ospf reference-bandwidth

### Description

This command configures the reference bandwidth in kilobits per second (kb/s) that provides the reference for the default costing of interfaces based on their underlying link speed.

The default interface cost is calculated as follows:

cost = reference-bandwidth # bandwidth

The default *reference-bandwidth* is 100,000,000 kb/s or 100 Gb/s, so the default auto-cost metrics for various link speeds are as follows:

- 10 Mb/s link default cost of 10000
- 100 Mb/s link default cost of 1000
- 1 Gb/s link default cost of 100
- 10 Gb/s link default cost of 10
- 40 Gb/s link default cost of 2
- 100 Gb/s link default cost of 1
- 400 Gb/s link default cost of 1

#### Note:

The default **reference-bandwidth** value must be manually configured to a higher value if interface speeds are greater than 100 Gb/s, and metrics based on link speed are used. When the default **reference-bandwidth** value is used, a metric of 1 is set on all interface speeds  $\geq$  100 Gb/s. For example, 100 GE, 100 GE LAG, 400 GE, and 400 GE LAG interfaces will all have a metric of 1.

If the reference bandwidth is configured as 10 Gb (reference-bandwidth 10000000000), a 100 Mb/s interface has a default metric of 100.

When a very large reference bandwidth value is configured, a metric calculation may result in a value higher than the supported protocol cost value. If this occurs, OSPF automatically reverts to the maximum configurable cost metric.

The `reference-bandwidth` command assigns a default cost to the interface based on the interface speed. To override this default cost on a particular interface, use the **metric** *metric* command configured in the `config>router>ospf>area>if ip-int-name` context.

The **no** form of this command reverts the reference bandwidth to the default value.

## Default

`reference-bandwidth 100000000`

## Parameters

### ***bandwidth-in-kbps***

Specifies the reference bandwidth in kilobits per second expressed as a decimal integer.

**Values** 1 to 4000000000

### ***tbps Tera-bps***

Specifies the reference bandwidth in terabits per second expressed as a decimal integer.

**Values** 1 to 4

### ***gbps Giga-bps***

Specifies the reference bandwidth in gigabits per second expressed as a decimal integer.

**Values** 1 to 999

### ***mbps Mega-bps***

Specifies the reference bandwidth in megabits per second expressed as a decimal integer.

**Values** 1 to 999

### ***kbps Kilo-bps***

Specifies the reference bandwidth in kilobits per second expressed as a decimal integer.

**Values** 1 to 999

configure router ospf reference-bandwidth

### **Description**

This command configures the reference bandwidth in kilobits per second (kb/s) that provides the reference for the default costing of interfaces based on their underlying link speed.

The default interface cost is calculated as follows:

cost = reference-bandwidth # bandwidth

The default *reference-bandwidth* is 100,000,000 kb/s or 100 Gb/s, the default auto-cost metrics for various link speeds are as follows:

- 10 Mb/s link default cost of 10000
- 100 Mb/s link default cost of 1000
- 1 Gb/s link default cost of 100
- 10 Gb/s link default cost of 10

- 100 Gb/s link default cost of 1
- 400 Gb/s link default cost of 1

**Note:**

The default reference-bandwidth must be manually configured to a higher value if interface speeds are greater than 100 Gb/s, and metrics based on link speed are used. When the default reference-bandwidth is used, a metric of 1 is set on all interface speeds  $\geq$  100 Gb/s. For example, 100 GE, 100 GE LAG, 400 GE, and 400 GE LAG interfaces will all have a metric of 1.

If the reference bandwidth is configured as 10 Gb (reference-bandwidth 10000000000), a 100 Mb/s interface has a default metric of 100.

When a very large reference bandwidth value is configured, a metric calculation may result in a value higher than the supported protocol cost value. If this occurs, OSPF automatically reverts to the maximum configurable cost metric.

The **reference-bandwidth** command assigns a default cost to the interface based on the interface speed. To override this default cost on a particular interface, use the **metric** *metric* command configured in the **config>router>ospf>area>interface** *ip-int-name* context.

The **no** form of this command reverts to the default value.

**Default**

reference-bandwidth 100000000

**Parameters*****bandwidth-in-kbps***

Specifies the reference bandwidth in kilobits per second, expressed as a decimal integer.

**Values** 1 to 18446744073709551615

### ***Kilo-bps***

Specifies the reference bandwidth in kilobits per second, expressed as a decimal integer.

**Values** 1 to 999

## **Platforms**

All

## **22.103 reflect-pad**

### **reflect-pad**

#### **Syntax**

[no] reflect-pad

#### **Context**

[\[Tree\]](#) (config>oam-pm>session>mpls>dm reflect-pad)

#### **Full Context**

configure oam-pm session mpls dm reflect-pad

#### **Description**

This command enables copying the padding in each MPLS-DM query to the response.

When padding is included in the DM frame the option exists to reflect the padding back in the direction of the source or remove the padding. The removal of the pad-tlv is good practice when using unidirectional tunnels such as RSVP.

This command uses the mandatory TLV type 0, instructing the responder to include the pad TLV from the response. The no form of this command uses the optional TVL type 128, instructing the responder to remove the pad TLV from the response.

The **no** form of this command disables copying the padding in each MPLS-DM query to the response.

#### **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.104 reflector

reflector

### Syntax

**reflector** [**udp-port** *udp-port-number*] [**create**]

**no reflector**

### Context

**[Tree]** (config>service>vprn>twamp-light reflector)

**[Tree]** (config>router>twamp-light reflector)

### Full Context

configure service vprn twamp-light reflector

configure router twamp-light reflector

### Description

This command configures a TWAMP Light session reflector parameters and to enable TWAMP Light functionality with the **no shutdown** command. The **udp-port** keyword and value must be specified with the **create** keyword. An error message is generated if the specific UDP port is unavailable.

### Parameters

#### *udp-port-number*

Specifies the UDP port number. A strictly enforced restricted range has been introduced. The TWAMP Light session reflector must be brought in line with this new restriction prior upgrading or rebooting from any previous release if there is an active TWAMP Light session reflector configured. Failure to do so prevents an ISSU operation from proceeding and fails to activate any reflector outside of the enforced range.

Note that in the Two-Way Active Measurement Protocol Light (TWAMP Light) section for a complete description. This parameter is required and specifies the destination udp-port that the session reflector uses to listen for TWAMP Light packets. The session controller launching the TWAMP Light packets must be configured with the same destination UDP port as part of the TWAMP Light test. The IES service uses the destination UDP port that is configured under the **router** context. Only one UDP port can be configured per unique context.

**Values** 862, 64364 to 64373

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Specifies the reflecter name, up to 32 characters.

### Platforms

All

## 22.105 refresh-reduction

## refresh-reduction

### Syntax

[no] **refresh-reduction**

### Context

**[Tree]** (config>router>rsvp>interface refresh-reduction)

### Full Context

configure router rsvp interface refresh-reduction

### Description

This command enables the use of the RSVP overhead refresh reduction capabilities on this RSVP interface.

When this option is enabled, a node will enable support for three capabilities. It will accept bundles RSVP messages from its peer over this interface, it will attempt to perform reliable RSVP message delivery to its peer, and will use summary refresh messages to refresh path and resv states. The reliable message

delivery must be explicitly enabled by the user after refresh reduction is enabled. The other two capabilities are enabled immediately.

A bundle message is intended to reduce overall message handling load. A bundle message consists of a bundle header followed by one or more bundle sub-messages. A sub-message can be any regular RSVP message except another bundle message. A node will only process received bundled RSVP messages but will not generate them.

When reliable message delivery is supported by both the node and its peer over the RSVP interface, an RSVP message is sent with a `message_id` object. A `message_id` object can be added to any RSVP message when sent individually or as a sub-message of a bundled message.

if the sender sets the `ack_desired` flag in the `message_id` object, the receiver acknowledges the receipt of the RSVP message by piggy-backing a `message_ack` object to the next RSVP message it sends to its peer. Alternatively, an ACK message can also be used to send the `message_ack` object. In both cases, one or many `message_ack` objects could be included in the same message.

The router supports the sending of separate ACK messages only but is capable of processing received `message_ack` objects piggy-backed to hop-by-hop RSVP messages, such as `path` and `resv`.

The router sets the `ack_desired` flag only in non-refresh RSVP messages and in refresh messages which contain new state information.

A retransmission mechanism based on an exponential backoff timer is supported in order to handle unacknowledged `message_id` objects. The RSVP message with the same `message_id` is retransmitted every  $2 * \text{rapid-retransmit-time}$  interval of time. The `rapid-retransmit-time` is referred to as the rapid retransmission interval as it must be smaller than the regular refresh interval configured in the **`config>router>rsvp>refresh-time`** context. There is also a maximum number of retransmissions of an unacknowledged RSVP message `rapid-retry-limit`. The node will stop retransmission of unacknowledged RSVP messages whenever the updated backoff interval exceeds the value of the regular refresh interval or the number of retransmissions reaches the value of the `rapid-retry-limit` parameter, whichever comes first. These two parameters are configurable globally on a system in the **`config>router>rsvp`** context.

Refresh summary consists of sending a summary refresh message containing a `message_id` list object. The fields of this object are populated each with the value of the `message_identifier` field in the `message_id` object of a previously sent individual `path` or `resv` message. The summary refresh message is sent every refresh regular interval as configured by the user using the `refresh-time` command in the **`config>router>rsvp`** context. The receiver checks each `message_id` object against the saved `path` and `resv` states. If a match is found, the state is updated as if a regular `path` or `resv` refresh message was received from the peer. If a specific `message_identifier` field does not match, then the node sends a `message_id_nack` object to the originator of the message.

The above capabilities are referred to collectively as "refresh overhead reduction extensions". When the refresh-reduction is enabled on an RSVP interface, the node indicates this to its peer by setting a "refresh-reduction-capable" bit in the flags field of the common RSVP header. If both peers of an RSVP interface set this bit, all the above three capabilities can be used. Furthermore, the node monitors the settings of this bit in received RSVP messages from the peer on the interface. As soon as this bit is cleared, the router stops sending summary refresh messages. If a peer did not set the "refresh-reduction-capable" bit, a node does not attempt to send summary refresh messages.

However, if the peer did not set the "refresh-reduction-capable" bit, a node, with refresh reduction enabled and reliable message delivery enabled, will still attempt to perform reliable message delivery with this peer. If the peer does not support the `message_id` object, it returns an error message "unknown object class". In this case, the node retransmits the RSVP message without the `message_id` object and reverts to using this method for future messages destined to this peer. The RSVP Overhead Refresh Reduction is supported with both RSVP P2P LSP `path` and the S2L `path` of an RSVP P2MP LSP instance over the same RSVP instance.

The **no** form of this command reverts to the default value.

**Default**

no refresh-reduction

**Platforms**

All

## 22.106 refresh-reduction-over-bypass

### refresh-reduction-over-bypass

**Syntax**

**refresh-reduction-over-bypass** [**enable** | **disable**]

**Context**

[\[Tree\]](#) (config>router>rsvp refresh-reduction-over-bypass)

**Full Context**

configure router rsvp refresh-reduction-over-bypass

**Description**

This command enables the refresh reduction capabilities over all bypass tunnels originating on this PLR node or terminating on this Merge Point (MP) node.

By default, this is disabled. Since a bypass tunnel may merge with the primary LSP path in a node downstream of the next-hop, there is no direct interface between the PLR and the MP node and it is possible the latter will not accept summary refresh messages received over the bypass.

When disabled, the node as a PLR or MP will not set the "Refresh-Reduction-Capable" bit on RSVP messages pertaining to LSP paths tunneled over the bypass. It will also not send Message-ID in RSVP messages. This effectively disables summary refresh.

**Default**

refresh-reduction-over-bypass disable

**Platforms**

All

## 22.107 refresh-time

## refresh-time

### Syntax

**refresh-time** *seconds*

**no refresh-time**

### Context

[\[Tree\]](#) (config>router>rsvp refresh-time)

### Full Context

configure router rsvp refresh-time

### Description

The **refresh-time** controls the interval (in s), between the successive Path and Resv refresh messages. RSVP declares the session down after it misses **keep-multiplier** *number* consecutive refresh messages.

The **no** form of this command reverts to the default value.

### Default

refresh-time 30

### Parameters

**seconds**

The refresh time in s.

**Values** 1 to 65535

### Platforms

All

## refresh-time

### Syntax

**refresh-time** *seconds* **hold-time** *seconds*

**no refresh-time**

### Context

[\[Tree\]](#) (config>router>origin-validation>rpki-session refresh-time)

### Full Context

configure router origin-validation rpki-session refresh-time

## Description

This command is used to configure the **refresh-time** and **hold-time** intervals that are used for liveness detection of the RPKI-Router session. The **refresh-time** defaults to 300 seconds and is reset whenever a Reset Query PDU or Serial Query PDU is sent to the cache server. When the timer expires, a new Serial Query PDU is sent with the last known serial number.

The **hold-time** specifies the length of time in seconds that the session is to be considered UP without any indication that the cache server is alive and reachable. The timer defaults to 600 seconds and must be at least 2x the refresh-time (otherwise the CLI command is not accepted). Reception of any PDU from the cache server resets the hold timer. When the **hold-time** expires, the session is considered to be DOWN and the stale timer is started.

## Default

no refresh-time

## Parameters

### *seconds*

Specifies a time in seconds.

**Values** 30 to 32767

### *seconds*

Specifies a time in seconds.

**Values** 60 to 65535

## Platforms

### register-message

**Syntax**

[no] register-message {*ip-address* | *ipv6-address*}

**Context**

[\[Tree\]](#) (config>router>pim>src-address register-message)

[\[Tree\]](#) (config>service>vprn>pim>src-address register-message)

**Full Context**

configure router pim source-address register-message

configure service vprn pim source-address register-message

## Description

This command configures the source IP address for PIM register messages. The IP address can be set to any unicast address, regardless of whether it resides on the node. Ensure that the specified IP address is configured on the router as a loopback or interface IP address.

The **no** form of this command removes the IP address. By default, when no IP address is specified for the PIM instance, the source IP address for register messages is selected by choosing the smallest IP address from available interfaces on the node.

## Parameters

*ip-address* | *ipv6-address*

Specifies the source IPv4 or IPv6 address, up to 64 characters.

## Platforms

**no relative**

### Context

**[Tree]** (config>test-oam>link-meas>template>asw>thr relative)

**[Tree]** (config>test-oam>link-meas>template>sw>thr relative)

### Full Context

configure test-oam link-measurement measurement-template aggregate-sample-window threshold relative

configure test-oam link-measurement measurement-template sample-window threshold relative

### Description

This command configures the percentage value of change, positive or negative, compared to the previously reported measurement. If this percentage value is reached in either direction, the new value is conveyed to the routing engine for further handling and stored as the delay measurement last reported. If the percentage value is not configured, this threshold is disabled.

The **no** form of this command reverts to the default value.

### Default

relative 0

### Parameters

#### *percent*

Specifies the percentage of change.

A value of 0 (zero) indicates no relative thresholding is performed when considering report to the routing engine.

**Values** 0 to 100

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure service ies interface dhcp relay-proxy
```

## Description

This command enables the DHCPv4 relay proxy function on the interface. The command has no effect when no dhcp servers are configured (DHCPv4 relay not configured). By default, unicast DHCPv4 release messages are forwarded transparently.

A relay proxy enhances the relay such that it also relays unicast client DHCPv4 REQUEST messages (lease renewals).

- In the upstream direction, update the source IP address and add the gateway IP address (*gi-address*) field before sending the message to the intended DHCP server (the message is not broadcasted to all configured DHCP servers).
- In the downstream direction, remove the *gi-address* and update the destination IP address to the address of the *yiaddr* (your IP address) field.

The optional **release-update-src-ip** parameter updates the source IP address of a DHCP RELEASE message with the address used for relayed DHCPv4 messages.

The optional **siaddr-override** *ip-address* parameter enables DHCP server IP address hiding towards the client. This parameter requires that **lease-populate** is enabled on the interface. The DHCP server ip address is required for the address hiding function and is stored in the lease state record. The client interacts with the relay proxy as if it is the DHCP server. In all DHCP messages to the client, the value of following header fields and DHCP options containing the DHCP server IP address is replaced with the configured *<ip-address>*:

- the "source IP address" field in the IP DHCPv4 packet header
- the "siaddr" field in the DHCPv4 header if not equal to zero in the message received from the server
- the Server Identification option (DHCPv4 option 54) if present in the original server message
- the source IP address field in the IP packet header

DHCP OFFER selection during initial binding is done in the relay-proxy. Only the first DHCP OFFER message is forwarded to the client. Subsequent DHCP OFFER messages from different servers are silently dropped.

## Parameters

### **release-update-src-ip**

Updates the source IP address of a DHCP RELEASE message with the address used for relayed DHCPv4 messages.

### **ip-address**

Enables DHCPv4 server address hiding towards the DHCPv4 client and activates DHCPv4 OFFER selection in case multiple DHCP servers are configured. The *ip-address* can be any local address in the same routing instance. If DHCP relay lease-split is enabled,

**siaddr-override** *ip-address* has priority over the **emulated-server** *ip-address* configured in the proxy-server and is used as the source IP address.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies interface dhcp relay-proxy

## 22.118 relay-unsolicited-cfg-attribute

### relay-unsolicited-cfg-attribute

#### Syntax

**relay-unsolicited-cfg-attribute**

#### Context

[\[Tree\]](#) (config>ipsec>ike-policy relay-unsolicited-cfg-attribute)

#### Full Context

configure ipsec ike-policy relay-unsolicited-cfg-attribute

#### Description

This command enters relay unsolicited configuration attributes context. With this configuration, the configured attributes returned from source (such as a RADIUS server) will be returned to IKEv2 remote-access tunnel client regardless if the client has requested it in the CFG\_REQUEST payload.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.119 release-reason

## release-reason

### Syntax

[no] release-reason

### Context

[\[Tree\]](#) (config>aaa>isa-radius-plcy>acct-include-attributes release-reason)

### Full Context

configure aaa isa-radius-policy acct-include-attributes release-reason

### Description

This command enables the inclusion of the release reason attributes.

The **no** form of the command excludes release reason attributes.

### Default

no release-reason

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.120 release-timeout

## release-timeout

### Syntax

release-timeout *seconds*

no release-timeout

### Context

[\[Tree\]](#) (config>subscr-mgmt>pfcf-association release-timeout)

### Full Context

configure subscriber-mgmt pfcf-association release-timeout

### Description

This command configures the time to wait to clean up the PFCF association after administratively disabling it and requesting a shutdown to the BNG CPF. If the BNG CPF does not gracefully remove the PFCF association before the timer expires, the full association and all related sessions are forcefully removed.

The **no** form of this command reverts to the default.

**Default**

release-timeout 3600

**Parameters****seconds**

Specifies the wait time, in seconds, for cleanup of the PFCP association.

**Values** 30 to 3600

**Note:**

The PFCP protocol encoding does not allow the full range of configured values. The system automatically rounds up the configured value to the nearest value allowed by the protocol. For more information about the protocol encoding, see 3GPP TS 29.244 8.2.78.1.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.121 reliable-delivery

### reliable-delivery

**Syntax**

[no] **reliable-delivery**

**Context**

[\[Tree\]](#) (config>router>rsvp>if>refresh-reduction reliable-delivery)

**Full Context**

configure router rsvp interface refresh-reduction reliable-delivery

**Description**

This command enables reliable delivery of RSVP messages over the RSVP interface. When refresh-reduction is enabled on an interface and reliable-delivery is disabled, the router will send a message\_id and not set ACK desired in the RSVP messages over the interface. The router does not expect an ACK and but will accept it if received. The node will also accept message ID and reply with an ACK when requested. In this case, if the neighbor set the "refresh-reduction-capable" bit in the flags field of the common RSVP header, the node will enter summary refresh for a specific message\_id it sent regardless if it received an ACK or not to this message from the neighbor.

Finally, when 'reliable-delivery' option is enabled on any interface, RSVP message pacing is disabled on all RSVP interfaces of the system, for example, the user cannot enable the **msg-pacing** option in the **config>router>rsvp** context, and error message is returned in CLI. Conversely, when the **msg-pacing**

option is enabled, the user cannot enable the reliable delivery option on any interface on this system. An error message is also generated in CLI after such an attempt.

The **no** form of this command reverts to the default value.

### Default

no reliable-delivery

### Platforms

All

## 22.122 reload

```
reload
```

### Syntax

```
reload type {cert | key | cert-key-pair} filename protocol protocol [key-file filename]
```

### Context

[\[Tree\]](#) (admin>certificate reload)

### Full Context

admin certificate reload

### Description

This command reloads imported certificate or key file or both at the same time. This command is typically used to update certificate or key file without shutting down **ipsec-tunnel/ipsec-gw/cert-profile/ca-profile**. Note that **type cert** and **type key** is deprecated in a future release. Use **type cert-key-pair** instead. Instead of **type cert** use **type key** instead.

- If the new file exists and valid, then for each tunnel using it:
  - If the key matches the certificate, then the new file is downloaded to the MS-ISA to be used the next time. Tunnels currently up are not affected.
  - If the key does not match the certificate:
    - If **cert** and **key** configuration is used instead of **cert-profile** then the tunnel is brought down.
    - If **cert-profile** is used, then **cert-profile** is brought down. The next authentication fails while the established tunnels are not affected.

If the new file does not exist or somehow invalid (bad format, does not contain right extension, and so on), then this command will abort.

In the case of **type cert-key-pair**, if the new file does not exist or is invalid or **cert** and **key** do not match, then this command aborts with an error message.

## Parameters

**type**

Specifies what item will be reloaded.

**cert**

Specifies that a certificate cache will be reloaded.

**key**

Specifies that a key cache will be reloaded.

**cert-key-pair**

Specifies that a paired certificate and key cache will be reloaded.

**filename**

Up to 95 characters.

**protocol**

Specifies which protocol the certificate will be reloaded for.

**Values** ipsec, tls

**Full Context**

```
configure filter ip-filter entry action extended-action remark
```

configure filter ipv6-filter entry action extended-action remark  
 configure filter ipv6-filter entry action remark  
 configure filter ip-filter entry action remark

## Description

This command enables and configures the remarking of the DiffServ Code Points of packets matching the criteria of the IPv4/IPv6 filter policy entry, in conjunction with a PBR action. Packets are remarked regardless of QoS-based in-profile or out-of-profile classification. QoS-based DSCP remarking is overridden. If the status of the PBR target is tracked and it is down, the extended action will not be executed; otherwise, the extended action will be performed.

## Parameters

### *dscp-name*

Specifies the DSCP value to write.

**Values** be, ef, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cp9, cs1, cs2, cs3, cs4, cs5, nc1, nc2, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, cp11, cp13, cp15, cp17, cp19, cp21, cp23, cp25, cp27, cp29, cp31, cp33, cp35, cp37, cp39, cp41, cp42, cp43, cp44, cp45, cp47, cp49, cp50, cp51, cp52, cp53, cp54, cp55, cp57, cp58, cp59, cp60, cp61, cp62, cp63

## Platforms

## 22.125 remarking

### marking

## Syntax

marking [force]

no marking

## Context

[\[Tree\]](#) (config>qos>network>egress remarking)

## Full Context

configure qos network egress remarking

## Description

This command remarks both customer traffic and egress network IP interface traffic; VPRN customer traffic is not remarked. The remarking is based on the forwarding class to DSCP and LSP EXP bit mapping defined under the egress node of the network QoS policy.

Normally, packets that ingress on network ports have either the DSCP or, for MPLS packets, LSP EXP bit set by an upstream router. The packets are placed in the appropriate forwarding class based on the DSCP-to-forwarding class mapping or the LSP EXP-to-forwarding class mapping. The DSCP or LSP EXP bits of such packets are not altered as the packets egress this router, unless **remark**ing is enabled.

Remark

ing can be required if this router is connected to a different DiffServ domain where the DSCP-to-forwarding class mapping is different.

Normally, no remarking is necessary when all router devices are in the same DiffServ domain.

The network QoS policy supports an egress flag that forces remarking of packets that were received on trusted IES and network IP interfaces. This provides the capability of remarking without regard to the ingress state of the IP interface on which a packet was received. The effect of the egress network remark trusted state on each type of ingress IP interface and trust state is listed in [Table 110: Ingress IP Interface Type and Trust State Effect on Egress Network Remark](#)ing.

The remark trusted state has no effect on packets received on an ingress VPRN IP interface.

*Table 110: Ingress IP Interface Type and Trust State Effect on Egress Network Remark*ing

Ingress IP Interface Type and Trust State	Egress Network IP Interface Trust Remark Disabled (Default)	Egress Network IP Interface Trust Remark Enabled
IES Non-Trusted (Default)	Egress Remark	Egress Remark
IES Trusted	Egress Not Remark	Egress Remark
VPRN Non-Trusted	Egress Remark	Egress Remark
VPRN Trusted (Default)	Egress Not Remark	Egress Not Remark
Network Non-Trusted	Egress Remark	Egress Remark
Network Trusted (Default)	Egress Not Remark	Egress Remark

The **no** form of this command resets the configuration to the default behavior.

## Default

no remarking — Remarking disabled in the Network QoS policy.

## Parameters

### force

Specifies that all IP routed traffic egressing the associated network interface will have its EXP, DSCP, P-bit, and DE bit setting remarked as defined in the associated QoS policy. Only bit fields configured in the QoS policy will be remarked; all others will be left untouched or set based on the default if the fields were not present at ingress.

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>tunnel-query remote-address)

### Full Context

configure subscriber-mgmt wlan-gw tunnel-query remote-address

### Description

This command enables matching only on the tunnel that uses the specified source IP address.

The **no** form of this command disables matching on a tunnel's source IP address.

### Default

no remote-address

**Parameters*****ip-address***

Specifies the IPv4 or IPv6 remote address.

Values		
ipv4-address		a.b.c.d
ipv6-address		x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

**22.128 remote-age****remote-age****Syntax**

**remote-age** *aging-timer*

**no remote-age** [*aging-timer*]

**Context**

**[Tree]** (config>service>vpls remote-age)

**[Tree]** (config>service>template>vpls-template remote-age)

**Full Context**

configure service vpls remote-age

configure service template vpls-template remote-age

**Description**

This command specifies the aging time for remotely learned MAC addresses in the forwarding database (FDB) for the Virtual Private LAN Service (VPLS) instance.

In a VPLS service, MAC addresses are associated with a Service Access Point (SAP) or with a Service Distribution Point (SDP). MACs associated with a SAP are classified as local MACs, and MACs associated with an SDP are remote MACs.

Like in a Layer 2 switch, learned MACs can be aged out if no packets are sourced from the MAC address for a period of time (the aging time). In each VPLS service instance, there are independent aging timers for local learned MAC and remote learned MAC entries in the FDB. The **remote-age** timer specifies the aging

time for remote learned MAC addresses. To reduce the amount of signaling required between switches configure this timer larger than the **local-age** timer.

The **no** form of this command returns the remote aging timer to the default value.

### Default

remote-age 900

### Parameters

#### *seconds*

Specifies the aging time for remote MACs expressed in seconds

**Values** 60 to 86400

### Platforms

All

## 22.129 remote-attachment-circuit

### remote-attachment-circuit

### Syntax

**remote-attachment-circuit** *ac-name* [**endpoint** *endpoint-name*] [**create**]

**no remote-attachment-circuit** *ac-name*

### Context

[\[Tree\]](#) (config>service>epipe>bgp-evpn remote-attachment-circuit)

### Full Context

configure service epipe bgp-evpn remote-attachment-circuit

### Description

This command configures the remote attachment circuit.

The **no** form of this command disables the context.

### Default

no remote-attachment-circuit

### Parameters

#### *ac-name*

Specifies the name of the remote attachment circuit, up to 32 characters.

#### *endpoint-name*

Specifies the name of the endpoint, up to 32 characters.

**create**

Keyword used to create the remote AC.

**Platforms**

All

## 22.130 remote-ecid

### remote-ecid

**Syntax**

**remote-ecid** *emulated circuit identifier*

**no remote-ecid**

**Context**

[\[Tree\]](#) (config>service>epipe>sap>cem remote-ecid)

**Full Context**

configure service epipe sap cem remote-ecid

**Description**

This command defines the Emulated Circuit Identifiers (ECID) to be used for the remote (destination) end of the circuit emulation service.

**Parameters*****emulated circuit identifier***

Specifies the value to be used as the remote (destination) ECID for the circuit emulation service. Upon CES packet reception, the ECID in the packet will be compared to the configured local-ecid value. These must match for the packet payload to be used for the TDM circuit. The remote-ecid value is inserted into the MEF-8 CES packet to be transmitted.

**Values** 0 to 1048575

**Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 22.131 remote-gateway-address

### remote-gateway-address

#### Syntax

**remote-gateway-address** [*ip-address* | *ipv6-address*]

**no remote-gateway-address**

#### Context

[\[Tree\]](#) (config>router>if>ipsec>ipsec-tunnel remote-gateway-address)

#### Full Context

configure router interface ipsec ipsec-tunnel remote-gateway-address

#### Description

This command configures the remote IPsec tunnel endpoint address.

#### Parameters

##### *ip-address*

Specifies a remote unicast IPv4 address, up to 64 characters.

##### *ipv6-address*

Specifies a remote unicast global unicast IPv6 address, up to 64 characters.

#### Platforms

VSR

## 22.132 remote-id

### remote-id

#### Syntax

**remote-id hex** *hex-string*

**remote-id string** *ascii-string*

**no remote-id**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident remote-id)

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp>host>host-ident remote-id)

## Full Context

```
configure subscriber-mgmt local-user-db ipoe host host-identification remote-id
configure subscriber-mgmt local-user-db ppp host host-identification remote-id
```

## Description

This command specifies the remote ID to match for a host lookup. When the LUDB is accessed using a DHCPv4 server, the SAP-ID is matched against DHCP option 82.

### Note:

This command is used only when **remote-id** is configured as one of the **match-list** parameters.

The **no** form of this command removes the remote ID from the configuration.

## Parameters

### *hex-string*

Specifies the hexadecimal format for the remote ID.

**Values** 0x0 to 0xFFFFFFFF (maximum 254 hex nibbles)

### *ascii-string*

Specifies the string format for the remote ID, up to 255 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## remote-id

## Syntax

**remote-id mac**

**remote-id string** *ASCII string*

**no remote-id**

## Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp>host>ali remote-id)

## Full Context

```
configure subscriber-mgmt local-user-db ppp host access-loop-information remote-id
```

## Description

This command specifies a remote-id for PPPoE hosts. A remote-id received in PPPoE tags has precedence over the LUDB specified remote ID.

The **no** form of this command reverts to the default.

## Parameters

### mac

Specifies MAC address of the PPPoE session as the remote ID.

### ASCII string

Specifies the circuit ID as a string, up to 63 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## remote-id

## Syntax

**remote-id**

**remote-id mac**

**remote-id string** [*string*]

**no remote-id**

## Context

[\[Tree\]](#) (config>service>vprn>if>ipv6>dhcp6>option remote-id)

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>ipv6>dhcp6>option remote-id)

[\[Tree\]](#) (config>service>ies>if>ipv6>dhcp6>option remote-id)

## Full Context

configure service vprn interface ipv6 dhcp6-relay option remote-id

configure service vprn subscriber-interface group-interface ipv6 dhcp6 option remote-id

configure service ies interface ipv6 dhcp6-relay option remote-id

## Description

This command enables the sending of remote ID option in the DHCPv6 relay packet.

The client DHCP Unique Identifier (DUID) is used as the remote ID.

The **no** form of this command disables the sending of remote ID option in the DHCPv6 relay packet.

## Platforms

All

- configure service vprn interface ipv6 dhcp6-relay option remote-id

- configure service ies interface ipv6 dhcp6-relay option remote-id

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn subscriber-interface group-interface ipv6 dhcp6 option remote-id

## remote-id

### Syntax

**remote-id**

**remote-id hex** [*hex-string*]

**remote-id {mac | string}** *string*

**no remote-id**

### Context

**[Tree]** (config>service>vprn>sub-if>grp-if>dhcp>option remote-id)

**[Tree]** (config>service>ies>sub-if>grp-if>dhcp>option remote-id)

**[Tree]** (config>subscr-mgmt>msap-policy>vpls-only>dhcp>option remote-id)

**[Tree]** (config>service>ies>if>dhcp>option remote-id)

### Full Context

configure service vprn subscriber-interface group-interface dhcp option remote-id

configure service vprn interface dhcp option remote-id

configure service vpls sap dhcp option remote-id

configure service ies subscriber-interface group-interface dhcp option remote-id

configure subscriber-mgmt msap-policy vpls-only-sap-parameters dhcp option remote-id

configure service ies interface dhcp option remote-id

### Description

This command specifies what information goes into the remote-id sub-option in the DHCP relay packet.

If disabled, the **remote-id** sub-option of the DHCP packet is left empty. When the command is configured without any parameters, it equals to the remote-id mac option.

The **no** form of this command reverts to the default.

### Parameters

#### **string**

Specifies the remote-id, up to 32 characters.

#### **hex-string**

Specifies the hex value of this option.

**Values** 0x0 to 0xFFFFFFFF...(up to 64 hex nibbles)

#### **mac**

Specifies that the MAC address of the remote end is encoded in the sub-option.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn subscriber-interface group-interface dhcp option remote-id
- configure service ies subscriber-interface group-interface dhcp option remote-id
- configure subscriber-mgmt msap-policy vpls-only-sap-parameters dhcp option remote-id

All

- configure service vprn interface dhcp option remote-id
- configure service vpls sap dhcp option remote-id
- configure service ies interface dhcp option remote-id

## remote-id

### Full Context

configure subscriber-mgmt radius-accounting-policy include-radius-attribute remote-id

configure subscriber-mgmt authentication-policy include-radius-attribute remote-id

### Description

This command enables the generation of the Broad Band Forum Agent-Remote-Id VSA in RADIUS request messages.

The **no** form of this command disables the generation of the Broad Band Forum Agent-Remote-Id VSA.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## remote-id

### Syntax

[no] remote-id

### Context

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>nasreq>include-avp remote-id)

## Full Context

```
configure subscriber-mgmt diameter-application-policy nasreq include-avp remote-id
```

## Description

This command enables the generation of the Broad Band Forum Agent-Remote-Id Vendor Specific AVP in Diameter NASREQ AAR messages.

The **no** form of this command reverts to the default.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## remote-id

## Syntax

```
[no] remote-id remote-id
```

## Context

```
[Tree] (debug>service>id>ppp remote-id)
```

## Full Context

```
debug service id ppp remote-id
```

## Description

This command enable PPP debug for the specified remote-id.

Multiple remote-id filters can be specified in the same debug command.

## Parameters

***remote-id***

Specifies the remote-id in PADI.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## remote-id

## Syntax

```
[no] remote-id
```

## Context

```
[Tree] (config>aaa>isa-radius-plcy>acct-include-attributes remote-id)
```

```
[Tree] (config>aaa>isa-radius-plcy>auth-include-attributes remote-id)
```

## Full Context

```
configure aaa isa-radius-policy acct-include-attributes remote-id
configure aaa isa-radius-policy auth-include-attributes remote-id
```

## Description

This command enables the sending of remote ID option. The client DHCP Unique Identifier (DUID) is used as the remote ID.

The **no** form of the command disables the sending of remote ID option relay packet.

## Default

```
no remote-id
```

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## remote-id

## Syntax

```
remote-id [{mac | string string}]
no remote-id
```

## Context

[\[Tree\]](#) (config>router>if>dhcp>option remote-id)

## Full Context

```
configure router interface dhcp option remote-id
```

## Description

When enabled, the router sends the MAC address of the remote end (typically the DHCP client) in the **remote-id** suboption of the DHCP packet. This command identifies the host at the other end of the circuit. If disabled, the **remote-id** suboption of the DHCP packet will be left empty.

The **no** form of this command returns the system to the default.

## Default

```
no remote-id
```

## Parameters

### **mac**

This keyword specifies the MAC address of the remote end is encoded in the suboption.

### **string**

Specifies the remote ID.

## Platforms

All

## remote-id

### Syntax

**remote-id mac**

**remote-id string** <*string*>

**no remote-id**

### Context

**[Tree]** (config>service>vpls>sap>dhcp6>ldra>options remote-id)

### Full Context

configure service vpls sap dhcp6 ldra options remote-id

### Description

This command configures the information for the remote ID suboption in the DHCP6 LDRA.

The **no** form of this command reverts to the default.

### Default

no remote-id

### Parameters

#### mac

Sets the enterprise number field of the Relay Agent remote ID to 6527 and configures the DHCPv6 client source MAC address as six hexadecimal numbers.

#### string

Sets the enterprise number field of the Relay-Agent remote ID to 6527 and configures the ASCII-encoded string using up to 32 characters.

## Platforms

All

## 22.133 remote-ip

## remote-ip

### Syntax

**remote-ip ip-address**

## no remote-ip

### Context

[\[Tree\]](#) (config>service>ies>if>sap>ip-tunnel remote-ip)

### Full Context

configure service ies interface sap ip-tunnel remote-ip

### Description

This command configures the primary destination IPv4 or IPv6 address to use for an IP tunnel. This configuration applies to the outer IP header of the encapsulated packets. The **source** address, **remote-ip** address and **backup-remote-ip** address of a tunnel must all belong to the same address family (IPv4 or IPv6). When the remote-ip address contains an IPv6 address it must be a global unicast address.

### Default

no remote-ip

### Parameters

#### *ip-address*

An IPv4 address or an IPv6 address.

### Platforms

All

## remote-ip

### Syntax

**remote-ip** *ip-address*

**no remote-ip**

### Context

[\[Tree\]](#) (config>service>vprn>if>sap>ip-tunnel remote-ip)

### Full Context

configure service vprn interface sap ip-tunnel remote-ip

### Description

This command sets the primary destination IPv4 address of GRE encapsulated packets associated with a particular GRE tunnel. If this address is reachable in the delivery service (there is a route) then this is the destination IPv4 address of GRE encapsulated packets sent by the delivery service.

The **no** form of this command deletes the destination address from the GRE tunnel configuration.

## Parameters

### *ip-address*

Specifies the destination IPv4 address of the GRE tunnel.

**Values** 1.0.0.0 to 223.255.255.255

## Platforms

All

## remote-ip

## Syntax

**remote-ip** {*ip-prefix/prefix-length* | *ip-prefix netmask* | **any**}

## Context

[\[Tree\]](#) (config>router>ipsec>sec-plcy>entry remote-ip)

[\[Tree\]](#) (config>service>vpn>ipsec>sec-plcy>entry remote-ip)

## Full Context

configure router ipsec security-policy entry remote-ip

configure service vpn ipsec security-policy entry remote-ip

## Description

This command configures the remote (from the tunnel) IP prefix/mask for the policy parameter entry.

Only one entry is necessary to describe a potential flow. The **local-ip** and **remote-ip** commands can be defined only once. The system evaluates:

- the local IP as the source IP when traffic is examined in the direction of the flows from private to public and as the destination IP when traffic flows from public to private
- the remote IP as the source IP when traffic flows public to private and as the destination IP when traffic flows from private to public

## Parameters

### *ip-prefix*

Specifies the destination address of the aggregate route in dotted decimal notation.

**Values** a.b.c.d (host bits must be 0)  
prefix-length 1 to 32

### *netmask*

Specifies the subnet mask in dotted decimal notation.

### **any**

keyword to specify that it can be any address.

## Platforms

VSR

- configure router ipsec security-policy entry remote-ip  
7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR
- configure service vpn ipsec security-policy entry remote-ip

## 22.134 remote-ip-address

### remote-ip-address

#### Syntax

**remote-ip-address** *ip-address*

**no remote-ip-address**

#### Context

[\[Tree\]](#) (config>lag>bfd>family remote-ip-address)

#### Full Context

configure lag bfd family remote-ip-address

#### Description

This command specifies the IPv4 or IPv6 address of the BFD destination.

The **no** form of this command removes this address from the configuration.

#### Default

no remote-ip-address

#### Parameters

***ip-address***

Specifies the IP address.

#### Values

ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x:[0 to FFFF]H

d: [0 to 255]D

## 22.135 remote-ip-range-start

```
remote-ip-range-start
```

### Syntax

```
remote-ip-range-start ip-address
```

```
no remote-ip-range-start
```

### Context

[\[Tree\]](#) (config>isa>nat-group>inter-chassis-redundancy remote-ip-range-start)

### Full Context

```
configure isa nat-group inter-chassis-redundancy remote-ip-range-start
```

### Description

This command configures the first IPv4 address that is assigned to a first member ISA on the remote node. The remaining member ISAs on the remote node are assigned the consecutive IP addresses starting from the first IP address. These IP addresses are used to communicate between the ISAs on redundant nodes for the purpose of flow synchronization. Traffic from the first local IP address (member ISA), is sent to the first IP address from the remote IP range.

The **no** form of this command removes the ip-address from the configuration.

### Default

```
no remote-ip-range-start
```

### Parameters

***ip-address***

Specifies the first IPv4 address, in the a.b.c.d format, from the range assigned to the first member ISA on the remote node.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.136 remote-lfa

## remote-lfa

### Syntax

**remote-lfa** [**max-pq-cost** *value*]

**no remote-lfa**

### Context

**[Tree]** (config>router>isis>loopfree-alternates remote-lfa)

### Full Context

configure router isis loopfree-alternates remote-lfa

### Description

This command enables the use of the Remote LFA algorithm in the LFA SPF calculation for this ISIS instance.

The **no** form of this command disables the use of the Remote LFA algorithm in the LFA SPF calculation for this ISIS instance.

### Default

no remote-lfa

### Parameters

#### *value*

Specifies the integer used to limit the search of candidate P and Q nodes in the remote LFA by setting the maximum IGP cost from the router performing the remote LFA calculation to the candidate P or Q node.

**Values** 0 to 4294967295

**Default** 4261412864

### Platforms

All

## remote-lfa

### Syntax

**remote-lfa** [**max-pq-cost** *value*]

**no remote-lfa**

### Context

**[Tree]** (config>router>ospf3>loopfree-alternates remote-lfa)

**[Tree]** (config>router>ospf>loopfree-alternates remote-lfa)

## Full Context

```
configure router ospf3 loopfree-alternates remote-lfa
configure router ospf loopfree-alternates remote-lfa
```

## Description

This command enables the use of the Remote LFA algorithm in the LFA SPF calculation in this OSPF or OSPF3 instance.

The **no** form of this command disables the use of the Remote LFA algorithm in the LFA SPF calculation in this OSPF or OSPF3 instance.

## Default

```
no remote-lfa
```

## Parameters

### *max-pq-cost value*

Specifies the integer used to limit the search of candidate P and Q nodes in the remote LFA by setting the maximum IGP cost from the router performing the remote LFA calculation to the candidate P or Q node.

**Values** 0 to 4294967295

**Default** 4261412864

## Platforms

All

## 22.137 remote-loop-respond

```
remote-loop-respond
```

## Syntax

```
[no] remote-loop-respond
```

## Context

**[Tree]** (config>port>tdm>ds1 remote-loop-respond)

## Full Context

```
configure port tdm ds1 remote-loop-respond
```

## Description

When enabled, the channel responds to requests for remote loopbacks.

**Default**

no remote-loop-respond — The port will not respond.

**Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 22.138 remote-mac

### remote-mac

**Syntax**

**remote-mac** *ieee-address*

**no remote-mac**

**Context**

[\[Tree\]](#) (config>service>epipe>sap>cem remote-mac)

**Full Context**

configure service epipe sap cem remote-mac

**Description**

This command defines the destination IEEE MAC address to be used to reach the remote end of the circuit emulation service.

**Default**

remote-mac 00:00:00:00:00:00

**Parameters*****ieee-address***

Specifies the 48-bit MAC address in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

**Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 22.139 remote-management

## remote-management

### Syntax

**remote-management**

### Context

[\[Tree\]](#) (config>system>management-interface remote-management)

### Full Context

configure system management-interface remote-management

### Description

Commands in this context configure the SR OS node to use the remote management service. Configuring remote management enables the SR OS node to report itself to a remote manager service running on a remote server, so that it is included in the dynamic list of available nodes. The manager service streamlines the management of multiple SR OS nodes running different SR OS versions using the same client application providing a similar shell to the MD-CLI.

### Platforms

All

## remote-management

### Syntax

**remote-management**

**no remote-management**

**remote-management manager** [*manager-name*]

**no remote-management manager** [*manager-name*]

### Context

[\[Tree\]](#) (debug>system>management-interface remote-management)

### Full Context

debug system management-interface remote-management

### Description

This command configures the management interface to debug the **remote-management** managers.

The **no** form of this command removes the configuration.

### Parameters

*manager manager-name*

Specifies the name of the manager, up to 64 characters. If the parameter is not specified, all configured managers are debugged.

### Platforms

All

## 22.140 remote-max-checkpoints

### remote-max-checkpoints

#### Syntax

**remote-max-checkpoints** [*number-of-files*]

**no remote-max-checkpoints**

#### Context

[\[Tree\]](#) (config>system>rollback remote-max-checkpoints)

#### Full Context

configure system rollback remote-max-checkpoints

#### Description

This command configures the maximum number of rollback checkpoint files when the rollback-location is remote (for example, ftp).

#### Default

no remote-max-checkpoints

#### Parameters

##### *number of files*

Specifies the maximum rollback files saved at a remote location.

**Values** 1 to 200

### Platforms

All

## 22.141 remote-mepid

## remote-mepid

### Syntax

**remote-mepid** *mep-id* **remote-mac** {*unicast-da* | **default**}

**no remote-mepid** *mep-id*

### Context

[\[Tree\]](#) (config>eth-cfm>domain>assoc remote-mepid)

### Full Context

configure eth-cfm domain association remote-mepid

### Description

This command configures the remote MEP ID. Optionally, the operator may configure a unicast MAC address associated with the remote MEP. This unicast value replaces the default Layer 2 class 1 multicast address that is typically associated with ETH-CC packets.

#### Note:

This command is not supported with sub second CCM intervals. The *unicast-da* parameter may only be configured when a single remote MEP exists in the association.

The **no** form of this command removes the peer information.

### Parameters

#### *mep-id*

Specifies the peer MEP ID.

**Values** 1 to 8191

#### *unicast-da*

Specifies the unicast MAC destination address.

**Values** xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx or default

**default** — Removes the remote MAC unicast address and reverts back to class 1 multicast address.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## remote-mepid

### Syntax

**remote-mepid** *mep-id*

**no remote-mepid**

## Context

[\[Tree\]](#) (config>oam-pm>session>ethernet remote-mepid)

## Full Context

configure oam-pm session ethernet remote-mepid

## Description

This command specifies the remote MEP ID as an alternative to the static **dest-mac** *ieee-address*. When the **remote-mepid** option is configured as an alternative to the **dest-mac**, the domain and association information of the **source mep** within the session is used to check for a locally-stored unicast MAC address for the peer. The local MEP must be administratively enabled. Peer MEP MAC addresses are learned and maintained by the ETH-CC protocol.

The **no** form of this command removes this session parameter.

## Parameters

*mep-id*

Specifies the remote MEP ID of the peer within the association.

**Values** 1 to 8191

## Platforms

All

## 22.142 remote-name

remote-name

## Syntax

**no remote-name**

## Context

[\[Tree\]](#) (config>router>l2tp>group>tunnel remote-name)

[\[Tree\]](#) (config>service>vprn>l2tp>group>tunnel remote-name)

## Full Context

configure router l2tp group tunnel remote-name

configure service vprn l2tp group tunnel remote-name

## Description

This command configures a string to be compared to the host name used by the tunnel peer during the authentication phase of tunnel establishment.

## Default

no remote-name

## Parameters

### *host-name*

Specifies a remote host name for the tunnel, up to 64 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.143 remote-proxy-arp

### remote-proxy-arp

## Syntax

[no] remote-proxy-arp

## Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if remote-proxy-arp)

[\[Tree\]](#) (config>service>vprn>if remote-proxy-arp)

## Full Context

configure service ies subscriber-interface group-interface remote-proxy-arp

configure service vprn nw-if remote-proxy-arp

configure service ies interface remote-proxy-arp

configure service vprn subscriber-interface group-interface remote-proxy-arp

configure service vprn interface remote-proxy-arp

## Description

This command enables remote proxy ARP on the interface.

Remote proxy ARP is similar to proxy ARP. It allows the router to answer an ARP request on an interface for a subnet that is not provisioned on that interface. This allows the router to forward to the other subnet

on behalf of the requester. To distinguish remote proxy ARP from local proxy ARP, local proxy ARP performs a similar function but only when the requested IP is on the receiving interface.

The **no** form of this command reverts to the default.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface remote-proxy-arp
- configure service vpn subscriber-interface group-interface remote-proxy-arp

## 22.145 remote-source

## remote-source

### Syntax

[no] remote-source

### Context

[\[Tree\]](#) (config>mirror>mirror-dest remote-source)

### Full Context

configure mirror mirror-dest remote-source

### Description

This command is used on a destination router in a remote mirroring solution. The mirroring (packet copy) is performed on the source router and sent via an SDP to the destination router. Remote mirroring requires remote source configuration on the destination router.

Remote mirroring allows a destination router to terminate SDPs from multiple remote source routers. This allows consolidation of packet sniffers or analyzers at a single or small set of points in a network (for example, a sniffer or analyze farm, or lawful interception gateway).

A **remote-source** entry must be configured on the destination router for each source router from which mirrored traffic is being sent via SDPs.

A mirror destination service that is configured for a destination router must not be configured as for a source router.

The remote source configuration is not applicable when routable LI encapsulation is being used on the mirror source router. The remote source configuration is only used when a source router is sending mirrored traffic to a destination router via SDPs.

Two types of remote-source entries can be configured:

- far end
- spoke SDP

Certain remote source types are applicable with certain SDP types. For descriptions of the command usage in the **mirror-dest** context, see the **far-end** and **spoke-sdp** commands.

The **no** form of this command removes all remote-source entries.

- configure service vprn ipsec security-policy entry remote-v6-ip

## 22.147 remote-ve-name

### remote-ve-name

#### Syntax

[no] remote-ve-name *name*

#### Context

[\[Tree\]](#) (config>service>epipe>bgp-vpws remote-ve-name)

#### Full Context

configure service epipe bgp-vpws remote-ve-name

#### Description

This command creates or edits a remote-ve-name. A single remote-ve-name can be created per BGP VPWS instance if the service is single-homed or uses a single pseudowire to connect to a pair of dual-homed systems. When the service requires active/standby pseudowires to be created to remote dual-homed systems then two remote-ve-names must be configured.

This context defines the remote PE to which a pseudowire will be signaled.

**remote-ve-name** commands can be added even if bgp-vpws is not shutdown.

The **no** form of this command removes the configured remote-ve-name from the bgp vpws node. It can be used when the BGP VPWS status is either shutdown or "no shutdown".

#### Parameters

*name*

Specifies a site name up to 32 characters in length.

#### Platforms

All

## 22.148 remove

### remove

#### Syntax

[no] remove

#### Context

[\[Tree\]](#) (config>service>vprn>bgp>attribute-set remove)

## Full Context

```
configure service vprn bgp attribute-set remove
```

## Description

This command configures BGP to ignore and silently discard ATTR\_SETs in BGP routes received from PE-CE peers of the VPRN. The discarded ATTR\_SETs do not affect BGP best-path selection in the VPRN, and they do not appear in the VPN-IP routes that result from the VRF export of the BGP routes. Nokia recommends enabling this command in most deployments.

The **no** form of this command configures BGP to ignore ATTR\_SETs in BGP routes received from PE-CE peers of the VPRN without discarding them. This allows the ATTR\_SETs to propagate between CE devices connected to the VPRN and to other PE devices when the BGP routes are exported as VPN-IP routes.

**Note:** If the configuration of this command is changed, ROUTE\_REFRESH messages are sent to all PE-CE peers of the VPRN.

## Default

```
no remove
```

## 22.150 remove-private

### remove-private

#### Syntax

**[no] remove-private**

#### Context

**[Tree]** (config>subscr-mgmt>bgp-prng-plcy remove-private)

#### Full Context

configure subscriber-mgmt bgp-peering-policy remove-private

#### Description

This command allows private AS numbers to be removed from the AS path before advertising them to BGP peers.

The OS software recognizes the set of AS numbers that are defined by IANA as private. These are AS numbers in the range 64512 through 65535, inclusive.

The **no** form of this command used at the global level reverts to default value.

Private AS numbers are included in the AS path attribute.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### remove-private

#### Syntax

**remove-private [limited] [skip-peer-as] [replace]**

**no remove-private**

#### Context

**[Tree]** (config>service>vprn>bgp>group>neighbor remove-private)

**[Tree]** (config>service>vprn>bgp remove-private)

**[Tree]** (config>service>vprn>bgp>group remove-private)

#### Full Context

configure service vprn bgp group neighbor remove-private

configure service vprn bgp remove-private

configure service vprn bgp group remove-private

## Description

When this command is configured private AS numbers are removed or replaced when they are found inside the AS path of BGP routes advertised to peers within the scope of the command.

The set of AS numbers that are defined by IANA as private are in the range of 64512 to 65534, and 4200000000 to 4294967294, inclusive. In SR OS, this command also removes ASN 65535 and ASN 4294967295, which are reserved values.

The **no** form of this command (at the BGP instance level) implements the default behavior, private AS numbers are allowed without restriction or modification in routes advertised to peers.

## Default

no remove-private

## Parameters

### limited

This keyword instructs BGP to process private ASNs only up to the first public ASN encountered. Private ASNs beyond that first public AS will not be stripped or replaced.

### skip-peer-as

This keyword instructs BGP to not strip or replace a private ASN from the AS-Path if that ASN is the same as the BGP peer AS number.

### replace

When this keyword is configured, private ASNs are not stripped. Each occurrence is replaced by the ASN of the advertising BGP router (the ASN the router advertised to its peer in its OPEN message). When the **replace** keyword is not configured, private ASNs are stripped, subject to influence by the other keyword options. This generally results in a shortening of AS\_PATH length.

## Platforms

renew est-profile name cert cert-filename key key-filename [hash-alg hash-algorithm] output output-cert-filename [validate-cert-chain] [force]
```

### Context

[\[Tree\]](#) (admin>certificate>est renew)

## Full Context

admin certificate est renew

## Description

This command renews an imported certificate (specified by the **cert** *cert-filename*) with a Certificate Authority (CA) using the EST protocol specified by the **est-profile** name, with an imported private key specified the key parameter. The key can be either the key of the certificate to be renewed or a new key.

The authentication between system and EST server is specified by the est-profile.

The **hash-alg** *hash-alorithm* parameter is used to generate the CSR (Certificate Signing Request) in the EST request message.

## Parameters

### **name**

Specifies EST profile name, up to 32 characters

### **cert-filename**

Specifies the certificate file name, up to 95 characters

### **key-filename**

Specifies the file name of a key, up to 95 characters

### **hash-algorithm**

Specifies the hash algorithm to be used in a certificate request.

**Values** sha1, sha224, sha256, sha384, sha512

### **output-cert-filename**

Specifies the output cert file name, up to 200 characters

### **validate-cert-chain**

Specifies that the the system validates the certificate chain of the result certificate before importing it

### **force**

Specifies the system to overwrite the existing file with same **output** *output-cert-filename*

configure router dhcp6 local-dhcp-server pool prefix renew-timer

configure subscriber-mgmt local-user-db ppp host ipv6-lease-times renew-timer

configure service vprn subscriber-interface group-interface ipv6 dhcp6 proxy-server renew-timer

## Description

This command configures the lease renew time (T1) via LUDB.

The T1 is the time at which the client contacts the addressing authority to extend the lifetimes of the DHCPv6 leases (addresses or prefixes). T1 is a time duration relative to the current time expressed in units of seconds.

The IP addressing authority controls the time at which the client contacts the addressing authority to extend the lifetimes on assigned addresses through the T1 and T2 parameters assigned to an IA. At time T1 for an IA, the client initiates a Renew/Reply message exchange to extend the lifetimes on any addresses in the IA. The client includes an IA option with all addresses currently assigned to the IA in its Renew message. Recommended values for T1 and T2 are .5 and .8 times the shortest preferred lifetime of the addresses in the IA that the addressing authority is willing to extend, respectively.

The configured renew timer should always be smaller than or equal to the rebind timer.

The T1 and T2 are carried in the IPv6 address option that is within the IA.

The **no** form of this command reverts to the default.

## Default

renew-timer min 30

## Parameters

### *renew-timer*

Specifies the preferred lifetime.

Values		
<b>days</b> <i>days</i>		0 to 7
<b>hrs</b> <i>hours</i>		0 to 23
<b>min</b> <i>minutes</i>		0 to 59

**sec seconds**      0 to 59

## renumber

### Syntax

**renumber from** *entry-id to entry-id*

## Context

**[Tree]** (config>router>policy-options>policy-statement renumber)

## Full Context

configure router policy-options policy-statement renumber

## Description

This command allows the operator to renumber the existing entry ID to a new entry ID. When performing the renumbering action, the two entry IDs must be different. The existing (**from**) *entry-id* must exist. The new (**to**) *entry-id* must not exist.

Renumbering is not saved in the configuration because it is a performing action.

## Parameters

### from *entry-id*

Specifies the existing entry ID to be renumbered.

**Values** 1 to 4294967295

### to *entry-id*

Specifies the new entry ID to be assigned.

**Values** 1 to 4294967295

## Platforms

## 22.156 reorder-audio

### reorder-audio

## Syntax

**reorder-audio** *time*

**no reorder-audio**

## Context

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>video reorder-audio)

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>channel>video reorder-audio)

## Full Context

configure mcast-management multicast-info-policy bundle video reorder-audio

configure mcast-management multicast-info-policy bundle channel video reorder-audio

## Description

This command configures the time, in milliseconds, by which the audio packets are reordered in the ad stream.

Configuring this parameter depends on what is configured on the A Server and the GOP sizes of the network stream. Typically, this configuration should match the A Server configuration.

The **no** form of the command removes the time value from the configuration.

## Default

no reorder-audio

## Parameters

### *time*

Specifies the audio reorder time, in milliseconds.

**Values** 100 to 1000

## Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 22.157 repair

```
repair
```

## Syntax

```
repair [cflash-id]
```

## Context

[\[Tree\]](#) (file repair)

## Full Context

file repair

## Description

This command checks a compact flash device for errors and repairs any errors found.

## Parameters

### *cflash-id*

Specifies the compact flash slot ID to be shut down or enabled. When a specific *cflash-id* is specified, then that drive is shut down. If no *flash-id* is specified, the drive referred to by the current working directory is assumed. If a slot number is not specified, then the active CSM is assumed.

**Values** cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

**Default** the current compact flash device.

## 22.158 repeat

repeat

### Syntax

repeat *padding*

### Context

[\[Tree\]](#) (config>test-oam>sath>svc-test>svc-stream>frm-payl>patt repeat)

### Full Context

configure test-oam service-activation-testhead service-test service-stream frame-payload data-pattern  
repeat

### Description

This command configures the data pattern padding bytes for the frames launched for the service stream.

The specified data pattern value is repeated as many times as required to fill the remaining length of the payload for the highest level of the specified PDU. If only the Ethernet and ETH-CFM information is added, the data pattern is included in the data TLV of the ETH-CFM frame.

### Default

repeat 0

### Parameters

*padding*

Specifies the data pattern to populate the payload data.

**Values** 0 to 4294967295

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

**repeated-characters** *count*

**no repeated-characters**

#### Context

[\[Tree\]](#) (config>system>security>password>complexity-rules repeated-characters)

#### Full Context

configure system security password complexity-rules repeated-characters

#### Description

The number of times a characters can be repeated consecutively.

The **no** form of this command resets to default.

#### Default

no repeated-characters

#### Parameters

***count***

Specifies the minimum count of consecutively repeated characters.

**Values** 2 to 8

#### Platforms

All

## 22.160 replace

### replace

#### Syntax

**replace** [*line*]

#### Context

[\[Tree\]](#) (candidate replace)

**Full Context**

candidate replace

**Description**

This command displays the specified line (a single line only) and allows it to be changed.

**Parameters*****line***

Indicates which line to replace starting at the point indicated by the following options.

**Values**

line, offset, **first**, **edit-point**, **last**

line	absolute line number
offset	relative line number to current edit point. Prefixed with '+' or '-'
<b>first</b>	keyword - first line
<b>edit-point</b>	keyword - current edit point
<b>last</b>	keyword - last line that is not 'exit'

**Platforms**

**22.161 replace-result-code**

replace-result-code

**Syntax**

**replace-result-code** *code* [*code*]

**no replace-result-code**

**Context**

[\[Tree\]](#) (config>service>vprn>l2tp replace-result-code)

[\[Tree\]](#) (config>router>l2tp replace-result-code)

**Full Context**

configure service vprn l2tp replace-result-code

configure router l2tp replace-result-code

## Description

This command replaces CDN Result-Code 4, 5 and 6 on LNS with the Result Code 2. This is needed for interoperability with some implementation of LAC which only takes action based on CDN Result-Code 2 while ignoring CDN Result-Code 4, 5 and 6.

## Default

no replace-result-code

## Parameters

### *code*

Specifies the L2TP Result codes that need to be replaced. Up to three codes can be specified.

- Values**
- cdn-tmp-no-facilities — CDN Result-Code 4 on LNS are replaced with the result code 2 before it is sent to LAC.
  - cdn-prem-no-facilities — CDN Result-Code 5 on LNS are replaced with the result code 2 before it is sent to LAC.
  - cdn-inv-dest — CDN Result-Code 6 on LNS are replaced with the result code 2 before it is sent to LAC.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.162 replay-protection

### replay-protection

## Syntax

[no] replay-protection

## Context

[\[Tree\]](#) (config>macsec>connectivity-association replay-protection)

## Full Context

configure macsec connectivity-association replay-protection

## Description

Specifies the size of the replay protection window.

This command must be configured to force packet discard when it has detected a packet that is not within the replay-window-size.

When replay protection is enabled, the sequence of the ID number of the received packets are checked. If the packet arrives out of sequence and the difference between the packet numbers exceeds the replay

window size, the packet is counted by the receiving port and then discarded. For example, if the replay protection window size is set to five and a packet assigned the ID of 1006 arrives on the receiving link immediately after the packet assigned the ID of 1000, the packet that is assigned the ID of 1006 is counted and discarded because it falls outside the parameters of the replay window size.

Replay protection is especially useful for fighting man-in-the-middle attacks. A packet that is replayed by a man-in-the-middle attacker on the Ethernet link will arrive on the receiving link out of sequence, so replay protection helps ensure the replayed packet is dropped instead of forwarded through the network.

Replay protection should not be enabled in cases where packets are expected to arrive out of order.

### Default

no replay-protection

### Platforms

All

## 22.163 replay-window

### replay-window

#### Syntax

**replay-window** *replay-window-size*

**[Tree]** (config>service>vprn>if>ipsec>ipsec-tunnel replay-window)

#### Full Context

configure service ies interface ipsec ipsec-tunnel replay-window

configure ipsec tunnel-template replay-window

configure service vprn interface sap ipsec-tunnel replay-window

configure ipsec ipsec-transport-mode-profile replay-window

configure service vprn interface ipsec ipsec-tunnel replay-window

## Description

This command specifies the size of the anti-replay window. The anti-replay window protocol further secures IPsec against an entity that can inject a recorded message in a message stream from a source to a destination computer on the Internet.

## Default

no replay-window

## Parameters

### ***replay-window-size***

Specifies the size of the SA anti-replay window.

**Values** 32, 64, 128, 256, 512

## Platforms

VSR

- configure service ies interface ipsec ipsec-tunnel replay-window
  - configure service vprn interface ipsec ipsec-tunnel replay-window
- 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR
- configure ipsec tunnel-template replay-window
  - configure ipsec ipsec-transport-mode-profile replay-window
  - configure service vprn interface sap ipsec-tunnel replay-window

## 22.164 replay-window-size

### replay-window-size

## Syntax

**replay-window-size** *number-of-packets*

**no replay-window-size**

## Context

[\[Tree\]](#) (config>macsec>connectivity-association replay-window-size)

## Full Context

configure macsec connectivity-association replay-window-size

## Description

This command specifies the size of the replay protection window.

This command must be configured to enable replay protection. When replay protection is enabled, the sequence of the ID number of received packets are checked. If the packet arrives out of sequence and the difference between the packet numbers exceeds the replay protection window size, the packet is dropped by the receiving port. For example, if the replay protection window size is set to five and a packet assigned the ID of 1006 arrives on the receiving link immediately after the packet assigned the ID of 1000, the packet that is assigned the ID of 1006 is dropped because it falls outside the parameters of the replay protection window.

Replay protection is especially useful for fighting man-in-the-middle attacks. A packet that is replayed by a man-in-the-middle attacker on the Ethernet link will arrive on the receiving link out of sequence, so replay protection helps ensure the replayed packet is dropped instead of forwarded through the network.

Replay protection should not be enabled in cases where packets are expected to arrive out of order.

When the *number-of-packets* variable is set to 0, all packets that arrive out-of-order are dropped.

The **no** form of this command reverts to the default value.

### Default

replay-window-size 0

### Parameters

#### *number-of-packets*

Specifies the window for which the packets can arrive out of order.

**Values** 0 to 4294967294

### Platforms

All

## 22.165 replication-segment

### replication-segment

#### Syntax

[no] replication-segment *policy-name*

#### Context

**[Tree]** (config>router>p2mp-sr-tree replication-segment)

#### Full Context

configure router p2mp-sr-tree replication-segment

#### Description

This command creates a P2MP SR tree replication segment entry for the P2MP LSP.

The **no** form of this command deletes the replication segment entry.

## Parameters

### *policy-name*

Specifies the P2MP policy name, up to 32 characters, associated with the forwarding instructions contained in the replication segment.

## Platforms

All

## 22.166 replication-sid

### replication-sid

## Syntax

**replication-sid** *label* [*label*]

**no replication-sid**

## Context

[\[Tree\]](#) (config>router>p2mp-sr-tree>replication-segment>next-hop-id replication-sid)

## Full Context

configure router p2mp-sr-tree replication-segment next-hop-id replication-sid

## Description

This command configures the replication SID or a SID list for the next hop of the P2MP SR tree replication segment.

When a SID list is configured, the replication SID is at the bottom of the stack and the unicast node or the adjacency SID is at the top of the stack. The SID at the top of the stack must be configured first in the list and the replication SID at the bottom of the list must be configured last in the list.

The **no** form of this command removes the replication SID.

## Parameters

### *label*

Specifies the label of the replication SID; up to a maximum of 11 labels.

**Values** 3, 16 to 1048575, 4294967295

## Platforms

All

## 22.167 replication-threshold

```
replication-threshold
```

### Syntax

```
replication-threshold seconds
```

```
no replication-threshold
```

### Context

[\[Tree\]](#) (config>isa>nat-group>inter-chassis-redundancy replication-threshold)

### Full Context

```
configure isa nat-group inter-chassis-redundancy replication-threshold
```

### Description

This command configures the minimum duration of the flow that needs to be met before it is synchronized to the standby node. This way, flow synchronization and statefulness in a multi-chassis environment are limited only to long-lived flows.

The **no** form of this command reverts to the default values.

### Default

```
replication-threshold 20
```

### Parameters

***seconds***

Specifies the minimum flow existence time before it is synchronized.

**Values** 0 to 300

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.168 reply-on-padt

```
reply-on-padt
```

### Syntax

```
[no] reply-on-padt
```

## Context

[\[Tree\]](#) (config>subscr-mgmt>ppp-policy reply-on-padt)

## Full Context

configure subscriber-mgmt ppp-policy reply-on-padt

## Description

This command enables replying to PPPoE Active Discovery Terminate (PADT) packets. Some of the PPPoE clients expect reply on PADT message before the context of the session is cleared up. To support such client, a command enabling reply to PADT is provided.

The **no** form of this command reverts to the default.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.169 report-alarm

### report-alarm

## Syntax

**[no] report-alarm [ais] [los] [ oof] [rai] [looped]**

## Context

[\[Tree\]](#) (config>port>tdm>e3 report-alarm)

[\[Tree\]](#) (config>port>tdm>ds3 report-alarm)

## Full Context

configure port tdm e3 report-alarm

configure port tdm ds3 report-alarm

## Description

This command enables logging of DS-3 and E-3 alarms for a DS-3/E-3 port or channel.

The **no** form of this command disables logging of the specified alarms.

## Parameters

### ais

Reports alarm indication signal errors. When configured, **ais** alarms are not raised and cleared.

**Default**    **ais** alarms are issued

### los

Reports loss of signal errors. When configured, **los** traps are not raised and cleared.

**Default** **los** traps are issued

#### **oof**

Reports out-of-frame errors. When configured, **oof** alarms are not raised and cleared.

**Default** **oof** alarms are not issued

#### **rai**

Reports resource availability indicator events. When configured, **rai** events are not raised and cleared.

**Default** **rai** alarms are not issued

#### **looped**

Reports looped packets errors.

**Default** **looped** alarms are not issued

### **Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## report-alarm

### **Syntax**

[no] report-alarm [signal-fail] [remote] [ local] [no-frame-lock] [ high-ber] [no-block-lock] [ no-am-lock] [duplicate-lane]

### **Context**

[\[Tree\]](#) (config>port>ethernet report-alarm)

### **Full Context**

configure port ethernet report-alarm

### **Description**

This command specifies when and if to generate alarms and alarm clear notifications for this port.

#### **Note:**

For some DWDM transceivers, if the **configure port dwdm coherent rx-los-reaction squelch** command is disabled the signal-fail and no-am-lock alarm conditions are not reported when the media side of the transceiver has an RX LOS condition.

### **Parameters**

#### **signal-fail**

Reports an Ethernet signal lost alarm.

#### **remote**

Reports remote faults.

**local**

Reports local faults.

**no-frame-lock**

Reports a 'not locked on the Ethernet framing sequence' alarm.

**high-ber**

Reports High Bit Error Rate.

**no-block-lock**

Reports 40G/100G PCS Lanes Not Block Locked.

**no-am-lock**

Reports 40G/100G PCS Alignment Marker Loss of Lock.

**duplicate-lane**

Reports 40G/100G PCS Duplicate Lane Marker.

**Platforms**

All

## report-alarm

**Syntax**

**[no] report-alarm [loc] [lais] [ lrdi] [ss1f] [lb2er-sd] [lb2er-sf] [slof] [ slos] [lrei]**

**Context**

[\[Tree\]](#) (config>port>sonet-sdh report-alarm)

**Full Context**

configure port sonet-sdh report-alarm

**Description**

This command enables logging of SONET (SDH) line and section alarms for a SONET-SDH port. Only line and section alarms can be configured in the SONET/SDH context, for path alarms see the **sonet-sdh>path** context.

The **no** form of this command disables logging of the specified alarms.

This command is supported on TDM satellites.

**Parameters**

**loc**

Reports a loss of clock which causes the operational state of the port to be shut down.

**Default** **loc** alarms are issued

**lais**

Reports line alarm indication signal errors. When configured, **lais** alarms are raised and cleared.

**Default** **lais** alarms are not issued

#### **lrdi**

Reports line remote defect indication errors. LRDI's are caused by remote LOF, LOC, LOS. When configured, **lrdi** alarms are raised and cleared.

**Default** **lrdi** alarms are issued

#### **ss1f**

Reports section synchronization failure which is detected when the S1 byte is not consistent for 8 consecutive frames. When configured, **ss1f** alarms are raised and cleared.

**Default** **ss1f** alarms are not issued

#### **lb2er-sd**

Reports line signal degradation BER (bit interleaved parity) errors. Use the threshold command to set the error rate(s) that when crossed determine signal degradation and signal failure. When configured, **lb2er-sd** alarms are raised and cleared.

**Default** **lb2er-sd** alarms are not issued

#### **lb2er-sf**

Reports line signal failure BER errors. Use the threshold command to set the error rate(s) that when crossed determine signal degradation and signal failure. When configured, **lb2er-sf** alarms are raised and cleared.

**Default** **lb2er-sf** alarms are issued

#### **slof**

Reports section loss of frame errors. When configured, **slof** alarms are raised and cleared.

**Default** **slof** alarms are issued

#### **slos**

Reports a section loss of signal error on the transmit side. When configured, **slos** alarms are raised and cleared.

**Default** **slos** alarms are issued

#### **lrei**

Reports a line error condition raised by the remote as a result of b1 errors received from this node. When configured, **lrei** traps are raised but not cleared.

**Default** **lrei** traps are not issued

### **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## report-alarm

### Syntax

[no] report-alarm {pais | plop | prdi | pplm | prei}

### Context

[\[Tree\]](#) (config>port>sonet-sdh>path report-alarm)

### Full Context

configure port sonet-sdh path report-alarm

### Description

This command enables logging of SONET (SDH) path alarms for a SONET-SDH port. Only path alarms can be configured in the channel context.

The **no** form of this command disables logging of the specified alarms.

### Parameters

#### pais

Reports path alarm indication signal errors. When configured, **pais** alarms are raised and cleared.

**Default** pais alarms are not issued

#### plop

Reports path loss of pointer (per tributary) errors. When configured, **plop** traps are raised but not cleared.

**Default** plop traps are issued

#### prdi

Reports path remote defect indication errors. When configured, **prdi** alarms are raised and cleared.

**Default** prdi alarms are not issued

#### pplm

Reports a path payload mismatch, as a result the channel will be brought down. When configured, **pplm** traps are raised but not cleared.

**Default** pplm traps are issued

#### prei

Reports a path error condition raised by the remote as a result of b3 errors received from this node. When configured, **prei** traps are raised but not cleared.

**Default** prei traps are not issued

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## report-alarm

### Syntax

```
[no] report-alarm [ais] [los] [oof] [rai] [looped] [ber-sd] [ber-sf]
```

### Context

**[Tree]** (config>port>tdm>ds1 report-alarm)

### Full Context

```
configure port tdm e1 report-alarm
```

```
configure port tdm ds1 report-alarm
```

### Description

This command enables logging of DS-1/DS-3 or E-1/E-3 alarms for DS-1/DS-3 or E-1/E-3 ports or channels.

The **no** form of this command disables logging of the specified alarms.

### Parameters

#### ais

Reports alarm indication signal errors. When configured, **ais** alarms are not raised and cleared.

**Default** **ais** alarms are issued

#### los

Reports loss of signal errors. When configured, **los** traps are not raised and cleared.

**Default** **los** traps are issued.

#### oof

Reports out-of-frame errors. When configured, **oof** alarms are not raised and cleared.

**Default** **oof** alarms are not issued.

#### rai

Reports resource availability indicator events. When configured, **rai** events are not raised and cleared.

**Default** **rai** alarms are not issued

#### looped

Reports looped packets errors.

**looped alarms are not issuedlof**

Reports loss of frame errors. When configured, **lof** traps are not raised and cleared.

**Default** **lof** traps are issued

**ber-sd**

Specifies the BER that specifies signal degradation.

**ber-sf**

Specifies the BER that specifies signal failure.

**Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## report-alarm

**Syntax**

[no] report-alarm [stray] [malformed] [pktloss] [overrun] [underrun] [rpktloss] [rfault] [rrdi]

**Context**

[\[Tree\]](#) (config>service>cpipe>sap>cem report-alarm)

[\[Tree\]](#) (config>service>epipe>sap>cem report-alarm)

**Full Context**

configure service cpipe sap cem report-alarm

configure service epipe sap cem report-alarm

**Description**

This command indicates the type of CEM SAP alarm.

The **no** form of this command removes the parameter from the configuration.

**Default**

On: stray, malformed, pktloss and overrun

Off: rpktloss, rfault, rrdi

**Parameters****stray**

Reports the reception of packets not destined for this CES circuit.

**malformed**

Reports the reception of packet not properly formatted as CES packets.

**pktloss**

Reports the lack of reception of CES packets.

**overrun**

Reports the reception of too many CES packets resulting in a overrun of the receive jitter buffer.

#### **underrun**

Reports the reception of too few CES packets resulting in a overrun of the receive jitter buffer.

#### **rpktloss**

Reports that the remote peer is currently in packet loss status.

#### **rfault**

Reports that the remote TDM interface is currently not in service.

#### **rrdi**

Reports that the remote TDM interface is currently in RDI status.

### **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure service cpipe sap cem report-alarm

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

- configure service epipe sap cem report-alarm

## **report-alarm**

### **Syntax**

**report-alarm severity {tnc | qos | poa}**

**no report-alarm**

### **Context**

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>channel>video>analyzer>alarms report-alarm)

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>video>analyzer>alarms report-alarm)

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>channel>source-override>video>analyzer>alarms report-alarm)

### **Full Context**

configure mcast-management multicast-info-policy bundle channel video analyzer alarms report-alarm

configure mcast-management multicast-info-policy bundle video analyzer alarms report-alarm

configure mcast-management multicast-info-policy bundle channel source-override video analyzer alarms report-alarm

### **Description**

This command configures the type of alarm to monitor and raise through SNMP. The severity of alarms increases from TNC, to QoS, and then to POA. For example, if QoS alarms are configured, the analyzer only raises alarms and events related to QoS. The analyzer may raise alarms for POA events if they occur, but alarms for TNC are not sent.

**Default**

no report-alarm

**Parameters****severity**

Keyword to configure the type of alarm.

**tnc**

Specifies to monitor and raise alarms for TNC events.

**qos**

Specifies to monitor and raise alarms for QoS events.

**poa**

Specifies to monitor and raise alarms for POA events.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 22.170 report-alarms

### report-alarms

**Syntax**

[no] report-alarms [modflt] [mod] [ netrx] [nettx] [hosttx]

**Context**

[\[Tree\]](#) (config>port>dwdm>coherent report-alarms)

**Full Context**

configure port dwdm coherent report-alarms

**Description**

This command configures the alarms that will be reported for the coherent module.

**Default**

modflt mod netrx nettx hosttx

**Parameters****modflt**

Reports module fault alarm.

**mod**

Reports module alarm.

**netrx**

Reports network (optical side) receive alarm.

**nettx**

Reports network (optical side) transmit alarm.

**hosttx**

Reports host (electrical side) transmit alarm.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**report-alarms****Syntax**

```
[no] report-alarms [loc] [los] [lof] [lom] [otu-ais] [otu-ber-sf] [otu-ber-sd] [otu-bdi] [otu-tim] [otu-iae]
[otu-biae] [fec-sf] [fec-sd] [fec-fail] [fec-uncorr] [odu-ais] [odu-oci] [odu-lck] [odu-bdi] [odu-
tim] [opu-plm]
```

**Context**

[\[Tree\]](#) (config>port>otu report-alarms)

**Full Context**

configure port otu report-alarms

**Description**

This command enables OTU alarms. Specify specific alarms to add to the list of reported alarms. The **no** form of this command disables OTU alarm reporting.

**Default**

loc, los, lof, lom, otu-ber-sf, otu-bdi, fec-sf

**Parameters****alarms**

Refer to [Table 111: Alarm Descriptions](#) for alarm descriptions.

*Table 111: Alarm Descriptions*

Alarm	Description
loc	Loss of clock.
lof	Loss of OTU framing.
lom	Loss of Multi-frame.

Alarm	Description
los	Loss of signal transitions on the data.
otu-ais	OTU Alarm Indication Signal (all 1s, overwrites all OTU overhead, even framing bytes).
otu-ber-sf	SM Signal Fail (based on BPI8).
otu-ber-sd	SM Signal Degrade (based on BPI8).
otu-bdi	SM Backward defect indication.
otu-tim	SM Trace Id Mismatch.
otu-iae	SM Incoming Alignment Error.
otu-biae	SM Backward Incoming Alignment Error.
fec-sf	Signal Fail (based on FEC corrected bits).
fec-sd	Signal Degrade (based on FEC corrected bits).
fec-fail	FEC Mode mismatch (EFEC-GFEC) or High Uncorrectable rate (>10E-2).
fec-uncorr	One or More Uncorrectable FEC errors.
odu-ais	ODU Alarm Indication Signal.
odu-oci	ODU Open connection Indication.
odu-lck	ODU Locked.
odu-bdi	PM Backward Defect indication.
odu-tim	PM Trace Id Mismatch.
opu-plm	OPU PSI Payload Type Mismatch.

## 22.171 report-ip-address-event

report-ip-address-event

### Syntax

[no] report-ip-address-event

## Context

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>gx report-ip-address-event)

## Full Context

configure subscriber-mgmt diameter-application-policy gx report-ip-address-event

## Description

This command enables triggered CCR-u messages based on IP address allocation or de-allocation for the subscriber host.

If the requests for both IP address families (IPv4 and IPv6) arrive at approximately the same time, a single CCR-i is sent containing the IP addresses from both address families, IPv4 and IPv6 (NA, PD, or SLAAC). When the requests for IP addresses are not nearly simultaneous, the CCR-i contains only the IP address that was allocated first (the one that triggered the session creation). The request for the second IP address family, depending on configuration, triggers an additional CCR-u that will carry the IP address allocation update to the PCRF along with the UE\_IP\_ADDRESS\_ALLOCATE (18) event. The CCR-u content mirrors the content of the CCR-i with the exception of already allocated IP address(es).

When this command is disabled, IP address-triggered CCR-u messages are not sent.

The **no** form of this command disables the command.

## Default

report-ip-address-event

## 22.173 report-path-constraints

### report-path-constraints

#### Syntax

**report-path-constraints**

**no report-path-constraints**

#### Context

[\[Tree\]](#) (config>router>pcep>pcc report-path-constraints)

#### Full Context

configure router pcep pcc report-path-constraints

#### Description

This command enables the inclusion of LSP path constraints in the PCE report messages sent from the PCC to a PCE.

In order for the PCE to know about the original constraints for an LSP which is delegated, but for which there is no prior state in its LSP database, such as if no PCReq message was sent for the same PLSP-ID, the following proprietary behavior is observed:

- PCC appends a duplicate of each of the LSPA, METRIC, and BANDWIDTH objects in the PCRpt message. The only difference between two objects of the same type is that the P-flag is set in the common header of the duplicate object to indicate that it is a mandatory object for processing by PCE.
- The value of the metric or bandwidth in the duplicate object contains the original constraint value, while the first object contains the operational value. This is applicable to hop metrics in the METRIC and BANDWIDTH objects only. The SR OS PCC does not support configuring a boundary on the path computation IGP or TE metrics.
- The path computation on the PCE must use the first set of objects when updating a path if the PCRpt contained a single set. If the PCRpt contained a duplicate set, PCE path computation must use the constraints in the duplicate set.

The **no** form of the command disables the above behavior in case of interoperability issues with third-party PCE implementations.

## 22.174 report-rate

### report-rate

#### Syntax

**report-rate agg-rate-limit**  
**report-rate scheduler** *scheduler-name*  
**report-rate pppoe-actual-rate**  
**report-rate policer** *policer-id*  
**report-rate rfc5515-actual-rate**  
**no report-rate**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>sla-prof>ingress report-rate)

[\[Tree\]](#) (config>subscr-mgmt>sla-prof>egress report-rate)

#### Full Context

configure subscriber-mgmt sla-profile ingress report-rate  
configure subscriber-mgmt sla-profile egress report-rate

#### Description

This command configures the source for Tx and Rx connect speeds in AVP 38 (Rx Connect Speed) and AVP 24 (Tx Connect Speed) of an L2TP session established on a LAC.

The **no** form of this command reverts to the default.

#### Parameters

##### **agg-rate-limit**

Specifies that the rate (egress only) is taken from:

1. the agg-rate RADIUS override (RADIUS VSA "Alc-Subscriber-QoS-Override" in a RADIUS Access-Accept message) if present
2. the configured agg-rate-limit in the **config>subscr-mgmt>sub-prof>egr** context
3. fall back to the default (no report-rate)

##### **scheduler-name**

Specifies the rate taken from the **scheduler** *scheduler-name* up to 32 characters. If the **scheduler** *scheduler-name* is not present in the scheduler-policy configured in the **config>subscr-mgmt>sub-prof>egr** context, fall back to the default (no report-rate).

##### **pppoe-actual-rate**

Specifies rates taken from the DSL Line characteristics PPPoE tags (Actual Data Rate Upstream/Downstream) if present; otherwise fall back to the default (no report-rate).

***policer-id***

Specifies the rate taken from the policer with the specified ID.

**Values** 1 to 63

***rfc5515-actual-rate***

Puts the same value as the transmitted Actual-Data-Rate-Upstream AVP in the Rx-Connect-Speed AVP, and the same value as the transmitted Actual-Data-Rate-Downstream AVP in the Tx-Connect-Speed AVP

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.175 report-src-ip

### report-src-ip

**Syntax**

**report-src-ip** *ip-address*

**no report-src-ip**

**Context**

[\[Tree\]](#) (config>service>vpls>igmp-snooping report-src-ip)

**Full Context**

configure service vpls igmp-snooping report-src-ip

**Description**

This command configures the source IPv4 address used when generating IGMP reports. According the IGMPv3 standard, a zero source address is allowed in sending IGMP reports. However, for interoperability with some multicast routers, the source IP address of IGMP group reports can be configured using this command.

**Default**

report-src-ip 0.0.0.0

**Parameters*****ip-address***

Specifies the source IPv4 address in transmitted IGMP reports.

**Values** a.b.c.d

## Platforms

All

## report-src-ip

### Syntax

**report-src-ip** *ipv6-address*

**no report-src-ip**

### Context

[\[Tree\]](#) (config>service>vpls>mld-snooping report-src-ip)

### Full Context

configure service vpls mld-snooping report-src-ip

### Description

This command configures the source IPv6 address used when generating MLD reports. A zero source address is allowed in sending MLD reports. However, for interoperability with some multicast routers, the source IP address of MLD reports can be configured using this command.

### Default

report-src-ip 0:0:0:0:0:0:0

### Parameters

*ipv6-address*

Specifies the source IPv6 address in transmitted MLD reports.

**Values** x:x:x:x:x:x:x (eight 16-bit pieces)

## 22.177 reporting

### reporting

## Syntax

[no] reporting

## Context

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>gy>efh>interim-c reporting)

## Full Context

configure subscriber-mgmt diameter-application-policy gy extended-failure-handling interim-credit reporting

## Description

This command enables reporting of the used interim credit for each rating group when a new Diameter Gy session is successfully established with the Online Charging Server (OCS). When enabled, the used interim credit report includes:

- the unreported used credit assigned via the initial Diameter Gy session when Extended Failure Handling (EFH) became active
- the used interim credits during EFH
- the used credits assigned via the new established Diameter Gy session

The **no** form of this command disables interim credit reporting. Only credit assigned via the new established Diameter Gy session is reported.

## Platforms

**[Tree]** (config>service>epipe>spoke-sdp>control-channel-status request-timer)

**[Tree]** (config>service>cpipe>spoke-sdp>control-channel-status request-timer)

## Full Context

configure service vpls spoke-sdp control-channel-status request-timer

configure service epipe spoke-sdp control-channel-status request-timer

configure service cpipe spoke-sdp control-channel-status request-timer

## Description

This command configures the control channel status request mechanism. When it is configured, control channel status request procedures are used. These augment the procedures for control channel status messaging from RFC 6478. This command cannot be used with a non-zero refresh-timer value.

## Parameters

***timer1***

Specifies the interval, in seconds, at which pseudowire status messages, including a reliable delivery TLV with the "request" bit set, are sent.

**Values** 10 to 65535

**timer2**

specifies the timeout interval, in seconds, if no response to a pseudowire status request is received. This parameter must be configured. A value of zero (0) disables retries.

**Values** 0, 3 to 60

**multiplier**

If a requesting node does not receive a valid response to a pseudowire status request within a number of seconds equal to the retry timer multiplied by this multiplier, then it will assume the pseudowire is down. This parameter is optional.

**Values** 3 to 20

**Platforms**

**no reserved-label-block**

### Context

[\[Tree\]](#) (config>router>segment-routing>sr-policies reserved-label-block)

### Full Context

configure router segment-routing sr-policies reserved-label-block

### Description

This command associates a reserved label block with segment routing policies. The *name* must already exist. Reserved label blocks are configured under the **config>router>mpls-labels** hierarchy.

A locally-targeted segment routing policy (statically configured or BGP signaled) cannot be activated if its binding SID (BSID) is not an available label between the start-label and end-label of the referenced reserved label block.

The **no** form of this command removes any association of segment routing policies with a reserved label block.

### Default

no reserved-label-block

### Parameters

#### *name*

Specifies the name of a **reserved-label-block** that has already been configured, up to 64 characters.

### Platforms

All

## reserved-label-block

### Syntax

[no] reserved-label-block *name*

### Context

[\[Tree\]](#) (config>anysec reserved-label-block)

### Full Context

configure anysec reserved-label-block

### Description

This command assigns the label block that is reserved for ANYsec encryption SID under the **configure router mpls-labels** context. Without this reserved block, ANYsec cannot assign any encryption SIDs. The encryption SID uniquely identifies the encrypting node within a network and avoids double encryption scenarios. The encryption SID can be assigned per encryption group. However, all encryption groups can have the same encryption SID.

To save label space, Nokia recommends limiting the number of encryption SIDs within a network.

The **no** form of this command removes a reserved label block.

### Parameters

#### *name*

Specifies the name of the reserved label block.

### Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se

## 22.187 reserved-lbl-block

### reserved-lbl-block

#### Syntax

**reserved-lbl-block** *reserved-lbl-block*

**no reserved-lbl-block**

#### Context

[\[Tree\]](#) (config>router>p2mp-sr-tree reserved-lbl-block)

#### Full Context

configure router p2mp-sr-tree reserved-lbl-block

#### Description

This command configures the reserved label block name for the P2MP SR tree. Before configuring for the P2MP SR tree, the reserved label block name must be configured on the root node of the P2MP policy in the **config>router>mpls-labels** context.

The **no** form of this command removes the reserved label block name for the P2MP SR tree.

#### Default

no reserved-lbl-block

#### Parameters

*reserved-lbl-block*

Specifies the value of the reserved label block name, up to 64 characters.

#### Platforms

All

## 22.188 reserved-non-shaper-queues

### reserved-non-shaper-queues

#### Syntax

**reserved-non-shaper-queues** *range*

#### Context

[\[Tree\]](#) (config>qos>fp-resource-policy>aggregate-shapers reserved-non-shaper-queues)

## Full Context

configure qos fp-resource-policy aggregate-shapers reserved-non-shaper-queues

## Description

This command configures the number of egress queues which will not be used by hardware aggregate shapers.

## Parameters

### *range*

Specifies the number of queues which will not be used by hardware aggregate shapers

**Values** 2048 to 262144

**Default** 8192

## Platforms

7750 SR-1, 7750 SR-s

## 22.189 reset-on-recoverable-error

### reset-on-recoverable-error

## Syntax

[no] reset-on-recoverable-error

## Context

## Full Context

```
configure router mpls sr-te-resignal resignal-on-igp-event
```

## Description

This command introduces the ad-hoc resignaling of all SR-TE LSPs at the receipt of one or more IGP link down events in TE-DB. Once the re-optimization is triggered, the behavior is exactly the same as the timer based resignal or the **delay** option of the manual based resignal. MPLS forces the expiry of the resignal timer and asks TE-DB to re-evaluate the active paths of all SR-TE LSPs. The re-evaluation consists of updating the total IGP or TE metric of the current path, checking the validity of the hops and labels, and computing a new CSPF for each SR-TE LSP. MPLS programs the new path only if the total metric of the new computed path is different than the updated metric of the current path, or if one or more hops or labels of the current path are invalid. Otherwise, the current path is considered to be one of the most optimal ECMP paths and is not updated in data path.

## Platforms

## 22.194 resignal-on-igp-overload

### resignal-on-igp-overload

## Syntax

```
[no] resignal-on-igp-overload
```

## Context

[\[Tree\]](#) (config>router>mpls resignal-on-igp-overload)

## Full Context

```
configure router mpls resignal-on-igp-overload
```

## Description

This command enables the resignaling of all RSVP-TE LSPs at the receipt of the IS-IS overload bit in the TE-DB.

Once the re-optimization is triggered, the behavior is the same as the timer-based resignal or the **delay** option of the manual-based resignal. MPLS forces the expiry of the resignal timer and requests the TE-DB to compute a new CSPF for each RSVP-TE LSP active path.

This re-optimization effectively causes the immediate move of transit RSVP-TE LSP paths away from the IS-IS node in overload.

By default, MPLS re-optimizes, using the MBB procedure, the transit paths away from the node in an IS-IS overload state only at the time a manual or timer-based resignal is performed for the LSP paths. MPLS does not act immediately on the receipt of the IS-IS overload bit.

**Note:**

This command and the **retry-on-overload** command are mutually exclusive.

The **no** form of this command results in the MPLS not acting immediately to the request of the IS-IS overload bit.

**Default**

no resignal-on-overload

**Platforms**

All

## resignal-on-igp-overload

**Syntax**

[no] **resignal-on-igp-overload**

**Context**

[\[Tree\]](#) (config>router>mpls>sr-te-resignal resignal-on-igp-overload)

**Full Context**

configure router mpls sr-te-resignal resignal-on-igp-overload

**Description**

This command enables the ad-hoc re-optimization of the CSPF paths of all SR-TE LSPs when IS-IS receives an IS-IS overload bit advertisement from a remote router.

When this command is enabled on the router and an IGP overload bit is set in a Layer 1 or Layer 2 IS-IS LSP received from a remote router, MPLS performs an ad-hoc re-optimization of all the paths of all the SR-TE LSPs that have paths computed by the local CSPF. For each SR-TE LSP current path that transits the router in overload, the CSPF looks for a new path that avoids the router. For each SR-TE LSP current path that terminates on the router in overload, the CSPF checks if a better path exists. In both cases, if a new path is not found the system maintains the current path when operationally up.

The ad-hoc re-optimization triggers the timer-based re-optimization by forcing the resignal timer to expire. Therefore, the user must use the following command to configure the resignal timer for the SR-TE application.

```
configure router mpls sr-te-resignal resignal-timer
```

The **no** form of this command configures MPLS to not act immediately on an IS-IS overload bit from a remote router. MPLS will act on it at the next timer-based or manual re-optimization of the SR-TE LSPs.

**Default**

no resignal-on-igp-overload

## Platforms

All

## 22.195 resignal-timer

### resignal-timer

#### Syntax

**resignal-timer** *minutes*

**no resignal-timer**

#### Context

[\[Tree\]](#) (config>router>mpls resignal-timer)

#### Full Context

configure router mpls resignal-timer

#### Description

This command specifies the value for the LSP resignal timer. The resignal timer is the time, in minutes, the software waits before attempting to resignal the LSPs.

When the resignal timer expires, if the new computed path for an LSP has a better metric than the current recorded hop list, an attempt is made to resignal that LSP using the make-before-break mechanism. If the attempt to resignal an LSP fails, the LSP continues to use the existing path and a resignal will be attempted the next time the timer expires.

The **no** form of this command disables timer-based LSP resignaling.

#### Default

no resignal-timer

#### Parameters

*minutes*

Specifies the time the software waits before attempting to resignal the LSPs.

**Values** 30 to 10080

## Platforms

All

## resignal-timer

### Syntax

**resignal-timer** *minutes*

**no resignal-timer**

### Context

**[Tree]** (config>router>mpls>sr-te-resignal resignal-timer)

### Full Context

configure router mpls sr-te-resignal resignal-timer

### Description

This command specifies the value for the SR-TE LSP resignal timer when the path computation method is set to the local CSPF or the PCE.

The resignal timer is the time, in minutes, MPLS waits before attempting to re-optimize all paths of all SR-TE LSPs. The re-optimization is performed by the local CSPF or the PCE, depending on the value of the parameter **path-computation-method**.

When local CSPF is used and the resignal timer expires, MPLS provides the current path of the SR-TE LSP and TE-DB updates the total IGP or TE metric of the current path and checks the validity of the hops and labels. CSPF then computes a new path for each SR-TE LSP. MPLS programs the new path only if the total metric of the new computed path is different than the updated metric of the current path, or if one or more hops or labels of the current path are invalid. Otherwise, the current path is considered to be one of the most optimal ECMP paths and is not updated in data path.

The **no** form of this command disables timer-based LSP resignaling.

### Default

no resignal-timer

### Parameters

***minutes***

Specifies the time, in minutes, the software waits before attempting to resignal the SR-TE LSPs.

**Values** 30 to 10080

configure router bgp segment-routing-v6 family resolution

configure service vprn bgp-evpn segment-routing-v6 resolution

configure service vpls bgp-evpn segment-routing-v6 resolution

configure service epipe bgp-evpn segment-routing-v6 resolution

### Description

This command configures the resolution option for routes in the specified family.

The **no** form of the command reverts to the default.

### Default

resolution route-table

### Parameters

#### **route-table**

Keyword that specifies to resolve the route to the shortest-path SRv6 tunnel. If no such shortest-path tunnel is found, the resolution fails.

#### **tunnel-table**

Keyword that specifies to resolve the route directly to a tunnel in TTMv6. The system tries to find an SRv6 policy with a matching color and endpoint for BGP routes received with an SRv6 TLV and containing an SRv6 service SID in the IPv6 tunnel table. If none is found, the resolution fails.

#### **fallback-tunnel-to-route-table**

Keyword that specifies to first try resolving the route to a tunnel in the IPv6 tunnel table. If none is found in the IPv6 tunnel table, fall back to the shortest-path SRv6 resolution. If no such shortest-path tunnel is found in RTM, the resolution fails.

### Platforms

## 22.199 resolve-root-using

### resolve-root-using

#### Syntax

```
resolve-root-using {ucast-rtm | mcast-rtm}
```

#### Context

[\[Tree\]](#) (config>router>ldp resolve-root-using)

#### Full Context

```
configure router ldp resolve-root-using
```

#### Description

By default, MLDP resolves the FEC using the unicast RTM. When this command is set to **mcast-rtm**, MLDP will resolve the FEC using the multicast route table. The multicast route table does not include any IGP shortcuts, unlike the unicast RTM. MLDP cannot resolve a FEC using an IGP shortcut, so if IGP shortcuts are used for unicast, enable multicast MLDP lookups.

If this command is set to **mcast-rtm**:

- For FEC resolution using IGP, static or local, the ROOT in this FEC is resolved using the multicast RTM.
- A FEC being resolved using BGP is recursive, so the FEC next-hop (ASBR/ABR) is resolved using the multicast RTM first and, if this fails, it is resolved using the unicast RTM. This next-hop needs to be recursively resolved again using IGP/Static-Route or Local, this second resolution (recursive resolution) uses the multicast RTM only.
- In all cases, MLDP uses the unicast RTM to resolve the FEC and will not resolve the FEC if its next hop is resolved using an IGP shortcut.

#### Default

```
resolve-root-using ucast-rtm
```

## 22.200 resolve-static

### resolve-static

#### Syntax

[no] resolve-static

#### Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>default-action resolve-static)

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>action resolve-static)

#### Full Context

configure router policy-options policy-statement default-action resolve-static

configure router policy-options policy-statement entry action resolve-static

#### Description

This command has an affect only in BGP route-table-import policies and applies only to BGP IPv4 and IPv6 routes created by importing static routes with indirect next-hops. When such a route matches a policy entry with this action, the BGP next-hop is the resolved next-hop of the static route.

The **no** form of this command reverts to the default behavior, which copies the indirect next-hop of the static route into the BGP next-hop without resolving it further.

#### Default

no resolve-static

#### Platforms

All

## 22.202 responder-url

responder-url

**Syntax**

**responder-url** *url-string*  
**no responder-url**

**Context**

[\[Tree\]](#) (config>system>security>pki>ca-profile>ocsp responder-url)

**Full Context**

configure system security pki ca-profile ocsp responder-url

**Description**

This command specifies HTTP URL of the OCSP responder for the CA, this URL will only be used if there is no OCSP responder defined in the AIA extension of the certificate to be verified.

**Default**

no responder-url

**Parameters**

***url-string***

Specifies the HTTP URL of the OCSP responder

**Platforms**

All

## 22.203 response-signing-cert

## response-signing-cert

### Syntax

**response-signing-cert** *filename*  
**no response-signing-cert**

### Context

**[Tree]** (config>system>security>pki>ca-profile>cmp2 response-signing-cert)

### Full Context

configure system security pki ca-profile cmp2 response-signing-cert

### Description

This command specifies a imported certificate that is used to verify the CMP response message if they are protected by signature. If this command is not configured, then CA's certificate will be used.

### Default

no response-signing-cert

### Parameters

***filename***

Specifies the filename of the imported certificate.

## 22.204 restart-backoff

## restart-backoff

### Syntax

**restart-backoff** *initial-time seconds max-time seconds*  
**no restart-backoff**

### Context

**[Tree]** (config>subscr-mgmt>pppoe-client-policy restart-backoff)

### Full Context

configure subscriber-mgmt pppoe-client-policy restart-backoff

### Description

This command configures backoff timer parameters that determine how often and how long the system will attempt to restart a PPPoE client after a failure. When a client first fails, the system immediately tries to re-establish connectivity. If this attempt is also unsuccessful, the system initiates a backoff timer and waits

until it expires before attempting to restart the client again, to avoid flooding the BNG. The initial duration of the backoff timer is configured with the **initial-time** parameter. With each subsequent failure, the backoff timer is doubled until the configured **max-time** is reached.

The **no** form of this command reverts to the default.

## Default

```
restart-backoff initial-time 30 max-time 600
```

## Parameters

### *initial-time seconds*

Specifies the initial backoff time to wait before attempting a client restart.

**Values** 10 to 3600

### *max-time seconds*

Specifies the maximum time to attempt client restarts.

**Values** 10 to 3600

## Platforms

- [Tree] (config>service>vpls>endpoint restrict-protected-src)
- [Tree] (config>service>pw-template>split-horizon-group restrict-protected-src)

## Full Context

```

configure service vpls sap restrict-protected-src
configure service pw-template restrict-protected-src
configure service vpls spoke-sdp restrict-protected-src
configure service vpls split-horizon-group restrict-protected-src
configure service vpls mesh-sdp restrict-protected-src
configure service vpls endpoint restrict-protected-src
configure service pw-template split-horizon-group restrict-protected-src

```

## Description

This command indicates how the agent will handle relearn requests for protected MAC addresses, either manually added using the `mac-protect` command or automatically added using the **auto-learn-mac-protect** command. While enabled all packets entering the configured SAP, spoke SDP, mesh SDP, or any SAP that is part of the configured split horizon group (SHG) is verified not to contain a protected source MAC address. If the packet is found to contain such an address, the action taken depends on the parameter specified on the **restrict-protected-src** command, namely:

- **No parameter** — The packet is discarded, an alarm is generated and the SAP, spoke SDP or mesh SDP is set operationally down. The SAP, spoke SDP or mesh SDP must be shut down and enabled (**no shutdown**) for this state to be cleared.
- **alarm-only** — The packet is forwarded, an alarm is generated but the source MAC is not learned on the SAP, spoke SDP or mesh SDP.
- **discard-frame** — The packet is discarded and an alarm generated. The frequency of alarm generation is fixed to be at most one alarm per MAC address per FP per 10 minutes in a given VPLS service. This parameter is only applicable to automatically protected MAC addresses.

When the **restrict-protected-src** is enabled on an SHG the action only applies to the associated SAPs (no action is taken by default for spoke SDPs in the SHG) and is displayed in the SAP show output as the oper state unless it is overridden by the configuration of **restrict-protected-src** on the SAP itself. To enable this function for spoke SDPs within a SHG, the **restrict-protected-src** must be enabled explicitly under the spoke SDP. If required, **restrict-protected-src** can also be enabled explicitly under specific SAPs within the SHG.

When this command is applied or removed, with either the **alarm-only** or **discard-frame** parameters, the MAC addresses are cleared from the related object.

The use of **restrict-protected-src discard-frame** is mutually exclusive with the configuration of manually protected MAC addresses within a given VPLS.

The **alarm-only** parameter is not supported on the 7750 SR-a, 7750 SR-1e/2e/3e, 7950 XRS, 7750 SR-1, or 7750 SR-1s/2s/7s/14s platforms.

The **no** form of the command reverts to the default.

## Default

no restrict-protected-src

## Parameters

### alarm-only

Specifies that the packet is forwarded, an alarm is generated but the source MAC is not learned on the SAP, spoke SDP, or mesh SDP.

**Default** no alarm-only

### discard-frame

Specifies that the packet is discarded and an alarm generated. The frequency of alarm generation is fixed to be at most one alarm per MAC address per FP per 10 minutes within a given VPLS service.

**Default** no discard-frame

## Platforms

All

**no restrict-protected-src**

## Context

[\[Tree\]](#) (config>service>vpls>pbb>backbone-vpls restrict-protected-src)

## Full Context

configure service vpls pbb backbone-vpls restrict-protected-src

## Description

This command indicates how the agent handles relearn requests for protected MAC addresses, either manually added using the **mac-protect** command or automatically added using the **auto-learn-mac-protect** command. While enabled, all packets entering the configured SAP, spoke SDP, mesh SDP, or any SAP that is part of the configured split horizon group (SHG) is verified not to contain a protected source MAC address. If the packet is found to contain such an address, the action taken depends on the parameter specified on the **restrict-protected-src** command, namely:

- No parameter — The packet is discarded, an alarm is generated and the SAP, spoke SDP or mesh SDP will be set as operationally down. The SAP, spoke SDP or mesh SDP must be shutdown and enabled (no shutdown) for this state to be cleared.
- **discard-frame** — The packet is discarded and an alarm generated. The frequency of alarm generation is fixed to be at most one alarm per MAC address per FP per 10 minutes in a specified VPLS service. This parameter is only applicable to automatically protected MAC addresses.

When the **restrict-protected-src** is enabled on an SHG, the action only applies to the associated SAPs (no action is taken by default for spoke-SDPs in the SHG) and is displayed in the SAP show output as the oper state unless it is overridden by the configuration of **restrict-protected-src** on the SAP itself. To enable this function for spoke SDPs within a SHG, the **restrict-protected-src** must be enabled explicitly under the spoke SDP. If required, **restrict-protected-src** can also be enabled explicitly under specific SAPs within the SHG.

When this command is applied or removed, with the **discard-frame** parameter, the MAC addresses are cleared from the related object.

The use of **restrict-protected-src discard-frame** is mutually exclusive with the configuration of manually protected MAC addresses within a specified VPLS.

## Default

no restrict-protected-src

## Parameters

### discard-frame

Specifies that the packet is discarded and an alarm generated. The frequency of alarm generation is fixed to be at most one alarm per MAC address per FP per 10 minutes within a specified VPLS service

## Platforms

All

## restrict-protected-src

## 22.208 restrict-unprotected-dst

### restrict-unprotected-dst

#### Syntax

**restrict-unprotected-dst**

**no restrict-unprotected-dst**

#### Context

**[Tree]** (config>service>vpls restrict-unprotected-dst)

**[Tree]** (config>service>vpls>split-horizon-group restrict-unprotected-dst)

**[Tree]** (config>service>vpls>sap restrict-unprotected-dst)

**[Tree]** (config>service>pw-template>split-horizon-group restrict-unprotected-dst)

#### Full Context

configure service vpls restrict-unprotected-dst

configure service vpls split-horizon-group restrict-unprotected-dst

configure service vpls sap restrict-unprotected-dst

configure service pw-template split-horizon-group restrict-unprotected-dst

#### Description

This command indicates how the system will forward packets destined for an unprotected MAC address, either manually added using the **mac-protect** command or automatically added using the **auto-learn-mac-protect** command. While enabled all packets entering the configured SAP or SAPs within a split horizon group (but not spoke or mesh-SDPs) will be verified to contain a protected destination MAC address. If the packet is found to contain a non-protected destination MAC, it will be discarded. Detecting a non-protected destination MAC on the SAP will not cause the SAP to be placed in the operationally down state. No alarms are generated.

If the destination MAC address is unknown, even if the packet is entering a restricted SAP, with **restrict-unprotected-dst** enabled, it will be flooded.

#### Default

no restrict-unprotected-dst

configure system script-control script-policy results

## Description

This command is used to specify the location where the system writes the output of an event script's execution.

The **no** form of the command removes the file location from the configuration. Scripts will not execute if there is no result location defined.

## Default

no results

## Parameters

### *file-url*

Specifies the location to send CLI output from script runs. The *file-url* is a location, directory, and filename prefix to which a data and timestamp suffix is added when the results files are created during a script run, as follows:

*file-url*\_YYYYMMDD-hhmmss.uuuuuu.out

where:

YYYYMMDD — date

hhmmss — hours, minutes, and seconds

uuuuuu — microseconds (padded to 6 characters with leading zeros)

**Values** *local-url* | *remote-url*

*local-url* — [*cflash-id*] [*file-path*] 167 chars max, including *cflash-id*  
*file-path* 166 chars max

*remote url* — [{ftp:// | tftp://}login:password@remote-location/][*file-path*]  
255 characters max directory length 99 characters max each

*remote-location* — [*hostname* | *ipv4-address* | *ipv6-address*]

*ipv4-address* — *a.b.c.d*

*ipv6-address* — x:x:x:x:x:x[*-interface*] x:x:x:x:x:d.d.d.d[*-interface*] x  
— [0 to FFFF]H d — [0 to 255]D interface — 32 characters max, for link  
local addresses

*cflash-id* — cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

## 22.212 resv-cbs

### resv-cbs

## Syntax

**resv-cbs** *percent-or-default* **amber-alarm-action** **step** *percent* **max** *percent*

**resv-cbs** *percent-or-default*

**no resv-cbs**

## Context

**[Tree]** (config>port>access>egress>pool resv-cbs)

**[Tree]** (config>port>network>egress>pool resv-cbs)

**[Tree]** (config>port>access>ingress>pool resv-cbs)

**[Tree]** (config>port>access>egress>channel>pool resv-cbs)

## Full Context

configure port access egress pool resv-cbs

configure port network egress pool resv-cbs

configure port access ingress pool resv-cbs

configure port access egress channel pool resv-cbs

## Description

This command defines the percentage or specifies the sum of the pool buffers that are used as a guideline for CBS calculations for access and network ingress and egress queues. Two actions are accomplished by this command:

- A reference point is established to compare the currently assigned (provisioned) total CBS with the amount the buffer pool considers to be reserved. Based on the percentage of the pool reserved that has been provisioned, the over provisioning factor can be calculated.
- The size of the shared portion of the buffer pool is indirectly established. The shared size is important to the calculation of the instantaneous-shared-buffer-utilization and the average-shared-buffer-utilization variables used in Random Early Detection (RED) per packet slope plotting.

It is important to note that this command does not actually set aside buffers within the buffer pool for CBS reservation. The CBS value per queue only determines the point at which enqueueing packets are subject

to a RED slope. Oversubscription of CBS could result in a queue operating within its CBS size and still not able to enqueue a packet due to unavailable buffers. The `resv-cbs` parameter can be changed at any time.

If the total pool size is 10 Mb and the `resv-cbs` set to 5, the 'reserved size' is 500 kb.

The **no** form of this command clears all the adaptive configurations. There cannot be any adaptive sizing enabled for default **resv-cbs**.

## Default

`resv-cbs 30`

## Parameters

### *percent-or-default*

Specifies the pool buffer size percentage.

**Values** 0 to 100, **default**

### *amber-alarm-action step percent*

Specifies the percentage step-size for the reserved CBS size of the pool. When using the default value, the adaptive CBS sizing is disabled. To enable adaptive CBS sizing, **step percent** must be set to non-default value along with the **max** parameter. When reserved CBS is default adaptive CBS sizing cannot be enabled. The reserved CBS (Committed Burst Size) defines the amount of buffer space within the pool that is not considered shared.

**Values** 1 to 100

**Default** 0

### *max percent*

Specifies the maximum percentage for the reserved CBS size of the pool. When using the default value, the adaptive CBS sizing is disabled. To enable adaptive CBS sizing, **max** value must be set to non-default value along with the **step percent**. When reserved CBS is default adaptive CBS sizing cannot be enabled. The reserved CBS (Committed Burst Size) defines the amount of buffer space within the pool that is not considered shared. Max reserved CBS must not be more than the reserved CBS.

**Values** 1 to 100

**Default** 0

## Platforms

## resv-cbs

## Syntax

`resv-cbs min percentage max percentage`

`no resv-cbs`

## Context

[\[Tree\]](#) (config>card>fp>egress>wred-queue-control resv-cbs)

## Full Context

```
configure card fp egress wred-queue-control resv-cbs
```

## Description

This command defines the amount of buffers within the WRED mega-pool that will be set aside for WRED queues operating within their configured CBS thresholds. **Note** that the **min percentage** and **max percentage** parameters must be set to the same value. The forwarding plane protects against WRED queue buffer starvation by setting aside a portion of the buffers within the WRED mega-pool. The WRED queue CBS threshold defines when a WRED queue requests buffers from reserved portion of the WRED mega-pool and when it starts requesting buffers from the shared portion of the mega-pool. With proper oversubscription provisioning, this prevents a seldom active queue from being denied a buffer from the mega-pool when the shared portion of the mega-pool is congested.

The WRED mega-slope reserve CBS size is controlled in the same manner as the overall sizing of the WRED mega-pool. A min and max parameter is provided to scope the range that the reserved portion based on percentages of the WRED mega-pool current size.

The **no** form of this command immediately restores the default min and max percentage values for sizing the WRED mega-pool CBS reserve.

## Default

```
resv-cbs min 25.00 max 25.00
```

## Parameters

### **min percentage**

Specifies that the required keyword defines the minimum percentage of the WRED mega-pool buffers that will be applied to the CBS reserve. The value given for *percentage* must be less than or equal to the value given for the **max percentage**. Percentages are defined with an accuracy of hundredths of a percent in the nn.nn format (15.65 = 15.65%).

**Values** 0.00 to 99.99

**Default** 25.00

### **max percentage**

Specifies that the required keyword defines the maximum percentage of the WRED mega-pool buffers that may be applied to the CBS reserve. The value given for *percentage* must be greater than or equal to the value given for the **min percentage**. Percentages are defined with an accuracy of hundredths of a percent in the nn.nn format (15.65 = 15.65%).

**Values** 0.01 to 99.99

**Default** 25.00

### Parameters

#### ***percent-or-default***

Specifies the pool buffer size percentage.

**Values** 0 to 100, **default**

#### ***amber-alarm-action step percent***

Specifies the percentage step-size for the reserved CBS size of the pool. When using the default value, the adaptive CBS sizing is disabled. To enable adaptive CBS sizing, step percent must be set to non-default value along with the max parameter. When reserved

CBS is default adaptive CBS sizing cannot be enabled. The reserved CBS defines the amount of buffer space within the pool that is not considered shared.

**Values** 1 to 100

**Default** 0

### **max percent**

Specifies the maximum percentage for the reserved CBS size of the pool. When using the default value, the adaptive CBS sizing is disabled. To enable adaptive CBS sizing, **max** value must be set to non-default value along with the **step percent**. When reserved CBS is default adaptive CBS sizing cannot be enabled. The reserved CBS defines the amount of buffer space within the pool that is not considered shared. Max reserved CBS must not be more than the reserved CBS.

**Values** 1 to 100

**Default** 0

## **Full Context**

configure isa application-assurance-group qos egress to-subscriber pool resv-cbs

configure isa application-assurance-group qos egress from-subscriber pool resv-cbs

## **Description**

This command defines the percentage or specifies the sum of the pool buffers that are used as a guideline for CBS calculations for access and network ingress and egress queues. Two actions are accomplished by this command.

- A reference point is established to compare the currently assigned (provisioned) total CBS with the amount the buffer pool considers to be reserved. Based on the percentage of the pool reserved that has been provisioned, the over provisioning factor can be calculated.

- The size of the shared portion of the buffer pool is indirectly established. The shared size is important to the calculation of the instantaneous-shared-buffer-utilization and the average-shared-buffer-utilization variables used in Random Early Detection (RED) per packet slope plotting.

This command does not actually set aside buffers within the buffer pool for CBS reservation. The CBS value per queue only determines the point at which enqueueing packets are subject to a RED slope. Oversubscription of CBS could result in a queue operating within its CBS size and still not able to enqueue a packet due to unavailable buffers. The `resv-cbs` parameter can be changed at any time.

If the total pool size is 10 MB and the `resv-cbs` set to 5, the 'reserved size' is 500 KB.

The `no` form of this command restores the default value of 30.

### Default

`resv-cbs default`

### Parameters

#### *percent-or-default*

Specifies the pool buffer size percentage.

**Values** 0 to 100, default

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.213 resv-ret

### resv-ret

### Syntax

`resv-ret resv-ret`

### Context

[\[Tree\]](#) (config>isa>video-group resv-ret)

### Full Context

configure isa video-group resv-ret

### Description

This command provides a mechanism to reserve an explicit amount of egress bandwidth, in Mb/s, for RET for all the ISAs within a video group. If the amount of egress bandwidth is less than the reserved amount, FCC requests are discarded and only RET requests processed. The bandwidth is dynamically adjusted per ISA within the video group if an ISA becomes operational/non-operational within the group.

**Default**

resv-ret 0

**Parameters****resv-ret**

Specifies the egress bandwidth in Mb/s.

**Values** 0 to 10500

**Platforms**

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

debug router rsvp packet resvtear

### Description

This command debugs ResvTear packets.

The **no** form of the command disables the debugging.

### Parameters

**detail**

Displays detailed information about ResvTear packets.

### Platforms

All

## 22.216 ret

## ret

### Syntax

**ret** *percent*

### Context

[\[Tree\]](#) (config>isa>video-group>watermark>session ret)

[\[Tree\]](#) (config>isa>video-group>watermark>bandwidth ret)

### Full Context

configure isa video-group watermark session ret

configure isa video-group watermark bandwidth ret

## Description

This command sets the watermark to trigger the SNMP trap if the RET bandwidth or session exceeds the configured percentage. The bandwidth is the available egress bandwidth of the ISA. The SNMP trap is cleared when the consumption is lowered by 10%. For example, if the system resource of the bandwidth available is 10 Gb/s and the watermark is configured to be 90%, the SNMP trap is raised as the bandwidth exceeds 9 Gb/s (90% of 10 Gb/s). The SNMP trap is cleared when the bandwidth drops below 8.1 Gb/s (10% of 9 Gb/s = 0.9 Gb/s, and 9 Gb/s - 0.9 Gb/s = 8.1 Gb/s). The default value of the watermark is set at 90% of the system resources for both bandwidth and session.

## Default

ret 90

## Parameters

### *percent*

Specifies the percentage of the system resources per ISA.

**Values** 1 to 99

## Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 22.217 ret-session-timeout

### ret-session-timeout

## Syntax

**ret-session-timeout** *seconds*

**no ret-session-timeout**

## Context

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if ret-session-timeout)

## Full Context

configure mcast-management multicast-info-policy video-policy video-interface ret-session-timeout

## Description

By default, the video ISA will wait for 5 minutes before closing the RTCP session from the subscriber. The RTCP session can be adjusted from 5 second to 5 minutes. The timeout is applicable to both RET and FCC RTCP sessions.

The **no** form of the command reverts to the default.

**Default**

ret-session-timeout 300

**Parameters****seconds**

Specifies the RET session timeout, in seconds.

**Values** 5 to 300**Platforms**

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

configure system security ldap retry

**Description**

This command configures the number of retries for the SR OS in its attempt to reach the current LDAP server before attempting the next server.

The **no** form of this command reverts to the default value.

**Default**

retry 3

**Parameters*****count***

Specifies the number of retransmissions.

**Values** 1 to 10

**Default** 3

**Platforms**

All

## 22.224 retry-count

### retry-count

#### Syntax

**retry-count** [*count*]

**no retry-count**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>shcv-policy>periodic retry-count)

#### Full Context

configure subscriber-mgmt shcv-policy periodic retry-count

#### Description

This command configures the number of retransmissions.

The **no** form of this command reverts to the default.

#### Default

retry-count 1 — For trigger-type ip-conflict, host-limit-exceeded and mobility

retry-count 10 — For trigger-type inactivity and MAC learning

#### Parameters

##### *count*

Specifies the number of retransmissions in periodic connectivity verification.

**Values** 2 to 29

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### retry-count

#### Syntax

**retry-count** [*count*]

**no retry-count**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>shcv-policy>trigger retry-count)

## Full Context

configure subscriber-mgmt shcv-policy trigger retry-count

## Description

This command configures the number of retransmissions in periodic connectivity verification.

The **no** form of this command reverts to the default.

## Default

retry-count 1

## Parameters

### *count*

Specifies the number of retransmissions in periodic connectivity verification.

**Values** 1 to 29

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## retry-count

## Syntax

**retry-count** *retry-count*

**no retry-count**

## Context

[\[Tree\]](#) (config>service>epipe>spoke-sdp-fec retry-count)

## Full Context

configure service epipe spoke-sdp-fec retry-count

## Description

This optional command specifies the number of attempts software should make to reestablish the spoke SDP after it has failed. After each successful attempt, the counter is reset to zero.

When the specified number is reached, no more attempts are made and the spoke-sdp is put into the shutdown state.

Use the no shutdown command to bring up the path after the retry limit is exceeded.

The **no** form of this command reverts the parameter to the default value.

## Default

retry-count 30

## Parameters

### *retry-count*

The maximum number of retries before putting the spoke-sdp into the shutdown state.

**Values** 10 to 10000

## Platforms

All

## retry-count

## Syntax

**retry-count** *retry-count*

**no retry-count**

## Context

**[Tree]** (config>test-oam>ldp-treetrace>path-discovery retry-count)

**[Tree]** (config>test-oam>ldp-treetrace>path-probing retry-count)

## Full Context

configure test-oam ldp-treetrace path-discovery retry-count

configure test-oam ldp-treetrace path-probing retry-count

## Description

In the path discovery phase of the LDP tree trace feature, this command configures the number of retransmissions of an LSP trace message to discover the path of an LDP FEC when no response is received within the **timeout** parameter.

In the path-probing phase of the LDP tree trace, this command configures the number of retransmissions of an LSP ping message to probe the path of an LDP FEC when no response is received within the **timeout** parameter.

The **no** form of this command resets the retry count to its default value.

## Default

no retry-count

## Parameters

### *retry-count*

Specifies the maximum number of consecutive time outs allowed before failing a path probe (ping).

## Platforms

All

## retry-count

### Syntax

**retry-count** [*count*]

**no retry-count**

### Context

**[Tree]** (config>service>pw-routing retry-count)

### Full Context

configure service pw-routing retry-count

### Description

This optional command specifies the number of attempts software should make to re-establish the spoke SDP after it has failed. After each successful attempt, the counter is reset to zero.

When the specified number is reached, no more attempts are made and the spoke SDP is put into the shutdown state.

Use the **no shutdown** command to bring up the path after the retry limit is exceeded.

The **no** form of this command reverts the parameter to the default value.

### Default

no retry-count

### Parameters

**count**

Specifies the maximum number of retries before putting the spoke SDP into the shutdown state.

**Values** 10 to 10000

### Platforms

All

## 22.225 retry-interval

## retry-interval

### Syntax

**retry-interval** min *minimum* max *maximum*

## no retry-interval

### Context

[\[Tree\]](#) (config>aaa>route-downloader retry-interval)

### Full Context

configure aaa route-downloader retry-interval

### Description

This command sets the duration, in minutes, of the retry interval. The retry interval is the interval meant for the system to retry sending an Access Request message after the previous one was unanswered (not with an access reject but rather just a RADIUS failure or ICMP port unreachable). This timer is actually an exponential backoff timer that starts at **min** and is capped at **max** minutes.

The **no** form of this command reverts to the default values.

### Default

retry-interval min 10 max 20

### Parameters

#### min *minimum*

Specifies the duration, in minutes, of the retry interval. This duration grows exponentially after each sequential failure.

**Values** 1 to 1440

#### max *maximum*

Specifies the maximum duration, in minutes, of the retry interval.

**Values** 1 to 1440

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## retry-interval

### Syntax

**retry-interval** *milliseconds*

**no retry-interval**

### Context

[\[Tree\]](#) (config>router>wpp>portals>portal retry-interval)

[\[Tree\]](#) (config>service>vprn>wpp>portals>portal retry-interval)

## Full Context

```
configure router wpp portals portal retry-interval
configure service vprn wpp portals portal retry-interval
```

## Description

This command configures the time interval between two consecutive retransmissions. The **no** form of this command reverts to the default.

## Default

```
retry-interval 2000
```

## Parameters

### *milliseconds*

Specifies the time interval between two consecutive retransmissions.

**Values** 10 to 2000

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## retry-interval

## Syntax

```
retry-interval seconds
no retry-interval
```

## Context

[\[Tree\]](#) (config>system>security>pki>ca-prof>auto-crl-update retry-interval)

## Full Context

```
configure system security pki ca-profile auto-crl-update retry-interval
```

## Description

This command specifies the interval, in seconds, that the system waits before retrying the configured **url-entry** list when **schedule-type** is **next-update-based** and none of the URLs return a qualified CRL.

The **no** form of this command causes the system to retry immediately without waiting.

## Default

```
retry-interval 3600
```

## Parameters

### *seconds*

Specifies an interval, in seconds, before retrying to update the CRL.

**Values** 1 to 31622400

### Platforms

All

## retry-interval

### Syntax

**retry-interval** *seconds*

### Context

[\[Tree\]](#) (config>system>security>pki>cert-upd-prof retry-interval)

### Full Context

configure system security pki certificate-update-profile retry-interval

### Description

This command configures the retry interval after the update fails.

### Default

retry-interval 3600

### Parameters

*seconds*

Specifies a retry interval, in seconds, after a failed update.

**Values** 60 to 36000

### Platforms

All

## 22.226 retry-limit

## retry-limit

### Syntax

**retry-limit** *number*

**no retry-limit**

## Context

[\[Tree\]](#) (config>router>mpls>lsp retry-limit)

[\[Tree\]](#) (config>router>mpls>lsp-template retry-limit)

## Full Context

configure router mpls lsp retry-limit

configure router mpls lsp-template retry-limit

## Description

This optional command specifies the number of attempts software should make to re-establish the LSP after it has failed LSP. After each successful attempt, the counter is reset to zero.

When the specified number is reached, no more attempts are made and the LSP path is put into the **shutdown** state.

Use the config router **mpls lsp *lsp-name* no shutdown** command to bring up the path after the retry-limit is exceeded.

For P2MP LSP that are created based on the LSP template, all S2Ls must attempt to retry-limit before the client application is informed of failure.

The **no** form of this command reverts to the default value.

## Default

retry-limit 0 (no limit, retries forever)

## Parameters

### *number*

Specifies the number of times software will attempt to re-establish the LSP after it has failed. Allowed values are integers in the range of 0 to 10000.

**Values** 0 to 10000

## Platforms

All

## 22.227 retry-on-igp-overload

retry-on-igp-overload

## Syntax

[no] retry-on-igp-overload

## Context

[\[Tree\]](#) (config>router>mpls retry-on-igp-overload)

## Full Context

```
configure router mpls retry-on-igp-overload
```

## Description

This command allows for the global configuration of the handling in the ingress LER of the LSP paths which transit an LSR that advertised the IS-IS overload bit.

By default, MPLS re-optimizes using make-before-break (MBB) the transit paths away from the node in an IS-IS overload state only at the time a manual or timer-based re-signal is performed for the LSP paths. MPLS will not act immediately on the receipt of the IS-IS overload bit.

When this command is enabled, MPLS in the ingress LER immediately tears down and re-signals all LSP paths away from a transit LSR node which advertised the IS-IS overload bit.

LSP paths that terminate on the node that advertised the IS-IS overload bit are not acted on whether this command is enabled or disabled.

The **no** form of this command returns to the default behavior.

## Platforms

All

## 22.228 retry-timeout

### retry-timeout

## Syntax

```
retry-timeout timer
```

```
no retry-timeout
```

## Context

[\[Tree\]](#) (config>port>ethernet>dwl retry-timeout)

## Full Context

```
configure port ethernet down-when-looped retry-timeout
```

## Description

This command configures the minimum wait time before re-enabling port after loop detection.

## Default

```
no retry-timeout
```

## Parameters

*timer*

Specifies the minimum wait time before re-enabling port after loop detection.

**Values** 0, 10 to 160

## Platforms

All

## retry-timeout

## Syntax

**retry-timeout** *timeout*

**no retry-timeout**

## Context

**[Tree]** (config>service>template>vpls-template>mac-move retry-timeout)

**[Tree]** (config>service>vpls>mac-move retry-timeout)

## Full Context

configure service template vpls-template mac-move retry-timeout

configure service vpls mac-move retry-timeout

## Description

This indicates the time in seconds to wait before a SAP that has been disabled after exceeding the maximum relearn rate is re-enabled.

It is recommended that the retry-timeout value is larger or equal to 5s \* cumulative factor of the highest priority port so that the sequential order of port blocking will not be disturbed by re-initializing lower priority ports.

A zero value indicates that the SAP will not be automatically re-enabled after being disabled. If, after the SAP is re-enabled it is disabled again, the retry timeout is increased with the provisioned retry timeout in order to avoid thrashing. For example, when retry-timeout is set to 15, it increments (15,30,45,60...).

The **no** form of this command reverts to the default value.

## Default

retry-timeout 10 (when mac-move is enabled)

## Parameters

### *timeout*

Specifies the time, in seconds, to wait before a SAP that has been disabled after exceeding the maximum relearn rate is re-enabled.

**Values** 0 to 120

## Platforms

All

## 22.229 retry-timer

### retry-timer

#### Syntax

**retry-timer** *retry-timer*

**no retry-timer**

#### Context

**[Tree]** (config>service>epipe>spoke-sdp-fec retry-timer)

#### Full Context

configure service epipe spoke-sdp-fec retry-timer

#### Description

This command specifies a retry-timer for the spoke SDP. This is a configurable exponential back-off timer that determines the interval between retries to reestablish a spoke SDP if it fails and a label withdraw message is received with the status code "All unreachable".

The **no** form of this command reverts the timer to its default value.

#### Default

retry-timer 30

#### Parameters

***retry-timer***

The initial retry-timer value in seconds.

**Values** 10 to 480

#### Platforms

All

### retry-timer

#### Syntax

**retry-timer** *seconds*

**no retry-timer**

#### Context

**[Tree]** (config>router>mpls>lsp retry-timer)

[\[Tree\]](#) (config>router>mpls>lsp-template retry-timer)

### Full Context

```
configure router mpls lsp retry-timer
configure router mpls lsp-template retry-timer
```

### Description

This command configures the time (in s), for LSP re-establishment attempts after it has failed. The retry time is jittered to +/- 25% of its nominal value.

For P2MP LSP created based on LSP template, all S2Ls must attempt to retry-limit before client application is informed of failure.

The **no** form of this command reverts to the default value.

### Default

```
retry-timer 30
```

### Parameters

#### *seconds*

Specifies the amount of time (in s), between attempts to re-establish the LSP after it has failed. Allowed values are integers in the range of 1 to 600.

**Values** 1 to 600

### Platforms

All

## retry-timer

### Syntax

```
retry-timer secs
no retry-timer
```

### Context

[\[Tree\]](#) (config>service>pw-routing retry-timer)

### Full Context

```
configure service pw-routing retry-timer
```

### Description

This command configures a retry-timer for the spoke-SDP. This is a configurable exponential back-off timer that determines the interval between retries to re-establish a spoke-SDP if it fails and a label withdraw message is received with the status code "All unreachable".

The **no** form of this command reverts the timer to its default value.

**Default**

no retry-timer

**Parameters**

**secs**

Specifies initial retry-timer value in seconds.

**Values** 10 to 480

**Platforms**

All

## 22.230 return-path

```
return-path
```

**Syntax**

```
return-path
```

**Context**

[\[Tree\]](#) (config>test-oam>link-meas>template>twl return-path)

**Full Context**

```
configure test-oam link-measurement measurement-template twamp-light return-path
```

**Description**

Commands in this context configure the return-path TLV for the test packet.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.231 return-path-bfd-sid

```
return-path-bfd-sid
```

**Syntax**

```
return-path-bfd-sid ipv6-address
```

```
no return-path-bfd-sid
```

**Context**

[\[Tree\]](#) (conf>router>segment-routing>sr-policies>policy>srv6 return-path-bfd-sid)

**Full Context**

configure router segment-routing sr-policies static-policy segment-routing-v6 return-path-bfd-sid

**Description**

This command configures the Seamless Bidirectional Forwarding Detection (S-BFD) session to echo mode and pushes an additional SRv6 SID in the SRH on S-BFD packets only.

The command applies to the initiator of the S-BFD sessions. The return path SID refers to a binding SID on a SRv6 policy configured on the far-end router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this SRv6 return path.

The **no** form of this command disables the controlled return-path SID and echo mode for S-BFD. If the command is deleted, the S-BFD session returns to asynchronous mode and the initiator node does not push a return-path SID. Any S-BFD packets for this SRv6 policy that the terminating router receives are sent back using a routed return path.

**Parameters*****ipv6-address***

Specifies the IPv6 address.

- Values**
- x:x:x:x:x:x:x (eight 16-bit pieces)
  - x:x:x:x:x:d.d.d.d
  - x: [0 to FFFF]H
  - d: [0 to 255]D

**Platforms**

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

**22.232 return-path-label****return-path-label****Syntax**

**return-path-label** *label-value*

**no return-path-label**

**Context**

[\[Tree\]](#) (config>router>mpls>lsp>bfd return-path-label)

[\[Tree\]](#) (config>router>mpls>lsp>primary>bfd return-path-label)

[\[Tree\]](#) (config>router>segment-routing>main-plcy return-path-label)

[\[Tree\]](#) (config>router>mpls>lsp>sec>bfd return-path-label)

[\[Tree\]](#) (config>router>mpls>lsp-template>bfd return-path-label)

## Full Context

configure router mpls lsp bfd return-path-label

configure router mpls lsp primary bfd return-path-label

configure router segment-routing maintenance-policy return-path-label

configure router mpls lsp secondary bfd return-path-label

configure router mpls lsp-template bfd return-path-label

## Description

This command configures the Seamless Bidirectional Forwarding Detection (S-BFD) session to echo mode and adds an additional MPLS label, referring to an MPLS-labeled reply path for the S-BFD packet, to the bottom of the label stack for the S-BFD packet.

The command applies to the initiator of the S-BFD sessions. The return-path label may be a binding SID for an SR policy or other MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this MPLS return path.

The **no** form of this command disables the controlled return-path label and echo mode for S-BFD. S-BFD returns to asynchronous mode and the initiator node does not push a return-path label. Any S-BFD packets for this LSP or path that the reflector receives are sent back using a routed return path.

## Default

no return-path-label

## Parameters

### *label-value*

Specifies the label value.

**Values** 32 to 1048512

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure router mpls lsp-template bfd return-path-label
- configure router mpls lsp secondary bfd return-path-label
- configure router mpls lsp primary bfd return-path-label
- configure router mpls lsp bfd return-path-label

All

- configure router segment-routing maintenance-policy return-path-label

## 22.233 reuse

```
reuse
```

### Syntax

```
reuse integer
```

```
no reuse
```

### Context

[\[Tree\]](#) (config>router>policy-options>damping reuse)

### Full Context

```
configure router policy-options damping reuse
```

### Description

This command configures the reuse parameter for the route damping profile.

When the Figure of Merit (FoM) value falls below the **reuse** threshold, the route is once again considered valid and can be reused or included in route advertisements.

The **no** form of this command removes the reuse parameter from the damping profile.

### Default

```
no reuse
```

### Parameters

*integer*

Specifies the reuse value expressed as a decimal integer.

**Values** 1 to 20000

### Platforms

All

## 22.234 reuse-ext-ip

```
reuse-ext-ip
```

### Syntax

```
[no] reuse-ext-ip
```

## Context

[\[Tree\]](#) (config>service>nat>pcp-server-policy reuse-ext-ip)

## Full Context

configure service nat pcp-server-policy reuse-ext-ip

## Description

This command enables the system to reuse the external IP address assigned to a subscriber when the requested well-known port or external IP mapping is not available.

The **no** form of this command causes a request for a well-known port to be allocated exactly as requested but on a different external IP address from the one that the subscriber is already using. This occurs if the requested well-known port is already allocated to another subscriber which is sharing the same external IP address. The existing external IP address is initially allocated to the subscriber by the virtue of initial traffic flow.

## Default

no reuse-ext-ip

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.235 reverse-path

### reverse-path

## Syntax

[no] reverse-path

## Context

[\[Tree\]](#) (config>router>mpls>mpls-tp>transit-path reverse-path)

## Full Context

configure router mpls mpls-tp transit-path reverse-path

## Description

This command enables the reverse path of an MPLS-TP reverse path to be created or edited.

The reverse path must be created after the forward path.

The **no** form of this command removes the reverse path. The reverse path must be removed before the forward path.

**Default**

no reverse-path

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.236 revert

### revert

**Syntax**

**revert** {**latest-rb** | *checkpoint-id* | **rescue**} [**now**]

**Context**

[\[Tree\]](#) (admin>rollback revert)

**Full Context**

admin rollback revert

**Description**

This command initiates a configuration rollback revert operation that will return the configuration state of the node to a previously saved checkpoint. The rollback revert minimizes impacts to running services. There are no impacts in areas of configuration that did not change since the checkpoint. Configuration parameters that changed (or items on which changed configuration have dependencies) are first removed (revert to default) and the previous values are then restored (can be briefly service impacting in changed areas).

**Parameters****latest-rb**

Specifies the most recently created rollback checkpoint (corresponds to the file-url.rb rollback checkpoint file).

**checkpoint-id**

Specifies the configuration to return to (which rollback checkpoint file to use). Checkpoint-id of 1 corresponds to the file-url.rb.1 rollback checkpoint file. The higher the id, the older the checkpoint. Max is the highest rollback checkpoint supported or configured.

**Values** 1 to 9

**rescue**

Specifies to revert to the rescue checkpoint.

**now**

Forces a rollback revert without any interactive confirmations (assumes 'y' for any confirmations that would have occurred).

## Platforms

All

revert

## Syntax

[no] revert

## Context

[\[Tree\]](#) (config>system>sync-if-timing revert)

## Full Context

configure system sync-if-timing revert

## Description

This command allows the clock to revert to a higher priority reference if the current reference goes offline or becomes unstable. When the failed reference becomes operational, it is eligible for selection. When the mode is non-revertive, a failed clock source is not selected again.

## Default

no revert

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.237 revert-members

revert-members

## Syntax

revert-members [1..8]

no revert-members

## Context

[\[Tree\]](#) (config>service>vprn>isis>link-group>level revert-members)

## Full Context

configure service vprn isis link-group level revert-members

## Description

This command sets the threshold for the minimum number of operational links to return the associated link group to its normal operating state and remove the associated offsets to the IS-IS metrics. If the number of operational links is equal to or greater than the configured **revert-members** threshold, the configured offsets are removed.

The **no** form of this command reverts the threshold back to the default, which is equal to the **oper-members** threshold value.

## Default

no revert-members *oper-members*

## Parameters

**1..8**

Specifies the number of revert members.

**Values** 1 to 8

## Platforms

All

## revert-members

## Syntax

**revert-members** [*1..8*]

**no revert-members**

## Context

[\[Tree\]](#) (config>router>isis>link-group>level revert-members)

## Full Context

configure router isis link-group level revert-members

## Description

This command sets the threshold for the minimum number of operational links to return the associated link group to its normal operating state and remove the associated offsets to the IS-IS metrics. If the number of operational links is equal to or greater than the configured revert-member threshold then the configured offsets are removed.

The **no** form of this command reverts the threshold back to the default which is equal to the oper-member threshold value.

## Default

no revert-members oper-members

## Parameters

1..8

Specifies the threshold for revertive members.

**Values** 1 to 8

## Platforms

All

## 22.238 revert-time

### revert-time

#### Syntax

**revert-time** *minutes*

**no revert-time**

#### Context

[\[Tree\]](#) (config>port>aps revert-time)

#### Full Context

configure port aps revert-time

#### Description

This command configures the revert-time timer to determine how long to wait before switching back to the working circuit after that circuit has been restored into service.

A change in the *minutes* value takes effect upon the next initiation of the wait to restore (WTR) timer. It does not modify the length of a WTR timer that has already been started. The WTR timer of a non-revertive switch can be assumed to be infinite.

The **no** form of this command restores the default (non-revertive mode).

#### Default

The default is to not revert back unless the protect circuit fails or there is an operator intervention.

#### Parameters

*minutes*

Specifies the time, in minutes, to wait before reverting back to the original working circuit after it has been restored into service.

**Values** 0 to 60 minutes

**Default** 5

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## revert-time

### Syntax

**revert-time** *time*

**no revert-time**

### Context

**[Tree]** (config>eth-tunnel revert-time)

### Full Context

configure eth-tunnel revert-time

### Description

This command configure how long to wait before switching back to the primary path after it has been restored to Ethernet tunnel.

The **no** form of this command disables the revert behavior, effectively setting the revert time to zero.

### Default

no revert-time

### Parameters

*time*

Specifies the re-activation delay, in seconds, for the primary path.

**Values** 1 to 720

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## revert-time

### Syntax

**revert-time** [*revert-time* | **infinite**]

**no revert-time**

### Context

**[Tree]** (config>service>ipipe>endpoint revert-time)

**[Tree]** (config>service>cpipe>endpoint revert-time)

[\[Tree\]](#) (config>service>epipe>endpoint revert-time)

### Full Context

```
configure service ipipe endpoint revert-time
configure service cpipe endpoint revert-time
configure service epipe endpoint revert-time
```

### Description

This command configures the time to wait before reverting back to the primary spoke SDP defined on this service endpoint, after having failed over to a backup spoke SDP.

### Parameters

#### *revert-time*

Specifies the time, in seconds, to wait before reverting to the primary SDP.

**Values** 0 to 600

**Default** 0

#### *infinite*

Causes the endpoint to be non-revertive.

### Platforms

All

- configure service epipe endpoint revert-time
  - configure service ipipe endpoint revert-time
- 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS
- configure service cpipe endpoint revert-time

## revert-time

### Syntax

**revert-time** *revert-time* | **infinite**

**no revert-time**

### Context

[\[Tree\]](#) (config>service>vpls>endpoint revert-time)

### Full Context

```
configure service vpls endpoint revert-time
```

## Description

This command configures the time to wait before reverting to primary spoke-SDP.

In a regular endpoint the revert-time setting affects just the pseudowire defined as primary (precedence 0). For a failure of the primary pseudowire followed by restoration the revert-timer is started. After it expires the primary pseudowire takes the active role in the endpoint. This behavior does not apply for the case when both pseudowires are defined as secondary. For example, if the active secondary pseudowire fails and is restored it will stay in standby until a configuration change or a force command occurs.

## Parameters

### *revert-time*

Specifies the time to wait, in seconds, before reverting back to the primary spoke-SDP defined on this service endpoint, after having failed over to a backup spoke-SDP

**Values** 0 to 600

### *infinite*

Specifying this keyword makes endpoint non-revertive

## Platforms

All

## revert-time

## Syntax

**revert-time** {*revert-time* | **infinite**}

**no revert-time**

## Context

[\[Tree\]](#) (config>mirror>mirror-dest>endpoint revert-time)

## Full Context

configure mirror mirror-dest endpoint revert-time

## Description

This command configures the time to wait before reverting to the primary spoke SDP. This command has an effect only when used in conjunction with an endpoint which contains a SDP of type 'primary'. It is ignored and has no effect in all other cases. The revert-timer is the delay in seconds the system waits before it switches the path of the mirror service from an active secondary SDP in the endpoint into the endpoint primary SDP after the latter comes back up.

The **no** form of this command resets the timer to the default value of 0. This means that the mirror-service path is switched back to the endpoint primary sdp immediately after it comes back up.

## Parameters

### *revert-time*

Specifies a delay, in seconds, the system waits before it switches the path of the mirror service from an active secondary SDP in the endpoint into the endpoint primary SDP after the latter comes back up.

**Values** 0 to 600

### **infinite**

Forces the mirror or LI service path to never revert to the primary SDP as long as the currently active secondary SDP is UP.

## **Platforms**

All

## **revert-time**

### **Syntax**

**revert-time** {*revert-time* | **infinite**}

**no revert-time**

### **Context**

[\[Tree\]](#) (config>service>sdp>mixed-lsp-mode revert-time)

### **Full Context**

configure service sdp mixed-lsp-mode revert-time

### **Description**

This command configures the delay period the SDP must wait before it reverts to a higher priority LSP type when one becomes available.

The **no** form of the command resets the timer to the default value of 0. This means the SDP reverts immediately to a higher priority LSP type when one becomes available.

### **Default**

no revert-time

### **Parameters**

#### ***revert-time***

Specifies the delay period, in seconds, that the SDP must wait before it reverts to a higher priority LSP type when one becomes available. A value of zero means the SDP reverts immediately to a higher priority LSP type when one becomes available.

**Values** 0 to 600

#### **infinite**

This keyword forces the SDP to never revert to another higher priority LSP type unless the currently active LSP type is down.

## Platforms

All

## revert-time

### Syntax

**revert-time** *time*

**no revert-time**

### Context

[\[Tree\]](#) (config>eth-ring revert-time)

### Full Context

configure eth-ring revert-time

### Description

This command configures the revert time for an Eth-Ring. It ranges from 60 seconds to 720 second by 1 second intervals.

The **no** form of this command means non-revertive mode and revert time is essentially 0, and the revert timers are not set.

### Default

revert-time 300

### Parameters

*time*

Specifies the guard-time, in seconds.

**Values** 60 to 720

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.239 revert-timer

## revert-timer

### Syntax

**revert-timer** *timer-value*

**no revert-timer**

## Context

[\[Tree\]](#) (config>router>mpls>lsp revert-timer)

## Full Context

configure router mpls lsp revert-timer

## Description

This command configures a revert timer on an LSP. The timer starts when the LSP primary path recovers from a failure. The LSP reverts from a secondary path to the primary path when the timer expires, or when the secondary path fails.

The **no** form of this command cancels any currently outstanding revert timer. If the LSP is up when a no revert-timer is issued, the LSP will revert to the primary path. Otherwise the LSP reverts when the primary path is restored.

## Default

no revert-timer

## Parameters

### *timer-value*

Specifies the amount of time, in one minute increments, between attempts to re-establish the LSP after it has failed.

**Values** 1 to 4320

## Platforms

All

## revert-timer

## Syntax

**revert-timer** *seconds*

**no revert-timer**

## Context

[\[Tree\]](#) (config>router>mpls>fwd-policies>fwd-policy revert-timer)

## Full Context

configure router mpls forwarding-policies forwarding-policy revert-timer

## Description

This command configures the revert timer in an MPLS forwarding policy.

When the primary direct or indirect next hop is restored and is added back into the routing table, CPM waits for an amount of time equal to the user-programmed revert timer before activating it and updating the

data path. However, if the backup direct or indirect next hop fails while the timer is running, CPM activates it and updates the data path immediately.

A value of 0 disables the revert timer; meaning the policy reverts immediately.

The **no** form of this command removes the revert timer from the MPLS forwarding policy.

## Default

revert-timer 0

## Parameters

### *seconds*

Specifies the revert-timer value, in number of seconds.

**Values** 1 to 600

## Platforms

All

## revert-timer

## Syntax

**revert-timer** *revert-timer*

**no revert-timer**

## Context

[\[Tree\]](#) (config>router>segment-routing>maintenance-policy revert-timer)

## Full Context

configure router segment-routing maintenance-policy revert-timer

## Description

This command configures the revert timer for SR Policy candidate paths.

The revert timer is started when the primary path (for example, the best preference programmed candidate path) recovers (for example, after the number of S-BFD sessions that are up is  $\geq$  **threshold** and the **hold-down-timer** has expired) and switches back when the timer expires.

The **no** form of this command removes the revert timer from the SR policy.

## Default

no revert-timer

## Parameters

### *revert-timer*

Specifies the revert timer, in minutes.

**Values** 1 to 4320

### Platforms

All

## 22.240 revertive

revertive

### Syntax

[no] revertive

### Context

[\[Tree\]](#) (config>router>mpls>mpls-tp>protection-template revertive)

### Full Context

configure router mpls mpls-tp protection-template revertive

### Description

This command configured revertive behavior for MPLS-TP linear protection. The protect-tp-path MEP must be in the shutdown state for of the MPLS-TP LSPs referencing this protection template in order to change the revertive parameter.

### Default

revertive

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

revertive

### Syntax

[no] revertive

### Context

[\[Tree\]](#) (config>redundancy>multi-chassis>ipsec-domain revertive)

### Full Context

configure redundancy multi-chassis ipsec-domain revertive

## Description

This command configures whether to allow a revertive activity state after a designated active state recovers from an ineligibility event. The revertive function allows a router in an N:M domain to automatically take over as the active router in the domain, when it becomes eligible to do so.

The **no** form of this command reverts to the default value.

## Default

no revertive

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.241 revertive-timer

### revertive-timer

## Syntax

**revertive-timer** *sec*

**no revertive-timer**

## Context

**[Tree]** (config>service>vprn>mvpn>pt>selective>umh-rm>group>source revertive-timer)

**[Tree]** (config>service>vprn>mvpn>pt>inclusive>umh-rm revertive-timer)

## Full Context

configure service vprn mvpn provider-tunnel selective umh-rate-monitoring group source revertive-timer

configure service vprn mvpn provider-tunnel inclusive umh-rate-monitoring revertive-timer

## Description

This command configures the timer value (in seconds) after which to revert to the primary UMH after traffic is restored. This value must account for the traffic flapping from the primary UMH. If there is traffic flapping, the timer resets and starts over.

The **no** form of the command means that there is no revertive behavior.

## Default

no revertive-timer

## Parameters

**sec**

Specifies the timer value (in seconds).

**Values** 1 to 3600

## Platforms

All

## 22.242 revocation-check

### revocation-check

#### Syntax

**revocation-check** {**crl** | **crl-optional**}

#### Context

[\[Tree\]](#) (config>system>security>pki>ca-profile revocation-check)

#### Full Context

configure system security pki ca-profile revocation-check

#### Description

This command specifies the revocation method system used to check the revocation status of certificate issued by the CA, the default value is **crl**, which will use CRL. But if it is **crl-optional**, then it means when the user disables the ca-profile, then the system will try to load the configured CRL (specified by the **crl-file** command). However, if the system fails to load it for following reasons, then the system still brings the ca-profile oper-up, but leaves the CRL as **non-exist**.

- CRL file does not exist
- CRL is not properly encoded - maybe due to interrupted file transfer
- CRL does not match cert
- Wrong CRL version
- CRL expired

If the system needs to use the CRL of a specific ca-profile to check the revocation status of an end-entity cert, and the CRL is non-existent due to the above reasons, then the system will treat it as being unable to get an answer from CRL and fall back to the next status-verify method or default-result.

If the system needs to check the revocation of a CA cert in cert chain, and if the CRL is non-existent due to the above reasons, then the system will skip checking the revocation status of the CA cert. For example, if CA1 is issued by CA2, if CA2's revocation-check is **crl-optional** and the CA2's CRL is non-existent, then the system will not check CA1 cert's revocation status and consider it as "good".

#### Note:

Users must shutdown the ca-profile to change the revocation-check configuration.

**Default**

revocation-check crl

**Parameters**

**crl**

Specifies to use the configured CRL.

**crl-optional**

Specifies that the CRL is optional.

**Platforms**

All

## 22.243 revoke-key

### revoke-key

**Syntax**

**revoke-key card** *cpm-slot* **serial-number** *cpm-serial-number* **confirmation-code** *code*

**Context**

```

### Context

[\[Tree\]](#) (config>system>thresholds rmon)

### Full Context

```
configure system thresholds rmon
```

### Description

This command creates the context to configure generic RMON alarms and events.

Generic RMON alarms can be created on any SNMP object-ID that is valid for RMON monitoring (for example, an integer-based datatype).

The configuration of an event controls the generation and notification of threshold crossing events configured with the alarm command.

### Platforms

All

## 22.255 roaming

```
roaming
```

### Syntax

```
roaming bit [bit]
```

```
no roaming
```

### Context

[\[Tree\]](#) (config>subscr-mgmt>gtp>peer-profile>charging roaming)

### Full Context

```
configure subscriber-mgmt gtp peer-profile charging-characteristics roaming
```

## Description

This command configures the charging characteristics for roaming UE.

The **no** form of this command removes the *bit* value from the configuration.

## Default

no roaming

## Parameters

### *bit*

Specifies up to 16 bits to set in the Charging Characteristics Information Element (IE) for roaming UE, if not known by other means such as RADIUS.

**Values** bit0, bit1, bit2, bit3, bit4, bit5, bit6, bit7, bit8, bit9, bit10, bit11, bit12, bit13, bit14, bit15

## Platforms

configure service vpls mesh-sdp igmp-snooping robust-count

configure service vpls sap mld-snooping robust-count

configure service vpls mesh-sdp mld-snooping robust-count

```
configure service vpls igmp-snooping robust-count
configure service vpls sap igmp-snooping robust-count
configure service vpls spoke-sdp mld-snooping robust-count
configure service vpls spoke-sdp igmp-snooping robust-count
```

## Description

If the **send-queries** command is enabled, this parameter allows tuning for the expected packet loss on a SAP or SDP. The robust-count variable allows tuning for the expected packet loss on a subnet and is comparable to a retry count. If this SAP or SDP is expected to be 'lossy', this parameter may be increased. IGMP snooping on this SAP or SDP is robust to (robust-count-1) packet losses.

If **send-queries** is not enabled, this parameter will be ignored.

## Default

robust-count 2

## Parameters

### *robust-count*

Specifies the robust count for the SAP or SDP

**Values** 2 to 7 (for **config>service>vpls>sap>igmp-snooping**) 1 to 255 (for **config>service>vpls>igmp-snooping**)

## Platforms

All

## robust-count

## Syntax

**robust-count** *robust-count*

**no robust-count**

## Context

[\[Tree\]](#) (config>subscr-mgmt>msap-policy>vpls-only>igmp-snp robust-count)

## Full Context

```
configure subscriber-mgmt msap-policy vpls-only-sap-parameters igmp-snooping robust-count
```

## Description

This command configures the IGMP robustness variable. If the **send-queries** command is enabled, this parameter allows tuning for the expected packet loss on a SAP or SDP. The robust-count variable allows tuning for the expected packet loss on a subnet and is comparable to a retry count. If an MSAP or SDP is expected to be "lossy", this parameter may be increased. IGMP snooping on an MSAP or SDP is robust to (robust-count-1) packet losses.

If send-queries is not enabled, this parameter is ignored.  
The **no** form of this command reverts to the default.

### Default

robust-count 2

### Parameters

#### *robust-count*

Specifies the robust count for the SAP or SDP.

**Values** 2 to 7

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

All

**22.257 role**

role

**Syntax****role** *role-type***Context**[\[Tree\]](#) (config>system>satellite>port-template>port role)**Full Context**

configure system satellite port-template port role

**Description**

This command configures the role that the associated port is to take on.

**Parameters****none**

Clears the role association for the associated port.

**uplink**

Specifies that the associated satellite port is assigned the role of an uplink port.

**client**

Specifies that the associated satellite port is assigned the role of a satellite client port.

**system-default**

Specifies that the associated satellite port is returned to the system default.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**22.258 rollback**

rollback

**Syntax****rollback**

## Context

[\[Tree\]](#) (config>system rollback)

## Full Context

configure system rollback

## Description

Configure parameters of the classic CLI configuration rollback functionality. Configuration rollback provides the ability to undo configuration and revert back to previous router configuration states.

## Platforms

All

## rollback

## Syntax

rollback

## Context

[\[Tree\]](#) (admin rollback)

## Full Context

admin rollback

## Description

Commands in this context configure rollback operations.

## Platforms

All

## 22.259 rollback-location

## rollback-location

## Syntax

**rollback-location** *file-url /rollback filename*

**no rollback-location**

## Context

[\[Tree\]](#) (config>system>rollback rollback-location)

## Full Context

configure system rollback rollback-location

## Description

The location and name of the rollback checkpoint files is configurable to be local (on compact flash) or remote. The *file-url* must not contain a suffix (just a path/directory + filename). The suffixes for rollback checkpoint files are ".rb", ".rb.1", ..., ".rb.9" and are automatically appended to rollback checkpoint files.

## Default

no rollback-location

## Parameters

### *file-url*

Specifies the URL or rollback filename.

#### Values

*local-url* | *remote-url*

*local-url* [cflash-id]/[file-path] up to 200 characters, including cflash-id directory length of up to 99 characters each

*remote-url* [ftp://login:pswd@ remote-locn]/[file-path] up to 255 characters, directory length of up to 99 characters each

*remote-locn* [hostname | ipv4-address | ipv6-address]

*ipv4-address* a.b.c.d

*ipv6-address* x:x:x:x:x:x[-interface]

x:x:x:x:x:d.d.d[-interface]

x - [0 to FFFF]H

d - [0 to 255]D

*interface* - up to 32 characters each, for link local addresses

*cflash-id* cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

### *rollback-filename*

Specifies the rollback file name.

**Values** suffixed with .rb, .rb.1 up to .9 during rollback checkpoint creation

## Platforms

All

## 22.260 rollback-sync

### rollback-sync

#### Syntax

**rollback-sync**

#### Context

**[Tree]** (admin>redundancy rollback-sync)

#### Full Context

admin redundancy rollback-sync

#### Description

This command copies the entire set of rollback checkpoint files from the active CPM CF to the standby CPM CF.

#### Platforms

All

### rollback-sync

#### Syntax

**[no] rollback-sync**

#### Context

**[Tree]** (config>redundancy rollback-sync)

#### Full Context

configure redundancy rollback-sync

#### Description

The operator can enable automatic synchronization of rollback checkpoint files between the active CPM and standby CPM. When this automatic synchronization is enabled, a rollback save will cause the new checkpoint file to be saved on both the active and standby CPMs. The suffixes of the old checkpoint files on both active and standby CPMs are incremented. Note that automatic sync only causes the one new checkpoint file to be copied to both CFs (the other 9 checkpoints are not automatically copied from active to standby but that can be done manually with **admin red rollback-sync**).

Automatic synchronization of rollback checkpoint files across CPMs is only performed if the rollback-location is configured as a local file-url (for example, "cf3:/rollback-files/rollback). Synchronization is not done if the rollback-location is remote.

The **config red sync {boot-env | config}** and **admin red sync {boot-env | config}** do not apply to rollback checkpoint files. These commands do not manually or automatically sync rollback checkpoint files. The dedicated **rollback-sync** commands must be used to sync rollback checkpoint files.

### Default

no rollback-sync

### Platforms

All

## 22.261 rollover

rollover

### Syntax

**rollover** *minutes* [**retention** *hours*]

**no rollover**

### Context

[\[Tree\]](#) (config>log>file-id rollover)

### Full Context

configure log file-id rollover

### Description

This command configures how often an event or accounting log is rolled over or partitioned into a new file.

An event or accounting log is actually composed of multiple, individual files. The system creates a new file for the log based on the **rollover** time, expressed in minutes.

The *retention* option, expressed in hours, allows you to modify the default time to keep the file in the system. The retention time is based on the rollover time of the file.

If logs are needed to be retained for more than 16 days, use a CRON job to move the logs to a different location, either on a local drive or a remote server. For more information, contact Nokia support.

When multiple **rollover** commands for a *file-id* are entered, the last command overwrites the previous command.

The **no** form of this command reverts to the default values.

### Default

rollover 1440 retention 12

### Parameters

*minutes*

Specifies the rollover time, in minutes.

**Values** 5 to 10080

#### ***retention hours***

Specifies the retention period in hours, expressed as a decimal integer. The retention time is based on the time creation time of the file. The file becomes a candidate for removal once the creation datestamp + rollover time + retention time is less than the current timestamp.

**Default** 12

**Values** 1 to 500

#### **Platforms**

All

## 22.262 root

root

#### **Syntax**

root

#### **Context**

[\[Tree\]](#) (config>qos>policer-control-policy root)

#### **Full Context**

configure qos policer-control-policy root

#### **Description**

The **root** node contains the policer control policies configuration parameters for the root arbiter. Within the node, the parent policer's maximum rate limit can be set, the strict priority level, and fair threshold portions may be defined per priority level.

The root node always exists and does not need to be created.

#### **Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## 22.263 root-address

## root-address

### Syntax

**root-address** *ip-address*

**no root-address**

### Context

**[Tree]** (config>router>p2mp-sr-tree>p2mp-policy root-address)

### Full Context

configure router p2mp-sr-tree p2mp-policy root-address

### Description

This command configures the IP address of the P2MP SR tree root node of the P2MP policy. The root tree ID and the root address uniquely identify the P2MP policy on the root node.

The **no** form of this command removes the root address entry.

### Parameters

***ip-address***

Specifies the IPv4 address of the root node.

**Values** a.b.c.d

### Platforms

All

## root-address

### Syntax

**root-address** *ip-address*

**no root address**

### Context

**[Tree]** (config>router>p2mp-sr-tree>replication-segment root-address)

### Full Context

configure router p2mp-sr-tree replication-segment root-address

### Description

This command configures the replication segment with the IP address of the root node of the P2MP SR tree replication segment.

The **no** form of this command removes the root node address.

## Parameters

### *ip-address*

Specifies the IPv4 address.

**Values** a.b.c.d

## Platforms

All

## 22.264 root-and-leaf

### root-and-leaf

## Syntax

[no] root-and-leaf

## Context

**[Tree]** (config>service>vpls>provider-tunnel>inclusive root-and-leaf)

## Full Context

configure service vpls provider-tunnel inclusive root-and-leaf

## Description

This command configures the node to operate as both root and leaf of the I-PMSI in a specified VPLS/B-VPLS instance.

By default, a node will behave as a leaf-only node. When the node is leaf only for the I-PMSI of type P2MP RSVP LSP, no PMSI Tunnel Attribute is included in BGP-AD route update messages and therefore no RSVP P2MP LSP is signaled but the node can join RSVP P2MP LSP rooted at other PE nodes participating in this VPLS/B-VPLS service. The user must still configure a LSP template even if the node is a leaf only.

For the I-PMSI of type mLDP, the leaf-only node will join I-PMSI rooted at other nodes it discovered but will not include a PMSI Tunnel Attribute in BGP-AD route update messages. This way a leaf-only node will forward packets to other nodes in the VPLS/B-VPLS using the point-to-point spoke-SDPs.

The **no** version of this command re-instates the default value.

## Platforms

All

## 22.265 root-guard

### root-guard

#### Syntax

[no] root-guard

#### Context

**[Tree]** (config>service>vpls>sap>stp root-guard)

**[Tree]** (config>service>vpls>spoke-sdp>stp root-guard)

**[Tree]** (config>service>template>vpls-sap-template>stp root-guard)

#### Full Context

configure service vpls sap stp root-guard

configure service vpls spoke-sdp stp root-guard

configure service template vpls-sap-template stp root-guard

#### Description

This command specifies whether this port is allowed to become an STP root port. It corresponds to the restrictedRole parameter in 802.1Q. If set, it can cause lack of spanning tree connectivity.

#### Default

no root-guard

#### Platforms

All

### root-guard

## 22.266 root-pool

```
root-pool
```

**Syntax**

[no] **root-pool** *root-pool-id*

**Context**

[\[Tree\]](#) (config>qos>hs-pool-policy>root-tier root-pool)

**Full Context**

configure qos hs-pool-policy root-tier root-pool

**Description**

Commands in this context configure root tier parameters. Within the **root-tier** context, root pools can be sized using the **allocation-weight** command or a slope policy can be associated with a root pool.

The **no** form of the command restores the default **allocation-weight** value and default slope policy to the specified root pool. Root pool 1 has a different default weight than root pools 2 through 16. The **no root-pool** command fails for root pools 2 through 16 if the root pool is currently the parent of a mid-tier pool.

**Parameters**

*root-pool-id*

Specifies the root pool ID. This is a required parameter when executing the **root-pool** command and specifies which root pool context is being entered.

**Values** 1 to 16

**Platforms**

7750 SR-7/12/12e

## 22.267 root-tier

## root-tier

### Syntax

**root-tier**

### Context

**[Tree]** (config>qos>hs-pool-policy root-tier)

### Full Context

configure qos hs-pool-policy root-tier

### Description

Commands in this context configure root pool parameters. Within the **root-tier** context, root pools can be sized using the **allocation-weight** command or a slope policy can be associated with a root pool.

### Platforms

7750 SR-7/12/12e

## 22.268 root-tree-id

## root-tree-id

### Syntax

**root-tree-id** *tree-id*

**no root-tree-id**

### Context

**[Tree]** (config>router>p2mp-sr-tree>p2mp-policy root-tree-id)

### Full Context

configure router p2mp-sr-tree p2mp-policy root-tree-id

### Description

This command configures the P2MP SR tree ID on the root node of the P2MP policy. The root tree ID and the root address uniquely identify the P2MP policy on the root node.

The **no** form of this command removes the root tree ID entry.

### Parameters

*tree-id*

Specifies the ID of the tree.

**Values** 8193 to 16286

### Platforms

All

root-tree-id

### Syntax

**root-tree-id** *tree-id*

**no root-tree-id**

### Context

[\[Tree\]](#) (config>router>p2mp-sr-tree>replication-segment root-tree-id)

### Full Context

configure router p2mp-sr-tree replication-segment root-tree-id

### Description

This command configures the root-tree ID for the replication segment of the P2MP SR tree.

The **no** form of this command removes the root-tree ID.

### Parameters

*tree-id*

Specifies the root-tree ID.

**Values** 8193 to 16286

### Platforms

## 22.269 round-robin-inactive-records

round-robin-inactive-records

### Syntax

**[no] round-robin-inactive-records**

### Context

[\[Tree\]](#) (config>mcast-mgmt>chassis-level round-robin-inactive-records)

## Full Context

configure mcast-management chassis-level round-robin-inactive-records

## Description

This command specifies whether initially inactive multicast records use the IOM default secondary multicast path or not. When enabled, the system redistributes newly populated inactive records among all available IOM multicast paths and multicast switch fabric planes. When disabled, the system continues to set all initially inactive multicast records to use the IOM default secondary multicast path.

The **no** form of this command reverts to the default.

## Platforms

7450 ESS, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

## 22.270 route

route

## Syntax

**route index** *index* [**realm** *realm-string*] [**application** *application*] [**create**]

**no route index** *index*

## Context

[\[Tree\]](#) (config>aaa>diam>node>peer route)

## Full Context

configure aaa diameter node peer route

## Description

This command configures the index of the static route within the Diameter peer used to reach remote realms that are not directly connected to the origin realm, or to override the route preference (peer preference) of the directly-connected realms.

The **no** form of this command removes the route index information from the configuration.

## Parameters

### *index*

Specifies the index of the static route within the Diameter peer.

**Values** 1 to 15

### *realm-string*

Specifies the destination realm reachable through this static route, up to 80 characters.

### *application*

Specifies the ID of the Diameter application of the static route.

**Values** nasreq, gy, gx

#### **create**

Keyword used to create the route index. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

#### **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.271 route-admin-tag-policy

### route-admin-tag-policy

#### **Syntax**

[no] route-admin-tag-policy *policy-name*

#### **Context**

[\[Tree\]](#) (config>router>admin-tags route-admin-tag-policy)

#### **Full Context**

configure router admin-tags route-admin-tag-policy

#### **Description**

This command configures a route admin tag policy.

Up to 2,000 policies can be configured per system.

The **no** form of this command removes the route admin tag policy.

#### **Parameters**

*policy-name*

The name of the route admin tag policy, up to 32 characters.

#### **Platforms**

All

## 22.272 route-advertisement

## route-advertisement

### Syntax

**[no] route-advertisement**

### Context

**[Tree]** (config>router>bgp>group>srv6 route-advertisement)

**[Tree]** (config>router>bgp>group>neighbor>srv6 route-advertisement)

### Full Context

configure router bgp group segment-routing-v6 route-advertisement

configure router bgp group neighbor segment-routing-v6 route-advertisement

### Description

Commands in this context configure the route advertisement options.

The **no** form of this command deletes the context.

### Default

no route-advertisement

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 22.273 route-distinguisher

## route-distinguisher

### Syntax

**route-distinguisher auto-rd**

**route-distinguisher rd**

**no route-distinguisher**

### Context

**[Tree]** (config>subscr-mgmt>isa-svc-chain>evpn>bgp route-distinguisher)

### Full Context

configure subscriber-mgmt isa-service-chaining evpn bgp route-distinguisher

### Description

This command configures the Route Distinguisher (RD) field that is signaled in NLRI in EVPN routes.

The **no** form of this command reverts to the default.

## Parameters

### **auto-rd**

Specifies that the system automatically generates an RD.

### **rd**

Specifies the RD.

**Values** rd: *ip-addr:comm-val* | *2byte-asnumber:ext-comm-val* | *4byte-asnumber:comm-val*  
*ip-addr*: a.b.c.d  
 comm-val: [0 to 65535]  
 2byte-asnumber: [1 to 65535]  
 ext-comm-val: [0 to 4294967295]  
 4byte-asnumber: [1 to 4294967295]

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## route-distinguisher

## Syntax

**route-distinguisher auto-rd**

**no route-distinguisher**

**route-distinguisher rd**

## Context

**[Tree]** (config>service>epipe>bgp route-distinguisher)

**[Tree]** (config>service>vpls>bgp route-distinguisher)

## Full Context

configure service epipe bgp route-distinguisher

configure service vpls bgp route-distinguisher

## Description

This command configures the Route Distinguisher (RD) component that will be signaled in the MP-BGP NLRI for L2VPN and EVPN families. This value will be used for BGP-AD, BGP VPLS and BGP multi-homing NLRI if these features are configured.

If this command is not configured, the RD is automatically built using the BGP-AD VPLS ID. The following rules apply:

- if BGP AD VPLS-id is configured and no RD is configured under BGP node - RD=VPLS-ID

- if BGP AD VPLS-id is not configured then an RD value must be configured under BGP node (this is the case when only BGP VPLS is configured)
- if BGP AD VPLS-id is configured and an RD value is also configured under BGP node, the configured RD value prevails

Values and format (6 bytes, other 2 bytes of type will be automatically generated)

Alternatively, the **auto-rd** option allows the system to automatically generate an RD based on the **bgp-auto-rd-range** command configured at the service level. For **BGP-EVPN** enabled VPLS and Epipe services, the **route-distinguisher** value can also be auto-derived from the **evi** value (**config>service>vpls>bgp-evpn>evi** or **config>service>epipe>bgp-evpn>evi**) if this command is not configured. See the **config>service>system>bgp-evpn>eth-seg>service-carving>manual evi** command description for more information.

## Parameters

### ***ip-addr:comm-val***

Specifies the IP address.

**Values** *ip-addr*: a.b.c.d  
*comm-val*: 0 to 65535

### ***as-number:ext-comm-val***

Specifies the AS number.

**Values** *as-number*: 1 to 65535  
*ext-comm-val*: 0 to 4294967295

### **auto-rd**

The system will generate an RD for the service according to the IP address and range configured in the **bgp-auto-rd-range** command.

## Platforms

All

## route-distinguisher

## Syntax

**route-distinguisher** [*ip-addr:comm-val* | *as-number:ext-comm-val*]

**no route-distinguisher**

## Context

**[Tree]** (config>service>system>bgp-evpn route-distinguisher)

## Full Context

configure service system bgp-evpn route-distinguisher

## Description

This command configures the Route Distinguisher (RD) component that will be signaled in the MP-BGP NLRI for EVPN corresponding to the base EVPN instance (Ethernet Segment routes). If the route-distinguisher component is not configured, the system will use system:ip-address as the default route-distinguisher

## Default

no route-distinguisher

## Parameters

### *ip-addr:comm-val*

Specifies the IP address.

**Values** *ip-addr*: a.b.c.d  
*comm-val*: 0 to 65535

### *as-number:ext-comm-val*

Specifies the AS number.

**Values** *as-number*: 1 to 65535  
*ext-comm-val*: 0 to 4294967295

## Platforms

All

## route-distinguisher

## Syntax

**route-distinguisher** *rd*

**route-distinguisher** auto-rd

**no route-distinguisher**

## Context

**[Tree]** (config>service>vprn>bgp-ipvpn>mpls route-distinguisher)

**[Tree]** (config>service>vprn>bgp-ipvpn>srv6 route-distinguisher)

**[Tree]** (config>service>vprn>bgp-evpn>mpls route-distinguisher)

## Full Context

configure service vprn bgp-ipvpn mpls route-distinguisher

configure service vprn bgp-ipvpn segment-routing-v6 route-distinguisher

configure service vprn bgp-evpn mpls route-distinguisher

## Description

This command specifies an identifier attached to a route, which enables the user to identify the VPN to which the route belongs. Each routing instance must have a unique (within the carrier's domain) route distinguisher (RD) associated with it.

Alternatively, the **auto-rd** option allows the system to automatically generate an RD based on the **bgp-auto-rd-range** command configured at the service level.

The **no** form of this command removes the RD configuration.

## Default

no route-distinguisher

## Parameters

### auto-rd

Keyword that allows the system to generate an RD for the service according to the IP address and range configured in the **bgp-auto-rd-range** command.

### rd

Specifies the route distinguisher.

**Values** *rd: ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val*  
*ip-addr: a.b.c.d*  
*comm-val: [0 to 65535]*  
*2byte-asnumber: [1 to 65535]*  
*ext-comm-val: [0 to 4294967295]*  
*4byte-asnumber: [1 to 4294967295]*

## Platforms

All

- configure service vprn bgp-evpn mpls route-distinguisher
- configure service vprn bgp-ipvpn mpls route-distinguisher

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

- configure service vprn bgp-ipvpn segment-routing-v6 route-distinguisher

## route-distinguisher

## Syntax

**route-distinguisher**

## Context

[\[Tree\]](#) (config>service>vprn route-distinguisher)

### Full Context

```
configure service vprn route-distinguisher
```

### Description

**Note:** This command is no longer supported and will be removed in a future release.

### Platforms

All

## 22.274 route-distinguisher-list

```
route-distinguisher-list
```

### Syntax

```
route-distinguisher-list name
no route-distinguisher-list name
```

### Context

[\[Tree\]](#) (config>router>policy-options route-distinguisher-list)

### Full Context

```
configure router policy-options route-distinguisher-list
```

### Description

This command creates a list of entries used to match the RD in BGP routes of specific address families.

### Parameters

*name*

Specifies the name of the RD list, up to 64 characters.

### Platforms

All

```
route-distinguisher-list
```

### Syntax

```
route-distinguisher-list name
no route-distinguisher-list name
```

## Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from route-distinguisher-list)

## Full Context

configure router policy-options policy-statement entry from route-distinguisher-list

## Description

This command configures a route distinguisher (RD) list as a match criterion for the policy statement entry.

This match condition is supported by policies applied as VRF import or BGP peer import policies. A BGP route can match a policy entry with this match criterion if the NLRI field contains an RD that is matched by at least one of the entries in the **route-distinguisher-list**.

BGP routes belonging to address families other than VPN-IPv4, VPN-IPv6, MCAST-VPN-IPv4, MCAST-VPN-IPv6, EVPN, FlowSpec-VPN IPv4, FlowSpec-VPN IPv6, MVPN-IPv4 or MVPN-IPv6 routes do not match policy entries with this match criterion.

## Parameters

*name*

Specifies the (possibly parameterized) name of an RD list.

## Platforms

All

## 22.275 route-downloader

route-downloader

## Syntax

**route-downloader** *name* [create]

**no route-downloader** *name*

## Context

[\[Tree\]](#) (config>aaa route-downloader)

## Full Context

configure aaa route-downloader

## Description

Commands in this context configure a route-downloader instance. The route-downloader is a process that uses radius access-request messages to a particular server. The server returns either an access-accept or access-deny message. Access-accept messages also contain the prefixes (in the form of static blackhole routes in various formats). Only a single route-downloader object can be created.

The **no** form of this command removes the name from the configuration. The object must be shutdown prior to deletion. No prefix is needed to delete an existing route-download object.

### Parameters

#### *name*

Specifies the name of this RADIUS route downloader.

#### **create**

This keyword is mandatory while creating an instance of the route-download object.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.276 route-entry

### route-entry

### Syntax

**[no] route-entry** {*ip-prefix/length* | *ip-prefix netmask*}

**[no] route-entry** *ipv6-prefix/prefix-length*

### Context

**[Tree]** (config>service>ies>sub-if>grp-if>sap>static-host>managed-routes route-entry)

**[Tree]** (config>service>vprn>sub-if>grp-if>sap>static-host>managed-routes route-entry)

### Full Context

configure service ies subscriber-interface group-interface sap static-host managed-routes route-entry

configure service vprn subscriber-interface group-interface sap static-host managed-routes route-entry

### Description

This command assigns a managed route to a specified subscriber host. As a consequence, a static route pointing subscriber-host IP address as a next hop is installed in the FIB.

The **no** form of this command removes the respective route. By default, there are no managed routes configured.

### Parameters

#### *ip-prefix/length*

Specifies the IP prefix and length.

#### **Syntax:**

ip-prefix/length:                      ip-prefix                      a.b.c.d

ip-prefix-length 1 to 32

**netmask**

Specifies the subnet mask in dotted decimal notation.

**Values** a.b.c.d (0.0.0.0 not allowed)

**ipv6-prefix/prefix-length**

Specifies the IPv6 prefix and prefix length.

**Values**

ipv6-prefix	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D
ipv6-prefix-length	1 to 128

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.277 route-exists

### route-exists

**Syntax**

**route-exists** *expression*

**no route-exists**

**Context**

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>cond-expr route-exists)

**Full Context**

configure router policy-options policy-statement entry conditional-expression route-exists

**Description**

This command is used to specify a route existence expression to control evaluation of the policy entry. If the route existence expression evaluates to 'true' the matching and action commands of the policy entry are applied as normal. If the route existence expression evaluates to 'false' the entire policy entry is skipped and processing continues with the next entry; however, conditional expressions are only parsed when the route policy is used as a BGP export policy or VRF export policy.

## Default

no route-exists

## Parameters

### *expression*

"["<pfx-list-name>"]" [all | none]

If neither the **all** nor the **none** keyword are used the match logic is 'any' – that is, the route expression evaluates as 'true' if any exact match entry in the referenced prefix-list has an active route in the route table associated with the policy.

**all** – the route expression evaluates as 'true' only if all the exact match entries in the referenced prefix-list have an active route in the route table associated with the policy.

**none** – the route expression evaluates as 'true' only if none of the exact match entries in the referenced prefix-list have an active route in the route table associated with the policy.

## Platforms

All

## 22.278 route-limit

### route-limit

## Syntax

**route-limit** [*limit*]

## Context

**[Tree]** (config>service>vprn>nat>outside>dnat-only route-limit)

**[Tree]** (config>router>nat>outside>dnat-only route-limit)

## Full Context

configure service vprn nat outside dnat-only route-limit

configure router nat outside dnat-only route-limit

## Description

This command limits the number of source routes (inside routes) that are installed on the outside in **dnat-only** case. In case that the number of actual routes is larger than the number of configured routes, the excess of the routes will not be installed in the routing table and a log will be raised.

The source IP addresses on the inside must be known in advance in a **dnat-only** instance. This is required so that the corresponding routes can be installed in the routing table and thus the downstream traffic is properly routed towards the MS-ISAs where the original translation was performed (and state is kept).

In the dnat-only case, it is mandatory that the inside (private side) and the outside (public side) are in separated VPRNs.

**Default**

route-limit 32768

**Parameters**

**[1..131072]**

Specifies the maximum number of source routes installed on the outside the **dnat-only** scenario.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.279 route-monitoring

### route-monitoring

**Syntax**

**route-monitoring pre-policy [post-policy]**

**route-monitoring post-policy**

**no route-monitoring**

**Context**

**[Tree]** (config>service>vprn>bgp>group>monitor route-monitoring)

**[Tree]** (config>router>bgp>monitor route-monitoring)

**[Tree]** (config>service>vprn>bgp>monitor route-monitoring)

**[Tree]** (config>router>bgp>group>neighbor>monitor route-monitoring)

**[Tree]** (config>router>bgp>group>monitor route-monitoring)

**Full Context**

configure service vprn bgp group monitor route-monitoring

configure router bgp monitor route-monitoring

configure service vprn bgp monitor route-monitoring

configure router bgp group neighbor monitor route-monitoring

configure router bgp group monitor route-monitoring

**Description**

This command specifies if BMP sends pre-policy route monitoring messages, post-policy route monitoring messages, both types of messages, or none.

The **no** form of this command disables sending of route-monitoring messages.

## Parameters

### pre-policy

Enables sending pre-policy route monitoring messages using the pre-policy path attribute values, if available.

### post-policy

Enables sending post-policy route monitoring messages using the post-policy path attribute values, if available.

## Platforms

All

## 22.280 route-next-hop

[\[Tree\]](#) (config>service>vpls>bgp-evpn>srv6 route-next-hop)

## Full Context

```
configure service epipe bgp-evpn segment-routing-v6 route-next-hop
```

```
configure service vpls bgp-evpn mpls route-next-hop
```

```
configure service epipe bgp-evpn mpls route-next-hop
```

```
configure service vpls bgp-evpn segment-routing-v6 route-next-hop
```

## Description

This command configures the next hop of the EVPN routes.

## Default

```
route-next-hop system-ipv4
```

## Parameters

### system-ipv4

Specifies the system IPv4 address as the next hop for the service EVPN routes.

### system-ipv6

Specifies the system IPv6 address as the next hop for the service EVPN routes.

***ip-address***

Specifies the IPv4 address value as the next hop for the service EVPN.

**Values** a.b.c.d

**Platforms**

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

- configure service vpls bgp-evpn segment-routing-v6 route-next-hop
- configure service epipe bgp-evpn segment-routing-v6 route-next-hop

All

- configure service epipe bgp-evpn mpls route-next-hop
- configure service vpls bgp-evpn mpls route-next-hop

**route-next-hop****Syntax**

**route-next-hop** {*ip-address* | *ipv6-address*}

**no route-next-hop**

**Context**

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg route-next-hop)

**Full Context**

configure service system bgp-evpn ethernet-segment route-next-hop

**Description**

This command modifies the next hop to the configured IP address value, for the following routes:

- ES
- AD per-ES (irrespective of the **evi-rt-set** or **evi-rt configuration mode**)

The **no** form of the command changes the originating IP address back to the system-ip.

**Default**

no route-next-hop

**Parameters*****ip-address***

Specifies an IPv4 or IPv6 address.

**Values** *ip-address* | *ipv6-address*

## Platforms

All

## 22.281 route-next-hop-policy

route-next-hop-policy

### Syntax

**route-next-hop-policy**

### Context

[\[Tree\]](#) (config>router route-next-hop-policy)

### Full Context

configure router route-next-hop-policy

### Description

This command creates the context to configure route next-hop policies.

## Platforms

All

## 22.282 route-preference

route-preference

### Syntax

**route-preference primary {inband | outband} secondary {inband | outband | none}**

**no route-preference**

### Context

[\[Tree\]](#) (config>log route-preference)

### Full Context

configure log route-preference

## Description

This command specifies the primary and secondary routing preference for traffic generated for SNMP notifications and syslog messages. If the remote destination is not reachable through the routing context specified by primary route preference then the secondary routing preference will be attempted.

The **no** form of this command reverts to the default values.

## Default

no route-preference

## Parameters

### primary

Specifies the primary routing preference for traffic generated for SNMP notifications and syslog messages.

**Default** outband

### secondary

Specifies the secondary routing preference for traffic generated for SNMP notifications and syslog messages. The routing context specified by the secondary route preference will be attempted if the remote destination was not reachable by the primary routing preference, specified by primary route preference. The value specified for the secondary routing preference must be distinct from the value for primary route preference.

**Default** inband

### inband

Specifies that the logging utility will attempt to use the base routing context to send SNMP notifications and syslog messages to remote destinations.

### outband

Specifies that the logging utility will attempt to use the management routing context to send SNMP notifications and syslog messages to remote destinations.

### none

Specifies that no attempt will be made to send SNMP notifications and syslog messages to remote destinations.

## Platforms

All

## route-preference

## Syntax

**route-preference** {**both** | **inband** | **outband**}

**no route-preference**

## Context

[\[Tree\]](#) (config>system>security>tacplus route-preference)

[\[Tree\]](#) (config>system>security>radius route-preference)

[\[Tree\]](#) (config>system>security>ldap route-preference)

## Full Context

configure system security tacplus route-preference

configure system security radius route-preference

configure system security ldap route-preference

## Description

This command specifies the routing preference to reach the AAA server. If the configured option is to use both in-band and out-of-band routes, the out-of-band routes in the management routing instance are used to reach the server before the in-band routes in the Base routing instance.

The **no** form of this command reverts to the default value.

## Default

route-preference both

## Parameters

### both

Specifies the use of out-of-band routes before in-band routes.

### inband

Specifies the use of in-band routes only.

### outband

Specifies the use of out-of-band routes only.

## Platforms

All

## route-preference

## Syntax

**route-preference** {**both** | **inband** | **outband**}

**no route-preference**

## Context

[\[Tree\]](#) (config>router>pcep>pcc>peer route-preference)

## Full Context

configure router pcep pcc peer route-preference

## Description

This command specifies the routing preference to reach the PCE server. If the configured option is to use both in-band and out-of-band routes, the out-of-band routes in the management routing instance are used to reach the server before the in-band routes in the Base routing instance.

The **no** form of this command reverts to the default value.

## Default

route-preference both

## Parameters

### both

Specifies the use of out-of-band routes before in-band routes.

### inband

Specifies the use of in-band routes only.

### outband

Specifies the use of out-of-band routes only.

## Platforms

All

## 22.283 route-recovery-wait

### route-recovery-wait

## Syntax

**route-recovery-wait** *seconds*

**no route-recovery-wait**

## Context

[\[Tree\]](#) (config>log>app-route-notifications route-recovery-wait)

## Full Context

configure log app-route-notifications route-recovery-wait

## Description

The time delay that must pass before notifying specific CPM applications after the recovery or change of a route during normal operation.

The **no** form of this command disables the time-delay configuration.

**Default**

no route-recovery-wait

**Parameters****seconds**

Time delay in seconds.

**Values** 1 to 100

**Platforms**

All

## 22.284 route-refresh

### route-refresh

**Syntax**

route-refresh [**neighbor** *ip-address* | **group** *name*]

no route-refresh

**Context**

[\[Tree\]](#) (debug>router>bgp route-refresh)

**Full Context**

debug router bgp route-refresh

**Description**

This command enables debugging for BGP route-refresh.

The **no** form of this command disables debugging.

**Parameters****neighbor *ip-address***

Debugs only events affecting the specified BGP neighbor.

**Values** ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address:

- x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H

- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

**group name**

Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

**Platforms**

All

**22.285 route-table****route-table****Syntax**

**route-table** [*ip-prefix/prefix-length*]

**route-table** *ip-prefix/prefix-length* **longer**

**no route-table**

**Context**

[\[Tree\]](#) (debug>router>ip route-table)

**Full Context**

debug router ip route-table

**Description**

This command configures route table debugging.

**Parameters*****ip-prefix/prefix-length***

The IP prefix for prefix list entry in dotted decimal notation.

**Values** The following values apply to the 7750 SR and 7950 XRS:

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32
ipv6-prefix	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H

d: [0 to 255]D

ipv6-prefix-length 0 to 128

**Values** The following values apply to the 7450 ESS:

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32

### longer

Specifies the prefix list entry matches any route that matches the specified *ip-prefix* and prefix *mask* length values greater than the specified *mask*.

## 22.286 route-table-import

### route-table-import

#### Syntax

**route-table-import** *policy-name*

**no route-table-import**

#### Context

[\[Tree\]](#) (config>service>vprn>bgp>rib-management>label-ipv4 route-table-import)

[\[Tree\]](#) (config>service>vprn>bgp>rib-management>ipv4 route-table-import)

[\[Tree\]](#) (config>service>vprn>bgp>rib-management>ipv6 route-table-import)

#### Full Context

configure service vprn bgp rib-management label-ipv4 route-table-import

configure service vprn bgp rib-management ipv4 route-table-import

configure service vprn bgp rib-management ipv6 route-table-import

#### Description

This command specifies the name of a route policy to control the importation of active routes from the IP route table into one of the BGP RIBs.

If the **route-table-import** command is not configured, or if the command refers to an empty policy, all non-BGP routes from the IP route table are imported into the applicable RIB.

If the **route-table-import** command is configured, then routes dropped or rejected by the configured policy are not installed in the associated RIB. Rejected routes cannot be advertised to BGP peers associated with the RIB, but they can still be used to resolve BGP next-hops of routes in that RIB. If the active route for a prefix is rejected by the **route-table-import** policy, then the best BGP route for that prefix in the BGP RIB can be advertised to peers as though it is used.

Aggregate routes are always imported into each RIB, independent of the **route-table-import** policy.

Route modifications specified in the actions of a **route-table-import** policy are ignored and have no effect on the imported routes.

## Default

no route-table-import

## Parameters

### *policy-name*

Specifies the name of a policy-statement (up to 64 characters).

## Platforms

All

## route-table-import

## Syntax

**route-table-import** *policy-name*

**no route-table-import**

## Context

configure router bgp rib-management label-ipv6 route-table-import

configure router bgp rib-management ipv6 route-table-import

configure router bgp rib-management label-ipv4 route-table-import

## Description

This command specifies the name of a policy to control the importation of active routes from the IP route table into one of the BGP RIBs.

If the **route-table-import** command is not configured, or if the command refers to an empty policy, all non-BGP routes from the IP route table are imported into the applicable RIB.

If the **route-table-import** command is configured, then routes dropped or rejected by the configured policy are not installed in the associated RIB. Rejected routes cannot be advertised to BGP peers associated with the RIB, but they can still be used to resolve BGP next-hops of routes in that RIB. If the active route for a prefix is rejected by the **route-table-import** policy, then the best BGP route for that prefix in the BGP RIB can be advertised to peers as though it is used.

Aggregate routes are always imported into each RIB, independent of the **route-table-import** policy.

Route modifications specified in the actions of a **route-table-import** policy are ignored and have no effect on the imported routes.

### Default

no route-table-import

### Parameters

*policy-name*

Specifies the name of a policy-statement (up to 64 characters).

### Platforms

All

## 22.287 route-target

### route-target

#### Syntax

**route-target export** *ext-community* **import** *ext-community*

**no route-target**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>isa-svc-chain>evpn>bgp route-target)

#### Full Context

configure subscriber-mgmt isa-service-chaining evpn bgp route-target

#### Description

This command configures route target attributes to be signaled in EVPN routes used for service chaining.

The **no** form of this command removes the parameters from the configuration.

#### Parameters

**export**

Specifies the route target to be used by BGP in this EVPN service when exporting EVPN routes.

**import**

Specifies the route target to be used by BGP in this EVPN service when importing EVPN routes.

**ext-community**

Specifies the extended community.

**Values** rd: *ip-addr:comm-val* | *2byte-asnumber:ext-comm-val* | *4byte-asnumber:comm-val*  
*ip-addr*: a.b.c.d  
 comm-val: [0 to 65535]  
 2byte-asnumber: [1 to 65535]  
 ext-comm-val: [0 to 4294967295]  
 4byte-asnumber: [1 to 4294967295]

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**route-target****Syntax**

**route-target** {*ext-community* | **{[export *ext-community*][import *ext-community*]}**}

**no route-target**

**Context**

**[Tree]** (config>service>epipe>bgp route-target)

**[Tree]** (config>service>vpls>bgp-ad route-target)

**[Tree]** (config>service>vpls>bgp route-target)

**Full Context**

configure service epipe bgp route-target

configure service vpls bgp-ad route-target

configure service vpls bgp route-target

**Description**

This command configures the route target (RT) component that will be signaled in the related MP- BGP attribute to be used for BGP auto-discovery, BGP VPLS, BGP multi-homing and EVPN if these features are configured in this VPLS service, or for BGP multi-homing, BGP-VPWS and EVPN in case of Epipe services.

If this command is not used in VPLS services, the RT is built automatically using the VPLS ID. The extended community can have the same two formats as the VPLS ID, a two-octet AS-specific extended community, IPv4 specific extended community. For BGP EVPN enabled VPLS and Epipe services,

the route target can also be auto-derived from the **evi** value (**config>service>vpls>bgp-evpn>evi** or **config>service>epipe>bgp-evpn>evi**) if this command is not configured.

### Parameters

#### **export** *ext-community*

Specifies communities allowed to be sent to remote PE neighbors.

#### **import** *ext-community*

Specifies communities allowed to be accepted from remote PE neighbors.

### Platforms

All

## 22.288 route-target-list

### route-target-list

### Syntax

**route-target-list** *comm-id* [*comm-id*]

**no route-target-list** [*comm-id*]

### Context

[\[Tree\]](#) (config>router>bgp route-target-list)

### Full Context

configure router bgp route-target-list

### Description

This command specifies the route target(s) to be accepted from or advertised to peers. If the **route-target-list** is a non-null list, only routes with one or more of the given route targets are accepted from or advertised to peers.

The **route-target-list** is assigned at the global level and applies to all peers connected to the system.

This command is only applicable if the router is a route-reflector server.

The **no** form of this command with a specified route target community removes the specified community from the **route-target-list**. The **no** form of this command entered without a route target community removes all communities from the list.

### Default

no route-target-list

### Parameters

*comm-id*

Specifies up to 15 route target communities.

**Values** `[target: {ip-address:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val}]`

where:

- `ip-address` — a.b.c.d
- `comm-val` — 0 to 65535
- `2byte-asnumber` — 0 to 65535
- `ext-comm-val` — 0 to 4294967295
- `4byte-asnumber` — 0 to 4294967295

## Platforms

All

## 22.289 route-unknown

### route-unknown

#### Syntax

`[no] route-unknown [{ip-prefix/mask | ipv6-address/prefix-length}]`

#### Context

[\[Tree\]](#) (config>vrrp>policy>priority-event route-unknown)

#### Full Context

configure vrrp policy priority-event route-unknown

#### Description

This command creates a context to configure a route unknown priority control event that monitors the existence of a specific active IP route prefix within the routing table.

The **route-unknown** command configures a priority control event that defines a link between the VRRP priority control policy and the Route Table Manager (RTM). The RTM registers the specified route prefix as monitored by the policy. If any change (add, delete, new next hop) occurs relative to the prefix, the policy is notified and takes correct action according to the priority event definition. If the route prefix exists and is active in the routing table according to the conditions defined, the event is in the cleared state. If the route prefix is removed, becomes inactive or fails to meet the event criteria, the event is in the set state.

The command creates a **route-unknown** node identified by *prefix/mask-length* and containing event control commands.

Multiple unique (different *prefix/mask-length*) **route-unknown** event nodes can be configured within the **priority-event** node up to the maximum limit of 32 events.

The **route-unknown** command can reference any valid IP address mask-length pair. The IP address and associated mask length define a unique IP router prefix. The dynamic monitoring of the route prefix results in one of the event operational states listed in [Table 112: Route-unknown Operational States](#).

Table 112: Route-unknown Operational States

route-unknown Operational State	Description
Set – non-existent	The route does not exist in the route table
Set – inactive	The route exists in the route table but is not being used
Set – wrong next hop	The route exists in the route table but does not meet the <b>next-hop</b> requirements
Set – wrong protocol	The route exists in the route table but does not meet the <b>protocol</b> requirements
Set – less specific found	The route exists in the route table but does is not an exact match and does not meet any <b>less-specific</b> requirements
Set – default best match	The route exists in the route table as the default route but the default route is not allowed for route matching
Cleared – less specific found	A less specific route exists in the route table and meets all criteria including the <b>less-specific</b> requirements
Cleared – found	The route exists in the route table manager and meets all criteria

An existing route prefix in the RTM must be active (used by the IP forwarding engine) to clear the event operational state. It may be less specific (the defined prefix may be contained in a larger prefix according to Classless Inter-Domain Routing (CIDR) techniques) if the event has the **less-specific** statement defined. The less specific route that incorporates the router prefix may be the default route (0.0.0.0) if the **less-specific allow-default** statement is defined. The matching prefix may be required to have a specific next hop IP address if defined by the event **next-hop** command. Finally, the source of the RTM prefix may be required to be one of the dynamic routing protocols or be statically defined if defined by the event **protocol** command. If an RTM prefix is not found that matches all the above criteria (if defined in the event control commands), the event is considered to be set. If a matching prefix is found in the RTM, the event is considered to be cleared.

When an event transitions from clear to set, the set is processed immediately and must be reflected in the associated virtual router instances in-use priority value. As the event transitions from clear to set, a hold-set timer is loaded with the value configured by the events **hold-set** command. This timer prevents the event from clearing until it expires, damping the effect of event flapping. If the event clears and becomes set again before the hold-set timer expires, the timer is reset to the **hold-set** value, extending the time before another clear can take effect.

The **no** form of the command is used to remove the specific *prefix/mask-length* monitoring event. The event can be removed at anytime. When the event is removed, the in-use priority of all associated virtual router instances must be reevaluated. The events **hold-set** timer has no effect on the removal procedure.

**Default**

no route-unknown — No route unknown priority control events are defined for the priority control event policy.

**Parameters*****ip-prefix/mask***

The IP prefix address in dotted decimal notation and the subnet mask length expressed as a decimal integer associated with the IP *prefix* defining the route prefix to be monitored by the route unknown priority control event.

**Values** The following values apply to the 7750 SR, 7950 XRS, and 7450 ESS:

<i>ip-prefix/</i>	ip-prefix	a.b.c.d (host bits must
<i>mask:</i>		be 0)
	mask	0 to 32

***ipv6-address/prefix-length***

The IPv6 address of the host for which the specific event will monitor connectivity. The *ipv6-address* can only be monitored by a single event in this policy. The IPv6 address can be monitored by multiple VRRP priority control policies. The IPv6 address can be used in one or multiple **ping** requests. Each VRRP priority control **host-unreachable** and **ping** destined to the same *ipv6-address* is uniquely identified on a per message basis. Each session originates a unique identifier value for the ICMP echo request messages it generates. This allows received ICMP echo reply messages to be directed to the appropriate sending application.

**Values** The following values apply to the 7750 SR and 7950 XRS:

<i>ipv6-address</i>	x:x:x:x:x:x:x (eight 16-bit
	pieces)
	x:x:x:x:x:d.d.d.d
	x: [0..FFFF]H
<i>prefix-length</i>	0 to 128

**Platforms**

All

**22.290 routed-subnet-transparent-forward**

## routed-subnet-transparent-forward

### Syntax

**[no] routed-subnet-transparent-forward**

### Context

**[Tree]** (config>router>subscriber-mgmt>dhcpv4 routed-subnet-transparent-forward)

**[Tree]** (config>service>vprn>subscriber-mgmt>dhcpv4 routed-subnet-transparent-forward)

### Full Context

configure router subscriber-mgmt dhcpv4 routed-subnet-transparent-forward

configure service vprn subscriber-mgmt dhcpv4 routed-subnet-transparent-forward

### Description

This command configures the transparent forwarding of DHCPv4 packets that are received on a subscriber interface with a source IP in a routed subnet that is associated with a routed IPoE session or host. Supported routed subnets are RADIUS and NASREQ framed routes or routes learned via an ESM dynamic BGP peer and managed routes associated with a static IPv4 host.

The **no** form of this command disables transparent forwarding of DHCPv4 packets.

### Default

no routed-subnet-transparent-forward

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.291 router

## router

### Syntax

**router** *router-instance*

**router service-name** *service-name*

**no router**

### Context

**[Tree]** (config>aaa>l2tp-acct-plcy>radius-acct-server router)

### Full Context

configure aaa l2tp-accounting-policy radius-accounting-server router

## Description

This command specifies the number of times the router attempts to contact the RADIUS server for authentication, if not successful the first time.

The **no** form of this command reverts to the default value.

## Parameters

### *router-instance*

Specifies the router instance.

#### Values

*router-name* | *vprn-svc-id*

*router-name* Base, management

Default - Base

*vprn-svc-id* 1 to 2147483647

### *service-name*

Specifies the service name, up to 64 characters.

## Platforms

configure service vprn subscriber-interface group-interface wlan-gw router

configure service ies subscriber-interface group-interface wlan-gw router

## Description

This command specifies the routing instance that wlan-gw gateway endpoint resides in.

The **no** form of this command removes the value from the wlan-gw configuration.

## Default

router

## Parameters

### *router-instance*

Specifies the identifier of the virtual router instance where the tunneled UE traffic is routed.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## router

## Syntax

**router** [*router-instance*] [**create**]

**no router** [*router-instance*]

## Context

[\[Tree\]](#) (config router)

## Full Context

configure router

## Description

Commands in this context configure router parameters including interfaces, route policies and protocols. This command is also used to create CPM router instances.

For CPM router instances, this command enters or creates a user-created CPM router instance. A CPM router instance is not a VPRN router instance. VPRN router instances are configured under **configure service vprn**. CPM router instances are the only type of non-VPRN router instances that can be created by a user, and they have a user-defined name. CPM router instances only use CPM/CCM ethernet ports as interfaces.

## Parameters

### *router-instance*

Specifies the router name or CPM router instance.

### Values

*router-instance* : *router name*

*router-name*      Base | management | *cpm-vr-name*

*cpm-vr-name*      [32 characters maximum]

**Default**      Base

### **create**

Mandatory keyword when creating a router instance. The create keyword requirement can be enabled or disabled in the **environment>create** context.

## Platforms

All

## router

### Syntax

```

router router-instance group tunnel-group-name
router group tunnel-group-name service-name service-name
no router

```

### Context

**[Tree]** (config>service>epipe>sap>l2tpv3-session router)

**[Tree]** (config>service>vpls>sap>l2tpv3-session router)

### Full Context

configure service epipe sap l2tpv3-session router

configure service vpls sap l2tpv3-session router

### Description

This command configures the service and L2TPv3 group to which this L2TPv3 session should be associated. The associated services are used to provide transport for the L2TPv3 tunnel. The service can be specified with either the service-name or router ID. The group name specifies the L2TPv3 group parameters that should be associated with the session.

The **no** form of this command deletes the router configuration.

### Parameters

#### ***router-instance***

Specifies the router name or service ID used to identify the router instance.

#### **Values**

*router-instance*: *router-name* or *vprn-svc-id*

*router-name* "Base"

*vprn-svc-id* 1 to 2147483647

**Default** Base

#### ***tunnel-group-name***

Specifies the tunnel group name, up to 32 characters.

#### ***service-name***

Specifies the service name, up to 64 characters.

### Platforms

### Syntax

```
router router-instance
router service vprn-service-name
```

### Context

[\[Tree\]](#) (config>system>file-trans-prof router)

## Full Context

configure system file-transmission-profile router

## Description

This command specifies the routing instance that the transport protocol uses.

## Default

router Base

## Parameters

### *router-instance*

Specifies the router instance on which the file transmission connection will be established.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **router service vprn-service-name** variant can be used in all configuration modes.

**Values** {router-name | vprn-svc-id}

*router-name*: Base, management

*router-name* is an alias for input only. The *router-name* gets replaced with an id automatically by SR OS in the configuration).

*vprn-svc-id*: 1 to 2147483647

**Default** Base

### *service vprn-service-name*

Identifies the service, up to 64 characters.

## Platforms

## Syntax

**router** *router-instance*

**router service** *vprn-service-instance*

**no router**

## Context

[\[Tree\]](#) (config>system>management-interface>remote-management router)

## Full Context

configure system management-interface remote-management router

## Description

This command defines the router instance in which all remote managers are reachable.

If this command is also configured for a specific manager in the **config>system> management-interface>remote-management>manager** context, that configuration takes precedence.

The **no** form of this command configures management as the router (default).

## Default

router management

## Parameters

### *router-instance*

Specifies a router instance on which the remote management connection is established, up to 32 characters.

### *service vprn-service-instance*

Specifies a VPRN service instance, up to 64 characters.

## Platforms

All

router

## Syntax

**router** *router-instance*

**router service** *vprn-service-instance*

**no router**

## Context

[\[Tree\]](#) (config>system>management-interface>remote-management>manager router)

## Full Context

configure system management-interface remote-management manager router

## Description

This command defines the router instance in which this manager is reachable.

This command takes precedence over the same command configured in the global context (**config>system>management-interface>remote-management**).

The **no** form of this command causes the router to be inherited from the global context (**config>system>management-interface>remote-management**).

## Default

management

## Parameters

### *router-instance*

Specifies the router instance on which the remote management connection is established for this manager, up to 32 characters.

### *service vprn-service-instance*

Specifies a VPRN service instance, up to 64 characters.

## Platforms

## Full Context

configure aaa isa-radius-policy servers router

## Description

This command specifies the number of times the router attempts to contact the RADIUS server for authentication, if not successful the first time.

The **no** form of the command reverts to the default value.

## Default

no router

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

```
router
```

## Syntax

**router** *router-instance*

**router service-name** *service-name*

**no router**

## Context

[\[Tree\]](#) (config>mirror>mirror-dest>encap>layer-3-encap router)

## Full Context

configure mirror mirror-dest encap layer-3-encap router

## Description

This command specifies the routing instance into which to inject the mirrored packets. The packets are forwarded in the routing instance based on the configurable destination IP address in the inserted IP header. If a mirror-dest is configured to inject into a VPRN service, then that VPRN service cannot be deleted. A mirror-dest with layer-3-encap is set to operationally down if the configured destination IP address is not reachable via an interface in the routing instance or service configured for the mirror-dest. No changes are allowed to the router configuration once a gateway is configured. A service must already exist before it is specified as a router-instance. VPRN and IES services share the same number space for the service-id, but IES services cannot be specified as the router-instance for routable LI encap.

Forwarding of routable encapsulated LI packets out an R-VPLS interface is not supported. A mirror-dest configured with routable encapsulation can be bound to a routing instance that also has an R-VPLS bound to it but the operator must ensure that the destination of the LI packets is not reachable via any R-VPLS interfaces. Any routable encapsulated LI packets that arrive at the egress of an R-VPLS interface are discarded. Parallel use of routable LI encapsulation and R-VPLS in the same routing instance is supported as long as the mirrored packets do not egress out the R-VPLS interface.

## Default

router Base

## Parameters

### ***router-instance***

Specifies the router instance.

Values	<router-name>   <service-id>
<i>router-name</i>	"Base", <i>name</i>
<i>service-id</i>	1 to 2147483647

### ***service-name***

Specifies the service name, up to 64 characters.

## Platforms

All

## router

## Syntax

**router** *router-instance*

**no router**

## Context

[\[Tree\]](#) (config>li>mirror-dest-template>layer-3-encap router)

## Full Context

```
configure li mirror-dest-template layer-3-encap router
```

## Description

This command specifies the routing instance into which to inject the mirrored packets. The packets will be forwarded in the routing instance based on the configurable destination IP address in the inserted IP header. This parameter can be overridden by RADIUS.

If a mirror destination is configured to inject into a VPRN service, that VPRN service cannot be deleted. A mirror destination with Layer 3 encapsulation will be set to operationally down if the configured destination IP address is not reachable via an interface in the routing instance or service configured for the mirror destination. A service must exist before it is specified as a router instance. VPRN and IES services share the same number space for the service ID; however, IES services cannot be specified as the router instance for routable LI encapsulation.

## Default

```
router "Base"
```

## Parameters

### *router-instance*

Specifies the router instance using the router name or service ID.

Values	<i>router-instance</i>	<i>router-name</i>   <i>vprn-svc-id</i>
		<i>router-name</i> "Base"
		<i>vprn-svc-id</i> 1 to 2147483647

## Full Context

```
configure oam-pm session ip router
```

## Description

This command numerically references the source context from which the TWAMP Light packet is launched. The **router-instance** *router-instance* configuration, under the same context as the **router** command, is the preferred method for referencing. This method references the launch context by name, and not number, or alias that converts **service-name** to a number.

The **no** form of this command restores the default value.

## Parameters

### *router-or-service*

Specifies the numerical reference to the router instance or service. Well known router-name "Base" is allowed for convenience, but mapped numerically.

<b>Values</b>	{ <i>router-name</i>   <i>vprn-svc-id</i> }
---------------	---------------------------------------------

*router-name:* Base  
*vprn-svc-id:* 1 to 2147483647

The parameter *router-instance* is preferred for specifying the router or service.

### **service-name**

Specifies the alias function that allows the service-name to be used converted and stored as service ID, up to 64 characters. The parameter *router-instance* is preferred for specifying the router or service.

## **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## **router**

### **Syntax**

**no router** *router-instance* **interface** *interface-name*

**router** *router-instance* **interface** *interface-name* [**direction** {**ingress** | **egress** | **both**}]

### **Context**

[\[Tree\]](#) (config>cflowd>collector>exp-filter>if-list router)

### **Full Context**

configure cflowd collector export-filter interface-list router

### **Description**

This command configures the interface flow data sent to this collector.

The **no** form of this command removes the specified interface from the **interface-list** filter.

### **Parameters**

#### ***router-instance***

Specifies the router instance ID associated with the interface name

**Values** *router-name* | *vprn-svc-id*

*router-name:* Base, management Default - Base

*vprn-svc-id:* 1 to 2147483647

#### ***interface-name***

Specifies the interface name, up to 32 characters and must start with a letter, for the router to the service interface or SAP.

#### **ingress**

Keyword to specify that ingress flows are sent to the associated Cflowd Collector.

**Default** both

### egress

Keyword to specify that egress flows are sent to the associated Cflowd Collector.

**Default** both

### both

Keyword to specify that both ingress and egress flows are sent to the associated Cflowd Collector.

**Default** both

## Platforms

All

## router

## Syntax

[no] **router** *router-instance*

## Context

[\[Tree\]](#) (config>cflowd>collector>export-filter router)

## Full Context

configure cflowd collector export-filter router

## Description

This command allows the flow data from only specific router instances to be sent to the associated collector.

Multiple router instances can be configured by issuing the command multiple times with the different router-instances.

The **no** form of this command removes the specified router-instance restriction, which means flows from that router-instance will no longer be exported. If all router-instances are removed, then flows from all router instances are sent to the associated collector.

## Default

no router

## Parameters

### *router-instances*

Specifies the router name or router instance VPRN service ID. Only "Base" is supported.

**Values** router-name: Base, management Default - management

vprn-svc-id: 1 to 2147483647

## Platforms

All

## router

## Syntax

**router** {*router-name* | *vprn-svc-id*}

## Context

[\[Tree\]](#) (config>cflowd>collector router)

## Full Context

configure cflowd collector router

## Description

This command configures the flow data sent to the associated collector to be sent within the specified router context. If this parameter is not specified, flow data is exported using the management routing context.

## Default

router management

## Parameters

### *router-name*

Specifies the router name.

**Values** Base, management

**Default** management

### *vprn-svc-id*

Specifies the router instance VPRN service ID.

**Values** 1 to 2147483647

## Platforms

All

## router

### Syntax

```
router router-instance
router service-name service-name
no router
```

### Context

[\[Tree\]](#) (config>filter>redirect-policy router)

### Full Context

```
configure filter redirect-policy router
```

### Description

This command enhances VRF support in redirect policies. When a router instance is specified, the configured destination tests are run in the specified router instance, and the PBR action is executed in the specified router instance. If no destination is active or if the hardware does not support PBR action "next-hop router", action forward will be executed (i.e. routing will be performed in the context of the incoming interface routing instance).

The **no** form of the command preserves backward-compatibility. Tests always run in the "Base" routing instance context, and the PBR action executes in the routing context of the ingress interface that the filter using this redirect policy is deployed on.

### Default

```
no router
```

### Parameters

#### ***router-instance***

Specifies a router instance in the form of **router-name** or **service-id**.

**Values** **router-name** — Base

**service-id** — Specifies an existing Layer 3 service [1 to 2147483647]

#### ***service-name***

Specifies the name of a configured Layer 3 service.

### Platforms

All

## router

### Syntax

```
router {eq | neq} router-instance [regexp]
```

## no router

### Context

[\[Tree\]](#) (config>log>filter>entry>match router)

### Full Context

configure log filter entry match router

### Description

This command specifies the log event matches for the router instance using a special vrtr-name format used by the logging system.

The **no** form of this command removes the log event matches.

### Parameters

#### eq

Determines if the matching criteria should be equal to the specified value.

#### neq

Determines if the matching criteria should not be equal to the specified value.

#### *router-instance*

Specifies a router name, up to 32 characters, to be used in the match criteria. The router-instance in this command is a name for a router instance in a special format used in the logging system (called the vrtr-name). Examples of vrtr-names include **Base** and **vprn101** (where 101 is the service-id of the VPRN service). It represents the router instance that generated the log event.

#### regex

Specifies the type of string comparison to use to determine if the log event matches the value of the specified router instance. When the **regex** keyword is specified, the string in the **router** command is a regular expression string that is matched against the vrtr-name string in the log event being filtered.

### Platforms

### Full Context

configure system security management-access-filter ip-filter entry router

configure system security management-access-filter ipv6-filter entry router

### Description

This command configures a router name or service ID to be used as a management access filter match criterion.

The **no** form of the command removes the router name or service ID from the match criteria.

### Parameters

#### *router-instance*

Specifies one of the following parameters for the router instance:

*router-name* — Specifies a router name or CPM router instance, up to 32 characters to be used in the match criteria.

**Values** "Base" | "management" | "vpls-management"

**Default** Base

*vprn-svc-id* — Specifies a CPM router instance to be used in the match criteria.

**Values** 1 to 2147483647

#### *service name*

Specifies an existing service name, up to 64 characters.

## 22.295 router-id

### router-id

#### Syntax

**router-id** *ip-address*

**no router-id**

## Context

**[Tree]** (config>service>vprn router-id)

**[Tree]** (config>service>vprn>bgp router-id)

**[Tree]** (config>service>vprn>ospf router-id)

## Full Context

configure service vprn router-id

configure service vprn bgp router-id

configure service vprn ospf router-id

## Description

This command sets the router ID for a specific VPRN context.

When configuring the router ID in the base instance of OSPF it overrides the router ID configured in the **config>router** context. The default value for the base instance is inherited from the configuration in the **config>router** context. If the router ID in the **config>router** context is not configured, the following applies:

- The system uses the system interface address (which is also the loopback address).
- If a system interface address is not configured, use the last 32 bits of the chassis MAC address.

If neither the router ID nor system interface are defined, the router ID from the base router context is inherited.

This is a **required** command when configuring multiple instances and the instance being configured is not the base instance.

When configuring a new router ID, the instance is not automatically restarted with the new router ID. The next time the instance is initialized, the new router ID is used.

To force the new router ID to be used, issue the **shutdown** and **no shutdown** commands for the instance, or reboot the entire router.

It is possible to configure an SR OS to operate with an IPv6 only BOF and no IPv4 system interface address. When configured in this manner, the operator must explicitly define IPv4 router IDs for protocols such as OSPF and BGP as there is no mechanism to derive the router ID from an IPv6 system interface address.

The **no** form of this command removes the router ID definition from the given VPRN context.

## Default

no router-id

## Parameters

*ip-address*

The IP address must be given in dotted decimal notation.

## Platforms

All

## router-id

### Syntax

**router-id** *ip-address*

**no router-id**

### Context

[\[Tree\]](#) (config>service>vprn>isis router-id)

### Full Context

configure service vprn isis router-id

### Description

This command sets the router ID for a specific VPRN context.

If neither the router ID nor system interface are defined, the router ID from the base router context is inherited.

The **no** form of this command removes the router ID definition from the given VPRN context.

### Default

no router-id

### Parameters

*ip-address*

The IP address must be given in dotted decimal notation.

### Platforms

All

## router-id

### Syntax

**[no] router-id** *ip*

### Context

[\[Tree\]](#) (config>router>mpls>srlg-database router-id)

### Full Context

configure router mpls srlg-database router-id

### Description

Commands in this context configure the link members of SRLG groups for a specific router in the network.

The user must also use this command to enter the local interface SRLG membership into the user SRLG

database. Use by CSPF of all interface SRLG membership information of a specific router ID may be temporarily disabled by shutting down the node. If this occurs, CSPF assumes these interfaces have no SRLG membership association.

The **no** form of this command will delete all interface entries under the router ID.

## Parameters

### *ip-address*

Specifies the router ID for this system. This must be the router ID configured under the base router instance, the base OSPF instance or the base IS-IS instance.

## Platforms

All

## router-id

## Syntax

**router-id** *ip-address*

**no router-id**

## Context

[\[Tree\]](#) (config>router router-id)

## Full Context

configure router router-id

## Description

This command configures the router ID for the router instance.

The router ID is used by both OSPF and BGP routing protocols in this instance of the routing table manager. IS-IS uses the router ID value as its system ID.

When configuring a new router ID, protocols are not automatically restarted with the new router ID. The next time a protocol is initialized, the new router ID is used. This can result in an interim period of time when different protocols use different router IDs.

It is possible to configure SR OS to operate with an IPv6 only BOF and no IPv4 system interface address. When configured in this manner, the operator must explicitly define IPv4 router IDs for protocols such as OSPF and BGP as there is no mechanism to derive the router ID from an IPv6 system interface address.

To force the new router ID to be used, issue the **shutdown** and **no shutdown** commands for each protocol that uses the router ID, or restart the entire router.

The system uses the system interface address which is also the loopback address. If a system interface address is not configured, use the last 32 bits of the chassis MAC address.

The **no** form of this command removes the configured value and the last 32 bits of the chassis MAC address are used.

## Default

no router-id

## Parameters

### *ip-address*

Specifies the 32 bit router ID expressed in dotted decimal notation or as a decimal value.

## Platforms

All

## router-id

## Syntax

**router-id** *ip-address*

**no router-id**

## Context

[\[Tree\]](#) (config>router>bgp router-id)

## Full Context

configure router bgp router-id

## Description

This command specifies the router ID to be used with this BGP instance.

Changing the BGP router ID on an active BGP instance causes the BGP instance to restart with the new router ID.

It is possible to configure an SR OS to operate with an IPv6 only BOF and no IPv4 system interface address. When configured in this manner, the operator must explicitly define IPv4 router IDs for protocols such as OSPF and BGP as there is no mechanism to derive the router ID from an IPv6 system interface address.

When no **router-id** is configured for BGP, the system interface IP address is used.

## Default

no router-id

## Parameters

### *ip-address*

Specifies the router ID, expressed as any non-zero value in the range 0.0.0.1 to 255.255.255.255 (or when converted to decimal it can have any value in the range 1-4294967295). It is recommended to use the system IPv4 address.

## 22.300 router-target-as-number

### router-target-as-number

### Syntax

**router-target-as-number** *as-number*

**no router-target-as-number**

## Context

[\[Tree\]](#) (config>subscr-mgmt>vrgw>lanext router-target-as-number)

## Full Context

configure subscriber-mgmt vrgw lanext router-target-as-number

## Description

This command specifies the AS number for the HLE service. It is used to derive the route target (RT) and route distinguisher (RD) for the HLE EVPN service only when the RADIUS server does not return a specific route target or route distinguisher.

The derived RT is in the "target:<configured-router-target-as-number>:<returned Alc-Bridge-Id>" format.

The derived RD is in the "<configured-router-target-as-number>:<returned Alc-Bridge-Id>" format.

The **no** form of this command removes the AS number from the configuration.

## Parameters

### *as-number*

Specifies the AS number of the HLE service.

**Values** 1 to 65535

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.301 router-unsolicited-na-flood-evpn

router-unsolicited-na-flood-evpn

## Syntax

[no] router-unsolicited-na-flood-evpn

## Context

[\[Tree\]](#) (config>service>vpls>proxy-nd router-unsolicited-na-flood-evpn)

## Full Context

configure service vpls proxy-nd router-unsolicited-na-flood-evpn

## Description

This command controls whether the system floods router unsolicited Neighbor Advertisements to EVPN. The NA messages impacted by this command are NA messages with the following flags: S=0 and R=1.

The **no** form of the command will only flood to local SAPs/binds but not to EVPN destinations. This is only recommended in networks where CEs are routers directly connected to the PEs. Networks using

aggregation switches between the host/routers and the PEs should flood unsolicited NA messages in EVPN to ensure that the remote caches are updated and BGP does not miss the advertisement of these entries.

**Default**

router-unsolicited-na-flood-evpn

**Platforms**

All

## 22.302 routing-type0

### routing-type0

**Syntax**

**routing-type0** {true | false}

**no routing-type0**

**Context**

[\[Tree\]](#) (config>filter>ipv6-filter>entry>match routing-type0)

configure filter ipv6-filter entry match routing-type0

**Description**

This command enables match on existence of Routing Type Extension Header type 0 in the IPv6 filter policy.

The **no** form of this command ignores Routing Type Extension Header type 0 presence/absence in a packet when evaluating match criteria of a given filter policy entry.

**Default**

no routing-type0

**Parameters**

**true**

Specifies whether a packet contains Routing Type Extension Header type 0.

**false**

Specifies whether a packet does not contain Routing Type Extension Header type 0.

**Platforms**

All

## 22.303 rp

```
rp
```

### Syntax

```
rp
```

### Context

[\[Tree\]](#) (config>service>vprn>pim rp)

### Full Context

```
configure service vprn pim rp
```

### Description

This command enables access to the context to configure the rendezvous point (RP) of a PIM protocol instance.

A Nokia PIM router acting as an RP must respond to a PIM register message specifying an SSM multicast group address by sending stop register message(s) to the first hop router. It does not build an (S, G) shortest path tree toward the first hop router. An SSM multicast group address can be either from the SSM default range of 232/8 or from a multicast group address range that was explicitly configured for SSM.

### Default

rp enabled when PIM is enabled.

### Platforms

All

```
rp
```

### Syntax

```
rp
```

### Context

[\[Tree\]](#) (config>router>pim rp)

### Full Context

```
configure router pim rp
```

## Description

Commands in this context configure rendezvous point (RP) parameters. The address of the root of the group's shared multicast distribution tree is known as its RP. Packets received from a source upstream and join messages from downstream routers rendezvous at this router.

If this command is not enabled, then the router can never become the RP.

[\[Tree\]](#) (config>service>vprn>pim>rp>ipv6 rp-candidate)

### Full Context

configure service vprn pim rp rp-candidate

configure service vprn pim rp ipv6 rp-candidate

### Description

Commands in this context configure the candidate rendezvous point (RP) parameters.

### Default

enabled when PIM is enabled

### Platforms

All

rp-candidate

### Syntax

rp-candidate

### Context

[\[Tree\]](#) (config>router>pim>rp rp-candidate)

**[Tree]** (config>router>pim>rp>ipv6 rp-candidate)

### Full Context

```
configure router pim rp rp-candidate
configure router pim rp ipv6 rp-candidate
```

### Description

Commands in this context configure the Candidate RP parameters.

Routers use a set of available rendezvous points distributed in Bootstrap messages to get the proper group-to-RP mapping. A set of routers within a domain are also configured as candidate RPs (C-RPs); typically, these will be the same routers that are configured as candidate BSRs.

Every multicast group has a shared tree through which receivers learn about new multicast sources and new receivers learn about all multicast sources. The rendezvous point (RP) is the root of this shared tree.

### Default

rp-candidate shutdown

### Platforms

All

## 22.305 rp-set-peer

rp-set-peer

### Syntax

```
[no] rp-set-peer ip-address
```

### Context

**[Tree]** (config>service>vprn>pim>rp>anycast rp-set-peer)

### Full Context

```
configure service vprn pim rp anycast rp-set-peer
```

### Description

This command configures a peer in the anycast RP-set. The address identifies the address used by the other node as the RP candidate address for the same multicast group address range as configured on this node.

This is a manual procedure. Caution should be taken to produce a consistent configuration of an RP-set for a given multicast group address range. The priority should be identical on each node and be a higher value than any other configured RP candidate that is not a member of this RP-set.

Although there is no set maximum of addresses that can be configured in an RP-set, up to 15 multicast addresses is recommended.

The **no** form of this command removes an entry from the list.

## Parameters

### *ip-address*

Specifies the address used by the other node as the RP candidate address for the same multicast group address range as configured on this node.

## Platforms

All

## rp-set-peer

## Syntax

[no] **rp-set-peer** *ipv6-address*

## Context

**[Tree]** (config>service>vprn>pim>rp>ipv6>anycast rp-set-peer)

## Full Context

configure service vprn pim rp ipv6 anycast rp-set-peer

## Description

This command configures an IPv6 peer in the anycast rp-set. The address identifies the address used by the other node as the RP candidacy address for the same multicast group address range as configured on this node.

This is a manual procedure. Caution should be taken to produce a consistent configuration of an RP- set for a given multicast group address range. The priority should be identical on each node and be a higher value than any other configured RP candidate that is not a member of this rp-set.

Although there is no set maximum of addresses that can be configured in an rp-set, up to 15 multicast addresses is recommended.

The **no** form of this command removes an entry from the list.

## Parameters

### *ipv6-address*

Specifies the address used by the other node as the RP candidacy address for the same multicast group address range as configured on this node.

### Values

ipv6-address : x:x:x:x:x:x:x (eight 16-bit pieces)  
 x:x:x:x:x:d.d.d.d  
 x [0 to FFFF]H  
 d [0 to 255]D

## Platforms

## Syntax

[no] **rp-set-peer** *ip-address*

## Context

**[Tree]** (config>router>pim>rp>anycast rp-set-peer)

## Full Context

configure router pim rp anycast rp-set-peer

## Description

This command configures an IP peer in the anycast RP-set. The address identifies the address used by the other node as the RP candidate address for the same multicast group address range as configured on this node.

This is a manual procedure. Caution should be taken to produce a consistent configuration of an RP-set for a given multicast group address range. The priority should be identical on each node and be a higher value than any other configured RP candidate that is not a member of this RP-set.

Although there is no set maximum number of addresses that can be configured in an RP-set, up to 15 IP addresses is recommended.

The **no** form of this command removes an entry from the list.

## Parameters

### *ip-address*

Specifies an IP peer in the anycast RP-set.

## Platforms

All

### rp-set-peer

## Syntax

[no] **rp-set-peer** *ipv6-address*

## Context

**[Tree]** (config>router>pim>rp>ipv6>anycast rp-set-peer)

## Full Context

configure router pim rp ipv6 anycast rp-set-peer

## Description

This command configures a peer in the anycast RP-set. The address identifies the address used by the other node as the RP candidate address for the same multicast group address range as configured on this node.

This is a manual procedure. Caution should be taken to produce a consistent configuration of an RP-set for a given multicast group address range. The priority should be identical on each node and be a higher value than any other configured RP candidate that is not a member of this RP-set.

Although there is no set maximum number of addresses that can be configured in an RP-set, up to 15 IP addresses is recommended.

The **no** form of this command removes the IPv6 address from the anycast RP set.

## Parameters

### *ipv6-address*

Specifies an IPv6 peer in the anycast RP-set.

## Platforms

configure system security profile grpc rpc-authorization

## Description

This command opens a configuration context for configuring user privileges related to RPCs.

## Platforms

All

## 22.307 rpf-select

## rpf-select

### Syntax

**rpf-select**

### Context

[\[Tree\]](#) (config>service>vprn>mvpn rpf-select)

### Full Context

configure service vprn mvpn rpf-select

### Description

This command enables context for VRF extranet mapping for C-instance receivers in this receiver MVPN instance to multicast streams in P-instance core MVPN instances.

### Platforms

All

## 22.308 rpf-table

## rpf-table

### Syntax

**rpf-table** {*rtable-m* | *rtable-u* | *both*}

**no rpf-table**

### Context

[\[Tree\]](#) (config>service>vprn>msdp rpf-table)

### Full Context

configure service vprn msdp rpf-table

### Description

This command configures the sequence of route tables used to find a Reverse Path Forwarding (RPF) interface for a particular multicast route.

By default, only the unicast route table is looked up to calculate RPF interface towards the source/rendezvous point. However, the operator can specify the following:

- use the unicast route table only
- use the multicast route table only or
- use both the route tables

The **no** form of this command reverts to the default.

## Default

rpf-table rtable-u

## Parameters

### rtable-m

Specifies that only the multicast route table will be used by the multicast protocol (PIM) for IPv4 RPF checks. This route table will contain routes submitted by static routes, ISIS and OSPF.

### rtable-u

Specifies only that the unicast route table will be used by the multicast protocol (PIM) for IPv4 RPF checks. This route table will contain routes submitted by all the unicast routing protocols.

### both

Will always look up first in the multicast route table and, if there is a route, it will use it. If PIM does not find a route in the first lookup, it will try to find it in the unicast route table. Rtable-m is checked before rtable-u.

## Platforms

All

## rpf-table

## Syntax

**rpf-table** {**rtable-m** | **rtable-u** | **both**}

**no rpf-table**

## Context

[\[Tree\]](#) (config>service>vprn>pim rpf-table)

[\[Tree\]](#) (config>router>msdp rpf-table)

## Full Context

configure service vprn pim rpf-table

configure router msdp rpf-table

## Description

This command configures the sequence of route tables used to find a Reverse Path Forwarding (RPF) interface for a particular multicast route.

By default, only the unicast route table is looked up to calculate RPF interface towards the source/ rendezvous point. However, the operator can specify the following:

- use the unicast route table only

- use the multicast route table only
- use both the route tables

## Default

rpf-table rtable-u

## Parameters

### rtable-m

Specifies that only the multicast route table will be used by the multicast protocol (PIM) for IPv4 RPF checks. This route table will contain routes submitted by static routes, IS-IS and OSPF.

### rtable-u

Specifies only that the unicast route table will be used by the multicast protocol (PIM) for IPv4 RPF checks. This route table will contain routes submitted by all the unicast routing protocols.

### both

Specifies that the multicast route table will be used first by the multicast protocol (PIM) for checks, and then the unicast route table will be used if the multicast route table lookup fails. rtable-m is checked before rtable-u.

## Platforms

All

## rpf-table

## Syntax

rpf-table {rtable-m | rtable-u | both}

no rpf-table

## Context

[\[Tree\]](#) (config>router>pim rpf-table)

## Full Context

configure router pim rpf-table

## Description

This command configures the sequence of route tables used to find a Reverse Path Forwarding (RPF) interface for a particular multicast route.

By default, only the unicast route table is looked up to calculate RPF interface towards the source or rendezvous point. However, the operator can specify one of the following:

- use the unicast route table only
- use the multicast route table only

- use both the route tables

The **no** form of this command reverts to the default value.

## Default

rpf-table rtable-u

## Parameters

### rtable-m

Specifies that only the multicast route table will be used by the multicast protocol (PIM) for IPv4 RPF checks. This route table will contain routes submitted by static routes, ISIS and OSPF.

### rtable-u

Specifies only that the unicast route table will be used by the multicast protocol (PIM) for IPv4 RPF checks. This route table will contain routes submitted by all the unicast routing protocols.

### both

Specifies to always lookup first in the multicast route table and if there is a route, it will use it. If PIM does not find a route in the first lookup, it will try to find it in the unicast route table. Rtable-m is checked before rtable-u.

## Platforms

All

## 22.309 rpf6-table

### rpf6-table

## Syntax

rpf6-table {rtable6-m | rtable6-u | both}

no rpf6-table

## Context

[\[Tree\]](#) (config>service>vprn>pim rpf6-table)

## Full Context

configure service vprn pim rpf6-table

## Description

This command configures the sequence of route tables used to find a Reverse Path Forwarding (RPF) interface for a specific multicast route.

By default, only the unicast route table is looked up to calculate the RPF interface toward the source/ rendezvous point. However, the operator can specify to use the following:

- unicast route table only
- multicast route table only
- both route tables

## Default

rpf6-table rtable6-u

## Parameters

### rtable6-m

Specifies that only the multicast route table will be used by the multicast protocol (PIM) for IPv6 RPF checks. This route table will contain routes submitted by static routes, ISIS and OSPF.

### rtable6-u

Specifies that only the unicast route table will be used by the multicast protocol (PIM) for IPv6 RPF checks. This route table will contain routes submitted by all unicast routing protocols.

### both

Specifies that the multicast route table will be used first by the multicast protocol (PIM) for IPv6 RPF checks, then the unicast route table will be used if the multicast route table lookup fails.

## Platforms

All

## rpf6-table

## Syntax

rpf6-table {rtable6-m | rtable6-u | both}

no rpf6-table

## Context

[\[Tree\]](#) (config>router>pim rpf6-table)

## Full Context

configure router pim rpf6-table

## Description

This command configures the sequence of route tables used to find a Reverse Path Forwarding (RPF) interface for a particular multicast route.

By default, only the unicast route table is looked up to calculate RPF interface towards the source/ rendezvous point. However, the operator can specify the following:

- use unicast route table only
- use multicast route table only or
- use both the route tables

The **no** form of this command reverts to the default value.

## Default

rpf6-table rtable6-u

## Parameters

### rtable6-m

Specifies that only the multicast route table will be used by the multicast protocol (PIM) for IPv6 RPF checks. This route table will contain routes submitted by static routes, ISIS and OSPF.

### rtable6-u

Specifies that only the unicast route table will be used by the multicast protocol (PIM) for IPv6 RPF checks. This route table will contain routes submitted by all the unicast routing protocols.

### both

Specifies that the multicast route table will be used first by the multicast protocol (PIM) for IPv6 RPF checks, and then the unicast route table will be used if the multicast route table lookup fails.

## 22.310 rpfv

```
rpfv
```

### Syntax

```
rpfv [detail]
```

```
no rpfv
```

### Context

[\[Tree\]](#) (debug>router>pim rpfv)

### Full Context

```
debug router pim rpfv
```

### Description

This command enables debugging for PIM RPF vector.

The **no** form of this command disables debugging for PIM RPF vector.

## Parameters

### detail

Debugs detailed RPF vector information.

## Platforms

All

## rpfv

## Syntax

**rpfv core**

**rpfv mvpn**

**rpfv core mvpn**

**no rpfv [core] [mvpn]**

## Context

[\[Tree\]](#) (config>router>pim rpfv)

## Full Context

configure router pim rpfv

## Description

This command enables RPF Vector processing for Inter-AS Rosen MVPN Option-B and Option-C. The **rpfv** must be enabled on every node for Inter-AS Option B/C MVPN support.

If **rpfv** is configured, MLDP inter-AS resolution cannot be used. These two features are mutually exclusive.

The **no** form of this command reverts to the default.

## Default

no rpfv

## Parameters

### mvpn

Enables MVPN RPF vector processing for Inter-AS Option B/C MVPN based on RFC 5496 and RFC 6513. If a core RPF vector is received, it will be dropped before a message is processed.

### core

Enables core RPF vector (no RD) processing for Inter-AS Option B/C MVPN, which allows SR OS interoperability as P-router with third-party vendors that do not encode RD in the RPF vector for Inter-AS MVPN.

### core mvpn

Enables core RPF vector (no RD) processing for Inter-AS Option B/C MVPN, which allows SR OS interoperability as P-router with third-party vendors that do not encode RD in the RPF vector for Inter-AS MVPN.

The **no** version of this command disables RPF Vector processing. If RPF vector is received in a PIM join message, the vector will be removed before local processing of PIM message starts.

## Platforms

All

## 22.311 rpki-session

### rpki-session

#### Syntax

**[no] rpki-session** *ip-address*

#### Context

**[Tree]** (config>router>origin-validation rpki-session)

#### Full Context

configure router origin-validation rpki-session

#### Description

This command configures a session with an RPKI local cache server by using the RPKI-Router protocol. It is over these sessions that the router learns dynamic VRP entries expressing valid origin AS and prefix associations. SR OS supports the RPKI-Router protocol over TCP/IPv4 or TCP/IPv6 transport. The router can set up an RPKI-Router session using the base routing table (in-band) or the management router (out-of-band). Configure the command in the **config>router management** instance to configure a session using the management port.

#### Default

no rpki-session

#### Parameters

##### *ip-address*

Specifies the IPv4 address or an IPv6 address. If the IPv6 address is link-local then the interface name must be appended to the IPv6 address after a hyphen (-).

## Platforms

All

## rpk-session

### Syntax

[no] rpk-session *ip-address*

### Context

[\[Tree\]](#) (debug>router rpk-session)

### Full Context

debug router rpk-session

### Description

This command enables and configures debugging for RPKI session.

The **no** form of this command disables debugging for RPKI session.

### Parameters

#### *ip-address*

Debugs the RPKI session associated with the specified IP address.

Values			
ipv4-address:	a.b.c.d		
ipv6-address	x:x:x:x:x:x:x		[-interface]
	x:x:x:x:x:d.d.d.d		[-interface]
	x:		[0 to FFFF]H
	d:		[0 to 255]D
	interface		up to 32 characters, mandatory for link local addresses

### Platforms

All

## 22.312 rpl-end

## rpl-end

### Syntax

[no] rpl-end

## Context

[\[Tree\]](#) (config>eth-ring>path rpl-end)

## Full Context

configure eth-ring path rpl-end

## Description

This command configures the G.8032 path as a ring protection link end. The ring should be declared as either a RPL owner or RPL neighbor for this command to be allowed. Only path a or path b can be declared an RPL-end.

The **no** form of this command sets the rpl-end to default no rpl-end.

## Default

no rpl-end

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.313 rpl-node

### rpl-node

## Syntax

**rpl-node** [owner | nbr]

**no rpl-node**

## Context

[\[Tree\]](#) (config>eth-ring rpl-node)

## Full Context

configure eth-ring rpl-node

## Description

This command configures the G.8032 ring protection link type as owner or neighbor. The **no** form of the command means this node is not connected to an RPL link. When RPL owner or neighbor is specified either the a or b path must be configured with the **rpl-end** command. An owner is responsible for operation of the rpl link. Configuring the RPL as neighbor is optional (can be left as no rpl-node) but if the command is used the nbr is mandatory.

On a sub-ring without virtual channel it is mandatory to configure sub-ring non-virtual-link on all nodes on the sub-ring to propagate the R-APS messages around the sub-ring.

The **no** form of this command removes the RPL link.

**Default**

no rpl-node

**Parameters****owner**

Specifies the owner link type.

**nbr**

Specifies the neighbor link type.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.314 rr

```
rr
```

**Syntax**

[no] rr

**Context**

[\[Tree\]](#) (debug>router>rsvp>event rr)

**Full Context**

debug router rsvp event rr

**Description**

This command debugs refresh reduction events.

The **no** form of the command disables the debugging.

**Platforms**

All

## 22.315 rr-use-route-table

```
rr-use-route-table
```

**Syntax**

rr-use-route-table

## no rr-use-route-table

### Context

[\[Tree\]](#) (config>router>bgp>next-hop-res>labeled-routes rr-use-route-table)

### Full Context

configure router bgp next-hop-resolution labeled-routes rr-use-route-table

### Description

This command enables BGP to perform a lookup of IGP routes in the route table to resolve the BGP next-hop of label-IPv4 and label-IPv6 routes. This is useful for a Route Reflector (RR) that does not participate in tunnel signaling protocols such as LDP and RSVP and therefore, does not have tunnels to resolve the BGP next-hops of label-unicast routes.

Configure the **disable-route-table-install** command before you configure the **rr-use-route-table** command because forwarding would otherwise be incorrect for cases where label routes are resolved this way.

### Default

no rr-use-route-table

### Platforms

All

## 22.316 rs-fec-mode

### rs-fec-mode

### Syntax

**rs-fec-mode** *rs-fec-mode*

**no rs-fec-mode**

### Context

[\[Tree\]](#) (config>port>connector rs-fec-mode)

### Full Context

configure port connector rs-fec-mode

### Description

This command is used for breakout connectors when all connector ports must use the same **rs-fec-mode** setting.

In all other cases, the **rs-fec-mode** is set using the **configure port ethernet rs-fec-mode** command for each individual connector port.

See "Forward Error Correction" in the *Interface Configuration Guide* for more information about **rs-fec-mode** settings.

### Default

no rs-fec-mode

### Parameters

#### **rs-fec-mode**

Specifies the RS-FEC mode to support.

**Values** cl91-514-528, cl91-514-544

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## rs-fec-mode

### Syntax

**rs-fec-mode** *rs-fec-mode*

**no rs-fec-mode**

### Context

[\[Tree\]](#) (config>port>ethernet rs-fec-mode)

### Full Context

configure port ethernet rs-fec-mode

### Description

This command enables RS-FEC on the Ethernet port. RS-FEC Clause 91 is required for QSFP28, CFP4, 100GBase-SR4, 100GBase-ER4 lite, and CWDM4 for the QSFP28 package optics for short-reach optics.

See "Forward Error Correction" in the *Interface Configuration Guide* for more information about **rs-fec-mode** settings.

### Default

no rs-fec-mode

### Parameters

#### **rs-fec-mode**

Specifies the RS-FEC mode to support.

**Values** cl91-514-528, cl74, cl108

```

```
configure service epipe bgp-evpn mpls auto-bind-tunnel resolution-filter rsvp
```

```
configure service vprn bgp-ipvprn mpls auto-bind-tunnel resolution-filter rsvp
```

```
configure service vprn bgp-evpn mpls auto-bind-tunnel resolution-filter rsvp
```

### Description

This command selects the RSVP-TE tunnel type.

The **rsvp** value instructs BGP to search for the best metric RSVP LSP to the address of the BGP next hop. This address can correspond to the system interface or to another loopback interface used by the BGP instance on the remote node. The LSP metric is provided by MPLS in the tunnel table. In the case of multiple RSVP LSPs with the same lowest metric, BGP selects the LSP with the lowest **tunnel-id**.

The **no** form of this command removes the RSVP-TE tunnel type.

### Default

```
no rsvp
```

### Platforms

```
All
```

```
rsvp
```

### Syntax

```

[\[Tree\]](#) (config>service>vprn>mvpn>pt>selective rsvp)

## Full Context

configure service vprn mvpn provider-tunnel inclusive rsvp  
configure service vprn mvpn provider-tunnel selective rsvp

## Description

Commands in this context configure the RSVP P2MP LSP for the provider tunnel.

The **no** form of this command removes the rsvp context including all the statements in the context.

## Default

no rsvp

## Platforms

All

rsvp

## Syntax

[no] rsvp

## Context

[\[Tree\]](#) (config>router rsvp)

## Full Context

configure router rsvp

## Description

Commands in this context configure RSVP protocol parameters. RSVP is not enabled by default and must be explicitly enabled (**no shutdown**).

RSVP is used to set up LSPs. RSVP should be enabled on all router interfaces that participate in signaled LSPs.

The **no** form of this command deletes this RSVP protocol instance and removes all configuration parameters for this RSVP instance. To suspend the execution and maintain the existing configuration, use the **shutdown** command. RSVP must be shutdown before the RSVP instance can be deleted. If RSVP is not shutdown, the **no rsvp** command does nothing except issue a warning message on the console indicating that RSVP is still administratively enabled.

## Default

no shutdown

## Platforms

All

## rsvp

### Syntax

**rsvp** [**lsp** *lsp-name*] [**sender** *source-address*] [**endpoint** *endpoint-address*] [**tunnel-id** *tunnel-id*] [**lsp-id** *lsp-id*] [**interface** *ip-int-name*]

**no rsvp**

### Context

[\[Tree\]](#) (debug>router rsvp)

### Full Context

debug router rsvp

### Description

This command enables and configures debugging for RSVP.

### Parameters

#### **lsp** *lsp-name*

Specifies the LSP name up to 64 characters in length.

#### **sender** *source-address*

Specifies the IP address of the sender.

#### **endpoint** *endpoint-address*

Specifies the far-end IP address.

#### **tunnel-id** *tunnel-id*

Specifies the RSVP tunnel ID.

**Values** 0 to 4294967295

#### **lsp-id** *lsp-id*

Specifies the LSP ID.

**Values** 1 to 65535

#### **interface** *ip-int-name*

Specifies the interface name. The interface name can be up to 32 characters long and must be unique. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### Full Context

configure router bgp next-hop-resolution labeled-routes transport-tunnel family resolution-filter rsvp

configure router bgp next-hop-resolution shortcut-tunnel family resolution-filter rsvp

### Description

This command selects RSVP tunneling for next-hop resolution and specifies RSVP tunnels in a tunnel table to IPv4 destinations. This option allows BGP to use the best metric RSVP LSP to the address of the BGP next-hop. This address can correspond to the system interface or to another loopback interface of the remote BGP router. In the case of multiple RSVP LSPs with the same lowest metric, BGP selects the LSP with the lowest tunnel ID.

## 22.322 rsvp-resv-style

### rsvp-resv-style

#### Syntax

**rsvp-resv-style** [se | ff]

#### Context

[\[Tree\]](#) (config>router>mpls>lsp rsvp-resv-style)

#### Full Context

configure router mpls lsp rsvp-resv-style

#### Description

This command specifies the RSVP reservation style, shared explicit (se) or fixed filter (ff). A reservation style is a set of control options that specify a number of supported parameters. The style information is part of the LSP configuration.

#### Default

rsvp-resv-style se

#### Parameters

##### **ff**

Fixed filter is single reservation with an explicit scope. This reservation style specifies an explicit list of senders and a distinct reservation for each of them. A specific reservation request is created for data packets from a particular sender. The reservation scope is determined by an explicit list of senders.

##### **se**

Shared explicit is shared reservation with a limited scope. This reservation style specifies a shared reservation environment with an explicit reservation scope. This reservation style creates a single reservation over a link that is shared by an explicit list of senders. Because each sender is explicitly listed in the RESV message, different labels can be assigned to different sender-receiver pairs, thereby creating separate LSPs.

### Full Context

configure router mpls lsp-self-ping rsvp-te

### Description

This command enables LSP Self Ping on all RSVP-TE LSPs, unless an individual LSP is explicitly disabled under the **lsp>lsp-self-ping** command or in the LSP template.

The **no** form of this command reverts to the default value.

## Default

rsvp-te disable

## Parameters

### *rsvp-te*

Specifies whether LSP Self Ping is enabled on RSVP-TE LSPs.

**Values** enable, disable

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## rsvp-te

## Syntax

*rsvp-te value*

**no rsvp-te**

## Context

[\[Tree\]](#) (config>router>mpls>tunnel-table-pref rsvp-te)

## Full Context

configure router mpls tunnel-table-pref rsvp-te

## Description

This command configures the tunnel table preference for RSVP-TE LSP tunnel type away from its default value.

The tunnel table preference applies to the next-hop resolution of BGP routes of the following families: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPv6 in the tunnel table.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The tunnel preference in such an SDP is fixed and is controlled by the service manager. The configuration of the tunnel table preference parameter does not modify the behavior of such an SDP and the services that bind to it.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default.

## Default

rsvp-te 7

## Parameters

### *value*

Specifies the tunnel table preference value for RSVP-TE LSP.

**Values** 1 to 255

**Default** 7

## Platforms

## Full Context

```
configure router static-route-entry indirect tunnel-next-hop resolution-filter rsvp-te
```

## Description

This command enables the use of RSVP-TE sourced tunnel entries in the TTM to resolve the associated static route next-hop.

The rsvp-te value instructs the code to search for the set of lowest metric RSVP-TE LSPs to the address of the indirect next-hop. The LSP metric is provided by MPLS in the tunnel table. The static route treats a set of RSVP-TE LSPs with the same lowest metric as an ECMP set. The user has the option of configuring a list of RSVP-TE LSP names to be used exclusively instead of searching in the tunnel table. In that case, all LSPs must have the same LSP metric in order for the static route to use them as an ECMP set. Otherwise, only the LSPs with the lowest common metric value will be selected.

A P2P auto-lsp that is instantiated via an LSP template can be selected in TTM when resolution is set to any. However, Nokia does not recommend configuring an auto-lsp name explicitly under the rsvp-te node as the auto-generated name can change if the node reboots, which will blackhole the traffic of the static route.

#### Full Context

configure mcast-management multicast-info-policy bundle channel video rt-buffer-size

configure mcast-management multicast-info-policy bundle channel source-override video rt-buffer-size

#### Description

This command configures the retransmission buffer for channels within the bundle or channel range.

The **no** form of the command returns the parameter to the default value.

#### Default

300

#### Parameters

***rt-buffer-size***

Specifies the buffer size, in milliseconds, to store channel packets.

**Values** 300 to 8000

#### Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

#### Syntax

**rt-payload-type** *payload-type*

**no rt-payload-type**

## Context

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if rt-payload-type)

## Full Context

configure mcast-management multicast-info-policy video-policy video-interface rt-payload-type

## Description

This command describes the format to be used by Retransmission (RT) server to send retransmission packets. The RET server interface allows the payload type within the retransmission packets to be configured.

## Default

rt-payload-type 99 — Indicates that the frames will be sent in the RFC 4588, *RTP Retransmission Payload Format*, format.

## Parameters

### *payload-type*

Indicates the format expected for received retransmission packets. The value 33 indicates that the frames will be received as originally sent. A value between 96 and 127 indicates the dynamic payload type value (per RFC 3551) to be used for RFC 4588 formatted retransmission packets.

**Values** 33, 96 to 127

## Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## Full Context

configure mcast-management multicast-info-policy bundle channel video rt-server  
 configure mcast-management multicast-info-policy bundle channel source-override video rt-server  
 configure mcast-management multicast-info-policy bundle video rt-server

## Description

This command enables and configures the upstream retransmission server configuration parameters.

The **no** form of the command removes the upstream retransmission server configuration and implies the configuration is inherited from a higher context or from the default policy.

## Default

no rt-server – The upstream retransmission server settings are inherited.

## Parameters

### disable

This keyword explicitly disables the upstream retransmission server within the policy. For the default bundle within the default Multicast Information Policy, the **no** form of the command and the disable keyword have the same meaning and imply the server is disabled.

### ip-address

The IP address of the upstream retransmission server.

### port num

The UDP port to use to send RET requests to the upstream RET server.

**Values** 1024 to 5999, 6251 to 65535

## Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 22.331 rtm-debounce-time

### rtm-debounce-time

#### Syntax

**rtm-debounce-time** *debounce-time*

**no rtm-debounce-time**

#### Context

**[Tree]** (config>router>l2tp rtm-debounce-time)

**[Tree]** (config>service>vprn>l2tp rtm-debounce-time)

#### Full Context

configure router l2tp rtm-debounce-time

configure service vprn l2tp rtm-debounce-time

#### Description

This command configures the amount of time, in milliseconds, that the system waits before declaring an L2TP tunnel down when the remote endpoint IP address cannot be resolved to an active IP route in the local routing table.

The default behavior is for the L2TP tunnel to not be declared down based on the remote endpoint IP address reachability.

The **no** form of this command returns the **rtm-debounce-time** to a value of 0.

#### Default

no rtm-debounce-time

#### Parameters

##### *debounce-time*

Specifies the amount of time, in milliseconds, that the system waits before declaring the associated L2TP tunnel as down.

**Values** 0 to 5000

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.332 rtp-header

## rtp-header

### Syntax

[no] rtp-header

### Context

[\[Tree\]](#) (config>service>epipe>sap>cem rtp-header)

[\[Tree\]](#) (config>service>cpipe>sap>cem rtp-header)

### Full Context

configure service epipe sap cem rtp-header

configure service cpipe sap cem rtp-header

### Description

This command specifies whether an RTP header is used when packets are transmitted to the packet service network (PSN) by the CEM SAP. This mode must be enabled for differential-timed DS1/E1s. It can optionally be enabled for other DS1/E1s for interoperability purposes.

### Default

no rtp-header

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## rtp-header

### Syntax

[no] rtp-header

### Context

[\[Tree\]](#) (config>mirror>mirror-dest>sap>cem rtp-header)

### Full Context

configure mirror mirror-dest sap cem rtp-header

### Description

This command specifies whether an RTP header is used when packets are transmitted to the packet service network (PSN) by the CEM SAP.

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 22.333 rtp-performance

configure application-assurance group cflowd rtp-performance

#### Description

This command configures the cflowd RTP performance export.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.334 rtr-adv-lsa-limit

### rtr-adv-lsa-limit

#### Syntax

**rtr-adv-lsa-limit** [*1..4294967295*] [**log-only**] [**threshold** *percentf*]  
**rtr-adv-lsa-limit** [*1..4294967295*] [**log-only**] [**threshold** *percentf*] **overload-timeout forever**  
**rtr-adv-lsa-limit** [*1..4294967295*] [**log-only**] [**threshold** *percentf*] **overload-timeout seconds**  
**no rtr-adv-lsa-limit**

#### Context

[\[Tree\]](#) (config>service>vprn>ospf rtr-adv-lsa-limit)

#### Full Context

configure service vprn ospf rtr-adv-lsa-limit

#### Description

This command configures the maximum number of LSAs OSPF can learn from another router, in order to protect the system from a router that accidentally advertises a large number of LSAs. When the number

of advertised LSAs reaches the configured percentage of this limit, an SNMP trap is sent. If the limit is exceeded, OSPF goes into overload.

The **overload-timeout** option allows the administrator to control how long OSPF is in overload as a result of the advertised LSA limit being reached. At the end of this duration of time the system automatically attempts to restart OSPF. One possible value for the **overload-timeout** is **forever**, which means OSPF is never restarted automatically and this corresponds to the default behavior when the **overload-timeout** option is not configured.

The **no** form of this command removes the **rtr-adv-lsa-limit**.

## Default

rtr-adv-lsa-limit forever

## Parameters

### log-only

Enables the warning message to be sent at the specified threshold percentage, and also when the limit is exceeded. However, overload is not set.

### percent

The threshold value (as a percentage) that triggers a warning message to be sent.

**Values** 0 to 100

### seconds

Specifies duration in seconds before restarting OSPF.

**Values** 1 to 1800

## Platforms

All

## rtr-adv-lsa-limit

## Syntax

**rtr-adv-lsa-limit** *limit* [**log-only**] [**threshold** *percent*]

**rtr-adv-lsa-limit** *limit* [**log-only**] [**threshold** *percent*] [**overload-timeout** {*seconds* | **forever**}]

**no** rtr-adv-lsa-limit

## Context

**[Tree]** (config>router>ospf3 rtr-adv-lsa-limit)

**[Tree]** (config>router>ospf rtr-adv-lsa-limit)

## Full Context

configure router ospf3 rtr-adv-lsa-limit

configure router ospf rtr-adv-lsa-limit

## Description

This command configures the maximum number of LSAs OSPF can learn from another router, in order to protect the system from a router that accidentally advertises a large number of LSAs. When the number of advertised LSAs reaches the configured percentage of this limit, an SNMP trap is sent. If the limit is exceeded, OSPF goes into overload.

The **overload-timeout** option allows the administrator to control how long OSPF is in overload as a result of the advertised LSA limit being reached. At the end of this duration of time, the system automatically exits overload. One possible value for the **overload-timeout** is **forever**, which means OSPF is never exiting overload.

The **no** form of this command removes the **rtr-adv-lsa-limit**.

## Default

no rtr-adv-lsa-limit

## Parameters

### log-only

Enables the warning message to be sent at the specified threshold percentage, and also when the limit is exceeded. However, overload is not set.

### percent

Specifies the threshold value (as a percentage) that triggers a warning message to be sent.

**Values** 0 to 100

### limit

Specifies the number of LSAs, expressed as a decimal integer, that can be learned.

**Values** 1 to 4294967295

### second

Specifies duration in minutes before restarting OSPF.

**Values** Values 1 to 1800

### forever

Specifies that OSPF is restarted only after the **clear router ospf | ospf3 overload rtr-adv-lsa-limit** command is executed.

## 22.335 rtr-solicit-user-db

## rtr-solicit-user-db

### Syntax

**rtr-solicit-user-db** *local-user-db*

**no rtr-solicit-user-db**

### Context

**[Tree]** (config>service>vpls>sap rtr-solicit-user-db)

### Full Context

configure service vpls sap rtr-solicit-user-db

### Description

This command enabled access to LUDB for SLAAC hosts under the capture SAP. The name of this ludb must match the name of ludb configured under the **configure>service>vprn/ies>sub-if>group-if>ipv6>router-solicit** hierarchy.

The **no** form of this command reverts to the default.

### Parameters

***local-user-db***

Specifies the name of the local-user-database up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.336 rtsp

## rtsp

### Syntax

## 22.337 rtt-threshold

### rtt-threshold

#### Syntax

```
rtt-threshold threshold
```

```
no rtt-threshold
```

#### Context

[\[Tree\]](#) (config>app-assure>group>aa-sub-cong rtt-threshold)

[\[Tree\]](#) (config>app-assure>group>anl>source rtt-threshold)

#### Full Context

```
configure application-assurance group aa-sub-congestion-detection rtt-threshold
```

```
configure application-assurance group access-network-location source rtt-threshold
```

#### Description

This command configures the roundtrip delay threshold used by the DEM gateway algorithm to determine ANL congestion or subscriber congestion for NLB-DEM.

#### Default

```
rtt-threshold 173
```

## Parameters

### *threshold*

Specifies the maximum acceptable round trip time (RTT), in milliseconds, for TCP connections with no congestion. Any measured RTT above the threshold is considered an indication of possible congestion.

**Values** 0 to 500

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.338 rtt-threshold-rat

### rtt-threshold-rat

## Syntax

**rtt-threshold-rat** *rat-type* *rat-type* **rtt-threshold** *rtt-threshold*

**no** **rtt-threshold-rat** *rat-type* *rat-type*

## Context

[\[Tree\]](#) (config>app-assure>group>aa-sub-cong rtt-threshold-rat)

[\[Tree\]](#) (config>app-assure>group>anl>source rtt-threshold-rat)

## Full Context

configure application-assurance group aa-sub-congestion-detection rtt-threshold-rat

configure application-assurance group access-network-location source rtt-threshold-rat

## Description

This command configures the roundtrip delay threshold for each RAT type to be used for a congestion detection algorithm (if applicable).

The **no** form of this command reverts to the default value.

## Default

rtt-threshold-rat 173

## Parameters

### *rat-type*

Specifies the 3GPP RAT type.

**Values** utran, geran, wlan, gan, hspa-evol, eutran, virtual, eutran-nb, ehrpd, hrpd, cdma-1x, umb, wifi, nr, lte-m

***rtt-threshold***

Specifies the parameter used by the DEM-GW algorithm that determines ANL congestion or subscriber congestion in the case of NLB-DEM. It specifies the maximum acceptable round trip time (RTT), under no congestion, in milliseconds. Any measured RTT above the threshold is considered an indication of possible congestion.

**Values** 0 to 500

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.339 rtt-threshold-tolerance

### rtt-threshold-tolerance

**Syntax**

**rtt-threshold-tolerance** *tolerance*

**no rtt-threshold-tolerance**

**Context**

**[Tree]** (config>app-assure>group>aa-sub-cong rtt-threshold-tolerance)

**[Tree]** (config>app-assure>group>anl>source rtt-threshold-tolerance)

**Full Context**

configure application-assurance group aa-sub-congestion-detection rtt-threshold-tolerance

configure application-assurance group access-network-location source rtt-threshold-tolerance

**Description**

This command configures the ANL roundtrip delay threshold tolerance used by the DEM gateway algorithm to determine ANL-level or subscriber-level congestion.

**Default**

rtt-threshold-tolerance 50

**Parameters*****tolerance***

Specifies the ratio, in percentage, of RTTs above the configured threshold (**rtt-threshold**) over the total RTT measurements.

The ratio is calculated as follows, measured across a one-minute period:

**rtt-threshold-tolerance** = #(RTTs > **rtt-threshold**) / (Total #RTTs)

If the **rtt-threshold-tolerance** ratio is exceeded, the ANL is declared congested.

**Values** 0 to 100

**Default** 50

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.340 rule-prefix

### rule-prefix

#### Syntax

**rule-prefix** *rule-prefix*

**no rule-prefix**

#### Context

[\[Tree\]](#) (config>service>nat>map-domain>mapping-rule rule-prefix)

#### Full Context

configure service nat map-domain mapping-rule rule-prefix

#### Description

This command configures a MAP rule prefix.

#### Parameters

***rule-prefix***

Specifies the IPv6 MAP rule prefix.

**Values** *<ipv6-prefix/prefix-length>* :

*ipv6-prefix* — *x:x:x:x:x:x:x* (eight 16-bit pieces)  
*x:x:x:x:x:d.d.d.d*  
*x*—[0 to FFFF]H  
*d*—[0 to 255]D  
*prefix-length*—[0 to 64]

#### Platforms

VSR

## 22.341 run-as-user

```
run-as-user
```

### Syntax

```
run-as-user user-name
```

```
no run-as-user
```

### Context

[\[Tree\]](#) (config>python>python-script run-as-user)

### Full Context

```
configure python python-script run-as-user
```

### Description

This command configures a user that is different from the current user of the session. Script authentication, authorization, accounting, and any activity within the script, is run as the specified user.

The **no** form of this command specifies that the current user of the session is used.

### Default

```
no run-as-user
```

### Parameters

*user-name*

Specifies the name of the user, up to 32 characters, that is used to run the script.

### Platforms

All

## 22.342 rx-discard-on-ndf

```
rx-discard-on-ndf
```

### Syntax

```
rx-discard-on-ndf {bm | bum | none}
```

### Context

[\[Tree\]](#) (config>service>vpls>vxlan rx-discard-on-ndf)

## Full Context

```
configure service vpls vxlan rx-discard-on-ndf
```

## Description

This command, supported by static and BGP-EVPN VXLAN binds, determines the type of traffic that the Non Designated Forwarder (NDF) PE discards in an EVPN multi-homed Ethernet Segment. It is only relevant when the VXLAN instance is associated to a network-interconnect-vxlan ES. The option BM is the default option and discards BM on reception (unicast, known and known is allowed). The option BUM discards any BUM frame on reception. Option none allows any BUM traffic on reception.

## Default

```
rx-discard-on-ndf bm
```

## Parameters

### *bm*

Discards Broadcast and Multicast on the EVPN Non Designated Forwarder (NDF) router, but not Unknown Unicast.

### *bum*

Discards Broadcast, Multicast and Unknown Unicast traffic on the NDF.

### *none*

Allows Broadcast, Multicast or Unknown Unicast traffic on the NDF.

The **no** form of this command disables the reception of the Nokia ETH-CFM Grace PDU on the MEP.

## Default

rx-eth-vsm-grace

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.345 rx-los-reaction

### rx-los-reaction

#### Syntax

```
rx-los-reaction {squelch}
no rx-los-reaction
```

#### Context

[\[Tree\]](#) (config>port>dwdm>coherent rx-los-reaction)

#### Full Context

```
configure port dwdm coherent rx-los-reaction
```

#### Description

This command configures the reaction to an RX LOS.

#### Note:

If **rx-los-reaction squelch** is disabled for some coherent DWDM transceivers, the transceiver only reports local fault alarms when an RX LOS condition occurs; however, the port returns to service faster after the LOS condition is cleared. For these transceivers, if **rx-los-reaction squelch** is enabled, there is better visibility of individual alarms (for example, signal-fail, local fault, and no-am-lock), but the port takes longer to return to service after the LOS condition is cleared.

#### Parameters

**squelch**

Specifies to squelch (turn off) the transmit signal on RX LOS.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.346 rx-los-thresh

### rx-los-thresh

#### Syntax

```
rx-los-thresh threshold
```

#### Context

[\[Tree\]](#) (config>port>dwdm>coherent rx-los-thresh)

### Full Context

configure port dwdm coherent rx-los-thresh

### Description

This command configures the average input power LOS threshold.

### Default

-23.00

### Parameters

#### *threshold*

Specifies the RX LOS threshold.

**Values** -30.00 to -13.00

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.347 rx-must-be-encrypted

rx-must-be-encrypted

### Syntax

[no] rx-must-be-encrypted

### Context

[\[Tree\]](#) (config>port>ethernet>dot1x>macsec rx-must-be-encrypted)

### Full Context

configure port ethernet dot1x macsec rx-must-be-encrypted

### Description

When the **rx-must-be-encrypted** option is enabled, all traffic that is not MACsec-secured that is received on the port is dropped.

When the **rx-must-be-encrypted** option is disabled, all arriving traffic, whether MACsec secured or not, will be accepted.

#### Note:

This command is only available on the NULL port level and does not have per-VLAN granularity.

The **no** form of this command disables the **rx-must-be encrypted** option.

**Default**

rx-must-be-encrypted

**Platforms**

All

rx-must-be-encrypted

**Syntax**

[no] rx-must-be-encrypted

**Context**

[\[Tree\]](#) (config>anysec>tnl-enc>sec-term-pol rx-must-be-encrypted)

**Full Context**

configure anysec tunnel-encryption security-termination-policy rx-must-be-encrypted

**Description**

This command accepts all arriving traffic that is ANYsec secured on the port. All other traffic is dropped. The **no** form of this command accepts all arriving traffic regardless of whether ANYsec secured or not.

**Default**

no rx-must-be-encrypted

**Platforms**

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se

## 22.348 rx-update-pacing

rx-update-pacing

**Syntax**

rx-update-pacing *seconds*

**Context**

[\[Tree\]](#) (config>port>ethernet>eth-cfm>mep>eth-bn rx-update-pacing)

**Full Context**

configure port ethernet eth-cfm mep eth-bn rx-update-pacing

**Description**

This command sets the pace for update messages to and from the **eth-cfm** subsystem to the QoS subsystem. The most recent update messages are held by the ETH-CFM subsystem, but the most recent update is held until the expiration of the pacing timer.

**Parameters*****seconds***

The time to wait before sending subsequent updates (in seconds).

**Values** 1 to 600

**Default** 5

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23 s Commands

### 23.1 s-pmsi

```
s-pmsi
```

#### Syntax

```
s-pmsi [{vpnSrcAddr [vpnGrpAddr]} [mdSrcAddr]]
```

```
no s-pmsi
```

#### Context

```
[Tree] (debug>router>pim s-pmsi)
```

#### Full Context

```
debug router pim s-pmsi
```

#### Description

This command enables debugging for PIM selective provider multicast service interface.

The **no** form of this command disables the debugging.

#### Parameters

***vpnSrcAddr***

Specifies the VPN source address.

***vpnGrpAddr***

Specifies the VPN group address.

***mdSrcAddr***

Specifies the source address of the multicast domain.

#### Platforms

All

### 23.2 s-tag

## s-tag

### Syntax

**s-tag** *qtag1* **c-tag-range** *qtag2* [**to** *qtag2*]

**no s-tag** *qtag1* **c-tag-range** *qtag2*

### Context

**[Tree]** (config>service>system>bgp-evpn>eth-seg>qinq s-tag)

### Full Context

configure service system bgp-evpn ethernet-segment qinq s-tag

### Description

This command determines the inner VIDs (for a specified outer VID) associated with the virtual Ethernet Segment on a specific qinq port or LAG based on the following:

- Values \*, null, 0 to 4094 are allowed.
- Any SAP for which the outer and inner service-delimiting qtags match the range is associated with the virtual ES, and only those, for example, SAP 1/1/1:10.\* will not match port 1/1/1, s-tag 10 c-tag-range 10 to 100.
- A maximum of 8 ranges (including the s-tag ranges) are allowed in the qinq context.
- A c-tag range can be composed of a single qtag.
- Shutting down the ES is not required before making changes.
- A qtag included in the **s-tag-range** command cannot be included in the s-tag qtag of this command.

#### Note:

Not all qtag1 and qtag2 combinations are valid for values 0, \*, and null. The following combinations are allowed:

- s-tag 0 c-tag-range \*
- s-tag \* c-tag-range \*
- s-tag \* c-tag-range null
- s-tag null c-tag-range null
- s-tag X c-tag-range 0 (where: X=1 to 4094)
- s-tag X c-tag-range \* (where: X=1 to 4094)

The **no** form of the command removes the configured range. Only the first qtag1 value is required to remove the range.

### Parameters

#### *qtag1*

Specifies the outer VID for the c-tag range.

**Values** \*, null, 0 to 4094

#### *qtag2*

Specifies the inner VID for the c-tag range. When configuring a range of qtags (and not a single value), the second qtag1 value must be greater than the value of the first qtag1.

**Values** \*, null, 0 to 4094

### Platforms

All

## s-tag

### Syntax

**s-tag**

### Context

[\[Tree\]](#) (config>test-oam>sath>svc-test>svc-stream>frm-payl>eth s-tag)

### Full Context

configure test-oam service-activation-testhead service-test service-stream frame-payload ethernet s-tag

### Description

Commands in this context configure service VLAN tag (s-tag) information specification.

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 23.3 s-tag-range

## s-tag-range

### Syntax

**s-tag-range** *qtag1* [to *qtag1*]

**no s-tag-range** *qtag1*

### Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg>qinq s-tag-range)

### Full Context

configure service system bgp-evpn ethernet-segment qinq s-tag-range

## Description

This command determines the VIDs associated with the virtual Ethernet Segment on a specific qinq port or LAG based on the following considerations:

- Values \*, 0 to 4094 are allowed.
- Any SAP for which the service-delimiting qtag matches the range is associated with the virtual ES, and only those, for example, SAP 1/1/1:0.\* will not match port 1/1/1, s-tag-range 100.
- Maximum 8 ranges are allowed in the qinq context.
- A range can be composed of a single qtag.
- Shutting down the ES is not required before making changes in the q-tag-range.

The **no** form of the command removes the configured range. Only the first qtag1 value is required to remove the range.

## Parameters

### *qtag1*

Specifies the outer VID. When configuring a range of qtags (and not a single value), the second qtag1 value must be greater than the first qtag1.

**Values** \*, 0 to 4094

## Platforms

All

## 23.4 s1-release

### s1-release

## Syntax

[no] s1-release

## Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>triggered-updates>gc s1-release)

## Full Context

configure subscriber-mgmt radius-accounting-policy triggered-updates gtp-change s1-release

## Description

This command configures the router to send an interim accounting update when an S1 release (idle) procedure is performed.

The **no** form of the command configures the router not to send an interim accounting update when an S1 release (idle) procedure is performed.

**Default**

no s1-release

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.5 s11

```
s11
```

**Syntax**

s11

**Context**

[\[Tree\]](#) (config>router>gtp s11)

[\[Tree\]](#) (config>service>vprn>gtp s11)

**Full Context**

configure router gtp s11

configure service vprn gtp s11

**Description**

This command enables GTP configuration related to S11 termination in this VRF.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.6 s2l-path

```
s2l-path
```

**Syntax**

[no] s2l-path *path-name* to *ip-address*

**Context**

[\[Tree\]](#) (config>router>mpls>lsp>primary-p2mp-instance s2l-path)

## Full Context

```
configure router mpls lsp primary-p2mp-instance s2l-path
```

## Description

This command creates a root-to-leaf (S2L) sub-LSP path for the primary instance of a P2MP LSP. The primary instance of a P2MP LSP is modeled as a set of root-to-leaf (S2L) sub-LSPs. The root, for example, head-end node, triggers signaling using one path message per S2L path. The leaf sub-LSP paths are merged at branching points.

Each S2L sub-LSP is signaled in a separate path message. Each leaf node will respond with its own RESV message. A branch LSR node will forward the path message of each S2L sub-LSP to the downstream LSR without replicating it. It will also forward the RESV message of each S2L sub-LSP to the upstream LSR without merging it with the RESV messages of other S2L sub-LSPs of the same P2MP LSP. The same is done for subsequent refreshes of the path and RESV states.

The S2L paths can be empty paths or can specify a list of explicit hops. The path name must exist and must have been defined using the **config>router>mpls>path** command. The same path name can be re-used by more than one S2L of the primary P2MP instance. However, the **to** keyword must have a unique argument per S2L as it corresponds to the address of the egress LER node.

This command is not supported on the 7450 ESS.

## Parameters

### *path-name*

Specifies the name of the path which consists of up to 32 alphanumeric characters.

### **to** *ip-address*

Specifies the IP address of the egress router.

## Platforms

All

## 23.7 sa-db

### sa-db

## Syntax

```
sa-db [group grpAddr] [source srcAddr] [rp rpAddr]
```

```
no sadb
```

## Context

**[Tree]** (debug>router>msdp sa-db)

## Full Context

```
debug router msdp sa-db
```

## Description

This command enables debugging for Multicast Source Discovery Protocol (MSDP) source-active requests.

The **no** form of the command disables the MSDP source-active database debugging.

## Parameters

### *grpAddr*

Debugs the IP address of the group.

### *srcAddr*

Debugs the source IP address.

### *rpAddr*

Debugs the specified rendezvous point RP address.

## Platforms

All

## 23.8 sa-mac

### sa-mac

## Syntax

**sa-mac** *ieee-address* **da-mac** *ieee-address*

**no sa-mac**

## Context

[\[Tree\]](#) (config>mirror>mirror-dest>sap>egress>ip-mirror sa-mac)

## Full Context

configure mirror mirror-dest sap egress ip-mirror sa-mac

## Description

This command configures the source and destination MAC addresses for IP mirroring.

The **no** form of this command reverts to the default.

## Parameters

### **sa-mac** *ieee-address*

Specifies the source MAC address. Multicast, Broadcast and zeros are not allowed.

### **da-mac** *ieee-address*

Specifies the destination MAC address. Zeros are not allowed.

## Platforms

All

## 23.9 sa-timeout

### sa-timeout

#### Syntax

**sa-timeout** *seconds*

**no sa-timeout**

#### Context

[\[Tree\]](#) (config>service>vprn>msdp sa-timeout)

#### Full Context

configure service vprn msdp sa-timeout

#### Description

This command configures the value for the SA entries in the cache. If these entries are not refreshed within the timeout value, they are removed from the cache. Normally, the entries are refreshed at least once a minute. But under high load with many of MSDP peers, the refresh cycle could be incomplete. A higher timeout value (more than 90) could be useful to prevent instabilities in the MSDP cache.

#### Default

90

#### Parameters

***seconds***

Specifies the time, in seconds, to wait for a response from the peer before declaring the peer unavailable.

**Values** 90 to 600

## Platforms

All

### sa-timeout

#### Syntax

**sa-timeout** *seconds*

**no sa-timeout**

## Context

[\[Tree\]](#) (config>router>msdp sa-timeout)

## Full Context

configure router msdp sa-timeout

## Description

This command configures the value for the SA entries in the cache. If these entries are not refreshed within the timeout value, they are removed from the cache. Normally, the entries are refreshed at least once a minute. But under high load with many of MSDP peers, the refresh cycle could be incomplete. A higher timeout value (more than 90) could be useful to prevent instabilities in the MSDP cache.

## Default

sa-timeout 90

## Parameters

### *seconds*

Specifies the time, in seconds, to wait for a response from the peer before declaring the peer unavailable.

**Values** 90 to 600

## Platforms

All

## 23.10 saa

saa

## Syntax

saa

## Context

[\[Tree\]](#) (config saa)

## Full Context

configure saa

## Description

Commands in this context configure the Service Assurance Agent (SAA) tests.

## Platforms

All

## saa

## Syntax

```
saa test-name [owner test-owner] {start | stop} [no-accounting]
```

## Context

[\[Tree\]](#) (oam saa)

## Full Context

oam saa

## Description

This command starts or stops an SAA test that is not configured as continuous.

## Parameters

### *test-name*

Specifies the name of the SAA test, up to 32 characters. The test name must already be configured in the **config>saa>test** context.

### *test-owner*

Specifies the owner of an SAA operation, up to 32 characters. If a *test-owner* value is not specified, the default owner is used.

**Default** "TiMOS CLI"

### **start**

Starts the test. A test cannot be started if the same test is still running.

A test cannot be started if it is in a shut-down state. An error message and log event is generated to indicate a failed attempt to start an SAA test run. A test cannot be started if it is in a continuous state.

### **stop**

Stops a test in progress. A test cannot be stopped if it is not in progress. A log message is generated to indicate that an SAA test run has been aborted. A test cannot be stopped if it is in a continuous state.

### **no-accounting**

Disables the recording results in the accounting policy. When specifying **no-accounting** the MIB record produced at the end of the test is not added to the accounting file. It uses one of the three MIB rows available for the accounting module for collection.

## Platforms

All

## 23.11 saii-type2

### saii-type2

#### Syntax

**saii-type2** *global-id:node-id:ac-id*

**no saii-type2**

#### Context

**[Tree]** (config>service>vpls>spoke-sdp>pw-path-id saii-type2)

**[Tree]** (config>service>cpipe>spoke-sdp>pw-path-id saii-type2)

**[Tree]** (config>service>epipe>spoke-sdp>pw-path-id saii-type2)

#### Full Context

configure service vpls spoke-sdp pw-path-id saii-type2

configure service cpipe spoke-sdp pw-path-id saii-type2

configure service epipe spoke-sdp pw-path-id saii-type2

#### Description

This command configures the Source Individual Attachment Identifier (SAII) for an MPLS-TP spoke-sdp. If this is configured on a spoke-sdp for which vc-switching is also configured (for example, it is at an S-PE), then the values must match those of the taii-type2 of the mate spoke-sdp.

#### Parameters

##### *global-id*

Specifies the global ID at the source PE or T-PE for the MPLS-TP PW for a spoke SDP.

**Values** 0 to 4294967295

##### *node-id*

Specifies the node ID at the source PE or T-PE for the MPLS-TP PW for a spoke SDP.

**Values** a.b.c.d or 0 to 4294967295

##### *ac-id*

Specifies the attachment circuit ID at the source PE or T-PE for the MPLS-TP PW for a spoke SDP. If this node is the source of the PW, then the AC ID must be set to a locally unique value.

**Values** 1 to 4294967295

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## saii-type2

### Syntax

```
saii-type2 global-id:prefix:ac-id
no saii-type2
```

### Context

[\[Tree\]](#) (config>service>epipe>spoke-sdp-fec saii-type2)

### Full Context

```
configure service epipe spoke-sdp-fec saii-type2
```

### Description

This command configures the source attachment individual identifier for the spoke-sdp. This is only applicable to FEC129 All type 2.

### Parameters

#### *global-id*

A Global ID of this router T-PE. This value must correspond to one of the `global_id` values configured for a local-prefix under **config>service>pw-routing>local-prefix** context.

**Values** 1 to 4294967295

#### *prefix*

The prefix on this router T-PE that the spoke-sdp SDP is associated with. This value must correspond to one of the prefixes configured under **config>service>pw-routing>local-prefix** context.

**Values** an IPv4-formatted address a.b.c.d or 1 to 4294967295

#### *ac-id*

An unsigned integer representing a locally unique identifier for the spoke SDP.

**Values** 1 to 4294967295

### Platforms

All

## saii-type2

### Syntax

```
saii-type2 global-id:node-id:ac-id
no saii-type2
```

## Context

## 23.12 same-recipnonce-for-pollreq

same-recipnonce-for-pollreq

**Syntax**

[no] same-recipnonce-for-pollreq

**Context**

**[Tree]** (config>system>security>pki>ca-profile>cmpv2 same-recipnonce-for-pollreq)

**Full Context**

configure system security pki ca-profile cmpv2 same-recipnonce-for-pollreq

**Description**

This command enables the system to use same recipNonce as the last CMPv2 response for poll request.

**Default**

no same-recipnonce-for-pollreq

**Platforms**

All

same-recipnonce-for-pollreq

**Syntax**

[no] same-recipnonce-for-pollreq

**Context**

[\[Tree\]](#) (config>system>security>pki>ca-profile>cmp2 same-recipnonce-for-pollreq)

**Full Context**

configure system security pki ca-profile cmp2 same-recipnonce-for-pollreq

**Description**

This command enables the system to use same recipNonce as the last CMPv2 response for poll request.

The **no** form of this command disables system to use same recipNonce as the last CMPv2 response for poll request.

**Default**

no same-recipnonce-for-pollreq

## 23.13 sample-interval

sample-interval

**Syntax**

sample-interval *interval*

**Context**

[\[Tree\]](#) (config>router>rsvp>dbw-accounting sample-interval)

## Full Context

```
configure router rsvp dbw-accounting sample-interval
```

## Description

This command sets the dark bandwidth sample interval to the specified value. Changing this parameter in the course of dark bandwidth accounting restarts the accounting cycle. The user is encouraged to specify values as multiples of 10. Selecting other values may lead to inconsistent estimation of Dark Bandwidth.

## Default

```
sample-interval 30
```

## Parameters

### *interval*

Specifies the sample interval, expressed in seconds.

**Values** 10 to 600

## Platforms

7750 SR, 7750 SR-s, 7950 XRS, VSR

## sample-interval

## Syntax

```
sample-interval sample-period
```

```
no sample-interval
```

## Context

[\[Tree\]](#) (config>qos>adv-config-policy>child-control>offered-measurement sample-interval)

## Full Context

```
configure qos adv-config-policy child-control offered-measurement sample-interval
```

## Description

This command defines the number of intervening sample periods before a new offered rate is measured and is only applicable when the policy is applied to a policer. By decreasing the sampling interval, the system measures a child's new offered rate more frequently. Inversely, increasing the sampling interval causes the child's offered rate to be measured less frequently.

The overall number of offered rate measurements the system attempts within a specified timeframe is not affected by the **sample-interval** command. If the system is asked to perform offered rate measurements more often on some policers, it takes longer to get to all children.

When this command is not specified or removed, the system evaluates the offered rate of each child after 1 sampling period.

The **no** form of this command is used to restore the sampling interval default of 1 sample period.

## Parameters

### *sample-period*

The sample-periods parameter is specified as a whole number between 1 and 8. The value '1' represents the fastest sampling rate available and the value '8' represents the slowest sampling period available.

**Default** 1

**Values** 1 to 8

## Platforms

All

## sample-interval

## Syntax

**sample-interval** *interval*

## Context

[\[Tree\]](#) (config>system>telemetry>persistent-subscriptions>subscription sample-interval)

## Full Context

configure system telemetry persistent-subscriptions subscription sample-interval

## Description

This command configures the sample interval for persistent subscription.

This sampling interval only applies when the **mode** command is set to either **target-defined** or **sample**.

## Default

sample-interval 10000

## Parameters

### *interval*

Specifies the sample interval, in milliseconds.

**Values** 1000 to 4294967295

## Platforms

All

## 23.14 sample-multiplier

### sample-multiplier

#### Syntax

**sample-multiplier** *multiplier*

#### Context

**[Tree]** (config>router>rsvp>dbw-accounting sample-multiplier)

#### Full Context

configure router rsvp dbw-accounting sample-multiplier

#### Description

This command sets the dark bandwidth sample interval multiplier to the specified value. Changing this parameter in the course of dark bandwidth accounting restarts the accounting cycle.

#### Default

sample-multiplier 3

#### Parameters

***multiplier***

Specifies the sample interval multiplier, expressed as an integer.

**Values** 1 to 10

#### Platforms

7750 SR, 7750 SR-s, 7950 XRS, VSR

## 23.15 sample-profile

### sample-profile

#### Syntax

**sample-profile** *profile-id* [create]

**no sample-profile** *profile-id*

#### Context

**[Tree]** (config cflowd sample-profile)

## Full Context

configure cflowd sample-profile

## Description

Commands in this context create and define sampling parameters.

The **no** form of this command removes the associated sample-profile. **sample-profile 1** cannot be deleted.

## Parameters

### *profile-id*

Specifies the rate profile.

**Values** 1 to 5

### **create**

Mandatory keyword when creating a sample profile. The create keyword requirement can be enabled or disabled in the **environment>create** context.

## Platforms

All

## sample-profile

## Syntax

**sample-profile** *sample-profile-id*

**no sample-profile**

## Context

[\[Tree\]](#) (config filter ipv6-filter entry sample-profile)

[\[Tree\]](#) (config filter ip-filter entry sample-profile)

## Full Context

configure filter ipv6-filter entry sample-profile

configure filter ip-filter entry sample-profile

## Description

This command allows traffic matching of an IPv4 or IPv6 filter to be sampled for cflowd processing using a specific sample profile.

This command is only compatible if the associated interface is configured for interface-based sampling and is only supported for ingress sampling.

An IP filter can only specify a single alternate sample profile for cflowd sampling, but that sample profile can be used in multiple entries.

The **no** form of this command removes the specified sampling profile from the configuration. Cflowd continues to process traffic based on the default or configured interface cflowd sampling profile.

**Default**

no sample-profile

**Parameters*****sample-profile-id***

Specifies the cflowd sample profile to be used for packets matching this filter entry.

**Values** 1 to 5

**Platforms**

All

## 23.16 sample-rate

### sample-rate

**Syntax**

**sample-rate** [*rate*]

**Context**

[\[Tree\]](#) (config>cflowd>sample-profile sample-rate)

**Full Context**

configure cflowd sample-profile sample-rate

**Description**

This command defines the cflowd sampling rate for the sample profile ID.

The sample rate indicates that the associated interface samples 1 in N packets for cflowd analysis. Only one rate profile below 1:256 with a specific IOM, IMM, or XMA can be associated.

**Default**

sample-rate 1000

**Parameters*****rate***

Specifies the rate at which traffic is sampled and forwarded for cflowd analysis.

**Values** 1 to 60000

**Platforms**

All

## 23.17 sample-window

### sample-window

#### Syntax

**sample-window** *seconds*

**no sample-window**

#### Context

[\[Tree\]](#) (config>oam-pm>streaming>delay-template sample-window)

#### Full Context

configure oam-pm streaming delay-template sample-window

#### Description

This command specifies the sample window duration in seconds for the template. This configuration option represents time over which the average will be calculated and subsequently streamed.

The **no** form of this command reverts to the default.

#### Default

sample-window 60

#### Parameters

***seconds***

Specifies the sample window duration.

**Values** 10 to 60

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### sample-window

#### Syntax

**sample-window**

#### Context

[\[Tree\]](#) (config>test-oam>link-meas>template sample-window)

**Full Context**

```
configure test-oam link-measurement measurement-template sample-window
```

**Description**

Commands in this context configure sample window parameters to be used when the **measurement-template** is assigned to an IP interface. The sample window is the collection of individual probe results, over a defined period.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**23.18 sampling****sampling****Syntax**

```
sampling {unicast | multicast} type {acl | interface} [direction { ingress-only | egress-only | both}]
 [sample-profile [profile-id]]
no sampling {unicast | multicast}
```

**[Tree]** (config>service>vprn>nw-if>cflowd-parameters sampling)

**[Tree]** (config>service>vprn>if>cflowd-parameters sampling)

**[Tree]** (config>service>ies>if>cflowd-parameters sampling)

**[Tree]** (config>service>ies>sub-if>grp-if>cflowd-parameters sampling)

**Full Context**

```
configure service vprn subscriber-interface group-interface cflowd-parameters sampling
```

```
configure service vprn network-interface cflowd-parameters sampling
```

```
configure service vprn interface cflowd-parameters sampling
```

```
configure service ies interface cflowd-parameters sampling
```

```
configure service ies subscriber-interface group-interface cflowd-parameters sampling
```

**Description**

This command enables and configures the cflowd sampling behavior to collect traffic flow samples through a router for analysis.

This command can be used to configure the sampling parameters for unicast and multicast traffic separately. If sampling is not configured for either **unicast** or **multicast** traffic, then that type of traffic will not be sampled.

If cflowd is enabled without either **egress-only** or **both** keywords specified or with the **ingress-only** keyword specified, then only ingress sampling is enabled on the associated IP interface.

The **no** form of this command disables the associated type of traffic sampling.

## Parameters

### **unicast | multicast**

Specifies unicast or multicast sampling.

### **type**

Specifies the cflowd sampling type on the specific virtual router interface.

**Values**    **acl** — Specifies ACL cflowd analysis be applied to the specified virtual router interface.

**interface** — Specifies interface cflowd analysis be applied to the specified virtual router interface

### **direction**

Specifies the direction of the cflowd analysis that is applied to the specified virtual router interface.

**Values**    **ingress-only** — Specifies an ingress only direction of the cflowd analysis be applied to the specified virtual router interface.

**egress-only** — Specifies an egress only direction of the cflowd analysis be applied to the specified virtual router interface.

**both** — Specifies both ingress and egress direction of the cflowd analysis be applied to the specified virtual router interface.

### **profile-id**

Defines the sampling rate profile to be associated with this interface.

**Values**    1 to 5

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface cflowd-parameters sampling
- configure service vprn subscriber-interface group-interface cflowd-parameters sampling

All

- configure service vprn network-interface cflowd-parameters sampling
- configure service vprn interface cflowd-parameters sampling
- configure service ies interface cflowd-parameters sampling

## sampling

### Syntax

```

sampling {unicast | multicast} type {acl | interface} [direction { ingress-only | egress-only | both}]
 [sample-profile profile]
no sampling {unicast | multicast}

```

### Context

[\[Tree\]](#) (config>router>if>cflowd-parameters sampling)

### Full Context

configure router interface cflowd-parameters sampling

### Description

This command enables and configures the cflowd sampling behavior to collect traffic flow samples through a router for analysis.

This command can be used to configure the sampling parameters for unicast and multicast traffic separately. If sampling is not configured for either unicast or multicast traffic, then that type of traffic will not be sampled.

If cflowd is enabled without either **egress-only** or **both** specified or with the **ingress-only** keyword specified, then only ingress sampling will be enabled on the associated IP interface.

The **no** form of this command disables the associated type of traffic sampling on the associated interface.

### Default

no sampling

### Parameters

#### unicast

Specifies that the sampling command will control the sampling of unicast traffic on the associated interface/SAP.

#### multicast

Specifies that the sampling command will control the sampling of multicast traffic on the associated interface/SAP.

#### type

Specifies whether the traffic sampling is based on an **acl** match, or all traffic entering or exiting the associated interface.

**Values**

- acl** — Specifies that the sampled traffic is controlled via an IP traffic filter entry with the action "filter-sample" configured.
- interface** — Specifies that all traffic entering or exiting the interface is subject to sampling.

#### direction

Specifies the direction to collect traffic flow samples.

**Values** **ingress-only** — Enables ingress sampling only on the associated interface.

**egress-only** — Enables egress sampling only on the associated interface.

**both** — Enables both ingress and egress cflowd sampling.

***profile***

Specifies the sampling profile to be associated with this interface.

**Values** 1 to 5

**Platforms**

All

## 23.19 sampling-rate

### sampling-rate

**Syntax**

**sampling-rate** *sampling-rate*

**no sampling-rate**

**Context**

[\[Tree\]](#) (config>mirror>mirror-dest sampling-rate)

**Full Context**

configure mirror mirror-dest sampling-rate

**Description**

This command configures the packet sampling rate for mirrored traffic and is supported with **config** and **debug** mirror sources. The sampling rate is common to all endpoints on a specified line card FP per mirror destination service.

The **no** form of this command disables the packet sampling rate for mirrored traffic.

**Default**

no sampling-rate

**Parameters**

***sampling-rate***

Specifies the sampling rate.

**Values** 256 to 100000

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.20 sap

```
sap
```

### Syntax

```
sap sap-id [split-horizon-group group-name] [create] [capture-sap] [eth-ring ring-index]
sap sap-id [split-horizon-group group-name] [create] [capture-sap] [eth-ring ring-index] leaf-ac
sap sap-id [split-horizon-group group-name] [create] [capture-sap] [eth-ring ring-index] root-leaf-tag
 leaf-tag leaf-tag
no sap sap-id
```

### Context

[\[Tree\]](#) (config>service>vpls sap)

### Full Context

```
configure service vpls sap
```

### Description

This command creates a Service Access Point (SAP) within a service. A SAP is a combination of port and encapsulation parameters which identifies the service access point on the interface and within the 7450 ESS or 7750 SR. Each SAP must be unique. All SAPs must be explicitly created within a service or on an IP interface.

Enter an existing SAP without the **create** keyword to edit SAP parameters. The SAP is owned by the service in which it was created.

A SAP can only be associated with a single service. A SAP can only be defined on a port that has been configured as an access port using the **configure port port-id ethernet mode access** command. Channelized TDM ports are always access ports (TDM applies to the 7750 SR only).

If a port is shut down, all SAPs on that port become operationally down. When a service is shut down, SAPs for the service are not displayed as operationally down although all traffic traversing the service is discarded. The operational state of a SAP is relative to the operational state of the port on which the SAP is defined.

The **no** form of this command deletes the SAP with the specified port. When a SAP is deleted, all configuration parameters for the SAP are also deleted. For Internet Ethernet Service (IES), the IP interface must be shut down before the SAP on that interface may be removed.

### Parameters

**sap-id**

Specifies the physical port identifier portion of the SAP definition.

**port-id**

Specifies the physical port ID in the *slot/mda/port* format.

If the card in the slot has Media Dependent Adapters (MDAs) installed, the *port-id* must be in the *slot\_number/MDA\_number/port\_number [.channel]* format. For example 6/2/3 specifies port 3 on MDA 2 in slot 6.

The *port-id* must reference a valid port type. When the *port-id* parameter represents SONET/SDH and TDM channels, the port ID must include the channel ID. A period "." separates the physical port from the *channel-id*. The port must be configured as an access port.

If the SONET/SDH port is configured as clear-channel then only the port is specified.

**group-name**

Specifies the name of the split horizon group to which the SAP belongs. This parameter applies to the 7450 ESS or 7750 SR only.

**capture-sap**

Specifies a capturing SAP in which triggering packets are sent to the CPM. Non-triggering packets captured by the capture SAP are dropped. This parameter applies to the 7450 ESS or 7750 SR only.

**create**

Keyword used to create a SAP instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

**root-leaf-tag**

Specifies a SAP as a root leaf tag SAP. Only SAPs of the form dot1q (for example, 1/1/1:X) or QinQ (for example, 1/1/1:X.Y, 1/1/1:X.\*) are supported. The default E-Tree SAP type is a root AC, if *root-leaf-tag* (or *leaf-ac*) is not specified at SAP creation. This option is only available when the VPLS is designated as an E-Tree VPLS.

**leaf-tag-vid**

Specifies to replace the outer SAP-ID for leaf traffic. The leaf tag VID is only significant between peering VPLS but the values must be consistent on each end.

**leaf-ac**

Specifies a SAP as a leaf access (AC) SAP. The default E-Tree SAP type is root AC if **leaf-ac** (or **root-leaf-tag**) is not specified at SAP creation. This option is only available when the VPLS is designated as an E-Tree VPLS.

## Description

This command creates a Service Access Point (SAP) within a service. A SAP is a combination of port and encapsulation parameters which identifies the service access point on the interface and within the device. Each SAP must be unique.

All SAPs must be explicitly created. If no SAPs are created within a service or on an IP interface, a SAP will not exist on that object.

Enter an existing SAP without the **create** keyword to edit SAP parameters. The SAP is owned by the service in which it was created.

A SAP can only be associated with a single service. A SAP can only be defined on a port that has been configured as an access port. Channelized TDM ports are always access ports.

If a port is shutdown, all SAPs on that port become operationally down. When a service is shutdown, SAPs for the service are not displayed as operationally down although all traffic traversing the service will be discarded.

The operational state of a SAP is relative to the operational state of the port on which the SAP is defined.

Ethernet SAPs support null, dot1q, and QinQ is supported for all routers.

The **no** form of this command deletes the SAP with the specified port. When a SAP is deleted, all configuration parameters for the SAP will also be deleted. For Internet Enhanced Service (IES), the IP interface must be shutdown before the SAP on that interface may be removed.

By default, no SAPs are defined.

## Parameters

### **sap-id**

Specifies the physical port identifier portion of the SAP.

### **port-id**

Specifies the physical port ID.

If the card in the slot has Media Dependent Adapters (MDAs) installed, the *port-id* must be in the *slot\_number/MDA\_number/port\_number* format. For example *6/2/3* specifies port 3 on MDA 2 in slot 6.

The *port-id* must reference a valid port type. When the *port-id* parameter represents SONET/SDH and TDM channels, the port ID must include the channel ID. A period "." separates the physical port from the *channel-id*. The port must be configured as an access port.

If the SONET/SDH port is configured as clear-channel then only the port is specified.

<i>port-id</i>	<i>slot/mda/port [.channel]</i>

## Description

This command creates a Service Access Point (SAP) within a service. A SAP is a combination of port and encapsulation parameters which identifies the service access point on the interface and within the router. Each SAP must be unique.

All SAPs must be explicitly created. If no SAPs are created within a service or on an IP interface, a SAP will not exist on that object.

Enter an existing SAP without the **create** keyword to edit SAP parameters. The SAP is owned by the service in which it was created.

A SAP can only be associated with a single service. A SAP can only be defined on a port that has been configured as an access port using the **configure port *port-id* ethernet mode access** command. For the 7750 SR, channelized TDM ports are always access ports.

If a port is shutdown, all SAPs on that port become operationally down. When a service is shutdown, SAPs for the service are not displayed as operationally down although all traffic traversing the service will be discarded. The operational state of a SAP is relative to the operational state of the port on which the SAP is defined.

### Note:

Configure an IES interface as a loopback interface by issuing the **loopback** command instead of the **sap *sap-id*** command. The loopback flag cannot be set on an interface where a SAP is already defined and a SAP cannot be defined on a loopback interface.

The **no** form of this command deletes the SAP with the specified port. When a SAP is deleted, all configuration parameters for the SAP are also deleted. For Internet Enhanced Service (IES), the IP interface must be shutdown before the SAP on that interface may be removed. The no form of this command causes the ptp-hw-assist to be disabled.

## Default

No SAPs are defined.

## Parameters

### ***sap-id***

Specifies the physical port identifier portion of the SAP definition.

### ***port-id***

Specifies the physical port ID in the *slot/mda/port* format.

If the card in the slot has Media Dependent Adapters (MDAs) installed, the *port-id* must be in the *slot\_number/MDA\_number/port\_number* format. For example 61/2/3 specifies port 3 on MDA 2 in slot 61.

Table 113: Port ID Syntax

null	<i>port-id</i>   <i>lag-id</i>		
dot1q	{ <i>port-id</i>   <i>lag-id</i> };{ <i>qtag1</i>   <i>cp-conn-prof-id</i> }		
qinq	{ <i>port-id</i>   <i>lag-id</i> };{ <i>qtag1</i>   <i>cp-conn-prof-id</i> }.{ <i>qtag2</i>   <i>cp-conn-prof-id</i> }		
	cp: keyword <i>conn-prof-id</i> : 1 to 8000		
port-id	slot/mda/port [.channel]		
	eth-sat-id	esat-id/slot/port	
		esat: keyword	
		id: 1 to20	
	pxc-id	psc-id.sub-port	
		pxc psc-id.sub-port	
		pxc: keyword	
		id: 1 to 64	
sub-port: a, b			
lag-id	lag-id	lag: keyword	
		id: 1 to 800	
qtag1	0 to 4094		
qtag2	*   null   0 to 4094		

The *port-id* must reference a valid port type. When the *port-id* parameter represents SONET/SDH and TDM channels (7750 SR), the port ID must include the channel ID. A period "." separates the physical port from the *channel-id*. The port must be configured as an access port.

If the SONET/SDH port is configured as clear-channel then only the port is specified.

**sap** *sap-id* [**create**] **endpoint** *name*

**no sap**

## Context

[\[Tree\]](#) (config>mirror>mirror-dest sap)

## Full Context

configure mirror mirror-dest sap

## Description

This command creates a service access point (SAP) within a mirror destination service. The SAP is owned by the mirror destination service ID.

The SAP is defined with port and encapsulation parameters to uniquely identify the (mirror) SAP on the interface and within the box. The specified SAP may be defined on an Ethernet access port with a dot1q, null, or q-in-q encapsulation type.

Only one SAP can be created within a **mirror-dest** service ID. If the defined SAP has not been created on any service within the system, the SAP is created and the context of the CLI will change to the newly created SAP. In addition, the port cannot be a member of a multi-link bundle, APS group or IMA bundle.

If the defined SAP exists in the context of another service ID, **mirror-dest** or any other type, an error is generated.

Mirror destination SAPs can be created on Ethernet interfaces that have been defined as an access interface. If the interface is defined as network, the SAP creation returns an error.

When the **no** form of this command is used on a SAP created by a mirror destination service ID, the SAP with the specified port and encapsulation parameters is deleted.

## Parameters

### *sap-id*

Specifies the physical port identifier portion of the SAP definition.

### **no-endpoint**

Removes the association of a SAP or a sdp with an explicit endpoint name.

### *name*

Specifies the name of the endpoint associated with the SAP.

## Syntax

```
sap sap-id {[egress] [ingress]}
```

```
no sap sap-id [egress] [ingress]
```

## Context

[\[Tree\]](#) (config>mirror>mirror-source sap)

## Full Context

```
configure mirror mirror-source sap
```

## Description

This command enables mirroring of traffic ingressing or egressing a service access port (SAP). A SAP that is defined within a mirror destination cannot be used in a mirror source. The mirror source SAP referenced by the *sap-id* is owned by the service ID of the service in which it was created. The SAP is only referenced in the mirror source name for mirroring purposes. The mirror source association does not need to be removed before deleting the SAP from its service ID. If the SAP is deleted from its service ID, the mirror association is removed from the mirror source.

More than one SAP can be associated within a single **mirror-source**. Each SAP has its own **ingress** and **egress** parameter keywords to define which packets are mirrored to the mirror destination.

The SAP must be valid and properly configured. If the associated SAP does not exist, an error occurs and the command will not execute.

The same SAP cannot be associated with multiple mirror source definitions for ingress packets.

The same SAP cannot be associated with multiple mirror source definitions for egress packets.

If a particular SAP is not associated with a mirror source name, then that SAP will not have mirroring enabled for that mirror source.

Note that the ingress and egress options cannot be supported at the same time on a CEM encap-type SAP. The options must be configured in either the ingress **or** egress contexts (applies to the 7750 SR and 7950 XRS).

The **no** form of this command disables mirroring for the specified SAP. All mirroring for that SAP on ingress and egress is terminated. Mirroring of packets on the SAP can continue if more specific mirror criteria is configured. If the **egress** or **ingress** parameter keywords are specified in the **no** command, only the ingress or egress mirroring condition is removed.

### Parameters

**sap-id**

Specifies the physical port identifier portion of the SAP definition.

**egress**

Specifies that packets egressing the SAP should be mirrored. Egress packets are mirrored to the mirror destination after egress packet modification.

**ingress**

Specifies that packets ingressing the SAP should be mirrored. Ingress packets are mirrored to the mirror destination before the ingress packet modification.

### Platforms

**no sap** *sap-id* [**ingress**] [**egress**]

### Context

[\[Tree\]](#) (config>li>li-source sap)

### Full Context

configure li li-source sap

### Description

This command creates a service access point (SAP) within an LI configuration. The specified SAP must define a FastE, GigE, or XGigE, or XGigE access port with a dot1q, null, or q-in-q encapsulation type.

When the **no** form of this command is used on a SAP, the SAP with the specified port and encapsulation parameters is deleted.

### Parameters

**sap-id**

Specifies the physical port identifier portion of the SAP definition.

**egress**

Specifies that the router perform lawful intercept on egress traffic. Packets egressing the SAP are mirrored to the mirror destination after egress packet modification.

## ingress

Specifies that the router perform lawful intercept on ingress traffic. Packets ingressing the SAP are mirrored to the mirror destination before ingress packet modification.

## Platforms

## Full Context

debug mirror-source sap

## Description

This command enables mirroring of traffic ingressing or egressing a service access port (SAP). A SAP that is defined within a mirror destination cannot be used in a mirror source. The mirror source SAP referenced by the *sap-id* is owned by the service ID of the service in which it was created. The SAP is only referenced in the mirror source name for mirroring purposes. The mirror source association does not need to be removed before deleting the SAP from its service ID. If the SAP is deleted from its service ID, the mirror association is removed from the mirror source.

More than one SAP can be associated within a single **mirror-source**. Each SAP has its own **ingress** and **egress** parameter keywords to define which packets are mirrored to the mirror destination.

The SAP must be valid and properly configured. If the associated SAP does not exist, an error occurs and the command does not execute.

The same SAP cannot be associated with multiple mirror source definitions for ingress packets.

The same SAP cannot be associated with multiple mirror source definitions for egress packets.

If a particular SAP is not associated with a mirror source name, then that SAP does not have mirroring enabled for that mirror source.

Note that the ingress and egress options cannot be supported at the same time on a CEM encap-type SAP. The options must be configured in either the ingress **or** egress contexts (applies to the 7750 SR and 7950 XRS).

The **no** form of this command disables mirroring for the specified SAP. All mirroring for that SAP on ingress and egress is terminated. Mirroring of packets on the SAP can continue if more specific mirror criteria is configured. If the **egress** or **ingress** parameter keywords are specified in the **no** command, only the ingress or egress mirroring condition is removed.

## Parameters

### *sap-id*

Specifies the physical port identifier portion of the SAP definition.

### **egress**

Specifies that packets egressing the SAP should be mirrored. Egress packets are mirrored to the mirror destination after egress packet modification.

### **ingress**

Specifies that packets ingressing the SAP should be mirrored. Ingress packets are mirrored to the mirror destination before the ingress packet modification.

**no sap**

**Context**

[\[Tree\]](#) (config>li>li-fltr>li-mac-fltr>entry>match sap)

**Full Context**

configure li li-filter li-mac-filter entry match sap

**Description**

This command specifies the QinQ SAP to match from the Epipe or VPLS service, where the s-tag must be a value and the outer-tag must be of type \*. This filter match is used in conjunction with match criteria **outer-tag** where the outer-tag must also be provisioned for the entry match on the QinQ packet to activate.

The match criteria SAP must be an exact match with the QinQ configured on the Epipe or VPLS service. An associated outer-tag must be provisioned to match on the QinQ packet. For example, SAP 1/1/1:1.\*, where the outer-tag is "\*", and an outer-tag of 1 would perform LI on 1/1/1:1.1 on a 1/1/1:1.\* SAP.

The **no** form of this command removes the QinQ SAP as the match criterion.

**Default**

no sap

**Parameters**

**sap-id**

Specifies the physical port identifier portion of the SAP definition.

**Values**

## 23.21 sap-egress

## sap-egress

### Syntax

**sap-egress** {*policy-id* | *policy-name*} [**create**] [**name** *name*]

**no sap-egress** {*policy-id* | *policy-name*}

### Context

[\[Tree\]](#) (config>qos sap-egress)

### Full Context

configure qos sap-egress

### Description

This command is used to create or edit a Service Egress QoS policy. The egress policy defines the SLA for service packets as they egress on the SAP.

Policies are templates that can be applied to multiple services as long as the scope of the policy is template. The queues defined in the policy are not instantiated until a policy is applied to a service.

Sap-egress policies determine queue mappings based on ingress DSCP, IP precedence, dot1p, and IPv4 or IPv6 match criteria. Multiple queues can be created per forwarding class and each queue can have different CIR or PIR parameters.

Egress SAP QoS policies allow the definition of queues and the mapping of forwarding classes to those queues. Each queue needs to have a relative CIR for determining its allocation of QoS resources during periods of congestion. A PIR can also be defined that forces a hard limit on the packets transmitted through the queue. When the forwarding class is mapped to the queue, a DSCP, IP precedence, or dot1p value can optionally be specified.

The sap-egress policy with *policy-id* 1 is the default sap-egress QoS policy and is applied to service egress SAPs when an explicit policy is not specified or removed. The default sap-egress policy cannot be modified or deleted.

By default, all forwarding classes map to queue 1.

Any changes made to an existing policy, using any of the sub-commands, will be applied immediately to all egress SAPs where this policy is applied. For this reason, when many changes are required on a policy, it is highly recommended that the policy be copied to a work area *policy-id*. That work-in-progress policy can be modified until complete, then written over the original policy-id. Use the **config qos copy** command to maintain policies in this manner.

The **no** form of this command deletes the sap-egress policy. A policy cannot be deleted until it is removed from all service SAPs where it is applied. When a sap-egress policy is removed from a SAP, the SAP will revert to the default sap-egress *policy-id* 1.

### Parameters

#### *policy-id*

The *policy-id* uniquely identifies the policy on the router.

**Values** 1 to 65535

#### *policy-name*

The *policy-name* uniquely identifies the policy.

**Values** 64 characters maximum.

### create

Required parameter when creating a SAP QoS egress policy.

### name

Configures an optional policy name which adds a name identifier to a specific policy to then use that policy name in configuration references as well as display and use policy names in show commands throughout the system. This helps the service provider or administrator to identify and manage sap-egress policies within the SR OS platforms.

All sap-egress policies are required to assign a policy ID to initially create a policy. However, either the policy ID or the policy name can be used to identify and reference a specific policy once it is initially created.

If a name is not specified at creation time, then SR OS assigns a string version of the *policy-id* as the name.

**Values** 64 characters maximum

## Platforms

## sap-egress

## Syntax

**sap-egress** *src-pol dst-pol* [**overwrite**]

## Context

[\[Tree\]](#) (config>qos>copy sap-egress)

## Full Context

configure qos copy sap-egress

## Description

This command copies existing QoS policy entries for a QoS policy-id to another QoS policy-id.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

## Parameters

### overwrite

Specifies to replace the existing destination policy. Everything in the existing destination policy will be overwritten with the contents of the source policy. If **overwrite** is not specified, an error will occur if the destination policy ID exists.

### Example:

```
– SR>config>qos# copy sap-egress 1 1010
```

```
- MINOR: CLI Destination "1010" exists use {overwrite}.
- SR>config>qos# copy sap-egress 1 1010 overwrite
```

***src-pol dst-pol***

Indicates that the source policy ID and the destination policy ID are SAP egress policy IDs. Specify the source policy ID that the copy command will attempt to copy from and specify the destination policy ID to which the command will copy a duplicate of the policy.

**Values** 1 to 65535

**Platforms**

All

## 23.22 sap-host-limit

### sap-host-limit

**Syntax**

**sap-host-limit** *max-num-hosts-sap*

**no sap-host-limit**

**Context**

**[Tree]** (config>service>vprn>sub-if>grp-if>arp-host sap-host-limit)

**[Tree]** (config>service>ies>sub-if>grp-if>arp-host sap-host-limit)

configure service vprn subscriber-interface group-interface arp-host sap-host-limit

configure service ies subscriber-interface group-interface arp-host sap-host-limit

**Description**

This command configures the maximum number of ARP hosts per SAP.

The **no** form of this command reverts to the default.

**Default**

sap-host-limit 1

**Parameters**

***max-num-hosts-sap***

Specifies the maximum number of ARP hosts per SAP allowed on this interface.

**Note:**

The operational maximum value may be smaller because of equipped hardware dependencies.

**Values** 1 to 131071

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.23 sap-id

```
sap-id
```

**Syntax**

```
sap-id sap-id
```

```
no sap-id
```

**Context**

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident sap-id)

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp>host>host-identification sap-id)

**Full Context**

```
configure subscriber-mgmt local-user-db ipoe host host-identification sap-id
```

```
configure subscriber-mgmt local-user-db ppp host host-identification sap-id
```

**Description**

This command specifies the SAP ID to match for a host lookup. When the LUDB is accessed using a DHCPv4 server, the SAP-ID is matched against the Nokia vendor-specific sub-option in DHCP Option 82.

**Note:**

This command is used only when **sap-id** is configured as one of the **match-list** parameters.

The **no** form of this command removes the SAP ID from the configuration.

**Parameters**

*sap-id*

Specifies a SAP ID, up to 255 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## sap-id

### Syntax

[no] sap-id

### Context

## sap-id

### Syntax

sap-id sap-string

## no sap-id

### Context

[\[Tree\]](#) (config>service>dynsvc>ladb>user>idx sap-id)

### Full Context

configure service dynamic-services local-auth-db user-name index sap-id

### Description

This command specifies the dynamic data service SAP that is created. A dynamic service SAP ID uniquely identifies a dynamic data service instance. For a local authenticated dynamic service data trigger, one of the dynamic service SAP IDs must be the data trigger SAP.

The **no** form of this command removes the **sap-id** from the configuration.

### Parameters

#### *sap-string*

Specifies a string representing the dynamic service SAP ID (only SAPs on Ethernet ports and LAGs are valid), up to 64 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.24 sap-ingress

### sap-ingress

### Syntax

**sap-ingress** {*policy-id* | *policy-name*} [**create**] [**name** *name*]

**no sap-ingress** {*policy-id* | *policy-name*}

### Context

[\[Tree\]](#) (config>qos sap-ingress)

### Full Context

configure qos sap-ingress

### Description

This command is used to create or edit the ingress policy. The ingress policy defines the SLA enforcement that service packets receive as they ingress a SAP. SLA enforcement is accomplished through the definition of queues that have Forwarding Class (FC), Fair Information Rate (FIR), Committed Information Rate (CIR), Peak Information Rate (PIR), Committed Burst Size (CBS), and Maximum Burst Size (MBS) characteristics.

Policies in effect are templates that can be applied to multiple services as long as the **scope** of the policy is template. Queues defined in the policy are not instantiated until they are assigned to at least one forwarding class and a policy is applied to a service SAP.

It is possible that a SAP ingress policy will include the **dscp** map command, the **dot1p** map command, and an IP or MAC match criteria. When multiple matches occur for the traffic, the order of precedence will be used to arrive at the final action. The order of precedence is as follows:

1. 802.1p bits
2. DSCP
3. IP quintuple or MAC headers

The SAP ingress policy with *policy-id* 1 is a system-defined policy applied to services when no other policy is explicitly specified. The system SAP ingress policy cannot be modified or deleted. The default SAP ingress policy defines one unicast and one multipoint queue associated with all forwarding classes, with an FIR of zero, a CIR of zero, and a PIR of line rate.

Any changes made to the existing policy, using any of the sub-commands, are applied immediately to all services where this policy is applied. For this reason, when many changes are required on a policy, it is recommended that the policy be copied to a work area policy ID. That work-in-progress policy can be modified until complete, then written over the original policy-id. Use the **config>qos>copy** command to maintain policies in this manner.

The **no** form of this command deletes the SAP ingress policy. A policy cannot be deleted until it is removed from all services where it is applied.

## Parameters

### *policy-id*

The *policy-id* uniquely identifies the policy.

**Values** 1 to 65535

### *policy-name*

The *policy-name* uniquely identifies the policy.

**Values** 64 characters maximum

### **create**

Required parameter when creating a SAP QoS ingress policy.

### **name name**

Configures an optional policy name which adds a name identifier to a specific policy to then use that policy name in configuration references as well as display and use policy names in show commands throughout the system. This helps the service provider and administrator to identify and manage sap-ingress policies within the SR OS platforms.

All sap-ingress policies are required to assign a policy ID to initially create a policy. However, either the policy ID or the policy name can be used to identify and reference a specific policy after it is initially created.

If a name is not specified at creation time, then SR OS assigns a string version of the *policy-id* as the name.

**Values** 64 characters

## Platforms

All

## sap-ingress

### Syntax

```
sap-ingress src-pol dst-pol [overwrite]
```

### Context

[\[Tree\]](#) (config>qos>copy sap-ingress)

### Full Context

```
configure qos copy sap-ingress
```

### Description

This command copies existing QoS policy entries for a QoS policy-id to another QoS policy-id.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

### Parameters

#### **overwrite**

Specifies to replace the existing destination policy. Everything in the existing destination policy will be overwritten with the contents of the source policy. If **overwrite** is not specified, an error will occur if the destination policy ID exists.

#### **Example:**

```
- SR>config>qos# copy sap-egress 1 1010
- MINOR: CLI Destination "1010" exists use {overwrite}.
- SR>config>qos# copy sap-egress 1 1010 overwrite
```

#### ***src-pol dst-pol***

Indicates that the source policy ID and the destination policy ID are SAP ingress policy IDs. Specify the source policy ID that the copy command will attempt to copy from and specify the destination policy ID to which the command will copy a duplicate of the policy.

## Full Context

configure service vprn subscriber-interface group-interface ipoe-session sap-session-limit

configure service ies subscriber-interface group-interface ipoe-session sap-session-limit

## Description

This command specifies the number of IPoE sessions per SAP allowed for this group-interface. The **no** form of this command reverts to the default.

## Default

sap-session-limit 1

## Parameters

### *sap-session-limit*

Specifies the number of allowed IPoE sessions.

#### Note:

The operational maximum value may be smaller due to equipped hardware dependencies.

**Values** 1 to 131071 131071 on wlan-gw group interfaces

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.29 sap-template

### sap-template

## Syntax

**sap-template** *sap-template*

**no sap-template**

## Context

[\[Tree\]](#) (config>service>vpls>wlan-gw sap-template)

## Full Context

configure service vpls wlan-gw sap-template

## Description

This command specifies the VPLS SAP template that is applied on the internal SAPs created for communication between the VPLS and the ISAs.

The **no** form of this command removes the SAP template.

## Parameters

**sap-template**

Specifies the existing SAP template to apply. The template is created in the **config>service>template** context.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## sap-template

### Syntax

**sap-template** *name* [**create**]

**no sap-template** *name*

### Context

[\[Tree\]](#) (config>subscr-mgmt sap-template)

### Full Context

configure subscriber-mgmt sap-template

### Description

This command configures a template that specifies parameters for automatically generated subscriber SAPs, for example, when creating CUPS sessions. A template with the name "default" is used if no specific name is provided, but this must be manually provisioned.

The **no** form of this command removes the template.

### Parameters

#### *name*

Specifies the name of the PFCP association, up to 32 characters.

#### **create**

Keyword used to create the SAP template.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.30 sap-template-binding

## sap-template-binding

### Syntax

**sap-template-binding** *name/id*

**no sap-template-binding**

## Context

[Tree] (config>service>vpls>vpls-group sap-template-binding)

## Full Context

configure service vpls vpls-group sap-template-binding

## Description

This command configures the binding to a SAP template to be used to instantiate SAPs in the data VPLS using as input variables the VLAN IDs generated by the vid-range command.

The **no** form of this command removes the binding and deletes the related SAP instances. The command will fail if any of the affected VPLS instances have either a provisioned SAP or an active MVRP declaration/registration or if the related vpls-group is in no shutdown state. Any changes to the **sap-template-binding** require the **vpls-group** to be in **shutdown** state. New control SAP additions to the management VPLS are allowed as long as data VPLS instantiations/removals for vpls-groups are not in progress. Control SAPs can be removed at any time generating the removal of related data SAPs from the data VPLS. The **shutdown** or **no shutdown** state for the control SAPs does not have any effect on data SAPs instantiated with this command.

## Default

no sap-template-binding

## Parameters

### *name*

Specifies the name of the VPLS template

**Values** ASCII character string

### *id*

Specifies the ID of the VPLS template

**Values** 1 to 8196

## Platforms

All

## 23.31 saps

saps

## Syntax

**saps {qset-size size | non-shaper-queues}**

**Context**

[\[Tree\]](#) (config>qos>fp-resource-policy>aggregate-shapers>queue-sets>default-size saps)

**Full Context**

configure qos fp-resource-policy aggregate-shapers queue-sets default-size saps

**Description**

This command configures the default queue-set size for SAPs.

**Parameters****size**

Specifies the size of the queue sets.

**Values** 2 to 8

**non-shaper-queues**

Specifies that subscribers will not use hardware aggregate shapers on FPs where the FP resource policy is applied.

**Platforms**

7750 SR-1, 7750 SR-s

## 23.32 sat-type

### sat-type

**Syntax**

**sat-type** *sat-type* [**port-template** *template-name*]

**no sat-type**

**Context**

[\[Tree\]](#) (config>system>satellite>eth-sat sat-type)

[\[Tree\]](#) (config>system>satellite>tdm-sat sat-type)

**Full Context**

configure system satellite eth-sat sat-type

configure system satellite tdm-sat sat-type

**Description**

This command configures the type of satellite variant for the associated satellite chassis.

The **no** form of the command deletes the **sat-type** configuration.

**Default**

no sat-type

**Parameters*****sat-type***

Specifies the satellite type. Configuration of the following variants is supported:

**es24-1gb-sfp**

Specifies the 24xGE (SFP) + 4x10GE Ethernet satellite.

**es48-1gb-sfp**

Specifies the 48xGE (SFP) + 4x10GE Ethernet satellite.

**es24-sass-1gb-sfp**

Specifies the SAS-S 24xGE (SFP) + 4x10GE Ethernet satellite.

**es48-sass-1gb-sfp**

Specifies the SAS-S 48xGE (SFP) + 4x10GE Ethernet satellite.

**es24-1gb-tx**

Specifies the 24xGE (copper) + 4x10GE Ethernet satellite.

**es48-1gb-tx**

Specifies the 48xGE (copper) + 4x10GE Ethernet satellite.

**es24-1gb-tx**

Specifies the 24-port copper + PoE Ethernet satellite.

**es48-1gb-tx**

Specifies the 48-port copper + PoE Ethernet satellite.

**es64-10gb-sfpp+4-100gb-cfp4**

Specifies the 64x10GE + 4x100GE Ethernet satellite.

**es64-10gb-sfpp+4-100gb-qsfp28**

Specifies the 64x10GE + 4xQSFP28 Ethernet satellite.

**es24-sasmxp-1gb-sfp**

Specifies the 7210 SAS-Mxp as an ethernet satellite.

**ts4-choc3-sfp**

Specifies the 4-port OC3 TDM satellite.

**ts4-chstm1-sfp**

Specifies the 4-port STM1 TDM satellite.

**ts1-choc12-sfp**

Specifies the 1-port OC12 TDM satellite.

**ts1-chstm4-sfp**

Specifies the 1-port STM4 TDM satellite.

***template-name***

Specifies the name for the associated port template.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure system satellite eth-sat sat-type

## 23.34 save

```
save
```

### Syntax

```
save
```

### Context

[\[Tree\]](#) (config>li save)

### Full Context

```
configure li save
```

### Description

This command is required to save LI configuration parameters.

### Platforms

All

```
save
```

### Syntax

```
save [cflash-id]
```

### Context

[\[Tree\]](#) (bof save)

### Full Context

```
bof save
```

### Description

This command uses the boot option parameters currently in memory and writes them from the boot option file to the specified compact flash.

The BOF must be located in the root directory of the internal or external compact flash drives local to the system and have the mandatory filename of *bof.cfg*.

If a location is not specified, the BOF is saved to the default compact flash drive (cf3:) on the active CPM (typically the CPM in slot A, but the CPM in slot B could also be acting as the active CPM). The slot name is not case-sensitive. You can use upper or lowercase "A" or "B".

Command usage:

- **bof save** — saves the BOF to the default drive (cf3:) on the active CPM (either in slot A or B)
- **bof save cf3:** — saves the BOF to cf3: on the active CPM (either in slot A or B)

To save the BOF to a compact flash drive on the standby CPM (for example, the redundant (standby) CPM is installed in slot B), specify -A or -B option.

Command usage:

- **bof save cf3-A:** — saves the BOF to cf3: on CPM in slot A whether it is active or standby
- **bof save cf3-B:** — saves the BOF to cf3: on CPM in slot B whether it is active or standby

The slot name is not case-sensitive. You can use upper or lowercase "A" or "B".

The **bof save** and **show bof** commands allow you to save to or read from the compact flash of the standby CPM. Use the **show card** command to determine the active and standby CPM (A or B).

## Default

Saves must be explicitly executed. The BOF is saved to cf3: if a location is not specified.

## Parameters

### *flash-id*

Specifies the compact flash ID where the *bof.cfg* is to be saved.

**Values** cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

**Default** cf3:

## Platforms

All

## save

## Syntax

**save** *file-url*

## Context

[\[Tree\]](#) (candidate save)

## Full Context

candidate save

## Description

This command saves the current candidate to a file.

## Parameters

***file-url***

Specifies the directory and filename.

## Platforms

All

save

## Syntax

**save** [**comment** *comment*] [**rescue**]

## Context

[\[Tree\]](#) (admin>rollback save)

## Full Context

admin rollback save

## Description

If the optional **rescue** keyword is not used, this command saves a rollback checkpoint at the location and with the filename specified by the rollback-location with a suffix of .rb. The previously saved checkpoints will have their suffixes incremented by one (.rb.1 becomes .rb.2, and so on). If there are already as many checkpoint files as the maximum number supported, then the last checkpoint file is deleted.

If the **rescue** keyword is used, then this command saves the current operational configuration as a rescue configuration at the location and with the filename specified by the rescue location. The filename will have the suffix .rc appended.

## Parameters

***comment-string***

Specifies a comment, up to 255 characters, that is associated with the checkpoint.

**rescue**

Saves the rescue checkpoint instead of a normal rollback checkpoint.

## Platforms

All

save

## Syntax

**save** [*file-url*] [**detail**] [**index**]

**Context****[Tree]** (admin save)**Full Context**

admin save

**Description**

This command saves the running configuration to a configuration file. For example:

```
A:ALA-1>admin# save ftp://test:test@192.168.x.xx/./100.cfg
Saving configurationCompleted.
```

By default, the running configuration is saved to the primary configuration file.

**Parameters*****file-url***

Specifies the file URL location to save the configuration file.

**Values**

*local-url* |  
*remote-url*

*local-url* [cflash-id/][file-path] 200 chars max, including cflash-id

directory length 99 chars max each

*remote-url* [{ftp:// | tftp://}login:pswd@remote-locn/][file-path]

243 chars max

directory length 99 chars max each

*remote-locn* [hostname | ipv4-address | ipv6-address]

*ipv4-address* a.b.c.d

*ipv6-address* x:x:x:x:x:x[-interface]

x:x:x:x:x:d.d.d.d[-interface]

x - [0 to FFFF]H

d - [0 to 255]D

interface - 32 chars max, for link local addresses

*cflash-id* cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

**Default** the primary configuration file location

**detail**

Saves both default and non-default configuration parameters.

**index**

Forces a save of the persistent index file regardless of the persistent status in the BOF file. The index option can also be used to avoid an additional boot required while changing your system to use the persistence indexes.

## 23.35 save-deterministic-script

### save-deterministic-script

**Syntax**

**save-deterministic-script**

**Context**

[\[Tree\]](#) (admin>nat save-deterministic-script)

**Full Context**

admin nat save-deterministic-script

**Description**

This command saves the script that calculates Deterministic NAT map entries.

Once the location for the Python deterministic NAT script is configured, the script is generated/updated every time deterministic NAT configuration is modified. However, the script must be manually exported to the remote location. This command triggers the export of the script to a remote location.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.36 save-when-restricted

### save-when-restricted

**Syntax**

**[no] save-when-restricted**

**Context**

[\[Tree\]](#) (config>system>security>user save-when-restricted)

[\[Tree\]](#) (config>system>security>user-template save-when-restricted)

### Full Context

configure system security user save-when-restricted  
configure system security user-template save-when-restricted

### Description

This command specifies whether the system permits configuration save operations for all configuration regions (bof, debug, configure, li) via any management interface (such as CLI and NETCONF) even if **restricted-to-home** is enabled.

The configuration for a region can be saved with CLI commands such as **bof save**, **admin debug-save**, **admin save**, or **configure li save**.

The **no** form of this command denies saving the configuration when **restricted-to-home** is enabled.

### Default

no save-when-restricted

### Platforms

All

## 23.37 saved-ind-prompt

### saved-ind-prompt

### Syntax

[no] saved-ind-prompt

### Context

[\[Tree\]](#) (environment saved-ind-prompt)

## 23.38 scaling-profile

### scaling-profile

#### Syntax

**scaling-profile** *scaling-profile-id*

#### Context

[\[Tree\]](#) (config isa nat-group scaling-profile)

#### Full Context

configure isa nat-group scaling-profile

#### Description

This command determines profiles for NAT scaling. Lower profile numbers allocate less resources, therefore, supporting lower scaling.

Contact your Nokia representative for more information about NAT scaling figures in each profile.

#### Default

scaling-profile profile1

#### Parameters

##### ***scaling-profile-id***

Specifies the name of the profile, up to 32 characters.

- Values** ESA-VM supports three scaling profiles, while VSR-I supports only two.
- profile1 is a low scaling profile that requires 8 CPU cores and 32 GB of DRAM memory per ESA-VM
  - profile2 is a medium scaling profile that requires 11 CPU cores and 96 GB of DRAM memory per ESA-VM
  - profile3 is a high scaling profile that requires 15 CPU cores and 115 GB of DRAM memory per ESA-VM

For the number of required CPU control cores on a VSR-I in relation to profiles, see to the Sysinfo section in the Virtualized Service Router Installation and Setup Guide

.For the amount of required memory on VSR-I in relation to profiles, see the Software Release Notes, section VM Memory Requirements by Function Mix.

## Platforms

### Full Context

configure qos sap-egress sched-class-elevation

### Description

This command configures the scheduling class elevation.

The **no** form of this command removes the scheduling class elevation configuration.

### Parameters

#### ***sched-class***

Specifies the scheduling class ID.

**Values** 3 to 6

#### ***weight***

Specifies the weight for the scheduling class.

**Values** 3 to 8

### Platforms

7750 SR-1, 7750 SR-s

## 23.41 sched-run-min-int

### sched-run-min-int

#### Syntax

**sched-run-min-int** *percent-of-default*

**no sched-run-min-int**

#### Context

[\[Tree\]](#) (config>card>virt-sched-adj sched-run-min-int)

#### Full Context

configure card virtual-scheduler-adjustment sched-run-min-int

#### Description

This command overrides the default minimum time that must elapse before a virtual scheduler may redistribute bandwidth based on changes to the offered rates of member policers or queues. A minimum run interval is enforced to allow a minimum amount of "batching" queue changes before reacting to the changed rates. This minimum interval is beneficial since the periodic function of determining policer or queue offered rates is performed sequentially and the interval allows a number policer and queue rates to be determined before determining the distribution of bandwidth to the policers and queues.

The default minimum scheduler run interval is 0.5 seconds. The sched-run-min-int command uses a percent value to modify the default interval.

The **no** form of this command restores the default minimum scheduler run interval for all virtual schedulers on the card.

**Default**

no sched-run-min-int

**Parameters*****percent-of-default***

Specifies that the percent-of-default parameter is required and is used to modify the default minimum scheduler run interval for all virtual schedulers on the card. Defining 100.00 percent is equivalent to removing the override (restoring the default) for the minimum scheduler run interval.

**Values** 0.01% to 1000.00%

**Default** 100.00%

**Platforms**

All

**23.42 schedule****schedule****Syntax**

[no] **schedule** *schedule-name* [owner *schedule-owner*]

**Context**

[\[Tree\]](#) (config>system>cron schedule)

**Full Context**

configure system cron schedule

**Description**

This command configures the type of schedule to run, including one-time only (oneshot), periodic or calendar-based runs. All runs are determined by month, day of month or weekday, hour, minute and interval (seconds).

The **no** form of the command removes the context from the configuration.

**Parameters*****schedule-name***

Specifies the name of the schedule. The name can be up to 32 characters.

***schedule-owner***

Specifies the owner name of the schedule. The name can be up to 32 characters.

**Default** TiMOS CLI

## Platforms

## 23.43 schedule-type

### schedule-type

#### Syntax

**schedule-type** *schedule-type*

#### Context

[\[Tree\]](#) (config>system>security>pki>ca-prof>auto-crl-update schedule-type)

#### Full Context

configure system security pki ca-profile auto-crl-update schedule-type

#### Description

This command specifies the schedule type for auto CRL update. The system supports two types:

- **periodic**: — The system will download a CRL periodically at the interval configured via the **periodic-update-interval** command. For example, if the periodic-update-interval is 1 day, then the system will download a CRL every 1 day. The minimal periodic-update-interval is 1 hour.
- **next-update-based** — The system will download a CRL at the time = Next\_Update\_of\_existing\_CRL *minus* pre-update-time. For example, if the Next-Update of the existing CRL is 2015-06-30 06:00 and pre-update-time is 1 hour, then the system will start downloading at 2015-06-30, 05:00.

#### Default

schedule-type next-update-based

#### Parameters

**schedule-type**

Specifies the type of time scheduler to update the CRL.

**Values** periodic, next-update-based

## 23.44 scheduler

### scheduler

#### Syntax

**scheduler** *scheduler-name* **rate** *pir-rate* [**cir** *cir-rate*]

**no scheduler** *scheduler-name*

#### Context

[Tree] (config>subscr-mgmt>sub-prof>egr>sched scheduler)

[Tree] (config>subscr-mgmt>sub-prof>ing>sched scheduler)

#### Full Context

configure subscriber-mgmt sub-profile egress scheduler-policy scheduler

configure subscriber-mgmt sub-profile ingress scheduler-policy scheduler

#### Description

This command provides a way to override parameters of the existing scheduler associated with the egress or ingress scheduler policy. A scheduler defines bandwidth controls that limit each child (other schedulers and queues) associated with the scheduler. Scheduler objects are created within the hierarchical tiers of the policy. It is assumed that each scheduler created will have queues or other schedulers defined as child associations. The scheduler can be a child (take bandwidth from a scheduler in a higher tier).

The **no** form of this command reverts to the default.

#### Parameters

##### *scheduler-policy-name*

Specify an existing scheduler policy name.

##### *pir-rate*

Specify the *pir-rate*, in kilobits, to override the administrative PIR used by the scheduler. When the **rate** command is executed, a valid PIR setting must be explicitly defined. Fractional values are not allowed and must be specified as a positive integer.

**Values** 1 to 3200000000, max

##### *cir-rate*

The **cir** parameter overrides the administrative CIR used by the scheduler. When the **rate** command is executed, a CIR setting is optional. The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers or queues. Fractional values are not allowed and must be given as a positive integer.

**Values** 0 to 3200000000, sum, max

**Default** sum

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## scheduler

### Syntax

**scheduler** *scheduler-name* [**create**]

**no scheduler** *scheduler-name*

### Context

[\[Tree\]](#) (config>service>vpls>sap>egress>sched-override scheduler)

### Full Context

configure service vpls sap egress scheduler-override scheduler

### Description

This command overrides specific attributes of the specified scheduler name.

A scheduler defines a bandwidth control that limits each child (other schedulers, policers and queues) associated with the scheduler. Scheduler objects are created within the hierarchical tiers of the policy. It is assumed that each scheduler created has policers, queues or other schedulers defined as child associations. The scheduler can be a child which takes bandwidth from a scheduler in a higher tier. A total of 32 schedulers can be created within a single scheduler policy with no restriction on the distribution between the tiers.

Each scheduler must have a unique name within the context of the scheduler policy; however the same name can be reused in multiple scheduler policies. If *scheduler-name* already exists within the policy tier level (regardless of the inclusion of the keyword **create**), the context changes to that scheduler name for the purpose of editing the scheduler parameters. Modifications made to an existing scheduler are executed on all instantiated schedulers created through association with the policy of the edited scheduler. This can cause policers, queues or schedulers to become orphaned (invalid parent association) and adversely affect the ability of the system to enforce service level agreements (SLAs).

If the *scheduler-name* exists within the policy on a different tier (regardless of the inclusion of the keyword **create**), an error occurs and the current CLI context does not change.

If the *scheduler-name* does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. The success of the command execution is dependent on the following:

1. The maximum number of schedulers has not been configured.
2. The provided *scheduler-name* is valid.
3. The **create** keyword is entered with the command if the system is configured to require it (enabled in the **environment create** command).

When the maximum number of schedulers has been exceeded on the policy, a configuration error occurs and the command does not execute, nor does the CLI context change.

If the provided scheduler-name is invalid according to the criteria below, a name syntax error occurs, the command does not execute, and the CLI context does not change.

The **no** form of this command removes the scheduler name from the configuration.

## Parameters

### *scheduler-name*

Specifies name of the scheduler

**Values** Valid names consist of any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### **create**

This optional keyword explicitly specifies that it is acceptable to create a scheduler with the given *scheduler-name*. If the **create** keyword is omitted, **scheduler-name** is not created when the system environment variable create is set to true. This safeguard is meant to avoid accidental creation of system objects (such as schedulers) while attempting to edit an object with a mistyped name or ID. The keyword has no effect when the object already exists.

## Platforms

All

## scheduler

## Syntax

**scheduler** *scheduler-name* [**create**]

**no scheduler** *scheduler-name*

## Context

**[Tree]** (config>port>ethernet>access>egr>qgrp>sched-override scheduler)

**[Tree]** (config>port>ethernet>access>ing>qgrp>sched-override scheduler)

## Full Context

configure port ethernet access egress queue-group scheduler-override scheduler

configure port ethernet access ingress queue-group scheduler-override scheduler

## Description

This command can be used to override specific attributes of the specified scheduler name. A scheduler defines bandwidth controls that limit each child (other schedulers and queues) associated with the scheduler. Scheduler objects are created within the hierarchical tiers of the policy. It is assumed that each scheduler created will have queues or other schedulers defined as child associations. The scheduler can be a child which takes bandwidth from a scheduler in a higher tier. A total of 32 schedulers can be created within a single scheduler policy with no restriction on the distribution between the tiers. The *scheduler-name* must exist in the applied scheduler policy.

The **no** form of this command removes the scheduler overrides for the specified scheduler and returns the scheduler's parent weight and CIR weight, and its PIR and CIR to the values configured in the applied scheduler policy.

## Parameters

### *scheduler-name*

Specifies the name of the scheduler.

**Values** Valid names consist of any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### **create**

Creates a new scheduler for this port.

## Platforms

**[Tree]** (config>service>cpipe>sap>ingress>sched-override scheduler)

**[Tree]** (config>service>epipe>sap>ingress>sched-override scheduler)

## Full Context

configure service ipipe sap ingress scheduler-override scheduler

configure service epipe sap egress scheduler-override scheduler

configure service cpipe sap egress scheduler-override scheduler

configure service ipipe sap egress scheduler-override scheduler

configure service cpipe sap ingress scheduler-override scheduler

configure service epipe sap ingress scheduler-override scheduler

## Description

This command can be used to override specific attributes of the specified scheduler name. A scheduler defines bandwidth controls that limit each child (other schedulers, policers, and queues) associated with the scheduler. Scheduler objects are created within the hierarchical tiers of the policy. It is assumed that each scheduler created will have policers, queues or other schedulers defined as child associations. The scheduler can be a child which takes bandwidth from a scheduler in a higher tier. A total of 32 schedulers can be created within a single scheduler policy with no restriction on the distribution between the tiers.

Each scheduler must have a unique name within the context of the scheduler policy; however the same name can be reused in multiple scheduler policies. If *scheduler-name* already exists within the policy tier level (regardless of the inclusion of the keyword `create`), the context changes to that scheduler name for the purpose of editing the scheduler parameters. Modifications made to an existing scheduler are executed on all instantiated schedulers created through association with the policy of the edited scheduler. This can cause policers, queues, or schedulers to become orphaned (invalid parent association) and adversely affect the ability of the system to enforce service level agreements (SLAs).

If the *scheduler-name* exists within the policy on a different tier (regardless of the inclusion of the keyword `create`), an error occurs and the current CLI context will not change.

If the *scheduler-name* does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. The success of the command execution is dependent on the following:

1. The maximum number of schedulers has not been configured.
2. The provided *scheduler-name* is valid.
3. The **create** keyword is entered with the command if the system is configured to require it (enabled in the **environment create** command).

When the maximum number of schedulers has been exceeded on the policy, a configuration error occurs and the command will not execute, nor will the CLI context change.

If the provided scheduler-name is invalid according to the following criteria, a name syntax error will occur, the command will not execute, and the CLI context will not change.

## Parameters

### *scheduler-name*

The name of the scheduler. Each scheduler must be explicitly created.

**Values** Valid names consist of any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### `create`

This optional keyword explicitly specifies that it is acceptable to create a scheduler with the given *scheduler-name*. If the **create** keyword is omitted, **scheduler-name** is not created when the system environment variable `create` is set to true. This safeguard is meant to avoid accidental creation of system objects (such as schedulers) while attempting to edit an object with a mistyped name or ID. The keyword has no effect when the object already exists.

### Description

This command can be used to override specific attributes of the specified scheduler name.

A scheduler defines a bandwidth controls that limit each child (other schedulers, policers, and queues) associated with the scheduler. Scheduler objects are created within the hierarchical tiers of the policy. It is assumed that each scheduler created will have policers, queues, or other schedulers defined as child associations. The scheduler can be a child which takes bandwidth from a scheduler in a higher tier. A total of 32 schedulers can be created within a single scheduler policy with no restriction on the distribution between the tiers.

Each scheduler must have a unique name within the context of the scheduler policy; however the same name can be reused in multiple scheduler policies. If *scheduler-name* already exists within the policy tier level (regardless of the inclusion of the keyword create), the context changes to that scheduler name for the purpose of editing the scheduler parameters. Modifications made to an existing scheduler are executed on all instantiated schedulers created through association with the policy of the edited scheduler. This can cause queues or schedulers to become orphaned (invalid parent association) and adversely affect the ability of the system to enforce service level agreements (SLAs).

If the *scheduler-name* exists within the policy on a different tier (regardless of the inclusion of the keyword create), an error occurs and the current CLI context will not change.

If the *scheduler-name* does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. The success of the command execution is dependent on the following:

1. The maximum number of schedulers has not been configured.
2. The provided *scheduler-name* is valid.
3. The **create** keyword is entered with the command if the system is configured to require it (enabled in the **environment create** command).

When the maximum number of schedulers has been exceeded on the policy, a configuration error occurs and the command will not execute, nor will the CLI context change.

If the provided scheduler-name is invalid according to the criteria below, a name syntax error will occur, the command will not execute, and the CLI context will not change.

## Parameters

### *scheduler-name*

Specifies the name of the scheduler.

**Values** Valid names consist of any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed between double quotes.

### *create*

Specifies that it is acceptable to create a scheduler with the given *scheduler-name*. If the **create** keyword is omitted, **scheduler-name** is not created when the system environment variable `create` is set to true. This safeguard is meant to avoid accidental creation of system objects (such as schedulers) while attempting to edit an object with a mistyped name or ID. The keyword has no effect when the object already exists.

**no scheduler** *scheduler-name*

### Context

[\[Tree\]](#) (config>qos>scheduler-policy>tier scheduler)

### Full Context

configure qos scheduler-policy tier scheduler

### Description

This command creates a new scheduler or edits an existing scheduler within the scheduler policy tier. A scheduler defines bandwidth controls that limit each child (other schedulers and queues) associated with the scheduler. Scheduler objects are created within the hierarchical tiers of the policy. It is assumed that each scheduler created will have queues or other schedulers defined as child associations. The scheduler can be a child which takes bandwidth from a scheduler in a higher tier. A total of 32 schedulers can be created within a single scheduler policy with no restriction on the distribution between the tiers.

Each scheduler must have a unique name within the context of the scheduler policy; however, the same name can be reused in multiple scheduler policies. If *scheduler-name* already exists within the policy tier level (regardless of the inclusion of the keyword **create**), the context changes to that scheduler name for the purpose of editing the scheduler parameters. Modifications made to an existing scheduler are executed on all instantiated schedulers created through association with the policy of the edited scheduler. This can cause queues or schedulers to become orphaned (invalid parent association) and adversely affect the ability of the system to enforce SLAs.

If the *scheduler-name* exists within the policy on a different tier (regardless of the inclusion of the keyword **create**), an error occurs and the current CLI context will not change.

If the *scheduler-name* does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. The success of the command execution is dependent on the following:

1. The maximum number of schedulers has not been configured.
2. The provided *scheduler-name* is valid.
3. The **create** keyword is entered with the command if the system is configured to require it (enabled in the **environment create** command).

When the maximum number of schedulers has been exceeded on the policy, a configuration error occurs, the command will not execute, nor will the CLI context change.

If the provided scheduler-name is invalid according to the criteria below, a name syntax error will occur, the command will not execute, and the CLI context will not change.

## Parameters

### *scheduler-name*

Specifies the scheduler name.

**Values** Valid names consist of any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

### **create**

This optional keyword explicitly specifies that it is acceptable to create a scheduler with the given *scheduler-name*. If the **create** keyword is omitted, **scheduler-name** is not created when the system environment variable create is set to true. This safeguard is meant to avoid accidental creation of system objects (such as schedulers) while attempting to edit an object with a mistyped name or ID. The keyword has no effect when the object already exists.

## Platforms

[\[Tree\]](#) (config>service>cust>multi-service-site>egress>sched-override scheduler)

## Full Context

configure service customer multi-service-site ingress scheduler-override scheduler

configure service customer multi-service-site egress scheduler-override scheduler

## Description

This command override specifics attributes of the specified scheduler name.

A scheduler defines bandwidth controls that limit each child (other schedulers, policers and queues) associated with the scheduler. Scheduler objects are created within the hierarchical tiers of the policy. It is assumed that each scheduler created will have policers, queues or other schedulers defined as child associations. The scheduler can be a child which takes bandwidth from a scheduler in a higher tier. A total of 32 schedulers can be created within a single scheduler policy with no restriction on the distribution between the tiers.

Each scheduler must have a unique name within the context of the scheduler policy; however the same name can be reused in multiple scheduler policies. If *scheduler-name* already exists within the policy tier level (regardless of the inclusion of the keyword create), the context changes to that scheduler name for

the purpose of editing the scheduler parameters. Modifications made to an existing scheduler are executed on all instantiated schedulers created through association with the policy of the edited scheduler. This can cause policer, queues or schedulers to become orphaned (invalid parent association) and adversely affect the ability of the system to enforce service level agreements (SLAs).

If the *scheduler-name* exists within the policy on a different tier (regardless of the inclusion of the keyword `create`), an error occurs and the current CLI context will not change.

If the *scheduler-name* does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. The success of the command execution is dependent on the following:

1. The maximum number of schedulers has not been configured.
2. The provided *scheduler-name* is valid.
3. The **create** keyword is entered with the command if the system is configured to require it (enabled in the **environment create** command).

When the maximum number of schedulers has been exceeded on the policy, a configuration error occurs and the command will not execute, nor will the CLI context change.

If the provided scheduler-name is invalid according to the criteria below, a name syntax error will occur, the command will not execute, and the CLI context will not change.

The **no** form of the command disables the scheduler override.

## Parameters

### *scheduler-name*

Specifies the name of the scheduler.

**Values** Valid names consist of any string up to 32 characters in length, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### *create*

This optional keyword explicitly specifies that it is acceptable to create a scheduler with the given *scheduler-name*. If the **create** keyword is omitted, **scheduler-name** is not created when the system environment variable `create` is set to true. This safeguard is meant to avoid accidental creation of system objects (such as schedulers) while attempting to edit an object with a mistyped name or ID. The keyword has no effect when the object already exists.

## Platforms

All

## scheduler

## Syntax

**scheduler** *scheduler-name* **rate** *pir-rate* [**cir** *cir-rate*]

**no scheduler** *scheduler-name*

## Context

**[Tree]** (config>subscr-mgmt>sla-prof>egress>sched scheduler)

## Full Context

configure subscriber-mgmt sla-profile egress scheduler-policy scheduler

## Description

This command provides a way to override parameters of the existing scheduler associated with the egress scheduler policy. A scheduler defines bandwidth controls that limit each child (other schedulers and queues) associated with the scheduler. Scheduler objects are created within the hierarchical tiers of the policy. It is assumed that each scheduler created will have queues or other schedulers defined as child associations. The scheduler can be a child (take bandwidth from a scheduler in a higher tier).

The **no** form of this command reverts to the default.

## Parameters

### *scheduler-name*

Specify an existing scheduler policy name up to 32 characters.

### *pir-rate*

Specifies the PIR rate in kb/s. This parameter overrides the administrative PIR used by the scheduler. When the rate command is executed, a valid PIR setting must be explicitly defined. Fractional values are not allowed and must be given as a positive integer.

**Values** 1 to 3200000000, max

### *cir-rate*

Specifies the CIR rate in kb/s. This parameter overrides the administrative CIR used by the scheduler. When the rate command is executed, a CIR setting is optional. The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers or queues. Fractional values are not allowed and must be given as a positive integer.

**Values** 0 to 3200000000, sum, max

**Default** sum

no scheduler-parent

### Context

[\[Tree\]](#) (config>qos>sap-egress>policer scheduler-parent)

### Full Context

configure qos sap-egress policer scheduler-parent

### Description

This command defines an optional parent scheduler that governs the available bandwidth given to a policer in addition to the PIR setting of the policer. When multiple schedulers, queues, or policers share a child status with the parent scheduler, the **weight** or **level** parameters define how this policer contends with the

other children for the bandwidth of the parent. This command and the configuration of a SAP policer **port-parent** or **parent** arbiter are mutually exclusive.
