Multiple schedulers can exist in different scheduler policies with the same *scheduler-name*; in this command, the associated *scheduler-name* pertains to a scheduler that should exist on the SAP as the policy is applied and the policer is created. When the policer is created on the SAP, the existence of the *scheduler-name* is dependent on a scheduler policy containing the *scheduler-name* being directly applied or indirectly applied (through a multiservice customer site) to the SAP. The policer accepts packets, but is not bandwidth limited by a virtual scheduler or the scheduler hierarchy applied to the SAP. The SAP to which the policer belongs displays an orphan policer status with the SapEgressPolicerMismatch flag in the **show service sap-using** output. The orphaned state of the policer is automatically cleared when the *scheduler-name* becomes available on the SAP.

The parent scheduler can be made unavailable by the removal of a scheduler policy or scheduler. When an existing parent scheduler is removed or inoperative, the policer enters the orphaned state. The policer automatically returns to normal operation when the parent scheduler is available again.

The **no** form of this command removes a child association with a parent scheduler. If a parent association does not currently exist, the command has no effect and no error message is returned. When a parent association has been removed, the former child policer attempts to operate based on its configured rate parameter.

Removing the parent association on the policer within the policy takes effect immediately on all policers using the SAP QoS policy.

## Default

no scheduler-parent

## Parameters

### *scheduler-name*

Scheduler names are configured in the **config>qos>scheduler-policy>tier** context. There are no checks performed at the time of definition to ensure that the *scheduler-name* exists within an existing scheduler policy. For the policer to use the defined *scheduler-name*, the scheduler must exist on each SAP that the policer is created on. If a *scheduler-name* does not exist on the SAP, the policer operates in an orphaned state. Each parental association must be explicitly defined.

**Values** Any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

### *weight*

Defines the relative weight of this policer in comparison with other child policers, queues, and schedulers when competing for bandwidth on the parent *scheduler-name* at the above-CIR priority level defined by the **level** parameter.

All weight values from all weighted active policers, queues, and schedulers with a common port parent are added together. Then, each individual active weight is divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit. All child policers, queues, and schedulers with a weight of 0 are considered to have the lowest priority at the configured level and are not

serviced until all non-zero weighted policers, queues, and schedulers at that level are operating at the maximum bandwidth or are idle.

**Values** 0 to 100

**Default** 1

### ***level***

Defines the level of hierarchy when compared with other policers, queues, and schedulers when competing for bandwidth on the parent *scheduler-name*.

Children of the parent scheduler with a lower priority will not receive bandwidth until all children with a higher priority have either reached their maximum bandwidth or are idle. Children with the same level are serviced in relation to their relative weights.

**Values** 1 to 8 (8 is the highest priority)

**Default** 1

### ***cir-weight***

Defines the relative weight of this policer in comparison with other child policers, queues, or schedulers competing for bandwidth on the parent *scheduler-name* at the within-CIR priority level defined by the **cir-level** parameter.

All **cir-weight** values from all weighted active policers, queues, and schedulers with a common parent are added together. Then, each individual active weight is divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit.

The weight is specified as an integer value from 0 to 100, with 100 being the highest weight. When the **cir-weight** parameter is set to a value of 0, the policer receives bandwidth only after the other children with a non-zero weight at this level.

**Values** 0 to 100

**Default** 1

### ***cir-level***

Defines the level of hierarchy when compared with other policers, queues, and schedulers that the policer uses to receive bandwidth for its within-CIR offered load. If the **cir-level** parameter is set to a value of 0 (the default value), the policer does not receive bandwidth during the schedulers within-CIR pass and the **cir-weight** parameter is ignored. If the **cir-level** parameter is 1 or greater, the **cir-weight** parameter is used.

**Values** 0 to 8 (8 is the highest priority)

**Default** 0

## **Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-1s, 7750 SR-1se, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, VSR

## scheduler-parent

### Syntax

```
scheduler-parent scheduler-name [weight weight] [level level] [cir-weight cir-weight] [cir-level cir-level]
no scheduler-parent
```

### Context

**[Tree]** (config>qos>sap-ingress>policer scheduler-parent)

### Full Context

```
configure qos sap-ingress policer scheduler-parent
```

### Description

This command defines an optional parent scheduler that governs the available bandwidth given to a policer in addition to the PIR setting of the policer. When multiple schedulers, queues, or policers share a child status with the parent scheduler, the **weight** or **level** parameters define how this policer contends with the other children for the bandwidth of the parent. This command and the configuration of a SAP policer **scheduler-parent** or **parent** arbiter are mutually exclusive.

Multiple schedulers can exist in different scheduler policies with the same *scheduler-name*; in this command, the associated *scheduler-name* pertains to a scheduler that should exist on the SAP as the policy is applied and the policer is created. When the policer is created on the SAP, the existence of the *scheduler-name* is dependent on a scheduler policy containing the *scheduler-name* being directly applied or indirectly applied (through a multiservice customer site) to the SAP. The policer accepts packets, but is not bandwidth limited by a virtual scheduler or the scheduler hierarchy applied to the SAP.

The parent scheduler can be made unavailable by the removal of a scheduler policy or scheduler. When an existing parent scheduler is removed or inoperative, the policer enters the orphaned state. The policer automatically returns to normal operation when the parent scheduler is available again.

The **no** form of this command removes a child association with a parent scheduler. If a parent association does not currently exist, the command has no effect and no error message is returned. When a parent association has been removed, the former child policer attempts to operate based on its configured rate parameter.

Removing the parent association on the policer within the policy takes effect immediately on all policers using the SAP QoS policy.

### Default

```
no scheduler-parent
```

### Parameters

#### *scheduler-name*

Scheduler names are configured in the **config>qos>scheduler-policy>tier** context. There are no checks performed at the time of definition to ensure that the *scheduler-name* exists within an existing scheduler policy. For the policer to use the defined *scheduler-name*, the scheduler must exist on each SAP that the policer is created on. If a *scheduler-name* does

not exist on the SAP, the policer operates in an orphaned state. Each parental association must be explicitly defined.

**Values** Any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

### ***weight***

Defines the relative weight of this policer in comparison with other child policers, queues, and schedulers when competing for bandwidth on the parent *scheduler-name* at the above-CIR priority level defined by the **level** parameter.

All weight values from all weighted active policers, queues, and schedulers with a common parent are added together. Then, each individual active weight is divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit. All child policers, queues, and schedulers with a weight of 0 are considered to have the lowest priority at the configured level and are not serviced until all non-zero weighted policers, queues, and schedulers at that level are operating at the maximum bandwidth or are idle.

**Values** 0 to 100

**Default** 1

### ***level***

Defines the level of hierarchy when compared with other policers, queues, and schedulers when competing for bandwidth on the parent *scheduler-name*.

Children of the parent scheduler with a lower priority will not receive bandwidth until all children with a higher priority have either reached their maximum bandwidth or are idle. Children with the same level are serviced in relation to their relative weights.

**Values** 1 to 8 (8 is the highest priority)

**Default** 1

### ***cir-weight***

Defines the relative weight of this policer in comparison with other child policers, queues, or schedulers competing for bandwidth on the parent *scheduler-name* at the within-CIR priority level defined by the **cir-level** parameter.

All **cir-weight** values from all weighted active policers, queues, and schedulers with a common parent are added together. Then, each individual active weight is divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit.

The weight is specified as an integer value from 0 to 100, with 100 being the highest weight. When the **cir-weight** parameter is set to a value of 0, the policer receives bandwidth only after the other children with a non-zero weight at this level.

**Values** 0 to 100

**Default** 1

### *cir-level*

Defines the level of hierarchy when compared with other policers, queues, and schedulers that the policer uses to receive bandwidth for its within-CIR offered load. If the **cir-level** parameter is set to a value of 0 (the default value), the policer does not receive bandwidth during the schedulers within-CIR pass and the **cir-weight** parameter is ignored. If the **cir-level** parameter is 1 or greater, the **cir-weight** parameter is used.

**Values** 0 to 8 (8 is the highest priority)

**Default** 0

## 23.47 scheduler-policy

### scheduler-policy

#### Syntax

**scheduler-policy** *scheduler-policy-name*

**no scheduler-policy**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>sla-prof>egress scheduler-policy)

#### Full Context

configure subscriber-mgmt sla-profile egress scheduler-policy

#### Description

This command specifies a scheduler policy to associate to the sla profile. Scheduler policies are configured in the **configure>qos>scheduler>policy** context. Each scheduler policy is divided up into groups of schedulers based on the tier each scheduler is created under. A tier is used to give structure to the schedulers within a policy and define rules for parent scheduler associations. The policy defines the hierarchy and operating parameters for virtual schedulers.

The **no** form of this command removes the scheduler-policy-name from the configuration.

#### Parameters

***scheduler-policy-name***

Specifies an existing scheduler policy name up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## scheduler-policy

## Full Context

configure service ies subscriber-interface group-interface sap egress scheduler-policy

configure service ies sap egress scheduler-policy

configure service ies subscriber-interface group-interface sap ingress scheduler-policy

configure service vprn subscriber-interface group-interface sap egress scheduler-policy

configure service vprn subscriber-interface group-interface sap ingress scheduler-policy

configure service ies sap ingress scheduler-policy

## Description

This command applies an existing scheduler policy to an ingress or egress scheduler used by ingress SAP queues or egress SAP policers and queues associated with this multi-service customer site.

The schedulers defined in the scheduler policy can only be created once the customer site has been appropriately assigned to a chassis port, channel or slot. Scheduler policies are defined in the **config>qos>scheduler-policy scheduler-policy-name** context.

The **no** form of this command removes the configured ingress or egress scheduler policy from the multi-service customer site. When the policy is removed, the schedulers created due to the policy are removed also making them unavailable for the SAP policers or queues associated with the customer site. Policers and queues that lose their parent scheduler association are deemed to be orphaned and are no longer subject to a virtual scheduler. The SAPs that have policers or queues reliant on the removed schedulers enter into an operational state depicting the orphaned status of one or more policers or queues. When the **no** form of this command executed, the customer site ingress or egress node will not contain an applied scheduler policy.

## Parameters

### **scheduler-policy-name:**

Specifies the scheduler policy name to apply to an existing scheduler policy that was created in the **config>qos>scheduler-policy scheduler-policy-name** context to create the hierarchy of ingress or egress virtual schedulers. The scheduler names defined within the policy are created and made available to any ingress queues or egress policers and queues created on associated SAPs.

**Values** Any existing valid scheduler policy name.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## scheduler-policy

### Syntax

**scheduler-policy** *scheduler-policy-name*

**no scheduler-policy**

### Context

[\[Tree\]](#) (config>port>ethernet>access>egress>vport scheduler-policy)

### Full Context

configure port ethernet access egress vport scheduler-policy

### Description

This command specifies a scheduler policy to associate to the Vport. Scheduler policies are configured in the **configure>qos>scheduler>policy** context. Each scheduler policy is divided up into groups of schedulers based on the tier each scheduler is created under. A tier is used to give structure to the schedulers within a policy and define rules for parent scheduler associations. The policy defines the hierarchy and operating parameters for virtual schedulers.

The **no** form of this command removes the configured egress scheduler policy from the Vport.

The **agg-rate rate**, **port-scheduler-policy** and **scheduler-policy** commands are mutually exclusive. Changing between the use of a scheduler policy and the use of an agg-rate/port-scheduler-policy involves removing the existing command and applying the new command.

The configuration of a scheduler policy under a Vport is mutually exclusive with the configuration of the egress-rate-modify parameter.

The **no** form of this command reverts to the default.

### Parameters

#### ***scheduler-policy-name***

Specifies the *scheduler-policy-name* parameter applies an existing scheduler policy that was created in the **config>qos>scheduler-policy** *scheduler-policy-name* context to create the hierarchy of egress virtual schedulers.

### Platforms

All

```

## Description

This command applies an existing scheduler policy to an ingress or egress scheduler used by SAP queues associated with this multi-service customer site. The schedulers defined in the scheduler policy can only be created once the customer site has been appropriately assigned to a chassis port, channel or slot. Scheduler policies are defined in the **config>qos>scheduler-policy** *scheduler-policy-name* context.

The **no** form of this command removes the configured ingress or egress scheduler policy from the multi-service customer site. When the policy is removed, the schedulers created due to the policy are removed also making them unavailable for the ingress SAP queues and egress SAP policers and queues associated with the customer site. Policers and queues that lose their parent scheduler association are deemed to be orphaned and are no longer subject to a virtual scheduler. The SAPs that have policers or queues reliant on the removed schedulers enter into an operational state depicting the orphaned status of one or more policers or queues. When the **no scheduler-policy** command is executed, the customer site's ingress or egress node will not contain an applied scheduler policy.

## Parameters

### *scheduler-policy-name*

Specifies that the *scheduler-policy-name* is applied to an existing scheduler policy that was created in the **config>qos>scheduler-policy** *scheduler-policy-name* context to create the hierarchy of ingress or egress virtual schedulers. The scheduler names defined within the policy are created and made available to any ingress or egress queues created on associated SAPs.

**Values** Any existing valid scheduler policy name.

**no scheduler-policy** *scheduler-policy-name*

### Context

[\[Tree\]](#) (config>qos scheduler-policy)

### Full Context

configure qos scheduler-policy

### Description

Each scheduler policy is divided up into groups of schedulers based on the tier each scheduler is created under. A tier is used to give structure to the schedulers within a policy and define rules for parent scheduler associations.

The **scheduler-policy** command creates a scheduler policy or allows editing of an existing policy. The policy defines the hierarchy and operating parameters for virtual schedulers. Creating a policy does not create the schedulers; it only provides a template for the schedulers to be created when the policy is associated with a SAP or multiservice site.

Each scheduler policy must have a unique name within the context of the system. Modifications made to an existing policy are executed on all schedulers that use the policy. This can cause queues or schedulers to become orphaned (invalid parent association) and adversely affect the ability of the system to enforce SLAs.

If a *scheduler-policy-name* does not exist, it is assumed that an attempt is being made to create a new policy. The success of the command execution is dependent on the following:

1. The maximum number of scheduler policies has not been configured.
2. The provided scheduler-policy-name is valid.
3. The **create** keyword is entered with the command if the system is configured to require it (enabled in the **environment create** command).

When the maximum number of scheduler policies has been exceeded, a configuration error occurs, the command will not execute, and the CLI context will not change.

If the provided scheduler-policy-name is invalid according to the criteria below, a name syntax error occurs, the command will not execute, and the CLI context will not change.

### Parameters

#### **scheduler-policy-name**

The name of the scheduler policy.

**Values** Valid names consist of any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

## Platforms

### Syntax

**scheduler-policy** *scheduler-policy-name*

**no scheduler-policy**

### Context

**[Tree]** (config>service>cust>multi-service-site>egress scheduler-policy)

**[Tree]** (config>service>cust>multi-service-site>ingress scheduler-policy)

### Full Context

configure service customer multi-service-site egress scheduler-policy

configure service customer multi-service-site ingress scheduler-policy

### Description

This command applies an existing scheduler policy to an ingress or egress scheduler used by SAP queues or, at egress only, policers associated with this multi-service customer site. The schedulers defined in the scheduler policy can only be created once the customer site has been appropriately assigned to a chassis port, channel or slot. Scheduler policies are defined in the **config>qos>scheduler-policy scheduler-policy-name** context.

The **no** form of this command removes the configured ingress or egress scheduler policy from the multi-service customer site. When the policy is removed, the schedulers created due to the policy are removed also making them unavailable for the SAP policers and queues associated with the customer site. Policers and queues that lose their parent scheduler association are deemed to be orphaned and are no longer subject to a virtual scheduler.

The SAPs that have ingress queues reliant on the removed schedulers enter into an operational state depicting the orphaned status of one or more policers and queues. When the **no scheduler-policy** command is executed, the customer site ingress or egress node will not contain an applied scheduler policy.

### Parameters

#### **scheduler-policy-name**

Applies an existing scheduler policy that was created in the **config>qos>scheduler-policy scheduler-policy-name** context to create the hierarchy of ingress or egress virtual schedulers. The scheduler names defined within the policy are created and made available to any ingress or egress queues and egress policers managed by HQoS created on associated SAPs.

**Values** Any existing valid scheduler policy name up to 32 characters in length.

## Platforms

## scheduler-policy

### Syntax

```
scheduler-policy src-name dst-name [overwrite]
```

### Context

[\[Tree\]](#) (config>qos>copy scheduler-policy)

### Full Context

```
configure qos copy scheduler-policy
```

### Description

This command copies existing QoS policy entries for a QoS policy to another QoS policy.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

If **overwrite** is not specified, an error will occur if the destination policy exists.

### Parameters

#### ***src-name dst-name***

Indicates that the source policy and the destination policy are scheduler policy. Specify the source policy that the copy command will attempt to copy from and specify the destination policy to which the command will copy a duplicate of the policy.

#### **overwrite**

Forces the destination policy name to be copied as specified. When forced, everything in the existing destination policy will be completely overwritten with the contents of the source policy.

## Platforms

```
scheduling-class class weight weight-in-group
```

**no scheduling-class** *class*

## Context

[\[Tree\]](#) (config>port>ethernet>egress>hs-sched-ovr scheduling-class)

## Full Context

configure port ethernet egress hs-scheduler-overrides scheduling-class

## Description

This command overrides the scheduling class configuration in the HS scheduler policy applied to the port egress. The scheduling class rate or weight within the WRR group can be overridden.

The **no** form of this command removes the scheduling class override parameters from the port egress configuration.

## Parameters

### *class*

Specifies the scheduling class.

**Values** 1 to 6

### *rate*

Specifies the explicit maximum frame based bandwidth limit, in megabits per second, for this HS scheduler policy scheduling class. The **rate** keyword must be followed by either the keyword **max** or a rate specified in megabits per second.

**Values** 1 to 100000, max

The **max** keyword specifies that a limit is not enforced for the specified class. The **max** keyword is mutually exclusive to the rate value and when specified, must directly follow the **rate** keyword. Setting the rate of the class will fail when the class is currently a member of a group.

### *weight-in-group*

Specifies the weight the HS scheduler policy should apply to this scheduling class within the group in which it belongs. The *weight-in-group* parameter must follow the **weight** keyword and is used to specify the relative weight of class to the other scheduling classes within the group. Setting the weight will fail if the scheduling class is not currently configured in a group.

**Values** 1 to 127

## scheduling-class

### Syntax

**scheduling-class** *class-id* **group** *group-id* [**weight** *weight-in-group*]

**scheduling-class** *class-id* **rate** *rate*

**no scheduling-class** *class-id*

### Context

[\[Tree\]](#) (config>qos>hs-scheduler-policy scheduling-class)

### Full Context

configure qos hs-scheduler-policy scheduling-class

### Description

This command configures the behavior of a specific scheduling class on all HSQ schedulers associated with the policy. The **scheduler-class** command performs one of two operations: it configures a maximum

rate for the scheduling class or places the scheduling class into the weighted scheduling group. The two operations are mutually exclusive.

By default, none of the scheduling classes are members of the weighted scheduling group and each class is set to a rate limit of **max** (no rate limit applied).

**Specifying Scheduling Class Rate (or Removing the Scheduling Class from Group)** — If the **scheduling-class** command is executed with the **rate** keyword specified, either **max** or a specified rate value must follow. If a *class-id* was previously mapped into the weighted scheduling group, the class is removed from the group. However, if removing the class from the group causes the group to no longer have contiguous class members, the command fails with no effect on the specified class. A "non-contiguous grouping error" is returned. The lowest or highest members within a weighted group must be removed prior to removing the middle members. For example, if scheduling classes 3, 4, and 5 were members of weighted group 1, class 4 cannot be removed first.

This command using the **rate** keyword also fails when an override for the group weight is in place on the scheduling class within a scheduler associated with the policy. The override expects the class to be associated with a weighted scheduling group and the policy rate definition is attempting to remove the class from the group. An "override mismatch" error is generated, specifying the scheduling object where the override exists.

After a rate has been successfully defined for a scheduling class, the specified rate is automatically updated on all HSQ scheduler instances associated with the scheduling policy. The exception is where the scheduler instance has a local override for the rate on the scheduling class.

**Specifying Scheduling Class Weighted Group Membership** — If the **scheduling-class** command is executed with the **group** keyword specified, the group ID value of 1 must follow. The corresponding optional **weight** keyword is used to specify the weight of the scheduling class within the group. If weight is not specified, the default weight of 1 is used. If the specified scheduling class is not contiguous with the other scheduling classes in the group, the command fails with no change to the current state of the scheduling class and a "non-contiguous grouping" error is returned, specifying the weighted scheduling group and the current group members.

The **scheduling-class** command fails using the **group** keyword when a rate override for the scheduling class exists on an HSQ scheduler instance associated with the policy. The rate override for the scheduling class indicates the class is directly attached to a strict priority level, conflicting with the policy **group** keyword trying to place the class in the specified group. The command fails without affecting the scheduling class definition on the policy and returns an error specifying the scheduling object where the override exists.

**Other Override Constraints** — The scheduling overrides cannot change or remove a scheduling class from a policy-defined weighted group membership.

The **no** form of the command returns the scheduling class represented by *class-id* to the default behavior. The default behavior for a scheduling class is to not be a member of the weighted scheduling class group and have a rate set to **max**. The **no scheduling-class** command fails if the scheduling class is currently a member of the weighted scheduling class group and a weight override is in effect on a scheduling object for the class, in which case an error is returned.

## Parameters

### *class-id*

Specifies the scheduling class for HS scheduler policy. The *class-id* value is a required parameter that specifies which scheduling class the scheduling-class command is acting upon.

**Values** 1 to 6

### **group-id**

Specifies the group this HS scheduler policy scheduling class belongs to. The **group** and the **rate** keywords are mutually exclusive when executing this command. A group ID value of 1 must follow the **group** keyword. The **group** keyword removes the class ID from its inherent strict scheduling level and places it into the specified group ID. The associated **weight** parameter is optional and is used to specify the weight of a class ID within the weighted scheduling class group. Specifying the **group** parameter while an override for the scheduling class exists for rate causes the **scheduling-class** command to fail.

**Values** 1

### **weight-in-group**

Specifies the weight the HS scheduler policy should apply to this scheduling class within the group in which it belongs. This keyword is optional and must follow the **group** parameter when specified. The *weight-in-group* parameter must follow the **weight** keyword and is used to specify the relative weight of the *class-id* to the other scheduling classes within the group. If the group is specified without the **weight** parameter, a default weight of 1 is used.

**Values** 1 to 127

### **rate**

Specifies the explicit maximum frame-based bandwidth limit, in megabits per second, for this HS scheduler policy scheduling class. The **rate** and **group** keywords are mutually exclusive. Either the **rate** or **group** keyword must be specified when executing this command. When specified, the **rate** keyword must be followed by either the keyword **max** or a rate specified in megabits per second. The specified rate can be overridden at the port Ethernet egress using the scheduler override functions. A newly-created HS scheduler policy defaults each scheduling class to have its rate set to **max** and the weighted scheduling class group has no members.

**Values** 1 to 100000, max

The **max** keyword specifies that a limit is not enforced for the specified class ID and that the class ID is not a member of a weighted scheduling class group. The **max** keyword and the *rate* value are mutually exclusive; when **max** is specified, it must directly follow the **rate** keyword. Setting the rate of the class fails when the class currently has a group weight override defined on a scheduling object.

## **Platforms**

7750 SR-7/12/12e

## **23.49 schema-path**

## schema-path

### Syntax

**schema-path** *url-string*

**no schema-path**

### Context

**[Tree]** (config>system>management-interface schema-path)

### Full Context

configure system management-interface schema-path

### Description

This command specifies the schema path where the SR OS YANG modules can be placed by the user before using a <get-schema> request. Nokia recommends that the URL string not exceed 135 characters for the <get-schema> request to work correctly with all schema files.

If this command is not configured, the software upgrade process manages the YANG schema files to ensure the schema files are synchronized with the software image on both the primary and standby CPM.

The **no** form of this command reverts to the default value.

### Default

no schema-path

### Parameters

*url-string*

Specifies the schema path URL up to 180 characters. However, Nokia recommends that the string shall not exceed 135 characters to ensure that the <get-schema> request works properly with *all* schema files.

All

## 23.50 scope

## scope

### Syntax

**scope** {**exclusive** | **template**}

**no scope**

## Context

[\[Tree\]](#) (config>service>mrp>mrp-policy scope)

## Full Context

```
configure service mrp mrp-policy scope
```

## Description

This command configures the filter policy scope as exclusive or template. If the scope of the policy is template and is applied to one or more services, the scope cannot be changed.

The **no** form of this command sets the scope of the policy to the default of template.

## Default

scope template

## Parameters

### exclusive

When the scope of a policy is defined as exclusive, the policy can only be applied to a single entity (SAP or SDP). Attempting to assign the policy to a second entity will result in an error message. If the policy is removed from the entity, it will become available for assignment to another entity.

### template

When the scope of a policy is defined as template, the policy can be applied to multiple SAPs or network ports.

## Platforms

All

## scope

## Syntax

```
scope {exclusive | template}
```

```
no scope
```

## Context

[\[Tree\]](#) (config>qos>sap-ingress scope)

## Full Context

```
configure qos sap-ingress scope
```

## Description

This command configures the Service Ingress QoS policy scope as exclusive or template.

The policy's scope cannot be changed if the policy is applied to a service.

The **no** form of this command sets the scope of the policy to the default of **template**.

### Default

scope template

### Parameters

#### exclusive

When the scope of a policy is defined as exclusive, the policy can only be applied to one SAP. If a policy with an exclusive scope is assigned to a second SAP, an error message is generated. If the policy is removed from the exclusive SAP, it will become available for assignment to another exclusive SAP.

The system default policies cannot be put into the exclusive scope. An error will be generated if scope exclusive is executed in any policies with a policy-id equal to 1.

#### template

When the scope of a policy is defined as template, the policy can be applied to multiple SAPs on the router.

Default QoS policies are configured with template scopes. An error is generated when the template scope parameter to exclusive scope on default policies is modified.

### Platforms

All

## scope

configure qos sap-egress scope

### Description

Enter the scope of this policy. The scope of the policy cannot be changed if the policy is applied to one or more services.

The no form of this command sets the scope of the policy to the default of template.

### Default

scope template

## Parameters

### exclusive

When the scope of a policy is defined as exclusive, the policy can only be applied to a single SAP. Attempting to assign the policy to a second SAP will result in an error message. If the policy is removed from the exclusive SAP, it will become available for assignment to another exclusive SAP.

The system default policies cannot be put into the exclusive scope. An error will be generated if scope exclusive is executed in any policies with a policy-id equal to 1.

### template

When the scope of a policy is defined as template, the policy can be applied to multiple SAPs on the router.

## Platforms

All

## scope

## Syntax

**scope** {**exclusive** | **template**}

**no scope**

## Context

[\[Tree\]](#) (config>qos>network scope)

## Full Context

configure qos network scope

## Description

This command configures the network policy scope as exclusive or template. The policy's scope cannot be changed if the policy is applied to an interface.

The **no** form of this command sets the scope of the policy to the default of **template**.

## Default

scope template

## Parameters

### exclusive

When the scope of a policy is defined as exclusive, the policy can only be applied to one interface. If a policy with an exclusive scope is assigned to a second interface, an error message is generated. If the policy is removed from the exclusive interface, it will become available for assignment to another exclusive interface.

The system default policies cannot be put into the exclusive scope. An error will be generated if the **scope exclusive** command is executed in any policies with a policy-id equal to 1.

### template

When the scope of a policy is defined as template, the policy can be applied to multiple interfaces on the router.

Default QoS policies are configured with template scopes. An error is generated if the template scope parameter is modified to exclusive scope on default policies.

## Platforms

All

## scope

### Syntax

**scope {exclusive | template | embedded | system}**

**scope {exclusive | template}**

**no scope**

### Context

[\[Tree\]](#) (config>filter>ipv6-filter scope)

[\[Tree\]](#) (config>filter>ip-exception scope)

[\[Tree\]](#) (config>filter>ip-filter scope)

[\[Tree\]](#) (config>filter>mac-filter scope)

### Full Context

configure filter ipv6-filter scope

configure filter ip-exception scope

configure filter ip-filter scope

configure filter mac-filter scope

### Description

This command configures the filter policy scope as exclusive, template, embedded or system.

The scope of the policy cannot be changed when:

- the scope is **template** and the policy is applied to one or more services or network interfaces
- the scope is **embedded** and the policy is embedded by another policy

Changing the scope to/from system is only allowed when a policy is not active and the policy has no entries configured.

The **no** form of the command sets the scope of the policy to the default of **template**.

## Default

scope template

## Parameters

### exclusive

Specifies that the policy can only be applied to a single entity. Attempting to assign the policy to a second entity will result in an error message.

### template

Specifies that the policy can be applied to multiple entities.

### embedded

Specifies that the policy cannot be applied directly. The policy defines embedded filter rules, which are embedded by other exclusive/template/system filter policies. The **embedded** scope is supported for IPv4 and IPv6 filter policies only.

### system

Specifies that the policy defines system-wide filter rules. To apply system policy rules, activate system filter and chain exclusive/template ACL filter policy to the system filter. The **system** scope is supported for IPv4 and IPv6 filter policies only.

## Platforms

All

- configure filter mac-filter scope
- configure filter ip-filter scope
- configure filter ipv6-filter scope

VSR

- configure filter ip-exception scope

## 23.51 scp

scp

### Syntax

**scp** *local-file-url destination-file-url* [**router** *router-instance*] [**force**]

**scp** *local-file-url destination-file-url* [**force**] **service** *service-name*

### Context

[\[Tree\]](#) (file scp)

### Full Context

file scp

## Description

This command copies a local file to a remote host file system. It uses `ssh` for data transfer, and uses the same authentication and provides the same security as `ssh`. The following prompt appears:

"Are you sure (y/n)?" The destination must specify a user and a host.

## Parameters

### *local-file-url*

Specifies the local source file or directory.

#### Values

<i>[cflash-id]</i> <i>file-path</i>	up to 200 characters
<i>cflash-id</i>	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

### *destination-file-url*

Specifies the destination file.

#### Values

<i>destination-file-*</i> : <i>user@hostname:file-path</i>	- up to 255 characters
<i>user</i>	up to 32 characters
<i>hostname</i>	<i>[dns-name   ipv4-address   "[ipv6-address]"]</i>
<i>ipv4-address</i>	<i>a.b.c.d</i>
<i>ipv6-address</i>	<i>x:x:x:x:x:x[-interface]</i> <i>x:x:x:x:x.d.d.d[-interface]</i> <i>x</i> - [0 to FFFF]H <i>d</i> - [0 to 255]D <i>interface</i> - up to 32 characters, mandatory for link local addresses
<i>dns-name</i>	up to 128 characters
<i>file-path</i>	up to 200 characters, directory length up to 99 characters

### *user*

Specifies the SSH user.

### *hostname*

Specifies the remote host IP address or DNS name.

### *file-path*

Specifies the destination path.

### *router-instance*

Specifies the router name or service ID used to specify the router instance.

#### Values

<i>router-name</i>	"Base", "management", "vpls-management"
<i>vprn-service-id</i>	1 to 2147483647

<b>Default</b>	Base
----------------	------

**force**

Forces an immediate copy of the specified file. The command **file scp** *local-file-url destination-file-url* [**router** *router-instance*] **force** executes the command without displaying a user prompt message.

**service-name**

Specifies the service name used to identify the router instance. The service name can be a maximum of 64 characters long.

**Platforms**

All

## 23.52 scramble

### scramble

**Syntax**[no] **scramble****Context**[\[Tree\]](#) (config>port>tdm>ds3 **scramble**)[\[Tree\]](#) (config>port>tdm>e3 **scramble**)**Full Context**configure port tdm ds3 **scramble**configure port tdm e3 **scramble****Description**

This command enables payload scrambling on channel groups.

Scrambling randomizes the pattern of 1s and 0s carried in a SONET frame. Rearranging or scrambling the pattern prevents continuous strings of all 1s or all 0s and meets the needs of physical layer protocols that rely on sufficient transitions between 1s and 0s to maintain clocking.

The **no** form of this command disables scrambling.

**Default**no **scramble**

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## scramble

### Syntax

[no] **scramble**

### Context

[\[Tree\]](#) (config>port>sonet-sdh>path scramble)

### Full Context

configure port sonet-sdh path scramble

### Description

This command enables SONET/SDH payload scrambling. Scrambling randomizes the pattern of 1s and 0s carried in a SONET frame. Rearranging or scrambling the pattern prevents continuous strings of all 1s or all 0s and meets the needs of physical layer protocols that rely on sufficient transitions between 1s and 0s to maintain clocking.

For ATM, this command enables or disables ATM cell-level payload scrambling/descrambling using x43+1 polynomial as defined in ITU-T I.432.1. Scrambling is enabled by default for the ATM path/channel. Note that this scrambling is done in addition to SONET/SDH frame scrambling/descrambling, which is always enabled in the framer.

The **no** form of this command disables scrambling.

### Default

no scramble

configure service dynamic-services dynamic-services-policy script-policy

## Description

This command specifies the radius script policy to be used to setup the dynamic data services. The script-policy configuration cannot be changed when there are active dynamic data services referencing the policy.

The **no** form of this command removes the script-policy from the configuration. This is only allowed when there are no active dynamic data services referencing this policy.

## Parameters

### *name*

Specifies the RADIUS script policy name.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## script-policy

## Syntax

**script-policy** *policy-name* [**owner** *policy-owner*]

**no script-policy**

## Context

[\[Tree\]](#) (config>system>cron>schedule script-policy)

## Full Context

configure system cron schedule script-policy

## Description

This command is used to configure the CLI script policy.

## Parameters

### *policy-name*

Specifies the name of the policy. Can be up to 32 characters.

### *policy-owner*

Specifies the name of the policy owner. Can be up to 32 characters.

The owner is an arbitrary name and not necessarily a user name. Commands in the scripts are not authorized against the owner. The **configure system security cli-script authorization x cli-user** command determines the user context against which commands in the scripts are authorized.

**Default** "TiMOS CLI"

## Platforms

All

## script-policy

## Syntax

[**no**] **script-policy** *policy-name* [**owner** *policy-owner*]

## Context

[\[Tree\]](#) (config>system>script-control script-policy)

## Full Context

configure system script-control script-policy

## Description

This command is used to configure the CLI script policy.

## Parameters

### *policy-name*

Specifies the name of the policy, up to 32 characters.

### *policy-owner*

Specifies the name of the policy owner, up to 32 characters.

The owner is an arbitrary name and not necessarily a user name. Commands in the scripts are not authorized against the owner. The **configure system security cli-script authorization x cli-user** command determines the user context against which commands in the scripts are authorized.

**Default** "TiMOS CLI"

## Platforms

All

## script-policy

## Syntax

**script-policy** *policy-name* [**owner** *policy-owner*]

**no script-policy**

## Context

[\[Tree\]](#) (config>log>event-handling>handler>action-list>entry script-policy)

## Full Context

configure log event-handling handler action-list entry script-policy

## Description

This command configures the script policy parameters to use for this EHS handler action-list entry. The associated script is launched when the handler is triggered.

## Default

no script-policy

## Parameters

### *policy-name*

Specifies the script policy name. Can be up to 32 characters maximum.

### *owner policy-owner*

Specifies the script policy owner. Can be up to 32 characters maximum.

**Default** "TiMOS CLI"

## Platforms

## 23.65 script-runtime-error

### script-runtime-error

#### Syntax

[no] script-runtime-error

#### Context

[\[Tree\]](#) (debug>python>py-script script-runtime-error)

#### Full Context

debug python python-script script-runtime-error

#### Description

This command generates log information when detecting a script runtime error.

#### Platforms

All

### script-runtime-error

#### Syntax

[no] script-runtime-error

#### Context

[\[Tree\]](#) (debug>subscr-mgmt>sub-ident-plcy script-runtime-error)

#### Full Context

debug subscriber-mgmt sub-ident-policy script-runtime-error

## Description

This command sends the traceback of the Python script failure to the logger.  
The **no** form of this command disables debugging.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.66 script-url

### script-url

#### Syntax

**script-url** *primary-script-url*  
**no script-url**

#### Context

[\[Tree\]](#) (config>aaa>radius-scr-plcy>primary script-url)

#### Full Context

configure aaa radius-script-policy primary script-url

#### Description

This command configures the URL of the primary script.  
The **no** form of this command removes the URL from the configuration.

#### Parameters

##### *primary-script-url*

Specifies the URL of the secondary script to change RADIUS attributes of the RADIUS message.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### script-url

#### Syntax

**script-url** *secondary-script-url*  
**no script-url**

## Context

[\[Tree\]](#) (config>aaa>radius-scr-plcy>secondary script-url)

## Full Context

configure aaa radius-script-policy secondary script-url

## Description

Specifies the URL of the secondary script to change RADIUS attributes of the RADIUS message.

The **no** form of this command removes the URL from the configuration.

## Parameters

### *secondary-script-url*

Specifies the URL of the secondary script to change RADIUS attributes of the RADIUS message.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## script-url

## Syntax

**script-url** *dhcp-script-url*

**no script-url**

## Context

[\[Tree\]](#) (config>subscr-mgmt>sub-ident-pol>primary script-url)

[\[Tree\]](#) (config>subscr-mgmt>sub-ident-pol>tertiary script-url)

[\[Tree\]](#) (config>subscr-mgmt>sub-ident-pol>secondary script-url)

## Full Context

configure subscriber-mgmt sub-ident-policy primary script-url

configure subscriber-mgmt sub-ident-policy tertiary script-url

configure subscriber-mgmt sub-ident-policy secondary script-url

## Description

This command specifies the URL of the identification scripts.

The **no** form of this command reverts to the default.

## Parameters

### *dhcp-primary-script-url*

Specifies the URL of the primary identification script up to 180 characters.

***dhcp-secondary-script-url***

Specifies the URL of the secondary identification script up to 180 characters.

***dhcp-tertiary-script-url***

Specifies the URL of the tertiary identification script up to 180 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**script-url****Syntax**

**script-url** *script-url-name*

**no script-url**

**Context**

[\[Tree\]](#) (config>app-assure>group>http-notif script-url)

**Full Context**

configure application-assurance group http-notification script-url

**Description**

This command configures the URL of the script used by the http notification policy.

The **no** form of this command removes the script URL from the http-notification policy.

**Default**

no script-url

**Parameters*****script-url-name***

Specifies the string representing the URL of the script used in the http notification policy, up to 255 characters.

**create**

Keyword to create the script URL.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.67 scripts

## scripts

### Syntax

**scripts**

### Context

[\[Tree\]](#) (debug>dynsvc scripts)

### Full Context

debug dynamic-services scripts

### Description

Commands in this context configure dynamic services script debugging.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.68 scte35-action

## scte35-action

### Syntax

**scte35-action** {forward | drop}

### Context

[\[Tree\]](#) (config>service>ies>video-interface>channel scte35-action)

[\[Tree\]](#) (config>service>vprn>video-interface>channel scte35-action)

### Full Context

configure service ies video-interface channel scte35-action

configure service vprn video-interface channel scte35-action

### Description

This command specifies whether the Society of Cable Telecommunications Engineers 35 (SCTE 35) cue avails in the stream need to be forwarded or not. When specified to forward, SCTE 35 messages will be forwarded downstream. When specified to drop, SCTE 35 messages will not be forwarded downstream. They will be still be processed for local splicing decisions.

### Parameters

#### forward

Forwards SCTE 35 messages downstream.

**drop**

Drops SCTE 35 messages.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 23.69 sctp-filter

### sctp-filter

**Syntax**

**sctp-filter** *sctp-filter-name*

**no sctp-filter**

**Context**

[\[Tree\]](#) (config>app-assure>group>policy>aqp>entry>action sctp-filter)

**Full Context**

configure application-assurance group policy app-qos-policy entry action sctp-filter

**Description**

This command assigns an existing SCTP filter as an action on flows matching this AQP entry.

The **no** form of this command removes this SCTP filter from actions on flows matching this AQP entry.

**Default**

no sctp-filter

**Parameters*****sctp-filter-name***

Specifies the name of the existing SCTP filter for this application assurance profile. The *sctp-filter-name* is configured in the **config>app-assure>group[:partition]>sctp-filter** context.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### sctp-filter

**Syntax**

**sctp-filter** *sctp-filter-name*

## Context

[\[Tree\]](#) (config>app-assure>group>statistics>tca sctp-filter)

## Full Context

configure application-assurance group statistics threshold-crossing-alert sctp-filter

## Description

This command configures TCA generation for an SCTP filter.

## Parameters

### *sctp-filter-name*

Specifies the name of the SCTP filter, up to 32 characters

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## sctp-filter

## Syntax

**sctp-filter** *sctp-filter-name* [**create**]

**no sctp-filter** *sctp-filter-name*

## Context

[\[Tree\]](#) (config>app-assure>group sctp-filter)

## Full Context

configure application-assurance group sctp-filter

## Description

Commands in this context configure Stream Control Transmission Protocol (SCTP) parameters.

The **no** form of this command removes this filter.

## Parameters

### *sctp-filter-name*

Specifies the SCTP filter name, up to 32 characters.

### **create**

Keyword used to create the SCTP filter.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.70 sctp-filter-stats

### sctp-filter-stats

#### Syntax

[no] sctp-filter-stats

#### Context

[\[Tree\]](#) (config>app-assure>group>statistics>aa-admit-deny sctp-filter-stats)

#### Full Context

configure application-assurance group statistics aa-admit-deny sctp-filter-stats

#### Description

This command configures whether to include or exclude SCTP filter admit-deny statistics in accounting records.

#### Default

no sctp-filter-stats

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.71 sd

### sd

#### Syntax

sd

#### Context

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if sd)

#### Full Context

configure mcast-management multicast-info-policy video-policy video-interface sd

#### Description

Commands in this context configure within a video interface policy the properties relating to requests received by the video interface for Standard Definition (SD) channel requests.

## Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 23.72 sd-offset

### sd-offset

#### Syntax

**sd-offset** *offset-value*

**no sd-offset**

#### Context

[\[Tree\]](#) (config>service>vprn>isis>if>level sd-offset)

#### Full Context

configure service vprn isis interface level sd-offset

#### Description

If the pre-FEC error rate of the associated DWDM port crosses the configured **sd-threshold**, this offset-value is added to the IS-IS interface metric. This parameter is only effective if the interface is associated with a DWDM port and the **sd-threshold** value is configured under that port.

The **no** form of this command reverts the offset value to 0.

#### Default

**no sd-offset**

#### Parameters

***offset-value***

Specifies the amount the interface metric is increased by if the **sd-threshold** is crossed.

**Values** 0 to 16777215

#### Platforms

All

### sd-offset

#### Syntax

**sd-offset** *sd-offset*

**no sd-offset**

## Context

[\[Tree\]](#) (config>router>isis>if>level sd-offset)

## Full Context

configure router isis interface level sd-offset

## Description

If the pre-FEC error rate of the associated DWDM port crosses the configured **sd-threshold**, this offset-value is added to the IS-IS interface metric. This parameter is only effective if the interface is associated with a DWDM port and the **sd-threshold** value is configured under that port.

The **no** form of this command reverts the offset value to 0.

## Default

no sd-offset

## Parameters

### *sd-offset*

Specifies the amount the interface metric is increased by if the **sd-threshold** is crossed.

**Values** 0 to 16777215

## Platforms

All

## 23.73 sd-threshold

### sd-threshold

## Syntax

**sd-threshold** *threshold* [**coefficient** *coefficient*]

## Context

[\[Tree\]](#) (config>port>otu sd-threshold)

## Full Context

configure port otu sd-threshold

## Description

This command defines the error rate at which to declare the signal degrade (SD) condition.

The parameters define an error rate of  $(\text{coefficient}/10) * 10\text{E-}\text{threshold}$ . For example, **sd-threshold 5 coefficient 20** defines an error rate of  $(20/10) * 10\text{E-}5$ , or  $2 * 10\text{E-}5$ , or 0.000 02.

The SD threshold must be:

- greater than the SF threshold.
- 5 or higher before setting **sf-sd-method** to **bip8**.

The **coefficient** parameter is only used when **sf-sd-method** is set to **fec**. When **sf-sd-method** is set to **bip8**, **coefficient** is considered to have the value of 10.

## Parameters

### *threshold*

Specifies the exponent for the SD threshold value.

**Values** 5 to 9 when **sf-sd-method** is **bip8**  
3 to 9 when **sf-sd-method** is **fec**

**Default** 7

### *coefficient*

Specifies the coefficient for the SD threshold value.

**Values** 10 to 99

**Default** 10

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## sd-threshold

## Syntax

**sd-threshold** *errored-frames*

**no sd-threshold**

## Context

[\[Tree\]](#) (config>port>ethernet>efm-oam>link-mon>errored-frame sd-threshold)

## Full Context

configure port ethernet efm-oam link-monitoring errored-frame sd-threshold

## Description

The option defines the number of errored frames within the configured window which indicates the port has gone beyond an acceptable error rate and should be considered degraded. This is a first level warning that a port may be suspect. This generates an information log event message only and will be recorded in the Port event index but has no port level actions when the error count is equal to or greater than the threshold. This value must be lower than or equal to the sf-threshold value.

The **no** value of this option disables the sd-threshold.

**Default**

no sd-threshold

**Parameters*****errored-frames***

Specifies the number of errored frames within the configured window which indicates the port has become degraded.

**Values** 1 to 1000000

**Platforms**

All

**sd-threshold****Syntax**

**sd-threshold** *errored-frames*

**Context**

[\[Tree\]](#) (config>port>ethernet>efm-oam>link-mon>errored-frame-period sd-threshold)

**Full Context**

configure port ethernet efm-oam link-monitoring errored-frame-period sd-threshold

**Description**

The option defines the number of errored frames within the configured window which indicates the port has gone beyond an acceptable error rate and should be considered degraded. This is a first level warning that a port may be suspect. This generates an information log event message only and will be recorded in the Port event index but has no port level actions when the error count is equal to or greater than the threshold. This value must be lower than or equal to the sf-threshold value.

The **no** value of this option disables the sd-threshold

**Default**

no sd-threshold

**Parameters*****errored-frames***

Specifies the number of errored frames within the configured window which indicates the port has become degraded.

**Values** 1 to 1000000

**Platforms**

All

## sd-threshold

### Syntax

**sd-threshold** *errored-frames*

**no sd-threshold**

### Context

[\[Tree\]](#) (config>port>ethernet>efm-oam>link-mon>errored-frame-seconds sd-threshold)

### Full Context

configure port ethernet efm-oam link-monitoring errored-frame-seconds sd-threshold

### Description

This command defines the number of errored frame seconds within the configured window which indicates the port has gone beyond an acceptable error rate and should be considered degraded. This is a first level warning that a port may be suspect. This event is raised when the error count is equal to or greater than the configured threshold. This is an information log event message only and will be recorded in the Port event index but has no port level actions. This value must be lower than or equal to the sf-threshold value.

The **no** version of this command disables the sd-threshold.

### Parameters

#### ***errored-frames***

Specifies the number of errored seconds within the configured window which indicates the port has become degraded.

**Values** 1 to 900

### Platforms

All

## sd-threshold

### Syntax

**sd-threshold** *errored-symbols*

**no sd-threshold**

### Context

[\[Tree\]](#) (config>port>ethernet>efm-oam>link-mon>errored-symbols sd-threshold)

### Full Context

configure port ethernet efm-oam link-monitoring errored-symbols sd-threshold

## Description

This command defines the number of errored frames within the configured window which indicates the port has gone beyond an acceptable error rate and should be considered degraded. This is a first level warning that a port may be suspect. An event is raised when the error count is equal to or greater than this value. This is an information log event message only and will be recorded in the Port event index but has no port level actions. This value must be lower than or equal to the sf-threshold value. Specific to symbol errors, this value must be configured with the value that indicates anything less is acceptable and the port can be returned to service. If this value is not configured then manual operation is required to return the port to service.

The **no** value of this option means there is there is no automatic return to service.

## Default

no sd-threshold

## Parameters

### *errored-symbols*

Specifies the number of errored symbols which indicates the port has become degraded.

**Values** 1 to1000000

## Platforms

All

## sd-threshold

## Syntax

**sd-threshold** *threshold* [**multiplier** *multiplier*]

**no sd-threshold**

## Context

[\[Tree\]](#) (config>port>ethernet>sym-mon sd-threshold)

## Full Context

configure port ethernet symbol-monitor sd-threshold

## Description

This command specifies the error rate at which to declare the Signal Degrade condition on an Ethernet interface. The value represents  $M \cdot 10E-N$  a ratio of symbol errors over total symbols received over  $W$  seconds of the sliding window. The symbol errors on the interface are sampled once per second. A default of 10 seconds is used when there is no additional window-size configured. The multiplier keyword is optional. If the multiplier keyword is omitted or no sd-threshold is specified the multiplier will return to the default value of 1.

**Default**

no sd-threshold

**Parameters*****threshold***

Specifies the rate of symbol errors.

**Values** 1 to 9

***multiplier***

Specifies the multiplier used to scale the symbol error ratio.

**Values** 1 to 9

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**sd-threshold****Syntax**

**sd-threshold** *threshold* [**multiplier** *multiplier*]

**no sd-threshold**

**Context**

[\[Tree\]](#) (config>port>ethernet>crc-monitor sd-threshold)

**Full Context**

configure port ethernet crc-monitor sd-threshold

**Description**

This command specifies the error rate at which to declare the Signal Degrade condition on an Ethernet interface. The value represents  $M \cdot 10E-N$  a ratio of errored frames over total frames received over  $W$  seconds of the sliding window. The CRC errors on the interface are sampled once per second. A default of 10 seconds is used when there is no additional window-size configured. The multiplier keyword is optional. If the multiplier keyword is omitted or **no sd-threshold** is specified the multiplier will return to the default value of 1.

**Default**

no sd-threshold

**Parameters*****threshold***

Specifies the threshold value.

**Values** 1 to 9

***multiplier***

Specifies the multiplier value.

**Values** 1 to 9

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**23.74 sd-threshold-clear****sd-threshold-clear****Syntax**

**sd-threshold-clear** *threshold* [**coefficient** *coefficient*]

**Context**

[\[Tree\]](#) (config>port>otu sd-threshold-clear)

**Full Context**

configure port otu sd-threshold-clear

**Description**

This command defines the signal degrade (SD) threshold clear value.

When the bit error rate falls below this value, the SD condition is cleared. The parameters define an error rate of  $(\text{coefficient}/10) * 10\text{E-}\text{threshold}$ . For example, **sd-threshold-clear 7 coefficient 10** defines an error rate of  $(10/10) * 10\text{E-}7$ , or  $10\text{E-}7$ , or 0.000 000 1.

This SD threshold clear setting is valid only when **sf-sd-method** is set to **fec**.

**Parameters*****threshold***

Specifies the exponent for the SD threshold clear value.

**Values** 3 to 10

**Default** 8

***coefficient***

Specifies the coefficient for the SD threshold clear value.

**Values** 10 to 99

**Default** 10

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.75 sdp

sdp

### Syntax

**sdp** *sdp-id* [**sync-tag** *sync-tag*] [**create**]

**no sdp** *sdp-id*

### Context

[\[Tree\]](#) (config>redundancy>multi-chassis>peer>sync sdp)

### Full Context

configure redundancy multi-chassis peer sync sdp

### Description

This command specifies the manually configured spoke SDPs to be synchronized with the multi-chassis peer and a synchronization tag to be used while synchronizing these spoke SDPs with the multi-chassis peer.

Manually configured spoke SDPs with the specified *sdp-id* are synchronized according to the synchronization tag. If synchronization is required only for a subset of the spoke SDPs using the configured SDP, the **range** sub-command should be used. The **range** command and the **sync-tag** parameters are mutually exclusive.

The synchronization of PIM snooping is only supported for manually configured spoke SDPs but is not supported for spoke SDPs configured within an endpoint.

The synchronization of PIM snooping is not supported on any of the following when used with the configured *sdp-id*:

- Mesh SDPs
- Spoke SDPs in non-VPLS services
- BGP-AD/BGP-VPLS (FEC 129) spoke SDPs
- Spoke SDPs configured in endpoints
- Pseudowire SAPs
- ESM-over-MPLS Pseudowires

Non-existent spoke SDPs may be specified. If these spoke SDPs are created at a later time, then all states on the spoke SDPs are synchronized according to the synchronization tag and the synchronization protocols enabled.

A synchronization tag can be changed by entering the same command with a different synchronization tag. Changing the synchronization tag removes all states relating to the previous synchronization tag for the SDP and a new synchronization tag state is created.

## Parameters

### *sdp-id*

Specifies the SDP of the spoke SDPs to be synchronized with the multi-chassis peer.

**Values** 1 to 32767

### *sync-tag*

Specifies a synchronization tag, up to 32 characters, to be used when synchronizing with the multi-chassis peer.

### **create**

Creates the SDP instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## Platforms

All

sdp

## Syntax

**sdp** *sdp-id*

**no sdp**

## Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg sdp)

## Full Context

configure service system bgp-evpn ethernet-segment sdp

## Description

This command configures an *sdp-id* associated to the Ethernet-Segment. If the Ethernet-Segment is configured as **all-active**, then only a lag or PW port can be associated to the Ethernet-Segment. If the Ethernet-Segment is configured as **single-active**, then lag, port or sdp can be associated to the Ethernet-Segment. In any case, only one of the four objects can be configured in the Ethernet-Segment. A specified SDP can be part of only one Ethernet-Segment. Only user-configured SDPs can be added to an Ethernet-Segment.

## Default

no sdp

## Parameters

### *sdp-id*

Specifies the IP address.

**Values** 1 to 17407

## Platforms

All

sdp

## Syntax

[no] sdp *sdp-id:vc-id*

## Context

[\[Tree\]](#) (config>service>vpls>pbb>backbone-vpls sdp)

## Full Context

configure service vpls pbb backbone-vpls sdp

## Description

This command configures attributes of a SDP binding on the B-VPLS service.

## Parameters

*sdp-id*

Specifies the SDP ID.

**Values** 1 to 17407

*vc-id*

Specifies the VC ID.

**Values** 1 to 4294967295

## Platforms

All

sdp

## Syntax

[no] sdp *sdp-id:vc-id*

## Context

[\[Tree\]](#) (debug>service>id>mrp sdp)

## Full Context

```
debug service id mrp sdp
```

## Description

This command filters debug events and only shows events for the particular SDP.

The **no** form of this command removes the debug filter.

## Parameters

### *sdp-id*

Specifies the SDP ID for which to display information

**Default** All SDPs

**Values** 1 to 17407

### *vc-id*

Displays information about the virtual circuit identifier.

**Values** 1 to 4294967295

## Platforms

All

```
sdp
```

## Syntax

```
[no] sdp sdp-id:vc-id
```

## Context

[\[Tree\]](#) (debug>service>id sdp)

[\[Tree\]](#) (debug>service>id>dhcp sdp)

## Full Context

```
debug service id stp sdp
```

```
debug service id sdp
```

```
debug service id dhcp sdp
```

## Description

This command enables STP debugging for a specific SDP.

The **no** form of the command disables debugging.

## Parameters

### *sdp-id:vc-id*

Specifies the SDP ID and VC ID.

**Values** sdp-id: 1 to 17407  
vc-id: 1 to 4294967295

## Platforms

All

## sdp

## Syntax

[no] sdp *sdp-id:vc-id*

## Context

[\[Tree\]](#) (debug>service>id>igmp-snooping sdp)

## Full Context

debug service id igmp-snooping sdp

## Description

This command shows IGMP packets for a specific SDP.

The **no** form of this command disables the debugging for the SDP.

## Parameters

### *sdp-id*

Displays only IGMP snooping entries associated with the specified mesh SDP or spoke-SDP. For a spoke-SDP, the VC ID must be specified, for a mesh SDP, the VC ID is optional.

**Values** 1 to 17407

### *vc-id*

Displays information for the specified virtual circuit ID on the SDP ID

**Values** 1 to 4294967295

## Platforms

All

## sdp

### Syntax

[no] sdp sdp-id:vc-id

### Full Context

debug service id mld-snooping sdp

### Description

This command shows MLD packets for a specific SDP.

The **no** form of this command disables the debugging for the SDP.

### Parameters

#### *sdp-id*

Displays only MLD entries associated with the specified mesh SDP or spoke-SDP

**Values** 1 to 17407

#### *vc-id*

Displays information for the specified virtual circuit ID on the SDP ID

**Values** 1 to 4294967295

## sdp

### Syntax

sdp sdp-id [delivery-type] [create]

no sdp sdp-id

### Context

[\[Tree\]](#) (config>service sdp)

### Full Context

configure service sdp

### Description

This command creates or edits a Service Distribution Point (SDP). SDPs must be explicitly configured.

An SDP is a logical mechanism that ties a far-end router to a particular service without having to specifically define far-end SAPs. Each SDP represents a method to reach another router.

One method is IP Generic Router Encapsulation (GRE), which has no state in the core of the network. GRE does not specify a specific path to the far-end router. A GRE-based SDP uses the underlying IGP routing table to find the best next hop to the far-end router.

The second method is Multi-Protocol Label Switching (MPLS) encapsulation. A router supports both signaled and non-signaled Label Switched Paths (LSPs) through the network. Non-signaled paths are defined at each hop through the network. Signaled paths are communicated by protocol from end-to-end using Resource Reservation Protocol (RSVP). Paths may be manually defined or a constraint-based routing protocol (such as OSPF-TE or CSPF) can be used to determine the best path with specific constraints. An LDP LSP can also be used for an SDP when the encapsulation is MPLS. The use of an LDP LSP type or an RSVP/Static LSP type are mutually exclusive except when the mixed-lsp option is enabled on the SDP.

Segment routing is another MPLS tunnel type and is used to allow service binding to an SR tunnel programmed in TTM by OSPF or IS-IS. The SDP of type **sr-isis** or **sr-ospf** can be used with the **far-end** option. The **tunnel-far-end** option is not supported. In addition, the **mixed-lsp-mode** option does not support the **sr-isis** and **sr-ospf** tunnel types.

L2TPv3-over-IPv6 transport is also an option for 7750 SR and 7950 XR Ethernet Pipe (Epipe) Services. Like GRE, L2TPv3 is stateless in the core of the network, as well as on the service nodes as the L2TPv3 control plane functionality is disabled for this SDP type. A unique source and destination IPv6 address combined with TX and RX Cookie values are used to ensure that the SDP is bound to the correct service.

SDPs are created and then bound to services. Many services may be bound to a single SDP. The operational and administrative state of the SDP controls the state of the SDP binding to the service.

If the *sdp-id* does not exist, a new SDP is created. When creating an SDP, either the **gre**, **mpls**, or **l2tpv3** keyword must be specified. SDPs are created in the admin down state (**shutdown**) and the **no shutdown** command must be executed once all relevant parameters are defined and before the SDP can be used.

If *sdp-id* exists, the current CLI context is changed to that SDP for editing and modification. For editing an existing SDP, neither the **gre**, **mpls**, or **l2tpv3** keyword is specified. If a keyword is specified for an existing *sdp-id*, an error is generated and the context of the CLI will not be changed to the specified *sdp-id*.

The **no** form of this command deletes the specified SDP. Before an SDP can be deleted, it must be administratively down (shutdown) and not bound to any services. If the specified SDP is bound to a service, the **no sdp** command will fail generating an error message specifying the first bound service found during the deletion process. If the specified *sdp-id* does not exist an error will be generated.

## Parameters

### *sdp-id*

Specifies the SDP identifier.

**Values** 1 to 32767

### **gre**

Specifies the SDP will use GRE to reach the far-end router. The GRE encapsulation of the MPLS service packet uses the base 4-byte header as per RFC 2890. The optional fields Checksum (plus Reserved field), Key, and Sequence Number are not inserted. Only one GRE SDP can be created to a given destination address. Multiple GRE SDPs to a single destination address serve no purpose as the path taken to reach the far end is

determined by the IGP which will be the same for all SDPs to a given destination and there is no bandwidth reservation in GRE tunnels.

#### **mpls**

Specifies the SDP will use MPLS encapsulation and one or more LSP tunnels to reach the far-end device. Multiple MPLS SDPs may be created to a given destination device. Multiple MPLS SDPs to a single destination device are helpful when they use divergent paths.

#### **l2tpv3**

Specifies the SDP will use L2TPv3-over-IPv6 encapsulation for the 7750 SR or 7950 XRS. One SDP is created per service, regardless of whether the far-end node is common or not. Unique local and far-end addresses are configured for every L2TPv3 SDP type. The local address must exist on the local node.

#### **eth-gre-bridged**

Configures the SDP as an L2oGRE tunnel that is terminated on an FPE-based PW port. Only the end-points of such a tunnel (the far-end IPv4/IPv6 address or local-end IPv4/IPv6 address) are allowed to be configured under this SDP.

### **Platforms**

All

## **23.76 sdp-exclude**

### **sdp-exclude**

#### **Syntax**

**[no] sdp-exclude** *group-name*

#### **Context**

**[Tree]** (config>service>pw-template sdp-exclude)

#### **Full Context**

configure service pw-template sdp-exclude

#### **Description**

This command configures SDP admin group constraints for a pseudowire template.

The admin group name must have been configured or the command is failed. The user can execute the command multiple times to include or exclude more than one admin group. The **sdp-include** and **sdp-exclude** commands can only be used with the **use-provisioned-sdp** or **prefer-provisioned-sdp** options. If the same group name is included and excluded within the same pseudowire template, only the exclude option will be enforced.

Any changes made to the admin group **sdp-include** and **sdp-exclude** constraints will only be reflected in existing spoke-sdps after the following command has been executed:

**tools>perform>service>eval-pw-template>allow-service-impact**

When the service is bound to the pseudowire template, the SDP selection rules will enforce the admin group constraints specified in the `sdp-include` and `sdp-exclude` commands.

In the SDP selection process, all provisioned SDPs with the correct far-end IP address, the correct tunnel-far-end IP address, and the correct service label signaling are considered. The SDP with the lowest admin metric is selected. If more than one SDP with the same lowest metric are found then the SDP with the highest `sdp-id` is selected. The type of SDP, GRE or MPLS (BGP/RSVP/LDP) is not a criterion in this selection.

The selection rule with SDP admin groups is modified such that the following admin-group constraints are applied upfront to prune SDPs that do not comply:

- if one or more **sdp-include** statement is part of the PW template, then an SDP that is a member of one or more of the included groups will be considered. With the **sdp-include** statement, there is no preference for an SDP that belongs to all included groups versus one that belongs to one or fewer of the included groups. All SDPs satisfying the admin-group constraint will be considered and the selection above based on the lowest metric and highest `sdp-id` is applied.
- if one or more **sdp-exclude** statement is part of the PW template, then an sdp that is a member of any of the excluded groups will not be considered.

SDP admin group constraints can be configured on all router services that makes use of the pseudowire template (BGP-AD VPLS service, BGP-VPLS service, and FEC129 VLL service). In the latter case, only support at a T-PE node is provided.

The **no** form of this command removes the SDP admin group constraints from the pseudowire template.

## Parameters

### *group-name*

Specifies the name of the SDP admin group. A maximum of 32 characters can be entered.

## Platforms

All

## 23.77 sdp-group

sdp-group

## Syntax

sdp-group

## Context

[\[Tree\]](#) (config>service sdp-group)

## Full Context

configure service sdp-group

## Description

This command configures the SDP membership in admin groups.

The user can enter a maximum of one (1) admin group name at once. The user can execute the command multiple times to add membership to more than one admin group. The admin group name must have been configured or the command is failed. Admin groups are supported on an SDP of type GRE and of type MPLS (BGP/RSVP/LDP). They are also supported on an SDP with the mixed-lsp-mode option enabled.

The **no** form of this command removes this SDP membership to the specified admin group.

## Platforms

All

## 23.78 sdp-id-range

### sdp-id-range

## Syntax

**sdp-id-range** from *id* to *id*

**no sdp-id-range**

## Context

[\[Tree\]](#) (config>fwd-path-ext sdp-id-range)

## Full Context

configure fwd-path-ext sdp-id-range

## Description

This command reserves an SDP ID range used by the FPE based PW-Port and VXLAN termination applications.

Each configured FPE based PW-Port is associated with two internal SDPs (one in each direction) whose id(s) are allocated from the configured sdp-id-range.

When the FPE is associated to VXLAN termination, an internal SDP is allocated from the configured sdp-id-range and is used for R-VPLS services that terminate VXLAN IPv6. A spoke-sdp per VXLAN IPv6 R-VPLS service is created on that SDP for egress processing of the packets. Sdp-id-range cannot be modified if any of its IDs are currently in use.

## Default

no sdp-id-range

## Parameters

**from *id***

Specifies the start of the SDP ID range (inclusive).

**Values** 1 to 32767

**to id**

Specifies the end of the SDP ID range.

**Values** 1 to 32767

## Platforms

All

## 23.79 sdp-include

### sdp-include

#### Syntax

[no] **sdp-include** *group-name*

#### Context

[\[Tree\]](#) (config>service>pw-template sdp-include)

#### Full Context

configure service pw-template sdp-include

#### Description

This command configures SDP admin group constraints for a pseudowire template.

The admin group name must have been configured or the command is failed. The user can execute the command multiple times to include or exclude more than one admin group. The **sdp-include** and **sdp-exclude** commands can only be used with the **use-provisioned-sdp** or **prefer-provisioned-sdp** options. If the same group name is included and excluded within the same pseudowire template, only the exclude option will be enforced.

Any changes made to the admin group **sdp-include** and **sdp-exclude** constraints will only be reflected in existing spoke-sdps after the following command has been executed:

**tools>perform>service>eval-pw-template>allow-service-impact**

When the service is bound to the pseudowire template, the SDP selection rules will enforce the admin group constraints specified in the **sdp-include** and **sdp-exclude** commands.

In the SDP selection process, all provisioned SDPs with the correct far-end IP address, the correct tunnel-far-end IP address, and the correct service label signaling are considered. The SDP with the lowest admin metric is selected. If more than one SDP with the same lowest metric are found then the SDP with the highest **sdp-id** is selected. The type of SDP, GRE or MPLS (BGP/RSVP/LDP) is not a criterion in this selection.

The selection rule with SDP admin groups is modified such that the following admin-group constraints are applied upfront to prune SDPs that do not comply:

- if one or more **sdp-include** statement is part of the PW template, then an SDP that is a member of one or more of the included groups will be considered. With the **sdp-include** statement, there is no preference for an SDP that belongs to all included groups versus one that belongs to one or fewer of the included groups. All SDPs satisfying the admin-group constraint will be considered and the selection above based on the lowest metric and highest sdp-id is applied.
- if one or more **sdp-exclude** statement is part of the PW template, then an sdp that is a member of any of the excluded groups will not be considered.

SDP admin group constraints can be configured on all router services that make use of the pseudowire template (BGP-AD VPLS service, BGP-VPLS service, and FEC129 VLL service). In the latter case, only support at a T-PE node is provided.

The **no** form of this command removes the SDP admin group constraints from the pseudowire template.

### Parameters

#### *group-name*

Specifies the name of the SDP admin group. A maximum of 32 characters can be entered.

### Platforms

All

## 23.80 sdp-mtu

### sdp-mtu

### Syntax

```
sdp-mtu orig-sdp-id size-inc start-octets end-octets [step step-size] [timeout timeout] [interval interval]
```

### Context

[\[Tree\]](#) (oam sdp-mtu)

### Full Context

```
oam sdp-mtu
```

### Description

Performs MTU Path tests on an SDP to determine the largest path-mtu supported on an SDP. The **size-inc** parameter can be used to easily determine the **path-mtu** of a given SDP-ID. The forwarding class is assumed to be Best-Effort Out-of-Profile. The message reply is returned with IP/GRE encapsulation from the far-end router. OAM request messages sent within an IP/GRE SDP must have the 'DF' IP header bit set to 1 to prevent message fragmentation.

To terminate an **sdp-mtu** in progress, use the CLI break sequence <Ctrl-C>.

### Parameters

#### *orig-sdp-id*

Specifies the *sdp-id* to be used by **sdp-ping**, expressed as a decimal integer. The far-end address of the specified **sdp-id** is the expected *responder-id* within each reply received. The specified *sdp-id* defines the encapsulation of the SDP tunnel encapsulation used to reach the far end. This can be IP/GRE or MPLS. If *orig-sdp-id* is invalid or administratively down or unavailable, the SDP echo request message is not sent and an appropriate error message is displayed (once the **interval** timer expires, **sdp-ping** attempts to send the next request, if required).

**Values** 1 to 32767

#### **start-octets**

Specifies the beginning size in octets of the first message sent for an incremental MTU test, expressed as a decimal integer.

**Values** 40 to 9786

#### **end-octets**

Specifies the ending size in octets of the last message sent for an incremental MTU test, expressed as a decimal integer. The specified value must be greater than *start-octets*.

**Values** 40 to 9786

#### **step-size**

Specifies the number of octets to increment the message size request for each message sent for an incremental MTU test, expressed as a decimal integer. The next size message is not sent until a reply is received or three messages have timed out at the current size.

If the incremented size exceeds the *end-octets* value, no more messages are sent.

**Values** 1 to 512

**Default** 32

#### **timeout**

Specifies the *timeout* parameter in seconds, expressed as a decimal integer. This value is used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response is not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

**Values** 1 to 10

**Default** 5

#### **interval**

Specifies the *interval* parameter in seconds, expressed as a decimal integer. This parameter is used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the *interval* is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

**Values** 1 to 10

**Default** 1

## 23.81 sdp-ping

### sdp-ping

#### Syntax

```
sdp-ping orig-sdp-id [resp-sdp resp-sdp-id] [fc fc-name [profile { in | out }]] [size octets] [count send-count] [timeout timeout] [interval interval]
```

#### Context

[\[Tree\]](#) (oam sdp-ping)

[\[Tree\]](#) (config>saa>test>type sdp-ping)

#### Full Context

oam sdp-ping

configure saa test type sdp-ping

## Description

This command tests SDPs for uni-directional or round trip connectivity and performs SDP MTU Path tests.

The **sdp-ping** command accepts an originating SDP-ID and an optional responding SDP-ID. The size, number of requests sent, message time-out and message send interval can be specified. All **sdp-ping** requests and replies are sent with PLP OAM-Label encapsulation, as a *service-id* is not specified.

For round trip connectivity testing, the **resp-sdp** keyword must be specified. If **resp-sdp** is not specified, a uni-directional SDP test is performed.

To terminate an **sdp-ping** in progress, use the CLI break sequence <Ctrl-C>.

An **sdp-ping** response message indicates the result of the **sdp-ping** message request. When multiple response messages apply to a single SDP echo request/reply sequence, the response message with the highest precedence is displayed. [Table 114: sdp-ping Response Messages](#) shows the response messages sorted by precedence.

Table 114: sdp-ping Response Messages

Result of Request	Displayed Response Message	Precedence
Request time out without reply	Request Timeout	1
Request not sent due to non-existent <i>orig-sdp-id</i>	Orig-SDP Non-Existent	2
Request not sent due to administratively down <i>orig-sdp-id</i>	Orig-SDP Admin-Down	3
Request not sent due to operationally down <i>orig-sdp-id</i>	Orig-SDP Oper-Down	4
Request terminated by user before reply or time out	Request Terminated	5
Reply received, invalid <i>origination-id</i>	Far End: Originator-ID Invalid	6
Reply received, invalid <i>responder-id</i>	Far End: Responder-ID Error	7
Reply received, non-existent <i>resp-sdp-id</i>	Far End: Resp-SDP Non-Existent	8
Reply received, invalid <i>resp-sdp-id</i>	Far End: Resp-SDP Invalid	9
Reply received, <i>resp-sdp-id</i> down (admin or oper)	Far-end: Resp-SDP Down	10
Reply received, No Error	Success	11

## Parameters

### *orig-sdp-id*

Specifies the SDP ID to be used by **sdp-ping**, expressed as a decimal integer. The far-end address of the specified SDP-ID is the expected *responder-id* within each reply received. The specified SDP-ID defines the encapsulation of the SDP tunnel encapsulation used to

reach the far end. This can be IP/GRE or MPLS. If *orig-sdp-id* is invalid or administratively down or unavailable for some reason, the SDP Echo Request message is not sent and an appropriate error message is displayed (once the **interval** timer expires, **sdp-ping** attempts to send the next request if required).

**Values** 1 to 32767

### ***resp-sdp-id***

Specifies the return SDP-ID to be used by the far-end router for the message reply for round trip SDP connectivity testing. If *resp-sdp-id* does not exist on the far-end router, terminates on another router different than the originating router, or another issue prevents the far-end router from using *resp-sdp-id*, the SDP echo reply is sent using generic IP/GRE OAM encapsulation. The received forwarding class (as mapped on the ingress network interface for the far end) defines the forwarding class encapsulation for the reply message.

**Values** 1 to 32767

**Default** null. Use the non-SDP return path for message reply.

### ***fc-name***

Specifies the parameter to be used to indicate the forwarding class of the SDP encapsulation. The actual forwarding class encoding is controlled by the network egress DSCP or LSP-EXP mappings.

The DSCP or LSP-EXP mappings on the receive network interface controls the mapping back to the internal forwarding class used by the far-end router that receives the message request. The egress mappings of the egress network interface on the far-end router controls the forwarding class markings on the return reply message.

The DSCP or LSP-EXP mappings on the receive network interface controls the mapping of the message reply at the originating router. This is displayed in the response message output upon receipt of the message reply.

**Values** be, l2, af, l1, h2, ef, h1, nc

**Default** be

### **profile {in | out}**

Specifies the profile state of the SDP encapsulation.

**Default** out

### ***octets***

Specifies the **size** parameter in octets. This parameter is used to override the default message size for the **sdp-ping** request. Changing the message size is a method of checking the ability of an SDP to support a **path-mtu**. The size of the message does not include the SDP encapsulation, VC-Label (if applied) or any DLC headers or trailers.

When the OAM message request is encapsulated in an IP/GRE SDP, the IP 'DF' (Do Not Fragment) bit is set. If any segment of the path between the sender and receiver cannot handle the message size, the message is discarded. MPLS LSPs are not expected to fragment the message either, as the message contained in the LSP is not an IP packet.

**Values** 72 to 9786

**Default** 72

### **send-count**

Specifies the number of messages to send. The **count** parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message **interval** value must have expired before the next message request is sent.

**Values** 1 to 100

**Default** 1

### **timeout**

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the last probe for a specific test. Upon the expiration of time out, the test is marked complete and no more packets is processed for any of those request probes.

**Values** 1 to 10

**Default** 5

### **interval**

Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

**Values** 1 to 10

**Default** 1

All

## **Output**

### **Single Response Round Trip Connectivity Test Output Example**

```
A:router1> sdp-ping 10 resp-sdp 22 fc ef
Request Result: Sent - Reply Received
RTT:30ms

Err SDP-ID Info Local Remote
___ SDP-ID: 10 22
___ Administrative State: Up Up
___ Operative State: Up Up
___ Path MTU 4470 4470
___ Response SDP Used: Yes

Err System IP Interface Info
Local Interface Name: "ESR-System-IP-Interface (Up to 32 chars)..."
___ Local IP Interface State: Up
___ Local IP Address: 10.10.10.11
___ IP Address Expected By Remote: 10.10.10.11
```

```

___ Expected Remote IP Address: 10.10.10.10
___ Actual Remote IP Address: 10.10.10.10

Err FC Mapping Info Local Remote
___ Forwarding Class Assured Assured
___ Profile In In

```

**Multiple Response Connectivity Tests** — When the connectivity test count is greater than one (1), a single line is displayed per SDP echo request send attempt.

The request number is a sequential number starting with 1 and ending with the last request sent, incrementing by one (1) for each request. This should not be confused with the *message-id* contained in each request and reply message.

A response message indicates the result of the message request. Following the response message is the round trip time value. If any reply is received, the round trip time is displayed.

After the last reply has been received or response timed out, a total is displayed for all messages sent and all replies received. A maximum, minimum and average round trip time is also displayed. Error response and timed out requests do not apply towards the average round trip time.

#### Multiple Response Round Trip Connectivity Test Output Example

```

## 23.82 seamless-bfd

### seamless-bfd

#### Syntax

```
seamless-bfd
```

#### Context

[\[Tree\]](#) (config>bfd seamless-bfd)

#### Full Context

```
configure bfd seamless-bfd
```

#### Description

This command specifies the context for the configuration of a seamless BFD reflector.

## Platforms

All

## seamless-bfd

## Syntax

**seamless-bfd**

## Context

[\[Tree\]](#) (config>router>bfd seamless-bfd)

## Full Context

configure router bfd seamless-bfd

## Description

This command specifies the context for the configuration of seamless BFD initiator parameters that are global to this router.

The **no** form of this command removes the context.

## Platforms

All

## 23.83 search

## search

## Syntax

**search** *base-dn*

**no search**

## Context

[\[Tree\]](#) (config>system>security>ldap>server search)

## Full Context

configure system security ldap server search

## Description

This command configures the LDAP **search** command. The search *base-dn* tells the server which part of the external directory tree to search. The search DN uses the same LDAP attribute as *root-dn*. For

example, to search a public-key for an SSH generated for a Nokia vendor, one might use "dc=public-key,dc=nokia,dc=com".

The **no** version of this command removes the search DN; as such, no search is possible on the LDAP server.

### Parameters

#### ***base-dn***

Specifies the base domain name used in the search, up to 512 characters.

### Platforms

All

## 23.84 second-level-flow-rate

### second-level-flow-rate

#### Syntax

**second-level-flow-rate** {**ignore** | **shape**}

#### Context

[\[Tree\]](#) (config>subscr-mgmt>sla-profile>pfcp-mappings second-level-flow-rate)

#### Full Context

configure subscriber-mgmt sla-profile pfcp-mappings second-level-flow-rate

#### Description

This command configures the action to apply when flows are installed that are subject to two levels of rate-limiting. For example, in fixed wireless access (FWA) the first-level rate can represent an SDF (5-tuple) MBR, while the second-level rate can represent a QoS flow MBR. With the default **shape** option, the BNG-UP allocates a dynamic queue to enforce the second-level rate, and if that fails it rejects the PFCP transaction. The **ignore** option always ignores the second-level rate and only enforces the first-level rate.

#### Parameters

##### **ignore**

Keyword to indicate that the BNG-UP ignores the second-level rate and only enforces the first-level rate.

##### **shape**

Keyword to indicate that the BNG-UP allocates a dynamic queue to enforce the second-level rate and if that fails it rejects the PFCP transaction.

## secondary

### Syntax

**secondary** *ip-address[/mask] [netmask ] [broadcast {all-ones | host-ones}] [igp-inhibit] [track-srrp srrp-instance]*

**no secondary** *ip-address[/mask]*

### Context

[\[Tree\]](#) (config>service>ies>if secondary)

### Full Context

configure service ies interface secondary

### Description

This command assigns a secondary IP address or IP subnet/broadcast address format to the interface. The **no** form of this command reverts to the default.

### Parameters

#### *ip-address*

The IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that is used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

#### *mask*

The subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the *ip-address* from a traditional dotted decimal mask. The *mask* parameter indicates the complete mask that is used in a logical and function to derive the local subnet of the IP address. Allowed values are dotted decimal addresses in the range 128.0.0.0 – 255.255.255.254.

#### **Note:**

A mask of 255.255.255.255 is reserved for system IP addresses.

#### *netmask*

Specifies a string of 0s and 1s that mask or screen out the network part of an IP address so that only the host computer part of the address remains.

#### **broadcast**

Overrides the default broadcast address used by the IP interface when sourcing IP broadcasts on the IP interface. If no broadcast format is specified for the IP address, the default value is **host-ones** which indicates a subnet broadcast address. Use this parameter to change the broadcast address to **all-ones** or revert back to a broadcast address of **host-ones**.

The broadcast format on an IP interface can be specified when the IP address is assigned or changed.

This parameter does not affect the type of broadcasts that can be received by the IP interface. A host sending either the local broadcast (**all-ones**) or the valid subnet broadcast address (**host-ones**) is received by the IP interface. (Default: host-ones)

#### **all-ones**

Specifies the broadcast address used by the IP interface for this IP address is 255.255.255.255, also known as the local broadcast.

#### **host-ones**

Specifies that the broadcast address used by the IP interface for this IP address is the subnet broadcast address. This is an IP address that corresponds to the local subnet described by the *ip-address* and the *mask-length* or *mask* with all the host bits set to binary one. This is the default broadcast address used by an IP interface. The **broadcast** parameter within the **address** command does not have a negate feature, which is usually used to revert a parameter to the default value. To change the **broadcast** type to **host-ones** after being changed to **all-ones**, the **address** command must be executed with the **broadcast** parameter defined.

#### **igp-inhibit**

Signals that the given secondary IP interface should not be recognized as a local interface by the running IGP. For OSPF and IS-IS, this means that the specified secondary IP interfaces are not injected and used as passive interfaces and are not advertised as internal IP interfaces into the IGP's link state database. For RIP, this means that these secondary IP interfaces do not source RIP updates.

#### **track-srrp srrp-instance**

Specifies the SRRP instance ID that this interface route needs to track.

**Values** 1 to 4294967295

### **Platforms**

All

## secondary

### **Syntax**

**no secondary** *ip-address*[/*mask*]

### **Context**

**[Tree]** (config>service>vprn>if secondary)

**[Tree]** (config>service>vprn>nw-if secondary)

### **Full Context**

configure service vprn interface secondary

configure service vprn network-interface secondary

## Description

This command assigns a secondary IP address to the interface. Up to 16 total primary and secondary IPv4 and IPv6 addresses can be assigned to network interfaces, and up to 256 to access interfaces. Each address can be configured in an IP address, IP subnet or broadcast address format.

### Caution:

Configurations must not exceed 16 secondary IP addresses when IPsec, GRE, L2TPv3, or IP in IP protocols are active on an access interface.

## Parameters

### *ip-address*

The IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

### *mask*

The subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the *ip-address* from a traditional dotted decimal mask. The *mask* parameter indicates the complete mask that will be used in a logical 'AND' function to derive the local subnet of the IP address. Allowed values are dotted decimal addresses in the range 128.0.0.0 – 255.255.255.254. A mask of 255.255.255.255 is reserved for system IP addresses.

### *netmask*

Specifies a string of 0s and 1s that mask or screen out the network part of an IP address so that only the host computer part of the address remains.

### **broadcast**

The optional **broadcast** parameter overrides the default broadcast address used by the IP interface when sourcing IP broadcasts on the IP interface. If no broadcast format is specified for the IP address, the default value is **host-ones** which indicates a subnet broadcast address. Use this parameter to change the broadcast address to **all-ones** or revert back to a broadcast address of **host-ones**.

The broadcast format on an IP interface can be specified when the IP address is assigned or changed. This parameter does not affect the type of broadcasts that can be received by the IP interface. A host sending either the local broadcast (**all-ones**) or the valid subnet broadcast address (**host-ones**) will be received by the IP interface. (*Default: host-ones*)

### **all-ones**

The **all-ones** keyword following the **broadcast** parameter specifies the broadcast address used by the IP interface for this IP address will be 255.255.255.255, also known as the local broadcast.

### **host-ones**

The **host-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be the subnet broadcast address. This is an IP address that corresponds to the local subnet described by the *ip-address* and the *mask-length* or *mask* with all the host bits set to binary one. This is the default used by an IP interface.

The **broadcast** parameter within the **address** command does not have a negate feature, which is usually used to revert a parameter to the default value. To change the **broadcast** type to **host-ones** after being changed to **all-ones**, the **address** command must be executed with the **broadcast** parameter defined.

### igp-inhibit

The optional **igp-inhibit** parameter signals that the given secondary IP interface should not be recognized as a local interface by the running IGP. For OSPF and IS-IS, this means that the specified secondary IP interfaces will not be injected and used as passive interfaces and will not be advertised as internal IP interfaces into the IGP's link state database. For RIP, this means that these secondary IP interfaces will not source RIP updates.

### track-srrp *srrp-instance*

Specifies the SRRP instance ID that this interface route needs to track.

## Platforms

All

## secondary

## Syntax

[no] **secondary** *path-name*

## Context

[\[Tree\]](#) (config>router>mpls>lsp secondary)

## Full Context

configure router mpls lsp secondary

## Description

This command specifies an alternative path that the LSP uses if the primary path is not available. This command is optional and is not required if the **config router mpls lsp *lsp-name* primary *path-name*** command is specified. After the switch over from the primary to the secondary, the system continuously tries to revert to the primary path. The switch back to the primary path is based on the **retry-timer** interval.

For RSVP-TE LSPs, up to eight secondary paths can be specified (or seven if a primary is configured). For SR-TE LSPs, up to three paths of any type (with a maximum of one primary) can be configured. By default, a secondary path is non-standby unless the **standby** keyword is configured. All non-standby secondary paths are considered equal and the first available path is used.

The system does not switch among secondary paths. The system starts the signaling (RSVP-TE) or programming (SR-TE) of all non-standby secondary paths at the same time. Retry counters are maintained for each unsuccessful attempt. After the retry limit is reached on a path, the system does not attempt to signal the path and administratively shuts down the path. The first successfully established non-standby secondary path is made the active path for the LSP.

The **no** form of this command removes the association between this *path-name* and *lsp-name*. All specific configurations for this association are deleted. The secondary path must be shut down prior to deleting it. The **no secondary *path-name*** command does not result in any action except a warning message on the console indicating that the secondary path is administratively up.

## Parameters

### *path-name*

Specifies the case-sensitive alphanumeric name label for the LSP path, up to 64 characters.

## Platforms

All

## secondary

## Syntax

**secondary** {*ip-address/mask* | *ip-address netmask*} [**broadcast** {**all-ones** | **host-ones**}] [**igp-inhibit**] [**track-srrp** *srrp-instance*]

**no secondary** {*ip-address/mask* | *ip-address netmask*}

## Context

[\[Tree\]](#) (config>router>if secondary)

## Full Context

configure router interface secondary

## Description

This command assigns additional IP addresses to the interface. Up to 16 total primary and secondary IPv4 and IPv6 addresses can be assigned to network interfaces, and up to 256 to access interfaces. Each address can be configured in an IP address, IP subnet, or broadcast address format.

### Caution:

Configurations must not exceed 16 secondary IP addresses when IPsec, GRE, L2TPv3, or IP in IP protocols are active on an access interface.

## Parameters

### *ip-address*

Specifies the IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.

**Values** 1.0.0.0 to 223.255.255.255

/

The forward slash is a parameter delimiter that separates the *ip-address* portion of the IP address from the mask that defines the scope of the local subnet. No spaces are allowed between the *ip-addr*, the "/" and the *mask-length* parameter. If a forward slash does not immediately follow the *ip-addr*, a dotted decimal mask must follow the prefix.

### *mask*

Specifies the subnet mask length when the IP prefix is specified in CIDR notation. When the IP prefix is specified in CIDR notation, a forward slash (/) separates the *ip-address* from the *mask* parameter. The *mask* parameter indicates the number of bits used for the network portion of the IP address; the remainder of the IP address is used to determine the host portion of the IP address. Allowed values are integers in the range 1 to 32. A mask length of 32 is reserved for system IP addresses.

**Values** 1 to 32

### **netmask**

Specifies the subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the *ip-address* from a traditional dotted decimal mask. The *mask* parameter indicates the complete mask that will be used in a logical 'AND' function to derive the local subnet of the IP address. A mask of 255.255.255.255 is reserved for system IP addresses.

**Values** 128.0.0.0 to 255.255.255.255

### **broadcast**

The optional **broadcast** parameter overrides the default broadcast address used by the IP interface when sourcing IP broadcasts on the IP interface. If no broadcast format is specified for the IP address, the default value is **host-ones**, which indicates a subnet broadcast address. Use this parameter to change the broadcast address to **all-ones** or revert back to a broadcast address of **host-ones**.

The **broadcast** parameter within the **address** command does not have a negate feature, which is usually used to revert a parameter to the default value. To change the **broadcast** type to **host-ones** after being changed to **all-ones**, the **address** command must be executed with the **broadcast** parameter defined.

The broadcast format on an IP interface can be specified when the IP address is assigned or changed.

This parameter does not affect the type of broadcasts that can be received by the IP interface. A host sending either the local broadcast (**all-ones**) or the valid subnet broadcast address (**host-ones**) will be received by the IP interface.

### **all-ones**

The **all-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be 255.255.255.255, also known as the local broadcast.

### **host-ones**

The **host-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be the subnet broadcast address. This is an IP address that corresponds to the local subnet described by the *ip-address* and the *mask* with all the host bits set to binary 1. This is the default broadcast address used by an IP interface.

### **igp-inhibit**

The secondary IP address should not be recognized as a local interface by the running IGP.

### **srrp-instance**

Specifies the SRRP instance ID that this interface route needs to track.

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range dhcp secondary-dns

#### Description

This command configures the secondary DNS address to be returned via DHCP on WLAN-GW ISA.

The **no** form of this command reverts to the default.

#### Parameters

*ip-address*

Specifies the secondary DNS address.

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

### secondary-dns

#### Syntax

**secondary-dns** *ip-address*

**no secondary-dns**

#### Context

[\[Tree\]](#) (config>service>vprn>dns secondary-dns)

#### Full Context

configure service vprn dns secondary-dns

## Description

This command configures the secondary DNS server for DNS name resolution. The secondary DNS server is used only if the primary DNS server does not respond.

DNS name resolution can be used when executing ping, traceroute, and service-ping, and also when defining file URLs. DNS name resolution is not supported when DNS names are embedded in configuration files.

The **no** form of this command removes the secondary DNS server from the configuration.

## Default

no secondary-dns — No secondary DNS server is configured.

## Parameters

### *ip-address*

The IP or IPv6 address of the secondary DNS server.

#### Values

ipv4-address -a.b.c.d

ipv6-address: x:x:x:x:x:x:x[-interface]

x:x:x:x:x:x:d.d.d.d[-interface]

x: [0 to FFFF]H

d: [0 to 255]D

interface - 32 characters max, for link local addresses.

## Platforms

## 23.88 secondary-fast-retry-timer

### secondary-fast-retry-timer

#### Syntax

**secondary-fast-retry-timer** *seconds*

**no secondary-fast-retry-timer**

#### Context

[\[Tree\]](#) (config>router>mpls secondary-fast-retry-timer)

#### Full Context

configure router mpls secondary-fast-retry-timer

## Description

This command specifies the value used as the fast retry timer for a secondary path. If the first attempt to set up a secondary path fails due to a path error, the fast retry timer will be started for the secondary path so that the path can be retried sooner. If the next attempt also fails, further retries for the path will use the configured value for LSP retry timer.

If retry-timer for the LSP is configured to be less than the MPLS secondary-fast-retry-timer, all retries for the secondary path will use the LSP retry-timer.

The **no** form of this command reverts to the default.

## Default

no secondary-fast-retry-timer

## Parameters

### *seconds*

Specifies the value (in seconds), used as the fast retry timer for a secondary path

**Values** 1 to 10

## Platforms

All

## 23.89 secondary-image

### secondary-image

## Syntax

**secondary-image** *file-url*

**no secondary-image**

## Context

[\[Tree\]](#) (bof secondary-image)

## Full Context

bof secondary-image

## Description

This command specifies the secondary directory location for runtime image file loading.

The system attempts to load all runtime image files configured in the **primary-image** first. If this fails, the system attempts to load the runtime images from the location configured in the **secondary-image**. If the secondary image load fails, the tertiary image specified in **tertiary-image** is used.

All runtime image files (\*.tim files) must be located in the same directory.

The **no** form of this command removes the **secondary-image** configuration.

## Parameters

### *file-url*

Specifies the file URL; can be either local (this CPM) or a remote FTP server.

#### Values

<i>file-url</i>	{ <i>local-url</i>   <i>remote-url</i> } (up to 180 characters)
<i>local-url</i>	[ <i>cflash-id</i> ]/[ <i>file-path</i> ]
<i>remote-url</i>	[{ftp://  tftp://} <i>login:pswd@remote-locn</i> ]/[ <i>file-path</i> ]

## 23.96 secondary-retry-limit

### secondary-retry-limit

#### Syntax

```
secondary-retry-limit {number | infinite}
no secondary-retry-limit
```

#### Context

[\[Tree\]](#) (config>router>mpls>lsp>auto-bandwidth>use-last-adj-bw secondary-retry-limit)

#### Full Context

```
configure router mpls lsp auto-bandwidth use-last-adj-bw secondary-retry-limit
```

#### Description

This command configures the maximum number of retry attempts for secondary paths. After each successful attempt, the counter is reset to zero.

When the specified *number* is reached, no more attempts are made and the path is put into the shutdown state.

A value of 0 or **infinite** means that the system will retry forever.

The **no** form of this command reverts to the default.

#### Default

```
no secondary-retry-limit
```

#### Parameters

*number*

Specifies the number of retries.

**Values** 0 to 10000

**Default** 5

***infinite***

Specifies a retry limit of infinity.

**Platforms**

All

## 23.97 secondary-shaper-hashing

### secondary-shaper-hashing

**Syntax**

[no] secondary-shaper-hashing

**Context**

[\[Tree\]](#) (config>subscr-mgmt>sub-prof secondary-shaper-hashing)

**Full Context**

configure subscriber-mgmt sub-profile secondary-shaper-hashing

**Description**

This command enables LAG secondary shaper ID hashing. With this feature enabled, secondary shaper ID hashing can span multiple forwarding complexes on egress LAG. The default is to perform secondary shaper ID hashing on egress and requires all active LAG members to be on the same forwarding complex.

The **no** form of this command enables the default behavior.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.98 secondary-url

### secondary-url

**Syntax**

secondary-url *url*

no secondary-url

**Context**

**[Tree]** (config>python>py-script secondary-url)

**Full Context**

configure python python-script secondary-url

**Description**

This command specifies the location of secondary Python script. The system supports three locations for each Python-script. Users can store scripts file on either a local CF card or a FTP server.

The **no** form of this command removes the URL.

**Parameters**

**url**

Specifies the secondary URL of the Python script, up to 180 characters, either a local CF card URL or a FTP server URL.

**Platforms**

All

configure test-oam service-activation-testhead service-test test-duration cir-pir seconds

configure test-oam service-activation-testhead service-test test-duration performance seconds

configure test-oam service-activation-testhead service-test test-duration policing seconds

## Description

This command configures the seconds portion of the overall duration of a CIR, CIR-PIR, performance, or policing test.

## Parameters

### *seconds*

Specifies the number of seconds to run the test. This parameter applies to all test types.

**Values** 0 to 59

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 23.100 secret

```
secret
```

## Syntax

```
secret secret [hash | hash2 | custom]
```

```
no secret
```

## Context

[\[Tree\]](#) (config>router>wpp>portals>portal secret)

[\[Tree\]](#) (config>service>vprn>wpp>portals>portal secret)

## Full Context

```
configure router wpp portals portal secret
```

```
configure service vprn wpp portals portal secret
```

## Description

This command configures the secret that is used by WPPv2 to authenticate the messages between portal and BRAS.

The **no** form of this command removes the secret and hash from the configuration.

## Parameters

### *secret*

Specifies the secret key to access the server, up to 64 characters.

### *hash*

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys

are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### custom

Specifies the custom encryption to management interface.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## secret

## Syntax

**secret** *secret* [**hash** | **hash2** | **custom**]

**no secret**

## Context

[\[Tree\]](#) (config>router>radius-proxy>server secret)

[\[Tree\]](#) (config>service>vprn>radius-proxy>server secret)

## Full Context

configure router radius-proxy server secret

configure service vprn radius-proxy server secret

## Description

This command configures the shared secret key. The RADIUS client must have the same key to communicate with the RADIUS-proxy server.

The **no** form of this command removes the parameters from the configuration.

## Parameters

### secret key

Specifies the secret key up to 64 characters to access the RADIUS server. This secret key must match the password on the RADIUS server.

**Values** hash-key: Up to 33 characters  
hash2-key: Up to 55 characters.

### hash

Specifies that the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**hash2**

Specifies that the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**custom**

Specifies the custom encryption to management interface.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**secret****Syntax**

**secret** *secret-key* | *hash-key* [**hash** | **hash2** | **custom**]

**no secret**

**Context**

[\[Tree\]](#) (config>aaa>isa-radius-plcy>servers>server secret)

**Full Context**

configure aaa isa-radius-policy servers server secret

**Description**

This command configures the secret key to access the RADIUS server. This secret key must match the password on the RADIUS server.

**Default**

no secret

**Parameters****hash**

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**hash2**

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be

copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

#### custom

Specifies the custom encryption to management interface.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.101 section-trace

### section-trace

#### Syntax

**section-trace** {**increment-z0** | **byte** *value* | **string** *string*}

#### Context

[\[Tree\]](#) (config>port>sonet-sdh section-trace)

#### Full Context

configure port sonet-sdh section-trace

#### Description

This command configures the section trace bytes in the SONET section header to inter-operate with some older versions of ADMs or regenerators that require an incrementing STM ID. You can explicitly configure an incrementing STM value rather than a static one in the SDH overhead by specifying the z0-increment.

This command is supported on TDM satellite.

#### Default

section-trace byte *0x1*

#### Parameters

##### *increment-z0*

Configures an incrementing STM ID instead of a static value.

##### *value*

Sets values in SONET header bytes.

**Default** 0x1

**Values** 0 to 255 or 0x00 to 0xFF

##### *string*

Specifies a text string that identifies the section. The string can be a maximum of 16 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.102 secure-boot

secure-boot

#### Context

**[Tree]** (admin>certificate secure-nd-import)

#### Full Context

admin certificate secure-nd-import

#### Description

This command imports IPv6 Secure Neighbor Discovery (SeND) certificates from a file, and saves them to cf[1..3]:\system-pki\secureNdKey in PKCS #7 DER format.

**Parameters*****url-string***

Specifies the name of an input file up to 99 characters.

<b>Values</b>	local-url	<cf-flash-id>\<file-path>
	cf-flash-id	cf1:  cf2:  cf3:

***input-format***

Specifies the input file format.

<b>Values</b>	pkcs12, pem, or der
---------------	---------------------

***password***

Specifies the password to decrypt the input file if it is an encrypted PKCS#12 file.

<b>Values</b>	32 characters maximum
---------------	-----------------------

[Tree] (config>service>vprn>if>sap>ipsec-tunnel>manual-keying security-association)

[Tree] (config>service>ies>if>ipsec>ipsec-tunnel>manual-keying security-association)

[Tree] (config>router>if>ipsec>ipsec-tunnel>manual-keying security-association)

#### Full Context

configure service vprn interface ipsec ipsec-tunnel manual-keying security-association

configure service vprn interface sap ipsec-tunnel manual-keying security-association

configure service ies interface ipsec ipsec-tunnel manual-keying security-association

configure router interface ipsec ipsec-tunnel manual-keying security-association

#### Description

This command configures the information required for manual keying SA creation.

The **no** form of this command removes the **security-association** parameters from the configuration.

#### Parameters

##### **security-entry-id**

Specifies the ID of an SA entry.

**Values** 1 to 16

##### **authentication-key hex-string**

Specifies an authentication key.

**Values** none or 0x0 to 0xFFFFFFFF...(max 128 hex nibbles)

##### **encryption-key hex-string**

Specifies the key used for the encryption algorithm.

**Values** none or 0x0 to 0xFFFFFFFF...(max 64 hex nibbles)

##### **spi spi**

Specifies the Security Parameter Index (SPI) used to look up the instruction to verify and decrypt the incoming IPsec packets when the direction is inbound. When the direction is

outbound, the SPI that will be used in the encoding of the outgoing packets. The remote node can use this SPI to lookup the instruction to verify and decrypt the packet.

**Values** 256 to 16383

#### **transform** *transform-id*

Specifies the transform entry that will be used by this SA entry. This object should be specified for all the entries created which are manual SAs. If the value is dynamic, then this value is irrelevant and will be zero.

**Values** 1 to 2048

#### **direction**

Specifies the direction of an IPsec tunnel.

### Platforms

VSR

- configure service vprn interface ipsec ipsec-tunnel manual-keying security-association
- configure service ies interface ipsec ipsec-tunnel manual-keying security-association
- configure router interface ipsec ipsec-tunnel manual-keying security-association

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn interface sap ipsec-tunnel manual-keying security-association

## security-association

### Syntax

**security-association spi** *spi* **authentication-key** *authentication-key* **encryption-key** *encryption-key* [**crypto**]

**no security-association spi** *spi*

### Context

[\[Tree\]](#) (config>grp-encryp>encryp-keygrp security-association)

### Full Context

configure group-encryption encryption-keygroup security-association

### Description

This command is used to create a security association for a specific SPI value in a key group. The command is also used to enter the authentication and encryption key values for the security association, or to delete a security association.

The SPI value used for the security association is a node-wide unique value, meaning that no two security associations in any key group on the node may share the same SPI value.

Keys are entered in cleartext. After configuration, they are never displayed in their original, cleartext form. Keys are displayed in an encrypted form, which is indicated by the system-appended **crypto** keyword

when an **info** or an **admin>save** command is run. For security reasons, keys encrypted on one node are not usable on other nodes (that is, keys are not exchangeable between nodes).

The **no** form of the command removes the security association and related key values from the list of security associations for the key group. If the **no** form of the command is attempted using the same SPI value that is configured for **active-outbound-sa**, then a warning is issued and the command is blocked. If the **no** form of the command is attempted on the last SPI in the key group and the key group is configured on a service, then the command is blocked.

## Parameters

### *spi*

Specifies the SPI ID of the SPI being referenced for the security association.

**Values** 1 to 127

### *authentication-key*

Specifies the authentication key for the SPI, in hexadecimal format. The number of characters in the hexadecimal string must be 64 or 128, depending on whether the authentication algorithm is set to sha256 or sha512, respectively.

### *encryption-key*

Specifies the encryption key for the SPI, in hexadecimal format. The number of characters in the hexadecimal string must be 32 or 64, depending on whether the encryption algorithm is set to aes128 or aes256, respectively.

### *crypto*

Displays the keys showing on the CLI **info** display in an encrypted form.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.108 security-param-index

### security-param-index

#### Syntax

**security-param-index** *security-parameter-index*

**no security-param-index**

#### Context

**[Tree]** (config>test-oam>build-packet>header>ipsec-auth security-param-index)

**[Tree]** (debug>oam>build-packet>packet>field-override>header>ipsec-auth security-param-index)

#### Full Context

configure test-oam build-packet header ipsec-auth security-param-index

```
debug oam build-packet packet field-override header ipsec-auth security-param-index
```

### Description

This command defines the security index to be used in the IPsec header. This same context can be used for IPv4 and IPv6 packets.

The **no** form of this command removes the security parameter index value.

### Default

```
security-param-index 1
```

### Parameters

#### ***security-parameter-index***

Specifies the IPsec security parameter index to be used in the IPsec header.

**Values** 1 to 4294967295

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.109 security-parameter

All

## 23.110 security-policy

### security-policy

#### Syntax

**security-policy** *security-policy-id* [**create**]

**no security-policy** *security-policy-id*

#### Context

[\[Tree\]](#) (config>router>ipsec security-policy)

[\[Tree\]](#) (config>service>vprn>ipsec security-policy)

#### Full Context

configure router ipsec security-policy

configure service vprn ipsec security-policy

#### Description

This command configures a security policy to use for an IPsec tunnel.

The **no** form of this command removes the security policy ID from the configuration.

#### Parameters

***security-policy-id***

specifies a value to be assigned to a security policy.

**Values** 1 to 32768

**create**

Keyword used to create the security policy instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

#### Platforms

VSR

- configure router ipsec security-policy  
7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR
- configure service vprn ipsec security-policy

## security-policy

### Syntax

**security-policy** *security-policy-id* [**strict-match**]

**no security-policy**

### Context

**[Tree]** (config>service>vprn>if>ipsec>ipsec-tunnel security-policy)

**[Tree]** (config>router>if>ipsec>ipsec-tunnel security-policy)

**[Tree]** (config>service>ies>if>ipsec>ipsec-tunnel security-policy)

**[Tree]** (config>service>vprn>if>sap>ipsec-tunnel security-policy)

### Full Context

configure service vprn interface ipsec ipsec-tunnel security-policy

configure router interface ipsec ipsec-tunnel security-policy

configure service ies interface ipsec ipsec-tunnel security-policy

configure service vprn interface sap ipsec-tunnel security-policy

### Description

This command configures an IPsec security policy. The policy may then be associated with static IPsec tunnels defined in the same routing instance.

With **strict-match** parameter enabled, when a CREATE\_CHILD exchange request is received for a static IPsec tunnel, and this request is not a re-key request, then ISA matches the received TSi and TSr with the configured security policy. This can be a match only when a received TS (in TSi or TSr) address range matches exactly with the subnet in a security policy entry.

If there is no match, then the setup fails, and TS\_UNACCEPTABLE is sent.

If there is a match, but there is an existing CHILD\_SA for the matched security policy, then the setup fails, and NO\_PROPOSAL\_CHOSEN.

If there is a match, and there is not CHILD\_SA for the matched entry, then the subnet is sent in the matched security-policy entry as TSi and TSr, and the CHILD\_SA is created.

### Default

no security-policy

### Parameters

***security-policy-id***

Specifies the IPsec security policy entry that the tunnel will use.

**Values** 1 to 32768

**strict-match**

Enables strict match of security-policy entry.

**Platforms**

VSR

- configure service vprn interface ipsec ipsec-tunnel security-policy
- configure service ies interface ipsec ipsec-tunnel security-policy
- configure router interface ipsec ipsec-tunnel security-policy

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn interface sap ipsec-tunnel security-policy

## 23.111 security-termination-policy

### security-termination-policy

**Syntax**

**security-termination-policy** *policy*

**no security-termination-policy**

**Context**

[\[Tree\]](#) (config>anysec>tnl-enc>enc-grp security-termination-policy)

**Full Context**

configure anysec tunnel-encryption encryption-group security-termination-policy

**Description**

This command configures the local security termination policy parameters.

The **no** form of this command removes the security termination policy.

**Default**

no security-termination-policy

**Parameters**

**policy**

Specifies the local security termination policy name, up to 32 characters.

**create**

Keyword used to create the security termination policy.

## Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se

## security-termination-policy

### Syntax

**security-termination-policy** *policy* [**create**]

**no security-termination-policy** *policy*

### Context

[\[Tree\]](#) (config>anysec>tnl-enc security-termination-policy)

### Full Context

configure anysec tunnel-encryption security-termination-policy

### Description

Commands in this context configure the security termination policy that identifies the set of attributes for locally terminating tunnels for this encryption group.

The **no** form of this command removes the security termination policy.

### Default

no security-termination-policy

### Parameters

*policy*

Specifies the local security termination policy name, up to 32 characters.

## Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se

## 23.112 seen-ip-radius-acct-policy

## seen-ip-radius-acct-policy

### Syntax

**seen-ip-radius-acct-policy** *rad-acct-plcy-name*

**no seen-ip-radius-acct-policy**

## Context

[\[Tree\]](#) (config>app-assure>group>transit-ip-policy>radius seen-ip-radius-acct-policy)

## Full Context

configure application-assurance group transit-ip-policy radius seen-ip-radius-acct-policy

## Description

This command refers to a RADIUS accounting-policy to enable seen-IP notification.

The no form of this command removes the policy.

## Default

no seen-ip-radius-acct-policy

## Parameters

*rad-acct-plcy-name*

Specifies the RADIUS accounting policy name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.113 segment

segment

## Syntax

**segment** [*segment-id*] [**create**]

**no segment** *segment-id*

## Context

[\[Tree\]](#) (conf>router>segment-routing>sr-policies>policy>seg-list segment)

## Full Context

configure router segment-routing sr-policies static-policy segment-list segment

## Description

This command creates the context to configure a segment inside a segment-list of a statically-defined segment routing policy candidate path.

A segment list of a statically-defined SR policy candidate path of type **sr-mpls** can only accept a segment of type **mpls-label**.

A segment list of a statically-defined SR policy candidate path of type **srv6** can only accept a segment of type **srv6-sid**. However, you can mix SRv6 segments derived from both classic SRv6 and micro-segment SRv6 locators.

The **no** form of this command deletes the segment context.

### Default

no segment

### Parameters

#### ***segment-id***

Specifies the segment ID number.

**Values** 1 to 11 (for segment ID type **mpls-label**)  
1 to 7 (for segment ID type **srv6-sid**) in a classic SRv6 policy candidate path  
1 to 24 (for segment ID type **srv6-sid**) in a micro-segment SRv6 policy candidate path

#### **create**

Keyword used to create the list.

### Platforms

All

## 23.114 segment-list

### segment-list

## segment-routing

### Syntax

**segment-routing**

**no segment-routing**

### Context

[\[Tree\]](#) (config>router>isis segment-routing)

### Full Context

configure router isis segment-routing

### Description

Commands in this context configure segment routing parameters within a given IGP instance.

Segment routing adds to IS-IS and OSPF routing protocols the ability to perform shortest path routing and source routing using the concept of abstract segment. A segment can represent a local prefix of a node, a specific adjacency of the node (interface or next-hop), a service context, or a specific explicit path over the network. For each segment, the IGP advertises an identifier referred to as Segment ID (SID).

When segment routing is used together with MPLS data plane, the SID is a standard MPLS label. A router forwarding a packet using segment routing will thus push one or more MPLS labels.

Segment routing using MPLS labels can be used in both shortest path routing applications and in traffic engineering applications. This feature implements the shortest path forwarding application.

After segment routing is successfully enabled in the IS-IS or OSPF instance, the router will perform the following operations:

1. Advertise the Segment Routing Capability Sub-TLV to routers in all areas/levels of this IGP instance. However, only neighbors with which it established an adjacency interprets the SID or label range information and use it for calculating the label to swap to or push for a given resolved prefix SID.
2. Advertise the assigned index for each configured node SID in the new prefix SID sub-TLV with the N-flag (node-SID flag) set. Then the segment routing module programs the incoming label map (ILM) with a pop operation for each local node SID in the data path.
3. Assign and advertise automatically an adjacency SID label for each formed adjacency over a network IP interface in the new adjacency SID sub-TLV. The segment routing module programs the incoming label map (ILM) with a pop operation, in effect with a swap to an implicit null label operation, for each advertised adjacency SID.
4. Resolve received prefixes and if a prefix SID sub-TLV exists, the Segment Routing module programs the ILM with a swap operation and also an LTN with a push operation both pointing to the primary/LFA NHLFE. An SR tunnel is also added to the TTM.

When the user enables segment routing in a given IGP instance, the main SPF and LFA SPF are computed normally and the primary next-hop and LFA backup next-hop for a received prefix are added to RTM without the label information advertised in the prefix SID sub-TLV.

## segment-routing

### Syntax

**[no] segment-routing**

### Context

[\[Tree\]](#) (config>router>ospf segment-routing)

[\[Tree\]](#) (config>router>ospf3 segment-routing)

### Full Context

configure router ospf segment-routing

configure router ospf3 segment-routing

### Description

Commands in this context configure segment routing parameters within an IGP instance.

Segment routing adds to IS-IS, OSPF, or OSPF3 routing protocols the ability to perform shortest path routing and source routing using the concept of abstract segment. A segment can represent a local prefix of a node, a specific adjacency of the node (interface or next hop), a service context, or a specific explicit path over the network. For each segment, the IGP advertises an identifier referred to as a segment ID (SID).

When segment routing is used together with the MPLS data plane, the SID is a standard MPLS label. A router forwarding a packet using segment routing will thus push one or more MPLS labels.

Segment routing using MPLS labels can be used in both shortest path routing applications and traffic engineering applications. This feature implements the shortest path forwarding application.

After segment routing is successfully enabled in the IS-IS, OSPF, or OSPF3 instance, the router will perform the following operations:

- Advertise the Segment Routing Capability sub-TLV to routers in all areas or levels of the IGP instance. However, only neighbors with which the IGP instance established an adjacency will interpret the SID and label range information and use it for calculating the label to swap to or push for a particular resolved prefix SID.
- Advertise the assigned index for each configured node SID in the new prefix SID sub-TLV with the N-flag (node SID flag) set. The segment routing module then programs the incoming label map (ILM) with a pop operation for each local node SID in the data path.
- Automatically assign and advertise an adjacency SID label for each formed adjacency over a network IP interface in the new adjacency SID sub-TLV. The segment routing module programs the incoming label map (ILM) with a pop operation, in effect with a swap to an implicit null label operation, for each advertised adjacency SID.
- Resolve received prefixes, and if a prefix SID sub-TLV exists, the segment routing module programs the ILM with a swap operation and programs an LSP ID to NHLFE (LTN) with a push operation, both pointing to the primary/LFA NHLFE. An SR tunnel is also added to the TTM.

When the user enables segment routing in an IGP instance, the main SPF and LFA SPF are computed normally and the primary next hop and LFA backup next hop for a received prefix are added to the RTM without the label information advertised in the prefix SID sub-TLV.

## Platforms

configure router segment-routing segment-routing-v6

#### Description

Commands in this context configure global SRv6 parameters.

The **no** form of this command deletes the context.

#### Default

no segment-routing-v6

#### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## segment-routing-v6

### Syntax

[no] **segment-routing-v6**

### Context

[\[Tree\]](#) (config>router>isis segment-routing-v6)

### Full Context

configure router isis segment-routing-v6

### Description

Commands in this context configure SRv6 parameters specific to this IS-IS instance.

**Note:**

This context has its own **shutdown** command. The **config>router>segment-routing>shutdown** command only applies to SR-MPLS and does not impact this context.

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## segment-routing-v6

### Syntax

[no] **segment-routing-v6** [**bgp** *bgp-instance*]

### Context

[\[Tree\]](#) (config>service>vprn>bgp-ipvpn segment-routing-v6)

[\[Tree\]](#) (config>service>vprn>bgp-evpn segment-routing-v6)

### Full Context

configure service vprn bgp-ipvpn segment-routing-v6

configure service vprn bgp-evpn segment-routing-v6

### Description

Commands in this context configure SRv6 parameters specific to this BGP-IPVPN or BGP-EVPN instance.

The **no** form of this command deletes the context.

### Default

no segment-routing-v6

## Parameters

### **bgp** *bgp-instance*

Specifies the BGP instance. If this parameter is not specified, the value of "1" is used by default.

**Values** 1 to 2

**Default** 1

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## segment-routing-v6

## Syntax

[no] **segment-routing-v6**

## Context

[\[Tree\]](#) (config>router>bgp segment-routing-v6)

## Full Context

configure service epipe bgp-evpn segment-routing-v6

configure service vpls bgp-evpn segment-routing-v6

## Description

Commands in this context configure the SRv6 instance that is used in the service.

The **no** form of this command removes the configured SRv6 instance.

## Parameters

### *bgp-instance*

Specifies the SRv6 instance that is configured in the service and associated to an EVPN control plane.

**Values** 1, 2 (for Epipe)  
1 (for VPLS)

### *srv6-instance*

Specifies the SRv6 instance ID that exists in the service and is associated to a BGP EVPN control plane.

**Values** 1

### *default-locator*

Keyword that refers to a regular or micro-segment locator that exists in the service SRv6 instance and is used as the default locator for the service.

### *name*

Specifies a locator that exists in the service SRv6 instance and is used as the default locator for the service, up to 64 characters.

### *create*

Keyword used to create the SRv6 instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 23.117 sel-mcast-advertisement

## sel-mcast-advertisement

### Syntax

[no] sel-mcast-advertisement

### Context

[\[Tree\]](#) (config>service>vpls>bgp-evpn sel-mcast-advertisement)

### Full Context

configure service vpls bgp-evpn sel-mcast-advertisement

### Description

This command enables the advertisement of BGP EVPN Selective Multicast Ethernet Tag (SMET) routes. The **no** form of this command disables the advertisement of BGP EVPN SMET routes.

### Default

no sel-mcast-advertisement

### Platforms

All

## 23.118 selection-criteria

## selection-criteria

### Syntax

selection-criteria [best-port | highest-count | highest-weight] [slave-to-partner] [ subgroup-hold-time hold-time]  
no selection-criteria

### Context

[\[Tree\]](#) (config>lag selection-criteria)

### Full Context

configure lag selection-criteria

### Description

This command specifies which selection criteria should be used to select the active sub-group. If there is a tie for highest-count or highest-weight, the LAG will prefer the port with the lowest priority. If that does not break the tie, the currently active subgroup will stay active (that is, non-revertive behavior).

The **no** form of this command reverts to the default value.

**Default**

selection-criteria highest-count

**Parameters****highest-count**

Selects a sub-group with the highest number of eligible members as an active sub-group (not applicable to "power-off" mode of operations).

**highest-weight**

Selects a sub-group with the highest aggregate weight as an active subgroup (not applicable to "power-off" mode of operations). Aggregate weight is calculated as the sum of (65535 - port priority) all ports within a sub-group.

**best-port**

Selects a sub-group containing the port with highest priority port as an active subgroup. In case of equal port priorities, the sub-group containing the port with the lowest port-id is chosen.

**slave-to-partner**

The **slave-to-partner** keyword specifies that it, together with the selection criteria, should be used to select the active sub-group. An eligible member is a LAG-member link which can potentially become active. This means it is operationally up (not disabled) for use by the remote side. The **slave-to-partner** keyword can be used to control whether or not this latter condition is taken into account.

**hold-time**

Applicable with LACP enabled. Specifies the optional delay timer for switching to a newly selected active sub-group from the existing active sub-group. The timer delay applies only if the existing sub-group remains operationally up.

**Values**

not specified	Equivalent to specifying a value of 0. Specifies no delay and to switchover immediately to a new candidate active sub-group.
0 to 2000	Integer specifying the timer value in 10ths of a second.
infinite	Do not switchover from existing active sub-group if the subgroup remains UP. Manual switchover possible using tools perform lag force command.

## 23.120 selective-label-ip

## selective-label-ip

### Syntax

**selective-label-ip** {**no-install** | **route-table-install-only**}

**no selective-label-ip**

### Context

**[Tree]** (config>router>bgp selective-label-ip)

### Full Context

configure router bgp selective-label-ip

### Description

This command configures **selective-label-ip** for the BGP level.

The **no-install** option conserves labeled route table space on BGP-LU **next-hop-self** route reflectors. This option causes BGP-LU routes to be reflected downstream via the ABR with the **next-hop-self** update. BGP-LU routes are not installed to local MPLS tables or routing tables for use by local services.

The **route-table-install-only** option conserves labeled route table space on BGP-LU **next-hop-self** route reflectors and allows these routes to be used for IP transport, unlike the **no-install** option. When the **route-table-install-only** option is used, learned BGP-LU routes are also reflected downstream via the ABR with the **next-hop-self** update. BGP-LU routes are not installed to local MPLS tables for use by local services. These routes are installed to the RTM and used for the best route selection process.

**Note:** If local services need to use BGP-LU routes, the **no-install** and **route-table-install-only** options should not be used.

The default **no** form of this command installs BGP-LU routes to the datapath for local services and makes them available to the RTM for IP next-hop selection.

### Default

**no selective-label-ip**

### Parameters

#### **no-install**

Specifies that BGP-LU routes are not installed to local MPLS tables or routing tables.

#### **route-table-install-only**

Specifies the installation of BGP-LU routes to the RTM. BGP-LU routes are not installed to local MPLS tables for use by local services.

### Platforms

All

## 23.121 selective-label-ip-prioritization

### selective-label-ip-prioritization

#### Syntax

**[no] selective-label-ip-prioritization**

#### Context

**[Tree]** (config>router>bgp selective-label-ip-prioritization)

#### Full Context

configure router bgp selective-label-ip-prioritization

#### Description

This command enables selective-label IP prioritization for BGP labeled IPv4 and IPv6 routes.

When this command is configured, every received labeled IPv4 and IPv6 route that is potentially usable by a local service is automatically prioritized for fast control plane reconvergence. When the reachability of a BGP next-hop changes, these labeled IPv4 and IPv6 routes are updated into the route table first, along with other routes manually tagged as high priority by import policies.

A /32 or /128 labeled unicast route (and associated BGP-LU tunnel) is determined to be potentially usable by a local service if one of the following conditions is met:

- the route matches the far-end address of a user-provisioned SDP of an Layer 2 service and the SDP is configured to use BGP tunnels as transport
- the route matches the BGP next-hop address of a BGP-EVPN or IP VPN route, and this VPN route is either imported into a local service or readvertised by the router acting as a next-hop-self route-reflector or a model-B ASBR

The **no** form of this command disables selective-label IP prioritization for BGP.

#### Default

no selective-label-ip-prioritization

#### Platforms

All

## 23.122 selective-label-ipv4-install

### selective-label-ipv4-install

#### Syntax

**[no] selective-label-ipv4-install**

## Context

**[Tree]** (config>router>bgp>group selective-label-ipv4-install)

**[Tree]** (config>router>bgp>group>neighbor selective-label-ipv4-install)

**[Tree]** (config>router>bgp selective-label-ipv4-install)

## Full Context

configure router bgp group selective-label-ipv4-install

configure router bgp group neighbor selective-label-ipv4-install

configure router bgp selective-label-ipv4-install

## Description

This command enables selective download for BGP label-ipv4 routes.

When this command is configured so that it applies to a BGP session, label-ipv4 routes received on this session are marked as invalid if they are not needed for any eligible service. A /32 label-ipv4 route is determined to be required if one of the following applies:

1. It matches the far-end address of a manually configured or auto-created SDP Layer 2 VLL or VPLS service and the SDP is configured to use BGP tunnels as transport.
2. It matches the IPv4 BGP next hop of a BGP-EVPN route and this EVPN route is either imported into a VPLS service or re-advertised by the router acting as a next-hop-self route-reflector or a model-B ASBR.
3. It matches the IPv4 BGP next hop of a VPN-IPv4 route and this VPN-IP route is either imported into a VPRN service or re-advertised by the router acting as a next-hop-self route-reflector or a model-B ASBR.
4. It matches the IPv4 address in the IPv4-mapped IPv6 address of a VPN IPv6 route and this VPN-IP route is either imported into a VPRN service or re-advertised by the router acting as a next-hop-self route-reflector or a model-B ASBR.

The **no** form of this command at the top (**config>router>bgp**) level disables the selective installation functionality. The **no** form of this command at the **group** or **neighbor** level causes the setting to be inherited from a higher level configuration.

## Default

no selective-label-ipv4-install

## Platforms

All

## 23.123 selective-learned-fdb

## selective-learned-fdb

### Syntax

[no] selective-learned-fdb

### Context

[Tree] (config>service>vpls selective-learned-fdb)

### Full Context

configure service vpls selective-learned-fdb

### Description

This command determines which line cards FDB entries are allocated on for MAC addresses in the VPLS service in which the command is configured.

By default, FDB entries for MAC addresses in VPLS services are allocated on all line cards in the system. Enabling **selective-learned-fdb** causes FDB entries to be allocated only on the line cards on which the service has a configured object, which includes all line cards:

- on which a SAP is configured
- which have ports configured in a LAG SAP
- which have ports configured in an Ethernet tunnel SAP
- which have ports configured on a network interface (which also may be on a LAG) when the service has a mesh or spoke-SDP, VXLAN or EVPN-MPLS configured

Only MAC addresses with a type "L" or "Evpn" in the **show** output displaying the FDB can be allocated selectively, unless a MAC address configured as a conditional static MAC address is learned dynamically on an object other than its monitored object; this can be displayed with type "L" or "Evpn" but is allocated as global because of the conditional static MAC configuration.

The **no** form of this command returns the FDB MAC address entry allocation mode to its default where FDB entries for MAC addresses are allocated on all line cards in the system.

### Default

no selective-learned-fdb

configure service vprn ripng send

configure service vprn rip group neighbor send

configure service vprn ripng group send

configure service vprn rip group send

configure service vprn ripng group neighbor send

configure service vprn rip send

### Description

This command configures the type of RIP messages sent to RIP neighbors. This control can be issued at the global, group or interface level. The default behavior sends RIPv2 messages with the multicast (224.0.0.9) destination address.

If **version-1** is specified, the router only listens for and accepts packets sent to the broadcast address.

The **no** form of this command resets the type of messages sent back to the default value.

### Default

no send

### Parameters

#### ***broadcast***

Send RIPv2 formatted messages to the broadcast address.

#### ***multicast***

Send RIPv2 formatted messages to the multicast address.

#### ***none***

Do not send any RIP messages (i.e. silent listener).

#### ***version-1***

Send RIPv1 formatted messages to the broadcast address.

#### ***both***

Send both RIP v1 & RIP v2 updates to the broadcast address.

## 23.126 send-acct-stop-on-fail

```
send-acct-stop-on-fail
```

### Syntax

```
send-acct-stop-on-fail {[on-request-failure] [on-reject] [on-accept-failure]}
```

```
no send-acct-stop-on-fail
```

### Context

```
[Tree] (config>subscr-mgmt>auth-policy send-acct-stop-on-fail)
```

## Full Context

```
configure subscriber-mgmt authentication-policy send-acct-stop-on-fail
```

## Description

This command activates the reporting of RADIUS authentication failures of a PPPoE session to a RADIUS accounting server with an Accounting Stop message.

Three failure categories can be enabled separately:

- **on-request-failure**: All failure conditions between the sending of an Access-Request and the reception of an Access-Accept or Access-Reject.
- **on-reject**:
- **on-accept-failure**: All failure conditions that appear after receiving an Access-Accept and before successful instantiation of the host or session.

The RADIUS accounting policy to be used for sending the Accounting Stop messages must be obtained prior to RADIUS authentication via local user database pre-authentication.

The **no** form of this command reverts to the default.

## Parameters

### on-request-failure

Specifies that an accounting stop message is sent when a RADIUS Access-Request message could not be sent (for example, there is no server configured, or timeout).

### on-reject

Specifies that an accounting stop message is sent when an Access-Reject is received.

### on-accept-failure

Specifies that an accounting stop message is sent a failure occurred after the reception of a RADIUS Access-Accept message (such as a duplicate IP address).

## 23.128 send-bvpls-flush

### send-bvpls-flush

**Syntax**

```
send-bvpls-flush {[all-but-mine] [all-from-me]}
```

```
no send-bvpls-flush
```

**Context**

[\[Tree\]](#) (config>service>vpls>pbb send-bvpls-flush)

**Full Context**

```
configure service vpls pbb send-bvpls-flush
```

**Description**

This command enables generation of LDP MAC withdrawal "flush-all-from-me" in the B-VPLS domain when the following triggers occur in the related IVPLS:

- MC-LAG failure
- Failure of a local SAP
- Failure of a local pseudowire/SDP binding

A failure means transition of link SAP/pseudowire to either down or standby status.

This command does not require send-flush-on-failure in B-VPLS to be enabled on an IVPLS trigger to send an MAC flush into the BVPLS.

**Default**

```
no send-bvpls-flush
```

## Parameters

### **all-but-mine**

Specifies to send an LDP flush all-but-mine and also sent into the B-VPLS. Both parameters can be set together.

### **all-from-me**

Specifies to send an LDP flush-all-from and when STP initiates a flush, it is sent into the B-VPLS using LDP MAC flush all-from-me. Both parameters can be set together.

### send-chain

## Syntax

[no] **send-chain**

## Context

[\[Tree\]](#) (config>ipsec>cert-profile>entry send-chain)

## Full Context

configure ipsec cert-profile entry send-chain

## Description

Commands in this context configure the send-chain in the **cert-profile entry**.

The configuration of this command is optional, by default system will only send the certificate specified by **cert** command in the selected entry to the peer. This command allows system to send additional CA certificates to the peer. These additional CA certificates must be in the certificate chain of the certificate specified by the **cert** command in the same entry.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### send-chain

## Syntax

[no] **send-chain**

## Context

[\[Tree\]](#) (config>system>security>tls>cert-profile>entry send-chain)

## Full Context

configure system security tls cert-profile entry send-chain

## Description

This command enables the sending of certificate authority (CA) certificates, and enters the context to configure send-chain information.

By default, the system only sends the TLS server certificate or TLS client certificate specified by the **cert** command. If CA certificates are to be sent using send-chain, they must be in the chain of certificates specified by the **config>system>security>pki>ca-profile** command. The specification of the send-chain is not necessary for a working TLS profile if the TLS peer has the CA certificate used to sign the server or client certificate in its own trust anchor.

For example, given a TLS client running on SR OS, the ROOT CA certificate resides on the TLS server, but the subsequent SUB-CA certificate needed to complete the chain resides within SR OS. The **send-chain** command allows these SUB-CA certificates to be sent from SR OS to the peer to be authenticated using the ROOT CA certificate that resides on the peer.

The **no** form of the command disables the send-chain.

## Default

no send-chain

[\[Tree\]](#) (config>saa>test>type-multi-line>lsp-ping send-count)

## Full Context

configure saa test type-multi-line lsp-ping sr-policy send-count

configure saa test type-multi-line lsp-ping send-count

## Description

This command configures the number of messages to send. The *send-count* value is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message *interval* value must be expired before the next message request is sent.

The **no** form of this command reverts to the default value.

## Default

send-count 1

## Parameters

### *send-count*

Specifies the send count in number of packets.

**Values** 1 to 100

**Default** 1

## Platforms

All

## 23.131 send-default

### send-default

## Syntax

**send-default** [**ipv4**] [**ipv6**] [**export-policy** *export-policy*]

**no send-default**

## Context

[\[Tree\]](#) (config>router>bgp>group send-default)

[\[Tree\]](#) (config>router>bgp send-default)

## Full Context

configure router bgp group neighbor send-default

configure router bgp group send-default

configure router bgp send-default

## Description

This command enables the advertisement of a default route. When this command is configured to apply to an IBGP or EBGP session, the default route for IPv4 or IPv6 is automatically added to the Adj\_RIB-OUT of that peer. The advertised default routes are unrelated to any default routes installed in the FIB of the local router.

If a BGP export policy allows an active default route in the FIB of the local router to be advertised and conflict with this command, the artificially generated default route overrides the advertisement of the installed default route.

The artificially generated default route is not matched by BGP export policies. To modify its attributes or decide whether it should be advertised (based on a conditional expression), a route policy must be created and referenced by the **export-policy** parameter. Only conditional entries with an action and no from or to criteria are parsed. If there are no such entries, only the default action is applied.

The **no** form of this command restores the default behavior. At the group and neighbor levels, the default behavior is to inherit the configuration from a higher level. At the instance level, the default behavior is to neither generate nor inject a default route.

## Default

no send-default

## Parameters

### ipv4

Generates and advertises an IPv4 default route (0/0).

### ipv6

Generates and advertises an IPv6 default route (::/0).

### export-policy

Specifies the name of a route policy, up to 64 characters. Only the route modifications in the matching conditional-expression entry or the default action are applied. These modifications change the attributes of the advertised default routes.

### Full Context

```
configure service vprn subscriber-interface group-interface srrp send-fib-population-packets
configure service ies subscriber-interface group-interface srrp send-fib-population-packets
```

### Description

This command configures the mode used to send Fib population packets. When SRRP becomes master it generates gratuitous ARPs (GARPs) used by the Layer 2 access network to populate the correct SRRP gateway.

The **no** form of this command disables sending FDB population packets.

### Default

```
send-fib-population-packets all
```

### Parameters

#### *mode*

Specifies on which VLANs the gratuitous ARPs are sent.

**Values**    **all**: Generates, on SSRP master assignment, the GARPs on all VLANs  
               **out-tag-only**: Generates, on SRRP master assignment, the GARPs only on SAPs with unique outer VLAN and lowest VLAN tags

## 23.134 send-flush-on-failure

### send-flush-on-failure

## Syntax

[no] send-flush-on-failure

## Context

[\[Tree\]](#) (config>service>vpls send-flush-on-failure)

## Full Context

configure service vpls send-flush-on-failure

## Description

This command enables sending out flush-all-from-me messages to all LDP peers included in affected VPLS, in the event of physical port failures or "operationally down" events of individual SAPs. This feature provides an LDP-based mechanism for recovering a physical link failure in a dual-homed connection to a VPLS service. This method provides an alternative to RSTP solutions where dual homing redundancy and recovery, in the case of link failure, is resolved by RSTP running between a PE router and CE devices. If the endpoint is configured within the VPLS and send-flush-on-failure is enabled, flush-all-from-me messages will be sent out only when all spoke-SDPs associated with the endpoint go down.

This feature cannot be enabled on management VPLS.

## Default

no send-flush-on-failure

### Full Context

```
configure service vpls bgp-evpn vxlan send-imet-ir-on-ndf
```

## Description

This command controls the advertisement of Inclusive Multicast Ethernet Tag (IMET) routes for ingress replication in the case where the PE is Non-DF for a specified network interconnect VXLAN virtual ES. When enabled, the router will advertise IMET-IR routes even if the PE is NDF. This attracts BUM traffic but also speeds up convergence in case of DF failure.

The **no** form of this command withdraws the advertisement of the IMET-IR route on the network interconnect VXLAN NDF router.

## Default

send-imet-ir-on-ndf

## Platforms

**[Tree]** (config>router>bgp>group>outbound-route-filtering>extended-community send-orf)

**[Tree]** (config>router>bgp>outbound-route-filtering>extended-community send-orf)

## Full Context

configure router bgp group neighbor outbound-route-filtering extended-community send-orf

configure router bgp group outbound-route-filtering extended-community send-orf

configure router bgp outbound-route-filtering extended-community send-orf

## Description

This command instructs the router to negotiate the send capability in the BGP outbound route filtering (ORF) negotiation with a peer.

This command also causes the router to send a community filter, prefix filter, or AS path filter configured as an inbound filter on the BGP session to its peer as an ORF Action ADD.

The **no** form of this command causes the router to remove the send capability in the BGP ORF negotiation with a peer.

The **no** form also causes the router to send an ORF remove action for a community filter, prefix filter, or AS path filter configured as an inbound filter on the BGP session to its peer.

If the *comm-id* parameters are not exclusively route target communities then the router will extract appropriate route targets and use those. If, for some reason, the *comm-id* parameters specified contain no route targets, then the router will not send an ORF.

### Default

no send-orf

### Parameters

#### *comm-id*

Specifies up to 32 community policies, which must consist exclusively of route target extended communities. If it is not specified, then the ORF policy is automatically generated from configured route target lists, accepted client route target ORFs and locally configured route targets.

**Values** [target: {*ip-address:comm-val* | *2byte-asnumber.ext-comm-val* | *4byte-asnumber:comm-val*}

where:

- *ip-address* — a.b.c.d
- *comm-val* — 0 to 65535
- *2byte-asnumber* — 0 to 65535
- *ext-comm-val* — 0 to 4294967295
- *4byte-asnumber* — 0 to 4294967295

configure service vpls sap igmp-snooping send-queries
configure service vpls mesh-sdp mld-snooping send-queries
configure service vpls mesh-sdp igmp-snooping send-queries
```

## Description

This command specifies whether to send IGMP general query messages on the SAP or SDP.

When `send-queries` is configured, all type of queries generate ourselves are of the configured version. If a report of a version higher than the configured version is received, the report will get dropped and a new wrong version counter will get incremented. If `send-queries` is not configured, the version command has no effect. The version used will be the version of the querier. This implies that, for example, when we have a v2 querier, we will never send out a v3 group or group-source specific query when a host wants to leave a certain group.

If **mrouter-port** is enabled on this SAP or spoke SDP, the **send-queries** command parameter cannot be set.

The **no** form of this command disables the IGMP general query messages.

```

### Full Context

```
configure service vprn bgp group neighbor link-bandwidth send-to-ebgp
configure service vprn bgp group link-bandwidth send-to-ebgp
```

### Description

This command configures BGP to allow link-bandwidth extended community to be sent in routes advertised to EBGp peers in the scope of the command, as long the routes belong to one of the listed address families.

The link-bandwidth extended community is encoded as a non-transitive type. This means that by default it should not be attached to any route advertised to an EBGp peer and it should be discarded when received in any route from an EBGp peer. This command overrides the standard behavior.

Up to three families may be configured.

The **no** form of this command restores the default behavior of stripping the link-bandwidth extended community from any route advertised to an EBGp peer.

### Default

no send-to-ebgp

### Parameters

#### *family*

Specifies the address families for which receiving the link-bandwidth extended community from EBGp peers should be supported.

- Values**
- ipv4 — Adds a link-bandwidth extended community to unlabeled unicast IPv4 routes.
  - label-ipv4 — Adds a link-bandwidth extended community to labeled-unicast IPv4 routes.
  - ipv6 — Adds a link-bandwidth extended community to unlabeled unicast IPv6 routes.

## Full Context

configure eth-cfm system sender-id

## Description

This command allows the operator to include the configured "system name" (chassis3) or a locally configured value in ETH-CFM PDUs sent from MEPs and MIPs. The operator may only choose one of these options to use for ETH-CFM. MEPs include the **sender-id** TLV for CCM (not sub second CCM enabled MEPs), LBM/LBR, and LTM/LTR. MIPs include this value in the LBR and LTR PDUs.

### Note:

LBR functions reflect all TLVs received in the LBM unchanged, including the SenderID TLV.

## Parameters

### *local-name*

Specifies a local alphanumeric string different from the "system name" chassis(3) value that can be used for other means, up to 45 characters.

### **system**

Allows ETH-CFM to use the configured "system name" value as the chassis(3).

## 23.150 server

server

**Syntax**

radius-accounting-server

**Context**

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>server server)

**Full Context**

configure subscriber-mgmt radius-accounting-policy radius-accounting-server server

**Description**

Commands in this context define RADIUS server attributes under a given session authentication policy.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**server****Syntax**

**server** *server-index* **address** *ip-address* **secret** *key* [**hash** | **hash2** | **custom**] [**port** *port-num*] [**coa-only**]  
 [**pending-requests-limit** *limit*]

**no server** *index*

**Context**

[\[Tree\]](#) (config>subscr-mgmt>auth-plcy>radius-auth-server server)

**Full Context**

configure subscriber-mgmt authentication-policy radius-authentication-server server

**Description**

This command adds a RADIUS server and configures the RADIUS server IP address, index, and key values.

Up to sixteen RADIUS servers can be configured at any one time in a RADIUS authentication policy. Only five can be used for authentication, all other servers should be configured as coa-only servers. RADIUS servers are accessed in order from lowest to highest index for authentication or accounting requests until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other RADIUS servers are queried.

The **no** form of this command removes the server index from the configuration.

**Parameters*****server-index***

Specifies the index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

**Values** 1 to 16 (a maximum of 5 authentication servers)

**ip-address**

Specifies the IP address of the RADIUS server. Two RADIUS servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

**key**

Specifies the secret key to access the RADIUS server. This secret key must match the password on the RADIUS server.

**Values** secret-key: Up to 20 characters.  
hash-key: Up to 33 characters.  
hash2-ke: Up to 55 characters.

**hash**

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**hash2**

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**custom**

Specifies the custom encryption to management interface.

**port-num**

Specifies the UDP port number on which to contact the RADIUS server for authentication.

**Values** 1 to 65535

**coa-only**

Specifies Change-of-Authorization Messages only. Servers that are marked with the coa-only flag will not be used for authentication, but they are able to accept RADIUS CoA messages, independent of the accept-authorization-change setting in the authentication policy.

For authentication purposes, the maximum number of servers is 5. All other servers may only be used as coa-only servers.

**limit**

Specifies the maximum number of outstanding RADIUS authentication requests for this authentication server.

**Values** 1 to 4096

**Default** The default value when not configured is 4096

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## server

### Syntax

**server** *ip-address*

**no server**

### Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe>host server)

### Full Context

configure subscriber-mgmt local-user-db ipoe host server

### Description

This command configures the IP address of the DHCP server to relay to.

The configured DHCP server IP address must reference one of the addresses configured under the DHCP CLI context of an IES/VPDN subscriber or group interface.

The **no** form of this command reverts to the default.

### Parameters

***ip-address***

Specifies the IP address of the DHCP server.

**Values** a.b.c.d

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## server

### Syntax

**server** *ip-address*

**no server**

### Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>ipv6>dhcp6>relay server)

### Full Context

configure service vprn subscriber-interface group-interface ipv6 dhcp6 relay server

### Description

This command configures the IPv6 address of the DHCP6 server to relay to.

The configured DHCP6 server IPv6 address must reference one of the addresses configured under the DHCP6 CLI context of an IES/VPDN subscriber or group interface.

The **no** form of this command reverts to the default.

## Parameters

### ***ip-address***

Specifies up to eight IPv6 addresses of the DHCP6 server.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## server

## Syntax

**server** [**service** *service-id*] **name** *server-name*

**no server**

## Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe>host>match-radprox-cache server)

## Full Context

configure subscriber-mgmt local-user-db ipoe host match-radius-proxy-cache server

## Description

This command specifies the name of radius-proxy-server and optionally id of the service that the radius-proxy-server resides in.

The **no** form of this command removes the parameters from the configuration.

## Parameters

### **service** *service-id*

Specifies the ID or name of the service.

**Values** 1 to 214748365  
svc-name up to 64 char maximum

### **name** *server-name*

Specifies the name of radius-proxy-server up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## server

### Syntax

**server** *ipv6z-address* [*ipv6z-address*]

**no server** [*ipv6z-address*]

### Context

**[Tree]** (config>service>ies>if>ipv6>dhcp6 server)

### Full Context

configure service ies interface ipv6 dhcp6 server

### Description

This command specifies a list of servers where DHCP6 requests are forwarded. The list of servers can be entered as either IP addresses or fully qualified domain names. There must be at least one server specified for DHCP6 relay to work. If there are multiple servers then the request is forwarded to all servers in the list.

The **no** form of this command reverts to the default.

### Parameters

#### *ipv6z-address*

Specifies up to eight non-global IPv4 addresses including a zone index as defined by the InetAddressIPv4z textual convention.

#### Values

ipv6z-address: x:x:x:x:x:x:x (eight 16-bit pieces)  
 x:x:x:x:x:d.d.d.d  
 x: [0 to FFFF]H  
 d: [0 to 255]D

## server

### Syntax

**server** *server1* [*server2*]

### Context

**[Tree]** (config>service>ies>if>dhcp server)

**[Tree]** (config>service>ies>sub-if>grp-if>dhcp server)

**[Tree]** (config>service>vprn>if>dhcp server)

## Full Context

```
configure service ies interface dhcp server
configure service ies subscriber-interface group-interface dhcp server
configure service vprn interface dhcp server
```

## Description

This command specifies a list of servers where requests are forwarded. The list of servers can be entered as either IP addresses or fully qualified domain names. There must be at least one server specified for DHCP relay to work. If there are multiple servers then the request is forwarded to all servers in the list.

There can be a maximum of 8 DHCP servers configured.

The **no** form of this command reverts to the default.

## Parameters

### **server**

Specifies up to eight DHCP server IP addresses.

## Platforms

All

- configure service vprn interface dhcp server
- configure service ies interface dhcp server

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface dhcp server

configure service ies subscriber-interface local-address-assignment server
configure service ies subscriber-interface group-interface local-address-assignment server
configure service vprn subscriber-interface group-interface local-address-assignment server
```

```
configure service vprn subscriber-interface local-address-assignment server
```

## Description

This command designates a local DHCPv4 server for local pools management where IPv4 addresses for PPPoXv4 clients are allocated without the need for the internal DHCP relay-agent. Those addresses are tied to PPPoX sessions and they are de-allocated when the PPPoX session is terminated.

## Parameters

### ***server-name***

Specifies the name of the local DHCP server.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## server

## Syntax

```
server server-index address ip-address secret key [hash | hash2 | custom] [port port] [create]
```

```
no server server-index
```

## Context

[\[Tree\]](#) (config>aaa>l2tp-acct-plcy>radius-acct-server server)

## Full Context

```
configure aaa l2tp-accounting-policy radius-accounting-server server
```

## Description

This command adds a RADIUS server and configures the RADIUS server IP address, index, and key values.

Up to five RADIUS servers can be configured at any one time. RADIUS servers are accessed in order from lowest to highest index for authentication requests until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other RADIUS servers are queried.

The **no** form of this command removes the server from the configuration.

## Parameters

### ***server-index***

The index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

**Values** 1 to 16 (a maximum of 5 accounting servers)

### ***address ip-address***

The IP address of the RADIUS server. Two RADIUS servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

#### **secret key**

The secret key to access the RADIUS server. This secret key must match the password on the RADIUS server.

**Values** secret-key — A string up to 20 characters.  
 hash-key — A string up to 33 characters.  
 hash2-key — A string up to 55 characters.

#### **hash**

Specifies the key is entered in an encrypted form. If the hash parameter is not used, the key is assumed to be in a non-encrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the hash parameter specified.

#### **hash2**

Specifies the key is entered in a more complex encrypted form. If the hash2 parameter is not used, the less encrypted hash form is assumed.

#### **custom**

Specifies the custom encryption to management interface.

#### **port**

Specifies the UDP port number on which to contact the RADIUS server for authentication.

**Values** 1 to 65535

### **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## **server**

### **Syntax**

**server** *server-index* **address** *ip-address* **secret** *key* [**hash** | **hash2** | **custom**] [**port** *port*] [**create**]  
**no server** *server-index*

### **Context**

[\[Tree\]](#) (config>app-assure>rad-acct-plcy>server server)

### **Full Context**

configure application-assurance radius-accounting-policy radius-accounting-server server

### **Description**

This command adds a RADIUS server and configures the RADIUS server IP address, index, and key values.

Up to five RADIUS servers can be configured at any one time. RADIUS servers are accessed in order from lowest to highest index for authentication requests until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other RADIUS servers are queried.

The **no** form of this command removes the server from the configuration.

## Parameters

### ***server-index***

The index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

**Values** 1 to 16 (a maximum of 5 accounting servers)

### ***ip-address***

The IP address of the RADIUS server. Two RADIUS servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

### ***secret key***

The secret key to access the RADIUS server. This secret key must match the password on the RADIUS server.

**Values** secret-key — A string up to 20 characters  
hash-key — A string up to 33 characters  
hash2-key — A string up to 55 characters

### ***hash***

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### ***hash2***

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### ***custom***

Specifies the custom encryption to management interface.

### ***port***

Specifies the UDP port number on which to contact the RADIUS server for authentication.

**Values** 1 to 65535

## Platforms

configure service vprn radius-server server

configure router radius-server server

### Description

This command either specifies an external RADIUS server in the corresponding routing instance or enters configuration context of an existing server. The configured server could be referenced in the radius-server-policy.

The **no** form of this command removes the parameters from the server configuration.

### Parameters

#### *server-name*

Specifies the name of the external RADIUS server.

#### *ip-address*

Specifies the IPv4 or IPv6 IP address of the external RADIUS server.

#### *key*

Specifies the shared secret key of the external RADIUS server, up to 64 characters.

**hash**

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**hash2**

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**server****Syntax**

**server** *server-name* [**create**] [**purpose** {[**accounting** | **authentication**]}] [**wlan-gw-group** *group-id*]

**no server** *server-name*

**Context**

[\[Tree\]](#) (config>service>vprn>radius-proxy server)

[\[Tree\]](#) (config>router>radius-proxy server)

**Full Context**

configure service vprn radius-proxy server

configure router radius-proxy server

**Description**

This command creates a RADIUS-proxy server in the corresponding routing instance. The proxy server can be configured for the purpose of proxying authentication or accounting or both.

If a WLAN-GW ISA group is specified, then the RADIUS proxy server is instantiated on the set of ISAs in the specified wlan-gw group. The RADIUS messages from the AP are load-balanced to these ISAs. The ISA that processes the RADIUS message then hashes this message to the ISA that anchors the UE. The hash is based on UE MAC address (required to be present in the calling-station-id attribute) in the RADIUS message.

If the **create** parameter is not specified, then this command enters configuration context of the specified RADIUS-proxy server.

The **no** form of this command removes the server-name and parameters from the radius-proxy configuration.

**Parameters*****server-name***

Specifies the name of the RADIUS-proxy server.

**create**

Specifies that the system will create the specified RADIUS-proxy server.

**purpose**

Specifies the purpose the RADIUS-proxy server.

**Values**    accounting — proxy accounting packets  
              authentication — proxy authentication packets

***group-id***

Specifies the WLAN-GW ISA group.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**server****Syntax**

**server** *ipv6-address* [ *ipv6-address*]

**no server** [*ipv6-address* [*ipv6-address*]]

**Context**

[\[Tree\]](#) (config>service>vprn>sub-if>wlan-gw>pool-manager>dhcp6-client server)

**Full Context**

configure service vprn subscriber-interface wlan-gw pool-manager dhcpv6-client server

configure service ies subscriber-interface wlan-gw pool-manager dhcpv6-client server

**Description**

This specifies the DHCPv6 servers that are used for requesting addresses.

The **no** form of this command removes the server. This cannot be executed while any DHCPv6 client application is not shut down.

**Parameters*****ipv6-address***

Specifies up to 8 unicast IPv6 addresses of a DHCP6 server.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## server

### Syntax

**server** *index* **address** *ip-address* **secret** *key* [{**hash** | **hash2** | **custom**}] [**port** *port*]

**no server** *index*

### Context

[\[Tree\]](#) (config>service>vprn>aaa>remote-servers>tacplus server)

### Full Context

configure service vprn aaa remote-servers tacplus server

### Description

This command adds a TACACS+ server and configures the TACACS+ server IP address, index, and key values.

Up to five TACACS+ servers can be configured at any one time. TACACS+ servers are accessed in order from lowest index to the highest index for authentication requests.

The **no** form of this command removes the server from the configuration.

### Default

No TACACS+ servers are configured.

### Parameters

#### *index*

Specifies the index for the TACACS+ server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from the lowest index to the highest index.

**Values** 1 to 5

#### *ip-address*

Specifies the IP address of the TACACS+ server. Two TACACS+ servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

**Values**

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0..FFFF]H
	d: [0..255]D

#### *key*

Specifies the secret key, up to 128 characters, for access to the TACACS+ server. This secret key must match the password on the TACACS+ server.

**Values** Up to 128 characters in length.

#### **hash**

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

#### **hash2**

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

#### **custom**

Specifies the custom encryption to management interface.

#### **port**

Specifies the port ID.

**Values** 0 to 65535

### **Platforms**

configure service vprn router-advertisement interface dns-options server

configure service vprn router-advertisement dns-options server

### **Description**

This command specifies the IPv6 DNS servers to include in the RDNSS option in Router Advertisements. When specified at the router advertisement level this applies to all interfaces that have **include-dns** enabled, unless the interfaces have more specific **dns-options** configured.

## Parameters

### *ipv6-address*

Specifies the IPv6 address of the DNS server(s), up to a maximum of four, specified as eight 16-bit hexadecimal pieces.

## Platforms

All

## server

## Syntax

**server** *ip-address[:port]* [**create**]

**no server** *ip-address[:port]*

## Context

[\[Tree\]](#) (config>app-assure>group>url-filter>icap server)

## Full Context

configure application-assurance group url-filter icap server

## Description

This command configures the IP address and server port of the ICAP server.

## Parameters

### *ip-address[:port]*

Specifies the ICAP server IP address and port.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## server

## Syntax

**server** *ip-address* [*ip-address*] **router** *router-instance*

## Full Context

```
configure service vprn interface sap ipsec-gw dhcp server
configure service ies interface sap ipsec-gw dhcp server
```

## Description

This command specifies up to eight DHCPv4 server addresses for DHCPv4-based address assignment. If multiple server addresses are specified, the first advertised DHCPv6 address received is chosen.

## Default

no server

## Parameters

### *ip-address*

Specifies up to eight unicast IPv4 addresses.

**Values**            ipv4-address    a.b.c.d

### *router-instance*

Specifies the router instance ID used to reach the configured server address.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **server ip-address service-name service-name** variant can be used in all configuration modes.

**Values**    {router-name | vprn-svc-id}

*vprn-svc-id:*    1 to 2147483647

*router-name:*    *router-name* is an alias for input only.  
The *router-name* gets replaced with an id automatically by SR OS in the configuration).

**Default**    Base

### *service-name*

Specifies the name of the IES or VPRN service used to reach the configured server address, up to 64 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## server

## Syntax

```
server ipv6-address [ipv6-address] router router-instance
```

```
server ipv6-address [ipv6-address] service-name service-name
no server
```

configure service vprn interface sap ipsec-gw dhcp6 server

## Description

This command specifies up to eight DHCPv6 server addresses for DHCPv6-based address assignment. If multiple server addresses are specified, the first advertised DHCPv6 address received is chosen.

## Default

no server

## Parameters

### *ipv6-address*

Specifies up to eight unicast global unicast IPv6 addresses.

Values	ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:d.d.d.d
		x - [0..FFFF]H
		d - [0..255]D

### *router-instance*

Specifies the router instance ID used to reach the configured server address.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **server ip-address service-name service-name** variant can be used in all configuration modes.

Values	{router-name   vprn-svc-id}
	<i>vprn-svc-id</i> : 1 to 2147483647
	<i>router-name</i> : <i>router-name</i> is an alias for input only. The <i>router-name</i> gets replaced with an id automatically by SR OS in the configuration).

**Default** Base

**service-name**

Specifies the name of the IES or VPRN service used to reach the configured server address, up to 64 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**server****Syntax**

**server** *server-index* [ **create**]

**no server** *server-index*

**Context**

[\[Tree\]](#) (config>aaa>isa-radius-plcy>servers server)

**Full Context**

configure aaa isa-radius-policy servers server

**Description**

This command adds a RADIUS server and configures the RADIUS server IP address, index, and key values.

Up to five RADIUS servers can be configured at any one time. RADIUS servers are accessed in order from lowest to highest index for authentication requests until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other RADIUS servers are queried.

The **no** form of the command removes the server from the configuration.

**Parameters****server-index**

The index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

**Values** 1 to 10 (a maximum of 5 accounting servers)

**create**

Keyword used to create the server index.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## server

### Syntax

**server**

### Context

[\[Tree\]](#) (config>test-oam>twamp server)

### Full Context

configure test-oam twamp server

### Description

This command configures the node for TWAMP server functionality.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## server

### Syntax

**server** *server* [*server*]

### Context

[\[Tree\]](#) (config>router>if>dhcp server)

### Full Context

configure router interface dhcp server

### Description

This command specifies a list of servers where requests will be forwarded. The list of servers can be entered as either IP addresses or fully qualified domain names. There must be at least one server specified for DHCP relay to work. If there are multiple servers then the request is forwarded to all of the servers in the list. There can be a maximum of eight DHCP servers configured.

The flood command is applicable only in the VPLS case. There is a scenario with VPLS where the VPLS node only wants to add Option 82 information to the DHCP request to provider per-subscriber information, but it does not do full DHCP relay. In this case, the server is set to "flood". This means the DHCP request is still a broadcast and is sent through the VPLS domain. A node running at Layer 3 further upstream then can perform the full Layer 3 DHCP relay function.

### Default

no server

## Parameters

### *server*

Specifies the DHCP server IP address. A maximum of eight servers can be specified in a single statement.

## Platforms

All

```
server
```

## Syntax

```
server ipv6-address [ipv6-address]
```

```
no server
```

## Context

[\[Tree\]](#) (config>router>router-advert>dns-options server)

[\[Tree\]](#) (config>router>router-advert>if>dns-options server)

## Full Context

```
configure router router-advertisement dns-options server
```

```
configure router router-advertisement interface dns-options server
```

## Description

This command specifies the IPv6 DNS servers to include in the RDNSS option in Router Advertisements. When specified at the router advertisement level this applies to all interfaces that have **include-dns** enabled, unless the interfaces have more specific **dns-options** configured.

## Parameters

### *ipv6-address*

Specifies the IPv6 address of the DNS servers as eight 16-bit hexadecimal pieces. A maximum of four ipv6 addresses can be specified in a single statement.

## Platforms

All

```
server
```

## Syntax

```
server pcp-server-name [create]
```

```
no server pcp-server-name
```

## Context

[\[Tree\]](#) (config>router>pcp-server server)

## Full Context

configure router pcp-server server

## Description

Commands in this context configure a PCP server.

The **no** form of this command deletes the specified PCP server.

## Parameters

### *pcp-server-name*

Specifies the PCP server name, up to 32 characters.

### **create**

Creates a PCP server before entering the context to configure it.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## server

## Syntax

**server** [**router** *router-instance* | **service-name** *service-name*] {*ip-address* | *ipv6-address* | **ptp**} [**key-id** *key-id* | **authentication-keychain** *keychain-name*] [**version** *version*] [**prefer**]

**no server** [**router** *router-instance* | **service-name** *service-name*] {*ip address* | *ipv6-address* | **ptp**}

## Context

[\[Tree\]](#) (config>system>time>ntp server)

## Full Context

configure system time ntp server

## Description

This command configures the node to operate in client mode with the NTP server specified in the address field of this command.

If the internal PTP process is used as a source of time for System Time and OAM time then it must be specified as a server for NTP. If PTP is specified, the **prefer** parameter must be specified. After PTP has established a UTC traceable time from an external grandmaster it is always the source for time into NTP, even if PTP goes into time holdover. PTP applies only to the 7450 ESS and 7750 SR.

Using the internal PTP time source for NTP promotes the internal NTP server to stratum 1 level, which may impact the NTP network topology.

The **no** form of this command removes the server with the specified address from the configuration.

## Parameters

### *router-instance*

Specifies the routing context that contains the interface in the form of *router-name* or *service-id*.

**Values** *router-name* — Base | Management  
*service-id* — 1 to 2147483647

**Default** Base

### *service name*

Specifies the service name for the VPRN, up to 64 characters. CPM routing instances are not supported.

### *ip-address*

Configures the IPv4 address of an external NTP server.

**Values** a.b.c.d

### *ipv6-address*

Configures the IPv6 address of an external NTP server.

**Values**

- x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x: [0 to FFFF] H
- d: [0 to 255] D

### *key-id*

Specifies the key ID that identifies the configured authentication key and authentication type used by this node to transmit NTP packets to an NTP server. If an NTP packet is received by this node, the authentication key-id, type, and key value must be valid, otherwise the packet is rejected and an event/trap generated. This is an optional parameter.

**Values** 1 to 255

### *keychain-name*

Identifies the keychain name, up to 32 characters.

### *version*

Configures the NTP version number that is expected by this node. This is an optional parameter.

**Values** 2 to 4

**Default** 4

### *ptp*

Configures the internal PTP process as a time server into the NTP process. The **prefer** parameter is mandatory with this server option.

**prefer**

Specifies that, when configuring more than one peer, one remote system can be configured as the preferred peer. When a second peer is configured as preferred, the new entry overrides the old entry.

**Platforms**

All

**server****Syntax**

**server**

**Context**

**[Tree]** (config>system>security>ssh>key-re-exchange server)

**Full Context**

configure system security ssh key-re-exchange server

**Description**

This command enables the key re-exchange context for the SSH server.

**Platforms**

All

**server****Syntax**

**server** *index* **address** *ip-address* **secret** *key* [**hash** | **hash2** | **custom**] [**tls-client-profile** *profile*]  
[**authenticator** {**md5** | **sm3**}]

**no server** *index*

**Context**

**[Tree]** (config>system>security>radius server)

**[Tree]** (config>service>vprn>aaa>remote-servers>radius server)

**Full Context**

configure system security radius server

configure service vprn aaa remote-servers radius server

**Description**

This command adds a RADIUS server and configures the IP address, index, and key values.

Up to five RADIUS servers can be configured at any one time. For authentication requests, RADIUS servers are accessed in order from the lowest to highest index until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other RADIUS servers are queried. It is assumed that there are multiple identical servers configured as backups and that the servers do not have redundant data.

The **no** form of this command removes the server from the configuration.

## Default

no server

## Parameters

### *index*

Specifies the index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

**Values** 1 to 5

### *ip-address*

Specifies the IP address of the RADIUS server. Two RADIUS servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

<b>Values</b>		
ipv4-address		a.b.c.d (host bits must be 0)
ipv6-address		x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:d.d.d.d
		x: [0..FFFF]H
		d: [0..255]D

### *key*

Specifies the secret key to access the RADIUS server, up to 64 characters. This secret key must match the password on the RADIUS server.

### *hash*

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### *hash2*

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### *custom*

Specifies the custom encryption to management interface.

#### **tls-client-profile**

Specifies the TLS profile for the RADIUS server.

#### **profile**

Specifies the TLS profile name, up to 32 characters.

#### **md5**

Specifies the MD5 hash algorithm for the RADIUS server.

#### **sm3**

Specifies the SM3 hash algorithm for the RADIUS server.

### **Platforms**

All

## **server**

### **Syntax**

**server** *index* **address** *ip-address* **secret** *key* [**hash** | **hash2** | **custom**] [**port** *port*]

**no server** *index*

### **Context**

[\[Tree\]](#) (config>system>security>tacplus server)

### **Full Context**

configure system security tacplus server

### **Description**

This command adds a TACACS+ server and configures the TACACS+ server IP address, index, and key values.

Up to five TACACS+ servers can be configured at any one time. TACACS+ servers are accessed in order from lowest index to the highest index for authentication requests.

The **no** form of this command removes the server from the configuration.

### **Parameters**

#### ***index***

Specifies the index for the TACACS+ server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from the lowest index to the highest index.

**Values** 1 to 5

#### ***ip-address***

Specifies the IP address of the TACACS+ server. Two TACACS+ servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

Values	ipv4-address	a.b.c.d (host bits must be 0)
	ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x: [0..FFFF]H d: [0..255]D

**key**

Specifies the secret key, up to 128 characters, to access the TACACS+ server. This secret key must match the password on the TACACS+ server.

**hash**

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**hash2**

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**custom**

Specifies the custom encryption to management interface.

**port**

Specifies the port ID.

**Values** 0 to 65535

**server** *server-index* [ **create**]

**no server** *server-index*

**Context**

[\[Tree\]](#) (config>system>security>ldap server)

## Full Context

configure system security ldap server

## Description

This command configures an LDAP server. Up to five servers can be configured, which can then work in a redundant manner.

The **no** version of this command removes the server connection.

## Parameters

### *server-index*

Specifies a unique LDAP server connection.

**Values** 1 to 5

## Platforms

All

server

## Syntax

**server** *server-index* **address** *ip-address* **secret** *key* [**hash** | **hash2** | **custom**] [**auth-port** *auth-port*] [**acct-port** *acct-port*] [**type** *server-type*]

## Context

[\[Tree\]](#) (config>system>security>dot1x>radius-plcy server)

## Full Context

configure system security dot1x radius-plcy server

## Description

This command adds a Dot1x server and configures the Dot1x server IP address, index, and key values.

Up to five Dot1x servers can be configured at any one time. Dot1x servers are accessed in order from lowest to highest index for authentication requests until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other Dot1x servers are queried. It is assumed that there are multiple identical servers configured as backups and that the servers do not have redundant data.

The **no** form of this command removes the server from the configuration.

## Default

no server

## Parameters

### *server-index*

Specifies the index for the Dot1x server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

**Values** 1 to 5

### *ip-address*

Specifies the IP address of the Dot1x server. Two Dot1x servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

### *key*

Specifies the secret key, up to 128 characters, to access the Dot1x server. This secret key must match the password on the Dot1x server.

### *hash*

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### *hash2*

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### *custom*

Specifies the custom encryption to management interface.

### *acct-port*

Specifies the UDP port number on which to contact the RADIUS server for accounting requests.

### *auth-port*

Specifies a UDP port number to be used as a match criteria.

**Values** 1 to 65535

### *server-type*

Specifies the server type.

**Values** authorization, accounting, combined

configure application-assurance group policy app-filter entry server-address

**Description**

This command configures the server address to use in application definition. The server IP address may be the source or destination, network or subscriber IP address and may include the use of netmasks.

The **no** form of this command restores the default (removes the server address from application criteria defined by this entry).

**Default**

no server-address

**Parameters****eq**

Specifies a comparison operator that the value configured and the value in the flow are equal.

**neq**

Specifies a comparison operator that the value configured differs from the value in the flow.

***ip-address***

Specifies a valid unicast address.

Values		
	ipv4-address	a.b.c.d[/mask] mask - [1..32]
	ipv6-address	x:x:x:x:x:x/prefix-length x:x:x:x:x:d.d.d.d x - [0..FFFF]H d - [0..255]D prefix-length [1..128]

***netmask***

Specifies an IPv4 or IPv6 address mask.

Values		
	ipv4-address	a.b.c.d
	ipv6-address	x:x:x:x:x:x (eight 16-bit) x:x:x:x:x:d.d.d.d x - [0..FFFF]H d - [0..255]D

***masked-ip-address***

Specifies a valid unicast IPv4 or IPv6 address.

Values		
	ipv4-address	a.b.c.d
	ipv6-address	x:x:x:x:x:x (eight 16-bit) x:x:x:x:x:d.d.d.d x - [0..FFFF]H d - [0..255]D

***dns-ip-cache-name***

Specifies a DNS IP cache name, up to 32 characters.

***ip-prefix-list-name***

Specifies the name of an IP prefix list, up to 32 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## server-address

### Syntax

**server-address** *ip-address* [**version** *version-number*] [**normal** | **preferred**]  
[**interval** *seconds*]  
**no server-address** *ip-address*

### Context

**[Tree]** (config>system>time>ntp server-address)

### Full Context

configure system time ntp server-address

### Description

This command creates an SNTP server for unicast client mode.

### Parameters

#### *ip-address*

Specifies the IP address of the SNTP server.

**Values** a.b.c.d

#### *version-number*

Specifies the SNTP version supported by this server.

**Values** 1 to 3

**Default** 3

#### **normal** | **preferred**

Specifies the preference value for this SNTP server. When more than one time-server is configured, one server can have preference over others. The value for that server should be set to **preferred**. Only one server in the table can be a preferred server.

**Default** normal

#### *seconds*

Specifies the frequency at which this server is queried.

**Values** 64 to 1024

**Default** 64

### server-cipher-list

#### Syntax

**server-cipher-list**

#### Context

[\[Tree\]](#) (config>system>security>ssh server-cipher-list)

#### Full Context

configure system security ssh server-cipher-list

#### Description

Commands in this context configure a list of allowed ciphers by the SSH server.

#### Platforms

All

### server-cipher-list

#### Syntax

**server-cipher-list** *name* [create]

**no server-cipher-list** *name*

#### Context

[\[Tree\]](#) (config>system>security>tls server-cipher-list)

#### Full Context

configure system security tls server-cipher-list

#### Description

This command creates the cipher list that is compared against cipher lists sent by the client to the server in the client hello message. The list contains all ciphers that are supported and desired by SR OS for use in the TLS session. The first common cipher found in both the server and client cipher lists will be chosen. As such, the most desired ciphers should be added at the top of the list.

The **no** form of the command removes the cipher list.

#### Parameters

*name*

Specifies the name of the server cipher list, up to 32 characters in length.

**create**

Keyword used to create the server cipher list.

**Platforms**

All

## 23.153 server-group-list

**[Tree]** (config>service>vprn>sub-if>grp-if>ipv6>dhcp6>proxy server-id)

### Full Context

configure service vprn dhcp6 local-dhcp-server server-id

configure router dhcp6 local-dhcp-server server-id

configure service ies subscriber-interface group-interface ipv6 dhcp6 proxy-server server-id

configure service vprn subscriber-interface group-interface ipv6 dhcp6 proxy-server server-id

### Description

This command allows the operator to customize the **server-id** attribute of a DHCPv6 message (such as DHCPv6 advertise and reply). By default, the **server-id** uses DUID-ll derived from the chassis link layer address. Operators have the option to use a unique identifier by using the **duid-en** (vendor based on an enterprise number). There is a maximum length associated with the customizable hex-string and ascii-string.

The **no** form of this command reverts to the default.

### Default

server-id duid-ll

### Parameters

#### **hex-string**

Specifies a DUID system ID in a hex format.

**Values** 0x0 to 0xFFFFFFFF (maximum 116 hex nibbles)

#### **ascii-string**

Specifies a DUID system ID in an ASCII format, up to 58 characters.

#### **duid-ll**

Specifies that the DUID system ID is derived from the system link layer address.

#### **duid-en**

Specifies the enterprise number.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.155 server-ip

### server-ip

**Syntax**

**server-ip** {**eq** | **neq**} *ip-address*

**no server-ip**

**Context**

[\[Tree\]](#) (debug>app-assure>group>traffic-capture>match server-ip)

**Full Context**

debug application-assurance group traffic-capture match server-ip

**Description**

This command configures debugging on a servicer IP address.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.156 server-kex-list

### server-kex-list

**Syntax**

**server-kex-list**

**Context**

[\[Tree\]](#) (config>system>security>ssh server-kex-list)

**Full Context**

configure system security ssh server-kex-list

### Description

This command allows the user to configure SSH KEX algorithms for SR OS as an SSH server. An empty list is the default list that the SSH KEX advertises. The default list contains the following:

```
diffie-hellman-group16-sha512
diffie-hellman-group14-sha256
diffie-hellman-group14-sha1
diffie-hellman-group1-sha1
```

### Platforms

All

## 23.157 server-mac-list

### server-mac-list

#### Syntax

```
server-mac-list
```

#### Context

[\[Tree\]](#) (config>system>security>ssh server-mac-list)

#### Full Context

```
configure system security ssh server-mac-list
```

#### Description

This command allows the user to configure SSH MAC algorithms for SR OS as an SSH server.

#### Platforms

All

## 23.158 server-policy

### server-policy

#### Syntax

```
server-policy policy-name
no server-policy
```

## Context

[\[Tree\]](#) (config>service>dynsvc>acct-1 server-policy)

[\[Tree\]](#) (config>service>dynsvc>acct-2 server-policy)

## Full Context

configure service dynamic-services dynamic-services-policy accounting-1 server-policy

configure service dynamic-services dynamic-services-policy accounting-2 server-policy

## Description

This command configures the radius server policy to be used for dynamic data services RADIUS accounting.

The **no** form of this command removes the radius server policy from the configuration. This is only allowed when there are no active dynamic data services referencing this policy.

## Parameters

### *policy-name*

Specifies the name of the radius server policy.

**Values** Up to 32 characters maximum

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## server-policy

## Syntax

**server-policy** *policy-name*

**no server-policy**

## Context

[\[Tree\]](#) (config>service>dynsvc>plcy>auth server-policy)

## Full Context

configure service dynamic-services dynamic-services-policy authentication server-policy

## Description

This command configures the RADIUS server policy to be used for RADIUS authentication of data-triggered dynamic services.

Local authentication and RADIUS authentication are mutually exclusive.

The **no** form of this command removes the server policy from the configuration and disables RADIUS authentication.

## Parameters

### *policy-name*

Specifies a RADIUS server policy name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.159 server-port

### server-port

## Syntax

**server-port** {**eq** | **neq** | **gt** | **lt**} *port-num*

**server-port** {**eq** | **neq**} **range** *start-port-num end-port-num*

**server-port** {**eq**} {*port-num* | **range** *start-port-num end-port-num*} {**first-packet-trusted** | **first-packet-validate**}

**server-port** {**eq** | **neq**} **port-list** *port-list-name*

**server-port** {**eq**} **port-list** *port-list-name* {**first-packet-trusted** | **first-packet-validate**}

**no server-port**

## Context

[\[Tree\]](#) (config>app-assure>group>policy>app-filter>entry server-port)

## Full Context

configure application-assurance group policy app-filter entry server-port

## Description

This command specifies the server TCP or UDP port number to use in the application definition.

The **no** form of this command restores the default (removes server port number from application criteria defined by this app-filter entry).

## Default

no server-port (the server port is not used in the application definition)

## Parameters

### **eq**

Specifies that the value configured and the value in the flow are equal.

### **neq**

Specifies that the value configured differs from the value in the flow.

### **gt**

Specifies all port numbers greater than server-port-number match.

**lt**

Specifies all port numbers less than server-port-number match.

**port-list-name**

Specifies a named port list containing a set or range of ports.

**port-num**

Specifies a valid server port number.

**Values** 0 to 65535

**start-port-num, end-port-num**

Specifies the starting or ending port number.

**Values** 0 to 65535

### Server Port Options:

The following options are available:

- **No option specified:** TCP/UDP port applications with full signature verification:
  - AA ensures that other applications that can be identified do not run over a well-known port.
  - Application-aware policy applied once signature-based identification completes (likely requiring several packets).
- **first-packet-validate:** TCP/UDP trusted port applications with signature verification:
  - Application identified using well known TCP/UDP port based filters and re-identified once signature identification completes.
  - AA policy applied from the first packet of a flow while continuing signature-based application identification. Policy re-evaluated once the signature identification completes, allowing to detect improper/unexpected applications on a well-known port.
- **first-packet-trusted:** TCP/UDP trusted port applications - no signature verification:
  - Application identified using well known TCP/UDP port based filters only.
  - Application Aware policy applied from the first packet of a flow.
  - No signature processing assumes operator/customer trusts that no other applications can run on the well-known TCP/UDP port (statistics collected against trusted\_tcp or trusted\_udp protocol).

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## server-port

### Syntax

**server-port** {eq | neq} port-num

**no server-port**

### Context

[\[Tree\]](#) (debug>app-assure>group>traffic-capture>match server-port)

### Full Context

debug application-assurance group traffic-capture match server-port

### Description

This command configures debugging on a server port.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.160 server-shutdown

server-shutdown

### Syntax

[no] server-shutdown

### Context

[\[Tree\]](#) (config>system>security>ssh server-shutdown)

### Full Context

configure system security ssh server-shutdown

### Description

This command enables the SSH servers running on the system.

### Default

no server-shutdown

### Platforms

All

## 23.161 server-signature-list

## server-signature-list

### Syntax

**server-signature-list** *name* [**create**]

**no server-signature-list** *name*

### Context

[\[Tree\]](#) (config>system>security>tls server-signature-list)

### Full Context

configure system security tls server-signature-list

### Description

This command configures a list of TLS 1.3-supported signature suite codes for the digital signature that the server sends in a server Hello message.

The **no** form of this command removes the server signature list.

### Parameters

*name*

Specifies the name of the server signature list, up to 32 characters.

**create**

Keyword used to create the server signature list.

### Platforms

All

## 23.162 server-timeout

## server-timeout

### Syntax

**server-timeout** *seconds*

**no server-timeout**

### Context

[\[Tree\]](#) (config>port>ethernet>dot1x server-timeout)

### Full Context

configure port ethernet dot1x server-timeout

## Description

This command configures the period during which the router waits for the RADIUS server to respond to its access request message. When this timer expires, the router will re-send the access request message, up to the specified number times.

The **no** form of this command returns the value to the default.

## Default

server-timeout 30

## Parameters

### *seconds*

Specifies the server timeout period, in seconds.

**Values** 1 to 300

## Platforms

All

## 23.163 server-tls-profile

### server-tls-profile

## Syntax

**server-tls-profile** *name* [create]

**no server-tls-profile** *name*

## Context

[\[Tree\]](#) (config system security tls server-tls-profile)

## Full Context

configure system security tls server-tls-profile

## Description

This command creates a TLS server profile. This profile can be used by applications that support TLS for encryption. The applications should not send any PDUs until the TLS handshake has been successful.

The **no** form of the command removes the TLS server profile.

## Parameters

### *name*

Specifies the name of the TLS server profile, up to 32 characters in length.

### **create**

Keyword used to create the TLS server profile.

## Platforms

All

## 23.164 server6

### server6

#### Syntax

**server6** *ipv6-address*

**no server6**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe>host server6)

#### Full Context

configure subscriber-mgmt local-user-db ipoe host server6

#### Description

This command allows DHCP6 server selection based on the host entry in LUDB.

The configured DHCP6 server IP address must reference one of the v6 addressees configured under the **config>service>vprn>sub-if>grp-if>ipv6>dhcpv6>relay** or **config>service>ies>sub-if>grp-if>ipv6>dhcpv6>relay** context.

The **no** form of this command reverts to the default.

#### Parameters

##### *ipv6-address*

Specifies the retailer service ID.

##### Values

ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.165 servers

### servers

#### Syntax

**servers**

#### Context

[\[Tree\]](#) (config>aaa>radius-srv-plcy servers)

#### Full Context

configure aaa radius-server-policy servers

#### Description

Commands in this context configure radius-server-policy parameters.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.166 service

### service

#### Syntax

**service** *service-id*

**no service**

#### Context

[\[Tree\]](#) (config>service>vpls>sap>msap-defaults service)

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe>host>msap-defaults service)

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp>host>msap-defaults service)

#### Full Context

configure service vpls sap msap-defaults service

configure subscriber-mgmt local-user-db ipoe host msap-defaults service

configure subscriber-mgmt local-user-db ppp host msap-defaults service

## Description

This command sets default service for all subscribers created based on trigger packets received on the given capture SAP in case the corresponding VSA is not included in the RADIUS authentication response. This command is applicable to capture SAP only.

The **no** form of this command reverts to the default.

## Parameters

### *service-id*

Specifies the service ID as an integer or a name.

**Values**    *service-id* - 1 to 2147483648  
              *service-name* - up to 64 characters

## Platforms

All

- configure service vpls sap msap-defaults service
- 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR
- configure subscriber-mgmt local-user-db ipoe host msap-defaults service
  - configure subscriber-mgmt local-user-db ppp host msap-defaults service

## service

## Syntax

**service** *service-id*

**no service**

## Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>bonding-parameters>connection service)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>bonding-parameters>connection service)

## Full Context

configure service vprn subscriber-interface group-interface bonding-parameters connection service

configure service ies subscriber-interface group-interface bonding-parameters connection service

## Description

This command binds a specified service to this connection. ESM subscribers created under this service are eligible for bonding in this group interface and are identified by the provisioned connection ID. All connections in one bonding context must use subscriber interfaces in separate router instances.

The **no** form of this command removes the service from this bonding context, which can only be done when bonding is administratively disabled.

## Parameters

### *service-id*

Specifies the service ID of the service containing this subscriber interface.

## service

## Syntax

**service**

## Context

[\[Tree\]](#) (config>cflowd>collector>exp-filter>if-list service)

## Full Context

configure cflowd collector export-filter interface-list service

## Description

Commands in this context configure which service interfaces' flow data is being sent to this collector

## Platforms

All

## service

## Syntax

**service** *service-id* **preference** *preference*

**no service** *service-id*

## Context

[\[Tree\]](#) (config>router>dns>redirect-vprn service)

## Full Context

configure router dns redirect-vprn service

## Description

This command configures the VPRN DNS redirection for the specified service.

The **no** form of this command removes the service from the VPRN DNS resolution configuration.

## Parameters

### *service-id*

Specifies the unique service identification number or string identifying the service in the service domain.

**Values** *service-id*: 1 to 2147483647  
*svc-name*: 64 characters maximum

**preference**

Specifies the service preference.

**Values** 0 to 255

**Platforms**

All

**service****Syntax**

[no] **service** *service-id*

**Context**

[\[Tree\]](#) (config>log>services-all-events service)

**Full Context**

configure log services-all-events service

**Description**

This command enables access to the entire system-wide set of log events (VPRN and non-VPRN) in the logs configured within the management VPRN specified by the service ID.

The **no** form of the command enables the display of VPRN events only.

**Parameters*****service-id***

Identifies the VPRN.

**Values** {*id* | *svc-name*}

*id*: 1 to 2147483647

*svc-name*: up to 64 characters

**Platforms**

All

## service

### Syntax

**service** *service-id*

**service name** *service-name*

**no service**

### Context

[\[Tree\]](#) (config>system>security>pki>ca-profile>ocsp service)

### Full Context

configure system security pki ca-profile ocsp service

### Description

This command specifies the service or routing instance that used to contact OCSP responder. This applies to OCSP responders that either configured in CLI or defined in AIA extension of the certificate to be verified.

The responder-url will also be resolved by using the DNS server configured in the configured routing instance.

With VPRN services, the system checks whether the specified service ID or service name is an existing VPRN service at the time of CLI configuration. Otherwise the configuration fails.

### Parameters

#### *service-id*

Specifies an existing service ID to be used in the match criteria.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **service name** *service-name* variant can be used in all configuration modes.

**Values** service-id: 1 to 2147483647 base-router: 0

#### *name service-name*

Identifies the service, up to 64 characters.

### Platforms

All

## 23.167 service-activation-testhead

## service-activation-testhead

### Syntax

**service-activation-testhead service-test** *service-test-name* { **start** | **stop** }

### Context

[\[Tree\]](#) (oam service-activation-testhead)

### Full Context

oam service-activation-testhead

### Description

This command start or stops a service activation testhead service test.

### Parameters

#### **service-test-name**

Specifies a preconfigured service test name, up to 64 characters.

#### **start**

Keyword to start a service test. The software allows only one instance of a service test to be run for the specified *service-test-name*. If the user attempts to start another instance of a service test for the same *service-test-name* while the current instance is still running, the following error message is displayed: "MINOR: CLI #238 Configuration change failed validation - service test is already executing".

#### **stop**

Keyword to stop a service test. If the user attempts to stop a service test that is already complete, the following error message is displayed: "MINOR: CLI #238 Configuration change failed validation - service test is not executing".

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## service-activation-testhead

### Syntax

**service-activation-testhead**

### Context

[\[Tree\]](#) (config>test-oam service-activation-testhead)

### Full Context

configure test-oam service-activation-testhead

## Description

Commands in this context configure service activation launch parameters for the testhead function. Service Activation Testhead is supported on FP4 and later platforms.

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 23.168 service-carving

### service-carving

## Syntax

**service-carving**

## Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg service-carving)

## Full Context

configure service system bgp-evpn ethernet-segment service-carving

## Description

Commands in this context configure service-carving in the Ethernet-Segment. The service-carving algorithm determines which PE is the Designated Forwarder (DF) in a specified Ethernet Segment and for a specific service.

## Platforms

All

## 23.169 service-context-id

### service-context-id

## Syntax

**service-context-id** *name*

**no service-context-id**

## Context

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>gy>include-avp service-context-id)

### Full Context

configure subscriber-mgmt diameter-application-policy gy include-avp service-context-id

### Description

This command configures the value of the service context ID AVP.

The **no** form of this command returns the command to the default setting.

### Parameters

#### *name*

Specifies the service context ID AVP value, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.170 service-id

service-id

### Syntax

**service-id** *service-id*

**no service-id**

### Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident service-id)

### Full Context

configure subscriber-mgmt local-user-db ipoe host host-identification service-id

### Description

This command specifies the service ID to match for a host lookup. When the LUDB is accessed using a DHCPv4 server, the SAP ID is matched against the Nokia vendor-specific sub-option in DHCP Option 82.

The **no** form of this command removes the service ID from the configuration.

### Parameters

#### *service-id*

Specifies an existing service ID or service name.

**Values** *service-id* — 1 to 2147483647  
*service-name* — up to 64 characters

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Full Context

configure service vpls sap dhcp option vendor-specific-option service-id

configure subscriber-mgmt msap-policy vpls-only-sap-parameters dhcp option vendor-specific-option service-id

configure service vprn subscriber-interface group-interface dhcp option vendor-specific-option service-id

configure service ies subscriber-interface group-interface dhcp option vendor-specific-option service-id

configure service vprn interface dhcp option vendor-specific-option service-id

## Description

This command enables the sending of the service ID in the Nokia vendor-specific sub-option of the DHCP relay packet.

The **no** form of this command disables the sending of the service ID in the Nokia vendor-specific sub-option of the DHCP relay packet.

## Platforms

All

- configure service vprn interface dhcp option vendor-specific-option service-id
- configure service vpls sap dhcp option vendor-specific-option service-id

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure subscriber-mgmt msap-policy vpls-only-sap-parameters dhcp option vendor-specific-option service-id
- configure service ies subscriber-interface group-interface dhcp option vendor-specific-option service-id
- configure service vprn subscriber-interface group-interface dhcp option vendor-specific-option service-id

## service-id

### Syntax

[no] service-id

### Context

[\[Tree\]](#) (config>router>if>dhcp>option>vendor-specific-option service-id)

### Full Context

configure router interface dhcp option vendor-specific-option service-id

### Description

This command enables the sending of the service ID in the Nokia vendor-specific sub-option of the DHCP relay packet.

The **no** form of this command disables the sending of the service ID in the Nokia vendor-specific sub-option of the DHCP relay packet.

### Default

no service-id

### Platforms

All

## service-id

### Syntax

service-id *service-id*

no service-id

### Context

[\[Tree\]](#) (config>redundancy>mc>peer>mcr>ring>ibc service-id)

[\[Tree\]](#) (config>redundancy>mc>peer>mcr>l3-ring>ibc service-id)

### Full Context

configure redundancy multi-chassis peer mc-ring ring in-band-control-path service-id

configure redundancy multi-chassis peer mc-ring l3-ring in-band-control-path service-id

### Description

This command specifies the service ID if the interface used for the inband control connection belongs to a VPRN service. If not specified, the service-id is zero and the interface must belong to the Base router. This command supersedes the configuration of a service name.

The no form of this command removes the service ID from the IBC configuration.

## Parameters

### *service-id*

Specifies a service ID or an existing service name.

**Values** 1 to 214748364 - Only supported in 'classic' configuration-mode  
(**configure>system>management-interface>configuration-mode classic**)

## Platforms

All

service-id

## Syntax

**service-id** *service-id*

**no service-id**

## Context

[\[Tree\]](#) (config>redundancy>mc>peer>mcr>node>cv *service-id*)

[\[Tree\]](#) (config>redundancy>mc>peer>mcr>l3-ring>node>cv *service-id*)

## Full Context

configure redundancy multi-chassis peer mc-ring ring ring-node connectivity-verify *service-id*

configure redundancy multi-chassis peer mc-ring l3-ring ring-node connectivity-verify *service-id*

## Description

This command specifies the service ID of the SAP used for the ring-node connectivity verification of this ring node. This command supersedes the configuration of a service name.

The **no** form of the command removes the service ID from the CV configuration.

## Default

no *service-id*

## Parameters

### *service-id*

Specifies the service ID or an existing service name.

**Values** 1 to 2147483647- Only supported in "classic" configuration mode  
(**configure system management-interface configuration-mode classic**)

## Platforms

All

## service-id

### Syntax

**service-id**

### Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg service-id)

configure service system bgp-evpn ethernet-segment service-id

### Description

This command enables the **service-id** context within the virtual **ethernet-segment** configuration.

### Platforms

All

## 23.171 service-id-lag-hashing

### service-id-lag-hashing

### Syntax

**[no] service-id-lag-hashing**

### Context

[\[Tree\]](#) (config>system>load-balancing service-id-lag-hashing)

### Full Context

configure system load-balancing service-id-lag-hashing

### Description

This command enables enhanced VLL LAG service ID hashing. This command improves the LAG spraying of VLL service packets and is applied only when both ECMP and LAG hashing are performed by the same router. By default, the ECMP interface and LAG link for all packets on the VLL service are selected based on a direct modulo operation of the service ID. This command enhances distribution and hashes the service ID prior to the LAG link modulo operation when an ECMP link modulo operation is performed.

The **no** form of the command preserves the default behavior of VLL LAG service ID hashing.

### Default

no service-id-lag-hashing

## Platforms

All

## 23.172 service-id-range

### service-id-range

#### Syntax

**service-id-range start** *service-id* **end** *service-id*  
**no service-id-range**

#### Context

[\[Tree\]](#) (config>service>md-auto-id service-id-range)

#### Full Context

configure service md-auto-id service-id-range

#### Description

This command specifies the range of IDs used by SR OS to automatically assign an ID to services that are created in model-driven interfaces without an ID explicitly specified by the user or client.

A service created with an explicitly-specified ID cannot use an ID in this range. In the classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD interfaces, the range can be changed, which causes any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **config>service md-auto-id** command for further details.

#### Default

no service-id-range

#### Parameters

##### **start** *service-id*

Specifies the lower value of the ID range. The value must be less than or equal to the **end** value.

**Values** 1 to 2147483647

##### **end** *service-id*

Specifies the upper value of the ID range. The value must be greater than or equal to the **start** value.

**Values** 1 to 2147483647

## 23.173 service-mtu

### service-mtu

#### Syntax

**service-mtu** *octets*

**no service-mtu**

#### Context

[\[Tree\]](#) (config>service>template>vpls-template service-mtu)

[\[Tree\]](#) (config>service>vpls service-mtu)

#### Full Context

configure service template vpls-template service-mtu

configure service vpls service-mtu

#### Description

This command configures the service payload (Maximum Transmission Unit – MTU), in bytes, for the service. This MTU value overrides the service-type default MTU. The **service-mtu** defines the payload capabilities of the service. It is used by the system to validate the SAP and SDP binding's operational state within the service.

The service MTU and a SAP's service delineation encapsulation overhead (4 bytes for a dot1q tag) is used to derive the required MTU of the physical port or channel on which the SAP was created. If the required payload is larger than the port or channel MTU, then the SAP will be placed in an inoperative state. If the required MTU is equal to or less than the port or channel MTU, the SAP will be able to transition to the operative state.

When binding an SDP to a service, the service MTU is compared to the path MTU associated with the SDP. The path MTU can be administratively defined in the context of the SDP. The default or administrative path MTU can be dynamically reduced due to the MTU capabilities discovered by the tunneling mechanism of the SDP or the egress interface MTU capabilities based on the next hop in the tunnel path. If the service MTU is larger than the path MTU, the SDP binding for the service will be placed in an inoperative state. If the service MTU is equal to or less than the path MTU, then the SDP binding will be placed in an operational state.

If a service MTU, port or channel MTU, or path MTU is dynamically or administratively modified, then all associated SAP and SDP binding operational states are automatically re-evaluated.

For i-VPLS and Epipes bound to a b-VPLS, the service-mtu must be at least 18 bytes smaller than the b-VPLS service MTU to accommodate the PBB header.

The **no** form of this command returns the default **service-mtu** for the indicated service type to the default value.

**Default**

service-mtu 1514

**Parameters****octets**

The following table displays MTU values for specific VC types.

Table 115: MTU Values

VC-Type	Example Service MTU	Advertised MTU
Ethernet	1514	1500
Ethernet (with preserved dot1q)	1518	1504
VPLS	1514	1500
VPLS (with preserved dot1q)	1518	1504
VLAN (dot1p transparent to MTU value)	1514	1500
VLAN (qinq with preserved bottom qtag)	1518	1504

The size of the MTU in octets, expressed as a decimal integer

[\[Tree\]](#) (config>service>epipe service-mtu)

**Full Context**

configure service cpipe service-mtu

configure service ipipe service-mtu

configure service epipe service-mtu

## Description

This command configures the service payload in bytes, for the service. The configured Maximum Transmission Unit (MTU) value overrides the service-type default MTU. The **service-mtu** command defines the payload capabilities of the service. It is used by the system to validate the operational state of the SAP and SDP binding within the service.

The service MTU and a SAP's service delineation encapsulation overhead (4 bytes for a dot1q tag) is used to derive the required MTU of the physical port or channel on which the SAP was created. If the required payload is larger than the port or channel MTU, the SAP is placed in an inoperative state. If the required MTU is equal to or less than the port or channel MTU, the SAP transitions to the operative state.

When binding an SDP to a service, the service MTU is compared to the path MTU associated with the SDP. The path MTU can be administratively defined in the context of the SDP. The default or administrative path MTU can be dynamically reduced due to the MTU capabilities discovered by the tunneling mechanism of the SDP or the egress interface MTU capabilities based on the next hop in the tunnel path. If the service MTU is larger than the path MTU, the SDP binding for the service is placed in an inoperative state. If the service MTU is equal to or less than the path MTU, the SDP binding is placed in an operational state.

If a service MTU, port or channel MTU, or path MTU is dynamically or administratively modified, all associated SAP and SDP binding operational states are automatically reevaluated.

Binding operational states are automatically reevaluated.

For I-VPLS and Epipes bound to a B-VPLS, the service MTU must be at least 18 bytes smaller than the B-VPLS service MTU to accommodate the PBB header.

Because this connects a Layer 2 to a Layer 3 service, adjust the service MTU under the Epipe service. The MTU that is advertised from the Epipe side is service MTU minus EtherHeaderSize.

### Note:

In the **configure>service>epipe** context, the **adv-service-mtu** command can be used to override the configured MTU value used in T-LDP signaling to the far-end of an Epipe spoke-sdp. The **adv-service-mtu** command is also used to validate the value signaled by the far-end PE. For more information, see **adv-service-mtu** command.

The **no** form of this command returns the default **service-mtu** for the indicated service type to the default value.

By default, if **no service-mtu** is configured, the MTU value is  $(1514 - 14) = 1500$ .

## Default

no service-mtu 1508 (for Apipe, Fpipe)

no service-mtu 1500 (for Lpipe)

no service-mtu 1524 (for Epipe)

[Table 116: MTU Values](#) lists the MTU values for specific VC types.

Table 116: MTU Values

SAP VC-Type	Example: Service MTU	Advertised MTU
Ethernet	1514	1500
Ethernet (with preserved dot1q)	1518	1504
VPLS	1514	1500
VPLS (with preserved dot1q)	1518	1504
VLAN (dot1p transparent to MTU value)	1514	1500
VLAN (qinq with preserved bottom qtag)	1518	1504

**Parameters****octets**

Specifies the MTU size in octets, expressed as a decimal integer.

**Values** 1 to 9782  
1 to 9800 (for Epipe only)

**Platforms**

configure redundancy multi-chassis peer mc-ring ring ring-node connectivity-verify *service-name*

## Description

This command specifies the service name of the SAP used for ring-node connectivity verification of this ring node. This command supersedes the configuration of a service ID.

The **no** form of this command removes the service name from the CV configuration.

## Default

no *service-name*

## Parameters

### *service-name*

Specifies a service name, up to 64 characters.

## Platforms

All

## 23.175 service-range

## service-range

### Syntax

**service-range** *service-id service-id*

**no service-range**

### Context

**[Tree]** (config>service>dynsvc service-range)

### Full Context

configure service dynamic-services service-range

### Description

This command specifies the service ID range that is reserved for dynamic data service creation. The range cannot overlap with existing static configured services. Once configured with active dynamic services in the range, the service range can only be extended at the end.

The **no** form of this command removes the service-range from the configuration. This is only allowed when there are no active dynamic data services.

When **no service-range** is specified, the setup of dynamic data services fails.

### Parameters

***service-id***

Specifies the start and end service IDs to define the service range for dynamic services.

**Values** 1 to 2147483647

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## service-range

### Syntax

**service-range** *svc-id [to svc-id]*

**no service-range** *svc-id*

### Context

**[Tree]** (config>service>system>bgp-evpn>eth-seg>service-id service-range)

### Full Context

configure service system bgp-evpn ethernet-segment service-id service-range

## Description

This command associates a specified service range to a virtual ES, along with the **network-interconnect-vxlan** command. Up to eight service ranges per VXLAN instance can be configured, where the ranges may overlap. The service range may be configured before the service.

The **no** form of this command removes the association of the service range to the virtual ES for the configured VXLAN instance.

## Parameters

### *svc-id*

Specifies which service range will be associated with the virtual Ethernet Segment.

**Values** 1 to 2147483647

## Platforms

All

## service-range

## Syntax

**service-range** *startid-endid* [**start-vlan-id** *startvid*]

**no service-range**

## Context

[\[Tree\]](#) (config>service>vpls>vpls-group service-range)

## Full Context

configure service vpls vpls-group service-range

## Description

This command configures the service ID and implicitly the VLAN ID ranges to be used as input variables for related VPLS and SAP templates to pre-provision "data" VPLS instances and related SAPs using the service ID specified in the command. If the **start-vlan-id** is not specified then the service-range values are used for vlan-ids. The data SAPs will be instantiated on all the ports used to specify SAP instances under the related control VPLS.

Modifications of the service id and vlan ranges are allowed with the following restrictions.

- service-range increase can be achieved in two ways:
  - Allowed when vpls-group is in shutdown state
  - By creating a new vpls-group
- service-range decrease can be achieved in two ways:
  - Allowed when vpls-group is in shutdown state; when **shutdown** command is executed the associated service instances are deleted.

- Allowed when vpls-group is in no shutdown state and has completed successfully instantiating services.
- In both cases, only the services that do not have user configured SAPs will be deleted. Otherwise the above commands are rejected. Existing declarations or registrations do not prevent service deletion.
- start-vlan-id change can be achieved in two ways:
  - Allowed when vpls-group is in shutdown state
  - At the time of range decrease by increasing the start-vlan-id which can be done when vpls-group is in no shutdown state and has completed successfully instantiating services

The **no** form of this command removes the specified ranges and deletes the pre-provisioned VPLS instances and related SAPs. The command will fail if any of the VPLS instances in the affected ranges have a provisioned SAP.

### Default

no service-range

### Parameters

#### *startid-endid*

Specifies the range of service IDs

**Values** 1 to 2147483647

#### *startvid*

Specifies the starting VLAN ID; it provides a way to set aside a service ID range that is not the same as the VLAN range and allows for multiple MVRP control-VPLSs to control same VLAN range on different ports.

**Values** 1 to 4094

## session

### Syntax

**session** *session-name* [**test-family** [ **ethernet** | **ip** | **mpls**] [**session-type** {**proactive** | **on-demand**}]  
**create**]

**no session** *session-name*

### Context

[\[Tree\]](#) (config>oam-pm session)

### Full Context

configure oam-pm session

### Description

This command creates the individual session containers that houses the test specific configuration parameters. Since this session context provides only a container abstract to house the individual test functions, it cannot be shut down. Individual tests sessions within the container may be shut down. No values, parameters, or configuration within this context may be changed if any individual test is active. Changes may only be made when all tests within the context are shut down. The only exception to this is the description value.

The **no** form of this command deletes the session.

### Parameters

#### **session-name**

Specifies the session name, up to 32 characters.

#### **test-family**

Indicates the type family and sets the context for the individual parameters.

**Values** **ethernet** — Specifies that the test is based on the Ethernet layer.

**ip** — Specifies that the test is based on the IP layer.

**mpls** — Specifies that the test is based on the MPLS layer.

#### **session-type**

Specifies how to set the Type bit in the Flags byte, and influences how different test criteria may be applied to the individual test. Not all test families carry this information in the PDU.

**Values** **proactive** — Sets the type to always on, with an immediate start and no stop.

**on-demand** — Sets the type to on-demand, with an immediate start and no stop, or a stop based on the offset.

**Default** proactive

#### **create**

Creates the PM session.

## Platforms

All

## 23.184 session-accounting

### session-accounting

#### Syntax

**session-accounting** [interim-update] [host-update]

**no session-accounting**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy session-accounting)

#### Full Context

configure subscriber-mgmt radius-accounting-policy session-accounting

#### Description

This command enables per session accounting mode. In per session accounting mode, the acct-session-id is generated per session. This acct-session-id is uniformly included in all accounting messages (START/INTERIM-UPDATE/STOP) and it can be included in RADIUS Access-Request message.

This accounting mode of operation can be used only in PPPoE environment with dual-stack host in which case both hosts (IPv4 and IPv6) are considered part of the same session. In addition to regular interim-updates, *triggered* interim-updates are sent by a host joining or leaving the session.

When an IPv4/v6 address is allocated, or released from a dual-stack host, a triggered interim-update message is immediately sent. This triggered interim-update message reflects the change in the IP address. The triggered interim-update has no effect on the interval at which the regular interim updates are scheduled.

Accounting counters are based on the queue counters and as such are aggregated for all host sharing the queues within an sla-profile instance.

CoA and LI is supported based on the acct-session-id of the session.

The **no** form of this command reverts to the default.

#### Parameters

##### interim-update

Specifies to enable interim updates. Without this keyword only START and STOP accounting messages are generated when the session is established or terminated. This is equivalent to a time-based accounting where only the duration of the session is required.

##### host-update

Indicates that host updates messages are sent. INTERIM-UPDATE messages can be generated (volume based accounting) by selecting this keyword.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.185 session-assign-method

### session-assign-method

#### Syntax

**session-assign-method** {**weighted** | **weighted-random**}

**no session-assign-method**

#### Context

[\[Tree\]](#) (config>router>l2tp session-assign-method)

[\[Tree\]](#) (config>service>vprn>l2tp session-assign-method)

#### Full Context

configure router l2tp session-assign-method

configure service vprn l2tp session-assign-method

#### Description

This command configures the session assignment method.

The **no** form of this command reverts to the default value.

#### Default

no session-assign-method

#### Parameters

##### **weighted**

Specifies that the sessions are shared between the available tunnels. If necessary, new tunnels are set up until the maximum number is reached. The distribution aims at an equal ratio of the actual number of sessions to the maximum number of sessions.

##### **weighted-random**

Enhances the weighted algorithm such that when there are multiple tunnels with an equal number of sessions (equal weight), LAC randomly selects a tunnel.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## session-assign-method

### Syntax

**session-assign-method** {**existing-first** | **weighted** | **weighted-random**}  
**no session-assign-method**

### Context

**[Tree]** (config>service>vprn>l2tp>group session-assign-method)

**[Tree]** (config>router>l2tp>group session-assign-method)

### Full Context

configure service vprn l2tp group session-assign-method

configure router l2tp group session-assign-method

### Description

This command specifies how new sessions are assigned to one of the set of suitable tunnels that are available or could be made available.

The **no** form of this command reverts to the default value.

### Default

session-assign-method existing-first

### Parameters

#### existing-first

Specifies that all new sessions are placed by preference in the existing tunnels.

#### weighted

Specifies that the sessions are shared between the available tunnels. If necessary, new tunnels are set up until the maximum number is reached. The distribution aims at an equal ratio of the actual number of sessions to the maximum number of sessions.

#### weighted-random

Enhances the weighted algorithm such that when there are multiple tunnels with an equal number of sessions (equal weight), LAC randomly selects a tunnel.

## Context

[\[Tree\]](#) (config>app-assure>group>statistics>aa-admit-deny session-filter-stats)

### Full Context

configure application-assurance group statistics aa-admit-deny session-filter-stats

### Description

This command configures whether to include or exclude session filter admit-deny statistics in accounting records.

### Default

no session-filter-stats

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.188 session-hold-time

### session-hold-time

#### Syntax

**session-hold-time remaining-lease-time**

**session-hold-time** *seconds*

**no session-hold-time**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>gtp>peer-profile session-hold-time)

#### Full Context

configure subscriber-mgmt gtp peer-profile session-hold-time

#### Description

This command configures, in seconds, the time that a GTP session context is held after the corresponding UE is disconnected. If the same UE re-connects to this system before this time has elapsed, its GTP session context is re-used. When the timer expires, the GTP session context is cleared.

The **no** form of this command reverts to the default.

#### Default

session-hold-time 30

#### Parameters

**remaining-lease-time**

Specifies that the timer is equal to the UE's DHCP remaining lease time.

**seconds**

Specifies the time, in seconds, to hold a GTP session after its UE is disconnected.

**Values** 0 to 3600

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.189 session-id

### session-id

#### Syntax

**session-id** *session-id*

**no session-id**

#### Context

**[Tree]** (config>li>li-source>nat>l2-aware-sub session-id)

**[Tree]** (config>li>li-source>nat>classic-lsn-sub session-id)

**[Tree]** (config>li>li-source>nat>nat64-lsn-sub session-id)

**[Tree]** (config>li>li-source>nat>dslite-lsn-sub session-id)

**[Tree]** (config>li>li-source>nat>ethernet-header session-id)

#### Full Context

configure li li-source nat l2-aware-sub session-id

configure li li-source nat classic-lsn-sub session-id

configure li li-source nat nat64-lsn-sub session-id

configure li li-source nat dslite-lsn-sub session-id

configure li li-source nat ethernet-header session-id

#### Description

This command configures the session ID that is inserted into the packet header for all mirrored packets of the associated LI source entry. This session ID can be used (for example by a downstream LI gateway) to identify the particular LI session to which the packet belongs.

The session ID is only valid and used for mirror services that are configured with **ip-udp-shim** routable encapsulation (**config>mirror>mirror-dest>encap>ip-gre-shim**).

For all types of li-source entries (filter, nat, sap, or subscriber), when the mirror service is configured with **ip-udp-shim** routable encapsulation, a session-id field (as part of the routable encapsulation) is always present in the mirrored packets. If there is no *session-id* configured for an **li-source** entry, then the default value is inserted. When a mirror service is configured with **ip-gre** routable encapsulation, no *session-id* is inserted and none should be specified against the **li-source** entries.

The **no** form of this command removes the *session-id* from the configuration which results in the default value being used.

### Default

no session-id (an id of 0, or no id)

### Parameters

#### *session-id*

Specifies the value to insert into the header of the mirrored packets.

**Values** 1 to 4,294,967,295 (32b)

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## session-id

### Syntax

**session-id** [*session-id*]

**no session-id**

### Context

[\[Tree\]](#) (config>li>li-source>wlan-gw session-id)

### Full Context

configure li li-source wlan-gw session-id

### Description

This command configures the session ID inserted in the packet header for all mirrored packets of the associated li-source. When the mirror-service is configured with the **ip-udp-shim** routable encapsulation, session-id field (as part of the routable encapsulation) is always present in the mirrored packets. The session-id can be used by the LIG to identify a particular LI session to which the packet belongs.

### Parameters

#### *session-id*

Specifies the session ID inserted in the LI header.

**Values** 1 to 4294967295

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## session-id

### Syntax

**session-id** *session-id*

**no session-id**

### Context

[\[Tree\]](#) (debug>oam>build-packet>packet>field-override>header>l2tp session-id)

[\[Tree\]](#) (config>test-oam>build-packet>header>l2tp session-id)

### Full Context

debug oam build-packet packet field-override header l2tp session-id

configure test-oam build-packet header l2tp session-id

### Description

This command defines the session ID to be used in the L2TP header.

The **no** form of this command removes the session ID value.

### Default

session-id 0

### Parameters

***session-id***

Specifies the L2TP session ID to be used in the L2TP header.

**Values** 0 to 65535

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.190 session-id-format

## session-id-format

### Syntax

**session-id-format** {**description** | **number**}

**no session-id-format**

### Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy session-id-format)

## Full Context

```
configure subscriber-mgmt radius-accounting-policy session-id-format
```

## Description

This command specifies the format for the acct-session-id attribute used in RADIUS accounting requests. The **no** form of this command reverts to the default.

## Default

```
session-id-format description
```

## Parameters

### description

Specifies to use a string containing following information: <subscriber>@<sap-id>@<SLA-profile>\_<creation-time>

### number

Specifies to use a unique number generated by the OS to identify a given session.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.191 session-key

### session-key

## Syntax

```
session-key sap mac [cid] [rid]
```

```
no session-key
```

## Context

[\[Tree\]](#) (config>subscr-mgmt>ipoe-plcy session-key)

## Full Context

```
configure subscriber-mgmt ipoe-session-policy session-key
```

## Description

This command configures the key to logically group subscriber hosts that belong to the same dual stack end device in an IPoE session.

The SAP and MAC address are always part of the IPoE session key. Optionally the Circuit-Id/Interface-Id or Remote-Id can be added to the session key.

The **no** form of this command reverts to the default.

## Default

session-key sap mac

## Parameters

### sap

Includes the SAP as part of the IpoE session key. The **sap** parameter is mandatory and cannot be removed from the key.

### mac

Includes the MAC address as part of the IpoE session key. The **mac** parameter is mandatory and cannot be removed from the key.

### cid

Optionally adds the DHCPv4 Relay Agent Circuit-Id (Option 82, sub Option 1) and DHCPv6 Interface-Id (Option 18) field to the IpoE session key.

### rid

Optionally adds the DHCPv4 Relay Agent Remote-Id (Option 82, sub Option 2) and DHCPv6 Remote-Id (Option 37) field to the IpoE session key. For DHCPv6, the enterprise number is excluded from the key.

**sap** and **mac** are mandatory parameters while **cid** and **rid** are optional and mutually exclusive. Valid IpoE session key parameters are: **sap mac**, **sap mac cid** and **sap mac rid**.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.192 session-limit

### session-limit

## Syntax

**session-limit** *session-limit*

**session-limit unlimited**

**no session-limit**

## Context

**[Tree]** (config>service>vprn>l2tp session-limit)

**[Tree]** (config>service>vprn>l2tp>group>tunnel session-limit)

**[Tree]** (config>router>l2tp session-limit)

**[Tree]** (config>service>vprn>l2tp>group session-limit)

**[Tree]** (config>router>l2tp>group>tunnel session-limit)

**[Tree]** (config>router>l2tp>group session-limit)

## Full Context

```
configure service vprn l2tp session-limit
configure service vprn l2tp group tunnel session-limit
configure router l2tp session-limit
configure service vprn l2tp group session-limit
configure router l2tp group tunnel session-limit
configure router l2tp group session-limit
```

## Description

This command configures the session limit.

This command configures the L2TP session limit for the router. The value controls how many L2TP sessions will be allowed within a given context (system, group, tunnel).

L2TP is connection-oriented. The L2TP Network Server (LNS) and LAC maintain state for each call that is initiated or answered by an LAC. An L2TP session is created between the LAC and LNS when an end-to-end PPP connection is established between a remote system and the LNS. Datagrams related to the PPP connection are sent over the tunnel between the LAC and LNS. There is a one-to-one relationship between established L2TP sessions and their associated calls.

The **no** form of this command removes the value from the configuration.

## Default

no session-limit

## Parameters

### ***session-limit***

Specifies the allowed number of sessions within the given context.

**Values** 1 to 131071

### **unlimited**

Specifies to use the maximum number of sessions available.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## session-limit

## Syntax

**session-limit** *session-limit*

**no session-limit**

## Context

### Full Context

configure service vprn subscriber-interface group-interface pppoe session-limit

configure service ies subscriber-interface pppoe session-limit

configure service vprn subscriber-interface pppoe session-limit

configure service ies subscriber-interface group-interface pppoe session-limit

### Description

This command specifies the number of PPPoE hosts allowed for this group interface.

The **no** form of this command reverts to the default.

### Default

session-limit 1

### Parameters

#### *session-limit*

Specifies the number of PPPoE hosts allowed.

#### **Note:**

The operational maximum value may be smaller due to equipped hardware dependencies.

**Values** 1 to 131071  
1 to 262143 (retail subscriber interface)

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[\[Tree\]](#) (config>service>nat>up-nat-policy session-limits)

[\[Tree\]](#) (config>service>nat>nat-policy session-limits)

## Full Context

```
configure service nat firewall-policy session-limits
```

```
configure service nat up-nat-policy session-limits
```

```
configure service nat nat-policy session-limits
```

## Description

Commands in this context configure session limits for the NAT policy.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat firewall-policy session-limits

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat nat-policy session-limits
- configure service nat up-nat-policy session-limits

## session-limits

## Syntax

```
[no] session-limits
```

**Context**

[\[Tree\]](#) (config>subscr-mgmt>sla-profile session-limits)

[\[Tree\]](#) (config>subscr-mgmt>sub-profile session-limits)

**Full Context**

configure subscriber-mgmt sla-profile session-limits

configure subscriber-mgmt sub-profile session-limits

**Description**

Commands in this context configure session limits per SLA profile instance or per subscriber.

The **no** form of this command removes the configuration.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.194 session-messages

### session-messages

**Syntax**

[no] **session-messages**

**Context**

[\[Tree\]](#) (debug>diam>application>policy session-messages)

**Full Context**

debug diameter application policy session-messages

**Description**

This command debugs session messages.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.195 session-optimized-stop

## session-optimized-stop

### Syntax

[no] session-optimized-stop

### Context

[\[Tree\]](#) (config>subscr-mgmt>sub-prof>rad-acct session-optimized-stop)

### Full Context

configure subscriber-mgmt sub-profile radius-accounting session-optimized-stop

### Description

This command optimizes a RADIUS Accounting Stop message for a PPPoE session termination (specifically for session accounting mode when the host update is enabled). By default when a PPPoE session terminates, the system removes a dual stack host in sequence, one host at a time. Therefore, the system will generate a RADIUS accounting interim for each host termination until only the final host is left. The final host will generate a final accounting stop message. Enabling this command will trigger a single Stop RADIUS accounting message and include information of all hosts without the host updates.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.196 session-parameters

## session-parameters

### Syntax

session-parameters

### Context

[\[Tree\]](#) (config>router>ldp session-parameters)

## 23.197 session-qer

### session-qer

#### Syntax

**session-qer**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>sla-prof>pfcp session-qer)

#### Full Context

configure subscriber-mgmt sla-profile pfcp-mappings session-qer

#### Description

Commands in this context configure the mapping of the GBR/MBR IEs present in a per-session QER without a QER correlation ID. A QER that contains a QER correlation ID does not use the QER mapping because it is assumed not to be a per-session construct. If a signaled PFCP QER rate applies to all data-plane rules, it is interpreted as the session QER rate and is mapped to the QoS overrides in the configuration. Examples of such QER rates are APN-AMBR for 4G FWA sessions and session-AMBR for 5G FWA sessions.

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.198 session-sender-type

### session-sender-type

#### Syntax

**session-sender-type** {twamp-light | stamp}

#### Context

[\[Tree\]](#) (config>oam-pm>session>ip>twamp-light session-sender-type)

#### Full Context

configure oam-pm session ip twamp-light session-sender-type

#### Description

This command configures the type of test packet format to transmit.

**Default**

session-sender-type twamp-light

**Parameters****twamp-light**

Specifies TWAMP-Light transmission, packet formatting, and packet processing. TWAMP-Light test packets do not allow TLVs.

**stamp**

Specifies STAMP transmission, packet formatting, and packet processing. STAMP test packets support TLVs.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.199 session-time

### session-time

**Syntax**

[no] session-time

**Context**

[\[Tree\]](#) (config>aaa>isa-radius-plcy>acct-include-attributes session-time)

**Full Context**

configure aaa isa-radius-policy acct-include-attributes session-time

**Description**

This command enables the inclusion of the session-time attributes.

The **no** form of the command excludes session-time attributes.

**Default**

no session-time

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.200 session-timeout

## session-timeout

### Syntax

**session-timeout** *timeout*

**no session-timeout**

### Context

[\[Tree\]](#) (config>subscr-mgmt>ppp-policy session-timeout)

### Full Context

configure subscriber-mgmt ppp-policy session-timeout

### Description

This command defines the time before the PPP session is terminated.

A RADIUS specified session-timeout (attribute [27] Session-Timeout) overrides the CLI configured value.

The **no** form of this command reverts to the default.

### Parameters

*timeout*

Specifies the session timeout in seconds.

**Values** 1 to 31104000

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## session-timeout

### Syntax

**session-timeout** *timeout*

**no session-timeout**

### Context

[\[Tree\]](#) (config>subscr-mgmt>ipoe-plcy session-timeout)

### Full Context

configure subscriber-mgmt ipoe-session-policy session-timeout

### Description

This command defines the time in seconds between 1 second and 360 days before the IPoE session is disconnected. The default value is unlimited session timeout.

The **no** form of this command reverts to the default.

## Parameters

### *timeout*

Specifies the session timeout in seconds.

**Values** 1 to 31104000

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.201 set-time

### set-time

## Syntax

**set-time** *date time*

## Context

[\[Tree\]](#) (admin set-time)

## Full Context

admin set-time

## Description

This command sets the local system time.

The time entered should be accurate for the time zone configured for the system. The system will convert the local time to UTC before saving to the system clock which is always set to UTC. This command does not take into account any daylight saving offset if defined.

If SNTP or NTP is enabled (no shutdown) then this command cannot be used.

## Parameters

### *date*

Specifies the local date and time accurate to the minute in the YYYY/MM/DD format.

**Values** YYYY is the four-digit year  
MM is the two-digit month  
DD is the two-digit date

### *time*

Specifies the time (accurate to the second) in the *hh:mm[:ss]* format. If no seconds value is entered, the seconds are reset to :00.

**Values** *hh* is the two-digit hour in 24 hour format (00=midnight, 12=noon)*mm* is the two-digit minute

**Default** 0

## Platforms

All

## 23.202 set-tos

```
set-tos
```

### Syntax

```
set-tos [0..255]
no set-tos
```

### Context

[\[Tree\]](#) (config>service>vprn>nat>inside>nat64 set-tos)  
[\[Tree\]](#) (config>router>nat>inside>nat64 set-tos)

### Full Context

```
configure service vprn nat inside nat64 set-tos
configure router nat inside nat64 set-tos
```

### Description

This command specifies the value of the IPv4 ToS field. When enabled, the NAT64 node ignores IPv6 traffic-class and sets IPv4 ToS to the supplied ToS value in the translated IPv4 packet.

The **no** form of the command reverts to the default.

### Default

```
set-tos 0
```

### Parameters

**[0..255]**

Sets the IPv4 ToS to a fixed value the IPv6 Traffic Class and set the IPv4 ToS to a fixed value and ignores the IPv6 traffic class.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.203 setup-timeout

### setup-timeout

#### Syntax

**setup-timeout access-accept** *timeout*

**no setup-timeout**

#### Context

[\[Tree\]](#) (config>service>dynsvc>timers setup-timeout)

#### Full Context

configure service dynamic-services timers setup-timeout

#### Description

This command specifies the time that dynamic data services setup requests from a RADIUS Access-Accept are hold in an internal work queue waiting to be processed. If after the timeout, the dynamic data service setup request is still in the queue (meaning it is not setup), then the dynamic service setup request is removed from the queue and the setup fails.

The **no** form of this command reverts to the default value of 30 seconds.

#### Default

no setup-timeout

#### Parameters

##### *timeout*

Specifies the setup-timeout, in seconds, for setup requests of dynamic services received via Access-Accept.

**Values** 2 to 3600

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.204 severity

## severity

### Syntax

**severity** {**eq** | **neq** | **lt** | **lte** | **gt** | **gte**} *severity-level*

**no severity**

### Context

**[Tree]** (config>service>vprn>log>filter>entry>match severity)

### Full Context

configure service vprn log filter entry match severity

### Description

This command adds an event severity level as a match criterion. Only one severity command can be entered per event filter entry. The latest severity command overwrites the previous command.

The **no** form of this command removes the severity match criterion.

### Default

no severity

### Parameters

**eq** | **neq** | **lt** | **lte** | **gt** | **gte**

Specifies the type of match. Valid operators are listed below.

#### Values

Table 117: Valid Operators

Operator	Notes
eq	equal to
neq	not equal to
lt	less than
lte	less than or equal to
gt	greater than
gte	greater than or equal to

#### *severity-name*

The ITU severity level name. [Table 118: Severity Levels](#) lists severity names and corresponding numbers per ITU standards M.3100 X.733 & X.21 severity levels.

Table 118: Severity Levels

Severity Number	Severity Name
1	cleared

## 23.205 severity-level

### severity-level

#### Syntax

**severity-level** *syslog-level*

#### Context

[\[Tree\]](#) (config>service>nat>syslog>syslog-export-policy severity-level)

#### Full Context

configure service nat syslog syslog-export-policy severity-level

#### Description

This command configures the severity level.

For more information, refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide*. The **config>log>syslog>level** hierarchy also applies to this context.

#### Default

severity-level info

## Parameters

### *syslog-level*

Specifies the severity level.

**Values** emergency, alert, critical, error, warning, notice, info, debug

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.206 sf-offset

### sf-offset

## Syntax

**sf-offset** *offset-value*

**no sf-offset**

## Context

[\[Tree\]](#) (config>service>vprn>isis>if>level sf-offset)

## Full Context

configure service vprn isis interface level sf-offset

## Description

If the pre-FEC error rate of the associated DWDM port crosses the configured **sf-threshold**, this offset-value is added to the IS-IS interface metric. This parameter is only effective if the interface is associated with a DWDM port and the **sf-threshold** value is configured under that port.

The **no** form of this command reverts the offset value to 0.

## Default

no sf-offset

## Parameters

### *offset-value*

Specifies the amount the interface metric is increased by if the **sf-threshold** is crossed.

**Values** 0 to 16777215

## Platforms

All

## sf-offset

### Syntax

**sf-offset** *offset-value*

**no sf-offset**

### Context

[\[Tree\]](#) (config>router>isis>if>level sf-offset)

### Full Context

configure router isis interface level sf-offset

### Description

If the pre-FEC error rate of the associated DWDM port crosses the configured **sf-threshold**, this offset-value is added to the IS-IS interface metric. This parameter is only effective if the interface is associated with a DWDM port and the **sf-threshold** value is configured under that port.

The **no** form of this command reverts the offset value to 0.

### Default

no sf-offset

### Parameters

**offset-value**

Specifies the amount the interface metric is increased by if the **sf-threshold** is crossed.

**Values** 0 to 16777215

### Platforms

All

## 23.207 sf-sd-method

## sf-sd-method

### Syntax

**sf-sd-method** {**bip8** | **fec**}

### Context

[\[Tree\]](#) (config>port>otu sf-sd-method)

## Full Context

```
configure port otu sf-sd-method
```

## Description

This command specifies the method used to determine the signal failure (SF) and signal degrade (SD) alarms. When the **bip8** method is selected, the SM-BIP8 errors are used. When the **fec** method is selected, the FEC corrected bits are used.

The following rules must be followed:

- The port's OTU must be enabled to set or change the **sf-sd-method**.
- The FEC mode must be **enhanced** or **g709** before setting **sf-sd-method** to **fec**.
- The SF threshold must be 5 or higher before setting **sf-sd-method** to **bip8**.

## Default

```
sf-sd-method fec
```

## Parameters

### bip8

Specifies that SM-BIP8 errors are used to declare the presence of the SF and SD conditions.

### fec

Specifies that FEC corrected bit errors are used to declare the presence of the SF and SD conditions.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.208 sf-threshold

### sf-threshold

## Syntax

```
sf-threshold threshold [coefficient coefficient]
```

## Context

[\[Tree\]](#) (config>port>otu sf-threshold)

## Full Context

```
configure port otu sf-threshold
```

## Description

This command defines the error rate at which to declare the signal failure (SF) condition.

The parameters define an error rate of  $(\text{coefficient}/10) * 10\text{E-}\text{threshold}$ . For example, **sf-threshold 5 coefficient 20** defines an error rate of  $(20/10) * 10\text{E-}5$ , or  $2 * 10\text{E-}5$ , or 0.000 02.

The SF threshold must be the following:

- less than the SD threshold
- 5 or higher before setting **sf-sd-method** to **bip8**

The **coefficient** parameter is only used when **sf-sd-method** is set to **fec**. When **sf-sd-method** is set to **bip8**, **coefficient** is considered to have the value of 10.

## Parameters

### *threshold*

Specifies the exponent for the SF threshold value.

**Values** 3 to 6 when **sf-sd-method** is **bip8**  
3 to 8 when **sf-sd-method** is **fec**

**Default** 5

### *coefficient*

Specifies the coefficient for the SF threshold value.

**Values** 10 to 99

**Default** 10

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## sf-threshold

### Syntax

**sf-threshold** *errored-frames*

### Context

**[Tree]** (config>port>ethernet>efm-oam>link-mon>errored-frame sf-threshold)

### Full Context

configure port ethernet efm-oam link-monitoring errored-frame sf-threshold

### Description

The option defines the number of frame errors within the configured window which indicates the port has exceeded an acceptable error rate. A log event will be raised, and the port will be taken out of service by default. Configuration options exist to take additional actions when the error rate exceeds the threshold. These actions are defined using the **local-sf-action** configuration. This event can only be cleared through manual intervention that affects the state of the port.

## Parameters

### *errored-frames*

The number of errored frames within the configured window which indicates the port has become unusable.

**Values** 1 to 1000000

**Default** 1

## Platforms

All

## sf-threshold

## Syntax

**sf-threshold** *errored-frames*

## Context

[\[Tree\]](#) (config>port>ethernet>efm-oam>link-mon>errored-frame-period sf-threshold)

## Full Context

configure port ethernet efm-oam link-monitoring errored-frame-period sf-threshold

## Description

This command defines the number of frame errors within the configured window which indicates the port has exceeded an acceptable error rate. A log event will be raised, and the port will be taken out of service by default. Configuration options exist to take additional actions when the error rate exceeds the threshold. These actions are defined using the local-sf-action configuration. This event can only be cleared through manual intervention that affects the state of the port.

## Default

sf-threshold 1

## Parameters

### *errored-frames*

Specifies the number of errored frames within the configured window which indicates the port has become unusable.

**Values** 1 to 1000000

## Platforms

All

## sf-threshold

### Syntax

**sf-threshold** *errored-seconds*

### Context

[\[Tree\]](#) (config>port>ethernet>efm-oam>link-mon>errored-frame-seconds sf-threshold)

### Full Context

configure port ethernet efm-oam link-monitoring errored-frame-seconds sf-threshold

### Description

This command defines the number of errors seconds within the configured window which indicates the port has exceeded an acceptable error rate. A log event will be raised, and the port will be taken out of service by default. Configuration options exist to take additional actions when the error rate exceeds the threshold. These actions are defined using the **local-sf-action** configuration. This event can only be cleared through manual intervention that affects the state of the port.

### Parameters

#### ***errored-seconds***

Specifies the number of errored seconds within the configured window which indicates the port has become unusable.

**Values** 1 to 900

### Platforms

All

## sf-threshold

### Syntax

**sf-threshold** *errored-symbols*

### Context

[\[Tree\]](#) (config>port>ethernet>efm-oam>link-mon>errored-symbols sf-threshold)

### Full Context

configure port ethernet efm-oam link-monitoring errored-symbols sf-threshold

### Description

This command defines the number of symbol errors within the configured window which indicates the port has exceeded an acceptable error rate. A log event will be raised, and the port will be taken out of service by default. Configuration options exist to take additional actions when the error rate exceeds the threshold. These actions are defined using the local-sf-action configuration.

## Parameters

### *errored-symbols*

Specifies the number of errored-symbols which indicates the port has become unusable.

**Values** 1 to 1000000

## Platforms

All

## sf-threshold

## Syntax

**sf-threshold** *threshold* [**multiplier** *multiplier*]

**no sf-threshold**

## Context

[\[Tree\]](#) (config>port>ethernet>sym-mon sf-threshold)

## Full Context

configure port ethernet symbol-monitor sf-threshold

## Description

This command specifies the error rate at which to declare the Signal Fail condition on an Ethernet interface. The value represents  $M \cdot 10^E - N$  symbol errors over total symbols received over  $W$  seconds of the sliding window. The symbol errors on the interface are sampled once per second. A default of 10 seconds is used when there is no additional window-size configured. The multiplier keyword is optional. If the multiplier keyword is omitted or no sf-threshold is specified, the multiplier will return to the default value of 1.

## Default

no sf-threshold

## Parameters

### *threshold*

Specifies the rate of symbol errors.

**Values** 1 to 9

### *multiplier*

Specifies the multiplier used to scale the symbol error ratio.

**Values** 1 to 9

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## sf-threshold

### Syntax

**sf-threshold** *threshold* [**multiplier** *multiplier*]

**no sf-threshold**

### Context

**[Tree]** (config>port>ethernet>crc-monitor sf-threshold)

### Full Context

configure port ethernet crc-monitor sf-threshold

### Description

This command specifies the error rate at which to declare the Signal Fail condition on an Ethernet interface. The value represents  $M \cdot 10E^{-N}$  errored frames over total frames received over  $W$  seconds of the sliding window. The CRC errors on the interface are sampled once per second. A default of 10 seconds is used when there is no additional window-size configured. The multiplier keyword is optional. If the multiplier keyword is omitted or **no sf-threshold** is specified the multiplier will return to the default value of 1.

### Default

no sf-threshold

### Parameters

#### ***threshold***

Specifies the threshold value.

**Values** 1 to 9

#### ***multiplier***

Specifies the multiplier value.

**Values** 1 to 9

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.209 sf-threshold-clear

## sf-threshold-clear

### Syntax

**sf-threshold-clear** *threshold* [**coefficient** *coefficient*]

### Context

**[Tree]** (config>port>otu sf-threshold-clear)

### Full Context

configure port otu sf-threshold-clear

### Description

This command defines the signal failure (SF) threshold clear value.

When the bit error rate falls below this value, the SF condition is cleared. The parameters define an error rate of  $(\text{coefficient}/10) * 10E\text{-threshold}$ . For example, **sf-threshold-clear 7 coefficient 10** defines an error rate of  $(10/10) * 10E\text{-7}$ , or  $10E\text{-7}$ , or 0.000 000 1.

This SF threshold clear setting is valid only when **sf-sd-method** is set to **fec**.

### Parameters

#### ***threshold***

Specifies the exponent for the SF threshold clear value.

**Values** 3 to 9

**Default** 6

#### ***coefficient***

Specifies the coefficient for the SF threshold clear value.

**Values** 10 to 99

**Default** 10

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.210 sflow

## sflow

### Syntax

[no] **sflow**

## Context

[\[Tree\]](#) (config>port>ethernet sflow)

## Full Context

configure port ethernet sflow

## Description

This command enables sFlow data collection for a port and its SAPs that support sFlow data collection.

The **no** form of this of this command disables sFlow.

## Default

no sflow

## Platforms

7750 SR, 7750 SR-s, 7950 XRS

## sflow

## Syntax

**sflow**

## Context

[\[Tree\]](#) (config sflow)

## Full Context

configure sflow

## Description

Commands in this context configure sflow agent parameters.

## Platforms

7750 SR, 7750 SR-s, 7950 XRS

## 23.211 sfm

## sfm

## Syntax

**sfm** *sfm-name*

**no sfm** *sfm-name*

**Context**

[\[Tree\]](#) (config sfm)

**Full Context**

configure sfm

**Description**

Commands in this context configure the specified SFM.

The **no** form of this command removes the SFM configuration for the specified SFM.

**Parameters*****sfm-name***

Specifies the SFM identifier.

**Values** 1 to 4

**Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## 23.212 sfm-loss-threshold

### sfm-loss-threshold

**Syntax**

**sfm-loss-threshold** *num-sfm*

**no sfm-loss-threshold**

**Context**

[\[Tree\]](#) (config>system>switch-fabric sfm-loss-threshold)

**Full Context**

configure system switch-fabric sfm-loss-threshold

**Description**

This command sets the number of SFMs that are permitted to fail before the system goes into SFM overload state. This command is only applicable on the 7750 SR-7s and the 7750 SR-14s. Users can select the SFM limit based on the number possible for the system minus one. For the 7750 SR-7s this is a value of 3 and for the 7750 SR-14s this is a value of 7.

For networks that can accommodate more SFM failures than the default value, this command allows the selection of the number of SFMs to fail prior to the system going into SFM overload state.

The **no** form of this command reverts the threshold to the default value.

**Default**

7750 SR-7s: sfm-loss-threshold 1

7750 SR-14s: sfm-loss-threshold 2

**Parameters*****num-sfm***

Specifies the number of SFMs permitted to fail before SFM overload state.

**Values** 1 to 7

**Platforms**

7750 SR-7s, 7750 SR-14s

## 23.213 sfm-type

### sfm-type

**Syntax**

**sfm-type** *sfm-type*

**no sfm** *sfm-type*

**Context**

[\[Tree\]](#) (config>sfm sfm-type)

**Full Context**

configure sfm sfm-type

**Description**

This command provisions the SFM.

The **no** form of this command deprovisions the SFM.

**Default**

no sfm *sfm-type*

**Parameters*****sfm-type***

Specifies the SFM card type.

**Values** Depending on the SR hardware platform.

**Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

**23.214 sg**

sg

**Syntax**

**sg** [**group** *grp-addr* [**source** *src-addr*]]

**no sg**

**Context**

[\[Tree\]](#) (debug>service>id>video-interface sg)

**Full Context**

debug service id video-interface sg

**Description**

This command enables channel debugging.

**Parameters**

**group** *grp-addr*

Specifies the multicast channel address.

**source** *src-addr*

Specifies the source address.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

**23.215 sgsn-mcc-mnc**

sgsn-mcc-mnc

**Syntax**

## 23.218 sham-link

### sham-link

## Syntax

**sham-link** *ip-int-name ip-address*

## Context

[\[Tree\]](#) (config>service>vprn>ospf>area sham-link)

## Full Context

configure service vprn ospf area sham-link

## Description

This command is similar to a virtual link with the exception that metric must be included in order to distinguish the cost between the MPLS-VP RN link and the backdoor.

## Parameters

### *ip-int-name*

The local interface name used for the sham-link. This is a mandatory parameter and interface names must be unique within the group of defined IP interfaces for **config>router>if**, **config>service>ies>if** and **config>service>vprn>if** commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters, the entire string must be enclosed between double quotes. If the IP interface name does not exist or does not have an IP address configured, an error message will be returned.

### *ip-address*

The IP address of the sham-link neighbor in IP address dotted decimal notation. This parameter is the remote peer of the sham link's IP address used to set up the sham-link. This is a mandatory parameter and must be a valid IP address.

### Platforms

All

## 23.219 sham-neighbor

### sham-neighbor

#### Syntax

**sham-neighbor** [*ip-address*]

**no sham-neighbor**

#### Context

[\[Tree\]](#) (debug>router>ospf sham-neighbor)

#### Full Context

debug router ospf sham-neighbor

#### Description

This command enables debugging of the OSPFv2 sham-link neighbor.

#### Parameters

***ip-address***

Debugs the sham-link neighbor identified by this IP address.

#### Platforms

All

## 23.220 shape-multi-client-only

### shape-multi-client-only

#### Syntax

**[no] shape-multi-client-only**

**Context**

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>wlan-gw>egress shape-multi-client-only)

**Full Context**

configure service ies subscriber-interface group-interface wlan-gw egress shape-multi-client-only

**Description**

This command enables the egress shaping is only enabled for a wlan-gw tunnel while there are multiple UE (User Equipment) using it.

The **no** form of this command disables the egress shaping.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.221 shaper

### shaper

**Syntax**

[no] shaper

**Context**

[\[Tree\]](#) (config>service>sdp>binding>pw-port>egress shaper)

**Full Context**

configure service sdp binding pw-port egress shaper

**Description**

This command enables the egress shaping option for use by a pseudowire port.

The **no** form of the command disables the egress shaping option.

**Default**

no shaper

**Platforms**

All

## shaper

### Syntax

[no] shaper

### Context

[\[Tree\]](#) (config>service>epipe>pw-port>egress shaper)

### Full Context

configure service epipe pw-port egress shaper

### Description

Commands in this context configure PW-port shaper parameters.

### Platforms

All

## 23.222 shaping

## shaping

### Syntax

shaping {per-retailer | per-tunnel}

no shaping

### Context

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>wlan-gw>egress shaping)

### Full Context

configure service ies subscriber-interface group-interface wlan-gw egress shaping

### Description

This command configures the granularity of the egress shaping for wlan-gw on this group interface.

The **no** form of this command removes the parameter from the configuration.

### Parameters

**per-tunnel**

Specifies that a separate shaper is applied to each wlan-gw tunnel.

**per-retailer**

Specifies that a separate shaper is applied to each retailer Mobile Network Operator's fraction of the wlan-gw tunnel payload.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.223 shared-circuit-id

```
shared-circuit-id
```

### Syntax

[no] shared-circuit-id

### Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if shared-circuit-id)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if shared-circuit-id)

### Full Context

configure service vprn subscriber-interface group-interface shared-circuit-id

configure service ies subscriber-interface group-interface shared-circuit-id

### Description

If configured, circuit-id in DHCPv4 Option82 is used to authenticate DHCPv6. If DHCPv6 is received before DHCPv4, it is dropped. Also, a SLAAC host is created based on DHCPv4 authentication if RADIUS returns IPv6 framed-prefix. The IPv6oE host is deleted if the linked IPv4oE host is deleted due to DHCP release or lease time-out. The linkage between IPv4 and IPv6 is based on SAP and MAC address. The sharing of circuit-id from DHCPv4 for authentication of DHCPv6 (or SLAAC) allows 7750 SR to work around lack of support for LDRA on access nodes.

The **no** form of this command reverts to the default.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.224 shared-policer

```
shared-policer
```

### Syntax

[no] shared-policer

## Context

[\[Tree\]](#) (config>filter>ip-filter shared-policer)

[\[Tree\]](#) (config>filter>ipv6-filter shared-policer)

## Full Context

configure filter ip-filter shared-policer

configure filter ipv6-filter shared-policer

## Description

When enabled and when the filter policy is configured on a LAG endpoint, the system programs the policer rates in the filter policy per line card FP of the LAG based on the number of active ports in the LAG for each FP. When disabled and when the filter policy is configured on a LAG endpoint, the system programs the same policer rate on each line card FP of the LAG.

The **no** form of this command disables the configuration.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.225 shared-queue

### shared-queue

## Syntax

**shared-queue** *policy-name* [**create**]

**no shared-queue** *policy-name*

## Context

[\[Tree\]](#) (config>qos shared-queue)

## Full Context

configure qos shared-queue

## Description

Commands in this context modify the QoS default shared-queue policy.

## Parameters

*policy-name*

The name of the default shared-queue policy.

**Values** default

## Platforms

All

## shared-queue

### Syntax

```
shared-queue src-name dst-name [overwrite]
```

### Context

[\[Tree\]](#) (config>qos>copy shared-queue)

### Full Context

```
configure qos copy shared-queue
```

### Description

This command copies an existing **shared-queue** to another **shared-queue**. The **copy** command is a configuration level maintenance tool used to create new entries using an existing mapping policy name. If **overwrite** is not specified, an error occurs if the destination policy exists.

### Parameters

#### *src-name*

Specifies the existing source **shared-queue**, up to 32 characters, from which the **copy** command attempts to copy.

#### *dst-name*

Specifies the destination **shared-queue**, up to 32 characters, to which the copy command attempts to copy.

#### **overwrite**

Use this parameter when the **shared-queue** *dst-name* already exists. If it does, everything in the existing destination **shared-queue** *dst-name* is completely overwritten with the contents of the **shared-queue** *src-name*. The **overwrite** parameter must be specified or else the following error message is returned:

```
MINOR: CLI Destination "sqtest10" exists - use {overwrite}.
```

If **overwrite** is specified, the function of copying from source to destination occurs in a "break before make" manner and therefore should be handled with care.

## Platforms

## 23.226 shared-radius-filter-wmark

## shared-radius-filter-wmark

### Syntax

**shared-radius-filter-wmark** **low** *low-watermark* **high** *high-watermark*  
**no shared-radius-filter-wmark**

### Context

**[Tree]** (config>filter>ip-filter shared-radius-filter-wmark)

**[Tree]** (config>filter>ipv6-filter shared-radius-filter-wmark)

### Full Context

configure filter ip-filter shared-radius-filter-wmark

configure filter ipv6-filter shared-radius-filter-wmark

### Description

This command configures the low and high watermark for the number of RADIUS shared filters reporting

### Default

no shared-radius-filter-wmark

### Parameters

#### *low-watermark*

Specifies the utilization of the filter ranges for filter entry insertion, at which a table full alarm will be raised by the agent.

**Values** 0 to 8000

#### *high-watermark*

Specifies the utilization of the filter ranges for filter entry insertion, at which a table full alarm will be cleared by the agent.

**Values** 1 to 8000

## 23.228 shcv-policy

### shcv-policy

## Syntax

**shcv-policy** *name* [**create**]

**no shcv-policy** *name*

## Context

[\[Tree\]](#) (config>subscr-mgmt shcv-policy)

## Full Context

configure subscriber-mgmt shcv-policy

## Description

This command configures a Subscriber Host Connectivity Verification (SHCV) policy. An SHCV policy can be applied to both the subscriber management group interface and VPLS instances. All SHCV-related features inside a group interface and a VPLS service follows the configuration specified in the SHCV policy. The SHCV policy and the SHCV configuration on a group interface are mutually exclusive. Only one can be applied to the group interface.

The **no** form of this command removes the policy name from the configuration.

## Parameters

### *name*

Specifies the name of the SHCV policy, up to 32 characters.

### **create**

Keyword required to create the configuration context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## shcv-policy

### Syntax

**shcv-policy** *name*

**no shcv-policy**

### Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if shcv-policy)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if shcv-policy)

### Full Context

configure service vprn subscriber-interface group-interface shcv-policy

configure service ies subscriber-interface group-interface shcv-policy

### Description

This command references the SHCV policy to be used for both IPv4 and IPv6 subscriber hosts. The policy name must already exist in the **config>subscr-mgmt** context.

The **no** form of this command removes the policy name from the service configuration.

### Parameters

*name*

Specifies an existing SHCV policy name up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.229 shcv-policy-ipv4

## shcv-policy-ipv4

### Syntax

**shcv-policy-ipv4** *name*

**no shcv-policy-ipv4**

### Context

[\[Tree\]](#) (config>service>vpls shcv-policy-ipv4)

[Tree] (config>service>ies>if shcv-policy-ipv4)  
[Tree] (config>service>ies>sub-if>grp-if shcv-policy-ipv4)  
[Tree] (config>service>vprn>if shcv-policy-ipv4)  
[Tree] (config>service>vprn>sub-if>grp-if shcv-policy-ipv4)  
[Tree] (config>service>vpls>sap shcv-policy-ipv4)

### Full Context

```
configure service vpls shcv-policy-ipv4
configure service ies interface shcv-policy-ipv4
configure service ies subscriber-interface group-interface shcv-policy-ipv4
configure service vprn interface shcv-policy-ipv4
configure service vprn subscriber-interface group-interface shcv-policy-ipv4
configure service vpls sap shcv-policy-ipv4
```

### Description

This command specifies the Subscriber Host Connectivity Verification (SHCV) policy to be used exclusive for IPv4 subscriber hosts. The shcv-policy name must already exist in the **config>subscr-mgmt** context.

The **no** form of this command removes the policy name from the service configuration.

### Parameters

***name***

Specifies an existing SHCV policy name up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.230 shcv-policy-ipv6

shcv-policy-ipv6

### Syntax

```
shcv-policy-ipv6 name
no shcv-policy-ipv6
```

### Context

[Tree] (config>service>vprn>if shcv-policy-ipv6)  
[Tree] (config>service>vprn>sub-if>grp-if shcv-policy-ipv6)  
[Tree] (config>service>ies>sub-if>grp-if shcv-policy-ipv6)  
[Tree] (config>service>ies>if shcv-policy-ipv6)

## Full Context

```
configure service vprn interface shcv-policy-ipv6
configure service vprn subscriber-interface group-interface shcv-policy-ipv6
configure service ies subscriber-interface group-interface shcv-policy-ipv6
configure service ies interface shcv-policy-ipv6
```

## Description

This command references the Subscriber Host Connectivity Verification (SHCV) policy to be used exclusive for IPv6 subscriber hosts. The policy name must already exist in the **config>subscr-mgmt** context.

The **no** form of this command removes the policy name from the service configuration.

## Parameters

### *name*

Specifies an existing SHCV policy name up to 32 characters.

## Platforms

All

- configure service ies interface shcv-policy-ipv6
  - configure service vprn interface shcv-policy-ipv6
- 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR
- configure service vprn subscriber-interface group-interface shcv-policy-ipv6
  - configure service ies subscriber-interface group-interface shcv-policy-ipv6

## 23.231 shell

```
shell
```

## Syntax

```
shell -password password
```

```
no shell
```

## Context

[\[Tree\]](#) (environment shell)

## Full Context

```
environment shell
```

**Description**

This command enables and disables the shell.

**Parameters*****password***

Specifies the password to enter the shell, up to 256 characters.

**Platforms**

All

## 23.232 short-duration-flow-count

### short-duration-flow-count

**Syntax**

[no] short-duration-flow-count

**Context**

[\[Tree\]](#) (config>log>acct-policy>cr>aa>aa-sub-cntr short-duration-flow-count)

**Full Context**

configure log accounting-policy custom-record aa-specific aa-sub-counters short-duration-flow-count

**Description**

This command includes the short duration flow count in the AA subscriber's custom record. This command only applies to the 7750 SR.

The **no** form of this command excludes the short duration flow count.

**Default**

no short-duration-flow-count

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.233 short-sequence-numbers

## short-sequence-numbers

### Syntax

[no] short-sequence-numbers

### Context

**[Tree]** (config>subscr-mgmt>ppp-policy>mlppp short-sequence-numbers)

**[Tree]** (config>router>l2tp>group>tunnel>mlppp short-sequence-numbers)

**[Tree]** (config>router>l2tp>group>mlppp short-sequence-numbers)

**[Tree]** (config>service>vprn>l2tp>group>tunnel>mlppp short-sequence-numbers)

**[Tree]** (config>service>vprn>l2tp>group>mlppp short-sequence-numbers)

### Full Context

configure subscriber-mgmt ppp-policy mlppp short-sequence-numbers

configure router l2tp group tunnel mlppp short-sequence-numbers

configure router l2tp group mlppp short-sequence-numbers

configure service vprn l2tp group tunnel mlppp short-sequence-numbers

configure service vprn l2tp group mlppp short-sequence-numbers

### Description

This command enables a peer request to send short sequence numbers. This command is applicable to LAC and LNS. By default, MLPPPoX negotiates 24bit long sequence numbers. This command allows this to be changed to shorter, 12-bit sequence numbers.

The **no** form of this command reverts to the default.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

## 23.234 shortcut-local-ttl-propagate

## shortcut-local-ttl-propagate

### Syntax

[no] shortcut-local-ttl-propagate

### Context

**[Tree]** (config>router>ldp shortcut-local-ttl-propagate)

**[Tree]** (config>router>mpls shortcut-local-ttl-propagate)

## Full Context

```
configure router ldp shortcut-local-ttl-propagate
configure router mpls shortcut-local-ttl-propagate
```

## Description

This command configures the TTL handling of locally generated packets for all LSP shortcuts originating on this ingress LER. It applies to all LDP or RSVP LSPs that are used to resolve static routes, BGP routes, and IGP routes.

The user can enable or disable the propagation of the TTL from the header of an IP packet into the header of the resulting MPLS packet independently for local and transit packets forwarded over an LSP shortcut.

Local IP packets include ICMP Ping, traceroute, and OAM packets, that are destined to a route that is resolved to the LSP shortcut. Transit IP packets are all IP packets received on any IES interface and destined to a route that is resolved to the LSP shortcut

By default, the feature propagates the TTL from the header of locally generated IP packets into the label stack of the resulting MPLS packets forwarded over the LSP shortcut. This is referred to as Uniform mode.

When the **no** form of this command is enabled, TTL propagation is disabled on all locally generated IP packets, including ICMP Ping, traceroute, and OAM packets, that are destined to a route that is resolved to the LSP shortcut. In this case, a TTL of 255 is programmed onto the pushed label stack. This is referred to as Pipe mode.

## Default

## 23.236 shortcut-tunnel

### shortcut-tunnel

## Syntax

shortcut-tunnel

## Context

[\[Tree\]](#) (config>router>bgp>next-hop-resolution shortcut-tunnel)

## Full Context

configure router bgp next-hop-resolution shortcut-tunnel

## Description

This command creates the context to configure the tunnel types that can be used to resolve unlabeled IPv4 and IPv6 BGP routes.

The following tunnel types are supported for resolving IPv4 routes and IPv6 routes with IPv4-mapped IPv6 next-hop addresses: **bgp**, **ldp**, **rsvp**, **sr-isis**, **sr-ospf**, **sr-policy** and **sr-te**. In this context:

- **bgp** — refers to IPv4 tunnels created by receiving BGP label-unicast IPv4 routes for /32 IPv4 prefixes.
- **ldp** — refers to /32 and shorter length LDP FEC prefixes imported into the tunnel table. For IPv4 NLRI, BGP selects the LDP FEC that is the longest-prefix-match (LPM) of the BGP next-hop address. For IPv6 NLRI, BGP selects the /32 FEC that is an exact match of the BGP next-hop address.

- **rsvp** — refers to RSVP tunnels in the tunnel table to IPv4 destinations. This option allows BGP to use the best metric RSVP LSP to the address of the BGP next-hop. This address can correspond to the system interface or to another loopback interface of the remote BGP router. In the case of multiple RSVP LSPs with the same lowest metric, BGP selects the LSP with the lowest tunnel id.
- **sr-isis** — refers to segment routing tunnels (shortest path) to IPv4 destinations reachable by the IS-IS protocol. This option allows BGP to use the segment routing tunnel in the tunnel table submitted by the lowest preference IS-IS instance or (in case of a tie) the lowest numbered IS-IS instance.
- **sr-ospf** — refers to segment routing tunnels (shortest path) to IPv4 destinations reachable by the OSPF protocol. This option allows BGP to use the segment routing tunnel in the tunnel table submitted by the lowest preference OSPF instance or (in case of a tie) the lowest numbered OSPF instance.
- **sr-policy** — refers to segment routing policies with an IPv4 endpoint that are statically configured in the local router or learned through BGP routes (AFI 1/SAFI 73). For BGP to resolve the next hop of an unlabeled IPv4 or IPv6 route using a segment routing policy the highest numbered color extended community attached to the IPv4 or IPv6 route must match the color of the segment routing policy.
- **sr-te** — refers to traffic engineered (TE) segment routing tunnels. This option allows BGP to use the best metric SR-TE tunnel to the address of the BGP next-hop. In the case of multiple SR-TE tunnels with the same lowest metric, BGP selects the tunnel with the lowest tunnel id.
- **udp** — refers to MPLSoUDPoIPv4 tunnels set up by action of the BGP import policies.

The following tunnel types are supported for resolving IPv6 routes with IPv6 next-hops that are not IPv4-mapped IPv6 addresses: ldp, sr-isis, and sr-policy. In this context:

- **ldp** — refers to /128 LDP FEC prefixes in the tunnel table. BGP selects the /128 FEC that is an exact match of the BGP next-hop address.
- **sr-isis** — refers to segment routing tunnels (shortest path) to IPv6 destinations reachable by the IS-IS protocol. This option allows BGP to use the segment routing tunnel in the tunnel table submitted by the lowest preference IS-IS instance or (in case of a tie) the lowest numbered IS-IS instance.
- **sr-policy** — refers to segment routing policies with a null IPv4 endpoint (0.0.0.0) that are statically configured in the local router or learned through BGP routes (AFI 1/SAFI 73). For BGP to resolve the next hop of an IPv6 route using a segment routing policy the highest numbered color extended community attached to the IPv6 route must match the color of the segment routing policy and its color bits must be set to '01' or '10'.

## Platforms

## 23.237 show-ipsec-keys

```
show-ipsec-keys
```

### Syntax

```
[no] show-ipsec-keys
```

## Context

[\[Tree\]](#) (config>ipsec show-ipsec-keys)

## Full Context

configure ipsec show-ipsec-keys

## Description

This command enables user to optionally include IKE-SA or CHILD-SA keys in the output of **debug ipsec** or **admin ipsec display-key**.

The **no** form of this command disallows the user from including keys in the output.

## Default

no show-ipsec-keys

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.238 show-request

### show-request

## Syntax

**show-request** [*ca ca-profile-name*]

## Context

[\[Tree\]](#) (admin>certificate>cmpv2 show-request)

## Full Context

admin certificate cmpv2 show-request

## Description

This command displays current the CMPv2 pending request toward the specified CA. If there is no pending request, the last pending request is displayed including the status (success/fail/rejected) and the receive time of last CMPv2 message from server.

The following information is included in the output:

- Request type, original input parameter (password is not displayed), checkAfter and reason in of last PollRepContent, time of original command input.

## Parameters

*ca-profile-name*

Specifies a ca-profile name, up to 32 characters. If not specified, the system will display pending requests of all ca-profiles.

## Platforms

All

## Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The **no** form of this command places the entity into an administratively enabled state.

## Default

shutdown

## Description

This command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Unlike other commands and parameters where the default state is not indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system-generated configuration files.

The **no** form of this command places the entity into an administratively enabled state.

## Default

no shutdown

## Platforms

All

- configure router mld shutdown

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>subscr-mgmt>shcv-policy>trigger shutdown)

### Full Context

```
configure subscriber-mgmt shcv-policy trigger shutdown
```

### Description

This command administratively disables the SHCV triggers.

The **no** form of this command administratively enables the the SHCV triggers.

### Default

```
no shutdown
```

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## shutdown

### Syntax

```
[no] shutdown
```

### Context

[\[Tree\]](#) (config>subscr-mgmt>shcv-policy>periodic shutdown)

### Full Context

```
configure subscriber-mgmt shcv-policy periodic shutdown
```

### Description

This command administratively disables the periodic connectivity verification.

The **no** form of this command administratively enables the periodic connectivity verification.

### Default

```
no shutdown
```

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## shutdown

### Syntax

```
[no] shutdown
```

### Context

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>ipoe-session shutdown)

**[Tree]** (config>service>vprn>sub-if>grp-if>ipoe-session shutdown)

**[Tree]** (config>service>vpls>sap>ipoe-session shutdown)

### Full Context

configure service ies subscriber-interface group-interface ipoe-session shutdown

configure service vprn subscriber-interface group-interface ipoe-session shutdown

configure service vpls sap ipoe-session shutdown

### Description

The **shutdown** command enables or disables IPoE session management on a group interface or capture SAP.

A **shutdown** of the IPoE session CLI hierarchy on a group-interface clears all active IPoE sessions on that interface, resulting in a deletion of all corresponding subscriber hosts.

On wlan-gw group interfaces it is not possible to disable an IPoE session.

The **no** form of this command reverts to the default.

### Default

shutdown no shutdown on wlan-gw group interfaces

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service ies shutdown

### Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Services are created in the administratively down (**shutdown**) state. When a **no shutdown** command is entered, the service becomes administratively up and then tries to enter the operationally up state. Default administrative states for services and service entities is described below in Special Cases.

The **no** form of this command places the entity into an administratively enabled state.

## Platforms

All

- configure service ies interface dhcp shutdown
- configure service ies interface spoke-sdp shutdown

```

## Description

The **shutdown** command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they can be deleted.

Unlike other commands and parameters where the default state is not indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system generated configuration files.

Shutting down a subscriber interface on a 7750 SR will operationally shut down all child group interfaces and SAPs. Shutting down a group interface on a 7750 SR will operationally shut down all SAPs that are part of that group-interface.

The **no** form of this command puts an entity into the administratively enabled state.

## Platforms

```

## Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Services are created in the administratively down (**shutdown**) state. When a **no shutdown** command is entered, the service becomes administratively up and then tries to enter the operationally up state. Default administrative states for services and service entities is described below in Special Cases.

The **no** form of this command places the entity into an administratively enabled state.

If the AS number was previously changed, the BGP AS number inherits the new value.

## Platforms

All

configure service vpls sap shutdown  
configure service vpls sap arp-host shutdown

## Description

This command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Unlike other commands and parameters where the default state is not indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system-generated configuration files.

Default administrative states for services and service entities is described below in Special Cases.

The **no** form of this command places the entity into an administratively enabled state.

[\[Tree\]](#) (config>service>vpls>spoke-sdp>spb shutdown)

### Full Context

configure service vpls spb shutdown

configure service vpls mrp mmrp shutdown

configure service vpls spoke-sdp spb shutdown

### Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within.

The **no** form of this command administratively enables an entity.

SPB Interface — In the `config>service>vpls>spb>` context, the command disables the IS-IS interface. By default, the IS-IS interface is disabled (shutdown).

[\[Tree\]](#) (config>python>py-policy>cache shutdown)

[\[Tree\]](#) (config>python>python-script shutdown)

## Full Context

configure python python-policy cache shutdown  
configure python python-script shutdown

## Description

Shutting down a Python script triggers the system to load and compile the script from the configured location(s). Since the system supports three locations, the primary, secondary and tertiary, the system will try to load the Python script in that order.

Shutting down a Python script will disable the Python script and cause the corresponding packet to pass through without any modification.

The **no** form of this command enables the cache or policy script.

### Full Context

```
configure subscriber-mgmt diameter-application-policy gx ccrt-replay shutdown
configure subscriber-mgmt diameter-application-policy gy ccrt-replay shutdown
```

### Description

This command, enables or disables the CCR-T replay function for all Gx or Gy sessions that belong to the diameter application policy. Sessions in CCR-T replay are dropped when **ccrt-replay** is shut down.

The **no** form of this command enables the CCR-T replay function.

### Default

shutdown

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>bonding-parameters shutdown)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>bonding-parameters shutdown)

### Full Context

```
configure service vprn subscriber-interface group-interface bonding-parameters shutdown
configure service ies subscriber-interface group-interface bonding-parameters shutdown
```

### Description

The **shutdown** command administratively disables the entity. When a bonding context is shut down, all bonding subscribers are removed and no new bonding subscribers can be created in this context. The bonding configuration can be altered.

When a bonding context is placed in **no shutdown**, bonding subscribers can be created with connections in the specified subscriber interfaces. The specified FPE and connections can no longer be changed in this mode.

[no] shutdown

## Context

[\[Tree\]](#) (config>subscr-mgmt>pfc-p-association shutdown)

## Full Context

configure subscriber-mgmt pfc-p-association shutdown

## Description

This command administratively enables or disables the PFCP association.

When administratively enabled, the system will try to maintain an active PFCP association with the configured peer. While no association is established, it will continue to retry setting up the association using the **association-setup-retry** configuration.

Shutting down a subscriber interface on a 7750 SR operationally shuts down all child group interfaces and SAPs. Shutting down a group interface on a 7750 SR operationally shuts down all SAPs that are part of that group interface.

## Default

shutdown

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (cfg>sys>pwr-mgmt>peq shutdown)

### Full Context

configure system power-management peq shutdown

### Description

This command administratively enables/disables the APEQ.

## Platforms

7750 SR-12e, 7950 XRS

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>card>fp>egress>wred-queue-control shutdown)

### Full Context

configure card fp egress wred-queue-control shutdown

### Description

This command enables or disables egress WRED queue support on the forwarding plane. By default, WRED queue support is disabled (shutdown). While disabled, the various wred-queue-control commands may be executed on the forwarding plane and SAP egress QoS policies and egress queue group templates with wred-queue enabled may be applied to egress SAPs and port, respectively. The forwarding plane will allocate WRED pools to the WRED queues and the appropriate WRED mega-pool size and CBS reserve size will be calculated, but the WRED mega-pool will be empty and all buffers will be allocated to the default mega-pool. Each WRED queue will be mapped to its appropriate default pool.

Once the **no shutdown** command is executed, the calculated WRED mega-pool buffers will be moved from the default mega-pool to the WRED mega-pool. The WRED mega-pool CBS reserve size will be applied and each egress WRED queue will be moved from its default mega-pool buffer pool to its WRED pool within the WRED mega-pool hierarchy.

The **no** form of this command enables WRED queuing on an egress forwarding plane.

**Default**

shutdown

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

[no] shutdown

**Context**

[\[Tree\]](#) (config>anysec>tnl-enc>enc-grp>peer shutdown)

**Full Context**

configure anysec tunnel-encryption encryption-group peer shutdown

**Description**

This command shuts down the ANYsec and encryption to the peer.

**Note:** When ANYsec is shutdown to the peer, clear traffic is forwarded on the LSP to the peer.

The **no** form of this command enables ANYsec and encryption to the peer.

**Default**

shutdown

**Platforms**

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se

**shutdown****Syntax**

[no] shutdown

**Context**

[\[Tree\]](#) (config>anysec>tnl-enc>enc-grp shutdown)

## Full Context

configure anysec tunnel-encryption encryption-group shutdown

## Description

This command shuts down the ANYsec on the encryption group.

**Caution:** Clear traffic is forwarded on all the LSPs in the encryption group.

The **no** form of this command enables ANYsec and encryption for the encryption group.

## Default

shutdown

## Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se

shutdown

## Syntax

[no] shutdown

## Context

[\[Tree\]](#) (config>anysec>tnl-enc>sec-term-pol shutdown)

## Full Context

configure anysec tunnel-encryption security-termination-policy shutdown

## Description

This command places the tunnel in an operationally down state and causes traffic to drop. However, ANYsec remains enabled.

The **no** form of this command places the tunnel in an operationally up state.

## Default

shutdown

## Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>port>ethernet>efm-oam>link-monitoring shutdown)

### Full Context

configure port ethernet efm-oam link-monitoring shutdown

### Description

This command enables the link monitoring function. Issuing a no shutdown will start the process. Issuing a shutdown will clear any previously established negative conditions that were a result of the link monitoring process on this port and all collected data. This also controls the advertising capabilities.

The **no** form of this command activates the link monitoring function.

### Default

shutdown

### Platforms

All

## shutdown

### Syntax

[no] shutdown

### Context

configure port ethernet efm-oam link-monitoring errored-symbols shutdown

configure port ethernet efm-oam link-monitoring errored-frame shutdown

configure port ethernet efm-oam link-monitoring errored-frame-seconds shutdown

## Description

This command enables or disables the local counting, thresholding and actions associated with this type of local monitor. Peer received errors are not controlled by this command. Reaction to peer messaging is defined in the peer-rdi-rx hierarchy.

The **no** form of this command activates the local monitoring function and actions for the event.

## Default

shutdown

## Platforms

All

shutdown

## Syntax

[no] shutdown

## Context

[\[Tree\]](#) (config>port>ethernet>dot1x>macsec>sub-port shutdown)

## Full Context

configure port ethernet dot1x macsec sub-port shutdown

## Description

This command shuts down the MACsec under this sub-port specifically, including MKA negotiation. In the shutdown state, this port is not MACsec capable and all PDUs will be transmitted and expected without encryption and authentication.

The **no** form of this command puts the port in MACsec-enabled mode. A valid CA, different than any other CA configured on any other sub-port of this port and also a *max-peer* value larger than 0 must be configured. In MACsec-enabled mode, packets are sent in cleartext until the MKA session is up, and if the **rx-must-be-encrypted** is set on the port, all incoming packets with no MACsec encapsulations are dropped.

## Default

configure service sdp binding pw-port shutdown  
 configure eth-tunnel path eth-cfm mep shutdown

## Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

Services are created in the administratively down (**shutdown**) state. When a **no shutdown** command is entered, the service becomes administratively up and then tries to enter the operationally up state. Default administrative states for services and service entities is described below in Special Cases.

The **no** form of this command places the entity into an administratively enabled state.

## Platforms

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>service>vpls>proxy-arp shutdown)

[\[Tree\]](#) (config>service>vpls>proxy-nd shutdown)

### Full Context

configure service vpls proxy-arp shutdown

configure service vpls proxy-nd shutdown

### Description

This command enables and disables the proxy-ARP and proxy-nd functionality. ARP/GARP/ND messages will be snooped and redirected to the CPM for lookup in the proxy-ARP/proxy-ND table. The proxy-ARP/proxy-ND table is populated with IP->MAC pairs received from different sources (EVPN, static, dynamic). When the **shutdown** command is issued, it flushes the dynamic/EVPN dup proxy-ARP/proxy-ND table entries and instructs the system to stop snooping ARP/ND frames. All the static entries are kept in the table as *inactive*, regardless of their previous *Status*.

### Default

shutdown

### Platforms

All

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg shutdown)

### Full Context

configure service system bgp-evpn ethernet-segment shutdown

### Description

This command changes the administrative status of the Ethernet-Segment.

The user can do **no shutdown** only when esi, multi-homing and lag/port/sdp are configured. If the Ethernet-Segment or the corresponding lag/port/sdp shutdown, the Ethernet-Segment route and the AD per-ES routes will be withdrawn. No changes are allowed when the Ethernet-Segment is **no shutdown**.

## Platforms

All

shutdown

## Syntax

[no] shutdown

## Context

[\[Tree\]](#) (config>service>vpls>bgp-vpls shutdown)

## Full Context

configure service vpls bgp-vpls shutdown

## Description

This command administratively enables/disables the local BGP VPLS instance. On de-activation an MP-UNREACH-NLRI must be sent for the local NLRI.

The **no** form of this command enables the BGP VPLS addressing and the related BGP advertisement. The associated BGP VPLS MP-REACH-NLRI will be advertised in an update message and the corresponding received NLRIs must be considered to instantiate the data plane. RT, RD usage: same as in the BGP AD solution, if the values are not configured here, the value of the VPLS-id from under the bgp-ad node is used. If VPLS-id value is not configured either the MH site cannot be activated – i.e. no shutdown returns an error. Same applies if a pseudowire template is not specified under the BGP node.

configure router ldp egress-statistics fec-prefix shutdown  
configure router ldp aggregate-prefix-match shutdown  
configure router ldp targeted-session peer shutdown

## Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted. For an LDP interface, the **shutdown** command exists under the main interface context and under each of the interface IPv4 and IPv6 contexts.

- **shutdown** under the **interface** context brings down both IPv4 and IPv6 Hello adjacencies and stops Hello transmission in both contexts.
- **shutdown** under the **interface** IPv4 or IPv6 contexts brings down the Hello adjacency and stops Hello transmission in that context only.

The user can also delete the entire IPv4 or IPv6 context under the interface with the **no ipv4** or **no ipv6** command which in addition to bringing down the Hello adjacency will delete the configuration.

The **no** form of this command administratively enables an entity.

Unlike other commands and parameters where the default state is not indicated in the configuration file, the **shutdown** and **no shutdown** states are always indicated in system generated configuration files.

## Default

## Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The **config>router>mpls>ingr-stats>p2mp-template-lsp> shutdown** command is supported on the 7750 SR, 7950 XRS, and with VPLS only on the 7450 ESS.

The **config>router>mpls>lsp>primary-p2mp-instance> shutdown** is not supported on the 7450 ESS. MPLS is not enabled by default and must be explicitly enabled (**no shutdown**).

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The **no** form of this command places the entity into an administratively enabled state.

## shutdown

## Syntax

[no] shutdown

## Context

[\[Tree\]](#) (config>router>rsvp shutdown)

[\[Tree\]](#) (config>router>rsvp>interface shutdown)

## Full Context

configure router rsvp shutdown

configure router rsvp interface shutdown

## Description

This command disables the RSVP protocol instance or the RSVP-related functions for the interface. The RSVP configuration information associated with this interface is retained. When RSVP is administratively disabled, all the RSVP sessions are torn down. The existing configuration is retained.

The **no** form of this command administratively enables RSVP on the interface.

## Default

shutdown

## Platforms

All

## shutdown

## Syntax

[no] shutdown

**Context**

[\[Tree\]](#) (config>router>mpls>fwd-policies>fwd-policy>nh-grp shutdown)

**Full Context**

configure router mpls forwarding-policies forwarding-policy next-hop-group shutdown

**Description**

This command shuts down an NHG entry in a forwarding policy.

When an NHG is shut down, it is removed from the data path entry of the forwarding policy.

The **no** form of this command brings up an NHG entry in a forwarding policy.

**Platforms**

All

shutdown

**Syntax**

[no] shutdown

**Context**

[\[Tree\]](#) (config>router>mpls>fwd-policies>fwd-policy shutdown)

**Full Context**

configure router mpls forwarding-policies forwarding-policy shutdown

**Description**

This command shuts down the forwarding policy.

The **no** form of this command enables the forwarding policy.

**Platforms**

All

shutdown

**Syntax**

[no] shutdown

**Context**

[\[Tree\]](#) (config>router>mpls>fwd-policies shutdown)

## Full Context

configure router mpls forwarding-policies shutdown

## Description

This command shuts down the **forwarding-policies** context; causing all forwarding policies to be removed from the data path, however they remain in the MPLS forwarding database.

The **no** form of this command enables the **forwarding-policies** context.

## Platforms

All

## Description

This command administratively disables the entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics. Many entities must be explicitly enabled using the **no shutdown** command.

The **shutdown** command administratively disables an entity. The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>app-assure>group>transit-ip>diameter shutdown)

### Full Context

configure application-assurance group transit-ip-policy diameter shutdown

### Description

This command removes all transit AA subscribers created via Diameter on this transit AA subscriber IP policy and clears all corresponding Diameter sessions.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>isa>aa-grp>overload-sub-quarantine shutdown)

### Full Context

configure isa application-assurance-group overload-sub-quarantine shutdown

### Description

This command disables the overload subscriber detection algorithm in the ISA group for the purpose of quarantining an overloaded subscriber. It is possible to manually quarantine an AA subscriber even when this command is disabled (**shutdown**).

The **no** form of this command enables the overload subscriber detection algorithm in the ISA group. When enabled, each ISA monitors the traffic on a continuous basis to identify AA subscribers that occupy more than their fair share of ISA resources and need to be quarantined.

### Default

shutdown

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## shutdown

### Syntax

[no] shutdown

### Context

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>service>nat>map-domain>mapping-rule shutdown)

### Full Context

configure service nat map-domain mapping-rule shutdown

### Description

This command enables or disables a rule within a MAP domain. A MAP rule can be enabled (**no shutdown**) only when all parameters within the rule are defined. Disabling a rule within an instantiated MAP domain will withdraw the rule IPv4 routes and disable forwarding for the rule.

### Interactions:

config>service>vprn>nat>map>map-domain *domain-name*

config>service>router>nat>map>map-domain *domain-name*

Shutdown of an instantiated MAP rule disables the rule (the rule routes will be withdrawn and forwarding will be disabled).

### Default

shutdown

## Platforms

VSR

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>service>nat>map-domain shutdown)

### Full Context

configure service nat map-domain shutdown

### Description

This command enables or disables a MAP domain. A MAP domain can be enabled (**no shutdown**) only when the DMR prefix is configured. Disabling an instantiated domain will withdraw all routes associated with it.

#### Interactions:

config>service>vprn>nat>map>map-domain *domain-name*

config>service>router>nat>map>map-domain *domain-name*

Shutdown of a MAP domain template disables the instantiated MAP domain (the routes will be withdrawn and forwarding will be disabled).

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>service>vprn>twamp-light>reflector shutdown)

[\[Tree\]](#) (config>router>twamp-light>reflector shutdown)

### Full Context

configure service vprn twamp-light reflector shutdown

configure router twamp-light reflector shutdown

### Description

This command disables or enables TWAMP Light functionality within the context where the configuration exists, either the base router instance or the service. Enabling the base router context enables the IES prefix list since the IES service uses the configuration under the base router instance.

The **no** form of this command allows the router instance or the service to accept TWAMP Light packets for processing.

### Default

shutdown

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>bfd>seamless-bfd>reflector shutdown)

### Full Context

configure bfd seamless-bfd reflector shutdown

### Description

This command specifies the administrative state of the seamless BFD reflector.

The **no** form of this command administratively enables the reflector. A discriminator must be configured before the **no shutdown** command is invoked.

**Default**

shutdown

**Platforms**

All

**shutdown****Syntax**

[no] shutdown

**Context**

**[Tree]** (config>qos>slope-policy>exceed-slope shutdown)

**[Tree]** (config>qos>slope-policy>high-slope shutdown)

**[Tree]** (config>qos>slope-policy>highplus-slope shutdown)

**[Tree]** (config>qos>slope-policy>low-slope shutdown)

**Full Context**

configure qos slope-policy exceed-slope shutdown

configure qos slope-policy high-slope shutdown

configure qos slope-policy highplus-slope shutdown

configure qos slope-policy low-slope shutdown

**Description**

This command enables or disables the administrative status of the Random Early Detection slope.

By default, all slopes are shutdown and have to be explicitly enabled (**no shutdown**).

The **no** form of this command administratively enables the RED slope.

**Default**

shutdown

**Platforms**

All

**shutdown****Syntax**

[no] shutdown

## Context

[\[Tree\]](#) (config>filter>log>summary shutdown)

[\[Tree\]](#) (config>filter>redirect-policy shutdown)

[\[Tree\]](#) (config>filter>redirect-policy>destination shutdown)

## Full Context

configure filter log summary shutdown

configure filter redirect-policy shutdown

configure filter redirect-policy destination shutdown

## Description

Administratively enables/disabled (AdminUp/AdminDown) an entity. Downing an entity does not change, reset or remove any configuration settings or statistics. Many objects must be shutdown before they may be deleted.

The **shutdown** command administratively downs an entity. Administratively downing an entity changes the operational state of the entity to down.

Unlike other commands and parameters where the default state will not be indicated in the configuration file, **shutdown** and **no shutdown** are always indicated in system generated configuration files.

The **no** form of the command puts an entity into the administratively enabled state.

## Default

no shutdown

## Platforms

All

## shutdown

## Syntax

[no] shutdown

## Context

[\[Tree\]](#) (config>router>if>ipv6>secure-nd shutdown)

## Full Context

configure router interface ipv6 secure-nd shutdown

## Description

This command enables or disables Secure Neighbor Discovery (SeND) on the interface.

## Platforms

All

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>router>pcp-server>server shutdown)

### Full Context

configure router pcp-server server shutdown

### Description

This command administratively enables the PCP server.

The **no** form of this command administratively disables the PCP server.

### Default

shutdown

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>open-flow>of-switch shutdown)

### Full Context

configure open-flow of-switch shutdown

### Description

This command administratively enables or disables the OpenFlow switch instance. Disabling the switch purges all flowtable entries.

### Default

shutdown

### Platforms

All

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>router>if>vrrp shutdown)

[\[Tree\]](#) (config>router>if>ipv6>vrrp shutdown)

[\[Tree\]](#) (config>vrrp>policy shutdown)

### Full Context

configure router interface vrrp shutdown

configure router interface ipv6 vrrp shutdown

configure vrrp policy shutdown

### Description

This command administratively disables an entity. When disabled, an entity does not change, reset, or remove any configuration settings or statistics.

The operational state of the entity is disabled as well as the operational state of any entities contained within. Many objects must be shut down before they may be deleted.

The **no** form of this command administratively enables an entity.

### Default

no shutdown

### Platforms

All

## shutdown

### Syntax

[no] shutdown [active] [standby]

[no] shutdown [*cflash-id*]

### Context

[\[Tree\]](#) (file shutdown)

### Full Context

file shutdown

## Description

This command shuts down (unmounts) the specified CPM(s).

Use the **no shutdown** [active] [standby] command to enable one or both CPM.

Use the **no shutdown** [cflash-id] command to enable a compact flash (cf1:, cf2:, or cf3:) on the CPM/CCM. The **no shutdown** command can be issued for a specific slot when no compact flash is present. When a flash card is installed in the slot, the card will be activated upon detection.

In redundant systems, use the **no shutdown** command on cf3: on both SF/CPMs or CCMs in order to facilitate synchronization. See the **config>redundancy synchronize** command.

### Note:

The **shutdown** command must be issued prior to removing a flash card. If no parameters are specified, then the drive referred to by the current working directory will be shut down.

## LED Status Indicators

[Table 121: LED Status Indicators](#) lists the possible states for the compact flash and their LED status indicators.

Table 121: LED Status Indicators

State	Description
Operational	If a compact flash is present in a drive and operational (no shutdown), the respective LED is lit green. The LED flickers when the compact flash is accessed. <b>Note:</b> Do not remove the compact flash during a read/write operation.
Flash defective	If a compact flash is defective, the respective LED blinks amber to reflect the error condition and a trap is raised.
Flash drive shut down	When the compact flash drive is shut down and a compact flash present, the LED is lit amber. In this state, the compact flash can be ejected.
No compact flash present, drive shut down	If no compact flash is present and the drive is shut down the LED is unlit.
No compact flash present, drive enabled	If no compact flash is present and the drive is not shut down the LED is unlit.
Ejecting a compact flash	The compact flash drive should be shut down before ejecting a compact flash card. The LED should turn to solid (not blinking) amber. This is the only mode to safely remove the flash card. If a compact flash drive is not shut down before a compact flash is ejected, the LED blinks amber for approximately 5 seconds before shutting off.

The **shutdown** or **no shutdown** state is not saved in the configuration file. Following a reboot all compact flash drives are in their default state.

## Default

no shutdown

## Parameters

### *cf-flash-id*

Specifies the compact flash slot ID to be shut down or enabled. If *cf-flash-id* is specified, the drive is shut down or enabled. If no *cf-flash-id* is specified, the drive referred to by the current working directory is assumed. If a slot number is not specified, then the active CPM is assumed.

**Values** cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

**Default** the current compact flash device

### **active**

Specifies that all drives on the active CPM are shutdown or enabled.

### **standby**

Specifies that all drives on the standby CPM are shutdown or enabled.

When both **active** and **standby** keywords are specified, then all drives on both CPM are shutdown.

## Platforms

All

## shutdown

## Syntax

[no] shutdown

## Context

[\[Tree\]](#) (config>system>satellite>tdm-sat shutdown)

[\[Tree\]](#) (config>system>satellite>eth-sat shutdown)

## Full Context

configure system satellite tdm-sat shutdown

configure system satellite eth-sat shutdown

## Description

This command disables the associated satellite.

If the associated satellite is active, the satellite will not be reset but all satellite client ports will be shut down.

If the satellite is not active but attempts to associate with the host, the satellite chassis will be brought up according to the satellite configuration but all client ports will be shut down.

The **no** form of this command removes the shutdown state and all client ports on active satellites will be brought back up.

### Default

shutdown

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

- configure system satellite tdm-sat shutdown

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure system satellite eth-sat shutdown

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>system>alarm-contact-input shutdown)

### Full Context

configure system alarm-contact-input shutdown

### Description

This command disables tracking of state changes associated with the alarm contact input. The system does not generate or clear the alarms for the alarm contact input while tracking is disabled. The system clears existing alarms when the **shutdown** command is executed.

The **no** form of this command enables tracking of state changes associated with the alarm contact input.

### Default

shutdown

### Platforms

7750 SR-a

## shutdown

### Syntax

[no] shutdown

## Context

[\[Tree\]](#) (config>system>ptp>peer shutdown)

## Full Context

configure system ptp peer shutdown

## Description

This command disables or enables a specific PTP peer. Shutting down a peer sends cancel unicast negotiation messages on any established unicast sessions. When shutdown, all received packets from the peer are ignored.

If the clock-type is **ordinary slave** or **boundary**, and PTP is **no shutdown**, the last enabled peer cannot be shutdown. This prevents the user from having PTP enabled without any peer configured and enabled.

## Default

no shutdown

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## shutdown

## Syntax

[no] shutdown

## Context

[\[Tree\]](#) (config>system>ptp>port shutdown)

## Full Context

configure system ptp port shutdown

## Description

This command disables or enables a specific PTP port. When shutdown, all PTP Ethernet messages are dropped on the IOM. They will not be counted in the PTP message statistics. No PTP packets are transmitted by the node toward this port.

If the clock-type is **ordinary slave** or **boundary**, and PTP is **no shutdown**, the last enabled port or peer cannot be shutdown. This prevents the user from having PTP enabled without any means to synchronize the local clock to a parent clock.

## Default

no shutdown

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## shutdown

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>system>grpc>gnmi shutdown)

### Full Context

configure system grpc gnmi shutdown

### Description

This command stops the gNMI service.

The **no** form of this command starts the gNMI service.

## Platforms

All

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>system>grpc>rib-api shutdown)

### Full Context

configure system grpc rib-api shutdown

### Description

This command stops the RibApi gRPC service, deletes all programmed RIB entries (stale and non-stale), but does not close the TCP connections.

The **no** form of this command restarts the RibApi gRPC service.

## Platforms

All

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>system>grpc shutdown)

### Full Context

configure system grpc shutdown

### Description

This command stops the gRPC server. This closes all of the associated TCP connections and immediately purges all RIB entries that were programmed using the RibApi Service.

The **shutdown** command is not blocked if there are active gRPC sessions. Shutting down gRPC will terminate all active gRPC sessions.

The **no** form of this command starts the gRPC server.

### Platforms

All

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>system>grpc>tcp-keepalive shutdown)

### Full Context

configure system grpc tcp-keepalive shutdown

### Description

This command stops the TCP keepalives from being sent to all gRPC clients.

The **no** form of this command restarts the sending of TCP keepalives to all gRPC clients.

### Platforms

All

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>system>snmp>streaming shutdown)

### Full Context

configure system snmp streaming shutdown

### Description

This command administratively disables proprietary SNMP request/response bundling and TCP-based transport mechanism for optimizing network management of the router nodes.

The **no** form of the command administratively re-enables SNMP request/response bundling and TCP-based transport mechanism.

### Default

shutdown

### Platforms

All

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>system>snmp shutdown)

### Full Context

configure system snmp shutdown

### Description

This command administratively disables SNMP agent operations. System management can then only be performed using the command line interface (CLI). Shutting down SNMP does not remove or change configuration parameters other than the administrative state. This command does not prevent the agent from sending SNMP notifications to any configured SNMP trap destinations. SNMP trap destinations are configured under the **config>log>snmp-trap-group** context.

This command is automatically invoked in the event of a reboot when the processing of the configuration file fails to complete or when an SNMP persistent index file fails while the **bof persist on** command is enabled.

The **no** form of the command administratively enables SNMP which is the default state.

**Default**

no shutdown

[\[Tree\]](#) (config>router>segment-routing>sr-policies>ingress-statistics shutdown)

## Full Context

configure router segment-routing sr-policies egress-statistics shutdown

configure router segment-routing sr-policies ingress-statistics shutdown

## Description

This command administratively disables the collection of egress or ingress statistics for all segment routing policies.

The **no** form of this command administratively enables the collection of egress or ingress statistics for all segment routing policies.

## Platforms

All

## shutdown

## Syntax

[no] shutdown

## Context

[\[Tree\]](#) (config>router>segment-routing>sr-policies shutdown)

## Full Context

configure router segment-routing sr-policies shutdown

## Description

This command deactivates all segment routing policies and removes the associated entries from the forwarding plane of the router.

It is necessary to execute this shutdown if you want to make a change to the reserved-label-block reference.

The **no** form of this command enables all segment routing policies so that they can be revalidated and reinstalled as necessary.

## Platforms

All

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (conf>router>segment-routing>sr-policies>policy>seg-list shutdown)

### Full Context

configure router segment-routing sr-policies static-policy segment-list shutdown

### Description

This command deactivates a segment-list. If this is done on an active policy with more than one segment list, then traffic forwarded by the policy will be diverted to the remaining segment-lists.

The **no** form of this command enables the segment list so that it can be validated and installed as necessary.

### Default

shutdown

## shutdown

### Syntax

[no] shutdown

### Context

[\[Tree\]](#) (config>test-oam>link-meas>template shutdown)

### Full Context

configure test-oam link-measurement measurement-template shutdown

### Description

This command administratively enables and disables the measurement template. The **measurement-template** can be referenced even if it is disabled. The template must be administratively enabled to transmit probes on any associated IP interface. The template configuration can be modified even if it is administratively enabled. The template can be administratively disabled even if interfaces are actively registered with the template. When the template configuration is modified, all registered IP interfaces start from the initial state and enter a first reporting scenario. This is true even if the template is administratively disabled and enabled, and no configuration changes are made.

The **no** form of this command disables the measurement template.

**Default**

shutdown

## 23.240 sid

```
sid
```

### Syntax

**sid** *label value*

### Context

**[Tree]** (config>router>isis>segm-rtng>adjacency-set sid)

**[Tree]** (config>router>ospf>segm-rtng>adjacency-set sid)

### Full Context

```
configure router isis segment-routing adjacency-set sid
configure router ospf segment-routing adjacency-set sid
```

### Description

This command allows a static SID value to be assigned to an adjacency set in IS-IS or OSPF segment routing.

The **label** option specifies the value is assigned to an MPLS label.

The **no** form of this command removes the adjacency SID.

### Parameters

*label value*

Specifies the value of adjacency SID label.

**Values** 18432 to 524287 | 1048575 (FP4 only)

### Platforms

All

## 23.241 sid-action

### sid-action

#### Syntax

**sid-action** *action*

**no sid-action**

#### Context

[\[Tree\]](#) (config>router>p2mp-sr-tree>replication-segment sid-action)

#### Full Context

configure router p2mp-sr-tree replication-segment sid-action

#### Description

This command configures the SID action to take for the replication segment of the P2MP SR tree.

The **no** form of this command removes the SID action.

#### Default

no sid-action

#### Parameters

**action**

Specifies the name of the SID action.

**Values** **push** — Specifies that an outgoing SID list is pushed and forwarded on to the corresponding programmed outgoing interfaces.

**pop** — Specifies that on the leaf node the incoming SID is popped on the underlay packet forwarded to the host.

**swap** — Specifies, if an incoming SID is configured, that the SID is swapped with an outgoing SID or SID list and forwarded to the corresponding OIF.

## 23.242 sid-allocation

### sid-allocation

#### Syntax

**sid-allocation** {**sequential** | **random**}

**no sid-allocation**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>ppp-policy sid-allocation)

#### Full Context

configure subscriber-mgmt ppp-policy sid-allocation

#### Description

This command configures the method for allocating the PPPoE session ID.

For both **sequential** and **random** options, the session ID range is 1 to 8191.

The **no** form of this command reverts to the default.

#### Default

sid-allocation sequential

#### Parameters

##### *sequential*

Specifies for PPPoE sessions with the same client MAC address and active on the same SAP, to allocate the session ID in sequential order starting with ID = 1.

##### *random*

Specifies for PPPoE sessions with the same client MAC address and active on the same SAP, to allocate a unique session ID in random order.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.243 sid-length

## sid-length

### Context

[\[Tree\]](#) (conf>router>sr>srv6>micro-segment sid-length)

### Full Context

configure router segment-routing segment-routing-v6 micro-segment sid-length

### Description

This command configures the length of the micro-segments.

### Default

sid-length 16

### Parameters

***sid-length***

Specifies the length of micro-segments, in bits.

**Values** 16

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 23.244 sid-map

## sid-map

### Syntax

**sid-map node-sid** {*index value* [*range value*]} **prefix** {{*ip-address/mask*} | {*ip-address*} {*netmask*}} [ **set-flags** {*s*}] [*level* { 1 | 2 | 1/2}] [**clear-n-flag**]

**no sid-map node-sid index** *value*

### Context

[\[Tree\]](#) (config>router>isis>segm-rtng>mapping-server sid-map)

### Full Context

configure router isis segment-routing mapping-server sid-map

## Description

This command configures the Segment Routing mapping server database in IS-IS.

The user enters the node SID index for one or a range of prefixes by specifying the first index value and optionally a range value can be entered. The default value for the range option is 1. Only the first prefix in a consecutive range of prefixes must be entered. The user can enter the first prefix with a mask lower than 32 and the SID or label binding TLV is advertised, but the routers will not resolve these prefix SIDs and will generate a trap.

By setting the S-flag, the user can indicate to the IS-IS routers in the rest of the network that the flooding scope of the SID or label binding TLV is the entire domain. In that case, a router receiving the TLV advertisement should leak it between ISIS levels. If leaked from level 2 to level 1, the D-flag must be set and once set the TLV cannot be leaked back into level 2. Otherwise, the S-flag is clear by default and the TLV must not be leaked by routers that receive the mapping server advertisement.

Note that the SR OS does not leak this TLV between IS-IS instances and does not support the multi-topology SID/Label Binding TLV format.

In addition, the user can specify the mapping server own flooding scope for the generated SID or label binding TLV using the **level** option. This option allows the user to narrow the flooding scope configured under the router IS-IS level-capability for a one or more SID or label binding TLVs if required. The default flooding scope of the mapping server is Layer 1 or Layer 2, which can be narrowed by the value configured under the router IS-IS level-capability.

The A-flag and M-flag are not supported by the mapping server feature. The mapping client ignores the flags.

Each time a prefix or a range of prefixes is configured in the SR mapping database in any routing instance, the router issues for this prefix or range of prefixes, a prefix-SID sub-TLV within a ISIS SID or label binding TLV in that instance. The flooding scope of the TLV from the mapping server is determined as explained above. No further check of the reachability of that prefix in the mapping server route table is performed. Additionally, no check is performed if the SID index is a duplicate of an existing prefix in the local IGP instance database or if the SID index is out of range with the local SRGB.

The **no** form of this command deletes the range of node SIDs beginning with the specified index value.

## Parameters

### *index*

Specifies the node SID index for the IS-IS prefix that is advertised in a SID/Label Binding TLV.

**Values** 0 to 4294967295

### *value*

Specifies the node SID range for the IS-IS prefix that is advertised in a SID/Label Binding TLV.

**Values** 0 to 65535

### *ip-address/mask*

Specifies the IP address and mask.

**Values** *ip-address:* **a.b.c.d.** (host bits must be 0)

*mask:* **0 to 32**

***ip-address netmask***

Specifies the IP address netmask.

**Values** **a.b.c.d.** (network bits all 1 and host bits all 0)

**set-flags**

Specifies the flooding scope of the SID/Label binding TLV.

**Default** **S-flag clear**

The TLV is not leaked by routers receiving the mapping server advertisement

**level {1 | 2| 1/2}**

Configures the mapping server own flooding scope for the generated SID/Label binding TLV.

**Default** 1/2

**clear-n-flag**

Specifies whether the node-sid flag (N-flag) should be cleared in a SID Label Binding TLV.

**Platforms**

All

**sid-map****Syntax**

**sid-map node-sid index** *index-value* [**range** *range-value*] **prefix** *ip-address/mask* [*netmask*]

**sid-map node-sid index** *index-value* [**range** *range-value*] **prefix** *ip-address/mask* [*netmask*] **scope** {*area* *area-id* | **as**}

**no sid-map node-sid index** *index-value*

**Context**

**[Tree]** (config>router>ospf>segm-rtnng>mapping-server sid-map)

**Full Context**

configure router ospf segment-routing mapping-server sid-map

**Description**

This command configures the Segment Routing mapping server database in OSPF.

The user enters the node SID index for one or a range of prefixes by specifying the first index value and optionally a range value. The default value for the range option is 1. Only the first prefix in a consecutive range of prefixes must be entered. If the user enters the first prefix with a mask lower than 32, the OSPF Extended Prefix Range TLV is advertised but a router which receives it will not resolve SID and instead originates a trap.

The user specifies the mapping server own flooding scope for the generated OSPF Extended Prefix Range TLV using the scope option. There is no default value. If the scope is a specific area, then the TLV is flooded only in that area.

An ABR that propagates an intra-area OSPF Extended Prefix Range TLV flooded by the mapping server in that area into other areas, sets the inter-area flag (IA-flag). The ABR also propagates the TLV if received with the inter-area flag set from other ABR nodes but only from the backbone to leaf areas and not vice-versa. However, if the exact same TLV is advertised as an intra-area TLV in a leaf area, the ABR will not flood the inter-area TLV into that leaf area.

**Note:**

SR OS does not leak this TLV between OSPF instances.

Each time a prefix or a range of prefixes is configured in the SR mapping database in any routing instance, the router issues for this prefix, or range of prefixes, a prefix-SID sub-TLV within a OSPF Extended Prefix Range TLV in that instance. The flooding scope of the TLV from the mapping server is determined as previously explained. No further check of the reachability of that prefix in the mapping server route table is performed and no check if the SID index is duplicate with some existing prefix in the local IGP instance database or if the SID index is out of range with the local SRGB.

The **no** form of this command deletes the range of node SIDs beginning with the specified index value.

## Default

no prefix-sid-range

## Parameters

### *index index-value*

Specifies the index.

**Values** 0 to 4294967295

### *range range-value*

Specifies the range.

**Values** 1 to 65535

### *prefix ip-address/mask*

Specifies the IP address in dotted decimal notation.

**Values** ip-address/mask:

- ip-address a.b.c.d (host bits must be 0)

mask: 0 to 132

### *netmask*

Specifies the netmask.

**Values** netmask — a.b.c.d (network bits all 1 and host bits all 0)

### *area area-id*

Configures the mapping server own flooding scope for the generated OSPF Extended Prefix Range TLV.

**Values** ip-address | 0 to 4294967295

## 23.245 sid-protection

sid-protection

### Syntax

[no] sid-protection

### Context

[\[Tree\]](#) (config>router>isis>interface sid-protection)

### Full Context

configure router isis interface sid-protection

### Description

This command enables or disables adjacency SID protection by LFA and remote LFA.

While LFA and remote LFA Fast-Reroute (FRR) protection is enabled for all node SIDs and local adjacency SIDs when the user enables the **loopfree-alternates** option in IS-IS or OSPF at the LER and LSR, there are applications where the user wants traffic to never divert from the strict hop computed by CSPF for a SR-TE LSP. In that case, the user can disable protection for all adjacency SIDs formed over a given network IP interface using this command.

The protection state of an adjacency SID is advertised in the B-FLAG of the IS-IS or OSPF Adjacency SID sub-TLV.

### Default

sid-protection

### Platforms

All

sid-protection

### Syntax

[no] sid-protection

## Context

[\[Tree\]](#) (config>router>ospf>area>interface sid-protection)

## Full Context

configure router ospf area interface sid-protection

## Description

This command enables or disables adjacency SID protection by LFA and remote LFA.

LFA and remote LFA Fast-Reroute (FRR) protection is enabled for all node SIDs and local adjacency SIDs when the user enables the **loopfree-alternate** option in IS-IS or OSPF at the LER and LSR. However, may be applications where the user never wants traffic to divert from the strict hop computed by CSPF for an SR-TE LSP. In this case, the user can disable protection for all adjacency SIDs formed over a particular network IP interface using this command.

The protection state of an adjacency SID is advertised in the B-FLAG of the IS-IS or OSPF Adjacency SID sub-TLV.

## 23.248 signaling

### signaling

#### Syntax

**signaling** *signaling*

#### Context

[\[Tree\]](#) (config>service>epipe>spoke-sdp-fec signaling)

#### Full Context

configure service epipe spoke-sdp-fec signaling

#### Description

This command enables a user to configure this router as the active or passive T-PE for signaling this MS-PW, or to automatically select whether this T-PE is active or passive based on the prefix. In an active role, this endpoint initiates MS-PW signaling without waiting for a T-LDP label mapping message to arrive from the far end T-PE. In a passive role, it will wait for the initial label mapping message from the far end before sending a label mapping for this end of the PW. In auto mode, if the SAIL has the greater prefix value, then the router will initiate MS-PW signaling without waiting for a label mapping message from the far end. However, if the TAIL has the greater value prefix, then the router will assume that the far end T-PE will initiate MS-PW signaling and will wait for that label mapping message before responding with a T-LDP label mapping message for the MS-PW in the reverse direction.

The **no** form of this command means that the router T-PE automatically selects the which router will initiate MS-PW signaling based on the prefix values configured in the SAIL and TAIL of the spoke SDP, as previously described.

#### Default

signaling auto

#### Parameters

##### **signaling**

Configures this router as the active T-PE for signaling this MS-PW.

**Values** auto, master

#### Platforms

All

## signaling

### Syntax

**signaling** {**off** | **tldp** | **bgp**}

### Context

[\[Tree\]](#) (config>service>sdp signaling)

### Full Context

configure service sdp signaling

### Description

This command specifies the signaling protocol used to obtain the ingress and egress pseudowire labels in frames transmitted and received on the SDP. When signaling is *off* then labels are manually configured when the SDP is bound to a service. The signaling value can only be changed while the administrative status of the SDP is down. Additionally, the signaling can only be changed on an SDP if that SDP is not in use by BGP-AD or BGP-VPLS. BGP signaling can only be enabled if that SDP does not already have pseudowires signaled over it.

#### Note:

If the **tldp** option is selected as the mechanism for exchanging service labels over an MPLS or GRE SDP and the T-LDP session is automatically established, an explicit T-LDP session that is subsequently configured takes precedence over the automatic T-LDP session. However, if the explicit, manually-configured session is then removed, the system does not revert to the automatic session and the automatic session is also deleted. To address this, recreate the T-LDP session by disabling and re-enabling the SDP using the **shutdown** and **no shutdown** commands.

The **no** form of this command is not applicable. To modify the signaling configuration, the SDP must be administratively shut down and then the signaling parameter can be modified and re-enabled.

### Default

signaling tldp

### Parameters

#### off

Ingress and egress signal auto-labeling is not enabled. If this parameter is selected, then each service using the specified SDP must manually configure VPN labels. This configuration is independent of the SDP's transport type, GRE, MPLS (RSVP or LDP).

#### tldp

Ingress and egress pseudowire signaling using T-LDP is enabled. Default value used when BGP AD automatically instantiates the SDP.

#### bgp

Ingress and egress pseudowire signaling using BGP is enabled. Default value used when BGP VPLS automatically instantiates the SDP.

## 23.249 signature-list

signature-list

### Syntax

**signature-list** *name*

**no signature-list**

### Context

[\[Tree\]](#) (config>system>security>tls>client-tls-profile signature-list)

### Full Context

configure system security tls client-tls-profile signature-list

### Description

This command assigns an existing TLS 1.3 signature list to the TLS client profile.

The **no** form of this command removes the signature list from the client profile.

### Default

no signature-list

### Parameters

*name*

Specifies the name of the signature list, up to 32 characters.

## Platforms

All

signature-list

### Syntax

**signature-list** *name*

**no signature-list**

### Context

[\[Tree\]](#) (config>system>security>tls>server-tls-profile signature-list)

**Full Context**

configure system security tls server-tls-profile signature-list

**Description**

This command assigns an existing TLS 1.3 signature list to the TLS server profile.

The **no** form of this command removes the signature list from the server profile.

**Default**

no signature-list

**Parameters**

*name*

Specifies the name of the signature list, up to 32 characters.

**Platforms**

## 23.250 significant-change

### significant-change

**Syntax**

**significant-change** *delta*

**no significant-change**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>cr significant-change)

**Full Context**

configure subscriber-mgmt radius-accounting-policy custom-record significant-change

**Description**

This command configures the significant change required to generate the record.

**Parameters**

*delta*

Specifies the delta change (significant change) that is required for the custom record to be generated.

**Values** 0 to 4294967295

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## significant-change

### Syntax

**significant-change** *delta*

**no significant-change**

### Context

[\[Tree\]](#) (config>app-assure>rad-acct-plcy significant-change)

### Full Context

configure application-assurance radius-accounting-policy significant-change

### Description

This command configures the significant change required to generate the record.

The **no** form of this command reverts to the default.

### Default

no significant-change

### Parameters

*delta*

Specifies the delta change (significant change) that is required for the charging-group counts to be included in the RADIUS Accounting VSAs.

**Values** 0 to 4294967295

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## significant-change

### Syntax

**significant-change** *delta*

**no significant-change**

### Context

[\[Tree\]](#) (config>log>acct-policy>cr significant-change)

## Full Context

configure log accounting-policy custom-record significant-change

## Description

This command configures the significant change required to generate the record. The custom record is only generated when the change in the reference counters equals or exceeds the configured (non-zero) significant change value. Only the reference counters for which there are corresponding counters configured under the related queues and policers are used for the significant change comparison. For reference queues and policers, the change applies to the sum of all configured reference queue and policer counters. When no reference counters are configured or **significant-change** is zero, the significant change reporting is not active.

## Default

significant-change 0

## Parameters

### *delta*

Specifies the delta change (significant change) that is required for the custom record to be written to the XML file.

**Values** 0 to 4294967295 (For custom-record-aa-sub only values 0 or 1 are supported.)

**23.252 single-fiber**

```
single-fiber
```

**Syntax**

**[no] single-fiber**

**Context**

**[Tree]** (config>port>sonet-sdh single-fiber)

**[Tree]** (config>port>ethernet single-fiber)

**Full Context**

configure port sonet-sdh single-fiber

configure port ethernet single-fiber

**Description**

This command enables packet gathering and redirection of IP packets from a single fiber (RX) port of the Ethernet or SONET/SDH interface and redistributes packets to other interfaces through either static routes or policy-based forwarding.

This parameter can be applied in conjunction with the strip-label command. If they are applied together, the port must have the single-fiber option configured before it can be associated with an interface that is configured with the strip-label option.

Once a port is configured with single-fiber, traffic will no longer be transmitted out of that port. This command can be used in conjunction with strip-label.

**Default**

no single-fiber

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**23.253 single-mac**

## single-mac

### Syntax

**[no] single-mac**

### Context

**[Tree]** (config>service>ies>sub-if>grp-if>sap>static-host-mgmt>mac-learning-options single-mac)

**[Tree]** (config>service>vprn>sub-if>grp-if>sap>static-host-mgmt>mac-learning-options single-mac)

### Full Context

configure service ies subscriber-interface group-interface sap static-host-mgmt mac-learning-options single-mac

configure service vprn subscriber-interface group-interface sap static-host-mgmt mac-learning-options single-mac

### Description

This command controls how the SAP learns the IPv6 static host MAC address. Enabling this command indicates that this particular SAP only has one subscriber and only has one MAC address for all hosts. With this parameter enabled, the subscriber's NS and RS source MAC address is used to automatically populate the subscriber MAC address. To allow this auto-populate behavior, the subscriber's NS and RS source IP must be of type link local address.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.254 single-sfm-overload

## single-sfm-overload

### Syntax

**single-sfm-overload [holdoff-time *holdoff-time*]**

**no single-sfm-overload**

### Context

**[Tree]** (config>service>vprn single-sfm-overload)

### Full Context

configure service vprn single-sfm-overload

## Description

This command configures OSPF, OSPFv3 and IS-IS to set overload when the router has fewer than the full set of SFMs functioning, which reduces forwarding capacity. Setting overload enables a router to still participate in exchanging routing information, but routes all traffic away from it.

The conditions to set overload are as follows:

- 7950 XRS-20, 7750 SR-12/SR-7, and 7450 ESS-12/ESS-7 platforms: if an SF/CPMs fails, the protocol will set the overload
- 7950-40 XRS and 7750 SR-12e platforms: if two SFMs fail (a connected pair on the XRS-40) the protocol will set the overload

The **no** form of this command configures the router to not set overload if an SFM fails.

## Default

no single-sfm-overload

## Parameters

### *holdoff-time*

Specifies the delay between detecting SFM failures and setting overload.

**Values** 1 to 600 seconds

**Default** 0 seconds

## Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS, VSR

## single-sfm-overload

## Syntax

**single-sfm-overload** [**holdoff-time** *holdoff-time*]

**no single-sfm-overload**

## Context

**[Tree]** (config>router single-sfm-overload)

## Full Context

configure router single-sfm-overload

## Description

This command configures OSPF, OSPFv3 and IS-IS to set overload when the router has fewer than the full set of SFMs functioning, which reduces forwarding capacity. Setting overload enables a router to still participate in exchanging routing information, but routes all traffic away from it.

The conditions to set overload are as follows:

- 7750 SR-12/SR-7 and 7450 ESS-12/ESS-7 platforms: protocol sets overload if one of the SF/CPMs fails
- 7750 SR-12e and 7950 XRS platforms: protocol sets overload if two SFMs fail (two SFMs belonging to different SFM pairs on the XRS-40)

The **no** form of this command configures the router to not set overload if an SFM fails.

### Default

no single-sfm-overload

### Parameters

#### *holdoff-time*

Specifies the delay between detecting SFM failures and setting overload.

**Values** 1 to 600 seconds

**Default** 0 seconds

### Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS, VSR

## 23.258 site-activation-timer

site-activation-timer

### Syntax

**site-activation-timer** *seconds*

**no site-activation-timer**

## Context

[\[Tree\]](#) (config>redundancy>bgp-mh site-activation-timer)

## Full Context

configure redundancy bgp-mh site-activation-timer

## Description

This command defines the amount of time the service manager will keep the local sites in standby status, waiting for BGP updates from remote PEs before running the DF election algorithm to decide whether the site should be unblocked. The timer is started when one of the following event occurs only if the site is operationally up:

- Manual site activation using "no shutdown" at site-id level or at member object(s) level (for example, SAP(s) or PW(s))
- Site activation after a failure

The **no** form of this command sets the value to 2.

## Default

no site-activation-timer

## Parameters

*seconds*

Specifies the timer, in seconds.

**Values** 1 to 100

## site-activation-timer

## Syntax

**site-activation-timer** *seconds*

**no site-activation-timer**

## Context

[\[Tree\]](#) (config>service>vpls>site site-activation-timer)

## Full Context

configure service vpls site site-activation-timer

## Description

This command configures the time-period the system keeps the local sites in standby status, waiting for BGP updates from remote PEs before running the DF (designated-forwarder) election algorithm to decide whether the site should be unblocked. This timer is terminated if an update is received for which the remote PE has transitioned from DF to non-DF.

The no form of this command removes the value from the configuration.

## Default

site-activation-timer 2

## Parameters

**seconds**

Specifies the site activation timer in seconds.

**Values** 0 to 100

## Platforms

All

## site-activation-timer

## Syntax

**site-activation-timer** *seconds*

**no site-activation-timer**

## Context

[\[Tree\]](#) (config>service>epipe>site site-activation-timer)

## Full Context

configure service epipe site site-activation-timer

## Description

This command configures the time-period the system keeps the local sites in standby status, waiting for BGP updates from remote PEs before running the DF (designated-forwarder) election algorithm to decide whether the site should be unblocked. This timer is terminated if an update is received for which the remote PE has transitioned from DF to non-DF.

The **no** form of this command removes the value from the configuration.

## Default

site-activation-timer 2

## Parameters

**seconds**

Specifies the site activation timer in seconds.

**Values** 0 to 100

## Platforms

All

## site-activation-timer

### Syntax

**site-activation-timer** *seconds*

**no site-activation-timer**

### Context

[\[Tree\]](#) (config>redundancy>bgp-multi-homing site-activation-timer)

### Full Context

configure redundancy bgp-multi-homing site-activation-timer

### Description

This command defines the amount of time the service manager will keep the local sites in standby status, waiting for BGP updates from remote PEs before running the DF election algorithm to decide whether the site should be unblocked. The timer is started when one of the following events occurs if the site is operationally up:

- Manual site activation using the **no shutdown** command at site-id level or at member object(s) level (SAP(s) or PW(s))
- Site activation after a failure

### Default

no site-activation-timer

### Parameters

***seconds***

Specifies the standby status in seconds.

All

## 23.260 site-min-down-timer

### site-min-down-timer

#### Syntax

**site-min-down-timer** *seconds*

**no site-min-down-timer**

#### Context

[\[Tree\]](#) (config>redundancy>bgp-multi-homing site-min-down-timer)

#### Full Context

configure redundancy bgp-multi-homing site-min-down-timer

#### Description

This command configures the BGP multi-homing site minimum down time. When this value is set and the site goes operationally down, it remains operationally down for at least the length of time configured by this timer, regardless of whether other state changes might cause the site to go operationally up. This timer is restarted every time the site transitions from operationally up to down.

This timer is optimized in the following circumstances:

- If the site goes down on the DF but there are no BGP multi-homing peers with the same site in an up state, this timer is not used.
- If the site goes down on the DF but there are no active BGP multi-homing peers, this timer is not used.
- If this timer is active and a BGP multihoming update is received from the DF indicating its site is down, this timer is immediately terminated and the BGP multihoming algorithm is triggered to determine whether this PE should become the DF.

The **no** form of this command removes the value from the configuration.

#### Default

no site-min-down-timer

#### Parameters

*seconds*

Specifies the time, in seconds, that a BGP multi-homing site remains operationally down after a transition from up to down.

**Values** 1 to 100

## Platforms

All

## site-min-down-timer

### Syntax

**site-min-down-timer** *min-down-time*

**no site-min-down-timer**

### Context

[\[Tree\]](#) (config>service>vpls>site site-min-down-timer)

### Full Context

configure service vpls site site-min-down-timer

### Description

This command configures the BGP multi-homing site minimum down time. When set to a non-zero value, if the site goes operationally down it will remain operationally down for at least the length of time configured for the **site-min-down-timer**, regardless of whether other state changes would have caused it to go operationally up. This timer is restarted every time that the site transitions from up to down. Setting this parameter to zero allows the minimum down timer to be disabled for this service.

The above operation is optimized in the following circumstances:

- If the site goes down on the designated forwarder but there are no BGP multi-homing peers with the same site in an operationally up state, then the **site-min-down-timer** is not started and is not used.
- If the site goes down on the designated forwarder but there are no active BGP multi-homing peers, then the **site-min-down-timer** is not started and is not used.
- If the **site-min-down-timer** is active and a BGP multi-homing update is received from the designated forwarder indicating its site has gone down, the **site-min-down-timer** is immediately terminated and this PE becomes the designated forwarder if the BGP multi-homing algorithm determines it should be the designated forwarder.

The **no** form of this command reverts to the default value.

### Default

Taken from the value of **site-min-down-timer** configured for Multi-Chassis BGP multi-homing under the **config>redundancy>bgp-multi-homing** context.

### Parameters

*min-down-time*

Specifies the time, in seconds, that a BGP multi-homing site remains operationally down after a transition from up to down.

**Values** 0 to 100 seconds

## Platforms

All

## site-min-down-timer

### Syntax

**site-min-down-timer** *min-down-time*

**no site-min-down-timer**

### Context

[\[Tree\]](#) (config>service>epipe>site site-min-down-timer)

### Full Context

configure service epipe site site-min-down-timer

### Description

This command configures the BGP multi-homing site minimum down time. When set to a non-zero value, if the site goes operationally down it will remain operationally down for at least the length of time configured for the **site-min-down-timer**, regardless of whether other state changes would have caused it to go operationally up. This timer is restarted every time that the site transitions from up to down. Setting this parameter to zero allows the minimum down timer to be disabled for this service.

The preceding operation is optimized in the following circumstances:

- If the site goes down on the designated forwarder but there are no BGP multi-homing peers with the same site in an operationally up state, then the **site-min-down-timer** is not started and is not used.
- If the site goes down on the designated forwarder but there are no active BGP multi-homing peers, then the **site-min-down-timer** is not started and is not used.
- If the **site-min-down-timer** is active and a BGP multi-homing update is received from the designated forwarder indicating its site has gone down, the **site-min-down-timer** is immediately terminated and this PE becomes the designated forwarder if the BGP multi-homing algorithm determines it should be the designated forwarder.

The **no** form of this command reverts to default value.

### Default

Taken from the value of **site-min-down-timer** configured for Multi-Chassis BGP multi-homing under the **config>redundancy>bgp-multi-homing** context.

### Parameters

*min-down-time*

Specifies the time, in seconds, that a BGP multi-homing site remains operationally down after a transition from up to down.

**Values** 0 to 100

### Platforms

All

## 23.261 site-preference

### site-preference

#### Syntax

**site-preference** *preference-value*

**no site-preference**

#### Context

[\[Tree\]](#) (config>service>epipe>site site-preference)

#### Full Context

configure service epipe site site-preference

#### Description

This command defines the value to advertise in the VPLS preference field of the BGP VPWS and BGP Multi-homing NLRI extended community. This value can be changed without having to shutdown the site itself. The site-preference is only applicable to VPWS services.

When not configured, the default is zero, indicating that the VPLS preference is not in use.

#### Default

no site-preference, value=0

#### Parameters

##### ***preference-value***

Specifies the preference value to advertise in the NLRI L2 extended community for this site.

**Values** 1 to 65535

##### **primary**

Sets the site-preference to 65535.

##### **backup**

Sets the site-preference to 1.

### Context

[\[Tree\]](#) (config>test-oam>icmp>ping-template size)

### Full Context

configure test-oam icmp ping-template size

### Description

This command configures the size of the Data field (in other words, padding) of the outgoing ICMP echo packet. Minimum packet sizes should be used to test connectivity. Larger packet size should only be used if there is a requirement to spot-check large packet size issues on a very limited number of tests and should not be used for normal connectivity testing. Packet sizes should never be configured to require fragmentation anywhere along the path. Exceeding these recommendations will negatively affect the scale and performance of icmp ping check testing.

The **no** form of this command reverts to the default value.

### Default

size 56

### Parameters

**octets**

Specifies the size of the ICMP echo ping padding field, in octets.

**Values** 12 to 9786

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**size-a** *bytes*

### Context

[\[Tree\]](#) (config>test-oam>sath>frame-size-tmpl size-a)

### Full Context

configure test-oam service-activation-testhead frame-size-template size-a

## Description

This command configures the Ethernet frame size for the letter "a".

## Parameters

### *bytes*

Specifies the Ethernet frame value, in bytes.

**Values** 64 to 9212

**Default** 64

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 23.264 size-b

### size-b

## Syntax

**size-b** *bytes*

## Context

[\[Tree\]](#) (config>test-oam>sath>frame-size-tmpl size-b)

## Full Context

configure test-oam service-activation-testhead frame-size-template size-b

## Description

This command configures the Ethernet frame size for the letter "b".

## Parameters

### *bytes*

Specifies the Ethernet frame value, in bytes.

**Values** 64 to 9212

**Default** 128

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 23.265 size-c

### Syntax

**size-c** *bytes*

### Context

[\[Tree\]](#) (config>test-oam>sath>frame-size-tmpl size-c)

### Full Context

configure test-oam service-activation-testhead frame-size-template size-c

### Description

This command configures the Ethernet frame size for the letter "c".

### Parameters

*bytes*

Specifies the Ethernet frame value, in bytes.

**Values** 64 to 9212

**Default** 256

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 23.266 size-d

size-d

### Syntax

**size-d** *bytes*

### Context

[\[Tree\]](#) (config>test-oam>sath>frame-size-tmpl size-d)

### Full Context

configure test-oam service-activation-testhead frame-size-template size-d

## Description

This command configures the Ethernet frame size for the letter "d".

## Parameters

### *bytes*

Specifies the Ethernet frame value, in bytes.

**Values** 64 to 9212

**Default** 512

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 23.267 size-e

### size-e

## Syntax

## Full Context

configure test-oam service-activation-testhead frame-size-template size-h

## Description

This command configures the Ethernet frame size for the letter "h".

## Parameters

### *bytes*

Specifies the Ethernet frame value, in bytes.

**Values** 64 to 9212

**Default** 9212

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 23.271 size-limit

### size-limit

#### Syntax

**size-limit** *limit-value*

**no size-limit**

#### Context

[\[Tree\]](#) (config>call-trace>location size-limit)

#### Full Context

configure call-trace location size-limit

#### Description

This command limits the total size of call-trace files on the specified compact flash card.

The **no** form of this command removes the size restriction.

#### Default

size-limit 1000

#### Parameters

*limit-value*

Specifies the total size of call-trace files on the specified compact flash card, in Mbytes.

**Values** 1 to 65536

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### size-limit

#### Syntax

**size-limit** *limit-value*

#### Context

[\[Tree\]](#) (config>call-trace>trace-profile size-limit)

#### Full Context

configure call-trace trace-profile size-limit

## Description

This command specifies a maximum of how big a trace may grow before it is stopped.

## Default

size-limit 10

## Parameters

### *limit-value*

Specifies the maximum data volume generated by a single call trace job to the output in megabytes. After reaching the limit the call trace job for a given host is automatically terminated.

**Values** 1 to 1000

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.272 size-u

size-u

## Syntax

size-u *bytes*

## Context

[\[Tree\]](#) (config>test-oam>sath>frame-size-tmpl size-u)

## Full Context

configure test-oam service-activation-testhead frame-size-template size-u

## Description

This command configures the Ethernet frame size for the letter "u", which is user-defined.

## Parameters

### *bytes*

Specifies the Ethernet frame value, in bytes.

**Values** 64 to 9212

**Default** 2000

**Platforms**

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 23.273 skip-gtp-ipv4-alloc

```
skip-gtp-ipv4-alloc
```

**Syntax**

[no] skip-gtp-ipv4-alloc

**Context**

[\[Tree\]](#) (config>subscr-mgmt>gtp>apn-policy>apn skip-gtp-ipv4-alloc)

**Full Context**

configure subscriber-mgmt gtp apn-policy apn skip-gtp-ipv4-alloc

**Description**

This command enables the ability to skip IPv4 address assignment using a GTP session setup response when PCO "allocation via NAS" is not present in a GTP session creation request. Without this configuration, IPv4 address allocation is done using GTP session setup response, even in absence of the PCO "allocation via NAS" in a GTP session setup request.

The **no** form of this command reverts to IPv4 address allocation using GTP.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.274 skip-ttl-decrement

```
skip-ttl-decrement
```

**Syntax**

[no] skip-ttl-decrement

**Context**

[\[Tree\]](#) (config>filter>gre-tun-tmp>ipv4 skip-ttl-decrement)

**Full Context**

configure filter gre-tunnel-template ipv4 skip-ttl-decrement

## Description

This command enables an option to not decrement the TTL of the IP packet matching the IPv4/IPv6 filter, when it is encapsulated into the GRE tunnel header.

The **no** form of this command disables this option (default). This results in the matching of IP packet's TTL field to be decremented before it is encapsulated in the GRE tunnel header.

## Platforms

configure service vprn interface sap static-host sla-profile

configure service vprn subscriber-interface group-interface sap static-host sla-profile

configure service ies subscriber-interface group-interface sap static-host sla-profile

configure service ies interface sap static-host sla-profile

### Description

This command specifies an existing SLA profile name to be associated with the static subscriber host. The SLA profile is configured in the **config>subscr-mgmt>sla-profile** context.

The **no** form of this command reverts to the default.

### Parameters

***sla-profile-name***

Specifies the SLA profile name.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## sla-profile

### Syntax

**sla-profile** *sla-profile-name* [**create**]

**no sla-profile** *sla-profile-name*

### Context

[\[Tree\]](#) (config subscr-mgmt sla-profile)

### Full Context

configure subscriber-mgmt sla-profile

### Description

This command configures an SLA profile mapping. Hosts associated with a subscriber are subdivided into Service Level Agreement (SLA) profiles. For each subscriber host an SLA profile can be specified. For a subscriber host, the SLA profile determines:

- The QoS-policies to use
  - The classification
  - The queues

- The queue mapping
- The IP filters to use

The SLA profile also has the attribute `host-limits` which limits the total number of hosts (belonging to the same subscriber) on a certain SAP that can be using this SLA profile.

The **no** form of this command reverts to the default.

### Parameters

#### ***sla-profile-name***

Specifies the name of the SLA profile.

#### **create**

Keyword used to create the SLA profile.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.276 sla-profile-map

### sla-profile-map

**Full Context**

configure subscriber-mgmt local-user-db ipoe host identification-strings sla-profile-string

configure subscriber-mgmt local-user-db ppp host identification-strings sla-profile-string

**Description**

This command specifies the SLA profile string which is encoded in the identification strings.

The **no** form of this command returns to the default.

**Parameters**

***sla-profile-string***

Specifies the SLA profile string, up to 16 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## sla-profile-string

### Syntax

**sla-profile-string** *string*

**no sla-profile-string**

### Context

**[Tree]** (config>subscr-mgmt>vrgw>brg>brg-profile sla-profile-string)

### Full Context

configure subscriber-mgmt vrgw brg brg-profile sla-profile-string

### Description

This command configures the SLA profile string which will be used as a default for SLA-profile lookup. This string can be overridden during BRG or host authentication.

The **no** form of the command removes the string from the configuration.

### Default

no sla-profile-string

### Parameters

*string*

Specifies the string to use to look up the subscriber profile.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**Description**

This command causes the console session to pause operation (sleep) for 1 second (default) or for the specified number of seconds.

**Default**

sleep 1

**Parameters*****seconds***

Specifies the number of seconds for the console session to sleep, expressed as a decimal integer.

**Values** 1 to 100**Default** 1**Platforms**

All

**23.281 slice-size**

## slice-size

### Syntax

**slice-size** *slice-size*

**no slice-size**

### Context

**[Tree]** (config>mirror>mirror-dest slice-size)

### Full Context

configure mirror mirror-dest slice-size

### Description

This command enables mirrored frame truncation and specifies the maximum size, in bytes, of a mirrored frame that can be transmitted to the mirror destination.

This command enables mirroring larger frames than the destination packet decode equipment can handle. It also allows conservation of mirroring resources by limiting the size of the packet stream through the router and the core network.

When defined, the mirror **slice-size** creates a threshold that truncates a mirrored frame to a specific size. For example, if the value of 256 bytes is defined, a frame larger than 256 bytes will only have the first 256 bytes transmitted to the mirror destination. The original frame is not affected by the truncation. The mirrored frame size may increase if encapsulation information is added during transmission through the network core or out the mirror destination SAP to the packet/protocol decode equipment.

The actual capability of the router to transmit a sliced or non-sliced frame is also dictated by the mirror destination SDP **path-mtu** or the mirror destination SAP physical MTU. Packets that require a larger MTU than the mirroring destination supports are discarded if the defined **slice-size** does not truncate the packet to an acceptable size.

Notes:

- When configuring IP mirroring, packet slice is rejected as an incorrect option as it will cause IP packets to be rejected by the next hop with an IP header verification error.
- Slice-size is not supported by CEM encap-types or IP-mirroring.

The **no** form of this command disables mirrored packet truncation.

### Parameters

#### **slice-size**

Specifies the number of bytes to which mirrored frames are truncated, expressed as a decimal integer.

**Values** 128 to 9216

### Platforms

All

## 23.282 slm

```
slm
```

### Syntax

```
slm [test-id test-id] [create]
```

```
no slm
```

### Context

[\[Tree\]](#) (config>oam-pm>session>ethernet slm)

### Full Context

```
configure oam-pm session ethernet slm
```

### Description

This command defines the test ID to be assigned to the synthetic loss test and creates the container to allow the individual test parameters to be configured.

The **no** form of this command removes the SLM test function from the PM Session.

### Parameters

#### *test-id*

Specifies the value placed in the 4-byte test ID field of the ETH-SLM PDU.

**Values** 0 to 2147483647 | **auto**

**auto** - automatically assigns a *test-id*

#### **create**

Creates the test.

configure port network egress pool slope-policy

configure port access egress channel pool slope-policy

configure port access ingress pool slope-policy

## Description

This command specifies an existing slope policy which defines high and low priority RED slope parameters and the time average factor. The policy is defined in the **config>qos>slope-policy** context.

## Default

slope-policy default

## Parameters

***name***

Specifies the policy name, a string up to 32 characters.

## Platforms

All

## slope-policy

### Syntax

**slope-policy** *slope-policy-name*

**no slope-policy**

### Context

**[Tree]** (config>card>fp>egress>wred-queue-control slope-policy)

### Full Context

configure card fp egress wred-queue-control slope-policy

### Description

This command configures WRED slopes within the WRED mega-pool. The WRED slopes in the WRED mega-pool are used when WRED queues are requesting buffers from the mega-pool while they are over their CBS threshold. Once over the CBS threshold, the WRED queue stops receiving buffers from the CBS reserve in the mega-pool and starts competing for buffers in the shared portion of the mega-pool. If the packet resulting in the buffer request is in-plus-profile, the packet will be associated with the high-plus-slope. In-profile packets are associated with the high slope. Out-of-profile packets are associated with the low slope. Exceed-profile packets are associated with the exceed slope. While the queue is within its CBS threshold, the slopes are ignored.

Within the defined slope-policy, each slope is enabled or disabled (no shutdown or shutdown) and each slope's geometry is defined as percentages of shared portion depth. If a slope is shutdown, the related traffic uses the minimum of the queue MBS and egress WRED megapool size as a drop tail.

The slope-policy also defines the time average factor (TAF) value that is used to determine how the pool's weighted average depth is calculated. The higher the factor, the slower the average depth tracks the actual pool depth.

The **no** form of this command reverts to the default slope policy to the WRED mega-pool.

### Default

slope-policy default

### Parameters

***slope-policy-name***

Specifies which slope policy the system should apply to the WRED mega-pool. When slope-policy is not executed, the WRED mega-pool will use the default slope policy. The defined slope policy must already exist or the command will fail. 32 characters maximum.

### Platforms

## slope-policy

## Syntax

**slope-policy** *policy-name*

**no slope-policy**

## Context

**[Tree]** (config>qos>hs-pool-policy>mid-tier>mid-pool slope-policy)

**[Tree]** (config>qos>hs-pool-policy>root-tier>root-pool slope-policy)

## Full Context

configure qos hs-pool-policy mid-tier mid-pool slope-policy

configure qos hs-pool-policy root-tier root-pool slope-policy

## Description

This command specifies the slope policy to be used to define the high, low, and exceed slopes within the pool. The slope (high, low, or exceed) used on the egress queue for the packet that generated the buffer request is also used in the mid-pool from the applied slope policy. The pool's current allocation amount is applied to the appropriate slope to derive the buffer rejection probability. The probability value is compared to a randomly-generated number. If the probability decision generates a rejection decision or the buffer pool has no remaining free buffers, the buffer request fails and the arriving packet is discarded. Otherwise, a buffer is allocated as long as the port-class and root-tier buffer pools also honor the buffer request.

The **no** form of the command restores the default slope policy to the associated pool.

## Default

slope-policy \_tmnx\_hs\_default

## Parameters

### *policy-name*

Specifies the slope policy associated with this pool, up to 32 characters.

## Platforms

7750 SR-7/12/12e

## slope-policy

### Syntax

**slope-policy** *policy-name*

**no slope-policy**

### Context

**[Tree]** (config>qos>hs-port-pool-policy>alt-port-class-pools>class-pool slope-policy)

**[Tree]** (config>qos>hs-port-pool-policy>std-port-class-pools>class-pool slope-policy)

### Full Context

configure qos hs-port-pool-policy alt-port-class-pools class-pool slope-policy

configure qos hs-port-pool-policy std-port-class-pools class-pool slope-policy

### Description

This command specifies the slope policy that is used to define the high, low, and exceed slopes within the port-class pool. The slope used on the egress queue for the packet that generated the buffer request is also used in the class-pool. The pool's current allocation amount is applied to the appropriate slope to derive the buffer rejection probability. The probability value is compared to a randomly generated number. If the probability decision generates a rejection or the buffer pool has no remaining free buffers, the buffer request fails and the arriving packet is discarded. Otherwise, a buffer is allocated as long as the mid-tier and root-tier buffer pools also honor the buffer request.

The **no** form of the command restores the default slope policy to the associated class-pool.

### Default

slope-policy \_tmnx\_hs\_default

### Parameters

#### *policy-name*

Specifies the policy name, up to 32 characters. This parameter is required when executing the **slope-policy** command and must refer to an existing slope policy within the system.

If a slope policy with the specified name does not exist, the **slope-policy** command fails without modifying the slope behavior on the pool. A non-existent slope-policy error is generated. After a slope policy is associated with any HSQ queue or buffer pool, the policy cannot be deleted.

## Platforms

7750 SR-7/12/12e

## slope-policy

### Parameters

#### *name*

The name of the slope policy.

**Values** Valid names consist of any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

### Platforms

All

## slope-policy

### Syntax

**slope-policy** *src-name* *dst-name* [overwrite]

### Context

[\[Tree\]](#) (config>qos>copy slope-policy)

### Full Context

configure qos copy slope-policy

### Description

This command copies existing QoS policy entries for a QoS policy-id to another QoS policy-id.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

## Parameters

### slope-policy

Indicates that the source policy ID and the destination policy ID are slope policy IDs. Specify the source policy ID that the copy command will attempt to copy from and specify the destination policy ID to which the command will copy a duplicate of the policy.

### overwrite

Specifies to replace the existing destination policy. Everything in the existing destination policy will be overwritten with the contents of the source policy. If **overwrite** is not specified, an error will occur if the destination policy ID exists.

```
ALA-7>config>qos# copy slope-policy default sp1
MINOR: CLI Destination "sp1" exists - use {overwrite}.
ALA-7>config>qos#overwrite
```

## Platforms

## 23.284 slow-psc-timer

### slow-psc-timer

#### Syntax

**slow-psc-timer** *interval*

**no slow-psc-timer**

#### Context

[\[Tree\]](#) (config>router>mpls>mpls-tp>protection-template slow-psc-timer)

#### Full Context

configure router mpls mpls-tp protection-template slow-psc-timer

#### Description

This command configures the slow timer value to be used for protection switching coordination (PSC) packets for MPLS-TP linear protection (RFC 6378).

#### Default

slow-psc-timer 5

## Parameters

### *interval*

Specifies the slow timer interval in seconds.

**Values** 5 to 60

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.285 slow-queue-threshold

### slow-queue-threshold

## Syntax

**slow-queue-threshold** *kilobits-per-second*

**no slow-queue-threshold**

## Context

[\[Tree\]](#) (config>card>virt-sched-adj slow-queue-threshold)

## Full Context

configure card virtual-scheduler-adjustment slow-queue-threshold

## Description

This command overrides the system default rate threshold where policers and queues are placed in the "slow" queue category. Slow rate policers and queues use a different minimum rate calculation interval time than fast rate queues. The rate is determined based on the previous calculated offered rate for the policer or queue.

The default slow policer or queue rate is 1 Mb/s. The fast rate is derived by multiplying the slow rate by a factor of 1.5 resulting in a default fast rate of 1.5 Mb/s. The `slow-queue-threshold` command uses a "Kilobit-Per-Second" value to modify the default slow queue rate threshold and indirectly changes the fast queue rate threshold.

The **no** form of this command restores the default slow queue and fast rate thresholds.

## Default

`no slow-queue-threshold`

## Parameters

### *kilobits-per-second*

Specifies that the kilobit-per-second parameter is required and is used to modify the default slow rate threshold. Defining a value of 0 forces all policers and queues to be

treated as fast rate. Defining a value of 1000 (1 Mb/s) returns the threshold to the default value and is equivalent to executing **no slow-queue-threshold**.

The fast rate threshold is derived by multiplying the new slow rate threshold by a factor of 1.5.

**Values** 0 to 1000000 kb/s

**Default** 1000 kb/s

## 23.288 snap-pid

## snap-pid

### Syntax

**snap-pid** *snap-pid*

**no snap-pid**

### Context

[\[Tree\]](#) (config>qos>sap-ingress>mac-criteria>entry>match snap-pid)

### Full Context

configure qos sap-ingress mac-criteria entry match snap-pid

### Description

Configures an IEEE 802.3 LLC SNAP Ethernet frame PID value to be used as a service ingress QoS policy match criterion.

This is a 2-byte protocol id that is part of the IEEE 802.3 LLC SNAP Ethernet Frame that follows the 3-byte OUI field.

The snap-pid field, etype field, ssap, and dsap fields are mutually exclusive and cannot be part of the same match criteria.

The **snap-pid** match criteria is independent of the OUI field within the SNAP header. Two packets with different 3-byte OUI fields, but the same PID field, will both match the same policy entry based on a snap-pid match criteria.

The **no** form of this command removes the snap-pid value as the match criteria.

### Default

no snap-pid

### Parameters

***snap-pid***

The 2-byte snap-pid value to be used as a match criterion in hexadecimal.

**Values** 0x0000 to 0xFFFF

### Platforms

All

## snap-pid

### Syntax

**snap-pid** *snap-pid*

**no snap-pid**

## Context

[\[Tree\]](#) (config>filter>mac-filter>entry>match snap-pid)

## Full Context

configure filter mac-filter entry match snap-pid

## Description

Configures an IEEE 802.3 LLC SNAP Ethernet Frame PID value to be used as a MAC filter match criterion.

This is a two-byte protocol id that is part of the IEEE 802.3 LLC SNAP Ethernet Frame that follows the three-byte OUI field.

The snap-pid field, etype field, ssap and dsap fields are mutually exclusive and may not be part of the same match criteria.

The snap-pid match criterion is independent of the OUI field within the SNAP header. Two packets with different three-byte OUI fields but the same PID field will both match the same filter entry based on a snap-pid match criteria.

The **no** form of the command removes the snap-pid value as the match criteria.

## Default

no snap-pid

## Parameters

### *snap-pid*

Specifies the two-byte snap-pid value to be used as a match criterion. The value can be expressed in decimal integer or hexadecimal format.

**Values** 0 to 65535 or 0x0000 to 0xFFFF

## Platforms

All

## snap-pid

## Syntax

**snap-pid** *snap-pid*

**no snap-pid**

## Context

[\[Tree\]](#) (config>system>security>mgmt-access-filter>mac-filter>entry>match snap-pid)

## Full Context

configure system security management-access-filter mac-filter entry match snap-pid

## Description

This command configures an IEEE 802.3 LLC SNAP Ethernet Frame PID value to be used as a MAC filter match criterion.

This is a two-byte protocol id that is part of the IEEE 802.3 LLC SNAP Ethernet Frame that follows the three-byte OUI field.

The snap-pid field, etype field, ssap and dsap fields are mutually exclusive and may not be part of the same match criteria. Refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for information about MAC Match Criteria Exclusivity Rules fields that are exclusive based on the frame format.

### Note:

The snap-pid match criterion is independent of the OUI field within the SNAP header. Two packets with different three-byte OUI fields but the same PID field will both match the same filter entry based on a snap-pid match criteria.

The **no** form of this command removes the snap-pid value as the match criteria.

## Default

no snap-pid

## Parameters

### *pid-value*

Specifies the two-byte snap-pid value to be used as a match criterion in hexadecimal.

## 23.290 snmp-trap-group

### snmp-trap-group

#### Syntax

**snmp-trap-group** *log-id* | *log-name* [**name** *log-name*]

**no snmp-trap-group** *log-id* | *log-name*

#### Context

[\[Tree\]](#) (config>service>vprn>log snmp-trap-group)

#### Full Context

configure service vprn log snmp-trap-group

#### Description

This command creates the context to configure a group of SNMP trap receivers and their operational parameters for a specific *log-id*.

A group specifies the types of SNMP traps and specifies the log ID that will receive the group of SNMP traps. The user must configure a trap group before SNMP traps can be sent.

To suppress the generation of all alarms and traps, see the **event-control** command. To suppress alarms and traps that are sent to this *log-id*, see the **filter** command. After alarms and traps are generated, they can be directed to one or more SNMP trap groups. Log events that can be forwarded as SNMP traps are always defined on the main event source.

The **no** form of this command deletes the SNMP trap group.

#### Default

There are no default SNMP trap groups.

#### Parameters

##### **log-id** | **log-name**

Specifies the log ID or name (up to 32 characters).

**Values** *log-id*: 1 to 100

##### **name log-name**

Specifies an optional log name of a log configured in the **log-id** context, up to 32 characters, that can be used to refer to the log after it is created. Alarms and traps cannot be sent to the trap receivers until a valid *log-id* exists.

## Platforms

All

# snmp-trap-group

## Syntax

**snmp-trap-group** *log-id* | *log-name* [**name** *log-name*]

**no snmp-trap-group** *log-id* | *log-name*

## Context

[\[Tree\]](#) (config>log snmp-trap-group)

## Full Context

configure log snmp-trap-group

## Description

This command creates the context to configure a group of SNMP trap receivers and their operational parameters for a specified *log-id*.

A group specifies the types of SNMP traps and the log ID which that will receive the SNMP trap group. The user must configure a trap to send SNMP traps.

To suppress the generation of all alarms and traps, see the **event-control** command. To suppress alarms and traps that are sent to this log ID, see the filter command. When alarms and traps are generated, they can be directed to one or more SNMP trap groups. Log events that can be forwarded as SNMP traps are always defined at the main event source.

The **no** form of this command deletes the SNMP trap group.

## Parameters

### *log-id* | *log-name*

Specifies the log ID or log name (up to 32 characters).

**Values** *log-id*: 1 to 100

### **name** *log-name*

Specifies an optional log name of a log configured in the **log-id** context, up to 32 characters, that can be used to refer to the log after it is created. Alarms and traps cannot be sent to the trap receivers until a valid *log-id* exists.

## Platforms

## 23.291 snoop

## snoop

### Syntax

[no] snoop

### Context

**[Tree]** (config>service>vprn>nw-if>dhcp snoop)

**[Tree]** (config>service>vpls>sap>dhcp snoop)

**[Tree]** (config>service>vpls>mesh-sdp>dhcp snoop)

**[Tree]** (config>service>vpls>spoke-sdp>dhcp snoop)

**[Tree]** (config>service>vprn>if>dhcp>option snoop)

### Full Context

configure service vprn nw-if dhcp snoop

configure service vpls sap dhcp snoop

configure service vpls mesh-sdp dhcp snoop

configure service vpls spoke-sdp dhcp snoop

configure service vprn interface dhcp option snoop

### Description

This command enables snooping of DHCP or DHCP6 messages on the SAP or SDP. Enabling DHCP or DHCP6 snooping on interfaces (SAPs and SDP bindings) is required where DHCP or DHCP6 messages important to lease state table population are received, or where Option 82 information is to be inserted. This includes interfaces that are in the path to receive messages from either DHCP or DHCP6 servers or from subscribers.

The **no** form of this command disables DHCP or DHCP6 snooping on the specified SAP or SDP binding.

### Default

no snoop

### Platforms

All

## 23.292 snooping

## snooping

### Syntax

[no] snooping

## Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>ipv6>dhcp6 snooping)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>ipv6>dhcp6 snooping)

## Full Context

configure service vprn subscriber-interface group-interface ipv6 dhcp6 snooping

configure service ies subscriber-interface group-interface ipv6 dhcp6 snooping

## Description

This command enables the group-interface to snoop DHCPv6 relay messages exchange between the subscriber host and the DHCPv6 server. A successful DHCPv6 address assignment triggers ESM DHCPv6 host creation and a release of the lease triggers host deletion. This feature is for ESMv6 applications where a Layer 3 aggregation network is upstream from the BNG.

The **no** form of this command reverts to the default.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.293 sntp

sntp

## Syntax

[no] sntp

## Context

[\[Tree\]](#) (config>system>time sntp)

## Full Context

configure system time sntp

## Description

This command creates the context to edit the Simple Network Time Protocol (SNTP).

SNTP can be configured in either broadcast or unicast client mode. SNTP is a compact, client-only version of the NTP. SNTP can only receive the time from SNTP/NTP servers. It cannot be used to provide time services to other systems.

The system clock is automatically adjusted at system initialization time or when the protocol first starts up.

When the time differential between the SNTP/NTP server and the system is more than 2.5 seconds, the time on the system is gradually adjusted.

SNTP is created in an administratively enabled state (**no shutdown**).

The **no** form of the command removes the SNTP instance and configuration. SNTP does not need to be administratively disabled when removing the SNTP instance and configuration.

**Default**

sntp

**Platforms**

All

## 23.294 socket

### socket

**Syntax**

**socket** [*neighbor ip-address* | **group name**]

**no socket**

**Context**

[\[Tree\]](#) (debug>router>bgp socket)

**Full Context**

debug router bgp socket

**Description**

This command logs all TCP socket events to the debug log.

The **no** form of this command disables debugging.

**Parameters****neighbor *ip-address***

Debugs only events affecting the specified BGP neighbor.

- Values**
- ipv4-address:
    - a.b.c.d (host bits must be 0)
  - ipv6-address:
    - x:x:x:x:x:x [-interface] (eight 16-bit pieces)
    - x:x:x:x:x:d.d.d.d [-interface]
    - x: [0 to FFFF]H
    - d: [0 to 255]D
    - interface: up to 32 characters for link local addresses

**group *name***

Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

**[Tree]** (config>aaa>isa-radius-policy>acct-update-triggers soft-quota-exhausted)

#### Full Context

configure subscriber-mgmt wlan-gw ue-query soft-quota-exhausted

configure aaa isa-radius-policy acct-update-triggers soft-quota-exhausted

#### Description

This command sends an interim update message when a soft volume quota is reached.

#### Default

soft-quota-exhausted

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.297 soft-quota-exhausted-filter

### soft-quota-exhausted-filter

#### Syntax

**soft-quota-exhausted-filter** *dsm-ip-filter-name*

**no soft-quota-exhausted-filter**

#### Context

**[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>dsm soft-quota-exhausted-filter)

**[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>dsm soft-quota-exhausted-filter)

#### Full Context

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt soft-quota-exhausted-filter

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt soft-quota-exhausted-filter

### Description

This command applies a filter when a soft volume quota is reached. The filter replaces the currently applied filter (which can be preconfigured using the **vlan-range ip-filter** command or be set using RADIUS authentication/ CoA message) for the UE upon quota exhaustion. If the quota is extended using a RADIUS CoA message, the filter is automatically reverted. Configuration changes apply only to new DSM UEs and not to existing UEs.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.298 software-repository

### software-repository

#### Syntax

**software-repository** *repository-name*

**no software-repository**

#### Context

[\[Tree\]](#) (config>system>satellite>eth-sat software-repository)

[\[Tree\]](#) (config>system>satellite>tdm-sat software-repository)

#### Full Context

configure system satellite eth-sat software-repository

configure system satellite tdm-sat software-repository

#### Description

This command binds the specified software repository to the associated satellite. The software repository is used to locate and serve the correct software image to the satellite at boot time.

The configured software repository is only used when the satellite boots. Changing the software repository for an active satellite does not have an effect until the next time a satellite boots.

A satellite cannot be booted if there is no software repository defined for it.

The **no** form of the command removes the software repository.

#### Default

no software-repository

## Parameters

### *repository-name*

Specifies a string, up to 32 characters, that uniquely identifies the software repository.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure system satellite eth-sat software-repository

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

- configure system satellite tdm-sat software-repository

## software-repository

## Syntax

**software-repository** *repository-name* [**create**]

**no software-repository** *repository-name*

## Context

[\[Tree\]](#) (config>system software-repository)

## Full Context

configure system software-repository

## Description

This command creates or deletes an instance of a software repository. The instance is identified by a repository name.

A software repository is used to obtain files to upgrade software on certain subsystems of the router (for example, Ethernet satellites).

Up to three locations can be specified within a software repository for the router to access files in the repository. The router will first attempt to access the file at the primary location. If the primary location is not configured or the files are not found at the primary location, then the router will attempt to access the files at the secondary location. If the secondary location is not configured or the files are not found at the secondary location, then the router will attempt to access the files at the tertiary location. If the tertiary location is not configured or the files are not found at the tertiary location, then the software repository access will fail.

The **no** form of the command removes the software repository.

## Parameters

### *repository-name*

Specifies a string, up to 32 characters, that uniquely identifies the software repository.

### **create**

Specifies the keyword required when the software-repository context is first created. Once the context is created, it can be accessed without the **create** keyword.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### solicited-release

### Syntax

[no] **solicited-release**

### Context

**[Tree]** (config>router>dhcp>server>lease-hold-time-for solicited-release)

**[Tree]** (config>service>vprn>dhcp>server>lease-hold-time-for solicited-release)

**[Tree]** (config>service>vprn>dhcp6>server>lease-hold-time-for solicited-release)

**[Tree]** (config>router>dhcp6>server>lease-hold-time-for solicited-release)

### Full Context

configure router dhcp local-dhcp-server lease-hold-time-for solicited-release

configure service vprn dhcp local-dhcp-server lease-hold-time-for solicited-release

configure service vprn dhcp6 local-dhcp-server lease-hold-time-for solicited-release

```
configure router dhcp6 local-dhcp-server lease-hold-time-for solicited-release
```

### Description

This command enables the server to hold up a lease even in case of solicited release; for example, when the server receives a normal DHCP release message.

The **no** form of this command disables the ability of the server to hold up a lease when a solicited release is received.

### Platforms

## 23.301 sonet-sdh

```
sonet-sdh
```

### Syntax

```
sonet-sdh
```

### Context

[\[Tree\]](#) (config>port sonet-sdh)

### Full Context

```
configure port sonet-sdh
```

### Description

This command enables access to the context to configure SONET/SDH ports. This context can only be used when configuring an OC-3 and OC-12 SONET/SDH ports on an appropriate MDA.

This command also enables access to the context to configure SONET/SDH parameters for an Ethernet port in WAN PHY (xgig wan) mode.

The 10 Gigabit Ethernet LAN port also has SONET/SDH characteristics. However, these characteristics are predetermined and not configurable.

This command is supported by TDM satellite.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure service vpls sap igmp-snooping static group source

configure service vpls mesh-sdp mld-snooping static group source

configure service vpls spoke-sdp igmp-snooping static group source

### Description

This command specifies a IPv4 or IPv6 unicast address that sends data on an interface. This enables a multicast receiver host to signal a router the group to receive multicast traffic from, and from the sources that the traffic is expected.

The **source** command is mutually exclusive with the specification of individual sources for the same group.

The **source** command in combination with the group is used to create a specific (S,G) static group entry.

Static (s,g) entries cannot be entered when a starg is already created.

Use the **no** form of this command to remove the source from the configuration.

### Parameters

#### ***ip-address***

Specifies the IPv4 unicast address

#### ***src-ipv6-address***

Specifies the IPv6 unicast address.

### Platforms

All

## source

### Syntax

**source** *ip-address*

**no source**

### Context

**[Tree]** (config>service>vprn>if>sap>ip-tunnel source)

**[Tree]** (config>service>ies>if>sap>ip-tunnel source)

## Full Context

configure service vprn interface sap ip-tunnel source  
 configure service ies interface sap ip-tunnel source

## Description

This command configures the source IPv4 or IPv6 address to use for an IP tunnel. This configuration applies to the outer IP header of the encapsulated packets. The IPv4 or IPv6 address must belong to the one of the IP subnets associated with the public SAP interface of the tunnel-group. The **source** address, **remote-ip** address and **backup-remote-ip** address of a tunnel must all belong to the same address family (IPv4 or IPv6). When the source address contains an IPv6 address it must be a global unicast address.

The **no** form of this command deletes the source address from the tunnel configuration. The tunnel must be administratively shutdown before issuing the **no source** command.

## Default

no source

## Parameters

### *ip-address*

Specifies an IPv4 address or an IPv6 address.

### Values

ipv4-address	a.b.c.d
ipv6-address	x::x::x::x::x::x (eight 16-bit pieces) x::x::x::x::d.d.d.d
	x [0..FFFF]H
	d [0..255]D

## Platforms

All

## SOURCE

### Syntax

[no] **source** *unicast-ip-prefix/mask*

### Context

**[Tree]** (config>service>vprn>msdp source)

### Full Context

configure service vprn msdp source

### Description

This command limits the number of active source messages the router accepts from sources in the specified address range.

If the prefix and mask provided is already a configured then this command only provides the context to configure the parameters pertaining to this active source-message filter.

If the prefix and mask provided is not already a configured, then the source node instance must be created and the context to configure the parameters pertaining to this node should be provided. In this case, the \$ prompt to indicate that a new entity (source) is being created should be used.

The source active msdp messages are not rate limited based on the source address range.

The **no** form of this message removes the source active rate limiter for this source address range.

### Parameters

#### *unicast-ip-prefix*

Specifies the IP prefix in dotted decimal notation for the range used by the ABR to advertise that summarizes the area into another area.

**Values** ip-prefix/mask: ip-prefix a.b.c.d (host bits must be 0)

#### *mask*

Specifies the subnet mask for the range expressed as a decimal integer mask length or in dotted decimal notation.

**Values** 0 to 32 (mask length), 0.0.0.0 to 255.255.255.255 (dotted decimal)

### Platforms

## Full Context

configure application-assurance group access-network-location source

## Description

This command configures location sources for the dynamic experience management. The location source types are, for example, 3G and congestion point.

## Default

source mobile-3g

## Parameters

### *source-type*

Specifies the location or access technology.

**Values** **access-point** — Provides Dynamic Experience Management (DEM) for the WLGW access point.

**Note:**

The access points do not need to support the Nokia CEA function.

### *level*

Specifies which congestion point within the specified source-type to monitor for congestion.

**Values** **MAC+VLAN** — WLGW access point (MAC) and radio (VLAN).

**Note:**

The access points do not need to support the Nokia CEA function.

**source mep** *mep-id* **domain-name** *admin-name* **association-name** *admin-name*

**no source**

## Context

[\[Tree\]](#) (config>oam-pm>session>ethernet source)

## Full Context

```
configure oam-pm session ethernet source
```

## Description

This command defines the source launch point identification Y.1731 parameters that are used by the individual tests within the session. If an MEP matching the configuration does not exist, the session is allowed to become active, however the frames sent frames and received as seen under the **show >oam-pm>statistics>session session-name** command is zero. The preferred reference to the MEP launch point is by *admin-name*. Therefore, the syntax **source mep mep-id domain-name admin-name association-name admin-name** should be used.

The **no** form of this command removes this session parameter.

## Parameters

### *mep-id*

Specifies the maintenance association end point identifier of the launch point.

**Values** 1 to 8191

### *md-index*

Specifies the maintenance domain (MD) index value of the launch point. The **domain-name admin-name** parameter is preferred for specifying the domain information.

**Values** 1 to 4294967295

### *ma-index*

Specifies the maintenance association (MA) index value of the launch point. The **association-name ma-name** parameter is preferred for specifying the association information.

**Values** 1 to 4294967295

### *admin-name*

Specifies the name reference for the maintenance domain (MD), or the association (MA) *admin-name* value of the launch point, up to 64 characters.

## Platforms

source ip-address
```

```
no source
```

## Context

```
[Tree] (config>oam-pm>session>ip source)
```

## Full Context

```
configure oam-pm session ip source
```

## Description

This command defines the source IP address that the session controller (launch point) uses for the test. The source address must be a local resident IP address in the context; otherwise, the response packets are processed by the TWAMP Light application. Only source addresses configured as part of TWAMP tests can process the reflected TWAMP packets from the session reflector.

The **no** form of this command removes the source address parameters.

## Parameters

### source

Indicates the launch point.

### ip-address

Specifies the source IP address that the session controller (launch point) uses for the test.

#### Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
x:	[0 to FFFF]H
d:	[0 to 255]D

## Platforms

## source

## Syntax

```
source {line-ref | internal-clock}
```

## Context

[\[Tree\]](#) (config>system>sync-if-timing>bits>output source)

## Full Context

```
configure system sync-if-timing bits output source
```

## Description

This command configures the values used to identify the source of the BITS (Building Integrated Timing Supply) output. This is either the signal recovered directly from ref1, ref2 or ptp, or it is the output of the node's central clock. The directly recovered signal would be used when the BITS output signal is feeding into an external standalone timing distribution device (BITS/SASE). The specific directly recovered signal

used is the best of the available signals based of the QL and/or the ref-order. The central clock output would be used when no BITS/SASE device is present and the BITS output signal is used to monitor the quality of the recovered clock within the system.

### Default

source line-ref

### Parameters

#### line-ref

Specifies that the BITS output timing is selected from one of the input references, without any filtering.

#### internal-clock

Specifies that the BITS output timing is driven from the system timing.

### Platforms

## source

### Syntax

**source** *ip-address*

**no source**

### Context

[\[Tree\]](#) (config>router>if>if-attr>delay>dyn>twamp>ipv4 source)

### Full Context

configure router interface if-attribute delay dynamic twamp-light ipv4 source

### Description

This command configures the unicast IPv4 address used as the source of the TWAMP Light test packet. When this command is not configured, the primary IPv4 address, or the reference IPv4 address in the case of unnumbered interfaces, is used as the source. This command can be used when the IPv4 primary address or reference interface is not the desired source address for the packet.

Changes are allowed without administratively disabling the IPv4 protocol.

The **no** form of this command removes the specified address, which causes the source address to be auto-learned.

### Default

no source

### Parameters

*ip-address*

Specifies TWAMP Light IPv4 source address.

**Values** a.b.c.d

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## SOURCE

## Syntax

**no source**

## Context

[\[Tree\]](#) (config>router>if>if-attr>delay>dyn>twamp>ipv6 source)

## Full Context

configure router interface if-attribute delay dynamic twamp-light ipv6 source

## Description

This command configures the IPv6 address used as the source of the TWAMP Light test packet. When this command is not configured, no source address is present and an error is raised to prevent the transmission of the test packet.

The IPv6 protocol can be enabled even without addressing. However, the test will not transmit packets. The link local address must be in the form fe80::/64 in accordance with RFC 4291, *IP Version 6 Addressing Architecture*.

The **no** form of this command removes the specified address.

## Default

no source

## Parameters

### *ipv6-address*

Specifies the TWAMP Light IPv6 source address.

### Values

ipv6-address:	x:x:x:x:x:x
	x - [0 to FFFF]H
	unicast and link local IPv6 address only

## Platforms

[\[Tree\]](#) (config>system>management-interface>remote-management source-address)

## Full Context

configure system management-interface remote-management source-address

## Description

This command configures the address local to this device that NISH uses to connect to this node.

If this command is also configured for a specific manager in the **config>system> management-interface>remote-management>manager** context, that configuration takes precedence.

The **no** form of this command causes the system to select the source address based on the selected routing instance of the manager.

## Parameters

### *ip-address*

Specifies the IP address that NISH managers use to connect to the node.

#### Values

*ipv4-address:* a.b.c.d

*ipv6-address:* x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

## Platforms

All

## source-address

## Syntax

**source-address** *ip-address*

**no source-address**

## Context

**[Tree]** (config>system>management-interface>remote-management>manager source-address)

## Full Context

configure system management-interface remote-management manager source-address

## Description

This command configures the address local to this device that this NISH manager uses to connect to this node.

This command takes precedence over the command configured in the global context (**config>system>management-interface>remote-management**).

The **no** form of this command causes the source address to be inherited from the global context (**config>system>management-interface>remote-management**).

## Parameters

### *ip-address*

Specifies the IP address that NISH managers use to connect to the node.

#### Values

*ipv4-address:* a.b.c.d

*ipv6-address:* x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

## Platforms

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>server source-address)

## Full Context

configure subscriber-mgmt authentication-policy radius-authentication-server source-address

configure subscriber-mgmt radius-accounting-policy radius-accounting-server source-address

## Description

This command configures the source address of the RADIUS packet.

The system IP address must be configured in order for the RADIUS client to work. See [Configuring a System Interface](#) in the Router Configuration Guide.

### Note:

The system IP address must only be configured if the source-address is not specified. When the **no source-address** command is executed, the source address is determined at the moment the request is sent. This address is also used in the nas-ip-address attribute: over there it is set to the system IP address if **no source-address** was given.

The **no** form of this command reverts to the default value.

### Default

System IP address

### Parameters

#### *ip-address*

Specifies the IP prefix for the IP match criterion in dotted decimal notation.

**Values** 0.0.0.0 to 255.255.255.255

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## source-address

### Syntax

**source-address** *ip-address* [**allow-connections**]

**no source-address**

### Context

[\[Tree\]](#) (config>aaa>diam>node source-address)

### Full Context

configure aaa diameter node source-address

### Description

This command configures IPv4 source address that the SR OS node will use for its peering connection.

The **no** form of this command removes the IP address from the configuration.

### Parameters

#### *ip-address*

Specifies IP prefix for the IP match criterion in dotted decimal notation

**Values** 0.0.0.0 to 255.255.255.255

#### **allow-connections**

Specifies to accept peering connections on the configured source IPv4 address. The peer initiating the connection can only be an inter-chassis peer.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```

## Description

Commands in this context specify the source address and application that should be used in all unsolicited packets.

## Platforms

All

## source-address

### Syntax

**source-address** *ip-address*

**no source-address**

### Context

**[Tree]** (config>router>ldp>lsp-bfd source-address)

### Full Context

configure router ldp lsp-bfd source-address

### Description

This command configures the source address of periodic LSP ping packets and BFD control packets for LSP BFD sessions that are associated with LDP prefixes in the prefix list. The system IP address is used by default. If the system IP address is not routable from the far-end node of the BFD session, then an alternate routable IP address that is local to the source node should be used.

### Default

no source-address

### Parameters

#### *ip-address*

Specifies a routable IPv4 or IPv6 address that is local to the node.

<b>Values</b>	<i>ipv4-address</i> — a.b.c.d
	<i>ipv6-address</i> — x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x — 0 to FFFF in hexadecimal
	d — 0 to 255 in decimal
<b>Default</b>	system IP address

### Platforms

### Syntax

**source-address** *ip-address*

**no source-address**

## Context

[\[Tree\]](#) (config>app-assure>rad-acct-plcy>server source-address)

## Full Context

configure application-assurance radius-accounting-policy radius-accounting-server source-address

## Description

This command configures the source address of the RADIUS packet. The system IP address must be configured in order for the RADIUS client to work. See "Configuring a System Interface" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide*. The system IP address must only be configured if the source-address is not specified. When the **no source-address** command is executed, the source address is determined at the moment the request is sent. This address is also used in the nas-ip-address attribute: over there it is set to the system IP address if no source address was given.

The **no** form of this command reverts to the default value, where the source address is the system IP address.

## Default

no source-address

## Parameters

### *ip-address*

The IP prefix for the IP match criterion in dotted decimal notation.

**Values** 0.0.0.0 - 255.255.255.255

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Syntax

**source-address** *ip-address*

**no source-address**

## Context

[\[Tree\]](#) (config>service>ipfix>export-policy>collector source-address)

## Full Context

configure service ipfix ipfix-export-policy collector source-address

## Description

This command configures the source address from which UDP streams containing IPFIX flow records will be sourced.

## Default

no source-address

## Parameters

### *ip-address*

Source IPv4 address from which UDP streams are sent.

## Platforms

All

## source-address

## Syntax

**source-address** *ip-address*

**no source-address**

## Context

[\[Tree\]](#) (config>filter>gre-tun-tmp>ipv4 source-address)

## Full Context

configure filter gre-tunnel-template ipv4 source-address

## Description

This command defines the source IPv4 address to be used in the GRE IP header used to encapsulate the matching IPv4/IPv6 packet. This IP address can be configured as any value and is not validated against a local IP address. The **source-address** command must be configured for the template to be valid.

The **no** form of this command removes the source IP address configuration from the associated GRE tunnel template.

## Parameters

### *ip-address*

Specifies the IPv4 address (in dotted decimal notation) to be used as the source address.

## Platforms

All

## source-address

## Syntax

**source-address** [*ip-address*]

**no source-address**

**Context**

[\[Tree\]](#) (config>filter>redirect-policy>dest>ping-test source-address)

**Full Context**

configure filter redirect-policy destination ping-test source-address

**Description**

This command configures the source address to use in the IP packet of the ping test for this destination.

**Default**

no source-address

**Parameters*****ip-address***

The source address of the IP packet. This can be IPv4 only for an IPv4 destination and IPv6 only for an IPv6 destination.

**Values**

ipv4-address:	a.b.c.d.
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

**Platforms**

All

**source-address****Syntax**

**source-address**

**Context**

[\[Tree\]](#) (config>system>security source-address)

**Full Context**

configure system security source-address

## Description

This command configures the IP source address that is used in all unsolicited packets sent by the application.

The configured source address applies only to packets transmitted in-band (for example, a network port on an IOM). Packets transmitted out-of-band on the management interface on the CPM Ethernet port use the address of the CPM Ethernet port as the IP source address in the packet.

When a source address is specified for the **ptp** application, the port-based 1588 hardware timestamping assist function will be applied to PTP packets matching the IPv4 address of the router interface used to ingress the SR/ESS or IP address specified in this command. If the IP address is removed, then the port-based 1588 hardware timestamping assist function will only be applied to PTP packets matching the IPv4 address of the router interface.

**no source-address**

### Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from source-address)

### Full Context

configure router policy-options policy-statement entry from source-address

### Description

This command specifies the source address that is embedded in the join or prune packet as a filter criterion.

The **no** form of this command removes the criterion from the configuration.

This command specifies a multicast data source address as a match criterion for this entry.

### Default

no source-address

### Parameters

#### *ip-address*

Specifies the IP prefix for the IP match criterion in dotted decimal notation.

- |               |                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Values</b> | ipv4-address:                                                                                                                          |
|               | <ul style="list-style-type: none"><li>a.b.c.d</li></ul>                                                                                |
|               | ipv6-address:                                                                                                                          |
|               | <ul style="list-style-type: none"><li>x:x:x:x:x:x:x</li><li>x:x:x:x:x:d.d.d.d</li><li>x: [0 to FFFF]H</li><li>d: [0 to 255]D</li></ul> |

#### *prefix-list-name*

The prefix list name. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### Platforms

All

## source-address

### Syntax

**source-address** *ipv6-address*

**no source-address**

### Context

[\[Tree\]](#) (config>router>segment-routing>srv6 source-address)

### Full Context

configure router segment-routing segment-routing-v6 source-address

### Description

This command configures the global default source IPv6 address used in the SA field of the outer IPv6 header of the SRv6 encapsulated packet. This value is inherited in the BGP and service contexts by default, but can be overwritten in each context. A maximum of 16 address values can be configured in all contexts in the system.

There is no default value for this command. A default source IPv6 address must be configured in this context or in the BGP or service context. The system does not check if the entered address is a valid local address.

The **no** form of this command removes the source IPv6 address from the configuration.

### Parameters

#### *ipv6-address*

Specifies the source IPv6 address of the SRv6.

#### Values

ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## source-address

### Syntax

**source-address** *ipv6-address*

**no source-address**

**Context**

[\[Tree\]](#) (config>router>bgp>srv6 source-address)

**Full Context**

configure router bgp segment-routing-v6 source-address

**Description**

This command configures the source IPv6 address for SRv6.

This command overrides the source IPv6 address for all address families in the base router instance. By default, BGP uses the value from the top level configuration under **config>router>segment-routing>segment-routing-v6**.

The **no** form of this command removes the source IPv6 address from the configuration.

**Default**

no source-address

**Parameters*****ipv6-address***

Specifies the source IPv6 address of the SRv6.

**Values**

ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

## 23.304 source-address-range

### source-address-range

#### Syntax

**source-address-range** *start-ip-address*

**no source-address-range**

#### Context

[\[Tree\]](#) (config>aaa>isa-radius-plcy>servers source-address-range)

#### Full Context

configure aaa isa-radius-policy servers source-address-range

#### Description

This command specifies the first IP address in the range of IPv4 addresses that are assigned to a BB-ISA in a given NAT group for NAT RADIUS accounting. The IP addresses are unique within the NAT group and are used to bind the RADIUS client instantiated on each BB-ISA card. The number of IPv4 addresses allocated is equal to the number of BB-ISAs in a NAT group that are enabled for NAT RADIUS accounting. Although only the first IPv4 address is explicitly configured with this command, each internally allocated IPv4 address associated with the BB-ISA card can be seen in the routing table (via show commands) as /32 with protocol designation 'NAT'.

#### Default

no source-address-range

#### Parameters

##### ***start-ip-address***

The starting IP address of the IP address range.

**Values** 0.0.0.0 - 255.255.255.255

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## source-address-range

### Syntax

**[no] source-address-range start *ip-address* end *ip-address***

### Context

**[Tree]** (config>service>vprn>wlan-gw>gtp>source-ranges source-address-range)

### Full Context

configure service vprn wlan-gw gtp source-ranges source-address-range

### Description

This command configures a range of IP addresses used by ISA MDA's as source address in GTP messages.

The **no** form of this command removes the IP address ranges.

### Parameters

#### **start *ip-address***

Specifies the start of the source IP address range.

**Values** ipv4-address: a.b.c.d  
ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x [0..FFFF]H  
d [0..255]D

#### **end *ip-address***

Specifies the end of the source IP address range.

**Values** ipv4-address: a.b.c.d  
ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x [0..FFFF]H  
d [0..255]D

## 23.305 source-bmac

## source-bmac

### Syntax

**source-bmac** *ieee-address*

**no source-bmac**

### Context

[\[Tree\]](#) (config>service>pbb source-bmac)

### Full Context

configure service pbb source-bmac

### Description

This command configures the source B-VPLS MAC address to use with PBB and provisions a chassis level source B-MAC.

### Parameters

*ieee-address*

The MAC address assigned to the B-MAC. The value should be input in either a `xx:xx:xx:xx:xx:xx` or `xx-xx-xx-xx-xx-xx` format.

### Platforms

All

## source-bmac

### Syntax

**source-bmac** *ieee-address*

### Context

[\[Tree\]](#) (config>service>vpls>pbb source-bmac)

### Full Context

configure service vpls pbb source-bmac

### Description

This command configures the base source B-MAC for the B-VPLS. The first 32 bits must be the same with what is configured in the MC-LAG peer. If not configured here, it will inherit the chassis level B-MAC configured under the new PBB object added in the previous section. If the **use-sap-bmac** command is on, the value of the last 16 bits (lsb) of the source B-MAC must be part of the **reserved-source-bmac-lsb** configured at chassis level, under service PBB component. If that is not the case, the command will fail.

## Platforms

All

## 23.306 source-bmac-lsb

### source-bmac-lsb

#### Syntax

**source-bmac-lsb** *MAC-Lsb* [**es-bmac-table-size** *size*]

**no source-bmac-lsb**

#### Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg source-bmac-lsb)

#### Full Context

configure service system bgp-evpn ethernet-segment source-bmac-lsb

#### Description

This command configures the least significant two bytes of the B-MAC used as the source B-MAC for packets generated from the Ethernet-Segment in PBB-EVPN.

When the multi-homing mode is **all-active**, this value and the first high order four bytes must match on all the PEs that are part of the same Ethernet-Segment.

The **es-bmac-table-size** parameter modifies the default value (8) for the maximum number of virtual bmacs that can be associated to the Ethernet-Segment, that is, the es-bmacs. When the **source-bmac-lsb** is configured, the associated **es-bmac-table-size** is reserved out of the total FDB. The es-bmac will consume a separate B-MAC per B-VPLS that is linked to an Ethernet-Segment.

#### Parameters

##### *MAC-Lsb*

Specifies the two least significant bytes of the es-bmac.

**Values** 1 to 65535, or xx-xx or xx:xx

##### *size*

Specifies the reserved space in the FDB for a specified es-bmac. By default the system reserves 8 entries for a specified Ethernet-Segment B-MAC.

**Values** 1 to 511999

**Default** 8

## Platforms

All

## source-bmac-lsb

### Syntax

**source-bmac-lsb** *mac-lsb* **control-pw-vc-id** *vc-id*  
**no source-bmac-lsb**

### Context

[\[Tree\]](#) (config>service>sdp source-bmac-lsb)

### Full Context

configure service sdp source-bmac-lsb

### Description

This command defines the 16 least significant bits (lsb) which, when combined with the 32 most significant bits of the PBB **source-bmac**, are used as the virtual backbone MAC associated with this SDP. The virtual backbone MAC is used as the source backbone MAC for traffic received on a PBB EPIPE spoke-SDP with **use-sdp-bmac** configured (that is, a redundant pseudowire) and forwarded into the B-VPLS domain.

The control-pw-vc-id defines VC identifier of the spoke-SDP relating to the control pseudowire whose status is to be used to determine whether SPBM advertises this virtual backbone MAC. This is a mandatory parameter when the **source-bmac-lsb** is added or changed. The spoke SDP must have the parameter **use-sdp-bmac** for the control pseudowire to be active.

### Default

no source-bmac-lsb

### Parameters

#### **mac-lsb**

Specifies the 16 least significant bits of the virtual backbone MAC associated with this SDP.

**Values** 1 to 65535 or xx-xx or xx:xx

#### **control-pw-vc-id** *vc-id*

Specifies the VC identifier of the control pseudowire.

**Values** 1 to 4294967295

### Platforms

## 23.307 source-class

## source-class

### Syntax

**source-class** *source-index*

**no source-class** [*source-index*]

### Context

**[Tree]** (config>service>vprn>static-route-entry>indirect source-class)

**[Tree]** (config>service>vprn>static-route-entry>ipsec-tunnel source-class)

**[Tree]** (config>service>vprn>static-route-entry>next-hop source-class)

### Full Context

configure service vprn static-route-entry indirect source-class

configure service vprn static-route-entry ipsec-tunnel source-class

configure service vprn static-route-entry next-hop source-class

### Description

This command configures the policy accounting source-class index to be used when incrementing accounting statistic for traffic matching the associated static route.

If source route policy accounting is enabled and a source-class index is configured, traffic with a source IP address matches the associated static route, the source accounting statistics for the specified class will be incremented.

The **no** form of this command removes the associated destination-class from the associated static route nexthop.

### Default

no source-class

### Parameters

***source-index***

Specifies an integer value for the accounting source class index.

**Values** 1 to 255

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## source-class

### Syntax

**source-class** *source-index*

**no source-class** [*source-index*]

## Context

[\[Tree\]](#) (config>router>static-route-entry>indirect source-class)

[\[Tree\]](#) (config>router>static-route-entry>next-hop source-class)

## Full Context

configure router static-route-entry indirect source-class

configure router static-route-entry next-hop source-class

## Description

This command configures the policy accounting source-class index to be used when incrementing accounting statistic for traffic matching the associated static route.

If source route policy accounting is enabled and a source-class index is configured, traffic with a source IP address matches the associated static route, the source accounting statistics for the specified class will be incremented.

The **no** form of this command removes the associated destination-class from the associated static route nexthop.

## Default

no source-class

## Parameters

### *source-index*

Specifies an integer value for the accounting source class index.

**Values** 1 to 255

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## source-class

## Syntax

**source-class** *index* [*index*]

**source-class** {*index* | **all**}

## Context

[\[Tree\]](#) (config>router>policy-acct-template source-class)

## Full Context

configure router policy-acct-template source-class

## Description

This command configures a source class index.

The **no** form of this command deletes the specified source class index.

## Parameters

### *index*

Specifies the index value.

**Values** 1 to 255

### **all**

Deletes all the source class indices.

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## source-class

## Syntax

**source-class** [*value*]

**no source-class**

## Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>default-action source-class)

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>action source-class)

## Full Context

configure router policy-options policy-statement default-action source-class

configure router policy-options policy-statement entry action source-class

## Description

This command specifies the policy accounting source class index to associate with matched routes.

## Parameters

### *value*

Specifies the default operational source-class for this policy statement.

**Values** 1 to 255

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 23.308 source-destination-prefix

### source-destination-prefix

#### Syntax

[no] source-destination-prefix

#### Context

[\[Tree\]](#) (config>cflowd>collector>aggregation source-destination-prefix)

#### Full Context

configure cflowd collector aggregation source-destination-prefix

#### Description

This command configures cflowd aggregation based on source and destination prefixes.

The **no** form of this command removes this type of aggregation from the collector configuration.

#### Platforms

All

## 23.309 source-ip

### source-ip

#### Syntax

source-ip *ip-address*

no source-ip

#### Context

[\[Tree\]](#) (config>subscr-mgmt>shcv-policy>vpls source-ip)

#### Full Context

configure subscriber-mgmt shcv-policy vpls source-ip

#### Description

This command configures the IPv4 address to be used as source address for connectivity verification in a VPLS service.

The **no** form of this command reverts to the default.

## Parameters

### *ip-address*

Specifies the IPv4 address to be used as source address for connectivity verification in a VPLS service.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## source-ip

## Syntax

**source-ip** *ipv6-address*

**no source-ip**

## Context

**[Tree]** (config>service>ies>sub-if>wlan-gw>pool-manager>dhcp6-client source-ip)

**[Tree]** (config>service>vprn>sub-if>wlan-gw>pool-manager>dhcp6-client source-ip)

## Full Context

configure service ies subscriber-interface wlan-gw pool-manager dhcpv6-client source-ip

configure service vprn subscriber-interface wlan-gw pool-manager dhcpv6-client source-ip

## Description

This command specifies the source-ip to be used by the DHCPv6 client.

The **no** form of this command removes the specific source-ip. In this case the DHCPv6 client will fall back to the IP address configured on the outgoing interface.

## Parameters

### *ipv6-address*

Specifies the IPv6 address, up to 32 characters.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.310 source-ip-address

## source-ip-address

## Syntax

**Description**

Commands in this context configure IP addresses used by the ISA MDA's as source address in GTP messages

## 23.312 source-ip-origin

### source-ip-origin

**Syntax**

**source-ip-origin** {**interface** | **vrrp**}

**no source-ip-origin**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>shcv-policy>layer-3 source-ip-origin)

**Full Context**

configure subscriber-mgmt shcv-policy layer-3 source-ip-origin

**Description**

This command selects the source IP address to be used for SHCV messages.

The **no** form of this command reverts to the default.

**Parameters****interface**

Specifies to use the interface IP as the source address of SHCV.

**vrrp**

Specifies to use the VRRP configured IP as the source address of SHCV.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.313 source-mac

### source-mac

#### Syntax

**source-mac** *ieee-address*  
**no source-mac**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>shcv-policy>vpls source-mac)

#### Full Context

configure subscriber-mgmt shcv-policy vpls source-mac

#### Description

Specifies the MAC address to be used as source address for connectivity verification in a VPLS service. The **no** form of this command reverts to the default.

#### Parameters

*ieee-address*

Specifies the 48-bit MAC address in the xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx format.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.314 source-override

### source-override

#### Syntax

**source-override** *ip-address* [**create**]  
**no source-override** *ip-address*

#### Context

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>bundle>channel source-override)

#### Full Context

configure mcast-management multicast-info-policy bundle channel source-override

## Description

This command defines a multicast channel parameter override context for a specific multicast sender within the channel range. The specified sender's IP address must be the same IP type, IPv4 or IPv6, as defined in the **channel** command.

The **no** form of this command removes the specified sender override context from the channel range.

## Parameters

### *ip-address*

Specifies either an IPv4 or IPv6 address and must be the same IP type as the containing **channel** command range.

Values		
	ipv4-address	a.b.c.d
	ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d
		x - [0 to FFFF]H
		d - [0 to 255]D

### **create**

The **create** keyword is required if creating a new source override when the system is configured to require the explicit use of the keyword to prevent accidental object creation. Objects may be accidentally created when this protection is disabled and an object name is mistyped when attempting to edit the object. This keyword is not required when the protection is disabled. The keyword is ignored when the specified source override IP address already exists.

## Platforms

All

## 23.315 source-port

source-port

### Syntax

**source-port** *port-num*

**no source-port**

### Context

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>bundle>video source-port)

## Full Context

```
configure mcast-management multicast-info-policy bundle video source-port
```

## Description

This command configures the source port for upstream RET requests. The **source-port** *port-num* value is the only configuration parameter in the bundle "default" context.

The **no** form of the command removes the value from the configuration.

## Parameters

### *port-num*

Specifies the source port in the received RTP multicast stream.

**Values** 1024 to 65535

## Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## source-port

## Syntax

```
source-port port-id
```

```
no source-port
```

## Context

```
[Tree] (config>system>sync-if-timing>ref1 source-port)
```

```
[Tree] (config>system>sync-if-timing>ref2 source-port)
```

## Full Context

```
configure system sync-if-timing ref1 source-port
```

```
configure system sync-if-timing ref2 source-port
```

## Description

This command configures the source port for timing reference **ref1** or **ref2**. If the port is unavailable or the link is down, then the reference sources are re-evaluated according to the reference order configured in the **ref-order** command.

In addition to physical port on the 7750 SR, T1 or E1 channels on a channelized OC3/OC12/STM1/STM4 Circuit Emulation Service port can be specified if they are using adaptive timing.

There are restrictions on the source-port location for **ref1** and **ref2** based on platform. Refer to the description of the **ref1** command for details.

## Default

```
no source-port
```

## Parameters

### *port-id*

Identifies the physical port in the *slot/mda/port*, **esat-id/slot/port**, or **pxc-id.sub-port** format.

**Values** *slot/mda/port* [*.channel*]

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## source-port

## Syntax

**source-port** *port-id*

**no source-port**

## Context

[\[Tree\]](#) (conf>sys>sat>eth-sat>sync-if>ref1 source-port)

[\[Tree\]](#) (conf>sys>sat>eth-sat>sync-if>ref2 source-port)

## Full Context

configure system satellite eth-sat sync-if-timing ref1 source-port

configure system satellite eth-sat sync-if-timing ref2 source-port

## Description

This command configures the source port used for the input reference to the frequency clock. The port can be any port of the Ethernet satellite.

The **no** form of this command removes the configuration.

## Default

no source-port

## Parameters

### *port-id*

Specifies the physical port.

*port-id* *slot/mda/port*

eth-sat-id esat-<id>/<slot>/[u]<port>

esat keyword

id 1 to 20

u keyword for uplink port

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## source-port

### Syntax

**source-port** *port*

**source-port** **grpc**

**no source-port**

### Context

[\[Tree\]](#) (config>system>management-interface>remote-management source-port)

### Full Context

configure system management-interface remote-management source-port

### Description

This command configures the TCP port local to this device that NISH uses to send packets to this node.

If this command is also configured for a specific manager in the **config>system> management-interface>remote-management>manager** context, that configuration takes precedence.

The **no** form of this command causes the system to select the default gRPC port, 57400.

### Default

source-port grpc

### Parameters

*port*

Specifies the TCP source port.

**Values** 1 to 65535

**grpc**

Keyword that specifies the default gRPC protocol port as the source port.

## Platforms

All

## source-port

### Syntax

**source-port** *port*

**source-port** **grpc**

## no source-port

### Context

[\[Tree\]](#) (config>system>management-interface>remote-management>manager source-port)

### Full Context

configure system management-interface remote-management manager source-port

### Description

This command configures the TCP port local to this device that this NISH manager uses to send packets to this node.

This command takes precedence over the same command configured in the global context (**config>system>management-interface>remote-management**).

The **no** form of this command causes the source port to be inherited from the global context (**config>system>management-interface>remote-management**).

### Parameters

#### *port*

Specifies the TCP source port.

**Values** 1 to 65535

**Default** 57400

#### *grpc*

Keyword that specifies the default gRPC protocol port as the source port.

### Platforms

All

## 23.316 source-prefix

### source-prefix

### Syntax

[no] source-prefix

### Context

[\[Tree\]](#) (config>cflowd>collector>aggregation source-prefix)

### Full Context

configure cflowd collector aggregation source-prefix

## Description

This command configures cflowd aggregation based on source prefix information.

The **no** form of this command removes this type of aggregation from the collector configuration.

## Platforms

All

## source-prefix

## Syntax

**no source-prefix**

**source-prefix** *ipv6-address/prefix-length*

## Context

**[Tree]** (config>aaa>isa-radius-plcy>servers>ipv6 source-prefix)

## Full Context

configure aaa isa-radius-policy servers ipv6 source-prefix

## Description

This command configures an IPv6 prefix containing individual /128 addresses. These addresses are used as the source address for connections to IPv6 RADIUS servers.

The prefix must be large enough to accommodate all BB-ISAs or ESA VMs in the system.

The **no** form of this command removes the IPv6 prefix.

## Default

no source-prefix

## Parameters

### *ipv6-address/prefix-length*

Specifies an IPv6 address and prefix length for the address.

### Values

ipv6-prefix:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D
prefix-length:	0 to 128

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## source-prefix

### Syntax

**source-prefix** *ip-prefix/length* **nat-policy** *nat-policy-name*

**no source-prefix** *ip-prefix/length*

### Context

[\[Tree\]](#) (config>service>vprn>nat>inside source-prefix)

[\[Tree\]](#) (config>router>nat>inside source-prefix)

### Full Context

configure service vprn nat inside source-prefix

configure router nat inside source-prefix

### Description

This command configures the source prefix used to identify traffic for NAT processing. After the traffic is diverted to the ESA-VM or vISA, its source IP address is checked to determine if it belongs to the configured prefix. If it does, the traffic is processed by NAT, otherwise, it is dropped.

The **no** form of this command removes the source prefix used to identify traffic for NAT processing.

### Parameters

***nat-policy-name***

Specifies the NAT policy name, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.317 source-prefix-list

## source-prefix-list

### Syntax

**source-prefix-list** *prefix-list-name*

**no source-prefix-list**

## Context

[\[Tree\]](#) (config>router>nat>inside source-prefix-list)

[\[Tree\]](#) (config>service>vprn>nat>inside source-prefix-list)

## Full Context

configure router nat inside source-prefix-list

configure service vprn nat inside source-prefix-list

## Description

This command references the **nat-prefix-list** that contains source IP addresses on the inside (private side).

The source IP addresses on the inside must be known in advance in a **dnat-only** instance. This is required so the corresponding routes can be installed in the routing table and thus the downstream traffic is properly routed towards the MS-ISAs where the original translation was performed (and state is kept).

In the **dnat-only** case, it is mandatory that the inside (private side) and the outside (public side) are in separated VPRNs.

## Parameters

### *prefix-list-name*

Specifies the name, up to 32 characters in length, of the NAT prefix list that contains the source IP addresses (original IP addresses).

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.318 source-prefix-only

### source-prefix-only

## Syntax

[no] source-prefix-only

## Context

[\[Tree\]](#) (config>service>vprn>nat>inside>traffic-identification source-prefix-only)

[\[Tree\]](#) (config>router>nat>inside>traffic-identification source-prefix-only)

## Full Context

configure service vprn nat inside traffic-identification source-prefix-only

configure router nat inside traffic-identification source-prefix-only

## Description

This command enables the identification of traffic that is subject to NAT processing based on the source IP address in the packet.

Traffic is diverted to the ESA-VM or vISA for NAT processing using a configured destination prefix or a IPv4 filter. When this command is configured, after traffic arrives on the ESA-VM or vISA, the source IP address in the packet determines whether the traffic is processed by NAT or dropped. If the source IP address belongs to the configured source-prefix, traffic is processed by NAT. Otherwise, it is discarded.

Use the following commands to configure the source prefix:

```
configure service vprn nat inside source-prefix
```

```
configure router nat inside source-prefix
```

If traffic identification based on the source IP address is disabled, all traffic arriving to the ESA-VM or vISA is subject to NAT processing.

The **no** form of this command disables the identification of traffic that is subject to NAT processing.

## Default

no source-prefix-only

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.319 source-udp-port

### source-udp-port

#### Syntax

```
source-udp-port udp-port-number
```

```
no source-udp-port
```

#### Context

[\[Tree\]](#) (config>oam-pm>session>ip source-udp-port)

#### Full Context

```
configure oam-pm session ip source-udp-port
```

#### Description

This command should only be used when the source UDP port for the session-sender twamp-test packet must be specified.

The **no** form of this command means the session-sender automatically assigns the source UDP port from the available dynamic (private) UDP range.

## Parameters

### *udp-port-number*

Specifies the UDP source port.

**Values** 64374 to 64383

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.320 source-udp-port-pools

## Context

[\[Tree\]](#) (config>test-oam>twamp>twamp-light source-udp-port-pools)

## Full Context

configure test-oam twamp twamp-light source-udp-port-pools

## Description

Commands in this context configure the source UDP port pool allocation for TWAMP Light applications.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.321 source-vtep-security

### source-vtep-security

## Syntax

**[no] source-vtep-security**

## Context

[\[Tree\]](#) (config>service>vpls>vxlan source-vtep-security)

## Full Context

configure service vpls vxlan source-vtep-security

## Description

This command enables the outer IP Source Address lookup of incoming VXLAN packets, and discards those coming from untrusted VTEPs. The list of trusted VTEPs is shown in the **show service vxlan** command. Specifically, it shows the existing learned EVPN VTEPs (always trusted), and the statically configured VTEPs in any service (Epipe and VPLS).

The command is supported in VXLAN instances with static egress VTEPs or VXLAN instances with EVPN created VTEPs.

The **no** version of this command disables the outer IP source address lookup.

## Default

no source-vtep-security

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.322 sp-reverse-route

### sp-reverse-route

## Syntax

**sp-reverse-route** [**ignore-default-route**]

**no sp-reverse-route**

## Context

[\[Tree\]](#) (config>ipsec>tnl-temp sp-reverse-route)

## Full Context

configure ipsec tunnel-template sp-reverse-route

## Description

This command enables the system to automatically create a reverse route based on dynamic LAN-to-LAN tunnel's TSi in private service.

If **ignore-default-route** is specified, the system ignores any full range traffic selector when creating a reverse route. Otherwise, the system refuses to create a CHILD\_SA if any full range traffic selector is included in TSi.

The **no** form of this command disables sp-reverse-route.

**Default**

no sp-reverse-route

**Parameters****ignore-default-route**

Specifies to ignore any full range traffic selector in TSi.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.324 spb

## spb

### Syntax

**spb** [*isis-instance*] [**fid** *fid*] [**create**]

**no spb**

### Context

[\[Tree\]](#) (config>service>vpls>spoke-sdp spb)

[\[Tree\]](#) (config>service>vpls>sap spb)

[\[Tree\]](#) (config>service>vpls spb)

### Full Context

configure service vpls spoke-sdp spb

configure service vpls sap spb

configure service vpls spb

### Description

This command enables Shortest Path Bridging (SPB) on a B-VPLS instance. SPB uses IS-IS that supports multiple instances, therefore an instance must be specified. The declaration of SPB in this context is the control configuration for the SPB. This is an SPB management interface and it manages the configuration for IS-IS. Various parameters that define this SPB instance are configured under this SPB instance. Several of the parameters are shared with other B-VPLS service instances using SPB.

SPB enables an instance of IS-IS protocol with the **no shutdown** command. Alternatively, the IS-IS protocol instance under SPB is disabled with the **shutdown** command in the **config>service>vpls b-vpls>spb** context.

A Forwarding Identifier (FID) is optionally specified which is an abstraction of the BVID used for forwarding in SPB. When no FID is configured the control VPLS is advertised with FID value 1. When a FID value is specified, the control VPLS is advertised and associated with the FID value specified. The default algorithm for any FID declared or implicit is low-path-id. When a FID is specified, the ect-algorithm can be specified for the FID and changed only when there are no VPLS, SAPs or SDP bindings associated with the FID. The FID for a control instance cannot be changed after it is created. To change a FID the SPB component would have to be shutdown, deleted and re-created with a new FID.

#### Note:

SPB operates with disable-learning, disable aging and discard-unknown. The state of these commands is ignored when SPB is configured.

### Default

no spb

### Parameters

#### *isis-instance*

Specifies the instance ID for an SPB IS-IS instance.

**Values** 1024 to 2047 (4 available)

**Default** 1024

### **FID**

Specifies the FID value.

**Values** 1 to 4095

**Default** 1

### **Platforms**

### spbm-control-vpls

#### **Syntax**

**spbm-control-vpls** *service-id* **fid** *fid*

**no spbm-control-vpls**

#### **Context**

[\[Tree\]](#) (config>service>vpls>b-vpls spbm-control-vpls)

#### **Full Context**

configure service vpls b-vpls spbm-control-vpls

#### **Description**

This command associates a user B-VPLS with a particular control B-VPLS and a FID. The ECT algorithm and the behavior of unicast and multicast come from the association to the FID.

A Forwarding Identifier (FID) is specified which is an abstraction of the BVID used for forwarding in SPB. The ect-algorithm is associated with the FID and can be changed only when there are no VPLS, SAPs or SDP bindings associated with the FID. The FID must be independent from the FID assigned to other services.

#### **Parameters**

##### ***service-id***

The B-VPLS service identifier.

**Values** 1 to 2147483647 | *svc-name*: 64 characters max

##### ***fid***

The forwarding identifier.

**Values** 1 to 4095

## 23.326 spe-address

### spe-address

#### Syntax

**spe-address** *global-id:prefix*  
**no spe-address**

#### Context

**[Tree]** (config>service>pw-routing spe-address)

#### Full Context

configure service pw-routing spe-address

#### Description

This command configures a single S-PE Address for the node to be used for dynamic MS-PWs. This value is used for the pseudowire switching point TLV used in LDP signaling, and is the value used by pseudowire status signaling to indicate the PE that originates a pseudowire status message. Configuration of this parameter is mandatory to enable dynamic MS-PW support on a node.

If the S-PE Address is not configured, spoke-sdps that use dynamic MS-PWs and pw-routing local-prefixes cannot be configured on a T-PE. Furthermore, the node will send a label release for any label mappings received for FEC129 All type 2.

The S-PE Address cannot be changed unless the dynamic ms-pw configuration is removed. Furthermore, changing the S-PE Address will also result in all dynamic MS-PWs for which this node is an S-PE being released. It is recommended that the S-PE Address should be configured for the life of an MS-PW configuration after reboot of the router.

The **no** form of this command removes the configured S-PE Address.

#### Default

no spe-address

#### Parameters

##### *global-id*

Specifies a 4-octet value that is unique to the service provider. For example, the global ID can contain the 2-octet or 4-octet value of the provider's Autonomous System Number (ASN).

<b>Values</b>	<global-id:prefix>:	<global-id>:{<prefix>  <ipaddress>}
global-id		1 to 4294967295

prefix	1 to 4294967295
ipaddress	a.b.c.d

## Platforms

All

## 23.327 speed

### speed

#### Syntax

**speed** {10 | 100 | 1000 | 10000 | 25000 | 40000 | 50000 | 100000}

#### Context

[\[Tree\]](#) (config>port>ethernet speed)

#### Full Context

configure port ethernet speed

#### Description

For ports that support multiple speeds, this command configures the port speed to be used. This applies to the following:

- fast Ethernet when autonegotiate is disabled
- 10/100/1000 Ethernet when autonegotiate is disabled
- 10/1G ports supporting 10G SFP+ or 1G SFP
- 40/100G ports supporting QSFP28s on non-connector-based MDAs

If the port is configured to autonegotiate this parameter is ignored. Speed cannot be configured for ports that are part of a Link Aggregation Group (LAG).

#### Default

dependent on port type

#### Parameters

**10**

Sets the link to 10 Mb/s speed.

**100**

Sets the link to 100 Mb/s speed.

**1000**

	Sets the link to 1000 Mb/s speed.
<b>10000</b>	Sets the link to 10000 Mb/s speed.
<b>25000</b>	Sets the link to 25000 Mb/s speed.
<b>40000</b>	Sets the link to 40000 Mb/s speed.
<b>50000</b>	Sets the link to 50000 Mb/s speed.
<b>100000</b>	Sets the link to 100000 Mb/s speed.

## Platforms

All

## speed

## Syntax

**speed** {oc3 | oc12}

**no speed**

## Context

[\[Tree\]](#) (config>port>sonet-sdh speed)

## Full Context

configure port sonet-sdh speed

## Description

This command configures the speed of a SONET/SDH port as either OC3 or OC12. The framer for this MDA operates in groups of four. Changing the port speed for a port requires resetting the framer and causes a slight disruption on all four ports. The first framer controls ports 1,2,3,4, the second framer controls ports 5,6,7,8 and so on.

To change the port speed on a SONET/SDH port, the port must be administratively shut down and all channels must be removed. When the port speed is changed, the default channel configuration is recreated.

The **no** form of this command reverts back to default.

This command is supported on TDM satellite.

## Default

speed oc12

## Parameters

### oc3

Sets the speed of the port to OC-3.

### oc12

Sets the speed of the port to OC-12.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## speed

## Syntax

**speed** {56 | 64}

## Context

[\[Tree\]](#) (config>port>tdm>e1>channel-group speed)

[\[Tree\]](#) (config>port>tdm>ds1>channel-group speed)

## Full Context

configure port tdm e1 channel-group speed

configure port tdm ds1 channel-group speed

## Description

This command sets the speed of the DS-0 channels used in the associated channel-group.

## Default

speed 64

## Parameters

### 56

Specifies that 56k byte (7-bits per byte) encoding will be used for the associated DS-0 channels. This channel speed value is only supported on the m4-chds3-as and m12-chds3-as MDAs and on DS-1 channels (ESF and SF framing) and not on E-1 (G.704) channels.

### 64

Specifies that 64k byte (8-bits per byte) encoding will be used for the associated DS-0 channels.

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## speed

### Syntax

**speed** *speed*

### Context

[\[Tree\]](#) (bof speed)

### Full Context

bof speed

### Description

This command configures the speed for the CPM management Ethernet port when autonegotiation is disabled in the running configuration and the Boot Option File (BOF).

If the port is configured to autonegotiate, this parameter is ignored.

Available speed options are dependent on the specific CPM variant in the system.

### Default

speed 100

### Parameters

***speed***

Sets the link speed, in Mb/s.

**Values** 10, 100, 1000

## Full Context

debug router ospf spf

debug router ospf3 spf

## Description

This command enables debugging for OSPF SPF. Information regarding overall SPF start and stop times will be shown. To see detailed information regarding the SPF calculation of a given route, the route must be specified as an optional argument.

## Parameters

### *type*

Specifies the area to debug.

**Values**   intra-area, inter-area, external

### *dest-addr*

Specifies the destination IP address to debug.

## Platforms

All

## 23.329 spf-wait

### spf-wait

#### Syntax

**spf-wait** *spf-wait* [**spf-initial-wait** *spf-initial-wait*] [**spf-second-wait** *spf-second-wait*]

**no spf-wait**

#### Context

[\[Tree\]](#) (config>service>vpls>b-vpls>spb>timers spf-wait)

#### Full Context

configure service vpls b-vpls spb timers spf-wait

#### Description

This command defines the maximum interval between two consecutive SPF calculations in milliseconds. Timers that determine when to initiate the first, second and subsequent SPF calculations after a topology change occurs can be controlled with this command.

Subsequent SPF runs (if required) will occur at exponentially increasing intervals of the *spf-second-wait* interval. For example, if the *spf-second-wait* interval is 1000, then the next SPF will run after 2000 milliseconds, and then next SPF will run after 4000 milliseconds, etc., until it reaches the *spf-wait* value. The SPF interval will stay at *spf-wait* value until there are no more SPF runs scheduled in that interval. After a full interval without any SPF runs, the SPF interval will drop back to *spf-initial-wait*.

#### Default

no spf-wait

#### Parameters

##### *spf-wait*

Specifies the maximum interval in milliseconds between two consecutive SPF calculations.

**Values** 10 to 120000

**Default** 10000

##### *spf-initial-wait*

Specifies the initial SPF calculation delay in milliseconds after a topology change.

**Values** 10 to 100000

**Default** 1000

### ***spf-second-wait***

Specifies the hold time in milliseconds between the first and second SPF calculation.

**Values** 10 to 100000

**Default** 1000

## spf-wait

### Syntax

**spf-wait** *spf-wait* [**spf-initial-wait** *spf-initial-wait*] [**spf-second-wait** *spf-second-wait*]

**no spf-wait**

### Context

[\[Tree\]](#) (config>service>vpls>spb>timers spf-wait)

### Full Context

configure service vpls spb timers spf-wait

### Description

This command defines the maximum interval between two consecutive SPF calculations in milliseconds. Timers that determine when to initiate the first, second and subsequent SPF calculations after a topology change occurs can be controlled with this command.

Subsequent SPF runs (if required) will occur at exponentially increasing intervals of the *spf-second-wait* interval. For example, if the *spf-second-wait* interval is 1000, then the next SPF will run after 2000 milliseconds, and then next SPF will run after 4000 milliseconds, and so on, until it reaches the *spf-wait* value. The SPF interval will stay at *spf-wait* value until there are no more SPF runs scheduled in that interval. After a full interval without any SPF runs, the SPF interval will drop back to *spf-initial-wait*.

#### **Note:**

The IS-IS timer granularity is 100 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

### Default

spf-wait 10000 spf-initial-wait 1000 spf-second-wait 1000

### Parameters

#### ***spf-wait***

Specifies the maximum interval in milliseconds between two consecutive SPF calculations.

**Values** 10 to 120000

**Default** 10000

***initial-wait***

Specifies the initial SPF calculation delay in milliseconds after a topology change

**Values** 10 to 100000

**Default** 1000

## 23.330 spi

spi

### Syntax

**spi** *spi*

**no spi**

### Context

[\[Tree\]](#) (config>ipsec>static-sa spi)

### Full Context

configure ipsec static-sa spi

### Description

This command configures the SPI key value for an IPsec manual SA.

This command specifies the SPI (Security Parameter Index) used to lookup the instruction to verify and decrypt the incoming IPsec packets when the value of the **direction** command is **inbound**.

The SPI value specifies the SPI that will be used in the encoding of the outgoing packets when the value of the **direction** command is **outbound**. The remote node can use this SPI to lookup the instruction to verify and decrypt the packet.

If **no spi** is selected, then this static SA cannot be used.

The **no** form of this command reverts to the default value.

### Default

no spi

### Parameters

**spi**

Specifies the security parameter index for this SA.

**Values** 256 to 16383

## Platforms

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp>host>ident-strings spi-sharing-group-id)

#### Full Context

configure subscriber-mgmt local-user-db ipoe host identification-strings spi-sharing-group-id

configure subscriber-mgmt local-user-db ppp host identification-strings spi-sharing-group-id

#### Description

This command configures the SLA Profile Instance (SPI) sharing group identifier for an IPoE or PPPoE session. It overrides the default SPI sharing method (**def-instance-sharing**) configured in the SLA profile.

When an spi-sharing-group-id is configured, the IPoE or PPPoE session shares the SLA Profile Instance with other IPoE or PPPoE sessions from the same subscriber that: have the same SLA profile associated, are active on the same SAP, and have the same group identifier.

Configuring an **spi-sharing-group-id** *group-id* for an IPoE host, when the IPoE session is disabled on the group interface, results in a setup failure.

The **no** form of this command returns the SPI sharing group identifier to its default.

#### Parameters

**group-id**

Specifies the SPI group identifier.

**Values** 0 to 65535

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.333 spi-sharing-id

```
spi-sharing-id
```

**Syntax**

**[no] spi-sharing-id**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>include-radius-attribute spi-sharing-id)

**Full Context**

```
configure subscriber-mgmt radius-accounting-policy include-radius-attribute spi-sharing-id
```

**Description**

This command enables RADIUS accounting messages to include the Alc-SPI-Sharing-Id RADIUS attribute. Together with the SLA profile name, this attribute provides details on the applicable SPI or queuing instance for this accounting session.

The **no** form of this command reverts to the default.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.334 split-horizon

```
split-horizon
```

**Syntax**

**split-horizon**

**no split-horizon**

**Context**

[\[Tree\]](#) (config>service>vprn>bgp split-horizon)

[\[Tree\]](#) (config>service>vprn>bgp>group>neighbor split-horizon)

[\[Tree\]](#) (config>service>vprn>bgp>group split-horizon)

## Full Context

```
configure service vprn bgp split-horizon
configure service vprn bgp group neighbor split-horizon
configure service vprn bgp group split-horizon
```

## Description

This command enables the use of split-horizon. When applied globally, to a group, or a specific peer, split-horizon prevents routes from being reflected back to a peer that sends the best route. It applies to routes of all address families and to any type of sending peer; confed-EBGP, EBGP and IBGP.

The configuration default is **no split-horizon**, meaning that no effort is taken to prevent a best route from being reflected back to the sending peer.

### Caution:

Use of the **split-horizon** command may have a detrimental impact on peer and route scaling and therefore operators are encouraged to use it only when absolutely needed.

The **no** form of this command disables split horizon command which allows the lower level to inherit the setting from an upper level.

## Default

```
no split-horizon
```

## Platforms

All

## split-horizon

## Syntax

```
split-horizon {enable | disable}
no split-horizon
```

configure service vprn rip group neighbor split-horizon
configure service vprn rip group split-horizon
```

```
configure service vprn ripng group neighbor split-horizon
configure service vprn ripng group split-horizon
configure service vprn ripng split-horizon
configure service vprn rip split-horizon
```

## Description

This command enables the use of split-horizon. RIP uses split horizon with poison reverse to protect from such problems as "counting to infinity". Split horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity).

The **no** form of this command disables the **split-horizon** command, which allows the lower level to inherit the setting from an upper level.

## Default

split-horizon enable

## Parameters

### enable

Enables split horizon and poison reverse.

### disable

Enables split horizon without poison reverse. This allows the routes to be readvertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value. This configuration parameter can be set at three levels: global level (applies to all groups and neighbor interfaces), group level (applies to all neighbor interfaces in the group) or neighbor level (only applies to the specified neighbor interface). The most specific value is used. In particular, if no value is set (**no split-horizon**), the lower level inherits the setting from the less-specific level.

## Platforms

```
[Tree] (config>router>bgp split-horizon)
```

## Full Context

```
configure router bgp group split-horizon
```

```
configure router bgp group neighbor split-horizon
configure router bgp split-horizon
```

### Description

This command enables the use of split-horizon. Split-horizon prevents routes from being reflected back to a peer that sends the best route. It applies to routes of all address families and to any type of sending peer; confed-EBGP, EBGp and IBGP.

The configuration default is **no split-horizon**, meaning that no effort is taken to prevent a best route from being reflected back to the sending peer.

### Default

```
no split-horizon
```

```

### Description

This command enables the use of split-horizon.

RIP uses split-horizon with poison-reverse to protect from such problems as "counting to infinity". Split-horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity).

The **split-horizon disable** command enables split horizon without poison reverse. This allows the routes to be re-advertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.

This configuration parameter can be set at three levels: global level (applies to all groups and neighbor interfaces), group level (applies to all neighbor interfaces in the group) or neighbor level (only applies to the specified neighbor interface). The most specific value is used. In particular if no value is set (**no split-horizon**), the setting from the less specific level is inherited by the lower level.

The **no** form of the command disables split horizon command which allows the lower level to inherit the setting from an upper level.

### Default

enabled

### Parameters

#### enable

Specifies enable split horizon and poison reverse.

#### disable

Specifies disable split horizon allowing routes to be re-advertised on the same interface on which they were learned with the advertised metric incremented by the **metric-in** value.

### Platforms

All

## 23.335 split-horizon-group

### split-horizon-group

### Syntax

```
split-horizon-group [group-name] [residential-group] [create]
```

### Context

[\[Tree\]](#) (config>service>vpls split-horizon-group)

### Full Context

```
configure service vpls split-horizon-group
```

## Description

This command creates a new split horizon group for the VPLS instance. Traffic arriving on a SAP or spoke-SDP within this split horizon group will not be copied to other SAPs or spoke-SDPs in the same split horizon group.

A split horizon group must be created before SAPs and spoke-SDPs can be assigned to the group.

The split horizon group is defined within the context of a single VPLS. The same group-name can be re-used in different VPLS instances.

Up to 30 split horizon groups can be defined per VPLS instance. Half are supported in i-VPLS.

The **no** form of this command removes the group name from the configuration.

## Default

A split horizon group is by default not created as a residential-group.

## Parameters

### *group-name*

Specifies the name of the split horizon group to which the SDP belongs

### **residential-group**

Defines a split horizon group as a residential split horizon group (RSHG). Doing so entails that:

a) SAPs which are members of this Residential Split Horizon Group will have:

- Double-pass queuing at ingress as default setting (can be disabled)
- STP disabled (cannot be enabled)
- ARP reply agent enabled per default (can be disabled)
- MAC pinning enabled per default (can be disabled)
- Downstream broadcast packets are discarded thus also blocking the unknown, flooded traffic
- Downstream multicast packets are allowed when IGMP snooping is enabled

b) Spoke SDPs which are members of this Residential Split Horizon Group will have:

- Downstream multicast traffic supported
- Double-pass queuing is not applicable
- STP is disabled (can be enabled)
- ARP reply agent is not applicable (dhcp-lease-states are not supported on spoke-SDPs)
- MAC pinning enabled per default (can be disabled)

## Platforms

All

### Full Context

configure subscriber-mgmt msap-policy vpls-only-sap-parameters split-horizon-group

### Description

This command specifies the name of the split horizon group to which the MSAP belongs.

### Parameters

**group-name**

Specifies the split horizon group name up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## split-horizon-group

### Syntax

**split-horizon-group** *name*

**no split-horizon-group**

### Context

[\[Tree\]](#) (config>service>vpls>bgp-evpn>srv6 split-horizon-group)

[\[Tree\]](#) (config>service>vpls>bgp-evpn>mpls split-horizon-group)

### Full Context

configure service vpls bgp-evpn segment-routing-v6 split-horizon-group

configure service vpls bgp-evpn mpls split-horizon-group

### Description

This command allows the user to configure an explicit split-horizon-group for all BGP-EVPN MPLS or SRv6 destinations that can be shared by other SAPs and/or spoke SDPs. The use of explicit split-horizon-groups for EVPN-MPLS or SRv6 and spoke SDPs allows the integration of VPLS and EVPN-MPLS or SRv6 networks.

If the **split-horizon-group** command for **bgp-evpn>mpls/srv6** contexts is not used, the default split-horizon-group (that contains all the EVPN destinations) is still used, but it is not possible to refer to it on

SAPs/spoke SDPs. User-configured split-horizon-groups can be configured within the service context. The same group-name can be associated to SAPs, spoke SDPs, pw-templates, pw-template-bindings and EVPN-MPLS or SRv6 destinations. The configuration of **bgp-evpn>mpls/srv6> split-horizon-group** is only allowed if **bgp-evpn>mpls/srv6** is shutdown; no changes are allowed when **bgp-evpn>mpls/srv6** is **no shutdown**.

When the SAPs and/or spoke SDPs (manual or BGP-AD-discovered) are configured within the same **split-horizon-group** as the EVPN-MPLS or SRv6 endpoints, MAC addresses are still learned on them but they are not advertised in BGP-EVPN. If provider-tunnel is enabled in the bgp-evpn service, the SAPs and SDP bindings that share the same split-horizon-group of the EVPN-MPLS provider-tunnel are brought operationally down if the point-to-multipoint tunnel is operationally up.

## Default

no split-horizon-group

## Parameters

### *name*

Specifies the split-horizon-group name.

**no split-horizon-group**

## Context

[\[Tree\]](#) (config>service>pw-template split-horizon-group)

## Full Context

configure service pw-template split-horizon-group

## Description

This command creates a new split horizon group (SGH).

Comparing a "residential" SGH and a "regular" SHG is that a residential SHG:

- Has different defaults for the SAP or SDP that belong to this group (ARP reply agent enabled (SAP only), MAC pinning enabled). These can be disabled in the configuration.
- Does not allow enabling spanning tree (STP) on a SAP. It is allowed on an SDP.
- Does not allow for downstream broadcast (broadcast/unknown unicast) on a SAP. It is allowed on an SDP.
- On a SAP, downstream multicast is only allowed when IGMP is enabled (for which an MFIB state exists; only IP multicast); on a SDP, downstream mcast is allowed.

When the feature was initially introduced, residential SHGs were also using ingress shared queuing by default to increase SAP scaling.

A residential SAP (SAP that belongs to a RSHG) is used to scale the number of SAPs in a single VPLS instance. The limit depends on the hardware used and is higher for residential SAPs (where there is no need for egress multicast replication on residential SAPs) than for regular SAPs. Therefore, residential SAPs are useful in residential aggregation environments (for example, triple play networks) with a VLAN/subscriber model.

The **no** form of the command removes the group name from the configuration.

## Parameters

### *group-name*

Specifies the name of the split horizon group to which the SDP belongs.

### *residential-group*

Defines a split horizon group as a residential split horizon group (RSHG). Doing so entails that:

- SAPs which are members of this Residential Split Horizon Group will have:
  - Double-pass queuing at ingress as default setting (can be disabled)
  - STP disabled (cannot be enabled)
  - ARP reply agent enabled per default (can be disabled)
  - MAC pinning enabled per default (can be disabled)
  - Downstream Broadcast packets are discarded thus also blocking the unknown, flooded traffic
  - Downstream Multicast packets are allowed when IGMP snooping is enabled
- Spoke SDPs which are members of this Residential Split Horizon Group will have:
  - Downstream multicast traffic supported
  - Double-pass queuing is not applicable
  - STP is disabled (can be enabled)
  - ARP reply agent is not applicable on the 7750 SR and 7450 ESS (dhcp-lease-states are not supported on spoke SDPs)
  - MAC pinning enabled per default (can be disabled)

All

## 23.336 spoke-sdp

### spoke-sdp

#### Syntax

**spoke-sdp** *sdp-id[:vc-id]* [**vc-type** {**ether** | **vlan**}] [**split-horizon-group** *group-name*] [**create**]

**no spoke-sdp** *sdp-id[:vc-id]*

#### Context

[\[Tree\]](#) (config>service>vpls spoke-sdp)

#### Full Context

configure service vpls spoke-sdp

#### Description

This command binds a service to an existing Service Distribution Point (SDP). A spoke SDP is treated like the equivalent of a traditional bridge "port" where flooded traffic received on the spoke SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down.

The SDP must already be defined in the **config>service>sdp** context in order to associate an SDP with a VPLS service. If the **sdp sdp-id** is not already configured, an error message is generated. If the *sdp-id* does exist, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end devices can participate in the service.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. When removed, no packets are forwarded to the far-end router.

## Default

No *sdp-id* is bound to a service.

## Parameters

### *sdp-id*

Specifies the SDP identifier

**Values** 1 to 32767

### *vc-id*

Specifies the virtual circuit identifier

**Values** 1 to 4294967295

### *vc-type*

This command overrides the default VC type signaled for the spoke or mesh binding to the far end of the SDP. The VC type is a 15 bit-quantity containing a value which represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. Changing the binding's VC type causes the binding to signal the new VC type to the far end when signaling is enabled. VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

The VC type value for Ethernet is 0x0005.

The VC type value for an Ethernet VLAN is 0x0004.

**Values** ether, vlan

### *ether*

Defines the VC type as Ethernet. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke SDP binding. (hex 5)

### *vlan*

Defines the VC type as VLAN. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings.

The VLAN VC-type inserts one dot1q tag within each encapsulated Ethernet packet transmitted to the far end and strips one dotQ tag, if a tag is present, from traffic received on the pseudowire.

The system expects a symmetrical configuration with its peer, specifically it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, an asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions will not necessarily function for asymmetrical configurations as they would with a symmetrical configurations resulting in an unexpected operation.

#### **group-name**

Specifies the name of the split horizon group to which the SDP belongs

#### **endpoint**

Specifies the service endpoint to which this SDP bind is attached. The service ID of the SDP binding must match the service ID of the service endpoint.

#### **no endpoint**

Removes the association of a spoke SDP with an explicit endpoint name

#### **root-leaf-tag**

Specifies a tagging spoke SDP under an E-Tree VPLS. When a tag SDP binding is required, it is created with a root-leaf-tag flag. Only VLAN tag SDP bindings are supported. The VLAN type must be set to VC VLAN type. The root-leaf-tag parameter indicates this SDP binding is a tag SDP that will use a default VID tag of 1 for root and 2 for leaf. The SDP binding tags egress E-Tree traffic with root and leaf VIDs as appropriate. Root and leaf VIDs are only significant between peering VPLS but the values must be consistent on each end. On ingress a tag SDP binding removes the VID tag on the interface between VPLS in the same E-Tree service. The tag SDP receives root tagged traffic and marks the traffic with a root indication internally. This option is not available on BGP EVPN-enabled E-Tree services.

#### **leaf-ac**

Specifies an access (AC) spoke SDP binding under a E-Tree VPLS as a leaf access (AC) SDP. The default E-Tree SDP binding type is a root-ac if *leaf-ac* or *root-leaf-tag* is not specified at SDP creation. This option is only available when the VPLS is designated as an E-Tree VPLS. BGP EVPN-enabled E-Tree VPLS services support the **leaf-ac** option.

```

## Context

[\[Tree\]](#) (config>service>vpls spoke-sdp)

## Full Context

```
configure service vpls spoke-sdp
```

## Description

This command binds a service to an existing Service Distribution Point (SDP).

A spoke SDP is treated like the equivalent of a traditional bridge port where flooded traffic received on the spoke SDP is replicated on all other ports (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down.

The SDP must already be defined in the **config>service>sdp** context in order to associate an SDP with a VPLS service. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* does exist, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end 7450 ESS or 7750 SR devices can participate in the service.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.

## Parameters

### *sdp-id*

Specifies the SDP identifier.

**Values** 1 to 17407

### *vc-id*

Specifies the virtual circuit identifier.

**Values** 1 to 4294967295

### *vc-type*

This command overrides the default VC type signaled for the spoke or mesh binding to the far end of the SDP. The VC type is a 15 bit-quantity containing a value which represents

the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. A change of the binding's VC type causes the binding to signal the new VC type to the far end when signaling is enabled.

VC types are derived according to IETF *draft-martini-l2circuit-trans-mps*.

The VC type value for Ethernet is 0x0005.

The VC type value for an Ethernet VLAN is 0x0004.

**Values** ether, vlan

### **ether**

Defines the VC type as Ethernet. The **ethernet**, **vlan**, and **vpls** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke SDP binding (hex 5).

### **vlan**

Defines the VC type as VLAN. The **ethernet**, **vlan**, and **vpls** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. The VLAN VC-type requires at least one dot1Q tag within each encapsulated Ethernet packet transmitted to the far end.

### **group-name**

Specifies the name of the split horizon group to which the SDP belongs.

### **root-leaf-tag**

Specifies a SAP as a root leaf tag SDP. This option is only available when the VPLS is designated as an E-Tree VPLS.

### **leaf-tag-vid**

Specifies to replace the outer SDP ID for leaf traffic. The leaf tag VID is only significant between peering VPLS but the values must be consistent on each end.

### **leaf-ac**

Specifies a SDP as a leaf access (AC) SDP. The default E-Tree SAP type is root AC if **leaf-ac** (or **root-leaf-tag**) is not specified at SDP creation. This option is only available when the VPLS is designated as an E-Tree VPLS.

### **create**

Keyword used to create the spoke SDP. The create keyword requirement can be enabled or disabled in the **environment>create** context.

## **Platforms**

All

## spoke-sdp

### Syntax

**spoke-sdp** *sdp-id:vc-id* [**vc-type** { **ether** | **vlan**}] [**split-horizon-group** *group-name*] **endpoint** [**no-endpoint**] [**root-leaf-tag** | **leaf-ac**]

### Full Context

configure service vpls spoke-sdp

### Description

This command binds a service to an existing Service Distribution Point (SDP). A spoke-SDP is treated like the equivalent of a traditional bridge "port" where flooded traffic received on the spoke-SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service will be down.

The SDP must already be defined in the **config>service>sdp** context in order to associate an SDP with a VPLS service. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* does exist, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end devices can participate in the service.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. After it is removed, no packets are forwarded to the far-end router.

### Parameters

#### *sdp-id*

Specifies the SDP identifier

**Values** 1 to 17407

#### *vc-id*

Specifies the virtual circuit identifier

**Values** 1 to 4294967295

#### **vc-type**

This command overrides the default VC type signaled for the spoke or mesh binding to the far end of the SDP. The VC type is a 15 bit-quantity containing a value which represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. A change of the bindings VC type causes the binding to signal the new VC type to the far end when

signaling is enabled. VC types are derived according to IETF *draft-martini-l2circuit-trans-mps*.

The VC type value for Ethernet is 0x0005.

The VC type value for an Ethernet VLAN is 0x0004.

**Values** ether, vlan

### **ether**

Defines the VC type as Ethernet. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke-SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke-SDP binding. (hex 5)

### **vlan**

Defines the VC type as VLAN. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke-SDP bindings. The VLAN VC-type inserts one dot1q tag within each encapsulated Ethernet packet transmitted to the far end and strips one dotQ tag, if a tag is present, from traffic received on the pseudowire.

Note: The system expects a symmetrical configuration with its peer, specifically it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, an asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions will not necessarily function for asymmetrical configurations as they would with a symmetrical configurations resulting in an unexpected operation.

### **group-name**

Specifies the name of the split horizon group to which the SDP belongs.

### **endpoint**

Specifies the service endpoint to which this SDP bind is attached. The service ID of the SDP binding must match the service ID of the service endpoint.

### **no endpoint**

Removes the association of a spoke-SDP with an explicit endpoint name.

### **root-leaf-tag**

Specifies a tagging spoke-SDP under an E-Tree VPLS. When a tag SDP binding is required, it is created with a root-leaf-tag flag. Only VLAN tag SDP bindings are supported. The VLAN type must be set to VC VLAN type. The root-leaf-tag parameter indicates this SDP binding is a tag SDP that will use a default VID tag of 1 for root and 2 for leaf. The SDP binding tags egress E-Tree traffic with root and leaf VIDs as appropriate. Root and leaf VIDs are only significant between peering VPLS but the values must be consistent on each end. On ingress a tag SDP binding removes the VID tag on the interface between VPLS in the same E-Tree service. The tag SDP receives root tagged traffic and marks the traffic with a root indication internally. This option is not available on BGP EVPN-enabled E-Tree services.

### **leaf-ac**

Specifies an access (AC) spoke-SDP binding under a E-Tree VPLS as a leaf access (AC) SDP. The default E-Tree SDP binding type is a root-ac if *leaf-ac* or *root-leaf-tag* is not

specified at SDP creation. This option is only available when the VPLS is designated as an E-Tree VPLS. BGP EVPN-enabled E-Tree VPLS services support the **leaf-ac** option.

### **vlan**

Defines the VC type as VLAN. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke-SDP bindings. The VLAN VC-type inserts one dot1q tag within each encapsulated Ethernet packet transmitted to the far end and strips one dotQ tag, if a tag is present, from traffic received on the pseudowire.

Note: The system expects a symmetrical configuration with its peer, specifically it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, an asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions will not necessarily function for asymmetrical configurations as they would with a symmetrical configurations resulting in an unexpected operation.

### **group-name**

Specifies the name of the split horizon group to which the SDP belongs

### **endpoint**

Specifies the service endpoint to which this SDP bind is attached. The service ID of the SDP binding must match the service ID of the service endpoint.

### **no endpoint**

Removes the association of a spoke-SDP with an explicit endpoint name

### **root-leaf-tag**

Specifies a tagging spoke-SDP under an E-Tree VPLS. When a tag SDP binding is required, it is created with a root-leaf-tag flag. Only VLAN tag SDP bindings are supported. The VLAN type must be set to VC VLAN type. The root-leaf-tag parameter indicates this

SDP binding is a tag SDP that will use a default VID tag of 1 for root and 2 for leaf. The SDP binding tags egress E-Tree traffic with root and leaf VIDs as appropriate. Root and leaf VIDs are only significant between peering VPLS but the values must be consistent on each end. On ingress a tag SDP binding removes the VID tag on the interface between VPLS in the same E-Tree service. The tag SDP receives root tagged traffic and marks the traffic with a root indication internally. This option is not available on BGP EVPN-enabled E-Tree services.

### leaf-ac

Specifies an access (AC) spoke-SDP binding under a E-Tree VPLS as a leaf access (AC) SDP. The default E-Tree SDP binding type is a root-ac if *leaf-ac* or *root-leaf-tag* is not specified at SDP creation. This option is only available when the VPLS is designated as an E-Tree VPLS. BGP EVPN-enabled E-Tree VPLS services support the **leaf-ac** option.

## Platforms

## spoke-sdp

### Syntax

[no] **spoke-sdp** *sdp-id*

### Context

**[Tree]** (config>service>vprn spoke-sdp)

### Full Context

configure service vprn spoke-sdp

### Description

This command binds a service to an existing Service Distribution Point (SDP).

A spoke SDP is treated like the equivalent of a traditional bridge "port" where flooded traffic received on the spoke SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down.

The SDP must already be defined in the **config>service>sdp** context in order to associate an SDP with a VPRN service. If the **sdp** *sdp-id* is not already configured, an error message is generated. If the *sdp-id* does exist, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end 7750 SR devices can participate in the service.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.

## Parameters

### *sdp-id*

Specifies the SDP identifier. Allowed values are integers in the range of 1 and 17407 for existing SDPs.

### *vc-id*

Specifies the virtual circuit identifier.

**Values** 1 to 4294967295

## Platforms

## Description

This command binds a service to an existing Service Distribution Point (SDP).

A spoke SDP is treated like the equivalent of a traditional bridge "port" where flooded traffic received on the spoke SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service is down.

The SDP must already be defined in the **config>service>sdp** context in order to associate an SDP with an IES service. If the **sdp sdp-id** is not already configured, an error message is generated. If the *sdp-id* does exist, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end devices can participate in the service.

Class-based forwarding is not supported on a spoke SDP used for termination on an IES or VPRN services. All packets are forwarded over the default LSP.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router. The spoke SDP must be shut down first before it can be deleted from the configuration.

## Default

no spoke-sdp

## Parameters

### *sdp-id*

Specifies the SDP identifier. Allowed values are integers in the range of 1 and 17407 for existing SDPs.

### *vc-id*

Specifies the virtual circuit identifier.

**Values** 1 to 4294967295

### *vc-type*

Specifies the encapsulation and pseudowire type for the spoke SDP.

**Values** ether: specifies Ethernet pseudowire as the type of virtual circuit (VC) associated with the SDP binding  
ipipe: specifies Ipipe pseudowire as the type of virtual circuit (VC) associated with the SDP binding

**Default** ether

### **create**

Keyword used to create the spoke SDP. The create keyword requirement can be enabled or disabled in the **environment>create** context.

**no spoke-sdp** *sdp-id[:vc-id]*

### Context

**[Tree]** (config>service>epipe spoke-sdp)

### Full Context

configure service epipe spoke-sdp

### Description

This command binds a service to an existing Service Distribution Point (SDP). A spoke SDP is treated like the equivalent of a traditional bridge "port" where flooded traffic received on the spoke SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service will be down.

The SDP must already be defined in the **config>service>sdp** context in order to associate an SDP with an Epipe, VPLS, VPRN, VPRN service. If the **sdp sdp-id** is not already configured, an error message is generated. If the *sdp-id* does exist, a binding between that *sdp-id* and the service is created.

SDPs must be explicitly associated and bound to a service. If an SDP is not bound to a service, no far-end devices can participate in the service.

This command can also be used to associate a GRE tunnel carrying Ethernet payload with an Epipe and terminate it on a PW port referenced within the same Epipe service. The spoke SDP represents a L2oGRE tunnel with SDP delivery type set to **eth-gre-bridged**. With this configuration, the **vc-id** is unused since there is no multiplexing of Ethernet payload within the same tunnel. The **vc-id** value is included only to maintain the expected spoke SDP structure within an EPIPE service. For L2oGRE tunnels, the **vc-id** can be set to any arbitrary value within its configurable range.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.

### Default

No *sdp-id* is bound to a service.

### Parameters

#### **sdp-id**

The SDP identifier.

**Values** 1 to 17407

#### **vc-id**

The virtual circuit identifier. The VC-ID is not used with L2TPv3 SDPs or L2oGRE tunnels, however it must be configured.

**Values** 1 to 4294967295

### **vc-type**

This command overrides the default VC type signaled for the spoke or mesh binding to the far end of the SDP. The VC type is a 15 bit-quantity containing a value which represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. A change of the bindings VC type causes the binding to signal the new VC type to the far end when signaling is enabled.

VC types are derived according to IETF *draft-martini-l2circuit-trans-mps*.

The VC type value for Ethernet is 0x0005.

The VC type value for an Ethernet VLAN is 0x0004.

**Values** ethernet

### **ether**

Defines the VC type as Ethernet. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke SDP binding.

### **vlan**

Defines the VC type as VLAN. The top VLAN tag, if a VLAN tag is present, is stripped from traffic received on the pseudowire, and a VLAN tag is inserted when forwarding into the pseudowire. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings.

The VLAN VC-type requires at least one dot1q tag within each encapsulated Ethernet packet transmitted to the far end.

Note: The system expects a symmetrical configuration with its peer, specifically it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, an asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions will not necessarily function for asymmetrical configurations as they would with a symmetrical configurations resulting in an unexpected operation.

### **no-endpoint**

Removes the association of a spoke SDP with an explicit endpoint name.

### **endpoint-name**

Specifies the name of the service endpoint.

### **icb**

Specifies the spoke SDP as an inter-chassis backup SDP binding.

## Context

**[Tree]** (config>mirror>mirror-dest spoke-sdp)

**[Tree]** (config>mirror>mirror-dest>remote-source spoke-sdp)

## Full Context

```
configure mirror mirror-dest spoke-sdp
configure mirror mirror-dest remote-source spoke-sdp
```

## Description

This command binds an existing (mirror) service distribution path (SDP) to the mirror destination service ID.

Spoke SDPs are used to send and receive mirrored traffic between mirror source and destination routers in a remote mirroring solution. A spoke SDP configured in the remote-source context (**remote-src>spoke-sdp**) is used on the destination router. A spoke SDP configured in the mirror service context (**mirror-dest>spoke-sdp**) is used on the source router.

The destination node should be configured with **remote-src>spoke-sdp** entries when using L2TPv3, MPLS-TP or LDP IPv6 LSP SDPs in the remote mirroring solution. For all other types of SDPs, **remote-source>far-end** entries should be used.

Spoke SDPs are not applicable when routable LI encapsulation is employed (**mirror-dest>encap**).

A mirror destination service that is configured for a destination router must not be configured as for a source router.

The **no** form of this command removes the SDP binding from the mirror destination service.

## Default

An SDP ID is bound to a mirror destination service ID. If no SDP is bound to the service, the mirror destination will be local and cannot be sent to another router over the core network.

## Parameters

### **sdp-id:vc-id**

Specifies a locally unique SDP identification (ID) number. The SDP ID must exist. If the SDP ID does not exist, an error will occur and the command will not execute.

For mirror services, the *vc-id* defaults to the *service-id*. However, there are scenarios where the *vc-id* is being used by another service. In this case, the SDP binding cannot be created. So, to avoid this, the mirror service SDP bindings now accepts *vc-ids*.

**Values** 1 to 17407

### **no-endpoint**

Removes the association of a SAP or a SDP with an explicit endpoint name.

### **name**

Specifies the name of the endpoint associated with the SAP.

### **icb**

Indicates that the SDP is of type Inter-Chassis Backup (ICB). This is a special pseudowire used for MC-LAG and pseudowire redundancy application.

An explicitly named endpoint can have a maximum of one SAP and one ICB. Once a SAP is added to the endpoint, only one more object of type ICB SDP is allowed. The ICB SDP cannot be added to the endpoint if the SAP is not part of a MC-LAG instance. This means that all other SAP types cannot exist on the same endpoint as an ICB SDP since non

Ethernet SAP cannot be part of a MC-LAG instance. Conversely, a SAP which is not part of a MC-LAG instance cannot be added to an endpoint which already has an ICB SDP.

An explicitly named endpoint, which does not have a SAP object, can have a maximum of four SDPs, which can include any of the following: a single primary SDP, one or many secondary SDPs with precedence, and a single ICB SDP.

**Default** Null. The user should explicitly configure this option at create time. The user can remove the ICB type simply by retyping the SDP configuration without the **icb** keyword.

#### Context

[\[Tree\]](#) (config>service>epipe spoke-sdp-fec)

#### Full Context

configure service epipe spoke-sdp-fec

#### Description

This command binds a service to an existing Service Distribution Point (SDP), using a dynamic MS-PW.

A spoke SDP is treated like the equivalent of a traditional bridge "port" where flooded traffic received on the spoke SDP is replicated on all other "ports" (other spoke and mesh SDPs or SAPs) and not transmitted on the port it was received.

The SDP has an operational state which determines the operational state of the SDP within the service. For example, if the SDP is administratively or operationally down, the SDP for the service will be down.

When using dynamic MS-PWs, the particular SDP to bind-to is automatically selected based on the Target Attachment Individual Identifier (TAII) and the path to use, specified under spoke SDP FEC. The selected SDP will terminate on the first hop S-PE of the MS-PW. Therefore, an SDP must already be defined in the config>service>sdp context that reaches the first hop router of the MS-PW. The router will in order to associate an SDP with a service. If an SDP to that is not already configured, an error message is generated. If the sdp-id does exist, a binding between that sdp-id and the service is created.

It differs from the spoke-sdp command in that the spoke-sdp command creates a spoke SDP binding that uses a pseudowire with the PW ID FEC. However, the spoke-sdp-fec command enables pseudowires with other FEC types to be used. Only the Generalized ID FEC (FEC129) may be specified using this command.

The **no** form of this command removes the SDP binding from the service. The SDP configuration is not affected; only the binding of the SDP to a service. Once removed, no packets are forwarded to the far-end router.

**Parameters*****spoke-sdp-fec-id***

An unsigned integer value identifying the spoke SDP.

**Values** 1 to 4294967295

***fec-type***

An unsigned integer value for the type of the FEC used by the MS-PW.

**Values** 129 to 130

***aii-type***

An unsigned integer value for the Attachment Individual Identifier (All) type used to identify the MS-PW endpoints.

**Values** 1 to 2

***endpoint-name***

Specifies the name of the service endpoint.

***no endpoint***

Adds or removes a spoke SDP association.

***icb***

Configures the spoke SDP as an inter-chassis backup SDP binding.

## Description

This command configures a shortest path tree (SPT tree) switchover threshold for a group prefix.

## Parameters

### ***grp-ip-address***

Specifies the multicast group address.

### ***grp-ipv6-address***

Specifies the multicast group address.

### ***prefix-length***

Specifies the address prefix length.

Values		
	grp-ipv6-address	: x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x [0 to FFFF]H d [0 to 255]D
	prefix-length	[1 to 128]

### ***mask***

Defines the mask of the multicast-ip-address.

**Values** 4 to 32

### ***netmask***

The subnet mask in dotted decimal notation.

**Values** 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

### ***spt-threshold***

Specifies the configured threshold in kilobits per second (kb/s) for the group to which this (S,G) belongs. For a group G configured with a threshold, switchover to SPT for an (S,G) is attempted only if the (S,G)'s rate exceeds this configured threshold.

## Context

[Tree] (config>router>pim spt-switchover-threshold)

## Full Context

configure router pim spt-switchover-threshold

## Description

This command configures shortest path (SPT) tree switchover thresholds for group prefixes.

PIM-SM routers with directly connected routers receive multicast traffic initially on a shared tree rooted at the Rendezvous Point (RP). Once the traffic arrives on the shared tree and the source of the traffic is known, a switchover to the SPT tree rooted at the source is attempted.

For a group that falls in the range of a prefix configured in the table, the corresponding threshold value determines when the router should switch over from the shared tree to the source specific tree. The switchover is attempted only if the traffic rate on the shared tree for the group exceeds the configured threshold.

In the absence of any matching prefix in the table, the default behavior is to switchover when the first packet is seen. In the presence of multiple prefixes matching a given group, the most specific entry is used.

The **no** form of this command removes the parameters from the PIM configuration.

## Parameters

### *grp-ipv4-prefix*

Specifies the group IPv4 multicast address in dotted decimal notation.

**Values** a.b.c.d

### *ipv4-prefix-length*

Specifies the length of the IPv4 prefix.

**Values** 4 to 32

### *netmask*

Specifies the netmask associated with the IPv4 prefix, expressed in dotted decimal notation. Network bits must be 1, and host bits must be 0.

**Values** a.b.c.d

### *grp-ipv6-prefix*

Specifies the group IPv6 multicast address in hexadecimal notation.

**Values** xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx (eight 16-bit pieces)

x:x:x:x:d.d.d.d

xx — 0 to FF (hex)

### *ipv6-prefix-length*

Specifies the length of the IPv6 prefix.

**Values** 8 to 128

**spt-threshold**

Specifies the configured threshold in kilobits per second (kb/s) for a group prefix. A switchover is attempted only if the traffic rate on the shared tree for the group exceeds this configured threshold. When the **infinity** keyword is specified, no switchover will occur at any time, regardless of the traffic level is detected.

**Values** 1 to 4294967294, infinity

**Platforms**

All

## 23.339 squelch

```
squelch
```

**Syntax**

[no] squelch

**Context**

[\[Tree\]](#) (config>system>sync-if-timing>bits>output squelch)

**Full Context**

configure system sync-if-timing bits output squelch

**Description**

This command configures the behavior of the BITSout port when there is no valid reference selected. When enabled with no valid reference, no signal is sent out the port. When disabled with no valid reference, an AIS signal is presented along with the QL-DNU/TL-DUS SSM code if the signal format supports SSM.

**Default**

no squelch

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.340 squelch-ingress-ctag-levels

## squelch-ingress-ctag-levels

### Syntax

**squelch-ingress-ctag-levels** [*md-level* [*md-level*]]

**no squelch-ingress-ctag-levels**

### Context

**[Tree]** (config>service>vpls>mesh-sdp>eth-cfm squelch-ingress-ctag-levels)

**[Tree]** (config>service>vpls>sap>eth-cfm squelch-ingress-ctag-levels)

**[Tree]** (config>service>epipe>sap>eth-cfm squelch-ingress-ctag-levels)

**[Tree]** (config>service>epipe>spoke-sdp>eth-cfm squelch-ingress-ctag-levels)

**[Tree]** (config>service>vpls>spoke-sdp>eth-cfm squelch-ingress-ctag-levels)

### Full Context

configure service vpls mesh-sdp eth-cfm squelch-ingress-ctag-levels

configure service vpls sap eth-cfm squelch-ingress-ctag-levels

configure service epipe sap eth-cfm squelch-ingress-ctag-levels

configure service epipe spoke-sdp eth-cfm squelch-ingress-ctag-levels

configure service vpls spoke-sdp eth-cfm squelch-ingress-ctag-levels

### Description

This command defines the levels of the ETH-CFM packets that are silently discarded on ingress into the SAP or SDP binding from the wire that matches the service delineation of the SAP or SDP binding plus an additional VLAN, up to a maximum tag length of two tags. All ETH-CFM packets inbound to the SAP or SDP binding that match the configured levels are dropped without regard for any other ETH-CFM criteria. No statistical information or drop count is available for any ETH-CFM packet that is silently discarded by this option. The list of levels must be a complete contiguous list from 0 up to the highest level to be dropped. The command must be retyped in complete form to modify a previous configuration, if the operator does not want to delete it first. Entering the command without any valid level information removes the command from the configuration and disables the feature.

The **no** form of this command removes the silent discarding of previously matching ETH-CFM PDUs.

### Default

no squelch-ingress-ctag-levels

### Parameters

***md-level***

Identifies the level

**Values** 0 to 7

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

```

### Description

This command defines the levels of the ETH-CFM packets that are silently discarded on ingress into the SAP or SDP binding from the wire that matches the service delineation of the SAP or SDP binding. All ETH-CFM packets inbound to the SAP or SDP binding that match the configured levels are dropped without regard for any other ETH-CFM criteria. No statistical information or drop count is available for any ETH-CFM packet that is silently discarded by this option. The operator must configure a complete contiguous list of md-levels up to the highest level that are to be dropped. The command must be retyped in complete form to modify a previous configuration, if the operator does not want to delete it first. Entering the command with no associated md-level information is equivalent to the **no** version of the command.

The **no** form of this command removes the silent discarding of previously matching ETH-CFM PDUs.

### Default

```
no squelch-ingress-levels
```

### Parameters

#### *md-level*

Identifies the level

**Values** 0 to 7

#### Full Context

configure service vprn bgp-ipvpn mpls auto-bind-tunnel resolution-filter sr-isis

configure service vprn bgp-evpn mpls auto-bind-tunnel resolution-filter sr-isis

configure service epipe bgp-evpn mpls auto-bind-tunnel resolution-filter sr-isis

configure service vpls bgp-evpn mpls auto-bind-tunnel resolution-filter sr-isis

#### Description

This command selects the Segment Routing (SR) tunnel type programmed by an IS-IS instance in TTM.

When the **sr-isis** value (or **sr-ospf**) is enabled, an SR tunnel to the BGP next hop is selected in the TTM from the lowest-numbered IS-IS (OSPF) instance.

The **no** form of this command disables the SR-ISIS setting for the auto-bind tunnel.

#### Default

no sr-isis

#### Platforms

All

### sr-isis

#### Syntax

[no] sr-isis

#### Context

**[Tree]** (config>router>static-route-entry>indirect>tunnel-next-hop>resolution-filter sr-isis)

## Full Context

configure router static-route-entry indirect tunnel-next-hop resolution-filter sr-isis

## Description

This command enables the use of SR-ISIS sourced tunnel entries in the TTM to resolve the associated static route next hop.

## Default

no sr-isis

## Platforms

All

sr-isis

## Syntax

[no] sr-isis

## Context

[\[Tree\]](#) (config>service>sdp sr-isis)

## Full Context

configure service sdp sr-isis

## Description

This command configures an MPLS SDP of LSP type ISIS Segment Routing. The SDP of LSP type sr-isis can be used with the far-end option. The signaling protocol for the service labels for an SDP using an SR tunnel can be configured to static (off), T-LDP (tldp), or BGP (bgp).

## Platforms

All

sr-isis

## Syntax

[no] sr-isis

## Context

[\[Tree\]](#) (config>router>bgp>next-hop-resolution>shortcut-tunn>family>resolution-filter sr-isis)

[\[Tree\]](#) (config>router>bgp>next-hop-resolution>labeled-routes>transport-tunnel>family>resolution-filter sr-isis)

## Full Context

```
configure router bgp next-hop-resolution shortcut-tunnel family resolution-filter sr-isis
configure router bgp next-hop-resolution labeled-routes transport-tunnel family resolution-filter sr-isis
```

## Description

This command selects the Segment Routing (SR) tunnel type programmed by an IS-IS instance in TTM for next-hop resolution of BGP routes and labeled routes. This option allows BGP to use the segment-routing tunnel in the tunnel table submitted by the lowest preference IS-IS instance or, in case of a tie, the lowest numbered IS-IS instance.

## Platforms

All

## sr-isis

## Syntax

```
[no] sr-isis
```

## Context

[\[Tree\]](#) (config>oam-pm>session>ip>tunnel>mpls sr-isis)

## Full Context

```
configure oam-pm session ip tunnel mpls sr-isis
```

## Description

This command configures the specification of **sr-isis** specific tunnel information that is used to transport the test packets. Entering this context removes all other tunnel type options configured under the **configure oam-pm session ip tunnel mpls** context. Only a single **mpls** type can be configured for an OAM-PM session.

The **no** form of this command deletes the context and all configurations under it.

## Parameters

### *ipv4-address*

Specifies IPv4 address.

**Values** ipv4-address: a.b.c.d (host bits must be 0)

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## sr-isis

### Syntax

**sr-isis**

### Context

[\[Tree\]](#) (config>service>vprn>auto-bind-tunnel>res-filter sr-isis)

### Platforms

All

## 23.343 sr-label-index

## sr-label-index

### Syntax

**sr-label-index** {*value* | *param-name*} [**prefer-igp**]

**no sr-label-index**

### Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>default-action sr-label-index)

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>action sr-label-index)

### Full Context

configure router policy-options policy-statement default-action sr-label-index

configure router policy-options policy-statement entry action sr-label-index

### Description

This command associates a BGP segment-routing label index value with all /32 BGP labeled IPv4 routes matching the entry or policy **default-action**.

**Note:**

Avoid using this action in a policy entry that matches more than one /32 label-ipv4 route, otherwise SID conflicts are created.

The **sr-label-index** action only takes effect in BGP peer import policies (and only on received /32 label-ipv4 routes) and in route-table-import policies associated with the label-ipv4 RIB.

The **prefer-igp** applies only in a route-table-import policy. If **prefer-igp** is specified and BGP segment-routing uses **prefix-sid-range global**, then BGP tries, as a first priority, to use the IGP segment routing label index for the IGP route matched by the **route-table-import** policy. If the IGP route does not have an SID index, or **prefer-igp** is not configured or **prefix-sid-range** is not **global**, BGP tries to use the label index value specified by this command.

When this action occurs in a policy applied as a peer-import policy, it can add a prefix SID attribute to a received /32 label-ipv4 route that was not sent with this attribute, or it can replace the received prefix SID attribute with a new one.

If this command specifies an index value that causes a SID conflict with another BGP route, then all conflicting BGP routes are re-advertised with label values based on dynamic allocation rather than SID-based allocation.

If this command specifies an index value that causes a SID conflict with an IGP route, the BGP route is re-advertised with a label value based on dynamic allocation rather than an SID-based allocation.

The **no** form of this command causes matched BGP routes to be advertised without any new or changed prefix SID attributes.

**Default**

no sr-label-index

**Parameters****value**

Specifies the BGP segment routing label index to associate with the matched route or routes.

**Values** 0 to 52487

**param-name**

Specifies the **type** parameter variable name, up to 32 characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@".

**prefer-igp**

A keyword that is applicable only in **route-table-import** policies, to instruct BGP to borrow the SID index from the IGP route if it has an SID index and the **prefix-sid-range** is **global**.

**Platforms**

All

## 23.344 sr-labels

### sr-labels

#### Syntax

**sr-labels start** *start-value* **end** *end-value*

**no sr-labels**

#### Context

[\[Tree\]](#) (config>router>mpls-labels sr-labels)

#### Full Context

configure router mpls-labels sr-labels

#### Description

This command configures the range of the Segment Routing Global Block (SRGB). It is a label block which is used for assigning labels to segment routing prefix SIDs originated by this router. This range is carved from the system dynamic label range and is not instantiated by default.

This is a reserved label and once configured it cannot be used by other protocols such as RSVP, LDP, and BGP to assign a label dynamically.

#### Default

no sr-labels

#### Parameters

##### **start-value**

Specifies the start label value in the SRGB

**Values** 18432 to 524287 within dynamic label range | 1048575 (FP4 or FP5 only)

##### **end-value**

Specifies the end label value in the SRGB

**Values** 18432 to 524287 within dynamic label range | 1048575 (FP4 or FP5 only)

## sr-policy-import

## Syntax

**[no] sr-policy-import**

## Context

**[Tree]** (config>router>bgp sr-policy-import)

## Full Context

configure router bgp sr-policy-import

## Description

This command instructs BGP to import all statically-configured non-local segment routing policies from the segment routing DB into the BGP RIB so that they can be advertised, as originated routes, towards BGP peers supporting the **sr-policy-ipv4** address family.

The **no** form of this command instructs BGP to not import any statically defined segment routing policies into BGP.

## Default

no sr-policy-import

## Platforms

## Full Context

configure router policy-options policy-statement entry action sr-return-path-bfd-label

configure router policy-options policy-statement default-action sr-return-path-bfd-label

## Description

This command configures an additional MPLS label to add to the bottom of the label stack for the S-BFD packet and sets the S-BFD session to echo mode.

This command applies to the initiator of the S-BFD sessions. The label value can either be a binding SID for an SR policy or another MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through the MPLS return path. This value takes precedence over the return path label value in a maintenance policy (configured using the **configure router segment-routing maintenance-policy return-path-label** command) that is also applied as the policy-statement action. This command can only be configured if the **sr-maintenance-policy** command is also configured.

The **no** form of this command deletes the label value. If this command is not configured and there is no **return-path-label** command configuration in the maintenance policy that is also applied as an action,

S-BFD returns to asynchronous mode and no return path label is pushed by the initiator node. S-BFD packets for this LSP or path received by the reflector are routed through the IGP path.

### Default

no sr-return-path-bfd-label

### Parameters

#### *value*

Specifies the label value.

**Values** 32 to 1048512

#### *param-name*

Specifies the parameter name to use as the label value, which can be up to 32 characters and must start and end with an at sign (@).

configure service vpls bgp-evpn mpls auto-bind-tunnel resolution-filter sr-te

configure service epipe bgp-evpn mpls auto-bind-tunnel resolution-filter sr-te

### Description

This command selects the Segment Routing (SR) Traffic Engineered (SR-TE) LSP programmed in TTM.

The **sr-te** value instructs the system to search for the best metric SR-TE LSP to the address of the BGP next hop. The LSP metric is provided by MPLS in the tunnel table. In the case of multiple SR-TE LSPs with the same lowest metric, BGP selects the LSP with the lowest tunnel ID.

The **no** form of this command disables the SR-TE LSP setting for the auto-bind tunnel.

### Default

no sr-te

The **no** form of this command removes SR-TE PCE-initiated LSP support. All PCE-initiated SR-TE LSPs are deleted.

### Platforms

All

sr-te

### Syntax

sr-te *value*

no sr-te

### Context

[\[Tree\]](#) (config>router>mpls>tunnel-table-pref sr-te)

### Full Context

configure router mpls tunnel-table-pref sr-te

## Description

This command configures the tunnel table preference for an SR-TE LSP tunnel type away from its default value.

The tunnel table preference applies to the next-hop resolution of BGP routes of the following families: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPv6 in the tunnel table.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The tunnel preference in such an SDP is fixed and is controlled by the service manager. The configuration of the tunnel table preference parameter does not modify the behavior of such an SDP and the services that bind to it.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default value.

## Default

sr-te 8

## Parameters

### *value*

Specifies the tunnel table preference value for SR-TE LSP.

**Values** 1 to 255

**Default** 8

## Platforms

sr-te

## Syntax

[no] sr-te

## Context

[\[Tree\]](#) (config>router>static-route-entry>indirect>tunnel-next-hop>resolution-filter sr-te)

## Full Context

configure router static-route-entry indirect tunnel-next-hop resolution-filter sr-te

## Description

The sr-te value instructs the code to search for the set of lowest metric SR-TE LSPs to the address of the indirect next-hop. The LSP metric is provided by MPLS in the tunnel table. The static route treats a set of SR-TE LSPs with the same lowest metric as an ECMP set. The user has the option of configuring a list of SR-TE LSP names to be used exclusively instead of searching in the tunnel table. In that case, all LSPs

must have the same LSP metric in order for the static route to use them as an ECMP set. Otherwise, only the LSPs with the lowest common metric value are selected.

## Full Context

```
configure router ospf traffic-engineering-options sr-te
```

## Description

This command configures the advertisement of TE attributes of each link on a per-application basis. Two applications are supported in SR OS: RSVP-TE and SR-TE. Although the **legacy** mode of advertising TE attributes is supported, additional configurations are possible.

The **no** form of this command deletes the context.

## Default

no sr-te

## Parameters

### *legacy*

Advertises the TE attributes for MPLS-enabled SR links using TE Opaque LSAs.

#### **Note:**

Do not configure the **legacy** mode if the network has both RSVP-TE and SR-TE attributes and the links are not congruent.

### *application-specific-link-attributes*

Advertises TE information for MPLS-enabled SR links using the new Application Specific Link Attributes (ASLA) TLVs.

## Syntax

[no] **sr-te-lsp** *lsp-name*

## Context

[\[Tree\]](#) (config>service>sdp sr-te-lsp)

## Full Context

configure service sdp sr-te-lsp

## Description

This command configures an MPLS SDP of LSP type SR-TE.

The user can specify up to 16 SR-TE LSP names. The destination address of all LSPs must match that of the SDP far-end option. Service data packets are sprayed over the set of LSPs in the SDP using the same procedures as for tunnel selection in ECMP. Each SR-TE LSP can, however, have up to 32 next-hops at the ingress LER when the first segment is a node SID-based SR tunnel. Thus, the service data packet is forwarded over one of a maximum of 16x32 next-hops.

The **tunnel-far-end** option is not supported. In addition, the **mixed-lsp-mode** option does not support the **sr-te** tunnel type.

The signaling protocol for the service labels for an SDP using a SR-TE LSP can be configured to static (**off**), T-LDP (**tldp**), or BGP (**bgp**).

## 23.356 src-access-list

## src-access-list

### Syntax

**src-access-list** *list-name*

**no src-access-list** *list-name*

### Context

[\[Tree\]](#) (config>system>security>snmp src-access-list)

### Full Context

configure system security snmp src-access-list

### Description

This command configures a list of source IP addresses used to validate SNMPv1 and SNMPv2c requests after the list is associated with one or more SNMPv1 and SNMPv2c communities.

A source access list referenced by one or more **community** instances is used to verify the source IP addresses of an SNMP request using the community, regardless of the VPRN/VRF interface (or "Base" interface) on which the request arrived. For example, if an SNMP request arrives on an interface in VPRN "100" but the request is referencing a community, the source IP address in the packet is validated against the source address list configured for the community. This occurs regardless of whether the request is destined to a VPRN interface address and the VPRN has SNMP access enabled, or the request is destined to the base system address via GRT leaking. If the source IP address of the request message does not match the IP address of any of the **src-host** entries contained in the list, the request is discarded and logged as an SNMP authentication failure.

#### Caution:

Using source access list validation can impact the time it takes for an SR OS node to reply to an SNMP request. Nokia recommends keeping the lists short by including only the addresses that are needed, and to place SNMP managers that send the highest volume of requests, such as the NSP NFM-P, at the top of the list.

A maximum of 16 source access lists can be configured. Each source access lists can contain a maximum of 16 source hosts.

The **no** form of this command removes the named source access list. Users cannot remove a source access list that is referenced by one or more **community** instances.

### Parameters

*list-name*

Specifies the name or key of the source access list. This parameter must begin with a letter (a-z or A-Z).

configure qos sap-egress ip-criteria entry match src-ip

configure qos sap-ingress ip-criteria entry match src-ip

## **Description**

This command configures a source IPv4 address range to be used as an SAP QoS policy match criterion.

To match on the source IPv4 or IPv6 address, specify the address and its associated mask, e.g. 10.1.0.0/16. The conventional notation of 10.1.0.0 255.255.0.0 can also be used for IPv4.

The **no** form of this command removes the source IPv4 or IPv6 address match criterion.

## **Default**

no src-ip

## Parameters

### *ip-address*

Specifies the source IPv4 address specified in dotted decimal notation.

**Values** ip-address: a.b.c.d

### *mask*

Specifies the length in bits of the subnet mask.

**Values** 1 to 32

### *ipv4-address-mask*

Specifies the subnet mask in dotted decimal notation.

**Values** a.b.c.d (dotted quad equivalent of mask length)

### *prefix-list-name*

Specifies the IPv4 prefix list name, a string of up to 32 printable ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

## Platforms

## Full Context

configure qos sap-egress ipv6-criteria entry match src-ip

configure qos sap-ingress ipv6-criteria entry match src-ip

## Description

This command configures a source IPv6 address range to be used as an SAP QoS policy match criterion.

To match on the source IPv6 address, specify the address and its associated mask, for example, 2001:db8:1000::/64.

The **no** form of this command removes the source IPv6 address match criterion.

**Default**

no src-ip

**Parameters*****ipv6-address***

Specifies the IPv6 address for the IP match criterion in hexadecimal digits.

**Values** x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d d: [0 to FFFF]H d: [0 to 255]D

***prefix-length***

Specifies the IPv6 prefix length for the IPv6 address expressed as a decimal integer.

**Values** 1 to 128

***ipv6-address-mask***

Specifies the IPv6 address mask.

**Values** x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d  
x: [0 to FFFF]H  
d: [0 to 255]D

***ipv6-prefix-list-name***

Specifies the IPv6 prefix list name, a string of up to 32 printable ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

**Platforms**

All

**src-ip****Syntax**

**src-ip** {*ip-address/mask* | *ip-address ipv4-address-mask* | **ip-prefix-list** *ip-prefix-list-name*}

**src-ip** {*ipv6-address/mask* | *ipv6-address ipv6-address-mask* | **ipv6-prefix-list** *ipv6-prefix-list-name*}

**no src-ip**

configure qos network egress ipv6-criteria entry match src-ip
configure qos network ingress ipv6-criteria entry match src-ip
```

## Description

This command configures a source IPv4 or IPv6 address range to be used as a network QoS policy match criterion.

To match on the source IPv4 or IPv6 address, specify the address and its associated mask, for example, when specifying an IPv4 address, 10.1.0.0/16 or 10.1.0.0 255.255.0.0 can be used.

The **no** form of this command removes the source IPv4 or IPv6 address match criterion.

## Parameters

### *ip-address*

Specifies the source IPv4 address specified in dotted decimal notation.

**Values** ip-address: a.b.c.d

### *mask*

Specifies the length in bits of the subnet mask.

**Values** 1 to 32

### *ipv4-address-mask*

Specifies the subnet mask in dotted decimal notation.

**Values** a.b.c.d (dotted quad equivalent of mask length)

### *ip-prefix-list-name*

Specifies an IPv4 prefix list which contains IPv4 address prefixes to be matched.

**Values** A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

### *ipv6-address*

Specifies the IPv6 prefix for the IP match criterion in hex digits.

**Values**

```
ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)
 x:x:x:x:x:d.d.d.d
 x: [0 to FFFF]H
 d: [0 to 255]D
```

### *mask*

Specifies the length of the ipv6-address expressed as a decimal integer.

**Values** 1 to 128

***ipv6-address-mask***

Specifies the eight 16-bit hexadecimal pieces representing bit match criteria.

**Values** x:x:x:x:x:x (eight 16-bit pieces)

***ipv6-prefix-list-name***

Specifies an IPv6 prefix list which contains IPv6 address prefixes to be matched.

**Values** A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

**Platforms**

All

**src-ip**

**Syntax**

**IPv4:**

**src-ip** {*ip-address/mask* | *ip-address ipv4-address-mask* | **ip-prefix-list** *prefix-list-name*}

**IPv6:**

**src-ip** {*ipv6-address/prefix-length* | *ipv6-address ipv6-address-mask* | **ipv6-prefix-list** *prefix-list-name*}

**no src-ip**

**Context**

**[Tree]** (config>filter>ipv6-filter>entry>match src-ip)

**[Tree]** (config>filter>ipv6-exception>entry>match src-ip)

**[Tree]** (config>filter>ip-exception>entry>match src-ip)

**Full Context**

configure filter ipv6-filter entry match src-ip

configure filter ipv6-exception entry match src-ip

configure filter ip-exception entry match src-ip

**Description**

This command configures a source IPv4 or IPv6 address range to be used as an IP filter or IP exception match criterion.

To match on the source IPv4 or IPv6 address, specify the address and its associated mask, for example, 10.1.0.0/16 for IPv4. The conventional notation of 10.1.0.0 255.255.0.0 may also be used for IPv4.

The **no** form of the command removes the source IP address match criterion.

## Default

no src-ip

## Parameters

### *ip-address*

Specifies the destination IPv4 address specified in dotted decimal notation.

**Values** a.b.c.d

### *mask*

Specifies the length in bits of the subnet mask.

**Values** 1 to 32

### *ipv4-address-mask*

Specifies the subnet mask in dotted decimal notation.

**Values** a.b.c.d (dotted quad equivalent of mask length)

### *ip-prefix-list*/*ipv6-prefix-list* *prefix-list-name*

Specifies to use a list of IP prefixes referred to by *prefix-list-name*, which is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

### *ipv6-address*

Specifies an IPv6 prefix for the IP match criterion in hex digits.

**Values** x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x: [0..FFFF]H

d: [0..255]D

### *prefix-length*

Specifies whether a the IPv6 prefix length for the specified *ipv6-address* expressed as a decimal integer.

**Values** 1 to 128

### *ipv6-address-mask*

Specifies eight 16-bit hexadecimal pieces representing bit match criteria.

**Values** x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x: [0..FFFF]H

d: [0..255]D

## Platforms

All

- configure filter ipv6-filter entry match src-ip
- VSR
- configure filter ip-exception entry match src-ip
  - configure filter ipv6-exception entry match src-ip

## src-ip

### Syntax

**src-ip** *ip-prefix*[/*mask*] [*netmask*]

**src-ip ip-prefix-list** *ip-prefix-list-name*

**no src-ip**

### Context

[\[Tree\]](#) (config>system>security>mgmt-access-filter>ip-filter>entry src-ip)

### Full Context

configure system security management-access-filter ip-filter entry src-ip

### Description

This command configures a source IP address range or an IP prefix list to be used as a management access filter match criterion.

The **no** form of this command removes the source IP address match criterion.

### Default

no src-ip

### Parameters

#### *ip-prefix*

Specifies the IP prefix for the IP match criterion in dotted decimal notation.

#### *mask*

Specifies the subnet mask length expressed as a decimal integer.

**Values** 1 to 32 (mask length), 0.0.0.0 to 255.255.255.255 (dotted decimal)

#### *netmask*

Specifies the dotted quad equivalent of the mask length.

**Values** 0.0.0.0 to 255.255.255.255

#### *ip-prefix-list-name*

Specifies the IP prefix list used as a match criterion for the source IP address. It is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes .

## Platforms

All

## Context

[\[Tree\]](#) (config>system>security>mgmt-access-filter>ipv6-filter>entry src-ip)

## Full Context

configure system security management-access-filter ipv6-filter entry src-ip

## Description

This command configures a source IPv6 address range or an IPv6 prefix list to be used as a management access filter match criterion. This command only applies to the 7750 SR and 7950 XRS.

The **no** form of this command removes the source IPv6 address match criterion.

## Default

no src-ip

## Parameters

### *ipv6-address/prefix-length*

Specifies the IPv6 address for the IPv6 match criterion in dotted decimal notation. An IPv6 IP address is written as eight 4-digit (16-bit) hexadecimal numbers separated by colons. One string of zeros per address can be left out, so that 2001:db8::0:217A is the same as 2001:db8:0:0:0:0:0:217A.

Values	<i>ipv6-address</i>	
		x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:d.d.d.d
		x: [0..FFFF]H
		d: [0..255]D
	<i>prefix-length</i>	1 to 128

### *ipv6-prefix-list-name*

Specifies the IPv6 prefix list used a match criterion for the source IP address. It is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes .

## Platforms

All

## Context

[\[Tree\]](#) (cfg>sys>sec>cpm>ip-filter>entry>match src-ip)

## Full Context

configure system security cpm-filter ip-filter entry match src-ip

## Description

This command specifies the IP address to match the source IP address of the packet.

To match on the source IP address, specify the address and its associated mask, such as 10.1.0.0/16. The conventional notation of 10.1.0.0 255.255.0.0 may also be used.

The **no** form of this command removes the source IP address match criterion.

## Default

no src-ip

## Parameters

### *ipv6-address/prefix-length*

Specifies the IP address for the match criterion in dotted decimal notation. An IP address is written as eight 4-digit (16-bit) hexadecimal numbers separated by colons. One string of zeros per address can be left out, so that 2001:db8::0:217A is the same as 2001:db8:0:0:0:0:0:217A.

### Values

*ipv4-address*

a.b.c.d (host bits must be 0)

x:x:x:x:x:d.d.d.d[-interface]

x: [0..FFFF]H

d: [0..255]D

interface: 32 characters maximum, mandatory for link local addresses

*prefix-length*

1 to 128

### **ip-prefix-list**

Creates a list of IPv4 prefixes for match criteria in IPv4 ACL and CPM filter policies.

***ip-prefix-list-name***

Specifies a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**src-ip****Syntax**

**src-ip** [*ip-address/mask* | **ipv6-prefix-list** *ipv6-prefix-list-name*]

## 23.363 src-mac

```
src-mac
```

### Syntax

```
src-mac ieee-address
```

```
no src-mac
```

### Context

[\[Tree\]](#) (config>redundancy>mc>peer>mc>l3-ring>connectivity-verify src-mac)

### Full Context

```
configure redundancy multi-chassis peer multi-chassis l3-ring connectivity-verify src-mac
```

### Description

This command specifies the source MAC address used for the Ring-Node Connectivity Verification of this ring node.

If all zeros are specified, then the MAC address of the system management processor (CPM) is used.

The **no** form of this command reverts to the default.

### Parameters

#### *ieee-address*

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

```
src-mac
```

### Syntax

```
src-mac ieee-address
```

```
no src-mac
```

### Context

[\[Tree\]](#) (config>redundancy>mc>peer>mcr>node>cv src-mac)

### Full Context

```
configure redundancy multi-chassis peer mc-ring ring ring-node connectivity-verify src-mac
```

## Description

This command specifies the source MAC address used for the Ring-Node Connectivity Verification of this ring node.

A value of all zeros (000000000000 H (0:0:0:0:0:0)) specifies that the MAC address of the system management processor (CPM) is used.

## Default

no src-mac

## Parameters

### *ieee-address*

Specifies the source MAC address.

**Values** xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

## Platforms

All

## src-mac

## Syntax

**src-mac** *ieee-address* [*ieee-address-mask*]

**no src-mac**

## Context

[\[Tree\]](#) (config>li>li-filter>li-mac-filter>entry>match src-mac)

## Full Context

configure li li-filter li-mac-filter entry match src-mac

## Description

This command configures a source MAC address or range to be used as a MAC filter match criterion.

The **no** form of this command removes the source mac as the match criteria.

## Parameters

### *ieee-address*

Specifies the 48-bit IEEE mac address to be used as a match criterion.

**Values** HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit

### *ieee-address-mask*

Specifies a 48-bit mask. The following table describes the format styles to configure the 48-bit mask.

Table 122: Format Styles to Configure Mask

Format Style	Format Syntax	Example
Decimal	DDDDDDDDDDDDDDDD	281474959933440
Hexadecimal	0xHHHHHHHHHHHHH	0x0FFFFFF000000
Binary	0bBBBBBBB...B	0b11110000...B

To configure so that all packets with a source MAC OUI value of 00-03-FA are subject to a match condition then the entry should be specified as: 003FA000000 0xFFFFFFFF000000

**Default** 0xFFFFFFFFFFFFFF (exact match)

**Values** 0x0000000000000000 to 0xFFFFFFFFFFFFFF

## Platforms

All

## src-mac

## Syntax

**src-mac** *ieee-address* [*ieee-address-mask*]

**no src-mac**

## Context

[\[Tree\]](#) (config>qos>sap-ingress>mac-criteria>entry>match src-mac)

## Full Context

configure qos sap-ingress mac-criteria entry match src-mac

## Description

This command configures a source MAC address or range to be used as a service ingress QoS policy match criterion.

The **no** form of this command removes the source mac as the match criteria.

## Default

no src-mac

## Parameters

***ieee-address***

Enter the 48-bit IEEE MAC address to be used as a match criterion.

**Values** HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit

### ***ieee-address-mask***

This 48-bit mask can be configured using the following formats:

Table 123: Format Styles to Configure Mask

Format Style	Format Syntax	Example
Decimal	DDDDDDDDDDDDDDDD	281474959933440
Hexadecimal	0xHHHHHHHHHHHHHH	0x0FFFFFF000000
Binary	0bBBBBBBB...B	0b11110000...B

To configure all packets with a source MAC OUI value of 00-03-FA to be subject to a match condition, the entry should be specified as: 003FA000000 0xFFFFFFFF000000

**Values** 0x0000000000000000 to 0xFFFFFFFFFFFFFFF (hex)

**Default** 0xFFFFFFFFFFFFFFF (hex) (exact match)

configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ip-filter-entries
entry match src-port
```

## Description

This command configures the source port match condition.

The **no** form of this command reverts to the default.

## Parameters

**lt | gt | eq**

Specifies the operators.

**src-port-number**

Specifies the source port number as a decimal hex or binary.

**Values** 0 to 65535

**dst-port-number**

Specifies the destination port number as a decimal hex or binary.

**Values** 0 to 65535

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## src-port

## Syntax

```
src-port {eq | neq} port-num
```

```
src-port {eq | neq} port-list port-list-name
```

```
src-port {eq | neq} range start-port-num end-port-num
```

```
no src-port
```

## Context

**[Tree]** (config>app-assure>group>policy>aqp>entry>match src-port)

## Full Context

```
configure application-assurance group policy app-qos-policy entry match src-port
```

## Description

This command specifies a source IP port, source port list, or source range to use as match criteria.

The **no** form of this command removes the parameters from the configuration.

## Default

no src-port

## Parameters

### eq

Specifies that a successful match occurs when the flow matches the specified port.

### neq

Specifies that a successful match occurs when the flow does not match the specified port.

### port-num

Specifies the source port number.

**Values** 0 to 65535

### start-port-num end-port-num

Specifies the start or end source port number.

**Values** 0 to 65535

### port-list-name

Specifies a named port-list, up to 32 characters, containing a set of ports or ranges of ports.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## src-port

## Syntax

**src-port** {eq | gt | lt} *port-num*

**src-port port-list** *port-list-name*

**src-port range** *start-port-num end-port-num*

**no src-port**

## Context

[\[Tree\]](#) (config>app-assure>group>sess-fltr>entry>match src-port)

## Full Context

configure application-assurance group session-filter entry match src-port

## Description

This command specifies a source IP port, source port list, or source range to use as match criteria.

The **no** form of this command removes the parameters from the configuration.

**Default**

no src-port

**Parameters****eq**

Specifies that a successful match occurs when the flow matches the specified port.

**gt**

Specifies all port numbers greater than the port-number match.

**lt**

Specifies all port numbers less than the port-number match.

***port-num***

Specifies the source port number.

**Values** 0 to 65535

***start-port-num end-port-num***

Specifies the start or end source port number.

**Values** 0 to 65535

***port-list-name***

Specifies a named port-list, up to 32 characters, containing a set of ports or ranges of ports.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**src-port****Syntax**

**src-port** {**eq** | **neq**} *port-num*

**no src-port**

**Context**

[\[Tree\]](#) (debug>app-assure>group>traffic-capture>match src-port)

**Full Context**

debug application-assurance group traffic-capture match src-port

**Description**

This command configures debugging on a source port.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## src-port

### Syntax

```
src-port {lt | gt | eq} src-port-number
src-port range src-port-number src-port-number
no src-port
```

### Context

```
[Tree] (config>li>li-filter>li-ipv6-filter>entry>match src-port)
[Tree] (config>li>li-filter>li-ip-filter>entry>match src-port)
```

### Full Context

```
configure li li-filter li-ipv6-filter entry match src-port
configure li li-filter li-ip-filter entry match src-port
```

### Description

This command configures a source TCP or UDP port number or port range for an IP LI filter match criterion. Note that an entry containing Layer 4 match criteria will not match non-initial (second, third, and so on) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

The **no** form of this command removes the source port match criterion.

### Parameters

**lt**

Specifies all port numbers less than *src-port-number* match.

**gt**

Specifies all port numbers greater than *src-port-number* match.

**eq**

Specifies that *src-port-number* must be an exact match.

***src-port-number***

Specifies the source port number to be used as a match criteria expressed as a decimal integer.

```
Values [0..65535]D
 [0x0..0xFFFF]H
 [0b0..0b1111111111111111]B
```

configure qos sap-ingress ipv6-criteria entry match src-port

### Description

This command configures a source TCP or UDP port number or port range for a SAP QoS policy match criterion.

The **no** form of this command removes the source port match criterion.

### Default

no src-port

### Parameters

**{lt | gt | eq} src-port-number**

The TCP or UDP port numbers to match, specified as less than (**lt**), greater than (**gt**), or equal to (**eq**) to the source port value, specified as a decimal integer.

**Values** 1 to 65535 (decimal)

**range startend**

The range of TCP or UDP port values to match, specified as between the *start* and *end* source port values inclusive.

**Values** 1 to 65535 (decimal)

### Platforms

configure qos network egress ipv6-criteria entry match src-port

### Description

This command configures a source TCP or UDP port number, port range, or a port list for a network QoS policy match criterion.

The **no** form of this command removes the source port match criterion.

### Default

no src-port

### Parameters

#### lt

Keyword used to specify TCP or UDP port numbers to match that are less than the source port value.

#### gt

Keyword used to specify TCP or UDP port numbers to match that are greater than the source port value.

#### eq

Keyword used to specify TCP or UDP port numbers to match that are equal to the source port value.

#### *src-port-number*

The source port value, specified as a decimal integer.

**Values** 1 to 65535

***port-list-name***

Specifies a port list name, up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

***start***

Specifies the starting range of TCP or UDP source port values to match.

**Values** 1 to 65535

***end***

Specifies the end range of TCP or UDP source port values to match.

**Values** 1 to 65535

**Platforms**

All

## src-port

**Syntax**

**src-port** {*lt* | *gt* | *eq*} *src-port-number*

**src-port port-list** *port-list-name*

**src-port range** *src-port-number src-port-number*

**no src-port**

**Context**

**Full Context**

configure filter ip-exception entry match src-port

configure filter ip-filter entry match src-port

configure filter ipv6-filter entry match src-port

configure filter ipv6-exception entry match src-port

**Description**

This command configures a source TCP, UDP, or SCTP port number, port range, or port match list for an IP filter or IP exception match criterion. An entry containing Layer 4 non-zero match criteria will not match non-initial (2nd, 3rd, and so on) fragments of a fragmented packet since only the first fragment contains the Layer 4 information. Similarly an entry containing "**src-port eq 0**" match criterion, may match non-initial

fragments when the source port value is not present in a packet fragment and other match criteria are also met.

The **no** form of the command removes the source port match criterion.

## Default

no src-port

## Parameters

### lt | gt | eq

Specifies the operator to use relative to *src-port-number* for specifying the port number match criteria.

**lt** specifies that all port numbers less than *src-port-number* match.

**gt** specifies that all port numbers greater than *src-port-number* match.

**eq** specifies that *src-port-number* must be an exact match.

### *src-port-number*

Specifies the source port number to be used as a match criteria expressed as a decimal integer, and in hexadecimal or binary format. Below shows decimal integer only.

**Values** 0 to 65535

### *port-list-name*

Specifies to use a list of ports referred to by *port-list-name*, which is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

### *src-port-number src-port-number*

Specifies inclusive port range between two *src-port-number* values.

## Platforms

## src-udp-port

### Syntax

**src-udp-port** *port-number*

**no src-udp-port**

### Context

**[Tree]** (config>test-oam>link-meas>template>twl src-udp-port)

### Full Context

configure test-oam link-measurement measurement-template twamp-light src-udp-port

### Description

This command configures a source UDP port to be used by the link measurement tests linked to this template.

Unless required, Nokia suggests that the link measurement dynamically select an available source UDP port from the dynamic range. Before a UDP port in the configurable range can be configured as a source it must be owned by the application. Use the **config>test-oam>twamp>twamp-light> source-udp-port-pools>port>pool-type** command to map the port range to the application.

To use a source port in this range for link-measurement, the selected port number must have a **pool-type link-measurement** configured. The source UDP port must be owned by the application prior to the configuration under the application. A configured **source-udp-port** cannot be used when multiple tests are configured between the same source IP, destination IP and destination UDP port. A conflict may occur when non-unique addressing is used between two peers. A conflicting situation may occur when tests between peers are using IPv6 discovery and the link-local addresses on both nodes are the same. Other conflicts exist, such as, multiple tests between peers using the same source and destination IP system address instead of an interface address. When this condition exists, the operational state of the link-measurement test is operationally down with a failure condition `UdpPortUnavailable`.

The **no** form of the command removes the port number from the link measurement template.

### Default

no src-udp-port

### Parameters

***port-number***

Specifies the source UDP port number.

**Values** 64374 to 64383

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure router ospf segment-routing srlb

## Description

This command specifies the reserved label block to use for the Segment Routing Local Block (SRLB) for the specified IS-IS or OSPF instance. The named reserved label block must already have been configured under **config>router>mpls>mpls-labels**.

The **no** form of this command removes an SRLB.

## Parameters

### *reserved-label-block-name*

Specifies the name of the reserved label block, up to 64 characters.

## Platforms

All

## 23.373 srlg

srlg

## Syntax

[no] srlg

## Context

[\[Tree\]](#) (config>router>mpls>lsp>secondary srlg)

## Full Context

configure router mpls lsp secondary srlg

## Description

This command enables the use of the SRLG constraint in the computation of a secondary path for an LSP at the head-end LER. The command is configurable for both RSVP-TE and SR-TE LSPs.

When SRLG is enabled, CSPF includes the SRLG constraint in the computation of the secondary LSP path if **path-computation-method local-cspf** is configured on the LSP. CSPF returns the list of SRLG groups along with the ERO during primary path CSPF computation. At a subsequent establishment of a secondary path with the SRLG constraint, the MPLS task again queries CSPF by providing the list of

SRLG group numbers to be avoided. CSPF prunes all links with interfaces that belong to the same SRLGs as the interfaces included in the ERO of the primary path. If CSPF finds a path, the secondary path is set up. If a path is not found, MPLS keeps retrying the requests to CSPF.

An SRLG enabled secondary or standby path of the LSP configured with a value of the **path-computation-method** command other than **local-cspf** remains operationally down with a failure code of `srlgPrimaryCspfDisabled(25)`.

When an LSP is administratively enabled, the SRLG-enabled secondary path is not tried if the first attempt to bring up the primary path is in progress. The SRLG enabled secondary path is kept down temporarily with failure code `srlgPrimaryPathDown(26)`. After this first attempt, MPLS begins setting up the SRLG-enabled standby paths. If primary path computation fails or primary path was not configured, MPLS requests CSPF to compute the secondary path using an empty primary SRLG list. The SRLG *disjoint* state field shows *True* in this scenario.

If the primary path is re-optimized, has undergone MBB, or has come back up after being down, the MPLS task check determines if any SRLG secondary paths should be re-signaled. If MPLS finds that a secondary path is no longer SRLG disjointed, and therefore becomes ineligible, MPLS puts it on a delayed MBB immediately after the expiry of the retry timer. If MBB fails at the first try, the secondary path is torn down and the path is put on retry if not active. If the secondary path is active, then it is only torn down and resignaled when the primary path is activated. The secondary path can remain active even when ineligible while the revert timer to activate the primary path is still running.

If the primary goes down while active, the LSP uses the path of an eligible SRLG secondary path if it is up. If all secondary eligible SRLG paths are down, MPLS uses a non-SRLG secondary path, if configured and up. While the LSP is using a non-SRLG secondary path, if an eligible SRLG secondary path comes back up, MPLS switches the path of the LSP to the eligible SRLG secondary path. As soon as a path for the primary is successfully computed by CSPF, MPLS schedules the delay retry MBB for the secondary path using the new SRLG list.

If the primary path goes down while inactive, for example it is waiting for the revert timer to expire, MPLS resets the SRLG list of the primary to empty and changes the state of all secondary paths, including the currently active one, to the Disjointed state. A delay retry MBB is still performed but results in no change to the active secondary path.

A secondary path that becomes ineligible as a result of an update to the SRLG membership list of the primary path has the ineligibility status removed on any of the following events:

- a successful delay retry MBB of the secondary SRLG path that makes it eligible again
- the secondary path goes down. MPLS puts the standby on retry at the expiry of the retry timer. If successful, it becomes eligible. If not successful after the retry-timer expires or the number of retries reached the number configured under the **retry-limit** parameter, it is left down.

Once the primary path of the LSP is set up and is operationally up, any subsequent changes to the SRLG group membership of an interface that the primary path is using is not considered until the next opportunity the primary path is re-signaled. The primary path may be re-signaled due to a failure or to a make-before-break operation. Make-before-break occurs as a result of a global revertive operation, a timer based or manual re-optimization of the LSP path, or an operator change to any of the path constraints.

Once an SRLG secondary path is set up and is operationally up, any subsequent changes to the SRLG group membership of an interface the secondary path is using is not considered until the next opportunity when the secondary path is re-signaled. The secondary path is re-signaled due to a failure, to a re-signaling of the primary path, or to a make before break operation. Make-before-break occurs as a result of a timer based or manual re-optimization of the secondary path, or an operator change to any of the path constraints of the secondary path, except for enabling or disabling the **srlg** command itself. Enabling or

disabling the **srlg** command on an active secondary or on an active or inactive secondary standby path causes the path to be torn down and re-signaled.

In addition, the user-configured **include** or **exclude** admin group statements for a secondary path are also checked together with the SRLG constraints by CSPF.

The following behavior of the feature is specific to the SR-TE LSP.

- An SRLG-enabled SR-TE LSP secondary path with SID label hops remains operational with failure code `srlgPathWithSidHops(59)`.
- An SR-TE LSP uses IGP advertised link SRLG information in the TE database. It does not support the use of SRLG information in the static user SRLG database (**configure router mpls srlg-database**).
- Delay Retry MBB for making a non-disjointed path a disjointed one is not supported with an SR-TE LSP. Instead, the system performs a break-before-make (that is, teardown and retry) operation. If a non-disjointed path is the active path of the LSP, that path is torn down and retried after the router switches to another path (for example, after **revert-timer** expires). If the non-disjointed path is not an active path, it is torn down and retried immediately.

The **no** form of this command reverts to the default value.

### srlg-database

#### Syntax

[no] srlg-database

#### Context

[\[Tree\]](#) (config>router>mpls srlg-database)

#### Full Context

configure router mpls srlg-database

#### Description

Commands in this context configure the link members of SRLG groups for the entire network at any node that needs to signal LSP paths (for example, a head-end node).

The **no** form of this command deletes the entire SRLG database. CSPF assumes all interfaces have no SRLG membership association if the database was not disabled with the command **configure>router>mpls>user-srlg-db disable**.

**Platforms**

All

**23.375 srlg-enable**`srlg-enable`**Syntax**`[no] srlg-enable`**Context**`[Tree] (config>router>route-next-hop-policy>template srlg-enable)`**Full Context**`configure router route-next-hop-policy template srlg-enable`**Description**

This command configures the SRLG constraint into the route next-hop policy template.

When this command is applied to a prefix, the LFA SPF will attempt to select an LFA next-hop, among the computed ones, which uses an outgoing interface that does not participate in any of the SLRGs of the outgoing interface used by the primary next-hop.

The SRLG criterion is applied before running the LFA next-hop selection algorithm.

The **no** form deletes the SRLG constraint from the route next-hop policy template.

**23.376 srlg-frr**`srlg-frr`**Syntax**`srlg-frr [strict]``no srlg-frr`

## Context

[\[Tree\]](#) (config>router>mpls srlg-frr)

## Full Context

```
configure router mpls srlg-frr
```

## Description

This command enables the use of the SRLG constraint in the computation of FRR bypass or detour to be associated with any primary LSP path on this system.

When this option is enabled, CSPF includes the SRLG constraint in the computation of a FRR detour or bypass for protecting the primary LSP path.

CSPF prunes all links with interfaces that belong to the same SRLG as the interface that is being protected, that is, the outgoing interface at the PLR the primary path is using. If one or more paths are found, the MPLS task will select one based on best cost and will signal the bypass/detour. If not found and the user has included the **strict** option, the bypass/detour is not setup and the MPLS task will keep retrying the request to CSPF. Otherwise, if a path exists that meets the other TE constraints, other than the SRLG one, the bypass/detour is setup.

A bypass or a detour LSP path is not intended to be SRLG disjoint from the entire primary path. Only the SRLGs of the outgoing interface at the PLR that the primary path is using are avoided.

When the MPLS task is searching for an SRLG bypass tunnel to associate with the primary path of the protected LSP, it will first check if any configured manual bypass LSP with CSPF enabled satisfies the SRLG constraints. The search skips any non-CSPF manual bypass LSP because there is no ERO returned to check the SRLG constraint. If no path is found, the task will check if an existing dynamic bypass LSP satisfies the SRLG and other primary path constraints. If not found, it will make a request to CSPF.

Once the primary path of the LSP is configured and is operationally up, subsequent changes to the SRLG group membership of an interface the primary path is using are not considered by the MPLS task at the PLR for bypass/detour association until the next opportunity the bypass LSP path or the primary path is resignaled. The path may be resignaled due to a failure or a Make-Before-Break (MBB) operation. MBB occurs as a result of a global revertive operation, a timer based or manual re-optimization of the bypass LSP or LSP primary path, or a user update of the primary path constraints.

Once the bypass or detour path is set up and is operationally up, subsequent changes to the SRLG group membership of an interface the bypass/detour path is using are not considered by the MPLS task at the PLR until the next opportunity when the association with the primary LSP path is rechecked. The association is rechecked if the bypass path is re-optimized using the timer or manual resignal MBB. Detour paths cannot be re-optimized separately from the primary path.

Enabling or disabling **srlg-frr** command only takes effect when the LSP primary path or the bypass path is resignaled. The user can either wait for the resignal timer to expire or cause the paths to be resignaled immediately by executing, at the ingress LER, the manual resignal command for the LSP primary path or for the bypass LSP path.

A MPLS interface can belong to a maximum of 64 SRLG groups. The SRLG groups are configured using the **config>router>if-attribute>srlg-group** command. The SRLG groups that an RSVP interface belong to are configured using the **srlg-group** command in the **config>router>mpls>interface** context.

The **no** form of this command reverts to the default value.

**Default**

no srlg-frr

**[Tree]** (config>service>vprn>if>if-attribute srlg-group)

**Full Context**

configure router interface if-attribute srlg-group

configure router mpls interface srlg-group

configure service ies interface if-attribute srlg-group

configure service vprn interface if-attribute srlg-group

**Description**

This command configures the SRLG membership of an interface. The user can apply SRLGs to an IES, VPRN, network IP, or MPLS interface.

An interface can belong to up to 64 SRLG groups. However, each single operation of the **srlg-group** command allows a maximum of five (5) groups to be specified at a time. Once an SRLG group is bound to one or more interface, its value cannot be changed until all bindings are removed.

The configured SRLG membership is applied in all levels/areas the interface is participating in. The same interface cannot have different memberships in different levels/areas.

Only the SRLGs bound to an MPLS interface are advertised area-wide in TE link TLVs and sub-TLVs when the **traffic-engineering** option is enabled in IS-IS or OSPF. IES and VPRN interfaces do not have their attributes advertised in TE TLVs.

The **no** form of this command deletes one or more of the SRLG memberships of an interface. The user can also delete all memberships of an interface by not specifying a group name.

## Parameters

### *group-name*

Specifies the name of the group, up to 32 characters. The association of group name and value should be unique within an IP/MPLS domain. Each single operation of the **srlg-group** command allows a maximum of 5 groups to be specified at a time.

## Platforms

All

## srlg-group

## Syntax

**srlg-group** *group-name* **value** *group-value* [**penalty-weight** *penalty-weight*]

**no srlg-group** *group-name*

## Context

[\[Tree\]](#) (config>router>if-attribute srlg-group)

## Full Context

configure router if-attribute srlg-group

## Description

This command defines a Shared Risk Link Group (SRLG) which can be associated with an IP or MPLS interface.

SRLG is used to tag IP or MPLS interfaces which share a specific fate with the same identifier. For example, an SRLG group identifier could represent all links which use separate fibers but are carried in the same fiber conduit. If the conduit is accidentally cut, all the fiber links are cut which means all interfaces using these fiber links will fail.

The user first configures locally on each router the name and identifier of each SRLG group. A maximum of 1024 SRLGs can be configured per system.

The user then configures the SRLG membership of an interface. The user can apply SRLGs to an IES, VPRN, network IP, or MPLS interface. A maximum of 64 SRLGs can be applied to a given interface.

When SRLGs are applied to MPLS interfaces, CSPF at a LER will exclude the SRLGs of interfaces used by the LSP primary path when computing the path of the secondary path. CSPF at a LER or LSR will also exclude the SRLGs of the outgoing interface of the primary LSP path in the computation of the path of the FRR backup LSP. This provides path disjointness between the primary path and the secondary path or FRR backup path of an LSP.

When SRLGs applied to IES, VPRN, or network IP interfaces, they are evaluated in the route next-hop selection by adding the **srlg-enable** option in a route next-hop policy template applied to an interface or a set of prefixes. For instance, the user can enable the SRLG constraint to select a LFA next-hop for a prefix which avoids all interfaces that share fate with the primary next-hop.

The following provisioning rules are applied to SRLG configuration. The system will reject the creation of a SRLG if it re-uses the same name but with a different group value than an existing group. The system will also reject the creation of an SRLG if it re-uses the same group value but with a different name than an existing group.

Only the SRLGs bound to an MPLS interface are advertised area-wide in TE link TLVs and sub-TLVs when the **traffic-engineering** option is enabled in IS-IS or OSPF. IES and VPRN interfaces do not have their attributes advertised in TE TLVs.

A user may specify a penalty weight (**penalty-weight**) associated with an SRLG. This controls the likelihood of paths with links sharing SRLG values with a primary path being used by a bypass or detour LSP. The higher the penalty weight, the less desirable it is to use the link with a given SRLG.

## Parameters

### **group-name**

Specifies the name of the group, up to 32 characters. The association of group name and value should be unique within an IP/MPLS domain.

### **group-value**

Specifies the integer value associated with the group. The association of group name and value should be unique within an IP/MPLS domain.

**Values** 0 to 4294967295

### **penalty-weight**

Specifies the integer value of the penalty weight that is assigned to the SRLG group

**Values** 0 to 65535

**Default** 0

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if srrp)

## Full Context

configure service ies subscriber-interface group-interface srrp

configure service vprn subscriber-interface group-interface srrp

## Description

This command creates a Subscriber Router Redundancy Protocol (SRRP) instance on a group IP interface. An SRRP instance manages all subscriber subnets within the group interfaces subscriber IP interface or other subscriber IP interfaces that are associated through a wholesale/retail relationship. Only one unique SRRP instance can be configured per group interface.

The **no** form of this command removes an SRRP instance from a group IP interface. Once removed, the group interface ignores ARP requests for the SRRP gateway IP addresses that may exist on subscriber subnets associated with the group IP interface. Then the group interface stops routing using the redundant IP interface associated with the group IP interface and will stop routing with the SRRP gateway MAC address. Ingress packets destined to the SRRP gateway MAC will also be silently discarded. This is the same behavior as a group IP interface that is disabled (shutdown).

The **no** form of this command removes the SRRP ID from the configuration.

## Default

no srrp

## Parameters

### *srrp-id*

Specifies a 32 bit instance ID that must be unique to the system. The instance ID must also match the instance ID used by the remote router that is participating in the same SRRP context. SRRP is intended to perform a function similar to VRRP where adjacent IP hosts within local subnets use a default gateway to access IP hosts on other subnets.

**Values** 1 to 4294967295

### Syntax

srv6 {origination| termination}

no srv6

### Context

[\[Tree\]](#) (config>fwd-path-ext>fpe srv6)

### Full Context

configure fwd-path-ext fpe srv6

### Description

This command configures if the SRv6 FPE application type is used for the origination or termination of SRv6 tunnels.

The origination or termination of SRv6 on services requires the configuration of a dedicated SRv6 FPE and cannot share the same FPE. A single FPE can be configured for SRv6 origination. One or more FPEs can

be configured for SRv6 termination, where a termination SRv6 FPE is assigned one or more configured locators. Transit SRv6 routers do not need SRv6 FPEs.

The **no** form of this command disables SRv6 on an FPE.

### Parameters

#### *origination*

Keyword used to specify the origination FPE application type.

#### *termination*

Keyword used to specify the termination FPE application type.

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

**no srv6-locator**

**Context**

**[Tree]** (config>router>policy-options>policy-statement>default-action srv6-locator)

**[Tree]** (config>router>policy-options>policy-statement>entry>action srv6-locator)

**Full Context**

configure router policy-options policy-statement default-action srv6-locator

configure router policy-options policy-statement entry action srv6-locator

**Description**

This command configures either a string encoding a midstring parameter delimited by at signs (@), or a reference to a named locator for the SRv6 TLV to use.

For a VRF export policy, the referenced locator must already be configured using the commands in the **configure service vprn segment-routing-v6 locator** context.

For a BGP export policy, the referenced locator must already be configured using the commands in the **configure router segment-routing segment-routing-v6 base-routing-instance locator** context.

The **no** form of this command specifies not to use a locator for the SRv6 TLV.

**Default**

no srv6-locator

**Parameters*****name***

Specifies either a string encoding a midstring parameter delimited by at signs (@) or a reference to a named locator for the SRv6 TLV to use, up to 64 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>action srv6-return-path-bfd-sid)

#### Full Context

configure router policy-options policy-statement default-action srv6-return-path-bfd-sid

configure router policy-options policy-statement entry action srv6-return-path-bfd-sid

#### Description

This command applies to the initiator of Seamless Bidirectional Forwarding Detection sessions. This command configures the S-BFD session to echo mode and pushes an additional SRv6 SID in the SRH for S-BFD packets only when it is sent on the imported SRv6 policy.

The return-path SID refers to a binding SID on a SRv6 policy configured on the far-end router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this SRv6 return path. The **no** form of this command disables the controlled return-path SID and echo mode for S-BFD.

#### Parameters

##### *ipv6-address*

Specifies the IPv6 address.

- Values**
- x:x:x:x:x:x:x (eight 16-bit pieces)
  - x:x:x:x:x:d.d.d.d
  - x: [0 to FFFF]H
  - d: [0 to 255]D

##### *param-name*

Specifies the parameter variable name, up to 32 characters. Policy parameters must start and end with an at-sign (@).

#### Platforms

All

## 23.386 srv6-sid

```
srv6-sid
```

### Syntax

```
srv6-sid ipv6-address
no srv6-sid
```

### Context

[\[Tree\]](#) (conf>router>segment-routing>sr-policies>policy>seg-list>segment srv6-sid)

### Full Context

```
configure router segment-routing sr-policies static-policy segment-list segment srv6-sid
```

### Description

This command defines the 128-bit SRv6 SID for the segment. The policy can only be administratively enabled if its type (defined with the **configure router segment-routing sr-policies static-policy type** command) and all its segments (defined with the **configure router segment-routing sr-policies static-policy segment-list segment** command) are SRv6.

### Parameters

*ipv6-address*  
Specifies the SID, up to 72 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 23.387 srv6-sid-prefix

```
srv6-sid-prefix
```

### Syntax

```
srv6-sid-prefix {ipv6-prefix/prefix-length | param-name}
no srv6-sid-prefix
```

### Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from srv6-sid-prefix)

### Full Context

```
configure router policy-options policy-statement entry from srv6-sid-prefix
```

## Description

This command configures either the name of a prefix policy variable or an IPv6 prefix and prefix length, as match criterion for a BGP route.

**Note:** If the name of a prefix policy variable is the match criterion, the name must start and end with an at sign (@).

A BGP route matches this criterion if it has an SRv6 TLV, and the SID or micro-segment (uSID) value in that TLV is matched by the bits of the IPv6 prefix (up to the specified prefix length).

This match criterion is supported in BGP import policies, BGP export policies, and VRF or VSI import policies.

## Default

no srv6-sid-prefix

## Parameters

### *ipv6-prefix/prefix-length*

Specifies the IPv6 address and prefix length.

#### Values

ipv6-prefix:	x:x:x:x:x:x:x (host bits must be 0)
	x:x:x:x:x:d.d.d.d
	x - [0..FFFF]H
	d - [0..255]D
prefix-length:	0 to 128

### *param-name*

Specifies the name of a prefix policy variable, which can be up to 32 characters and must start and end with an at sign (@)

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 23.388 srv6-tlv

### srv6-tlv

## Syntax

**srv6-tlv** {present | not-present}

**no srv6-tlv**

## Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from srv6-tlv)

## Full Context

configure router policy-options policy-statement entry from srv6-tlv

## Description

This command configures whether the entry matches a BGP route with a prefix SID attribute containing an SRv6 TLV. This match criterion is supported in BGP import policies, BGP export policies, and VRF or VSI import policies.

The **no** form of this command disables the router from taking whether a BGP route has a prefix SID attribute containing an SRv6 TLV into consideration when matching a BGP route with the entry.

## Default

no srv6-tlv

## Parameters

### present

Specifies that a BGP route only matches this entry if it has a prefix SID attribute containing an SRv6 TLV.

### not-present

Specifies that a BGP route only matches this entry if it does not have a prefix SID attribute containing an SRv6 TLV.

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 23.389 ssap

```
ssap

**no ssap**

## Context

[\[Tree\]](#) (config>qos>sap-ingress>mac-criteria>entry>match ssap)

## Full Context

configure qos sap-ingress mac-criteria entry match ssap

## Description

This command configures an Ethernet 802.2 LLC SSAP value or range for an ingress SAP QoS policy match criterion.

This is a 1-byte field that is part of the 802.2 LLC header of the IEEE 802.3 Ethernet Frame.

The snap-pid field, etype field, ssap, and dsap fields are mutually exclusive and cannot be part of the same match criteria.

The **no** form of this command removes the ssap match criterion.

## Default

no ssap

## Parameters

### *ssap-value*

The 8-bit ssap match criteria value in hex.

**Values** 0x00 to 0xFF (hex)

### *ssap-mask*

This is optional and can be used when specifying a range of ssap values to use as the match criteria.

This 8-bit mask can be configured using the following formats.

Table 125: Format Styles to Configure Mask

Format Style	Format Syntax	Example
Decimal	DDD	240
Hexadecimal	0xHH	0xF0
Binary	0bBBBBBBBB	0b11110000

**Values** 0x00 to 0xFF

## Platforms

All

ssap

## Syntax

**ssap** *ssap-value* [*ssap-mask*]

**no ssap**

## Context

[\[Tree\]](#) (config>filter>mac-filter>entry>match ssap)

## Full Context

```
configure filter mac-filter entry match ssap
```

## Description

This command configures an Ethernet 802.2 LLC SSAP value or range for a MAC filter match criterion.

This is a one-byte field that is part of the 802.2 LLC header of the IEEE 802.3 Ethernet Frame.

The snap-pid field, etype field, ssap and dsap fields are mutually exclusive and may not be part of the same match criteria.

The **no** form of the command removes the ssap match criterion.

## Default

```
no ssap
```

## Parameters

### *ssap-value*

Specifies the 8-bit ssap match criteria value in decimal, hexadecimal or binary.

**Values** 0 to 255

### *ssap-mask*

Specifies an optional parameter that may be used when specifying a range of ssap values to use as the match criteria.

This 8 bit mask and the ssap value can be configured as described in [Table 126: 8-bit Mask Syntax](#).

Table 126: 8-bit Mask Syntax

Format Style	Format Syntax	Example
Decimal	DDD	240
Hexadecimal	0xHH	0xF0
Binary	0BBBBBBBB	0b11110000

**Values** 0 to 255

## Platforms

**Context**

[\[Tree\]](#) (ssh)

## Full Context

ssh

## Description

This command initiates a client SSH session with the remote host and is independent from the administrative or operational state of the SSH server. However, to be the target of an SSH session, the SSH server must be operational. This command also allows the user to initiate a SSH session, with a key re-exchange, based on maximum megabytes or minutes, whichever occurs first. If the re-exchange options are not set, the default behavior will not perform a key re-exchange.

Quitting SSH while in the process of authentication is accomplished by either executing a ctrl-c or "~." (tilde and dot), assuming the "~" is the default escape character for SSH session.

## Parameters

### *host*

Specifies the remote host for the SSH session.

#### Values

*host*: *user@hostname* - [up to 255 characters]

*user* up to 32 characters

*hostname* [*dns-name* | *ipv4-address* | *ipv6-address*]

*ipv4-address* *a.b.c.d*

*ipv6-address* *x:x:x:x:x:x[-interface]*

*x:x:x:x:x:d.d.d.d[-interface]*

*x* - [0 to FFFF]H

*d* - [0 to 255]D

*interface*: up to 32 characters, mandatory for link local addresses

*dns-name* up to 128 characters

### *username*

Specifies the user name to use when opening the SSH session, up to 32 characters.

### *router-instance*

Specifies the router name or service ID.

#### Values

*router-instance*: *router-name* or *vprn-svc-id*

*router-name* "Base", "management", "vpls-management"

*vprn-svc-id* 1 to 2147483647

**Default** Base

**service-name**

Specifies the service name, up to 64 characters.

**minutes**

Specifies the time interval after which the SSH client will initiate the key-re-exchange.

**Values** 1 to 1440 minutes

**megabytes**

Specifies the number of megabytes, on a SSH session, after which the SSH client will initiate the key re-exchange.

**Values** 1 to 64000 megabytes

## 23.393 ssh-reply

### ssh-reply

#### Syntax

[no] ssh-reply

#### Context

[\[Tree\]](#) (config>service>ies>if>vrrp ssh-reply)

#### Full Context

configure service ies interface vrrp ssh-reply

#### Description

This command enables the non-owner master to reply to SSH Requests directed at the virtual router instances IP addresses. The SSH request can be received on any routed interface. SSH must not have been disabled at the management security level (either on the parental IP interface or based on the SSH source host address). Proper login and CLI command authentication is still enforced.

When ssh-reply is not enabled, SSH packets to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to SSH regardless of the ssh-reply configuration.

The ssh-reply command is only available in non-owner vrrp virtual-router-id nodal context. If the ssh-reply command is not executed, SSH packets to the virtual router instance IP addresses is silently discarded.

The **no** form of this command restores the default operation of discarding all SSH packets destined to the non-owner virtual router instance IP addresses.

#### Default

no ssh-reply

### Platforms

All

## ssh-reply

### Syntax

[no] ssh-reply

### Context

[\[Tree\]](#) (config>service>vprn>if>vrrp ssh-reply)

### Full Context

configure service vprn interface vrrp ssh-reply

### Description

This command enables the non-owner master to reply to SSH Requests directed at the virtual router instance's IP addresses. The SSH request can be received on any routed interface. SSH must not have been disabled at the management security level (either on the parental IP interface or based on the SSH source host address). Proper login and CLI command authentication is still enforced.

When ssh-reply is not enabled, SSH packets to non-owner master virtual IP addresses are silently discarded. Non-owner backup virtual routers never respond to SSH regardless of the ssh-reply configuration.

The ssh-reply command is only available in non-owner **vrrp** *virtual-router-id* nodal context. If the ssh-reply command is not executed, SSH packets to the virtual router instance IP addresses is silently discarded.

The **no** form of this command restores the default operation of discarding all SSH packets destined to the non-owner virtual router instance IP addresses.

### Default

no ssh-reply

### Platforms

All

## ssh-reply

### Syntax

[no] ssh-reply

### Context

[\[Tree\]](#) (config>router>if>vrrp ssh-reply)

### Full Context

configure router interface vrrp ssh-reply

## Description

This command enables the non-owner master to reply to SSH requests directed at the virtual router instance IP addresses. This command is only applicable to IPv4.

Non-owner virtual router instances are limited by the VRRP specifications to responding to ARP requests destined to the virtual router IP addresses and routing IP packets not addressed to the virtual router IP addresses.

This limitation can be disregarded for certain applications. Ping, Telnet and SSH can be individually enabled or disabled on a per-virtual-router-instance basis.

The **ssh-reply** command enables the non-owner master to reply to SSH requests directed at the virtual router instances IP addresses. The SSH request can be received on any routed interface. SSH must not have been disabled at the management security level (either on the parental IP interface or based on the SSH source host address). Correct login and CLI command authentication is still enforced.

When **ssh-reply** is not enabled, SSH requests to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to SSH requests regardless of the **ssh-reply** setting.

The **ssh-reply** command is only available in non-owner **vrrp** nodal context.

By default, SSH requests to the virtual router instance IP addresses are silently discarded.

The **no** form of the command discards all SSH request messages destined to the non-owner virtual router instance IP addresses.

## Default

no ssh-reply — SSH requests to the virtual router instance IP addresses are discarded.

## 23.400 stable-pool-sizing

### stable-pool-sizing

#### Syntax

```
[no] stable-pool-sizing
```

#### Context

```
[Tree] (config>card>fp stable-pool-sizing)
```

#### Full Context

```
configure card fp stable-pool-sizing
```

#### Description

This command provides a stable buffer pool allocation environment for all default port buffer pools on a forwarding plane. This stable environment is provided at the expense of optimal buffer allocation between the various port buffer pools. Normally, port pools are sized according to a ports relative bandwidth with other ports and the ability of a port to use pool buffers. As an example, on a forwarding plane with two potential MDAs and only one equipped, the normal behavior is to provide all available default pool buffers to the ports on the currently equipped MDA. If a second MDA is equipped in the future, buffers are freed from the existing MDA and provided to the ports on the new MDA. Stable pool sizing alters this behavior by reserving buffers for both MDAs whether they are equipped or not thus preventing a resizing event when an MDA is equipped. In addition, existing ports on a module always receive their maximum bandwidth share of buffers independent on any sub-rate condition that may currently exist. This provides a stable amount of buffers to other ports on the module independent of link or configuration events that may occur on the port.

Stable pool sizing preserves the ability to modify the effective bandwidth used to determine a port's relative share of the available buffers through the use of the `ing-percentage-of-rate` and `egr-percentage-of-rate` commands under the port configuration. Changing the values associated with these commands will cause a reevaluation of buffer distribution and thus a possible resizing of pools on each port within the module. These commands have no effect on ports associated with other modules on the forwarding plane.

Stable pool sizing may be enabled or disabled at any time on a forwarding plane. The system will dynamically change the pool sizes according to the stable pool sizing state.

When a port connector breakout is configured, its ports is included in the stable pool sizing calculation. Consequently, adding or removing a port connector breakout to or from the configuration will cause the buffer pool allocation to be recalculated even when stable pool sizing is enabled.

The **no** form of this command disables stable pool sizing on a forwarding plane. Existing buffer pools are resized according to normal pool sizing behavior.

#### Full Context

configure subscriber-mgmt pppoe-client-policy stack

#### Description

This command defines which NCP session is started in the PPPoE client and how addresses are retrieved within that NCP session.

#### Default

stack ipv4

#### Parameters

##### ipv4

Indicates that IPCP should be started and used to retrieve an IPv4 address.

##### ipv6-slaac

Indicates that IPv6CP should be started and that SLAAC is used to retrieve an IPv6 prefix.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.402 stack-capability-signaling

### stack-capability-signaling

#### Syntax

[no] **stack-capability-signaling**

#### Context

[\[Tree\]](#) (config>service>ipipe stack-capability-signaling)

#### Full Context

configure service ipipe stack-capability-signaling

#### Description

This command enables stack-capability signaling in the initial label mapping message of the Ipipe PW to indicate that IPv6 is supported.

When enabled, the 7750 SR includes the stack-capability TLV with the IPv6 stack bit set according to the **ce-address-discovery ipv6** keyword, and also checks the value of the stack-capability TLV received from the far end.

This command must be blocked if no **ce-address-discovery** is specified, or the **ipv6** keyword is not included with the **ce-address-discovery** command.

This command is only applicable to the Ipipe service and must be blocked for all other services.

This command has no effect if both SAPs on the Ipipe service are local to the node.

#### Default

no stack-capability-signaling

#### Platforms

All

[no] **standby**

## Context

[\[Tree\]](#) (config>router>mpls>lsp>secondary standby)

## Full Context

configure router mpls lsp secondary standby

## Description

The secondary path LSP is normally signaled once the primary path LSP fails. The **standby** keyword ensures that the secondary path LSP is signaled and maintained indefinitely in a hot standby state. Standby paths are selected in preference to non-standby secondary paths. When multiple standby secondary paths exist, then the path-preference is used to determine the order in which the paths are selected. If multiple standby secondary paths have the same, lowest, path-preference value then the system will select the path with the lowest up-time. When the primary path is re-established then the traffic is switched back to the primary path LSP.

The **no** form of this command specifies that the secondary LSP is signaled when the primary path LSP fails.

## 23.408 standby-ip-lifetime

**standby-ip-lifetime****Syntax**

**standby-ip-lifetime [days *days*] [hrs *hrs*] [min *min*] [sec *sec*]**

**standby-ip-lifetime** [*seconds*]

**standby-ip-lifetime**

## Context

**[Tree]** (config>subscr-mgmt>vrgw>brg>brg-profile>dhcp-pool standby-ip-lifetime)

## Full Context

configure subscriber-mgmt vrgw brg brg-profile dhcp-pool standby-ip-lifetime

## Description

This command defines how long these addresses are kept aside when standby addresses are signaled to the pool. During this time these addresses can only be used by devices explicitly requesting the IP (for example, datatrigger or DHCP renew/rebind). When the timer expires the addresses will again become available for dynamic allocation.

## Default

standby-ip-lifetime hrs 6

## Parameters

### *days*

Specifies the standby IP lifetime in days.

**Values** 1 to 3650

### *hrs*

Specifies the standby IP lifetime in hours.

**Values** 1 to 23

### *min*

Specifies the standby IP lifetime in minutes.

**Values** 1 to 59

### *sec*

Specifies the standby IP lifetime in seconds.

**Values** 1 to 59

### *seconds*

Specifies the lifetime of the standby IP addresses

**Values** 300 to 315446399

### *seconds*

Specifies the lifetime in seconds.

**Values** 300 to 315446399

#### Description

This command enables standby-signaling-slave for an Epipe.

#### Platforms

All

### standby-signaling-slave

#### Syntax

**[no] standby-signaling-slave**

#### Context

**[Tree]** (config>service>epipe>spoke-sdp standby-signaling-slave)

**[Tree]** (config>service>epipe>endpoint standby-signaling-slave)

#### Full Context

configure service epipe spoke-sdp standby-signaling-slave

configure service epipe endpoint standby-signaling-slave

#### Description

When this command is enabled, the node will block the transmit forwarding direction of a spoke SDP based on the pseudowire standby bit received from a T-LDP peer.

This command is present at the endpoint level as well as the spoke SDP level. If the spoke SDP is part of an explicit-endpoint, it will not be possible to change this setting at the spoke SDP level. An existing spoke SDP can be made part of the explicit endpoint only if the settings do not conflict. A newly created spoke SDP, which is part of a specific explicit-endpoint, will inherit this setting from the endpoint configuration.

This command is mutually exclusive with an endpoint that is part of an mc-lag, mc-aps or an ICB.

If the command is disabled, the node assumes the existing independent mode of behavior for the forwarding on the spoke SDP.

**Default**

no standby-signaling-slave

## 23.415 start-avg

start-avg

**Syntax**

**start-avg** *percent*

**no start-avg**

## Context

**[Tree]** (config>qos>slope-policy>high-slope start-avg)

**[Tree]** (config>qos>slope-policy>exceed-slope start-avg)

**[Tree]** (config>qos>slope-policy>low-slope start-avg)

**[Tree]** (config>qos>slope-policy>highplus-slope start-avg)

## Full Context

configure qos slope-policy high-slope start-avg

configure qos slope-policy exceed-slope start-avg

configure qos slope-policy low-slope start-avg

configure qos slope-policy highplus-slope start-avg

## Description

This command sets the exceed, low, high, or highplus Random Early Detection (RED) slope position for the shared buffer average utilization value where the packet discard probability starts to increase above zero. The percent parameter is expressed as a percentage of the shared buffer size.

The **no** form of this command restores the start-avg value to the default setting. If the max-avg setting is smaller than the default, an error will occur and the start-avg setting will not be changed to the default.

## Default

start-avg 85 - Highplus slope default is 85% buffer utilization before discard probability starts to increase above zero.

start-avg 70 — High slope default is 70% buffer utilization before discard probability starts to increase above zero.

start-avg 50 — Low slope default is 50% buffer utilization before discard probability starts to increase above zero.

start-avg 30 — Exceed slope default is 30% buffer utilization before discard probability starts to increase above zero.

## Parameters

### *percent*

The percentage of the shared buffer space for the buffer pool at which point the drop probability starts to increase above zero. The value entered must be less than or equal to the current setting of **max-avg**. If the entered value is greater than the current value of **max-avg**, an error will occur and no change will take place.

**Values** 0 to 100

## Platforms

All

## Full Context

```
configure router dhcp6 local-dhcp-server failover startup-wait-time
configure router dhcp6 server pool failover startup-wait-time
configure router dhcp local-dhcp-server failover startup-wait-time
configure router dhcp server pool failover startup-wait-time
```

## Description

This command enables the startup wait time during which each peer waits after the initialization process before assuming the active role for the prefix designated as local or access-driven. This is to avoid transient issues during the initialization process.

The **startup-wait-time** should be configured to an interval in which, after boot, both nodes can set up an MCS TCP link and start MCS. The timer is restarted each time the server downloads a lease from the MCS database and stops when the last state record from the peer is synchronized. The next state is (PRE-)NORMAL, unless the timer times out or is forced to stop via the tools command (**tools>perform>router>dhcp** or **dhcp6>local-dhcp-server server-name>pool/failover>abort-startup-wait**), in which case the local DHCP server transitions immediately to the COMMUNICATIONS-INTERRUPTED state.

## Default

startup-wait-time min 2

## Parameters

### *minutes*

Specifies the startup wait time, in minutes.

**Values** 1 to 59

### *seconds*

Specifies the startup wait time, in seconds.

**Values** 1 to 59

### *hours*

Specifies the startup wait time, in hours.

**Values** 1

## 23.419 stat-mode

## stat-mode

### Syntax

**stat-mode** *stat-mode*

**no stat mode**

### Context

**[Tree]** (config>subscr-mgmt>sla-prof>egress>qos>policer stat-mode)

**[Tree]** (config>subscr-mgmt>sla-prof>ingress>qos>queue stat-mode)

**[Tree]** (config>subscr-mgmt>sla-prof>ingress>qos>policer stat-mode)

**[Tree]** (config>subscr-mgmt>sla-prof>egress>qos>queue stat-mode)

### Full Context

configure subscriber-mgmt sla-profile egress qos policer stat-mode

configure subscriber-mgmt sla-profile ingress qos queue stat-mode

configure subscriber-mgmt sla-profile ingress qos policer stat-mode

configure subscriber-mgmt sla-profile egress qos queue stat-mode

### Description

This command is used to configure the forwarding plane octet and packet counters of a policer or queue to count packets of a specific type or state. For example separate counters for IPv4/IPv6 or separate counters for offered high and low priority policed traffic.

For policers, this command overrides the policer `stat-mode` configuration as defined in the `sap-ingress` or `sap-egress qos` policy. For details on `sap-ingress` and `sap-egress policer stat-mode`, refer to the *7450 ESS*, *7750 SR*, *7950 XRS*, and *VSR Quality of Service Guide*. For use in Enhanced Subscriber Management (ESM) context only, an additional `stat-mode` enables separate counters for IPv4 and IPv6 packets.

When a policer's `stat-mode` is changed while the sla profile is in use, any previous counter values are lost and any new counters are set to zero.

For queues, this command sets the `stat-mode`. Queue `stat-mode` is only available for use in Enhanced Subscriber Management (ESM) context to enable separate IPv4/IPv6 counters.

A queue's `stat-mode` cannot be changed while the SLA profile is in use.

The **no** form of this command reverts to the default.

### Default

For policers, the default is no `stat-mode` override. The `sap-ingress` or `sap-egress stat-mode` is used instead.

For queues, the default is to count in-/out-of-profile octets and packets.

### Parameters

#### **stat-mode**

Specifies the stat mode for the policer.

For ingress and egress qos queue `stat-mode` overrides.

For ingress and egress qos policer stat-mode overrides, refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for details on the **sap-ingress** and **sap-egress policer stat-mode** parameters.

For use in Enhanced Subscriber Management (ESM) context only:

**Values** no-stats, minimal, offered-profile-no-cir, offered-priority-no-cir, offered-profile-cir, offered-priority-cir, offered-total-cir, offered-limited-profile-cir, offered-profile-capped-cir, offered-limited-capped-cir, v4-v6 (count IPv4 and IPv6 forwarded/dropped octets and packets separately)

## Platforms

- configure subscriber-mgmt sla-profile egress qos queue stat-mode
- configure subscriber-mgmt sla-profile ingress qos queue stat-mode

## stat-mode

### Syntax

**stat-mode** *stat-mode*

**no stat mode**

### Context

**[Tree]** (config>card>fp>ingress>access>qgrp>policer-over>plcr stat-mode)

**[Tree]** (config>card>fp>ingress>network>qgrp>policer-over>plcr stat-mode)

### Full Context

configure card fp ingress access queue-group policer-override policer stat-mode

configure card fp ingress network queue-group policer-override policer stat-mode

### Description

This command configures the forwarding plane counters that allow offered, output and discard accounting to occur for the policer. An ingress policer has multiple types of offered packets (explicit in-profile, explicit out-of-profile, high priority or low priority) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow and red). Due to the large number of policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers will not be configured with a CIR profiling rate and not all policers will receive explicitly profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported which prevents any packet accounting, the use of the policer's **parent** command requires at the policer's **stat-mode** to be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. Once a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. You can view the total/allocated/free stats by using the **tools dump resource-usage** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's stat-mode setting to minimal. The command will fail if insufficient policer counter resources exist to implement minimal where the QoS policer is currently applied and has a forwarding class mapping.

## Parameters

See the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for details on the policer stat-mode parameters.

## Platforms

```

## Description

The SAP QoS policy's **policer stat-mode** command is used to configure the forwarding plane counters that allow offered, output, and discard accounting to occur for the policer. A policer has multiple types of offered packets (for example, soft in-profile and out-of-profile from ingress and hard in-profile and out-of-profile due to egress profile overrides) and each of these offered types is interacting with the policers metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potentially large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers will not be configured with a CIR profiling rate and not all policers will receive explicitly re-profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and indicates how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's parent command requires that the policer's **stat-mode** be set at least to the minimal setting so that offered statistics are available for the policer's Fair Information Rate (FIR) to be calculated.

Each time the policer's stat mode is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free statistics can be viewed by using the **tools dump resource-usage card slot-num fp fp-number** command. If insufficient counters exist to implement a mode on any policer instance, the stat-mode change will fail and the previous mode will continue unaffected for all instances of the policer.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on a SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the stat-mode override command will fail. The current active stat mode setting will continue to be used by the policer.

The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

The **no** form of this command attempts to return the policer's stat-mode setting to **minimal**.

Refer to the *7450 ESS*, *7750 SR*, *7950 XRS*, and *VSR Quality of Service Guide* for detailed information about the supported parameters for the **policer stat-mode** command.

configure service vpls sap ingress policer-override policer stat-mode

### Description

The SAP-egress QoS policy's policer stat-mode command is used to configure the forwarding plane counters that allow offered, output and discard accounting to occur for the policer. A policer has multiple types of offered packets (for example, soft in-profile and out-of-profile from ingress and hard in-profile and out-of-profile due to egress profile overrides) and each of these offered types is interacting with the policers metering and profiling functions resulting in colored output packets (green, yellow and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers will not be configured with a CIR profiling rate and not all policers will receive explicitly re-profiled offered packets. The stat-mode command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a no-stats mode is supported which prevents any packet accounting, the use of the policer's parent command requires that the policer's stat-mode to be set at least to the minimal setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated.

Each time the policer's stat-mode is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. You can view the total/allocated/free stats by using the **tools dump resource-usage card slot-num fp fp-number** command. If insufficient counters exist to implement a mode on any policer instance, the stat-mode change will fail and the previous mode will continue unaffected for all instances of the policer.

The default stat-mode when a policer is created within the policy is minimal.

The stat-mode setting defined for the policer in the QoS policy may be overridden on a SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the stat-mode

override command will fail. The previous `stat-mode` setting active for the policer will continue to be used by the policer.

The **no** form of the command returns the policer's `stat-mode` setting to minimal.

Refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for detailed information about the **policer `stat-mode`** command parameters.

```

```
configure qos sap-ingress policer stat-mode
```

### Description

This command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An ingress policer has multiple types of offered packets (explicit in-profile, explicit out-of-profile, uncolored, high-priority, or low priority) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the large number of policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made

a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free stats can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The ingress policer stat-modes are described in [Table 127: Ingress Policer Stat Mode Summary](#) .

Table 127: Ingress Policer Stat Mode Summary

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/Forwarded	
no-stats	0	—	—	—
Minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In/out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes only in-profile and out-of-profile.
offered-priority-no-cir	2	High/low entering policer	High/low entering policer	Intended for when only packet priority stats are required.
offered-profile-cir	4	In/out/uncolored entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in-profile and out-of-profile.
offered-priority-cir	4	High/low entering policer	In/out exiting policer	Intended for when packet priority entering the policer and profile exiting the policer is required.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/Forwarded	
offered-limited-profile-cir	3	Out/uncolored entering policer	In/out exiting policer	Intended for when the policer can change the profile of packet to in-profile and out-of-profile. The information is limited compared to offered-profile-capped-cir with the benefit of using one less stat resource.
offered-profile-capped-cir	5	In/out/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured.
offered-limited-capped-cir	4	In/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured. The information is limited compared to offered-profile-capped-cir with the benefit of using one less stat resource.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's stat-mode setting to minimal. The command will fail if insufficient policer counter resources exist to implement minimal where the QoS policer is currently applied and has a forwarding class mapping.

## Parameters

### no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, dropped, and forwarded statistics. A policer using no-stats cannot be a child to a parent policer and the policer's parent command will fail.

When **collect-stats** is enabled, no statistics are generated.

**minimal**

Counter resource allocation: 1

This **stat-mode** provides the minimal accounting resource usage and counter information, and includes the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types (profile or priority) and do not count in-profile or out-of-profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate.

This counter mode is useful when only the most basic accounting information is required.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 128: Ingress Accounting Statistics Collected in minimal stat-mode](#).

Table 128: Ingress Accounting Statistics Collected in minimal stat-mode

	aod	AllOctetsDropped
For. All	apf	AllPacketsForwarded
	aof	AllOctetsForwarded

**offered-profile-no-cir**

Counter resource allocation: 2

This **stat-mode** provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering the policer.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when the policer is receiving only in-profile and out-of-profile premarked (and trusted) packets. It is expected that, in this instance, a CIR rate will not be defined since all packets are already premarked. This mode does not prevent the policer from receiving untrusted (color undefined) traffic nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 129: Ingress Accounting Statistics Collected in offered-profile-no-cir stat-mode](#) .

### offered-priority-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the packet priority of traffic entering the policer.

The **offered-priority-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-priority-no-cir** mode is most useful when the policer is receiving only untrusted packets and the ingress priority high and priority low classification options are being used without a CIR profiling rate defined. This mode does not prevent the policer from receiving trusted packets that are premarked in-profile or out-of-profile nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied

accounting policy) are described in [Table 130: Ingress Accounting Statistics Collected in offered-priority-no-cir stat-mode](#).

	hof	HighPriorityOctetsForwarded
For. LowPrio	lpf	LowPriorityPacketsForwarded
	lof	LowPriorityOctetsForwarded

#### offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises hard in/out and uncolored traffic. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (uncolored).

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile and in-profile traffic and is also receiving untrusted packets that are being applied to a defined CIR profiling rate. This mode differs from **offered-limited-profile-cir** mode in that it expects both trusted in-profile and out-of-profile packets while still performing CIR profiling on packets with untrusted markings. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** stat-mode could be used instead, which has the benefit of using a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 131: Ingress Accounting Statistics Collected in offered-profile-cir stat-mode](#).

For. OutProf	opf	OutOfProfilePacketsForwarded
	oof	OutOfProfileOctetsForwarded

### offered-priority-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the priority of traffic entering the policer and the profile exiting the policer.

The **offered-priority-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-priority-cir** mode is most useful when the policer is receiving only untrusted packets that are being classified as high priority or low priority and are being applied to a defined CIR profiling rate. This mode differs from **offered-profile-cir** mode in that it does

not expect trusted in-profile and out-of-profile packets but does not exclude the ability of the policer to receive them.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 132: Ingress Accounting Statistics Collected in offered-priority-cir stat-mode](#).

Table 132: Ingress Accounting Statistics Collected in offered-priority-cir stat-mode

For. InProf	ipf	InProfilePacketsForwarded
	iof	InProfileOctetsForwarded
For. OutProf	opf	OutOfProfilePacketsForwarded
	oof	OutOfProfileOctetsForwarded

#### offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic and both high- and low-priority classifications are not being used on the untrusted packets and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or

out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 133: Ingress Accounting Statistics Collected in offered-total-cir stat-mode](#).

Table 133: Ingress Accounting Statistics Collected in offered-total-cir stat-mode

For. InProf	ipf	InProfilePacketsForwarded
	iof	InProfileOctetsForwarded
For. OutProf	opf	OutOfProfilePacketsForwarded
	oof	OutOfProfileOctetsForwarded

#### offered-limited-profile-cir

Counter resource allocation: 3

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard out and uncolored. The offered counters cover traffic explicitly profiled to out-of-profile and traffic that has not been explicitly profiled at ingress (Uncolor). The traffic explicitly profiled to in-profile is counted with the uncolored traffic.

The **offered-limited-profile-cir** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-limited-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile (profile out but no profile in) traffic and untrusted packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile packets. If trusted in-profile packets are not being received, the **offered-limited-**

**profile-cir** is preferred over **offered-profile-cir** because it uses a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 134: Ingress Accounting Statistics Collected in offered-limited-profile-cir stat-mode](#).

For. OutProf	opf	OutOfProfilePacketsForwarded
	oof	OutOfProfileOctetsForwarded

#### **offered-profile-cir**

Counter resource allocation: 4

#### **offered-profile-capped-cir**

Counter resource allocation: 5

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard in/out and uncolored. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (Uncolor).

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the **offered-profile-cir** mode except that it includes support for profile in and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

The impact of using **offered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 135: Ingress Accounting Statistics Collected in offered-profile-capped-cir stat-mode](#).

#### **offered-limited-capped-cir**

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed resulting in the traffic entering the policer

comprising of hard in/out and uncolored. The offered counters cover in-profile traffic and traffic that has not been explicitly profiled at ingress (Uncolor). The traffic explicitly profiled to out-of-profile is counted with the uncolored traffic.

When **offered-limited-capped-cir** is defined, the system creates four forwarding plane offered-output counters in the network processor and four discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** (InProf) and **profile out** (OutProf) with **soft-out-of-profile** (Uncolor) and eliminates the "offered undefined" statistic. If trusted out-of-profile packets are not being received, the **offered-limited-capped-cir** is preferred over **offered-profile-capped-cir** because it uses a reduced number of stat resources.

This mode is intended to be used with **profile-capped** configured within the policer.

The impact of using **offered-limited-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 136: Ingress Accounting Statistics Collected in offered-limited-capped-cir stat-mode](#) .

## stat-mode

### Syntax

**stat-mode** {**no-stats** | **minimal** | **offered-profile-no-cir** | **offered-profile-cir** | **offered-total-cir** | **offered-limited-capped-cir** | **offered-profile-capped-cir**}

**no stat mode**

### Context

[\[Tree\]](#) (config>qos>sap-egress>dyn-policer stat-mode)

### Full Context

configure qos sap-egress dynamic-policer stat-mode

### Description

The **sap-egress** QoS policy's policer **stat-mode** command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An egress policer has multiple types of offered packets (soft in-profile and out-of-profile from ingress and hard in-profile, out-of-profile, and exceed-profile due to egress profile overrides) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly reprofiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total, allocated, and free statistics can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The egress policer stat-modes are described in [Table 137: Egress Policer Stat-mode Summary](#).

Table 137: Egress Policer Stat-mode Summary

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/Forwarded	
no-stats	0	—	—	—
minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In or out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes only in-profile and out-of-profile.
offered-profile-cir	4	In, out, or uncolored (which corresponds to hard in-profile, hard out-of-profile, or soft in- or out-of-profile) entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in-profile and out-of-profile.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-capped-cir	4	In or out entering policer	In/out exiting policer	Intended for when the policer has <b>profile-capped</b> configured. The information is limited compared to <b>offered-profile-capped-cir</b> with the benefit of using one less stat resource.
offered-profile-capped-cir	5	In, out, or uncolored (which corresponds to hard in-profile, hard out-of-profile, or soft in- or out-of-profile) entering policer	In/out exiting policer	Intended for when the policer has <b>profile-capped</b> configured

When a policer is created within the policy, the default setting for **stat-mode** is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's **stat-mode** setting to **minimal**. The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

## Parameters

### no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, discard, and forward statistics. A policer using **no-stats** cannot be a child to a parent policer and the policer's **parent** command will fail.

When **collect-stats** is enabled, no statistics are generated.

### minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes only the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types and do not count different profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate or using exceed PIR.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 138: Egress Accounting Statistics Collected in minimal stat-mode](#).

Table 138: Egress Accounting Statistics Collected in minimal stat-mode

	aod	AllOctetsDropped
For. All	apf	AllPacketsForwarded
	aof	AllOctetsForwarded

**offered-profile-no-cir**

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. inplus-profile traffic is counted with the in-profile counters and exceed-profile traffic is counted with the out-of-profile counters.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when profile-based offered, dropped, and forwarded stats are required from the egress policer, but a CIR or **enable-exceed-pir** is not being used to recolor the soft in-profile and out-of-profile packets. This mode does not prevent the policer from being configured with a CIR rate or using **enable-exceed-pir**.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 139: Egress Accounting Statistics Collected in offered-profile-no-cir stat-mode](#).

	iof	InProfileOctetsForwarded
For. OutProf	opf	OutOfProfilePacketsForwarded
	oof	OutOfProfileOctetsForwarded

**offered-profile-cir**

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile) and traffic which has not been reclassified at egress (Uncolor). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when profile-based offered, dropped and forwarded stats are required from the egress policer and a CIR rate is being used to recolor the soft in-profile and out-of-profile packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 140: Egress Accounting Statistics Collected in offered-profile-cir stat-mode](#).

### offered-total-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, in-plus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic, and both high- and low- priority classifications are not being used on the untrusted packets, and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 141: Egress Accounting Statistics Collected in offered-total-cir stat-mode](#).

### offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover in-profile traffic (which includes traffic reclassified to inplus-profile) and out-of-profile traffic (which includes traffic reclassified to exceed-profile). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

**offered-limited-capped-cir** is defined, the system creates four forwarding plane offered-output counters in the network processor and three discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** and **soft-out-of-profile** with **profile out** and eliminates the offered-undefined statistic.

The impact of using **offered-limited-capped-cir** stat-mode while profile-capped mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and **soft-in-profile** will be treated as offered-in instead of offered-undefined.

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 142: Egress Accounting Statistics Collected in offered-limited-capped-cir stat-mode](#) .

### offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile) and traffic that has not been reclassified at egress (uncolored). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the **offered-profile-cir** mode except that it includes support for **profile inplus**, **profile in** and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

The impact of using **offered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and soft-in-profile will be treated as offered-in (hard in-profile) instead of offered-undefined (uncolored).

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 143: Egress Accounting Statistics Collected in offered-profile-capped-cir stat-mode](#) .

## Full Context

```
configure qos sap-egress policer stat-mode
```

## Description

The **sap-egress** QoS policy's policer **stat-mode** command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An egress policer has multiple types of offered packets (soft in-profile and out-of-profile from ingress and hard in-profile, out-of-profile, and exceed-profile due to egress profile overrides) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly reprofiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total, allocated, and free statistics can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The egress policer stat-modes are described in [Table 144: Egress Policer Stat-mode Summary](#).

Table 144: Egress Policer Stat-mode Summary

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/Forwarded	
no-stats	0	—	—	—
minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In or out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes only in-profile and out-of-profile.

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
offered-profile-cir	4	In, out, or uncolored (which corresponds to hard in-profile, hard out-of-profile, or soft in- or out-of-profile) entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in-profile and out-of-profile.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-capped-cir	4	In or out entering policer	In/out exiting policer	Intended for when the policer has <b>profile-capped</b> configured. The information is limited compared to <b>offered-profile-capped-cir</b> with the benefit of using one less stat resource.
offered-profile-capped-cir	5	In, out, or uncolored (which corresponds to hard in-profile, hard out-of-profile, or soft in- or out-of-profile) entering policer	In/out exiting policer	Intended for when the policer has <b>profile-capped</b> configured
offered-total-cir-exceed	3	Single counter entering policer	In/out/exceed exiting policer	Intended for when the policer is configured with <b>enable-exceed-pir</b> to forward packets that exceed its configured PIR or when traffic is reclassified at egress to exceed-profile
offered-four-profile-no-cir	4	Inplus, in, out, or exceed entering policer	Inplus/in/out/exceed entering policer	Intended to be used when the policer does not change the profile of the packets and traffic

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/Forwarded	
				is reclassified at egress to inplus and/or exceed-profile
offered-total-cir-four-profile	4	Single counter entering policer	Inplus, in, out, or exceed exiting policer	Intended to be used when the policer can change the profile of the packet and traffic is reclassified at egress to profile inplus

When a policer is created within the policy, the default setting for **stat-mode** is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's **stat-mode** setting to **minimal**. The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

## Parameters

### no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, discard, and forward statistics. A policer using **no-stats** cannot be a child to a parent policer and the policer's **parent** command will fail.

When **collect-stats** is enabled, no statistics are generated.

### minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes only the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types and do not count different profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate or using exceed PIR.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied

accounting policy) are described in [Table 145: Egress Accounting Statistics Collected in minimal stat-mode](#) .

	aod	AllOctetsDropped
For. All	apf	AllPacketsForwarded
	aof	AllOctetsForwarded

#### **offered-profile-no-cir**

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. inplus-profile traffic is counted with the in-profile counters and exceed-profile traffic is counted with the out-of-profile counters.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when profile-based offered, dropped, and forwarded stats are required from the egress policer, but a CIR or **enable-exceed-pir** is not being used to recolor the soft in-profile and out-of-profile packets. This mode does not prevent the policer from being configured with a CIR rate or using **enable-exceed-pir**.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 146: Egress Accounting Statistics Collected in offered-profile-no-cir stat-mode](#) .

### offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile) and traffic which has not been reclassified at egress (Uncolor). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when profile-based offered, dropped and forwarded stats are required from the egress policer and a CIR rate is being used to recolor the soft in-profile and out-of-profile packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 147: Egress Accounting Statistics Collected in offered-profile-cir stat-mode](#) .

**offered-total-cir**

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, in-plus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic, and both high- and low- priority classifications are not being used on the untrusted packets, and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 148: Egress Accounting Statistics Collected in offered-total-cir stat-mode](#).

#### offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover in-profile traffic (which includes traffic reclassified to inplus-profile) and out-of-profile traffic (which includes traffic reclassified to exceed-profile). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

**offered-limited-capped-cir** is defined, the system creates four forwarding plane offered-output counters in the network processor and three discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** and **soft-out-of-profile** with **profile out** and eliminates the offered-undefined statistic.

The impact of using **offered-limited-capped-cir** stat-mode while profile-capped mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and **soft-in-profile** will be treated as offered-in instead of offered-undefined.

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 149: Egress Accounting Statistics Collected in offered-limited-capped-cir stat-mode](#).

#### offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is made up of traffic that is inplus-profile, in-profile, out-of-profile, exceed-profile, soft in-profile, and soft out-of-profile. The offered counters cover traffic reclassified to in-profile (which includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (which includes traffic reclassified to exceed-profile) and traffic that has not been reclassified at egress (uncolored). In the dropped and forwarded counters, inplus-profile

traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the **offered-profile-cir** mode except that it includes support for **profile inplus**, **profile in** and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

The impact of using **offered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and soft-in-profile will be treated as offered-in (hard in-profile) instead of offered-undefined (uncolored).

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 150: Egress Accounting Statistics Collected in offered-profile-capped-cir stat-mode](#).

**offered-total-cir-exceed**

Counter resource allocation: 3

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter. The **offered-total-cir-exceed** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-total-cir-exceed** mode is similar to the **offered-total-cir** mode except that it includes support for forwarded and dropped counters for **profile exceed**.

This mode is intended to be used when the policer is configured with **enable-exceed-pir** to forward packets that exceed its configured PIR or when traffic is egress reclassified to profile exceed. The mode gives the forwarded and dropped counters per profile (in, out, exceed). It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 151: Egress Accounting Statistics Collected in offered-total-cir-exceed stat-mode](#).

#### offered-four-profile-no-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. Offered, dropped, and forwarded counters are provided for inplus, in, out and exceed-profile traffic.

The **offered-four-profile-no-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-four-profile-no-cir** mode is similar to the **offered-profile-no-cir** mode except that it includes support for offered, dropped, and forwarded counters for both inplus-profile and exceed-profile.

This mode is intended to be used when traffic is egress reclassified to inplus and/or exceed-profile. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 152: Egress Accounting Statistics Collected in offered-four-profile-no-cir stat-mode](#).

#### offered-total-cir-four-profile

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. There is a separate dropped and forwarded counter for inplus, in, out and exceed-profile traffic.

The **offered-total-cir-four-profile** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-total-cir-four-profile** mode is similar to the **offered-total-cir** except that it includes support for forwarded and dropped counters for both **profile inplus** and **profile exceed**.

This mode is intended to be used when traffic is reclassified at egress to inplus-profile. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 153: Egress Accounting Statistics Collected in offered-total-cir-four-profile stat-mode](#).

## stat-mode

## Syntax

**stat-mode** {no-stats | minimal | offered-profile-no-cir | offered-priority-no-cir | offered-profile-cir | offered-priority-cir | offered-total-cir | offered-limited-profile-cir | offered-profile-capped-cir | offered-limited-capped-cir}

**no stat mode****Context**

[\[Tree\]](#) (config>qos>qgrps>ing>qgrp>policer stat-mode)

**Full Context**

configure qos queue-group-templates ingress queue-group policer stat-mode

**Description**

This command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An ingress policer has multiple types of offered packets (explicit in-profile, explicit out-of-profile, uncolored, high-priority or low-priority) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the large number of policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly profiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free stats can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The stat-modes are described in [Table 154: Stat Mode Descriptions](#).

*Table 154: Stat Mode Descriptions*

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/Forwarded	
no-stats	0	None	None	—
Minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In/out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
				only in- and out-of-profile.
offered-priority-no-cir	2	High/low entering policer	High/low entering policer	Intended for when only packet priority stats are required.
offered-profile-cir	4	In/out/uncolored entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in- and out-of-profile.
offered-priority-cir	4	High/low entering policer	In/out exiting policer	Intended for when packet priority entering the policer and profile exiting the policer is required.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-profile-cir	3	Out/uncolored entering policer	In/out exiting policer	Intended for when the policer can change the profile of packet to in- and out-of-profile. The information is limited compared to offered-profile-capped-cir with the benefit of using one less stat resource.
offered-profile-capped-cir	5	In/out/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured.
offered-limited-capped-cir	4	In/uncolored entering policer	In/out exiting policer	Intended for when the policer has profile-capped configured. The information is limited compared to offered-profile-capped-cir with the benefit of

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
				using one less stat resource.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's stat-mode setting to minimal. The command will fail if insufficient policer counter resources exist to implement minimal where the QoS policer is currently applied and has a forwarding class mapping.

## Parameters

### no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, dropped and forwarded statistics. A policer using no-stats cannot be a child to a parent policer and the policer's parent command will fail.

When **collect-stats** is enabled, no statistics are generated.

### minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates 1 forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types (profile or priority) and do not count in-profile or out-of-profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate.

This counter mode is useful when only the most basic accounting information is required.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 155: Ingress Accounting Statistics Collected in minimal stat-mode](#).

	aof	AllOctetsForwarded

**offered-profile-no-cir**

Counter resource allocation: 2

This **stat-mode** provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering the policer.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when the policer is receiving only in-profile and out-of-profile premarked (and trusted) packets. It is expected that, in this instance, a CIR rate will not be defined since all packets are already premarked. This mode does not prevent the policer from receiving untrusted (color undefined) nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 156: Ingress Accounting Statistics Collected in offered-profile-no-cir stat-mode](#).

### offered-priority-no-cir

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the packet priority of traffic entering the policer.

The **offered-priority-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-priority-no-cir** mode is most useful when the policer is receiving only untrusted packets and the ingress priority high and priority low classification options are being used without a CIR profiling rate defined. This mode does not prevent the policer from receiving trusted packets that are premarked in-profile or out-of-profile nor does it prevent the policer from being configured with a CIR rate.

This mode is intended to be used without profile-capped configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 157: Ingress Accounting Statistics Collected in offered-priority-no-cir stat-mode](#).

### offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard in/out and uncolored. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (uncolored).

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile and in-profile traffic and is also receiving untrusted packets that are being applied to a defined CIR profiling rate. This mode differs from **offered-limited-profile-cir** mode in that it expects both trusted in-profile and out-of-profile packets while still performing CIR profiling on packets with untrusted markings. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** stat-mode could be used instead, which has the benefit of using a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 158: Ingress Accounting Statistics Collected in offered-profile-cir stat-mode](#) .

	oof	OutOfProfileOctetsForwarded

**offered-priority-cir**

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the priority of traffic entering the policer and the profile exiting the policer.

The **offered-priority-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-priority-cir** mode is most useful when the policer is receiving only untrusted packets that are being classified as high priority or low priority and are being applied to a defined CIR profiling rate. This mode differs from **offered-profile-cir** mode in that it does not expect trusted in-profile and out-of-profile packets but does not exclude the ability of the policer to receive them.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied

accounting policy) are described in [Table 159: Ingress Accounting Statistics Collected in offered-priority-cir stat-mode](#) .

### **offered-total-cir**

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic and both high- and low-priority classifications are not being used on the untrusted packets and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied

accounting policy) are described in [Table 160: Ingress Accounting Statistics collected in offered-total-cir stat-mode](#).

#### offered-limited-profile-cir

Counter resource allocation: 3

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard out and uncolored. The offered counters cover traffic explicitly profiled to out-of-profile and traffic that has not been explicitly profiled at ingress (uncolored). The traffic explicitly profiled to in-profile is counted with the uncolored traffic.

The **offered-limited-profile-cir** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-limited-profile-cir** mode is most useful when the policer is receiving trusted out-of-profile (profile out but no profile in) traffic and untrusted packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile packets. If trusted in-profile packets are not being received, the **offered-limited-profile-cir** is preferred over **offered-profile-cir** because it uses a reduced number of stat resources.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied

accounting policy) are described in [Table 161: Ingress Accounting Statistics Collected in offered-limited-profile-cir stat-mode](#).

### offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed so that the traffic entering the policer comprises of hard in/out and uncolored. The offered counters cover traffic explicitly profiled to in-profile, traffic explicitly profiled to out-of-profile, and traffic that has not been explicitly profiled at ingress (uncolored).

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the offered-profile-cir mode except that it includes support for profile in and **soft-in-profile** that may be output as 'out-of-profile' due to enabling **profile-capped** mode on the ingress policer.

The impact of using **offered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied

accounting policy) are described in [Table 162: Ingress Accounting Statistics Collected in offered-profile-capped-cir stat-mode](#) .

For. OutProf	opf	OutOfProfilePacketsForwarded
	oof	OutOfProfileOctetsForwarded

#### offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when ingress reclassification is performed resulting in the traffic entering the policer comprising of hard in/out and uncolored. The offered counters cover in-profile traffic and traffic that has not been explicitly profiled at ingress (uncolored). The traffic explicitly profiled to out-of-profile is counted with the uncolored traffic.

**offered-limited-capped-cir** is defined, the system creates four forwarding plane offered-output counters in the network processor and four discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft in-profile** with **profile in** (InProf) and **profile out** (OutProf) with **soft-out-of-profile** (Uncolor) and eliminates the 'offered undefined' statistic. If trusted out-of-profile packets are not being received, the **offered-limited-capped-cir** is preferred over **offered-profile-capped-cir** because it uses a reduced number of stat resources.

This mode is intended to be used with **profile-capped** configured within the policer.

The impact of using **offered-limited-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used.

The counters displayed in the show output and those collected when **collect-stats** is enabled (the actual fields collected depends on the **record** configured in the applied accounting policy) are described in [Table 163: Ingress Accounting Statistics Collected in offered-limited-capped-cir stat-mode](#).

## Context

[\[Tree\]](#) (cfg>qos>qgrps>egr>qgrp>policer stat-mode)

## Full Context

configure qos queue-group-templates egress queue-group policer stat-mode

## Description

The **sap-egress** QoS policy's policer **stat-mode** command is used to configure the forwarding plane counters that allow offered, forwarded, and dropped accounting to occur for the policer. An egress policer has multiple types of offered packets (soft in-profile and out-of-profile from ingress and hard in-profile, out-of-profile, and exceed-profile due to egress profile overrides) and each of these offered types is interacting with the policer's metering and profiling functions resulting in colored output packets (green, yellow, and red). Due to the potential large number of egress policers, it is not economical to allocate counters in the forwarding plane for all possible offered packet types and output conditions. Many policers, for example, will not be configured with a CIR profiling rate and not all policers will receive explicitly reprofiled offered packets. The **stat-mode** command allows provisioning of the number of counters each policer requires and how the offered packet types and output conditions should be mapped to the counters.

While a **no-stats** mode is supported that prevents any packet accounting, the use of the policer's **parent** command requires that the policer's **stat-mode** be set at least to the **minimal** setting so that offered stats are available for the policer's Fair Information Rate (FIR) to be calculated. When a policer has been made a child to a parent policer, the **stat-mode** cannot be changed to **no-stats** unless the policer parenting is first removed.

Each time the policer's **stat-mode** is changed, any previous counter values are lost and any new counters are set to zero.

Each mode uses a certain number of counters per policer instance that are allocated from the forwarding plane's policer counter resources. The total/allocated/free stats can be viewed by using the **tools dump resource-usage card fp** command. If insufficient counters exist to implement a mode on any policer instance, the **stat-mode** change will fail and the previous mode will continue unaffected for all instances of the policer.

The ingress policer stat-modes are described in [Table 164: Egress Policer Stat Mode Summary](#).

Table 164: Egress Policer Stat Mode Summary

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/Forwarded	
no-stats	0	None	None	—
Minimal	1	Single counter entering policer	Single counter for dropped/forwarded exiting policer	—
offered-profile-no-cir	2	In/out entering policer	In/out entering policer	Intended for when the policer does not change the profile of packets. Includes

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/ Forwarded	
				only in- and out-of-profile.
offered-profile-cir	4	In/out/uncolored (that corresponds to in- or out-of-profile from the ingress processing) entering policer	In/out exiting policer	Intended for when the policer can change the profile of packets to in- and out-of-profile.
offered-total-cir	2	Single counter entering policer	In/out exiting policer	—
offered-limited-capped-cir	4	In/out entering policer	In/out exiting policer	Intended for when the policer has <b>profile-capped</b> configured. The information is limited compared to <b>offered-profile-capped-cir</b> with the benefit of using one less stat resource.
offered-profile-capped-cir	5	In/out/uncolored (that corresponds to in- or out-of-profile from the ingress processing) entering policer	In/out exiting policer	Intended for when the policer has <b>profile-capped</b> configured.
offered-total-cir-exceed	3	Single counter entering policer	In/out/exceed exiting policer	Intended for when the policer is configured with <b>enable-exceed-pir</b> to forward packets that exceed its configured PIR or when traffic is egress reclassified to profile exceed.
offered-four-profile-no-cir	4	Inplus/in/out/exceed entering policer	Inplus/in/out/exceed entering policer	Intended to be used when the policer does not change the profile of the packets and traffic is egress reclassified

Stat Mode	Stat Resources	Traffic Counters (Packet/Octets)		Comments
		Offered	Dropped/Forwarded	
				to profile inplus and/or exceed.
offered-total-cir-four-profile	4	Single counter entering policer	Inplus/in/out/exceed exiting policer	Intended to be used when the policer can change the profile of the packet and traffic is egress reclassified to profile inplus.

The default **stat-mode** when a policer is created within the policy is **minimal**.

The **stat-mode** setting defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied. If insufficient policer counter resources exist to implement the override, the **stat-mode** override command will fail. The previous **stat-mode** setting active for the policer will continue to be used by the policer.

The **no** form of this command attempts to return the policer's **stat-mode** setting to **minimal**. The command will fail if insufficient policer counter resources exist to implement **minimal** where the QoS policer is currently applied and has a forwarding class mapping.

## Parameters

### no-stats

Counter resource allocation: 0

The policer does not have any forwarding plane counters allocated and cannot provide offered, discard, and forward statistics. A policer using **no-stats** cannot be a child to a parent policer and the policer's **parent** command will fail.

When **collect-stats** is enabled, no statistics are generated.

### minimal

Counter resource allocation: 1

This stat-mode provides the minimal accounting resource usage and counter information, and includes only the total offered, dropped and forwarded packet and octet counters for traffic entering (offered) and exiting (dropped/forwarded) the policer.

The default **stat-mode** for a policer is **minimal**. The **minimal** mode allocates one forwarding plane offered counter and one traffic manager discard counter. The forwarding counter is derived by subtracting the discard counter from the offered counter. The counters do not differentiate possible offered types and do not count different profile output. This does not prevent the policer from supporting different offered packet types and does not prevent the policer from supporting a CIR rate or using exceed PIR.

The counters displayed in the **show** output and those collected when **collect-stats** is enabled are described in [Table 165: Egress Accounting Statistics Collected in minimal stat-mode](#) (the actual fields collected depends on the **record** configured in the applied accounting policy).

Table 165: Egress Accounting Statistics Collected in minimal stat-mode

Dro. All	apd	AllPacketsDropped
	aod	AllOctetsDropped
For. All	apf	AllPacketsForwarded
	aof	AllOctetsForwarded

**offered-profile-no-cir**

Counter resource allocation: 2

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. inplus-profile traffic is counted with the in-profile counters and exceed-profile traffic is counted with the out-of-profile counters.

The **offered-profile-no-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-profile-no-cir** mode is most useful when profile-based offered, dropped and forwarded statistics are required from the egress policer, but a CIR or **enable-exceed-pir** is not being used to recolor the soft in-profile and out-of-profile packets. This mode does not prevent the policer from being configured with a CIR rate or using **enable-exceed-pir**.

This mode is intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in [Table 166: Egress Accounting Statistics Collected in offered-profile-no-cir stat-mode](#) (the actual fields collected depends on the **record** configured in the applied accounting policy).

### offered-profile-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer comprises of hard inplus/in/out/exceed and soft in/out. The offered counters cover traffic reclassified to in-profile (that includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (that includes traffic reclassified to exceed-profile), and traffic that has not been reclassified at egress (Uncolor). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-profile-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-profile-cir** mode is most useful when profile-based offered, dropped and forwarded stats are required from the egress policer and a CIR rate is being used to recolor the soft in-profile and out-of-profile packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in [Table 167: Egress Accounting Statistics Collected in offered-profile-cir stat-mode](#) (the actual fields collected depends on the **record** configured in the applied accounting policy).

	iof	InProfileOctetsForwarded
For. OutProf	opf	OutOfProfilePacketsForwarded
	oof	OutOfProfileOctetsForwarded

**offered-total-cir**

Counter resource allocation: 2

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, in-plus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

The **offered-total-cir** mode allocates two forwarding plane offered counters and two traffic manager discard counters.

The **offered-total-cir** mode is most useful when the policer is not receiving trusted in-profile or out-of-profile traffic and both high- and low-priority classifications are not being used on the untrusted packets and the offered packets are being applied to a defined CIR profiling rate. This mode does not prevent the policer from receiving trusted in-profile or out-of-profile packets and does not prevent the use of priority high or low classifications on the untrusted packets.

This mode is intended to be used without **profile-capped** or **enable-exceed-pir** configured within the policer as these could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in [Table 168: Egress Accounting Statistics Collected in offered-total-cir stat-mode](#) (the actual fields collected depends on the **record** configured in the applied accounting policy).

#### offered-limited-capped-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer comprises of hard inplus/in/out/exceed and soft in/out. The offered counters cover in-profile traffic (that includes traffic reclassified to inplus-profile) and out-of-profile traffic (that includes traffic reclassified to exceed-profile). In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-limited-capped-cir** is defined, the system creates four forwarding plane offered-output counters in the network processor and three discard counters in the traffic manager.

The **offered-limited-capped-cir** mode is similar to the **offered-profile-capped-cir** mode except that it combines **soft-in-profile** with **profile in** and **soft-out-of-profile** with **profile out** and eliminates the offered-undefined statistic.

The impact of using **offered-limited-capped-cir** stat-mode while profile-capped mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and **soft-in-profile** will be treated as offered-in instead of offered-undefined.

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in [Table 169: Egress Accounting Statistics Collected in offered-limited-capped-cir stat-mode](#) (the actual fields collected depends on the **record** configured in the applied accounting policy).

For. OutProf	opf	OutOfProfilePacketsForwarded
	oof	OutOfProfileOctetsForwarded

#### offered-profile-capped-cir

Counter resource allocation: 5

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer when egress reclassification is performed so that the traffic entering the policer is comprised of hard inplus, hard in, hard out, and hard exceed, as well as soft in and soft out. The offered counters cover traffic reclassified to in-profile (that includes traffic reclassified to inplus-profile), traffic reclassified to out-of-profile (that includes traffic reclassified to exceed-profile), and traffic that has not been reclassified at egress (uncolor).

In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter and exceed-profile traffic is counted with the out-of-profile counter.

When **offered-profile-capped-cir** is defined, the system creates five offered-output counters in the forwarding plane and five discard counters in the traffic manager.

The **offered-profile-capped-cir** mode is similar to the **offered-profile-cir** mode except that it includes support for **profile inplus**, **profile in**, and **soft-in-profile** that may be output as out-of-profile due to enabling **profile-capped** mode on the ingress policer.

The impact of using **offered-profile-capped-cir** stat-mode while **profile-capped** mode is disabled is that one of the counting resources in the forwarding plane and traffic manager will not be used and soft-in-profile will be treated as offered-in (hard in-profile) instead of offered-undefined (uncolored).

This mode is intended to be used with **profile-capped** configured within the policer but without **enable-exceed-pir** configured as this could cause the traffic profile to be modified by the policer in a way that is not accounted for in the statistics.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in [Table 170: Egress Accounting Statistics Collected in offered-profile-capped-cir stat-mode](#) (the actual fields collected depends on the **record** configured in the applied accounting policy).

	iof	InProfileOctetsForwarded
For. OutProf	opf	OutOfProfilePacketsForwarded
	oof	OutOfProfileOctetsForwarded

**offered-total-cir-exceed**

Counter resource allocation: 3

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. In the dropped and forwarded counters, inplus-profile traffic is counted with the in-profile counter. The **offered-total-cir-exceed** mode allocates three forwarding plane offered counters and three traffic manager discard counters.

The **offered-total-cir-exceed** mode is similar to the **offered-total-cir** mode except that it includes support for forwarded and dropped counters for **profile exceed**.

This mode is intended to be used when the policer is configured with **enable-exceed-pir** to forward packets that exceed its configured PIR or when traffic is egress reclassified to profile exceed. The mode gives the forwarded and dropped counters per profile (in, out, exceed). It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in [Table 171: Egress Accounting Statistics Collected in offered-total-cir-exceed stat-mode](#) (the actual fields collected depends on the **record** configured in the applied accounting policy).

#### offered-four-profile-no-cir

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering the policer. Offered, dropped, and forwarded counters are provided for inplus-profile, in-profile, out-of-profile, and exceed-profile traffic.

The **offered-four-profile-no-cir** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-four-profile-no-cir** mode is similar to the **offered-profile-no-cir** mode except that it includes support for offered, dropped and forwarded counters for both profile inplus and profile exceed.

This mode is intended to be used when traffic is egress reclassified to profile inplus and/or exceed. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in [Table 172: Egress Accounting Statistics Collected in offered-four-profile-no-cir stat-mode](#) (the actual fields collected depends on the **record** configured in the applied accounting policy).

Table 172: Egress Accounting Statistics Collected in offered-four-profile-no-cir stat-mode

### offered-total-cir-four-profile

Counter resource allocation: 4

This stat-mode provides offered, dropped, and forwarded packet and octet counters corresponding to the profile of traffic entering (offered) and exiting (dropped/forwarded) the policer. All offered traffic is provided in a single counter. There is a separate dropped and forwarded counter for inplus, in, out, and exceed-profile traffic.

The **offered-total-cir-four-profile** mode allocates four forwarding plane offered counters and four traffic manager discard counters.

The **offered-total-cir-four-profile** mode is similar to the **offered-total-cir** except that it includes support for forwarded and dropped counters for both inplus-profile and exceed-profile.

This mode is intended to be used when traffic is egress reclassified to inplus-profile. It is also intended to be used without **profile-capped** configured within the policer as it could cause the traffic profile to be modified by the policer. This stat-mode is not supported for dynamic policers.

The counters displayed in the show output and those collected when **collect-stats** is enabled are described in [Table 173: Egress Accounting Statistics Collected in offered-total-cir-four-profile stat-mode](#) (the actual fields collected depends on the **record** configured in the applied accounting policy).

configure router mpls lsp ingress-statistics stat-mode

configure router mpls lsp-template egress-statistics stat-mode

## Description

This command sets the mode used for collecting LSP statistics.

The **no** form of this command reverts to the default.

## Default

stat-mode per-fc

## Parameters

### per-fc

Specifies that RSVP-TE statistics will be collected per FC.

### aggregate

Specifies that SR-TE statistics will be collected as an aggregate across all FCs.

## Platforms

All

- configure router mpls lsp-template egress-statistics stat-mode

## 23.420 state

state

## Syntax

[no] state

## Context

**[Tree]** (config>subscr-mgmt>wlan-gw>ue-query state)

## Full Context

```
configure subscriber-mgmt wlan-gw ue-query state
```

## Description

This command enables matching on a specific UE state. Multiple states can be provisioned. The **no** form of this command disables matching on the specified UE state (all UEs match).

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## state

## Syntax

```
state state
```

```
no state
```

## Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from state)

## Full Context

```
configure router policy-options policy-statement entry from state
```

## Description

This command identifies in resilient gateways which routes are associated with an active context and which routes are associated with a standby context.

## Default

```
no state
```

## Parameters

### state

Specifies the state.

- Values**
- srrp-master — This is used in non-CUPS BNG resiliency to identify routes associated with an active SRRP instance.
  - srrp-non-master — This is used in non-CUPS BNG resiliency to identify routes associated with a standby SRRP instance.
  - ipsec-master-with-peer — This is used in stateful multi-chassis IPsec (MC-IPsec) redundancy to identify routes associated with an active MC-IPsec node with a reachable peer.
  - ipsec-non-master — This is used in stateful MC-IPsec redundancy to identify routes associated with a standby MC-IPsec node.

**ipsec-master-without-peer** — This is used in stateful MC-IPsec redundancy to identify routes associated with an active MC-IPsec node without a reachable peer.

**fsg-active** — This is used in BNG CUPS inter-BNG-UP resiliency to identify routes associated with an FSG on the active BNG-UP. This covers all session-related routes, including framed routes, IPv6 gateway addresses, and aggregated routes. It does not include loopback addresses.

**fsg-active-path-restoration** — This is used in BNG CUPS inter-BNG-UP resiliency to identify routes associated with an FSG on an active BNG-UP that is in a headless state. This covers all session-related routes, including framed routes, IPv6 gateway addresses, and aggregated routes. It does not include loopback addresses.

**fsg-standby** — This is used in BNG CUPS inter-BNG-UP resiliency to identify routes associated with an FSG on the standby BNG-UP. This covers all session-related routes, including framed routes, IPv6 gateway addresses, and aggregated routes. It does not include loopback addresses.

## 23.422 state-timer

### state-timer

#### Syntax

**state-timer** *seconds* [ **action** *action* ]

**no state-timer**

#### Context

[\[Tree\]](#) (config>router>pcep>pcc state-timer)

#### Full Context

configure router pcep pcc state-timer

#### Description

This command configures the state timer for PCE-initiated LSPs. The state timer must be set to a value greater than the redelegation timer.

The **no** form of the command sets this value to the default.

#### Default

state-timer 180 action remove

#### Parameters

##### *seconds*

Specifies the number of seconds before the state timer expires.

**Values** 1 to 3600

##### *action*

Specifies the actions that are taken on undelegated LSPs upon the state timer expiration.

**Values** remove, none

**Default** remove

#### Platforms

All

## static

## Syntax

**static** *ip-address ieee-address*

**no static** *ip-address*

## Context

[\[Tree\]](#) (config>service>vpls>proxy-arp static)

## Full Context

configure service vpls proxy-arp static

## Description

This command configures static entries to be added to the table. A static MAC-IP entry requires the addition of the MAC address to the FDB as either learned or CStatic (conditional static MAC) in order to become active.

## Parameters

### *ip-address*

Specifies the IPv4 address for the static entry.

### *ieee-address*

Specifies a 48-bit MAC address in the form xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx, where xx represents a hexadecimal number.

## Platforms

All

## static

### Syntax

**static** *ipv6-address ieee-address* {**host** | **router**}

**no static** *ipv6-address*

### Context

[\[Tree\]](#) (config>service>vpls>proxy-nd static)

### Full Context

configure service vpls proxy-nd static

### Description

This command configures static entries to be added to the table. A static MAC-IP entry requires the addition of the MAC address to the FDB as either dynamic or CStatic (Conditional Static MAC) in order to become active. Along with the IPv6 and MAC, the entry must also be configured as either host or router. This will determine if the received NS for the entry will be replied with the R flag set to 1 (router) or 0 (host).

### Parameters

#### *ipv6-address*

Specifies the IPv6 address for the static entry.

#### *ieee-address*

Specifies a 48-bit MAC address in the form xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx, where xx represents a hexadecimal number.

#### **host**

Specifies that the entry is type "host".

#### **router**

Specifies that the entry is type "router".

## Full Context

configure application-assurance group transit-ip-policy static-aa-sub

## Description

This command configures static transit aa-sub with a name and an app-profile. A new transit sub with both a name and an app-profile is configured with the create command. Static transit aa-sub must have an explicitly assigned app-profile. An existing transit sub can optionally be assigned a different app-profile, or this command can be used to enter the static-aa-sub context.

The **no** form of this command deletes the named static transit aa-sub from the configuration.

## Parameters

### ***transit-aasub-name***

Specifies the name of a transit subscriber up to 32 characters in length.

### ***app-profile-name***

Specifies the name of an existing application profile up to 32 characters in length.

### **create**

Keyword used to create a new app-profile entry.

## 23.428 static-arp

### static-arp

#### Syntax

```
static-arp ieee-mac-address unnumbered
static-arp ip-address ieee-mac-address
no static-arp [ieee-mac-address] unnumbered
no static-arp ip-address [ieee-mac-address]
```

#### Context

[\[Tree\]](#) (config>service>vprn>if static-arp)

[\[Tree\]](#) (config>service>ies>if static-arp)

#### Full Context

configure service vprn interface static-arp

configure service ies interface static-arp

#### Description

This command configures a static address resolution protocol (ARP) entry associating a subscriber IP address with a MAC address for the core router instance. This static ARP appears in the core routing ARP table. A static ARP can only be configured if it exists on the network attached to the IP interface.

If an entry for a particular IP address already exists and a new MAC address is configured for the IP address, the existing MAC address will be replaced with the new MAC address.

The **no** form of this command removes a static ARP entry.

#### Parameters

##### *ip-address*

Specifies the IP address for the static ARP in IP address dotted decimal notation.

##### *ieee-mac-address*

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff, where aa, bb, cc, dd, ee and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

##### *unnumbered*

Specifies the static ARP MAC for an unnumbered interface. Unnumbered interfaces support dynamic ARP. Once this command is configured, it overrides any dynamic ARP.

#### Platforms

All

## static-arp

### Syntax

```
static-arp ieee-mac-addr unnumbered
static-arp ip-address ieee-mac-address
no static-arp [ieee-mac-addr] unnumbered

**static-arp** *ieee-address* **unnumbered**

**no static-arp** **unnumbered**

### Context

[\[Tree\]](#) (config>router>if static-arp)

### Full Context

configure router interface static-arp

## Description

This command configures a static Address Resolution Protocol (ARP) entry associating an IP address with a MAC address for the core router instance. This static ARP appears in the core routing ARP table. A static ARP can only be configured if it exists on the network attached to the IP interface.

If an entry for a specific IP address already exists and a new MAC address is configured for the IP address, the existing MAC address is replaced by the new MAC address.

The number of static-arp entries that can be configured on a single node is limited to 1000.

Static ARP is used when a router needs to know about a device on an interface that cannot or does not respond to ARP requests. Therefore, the router configuration can state that if it has a packet that has a certain IP address to send it to the corresponding ARP address. Use proxy ARP so the router responds to ARP requests on behalf of another device.

The **no** form of this command removes a static ARP entry.

## Parameters

### *ieee-address*

Specifies the 48-bit MAC address for the static ARP in the form *aa:bb:cc:dd:ee:ff* or *aa-bb-cc-dd-ee-ff*, where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

### **unnumbered**

Specifies the static ARP MAC for an unnumbered interface. Unnumbered interfaces support dynamic ARP. Once this command is configured, it overrides any dynamic ARP.

## Platforms

## 23.430 static-entry

### static-entry

#### Syntax

**static-entry** *ip-prefix/ip-prefix-length upto prefix-length2 origin-as as-number* [{**valid** | **invalid**}]

**no static-entry** *ip-prefix/ip-prefix-length upto prefix-length2 origin-as as-number*

#### Context

[\[Tree\]](#) (config>router>origin-validation static-entry)

#### Full Context

configure router origin-validation static-entry

#### Description

This command configures a static VRP entry indicating that a specific origin AS is either valid or invalid for a specific IP prefix range. Static VRP entries are stored along with dynamic VRP entries (learned from local cache servers using the RPKI-Router protocol) in the origin validation database of the router. This database is used for determining the **origin-validation** state of IPv4 and/or IPv6 BGP routes received over sessions with the **enable-origin-validation** command configured.

Static entries can only be configured under the **config>router>origin-validation** context of the base router.

#### Parameters

##### *ip-prefix/ip-prefix-length*

Specifies an IPv4 or IPv6 address with a minimum prefix length value.

**Values** 60 to 3600

##### *prefix-length2*

Specifies the maximum prefix length.

**Values** 1 to 128

##### *as-number*

Specifies as-number.

**Values** 0 to 4294967295

##### **valid**

Specifies a keyword meaning the static entry expresses a valid combination of origin AS and prefix range.

**invalid**

Specifies a keyword meaning the static entry expresses an invalid combination of origin AS and prefix range.

**no static-host ip** *ip-prefix[/prefix-length]* [**mac** *ieee-address*]

**no static-host all** [**force**]

**no static-host ip** *ip-prefix[/prefix-length]*

#### Context

**[Tree]** (config>service>vprn>sub-if>grp-if>sap static-host)

**[Tree]** (config>service>ies>sub-if>grp-if>sap static-host)

#### Full Context

configure service vprn subscriber-interface group-interface sap static-host

configure service ies subscriber-interface group-interface sap static-host

#### Description

This command creates a static subscriber host for the SAP. Static subscriber hosts may be used by the system for various purposes. Applications within the system that make use of static host entries include anti-spoof, ARP reply agent and source MAC population into the VPLS forwarding database.

Multiple static hosts may be defined on the SAP. Each host is identified by either a source IP address, a source MAC address or both a source IP and source MAC address. Every static host definition must have at least one address defined, IP or MAC.

Static hosts can exist on the SAP even with anti-spoof and ARP reply agent features disabled. When enabled, each feature has different requirements for static hosts.

The **no** form of this command removes a static entry from the system. The specified *ip-address* and *mac-address* must match the host's exact IP and MAC addresses as defined when it was created. When a static host is removed from the SAP, the corresponding anti-spoof filter entry and/or FDB entry is also removed.

#### Parameters

***ip-prefix[/prefix-length]***

Specifies information for the specified IP address and mask.

**mac-address**

Specifies a MAC address. The MAC address must be specified for **anti-spoof mac**, and **anti-spoof ip-mac** and **arp-reply-agent** (**arp-reply-agent** is supported by the 7450 ESS only). Multiple static hosts may be configured with the same MAC address given that each definition is distinguished by a unique IP address.

Every static host definition must have at least one address defined, IP or MAC.

**force**

Specifies the forced removal of the static host addresses.

**create**

Keyword used to create the static host instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**static-host****Syntax**

**static-host ip** *ip-address* [**mac** *ieee-address*] [**create**]

**Description**

This command creates a static subscriber host for the SAP. Static subscriber hosts may be used by the system for various purposes. Applications within the system that make use of static host entries include anti-spoof, ARP reply agent and source MAC population into the VPLS forwarding database.

Multiple static hosts may be defined on the SAP. Each host is identified by either a source IP address, a source MAC address or both a source IP and source MAC address. Every static host definition must have at least one address defined, IP or MAC.

Static hosts can exist on the SAP even with anti-spoof and ARP reply agent features disabled. When enabled, each feature has different requirements for static hosts.

The **no** form of this command removes a static entry from the system. The specified *ip-address* and *mac-address* must match the host's exact IP and MAC addresses as defined when it was created. When a static host is removed from the SAP, the corresponding anti-spoof filter entry and/or FDB entry is also removed.

## Parameters

### *ip-address*

Specify this optional parameter when defining a static host. The IP address must be specified for **anti-spoof ip**, **anti-spoof ip-mac** and **arp-reply-agent** (**arp-reply-agent** is supported by the 7450 ESS only). Only one static host may be configured on the SAP with a given IP address.

### *mac-address*

Specify this optional parameter when defining a static host. The MAC address must be specified for **anti-spoof mac**, and **anti-spoof ip-mac** and **arp-reply-agent** (**arp-reply-agent** is supported by the 7450 ESS only). Multiple static hosts may be configured with the same MAC address given that each definition is distinguished by a unique IP address.

Every static host definition must have at least one address defined, IP or MAC.

### **force**

Specifies the forced removal of the static host addresses.

### **create**

Keyword used to create the static host instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## 23.435 static-label-range

### static-label-range

**Syntax**

**static-label-range** *static-range*

**no static-label-range**

**Context**

[\[Tree\]](#) (config>router>mpls-labels static-label-range)

## Full Context

```
configure router mpls-labels static-label-range
```

## Description

This command configures the range of MPLS static label values shared among static LSP, MPLS-TP LSP, and static service VC label. Once this range is configured, it is reserved and cannot be used by other protocols such as RSVP, LDP, BGP, or Segment Routing to assign a label dynamically.

## Default

```
static-label-range 18400
```

## Parameters

### *static-range*

Specifies the size of the static label range in number of labels. The minimum label value in the range is 32. The maximum label value is therefore computed as {32+ static-range-1}.

**Values** 0 to 262112

**Default** 18400

## Platforms

All

## 23.436 static-lsp

### static-lsp

## Syntax

```
[no] static-lsp lsp-name
```

## Context

[\[Tree\]](#) (config>router>mpls static-lsp)

## Full Context

```
configure router mpls static-lsp
```

## Description

This command is used to configure a static LSP on the ingress router. The static LSP is a manually set up LSP where the nexthop IP address and the outgoing label (push) must be specified.

The **no** form of this command deletes this static LSP and associated information.

The LSP must be shutdown first in order to delete it. If the LSP is not shut down, the **no static-lsp /sp-name** command does nothing except generate a warning message on the console indicating that the LSP is administratively up.

### Parameters

#### *lsp-name*

Specifies the name that identifies the LSP.

**Values** Up to 32 alphanumeric characters.

### Platforms

All

## 23.437 static-lsp-fast-retry

### static-lsp-fast-retry

#### Syntax

**static-lsp-fast-retry** *seconds*

**no static-lsp-fast-retry**

#### Context

[\[Tree\]](#) (config>router>mpls static-lsp-fast-retry)

#### Full Context

configure router mpls static-lsp-fast-retry

#### Description

This command specifies the value used as the fast retry timer for a static LSP.

When a static LSP is trying to come up, the MPLS request for the ARP entry of the LSP next-hop may fail when it is made while the next-hop is still down or unavailable. In that case, MPLS starts a retry timer before making the next request. This enhancement allows the user to configure the retry timer, so that the LSP comes up as soon as the next-hop is up.

The **no** form of this command reverts to the default.

#### Default

no static-lsp-fast-retry

#### Parameters

#### *seconds*

Specifies the value (in s), used as the fast retry timer for a static LSP.

**Values** 1 to 30**Platforms**

All

**23.438 static-mac****static-mac****Syntax****static-mac** *ieee-mac-address* [**create**]**no static-mac** *ieee-mac-address***Context****[Tree]** (config>service>vpls>spoke-sdp static-mac)**[Tree]** (config>service>vpls>mesh-sdp static-mac)**[Tree]** (config>service>vpls>sap static-mac)**Full Context**

configure service vpls spoke-sdp static-mac

configure service vpls mesh-sdp static-mac

configure service vpls sap static-mac

**Description**

This command creates a remote static MAC entry in the Virtual Private LAN Service (VPLS) forwarding database (FDB) associated with the Service Distribution Point (SDP).

In a VPLS service, MAC addresses are associated with a Service Access Point (SAP) or with a Service Distribution Point (SDP). MACs associated with a SAP are classified as local MACs, and MACs associated with an SDP are remote MACs.

Local and remote static MAC entries create a permanent MAC address to SDP association in the forwarding database for the VPLS instance so that MAC address is not learned on the edge device.

**Note:**

Static MAC definitions on one edge device are not propagated to other edge devices participating in the VPLS instance, that is, each edge device has an independent forwarding database for the VPLS.

Only one static MAC entry (local or remote) can be defined per MAC address per VPLS instance.

By default, no static MAC address entries are defined for the SDP.

The **no** form of this command deletes the static MAC entry with the specified MAC address associated with the SDP from the VPLS forwarding database.

## Parameters

### *ieee-mac-address*

Specifies the 48-bit MAC address for the static ARP in the form *aa:bb:cc:dd:ee:ff* or *aa-bb-cc-dd-ee-ff* where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

### **create**

Keyword used to create the static MAC instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## Platforms

All

## static-mac

## Syntax

**static-mac**

## Context

[\[Tree\]](#) (config>service>vpls static-mac)

## Full Context

configure service vpls static-mac

## Description

A set of conditional static MAC addresses can be created within a VPLS supporting BGP-EVPN. Conditional Static Macs are also supported in B-VPLS with SPBs. Unless they are configured as **black-hole**, conditional Static Macs are dependent on the SAP/SDP state.

This command allows the assignment of a set of conditional Static MAC addresses to a SAP/ spoke-SDP or **black-hole**. In the FDB, the static MAC is then associated with the active SAP or spoke-SDP.

When configured in conjunction with SPBM services, Static MACs are used for PBB Epipe and I-VPLS services that may terminate external to SPBM. If this is configured under a Control B-VPLS the interface referenced will not use IS-IS for this neighbor. This may also be configured under a User B-VPLS where the corresponding interface is not supported under the Control B-VPLS.

Static MACs configured in a BGP-EVPN service are advertised as protected (EVPN will signal the MAC as protected).

## Platforms

```

## Full Context

```
configure application-assurance group transit-prefix-policy static-remote-aa-sub
```

## Description

This command configures static remote transit aa-sub with a name and an app-profile. Remote transit subscribers are configured for sites on the opposite side of the system as the parent SAP/spoke- SDP. A new remote transit sub with both a name and an app-profile is configured with the create command. Static

remote transit aa-sub must have an explicitly assigned app-profile. An existing remote transit sub can optionally be assigned a different app-profile.

The **no** form of this command removes the name from the transit prefix policy.

### Parameters

***transit-aasub-name***

Specifies a transit aasub-name up to 32 characters.

***app-profile-name***

Specifies the name of an existing application profile up to 32 characters.

**create**

Keyword used to create a new app-profile entry.

## 23.442 static-route

### static-route

#### Syntax

[no] **static-route** *route-name*

#### Context

[\[Tree\]](#) (config>service>pw-routing static-route)

#### Full Context

configure service pw-routing static-route

#### Description

This command configures a static route to a next hop S-PE or T-PE. Static routes may be configured on either S-PEs or T-PEs.

A default static route is entered as follows:

```
static-route 0:0:next_hop_ip_address
```

or

```
static-route 0:0.0.0.0:next_hop_ip_address
```

The **no** form of this command removes a previously configured static route.

### Parameters

***route-name***

Specifies the static pseudowire route.

Values			
route-name		<global-id>:<prefix>:<next-hop-ip_addr>	
global-id		0 to 4294967295	
prefix		a.b.c.d   0 to 4294967295	
next-hop-ip_addr		a.b.c.d	

## Platforms

## Syntax

[no] **static-route** *ip-prefix/ip-prefix-length* **next-hop** *ip-address*

## Context

[\[Tree\]](#) (bof static-route)

## Full Context

bof static-route

## Description

This command creates a **static route** entry for the CPM management Ethernet port in the running configuration and the Boot Option File (BOF).

This command allows manual configuration of static routing table entries. These static routes are only used by traffic generated by the CPM Ethernet port. To reduce configuration, manual address aggregation should be applied where possible.

A maximum of 10 static routes can be configured on the CPM port.

The **no** form of this command deletes the static route.

## Default

no static-route

## Parameters

### *ip-prefix/ip-prefix-length*

Specifies the destination address of the static route in dotted decimal notation.

Values			
<i>ip-prefix/ip-prefix-length</i>	ipv4-prefix		a.b.c.d (host bits must be 0)
	ipv4-prefix-le		0 to 32

	ipv6-prefix	x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x: [0 to FFFF]H d: [0to 255]D
	ipv6-prefix-le	0 to128
<i>ip-address</i>	ipv4-address	a.b.c.d
	ipv6-address	x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x: [0 to FFFF]H d: [0 to 255]D

**Note:**

IPv6 is applicable to the 7750 SR and 7950 XRS only.

***mask***

Specifies the subnet mask, expressed as an integer or in dotted decimal notation.

**Values** 1 to 32 (mask length), 128.0.0.0 to255.255.255.255 (dotted decimal)***ip-address***

Specifies the next hop IP address used to reach the destination.

**Platforms**

## 23.443 static-route-entry

### static-route-entry

**Syntax****static-route-entry** *ip-prefix|prefix-length* [**mcast**]**no static-route-entry** *ip-prefix|prefix-length* [**mcast**]**Context****[Tree]** (config>service>vprn static-route-entry)**Full Context**

configure service vprn static-route-entry

## Description

This command creates a static route entry for both the network and access routes. A prefix and netmask must be specified.

Once the static route context for the specified prefix and netmask has been created, additional parameters associated with the static route(s) may be specified through the inclusion of additional static-route parameter commands.

The **no** form of this command deletes the static route entry. If a static route needs to be removed when multiple static routes exist to the same destination, then as many parameters to uniquely identify the static route must be entered.

IPv6 static routes are not supported on the 7450 ESS except in mixed mode.

## Default

No static routes are defined.

## Parameters

### *ip-prefix/prefix-length*

The destination address of the static route.

<b>Values</b>	The following values apply to the 7750 SR and 7950 XRS:	
	ipv4-prefix	a.b.c.d (host bits must be 0)
	ipv4-prefix-length	0 to 32
	ipv6-prefix	x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x: [0 to FFFF]H d: [0 to 255]D
	ipv6-prefix-length	0 to 128

<b>Values</b>	The following values apply to the 7450 ESS:	
	ipv4-prefix	a.b.c.d (host bits must be 0)
	ipv4-prefix-length	0 to 32

### **mcast**

Specifies that the associated static route should be populated in the associated VPRN multicast route table.

## Platforms

All

## static-route-entry

### Syntax

[no] static-route-entry *ip-prefix/prefix-length* [mcast]

### Context

[Tree] (config>router static-route-entry)

### Full Context

configure router static-route-entry

### Description

This command creates a static route entry for both the network and access routes. A prefix and netmask must be specified.

After the static route context for the specified prefix and netmask has been created, additional parameters associated with the static routes may be specified through the inclusion of additional static route parameter commands.

The **no** form of this command deletes the static route entry. If a static route needs to be removed when multiple static routes exist to the same destination, then as many parameters to uniquely identify the static route must be entered.

### Default

No static routes are defined.

### Parameters

#### *ip-prefix/prefix-length*

Specifies the destination address of the static route.

**Values** The following values apply to the 7750 SR and 7950 XRS:

ipv4-prefix	a.b.c.d (host bits must be 0)	
ipv4-prefix-length	0 to 32	
ipv6-prefix	x:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:d.d.d.d	
	x	[0 to FFFF]H
	d	[0 to 255]D
ipv6-prefix-length	0 to 128	

**Values** The following values apply to the 7450 ESS:

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32

**ip-address**

Specifies the IP address of the IP interface. The *ip-addr* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.

**Values** The following values apply to the 7750 SR and 7950 XRS:

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x[-interface]
	x:x:x:x:x:d.d.d.d[-interface]
	x: [0..FFFF]H
	d: [0..255]D
	<i>interface</i> : 32 characters maximum, mandatory for link local addresses

**Values** The following value applies to the 7450 ESS:

ipv4-address	a.b.c.d (host bits must be 0)
--------------	-------------------------------

**mcast**

Indicates that static route being configured is used for multicast table only.

**23.444 static-route-hold-down****static-route-hold-down****Syntax**

**static-route-hold-down** *initial initial multiplier multiplier max-value max-value*  
**no static-route-hold-down**

**Context**

[\[Tree\]](#) (config>router static-route-hold-down)

## Full Context

configure router static-route-hold-down

## Description

This command enables the hold down time feature globally for static routes in the system.

The static route hold-down time is a mechanism to protect from rapid, fluctuating state changes of static routes resulting from issues with reachability because of link flap.

This command applies to all static routes in the VPRN and the base router instance in which this hold-down time is configured.

The **no** form of this command disables the hold down time feature globally for static routes in the system.

## Default

no static-route-hold-down

## Parameters

### *initial*

Specifies the initial value of the hold down time, in seconds, globally for static routes in the system.

**Values** 1 to 65535

### *multiplier*

Specifies the multiplier value of the hold down time feature globally for static routes in the system.

**Values** 1 to 10

### *max-value*

Specifies the maximum value of the hold down time, in seconds, globally for static routes in the system.

**Values** 1 to 65535

## 23.447 static-tunnel-redundant-next-hop

### static-tunnel-redundant-next-hop

#### Syntax

**static-tunnel-redundant-next-hop** *ip-address*

**no static-tunnel-redundant-next-hop**

#### Context

**[Tree]** (config>service>ies>if static-tunnel-redundant-next-hop)

**[Tree]** (config>service>vprn>if static-tunnel-redundant-next-hop)

#### Full Context

configure service ies interface static-tunnel-redundant-next-hop

configure service vprn interface static-tunnel-redundant-next-hop

#### Description

This command specifies redundant next-hop address on public or private IPsec interface (with public or private tunnel-sap) for static IPsec tunnel. The specified next-hop address will be used by standby node to shunt traffic to master in case of it receives them. Refer to the *7450 ESS, 7750 SR, and VSR Multiservice Integrated Service Adapter and Extended Services Appliance Guide* for information about IPsec commands and descriptions.

The next-hop address will be resolved in routing table of corresponding service.

The **no** form of this command removes the address from the interface configuration.

#### Parameters

***ip-address***

Specifies the static ISA tunnel redundant next-hop address.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.448 station

### station

#### Syntax

**station** *station-name* [**create**]

**no station** *station-name*

## Context

[\[Tree\]](#) (config>bmp station)

## Full Context

configure bmp station

## Description

The command configures the BMP monitoring station name.

The **no** form of this command removes the station name from the configuration.

## Parameters

### *station-name*

Specifies the station name of the BMP monitoring station up to 32 characters.

### **create**

Keyword used to create the station name. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## Platforms

All

## station

## Syntax

[\[Tree\]](#) (config>service>vprn>bgp>group>neighbor>monitor station)

[\[Tree\]](#) (config>router>bgp>group>monitor station)

## Full Context

configure router bgp group neighbor monitor station

configure router bgp monitor station

configure service vprn bgp group monitor station

configure service vprn bgp group neighbor monitor station

configure router bgp group monitor station

## Description

This command configures the set of BMP monitoring stations for which BMP messages are to be sent, at the global BGP instance level, per group or for a particular neighbor.

Whatever value is configured for the station parameter at the most specific BGP hierarchy level is used.

- If a station list or the **no station** command is configured at a neighbor context, then that value is used.
- If **no station** command is configured at the neighbor context, the group value is used.
- If a station list or the **no station** command is configured at a group context, then that value is used.
- If **no station** command is configured at the group context, the global value is used.
- If a station list or the **no station** command is configured at the global context, then that value is used.
- If **no station** command is configured at the global context, then a **no station** is assumed.

The **no** form of this command disables sending BMP messages to BMP monitoring stations.

## Parameters

### *name*

Specifies up to eight station names up to 32 characters. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### **all**

Specifies all configured stations.

## Platforms

All

## 23.449 station-address

### station-address

## Syntax

**station-address** *ip-address* | *ipv6-address* **port** *port*

**no station-address**

## Context

[\[Tree\]](#) (config>bmp>station>connection station-address)

## Full Context

configure bmp station connection station-address

## Description

This command configures the IP address and TCP port number of the remote BMP monitoring station. This is a mandatory parameter and must be configured before the associated station can transitioned out of the shut down state.

The **no** form of this command removes the configured station IP address and port number for the BMP session. The **no station-address** command cannot be accepted unless the BMP or station instance is shut down.

## Parameters

### *ip-address*

Specifies the station address expressed in dotted decimal notation. Allowed value is a valid routable IP address on the router, either an interface or system IP address.

- Values** ipv4-address:
- a.b.c.d (host bits must be 0)

### *ipv6-address*

Specifies the station address expressed in dotted decimal notation. Allowed value is a valid routable IPv6 address on the router, either an interface or system IPv6 address.

- Values** ipv6-address:
- x:x:x:x:x:x:x (eight 16-bit pieces)
  - x:x:x:x:x:d.d.d.d
  - x: [0 to FFFF]H
  - d: [0 to 255]D

### *port*

Specifies the TCP (destination) port number to be used when establishing the connection to the associated BMP station.

- Values** 1 to 65535

## Context

[\[Tree\]](#) (debug>wlan-gw>group statistic)

## Full Context

debug wlan-gw group statistic

## Description

This command enables debugging of the specified statistic. The first packet that causes an increase of the specified statistic is shown in debug output. After the first packet, debugging of the counter is stopped.

## Parameters

### *type*

Displays the type of statistic to be debugged; for example, DHCP or RADIUS.

**Values** packet-errors, host-errors, bd-errors, forwarding, reassembly, aa, radius, arp, dhcp, dhcp6, icmp, icmp6

### *name*

Specifies the name, up to 256 characters, of the statistic within that group. For a complete list, see the command **show isa wlan-gw-group wlan-gw-group-id member member-id statistics**.

### Syntax

**stats-report-interval** [*seconds*]

**no stats-report-interval**

### Context

**[Tree]** (config>bmp>station stats-report-interval)

### Full Context

configure bmp station stats-report-interval

### Description

This command configures the frequency of sending statistics reporting messages to the BMP monitoring station.

The **no** form of this command removes the interval from the configuration.

### Parameters

#### *seconds*

Specifies the frequency of sending statistics reporting messages, in seconds, to the BMP monitoring station.

**Values** 15 to 65535

### Platforms

All

## 23.454 stats-type

## stats-type

### Syntax

**stats-type** {*time* | *volume-time*}

**no stats-type**

### Context

**[Tree]** (config>service>dynsvc>acct-1 stats-type)

**[Tree]** (config>service>dynsvc>acct-2 stats-type)

### Full Context

configure service dynsvc acct-1 stats-type

```
configure service dynamic-services dynamic-services-policy accounting-2 stats-type
```

### Description

This command configures the type of statistics to be reported in dynamic data services RADIUS accounting. A RADIUS specified Stats Type overrides the CLI configured value.

The **no** form of this command resets the default value.

### Default

```
stats-type volume-time
```

### Parameters

#### *time*

Only report Session-Time in the RADIUS Accounting Interim-Update and Stop message.

#### *volume-time*

Report both Session-Time and Volume counter attributes in the RADIUS. Accounting Interim-Update and Stop messages.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## stats-type

### Syntax

```
stats-type {volume-time | time}
```

```
no stats-type
```

### Context

[\[Tree\]](#) (config>service>dynsvc>ladb>user>idx>acct stats-type)

### Full Context

```
configure service dynamic-services local-auth-db user-name index accounting stats-type
```

### Description

This command specifies whether dynamic service accounting should be enabled or disabled for this destination. RADIUS accounting is enabled by specifying the stats type: volume and time or time only. This command overrides the local configured value in the dynamic services policy.

The **no** form of this command disables RADIUS accounting (**stats-type off**).

### Parameters

#### *volume-time | time*

Enables RADIUS accounting for this dynamic service and specifies if volume counters should be included (**volume-time**) or time only (**time**) in the RADIUS accounting messages.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**[Tree]** (config>service>vprn>if>sap>ipsec-tun>dyn>cert status-verify)

**[Tree]** (config>service>ies>if>ipsec>ipsec-tunnel>dyn>cert status-verify)

#### Full Context

configure ipsec ipsec-transport-mode-profile dynamic-keying cert status-verify

configure service vprn interface sap ipsec-gw cert status-verify

configure service ies interface sap ipsec-gw cert status-verify

configure router interface ipsec ipsec-tunnel dynamic-keying cert status-verify

configure service vprn interface ipsec ipsec-tunnel dynamic-keying cert status-verify

configure service vprn interface sap ipsec-tunnel dynamic-keying cert status-verify

configure service ies interface ipsec ipsec-tunnel dynamic-keying cert status-verify

#### Description

Commands in this context configure Certificate Status Verification (CSV) parameters.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure ipsec ipsec-transport-mode-profile dynamic-keying cert status-verify
- configure service ies interface sap ipsec-gw cert status-verify
- configure service vprn interface sap ipsec-gw cert status-verify
- configure service vprn interface sap ipsec-tunnel dynamic-keying cert status-verify

VSR

- configure router interface ipsec ipsec-tunnel dynamic-keying cert status-verify
- configure service ies interface ipsec ipsec-tunnel dynamic-keying cert status-verify
- configure service vprn interface ipsec ipsec-tunnel dynamic-keying cert status-verify

## status-verify

### Syntax

**status-verify default-result {revoked | good}**

**no status-verify**

### Context

**[Tree]** (config>system>security>tls>server-tls-profile status-verify)

**[Tree]** (config>system>security>tls>client-tls-profile status-verify)

### Full Context

configure system security tls server-tls-profile status-verify

configure system security tls client-tls-profile status-verify

### Description

This command configures the certificate revocation status verification parameters for end-entity (EE) certificates in the TLS client or server. This configuration overrides the existing revocation check policy.

By default the router checks the certification revocation status, but if this command is set to **good**, the end-entity certificate revocation status is overwritten and a good revocation status is returned for the EE certificate.

If this command is set to **revoked**, the router returns the actual revocation status of the end-entity certificate.

The **no** form of this command returns the actual revocation status to that of the end entity certificate.

### Default

status-verify default-result revoked

### Parameters

**good**

Specifies that the certificate is considered acceptable.

**revoked**

Specifies that the certificate is considered revoked.

### Platforms

All

## 23.456 std-acct-attributes

### std-acct-attributes

#### Syntax

[no] **std-acct-attributes**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>include-radius-attribute std-acct-attributes)

#### Full Context

configure subscriber-mgmt radius-accounting-policy include-radius-attribute std-acct-attributes

#### Description

This command enables reporting of aggregated forwarded IPv4 and IPv6 octet, packet and gigaword counters using standard RADIUS attributes. This attribute is by default. It can be enabled simultaneously with detailed per queue or policer counters (**detailed-acct-attributes**).

The **no** form of this command reverts to the default.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.457 std-port-class-pools

### std-port-class-pools

#### Syntax

**std-port-class-pools**

#### Context

[\[Tree\]](#) (config>qos>hs-port-pool-policy std-port-class-pools)

#### Full Context

configure qos hs-port-pool-policy std-port-class-pools

#### Description

Commands in this context configure standard port-class pools parameters. Within this context, the corresponding port-class pools can be associated with a mid-pool, explicitly sized as a percentage of the mid-pool size, dynamically-sized based on relative port bandwidth, or have a slope policy applied.

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.459 steering-route

## steering-route

## Syntax

**steering-route** *ip-prefix/length*

**no steering-route**

## Context

[\[Tree\]](#) (config>service>vprn>nat>inside>redundancy steering-route)

## Full Context

configure service vprn nat inside redundancy steering-route

## Description

This command configures specifies the IP address and prefix length of the steering route. The steering route is used in the realm of this virtual router instance as an indirect next-hop for all the traffic that must be routed to the large scale NAT function.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## steering-route

## Syntax

**steering-route** *ip-prefix/length*

**no steering-route**

## Context

[\[Tree\]](#) (config>router>nat>inside>redundancy steering-route)

## Full Context

configure router nat inside redundancy steering-route

## Description

This command is optionally used in LSN44 multi-chassis redundancy when filters are used on the inside to send traffic destined for the LSN44 function to MS-ISA, where NAT is performed.

If configured, the steering-route is advertised only from the active LSN44 node: the purpose is to bring the LSN44 node activity awareness to downstream routers. In this fashion, downstream routers can make a more intelligent decision when forwarding traffic in the upstream direction. Based on the steering-route, traffic can be sent directly towards the active LSN44 node. This route avoids an extra forwarding hop which would ensue in the case without LSN44 activity awareness, where the upstream traffic can be forwarded to the standby LSN44 node and then to the active LSN44 node.

LSN44 node activity (active/standby) is evaluated per isa-group based on monitoring routes advertised on the outside.

The **no** form of the command removes the ip-prefix/length from the configuration.

## Parameters

### *ip-prefix/length*

Specifies the IP address and length of the steering route.

Values		
	ip-prefix:	a.b.c.d
	ip-prefix-length:	0 to 32

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.460 sticky-dest

### sticky-dest

#### Syntax

**sticky-dest** *hold-time-up*

**sticky-dest no-hold-time-up**

**no sticky-dest**

#### Context

**[Tree]** (config>filter>ip-filter>entry sticky-dest)

**[Tree]** (config>filter>ipv6-filter>entry sticky-dest)

**[Tree]** (config>filter>mac-filter>entry sticky-dest)

**[Tree]** (config>filter>redirect-policy sticky-dest)

#### Full Context

configure filter ip-filter entry sticky-dest

configure filter ipv6-filter entry sticky-dest

configure filter mac-filter entry sticky-dest

configure filter redirect-policy sticky-dest

#### Description

This command configures sticky destination behavior for redundant PBR/PBF actions. Configuring sticky destination has an effect on PBR/PBF actions whether a secondary action is configured.

The *hold-time-up* parameter allows the operator to delay programming of a PBR/PBF action for a specified amount of time. The timer is only started when transitioning from all configured targets being down (that is, the primary target if no secondary target is configured, or both the primary and secondary targets when both are configured) to at least one target being up.

When the timer expires, the primary PBR/PBF action is programmed if its target is up. If the primary PBR/PBF target is down and a secondary PBR/PBF action has been configured and its target is up, then this secondary PBR/PBF action is programmed. In all other cases, no specific programming occurs when the timer expires.

When sticky destination is configured and the secondary PBR/PBF target is up and its associated action is programmed, it is not automatically replaced by the primary PBR/PBF action when its target transitions from down to up. In this situation, programming the primary PBR/PBF action can be forced using the **activate-primary-action** tools command.

Changing the value of the timer while the timer is running takes effect immediately (that is, the timer is restarted immediately using the new value).

The **no** form of the command disables sticky destination behavior.

### Default

no sticky-dest

### Parameters

#### *hold-time-up*

Specifies the initial delay in seconds. Zero is equivalent to **no-hold-time-up** (no delay).

**Values** 0 to 65535 seconds

### Platforms

All

## 23.461 sticky-dr

### sticky-dr

### Syntax

**sticky-dr** [*priority dr-priority*]

**no sticky-dr**

### Context

[\[Tree\]](#) (config>service>vprn>pim>if sticky-dr)

### Full Context

configure service vprn pim interface sticky-dr

### Description

This command enables sticky-dr operation on this interface. When enabled, the priority in PIM hellos sent on this interface when elected as the designated router (DR) is modified to the value configured in *dr-priority*. This is done to avoid the delays in forwarding caused by DR recovery, when switching back to the old DR on a LAN when it comes back up.

By enabling **sticky-dr** on this interface, it will continue to act as the DR for the LAN even after the old DR comes back up.

The **no** form of this command disables sticky-dr operation on this interface.

### Default

no sticky-dr

## Parameters

### **priority** *dr-priority*

Sets the DR priority to be sent in PIM Hello messages following the election of that interface as the DR, when sticky-dr operation is enabled.

**Values** 1 to 4294967295

## Platforms

All

## sticky-dr

## Syntax

**sticky-dr** [*priority dr-priority*]

**no sticky-dr**

## Context

[\[Tree\]](#) (config>router>pim>interface sticky-dr)

configure router pim interface sticky-dr

## Description

This command enables sticky-dr operation on this interface. When enabled, the priority in PIM hellos sent on this interface when elected as the designated router (DR) will be modified to the value configured in *dr-priority*. This is done to avoid the delays in forwarding caused by DR recovery, when switching back to the old DR on a LAN when it comes back up.

By enabling **sticky-dr** on this interface, it will continue to act as the DR for the LAN even after the old DR comes back up.

The **no** form of this command disables sticky-dr operation on this interface.

## Default

no sticky-dr

## Parameters

### **priority** *dr-priority*

Sets the DR priority to be sent in PIM Hello messages following the election of that interface as the DR, when sticky-dr operation is enabled.

**Values** 1 to 4294967295

## Platforms

All

## 23.462 sticky-ecmp

```
sticky-ecmp
```

### Syntax

```
sticky-ecmp
no sticky-ecmp
```

### Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>default-action sticky-ecmp)

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>action sticky-ecmp)

### Full Context

```
configure router policy-options policy-statement default-action sticky-ecmp
```

```
configure router policy-options policy-statement entry action sticky-ecmp
```

### Description

This command specifies that BGP routes matching an entry or default-action of a route policy should be tagged internally as requiring sticky ECMP behavior. When a BGP route with multiple equal-cost BGP next-hops is programmed for sticky ECMP the failure of one or more of its BGP next-hops causes only the affected traffic flows to be re-distributed to the remaining next-hops; by default (without sticky-ECMP) all flows are potentially affected, even those using a next-hop that did not fail.

### Default

```
no sticky-ecmp
```

### Platforms

All

## 23.463 sticky-msaps

```
sticky-msaps
```

### Syntax

```
sticky-msaps [idle-timeout seconds]
no sticky-msaps
```

## Context

[\[Tree\]](#) (config>subscr-mgmt>msap-policy sticky-msaps)

## Full Context

```
configure subscriber-mgmt msap-policy sticky-msaps
```

## Description

This command prevents MSAPs associated with the specified MSAP policy from being deleted unless a manual **clear** command is issued. If this command is not enabled, an MSAP is deleted when a host creation fails or when a subscriber is no longer associated with the MSAP, for example, when a subscriber ends the session. This feature is useful for an operator who wants to keep historical statistics on MSAPs. It can also speed up host creation on an MSAP since the MSAP is already created. The **idle-timeout** parameter allows the removal of MSAPs that are idle for longer than the specified time.

The **no** form of this command allows an MSAP to be deleted when a host creation fails or when a subscriber is no longer associated with the MSAP.

## Default

```
no sticky-msaps
```

## Parameters

### *seconds*

Specifies the idle timeout, in seconds.

**Values** 5 to 604800

## Platforms

[\[Tree\]](#) (config>service>template>vpls-template stp)

## Full Context

configure service template vpls-sap-template stp

configure service vpls stp

configure service vpls sap stp

configure service vpls spoke-sdp stp

configure service template vpls-template stp

## Description

Commands in this context configure the Spanning Tree Protocol (STP) parameters. Nokia's STP is simply the Spanning Tree Protocol (STP) with a few modifications to better suit the operational characteristics of VPLS services. The most evident change is to the root bridge election. Since the core network operating between Nokia's service routers should not be blocked, the root path is calculated from the core perspective.

## 23.465 stream-run-type

### stream-run-type

#### Syntax

**stream-run-type** {**sequential** | **parallel**}

**no stream-run-type**

#### Context

[\[Tree\]](#) (config>test-oam>sath>svc-test stream-run-type)

#### Full Context

configure test-oam service-activation-testhead service-test stream-run-type

#### Description

This command configures the execution sequence for service streams that are run during the specified service test.

The **no** form of this command removes the configured run type.

#### Default

stream-run-type parallel

#### Parameters

##### **sequential**

Keyword to run the streams consecutively.

##### **parallel**

Keyword to run the streams in parallel.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 23.466 stream-selection

## stream-selection

### Syntax

[no] **stream-selection**

### Context

[\[Tree\]](#) (config>isa>video-group stream-selection)

### Full Context

configure isa video-group stream-selection

### Description

This command specifies whether or not stream selection is enabled on this video group.

The **no** form of the command disables **stream-selection** for the group.

### Default

no stream-selection

### Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 23.467 streaming

## streaming

### Syntax

**streaming**

### Context

[\[Tree\]](#) (config>oam-pm streaming)

### Full Context

configure oam-pm streaming

### Description

This command specifies the context to configure the OAM-PM streaming template and its associated parameters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## streaming

### Syntax

**streaming**

### Context

[\[Tree\]](#) (config>system>snmp streaming)

### Full Context

configure system snmp streaming

### Description

This command enables the proprietary SNMP request/response bundling and TCP-based transport mechanism for optimizing network management of the router nodes. In higher latency networks, synchronizing router MIBs from network management via streaming takes less time than synchronizing via classic SNMP UDP requests. Streaming operates on TCP port 1491 and runs over IPv4 or IPv6.

### Platforms

All

## 23.468 strict

## strict

### Syntax

**[no] strict**

### Context

[\[Tree\]](#) (config>app-assure>group>tcp-validate strict)

### Full Context

configure application-assurance group tcp-validate strict

### Description

This command specifies whether enforcement of TCP sequence and acknowledgment numbers is applied. If a packet does not meet the expected sequence or acknowledgment number, it is dropped.

This command should only be enabled if the expected bit error rate or packet loss is low. For example, if acknowledgments are lost before being detected by AA, the server timeouts are triggered and retransmissions occur. If **strict** is enabled, these retransmissions would resemble a reply attack and would be dropped by AA.

The **no** form of this command removes TCP sequence and acknowledgment number enforcement.

**Default**

no strict

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.469 strict-adjacency-check

### strict-adjacency-check

**Syntax**

[no] **strict-adjacency-check**

**Context**

[\[Tree\]](#) (config>service>vprn>isis strict-adjacency-check)

**Full Context**

configure service vprn isis strict-adjacency-check

**Description**

This command enables strict checking of address families (IPv4 and IPv6) for IS-IS adjacencies. When enabled, adjacencies do not come up unless both routers have exactly the same address families configured. If there is an existing adjacency with unmatched address families, it is torn down.

This command is used to prevent black-holing traffic when IPv4 and IPv6 topologies are different. When disabled (**no strict-adjacency-check**) a BFD session failure for either IPv4 or IPv6 will cause the routes for the other address family to be removed as well.

When disabled (**no strict-adjacency-check**), both routers only need to have one common address family to establish the adjacency.

**Default**

no strict-adjacency-check

**Platforms**

All

### strict-adjacency-check

**Syntax**

[no] **strict-adjacency-check**

## Context

[\[Tree\]](#) (config>router>isis strict-adjacency-check)

## Full Context

```
configure router isis strict-adjacency-check
```

## Description

This command enables strict checking of address families (IPv4 and IPv6) for IS-IS adjacencies. When enabled, adjacencies will not come up unless both routers have exactly the same address families configured. If there is an existing adjacency with unmatched address families, it will be torn down. This command is used to prevent black-holing traffic when IPv4 and IPv6 topologies are different. When disabled (no strict-adjacency-check) a BFD session failure for either IPv4 or Ipv6 will cause the routes for the other address family to be removed as well.

When disabled (**no strict-adjacency-check**), both routers only need to have one common address family to establish the adjacency.

## 23.470 strict-ero-nhop-direct-resolution

```
strict-ero-nhop-direct-resolution
```

## Syntax

```
[no] strict-ero-nhop-direct-resolution
```

## Context

[\[Tree\]](#) (config>router>mpls strict-ero-nhop-direct-resolution)

## Full Context

```
configure router mpls strict-ero-nhop-direct-resolution
```

## Description

This command enables the strict Explicit Route Object (ERO) next-hop direct resolution. The feature restricts the routes used to resolve the next hop of an ERO address to local and host routes. This command avoids using a next hop over a parallel link when a half link is up in the routing table.

When enabled, this command applies to an ERO when all of the following conditions are met:

- the ERO next hop is an IPv4 address
- the ERO object is a strict hop
- the IPv4 address matches the primary subnet of a local numbered interface

An ERO that meets the preceding conditions restricts resolution of the next hop to a LOCAL or a HOST route. If no such route exists, RSVP rejects the PATH message with ErrCode = Routing Error (24) and SubErrCode = Bad Strict Node (2).

The **no** form of this command disables the strict ERO next-hop direct resolution.

### Default

no strict-ero-nhop-direct-resolution

### Platforms

All

## 23.471 strict-esp-seq-number-ordering

### strict-esp-seq-number-ordering

#### Syntax

[no] strict-esp-seq-number-ordering

#### Context

[\[Tree\]](#) (config>isa>tunnel-grp strict-esp-seq-number-ordering)

#### Full Context

configure isa tunnel-group strict-esp-seq-number-ordering

#### Description

This command configures the router to use strict ESP sequence number ordering.

When ESP sequence number ordering is enabled, the outbound ESP sequence number of a CHILD\_SA must be in the same order as when clear packets are received by the same CHILD\_SA.

The **no** form of this command disables strict ESP sequence number ordering.

#### Default

no strict-esp-seq-number-ordering

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

## 23.472 strict-isa-checking

## strict-lsa-checking

### Syntax

[no] **strict-lsa-checking**

### Context

**[Tree]** (config>service>vprn>ospf>graceful-restart strict-lsa-checking)

**[Tree]** (config>service>vprn>ospf3>graceful-restart strict-lsa-checking)

### Full Context

configure service vprn ospf graceful-restart strict-lsa-checking

configure service vprn ospf3 graceful-restart strict-lsa-checking

### Description

This command indicates whether an OSPF restart helper should terminate graceful restart when there is a change to an LSA that would be flooded to the restarting router during the restart process.

The default OSPF behavior is to terminate a graceful restart if an LSA changes, which causes the OSPF neighbor to go down.

The **no strict-lsa-checking** command disables strict LSA checking.

### Default

strict-lsa-checking

### Platforms

All

## strict-lsa-checking

### Syntax

[no] **strict-lsa-checking**

### Context

**[Tree]** (config>router>ospf3>graceful-restart strict-lsa-checking)

**[Tree]** (config>router>ospf>graceful-restart strict-lsa-checking)

### Full Context

configure router ospf3 graceful-restart strict-lsa-checking

configure router ospf graceful-restart strict-lsa-checking

### Description

This command indicates whether an OSPF restart helper should terminate graceful restart when there is a change to an LSA that would be flooded to the restarting router during the restart process.

The default OSPF behavior is to terminate a graceful restart if an LSA changes, which causes the OSPF neighbor to go down.

The **no** form of this command disables strict LSA checking.

**Default**

strict-lsa-checking

All

## 23.473 strict-mode

strict-mode

**Syntax**

[no] strict-mode

**Context**

[\[Tree\]](#) (config>service>upnp>upnp-policy strict-mode)

**Full Context**

configure service upnp upnp-policy strict-mode

**Description**

This command enable UPnP strict mode. With strict-mode, system only allows changes to existing UPnP mapping if the request comes from same UPnP client.

**Default**

no strict-mode

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.474 string

string

**Syntax**

string *string*

**no string**

### Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident string)

### Full Context

configure subscriber-mgmt local-user-db ipoe host host-identification string

### Description

This command specifies the string from the Nokia vendor-specific sub-option (VSO) in Option 82 to match when the LUDB is accessed using a DHCPv4 server.

#### Note:

This command is only used when **string** is configured as one of the **match-list** parameters.

The **no** form of this command removes the host identification string from the configuration.

### Parameters

**string**

Specifies the VSO string of this host, up to 255 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>dhcp>option>vendor string)

### Full Context

configure service vprn interface dhcp option vendor-specific-option string

configure service vpls sap dhcp option vendor-specific-option string

configure service vprn subscriber-interface group-interface dhcp option vendor-specific-option string

configure subscriber-mgmt msap-policy vpls-only-sap-parameters dhcp option vendor-specific-option string

configure service ies subscriber-interface group-interface dhcp option vendor-specific-option string

## Description

This command specifies the string in the Nokia vendor-specific sub-option of the DHCP relay packet. The **no** form of this command reverts to the default.

## Parameters

### *text*

Specifies a string that can be any combination of ASCII characters, up to 32 characters. If spaces are used in the string, enclose the entire string in quotation marks (" ").

## Platforms

All

- configure service vpls sap dhcp option vendor-specific-option string
- configure service vprn interface dhcp option vendor-specific-option string

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface dhcp option vendor-specific-option string
- configure subscriber-mgmt msap-policy vpls-only-sap-parameters dhcp option vendor-specific-option string
- configure service vprn subscriber-interface group-interface dhcp option vendor-specific-option string

## string

## Syntax

[no] **string** *text*

## Context

[\[Tree\]](#) (config>router>if>dhcp>option>vendor-specific-option string)

## Full Context

configure router interface dhcp option vendor-specific-option string

## Description

This command specifies the vendor-specific sub-option string of the DHCP relay packet. The **no** form of this command returns the default value.

## Default

no string

## Parameters

### *text*

Specifies a string that can be any combination of ASCII characters, up to 32 characters in length. If spaces are used in the string, enclose the entire string in quotation marks (" ").

## Platforms

All

## 23.475 strings-from-option

### strings-from-option

#### Syntax

**strings-from-option** *dhcp-option-number*

**no strings-from-option**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>sub-ident-pol strings-from-option)

#### Full Context

configure subscriber-mgmt sub-ident-policy strings-from-option

#### Description

This command enables DHCPv4 option processing on DHCP ACK for subscriber host identification.

The parameter *dhcp-option-number* specifies the DHCPv4 option number containing subscriber host identification strings such as subscriber ID, sub-profile, sla-profile strings, and so on. The identification strings can be inserted by an SR OS based DHCPv4 server via a local user database lookup.

Applicable to DHCPv4 hosts and PPP hosts that use the internal DHCP client to get an IPv4 address from an SR OS based DHCPv4 server.

The **no** form of this command reverts to the default.

#### Default

no strings-from-option

#### Parameters

***dhcp-option-number***

Specifies the DHCPv4 option number containing subscriber host identification strings.

**Values** 1 to 254

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.476 strip-label

### strip-label

#### Syntax

[no] strip-label

#### Context

[\[Tree\]](#) (config>router>if strip-label)

#### Full Context

configure router interface strip-label

#### Description

This command forces packets to be stripped of all (max 5) MPLS labels before the packets are handed over for possible filter (PBR) processing.

If the packets do not have an IP header immediately following the MPLS label stack after the strip, they are discarded. Only MPLS encapsulated IP, IGP shortcuts and VPRN over MPLS packets will be processed. However, IPv4 and IPv6 packets that arrive without any labels are supported on an interface with **strip-label** enabled.

This command operates in promiscuous mode. This means that the router does not filter on the destination MAC address of the Ethernet frames. In some network designs, multiple ports may be tapped and combined into interface toward the router. Promiscuous mode allows all of these flows to be processed without requiring the destination MAC address to be updated to match the router address.

This command is supported on:

- Optical ports for the 7750 SR and 7450 ESS
- Null/Dot1q encaps
- Network ports
- IPv4
- IPv6

In order to associate an interface that is configured with the strip-label parameter with a port, the port must be configured as single-fiber for the command to be valid.

Packets that are subject to the strip-label action and are mirrored (using mirrors or lawful interception) will contain the original MPLS labels (and other L2 encapsulation) in the mirrored copy of the packet, as they appeared on the wire, when the mirror-dest type is the default type "ether". If the mirror-dest type is "ip-only", then the mirrored copy of the packet will not contain the original L2 encapsulation or the stripped MPLS labels.

The **no** form of this command removes the strip-label command.

#### Default

no strip-label

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.477 strip-srv6-tlvs

```
strip-srv6-tlvs
```

### Syntax

**[no] strip-srv6-tlvs**

### Context

**[Tree]** (config>router>bgp>group>srv6>route>fam strip-srv6-tlvs)

**[Tree]** (config>router>bgp>group>neighbor>srv6>route>family strip-srv6-tlvs)

### Full Context

configure router bgp group segment-routing-v6 route-advertisement family strip-srv6-tlvs

configure router bgp group neighbor segment-routing-v6 route-advertisement family strip-srv6-tlvs

### Description

This command specifies that BGP routes that belong to the address family configured in the **family** command are advertised to peers with SRv6 TLVs removed. Locally or remotely added SRv6 TLVs can be removed.

The **no** form of this command configures the router not to strip SRv6 TLVs from the BGP routes advertised to peers.

### Default

no strip-srv6-tlvs

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 23.478 stub

```
stub
```

### Syntax

**[no] stub**

## Context

[\[Tree\]](#) (config>service>vprn>ospf3>area stub)

[\[Tree\]](#) (config>service>vprn>ospf>area stub)

## Full Context

```
configure service vprn ospf3 area stub
```

```
configure service vprn ospf area stub
```

## Description

This command enables access to the context to configure an OSPF stub area and adds/removes the stub designation from the area. External routing information is not flooded into stub areas. All routers in the stub area must be configured with the **stub** command. An OSPF area cannot be both an NSSA and a stub area. Existing virtual links of a non STUB or NSSA area will be removed when its designation is changed to NSSA or STUB.

By default, an area is not a stub area.

The **no** form of this command removes the stub designation and configuration context from the area.

## Default

no stub — The area is not configured as a stub area.

## Platforms

All

## stub

## Syntax

**[no] stub**

## Context

[\[Tree\]](#) (config>router>ospf>area stub)

[\[Tree\]](#) (config>router>ospf3>area stub)

## Full Context

```
configure router ospf area stub
```

```
configure router ospf3 area stub
```

## Description

This command enables access to the context to configure an OSPF or OSPF3 stub area and adds/removes the stub designation from the area.

External routing information is not flooded into stub areas. All routers in the stub area must be configured with the **stub** command. An OSPF or OSPF3 area cannot be both an NSSA and a stub area.

Existing virtual links of a non STUB or NSSA area will be removed when its designation is changed to NSSA or STUB.

By default, an area is not a stub area.

The **no** form of this command removes the stub designation and configuration context from the area.

### Default

no stub

## 23.479 sub-domain

### sub-domain

#### Syntax

**sub-domain** *sub-domain*

**no sub-domain**

#### Context

[\[Tree\]](#) (config>service>vprn>mvpn>provider-tunnel>inclusive>bier sub-domain)

[\[Tree\]](#) (config>service>vprn>mvpn>provider-tunnel>selective>bier sub-domain)

#### Full Context

configure service vprn mvpn provider-tunnel inclusive bier sub-domain

configure service vprn mvpn provider-tunnel selective bier sub-domain

#### Description

This command sets the sub-domain used to attach the BIER provider tunnel. Both PMSI within the MVPN need to have the same sub-domain.

The **no** form of this command removes the sub-domain.

#### Parameters

***sub-domain***

The identifier of the sub-domain.

**Values** 0 to 255

#### Platforms

All

## sub-domain

### Syntax

[no] **sub-domain** *sub-domain*

[no] **sub-domain start** *sub-domain* **end** *sub-domain*

### Context

[\[Tree\]](#) (config>router>bier>template sub-domain)

### Full Context

configure router bier template sub-domain

### Description

This command creates a BIER sub-domain or range of sub-domains. For example, for IS-IS each sub-domain is associated with a single IS-IS topology, which may be any of the topologies supported by IS-IS.

The **no** form of this command removes a sub-domain.

### Default

sub-domain 0

### Parameters

***sub-domain***

The ID of the sub-domain to be created or removed.

**Values** 0 to 255

### Platforms

All

## 23.480 sub-host-trk

## sub-host-trk

### Syntax

[no] **sub-host-trk**

### Context

[\[Tree\]](#) (config>redundancy>multi-chassis>peer>sync sub-host-trk)

**Full Context**

configure redundancy multi-chassis peer sync sub-host-trk

**Description**

This command specifies whether subscriber host tracking information should be synchronized with the multi-chassis peer.

**Default**

no sub-host-trk

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.481 sub-hosts-only

### sub-hosts-only

**Syntax**

[no] sub-hosts-only

**Context**

[\[Tree\]](#) (config>service>vprn>igmp>grp-if sub-hosts-only)

**Full Context**

configure service vprn igmp group-interface sub-hosts-only

**Description**

This command enables the IGMP traffic from known hosts only.

The **no** form of this command disable the IGMP traffic from known hosts only

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### sub-hosts-only

**Syntax**

[no] sub-hosts-only

**Context**

[\[Tree\]](#) (config>router>igmp>group-interface sub-hosts-only)

## Full Context

```
configure router igmp group-interface sub-hosts-only
```

## Description

This command disables the processing of IGMP messages outside of the subscriber-host context. No other hosts outside of the subscriber-hosts can create IGMP states.

Disabling this command allows the creation of the IGMP states that correspond to the AN that operate in IGMP proxy mode. In this mode, the AN will hide source IP addresses of IGMP messages and will source IGMP messages with its own IP address. In this case, an IGMP state can be created under the **sap** context. This IGMP state creation under the SAP is controlled via the import policy under the group-interface.

The IGMP state processing for regular subscriber-hosts is unaffected by this command.

The **no** form of the command disables the command.

## Default

```
sub-hosts-only
```

## Platforms

```
7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR
```

## sub-hosts-only

## Syntax

```
[no] sub-hosts-only
```

## Context

```
[Tree] (config>router>mld>group-interface sub-hosts-only)
```

## Full Context

```
configure router mld group-interface sub-hosts-only
```

## Description

This command processes the handling of MLD joins received from hosts that are not known in subscriber management or on which no MLD policy is applied.

Disabling this command allows the creation of the MLD states that correspond to the AN that operate in MLD proxy mode. In this mode, the AN will hide source IP addresses of MLD messages and will source MLD messages with its own IP address. In this case, an MLD state can be created under the **sap** context. This MLD state creation under the SAP is controlled via the import policy under the group-interface.

The MLD state processing for regular subscriber-hosts is unaffected by this command.

The **no** form of the command enables the command.

## Default

```
sub-hosts-only
```

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.482 sub-id

sub-id

### Syntax

[no] sub-id

### Context

[\[Tree\]](#) (config>service>nat>syslog>syslog-export-policy>include sub-id)

### Full Context

configure service nat syslog syslog-export-policy include sub-id

### Description

This command includes the **sub-id** string in the flow log. The **sub-id** is applicable only in subscriber-aware NAT. If subscriber-aware NAT is not enabled, the **sub-id** string is set to '-'.  
The **no** form of the command disables the feature.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.483 sub-ident-policy

sub-ident-policy

### Syntax

[no] sub-ident-policy *sub-ident-policy-name*

### Context

[\[Tree\]](#) (config>subscr-mgmt sub-ident-policy)

### Full Context

configure subscriber-mgmt sub-ident-policy

## Description

This command configures a subscriber identification policy. Each subscriber identification policy can have a default subscriber profile defined. The subscriber identification policy default subscriber profile overrides the system default and the subscriber SAP default subscriber profiles. Defining a subscriber identification policy default subscriber profile is optional.

The subscriber identification policy default subscriber profile cannot be defined with the subscriber profile name default.

Defining a subscriber profile as a subscriber identification policy default subscriber profile will cause all active subscribers currently associated with a subscriber SAP using the policy and associated with a subscriber policy through the system default or subscriber SAP default subscriber profiles to be reassigned to the subscriber policy defined as default on the subscriber identification policy.

Attempting to delete a subscriber profile that is currently defined as a default for a subscriber identification policy will fail.

When attempting to remove a subscriber identification policy default subscriber profile definition, the system will evaluate each active subscriber on all subscriber SAPs the subscriber identification policy is currently associated with that are using the default definition to determine whether the active subscriber can be either reassigned to a subscriber SAP default or the system default subscriber profile. If all active subscribers cannot be reassigned, the removal attempt will fail.

The **no** form of this command reverts to the default.

## Parameters

### *sub-ident-policy-name*

Specifies the name of the subscriber identification policy, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## sub-ident-policy

```

configure service vprn subscriber-interface group-interface sap-parameters sub-sla-mgmt sub-ident-policy
configure service ies subscriber-interface group-interface sap sub-sla-mgmt sub-ident-policy
configure service ies subscriber-interface group-interface sap-parameters sub-sla-mgmt sub-ident-policy
configure service vprn subscriber-interface group-interface sap sub-sla-mgmt sub-ident-policy
configure service vpls sap sub-sla-mgmt sub-ident-policy

```

## Description

This command associates a subscriber identification policy to this SAP. The subscriber identification policy must be defined prior to associating the profile with a SAP in the **config>subscr-mgmt>sub-ident-policy** context.

Subscribers are managed by the system through the use of subscriber identification strings such as a subscriber identifier, an sla-profile string, a sub-profile string and an app-profile string.

The subscriber identification policy performs following functions for subscriber hosts and sessions associated with the SAP or MSAP:

- mapping of sla-profile, sub-profile and app-profile strings obtained from authentication (for example, LUDB, RADIUS, Diameter, or Python) into profile names that are configured on the router
- for IPoE DHCPv4 hosts, the subscriber identification strings can be derived from the DHCP ACK message sent to the subscriber host using a Python script referenced in the sub-ident-policy
- for PPPoE hosts that get an IPv4 address via the PPPoE DHCPv4 client and for IPoE DHCPv4 hosts, an SR OS DHCPv4 server in combination with an LUDB returns the identification strings in a DHCPv4 option. The **strings-from-option** command in the sub-ident-policy tells the system from which option to extract the identification strings.

The **no** form of this command removes the default subscriber identification policy from the SAP configuration.

## Parameters

### *sub-ident-policy-name*

Specifies a subscriber identification policy for this SAP.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure subscriber-mgmt msap-policy sub-sla-mgmt sub-ident-policy
- configure service vpls sap sub-sla-mgmt sub-ident-policy
- configure service ies subscriber-interface group-interface sap sub-sla-mgmt sub-ident-policy
- configure service vprn subscriber-interface group-interface sap sub-sla-mgmt sub-ident-policy

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface sap-parameters sub-sla-mgmt sub-ident-policy
- configure service vprn subscriber-interface group-interface sap-parameters sub-sla-mgmt sub-ident-policy

## sub-ident-policy

### Syntax

**[no] sub-ident-policy** *policy-name*

### Context

**[Tree]** (debug>subscr-mgmt sub-ident-policy)

### Full Context

debug subscriber-mgmt sub-ident-policy

### Description

This command debugs subscriber identification policies.

The **no** form of this command disables debugging.

### Parameters

***policy-name***

Specifies the subscriber identification policy to debug.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## sub-ident-policy

### Syntax

**sub-ident-policy** *sub-ident-policy-name*

**no sub-ident-policy**

### Context

**[Tree]** (config>app-assure>group>transit-ip-policy sub-ident-policy)

### Full Context

configure application-assurance group transit-ip-policy sub-ident-policy

### Description

This command associates a subscriber identification policy to this SAP. The subscriber identification policy must be defined prior to associating the profile with a SAP in the **config>subscribermgmt>sub-ident-policy** context.

Subscribers are managed by the system through the use of subscriber identification strings. A subscriber identification string uniquely identifies a subscriber. For static hosts, the subscriber identification string is explicitly defined with each static subscriber host.

For dynamic hosts, the subscriber identification string must be derived from the DHCP ACK message sent to the subscriber host. The default value for the string is the content of Option 82 CIRCUIT-ID and REMOTE-ID fields interpreted as an octet string. As an option, the DHCP ACK message may be processed by a subscriber identification policy which has the capability to parse the message into an alternative ASCII or octet string value.

When multiple hosts on the same port are associated with the same subscriber identification string they are considered to be host members of the same subscriber.

A sub-ident-policy can also be used for identifying dynamic transit subscriber names.

The **no** form of this command removes the default subscriber identification policy from the SAP configuration.

### Default

no sub-ident-policy

### Parameters

#### *sub-ident-policy-name*

Specifies the subscriber identification policy name, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.484 sub-insert-credit-control

### sub-insert-credit-control

### Syntax

**sub-insert-credit-control start-entry** *entry-id* **count** *count*

**no sub-insert-credit-control**

### Context

[\[Tree\]](#) (config>filter>ip-filter sub-insert-credit-control)

[\[Tree\]](#) (config>filter>ipv6-filter sub-insert-credit-control)

### Full Context

configure filter ip-filter sub-insert-credit-control

configure filter ipv6-filter sub-insert-credit-control

### Description

This command inserts point information for credit control for the filter.

The **no** form of the command reverts to the default.

**Default**

no sub-insert-credit-control

**Parameters*****entry-id***

Identifies a filter on this system.

**Values** 1 to 2097151

***count***

Specifies the count

**Values** 1 to 65535

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.485 sub-insert-radius

### sub-insert-radius

**Syntax**

**sub-insert-radius start-entry** *entry-id* **count** *count*

**no sub-insert-radius**

**Context**

[\[Tree\]](#) (config>filter>ipv6-filter sub-insert-radius)

[\[Tree\]](#) (config>filter>ip-filter sub-insert-radius)

**Full Context**

configure filter ipv6-filter sub-insert-radius

configure filter ip-filter sub-insert-radius

**Description**

This command inserts point information for RADIUS for the filter.

The **no** form of the command reverts to the default.

**Default**

no sub-insert-radius

## Parameters

### *entry-id*

Specifies at what place the filter entries received from RADIUS will be inserted in the filter.

**Values** 1 to 2097151

### *count*

Specifies the count.

**Values** 1 to 65535

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.486 sub-insert-shared-pccrule

### sub-insert-shared-pccrule

## Syntax

**sub-insert-shared-pccrule start-entry** *entry-id* **count** *count*

**no sub-insert-shared-pccrule**

## Context

[\[Tree\]](#) (config>qos>sap-ingress sub-insert-shared-pccrule)

[\[Tree\]](#) (config>qos>sap-egress sub-insert-shared-pccrule)

## Full Context

```
configure qos sap-ingress sub-insert-shared-pccrule
```

```
configure qos sap-egress sub-insert-shared-pccrule
```

## Description

This command defines the range of filter and QoS policy entries that are reserved for shared entries received in Flow-Information AVP via Gx interface (PCC rules – Policy and Charging Control).

The **no** form of this command disables the insertion, which will result in a failure of PCC rule installation.

## Default

```
no sub-insert-shared-pccrule
```

## Parameters

### *entry-id*

Specifies the lowest entry in the range.

**Values** 1 to 65535

**count**

Specifies the number of entries in the range.

**Values** 1 to 65535

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## sub-insert-shared-pccrule

### Syntax

**sub-insert-shared-pccrule start-entry entry-id count count**

**no sub-insert-shared-pccrule**

### Context

**[Tree]** (config>filter>ipv6-filter sub-insert-shared-pccrule)

**[Tree]** (config>filter>ip-filter sub-insert-shared-pccrule)

### Full Context

configure filter ipv6-filter sub-insert-shared-pccrule

configure filter ip-filter sub-insert-shared-pccrule

### Description

This command defines the range of filter and QoS policy entries that are reserved for shared entries received in Flow-Information AVP via Gx interface (PCC rules – Policy and Charging Control). The **no** form of this command disables the insertion, which will result in a failure of PCC rule installation.

### Default

no sub-insert-shared-pccrule

### Parameters

**entry-id**

Specifies the lowest entry in the range.

**Values** 1 to 2097151

**count**

Specifies the number of entries in the range.

**Values** 1 to 65535

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.487 sub-insert-shared-radius

### sub-insert-shared-radius

#### Syntax

```
sub-insert-shared-radius start-entry entry-id count count
no sub-insert-shared-radius
```

#### Context

[\[Tree\]](#) (config>filter>ipv6-filter sub-insert-shared-radius)

[\[Tree\]](#) (config>filter>ip-filter sub-insert-shared-radius)

#### Full Context

```
configure filter ipv6-filter sub-insert-shared-radius
configure filter ip-filter sub-insert-shared-radius
```

#### Description

This command configures the insert point for shared host rules from RADIUS.

#### Default

```
no sub-insert-shared-radius
```

#### Parameters

##### *entry-id*

Identifies a filter on this system.

**Values** 1 to 2097151

##### *count*

Specifies the count.

**Values** 1 to 65535

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.488 sub-insert-wmark

### sub-insert-wmark

#### Syntax

**sub-insert-wmark low** *low-watermark* **high** *high-watermark*  
**no sub-insert-wmark**

#### Context

[\[Tree\]](#) (config>filter>ip-filter sub-insert-wmark)

[\[Tree\]](#) (config>filter>ipv6-filter sub-insert-wmark)

#### Full Context

configure filter ip-filter sub-insert-wmark

configure filter ipv6-filter sub-insert-wmark

#### Description

This command configures the low and high watermark percentage for inserted filter entry usage reporting. The **no** form of the command reverts to the default.

#### Default

sub-insert-wmark low 90 high 95

#### Parameters

##### *low-watermark*

Specifies the utilization of the filter ranges for filter entry insertion, at which a table full alarm will be cleared by the agent.

**Values** 0 to 100

##### *high-watermark*

Specifies the utilization of the filter ranges for filter entry insertion, at which a table full alarm will be raised by the agent.

**Values** 0 to 100

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.489 sub-mcac-policy

## sub-mcac-policy

### Syntax

**sub-mcac-policy** *sub-mcac-policy-name* [create]

**no sub-mcac-policy** *b*

### Context

[\[Tree\]](#) (config>subscr-mgmt sub-mcac-policy)

### Full Context

configure subscriber-mgmt sub-mcac-policy

### Description

This command creates a policy template with MCAC bandwidth limits that are applied to the subscriber.

Per interface mcac bandwidth limits are set directly under the interface (regular interface or group-interface) and no such policy templates are needed.

The need for a separate policy template for subscribers is due to the fact that groups of subscribers under the same group-interface can share certain settings that can be configured via this template.

To summarize, the MCAC bandwidth constraints for subscribers are defined in the sub-mcac-policy while the mcac bandwidth constraints for the interface are configured directly under the **igmp>interface>mcac** or **igmp>grp-if>mcac** context without the need for policy templates.

#### Note:

The sub-mcac-policy only deals with the mcac bandwidth limits and not the channel bandwidth definitions. Channels bandwidth is defined in a different policy (in the **config>router>mcac** context) and that policy is applied on the interface level as follows:

- For group-interface: under the **config>service>vprn>igmp>grp-if>mcac** context
- For regular interface: under the **config>service/router>igmp>interface>mcac** context.

In case of HQoS Adjustment, it is mandatory that the sub-mcac-policy be created and applied to the subscriber. The sub-mac-policy does not have to contain any bandwidth constrains, but it has to be in a no shutdown state in order for HQoS Adjustment to work.

The **no** form of this command reverts to the default.

### Parameters

*policy-name*

Specifies the name of the policy up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

## sub-mcac-policy

### Syntax

**sub-mcac-policy** *policy-name*

**no sub-mcac-policy**

### Context

[\[Tree\]](#) (config>subscr-mgmt>sub-prof sub-mcac-policy)

### Full Context

configure subscriber-mgmt sub-profile sub-mcac-policy

### Description

This command references the policy template in which the mcac bandwidth limits are defined. Mcac for the subscriber is effectively enabled with this command when the sub-profile is applied to the subscriber. The bandwidth of the channels is defined in a different policy (under the **config>router>mcac** context) and this policy is applied on the interface level as follows:

- For group-interfaces under the **config>service>vprn>igmp>grp-if>mcac** context
- For regular interfaces under the **config>service/router>igmp>interface>mcac** context

In case of HQoS Adjustment, it is mandatory that the sub-mcac-policy be created and applied to the subscriber. The sub-mac-policy does not have to contain any bandwidth constrains, but it has to be in a no shutdown state in order for HQoS Adjustment to work.

The **no** form of this command removes the policy from the configuration.

### Parameters

*policy-name*

Specifies the policy name configured in the config>subscr-mgmt>sub-mcac-policy context.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

## 23.490 sub-mgmt

## sub-mgmt

### Syntax

**[no] sub-mgmt**

### Context

[\[Tree\]](#) (config>redundancy>multi-chassis>options sub-mgmt)

**Full Context**

configure redundancy multi-chassis options sub-mgmt

**Description**

This command enables the CLI context to configure subscriber management multi-chassis options parameters.

**Default**

sub-mgmt

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.491 sub-mgmt-extensions

### sub-mgmt-extensions

**Syntax**

[no] sub-mgmt-extensions

**Context**

[\[Tree\]](#) (config>fwd-path-ext>fpe sub-mgmt-extensions)

**Full Context**

configure fwd-path-ext fpe sub-mgmt-extensions

**Description**

This command configures FPE for subscriber management extensions. The FPE cannot be used for other applications but can be used for multiple subscriber management applications.

The **no** version of this command disables FPE for subscriber management extensions.

**Default**

no sub-mgmt-extensions

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.492 sub-port

## sub-port

### Syntax

**sub-port** *port-id* [**create**]

**no sub-port** *port-id*

### Context

[\[Tree\]](#) (config>port>ethernet>dot1x>macsec sub-port)

### Full Context

configure port ethernet dot1x macsec sub-port

### Description

This command creates a MACsec instance on a physical port, targeting the specific subset of traffic defined by the **encap-match** command.

The **no** form of this command removes the MACsec instance.

### Parameters

#### *port-id*

Specifies the sub-port id index.

**Values** 1 to 1023

#### **create**

Creates a new sub-port.

### Platforms

All

## 23.493 sub-profile

## sub-profile

### Syntax

[**no**] **sub-profile**

### Context

[\[Tree\]](#) (config subscr-mgmt acct-plcy include-radius-attribute sub-profile)

### Full Context

configure subscriber-mgmt radius-accounting-policy include-radius-attribute sub-profile

## Description

This command specifies that subscriber profile attributes should be included into RADIUS accounting messages.

The **no** form of this command excludes subscriber profile attributes into RADIUS accounting messages.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## sub-profile

configure service ies interface sap static-host sub-profile

configure service vprn subscriber-interface group-interface sap static-host sub-profile

configure service vprn interface sap static-host sub-profile

configure service vpls sap static-host sub-profile

configure service ies subscriber-interface group-interface sap static-host sub-profile

## Description

This command specifies an existing subscriber profile name to be associated with the static subscriber host.

The **no** form of this command reverts to the default.

## Parameters

***sub-profile-name***

Specifies the sub-profile name.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## sub-profile

### Syntax

**[no] sub-profile** *subscriber-profile-name*

### Context

**[Tree]** (config subscr-mgmt sub-profile)

### Full Context

configure subscriber-mgmt sub-profile

### Description

Commands in this context configure a subscriber profile. A subscriber profile is a template used to define the aggregate QoS for all hosts within a subscriber context. This is done through the definition of the egress and ingress scheduler policies that govern the aggregate SLA for subscribers using the subscriber profile. Subscriber profiles also allow for specific SLA profile definitions when the default definitions from the subscriber identification policy must be overridden.

Subscribers are either explicitly mapped to a subscriber profile template or are dynamically associated by one of various non-provisioned subscriber profile definitions.

A subscriber host can be associated with a subscriber profile in the following ways, listed from lowest to highest precedence:

1. The subscriber profile named default.
2. The subscriber profile defined as the subscriber SAP default.
3. The subscriber profile found by the subscriber identification policy sub-profile-map.
4. The subscriber profile found by the subscriber identification policy explicit map.

In the event that no defaults are defined and the subscriber identification string is not explicitly provisioned to map to a subscriber profile, either the static subscriber host creation will fail or the dynamic subscriber host DHCP ACK is discarded.

Default Subscriber profile:

When a subscriber profile is created with the *subscriber-profile-name* default, it is used when no other subscriber profile is associated with the subscriber host by the system. Creating a subscriber profile with the *subscriber-profile-name* default is optional. If a default subscriber profile is not created, all subscriber hosts subscriber identification strings must match either a non-provisioned default or be provisioned as an explicit match to a subscriber profile.

The default profile has no effect on existing active subscriber on the system as they exist due to higher precedence mappings.

Attempting to delete any subscriber profile (including the profile named default) while in use by existing active subscribers will fail.

The **no** form of this command reverts to the default.

### Parameters

#### ***subscriber-profile-name***

Specifies the name of the subscriber profile, up to 32 characters.

**create**

Keyword used to create the subscriber profile.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.494 sub-profile-map

### sub-profile-map

**Syntax**

**sub-profile-map**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>sub-ident-pol sub-profile-map)

**Full Context**

configure subscriber-mgmt sub-ident-policy sub-profile-map

**Description**

Commands in this context configure subscriber profile mapping parameters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.495 sub-profile-string

### sub-profile-string

**Syntax**

**sub-profile-string** *sub-profile-string*

**no sub-profile-string**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp>host>ident-strings sub-profile-string)

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe>host>ident-strings sub-profile-string)

## Full Context

```
configure subscriber-mgmt local-user-db ppp host identification-strings sub-profile-string
configure subscriber-mgmt local-user-db ipoe host identification-strings sub-profile-string
```

## Description

This command specifies the subscriber profile string which is encoded in the identification strings. The **no** form of this command returns to the default.

## Parameters

### *sub-profile-string*

Specifies the subscriber profile string, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## sub-profile-string

## Syntax

```
sub-profile-string string
no sub-profile-string
```

## Context

[\[Tree\]](#) (config>subscr-mgmt>vrgw>brg>brg-profile sub-profile-string)

## Full Context

```
configure subscriber-mgmt vrgw brg brg-profile sub-profile-string
```

## Description

This string will be used as a default for subscriber-profile lookup. This string can be overridden during BRG or host authentication. The **no** form of the command removes the string from the configuration.

## Default

```
no sub-profile-string
```

## Parameters

### *string*

Specifies the string used to look up the subscriber profile.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.496 sub-ring

### sub-ring

#### Syntax

[no] sub-ring {virtual-link | non-virtual-link}

#### Context

[\[Tree\]](#) (config>eth-ring sub-ring)

#### Full Context

configure eth-ring sub-ring

#### Description

This command specifies this ring-id to be sub-ring as defined in G.80312. By declaring this ring as a sub-ring object, this ring will only have one valid path and the sub-ring will be connected to a major ring or a VPLS instance.

The **virtual-link** keyword declares that a sub-ring is connected to another ring and control messages can be sent over the attached ring to the other side of the sub-ring.

The **non-virtual-link** channel parameter declares that a sub-ring may be connected to another ring or to a VPLS instance but no control messages from the sub-ring use the attached ring or VPLS instance. The non-virtual channel behavior is standard G.8032 capability.

The **no** form of this command deletes the sub-ring and its virtual channel associations.

#### Default

no sub-ring

#### Parameters

##### virtual-link

Specifies that the interconnection is to a ring and a virtual link will be used.

##### non-virtual-link

Specifies that the interconnection is to a ring or a VPLS instance and a virtual link will not be used.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### Full Context

configure service ies subscriber-interface group-interface sap-parameters sub-sla-mgmt

configure service vprn subscriber-interface group-interface sap-parameters sub-sla-mgmt

### Description

Commands in this context configure subscriber management parameters.

The **no** form of this command removes the parameters from the configuration.

### Default

sub-sla-mgmt

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.498 subinterface

## subinterface

### Syntax

**subinterface** *subinterface*

**no subinterface**

### Context

**[Tree]** (config>router>if>extref>oc subinterface)

**[Tree]** (config>svc>vprn>if>extref>oc subinterface)

### Full Context

configure router interface external-reference openconfig subinterface

configure service vprn interface external-reference openconfig subinterface

## Description

This command configures the subinterface ID used to map a Nokia vendor-specific configuration and the OpenConfig state.

This command configures the ability to query the OpenConfig state through NETCONF, gRPC, and the MD-CLI from any configuration mode without having to add any OpenConfig model configuration. As part of the configuration, a user must also add a port to the Layer 3 interface.

The **no** form of this command reverts to the default.

## Default

no subinterface

## Parameters

### *subinterface*

Specifies the subinterface ID.

**Values** 0 to 4294967295

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.499 subject

### subject

## Syntax

**subject** {**eq** | **neq**} *subject* [*regexp*]

**no subject**

## Context

[\[Tree\]](#) (config>service>vprn>log>filter>entry>match subject)

## Full Context

configure service vprn log filter entry match subject

## Description

This command adds an event subject as a match criterion.

The subject is the entity for which the event is reported, such as a port. In this case the port-id string would be the subject. Only one **subject** command can be entered per event filter entry. The latest **subject** command overwrites the previous command.

The **no** form of this command removes the subject match criterion.

**Default**

no subject

**Parameters**

eq | neq

This operator specifies the type of match. Valid operators are listed below.

**Values**

Table 174: Valid Operators

Operator	Notes
eq	equal to
neq	not equal to

**subject**

A string used as the subject match criterion.

**regexp**

Specifies the type of string comparison to use to determine if the log event matches the value of **subject** command parameters. When the **regexp** keyword is specified, the string in the **subject** command is a regular expression string that will be matched against the subject string in the log event being filtered.

When **regexp** keyword is not specified, the **subject** command string is matched exactly by the event filter.

**Platforms**

All

**subject****Syntax**

```
subject {eq | neq} subject [regexp]
```

```
no subject
```

**Context**

```
[Tree] (config>log>filter>entry>match subject)
```

**Full Context**

```
configure log filter entry match subject
```

**Description**

This command adds an event subject as a match criterion.

The subject is the entity for which the event is reported, such as a port. In this case the port-id string would be the subject. Only one **subject** command can be entered per event filter entry. The latest **subject** command overwrites the previous command.

The **no** form of this command removes the subject match criterion.

## Parameters

**eq | neq**

Specifies the match type. Valid operators are listed in [Table 175: Valid Operators](#).

Table 175: Valid Operators

Operator	Notes
eq	equal to
neg	not equal to

**subject**

Specifies a string up to 32 characters, used as the subject match criterion.

**regexp**

Specifies the type of string comparison to use to determine if the log event matches the value of **subject** command parameters. When the **regexp** keyword is specified, the string in the **subject** command is a regular expression string that will be matched against the subject string in the log event being filtered. When the **regexp** keyword is not specified, the **subject** command string is matched exactly by the event filter.

## Platforms

## 23.500 subnet

subnet

### Syntax

**subnet** {*ip-address/mask* | *ip-address netmask*} [**create**]

**no subnet** {*ip-address/mask* | *ip-address netmask*}

### Context

[\[Tree\]](#) (config>service>vprn>dhcp>server>pool subnet)

[\[Tree\]](#) (config>router>dhcp>server>pool subnet)

### Full Context

configure service vprn dhcp local-dhcp-server pool subnet

```
configure router dhcp local-dhcp-server pool subnet
```

### Description

This command creates a subnet of IP addresses to be served from the pool. The subnet cannot include any addresses that were assigned to subscribers without those addresses specifically excluded. When the subnet is created, no IP addresses are made available until a range is defined.

The **no** form of the removes the subnet parameters from the configuration.

### Parameters

#### *ip-prefix/mask*

Specifies the address prefix and mask. A mask of 255.255.255.255 is reserved for system IP addresses.

**Values** ip-prefix: a.b.c.d  
mask: 8 to 32

#### *netmask*

Specifies a string of 0s and 1s that mask or screen out the network part of an IP address so that only the host computer part of the address remains.

**Values** a.b.c.d, any mask expressed as dotted quad

#### *create*

Keyword used to create the subnet. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.501 subnet-check

### subnet-check

#### Syntax

```
[no] subnet-check
```

#### Context

**[Tree]** (config>service>vprn>igmp>if subnet-check)

**[Tree]** (config>service>vprn>igmp>grp-if subnet-check)

#### Full Context

```
configure service vprn igmp interface subnet-check
```

```
configure service vprn igmp group-interface subnet-check
```

## Description

This command enables subnet checking for IGMP messages received on this interface. All IGMP packets with a source address that is not in the local subnet are dropped.

The **no** form of this command disables local subnet checking for IGMP.

## Platforms

All

- configure service vprn igmp interface subnet-check
- 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR
- configure service vprn igmp group-interface subnet-check

## subnet-check

## Syntax

[no] **subnet-check**

## Context

[\[Tree\]](#) (config>router>igmp>group-interface subnet-check)

[\[Tree\]](#) (config>router>igmp>if subnet-check)

## Full Context

configure router igmp group-interface subnet-check

configure router igmp interface subnet-check

## Description

This command enables subnet checking for IGMP messages received on this interface. All IGMP packets with a source address that is not in the local subnet are dropped.

## Default

subnet-check

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure router igmp group-interface subnet-check

All

- configure router igmp interface subnet-check

## subnet-check

### Syntax

[no] **subnet-check**

### Context

[\[Tree\]](#) (config>router>mld>group-interface subnet-check)

### Full Context

configure router mld group-interface subnet-check

### Description

This command enables subnet checking for MLD messages received on this interface. All MLD packets with a source address that is not in the local subnet are dropped.

### Default

subnet-check

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.502 subnet-mask

## subnet-mask

### Syntax

**subnet-mask** *ip-address*

**no subnet-mask**

### Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe>host>options subnet-mask)

[\[Tree\]](#) (config>router>dhcp>server>pool>subnet>options subnet-mask)

### Full Context

configure subscriber-mgmt local-user-db ipoe host options subnet-mask

configure router dhcp local-dhcp-server pool subnet options subnet-mask

### Description

This command specifies the subnet-mask option to the client. The mask can either be defined (for supernetting) or taken from the pool address.

The **no** form of this command removes the address from the configuration.

### Parameters

#### *ip-address*

Specifies the IP address of the subnet mask. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

**Values** a.b.c.d

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.503 subrate

### subrate

#### Syntax

**subrate** {**digital-link** | **larscom**} *rate-step*

**no subrate**

#### Context

[\[Tree\]](#) (config>port>tdm>ds3 subrate)

#### Full Context

configure port tdm ds3 subrate

#### Description

This command configures the channel service unit (CSU) compatibility mode to interoperate with existing DS-3 subrate standards.

This configuration applies only for non-channelized DS-3s on ASAP TDM MDAs.

The **no** form of this command remove the subrate functionality.

#### Default

no subrate

#### Parameters

##### **digital-link**

Enables the Digital-Link (Quick Eagle) CSU compatibility mode.

##### **larscom**

Enables the Larscom CSU compatibility mode.

**rate-step**

Specifies the subrate value for the associated DS-3.

**Values** 1 to 147 (digital-link) 1 to 14 (larscom)

**Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 23.504 subscriber

### subscriber

**Syntax**

**subscriber** *sub-ident*

**no subscriber**

**Context**

**[Tree]** (config>service>ies>if>sap>static-host subscriber)

**[Tree]** (config>service>vprn>sub-if>grp-if>sap>static-host subscriber)

**[Tree]** (config>service>vpls>sap>static-host subscriber)

**[Tree]** (config>service>ies>sub-if>grp-if>sap>static-host subscriber)

**[Tree]** (config>service>vprn>if>sap>static-host subscriber)

**Full Context**

configure service ies interface sap static-host subscriber

configure service vprn subscriber-interface group-interface sap static-host subscriber

configure service vpls sap static-host subscriber

configure service ies subscriber-interface group-interface sap static-host subscriber

configure service vprn interface sap static-host subscriber

**Description**

This command specifies an existing subscriber identification profile to be associated with the static subscriber host.

**Parameters**

***sub-ident***

Specifies the subscriber identification.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## subscriber

### Syntax

**subscriber** *sub-ident-string* [**sap** *sap-id*] [**ip** *ip-address*] [{**mac** *ieee-address*] | **sla-profile** *sla-profile-name*] [**fc** {**[be]** [**l2]** [**af]** [**l1]** [**h2]** [**ef]** [**h1]** [**nc**]}] {**[ingress]** [**egress**]} [**host-type** *host-type*] [**family** *family*]

**no subscriber** *sub-ident-string*

### Context

**[Tree]** (config>mirror>mirror-source subscriber)

### Full Context

configure mirror mirror-source subscriber

### Description

This command adds hosts of a subscriber to mirroring service.

### Parameters

#### **sub-ident-string**

Specifies the name of the subscriber identification policy.

#### **sap-id**

Specifies the physical port identifier portion of the SAP definition.

#### **ip-address**

Specifies the service IP address (system IP address) of the remote device sending LI traffic. If 0.0.0.0 is specified, any remote router is allowed to send to this service.

**Values** 1.0.0.1 to 223.255.255.254

#### **ieee-address**

Specify this optional parameter when defining a static host. The MAC address must be specified for **anti-spoof ip-mac** and **arp-populate**. Multiple static hosts may be configured with the same MAC address given that each definition is distinguished by a unique IP address.

#### **sla-profile-name**

Each host of a subscriber can use a different sla-profile. This option allows interception of only the hosts using the specified sla-profile. In some deployments sla-profiles are assigned per type of traffic. There can be, for example, a specific sla-profile for voice traffic (which could be used for all SIP-hosts). The name can have up to 32 characters.

#### **fc**

Specifies the name of the forwarding class with which to associate traffic. The forwarding class name must already be defined within the system. If the *fc-name* does not exist, an error will be returned and the **fc** command will have no effect. If the *fc-name* does exist, the forwarding class associated with *fc-name* will override the default forwarding class.

**Values** be, l2, af, l1, h2, ef, h1, nc

### **egress**

Specifies that packets egressing the SAP should be mirrored. Egress packets are mirrored to the mirror destination after egress packet modification.

### **ingress**

Specifies that packets ingressing the SAP should be mirrored. Ingress packets are mirrored to the mirror destination prior to ingress packet modification.

### **host-type**

Specifies the host type for mirroring. The anti-spoof filter on the SAP must be configured as **ip-mac**.

**Values** any, ipoe, ppp

### **family**

Specifies the IP family for mirroring. The anti-spoof filter on the SAP must be configured as **ip-mac**.

**Values** any, ipv4, ipv6

## **Platforms**

All

## **subscriber**

### **Syntax**

**subscriber** *sub-ident-string* [**sap** *sap-id* [**ip** *ip-address*] [**mac** *ieee-address*] | **sla-profile** *sla-profile-name*] [**fc** {[**be**] [**l2**] [**af**] [**l1**] [**h2**] [**ef**] [**h1**] [**nc**]}] [**intercept-id** *intercept-id*] [**session-id** *session-id*] {[**ingress**] [**egress**]} [**host-type** *host-type*] [**family** *ip-family*]

**no subscriber** *sub-ident-string*

### **Context**

[\[Tree\]](#) (config>li>li-source subscriber)

### **Full Context**

configure li li-source subscriber

### **Description**

This command adds hosts of a subscriber to mirroring service.

### **Parameters**

#### ***sub-ident-string***

Specifies the name of the subscriber identification policy.

#### ***sap-id***

Specifies the physical port identifier portion of the SAP definition.

### ***ip-address***

Specifies the service IP address (system IP address) of the remote device sending LI traffic. If 0.0.0.0 is specified, any remote router is allowed to send to this service.

**Values** 1.0.0.1 to 223.255.255.254

### ***ieee-address***

Specifies a MAC address when defining a static host. The MAC address must be specified for **anti-spoof ip-mac** and **arp-populate**. Multiple static hosts may be configured with the same MAC address given that each definition is distinguished by a unique IP address.

### ***sla-profile-name***

Specifies an SLA profile name, up to 32 characters. Each host of a subscriber can use a different sla-profile. This option allows interception of only the hosts using the specified sla-profile. In some deployments sla-profiles are assigned per type of traffic. There can be, for example, a specific sla-profile for voice traffic (which could be used for all SIP-hosts).

### ***fc***

The name of the forwarding class with which to associate LI traffic. The forwarding class name must already be defined within the system. If the *fc-name* does not exist, an error will be returned and the **fc** command will have no effect. If the *fc-name* does exist, the forwarding class associated with *fc-name* will override the default forwarding class.

**Values** be, l2, af, l1, h2, ef, h1, nc

### ***intercept-id***

Specifies the intercept-id that is inserted into the packet header for all mirrored packets of the associated li-source entry. This *intercept-id* can be used (for example by a downstream LI Gateway) to identify the particular LI session to which the packet belongs.

For all types of **li-source** entries (**filter**, **nat**, **sap**, or **subscriber**), when the mirror service is configured with **ip-udp-shim** routable encap, an *intercept-id* field (as part of the routable encap) is always present in the mirrored packets. If there is no *intercept-id* configured for an **li-source** entry, then the default value will be inserted. When the mirror service is configured with **ip-gre** or **ip-udp-shim-sampled** routable encap, no *intercept-id* is inserted and none can be specified against the **li-source** entries.

**Values** 1 to 4294967295 (32b) For **nat li-source** entries that are using a mirror service that is not configured with routable encap

**Values** 1 to 1,073,741,824 (30b) For all types of li-source entries that are using a mirror service with routable **ip-udp-shim** encapsulation and no direction-bit.

**Values** 1 to 536,870,912 (29b) For all types of li-source entries that are using a mirror service with routable **ip-udp-shim** encapsulation and with the direction-bit enabled.

### ***session-id***

Specifies the *session-id* that is inserted into the packet header for all mirrored packets of the associated **li-source** entry. This *session-id* can be used (for example by a downstream

LI gateway) to identify the particular LI session to which the packet belongs. The *session-id* is only valid and used for mirror services that are configured with **ip-udp-shim** routable encapsulation (**config>mirror>mirror-dest>encap>ip-udp-shim**).

For all types of **li-source** entries (**filter**, **nat**, **sap**, or **subscriber**), when the mirror service is configured with **ip-udp-shim** routable encap, a *session-id* field (as part of the routable encapsulation) is always present in the mirrored packets. If there is no *session-id* configured for an **li-source** entry, then the default value will be inserted. When a mirror service is configured with **ip-gre** or **ip-udp-shim-sampled** routable encap, no *session-id* is inserted and none can be specified against the **li-source** entries.

**Values** 1 to 4,294,967,295 (32b)

### **ingress**

Specifies the ingress policy for lawful intercept.

### **egress**

Specifies the egress policy for lawful intercept.

### **host-type**

Specifies the host type for lawful intercept. The anti-spoof filter on the SAP must be configured as **ip-mac**.

**Values** any, ipoe, ppp

### **ip-family**

Specifies the IP family for lawful intercept. The anti-spoof filter on the SAP must be configured as **ip-mac**.

**Values** any, ipv4, ipv6

## **Platforms**

All

## **subscriber**

### **Syntax**

**subscriber** *sub-ident-string* [**sap** *sap-id*] [**ip** *ip-address*] [{**mac** *ieee-address*] | **sla-profile** *sla-profile-name*}]  
[**fc** {[**be**] [**I2**] [**af**] [**I1**] [**h2**] [**ef**] [**h1**] [**nc**]}] {[**ingress**] [**egress**]}

**no subscriber** *sub-ident-string*

### **Context**

**[Tree]** (debug>mirror-source subscriber)

### **Full Context**

debug mirror-source subscriber

### **Description**

This command adds hosts of a subscriber to mirroring service.

## Parameters

### ***sub-ident-string***

Specifies the name of the subscriber identification policy.

### ***sap-id***

Specifies the physical port identifier portion of the SAP definition.

### ***ip-address***

The service IP address (system IP address) of the remote 7750 SR or 7450 ESS device sending LI traffic.

**Values** 1.0.0.1 to 223.255.255.254

### ***ieee-address***

Specify this optional parameter when defining a static host. The MAC address must be specified for **anti-spoof ip-mac** and **arp-populate**. Multiple static hosts may be configured with the same MAC address given that each definition is distinguished by a unique IP address.

### ***sla-profile-name***

Specifies the SLA profile name, up to 32 characters.

### ***fc***

Specifies name of the forwarding class with which to associate LI traffic.

**Values** be, l2, af, l1, h2, ef, h1, nc

### ***ingress***

Specifies information for the ingress policy.

### ***egress***

Specifies information for the egress policy.

## Platforms

All

## 23.505 subscriber-bw-limit

### subscriber-bw-limit

#### Syntax

**subscriber-bw-limit** *bandwidth*

**no subscriber-bw-limit**

#### Context

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if subscriber-bw-limit)

## Full Context

```
configure mcast-management multicast-info-policy video-policy video-interface subscriber-bw-limit
```

## Description

This command configures of an egress per-subscriber bandwidth limit for the combined retransmission and Fast Channel Change (FCC) replies for requests received directed to the IP address. If the bandwidth for a request will exceed the bandwidth limit, the request is logged and dropped.

The **no** form of the command disables enforcement of an egress bandwidth limit.

## Default

```
no subscriber-bw-limit
```

## Parameters

### *bandwidth*

The per-subscriber egress bandwidth limit for retransmission and FCC packets in kilobits per second expressed as an integer indicates infinity or no limit.

**Values** 1 to 4294967295 kb/s

## Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## Context

[\[Tree\]](#) (config>service>vprn subscriber-interface)

[\[Tree\]](#) (config>service>ies subscriber-interface)

## Full Context

configure service vprn subscriber-interface

configure service ies subscriber-interface

## Description

This command allows the operator to create special subscriber-based interfaces. It is used to contain multiple group interfaces. Multiple subnets associated with the subscriber interface can be applied to any of the contained group interfaces in any combination. The subscriber interface allows subnet sharing between group interfaces.

The **no** form of this command reverts to the default.

## Parameters

*ip-int-name*

Specifies the interface name of a subscriber interface, up to 32 characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

**create**

Keyword used to create the subscriber interface.

**fwd-service *service-id***

Specifies the wholesale service ID or service name.

**Values**    *service-id*: 1 to 214748364  
              *svc-name*: A string up to 64 characters

***ip-int-name***

Specifies the wholesale subscriber interface.

**wan-mode *mode***

Specifies the WAN mode as 64-bit or 128-bit. To change the WAN mode after creation, the interface must first be removed then recreated.

**Values**    *mode64*, *mode128*

**Default**    *mode64*

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### subscriber-interface-statistics

**Syntax**

**subscriber-interface-statistics**

**Context**

[\[Tree\]](#) (config>subscr-mgmt subscriber-interface-statistics)

**Full Context**

configure subscriber-mgmt subscriber-interface-statistics

**Description**

Commands in this context enable or disable the collection of subscriber interface statistics.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.511 subscriber-limit

### subscriber-limit

#### Syntax

**subscriber-limit** *limit*

**no subscriber-limit**

#### Context

**[Tree]** (config>service>vprn>nat>outside>pool subscriber-limit)

#### Full Context

configure service vprn nat outside pool subscriber-limit

#### Description

This command configures the maximum number of subscribers per outside IP address.

If multiple port blocks per subscriber are used, the block size is typically small; all blocks assigned to a given subscriber belong to the same IP address; the subscriber limit guarantees that any subscriber can get a minimum number of ports.

The subscribers are counted per protocol (UDP, TCP and ICMP). For example, in LSN44 a source IPv4 address that uses ports on each of the three protocols (UDP, TCP and ICMP) on an outside IP address count as 3 subscribers on that outside IP address. The 'no subscriber-limit' removes the limit for the number of subscribers per outside IP address.

This command is not applicable to pools with:

- arbitrary address pooling enabled
- flexible port allocations (application configured under a pool)

#### Parameters

*limit*

Specifies the maximum number of subscribers per outside IP address.

**Values** 1 to 65535

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.512 subscriber-mgmt

## subscriber-mgmt

### Syntax

**subscriber-mgmt**

### Context

**[Tree]** (config>service>vprn subscriber-mgmt)

**[Tree]** (config>service>ies subscriber-mgmt)

### Full Context

configure service vprn subscriber-mgmt

configure service ies subscriber-mgmt

### Description

Commands in this context configure per service subscriber management parameters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## subscriber-mgmt

### Syntax

**subscriber-mgmt**

### Context

**[Tree]** (config subscriber-mgmt)

### Full Context

configure subscriber-mgmt

### Description

Commands in this context configure subscriber management entities. A subscriber is uniquely identified by a subscriber identification string. Each subscriber can have several DHCP sessions active at any time. Each session is referred to as a subscriber host and is identified by its IP address and MAC address.

All subscriber hosts belonging to the same subscriber are subject to the same hierarchical QoS (HQoS) processing. The HQoS processing is defined in the sub-profile (the subscriber profile). A sub-profile refers to an existing scheduler policy (configured in **the config>qos>scheduler-policy** context) and offers the possibility to overrule the rate of individual schedulers within this policy.

Because all subscriber hosts use the same scheduler policy instance, they must all reside on the same complex.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## subscriber-mgmt

### Syntax

**subscriber-mgmt**

### Context

## subscriber-mgmt

### Syntax

**subscriber-mgmt [ipoe] [pppoe] [wlan-gw]**

**no subscriber-mgmt**

### Context

**[Tree]** (config>redundancy>multi-chassis>peer>sync subscriber-mgmt)

### Full Context

configure redundancy multi-chassis peer sync subscriber-mgmt

### Description

This command specifies whether subscriber management information should be synchronized with the multi-chassis peer.

### Default

no subscriber-mgmt

### Parameters

**ipoe**

Specifies to synchronize IPoE subscribers. The use of the keyword must match on both nodes, otherwise the subscriber synchronization fails.

**pppoe**

Specifies to synchronize PPPoE subscribers. The use of the keyword must match on both nodes, otherwise the subscriber synchronization fails.

**wlan-gw**

Specifies to synchronize WLAN-GW subscribers. The use of the keyword must match on both nodes, otherwise the subscriber synchronization fails.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.513 subscriber-prefix-length

### subscriber-prefix-length

**Syntax**

**subscriber-prefix-length** *prefix-length*

**no subscriber-prefix-length**

**Context**

[\[Tree\]](#) (config>service>vprn>nat>inside>dslite subscriber-prefix-length)

**Full Context**

configure service vprn nat inside dual-stack-lite subscriber-prefix-length

**Description**

This command configures the IPv6 prefix length of the DS-Lite subscribers.

The **no** form of this command reverts the default.

**Default**

subscriber-prefix-length 128

**Parameters**

**prefix-length** *prefix-length*

Specifies the IPv6 prefix length of the DS-Lite subscriber.

**Values** 32 to 64, 128

**Default** 128

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## subscriber-prefix-length

### Syntax

**subscriber-prefix-length** *prefix-length*

**no subscriber-prefix-length**

### Context

**[Tree]** (config>router>nat>inside>dual-stack-lite subscriber-prefix-length)

### Full Context

configure router nat inside dual-stack-lite subscriber-prefix-length

### Description

This command sets the value for the number of high order bits of the source IPv6 address that will be considered as DS-Lite subscriber. The remaining bits of the source IPv6 address will be masked off, effectively aggregation all IPv6 source addresses under the configured prefix length into a single DS-Lite subscriber. Source IPv4 addresses/ports of the traffic carried within the DS-Lite subscriber will be translated into a single outside IPv4 address and the corresponding deterministic port-block (port-blocks can be extended).

The range of values for subscriber-prefix-length in non-deterministic DS-Lite is limited from 32 to 64 (a prefix will be considered as a DS-Lite subscriber) or it can be set to a value of 128 (the source IPv6 address is considered as a DS-Lite subscriber).

In cases where deterministic DS-Lite is enabled in a given inside routing context, the range of values of the **subscriber-prefix-length** depends on the value of *dslite-max-subscriber-limit* parameter as follows:

**subscriber-prefix-length – n = [32..64,128]**

**where n = log2(dslite-max-subscriber-limit)**

[or in an alternate form:  $dslite-max-subscriber-limit = 2^n$ .]

In other words the largest prefix length for the deterministic DS-Lite subscriber will be  $32+n$ , where  $n = \log_2(dslite-max-subscriber-limit)$ . The subscriber prefix length can extend up to 64 bits. Beyond 64 bits for the subscriber prefix length, there only one value is allowed: 128. In the case  $n$  must be 0, which means that the mapping between B4 elements (or IPv6 address) and the IPv4 outside addresses is in 1:1 ratio (no sharing of outside IPv4 addresses).

This parameter can be changed only when there are no deterministic prefixes configured in the same routing context.

The **no** form of the command reverts to the default.

### Default

128

### Parameters

#### *prefix-length*

In non-deterministic DS-Lite this value can be [32..64,128], assuming that the deterministic DS-Lite is not concurrently enabled in the same inside routing context. In case that deterministic DS-Lite is enabled, this value can be within the range [(32+n)..64,128] where

$n = \log_2(\text{dslite-max-subscriber-limit})$ . The value of 128 is allowed only when  $n=0$  (each subscriber is mapped to a single outside IPv4 IP address).

**Values** 32 to 64

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## subscriber-prefix-length

### Syntax

**subscriber-prefix-length** *prefix-length*

**no subscriber-prefix-length**

### Context

[\[Tree\]](#) (config>router>nat>inside>nat64 subscriber-prefix-length)

[\[Tree\]](#) (config>service>vprn>nat>inside>nat64 subscriber-prefix-length)

### Full Context

configure router nat inside nat64 subscriber-prefix-length

configure service vprn nat inside nat64 subscriber-prefix-length

### Description

This command specifies the IPv6 address prefix length to be used for the NAT64 subscribers in this virtual router instance.

### Default

subscriber-prefix-length128

### Parameters

***prefix-length***

Specifies the subscriber identification for Large Scale NAT.

**Values** 32 to 64, 128

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.514 subscriber-prefixes

## subscriber-prefixes

### Syntax

**subscriber-prefixes**

### Context

**[Tree]** (config>service>vprn>sub-if>ipv6 subscriber-prefixes)

**[Tree]** (config>service>ies>sub-if>ipv6 subscriber-prefixes)

### Full Context

configure service vprn subscriber-interface ipv6 subscriber-prefixes

configure service ies subscriber-interface ipv6 subscriber-prefixes

### Description

Commands in this context configure aggregate off-link subscriber prefixes associated with this subscriber interface. Individual prefixes are specified under the prefix context list aggregate routes in which the next hop is indirect via the subscriber interface.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.515 subscriber-retention

## subscriber-retention

### Syntax

**subscriber-retention** [*hrs hours*] [*min minutes*]

**no subscriber-retention**

### Context

**[Tree]** (config>service>nat>nat-policy>timeouts subscriber-retention)

**[Tree]** (config>service>nat>up-nat-policy>timeouts subscriber-retention)

### Full Context

configure service nat nat-policy timeouts subscriber-retention

configure service nat up-nat-policy timeouts subscriber-retention

### Description

This command specifies the subscriber retention timeout, which is the time a NAT subscriber and its associated IP address are kept after all hosts and associated port blocks have expired. If a NAT subscriber host appears before the retention timeout has elapsed, it is given the same outside IP address.

## Default

no subscriber-retention

## Parameters

### hrs *hours*

Specifies the hours a subscriber's IP address is kept after all hosts and port blocks have expired.

**Values** 1 to 24

### min *minutes*

Specifies the minutes a subscriber's IP address is kept after all hosts and port blocks have expired.

**Values** 1 to 59

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.516 subscriber-sap-id

subscriber-sap-id

## Syntax

[no] subscriber-sap-id

## Context

configure service vpls sap static-host subscriber-sap-id

configure service vprn subscriber-interface group-interface sap static-host subscriber-sap-id

configure service ies subscriber-interface group-interface sap static-host subscriber-sap-id

configure service ies interface sap static-host subscriber-sap-id

## Description

This command enables using the SAP ID as the subscriber ID.

## Parameters

### **subscriber-sap-id**

Specifies to use the sap-id as the subscriber-id.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.517 subscribers

### subscribers

## Syntax

**subscribers {qset-size size | non-shaper-queues}**

## Context

[\[Tree\]](#) (config>qos>fp-resource-policy>aggregate-shapers>queue-sets>default-size subscribers)

## Full Context

configure qos fp-resource-policy aggregate-shapers queue-sets default-size subscribers

## Description

This command configures the default queue-set size for subscribers.

## Parameters

### **size**

Specifies the size of the queue sets.

**Values** 2 to 8

### **non-shaper-queues**

Specifies that subscribers will not use hardware aggregate shapers on FPs where the FP resource policy is applied.

## Platforms

7750 SR-1, 7750 SR-s

## 23.518 subscription

### subscription

#### Syntax

**subscription** *percentage*

**no subscription**

#### Context

[\[Tree\]](#) (config>router>rsvp>interface subscription)

#### Full Context

configure router rsvp interface subscription

#### Description

This command configures the percentage of the link bandwidth that RSVP can use for reservation and sets a limit for the amount of over-subscription or under-subscription allowed on the interface.

When the **subscription** is set to zero, no new sessions are permitted on this interface. If the *percentage* is exceeded, the reservation is rejected and a log message is generated.

The **no** form of this command reverts the *percentage* to the default value.

#### Default

subscription 100

#### Parameters

*percentage*

Specifies the percentage of the interface's bandwidth that RSVP allows to be used for reservations.

**Values** 0 to 1000

#### Platforms

All

### subscription

#### Syntax

**subscription** *subscription-id* **cancel**

**subscription** **cancel-all**

## Context

[\[Tree\]](#) (admin>system>telemetry>grpc subscription)

## Full Context

admin system telemetry grpc subscription

## Description

This command cancels an active telemetry subscription.

## Parameters

### *subscription-id*

Specifies the ID of the telemetry subscription to cancel.

**Values** 0 to 4294967295

## Platforms

All

## subscription

## Syntax

**subscription** *name* [create]

**no subscription** *name*

## Context

[\[Tree\]](#) (config>system>telemetry>persistent-subscriptions subscription)

## Full Context

configure system telemetry persistent-subscriptions subscription

## Description

Commands in this context configure persistent subscription commands.

The **no** form of this command removes the configuration.

## Parameters

### *name*

Specifies the subscription name, up to 32 characters.

### *create*

Keyword used to create the subscription.

## Platforms

All

## 23.519 subtype

### subtype

#### Syntax

[no] **subtype** *tls extension subtype*

#### Context

[\[Tree\]](#) (config>app-assure>group>http-enrich>tls-extension subtype)

#### Full Context

configure application-assurance group http-enrich tls-extension subtype

#### Description

This command configures a TLS subtype.

The **no** form of this command removes the TLS subtype from the configuration.

#### Parameters

*tls extension subtype*

Specifies a TLS subtype, up to 32 characters

## 23.520 suggest-internal-objects

### suggest-internal-objects

#### Syntax

[no] **suggest-internal-objects**

#### Context

[\[Tree\]](#) (environment suggest-internal-objects)

#### Full Context

## 23.521 summaries

### summaries

#### Syntax

[no] summaries

#### Context

[\[Tree\]](#) (config>service>vprn>ospf3>area>nssa summaries)

[\[Tree\]](#) (config>service>vprn>ospf>area>stub summaries)

[\[Tree\]](#) (config>service>vprn>ospf>area>nssa summaries)

#### Full Context

configure service vprn ospf3 area nssa summaries

configure service vprn ospf area stub summaries

configure service vprn ospf area nssa summaries

#### Description

This command enables sending summary (type 3) advertisements into a stub area or Not So Stubby Area (NSSA) on an Area Border Router (ABR). This parameter is particularly useful to reduce the size of the routing and Link State Database (LSDB) tables within the stub or nssa area. By default, summary route advertisements are sent into the stub area or NSSA.

The **no** form of this command disables sending summary route advertisements and, for stub areas, only the default route is advertised by the ABR.

#### Default

summaries — Summary routes are advertised by the ABR into the stub area or NSSA.

## Platforms

All

### summaries

#### Syntax

[no] summaries

## Context

[\[Tree\]](#) (config>router>ospf3>area>nssa summaries)

[\[Tree\]](#) (config>router>ospf>area>nssa summaries)

[\[Tree\]](#) (config>router>ospf>area>stub summaries)

[\[Tree\]](#) (config>router>ospf3>area>stub summaries)

## Full Context

configure router ospf3 area nssa summaries

configure router ospf area nssa summaries

configure router ospf area stub summaries

configure router ospf3 area stub summaries

## Description

This command enables sending summary (type 3) advertisements into a stub area or Not So Stubby Area (NSSA) on an Area Border Router (ABR).

This parameter is particularly useful to reduce the size of the routing and Link State Database (LSDB) tables within the stub or NSSA area (default: summary).

By default, summary route advertisements are sent into the stub area or NSSA.

The **no** form of this command disables sending summary route advertisements and, for stub areas; only the default route is advertised by the ABR.

## Default

summaries

## Platforms

**no summary**

## Context

[\[Tree\]](#) (debug>router>isis summary)

## Full Context

debug router isis summary

## Description

This command enables debugging for ISIS summary addresses.  
The **no** form of the command disables the debugging.

## Parameters

*ip-address*

When specified, only packets with the specified address are debugged.

## Platforms

All

## 23.523 summary-address

## summary-address

## Syntax

**summary-address** {*ip-prefix/mask* | *ip-prefix* [*netmask*]} [*level*] [ **tag** *tag*]

**no summary-address** {*ip-prefix/mask* | *ip-prefix* [*netmask*]}

## Context

[\[Tree\]](#) (config>service>vprn>isis summary-address)

## Full Context

configure service vprn isis summary-address

## Description

This command creates summary-addresses for the specified router or VPRN instance.

## Parameters

### *ip-prefix/mask*

Specifies information for the specified IP prefix and mask length.

Values		
ip-prefix	a.b.c.d	(host bits must be 0)
ipv4-prefix-length	0 to 32	
ipv6-prefix	x:x:x:x:x:x:x	(eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d	
	x: [0 to FFFF]H	
	d: [0 to 255]D	
ipv6-prefix-length	0 to 128	

### *netmask*

The subnet mask in dotted decimal notation.

**Values** 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

### *level*

Specifies IS-IS level area attributes. If no level parameter is specified, the default is level-1/2.

**Values** level-1, level-2, level-1/2

### *tag tag*

Assigns a route tag to the summary address.

**Values** 1 to 4294967295

## Platforms

All

## summary-address

## Syntax

**summary-address** {*ip-prefix/ip-prefix-length* | *ip-prefix netmask*} [*level*] [*tag tag*] [*algorithm algo-id*]

**no summary-address** {*ip-prefix/ip-prefix-length* | *ip-prefix netmask*}

**Context**

[\[Tree\]](#) (config>router>isis summary-address)

**Full Context**

configure router isis summary-address

**Description**

This command creates summary-addresses.

**Default**

no summary-address

**Parameters*****ip-prefix/ip-prefix-length***

Specifies the IP prefix and prefix length of the summary address.

<b>Values</b>		
ipv4-prefix		a.b.c.d (host bits must be 0)
ipv4-prefix-length		0 to 32
ipv6-prefix		x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x: [0 to FFFF]H d: [0 to 255]D
ipv6-prefix-length		0 to 128

***netmask***

Specifies the subnet mask in dotted decimal notation.

**Values** 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

***level***

Specifies IS-IS level area attributes. If no level parameter is specified, the default is level-1/2.

**Values** level-1, level-2, level-1/2

***tag***

Assigns a route tag to the summary address.

**Values** 1 to 4294967295

***algo-id***

Specifies the algorithm topology applied for the summary address. If no algo-id parameter is specified, the default is 0.

**Values** 0, 128 to 255

## Platforms

## 23.524 summary-crit

### summary-crit

#### Syntax

**summary-crit dst-addr**

**summary-crit src-addr**

**no summary-crit**

#### Context

[\[Tree\]](#) (config>filter>log>summary summary-crit)

#### Full Context

configure filter log summary summary-crit

#### Description

This command defines the key of the index of the mini-table. If key information is changed while summary is administratively enabled (no shutdown), the filter summary mini-table is flushed and recreated with different key information. Log packets received during the reconfiguration time will be handled as if summary was not active.

The **no** form of the command reverts to the default parameter.

#### Default

summary-crit src-addr

#### Parameters

##### dst-addr

Specifies that received log packets are summarized based on the destination IPv4, IPv6, or MAC address.

##### src-addr

Specifies that received log packets are summarized based on the source IPv4, IPv6 or MAC address.

## Platforms

All

## 23.525 super-backbone

super-backbone

### Syntax

[no] super-backbone

### Context

[\[Tree\]](#) (config>service>vprn>ospf super-backbone)

### Full Context

configure service vprn ospf super-backbone

### Description

This command specifies whether CE-PE functionality is required or not. The OSPF super backbone indicates the type of the LSA generated as a result of routes redistributed into OSPF. When enabled, the redistributed routes are injected as summary, external or NSSA LSAs. When disabled, the redistributed routes are injected as either external or NSSA LSAs only.

### Default

no super-backbone

### Platforms

## 23.528 suppress

```
suppress
```

### Syntax

```
suppress integer
```

```
no suppress
```

### Context

[\[Tree\]](#) (config>router>policy-options>damping suppress)

### Full Context

```
configure router policy-options damping suppress
```

### Description

This command configures the suppression parameter for the route policy damping profile.

A route is suppressed when it has flapped frequently enough to increase the Figure of Merit (FoM) value to exceed the **suppress** threshold limit. When the **FoM** value exceeds the **suppress** threshold limit, the route is removed from the route table or inclusion in advertisements.

The **no** form of this command removes the suppress parameter from the damping profile.

### Default

```
no suppress
```

### Parameters

*integer*

Specifies the suppress value expressed as a decimal integer.

**Values** 1 to 20000

### Platforms

All

## 23.529 suppress-attached-bit

**Description**

This command enables the suppression of lower order alarms on SONET/SDH port such as MLPPP bundle alarms, DS1/E1 links alarms and 336 APS channel groups alarms.

The **no** form of this command disables the suppression of lower order alarms on SONET/SDH port.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.532 suppress-lsn-events

### suppress-lsn-events

#### Syntax

[no] suppress-lsn-events

#### Context

[\[Tree\]](#) (configure>isa>wlan-gw-group>nat suppress-lsn-events)

#### Full Context

configure isa wlan-gw-group nat suppress-lsn-events

#### Description

This command suppresses the generation of Large Scale NAT (LSN) events when RADIUS accounting is enabled.

By default, only one logging facility for tracking subscribers in LSN44, DS-Lite, and NAT64 can be enabled at the time, either the SR OS event logging facility or the RADIUS logging facility. Note that SR OS event logs can be sent to multiple destinations, such as the console session, a telnet or SSH session, memory logs, file destinations, SNMP trap groups, and syslog destinations.

If RADIUS logging is enabled, the NAT logs are sent to the RADIUS destination and the NAT logs are suppressed in the SR OS event logging facility, for example, NAT logs are not sent to the syslog server.

If RADIUS logging is disabled, the NAT logs are sent to the SR OS event logging facility, for example, syslog, assuming that the events are enabled via the SR OS event-control (**config> log>event-control nat event generate**).

The **no** form of this command, the NAT logs can be sent to both logging facilities simultaneously, the SR OS event logging facility and RADIUS logging facility.

#### Default

suppress-lsn-events

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

### suppress-lsn-events

#### Syntax

[no] suppress-lsn-events

#### Context

[\[Tree\]](#) (config>isa>nat-group suppress-lsn-events)

## Full Context

```
configure isa nat-group suppress-lsn-events
```

## Description

This command suppresses the generation of Large Scale NAT (LSN) events when RADIUS accounting is enabled.

By default, only one logging facility for tracking subscribers in LSN44, DS-Lite, and NAT64 can be enabled at the time: either the SR OS event logging facility or the RADIUS logging facility. SR OS event logs can be sent to multiple destinations, such as the console session, a telnet or SSH session, memory logs, file destinations, SNMP trap groups, and syslog destinations.

If RADIUS logging is enabled, the NAT logs are sent to the RADIUS destination and the NAT logs are suppressed in the SR OS event logging facility, for example, NAT logs are not sent to the syslog server.

If RADIUS logging is disabled, the NAT logs are sent to the SR OS event logging facility; for example, syslog, assuming that the events are enabled via the event-control command (**config> log>event-control nat event generate**).

By explicitly disabling this command (**no suppress-lsn-events**), the NAT logs can be sent to both logging facilities simultaneously, the SR OS event logging facility, and the RADIUS logging facility.

## Default

```
suppress-lsn-events
```

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.533 suppress-lsn-sub-blks-free

```
suppress-lsn-sub-blks-free
```

## Syntax

```
[no] suppress-lsn-sub-blks-free
```

## Context

```
[Tree] (configure>isa>wlan-gw-group>nat suppress-lsn-sub-blks-free)
```

## Full Context

```
configure isa wlan-gw-group nat suppress-lsn-sub-blks-free
```

## Description

This command suppresses the `tmnxNatLsnSubBlksFree` summary notification and use the `tmnxNatPIBlockAllocationLsn` notifications. When the SR OS node is in a state of excessive logging, the queue associated with the transmission of logs on the MS-ISA can become congested. This event further delays the generation of logs, and with this, further allocations and deallocations of NAT resources (port-

blocks) is stalled until the queue is relieved of congestion. For example, an excessive logging state in the system can be caused by issuing a command to clear a large number of NAT subscribers where a large number of resources (port-blocks) are released at once.

The **suppress-lsn-sub-blks-free** command enables the generation of individual logs carried in event-id 2012 for every released port block regardless of the state of the transmission queue (whether congested or not). If NAT subscribers have a large number of allocated port blocks (this could be hundreds of port blocks per subscriber), generating individual logs per port-block release contributes to the congestion.

To alleviate transmission queue congestion, this behavior can be changed by disabling this command (**no suppress-lsn-sub-blks-free**). This causes the suppression of logs related to the release of individual port blocks of a NAT subscriber when the transmission queue is congested. As a result, only a summarized release log via event-id 2021 for the subscriber is generated. The purpose of this new log is to inform the operator in a single message that all ports blocks for the subscriber are released. For example, the log message for LSN is "LSN subscriber all blocks freed". The benefit of such summarization (or log aggregation) is to alleviate the congestion of the transmission queue and consequently accelerate resource releases. An effect is the decreased granularity of information.

If summarization is enabled (**no suppress-lsn-sub-blks-free**) while there is no logging congestion in the system, the port block releases continue to be logged individually via the event-id 2012 (assuming that this is enabled in the event control), except for the last port block of the subscriber. When the last port block is released, the log with event-id 2021 is generated indicating that all port blocks for the subscriber are now released without carrying the specific information about this last port block that is released.

## suppress-lsn-sub-blks-free

### Syntax

[no] **suppress-lsn-sub-blks-free**

### Context

**[Tree]** (config>isa>nat-group suppress-lsn-sub-blks-free)

### Full Context

configure isa nat-group suppress-lsn-sub-blks-free

### Description

This command suppresses the `tmnxNatLsnSubBlksFree` summary notification and use the `tmnxNatPIBlockAllocationLsn` notifications. When the SR OS node is in a state of excessive logging, the queue associated with the transmission of logs on the MS-ISA can become congested. This event further delays the generation of logs, and with this, further allocations and deallocations of NAT resources (port-blocks) will be stalled until the queue is relieved of congestion. For example, an excessive logging state in the system can be caused by issuing a command to clear a large number of NAT subscribers where a large number of resources (port-blocks) are released at once.

The **suppress-lsn-sub-blks-free** command enables the generation of individual logs carried in event-id 2012 for every released port block regardless of the state of the transmission queue (whether congested or

not). If NAT subscribers have a large number of allocated port blocks (this could be hundreds of port blocks per subscriber), generating individual logs per port-block release contributes to the congestion.

To alleviate transmission queue congestion, this behavior can be changed by disabling this command (**no suppress-lsn-sub-blks-free**). This causes the suppression of logs related to the release of individual port blocks of a NAT subscriber when the transmission queue is congested. As a result, only a summarized release log via event-id 2021 for the subscriber is generated. The purpose of this new log is to inform the operator in a single message that all ports blocks for the subscriber are released. For example, the log message for LSN will be "LSN subscriber all blocks freed". The benefit of such summarization (or log aggregation) is to alleviate the congestion of the transmission queue and consequently accelerate resource releases. An effect is the decreased granularity of information.

If summarization is enabled (**no suppress-lsn-sub-blks-free**) while there is no logging congestion in the system, the port block releases continue to be logged individually via the event-id 2012 (assuming that this is enabled in the event control), except for the last port block of the subscriber. When the last port block is released, the log with event-id 2021 is generated indicating that all port blocks for the subscriber are now released without carrying the specific information about this last port block that is released.

### Default

no suppress-lsn-sub-blks-free

## 23.534 suppress-standby-signaling

### suppress-standby-signaling

#### Syntax

[no] suppress-standby-signaling

#### Context

[\[Tree\]](#) (config>service>vpls>endpoint suppress-standby-signaling)

#### Full Context

configure service vpls endpoint suppress-standby-signaling

#### Description

When this command is enabled, the pseudowire standby bit (value 0x00000020) will not be sent to T-LDP peer when the specified spoke is selected as a standby. This allows faster switchover as the traffic will be sent over this SDP and discarded at the blocking side of the connection. This is particularly applicable to multicast traffic.

#### Default

suppress-standby-signaling

## Platforms

All

## 23.535 suppress-threshold

```
suppress-threshold
```

### Syntax

```
suppress-threshold suppress-penalties reuse-threshold reuse-penalties
```

### Context

[\[Tree\]](#) (config>port>ethernet>dampening suppress-threshold)

### Full Context

```
configure port ethernet dampening suppress-threshold
```

### Description

This command configures the penalties thresholds at which the port state events to the upper layer are dampened (suppress threshold) and then permitted (reuse threshold).

### Parameters

#### *suppress-penalties*

Specifies the threshold at which the port up state is suppressed until the accumulated penalties drop below the reuse threshold again.

**Values** 1 to 20000

**Default** 2000

#### *reuse-penalties*

Specifies the threshold at which the port up state is no longer suppressed, after the port has been in a suppressed state and the accumulated penalties decay drops below this threshold. The reuse threshold value must be less than the suppress threshold value.

**Values** 1 to 20000

**Default** 1000

## 23.538 svc-ping

### svc-ping

## Syntax

**svc-ping** *ip-address* [ **service** *service-id*] [**local-sdp**] [ **remote-sdp**]

## Context

[\[Tree\]](#) (oam svc-ping)

## Full Context

oam svc-ping

## Description

This command tests a service ID for correct and consistent provisioning between two service end points.

The **svc-ping** command accepts a far-end IP address and a service ID for local and remote service testing. The following information can be determined from **svc-ping**:

Local and remote service existence

- Local and remote service state
- Local and remote service type correlation
- Local and remote customer association
- Local and remote service-to-SDP bindings and state

- Local and remote ingress and egress service label association

Unlike **sdp-ping**, only a single message is sent per command; no count nor interval parameter is supported and round trip time is not calculated. A time out value of 10 seconds is used before failing the request. The forwarding class is assumed to be Best-Effort Out-of-Profile.

If no request is sent or a reply is not received, all remote information is shown as N/A.

To terminate a **svc-ping** in progress, use the CLI break sequence <Ctrl-C>.

Upon request time out, message response, request termination, or request error the following local and remote information is displayed. See [Table 176: Svc-ping](#). Local and remote information is dependent upon service existence and reception of reply.

Table 176: Svc-ping

Field	Description	Values
Request Result	The result of the <b>svc-ping</b> request message.	Sent - Request Timeout
		Sent - Request Terminated
		Sent - Reply Received
		Not Sent - Non-Existent Service-ID
		Not Sent - Non-Existent SDP for Service
		Not Sent - SDP For Service Down
Request Result		Not Sent - Non-existent Service Egress Label
Service-ID	The ID of the service being tested.	service-id
Local Service Type	The type of service being tested. If <i>service-id</i> does not exist locally, N/A is displayed.	Epipes, lpipes, Fpipes, Apipes
		TLS
		IES
		Mirror-Dest
		—
Local Service Admin State	The local administrative state of <i>service-id</i> . If the service does not exist locally, the administrative state is Non-Existent.	Admin-Up
		Admin-Down
		Non-Existent
Local Service Oper State	The local operational state of <i>service-id</i> . If the service does not exist locally, the state is N/A.	Oper-Up
		Oper-Down

Field	Description	Values
		—
Remote Service Type	The remote type of service being tested. If <i>service-id</i> does not exist remotely, N/A is displayed.	Epipes, Ipipes, Fpipes, Apipes
		TLS
		IES
		Mirror-Dest
		—
Remote Service Admin State	The remote administrative state of <i>service-id</i> . If the service does not exist remotely, the administrative state is Non-Existent.	Up
		Down
		Non-Existent
Local Service MTU	The local <b>service-mtu</b> for <i>service-id</i> . If the service does not exist, N/A is displayed.	<i>service-mtu</i>
		—
Remote Service MTU	The remote <b>service-mtu</b> for <i>service-id</i> . If the service does not exist remotely, N/A is displayed.	<i>remote-service-mtu</i>
		—
Local Customer ID	The local <i>customer-id</i> associated with <i>service-id</i> . If the service does not exist locally, N/A is displayed.	<i>customer-id</i>
		—
Remote Customer ID	The remote <i>customer-id</i> associated with <i>service-id</i> . If the service does not exist remotely, N/A is displayed.	<i>customer-id</i>
		—
Local Service IP Address	The local system IP address used to terminate remotely configured SDP-ID (as the <b>far-end</b> address). If an IP interface has not been configured to be the system IP address, N/A is displayed.	<i>system-ip-address</i>
		—
Local Service IP Interface Name	The name of the local system IP interface. If the local system IP interface has not been created, N/A is displayed.	<i>system-interface-name</i>
		—
Local Service IP Interface State	The state of the local system IP interface. If the local system IP interface has not been created, Non-Existent is displayed.	Up
		Down
		Non-Existent
Expected Far-end Address	The expected IP address for the remote system IP interface. This must be the <b>far-end</b> address entered for the <b>svc-ping</b> command.	<i>orig-sdp-far-end-addr</i>
		<i>dest-ip-addr</i>
		—

Field	Description	Values
Actual Far-end Address	The returned remote IP address. If a response is not received, the displayed value is N/A. If the far-end service IP interface is down or non-existent, a message reply is not expected. <b>sdp-ping</b> should also fail.	<i>resp-ip-addr</i>
		—
Responders Expected Far-end Address	The expected source of the originator's <i>sdp-id</i> from the perspective of the remote router terminating the <i>sdp-id</i> . If the far-end cannot detect the expected source of the ingress <i>sdp-id</i> or the request is transmitted outside the <i>sdp-id</i> , N/A is displayed.	<i>resp-rec-tunnel-far-end-address</i>
		—
Originating SDP-ID	The <i>sdp-id</i> used to reach the <b>far-end</b> IP address if <b>sdp-path</b> is defined. The originating <i>sdp-id</i> must be bound to the <i>service-id</i> and terminate on the <b>far-end</b> IP address. If an appropriate originating <i>sdp-id</i> is not found, Non-Existent is displayed.	orig-sdp-id
		Non-Existent
Originating SDP-ID Path Used	Whether the Originating router used the originating <i>sdp-id</i> to send the <b>svc-ping</b> request. If a valid originating <i>sdp-id</i> is found, operational and has a valid egress service label, the originating router should use the <i>sdp-id</i> as the requesting path if <b>sdp-path</b> has been defined. If the originating router uses the originating <i>sdp-id</i> as the request path, Yes is displayed. If the originating router does not use the originating <i>sdp-id</i> as the request path, No is displayed. If the originating <i>sdp-id</i> is non-existent, N/A is displayed.	Yes
		No
		—
Originating SDP-ID Administrative State	The local administrative state of the originating <i>sdp-id</i> . If the <i>sdp-id</i> has been shutdown, Admin-Down is displayed. If the originating <i>sdp-id</i> is in the no shutdown state, Admin-Up is displayed. If an originating <i>sdp-id</i> is not found, N/A is displayed.	Admin-Up
		Admin-Up
		—
Originating SDP-ID Operating State	The local operational state of the originating <i>sdp-id</i> . If an originating <i>sdp-id</i> is not found, N/A is displayed.	Oper-Up
		Oper-Down
		—
Originating SDP-ID Binding Admin State	The local administrative state of the originating <i>sdp-ids</i> binding to <i>service-id</i> . If an <i>sdp-id</i> is not bound to the service, N/A is displayed.	Admin-Up
		Admin-Up
		—
Originating SDP-ID Binding Oper State	The local operational state of the originating <i>sdp-ids</i> binding to <i>service-id</i> . If an <i>sdp-id</i> is not bound to the service, N/A is displayed.	Oper-Up
		Oper-Down

Field	Description	Values
		—
Responding SDP-ID	The <i>sdp-id</i> used by the far end to respond to the <b>svc-ping</b> request. If the request was received without the <b>sdp-path</b> parameter, the responding router does not use an <i>sdp-id</i> as the return path, but the appropriate responding <i>sdp-id</i> is displayed. If a valid <i>sdp-id</i> return path is not found to the originating router that is bound to the <i>service-id</i> , Non-Existent is displayed.	<i>resp-sdp-id</i> Non-Existent
Responding SDP-ID Path Used	Whether the responding router used the responding <i>sdp-id</i> to respond to the <b>svc-ping</b> request. If the request was received via the originating <i>sdp-id</i> and a valid return <i>sdp-id</i> is found, operational and has a valid egress service label, the far-end router should use the <i>sdp-id</i> as the return <i>sdp-id</i> . If the far end uses the responding <i>sdp-id</i> as the return path, Yes is displayed. If the far end does not use the responding <i>sdp-id</i> as the return path, No is displayed. If the responding <i>sdp-id</i> is non-existent, N/A is displayed.	Yes No —
Responding SDP-ID Administrative State	The administrative state of the far-end <i>sdp-id</i> associated with the return path for <i>service-id</i> . When a return path is administratively down, Admin-Down is displayed. If the return <i>sdp-id</i> is administratively up, Admin-Up is displayed. If the responding <i>sdp-id</i> is non-existent, N/A is displayed.	Admin-Up Admin-Up N/A
Responding SDP-ID Operational State	The operational state of the far-end <i>sdp-id</i> associated with the return path for <i>service-id</i> . When a return path is operationally down, Oper-Down is displayed. If the return <i>sdp-id</i> is operationally up, Oper-Up is displayed. If the responding <i>sdp-id</i> is non-existent, N/A is displayed.	Oper-Up Oper-Down —
Responding SDP-ID Binding Admin State	The local administrative state of the responder's <i>sdp-id</i> binding to <i>service-id</i> . If an <i>sdp-id</i> is not bound to the service, N/A is displayed.	Admin-Up Admin-Down —
Responding SDP-ID Binding Oper State	The local operational state of the responder's <i>sdp-id</i> binding to <i>service-id</i> . If an <i>sdp-id</i> is not bound to the service, N/A is displayed.	Oper-Up Oper-Down —
Originating VC-ID	The originator's VC-ID associated with the <i>sdp-id</i> to the far-end address that is bound to <i>service-id</i> . If	<i>originator-vc-id</i>

Field	Description	Values
	the <i>sdp-id</i> signaling is off, <i>originator-vc-id</i> is 0. If the <i>originator-vc-id</i> does not exist, N/A is displayed.	—
Responding VC-ID	The responder's VC-ID associated with the <i>sdp-id</i> to <i>originator-id</i> that is bound to <i>service-id</i> . If the <i>sdp-id</i> signaling is off or the service binding to <i>sdp-id</i> does not exist, <i>responder-vc-id</i> is 0. If a response is not received, N/A is displayed.	<i>responder-vc-id</i> —
Originating Egress Service Label	The originating service label (VC-Label) associated with the <i>service-id</i> for the originating <i>sdp-id</i> . If <i>service-id</i> does not exist locally, N/A is displayed. If <i>service-id</i> exists, but the egress service label has not been assigned, Non-Existent is displayed.	<i>egress-vc-label</i> — Non-Existent
Originating Egress Service Label Source	The originating egress service label source. If the displayed egress service label is manually defined, Manual is displayed. If the egress service label is dynamically signaled, Signaled is displayed. If the <i>service-id</i> does not exist or the egress service label is non-existent, N/A is displayed.	Manual Signaled —
Originating Egress Service Label State	The originating egress service label state. If the originating router considers the displayed egress service label operational, Up is displayed. If the originating router considers the egress service label inoperative, Down is displayed. If the <i>service-id</i> does not exist or the egress service label is non-existent, N/A is displayed.	Up Down —
Responding Service Label	The actual responding service label in use by the far-end router for this <i>service-id</i> to the originating router. If <i>service-id</i> does not exist in the remote router, N/A is displayed. If <i>service-id</i> does exist remotely but the remote egress service label has not been assigned, Non-Existent is displayed.	<i>rec-vc-label</i> — Non-Existent
Responding Egress Service Label Source	The responder's egress service label source. If the responder's egress service label is manually defined, Manual is displayed. If the responder's egress service label is dynamically signaled, Signaled is displayed. If the <i>service-id</i> does not exist on the responder or the responder's egress service label is non-existent, N/A is displayed.	Manual Signaled —
Responding Service Label State	The responding egress service label state. If the responding router considers its egress service label operational, Up is displayed. If the responding router considers its egress service label inoperative, Down is displayed. If the <i>service-id</i> does not exist	Up Down —

Field	Description	Values
	or the responder's egress service label is non-existent, N/A is displayed.	
Expected Ingress Service Label	The locally assigned ingress service label. This is the service label that the far-end is expected to use for <i>service-id</i> when sending to the originating router. If <i>service-id</i> does not exist locally, N/A is displayed. If <i>service-id</i> exists but an ingress service label has not been assigned, Non-Existent is displayed.	<i>ingress-vc-label</i>
		—
		Non-Existent
Expected Ingress Label Source	The originator's ingress service label source. If the originator's ingress service label is manually defined, Manual is displayed. If the originator's ingress service label is dynamically signaled, Signaled is displayed. If the <i>service-id</i> does not exist on the originator or the originator's ingress service label has not been assigned, N/A is displayed.	Manual
		Signaled
		—
Expected Ingress Service Label State	The originator's ingress service label state. If the originating router considers its ingress service label operational, Up is displayed. If the originating router considers its ingress service label inoperative, Down is displayed. If the <i>service-id</i> does not exist locally, N/A is displayed.	Up
		Down
		—
Responders Ingress Service Label	The assigned ingress service label on the remote router. This is the service label that the far end is expecting to receive for <i>service-id</i> when sending to the originating router. If <i>service-id</i> does not exist in the remote router, N/A is displayed. If <i>service-id</i> exists, but an ingress service label has not been assigned in the remote router, Non-Existent is displayed.	<i>resp-ingress-vc-label</i>
		—
		Non-Existent
Responders Ingress Label Source	The assigned ingress service label source on the remote router. If the ingress service label is manually defined on the remote router, Manual is displayed. If the ingress service label is dynamically signaled on the remote router, Signaled is displayed. If the <i>service-id</i> does not exist on the remote router, N/A is displayed.	Manual
		Signaled
		—
Responders Ingress Service Label State	The assigned ingress service label state on the remote router. If the remote router considers its ingress service label operational, Up is displayed. If the remote router considers its ingress service label inoperative, Down is displayed. If the <i>service-id</i> does not exist on the remote router or the ingress	Up
		Down
		—

Field	Description	Values
	service label has not been assigned on the remote router, N/A is displayed.	

## Parameters

### *ip-address*

Specifies the far-end IP address to which to send the **svc-ping** request message in dotted decimal notation.

**Values** a.b.c.d

### *service-id*

Specifies the service ID of the service being tested must be indicated with this parameter. The service ID need not exist on the local router to receive a reply message.

**Values** 1 to 2147483647, service-name: up to 64 characters

### *local-sdp*

Specifies the **svc-ping** request message should be sent using the same service tunnel encapsulation labeling as service traffic. If **local-sdp** is specified, the command attempts to use an egress *sdp-id* bound to the service with the specified **far-end** IP address with the VC-Label for the service. The far-end address of the specified *sdp-id* is the expected *responder-id* within the reply received. The *sdp-id* defines the encapsulation of the SDP tunnel encapsulation used to reach the far end; this can be IP/GRE or MPLS. On originator egress, the service-ID must have an associated VC-Label to reach the far-end address of the *sdp-id* and the *sdp-id* must be operational for the message to be sent.

If **local-sdp** is not specified, the **svc-ping** request message is sent with GRE encapsulation with the OAM label.

[Table 177: Message Encapsulation](#) indicates whether a message is sent and how the message is encapsulated based on the state of the service ID.

Table 177: Message Encapsulation

Local Service State	local-sdp Not Specified		local-sdp Specified	
	Message Sent	Message Encapsulation	Message Sent	Message Encapsulation
Invalid Local Service	Yes	Generic IP/GRE OAM (PLP)	No	None
No Valid SDP-ID Bound	Yes	Generic IP/GRE OAM (PLP)	No	None
SDP-ID Valid But Down	Yes	Generic IP/GRE OAM (PLP)	No	None
SDP-ID Valid and Up, But No Service Label	Yes	Generic IP/GRE OAM (PLP)	No	None

Local Service State	local-sdp Not Specified		local-sdp Specified	
	Message Sent	Message Encapsulation	Message Sent	Message Encapsulation
SDP-ID Valid, Up and Egress Service Label	Yes	Generic IP/GRE OAM (PLP)	Yes	SDP Encapsulation with Egress Service Label (SLP)

### remote-sdp

Specifies **svc-ping** reply message from the **far-end** should be sent using the same service tunnel encapsulation labeling as service traffic.

If **remote-sdp** is specified, the **far-end** responder attempts to use an egress *sdp-id* bound to the service with the message originator as the destination IP address with the VC-Label for the service. The *sdp-id* defines the encapsulation of the SDP tunnel encapsulation used to reply to the originator; this can be IP/GRE or MPLS. On responder egress, the service-ID must have an associated VC-Label to reach the originator address of the *sdp-id* and the *sdp-id* must be operational for the message to be sent.

If **remote-sdp** is not specified, the **svc-ping** request message is sent with GRE encapsulation with the OAM label.

[Table 178: Message Response Encapsulation](#) indicates how the message response is encapsulated based on the state of the remote service ID.

Table 178: Message Response Encapsulation

Remote Service State	Message Encapsulation	
	remote-sdp Not Specified	remote-sdp Specified
Invalid Ingress Service Label	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
Invalid Service-ID	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
No Valid SDP-ID Bound on Service-ID	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
SDP-ID Valid But Down	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
SDP-ID Valid and Up, but No Service Label	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
SDP-ID Valid and Up, Egress Service Label, but VC-ID Mismatch	Generic IP/GRE OAM (PLP)	Generic IP/GRE OAM (PLP)
SDP-ID Valid and Up, Egress Service Label, but VC-ID Match	Generic IP/GRE OAM (PLP)	SDP Encapsulation with Egress Service Label (SLP)

## 23.539 svlan-statistics

### svlan-statistics

#### Syntax

**svlan-statistics**

#### Context

[\[Tree\]](#) (config>subscr-mgmt svlan-statistics)

## Full Context

configure subscriber-mgmt svlan-statistics

## Description

Commands in this context enable subscriber VLAN statistics collection.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.540 swap

```
swap
```

## Syntax

```
swap {out-label | implicit-null-label} nexthop ip-address
```

```
no swap
```

## Context

[\[Tree\]](#) (config>router>mpls>if>label-map swap)

## Full Context

```
configure router mpls interface label-map swap
```

## Description

This command swaps the incoming label and specifies the outgoing label and next hop IP address on an LSR for a static LSP.

The **no** form of this command removes the swap action associated with the *in-label*.

## Parameters

### *implicit-null-label*

Specifies the use of the implicit label value for the outgoing label of the swap operation.

### *out-label*

Specifies the label value to be swapped with the in-label. Label values 16 through 1,048,575 are defined as follows:

- label values 16 through 31 are reserved
- label values 32 through 1,023 are available for static assignment
- label values 1,024 through 2,047 are reserved for future use
- label values 2,048 through 18,431 are statically assigned for services
- label values 28,672 through 131,071 are dynamically assigned for both MPLS and services

- label values 131,072 through 1,048,575 are reserved for future use

**Values** 16 to 1048575

#### **nexthop *ip-address***

Specifies the IP address to forward to. If an ARP entry for the next hop exists, then the static LSP will be marked operational. If ARP entry does not exist, software will set the operational status of the static LSP to down and continue to ARP for the configured nexthop. Software will continuously try to ARP for the configured nexthop at a fixed interval.

## 23.541 sweep

### sweep

#### **Syntax**

**sweep start** *dispersion-start* **end** *dispersion-end*

#### **Context**

[\[Tree\]](#) (config>port>dwdm>coherent sweep)

#### **Full Context**

configure port dwdm coherent sweep

#### **Description**

This command allows users to configure the dispersion sweep 'start' and 'end' values for the automatic mode of coherent control. If the user knows the approximate or theoretical residual dispersion of the link, this command can be used to limit the range of sweeping for the automatic control mode and thus achieve faster link up.

#### **Parameters**

##### ***dispersion-start***

Specifies the lower range limit for the dispersion compensation.

**Values** -50000 to 50000

**Default** -25500

##### ***dispersion-end***

Specifies the upper range limit for the dispersion compensation.

**Values** -50000 to 50000

**Default** 2000

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.542 switch-defined-cookie

switch-defined-cookie

### Syntax

[no] switch-defined-cookie

### Context

[\[Tree\]](#) (config>open-flow>of-switch>flowtable switch-defined-cookie)

### Full Context

configure open-flow of-switch flowtable switch-defined-cookie

### Description

This command enables OpenFlow switch-defined Flow Table cookie encoding for flowtable 0 that allows multi-service operation.

The **no** form of the command disables the above function.

### Default

no switch-defined-cookie

### Platforms

All

## 23.543 switch-fabric

switch-fabric

### Syntax

switch-fabric

### Context

[\[Tree\]](#) (config>system switch-fabric)

**Full Context**

configure system switch-fabric

**Description**

Commands in this context configure switch fabric parameters.

**Platforms**

7450 ESS, 7750 SR-7, 7750 SR-12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## 23.544 switching-mode

### switching-mode

**Syntax**

**switching-mode** {**bi-directional** | **uni-directional**}

**Context**

[\[Tree\]](#) (config>port>aps switching-mode)

**Full Context**

configure port aps switching-mode

**Description**

This command configures the switching mode for the APS group.

**Parameters****bi-directional**

Configures the group to operate in Bidirectional 1+1 Signaling APS mode.

**uni-directional**

Configures the group to operate in Unidirectional 1+1 Signaling APS mode.

**Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 23.545 switchover-exec

## switchover-exec

### Syntax

**switchover-exec** *file-url*

**no switchover-exec**

### Context

[\[Tree\]](#) (config>system switchover-exec)

### Full Context

configure system switchover-exec

### Description

This command specifies the location and name of the CLI script file executed following a redundancy switchover from the previously active CPM card. A switchover can happen because of a fatal failure or by manual action.

The CLI script file can contain commands for environment settings, classic CLI debug configuration (excluding mirroring settings), and other commands not maintained by the configuration redundancy.

The following commands are not supported in the switchover-exec file: clear, configure, candidate, oam, tools, oam, ping, traceroute, mstat, mtrace and mrinfo.

### Default

no switch-over-exec

### Parameters

#### *file-url*

Specifies the location and name of the CLI script file.

Values	
<i>local-url</i>   <i>remote-url</i>	
<i>local-url</i>	[ <i>cflash-id</i> ]/[ <i>file-path</i> ] 200 chars max, including <i>cflash-id</i> directory length 99 chars max each
<i>remote-url</i>	[{ftp://   tftp://}login:pswd@remote-locn]/[ <i>file-path</i> ] 243 chars max directory length 99 chars max each
<i>remote-locn</i>	[hostname   ipv4-address   ipv6-address]
<i>ipv4-address</i>	a.b.c.d
<i>ipv6-address</i>	x:x:x:x:x:x[-interface] x:x:x:x:x:d.d.d.d[-interface]

*x* - [0 to FFFF]H

*d* - [0 to 255]D

interface - 32 chars max, for link local addresses

*cflash-id*

cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

## 23.546 symbol-monitor

symbol-monitor

### Syntax

symbol-monitor

### Context

[\[Tree\]](#) (config>port>ethernet symbol-monitor)

### Full Context

configure port ethernet symbol-monitor

### Description

This command configures Ethernet Symbol Monitoring parameters. Support for symbol monitoring is hardware dependent. An error message indicating that the port setting cannot be modified will be presented when attempting to enable the feature or configure the individual parameters on unsupported hardware.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.547 sync

sync

### Syntax

[no] sync

**Context**

[\[Tree\]](#) (config>redundancy>multi-chassis>peer sync)

**Full Context**

configure redundancy multi-chassis peer sync

**Description**

Commands in this context configure synchronization parameters.

**Default**

no sync

**Platforms**

All

sync

**Syntax**

[no] sync

**Context**

[\[Tree\]](#) (config>isa>nat-group>inter-chassis-redundancy sync)

**Full Context**

configure isa nat-group inter-chassis-redundancy sync

**Description**

This command configures synchronization of NAT flows between the nodes.

The **no** form of this command disables synchronization of NAT flows that were enabled between the ISAs or ESAs across the nodes. This allows NAT reconfiguration on both nodes. The synchronization of flows must be disabled on both nodes, active and standby, while NAT configuration changes are performed. The active NAT node continues to forward traffic while flow synchronization is disabled.

**Default**

no sync

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.548 sync-boot-env

## sync-boot-env

### Syntax

**sync-boot-env**

### Context

[\[Tree\]](#) (admin>satellite>eth-sat sync-boot-env)

### Full Context

admin satellite eth-sat sync-boot-env

### Description

The command forces the specified Ethernet-satellite chassis to synchronize the boot image.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.549 sync-e

## sync-e

### Syntax

**[no] sync-e**

### Context

[\[Tree\]](#) (config>card>mda sync-e)

### Full Context

configure card xiom mda sync-e

configure card mda sync-e

### Description

This command enables synchronous Ethernet on the MDA. Then any port on the MDA can be used as a source port in the sync-if-timing configuration.

The **no** form of this command disables synchronous Ethernet on the MDA.

### Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

- configure card xiom mda sync-e

All

- configure card mda sync-e

## sync-e

### Syntax

[no] sync-e

### Context

[\[Tree\]](#) (config>system>satellite>eth-sat sync-e)

### Full Context

configure system satellite eth-sat sync-e

### Description

This command enables the Ethernet satellite for synchronous Ethernet operation so that the transmit timing of the satellite access ports use the frequency of the host router's central clock.

To enable this functionality, both host ports on the router that connect to the U1 and U2 ports of the satellite must be synchronous Ethernet-capable ports.

When the Ethernet satellite is configured for synchronous Ethernet, ESMC frames are enabled on the host ports. The SSM code-type used between the host and the satellite should be manually configured on the host ports to match the code-type desired on the satellite client ports. The code-type setting on the host ports does not restrict the code-type used on the satellite client ports, as those may be configured on an individual port basis.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.550 sync-if-timing

## sync-if-timing

### Syntax

sync-if-timing

### Context

[\[Tree\]](#) (config>system sync-if-timing)

### Full Context

configure system sync-if-timing

## Description

This command creates or edits the context to create or modify timing reference parameters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

synce

### Syntax

synce

### Context

[\[Tree\]](#) (config>system>sync-if-timing synce)

### Full Context

configure system sync-if-timing synce

### Description

Commands in this context configure attributes related to the CPM/CCM SyncE/1588 ports.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.552 synchronize

synchronize

### Syntax

synchronize {boot-env | config}

### Context

[\[Tree\]](#) (config>redundancy synchronize)

### Full Context

configure redundancy synchronize

### Description

This command performs a synchronization of the standby CPMs images and/or config files to the active CPM. Either the **boot-env** or **config** parameter must be specified. In the **config>redundancy** context, this command performs an automatically triggered standby CPM synchronization. When the standby CPM takes over operation following a failure or reset of the active CPM, it is important to ensure that the active and standby CPMs have identical operational parameters. This includes the saved configuration, CPM, XCM, and IOM images.

The active CPM ensures that the active configuration is maintained on the standby CPM. However, to ensure smooth operation under all circumstances, runtime images and system initialization configurations must also be automatically synchronized between the active and standby CPM.

If synchronization fails, alarms and log messages that indicate the type of error that caused the failure of the synchronization operation are generated. When the error condition ceases to exist, the alarm is cleared.

Only files stored on the router are synchronized. If a configuration file or image is stored in a location other than on a local compact flash, the file is not synchronized (for example, storing a configuration file on an FTP server).

## Default

synchronize config

## Parameters

### boot-env

Synchronizes all files required for the boot process (boot loader, BOF configuration, SR OS images, and all configuration files).

### config

Synchronizes the primary, secondary, and tertiary configuration files, SSH keys, the password history and the model-driven commit history.

**Default** config

## Platforms

All

# synchronize

## Syntax

synchronize cert

synchronize {boot-env | config}

## Context

[\[Tree\]](#) (admin>redundancy synchronize)

## Full Context

admin redundancy synchronize

## Description

This command performs a synchronization of the standby CPM's images and/or configuration files to the active CPM. Either the **boot-env** or **config** parameter must be specified.

In the **admin>redundancy** context, this command performs a manually triggered standby CPM synchronization. When the standby CPM takes over operation following a failure or reset of the active

CPM, it is important to ensure that the active and standby CPM have identical operational parameters. This includes the saved configuration, CPM, XCM, and IOM images.

The active CPM ensures that the active configuration is maintained on the standby CPM. However, to ensure smooth operation under all circumstances, runtime images and system initialization configurations must also be automatically synchronized between the active and standby CPM. If synchronization fails, alarms and log messages that indicate the type of error that caused the failure of the synchronization operation are generated. When the error condition ceases to exist, the alarm is cleared.

Only files stored on the router are synchronized. If a configuration file or image is stored in a location other than on a local compact flash, the file is not synchronized (for example, storing a configuration file on an FTP server).

The **no** form of the command removes the parameter from the configuration.

### Default

no synchronize

### Parameters

#### cert

Synchronizes the imported certificate, key, and CRL files.

#### boot-env

Synchronizes all files required for the boot process (boot loader, BOF, images, and configuration).

#### config

Synchronizes the primary, secondary, and tertiary configuration files.

### Platforms

All

## 23.553 synchronous-execution

### synchronous-execution

#### Syntax

**synchronous-execution** *seconds*

**synchronous-execution** **never**

#### Context

[\[Tree\]](#) (config>system>management-interface>ops>global-timeouts synchronous-execution)

#### Full Context

configure system management-interface operations global-timeouts synchronous-execution

## Description

This command configures the period of time that operations launched as "synchronous" (the default method for all operations) are allowed to execute before they are automatically stopped, and their associated data is deleted.

If a specific execution timeout is not included in the request for a particular synchronous operation, this system-level timeout applies.

### Note:

This execution timeout is part of the general global operations infrastructure and is separate and independent from any operation-specific timeouts (for example, the **ping** operation also has its own **timeout** parameter).

### Caution:

This timeout also applies to operations requested in the MD-CLI interface (for example, ping, file dir, and so on). If **synchronous-execution** is enabled with a specific time value, MD-CLI operations are subject to this timeout and are interrupted if they execute longer than the configured **synchronous-execution** time.

## Default

synchronous-execution never

## Parameters

### *seconds*

Specifies the period of time, in seconds, that synchronous operations are allowed to execute.

**Values** 1 to 604800

### *never*

Keyword to specify that an execution timeout is not applied to synchronous operations.

## Platforms

All

## 23.554 syslog

syslog

### Syntax

**syslog** *script name*

**no syslog**

### Context

[\[Tree\]](#) (config>python>py-policy syslog)

## Full Context

configure python python-policy syslog

## Description

This command enables Python script to process syslog related messages and events.

The **no** form of this command disables the Python script to process syslog related messages and events.

## Parameters

### *name*

Specifies the name of the Python script, up to 32 characters, that is used to handle the specified message.

## Platforms

All

## syslog

## Syntax

**syslog** *syslog-id* [**name** *syslog-name*]

**no syslog** *syslog-id*

## Context

[\[Tree\]](#) (config>service>vprn>log syslog)

## Full Context

configure service vprn log syslog

## Description

This command creates the context to configure a Syslog target host that is capable of receiving selected Syslog messages from this network element.

A valid *syslog-id* must have the target Syslog host address configured.

A maximum of 30 Syslog IDs can be configured.

No log events are sent to a Syslog target address until the syslog-id has been configured as the log destination (**to**) in the log-id node.

The Syslog ID configured in the **configure>service>vprn** context has a local VPRN scope and only needs to be unique within the specific VPRN instance. The same ID can be reused under a different VPRN service or in the global log context under **config>log**.

## Default

No syslog IDs are defined.

## Parameters

### *syslog-id*

Specifies the Syslog ID for the Syslog destination.

**Values** 1 to 30

### *name syslog-name*

Specifies an optional Syslog name, up to 64 characters, that can be used to refer to the Syslog destination after it is created.

## Platforms

All

## syslog

### Syntax

**syslog** *syslog-id* [**name** *syslog-name*]

**no syslog** *syslog-id*

### Context

[\[Tree\]](#) (config>log syslog)

### Full Context

configure log syslog

### Description

Commands in this context configure a Syslog target host capable of receiving selected syslog messages from this network element.

A valid *syslog-id* must have the target Syslog host address configured.

A maximum of 10 Syslog IDs can be configured.

Log events are not sent to a Syslog target address until the *syslog-id* is configured as the log destination (**to**) in the node specified by the Log ID.

The Syslog ID configured in the **config>service>vprn** context has a local VPRN scope and only needs to be unique within the specific VPRN instance. The same ID can be reused under a different VPRN service or in the global log context under **config>log**.

The **no** form of this command removes the Syslog configuration.

### Parameters

#### *syslog-id*

Specifies the Syslog ID for the Syslog destination.

**Values** 1 to 10

#### *name syslog-name*

Configures an optional Syslog name, up to 64 characters, that can be used to refer to the Syslog destination after it is created.

### Platforms

All

## 23.557 system-base-mac

### system-base-mac

**Syntax**

**system-base-mac** *mac-address*

**no system-base-mac**

**Context**

[\[Tree\]](#) (bof system-base-mac)

**Full Context**

bof system-base-mac

**Description**

This command is used to specify the base MAC address for a VSR-based system. The specified MAC address is used as the first MAC address by the system to assign MAC addresses to individual interfaces.

It is strongly recommended that a unique base MAC address is assigned to each VSR instance with a minimum gap of 1024 between base addresses to avoid a MAC address overlap.

The **no** form of this command removes the configured system base MAC address.

**Default**

no system-base-mac

**Parameters**

***mac-address***

Specifies the MAC address.

**Values**    xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS-20, 7950 XRS-20e, VSR

- configure service vpls sap dhcp option vendor-specific-option system-id

## system-id

### Syntax

**system-id** *isis-system-id*

**no system-id**

### Context

[\[Tree\]](#) (config>service>vprn>isis system-id)

### Full Context

```
configure service vprn isis system-id
```

## Description

This command configures the IS-IS system ID. The system ID has a fixed length of 6 octets; it is determined using the following preference order:

1. **config>service>vprn>isis>system-id**
2. **config>service>vprn>isis>router-id**
3. **config>service>vprn>router-id**
4. **config>service>vprn>if>address**
5. The default system ID 2550.0000.0000, based on the default router ID 255.0.0.0

The system ID is integral to IS-IS; therefore, for the **system-id** command to take effect, a **shutdown** and then **no shutdown** must be performed on the IS-IS instance. This will ensure that the configured and operational system ID are always the same.

The **no** form of this command removes the system ID from the configuration. The router ID is used when no system ID is specified.

## Default

no system-id

## Parameters

### *isis-system-id*

12 hexadecimal characters in dotted-quad notation.

**Values** aaaa.bbbb.cccc, where aaaa, bbbb, and cccc are hexadecimal numbers

## Platforms

All

```

### Syntax

```
[no] system-ip-load-balancing
```

### Context

[\[Tree\]](#) (config>system>load-balancing system-ip-load-balancing)

### Full Context

```
configure system load-balancing system-ip-load-balancing
```

### Description

This command enables the use of the system IP address in the ECMP hash algorithm to add a per system variable. This can help guard against cases where multiple routers, in series, will end up hashing traffic to the same ECMP/LAG path.

This command is set at a system wide basis, however if certain IOMs do not support the new load-balancing algorithm, they will continue to use the default algorithm. By default, the IPv4 system IP address is used in the hash algorithm. When no IPv4 system IP address is configured, the IPv6 system IP address, when configured, is used in the hash algorithm.

The **no** form of the command resets the system wide algorithm to default.

### Default

```
no system-ip-load-balancing
```

### Platforms

All

## 23.562 system-mac

```
system-mac
```

### Syntax

```
system-mac mac-address
```

```
no system-mac
```

### Context

[\[Tree\]](#) (config>system>ned>profile system-mac)

## Full Context

configure system network-element-discovery profile system-mac

## Description

This command configures the MAC address to be advertised.

The **no** form of this command removes any explicitly defined MAC address and chassis MAC address will be advertised.

## Default

no system-mac

## Parameters

### *mac-address*

Specifies the MAC address to be associated with the profile in *xx:xx:xx:xx:xx:xx* or *xx-xx-xx-xx-xx-xx* format.

## Platforms

All

## 23.563 system-password

system-password

## Syntax

**system-password dynsvc-password**

## Context

[\[Tree\]](#) (admin>system>security system-password)

## Full Context

admin system security system-password

## Description

This operational command changes a local system password.

## Parameters

### **admin-password**

Specifies to change the administrative password.

### **dynsvc-password**

Specifies to change the dynamic services password.

## Platforms

All

## 23.564 system-priority

```
system-priority
```

### Syntax

```
system-priority value
```

```
no system-priority
```

### Context

[\[Tree\]](#) (config>redundancy>multi-chassis>peer>mc-ep system-priority)

### Full Context

```
configure redundancy multi-chassis peer mc-endpoint system-priority
```

### Description

This command allows the operator to set the system priority. The peer configured with the lowest value is chosen to be the master. If system-priority are equal then the one with the highest system-id (chassis MAC address) is chosen as the master.

The **no** form of this command sets the system priority to default.

### Default

```
no system-priority
```

### Parameters

*value*

Specifies the priority assigned to the local MC-EP peer.

**Values** 1 to 255

## Platforms

All

## 23.565 system-profile

## system-profile

### Syntax

**system-profile** {**profile-a** | **profile-b**}

**no system-profile**

### Context

[\[Tree\]](#) (bof system-profile)

### Full Context

bof system-profile

### Description

This command configures the system profile in the BOF.

System profile none represents the existing system capabilities and allows FP3-, FP4-, and FP5-based hardware to co-exist within a system. This is indicated by the omission of the **system-profile** parameter in the BOF, except on 7750 SR-1 systems.

System profile **profile-a** is primarily targeted at subscriber services and layer 2 and 3 VPN business services.

System profile **profile-b** is primarily targeted at infrastructure routing, core, peering, and DC-GW applications.

System profile **profile-a** and **profile-b** are supported on 7950 XRS-20/20e, 7750 SR-1 and 7750 SR-12e systems, and support only FP4- and FP5-based line cards.

The system profile on 7750 SR-1 systems should be set to **profile-a**. It is set by default to **profile-a** when the **system-profile** parameter is omitted from the BOF, or configured to an invalid value.

On 7950 XRS-20/20e and 7750 SR-12e systems, default system profile is none.

On all other systems, the **system-profile** parameter must not be configured in the BOF which sets the system profile to none.

The **no** form of this command removes the **system-profile** parameter from the BOF.

### Parameters

#### **profile-a**

Specifies that the system profile is for subscriber services and Layer 2 and 3 VPN business services.

#### **profile-b**

Specifies that the system profile is primarily targeted at infrastructure routing, core, peering, and DC-GW applications.

### Platforms

All

## 23.566 system-reserve

### system-reserve

#### Syntax

**system-reserve** *percent-of-buffers*

**no system-reserve**

#### Context

[\[Tree\]](#) (config>qos>hs-pool-policy system-reserve)

#### Full Context

configure qos hs-pool-policy system-reserve

#### Description

This command defines the amount of HSQ IOM buffers that is set aside for internal system use. By default, 5% of the total buffer space is reserved for system internal queues. The command is provided for the case where the reserved buffer space is either insufficient or excessive. Exercise care when modifying this value.

When the system reserve value is changed, all the provisioned port-class, mid-tier, and root pool sizes are reevaluated and possibly changed.

Use the **show hs-pools card-slot-number fp forwarding-plane egress** command to display the current buffer allocation and buffer usage conditions on an HSQ IOM.

The **no** form of the command reverts to the default system reserve value.

#### Default

system-reserve 5.0

#### Parameters

##### *percent-of-buffers*

Specifies the percentage of HS buffers that are reserved for internal system use. This parameter is required when executing the **system-reserve** command. The parameter accepts a percent value with two decimal places (100th of a percent).

**Values** 1.00 to 30.00

#### Platforms

## 24.5 table-size

table-size

### Syntax

**table-size** *table-size*

### Context

[\[Tree\]](#) (config>service>vpls>proxy-nd table-size)

[\[Tree\]](#) (config>service>vpls>proxy-arp table-size)

### Full Context

configure service vpls proxy-nd table-size

configure service vpls proxy-arp table-size

## Description

This command adds a table-size limit per service. By default, the table-size limit is 250; it can be set up to 16k entries per service. A non-configurable implicit high watermark of 95% and low watermark of 90% exists, per service and per system. When those watermarks are reached, a syslog/trap is triggered. When the system/service limit is reached, entries for a specified IP can be replaced (a different MAC can be learned and added) but no new IP entries will be added, regardless of the type (Static, evpn, dynamic). If the user attempts to change the **table-size** value to a value that cannot accommodate the number of existing entries, the attempt will fail.

## Default

table-size 250

## Parameters

### *table-size*

Specifies the table-size as number of entries for the service.

**Values** 1 to 16384

## Platforms

All

## 24.6 tacplus

### tacplus

## Syntax

**no tacplus**

**tacplus create**

## Context

[\[Tree\]](#) (config>service>vprn>aaa>remote-servers tacplus)

## Full Context

configure service vprn aaa remote-servers tacplus

## Description

This command creates the context to configure TACACS+ authentication on the VPRN.

Configure multiple server addresses for each router for redundancy.

The **no** form of this command removes the TACACS+ configuration.

## Platforms

All

## tacplus

### Syntax

[no] tacplus

### Context

## Description

This command configures a route tag to the specified IP address of an interface.

The **no** form of this command removes the tag value from the configuration.

## Default

no tag

## Parameters

**tag**

Specifies a route tag.

**Values** 1 to 4294967295

## Platforms

All

tag

## Syntax

**tag** {no-tag | tag}

**no tag**

## Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from tag)

## Full Context

configure router policy-options policy-statement entry from tag

## Description

This command matches the tag value in static or IGP routes. A decimal or hexadecimal value of 4 octets can be entered. For IS-IS, OSPF, and static routes, all four octets can be used. For RIP and RIPng, only the two most significant octets are used if more than two octets are configured.

The **no** form of this command removes the tag field match criterion.

## Default

no tag

## Parameters

**tag**

Matches the configured tag value.

**Values** Accepts decimal or hexadecimal formats:

- IS-IS, OSPF and static routes: 0x0 – 0xFFFFFFFF or 1 – 4294967295
- RIP and RIPng: 0x0 – 0xFFFF or 1 – 65535

**no-tag**

Specifies that no tag value is set.

**Platforms**

All

**tag****Syntax**

**tag** *tag*

**no tag**

**Context**

[\[Tree\]](#) (config>router>policy-options>policy-statement>default-action tag)

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>action tag)

**Full Context**

configure router policy-options policy-statement default-action tag

configure router policy-options policy-statement entry action tag

**Description**

This command assigns a tag to routes matching the entry, which is then applied to IGP routes. A decimal or hexadecimal value of 4 octets can be entered.

For IS-IS and OSPF, all four octets can be used.

For RIP and RIPng, only the two most significant octets are used if more than two octets are configured.

The **no** form of this command removes the tag.

**Default**

no tag

**Parameters****tag**

Assigns an IS-IS, OSPF, RIP or RIPng tag to routes matching the entry.

**Values** Accepts decimal or hexadecimal formats:  
 IS-IS and OSPF: 0x0–0xFFFFFFFF or 1–4294967295  
 RIP and RIPng: 0x0–0xFFFF or 1–65535

name — The tag parameter variable name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@".

**[Tree]** (config>service>epipe>spoke-sdp>pw-path-id taii-type2)

## Full Context

```
configure service cpipe spoke-sdp pw-path-id taii-type2
configure service vpls spoke-sdp pw-path-id taii-type2
configure service epipe spoke-sdp pw-path-id taii-type2
```

## Description

This command configures the Target Individual Attachment Identifier (TAII) for an MPLS-TP spoke SDP. If this is configured on a spoke SDP for which vc-switching is also configured (for example, it is at an S-PE), then the values must match those of the saii-type2 of the mate spoke SDP.

## Parameters

### *global-id*

Specifies the global ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP.

**Values** 0 to 4294967295

### *node-id*

Specifies the node ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP.

**Values** a.b.c.d or 0 to 4294967295

### *ac-id*

Specifies the attachment circuit ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP. If this node is the source of the PW, then the AC ID must be set to a locally unique value.

**Values** 1 to 4294967295

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

```
taii-type2 global-id:prefix:ac-id
```

```
no taii-type2
```

## Context

[\[Tree\]](#) (config>service>epipe>spoke-sdp-fec taii-type2)

## Full Context

```
configure service epipe spoke-sdp-fec taii-type2
```

## Description

taii-type2 configures the target attachment individual identifier for the SDP SDP. This is only applicable to FEC129 All type 2.

This command is blocked in CLI if this end of the spoke SDP is configured for single-sided auto configuration (using the **auto-config** command).

## Parameters

### *global-id*

Specifies a global ID of this router T-PE. This value must correspond to one of the `global_id` values configured for a local-prefix under **config>service>pw-routing>local-prefix** context.

**Values** 1 to 4294967295

### *prefix*

Specifies prefix on this router T-PE that the spoke SDP SDP is associated with. This value must correspond to one of the prefixes configured under **config>service>pw-routing>local-prefix** context.

**Values** an IPv4-formatted address a.b.c.d or 1 to 4294967295

### *ac-id*

Specifies an unsigned integer representing a locally unique identifier for the spoke SDP.

**Values** 1 to 4294967295

## Platforms

**Description**

This command configures the target individual attachment identifier (TAII) for an MPLS-TP spoke SDP. If this is configured on a spoke SDP for which vc-switching is also configured (for example, it is at an S-PE), then the values must match those of the saii-type2 of the mate spoke SDP.

**Parameters*****global-id***

Specifies the global ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP.

**Values** 0 to 4294967295

***node-id***

Specifies the node ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP.

**Values** a.b.c.d or 1 to 4294967295

***ac-id***

Specifies the attachment circuit ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP. If this node is the source of the PW, then the AC ID must be set to a locally unique value.

**Values** 1 to 4294967295

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

## taii-type2

**Syntax**

**taii-type2** *global-id:node-id:ac-id*

**no taii-type2**

**Context**

**[Tree]** (config>mirror>mirror-dest>spoke-sdp>pw-path-id taii-type2)

**[Tree]** (config>mirror>mirror-dest>remote-src>spoke-sdp>pw-path-id taii-type2)

**Full Context**

configure mirror mirror-dest spoke-sdp pw-path-id taii-type2

configure mirror mirror-dest remote-source spoke-sdp pw-path-id taii-type2

**Description**

This command configures the target individual attachment identifier (TAIL) for an MPLS-TP spoke SDP. If this is configured on a spoke SDP for which vc-switching is also configured (for example, it is at an S-PE), then the values must match those of the saii-type2 of the mate spoke SDP.

**Parameters**

***global-id***

Specifies the global ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP.

**Values** 0 to 4294967295

***node-id***

Specifies the node ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP.

**Values** a.b.c.d or 0 to 4294967295

***ac-id***

Specifies the attachment circuit ID at the target PE or T-PE for the MPLS-TP PW for a spoke SDP. If this node is the source of the PW, then the AC ID must be set to a locally unique value.

**Values** 1 to 4294967295

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 24.11 tail-end

tail-end

### Syntax

[no] tail-end

### Context

[\[Tree\]](#) (config>router>lsp-bfd tail-end)

### Full Context

configure router lsp-bfd tail-end

### Description

This command enables the context to configure LSP BFD tail end parameters.

The **no** form of this command removes the context.

### Default

no tail-end

### Platforms

All

## 24.12 target-name

target-name

### Syntax

target-name {node-name | user-agent | custom-string *name*}

no target-name

## Context

[\[Tree\]](#) (config>system>grpc-tunnel>tunnel target-name)

## Full Context

configure system grpc-tunnel tunnel target-name

## Description

This command assigns a target name that the node will register with.

The **no** form of this command removes the target name.

## Default

no target-name

## Parameters

### node-name

Keyword to register the tunnel with the node name configured using the **configure system name** command.

### user-agent

Keyword to register the tunnel with the user agent name string defined as *node-name:vendor:model:software-version*.

### custom-string

Assigns an arbitrary string as the target name.

### name

Specifies a string, up to 64 characters, that defines the target name.

## Platforms

All

## 24.13 target-power

target-power

## Syntax

target-power *power*

## Context

[\[Tree\]](#) (config>port>dwdm>coherent target-power)

## Full Context

configure port dwdm coherent target-power

## Description

This command configures the target transmit optical power for the port.

## Default

target-power 1.00

## Parameters

### *power*

Specifies the desired average output power in dBm.

**Values** -20.00 to 3.00

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 24.14 target-retry-wait

### target-retry-wait

## Syntax

**target-retry-wait** *seconds*

## Context

[\[Tree\]](#) (config>li>x-interfaces>x3>timeouts target-retry-wait)

## Full Context

configure li x-interfaces x3 timeouts target-retry-wait

## Description

This command configures the retry interval for target tunnel set up.

## Parameters

### *seconds*

Specifies the time that the system must wait before attempting another tunnel creation request to avoid overloading the LIC.

**Values** 300 to 1200

**Default** 300

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 24.15 target-type

### target-type

#### Syntax

**target-type** {**grpc-server** | **ssh-server** | **custom-type** *type*}

**no target-type**

#### Context

**[Tree]** (config>system>grpc-tunnel>tunnel>handler target-type)

#### Full Context

configure system grpc-tunnel tunnel handler target-type

#### Description

This command assigns a server as a handler for all tunnel sessions.

The **no** form of this command disables the tunnel handler server.

#### Default

no target-type

#### Parameters

##### **grpc-server**

Keyword that assigns the gRPC server as a handler for all tunnels sessions. The gRPC-tunnel protocol value corresponds to "GNMI\_GNOI".

##### **ssh-server**

Keyword that assigns the SSH server as a handler for all tunnels sessions. The gRPC-tunnel protocol value corresponds to "SSH".

##### **custom-type**

Keyword that assigns an arbitrary string as the target type.

##### **type**

Specifies a string, up to 255 characters, defining the client to serve as a handler for all tunnel sessions. Values used by gRPC tunnel protocol, such as "GNMI\_GNOI" or "SSH" can also be used.

#### Platforms

All

## 24.16 targeted-session

### targeted-session

#### Syntax

**targeted-session**

#### Context

**[Tree]** (config>router>ldp targeted-session)

#### Full Context

configure router ldp targeted-session

#### Description

This command configures targeted LDP sessions. Targeted sessions are LDP sessions between non-directly connected peers. Hello messages are sent directly to the peer platform instead of to all the routers on this subnet multicast address. The user can configure different default parameters for IPv4 and IPv6 LDP targeted hello adjacencies.

The discovery messages for an indirect LDP session are addressed to the specified peer and not to the multicast address.

#### Platforms

All

## 24.17 task

### task

#### Syntax

**task [detail]**

**no task**

#### Context

**[Tree]** (debug>router>pcep>pcc>conn task)

**[Tree]** (debug>router>pcep>pcc task)

#### Full Context

debug router pcep pcc connection task

debug router pcep pcc task

## Description

This command enables debugging for PCC or connection task events.

The **no** form of this command disables debugging.

## Parameters

### detail

Keyword used to specify detailed information about PCC or connection task events.

## Platforms

All

## task

## Syntax

**task** [**detail**]

**no task**

## Context

[\[Tree\]](#) (debug>router>pcep>pce task)

[\[Tree\]](#) (debug>router>pcep>pce>conn task)

## Full Context

debug router pcep pce task

debug router pcep pce connection task

## Description

This command enables debugging for PCE or connection task events.

The **no** form of this command disables debugging.

## Parameters

### detail

Keyword used to specify detailed information about PCE or connection task events.

## Platforms

VSR-NRC

## 24.18 task-scheduling-int

## task-scheduling-int

### Syntax

**task-scheduling-int** *percent-of-default*

**no task-scheduling-int**

### Context

**[Tree]** (config>card>virt-sched-adj task-scheduling-int)

### Full Context

configure card virtual-scheduler-adjustment task-scheduling-int

### Description

This command overrides the system default time between scheduling the hierarchical virtual scheduling task. By default, the system "wakes" the virtual scheduler task every 50ms; this is equivalent to five 10ms timer ticks. The task-scheduling-int command uses a percent value parameter to modify the number of timer ticks.

While the system accepts a wide range of percent values, the result is rounded to the nearest 10ms tick value. The fastest wake interval is 10ms (1 timer tick).

The **no** form of this command restores the default task scheduling interval of the card's hierarchical virtual scheduler task.

### Parameters

#### *percent-of-default:*

Specifies that the percent-of-default parameter is required and is used to modify the default task scheduling interval for the hierarchical virtual scheduling task on the card. Defining 100.00 percent is equivalent to removing the override.

**Values** 0.01% to 1000.00%

**Default** 100.00%

### Platforms

All

## 24.19 tcp

### tcp

### Syntax

**tcp**

**Context**

**[Tree]** (debug>oam>build-packet>packet>field-override>header tcp)

**[Tree]** (config>test-oam>build-packet>header tcp)

**Full Context**

debug oam build-packet packet field-override header tcp

configure test-oam build-packet header tcp

**Description**

This command creates a TCP header and enables the context to define the associated parameters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 24.20 tcp-ack

tcp-ack

**Syntax**

tcp-ack {true | false}

no tcp-ack

**Context**

**[Tree]** (config>subscr-mgmt>cat-map>category>exh-lvl>egr-ip>entry>match tcp-ack)

**[Tree]** (config>subscr-mgmt>cat-map>category>exh-lvl>egr-ipv6>entry>match tcp-ack)

**[Tree]** (config>subscr-mgmt>cat-map>category>exh-lvl>ingr-ipv6>entry>match tcp-ack)

**[Tree]** (config>subscr-mgmt>cat-map>category>exh-lvl>ingr-ip>entry>match tcp-ack)

**Full Context**

configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ip-filter-entries  
entry match tcp-ack

configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ipv6-filter-entries  
entry match tcp-ack

configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ipv6-filter-entries  
entry match tcp-ack

configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ip-filter-entries  
entry match tcp-ack

**Description**

This command configures the TCP ACK match condition.

The **no** form of this command reverts to the default.

### Parameters

**true**

Enables checking for the ACK bit.

**false**

Disables checking for the ACK bit.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## tcp-ack

### Syntax

**tcp-ack** {**true** | **false**}

**no tcp-ack**

### Context

[\[Tree\]](#) (config>filter>ip-filter>entry>match tcp-ack)

[\[Tree\]](#) (config>filter>ipv6-filter>entry>match tcp-ack)

### Full Context

configure filter ip-filter entry match tcp-ack

configure filter ipv6-filter entry match tcp-ack

### Description

This command configures an IP filter match criterion based on the Acknowledgment (ACK) TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

### Default

no tcp-ack

### Parameters

**true**

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

**false**

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

## Platforms

All

## tcp-ack

## Syntax

**tcp-ack** {true | false}

**no tcp-ack**

## Context

**[Tree]** (cfg>sys>sec>cpm>ip-filter>entry>match tcp-ack)

**[Tree]** (cfg>sys>sec>cpm>ipv6-filter>entry>match tcp-ack)

## Full Context

configure system security cpm-filter ip-filter entry match tcp-ack

configure system security cpm-filter ipv6-filter entry match tcp-ack

## Description

This command configures matching on the ACK bit being set or reset in the control bits of the TCP header of an IP or IPv6 packet as an IP filter match criterion.

### Note:

An entry containing Layer 4 match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

The **no** form of this command removes the criterion from the match entry.

## Default

no tcp-ack

## Parameters

### true

Specifies matching on IP or IPv6 packets that have the ACK bit set in the control bits of the TCP header of an IP or IPv6 packet.

### false

Specifies matching on IP or IPv6 packets that do not have the ACK bit set in the control bits of the TCP header of the IP or IPv6 packet.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 24.21 tcp-adv-func

```
tcp-adv-func
```

### Syntax

```
tcp-adv-func size
```

### Context

[\[Tree\]](#) (config>isa>aa-grp>shared-resources tcp-adv-func)

### Full Context

```
configure isa aa-group shared-resources tcp-adv-func
```

### Description

This command configures the allocation of shared resource pool for TCP advanced functions.

### Default

```
tcp-adv-func 100
```

### Parameters

*size*

Specifies the allocation of the shared resource pool.

**Values** 0 to 100

## 24.22 tcp-client-reset

```
tcp-client-reset
```

### Syntax

```
[no] tcp-client-reset
```

### Context

[\[Tree\]](#) (config>app-assure>group>http-redirect tcp-client-reset)

### Full Context

```
configure application-assurance group http-redirect tcp-client-reset
```

## Description

This command enables an HTTP-redirect policy to initiate a TCP reset towards the client if the AA policy results in a redirect with packet drop but the http redirect cannot be delivered. Scenarios for this include HTTPs (TLS) sessions, blocking of non-HTTP TCP traffic, and blocking of existing flows after a policy re-evaluate of an existing subscriber.

The **no** form of this command disables the command.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.23 tcp-cwr

```
tcp-cwr
```

### Syntax

```
tcp-cwr {true | false}
```

```
no tcp-cwr
```

### Context

[\[Tree\]](#) (config>filter>ipv6-filter>entry>match tcp-cwr)

[\[Tree\]](#) (config>filter>ip-filter>entry>match tcp-cwr)

### Full Context

```
configure filter ipv6-filter entry match tcp-cwr
```

```
configure filter ip-filter entry match tcp-cwr
```

### Description

This command configures an IP filter match criterion based on the Congestion Window Reduced (CWR) TCP Flag bit, defined in RFC 3168, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

### Default

```
no tcp-cwr
```

### Parameters

**true**

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

**false**

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

## Platforms

All

## 24.24 tcp-ece

### tcp-ece

#### Syntax

**tcp-ece** {true | false}

**no tcp-ece**

#### Context

[\[Tree\]](#) (config>filter>ip-filter>entry>match tcp-ece)

[\[Tree\]](#) (config>filter>ipv6-filter>entry>match tcp-ece)

#### Full Context

configure filter ip-filter entry match tcp-ece

configure filter ipv6-filter entry match tcp-ece

#### Description

This command configures an IP filter match criterion based on the ECN-Echo (ECE) TCP Flag bit, defined in RFC 3168, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

#### Default

no tcp-ece

#### Parameters

##### true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

##### false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

## Platforms

All

## 24.25 tcp-established

[\[Tree\]](#) (config>service>nat>nat-policy>timeouts tcp-established)

#### Full Context

configure service nat up-nat-policy timeouts tcp-established

configure service nat firewall-policy timeouts tcp-established

configure service nat nat-policy timeouts tcp-established

#### Description

This command configures the idle timeout applied to a TCP session in the established state.

#### Default

tcp-established hrs 2 min 4

#### Parameters

##### *hours*

Specifies the timeout hours field.

**Values** 1 to 24

##### *minutes*

Specifies the timeout minutes field.

**Values** 1 to 59

##### *seconds*

Specifies the timeout seconds field.

**Values** 1 to 59

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat up-nat-policy timeouts tcp-established

- configure service nat nat-policy timeouts tcp-established

## tcp-established

### Syntax

[no] tcp-established

### Context

[\[Tree\]](#) (config>filter>ipv6-filter>entry>match tcp-established)

[\[Tree\]](#) (config>filter>ip-filter>entry>match tcp-established)

### Full Context

configure filter ipv6-filter entry match tcp-established

configure filter ip-filter entry match tcp-established

### Description

This command matches packets with the TCP flag ACK or RST.

### Default

tcp-established

### Platforms

All

## 24.26 tcp-fin

### tcp-fin

### Syntax

tcp-fin {true | false}

no tcp-fin

### Context

[\[Tree\]](#) (config>filter>ip-filter>entry>match tcp-fin)

[\[Tree\]](#) (config>filter>ipv6-filter>entry>match tcp-fin)

### Full Context

```
configure filter ip-filter entry match tcp-fin
configure filter ipv6-filter entry match tcp-fin
```

### Description

This command configures an IP filter match criterion based on the FIN TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

### Default

```
no tcp-fin
```

### Parameters

#### true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

#### false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

### Platforms

All

## 24.27 tcp-keepalive

### tcp-keepalive

### Syntax

```
tcp-keepalive
```

### Context

```
[Tree] (config>system>grpc tcp-keepalive)
```

### Full Context

```
configure system grpc tcp-keepalive
```

### Description

Commands in this context configure the sending of TCP keepalives by the router towards all gRPC clients.

Enabling TCP keepalive speeds up the detection of certain failures. The TCP keepalives sent by the router are controlled by three commands: **idle-time**, **interval**, and **retries**. The router starts sending TCP keepalives when the connection has been idle (no TCP segments sent or received) for more than **idle-time**

seconds. At that point, the router sends a probe (TCP ACK with a sequence number = current sequence number - 1) and expects a TCP ACK. It repeats this probe every **interval** seconds for the configured number of **retries**. If no response is received to any of the probes, the connection is immediately closed, which starts the purge timer if the TCP connection is currently supporting the RibApi service.

## 24.28 tcp-mss

### tcp-mss

#### Syntax

**tcp-mss** *mss-value*

**no tcp-mss**

#### Context

**[Tree]** (config>service>ies>if tcp-mss)

**[Tree]** (config>service>ies>if>ipv6 tcp-mss)

#### Full Context

configure service ies interface tcp-mss

configure service ies interface ipv6 tcp-mss

#### Description

This command statically sets the TCP maximum segment size (MSS) for TCP connections originated from the associated IP interface to the specified value.

The **no** form of this command removes the static value and allows the TCP MSS value to be calculated based on the IP MTU value by subtracting the base IP and TCP header lengths from the IP MTU value ( $\text{tcp\_mss} = \text{ip\_mtu} - 40$ ).

#### Default

no tcp-mss

#### Parameters

##### *mss-value*

The TCP MSS value that should be used in the TCP SYN packet during the three-way handshake negotiation of a TCP connection.

**Note:**  $9158 = \text{max-IP\_MTU} (9198) - 40$

**Values** 536 to 9746 (IPv4) 1220 to 9726 (IPv6)

[\[Tree\]](#) (config>router>bgp tcp-mss)

## Full Context

```
configure service vprn bgp tcp-mss
configure router bgp tcp-mss
```

## Description

This command configures an override for the TCP maximum segment size to use with a specific peer or set of peers (depending on the scope of the command).

The configured value controls two properties of the TCP connection as follows:

- TCP MSS option — The router advertises the TCP MSS option value in the TCP SYN packet it sends as part of the 3-way handshake. The advertised value may be lower than the configured value, depending on the IP MTU of the first hop IP interface. The peers are asked to abide by this value when sending TCP segments to the local router.
- TCP maximum segment size — The actual transmitted size may be lower than the configured value, depending on the TCP MSS option value signaled by the peers, the effect of path MTU discovery, or other factors.

The **no** form of this command removes the TCP MSS override values from the configuration.

## Default

```
no tcp-mss
```

## Parameters

### *mss-value*

Specifies the The router uses the TCP SYN to advertise the TCP MSS option value towards its peer. MSS value, in bytes, to use with the peers that fall within the scope of the command.

**Values** 384 to 9746

## Platforms

All

## tcp-mss

[\[Tree\]](#) (config>router>bgp>group>neighbor tcp-mss)

### Full Context

```
configure service vprn bgp group neighbor tcp-mss
configure router bgp group tcp-mss
configure service vprn bgp group tcp-mss
configure router bgp group neighbor tcp-mss
```

### Description

This command configures an override for the TCP maximum segment size to use with a specific peer or set of peers (depending on the scope of the command).

The configured value controls two properties of the TCP connection as follows:

- TCP MSS option — The router advertises the TCP MSS option value in the TCP SYN packet it sends as part of the 3-way handshake. The advertised value may be lower than the configured value, depending on the IP MTU of the first hop IP interface. The peers are asked to abide by this value when sending TCP segments to the local router.
- TCP maximum segment size — The actual transmitted size may be lower than the configured value, depending on the TCP MSS option value signaled by the peers, the effect of path MTU discovery, or other factors.

The **no** form of this command removes the TCP MSS override values from the configuration.

### Default

```
no tcp-mss
```

### Parameters

#### *mss-value*

Specifies the TCP MSS value, in bytes, to use with the peers that fall within the scope of the command.

**Values** 384 to 9746

#### *ip-stack*

This keyword requests that TCP MSS be derived from mechanisms and configurations outside of BGP, including the configuration of **tcp-mss** at the IP interface level. It provides a method to override inheritance within the BGP configuration.

### Platforms

All

## 24.29 tcp-mss-adjust

## tcp-mss-adjust

### Syntax

**tcp-mss-adjust** *segment-size*

**no tcp-mss-adjust**

### Context

**[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw tcp-mss-adjust)

**[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw tcp-mss-adjust)

### Full Context

configure service ies subscriber-interface group-interface wlan-gw tcp-mss-adjust

configure service vprn subscriber-interface group-interface wlan-gw tcp-mss-adjust

### Description

This command configures the TCP Maximum Segment Size (MSS) adjustment for the wlan-gw gateway.

The **no** form of this command disables adjusting tcp-mss values.

For DSM, this only applies to packets sent in the downstream direction (TCP SYN towards UE). For the upstream direction, it is also required to configure MSS adjust under the applicable NAT-policy.

### Parameters

#### *segment-size*

Specifies the value to put into the TCP Maximum Segment Size (MSS) option if not already present, or if the present value is higher.

**Values** 160 to 10240

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## tcp-mss-adjust

### Syntax

**tcp-mss-adjust** *segment-size*

**no tcp-mss-adjust**

### Context

**[Tree]** (config>app-assure>group>aqp>entry>action tcp-mss-adjust)

### Full Context

configure application-assurance group app-qos-policy entry action tcp-mss-adjust

## Description

This command configures the value to adjust the TCP Maximum Segment Size (MSS) option. The `no` form of this command disables the segment size adjustment.

## Default

`no tcp-mss-adjust`

## Parameters

### *segment-size*

Specifies the value to put into the TCP Maximum Segment Size (MSS) option if not already present, or if the present value is higher.

**Values** 160 to 10240

## tcp-mss-adjust

## Syntax

`tcp-mss-adjust segment-size`

`no tcp-mss-adjust`

## Context

[\[Tree\]](#) (config>service>nat>firewall-policy tcp-mss-adjust)

[\[Tree\]](#) (config>service>nat>up-nat-policy tcp-mss-adjust)

[\[Tree\]](#) (config>service>nat>nat-policy tcp-mss-adjust)

## Full Context

configure service nat firewall-policy tcp-mss-adjust

configure service nat up-nat-policy tcp-mss-adjust

configure service nat nat-policy tcp-mss-adjust

## Description

This command configures the value to adjust the TCP Maximum Segment Size (MSS) option.

The `no` form of the command returns the segment size to the default.

## Default

`no tcp-mss-adjust`

## Parameters

### *segment-size*

Specifies the value to put into the TCP Maximum Segment Size (MSS) option if not already present, or if the present value is higher.

**Values** 160 to 10240

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat firewall-policy tcp-mss-adjust

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat up-nat-policy tcp-mss-adjust
- configure service nat nat-policy tcp-mss-adjust

## tcp-mss-adjust

### Syntax

**tcp-mss-adjust**

### Context

[\[Tree\]](#) (config>filter>ip-filter>entry>action tcp-mss-adjust)

[\[Tree\]](#) (config>filter>ipv6-filter>entry>action tcp-mss-adjust)

### Full Context

configure filter ip-filter entry action tcp-mss-adjust

configure filter ipv6-filter entry action tcp-mss-adjust

### Description

This command activates the adjustment of the TCP Maximum Segment Size (MSS) option of TCP packets matching the entry.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## tcp-mss-adjust

### Syntax

**tcp-mss-adjust** *segment-size*

**no tcp-mss-adjust**

### Context

[\[Tree\]](#) (config>service>nat>map-domain tcp-mss-adjust)

### Full Context

configure service nat map-domain tcp-mss-adjust

## Description

This command enables the TCP maximum segment size (MSS) adjustments in a MAP domain. The TCP SYN and SYN-ACK packets are intercepted in both directions, and if their MSS value is larger than the one configured using this command, the MSS value in the packet is re-written (lowered) to the configured value. The end hosts use the lowest setting of the two hosts. The MSS value does not account for the IP or TCP header length.

If the MSS value in the SYN or SYN-ACK is not found, a new value is added and set to the configured value.

## Default

no tcp-mss-adjust

## Parameters

### *segment-size*

Specifies the maximum size of the segment.

**Values** 160 to 8626

## Platforms

VSR

## 24.30 tcp-ns

### tcp-ns

## Syntax

tcp-ns {true | false}

no tcp-ns

## Context

[\[Tree\]](#) (config>filter>ipv6-filter>entry>match tcp-ns)

[\[Tree\]](#) (config>filter>ip-filter>entry>match tcp-ns)

## Full Context

configure filter ipv6-filter entry match tcp-ns

configure filter ip-filter entry match tcp-ns

## Description

This command configures an IP filter match criterion based on the Nonce Sum (NS) TCP Flag bit, defined in RFC 3540, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

**Default**

no tcp-ns

**Parameters****true**

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

**false**

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

**Platforms**

All

## 24.31 tcp-optimizer

### tcp-optimizer

**Syntax**

**tcp-optimizer** *tcp-optimizer-name* [**create**]

**no tcp-optimizer** *tcp-optimizer-name*

**Context**

[\[Tree\]](#) (config>app-assure>group tcp-optimizer)

**Full Context**

configure application-assurance group tcp-optimizer

**Description**

This command configures the TCP optimizer policy. When a TCP optimizer policy is removed or deleted, the existing flows using this policy are abandoned, and optimization is stopped. If, however, the TCP optimizer action is removed from a session-filter entry (in the **config>app-assure>group>sess-fltr>entry action** context), the existing flows are not affected.

The **no** form of this command removes the specified TCP optimizer policy.

**Parameters*****tcp-optimizer-name***

Specifies the name of the TCP optimizer policy, up to 32 characters.

**create**

This keyword is mandatory when creating a TCP optimizer policy.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.32 tcp-option-number

tcp-option-number

**Syntax**

tcp-option-number

**Context**

[\[Tree\]](#) (config>system>security>keychain tcp-option-number)

**Full Context**

configure system security keychain tcp-option-number

**Description**

Commands in this context configure the TCP option number to be placed in the TCP packet header.

**Platforms**

All

## 24.33 tcp-performance

tcp-performance

**Syntax**

tcp-performance

**Context**

[\[Tree\]](#) (config>app-assure>group>cflowd tcp-performance)

**Full Context**

configure application-assurance group cflowd tcp-performance

**Description**

Commands in this context configure Cflowd TCP performance export parameters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.34 tcp-protocols

### tcp-protocols

**Syntax**

**tcp-protocols** *protocol-set*

**Context**

[\[Tree\]](#) (config>app-assure>group>tether-detect>tll-mon tcp-protocols)

**Full Context**

configure application-assurance group tethering-detection ttl-monitoring tcp-protocols

**Description**

This command configures whether AA analyzes all TCP traffic or only traffic from standard applications that generate consistent TTL values. Configuring AA to analyze all TCP traffic is typically recommended.

**Default**

tcp-protocols standard

**Parameters**

***protocol-set***

Specifies the scope of analysis for TCP traffic.

**Values** standard, all

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.35 tcp-psh

### tcp-psh

**Syntax**

**tcp-psh** {true | false}

**no tcp-psh**

## Context

[\[Tree\]](#) (config>filter>ipv6-filter>entry>match tcp-psh)

[\[Tree\]](#) (config>filter>ip-filter>entry>match tcp-psh)

## Full Context

configure filter ipv6-filter entry match tcp-psh

configure filter ip-filter entry match tcp-psh

## Description

This command configures an IP filter match criterion based on the Push (PSH) TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

## Default

no tcp-psh

## Parameters

**true**

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

**false**

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

## Platforms

All

## 24.36 tcp-rst

tcp-rst

## Syntax

**tcp-rst** [*min minutes*] [*sec sec*]

**no tcp-rst**

## Context

[\[Tree\]](#) (config>service>nat>up-nat-policy>timeouts tcp-rst)

[\[Tree\]](#) (config>service>nat>nat-policy>timeouts tcp-rst)

[\[Tree\]](#) (config>service>nat>firewall-policy>timeouts tcp-rst)

## Full Context

```
configure service nat up-nat-policy timeouts tcp-rst
configure service nat nat-policy timeouts tcp-rst
configure service nat firewall-policy timeouts tcp-rst
```

## Description

This command suspends the use of the outside TCP ports that have been used in translations for TCP connections that are closed via TCP RST. Once this timer expires, the outside ports can be reused for new TCP translations.

The **no** form of the command reverts to the default.

## Default

```
no tcp-rst
```

## Parameters

### *minutes*

Specifies the timeout, in minutes, after receiving a RST and closing the session before going to the LISTEN state again.

**Values** 1 to 4

### *sec*

Specifies the timeout, in seconds, after receiving a RST and closing the session before going to the LISTEN state again.

**Values** 1 to 59

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat up-nat-policy timeouts tcp-rst
- configure service nat nat-policy timeouts tcp-rst

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat firewall-policy timeouts tcp-rst

## tcp-rst

## Syntax

```
tcp-rst {true | false}
no tcp-rst
```

## Context

**[Tree]** (config>filter>ipv6-filter>entry>match tcp-rst)

[\[Tree\]](#) (config>filter>ip-filter>entry>match tcp-rst)

### Full Context

```
configure filter ipv6-filter entry match tcp-rst
configure filter ip-filter entry match tcp-rst
```

### Description

This command configures an IP filter match criterion based on the Reset (RST) TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

### Default

```
no tcp-rst
```

### Parameters

#### true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

#### false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

### Platforms

All

## 24.37 tcp-session-parameters

### tcp-session-parameters

### Syntax

```
tcp-session-parameters
```

### Context

[\[Tree\]](#) (config>router>ldp tcp-session-parameters)

### Full Context

```
configure router ldp tcp-session-parameters
```

### Description

Commands in this context configure parameters applicable to TCP transport session of an LDP session to remote peer.

## Platforms

All

## 24.38 tcp-stack

### tcp-stack

#### Syntax

**tcp-stack** *tcp-stack-type*

#### Context

[\[Tree\]](#) (config>app-assure>group>tcp-optimizer tcp-stack)

#### Full Context

configure application-assurance group tcp-optimizer tcp-stack

#### Description

This command configures the TCP stack used toward the subscriber.

#### Note:

- The TCP stack used toward the core network is new-reno, and it is not configurable.
- TCP BBR, TCP Illinois, and TCP Westwood implement a sender-side modification of the TCP congestion window algorithm that improves upon the performance of TCP Reno in wireless networks with lossy links.

The **no** form of this command reverts to the default.

#### Default

tcp-westwood

#### Parameters

##### *tcp-stack-type*

Specifies the TCP stack used toward the subscriber.

**Values** tcp-bbr | tcp-illinois | tcp-new-reno | tcp-westwood

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.39 tcp-syn

```
tcp-syn
```

### Syntax

```
tcp-syn {true | false}
```

```
no tcp-syn
```

### Context

```
[Tree] (config>subscr-mgmt>cat-map>category>exh-lvl>ingr-ipv6>entry>match tcp-syn)
```

```
[Tree] (config>subscr-mgmt>cat-map>category>exh-lvl>egr-ip>entry>match tcp-syn)
```

```

```
[Tree] (config>subscr-mgmt>cat-map>category>exh-lvl>egr-ipv6>entry>match tcp-syn)
```

### Full Context

```
configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ipv6-filter-entries
entry match tcp-syn
```

```
configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ip-filter-entries
entry match tcp-syn
```

```
configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ip-filter-entries
entry match tcp-syn
```

```
configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ipv6-filter-entries
entry match tcp-syn
```

### Description

This command configures the TCP SYN match condition.

The **no** form of this command reverts to the default.

### Parameters

**true**

Enables checking for the SYN bit.

**false**

Disables checking for the SYN bit.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## tcp-syn

### Syntax

**tcp-syn** [*hrs hours*] [*min minutes*] [*sec seconds*]

**no tcp-syn**

### Context

**[Tree]** (config>service>nat>nat-policy>timeouts tcp-syn)

**[Tree]** (config>service>nat>firewall-policy>timeouts tcp-syn)

**[Tree]** (config>service>nat>up-nat-policy>timeouts tcp-syn)

### Full Context

configure service nat nat-policy timeouts tcp-syn

configure service nat firewall-policy timeouts tcp-syn

configure service nat up-nat-policy timeouts tcp-syn

### Description

This command configures the timeout applied to a TCP session in the SYN state.

### Default

tcp-syn sec 15

### Parameters

#### *hours*

Specifies the timeout hours field.

**Values** 1 to 24

#### *minutes*

Specifies the timeout minutes field.

**Values** 1 to 59

#### *seconds*

Specifies the timeout seconds field.

**Values** 1 to 59

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat nat-policy timeouts tcp-syn
- configure service nat up-nat-policy timeouts tcp-syn

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat firewall-policy timeouts tcp-syn

## tcp-syn

### Syntax

**tcp-syn** {true | false}

**no tcp-syn**

### Context

**[Tree]** (config>filter>ipv6-filter>entry>match tcp-syn)

**[Tree]** (config>filter>ip-filter>entry>match tcp-syn)

### Full Context

configure filter ipv6-filter entry match tcp-syn

configure filter ip-filter entry match tcp-syn

### Description

This command configures an IP filter match criterion based on the Synchronize (SYN) TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

### Default

no tcp-syn

### Parameters

#### true

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

#### false

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

### Platforms

All

## tcp-syn

### Syntax

**tcp-syn** {true | false}

**no tcp-syn**

## Context

**[Tree]** (cfg>sys>sec>cpm>ipv6-filter>entry>match tcp-syn)

**[Tree]** (cfg>sys>sec>cpm>ip-filter>entry>match tcp-syn)

## Full Context

configure system security cpm-filter ipv6-filter entry match tcp-syn

configure system security cpm-filter ip-filter entry match tcp-syn

## Description

This command configures matching on the SYN bit being set or reset in the control bits of the TCP header of an IP or IPv6 packet as an IP filter match criterion.

### Note:

An entry containing Layer 4 match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

The SYN bit is normally set when the source of the packet wants to initiate a TCP session with the specified destination IP or IPv6 address.

The **no** form of this command removes the criterion from the match entry.

## Default

no tcp-syn

## Parameters

### true

Specifies matching on IP or IPv6 packets that have the SYN bit set in the control bits of the TCP header.

### false

Specifies matching on IP or IPv6 packets that do not have the SYN bit set in the control bits of the TCP header.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 24.40 tcp-time-wait

tcp-time-wait

## Syntax

**tcp-time-wait** [min *minutes*] [sec *seconds*]

**no tcp-time-wait**

## Context

**[Tree]** (config>service>nat>nat-policy>timeouts tcp-time-wait)

**[Tree]** (config>service>nat>firewall-policy>timeouts tcp-time-wait)

**[Tree]** (config>service>nat>up-nat-policy>timeouts tcp-time-wait)

## Full Context

configure service nat nat-policy timeouts tcp-time-wait

configure service nat firewall-policy timeouts tcp-time-wait

configure service nat up-nat-policy timeouts tcp-time-wait

## Description

This command configures the timeout applied to a TCP session in a time-wait state.

## Default

no tcp-time-wait

## Parameters

### *minutes*

Specifies the timeout minutes field.

**Values** 1 to 4

### *seconds*

Specifies the timeout seconds field.

**Values** 1 to 59

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat up-nat-policy timeouts tcp-time-wait
- configure service nat nat-policy timeouts tcp-time-wait

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat firewall-policy timeouts tcp-time-wait

## 24.41 tcp-transitory

tcp-transitory

## Syntax

**tcp-transitory** [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]

## no tcp-transitory

### Context

## 24.42 tcp-urg

```
tcp-urg
```

### Syntax

```
tcp-urg {true | false}
```

```
no tcp-urg
```

### Context

```
[Tree] (config>filter>ip-filter>entry>match tcp-urg)
```

```
[Tree] (config>filter>ipv6-filter>entry>match tcp-urg)
```

### Full Context

```
configure filter ip-filter entry match tcp-urg
```

```
configure filter ipv6-filter entry match tcp-urg
```

### Description

This command configures an IP filter match criterion based on the Urgent (URG) TCP Flag bit, defined in RFC 793, as being set or not in the TCP header of an IP packet.

The **no** form of the command removes the criterion from the match entry.

### Default

```
no tcp-urg
```

### Parameters

**true**

Specifies matching on IP packets that have the selected TCP flag bit set in the TCP header.

**false**

Specifies matching on IP packets that do not have the selected TCP flag bit set in the TCP header.

### Platforms

All

## 24.43 tcp-validate

## tcp-validate

### Syntax

**tcp-validate** *tcp-validate-name*

**no tcp-validate**

### Context

**[Tree]** (config>app-assure>group>policy>aqp>entry>action tcp-validate)

### Full Context

configure application-assurance group policy app-qos-policy entry action tcp-validate

### Description

This command assigns an existing TCP validation policy as an action on flows matching this AQP entry.

**tcp-validate** can only be called from AQP entries that:

- have no matching conditions that relate to information extracted from the incoming IP packets; for example, no application or IP address.
- allow the following match conditions:
  - none
  - aa-sub
  - characteristic
  - traffic-direction (both only)  
traffic-direction cannot be unidirectional (from or to sub). It can either be set to both or left unspecified.

The **no** form of this command removes the TCP validation policy action from flows matching this AQP entry.

### Default

no tcp-validate

### Parameters

#### ***tcp-validate-name***

Specifies the name of the TCP validation policy for this application assurance profile. The TCP validation policy is configured using the **config>app-assure>group>tcp-validate *tcp-validate-name*** command.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## tcp-validate

### Syntax

**tcp-validate** *tcp-validate-name* **direction** *direction* [**create**]

**no tcp-validate** *tcp-validate-name* **direction** *direction*

### Context

[\[Tree\]](#) (config>app-assure>group>statistics>tca tcp-validate)

### Full Context

configure application-assurance group statistics threshold-crossing-alert tcp-validate

### Description

This command configures TCA for the counter, and enables the capture of drop or admit events due to the specified TCP validation function.

### Parameters

#### *tcp-validate-name*

Specifies the name of the TCP validation policy up to 32 characters.

#### *direction*

Specifies the traffic direction in relation to the AA subscriber.

**Values** from-sub, to-sub

#### **create**

This keyword is mandatory when creating a TCA instance.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## tcp-validate

### Syntax

**tcp-validate** *tcp-validate-name* [**create**]

**no tcp-validate** *tcp-validate-name*

### Context

[\[Tree\]](#) (config>app-assure>group tcp-validate)

### Full Context

configure application-assurance group tcp-validate

## Description

This command configures a TCP validation policy.

The **no** form of this command removes the specified TCP validation policy.

## Default

no tcp-validate

## Parameters

### *tcp-validate-name*

Specifies the name of the TCP validation policy up to 32 characters.

### **create**

This keyword is mandatory when creating a TCP validation policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.44 tcp-validate-stats

### tcp-validate-stats

## Syntax

[no] tcp-validate-stats

## Context

[\[Tree\]](#) (config>app-assure>group>statistics>aa-admit-deny tcp-validate-stats)

## Full Context

configure application-assurance group statistics aa-admit-deny tcp-validate-stats

## Description

This command configures whether to include or exclude TCP validation admit-deny statistics in accounting records.

## Default

no tcp-validate-stats

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.45 tdcn

```
tdcn
```

### Syntax

```
tdcn
```

### Context

[\[Tree\]](#) (config>port>dwdm tdcn)

### Full Context

```
configure port dwdm tdcn
```

### Description

This command configures the Tunable Dispersion Compensation Module parameters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 24.46 tdm

```
tdm
```

### Syntax

```
tdm
```

### Context

[\[Tree\]](#) (config>port tdm)

### Full Context

```
configure port tdm
```

### Description

Commands in this context configure DS-1/E-1 and DS-3/E-3 parameters for a port on a channelized MDA T1/E1. This context cannot be accessed on non-channelized MDAs.

TDM is a mechanism to divide the bandwidth of a stream into separate channels or time slots by assigning each stream a different time slot in a set. TDM repeatedly transmits a fixed sequence of time slots over a single transmission channel. Each individual data stream is reassembled at the receiving end based on the timing.

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 24.47 tdm-sat

### tdm-sat

#### Syntax

**tdm-sat** *sat-id* [**create**]

**no tdm-sat** *sat-id*

#### Context

[\[Tree\]](#) (config>system>satellite tdm-sat)

#### Full Context

configure system satellite tdm-sat

#### Description

Commands in this context configure the specified TDM satellite.

The **no** form of the command deletes the specified TDM satellite.

#### Parameters

##### *sat-id*

Specifies the satellite ID for the associated TDM satellite.

**Values** 1 to 20

##### **create**

The keyword used to create a new TDM satellite context. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 24.49 te-class

## te-class

### Syntax

**te-class** *te-class-number* **class-type** *ct-number* **priority** *priority*

**no te-class** **te-class-number**

### Context

[\[Tree\]](#) (config>router>rsvp>diffserv-te te-class)

### Full Context

configure router rsvp diffserv-te te-class

### Description

This command configures a TE class. A TE class is defined as:

TE Class = {Class Type (CT), LSP priority}

Eight TE classes are supported. There is no default TE class once Diff-Serv is enabled. The user has to explicitly define each TE class.

When Diff-Serv is disabled, there will be an internal use of the default CT (CT0) and eight pre-emption priorities as shown in [Table 179: Default Class Type](#).

Table 179: Default Class Type

Class Type (CT internal)	LSP Priority
0	7
0	6
0	5
0	4
0	3
0	2
0	1
0	0

The **no** form of this command deletes the TE class.

### Parameters

#### **te-class** *te-class-number*

Specifies the TE class number.

**Values** 0 to 7

#### **class-type** *ct-number*

Specifies the Diff-Serv Class Type number. One or more system forwarding classes can be mapped to a CT.

**Values** 0 to 7

#### **priority** *priority*

Specifies the LSP priority.

**Values** 0 to 7

## 24.50 te-down-threshold

## te-down-threshold

### Syntax

**te-down-threshold** *threshold-level* [*threshold-level*]

**no te-down-threshold**

### Context

**[Tree]** (config>router>rsvp>interface te-down-threshold)

**[Tree]** (config>router>rsvp te-down-threshold)

### Full Context

configure router rsvp interface te-down-threshold

configure router rsvp te-down-threshold

### Description

This command configures the specific threshold levels per node and per interface. Threshold levels are for reserved bandwidth per interface. The **te-threshold-update** command is used to enable or disable threshold-based IGP TE updates. Any reserved bandwidth change per interface is compared with all the threshold levels and trigger an IGP TE update if a defined threshold level is crossed in either direction (LSP setup or teardown). Threshold-based updates must be supported with both ISIS and OSPF. A minimum of one and a maximum of 16 threshold levels is supported.

Threshold levels configured per node is inherited by all configured RSVP interfaces. Threshold levels defined under the RSVP interface is used to trigger IGP updates if non-default threshold levels are configured.

The **no** form of this command resets te-down-threshold to its default value.

### Default

no te-down-threshold (equals following values 100 99 98 97 96 95 90 85 80 75 60 45 30 15 0)

### Parameters

***threshold-level***

Specifies the threshold level.

**Values** 0 to 100

### Platforms

All

## 24.51 te-metric

## te-metric

### Syntax

**te-metric** *value*

**no te-metric**

### Context

**[Tree]** (config>router>mpls>interface te-metric)

### Full Context

configure router mpls interface te-metric

### Description

This command configures the TE metric used on the interface. This metric is in addition to the interface metric used by IGP for the shortest path computation.

This metric is flooded as part of the TE parameters for the interface using an opaque LSA or an LSP. The IS-IS TE metric is encoded as sub-TLV 18 as part of the extended IS reachability TLV. The metric value is encoded as a 24-bit unsigned integer. The OSPF TE metric is encoded as a sub-TLV Type 5 in the Link TLV. The metric value is encoded as a 32-bit unsigned integer.

When the use of the TE metric is enabled for an LSP, CSPF will first prune all links in the network topology which do not meet the constraints specified for the LSP path. Such constraints include bandwidth, admin-groups, and hop limit. Then, CSPF will run an SPF on the remaining links. The shortest path among the all SPF paths will be selected based on the TE metric instead of the IGP metric which is used by default.

The TE metric in CSPF LSP path computation can be configured by entering the command **config>router>mpls>lsp>metric-type te**.

Note that the TE metric is only used in CSPF computations for MPLS paths and not in the regular SPF computation for IP reachability.

The **no** form of this command reverts to the default value.

### Default

no te-metric

The value of the IGP metric is advertised in the TE metric sub-TLV by IS-IS and OSPF.

### Parameters

**value**

Specifies the metric value.

**Values** 1 to 16777215

## 24.52 te-threshold-update

### te-threshold-update

#### Syntax

**[no] te-threshold-update**

#### Context

**[Tree]** (config>router>rsvp te-threshold-update)

#### Full Context

configure router rsvp te-threshold-update

#### Description

This command is used to control threshold-based IGP TE updates. The **te-threshold-update** command must enable IGP TE update based only on bandwidth reservation thresholds per interface and must block IGP TE update on bandwidth changes for each reservation. Threshold levels can be defined using the **te-up-threshold** and **te-down-threshold** commands at the global RSVP or per-interface level.

The **no** form of this command should reset te-threshold-update to the default value and disable threshold based update.

#### Default

no te-threshold-update

## 24.54 tech-support

### tech-support

#### Syntax

**tech-support** [*file-url*]

#### Context

**[Tree]** (admin>satellite>eth-sat tech-support)

**[Tree]** (admin tech-support)

#### Full Context

admin satellite eth-sat tech-support

admin tech-support

#### Description

This command creates a system core dump. If the *file-url* is omitted, and a *ts-location* is defined, then the **tech support** file will have an automatic SR OS generated file name based on the system name and the date and time and will be saved to the directory indicated by the configured *ts-location*.

The format of the auto-generated filename is ts-XXXXX.YYYYMMDD.HHMMUTC.dat where:

- XXXXX: system name with special characters expanded to avoid problems with file systems (for example, a '.' is expanded to %2E.)
- YYYYMMDD: Date with leading zeros on year, month and day
- HHMM: Hours and Minutes in UTC time (24hr format, always 4 chars, with leading zeros on hours and minutes)

#### Note:

This command should only be used with authorized direction of Nokia support.

#### Parameters

***file-url***

Specifies the file URL location to save the binary file.

**Values**

*local-url* | *remote-url*

<i>local-url</i>	[ <i>cflash-id</i> ]/[ <i>file-path</i> ] 200 chars max, including <i>cflash-id</i> directory length 99 chars max each
<i>remote-url</i>	[{ftp://   tftp://}login:pswd@remote-locn/][ <i>file-path</i> ] 199 chars max
<i>remote-locn</i>	[hostname   ipv4-address   ipv6-address]
<i>ipv4-address</i>	a.b.c.d
<i>ipv6-address</i>	x:x:x:x:x:x:x[-interface] x:x:x:x:x:x:d.d.d.d[-interface] x - [0 to FFFF]H d - [0 to 255]D interface - 32 chars max, for link local addresses
<i>cflash-id</i>	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

telnet

**Description**

This command opens a Telnet session to a remote host. In SR-series networks, the Telnet servers limit Telnet clients to three login attempts; if unsuccessful, the Telnet client session is disconnected. The number is not user configurable.

If a source address is specified, it is used for the source IP address in the originated IP packets for the Telnet session.

**Parameters*****ip-address***

Specifies the IP address or the DNS name (if DNS name resolution is configured).

**Values**

<i>ipv4-address</i>	<i>a.b.c.d</i>	
<i>ipv6-address</i>	<i>x:x:x:x:x:x[-interface]</i>	<i>x</i> : [0 to FFFF]H
	<i>x:x:x:x:x:d.d.d.d[-interface]</i>	<i>d</i> : [0 to 255]D <i>ipv6-address</i>
		interface: up to 32 characters, mandatory for link local addresses
<i>dns-name</i>	up to 128 characters	

**Note:**

IPv6 applies to the 7750 SR and 7950 XRS.

***dns-name***

Specifies the DNS name (if DNS name resolution is configured), up to 128 characters.

***port***

Specifies the TCP port number to use Telnet to the remote host, expressed as a decimal integer.

**Values** 1 to 65535**Default** 23***router-instance***

Specifies the router name or service ID used to identify the router instance.

**Values***router-instance: router-name or vprn-svc-id**router-name* "Base", "management", vpls-management"*vprn-svc-id* 1 to 2147483647**Default** Base***service-name***

Specifies the service name, up to 64 characters.

***source ip-address***

Specifies the source IP address to use as the source of the Telnet packets.

**Values**

ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x

x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

### Full Context

```
configure router interface ipv6 vrrp telnet-reply
```

```
configure router interface vrrp telnet-reply
```

### Description

This command enables the non-owner master to reply to TCP port 23 Telnet requests directed at the virtual router instances' IP addresses.

Non-owner virtual router instances are limited by the VRRP specifications to responding to ARP requests destined to the virtual router IP addresses and routing IP packets not addressed to the virtual router IP addresses. Many network administrators find this limitation frustrating when troubleshooting VRRP connectivity issues.

This limitation can be disregarded for certain applications. Ping, SSH and Telnet can each be individually enabled or disabled on a per-virtual-router-instance basis.

The **telnet-reply** command enables the non-owner master to reply to Telnet requests directed at the virtual router instances' IP addresses. The Telnet request can be received on any routed interface. Telnet must not have been disabled at the management security level (either on the parental IP interface or based on the Telnet source host address). Correct login and CLI command authentication is still enforced.

When **telnet-reply** is not enabled, Telnet requests to non-owner master virtual IP addresses are silently discarded.

Non-owner backup virtual routers never respond to Telnet requests regardless of the **telnet-reply** setting.

The **telnet-reply** command is only available in non-owner **vrrp** nodal context.

By default, Telnet requests to the virtual router instance IP addresses will be silently discarded.

The **no** form of the command configures discarding all Telnet request messages destined to the non-owner virtual router instance IP addresses.

### Default

no telnet-reply — Telnet requests to the virtual router instance IP addresses are discarded.

```

```
no temp-flooding
```

### Context

[\[Tree\]](#) (config>service>vpls temp-flooding)

[\[Tree\]](#) (config>service>template>vpls-template temp-flooding)

## Full Context

```
configure service vpls temp-flooding
configure service template vpls-template temp-flooding
```

## Description

The temporary flooding is designed to minimize failover times by eliminating the time it takes to flush the MAC tables and if MVRP is enabled the time it takes for MVRP registration. Temporary flooding is initiated only upon xSTP TCN reception. During this procedure while the MAC flush takes place the frames received on one of the VPLS SAPs/pseudowires are flooded in a VPLS context which for MVRP case includes also the unregistered MVRP trunk ports. The MAC Flush action is initiated by the STP TCN reception or if MVRP is enabled for the data VPLS, by the reception of a MVRP New message for the SVLAN ID associated with the data VPLS. As soon as the MAC Flush is done, regardless of whether the temp-flooding timer expired or not, traffic will be delivered according to the regular FDB content which may be built from MAC Learning or based on MVRP registrations. This command provides a flood-time value that configures a fixed amount of time, in seconds, during which all traffic is flooded (BUM or known unicast) as a safety mechanism. Once the flood-time expires, traffic will be delivered according to the regular FDB content which may be built from MAC Learning or based on MVRP registrations. The temporary flooding timer should be configured in such a way to allow auxiliary processes like MAC Flush, MMRP and/or MVRP to complete/converge. The temporary flooding behavior applies to regular VPLS, VPLS instantiated with VPLS-template, IVPLS and BVPLS when MMRP is disabled.

The **no** form of this command disables the temporary flooding behavior.

## Default

```
no temp-flooding
```

**no template**

## Context

[\[Tree\]](#) (config>app-assure>group>http-error-redirect template)

[\[Tree\]](#) (config>app-assure>group template)

## Full Context

configure application-assurance group http-error-redirect template  
configure application-assurance group template

## Description

This command refers to the template of parameters passed from the AA-ISA to the redirect server via JavaScript in the redirect packet. The template is specific to the redirect server being used in the network. Currently, two partners are used and tested with AA-ISA redirect solution, Barefruit and Xerocole. The **no** form of this command reverts to the default.

## Parameters

### *template-id*

Specifies an HTTP error redirect template.

1 = Barefruit specific template

2 = xerocole specific template.

**Values** 0 to 4294967295

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## template

## Syntax

**template** *value*

**no template**

## Context

[\[Tree\]](#) (config>app-assure>group>http-notif template)

## Full Context

configure application-assurance group http-notification template

## Description

This command configures the template which defines the format and parameters included in the http notification message.

The **no** form of this command removes the template from the configuration.

## Default

no template

## Parameters

### *value*

Specifies the template id of this HTTP Notification.

- Values** 1 — Javascript-url with SubID and optional Http-Url-Param  
2 — Javascript-url and optional Http-Url-Param

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## template

## Syntax

**template** *template-id*

**no template**

## Context

[\[Tree\]](#) (config>app-assure>group>http-redirect template)

## Full Context

configure application-assurance group http-redirect template

## Description

This command configures the template that defines which parameters are appended to the HTTP host redirect field in the redirect message.

The HTTP redirect template provides HTTP 302 redirect containing only the URL specified in the redirect policy, with no other parameters.

The **no** form of this command removes the template from the configuration.

## Default

no template

## Parameters

### *template-id*

Specifies the HTTP Policy Redirect template.

- Values** 1 — Javascript based redirect embedded in HTTP 200 OK response with a predefined number of arguments automatically appended to the redirect URL  
2 — HTTP 302 Redirect with a predefined number of arguments automatically appended to the redirect URL.  
3 — HTTP 302 Redirect with no parameters appended to the URL (empty).

- 4 — Empty Redirect format using Javascript.
- 5 — Redirect supporting macro substitution using HTTP 302.
- 6 — Redirect supporting macro substitution using Javascript.

configure router bier template

### Description

This command creates a BIER template to be assigned to IGP.

The **no** form of this command removes a specific template.

### Parameters

*template-name*

The name of the template to be created or removed, up to 32 characters.

## Platforms

All

## template

### Syntax

[no] **template** *name*

### Context

[\[Tree\]](#) (config>router>route-next-hop-policy template)

### Full Context

configure router route-next-hop-policy template

## Description

This command creates a template to configure the attributes of a Loop-Free Alternate (LFA) Shortest Path First (SPF) policy. An LFA SPF policy allows the user to apply specific criteria, such as admin group and SRLG constraints, to the selection of an LFA backup next-hop for a subset of prefixes that resolve to a specific primary next-hop.

The user first creates a route next-hop policy template under the global router context and then applies it to a specific OSPF or IS-IS interface in the global routing instance or in a VPRN instance.

A policy template can be used in both IS-IS and OSPF to apply the specific criteria to prefixes protected by LFA. Each instance of IS-IS or OSPF can apply the same policy template to one or more interface.

The commands within the route next-hop policy template use the **begin-commit-abort** model. The following are the steps to create and modify the template:

To create a template, the user enters the name of the new template directly under the route-next-hop-policy context.

1. To delete a template that is not in use, the user enters the **no** form for the template name under the route-next-hop-policy context.
2. The user enters the editing mode by executing the **begin** command under the route-next-hop-policy context. The user can then edit and change any number of route next-hop policy templates. However, the parameter value will still be stored temporarily in the template module until the **commit** is executed under the route-next-hop-policy context. Any temporary parameter changes will be lost if the user enters the **abort** command before the **commit** command.
3. The user is allowed to create or delete a template instantly once in the editing mode without the need to enter the **commit** command. Furthermore, the **abort** command, if entered, will have no effect on the prior deletion or creation of a template.

Once the **commit** command is issued, IS-IS or OSPF will re-evaluate the templates and if there are any net changes, it will schedule a new LFA SPF to re-compute the LFA next-hop for the prefixes associated with these templates.

## Parameters

*name*

Specifies the name of the template, up to 32 characters.

## Platforms

All

## template

## Syntax

**template** *template-name*

**no template**

## Context

**[Tree]** (config>router>isis>level>bier template)

configure router ospf area bier template

## Description

This command configures an OSPF BIER template at the OSPF area level.

The **no** form of this command removes templates from the OSPF area.

## Parameters

*template-name*

The name of the template, up to 32 characters.

## Platforms

All

## 24.68 template-format

## template-format

### Syntax

**template-format** {format1 | format2}

**no template-format**

### Context

[\[Tree\]](#) (config>service>ipfix>ipfix-export-policy template-format)

### Full Context

configure service ipfix ipfix-export-policy template-format

### Description

This command selects one of two template formats that contains a set of element IDs and their interpretation in IPFIX NAT flow logging. The difference between the two formats is related to the fields conveying information about the translated source IP addresses and ports (outside IP addresses and ports). Further, format 1 conveys information about the translated source port (post NAT) in the sourceTransportPort information element while format 2 conveys this information in the postNAPTsourceTrasportPort element.

Further, format1 conveys information about the translated source port (post NAT) in the information element sourceTransportPort while a new information element postNAPTsourceTrasportPort is introduced in format2 to carry this information.

For more information about template formats, refer to "Template Formats" in the *7450 ESS, 7750 SR, and VSR Multiservice Integrated Service Adapter and Extended Services Appliance Guide*, where the table lists supported information elements and their description for each format.

The **no** form of the command reverts to the default value.

### Default

template-format format1

### Parameters

#### format1

Specifies that template format 1 is used by the IPFIX collectors associated with this IPFIX Export policy.

#### format2

Specifies that template format 2 is used by the IPFIX collectors associated with this IPFIX Export policy.

All

## 24.69 template-refresh-timeout

### template-refresh-timeout

#### Syntax

**template-refresh-timeout** [*hrs hours*] [*min minutes*] [*sec seconds*] [*days days*]

**no template-refresh-timeout**

#### Context

[\[Tree\]](#) (config>service>ipfix>export-policy>collector template-refresh-timeout)

#### Full Context

configure service ipfix ipfix-export-policy collector template-refresh-timeout

#### Description

This command configures the time interval in which Template Set messages are sent to the collector node. Template sets is an IPFIX message that defines fields for subsequent IPFIX messages but contains no data of its own. In other words, IPFIX data is not passed as set of TLVs, but instead data is encoded with a scheme defined through the Template Set message.

#### Default

template-refresh-timeout min 10

#### Parameters

##### *hours*

Specifies the time interval, in hours, after which IPFIX templates are resent to this collector.

**Values** 1 to 24

##### *minutes*

Specifies the time interval, in minutes, after which IPFIX templates are resent to this collector.

**Values** 1 to 59

##### *seconds*

Specifies the time interval, in seconds, after which IPFIX templates are resent to this collector.

**Values** 1 to 59

##### *days*

Specifies the time interval, in days, after which IPFIX templates are resent to this collector.

**Values** 1

## 24.70 template-retransmit

### template-retransmit

#### Syntax

**template-retransmit** *seconds*

**no template-retransmit**

#### Context

[\[Tree\]](#) (config>app-assure>group>cflowd template-retransmit)

#### Full Context

configure application-assurance group cflowd template-retransmit

#### Description

This command configures the period of time, in seconds, for the template to be retransmitted.

#### Default

template-retransmit 600

#### Parameters

***seconds***

Specifies the time period for the template to be retransmitted.

**Values** 10 to 600

**Default** 600

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### template-retransmit

#### Syntax

**template-retransmit** *seconds*

**no template-retransmit**

**Context**

[\[Tree\]](#) (config>cflowd template-retransmit)

**Full Context**

configure cflowd template-retransmit

**Description**

This command specifies the interval for sending template definitions.

**Default**

template-retransmit 600

**Parameters*****seconds***

Specifies the value expressed in seconds before sending template definitions.

**Values** 10 to 600

**Platforms**

All

## 24.71 template-set

### template-set

**Syntax**

template-set {basic | mpls-ip | l2-ip | mpls-transport}

**Context**

[\[Tree\]](#) (config>cflowd>collector template-set)

**Full Context**

configure cflowd collector template-set

**Description**

This command specifies the set of templates sent to the collector when using cflowd Version 9 or Version 10.

**Default**

template-set basic

## Parameters

### basic

Specifies that basic flow data is sent.

### mpls-ip

Specifies that extended flow data is sent that includes IP and MPLS flow information.

If the sampled traffic is part of a locally configured service or IPv4 or IPv6 traffic is being forwarded with an MPLS shortcut, then the MPLS labels associated with that service encapsulation are included in the extended flow data for both network ingress and egress sampling.

### l2-ip

Specifies that extended flow data is sent that includes Layer 2 (Ethernet) and IP flow information. This template is only applicable for V10 (IPFIX) collectors.

### mpls-transport

Specifies that cflowd can collect flow statistics for MPLS traffic using only the outer transport label, EXP bit value, and ingress interface as the flow identifier. This template enables the collection of flow statistics on a core router to develop LSP usage statistics.

## 24.73 termination-fpe

### termination-fpe

#### Syntax

**termination-fpe** *termination-fpe*

**no termination-fpe**

#### Context

[\[Tree\]](#) (config>router>segment-routing>srv6>locator termination-fpe)

[\[Tree\]](#) (conf>router>sr>srv6>ms>block termination-fpe)

#### Full Context

configure router segment-routing segment-routing-v6 locator termination-fpe

configure router segment-routing segment-routing-v6 micro-segment block termination-fpe

#### Description

This command configures the association between the FPE ID and the locator for termination of SRv6 in local services. One or more FPEs can be configured for SRv6 termination, where a termination SRv6 FPE is assigned one or more configured locators or micro-segment locators.

The **no** form of this command removes the association.

#### Parameters

##### **termination-fpe**

Specifies the FPE ID for SRv6 termination.

**Values** 1 to 64

#### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 24.74 tertiary

### tertiary

#### Syntax

**tertiary**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>sub-ident-pol tertiary)

**Full Context**

configure subscriber-mgmt sub-ident-policy tertiary

**Description**

Commands in this context configure tertiary identification script parameters.

## 24.75 tertiary-config

### tertiary-config

**Syntax**

**tertiary-config** *file-url*

**no tertiary-config**

**Context**

[\[Tree\]](#) (bof tertiary-config)

**Full Context**

bof tertiary-config

**Description**

This command specifies the name and location of the tertiary configuration file.

The system attempts to use the configuration specified in **tertiary-config** if both the primary and secondary config files cannot be located. If this file cannot be located, the system boots with the factory default configuration.

Note that if an error in the configuration file is encountered, the boot process aborts.

The **no** form of this command removes the **tertiary-config** configuration.

**Parameters*****file-url***

Specifies the tertiary configuration file location, expressed as a file URL.

**Values**

<i>file-url</i>	{ <i>local-url</i>   <i>remote-url</i> } (up to 180 characters)
<i>local-url</i>	[ <i>cflash-id</i> ]/[ <i>file-path</i> ]
<i>remote-url</i>	[{ftp://   tftp://} <i>login:pswd@remote-locn</i> ]/[ <i>file-path</i> ]

## 24.76 tertiary-dns

### tertiary-dns

#### Syntax

**tertiary-dns** *ip-address*

**no tertiary-dns**

#### Context

[\[Tree\]](#) (config>service>vprn>dns tertiary-dns)

#### Full Context

configure service vprn dns tertiary-dns

#### Description

This command configures the tertiary DNS server for DNS name resolution. The tertiary DNS server is used only if the primary DNS server and the secondary DNS server do not respond.

DNS name resolution can be used when executing ping, traceroute, and service-ping, and also when defining file URLs. DNS name resolution is not supported when DNS names are embedded in configuration files.

The **no** form of this command removes the tertiary DNS server from the configuration.

#### Default

no tertiary-dns — No tertiary DNS server is configured.

#### Parameters

##### *ip-address*

The IP or IPv6 address of the tertiary DNS server.

##### Values

ipv4-address -a.b.c.d

ipv6-address: x:x:x:x:x:x:x[-interface]

x:x:x:x:x:d.d.d.d[-interface]

x: [0 to FFFF]H

d: [0 to 255]D

interface - 32 characters max, for link local addresses.

## Platforms

All

## tertiary-dns

### Syntax

**tertiary-dns** *ip-address*

**no tertiary-dns** [*ip-address*]

### Context

[\[Tree\]](#) (bof tertiary-dns)

### Full Context

bof tertiary-dns

### Description

This command configures the tertiary DNS server for DNS name resolution. The tertiary DNS server is used only if the primary DNS server and the secondary DNS server do not respond.

DNS name resolution can be used when executing ping, traceroute, and service-ping, and also when defining file URLs. DNS name resolution is not supported when DNS names are embedded in configuration files.

The **no** form of this command removes the tertiary DNS server from the configuration.

### Default

no tertiary-dns

### Parameters

#### *ip-address*

Specifies the IP or IPv6 address of the tertiary DNS server.

#### Values

ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x[-interface]
	x:x:x:x:x:d.d.d.d[-interface]
	x: [0 to FFFF]H
	d: [0 to 255]D

interface 32 chars max, for link local addresses

## 24.77 tertiary-image

### tertiary-image

**Syntax**

**tertiary-image** *file-url*

**no tertiary-image**

**Context**

[\[Tree\]](#) (bof tertiary-image)

**Full Context**

bof tertiary-image

**Description**

This command specifies the tertiary directory location for runtime image file loading.

The system attempts to load all runtime image files configured in the **primary-image** first. If this fails, the system attempts to load the runtime images from the location configured in the **secondary-image**. If the secondary image load fails, the tertiary image specified in **tertiary-image** is used.

All runtime image files (\*.tim files) must be located in the same directory.

The **no** form of this command removes the **tertiary-image** configuration.

**Parameters*****file-url***

Specifies the file URL; can be either local (this CPM) or a remote FTP server.

**Values**

<i>file-url</i>	{ <i>local-url</i>   <i>remote-url</i> } (up to 180 characters)
<i>local-url</i>	[ <i>cflash-id</i> ]/[ <i>file-path</i> ]
<i>remote-url</i>	[{ftp://   tftp://} <i>login:pswd@remote-locn</i> ]/[ <i>file-path</i> ]

## 24.78 tertiary-ip-address

### tertiary-ip-address

#### Syntax

**tertiary-ip-address** *ipv4-address*

**no tertiary-ip-address**

#### Context

[\[Tree\]](#) (config>router>bgp>orr>location tertiary-ip-address)

#### Full Context

configure router bgp optimal-route-reflection location tertiary-ip-address

#### Description

This command specifies the tertiary IP address of a reference location used for BGP optimal route reflection. Up to three IPv4 addresses and three IPv6 addresses can be specified per location.

If the TE DB is unable to find a node in its topology database that matches the primary address, then the TE DB tries to find a node with the matching secondary address. If this attempt also fails, the TE DB then tries to find a node with the matching tertiary address.

The IP addresses specified for a location should be topologically "close" to a set of clients that should all receive the same optimal path for that location.

The **no** form of this command removes the tertiary IP address information.

#### Default

no tertiary-ip-address

#### Parameters

***ipv4-address***

Specifies the tertiary IPv4 address of a location, expressed in dotted decimal notation.

**Values** a.b.c.d

## Platforms

All

## 24.79 tertiary-ipv6-address

### tertiary-ipv6-address

#### Syntax

**tertiary-ipv6-address** *ipv6-address*

**no tertiary-ipv6-address**

#### Context

[\[Tree\]](#) (config>router>bgp>orr>location tertiary-ipv6-address)

#### Full Context

configure router bgp optimal-route-reflection location tertiary-ipv6-address

#### Description

This command specifies the tertiary IPv6 address of a reference location used for BGP optimal route reflection. Up to three IPv4 addresses and three IPv6 addresses can be specified per location.

If the TE DB is unable find a node in its topology database that matches a primary address of the location, then it tries to find a node matching a secondary address. If this attempt also fails, the TE DB tries to find a node matching a tertiary address.

The IP addresses specified for a location should be topologically "close" to a set of clients that should all receive the same optimal path for that location.

The **no** form of this command removes the tertiary IPv6 address information.

#### Default

no tertiary-ipv6-address

#### Parameters

##### *ipv6-address*

Specifies the tertiary IPv6 address of a location.

- |               |                                                                                                                                                            |

## 24.81 tertiary-url

### tertiary-url

#### Syntax

**tertiary-url** *url*

**no tertiary-url**

#### Context

[\[Tree\]](#) (config>python>py-script tertiary-url)

#### Full Context

configure python python-script tertiary-url

#### Description

This command specifies the location of tertiary Python script. The system supports three locations for each Python-script. Users can store scripts file on either a local CF card or a FTP server.

The **no** form of this command removes the URL.

#### Parameters

**url**

Specifies the tertiary URL of the Python script up to 180 characters, either a local CF card URL or a FTP server URL.

#### Platforms

All

## 24.82 test

## test

### Syntax

**[no] test** *test-name* [**owner** *test-owner*]

### Context

**[Tree]** (config>saa test)

### Full Context

configure saa test

### Description

This command identifies a test and enables the context to provide the test parameters for the named test. After the creation of the test instance, the test can be started in the OAM context.

A test can only be modified while it is shut down.

The **no** form of this command removes the test from the configuration. To remove a test, it cannot be active at the time.

### Parameters

#### ***test-name***

Identifies the SAA test name, up to 32 characters.

#### ***test-owner***

Specifies the owner, up to 32 characters, of an SAA operation. If a value is not specified, the default owner is used.

**Default** "TiMOS CLI"

[\[Tree\]](#) (config>oam-pm>session>ethernet>lmm test-duration)

## Full Context

configure oam-pm session ethernet slm test-duration

configure oam-pm session ethernet dmm test-duration

configure oam-pm session ethernet lmm test-duration

## Description

This optional command defines the length of time the test runs before stopping automatically. This command is only a valid option when a session has been configured with a **session-type** of **on-demand**. This is not an option when the **session-type** is configured as **proactive**. On-demand tests do not start until the **config>oam-pm>session>start** command has been issued and they stop when the **config>oam-pm>session>stop** command is issued.

The **no** form of this command removes a previously configured test-duration and allow the test to run until manually stopped.

## Parameters

### *seconds*

Specifies the number of seconds the test runs from its start time.

**Values** 1 to 86400

## Platforms

All

## test-duration

## Syntax

**test-duration** *seconds*

**no test-duration**

## Context

[\[Tree\]](#) (config>oam-pm>session>ip>twamp-light test-duration)

## Full Context

configure oam-pm session ip twamp-light test-duration

## Description

This command defines the length of time the test runs before stopping automatically. This optional command is only valid when a session has been configured with a **session-type** of **on-demand**. This

is not an option when the **session-type** is configured as **proactive**. On-demand tests do not start until the **config>oam-pm>session>start** command has been issued and they stop when the **config>oam-pm>session>stop** command is issued.

The **no** form of this command removes a previously configured test-duration value and allows the TWAMP Light test to execute until it is stopped manually.

## Parameters

### *seconds*

Specifies the length of time, in seconds, that the TWAMP Light test runs.

**Values** 1 to 86400

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## test-duration

## Syntax

**test-duration** *seconds*

**no test-duration**

## Context

[\[Tree\]](#) (config>oam-pm>session>mpls>dm test-duration)

## Full Context

configure oam-pm session mpls dm test-duration

## Description

This command defines the length of time the test runs before stopping automatically. This command is only valid when a session has been configured with a **session-type** of **on-demand**. This is not an option when the **session-type** is configured as **proactive**.

On-demand tests do not start until the **oam-pm>session>start** command has been issued and they stop when scheduled or the **oam-pm>session>stop** command is issued.

The **no** form of this command removes a previously configured test-duration and allow the test to run until manually stopped.

## Parameters

### *seconds*

Specifies the number of seconds the test runs from its start time.

**Values** 1 to 8640

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## test-duration

### Syntax

**test-duration**

### Context

[\[Tree\]](#) (config>test-oam>sath>svc-test test-duration)

### Full Context

configure test-oam service-activation-testhead service-test test-duration

### Description

Commands in this context configure the test duration for the various functional test types.

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 24.86 test-fail-enable

## test-fail-enable

### Syntax

**[no] test-fail-enable**

### Context

[\[Tree\]](#) (config>saa>test>trap-gen test-fail-enable)

### Full Context

configure saa test trap-gen test-fail-enable

### Description

This command enables the generation of a trap when a test fails. In the case of a ping test, the test is considered failed (for trap generation) if the number of failed probes is at least the value of the **test-fail-threshold** parameter.

The **no** form of this command disables the trap generation.

## Platforms

All

## 24.87 test-fail-threshold

### test-fail-threshold

#### Syntax

**test-fail-threshold** *threshold*

**no test-fail-threshold**

#### Context

[\[Tree\]](#) (config>saa>test>trap-gen test-fail-threshold)

#### Full Context

configure saa test trap-gen test-fail-threshold

#### Description

This command configures the threshold for trap generation on test failure.

This command has no effect when **test-fail-enable** is disabled. This command is not applicable to SAA trace route tests.

The **no** form of this command returns the threshold value to the default.

#### Default

test-fail-threshold 1

#### Parameters

***threshold***

Specifies the number of consecutive test failures required to generate a trap.

**Values** 0 to 15

## Platforms

All

## 24.88 test-oam

## test-oam

### Syntax

**test-oam**

## 24.89 test-pattern

## test-pattern

### Syntax

**test-pattern** {**all-zeros** | **all-ones**} [**crc-enable**]

**no test-pattern**

### Context

[\[Tree\]](#) (config>eth-tunnel>path>eth-cfm>mep>eth-test-enable test-pattern)

### Full Context

configure eth-tunnel path eth-cfm mep eth-test-enable test-pattern

### Description

This command configures the test pattern for eth-test frames.

The **no** form of this command removes the values from the configuration.

### Parameters

#### **all-zeros**

Specifies to use all zeros in the test pattern.

#### **all-ones**

Specifies to use all ones in the test pattern.

**crc-enable**

Generates a CRC checksum.

**Default** all-zeros

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**test-pattern****Syntax**

**test-pattern** {all-zeros | all-ones} [crc-enable]

**no test-pattern**

**Context**

## Context

[\[Tree\]](#) (config>eth-ring>path>eth-cfm>mep>eth-test-enable test-pattern)

## Full Context

configure eth-ring path eth-cfm mep eth-test-enable test-pattern

## Description

This command configures the test pattern for eth-test frames.

The **no** form of the command removes the values from the configuration.

## Default

test-pattern all-zeros

## Parameters

### all-zeros

Specifies to use all zeros in the test pattern.

### all-ones

Specifies to use all ones in the test pattern.

### crc-enable

Generates a CRC checksum.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 24.90 test-types

### test-types

#### Syntax

**test-types**

#### Context

[\[Tree\]](#) (config>test-oam>sath>svc-test>svc-stream test-types)

#### Full Context

configure test-oam service-activation-testhead service-test service-stream test-types

#### Description

Commands in this context configure the types of tests to perform on a specific service stream.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 24.91 tethered-flow

### tethered-flow

#### Syntax

**[no] tethered-flow**

#### Context

[\[Tree\]](#) (config>app-assure>group>policy>chrg-fltr>entry>match tethered-flow)

#### Full Context

configure application-assurance group policy charging-filter entry match tethered-flow

#### Description

This command configures the addition of the tethering status to the match criteria used by this charging filter entry.

The **no** form of this command removes the tethering status match criteria.

**Default**

no tethered-flow

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.92 tethering-detection

### tethering-detection

**Syntax**

**tethering-detection**

**Context**

[\[Tree\]](#) (config>app-assure>group tethering-detection)

**Full Context**

configure application-assurance group tethering-detection

**Description**

Commands in this context configure tethering detection for the group. The **shutdown** and **no shutdown** commands are used in this context to enable or disable tethering detection.

**Default**

tethering-detection shutdown

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.93 tethering-summary

### tethering-summary

**Syntax**

**[no] tethering-summary**

**Context**

[\[Tree\]](#) (config>app-assure>group>statistics>aa-partition tethering-summary)

**Full Context**

configure application-assurance group statistics aa-partition tethering-summary

**Description**

This command enables tethering summary statistics collection within an aa-partition.

The **no** form of this command disables tethering summary statistics collection.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.94 third-party

third-party

**Syntax**

[no] third-party

**Context**

[\[Tree\]](#) (config>service>nat>pcp-server-policy>option third-party)

**Full Context**

configure service nat pcp-server-policy option third-party

**Description**

This command enables/disables support for the **third-party** option.

**Default**

no third-party

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.95 third-party-nexthop

third-party-nexthop

**Syntax**

third-party-nexthop

## no third-party-nexthop

### Context

**[Tree]** (config>service>vprn>bgp>group>neighbor third-party-nexthop)

**[Tree]** (config>service>vprn>bgp>group third-party-nexthop)

**[Tree]** (config>service>vprn>bgp third-party-nexthop)

### Full Context

configure service vprn bgp group neighbor third-party-nexthop

configure service vprn bgp group third-party-nexthop

configure service vprn bgp third-party-nexthop

### Description

Use this command to enable the router to send third-party next-hop to EBGPeers in the same subnet as the source peer, as described in RFC 4271. If enabled when an IPv4 or IPv6 route is received from one EBGPeer and advertised to another EBGPeer in the same IP subnet, the BGP next-hop is left unchanged. Third-party next-hop is not done if the address family of the transport does not match the address family of the route.

The **no** form of this command prevents BGP from performing any third party next-hop processing toward any single-hop EBGPeers within the scope of the command. No third-party next-hop means the next-hop will always carry the IP address of the interface used to establish the TCP connection to the peer.

### Default

no third-party-nexthop

### Platforms

All

## third-party-nexthop

### Syntax

**third-party-nexthop**

no third-party-nexthop

### Context

## 24.97 threshold

### threshold

#### Syntax

**threshold** *xpl-errors*

#### Context

[\[Tree\]](#) (config>card>mda>egress-xpl threshold)

#### Full Context

configure card mda egress-xpl threshold

#### Description

This command configures the Egress XPL Error Threshold value used by the **fail-on-error** feature.

#### Default

threshold 1000

#### Parameters

##### *xpl-errors*

Specifies an upper limit on the frequency of Egress XPL Errors that can occur on the MDA. When **fail-on-error** is enabled, if the MDA experiences more than *xpl-errors* errors per minute for the specified number of minutes from the **window** *minutes* command, the MDA will be put in the failed state.

The threshold value cannot be changed while **fail-on-error** is enabled for this MDA.

**Values** 1 to 1000000

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### threshold

#### Syntax

**threshold** *xpl-errors*

#### Context

[\[Tree\]](#) (config>card>mda>ingress-xpl threshold)

#### Full Context

configure card mda ingress-xpl threshold

## Description

This command configures the Ingress XPL Error Threshold value used by the **fail-on-error** feature.

## Default

threshold 1000

## Parameters

### *xpl-errors*

Specifies an upper limit on the frequency of Ingress XPL Errors that can occur on the MDA. When **fail-on-error** is enabled, if the MDA experiences more than *xpl-errors* errors per minute for the specified number of minutes from the **window minutes** command, the MDA will be put in the failed state.

The threshold value cannot be changed while **fail-on-error** is enabled for this MDA.

**Values** 1 to 1000000

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## threshold

## Syntax

**threshold** {**ber-sd** | **ber-sf**} **rate** *threshold-rate*

**no threshold** {**ber-sd** | **ber-sf**}

## Context

[\[Tree\]](#) (config>port>sonet-sdh threshold)

## Full Context

configure port sonet-sdh threshold

## Description

This command configures the line signal degradation bit error rate (BER) and line signal failure thresholds.

Line signal (b2) bit interleaved parity error rates are measured and when they cross either the degradation or failure thresholds alarms are raised (see the **report-alarm** command), furthermore if the failure threshold is crossed the link will be set to operationally down.

For APS configurations, if the **ber-sd** or **ber-sf** threshold rates must be modified, the changes must be performed at the line level on both the working and protect APS port member.

The **no** form of this command reverts to the default value.

## Default

threshold ber-sd rate 6 — Signal degrade BER threshold of 10-6.

threshold ber-sf rate 3 — Signal failure BER threshold of 10-3.

## Parameters

### **ber-sd**

Specifies the BER that specifies signal degradation.

### **ber-sf**

Specifies the BER that specifies signal failure.

### **threshold-rate**

The BER negative exponent (n in 10-n), expressed as a decimal integer.

**Values** 3 to 9 (10-3 to 10-9) for ber-sd, 3 to 6 for ber-sf

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## threshold

## Syntax

**threshold** {**ber-sd** | **ber-sf**} **rate** {**1** | **5** | **10** | **50** | **100**}

**no threshold** {**ber-sd** | **ber-sf**}

## Context

[\[Tree\]](#) (config>port>tdm>e1 threshold)

## Full Context

configure port tdm ds1 threshold

configure port tdm e1 threshold

## Description

This command configures the line signal degradation bit error rate (BER) and line signal failure thresholds.

Line signal (b2) bit interleaved parity error rates are measured and when they cross either the degradation or failure thresholds alarms are raised (see the **report-alarm** command), furthermore if the failure threshold is crossed the link will be set to operationally down.

The **no** form of this command reverts to the default value.

## Default

threshold ber-sd rate 5 threshold ber-sf rate 50

## Parameters

### **ber-sd**

Specifies the BER that specifies signal degradation.

### **ber-sf**

Specifies the BER that specifies signal failure.

**rate**

Specifies the number of errors, in millions.

**Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

**threshold****Syntax**

**threshold** *threshold*

**no threshold**

**Context**

[\[Tree\]](#) (config>router>segment-routing>maintenance-policy threshold)

**Full Context**

configure router segment-routing maintenance-policy threshold

**Description**

This command configures the minimum number of S-BFD sessions that must be up in order to consider the SR policy candidate path to which the maintenance template is bound to be up. If it is below this number, then the policy candidate path is marked as BFD degraded by the system. This command is only valid in the **ecmp-protected** mode.

The **no** form of this command reverts to the default.

**Default**

threshold 1

**Parameters*****threshold***

Specifies the minimum number of S-BFD sessions that must be up.

**Values** 1 to 32

## 24.100 throttle-rate

### throttle-rate

#### Syntax

**throttle-rate** *events* [*interval seconds*]

**no throttle-rate**

#### Context

[\[Tree\]](#) (config>log throttle-rate)

#### Full Context

configure log throttle-rate

#### Description

This command configures the number of events and interval length to be applied to all event types that have throttling enabled by the **event-control** command and do not have a **specific-throttle-rate** configured.

The **no** form of this command reverts to the default values.

#### Default

throttle-rate 2000 interval 1

#### Parameters

##### *events*

Specifies the number of log events that can be logged within the specified interval for a specific event. Once the limit has been reached, any additional events of that type will be dropped, for example, the event drop count will be incremented. At the end of the throttle interval if any events have been dropped a trap notification will be sent.

**Values** 1 to 20000

**Default** 2000

##### *seconds*

Specifies the number of seconds that an event throttling interval lasts.

**Values** 1 to 1200

**Default** 1

## 24.101 throughput-alarm

### throughput-alarm

#### Syntax

**throughput-alarm high-threshold *Mbps* low-threshold *Mbps***  
**no throughput-alarm**

#### Context

[\[Tree\]](#) (config>li>x-interfaces>x3>alarms throughput-alarm)

#### Full Context

configure li x-interfaces x3 alarms throughput-alarm

#### Description

This command configures the thresholds for raising the throughput alarm. The throughput is shared with other ISA BB applications. The low threshold value must be configured with a smaller value than the high threshold.

The **no** form of this command reverts to the default values.

#### Parameters

##### **high-threshold *Mbps***

Specifies the high threshold value.

**Values** 1 to 4294967295

##### **low-threshold *Mbps***

Specifies the low threshold value.

**Values** 1 to 4294967295

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 24.102 ti-lfa

## ti-lfa

### Syntax

**ti-lfa** [**max-sr-frr-labels** *value*] [**max-srv6-frr-sids** *sids-value*]

**no ti-lfa**

### Context

**[Tree]** (config>router>isis>lfa ti-lfa)

### Full Context

configure router isis loopfree-alternates ti-lfa

### Description

This command enables the use of the Topology-Independent LFA (TI-LFA) algorithm in the LFA SPF calculation for this IS-IS instance.

The **no** form of this command disables the use of the TI-LFA algorithm in the LFA SPF calculation for this IS-IS instance.

### Default

no ti-lfa

### Parameters

#### *value*

Specifies the maximum number of labels allowed in the segment list of the TI-LFA repair tunnel. A higher value results in better coverage by TI-LFA at the expense of increased packet encapsulation overhead. The TI-LFA algorithm uses this value to limit the search for the Q-node from the P-node on the post-convergence path.

**Values** 0 to 3

**Default** 2

#### *sids-value*

Specifies the maximum number of SRv6 SIDs allowed in the segment list of the TI-LFA repair tunnel. A higher value results in better coverage by TI-LFA at the expense of increased packet encapsulation overhead. The TI-LFA algorithm uses this value to limit the search for the Q-node from the P-node on the post-convergence path.

**Values** 0 to 3

**Default** 1

### Platforms

All

## ti-lfa

### Syntax

**ti-lfa** [**max-sr-frr-labels** *value*]

**no ti-lfa**

### Context

**[Tree]** (config>router>ospf>loopfree-alternates ti-lfa)

### Full Context

configure router ospf3 loopfree-alternates ti-lfa

configure router ospf loopfree-alternates ti-lfa

### Description

This command enables the use of the Topology Independent Loop-Free Alternate (TI-LFA) algorithm in the LFA SPF calculation for this OSPF or OSPFv3 instance.

The **no** form of this command disables the use of the TI-LFA algorithm in the LFA SPF calculation in this OSPF or OSPFv3 instance.

### Default

no ti-lfa

### Parameters

#### **max-sr-frr-labels** [*value*]

Specifies the maximum number of labels allowed in the segment list of the TI-LFA repair tunnel. A higher value results in better coverage by TI-LFA at the expense of increased packet encapsulation overhead. The TI-LFA algorithm uses this value to limit the search for the Q-node from the P-node on the post-convergence path.

**Values** 0 to 3

**Default** 2

### Platforms

All

## 24.103 tier

## tier

### Syntax

**tier** {1 | 2}

### Context

[\[Tree\]](#) (config>qos>policer-control-policy tier)

### Full Context

configure qos policer-control-policy tier

### Description

This command is used to create, configure, and delete tiered arbiters. Two tiers are supported that always exist, specified as tier 1 and tier 2. Tiered arbiters enable the creation of a bandwidth control hierarchy for managing child policers in an arbitrary fashion. Each arbiter enables parenting of child policers within eight strict levels of priority and a maximum aggregate rate may be defined for the children that the arbiter will enforce. Arbiters created on tier 1 are automatically parented to the root arbiter that is always present. Arbiters created on tier 2 default to the root arbiter as parent but can also be explicitly parented to a tier 2 arbiter. Child policers associated with an instance of the **policer-control-policy** can be parented to any tiered arbiter or to the root arbiter.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## tier

### Syntax

**[no] tier** *tier*

### Context

[\[Tree\]](#) (config>qos>scheduler-policy tier)

### Full Context

configure qos scheduler-policy tier

### Description

This command identifies the level of hierarchy that a group of schedulers are associated with. Within a tier level, a scheduler can be created or edited. Schedulers created within a tier can only be a child (take bandwidth from a scheduler in a higher tier). Tier levels increase sequentially with 1 being the highest tier. All tier 1 schedulers are considered to be root and cannot be a child of another scheduler. Schedulers defined in tiers other than 1 can also be root (parentless).

3 tiers (levels 1, 2, and 3) are supported.

The **save config** and **show config** commands only display information on scheduler tiers that contain defined schedulers. When all schedulers have been removed from a level, that level ceases to be included in output from these commands.

### Parameters

#### *tier*

This parameter is required to indicate the group of schedulers to create or be edited. Tier levels cannot be created or deleted. If a value for level is given that is out-of-range, an error will occur and the current context of the CLI session will not change.

**Values** 1 to 3

### time

#### Syntax

**time** *time*

#### Context

[\[Tree\]](#) (config>system>security>pki>cert-udp-prof>sched time)

**Full Context**

configure system security pki certificate-update-profile schedule time

**Description**

This command configures the time relative to the valid certificate period.

**Default**

time 86400

**Parameters**

*time*

Specifies the time relative to valid certificate period.

**Values** 3600 to 157680000

**Platforms**

All

**24.105 time-average-factor****time-average-factor****Syntax**

**time-average-factor** *taf-value* [**dec-only**]

**no time-average-factor**

**Context**

**[Tree]** (config>qos>adv-config-policy>child-control>offered-measurement time-average-factor)

**Full Context**

configure qos adv-config-policy child-control offered-measurement time-average-factor

**Description**

This command is used to weight the new offered rate with a portion of the previous offered rate. It would be expected that this command would mainly be used with the dec-only option enabled.

The adjustment to the offered rate is performed using the following formula when taf-value is not set to '0':

$$\text{Adjusted\_Rate} = ((\text{Prev\_Offered\_Rate} \times (\text{taf-value} - 1)) + \text{New\_Offered\_Rate}) / \text{taf-value}$$

If the dec-only option is specified, the adjustment is only applied when New\_Offered\_Rate is less than the Prev\_Offered\_Rate. When taf-value is set to '0', the adjustment is never applied.

The **no** form of this command is used to remove the time average factor adjustments to new offered rate measurements.

## Parameters

### *taf-value*

The taf-value is specified as a whole number between 0 and 64. The value '0' has special meaning in that it disables the time average factor adjustment and has the same effect as no time-average-factor.

**Default** 0

**Values** 0 to 64

### *dec-only*

This keyword is an optional parameter. When enabled, the time average factor adjustment is only applied if the new offered rate is decreasing compared to the previous offered rate. If the new offered rate is greater than the previous offered rate, the adjustment is not applied.

## Platforms

All

## time-average-factor

## Syntax

**time-average-factor** *value*

**no time-average-factor**

## Context

**[Tree]** (config>qos>slope-policy time-average-factor)

## Full Context

configure qos slope-policy time-average-factor

## Description

This command sets a weighting factor to calculate the new shared buffer average utilization after assigning buffers for a packet entering a queue. To derive the new shared buffer average utilization, the buffer pool takes a portion of the previous shared buffer average and adds it to the inverse portion of the instantaneous shared buffer utilization.

The **time-average-factor** command sets the weighting factor between the old shared buffer average utilization and the current shared buffer instantaneous utilization when calculating the new shared buffer average utilization

The TAF value applies to all high- and low-priority RED slopes for ingress and egress access buffer pools controlled by the slope policy.

The **no** form of this command restores the default setting.

## Default

time-average-factor 7

## Parameters

### *value*

Represents the Time Average Factor (TAF), expressed as a decimal integer. The value specified for TAF affects the speed at which the shared buffer average utilization tracks the instantaneous shared buffer utilization. A low value weights the new shared buffer average utilization calculation more to the shared buffer instantaneous utilization; zero using it exclusively. A high value weights the new shared buffer average utilization calculation more to the previous shared buffer average utilization value.

**Values** 0 to 15

## Platforms

All

## 24.106 time-display

### time-display

## Syntax

**time-display** {local | utc}

## Context

[\[Tree\]](#) (environment time-display)

## Full Context

environment time-display

## Description

This command displays time stamps in the CLI session based on local time or Coordinated Universal Time (UTC).

The system keeps time internally in UTC and is capable of displaying the time in either UTC or local time based on the time zone configured.

This environment command only applies to times displayed in the current CLI session. This includes displays of event logs and all other places where a time stamp is displayed.

In event logs, the selected time is used to control the timestamps in the CLI output of **show log log-id** and in YANG state in the /state/log/log-id branch (for logs such as session, cli, memory, SNMP and NETCONF).

Also see the **configure log log-id time-format** command.

## Default

time-display local

## Parameters

### local

Indicates that local time should be used.

### utc

Indicates that UTC time should be used.

## Platforms

All

## time-display

## Syntax

```
time-display {local | utc}
```

## Context

[\[Tree\]](#) (config>system>management-interface>cli>md-cli>environment time-display)

## Full Context

```
configure system management-interface cli md-cli environment time-display
```

## Description

This command configures whether the time is displayed in coordinated Universal Time (UTC) or local time (as configured in **config>system>time**).

## Default

```
time-display local
```

## Parameters

### local

Specifies that the local time zone is used.

### utc

Specifies that UTC is used.

## Platforms

All

## 24.107 time-exceeded

## time-exceeded

### Syntax

**time-exceeded** [*number seconds*]

**no time-exceeded**

### Context

**[Tree]** (config>service>ies>if>ipv6>icmp6 time-exceeded)

### Full Context

configure service ies interface ipv6 icmp6 time-exceeded

### Description

This command specifies whether time-exceeded ICMP messages should be sent. When enabled, ICMPv6 time-exceeded messages are generated by this interface.

When disabled, ICMPv6 time-exceeded messages are not sent.

The **no** form of this command reverts to the default.

### Default

time-exceeded 100 10

### Parameters

#### *number*

Specifies the number of time-exceeded ICMP messages are to be issued in the time frame specified by the *seconds* parameter.

**Values** 10 to 2000

#### *seconds*

Specifies the time frame, in seconds, that is used to limit the number of time-exceeded ICMP message to be issued.

**Values** 1 to 60

### Platforms

All

## time-exceeded

### Syntax

**time-exceeded** [*number seconds*]

configure li log log-id time-format
```

## Description

This command specifies whether the time should be displayed in local or Coordinated Universal Time (UTC) format.

## Default

time-format utc

## Parameters

### local

Specifies that timestamps are written in the system's local time.

### utc

Specifies that timestamps are written using the UTC value. This was formerly called Greenwich Mean Time (GMT) and Zulu time.

## Platforms

All

## time-format

### Syntax

```
time-format {local | utc}
```

### Context

[\[Tree\]](#) (config>log>log-id time-format)

### Full Context

```
configure log log-id time-format
```

### Description

This command specifies whether the time should be output in local or Coordinated Universal Time (UTC) format in the following event log locations:

- in the syslog `TIMESTAMP` field
- in the timestamp of log events inside log files on local storage devices

The timestamp in the filename of event log files is not affected by this command.

The output of **show log log-id** and the output of YANG state under `/state/log/log-id` are not affected by this command. See the **environment time-display** command.

### Default

```
time-format utc
```

### Parameters

#### local

Specifies that timestamps are written in the system's local time.

#### utc

Specifies that timestamps are written using the UTC value. This was formerly called Greenwich Mean Time (GMT) and Zulu time.

## 24.110 time-range

## time-range

### Syntax

**time-range daily start** *start-time* **end** *end-time* [**on** *day* [*day*]]

**time-range weekly start** *start-time* **end** *end-time*

**no time-range**

### Context

**[Tree]** (config>app-assure>group>tod-override time-range)

### Full Context

configure application-assurance group policer tod-override time-range

## Description

This command configures up to seven time-ranges applicable to a particular override-id. The time-range can be configured as daily or weekly policies.

When using a daily override the operator can select which days during the week from Sunday to Saturday it is applicable along with the start/end hour/min time range repeated over these days.

When using a weekly override the operator can select between which days in the week the policy start up to the hours/min for both start day and end day.

## Default

no time-range

## Parameters

### daily

Schedule the override as a daily occurrence.

### weekly

Schedule the override as a weekly occurrence.

### Values

start-time	daily	<hh>:<mm>
	weekly	<day>,<hh>:<mm> <hh> : 0..23 <mm> : 0   15   30   45
end-time	daily	<hh>:<mm>
	weekly	<day>,<hh>:<mm> <hh> 0..23 <mm> 0   15   30   45
day		sunday   monday   tuesday   wednesday   thursday   friday   saturday

[\[Tree\]](#) (config>router>mpls>lsp-self-ping timeout)

## Full Context

configure router mpls lsp-self-ping timeout

## Description

This command configures a timeout value for LSP Self Ping. The LSP Self Ping timer is started when the RESV message is received for an LSP. The system then periodically sends LSP Self Ping packets until the timer expiry or the receipt of the first LSP Self Ping reply, whichever comes first. If the timeout expires before an LSP Self Ping packet is received, then the configured **timeout-action** is performed.

The **no** form of this command reverts to the default value.

## Default

timeout 300

## Parameters

### *seconds*

Specifies the value, in seconds, of the fast retry timer for a secondary path.

**Values** 3 to 3600

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## timeout

### Syntax

**timeout** *seconds*

### Context

[\[Tree\]](#) (config>system>file-trans-prof timeout)

### Full Context

configure system file-transmission-profile timeout

### Description

This command specifies timeout value in seconds for transport protocol. The timeout is the maximum waiting time to receive any data from the server (e.g., FTP or HTTP server).

### Default

timeout 60

### Parameters

***seconds***

Specifies the connection timeout (in seconds) for the file transmission.

**Values** 1 to 3600

### Platforms

All

## timeout

### Syntax

**timeout** [**sec** *seconds*] [**min** *minutes*]

**no timeout**

### Context

[\[Tree\]](#) (config>aaa>isa-radius-plcy>servers timeout)

### Full Context

configure aaa isa-radius-policy servers timeout

### Description

This command configures the number of seconds the router waits for a response from a RADIUS server.

The **no** form of the command reverts to the default value.

## Default

timeout sec 5

## Parameters

### *seconds*

Specifies the wait for a response from a RADIUS server, in seconds.

### *minutes*

Specifies the wait for a response from a RADIUS server, in minutes.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## timeout

## Syntax

timeout *timeout*

no timeout

## Context

[\[Tree\]](#) (config>test-oam>ldp-treetrace>path-discovery timeout)

## Full Context

configure test-oam ldp-treetrace path-discovery timeout

## Description

This command configures the time the node waits for the response to an LSP Trace message discovering the path of an LDP FEC before it declares failure. After consecutive failures equal to the **retry-count** parameter, the node gives up.

The **no** form of this command resets the timeout to its default value.

## Default

timeout 30

## Parameters

### *timeout*

Specifies the *timeout* parameter, in seconds, within a range of 1 to 60, expressed as a decimal integer.

**Values** 1 to 60

## Platforms

All

## timeout

### Syntax

**timeout** *timeout*

**no timeout**

### Context

**[Tree]** (config>test-oam>ldp-treetrace>path-probing timeout)

### Full Context

configure test-oam ldp-treetrace path-probing timeout

### Description

This command configures the time the node waits for the response to an LSP Ping message probing the path of an LDP FEC before it declares failure. After consecutive failures equal to the **retry-count** parameter, the node gives up.

The **no** form of this command resets the time out to its default value.

### Default

timeout 1

### Parameters

***timeout***

Specifies the timeout parameter, in minutes, expressed as a decimal integer.

**Values** 1 to 3

### Platforms

All

## timeout

### Syntax

**timeout** *timeout*

**no timeout**

### Context

## Full Context

```
configure saa test type-multi-line lsp-ping sr-policy timeout
configure saa test type-multi-line lsp-ping timeout
```

## Description

This command configures the number, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the last probe for a specific test. Upon the expiration of the time out, the test is marked complete and no more packets are processed for any of the request probes.

The **no** form of this command reverts to the default value.

## Default

```
timeout 5
```

## Parameters

### *timeout*

Specifies the timeout value in seconds.

**Values** 1 to 10

**Default** 5

## Platforms

All

## timeout

## Syntax

```
timeout timeout
```

```
no timeout
```

## Context

[\[Tree\]](#) (config>saa>test>type-multi-line>lsp-trace>sr-policy timeout)

## Full Context

```
configure saa test type-multi-line lsp-trace sr-policy timeout
```

## Description

This command configures the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response is not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

The **no** form of this command reverts to the default value.

### Default

timeout 3

### Parameters

#### *timeout*

Specifies the timeout value in seconds.

**Values** 1 to 60

**Default** 3

### Platforms

All

## timeout

### Syntax

**timeout** [*seconds*]

**no timeout**

### Context

[\[Tree\]](#) (config>filter>redirect-policy>dest>ping-test timeout)

### Full Context

configure filter redirect-policy destination ping-test timeout

### Description

Specifies the amount of time, in seconds, that is allowed for receiving a response from the far-end host. If a reply is not received within this time the far-end host is considered unresponsive.

### Default

timeout 1

### Parameters

#### *seconds*

Specifies the amount of time, in seconds, that is allowed for receiving a response from the far end host.

**Values** 1 to 60

### Platforms

All

## timeout

### Syntax

**timeout** *seconds*

**no timeout**

### Context

[\[Tree\]](#) (config>vrrp>vrrp-policy-id>priority-event>host-unreachable timeout)

### Full Context

configure vrrp vrrp-policy-id priority-event host-unreachable timeout

### Description

This command defines the time, in seconds, that must pass before considering the far-end IP host unresponsive to an outstanding ICMP echo request message.

The **timeout** value is not directly related to the configured **interval** parameter. The **timeout** value may be larger, equal, or smaller, relative to the **interval** value.

If the **timeout** value is larger than the **interval** value, multiple ICMP echo request messages may be outstanding. Every ICMP echo request message transmitted to the far end host is tracked individually according to the message identifier and sequence number.

With each consecutive attempt to send an ICMP echo request message, the timeout timer is loaded with the **timeout** value. The timer decrements until:

- an internal error occurs preventing message sending (request unsuccessful)
- an internal error occurs preventing message reply receiving (request unsuccessful)
- a required route table entry does not exist to reach the IP address (request unsuccessful)
- a required ARP entry does not exist and ARP request timed out (request unsuccessful)
- a valid reply is received (request successful)

It is possible for a required ARP request to succeed or timeout after the message timeout timer expires. In this case, the message request is unsuccessful.

If an ICMP echo reply message is not received prior to the **timeout** period for a given ICMP echo request, that request is considered to be dropped and increments the consecutive message drop counter for the priority event.

If an ICMP echo reply message with the same sequence number as an outstanding ICMP echo request message is received prior to that message timing out, the request is considered successful. The consecutive message drop counter is cleared and the request message no longer is outstanding.

If an ICMP Echo Reply message with a sequence number equal to an ICMP echo request sequence number that had previously timed out is received, that reply is silently discarded while incrementing the priority event reply discard counter.

The **no** form of the command reverts to the default value.

**Default**

timeout 1

**Parameters****seconds**

The number of seconds before an ICMP echo request message is timed out. Once a message is timed out, a reply with the same identifier and sequence number is discarded.

**Values** 1 to 60

**timeout****Syntax**

**timeout** *timeout*

**no timeout**

**Context**

[\[Tree\]](#) (config>service>sdp>keep-alive timeout)

### Parameters

*seconds*

Specifies the number of seconds the router waits for a response from a RADIUS server, expressed as a decimal integer.

**Values** 1 to 90

### Platforms

All

## timeout

### Syntax

**timeout** *seconds*

**no timeout**

### Context

[\[Tree\]](#) (config>test-oam>icmp>ping-template timeout)

### Full Context

configure test-oam icmp ping-template timeout

## Description

This command configures the time the function waits before declaring an ICMP echo request packet is lost. This is the timer used to time out the interval transmitted packets. The timeout can be equal to or lower than the interval but not higher.

The **no** form of this command reinstates the default value for timeout.

## Default

timeout 5

## Parameters

### *seconds*

Specifies the time, in seconds, before declaring an ICMP echo request being lost.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 24.113 timeout-action

### timeout-action

## Syntax

**timeout-action** *action*

**no timeout-action**

## Context

[\[Tree\]](#) (config>router>l2tp>tunnel-selection-blacklist timeout-action)

[\[Tree\]](#) (config>service>vprn>l2tp>tunnel-selection-blacklist timeout-action)

## Full Context

configure router l2tp tunnel-selection-blacklist timeout-action

configure service vprn l2tp tunnel-selection-blacklist timeout-action

## Description

This command defines an action that is executed on the entity (peer/tunnel) in the denylist once the entity becomes eligible for selection again.

The **no** form of this command reverts to the default.

## Default

timeout-action remove-from-blacklist

## Parameters

### *action*

Specifies the Action to be taken when a tunnel or peer has been in the denylist for the max-period of time.

**Values** **remove-from-blacklist** — The peer or tunnel in the denylist is removed completely from the denylist and made eligible for the selection process once the max-time expires. In this mode of operation, multiple new sessions can be mapped into the same, newly released tunnel from the denylist. The first such session will try to setup the tunnel, while the other is buffered until the tunnel establishment process is completed. In case that the tunnel remains unavailable, it is placed in the denylist again. Consequently, all new sessions are re-negotiated over an alternate tunnel.

**try-one-session** — Once the max-time expired, the peer or tunnel in the denylist is made available for selection only to a single new session request. Only upon successful tunnel establishment will the incoming new sessions be eligible to be mapped into this tunnel. This behavior will avoid session establishment delays in case that the tunnel just removed from the denylist is still unavailable.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## timeout-action

### Syntax

**timeout-action** {**retry** | **switch**}

**no timeout-action**

### Context

[\[Tree\]](#) (config>router>mpls>lsp-self-ping timeout-action)

### Full Context

configure router mpls lsp-self-ping timeout-action

### Description

This command configures an action that the router takes when the timeout LSP self ping timeout timer expires. The lsp-self-ping timer is started when the RESV is received for an LSP. If the retry is configured and the timeout expires before an LSP self ping packet is received, then the system tears down the candidate path and goes back to CSPF for a new path. If the switch is configured and the timeout expires before an LSP self ping packet is received, then the system switches to the candidate path.

The **no** form of this command reverts to the default value.

**Default**

timeout-action retry

**Parameters*****retry***

Specifies to retry the candidate path when the timeout expires.

***switch***

Specifies to switch to the candidate path when the timeout expires.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure service vprn ripng timers

configure service vprn rip timers

```
configure service vprn rip group neighbor timers
configure service vprn ripng group timers
configure service vprn ripng group neighbor timers
configure service vprn rip group timers
```

## Description

This command configures the values for the update, timeout, and flush timers:

- **update timer**

Determines how often RIP updates are sent.

- **timeout timer**

If a router is not updated by the time the timer expires, the route is declared invalid, but maintained in the RIP database.

- **flush timer**

Determines how long a route is maintained in the RIP database, after it has been declared invalid. Once this timer expires it is flushed from the RIP database completely.

The **no** form of this command resets all timers to their default values of 30, 180, and 120 seconds respectively.

## Default

no timers

## Parameters

### *update*

The RIP update timer value in seconds.

**Values** 1 to 600

**Default** 30

### *timeout*

The RIP timeout timer value in seconds.

**Values** 1 to 1200

**Default** 180

### *flush*

The RIP flush timer value in seconds.

**Values** 1 to 1200

**Default** 120

configure test-oam link-measurement measurement-template twamp-light timestamp-format

#### Description

This command configures the format of the timestamp used in the TWAMP Light PDU. This configuration places the requested timestamp format in the packet using the appropriate epoch. This is unrelated to any time distribution protocol being used to synchronize time between clocks.

**Default**

timestamp-format ntp

**Parameters*****parameter***

Specifies the timestamp format to be used in the TWAMP Light PDU.

**Values** ntp, ptp**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 24.119 timing

### timing

**Syntax****timing** *frames-per-delta-t frames* **consec-delta-t** *deltas* **chli-threshold** *threshold***no timing****Context**[\[Tree\]](#) (config>oam-pm>session>ethernet>lmm>availability timing)**Full Context**

configure oam-pm session ethernet lmm availability timing

**Description**

This command defines various availability parameters for LMM availability testing. This command does not define the probe interval. Validation occurs when the LMM test is activated using the **no shutdown** command. The maximum size of the availability window cannot exceed 100 seconds (100 000 milliseconds). LMM test activation fails if the availability window exceeds the maximum value.

The **no** form of this command restores the default values for all timing parameters, and uses those values to compute availability and set the loss frequency.

**Parameters*****frames***

Specifies the number of SLM frames that define the size of the small measurement window. Each delta-t is marked as a high-loss interval or non-high-loss interval based on the **flr-threshold**. The size of the delta-t measurement is the product of the number of frames and the interval.

**Values** 1 to 50

**Default** 10

### **deltas**

Specifies the number of consecutive delta-t measurement intervals that make up the sliding window over which availability and unavailability determined. Transitions from one state to another occurs when the **consec-delta-t** are in a new state. The sliding window cannot exceed 100 seconds.

**Values** 2 to 10

**Default** 10

### **threshold**

Specifies the number of consecutive unavailable delta-t intervals that, when reached or exceeded, increments the CHLI counter. A CHLI counter is an indication that the sliding window is available but has crossed a threshold of consecutive unavailable delta-t intervals. A CHLI can only be incremented once during a sliding window and, by default, is incremented during times of availability.

**Values** 1 to 9

**Default** 5

## **Platforms**

All

## **timing**

### **Syntax**

**timing** *frames-per-delta-t frames consec-delta-t deltas interval milliseconds chli-threshold threshold*  
**no timing**

### **Context**

[\[Tree\]](#) (config>oam-pm>session>ethernet>slm timing)

### **Full Context**

configure oam-pm session ethernet slm timing

### **Description**

This command defines various availability parameters and the probe spacing (interval) for the SLM frames. The maximum size of the availability window cannot exceed 10 s (10 000 ms).

The **no** form of this command installs the default values for all timing parameters and use those values to compute availability and set the SLM frequency. If an SLM test is in the **no shutdown** state, it always has timing parameters, default or operator configured.

## Parameters

### *frames*

Specifies the of SLM frames that define the size of the delta-t (small measurement window). Each delta-t is marked as available or unavailable based on the flr-threshold. The size of the delta-t measurement is the product of the number of frames and the interval.

**Values** 1 to 50

**Default** 10

### *deltas*

Specifies the number of consecutive delta-t small measurement intervals that make up the sliding window over which availability and unavailability is determined. Transitions from one state to another occurs when the consec-delta-t is in a new state.

**Values** 2 to 10

**Default** 10

### *milliseconds*

Specifies the number of milliseconds between the transmission of the SLM frames. By design, the default value for the SLM interval is different than the default interval for DMM.

**Values** 50, 100, 200, 300, 400, 500, 600, 700, 800, 900, 1000

**Default** 100

### *threshold*

Specifies the number of consecutive high loss intervals (unavailable delta-t) that when equal to or exceeded increments the CHLI counter. A CHLI counter is an indication that the sliding window is available but has crossed a threshold consecutive of unavailable delta-t intervals. A CHLI can only be incremented once during a sliding window and, by default, it is only incremented during times of availability.

**Values** 1 to 9

**Default** 5

## Platforms

All

## timing

## Syntax

**timing** *frames-per-delta-t frames consec-delta-t deltas chli-threshold threshold*

**no timing**

## Context

[Tree] (config>oam-pm>session>ip>twamp-light>loss timing)

## Full Context

```
configure oam-pm session ip twamp-light loss timing
```

## Description

This command defines various availability parameters but not the probe interval. A single TWAMP-Light frame is used to collect both delay and loss metrics; the interval is common to both and as such not unique per metric type. Any TWAMP light test that is attempting to become active validates the configuration of the timing parameter regardless of which statistics are being recorded.

The **no** form of this command restores the default values for all timing parameters and use those values to compute availability and set the loss frequency.

## Default

```
timing frames-per-delta-t 1 consec-delta-t 10 chli-threshold 5
```

## Parameters

### *frames*

Defines the size of the small measurement window. Each delta-t is marked as available or unavailable based on the flr-threshold. The size of the delta-t measurement is the product of the number of frames and the interval. This value defaults to a different value than single probe per metric approaches.

**Values** 1 to 50

**Default** 1

### *deltas*

Specifies the number of consecutive delta-t small measurement intervals that make up the sliding window over which availability and unavailability are determined. Transitions from one state to another occurs when the consec-delta-t are now in a new state. The sliding window cannot exceed 100 seconds.

**Values** 2 to 10

**Default** 10

### *threshold*

Specifies the number of consecutive high loss intervals (unavailable delta-t) that when equal to or exceeded increments the CHLI counter. A CHLI counter is an indication that the sliding window is available but has crossed a threshold consecutive of unavailable delta-t intervals. A CHLI can only be incremented once during a sliding window and, by default, is only incremented during times of availability.

**Values** 1 to 9

**Default** 5

[\[Tree\]](#) (config service vprn log syslog tls-client-profile)

### Full Context

configure log syslog tls-client-profile

configure service vprn log syslog tls-client-profile

### Description

This command specifies the Transport Layer Security (TLS) client profile used to encrypt syslog communications. When configured, syslog messages are sent using TLS.

Any change to this command results in a brief interruption of the event log, which may cause the loss of a few syslog messages.

The **no** form of this command removes TLS encryption of syslog communications and sends syslog messages over UDP.

### Parameters

***tls-client-profile***

Specifies the name of a TLS profile configured in the **config>system>security>tls** context, up to 32 characters.

### Platforms

All

## tls-client-profile

### Syntax

**tls-client-profile** *profile-name*

**no tls-client-profile**

### Context

[\[Tree\]](#) (config router pcep pcc peer tls-client-profile)

### Full Context

configure router pcep pcc peer tls-client-profile

## Description

This command configures a TLS client profile on the PCC. When the TLS profile is configured, the PCC tries to establish a PCEP connection with the PCE over TLS. Because SR OS supports a strict TLS-only mode, both the PCE and PCC must support TLS. If a TLS failure occurs, the connection over TLS is closed and a new connection is retried within 60 seconds.

The **no** form of this command removes TLS encryption from the communication between this PCC and the PCE.

## Default

no tls-client-profile

## Parameters

### *profile-name*

Specifies the TLS client profile name, up to 32 characters.

## Platforms

All

## 24.122 tls-extension

### tls-extension

## Syntax

## Full Context

configure application-assurance group http-enrich tls-extension

## Description

Commands in this context configure the TLS extension field name.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.123 tls-profile

## tls-profile

### Syntax

**tls-profile** *tls-profile-name*

**no tls-profile**

### Context

[\[Tree\]](#) (config system security ldap server tls-profile)

### Full Context

configure system security ldap server tls-profile

### Description

This command attaches a TLS client profile to the LDAP client. The parameter in the TLS profile is used to encrypt the LDAP connection to the server. Each LDAP server can use its own TLS profile.

When a TLS profile is assigned, the LDAP application will send encrypted PDUs from the client to the LDAP server. If TLS is operationally down, the LDAP application should not send any PDUs.

The **no** form of this command removes the TLS profile from LDAP and disables the TLS encryption from LDAP.

### Parameters

***tls-profile-name***

Specifies the TLD profile for encryption.

### Platforms

All

## 24.124 tls-re-negotiate-timer

## tls-re-negotiate-timer

### Syntax

**tls-re-negotiate-timer** *timer-min*

**no tls-re-negotiate-timer**

### Context

[\[Tree\]](#) (config>system>security>tls>server-tls-profile tls-re-negotiate-timer)

### Full Context

configure system security tls server-tls-profile tls-re-negotiate-timer

## Description

This command configures the timed interval after which the server is triggered to send a Hello request message to all clients and force a renegotiation of the symmetric encryption key. When an interval of 0 is configured, the server will never send a hello request message.

## Default

tls-re-negotiate-timer 0

## Parameters

### *timer-min*

Specifies the interval, in minutes, after which the server is triggered to send a Hello request message.

**Values** 0 to 65000

## Platforms

All

## 24.125 tls-server-profile

### tls-server-profile

## Syntax

**tls-server-profile** *name*

**no** **tls-server-profile**

## Context

[\[Tree\]](#) (config system grpc tls-server-profile)

## Full Context

configure system grpc tls-server-profile

## Description

This command adds a configured TLS server profile to the gRPC session. The TLS server is used for encryption of the gRPC session. gRPC will not transmit any PDUs if there is a TLS server profile assigned to it and the TLS connection is down.

The **no** form of this command removes the specified TLS server profile from the gRPC session.

## Parameters

### *name*

Specifies the name of the TLS server profile configured under the **config>system>security>tls** context.

## Platforms

All

## tls-server-profile

### Syntax

**tls-server-profile** *name*

**no** **tls-server-profile**

### Context

[\[Tree\]](#) (config router pcep pce tls-server-profile)

### Full Context

configure router pcep pce tls-server-profile

### Description

This command configures a TLS server profile on the PCE. When a TLS server profile is configured, the PCE accepts TLS handshakes from the PCC. Because SR OS supports a strict TLS mode only, both the PCE and the PCC must support TLS. If a TLS failure occurs, the connection over TLS is closed and a new connection is retried within 60 seconds.

The **no** form of this command removes the specified TLS server profile.

### Default

no **tls-server-profile**

### Parameters

*name*

Specifies the name of the TLS server profile, up to 32 characters.

## Platforms

VSR-NRC

## 24.126 tls-wait-timer

to

## Syntax

**to** [*ip-address* | **node-id** [*a.b.c.d* | 1...4294967295]]

## Context

[\[Tree\]](#) (config>router>mpls>lsp to)

## Full Context

configure router mpls lsp to

## Description

This command specifies the IP address or MPLS-TP node-id of the egress router for the LSP. This command is mandatory to create an LSP.

An IP address for which a route does not exist is allowed in the configuration. If the LSP signaling fails because the destination is not reachable, an error is logged and the LSP operational status is set to down.

For a non MPLS-TP LSP, the **to** *ip-address* can be an IP address of a network IP interface, the system interface, or a loopback interface of the egress router. When used in a SDP, if the LSP **to** address does not match the SDP address, the LSP is not included in the SDP definition.

For an MPLS-TP LSP, the **to** *node-id* may be either in 4-octet IPv4 address format, or a 32-bit unsigned integer. This command is mandatory to create an MPLS-TP LSP. A value of zero is invalid. This **to** address is used in the MPLS-TP LSP ID, and the MPLS-TP MEP ID for the LSP.

## Default

no default

## Parameters

### *ip-address*

Specifies the IP address of the egress router. When the LSP type is **sr-te**, then an IPv6 address can be used.

<b>Values</b>	ipv4-address — a.b.c.d
	ipv6-address — x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x — 0 to FFFF (hexadecimal)
	d — 0 to 255 (decimal)

### **node-id a.b.c.d. | 1...4294967295**

4-octet IPv4 formatted or unsigned 32-bit integer MPLS-TP node-id of the egress router.

## Platforms

All

to

## Syntax

**to** *ip-address*

## Context

[\[Tree\]](#) (config>router>mpls>static-lsp to)

## Full Context

configure router mpls static-lsp to

## Description

This command specifies the IP address of the egress router for the static LSP. When creating an LSP this command is required. The **to** IP address may be the address of a local interface, the system IP interface, or of a loopback interface of the egress router. When used in a SDP and the **to** address does not match the far-end SDP address, the LSP is not included in the SDP definition.

## Parameters

### *ip-address*

Specifies the system IP address of the egress router.

## Platforms

All

to

## Syntax

**to memory** [*size*]

**to netconf** [*size*]

**to session**

**to snmp** [*size*] [**send-using-vprn** *service-id*]

## Context

[\[Tree\]](#) (config>li>log>log-id to)

## Full Context

configure li log log-id to

## Description

Commands in this context configure the destination type for the event log.

The source of the data stream must be specified in the **from** command prior to configuring the destination with the **to** command.

The **to** command cannot be modified or re-entered. If the destination or maximum size of a memory log, NETCONF log, or SNMP log needs to be modified, the log ID must be removed and then re-created.

## Parameters

### **memory**

Specifies that log events are directed to a memory file. A memory file is a circular buffer; when the file is full, each new entry replaces the oldest entry in the log. If the optional size parameter is not configured, the default value is used.

**Default** 100

### **netconf**

Specifies that log events are directed to a NETCONF session as notifications. A NETCONF client can subscribe to a NETCONF log using the configured **netconf-stream** *stream-name* for the log in a subscription request. One or more NETCONF sessions can subscribe to a NETCONF log or stream.

### **session**

Specifies that log events are directed to the current console or telnet session. This command is only valid for the duration of the session. When the session is terminated, the **to session** configuration is removed. A log ID with a **session** destination is saved in the configuration file but the **to session** part is not stored.

### **snmp**

Specifies that log events are directed to the **snmp-trap-group** associated with the log ID. A local circular memory log is maintained for SNMP logs.

### **size**

The size parameter indicates the number of events that can be stored into memory.

**Default** 100

**Values** 50 to 1024

### **send-using-vprn service-id**

Configures the lawful intercept (LI) SNMP notifications to transmit in a VPRN. The parameter is the service ID of the VPRN. This configuration is useful when doing management of LI using a VPRN.

The specified VPRN service must exist. After an LI log is configured using the **send-using-vprn** command, the VPRN service cannot be deleted without removing the LI log ID first.

When unconfigured, the outgoing routing instance of LI SNMP notifications is determined by the **configure log route-preference** command.

## **Platforms**

All

to

## **Syntax**

**to** *ipv4-address*

**no to**

## Context

[\[Tree\]](#) (config>oam-pm>session>mpls>lsp>rsvp-auto to)

## Full Context

configure oam-pm session mpls lsp rsvp-auto to

## Description

This command specifies an IPv4 address used (with the LSP template) to identify the LSP to be tested.

One of three mandatory configuration statements that are required to identify automatically created RSVP LSPs, using **config>router>mpls>lsp-template**. The **config>router>mpls>auto-lsp>lsp-template** links three distinct functions, the **config>router>policy-options>prefix-list**, **config>router>policy-options>policy-statement>entry>from** and the **config>router>mpls>lsp-template**. The **to** address is the same address configured as the **from** address for the **config>router>policy-options>policy-statement>entry>from**. The required identifiers are **from**, **lsp-template** and **to**, all under this node.

## Parameters

### *ipv4-address*

Specifies the IPv4 address.

**Values** a.b.c.d

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

to

## Syntax

**to file** *file-id*

## Context

[\[Tree\]](#) (config>log>accounting-policy to)

## Full Context

configure log accounting-policy to

## Description

This command specifies the destination for the accounting records selected for the accounting policy.

## Parameters

### *file-id*

Specifies the destination for the accounting records selected for this destination. The characteristics of the file ID must have already been defined in the **config>log>file** context. A file ID can only be used once.

The file is generated when the file policy is referenced. This command identifies the type of accounting file to be created. The file definition defines its characteristics.

If the **to** command is executed while the accounting policy is in operation, then it becomes active during the next collection interval.

**Values** 1 to 99

## Platforms

All

to

## Syntax

[no] to

## Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry to)

## Full Context

configure router policy-options policy-statement entry to

## Description

This command creates the context to configure export policy match criteria based on a route's destination or the protocol into which the route is being advertised.

If no condition is specified, all route destinations are considered to match.

The **to** command context only applies to export policies. If it is used for an import policy, match criteria is ignored.

The **no** form of this command deletes export match criteria for the route policy statement entry.

## Platforms

All

## Syntax

**to cli** [*size*]

**to console**

**to file** *log-file-id*

**to memory** [*size*]

**to netconf** [*size*]

**to session**

**to snmp** [*size*]

**to syslog** *syslog-id*

## Context

[Tree] (config>log>log-id to)

## Full Context

configure log log-id to

## Description

This command specifies a destination for the log event data.

The source of the data stream must be specified in the **from** command before configuring the destination with the **to** command.

The **to** command cannot be modified or re-entered. If the destination or maximum size of an SNMP or memory log needs to be modified, the log ID must be removed and then recreated.

## Parameters

### cli

Specifies that log events are directed to any subscribed CLI session. Subscribe to a CLI log from within a CLI session using the **tools>perform>log>subscribe-to log-id** *log-id* command. Events are sent to the CLI session for the duration of that CLI session, or until an **unsubscribe-from** command is issued. A local circular memory log is maintained for CLI logs.

### console

Specifies that log events events are directed to the console port. If the console is not connected, all the entries are dropped.

### file *log-file-id*

Specifies that log events are directed to a file with the specified *log-file-id*. The characteristics of the *log-file-id* referenced in this parameter must have already been defined in the **config>log>file** *file-id* context. When the *file-id* location parameter is modified, log files are not written to the new location until a rollover occurs or the log is manually cleared. A rollover can be forced by using the **clear>log** command. Subsequent log entries are then written to the new location. If a rollover does not occur or the log is not cleared, the old location continues to be used.

**Values** 1 to 99, *name* (up to 64 characters max)

### memory

Specifies that log events are directed to a memory file. A memory file is a circular buffer; when the file is full, each new entry replaces the oldest entry in the log. If the optional size parameter is not configured, the default value is used.

**Default** 100

### netconf

Specifies that log events are directed to a NETCONF session as notifications. A NETCONF client can subscribe to a NETCONF log using the configured **netconf-stream**

*stream-name* for the log in a subscription request. One or more NETCONF sessions can subscribe to a NETCONF log or stream.

#### **session**

Specifies that log events are directed to the current console or telnet session. This command is only valid for the duration of the session. When the session is terminated, the **to session** configuration is removed. A log ID with a **session** destination is saved in the configuration file but the **to session** part is not stored.

#### **size**

Specifies the maximum size of the log data destination, in bytes.

**Values** 50 to 3000

#### **snmp**

Specifies that log events are directed to the **snmp-trap-group** associated with the log ID. A local circular memory log is maintained for SNMP logs.

#### **syslog syslog-id**

Specifies that log events are directed to the specified syslog collector. To remain consistent with the standards governing syslog, messages to syslog are truncated to 1024 bytes. The characteristics of the *syslog-id* referenced in this parameter must have already been defined in the **config>log>syslog syslog-id** context.

**Values** 1 to 10

### **Platforms**

All

configure subscriber-mgmt local-user-db ppp host to-client-options

**Description**

Commands in this context configure DHCP options to send to the client.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 24.133 to-sap

to-sap

**Syntax**

**to-sap** *sap-id*

**no to-sap**

**Context**

[\[Tree\]](#) (config>service>vpls>sap>snooping>mvr to-sap)

**Full Context**

configure service vpls sap snooping mvr to-sap

**Description**

In some situations, the multicast traffic should not be copied from the MVR VPLS to the SAP on which the IGMP message was received (standard MVR behavior) but to another SAP.

This command configures the SAP to which the multicast data needs to be copied.

The **no** form of this command reverts to the default value.

**Parameters**

*sap-id*

Specifies the SAP to which multicast channels should be copied.

## to-sap

### Syntax

**to-sap** *sap-id*

**no to-sap**

### Context

**[Tree]** (config>service>vpls>sap>igmp-snooping>mvr to-sap)

### Full Context

configure service vpls sap igmp-snooping mvr to-sap

### Description

In some situations, the multicast traffic should not be copied from the MVR VPLS to the SAP on which the IGMP message was received (standard MVR behavior) but to another SAP.

This command configures the SAP to which the multicast data needs to be copied.

### Default

no to-sap

### Parameters

*sap-id*

Specifies the SAP to which multicast channels should be copied

### Platforms

All

## 24.134 to-server-options

## to-server-options

### Syntax

**[no] to-server-options**

### Context

**[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host to-server-options)

### Full Context

configure subscriber-mgmt local-user-db ipoe host to-server-options

**Description**

Commands in this context configure DHCP options to send to the server.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 24.135 to-subscriber

to-subscriber

**Syntax**

**to-subscriber**

**Context**

[\[Tree\]](#) (config>isa>aa-grp>qos>egress to-subscriber)

**Full Context**

configure isa application-assurance-group qos egress to-subscriber

**Description**

Commands in this context configure Quality of Service for this application assurance group to-subscriber logical port, traffic destined to AA subscribers and entering an application assurance engine.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.136 tod-override

tod-override

**Syntax**

**tod-override** *tod-override-id* [**create**]

**no tod-override** *tod-override-id*

**Context**

[\[Tree\]](#) (config>app-assure>group>policer tod-override)

**Full Context**

configure application-assurance group policer tod-override

## Description

This commands creates a time of day override policy for a given policer. Up to 8 overrides can be configured per policer. Rate/mbs/cbs/flow-rate/flow-count configured in each override-id will override the default policer values at the specified time of day configured in the override.

## Parameters

### *tod-override-id*

Specifies the time of day override ID.

**Values** 1 to 255

### **create**

Keyword used to create the time of day override policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.137 tolerance

### tolerance

## Syntax

**tolerance** [*seconds* | **forever**]

**no tolerance**

## Context

[\[Tree\]](#) (config>system>security>keychain>direction>bi>entry tolerance)

[\[Tree\]](#) (config>system>security>keychain>direction>uni>receive>entry tolerance)

## Full Context

configure system security keychain direction bi entry tolerance

configure system security keychain direction uni receive entry tolerance

## Description

This command configures the amount of time that an eligible receive key should overlap with the active send key or to never expire.

## Parameters

### *seconds*

Specifies the duration that an eligible receive key overlaps with the active send key.

**Values** 0 to 4294967294 seconds

**forever**

Specifies that an eligible receive key overlap with the active send key forever.

**Platforms**

All

## 24.138 tos-marking-state

### tos-marking-state

**Syntax**

**tos-marking-state** {trusted | untrusted}

**no tos-marking-state**

**Context**

**[Tree]** (config>service>ies>sub-if>grp-if tos-marking-state)

**[Tree]** (config>service>vprn>sub-if>grp-if tos-marking-state)

**[Tree]** (config>service>ies>if tos-marking-state)

**[Tree]** (config>service>vprn>interface tos-marking-state)

**Full Context**

configure service ies subscriber-interface group-interface tos-marking-state

configure service vprn subscriber-interface group-interface tos-marking-state

configure service ies interface tos-marking-state

configure service vprn interface tos-marking-state

**Description**

This command is used to alter the default trusted state to a non-trusted state. When unset or reverted to the trusted default, the ToS field are not remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set, in which case the egress network interface treats all VPRN and network IP interface as untrusted.

When the ingress interface is set to untrusted, all egress network IP interfaces remark IP packets received on the network interface according to the egress marking definitions on each network interface. The egress network remarking rules also apply to the ToS field of IP packets routed using IGP shortcuts (tunneled to a remote next-hop). However, the tunnel QoS markings are always derived from the egress network QoS definitions.

Egress marking and remarking is based on the internal forwarding class and profile state of the packet once it reaches the egress interface. The forwarding class is derived from ingress classification functions. The profile of a packet is either derived from ingress classification or ingress policing.

The default marking state for network IP interfaces is trusted. This is equivalent to declaring no tos-marking-state on the network IP interface. When undefined or set to tos-marking-state trusted, the trusted

state of the interface will not be displayed when using `show config` or `show info` unless the `detail` parameter is given. The **save config** command will not store the default `tos-marking-state` trusted state for network IP interfaces unless the `detail` parameter is also specified.

The **no** form of this command restores the trusted state to a network IP interface. This is equivalent to executing the `tos-marking-state trusted` command.

## Default

`tos-marking-state trusted`

## Parameters

### trusted

The default prevents the ToS field to not be remarked by egress network IP interfaces unless the egress network IP interface has the `remark-trusted` state set.

### untrusted

Specifies that all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- `configure service vprn subscriber-interface group-interface tos-marking-state`
- `configure service ies subscriber-interface group-interface tos-marking-state`

All

- `configure service ies interface tos-marking-state`
- `configure service vprn interface tos-marking-state`

## tos-marking-state

## Syntax

`tos-marking-state {trusted | untrusted}`

`no tos-marking-state`

## Context

[\[Tree\]](#) (config>service>vprn>nw-if tos-marking-state)

## Full Context

`configure service vprn network-interface tos-marking-state`

## Description

This command is used to alter the default trusted state to a non-trusted state. When unset or reverted to the trusted default, the ToS field will not be remarked by egress network IP interfaces unless the egress network IP interface has the `remark-trusted` state set, in which case the egress network interface treats all VPRN and network IP interface as untrusted.

When the ingress interface is set to untrusted, all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface. The egress network remarking rules also apply to the ToS field of IP packets routed using IGP shortcuts (tunneled to a remote next-hop). However, the tunnel QoS markings are always derived from the egress network QoS definitions. Egress marking and remarking is based on the internal forwarding class and profile state of the packet once it reaches the egress interface. The forwarding class is derived from ingress classification functions. The profile of a packet is either derived from ingress classification or ingress policing.

The default marking state for network IP interfaces is trusted. This is equivalent to declaring no `tos-marking-state` on the network IP interface. When undefined or set to `tos-marking-state trusted`, the trusted state of the interface will not be displayed when using `show config` or `show info` unless the `detail` parameter is given. The **save config** command will not store the default `tos-marking-state trusted` state for network IP interfaces unless the `detail` parameter is also specified.

The **no** `tos-marking-state` command is used to restore the trusted state to a network IP interface. This is equivalent to executing the `tos-marking-state trusted` command.

## Default

`tos-marking-state trusted`

## Parameters

### trusted

The default prevents the ToS field to not be remarked by egress network IP interfaces unless the egress network IP interface has the `remark-trusted` state set.

### untrusted

Specifies that all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface.

## Platforms

All

## tos-marking-state

## Syntax

`tos-marking-state {trusted | untrusted}`

`no tos-marking-state`

## Context

**[Tree]** (config>router>if tos-marking-state)

## Full Context

configure router interface tos-marking-state

## Description

This command is used on a network IP interface to alter the default trusted state to a non-trusted state. When unset or reverted to the trusted default, the ToS field will not be remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set, in which case the egress network interface treats all IES and network IP interface as untrusted. When the ingress network IP interface is set to untrusted, all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface. The egress network remarking rules also apply to the ToS field of IP packets routed using IGP shortcuts (tunneled to a remote next-hop). However, the tunnel QoS markings are always derived from the egress network QoS definitions. Egress marking and remarking is based on the internal forwarding class and profile state of the packet once it reaches the egress interface. The forwarding class is derived from ingress classification functions. The profile of a packet is either derived from ingress classification or ingress policing. The default marking state for network IP interfaces is trusted. This is equivalent to declaring no tos-marking-state on the network IP interface. When undefined or set to tos-marking-state trusted, the trusted state of the interface will not be displayed when using show config or show info unless the detail parameter is given. The **save config** command will not store the default tos-marking-state trusted state for network IP interfaces unless the detail parameter is also specified.

The **no** form of this command is used to restore the trusted state to a network IP interface. This is equivalent to executing the tos-marking-state trusted command.

## Default

tos-marking-state trusted

## Parameters

### trusted

Specifies that the default prevents the ToS field to not be remarked by egress network IP interfaces unless the egress network IP interface has the remark-trusted state set

### untrusted

Specifies that all egress network IP interfaces will remark IP packets received on the network interface according to the egress marking definitions on each network interface.

## Platforms

All

## 24.139 total

total

## Syntax

**total** *percent*

## Context

[\[Tree\]](#) (config>isa>video-group>watermark>session total)

[\[Tree\]](#) (config>isa>video-group>watermark>bandwidth total)

### Full Context

```
configure isa video-group watermark session total
configure isa video-group watermark bandwidth total
```

### Description

This command sets the watermark to trigger the SNMP trap if the combined FCC and RET bandwidth or session exceeds the configured percentage. The bandwidth is the available egress bandwidth of the ISA. The SNMP trap is cleared when the consumption is lowered by 10%. For example, if the system resource of the bandwidth available is 10 Gb/s and the watermark is configured to be 90%, the SNMP trap is raised as the bandwidth exceeds 9 Gb/s (90% of 10 Gb/s). The SNMP trap is cleared when the bandwidth drops below 8.1 Gb/s (10% of 9 Gb/s = 0.9 Gb/s, and 9 Gb/s - 0.9 Gb/s = 8.1 Gb/s). The default value of the watermark is set at 90% of the system resources for both bandwidth and session.

### Default

```
total 90
```

### Parameters

#### *percent*

Specifies the percentage of the system resources per ISA.

**Values** 1 to 99

### Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 24.140 total-capacity

total-capacity

### Syntax

```
total-capacity capacity
no total-capacity
```

### Context

[\[Tree\]](#) (config>mcast-mgmt>chassis-level>plane-capacity total-capacity)

### Full Context

```
configure mcast-management chassis-level per-mcast-plane-capacity total-capacity
```

## Description

This command configures the total multicast plane capacity supported individually by all switch fabric multicast planes.

The multicast plane capacity is determined based on the provisioned line cards and switch fabrics in the chassis.

The **no** form of this command reverts to the default.

## Parameters

### *capacity*

Specifies the multicast plane capacity in Mb/s.

**Values** 2000, 4000, 5250, 8250, 15000, 19000, dynamic (Specifies that multicast plane capacity is determined based on provisioned line cards and switch fabrics in the chassis.)

## Platforms

7450 ESS, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

## 24.141 total-flow-duration

### total-flow-duration

## Syntax

[no] total-flow-duration

## Context

[\[Tree\]](#) (config>log>acct-policy>cr>aa>aa-sub-cntr total-flow-duration)

## Full Context

configure log accounting-policy custom-record aa-specific aa-sub-counters total-flow-duration

## Description

This command includes the total flow duration flow count in the AA subscriber's custom record. This command only applies to the 7750 SR.

The **no** form of this command excludes the total flow duration flow count.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.142 total-flows-completed-count

### total-flows-completed-count

#### Syntax

[no] total-flows-completed-count

#### Context

[\[Tree\]](#) (config>log>acct-policy>cr>aa>aa-sub-cntr total-flows-completed-count)

#### Full Context

configure log accounting-policy custom-record aa-specific aa-sub-counters total-flows-completed-count

#### Description

This command includes the total flows completed count in the AA subscriber's custom record. This command only applies to the 7750 SR.

The **no** form of this command excludes the total flow duration flow count.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.143 tp-tunnel-id-range

### tp-tunnel-id-range

#### Syntax

tp-tunnel-id-range *start-id end-id*

no tp-tunnel-id-range

#### Context

[\[Tree\]](#) (config>router>mpls>mpls-tp tp-tunnel-id-range)

#### Full Context

configure router mpls mpls-tp tp-tunnel-id-range

#### Description

This command configures the range of MPLS tunnel IDs reserved for MPLS-TP LSPs. The maximum difference between the start-id and end-id is 4K.

The tunnel ID referred to here is the RSVP-TE tunnel ID. This maps to the MPLS-TP Tunnel Number. There are some cases where the dynamic LSPs may have caused fragmentation to the number space such that contiguous range [*end-id* – *start-id*] is not available. In these cases, the command will fail.

There are no default values for the *start-id* and *end-id* of the tunnel id range, and they must be configured to enable MPLS-TP.

### Default

no tp-tunnel-id-range

### Parameters

#### *start-id*

Specifies the start ID.

**Values** 1 to 61440

#### *end-id*

Specifies the end ID.

**Values** 1 to 61440

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 24.144 trace

### trace

### Syntax

**trace sap** *sap-id* [**mac** *ieee-address*] [**circuit-id** *circuit-id*] [**remote-id** *remote-id*] [**profile** *trace-profile-name*] [**trace-existing-sessions**] [**max-jobs** *num*] [**name** *trace-name*]

**trace mac** *ieee-address* [**sap** *sap-id*] [**circuit-id** *circuit-id*] [**remote-id** *remote-id*] [**profile** *trace-profile-name*] [**trace-existing-sessions**] [**max-jobs** *num*] [**name** *trace-name*]

**trace circuit-id** *circuit-id* [**profile** *trace-profile-name*] [**trace-existing-sessions**] [**max-jobs** *num*] [**name** *trace-name*]

**trace remote-id** *remote-id* [**profile** *trace-profile-name*] [**trace-existing-sessions**] [**max-jobs** *num*] [**name** *trace-name*]

**no trace** [**sap** *sap-id*] [**mac** *ieee-address*] [{**circuit-id** *circuit-id* | **remote-id** *remoteid*}]

**no trace name** *trace-name*

### Context

[\[Tree\]](#) (debug>call-trace>ipoe trace)

## Full Context

debug call-trace ipoe trace

## Description

This command enables tracing for IPoE sessions specified by the configured parameters. This command can trace a single session or multiple sessions, and can use wildcard characters.

This command can be executed multiple times to start multiple traces. When rules overlap, such as for a wildcard SAP and a specific SAP, the rule that a specific trace is associated with cannot be guaranteed.

The **no** form of this command prevents new traces from being configured and terminates all trace jobs that were previously started using the **trace** command.

## Parameters

### *circuit-id*

Specifies a circuit ID that is used to filter sessions to trace. The *circuit-id* and *remote-id* parameters are mutually exclusive.

### *ieee-address*

Specifies a MAC address that is used to identify a session to trace, in the format "ab:cd:ef:01:23:45". A wildcard character can be used to match all remaining octets; for example, the format "ab:cd:ef:\*" can be used to filter by OUI.

### *num*

Specifies the maximum number of jobs that may be started with this rule.

**Values** 1 to 50

**Default** 1

### *remote-id*

Specifies a remote ID that is used to filter sessions to trace. The *remote-id* and *circuit-id* parameters are mutually exclusive.

### *sap-id*

Specifies a SAP to trace. The following formats are accepted:

- *port/lag/pw-port:svlan.cvlan*
- *port/lag/pw-port:vlan*
- *port/lag/pw-port*
- *port/lag/pw-port:vlan.\**
- *port/lag/pw-port:\** (also matches \*.\*)

### *trace-existing-sessions*

Specifies that existing IPoE sessions is traced. If this parameter is not included, only new IPoE sessions is traced.

### *trace-name*

Specifies the name by which the trace is referenced, up to 16 characters.

### *trace-profile-name*

Specifies the name of the trace profile to be applied. The default parameters is used if a trace profile is not specified.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 24.145 trace-profile

### trace-profile

#### Syntax

**trace-profile** *profile-name* [**create**]

**no trace-profile** *profile-name*

#### Context

[\[Tree\]](#) (config call-trace trace-profile)

#### Full Context

configure call-trace trace-profile

#### Description

This command creates a profile that can be applied to a specific trace job.

#### Parameters

##### *profile-name*

Specifies the unique name of the call trace profile.

##### **create**

Keyword used to create the trace profile instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 24.146 trace-string

### trace-string

#### Syntax

**trace-string** [*trace-string*]

**no trace-string****Context**

[Tree] (config>port>sonet-sdh>path trace-string)

**Full Context**

configure port sonet-sdh path trace-string

**Description**

This command specifies that a J1-path-trace that identifies the circuit is inserted continuously at source. This can be checked against the expected value by the receiver. If no trace string is entered then a null string is used.

The **no** form of this command resets the string to its default.

This command is supported on TDM satellite.

**Default**

The default J1 value is *Alcatel XXX YYY* where XXX is the platform number, such as "7750" or "7450", and YYY is the platform acronym, such as "SR" or "ESS". The value does not change when the encap-type changes. The J1 string contains all zeros for a non-provisioned path.

**Parameters*****trace-string***

Specifies either a string up to 62 bytes for SONET or 15 bytes for SDH. If the string contains spaces, enclose it in quotation marks. String 'zeros' will send all zeros in the J1 bytes.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 24.147 traceroute

**traceroute****Syntax****Context**

[Tree] (traceroute)

**Full Context**

traceroute

## Description

This command determines the route to a destination address. DNS lookups for the responding hosts are enabled by default.

## Parameters

### **candidate-path**

Specifies a candidate path of the SRv6 policy to traceroute. The candidate path does not need to be the currently active candidate path.

### **dest-port-udp-fixed**

Specifies that the destination UDP port number should not increment with each packet transmitted. By default, the UDP traceroute starts with destination UDP port 33434 and each subsequent packet sent to this destination UDP port increases by 1. The next packet uses UDP port 33435, the next 33436, and so on.

For a UDP test, this parameter prevents the per-transmitted packet increment of the destination UDP port number. The TCP protocol does not increment the destination TCP port, using a single destination TCP port for all traceroute packets for the test.

### **decode**

Perform additional original datagram parsing functions. This parameter must be used with the **detail** parameter.

### **detail**

Specifies to display additional information about the resulting packet.

### **distinguisher**

Specifies the distinguisher of the SRv6 policy candidate path to send the traceroute probe on. This parameter must be configured if **protocol-owner** is configured to **bgp**.

**Values** 1 to 4294967295

### **dns-name**

Specifies the DNS name, up to 63 characters, of the far-end device on which to send the traceroute request message.

### **endpoint ipv6-address**

Specifies an SRv6 policy for a specific endpoint as the target of the traceroute.

**Values**

ipv6-address:	x:x:x:x:x:x:x
	x:x:x:x:x:d.d.d.d
x:	[0 to FFFF]H
d:	[0 to 255]D

### **ip-address**

Specifies the far-end IP address on which to send the traceroute request message in dotted decimal notation.

**Values**

ipv4-address:	a.b.c.d
---------------	---------

ipv6-address: x:x:x:x:x:x  
 x:x:x:x:x:d.d.d.d  
 x: [0 to FFFF]H  
 d: [0 to 255]D

***max-ttl***

Specifies the maximum Time-To-Live (TTL) value to include in the traceroute request, expressed as a decimal integer.

**Values** 1 to 255

**Default** 30

***milliseconds***

Specifies the time in milliseconds to wait for a response to a probe, expressed as a decimal integer.

**Values** 1 to 60000

**Default** 5000

***min-ttl***

Specifies the IP TTL in the initial traceroute packet to target a specific node or starting node along the path.

**Values** 1 to 255

**Default** 1

***no-dns***

Specifies that, when the **no-dns** keyword is specified, DNS lookups of the responding hosts are not performed, and only the IP addresses are printed.

***original-datagram***

Parse the returned original datagram including any IPv6 and SRH header information.

***pad-size***

Specifies the number of bytes added to the UDP or TCP payload.

**Values** 0 to 9786

**Default** 0

***port-number***

Specifies the transport protocol destination port number.

**Values** 1 to 65535

**Default** 33434

**preference**

Specifies the preference of the SRv6 policy candidate path to send the traceroute probe on.

**Values** 0 to 4294967295

**Default** 100

**probes-per-hop**

Specifies the number of probes per hop.

**Values** 1 to 10

**Default** 3

**protocol-owner**

Specifies the protocol owner of the SRv6 policy candidate path to traceroute.

**Values** bgp — Specifies a BGP SRv6 policy.  
static — Specifies a locally configured static SRv6 policy.

**protocol udp | tcp**

Sets the transport protocol for the traceroute packet. The TCP protocol is silently discarded on a targeted VRPN service. VRPN services only respond to UDP traceroutes.

**Default** udp

**router-or-service**

Specifies the routing instance or service, by number. The *router-instance* parameter is the preferred parameter to specify the router or service.

**Values** router-name: Base, management, vpls-management  
vprn-svc-id: 1 to 2147483647

**Default** Base

**router-instance**

Specifies the preferred method for entering a service name. Stored as the service name, this is the only service-linking function allowed for both mixed-mode and model-driven configuration modes.

**Values** router-name: Base, management, vpls-management  
vprn-svc-name: up to 64 characters

**service-name**

Specifies the alias function that allows the service name to be used, converted, and stored as service ID.

**source ip-address**

Specifies the source IP address to use as the source of the probe packets, in dotted decimal notation. If the IP address is not one of the device's interfaces, an error is returned.

<b>Values</b>	ipv4-address:	a.b.c.d
	ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:d.d.d.d
	x:	[0 to FFFF]H
	d:	[0 to 255]D

### ***type-of-service***

Specifies the Type-of-Service (ToS) bits in the IP header of the probe packets, expressed as a decimal integer.

**Values** 0 to 255

**Default** 0

### ***srv6-policy***

Keyword to specify that the traceroute probe is applied to an SRv6 policy matching a specific color and endpoint. The traceroute probe may optionally be targeted at a specific segment list of the SRv6 policy. When the segment list is not specified, the traceroute probe is sent on the lowest available segment list.

### ***color-id***

Specifies the SRv6 policy color ID.

**Values** 0 to 4294967295

### ***segment-list***

Specifies the SRv6 policy segment list to trace.

**Values** 1 to 32

## **Platforms**

All

## **Output**

Table 180: ICMPv4 Type 3 symbols in CLI, Table 181: ICMPv6 Type 1 symbols in CLI, and Table 182: ICMPv6 Type 2 symbols in CLI describe the ICMPv4 Type 3, and the ICMPv6 Type 1 and 2 symbols in the CLI outputs. For references without a symbol in the form !<code>, see [www.iana.org/assignments/icmp-parameters/icmp-parameters.xhtml](http://www.iana.org/assignments/icmp-parameters/icmp-parameters.xhtml).

The following output is an example of traceroute for an IPv4 prefix.

**Output Example**

```
A:node-2# traceroute 192.168.xx.xx4
traceroute to 192.168.xx.xx4, 30 hops max, 40 byte packets
 1 192.168.xx.xx4 0.000 ms 0.000 ms 0.000 ms
```

The following output is an example of traceroute for an IPv4 prefix resolved to an IPv4 SR policy with ICMP tunneling enabled.

**Output Example**

```
A:node-2# traceroute 11.21.1.6 detail no-dns
traceroute to 11.21.1.6, 30 hops max, 40 byte packets
 1 1 10.10.11.3 3.36 ms
 returned MPLS Label Stack Object

## 24.148 traceroute-reply

## traceroute-reply

### Syntax

[no] traceroute-reply

### Context

[\[Tree\]](#) (config>service>ies>if>ipv6>vrrp traceroute-reply)

### Full Context

configure service ies interface ipv6 vrrp traceroute-reply

### Description

This command is valid only if the VRRP virtual router instance associated with this entry is a non-owner.

When this command is enabled, a non-owner master can reply to traceroute requests directed to the virtual router instance IP addresses.

A non-owner backup virtual router never responds to such traceroute requests regardless of the **traceroute-reply** status.

### Default

no traceroute-reply

### Platforms

All

## traceroute-reply

### Syntax

[no] traceroute-reply

### Context

[\[Tree\]](#) (config>service>ies>if>vrrp traceroute-reply)

### Full Context

configure service ies interface vrrp traceroute-reply

### Description

This command is valid only if the VRRP virtual router instance associated with this entry is a non-owner.

When this command is enabled, a non-owner master can reply to traceroute requests directed to the virtual router instance IP addresses.

A non-owner backup virtual router never responds to such traceroute requests regardless of the **traceroute-reply** status.

**Default**

no traceroute-reply

**Platforms**

All

**traceroute-reply****Syntax**

[no] traceroute-reply

**Context**

[\[Tree\]](#) (config>service>vprn>if>ipv6>vrrp traceroute-reply)

[\[Tree\]](#) (config>service>vprn>if>vrrp traceroute-reply)

**Full Context**

configure service vprn interface ipv6 vrrp traceroute-reply

configure service vprn interface vrrp traceroute-reply

**Description**

This command is valid only if the VRRP virtual router instance associated with this entry is a non-owner.

When this command is enabled, a non-owner master can reply to traceroute requests directed to the virtual router instance IP addresses.

A non-owner backup virtual router never responds to such traceroute requests regardless of the **traceroute-reply** status.

**Default**

no traceroute-reply

**Platforms**

All

[no] traceroute-reply

**Context**

[\[Tree\]](#) (config>router>if>vrrp traceroute-reply)

[\[Tree\]](#) (config>router>if>ipv6>vrrp traceroute-reply)

### Full Context

```
configure router interface vrrp traceroute-reply
configure router interface ipv6 vrrp traceroute-reply
```

### Description

This command is valid only if the VRRP virtual router instance associated with this entry is a non-owner.

When this command is enabled, a non-owner master can reply to traceroute requests directed to the virtual router instance IP addresses.

A non-owner backup virtual router never responds to such traceroute requests regardless of the **trace-route-reply** status.

Traceroute must not have been disabled at the management security level (either on the parental IP interface or the source host address).

### Default

```
no traceroute-reply
```

### Platforms

## 24.149 track-accounting

### track-accounting

### Syntax

```
track-accounting [start] [stop][interim-update][accounting-on] [accounting-off]
no track-accounting
```

### Context

[\[Tree\]](#) (config>service>vprn>radius-proxy>server>cache track-accounting)

[\[Tree\]](#) (config>router>radius-proxy>server>cache track-accounting)

### Full Context

```
configure service vprn radius-proxy server cache track-accounting
configure router radius-proxy server cache track-accounting
```

### Description

This command specifies the type of RADIUS accounting packets from RADIUS client (a WIFI AP) that the router should track.

The **no** form of this command removes the parameters from the configuration.

## Parameters

### start

Specifies that the router will update the associated ESM-host with the RADIUS client (for example, a WIFI AP) that generated the accounting-start. This is required in cases where a UE roams to a new AP that does not re-authenticate due to key caching.

### stop

Specifies that the router will remove the corresponding ESM host and forward the accounting-stop packet to the external RADIUS server.

### accounting-on | accounting-off

Specifies that the router will remove all ESM hosts associated with the RADIUS client (a WIFI AP), and forward the accounting-on packet to the external RADIUS server.

### interim-update

Specifies that the router will update the associated ESM-host with the RADIUS client (a WIFI AP) that generated the interim-update. The interim-updates with the updated information are sent to the RADIUS server as scheduled.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 24.150 track-authentication

### track-authentication

## Syntax

**track-authentication** [accept]

**no track-authentication**

## Context

[\[Tree\]](#) (config>router>radius-proxy>server>cache track-authentication)

[\[Tree\]](#) (config>service>vpn>radius-proxy>server>cache track-authentication)

## Full Context

configure router radius-proxy server cache track-authentication

configure service vpn radius-proxy server cache track-authentication

## Description

This command specifies if RADIUS authentication (from the AP) should be tracked in order to update the ESM host with the RADIUS client (for example, WIFI AP) on UE mobility. It also specifies the authentication packet from RADIUS client (for example, a WIFI AP) that the router should track for mobility.

The **no** form of this command stops tracking authentication for UE mobility.

**Default**

track-authentication accept

**Parameters****accept**

Indicates access-accept is tracked for mobility.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 24.151 track-delete-hold-time

### track-delete-hold-time

**Syntax**

**track-delete-hold-time** *seconds*

**no track-delete-hold-time**

**Context**

[\[Tree\]](#) (config>router>radius-proxy>server>cache track-delete-hold-time)

**Full Context**

configure router radius-proxy server cache track-delete-hold-time

**Description**

This command specifies the delete hold-time in case the DHCP host gets a trigger to delete from the matched RADIUS Proxy server.

The **no** form of this command reverts to the default.

**Default**

track-delete-hold-time 0

**Parameters*****seconds***

Specifies the delete hold time, in seconds.

**Values** 0 to 600

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 24.152 track-mobility

### track-mobility

#### Syntax

**track-mobility**

#### Context

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range track-mobility)

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range track-mobility)

#### Full Context

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range track-mobility

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range track-mobility

#### Description

Commands in this context configure RADIUS-proxy cache information required for subscribers that are created via data-triggered authentication. The RADIUS proxy cache enables efficient handling of UE mobility.

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.153 track-password-change

### track-password-change

#### Syntax

**[no] track-password-change**

#### Context

[\[Tree\]](#) (config>service>vprn>l2tp>group>l2tpv3 track-password-change)

#### Full Context

configure service vprn l2tp group l2tpv3 track-password-change

#### Description

This command enables tracking of password changes, allowing password tunnel passwords to be changed without bringing down active tunnels or sessions. This is only supported with L2TPv3.

The **no** form of this command disables password change tracking.

### Default

no track-password-change

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 24.154 track-srrp

### track-srrp

### Syntax

**track-srrp** *srrp-instance* **peer** *ip-address* **sync-tag** *sync-tag*

**no track-srrp** *srrp-instance*

### Context

**[Tree]** (config>router>l2tp>failover track-srrp)

**[Tree]** (config>service>vprn>l2tp>failover track-srrp)

### Full Context

configure router l2tp failover track-srrp

configure service vprn l2tp failover track-srrp

### Description

This command sets the sync-tag to be used to synchronize the tunnels with track-srrp *srrp-id* to MCS *peer IP-@*. The same sync-tag should be configured on the MCS peer.

The **no** form of this command reverts to the default.

### Default

Removes the sync-tag for the indicated track-srrp.

### Parameters

#### *srrp-instance*

Specifies the Simple Router Redundancy Protocol (SRRP) instance used for Multi-Chassis redundancy failover that is associated with this Layer Two Tunneling Protocol Tunnel.

#### *sync-tag*

Specifies a synchronization tag to be used while synchronizing with the peer.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## track-srrp

### Syntax

[no] **track-srrp** [*srrp-instance*]

### Context

[\[Tree\]](#) (config>redundancy>multi-chassis>peer>sync>track-srrp-instances track-srrp)

### Full Context

configure redundancy multi-chassis peer sync track-srrp-instances track-srrp

### Description

This command configures a tracked SRRP instance.

The **no** form of this command removes the SRRP instance identifier from the configuration.

### Parameters

#### *srrp-instance*

Indicates the unique identifier of the tracked SRRP instance.

**Values** 1 to 4294967295

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## track-srrp

### Syntax

**track-srrp** *srrp-id*

**no track-srrp**

### Context

[\[Tree\]](#) (config>service>vpls>sap track-srrp)

### Full Context

configure service vpls sap track-srrp

### Description

This command configures the SRRP instance this capture SAP will track. This is a capture SAP level command. This command is important in PPPoE deployments with MSAPs. PPPoE operation requires

that the MAC address learned by the client at the very beginning of the session negotiation phase remains unchanged for the lifetime of the session (RFC 2516). This command ensures that the virtual MAC address used during the PPPoE session negotiation phase on the capture SAP is the same virtual MAC address that is used by the SRRP on the group interface on which the session is established. Therefore, it is mandated that the SRRP instance (and implicitly the group-interface) where the session belongs to is known in advance. If the group interface name for the session is returned by the RADIUS, it must be ensured that this group interface is the one on which the tracked SRRP instance is configured. PPPoE sessions on the same capture SAP cannot be shared across multiple group interfaces, but instead they all must belong to a single group interface that is known in advance.

The same restrictions apply to IPE clients in MC Redundancy scenario if they are to be supported concurrently on the same capture SAP as PPPoE.

The supported capture SAP syntax is this:

```
sap <port-id>:X.* capture-sap
```

The capture SAP syntax that is not supported is this:

```
sap <port-id>:.*.* capture-sap
```

The **no** form of this command removes the SRRP ID from this configuration.

## Parameters

### *srrp-id*

Specifies the SRRP instance number.

**Values** 1 to 4294967295

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 24.155 track-srrp-instances

### track-srrp-instances

#### Syntax

```
track-srrp-instances
```

#### Context

[\[Tree\]](#) (config>redundancy>multi-chassis>peer>sync track-srrp-instances)

#### Full Context

```
configure redundancy multi-chassis peer sync track-srrp-instances
```

#### Description

Commands in this context configure tracked SRRP instances.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**24.156 tracking-support****tracking-support****Syntax**

[no] tracking-support

**Context**

[\[Tree\]](#) (config>service>vprn>mvpn>pt>inclusive>pim tracking-support)

**Full Context**

configure service vprn mvpn provider-tunnel inclusive pim tracking-support

**Description**

This command enables the setting of the T bit in the LAN Prune Delay option of the Hello message. This indicates the router's capability to disable Join message suppression.

The **no** form of this command disables the setting.

**Default**

no tracking-support

**Platforms**

All

**tracking-support****Syntax**

[no] tracking-support

**Context**

[\[Tree\]](#) (config>service>vprn>pim>if tracking-support)

**Full Context**

configure service vprn pim interface tracking-support

### Description

This command sets the T bit in the LAN Prune Delay option of the Hello Message. This indicates the router's capability to disable Join message suppression.

### Default

no tracking-support

### Platforms

All

tracking-support

### Syntax

[no] tracking-support

### Context

[\[Tree\]](#) (config>router>pim>interface tracking-support)

### Full Context

configure router pim interface tracking-support

### Description

This command sets the T bit in the LAN Prune Delay option of the Hello Message. This indicates the router's capability to enable join message suppression. This capability allows for upstream routers to explicitly track join membership.

The **no** form of this command disables tracking support.

### Default

no tracking-support

### Platforms

All

## 24.157 traffic-capture

traffic-capture

### Syntax

[no] traffic-capture

**Context**

[\[Tree\]](#) (debug>app-assure>group traffic-capture)

**Full Context**

debug application-assurance group traffic-capture

**Description**

This command configures debugging for traffic capture.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.158 traffic-class

### traffic-class

**Syntax**

**traffic-class** *traffic-class*

**no traffic-class**

**Context**

[\[Tree\]](#) (debug>oam>build-packet>packet>field-override>header>mpls traffic-class)

[\[Tree\]](#) (config>test-oam>build-packet>header>mpls traffic-class)

**Full Context**

debug oam build-packet packet field-override header mpls traffic-class

configure test-oam build-packet header mpls traffic-class

**Description**

This command defines the traffic class value to be used in the MPLS header.

The **no** form of this command removes the traffic class value.

**Default**

traffic-class 0 (BE)

**Parameters**

***traffic-class***

Specifies the MPLS traffic class to be used in the MPLS header.

**Values** 0 to 7

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 24.159 traffic-direction

### traffic-direction

#### Syntax

**traffic-direction** {**subscriber-to-network** | **network-to-subscriber** | **both**}

#### Context

[\[Tree\]](#) (config>app-assure>group>policy>aqp>entry>match traffic-direction)

#### Full Context

configure application-assurance group policy app-qos-policy entry match traffic-direction

#### Description

This command specifies the direction of traffic where the AQP match entry will be applied.

To use a policer action with the AQP entry the match criteria must specify a traffic-direction of either subscriber-to-network or network-to-subscriber.

#### Default

traffic-direction both

#### Parameters

##### **subscriber-to-network**

Traffic from a local subscriber will match this AQP entry.

##### **network-to-subscriber**

Traffic to a local subscriber will match this AQP entry.

##### **both**

Combines subscriber-to-network and network-to-subscriber.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.160 traffic-engineering

## traffic-engineering

### Syntax

**[no] traffic-engineering**

### Context

**[Tree]** (config>router>isis traffic-engineering)

### Full Context

configure router isis traffic-engineering

### Description

This command enables this IS-IS instance to advertise TE link attributes for RSVP-TE and SR-TE enabled interfaces.

### Default

no traffic-engineering

### Platforms

All

## traffic-engineering

### Syntax

**[no] traffic-engineering**

### Context

**[Tree]** (config>router>ospf traffic-engineering)

### Full Context

configure router ospf traffic-engineering

### Description

This command enables the advertisement of the traffic engineering information for the router and its links.

Traffic engineering enables the router to perform route calculations constrained by nodes or links. The traffic engineering of this router are limited to calculations based on link and nodal constraints.

The **no** form of this command disables the advertisement of the traffic engineering information.

### Default

no traffic-engineering

## Platforms

All

## 24.161 traffic-engineering-options

traffic-engineering-options

### Syntax

[no] traffic-engineering-options

### Context

[\[Tree\]](#) (config>router>isis traffic-engineering-options)

### Full Context

configure router isis traffic-engineering-options

### Description

Commands in this context configure advanced traffic-engineering options.

The **no** form of this command deletes the context.

### Default

no traffic-engineering-options

## Platforms

All

traffic-engineering-options

### Syntax

[no] traffic-engineering-options

### Context

[\[Tree\]](#) (config>router>ospf traffic-engineering-options)

### Full Context

configure router ospf traffic-engineering-options

### Description

Commands in this context configure the advanced traffic-engineering options.

The **no** form of this command removes the context to configure the advanced traffic-engineering options.

**Default**

no traffic-engineering-options

**Platforms**

All

## 24.162 traffic-identification

### traffic-identification

**Syntax**

**traffic-identification**

**Context**

[\[Tree\]](#) (config>service>vprn>nat>inside traffic-identification)

[\[Tree\]](#) (config>router>nat>inside traffic-identification)

**Full Context**

configure service vprn nat inside traffic-identification

configure router nat inside traffic-identification

**Description**

Commands in this context configure traffic identification for NAT processing.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.163 traffic-rate-delta

### traffic-rate-delta

**Syntax**

**traffic-rate-delta** *rate*

**no traffic-rate-delta**

**Context**

[\[Tree\]](#) (config>service>vprn>mvpn>pt>inclusive>umh-rm traffic-rate-delta)

[\[Tree\]](#) (config>service>vprn>mvpn>pt>selective>umh-rm>group>source traffic-rate-delta)

### Full Context

```
configure service vprn mvpn provider-tunnel inclusive umh-rate-monitoring traffic-rate-delta
configure service vprn mvpn provider-tunnel selective umh-rate-monitoring group source traffic-rate-delta
```

### Description

This command configures the bandwidth delta upwards of which the traffic is switched from the primary UMH to the backup UMH.

The **no** form of this command removes UMH redundancy with bandwidth monitoring.

### Default

1

### Parameters

*rate*

Specifies the bandwidth delta, in kbps.

**Values** 1 to 4294967294

### Platforms

All

## 24.164 traffic-type

traffic-type

### Syntax

[no] traffic-type

### Context

[\[Tree\]](#) (config>app-assure>group>statistics>aa-partition traffic-type)

### Full Context

```
configure application-assurance group statistics aa-partition traffic-type
```

### Description

This command enables traffic type statistics collection within an aa-partition.

The no form of this command disables traffic type statistics collection.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.165 transceiver

### transceiver

#### Syntax

**transceiver**

#### Context

[\[Tree\]](#) (config>port transceiver)

#### Full Context

configure port transceiver

#### Description

Commands in this context configure transceiver parameters.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 24.166 transform

### transform

#### Syntax

**transform** *transform-id* [*transform-id*]

**no transform**

#### Context

[\[Tree\]](#) (config>service>vprn>if>ipsec>ipsec-tunnel>dyn transform)

[\[Tree\]](#) (config>service>ies>if>ipsec>ipsec-tunnel>dyn transform)

[\[Tree\]](#) (config>ipsec>tnl-temp transform)

[\[Tree\]](#) (config>router>if>ipsec>ipsec-tunnel>dyn transform)

[\[Tree\]](#) (config>service>ies>if>sap>ipsec-gw transform)

[\[Tree\]](#) (config>service>vprn>if>sap>ipsec-gw transform)

[\[Tree\]](#) (config>service>vprn>if>sap>ipsec-tunnel transform)

## Full Context

configure service vprn interface ipsec ipsec-tunnel dynamic-keying transform  
 configure service ies interface ipsec ipsec-tunnel dynamic-keying transform  
 configure ipsec tunnel-template transform  
 configure ipsec ipsec-transport-mode-profile dynamic-keying transform  
 configure router interface ipsec ipsec-tunnel dynamic-keying transform  
 configure service ies interface sap ipsec-gw transform  
 configure service vprn interface sap ipsec-gw transform  
 configure service vprn interface sap ipsec-tunnel transform

## Description

This command associates the IPsec transform sets allowed for this the CHILD\_SA. A maximum of four transforms can be specified. The transforms are listed in decreasing order of preference (the first one specified is the most preferred).

The **no** form of this command removes the transform ID from the configuration.

## Default

no transform

## Parameters

### *transform-id*

Specifies a number to identify a transform used for CHILD\_SA negotiation. Up to four transform ID can be specified.

**Values** 1 to 2048

## Platforms

VSR

- configure service vprn interface ipsec ipsec-tunnel dynamic-keying transform
  - configure router interface ipsec ipsec-tunnel dynamic-keying transform
  - configure service ies interface ipsec ipsec-tunnel dynamic-keying transform
- 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR
- configure ipsec tunnel-template transform
  - configure service ies interface sap ipsec-gw transform
  - configure ipsec ipsec-transport-mode-profile dynamic-keying transform
  - configure service vprn interface sap ipsec-gw transform
  - configure service vprn interface sap ipsec-tunnel transform

## transform

### Syntax

**transform** *transform-id* [*transform-id*]

**no transform**

### Context

[\[Tree\]](#) (config>service>vprn>if>sap>ipsec-tun>dyn transform)

### Full Context

configure service vprn interface sap ipsec-tunnel dynamic-keying transform

### Description

This command associates the IPsec transform sets allowed for this tunnel. A maximum of four transforms can be specified. The transforms are listed in decreasing order of preference (the first one specified is the most preferred).

### Default

no transform

### Parameters

***transform-id***

Specifies the value used for transforms for dynamic keying.

**Values** 1 to 2048

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.167 transit

## transit

### Syntax

**transit** [*inherit* | *all* | *vc-only* | *none*]

### Context

[\[Tree\]](#) (config>service>vprn>tll-propagate transit)

### Full Context

configure service vprn tll-propagate transit

## Description

This command overrides the global configuration of the TTL propagation for in transit packets which are forwarded over a MPLS LSPs in a given VPRN service context.

The global configuration is performed under `config>router>ttl-propagate>vprn-transit`.

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value.

## Default

transit inherit

## Parameters

### *inherit*

specifies the TTL propagation behavior is inherited from the global configuration under `config>router>ttl-propagate>vprn-transit`.

### *none*

specifies the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack.

### *vc-only*

specifies the TTL of the IP packet is propagated into the VC label and not into the labels. in the transport label stack

### *all*

specifies the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

## Platforms

All

## 24.168 transit-auto-create

### transit-auto-create

## Syntax

**transit-auto-create**

## Context

[\[Tree\]](#) (config>app-assure>group>transit-ip-policy transit-auto-create)

## Full Context

configure application-assurance group transit-ip-policy transit-auto-create

## Description

This command enables seen-IP auto creation of transit subscribers using the transit-IP-policy name and subscriber IP address as the AA-sub name. The default app-profile configured against the transit-ip-policy is applied to these subscribers.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.169 transit-delay

### transit-delay

#### Syntax

**transit-delay** *seconds*

**no transit-delay**

#### Context

**[Tree]** (config>service>vprn>ospf3>area>virtual-link transit-delay)

**[Tree]** (config>service>vprn>ospf3>area>if transit-delay)

configure service vprn ospf3 area interface transit-delay

configure service vprn ospf area interface transit-delay

configure service vprn ospf area sham-link transit-delay

configure service vprn ospf area virtual-link transit-delay

#### Description

This command configures the estimated time, in seconds, that it takes to transmit a LSA on the interface or virtual link or sham-link.

The **no** form of this command reverts to the default delay time.

#### Default

transit-delay 1

#### Parameters

*seconds*

The transit delay in seconds expressed as a decimal integer.

**Values** 0 to 3600

## Platforms

All

## transit-delay

## Syntax

**transit-delay** *seconds*

**no transit-delay**

## Context

configure router ospf3 area virtual-link transit-delay

configure router ospf area interface transit-delay

configure router ospf area virtual-link transit-delay

configure router ospf3 area interface transit-delay

## Description

This command configures the estimated time, in seconds, that it takes to transmit a link state advertisement (LSA) on the interface or virtual link.

The **no** form of this command reverts to the default delay time.

## Default

transit-delay 1

## Parameters

***seconds***

Specifies the transit delay in seconds expressed as a decimal integer.

**Values** 1 to 1800

## Platforms

All

## 24.170 transit-ip-policy

transit-ip-policy

### Syntax

**transit-ip-policy** *ip-policy-id* [**create**]

**no transit-ip-policy** *ip-policy-id*

### Context

[\[Tree\]](#) (config>app-assure>group transit-ip-policy)

### Full Context

configure application-assurance group transit-ip-policy

### Description

This command defines a transit AA subscriber IP policy. Transit AA subscribers are managed by the system through the use of this policy assigned to services, which determines how transit subs are created and removed for that service.

The **no** form of this command deletes the policy from the configuration. All associations must be removed in order to delete a policy.

### Parameters

***ip-policy-id***

An integer that identifies a transit IP profile entry.

**Values** 1 to 65535

**create**

Keyword used to create the entry.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.171 transit-path

transit-path

### Syntax

**transit-path** *path-name*

## no transit-path

### Context

[Tree] (config>router>mpls>mpls-tp transit-path)

### Full Context

configure router mpls mpls-tp transit-path

### Description

This command enables the configuration or editing of an MPLS-TP transit path at an LSR.

### Default

no transit-path

### Parameters

#### *path-name*

Specifies the template of up to 32 characters in printable 7-bit ASCII, enclosed in double quotes.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 24.172 transit-policy

### transit-policy

### Syntax

**transit-policy ip** *ip-aasub-policy-id*

**transit-policy prefix** *prefix-aasub-policy-id*

**no transit-policy**

### Context

configure service ies interface spoke-sdp transit-policy
configure service vprn interface spoke-sdp transit-policy
configure service vprn interface sap transit-policy
configure service epipe sap transit-policy
configure service vpls spoke-sdp transit-policy
configure service ies interface sap transit-policy
```

## Description

This command associates a transit AA subscriber IP or prefix policy to the service. The transit policy must be defined prior to associating the policy with a SAP in the **config>app-assure>group>transit-ip-policy** or **transit-prefix-policy** context.

The **no** form of this command removes the association of the policy to the service.

## Default

```
no transit-policy
```

## Parameters

### *ip-aasub-policy-id*

Specifies a transit IP policy ID.

**Values** 1 to 65535

### *prefix-aasub-policy-id*

Specifies a transit prefix policy ID.

**Values** 1 to 65535

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## transit-policy

## Syntax

```
transit-policy prefix prefix-aasub-policy-id
```

```
no transit-policy
```

## Context

**[Tree]** (config>service>ipipe>spoke-sdp transit-policy)

**[Tree]** (config>service>ipipe>sap transit-policy)

### Full Context

```
configure service ipipe spoke-sdp transit-policy
configure service ipipe sap transit-policy
```

### Description

This command associates an AA transit policy to the service. The transit IP policy must be defined prior to associating the policy with a SAP in the **config>application assurance>group>policy>transit-ip-policy** context.

Transit AA subscribers are managed by the system through this service policy, which determines how transit subs are created and removed for that service.

The no form of this command removes the association of the policy to the service.

### Default

```
no transit-policy
```

### Parameters

#### ***prefix-aasub-policy-id***

Specifies an integer identifying a prefix transit profile entry.

**Values** 1 to 65535

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.173 transit-prefix-ipv4-entries

### transit-prefix-ipv4-entries

### Syntax

```
transit-prefix-ipv4-entries entries
```

```
no transit-prefix-ipv4-entries
```

### Context

[\[Tree\]](#) (config>isa>aa-grp transit-prefix-ipv4-entries)

### Full Context

```
configure isa application-assurance-group transit-prefix-ipv4-entries
```

### Description

This command defines the number of transit-prefix IPv4 entries for an ISA.

The **no** form of this command removes the assignment of entries space from the configuration. All entries must be removed in order to delete the configuration.

### Default

no transit-prefix-ipv4-entries

### Parameters

#### *entries*

Specifies an integer that determines the number of transit-prefix-ipv4 entries.

**Values** 0 to 16383

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.174 transit-prefix-ipv4-remote-entries

### transit-prefix-ipv4-remote-entries

### Syntax

**transit-prefix-ipv4-remote-entries** *entries*

**no transit-prefix-ipv4-remote-entries**

### Context

[\[Tree\]](#) (config>isa>aa-grp transit-prefix-ipv4-remote-entries)

### Full Context

configure isa application-assurance-group transit-prefix-ipv4-remote-entries

### Description

This command configures the ISA-AA-group transit prefix IPv4 remote entry limit. This entry space is allocated on the IOM within a common area with the second MDA/ISA position of the IOM and also used for IPv4filter entries for system SDPs. The per-ISA size allocated for transit-prefix-ipv4 entries should be set to allow sufficient space on the IOM for SDP IPv4 filters.

The **no** form of this command removes the assignment of entries space from the configuration. All entries must be removed in order to delete the configuration.

### Default

no transit-prefix-ipv4-remote-entries

### Parameters

#### *entries*

Specifies the ISA-AA-Group transit prefix IPv4 remote entry limit.

**Values** 0 to 2047

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.175 transit-prefix-ipv6-entries

### transit-prefix-ipv6-entries

#### Syntax

**transit-prefix-ipv6-entries** *entries*

**no transit-prefix-ipv6-entries**

#### Context

[\[Tree\]](#) (config>isa>aa-grp transit-prefix-ipv6-entries)

#### Full Context

configure isa application-assurance-group transit-prefix-ipv6-entries

#### Description

This command configures the ISA-AA-group transit prefix IPv6 entry limit for each ISA in the group. This entry space is allocated on the IOM within a common area with the second MDA / ISA position of the IOM and also used for ipv6-filter entries for system SDPs. The per-ISA size allocated for transit-prefix-ipv6 entries should be set to allow sufficient space on the IOM for SDP ipv6-filters.

The **no** form of this command removes the assignment of entries space from the configuration. All entries must be removed in order to delete the configuration.

#### Default

no transit-prefix-ipv6-entries

#### Parameters

**entries**

Specifies the ISA-AA-Group transit prefix IPv6 entry limit.

**Values** 0 to 8191

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.176 transit-prefix-ipv6-remote-entries

transit-prefix-ipv6-remote-entries

### Syntax

**transit-prefix-ipv6-remote-entries** *entries*  
**no transit-prefix-ipv6-remote-entries**

### Context

[\[Tree\]](#) (config>isa>aa-grp transit-prefix-ipv6-remote-entries)

### Full Context

configure isa application-assurance-group transit-prefix-ipv6-remote-entries

### Description

This command configures the ISA-AA-group transit prefix IPv6 remote entry limit. This entry space is allocated on the IOM within a common area with the second MDA/ISA position of the IOM and also used for IPv6filter entries for system SDPs. The per-ISA size allocated for transit-prefix-ipv6 entries should be set to allow sufficient space on the IOM for SDP IPv6 filters.

The **no** form of this command removes the assignment of entries space from the configuration. All entries must be removed in order to delete the configuration.

### Default

no transit-prefix-ipv6-remote-entries

### Parameters

**entries**

Specifies the ISA-AA-Group transit prefix IPv6 remote entry limit.

**Values** 0 to 1023

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.177 transit-prefix-policy

transit-prefix-policy

### Syntax

**transit-prefix-policy** *prefix-policy-id* [**create**]

**no transit-prefix-policy** *prefix-policy-id*

### Context

[\[Tree\]](#) (config>app-assure>group transit-prefix-policy)

### Full Context

configure application-assurance group transit-prefix-policy

### Description

This command defines a transit aa subscriber prefix policy. Transit AA subscribers are managed by the system through the use of this policy assigned to services, which determines how transit subs are created and removed for that service.

The **no** form of this command deletes the policy from the configuration. All associations must be removed in order to delete a policy.

### Parameters

#### *prefix-policy-id*

Indicates the transit prefix policy to which this subscriber belongs.

**Values** 1 to 65535

#### **create**

Mandatory keyword used when creating transit prefix policy. The create keyword requirement can be enabled/disabled in the **environment>create** context.

### Platforms

## 24.178 transmission-profile

transmission-profile

### Syntax

**transmission-profile** *name*

**no transmission-profile**

### Context

[\[Tree\]](#) (config>system>security>pki>ca-profile>ocsp transmission-profile)

### Full Context

configure system security pki ca-profile ocs p transmission-profile

## Description

This command specifies the transmission-profile for OCSP. When specified, this configuration overrides the **service** *service-id* or **service** *service-name* configured in the **config>system>security>pki>ca-profile>ocsp** context.

The **no** form of the command removes the profile name from the configuration.

## Default

no transmission-profile

## Parameters

### *name*

Specifies the file transmission profile name, up to 32 characters.

## Platforms

All

## transmission-profile

## Syntax

**transmission-profile** *name*

**no transmission-profile**

## Context

[\[Tree\]](#) (config>system>security>pki>est-profile transmission-profile)

## Full Context

configure system security pki est-profile transmission-profile

## Description

This command specifies the transmission profile name created in the **config>system file-transmission-profile** context for the EST profile.

The **no** form of the command removes the name from the EST profile configuration.

## Default

no transmission-profile

## Parameters

### *name*

Specifies the file transmission profile name, up to 32 characters.

## Platforms

All

## 24.179 transmit-interval

### transmit-interval

#### Syntax

[no] **transmit-interval** *interval* [**multiplier** *multiplier*]

#### Context

[\[Tree\]](#) (config>port>ethernet>efm-oam transmit-interval)

#### Full Context

configure port ethernet efm-oam transmit-interval

#### Description

This command configures the transmit interval of OAM PDUs.

#### Default

transmit-interval 10 multiplier 5

#### Parameters

##### *interval*

Specifies the transmit interval, in 100 milliseconds.

**Values** 1 to 600

##### *multiplier*

Specifies the multiplier for transmit-interval to set local link down timer.

**Values** 2 to 5

#### Platforms

All

### transmit-interval

#### Syntax

**transmit-interval** *transmit-interval*

**no transmit-interval**

#### Context

[\[Tree\]](#) (config>lag>bfd>family transmit-interval)

## Full Context

```
configure lag bfd family transmit-interval
```

## Description

This command specifies the transmit timer used for micro-BFD session over the associated LAG links. The **no** form of this command removes the transmit timer from the configuration.

## Default

```
transmit-interval 100
```

## Parameters

### *transmit-interval*

Specifies the interval value, in milliseconds.

**Values** 10 to 100000

**Default** 100 for CPM3 or later, 1000 for all others

## Platforms

All

## transmit-interval

## Syntax

```
transmit-interval transmit-interval
```

```
no transmit-interval
```

## Context

[\[Tree\]](#) (config>router>bfd>bfd-template transmit-interval)

## Full Context

```
configure router bfd bfd-template transmit-interval
```

## Description

This command specifies the transmit timer used for BFD packets. If the template is used for a BFD session on an MPLS-TP LSP, then this timer is used for CC packets.

The **no** form of this command reverts to the default value.

## Default

```
transmit-interval 100
```

## Parameters

### *transmit-interval*

Specifies the transmit interval. The minimum interval that can be configured is hardware dependent.

**Values** 10 ms to 100,000 ms in 1 ms intervals

**Default** 10 ms for CPM3 or higher; 1 second for other hardware

## Platforms

All

## transmit-interval

## Syntax

**transmit-interval** *transmit-interval*

**no transmit-interval**

## Context

[\[Tree\]](#) (config>router>lsp-bfd>tail-end transmit-interval)

## Full Context

configure router lsp-bfd tail-end transmit-interval

## Description

This command configures the LSP BFD minimum transmit interval for the tail end of LSP BFD sessions. The **no** form of this command reverts to the default value.

## Default

transmit-interval 1000

## Parameters

***transmit-interval***

Specifies the transmit interval, in milliseconds.

**Values** 100 to 1000

**Default** 1000

## Platforms

All

## 24.180 transmit-period

```
transmit-period
```

### Syntax

```
transmit-period seconds
```

```
no transmit-period
```

### Context

[\[Tree\]](#) (config>port>ethernet>dot1x transmit-period)

### Full Context

```
configure port ethernet dot1x transmit-period
```

### Description

This command configures the period after which the router sends a new EAPOL request message.

The **no** form of this command returns the value to the default.

### Default

```
transmit-period 30
```

### Parameters

***seconds***

Specifies the server transmit period in seconds.

**Values** 1 to 3600

### Platforms

All

## 24.181 transport-address

```
transport-address
```

### Syntax

```
transport-address {interface | system}
```

```
no transport-address
```

## Context

**[Tree]** (config>router>ldp>if-params>ipv6 transport-address)

**[Tree]** (config>router>ldp>if-params>if>ipv6 transport-address)

**[Tree]** (config>router>ldp>if-params>if>ipv4 transport-address)

**[Tree]** (config>router>ldp>if-params>ipv4 transport-address)

## Full Context

configure router ldp interface-parameters ipv6 transport-address

configure router ldp interface-parameters interface ipv6 transport-address

configure router ldp interface-parameters interface ipv4 transport-address

configure router ldp interface-parameters ipv4 transport-address

## Description

This command configures the transport address to be used when setting up the LDP TCP sessions. The transport address can be configured as **interface** or **system**. The transport address can be configured globally (applies to all LDP interfaces) or per interface. The most specific value is used.

The **config>router>ldp>if-params>ipv6> transport-address** command is not supported on the 7450 ESS.

With the transport-address command, you can set up the LDP interface to the connection which can be set to the interface address or the system address. However, there can be an issue of which address to use when there are parallel adjacencies. This situation can not only happen with parallel links, it could be a link and a targeted adjacency since targeted adjacencies request the session to be set up only to the system IP address.

The **transport-address** value should not be **interface** if multiple interfaces exist between two LDP neighbors. Depending on the first adjacency to be formed, the TCP endpoint is chosen. In other words, if one LDP interface is set up as **transport-address interface** and another for **transport-address system**, then, depending on which adjacency was set up first, the TCP endpoint addresses are determined. After that, because the hello contains the LSR ID, the LDP session can be checked to verify that it is set up and then match the adjacency to the session.

For any iLDP interface, as the **local-lsr-id** parameters is changed to **interface**, the **transport-address** configuration loses effectiveness. Since it will be ignored and the iLDP session will always use the relevant interface IP address as transport-address even though system is chosen.

The **no** form of this command, at the global level, sets the transport address to the default value.

The **no** form of this command, at the interface level, sets the transport address to the value defined under the global level.

## Default

system

## Parameters

### interface

Specifies the IP interface address is used to set up the LDP session between neighbors. The transport address interface cannot be used if multiple interfaces exist between two neighbors, since only one LDP session is set up between two neighbors.

**system**

Specifies the system IP address is used to set up the LDP session between neighbors.

All

## 24.182 transport-encryption

### transport-encryption

**Syntax**

**transport-encryption**

**Context**

[\[Tree\]](#) (config>redundancy>multi-chassis>peer>sync transport-encryption)

**Full Context**

configure redundancy multi-chassis peer sync transport-encryption

**Description**

Commands in this context configure MCS applications that need to encrypt synchronized states for transportation .

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.183 transport-tunnel

### transport-tunnel

**Syntax**

**transport-tunnel**

**Context**

[\[Tree\]](#) (config>router>bgp>next-hop-res>labeled-routes transport-tunnel)

**Full Context**

configure router bgp next-hop-resolution labeled-routes transport-tunnel

## Description

Commands in this context configure options for the next-hop resolution of BGP labeled routes (VPN-IP and labeled-unicast) using tunnels in TTM. The context allows the selection of different tunnel resolution options for different types of BGP labeled routes: label-unicast IPv4, label-unicast IPv6, and VPN-IP routes (both VPN-IPv4 and VPN-IPv6).

By default (if this context and the resolution options are not configured), these routes resolve only to LDP tunnels.

If the **resolution** option is explicitly set to **disabled**, the default binding to LDP tunnel resumes. If **resolution** is set to **any**, then any supported tunnel type is allowed and the selection is based on the lowest numerical TTM preference value.

## Platforms

All

## 24.184 transport-type

### transport-type

#### Syntax

**transport-type** {ip}  
**no transport-type**

#### Context

[\[Tree\]](#) (config>service>vprn>l2tp>l2tpv3 transport-type)  
[\[Tree\]](#) (config>router>l2tp>l2tpv3 transport-type)

#### Full Context

configure service vprn l2tp l2tpv3 transport-type  
configure router l2tp l2tpv3 transport-type

#### Description

This command configures the transport type to be used to carry the L2TPv3 tunnel. Currently, only IP transport is supported.

The **no** form of this command returns the **transport-type** to the default value.

#### Default

no transport-type

#### Parameters

**ip**

Specifies that IP should be used as the transport type for the L2TPv3 tunnel.

## 24.186 trap-target

trap-target

### Syntax

**trap-target name address** *ip-address* [**port port**] [**snmpv1 | snmpv2c | snmpv3**] **notify-community** *communityName* | *snmpv3SecurityName* [**security-level {no-auth-no-privacy | auth-no-privacy | privacy}**] [**replay**]  
**no trap-target name**

### Context

[\[Tree\]](#) (config>service>vprn>log>snmp-trap-group trap-target)

### Full Context

configure service vprn log snmp-trap-group trap-target

## Description

This command adds/modifies a trap receiver and configures the operational parameters for the trap receiver. A trap reports significant events that occur on a network device such as errors or failures.

Before an SNMP trap can be issued to a trap receiver, the **log-id**, **snmp-trap-group**, and at least one **snmp-trap-group** must be configured.

The **snmp-trap-group** command is used to add or remove a trap receiver from an **snmp-trap-group**. The operational parameters specified in the command include:

- The IP address of the trap receiver
- The UDP port used to send the SNMP trap
- SNMP version
- SNMP community name for SNMPv1 and SNMPv2c receivers.
- Security name and level for SNMPv3 trap receivers.

A single **snmp-trap-group** *log-id* can have multiple trap-receivers. Each trap receiver can have different operational parameters.

An address can be configured as a trap receiver more than once as long as a different port is used for each instance.

To prevent resource limitations, only configure a maximum of 10 trap receivers.

If the same **trap-target** *name* **port** *port* parameter value is specified in more than one SNMP trap group, each trap destination should be configured with a different *notify-community* value. This allows a trap receiving an application, such as NMS, to reconcile a separate event sequence number stream for each router event log when multiple event logs are directed to the same IP address and port destination.

The **no** form of this command removes the SNMP trap receiver from the SNMP trap group.

## Default

No SNMP trap targets are defined.

## Parameters

### *name*

specifies the name of the trap target up to 28 characters in length

### **address** *ip-address*

The IP address of the trap receiver in dotted decimal notation. Only one IP address destination can be specified per trap destination group.

### Values

ipv4-address a.b.c.d (host bits must be 0)

ipv6-address x:x:x:x:x:x:x[-interface]

x:x:x:x:x:d.d.d.d[-interface]

x: [0 to FFFF]H

d: [0 to 255]D

interface: 32 characters maximum, mandatory for link local addresses

The ipv6-address applies to the 7750 SR.

### **port**

Specifies the destination UDP port used to send traps to the destination, expressed as a decimal integer. Only one port can be specified per **trap-target** statement. If multiple traps need to be issued to the same address then multiple ports must be configured.

**Values** 1 to 65535

**Default** 162

### **snmpv1 | snmpv2c | snmpv3**

Specifies the SNMP version format to use for traps sent to the trap receiver.

The keyword **snmpv1** selects the SNMP version 1 format. When specifying **snmpv1**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv1**, then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv2c** selects the SNMP version 2c format. When specifying **snmpv2c**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv2c**, then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv3** selects the SNMP version 3 format. When specifying **snmpv3**, the **notify-community** must be configured for the SNMP *security-name*. If the SNMP version is changed from **snmpv1** or **snmpv2c** to **snmpv3**, then the **notify-community** parameter must be changed to reflect the *security-name* rather than the community string used by **snmpv1** or **snmpv2c**.

Pre-existing conditions are checked before the snmpv3SecurityName is accepted. These are:

- The username must be configured.
- The v3 access group must be configured.
- The v3 notification view must be configured.

**Values** snmpv1, snmpv2c, snmpv3

**Default** snmpv3

### **notify-community community | security-name**

Specifies the community string for **snmpv1** or **snmpv2c** or the **snmpv3** *security-name*. If no **notify-community** is configured, then no alarms nor traps will be issued for the trap destination. If the SNMP version is modified, the **notify-community** must be changed to the proper form for the SNMP version.

### **community**

The community string as required by the **snmpv1** or **snmpv2c** trap receiver. Allowed values are any string up to 31 characters, composed of printable, 7-bit ASCII characters. If

the string contains special characters (for example, #, \$, spaces), the entire string must be enclosed within double quotes.

### ***security-name***

The *security-name* as defined in the config>system>security>user context for SNMP v3. The *security-name* can be an ASCII string up to 31 characters in length.

### ***security-level {no-auth-no-privacy | auth-no-privacy | privacy}***

Specifies the required authentication and privacy levels required to access the views configured on this node when configuring an **snmpv3** trap receiver.

The keyword **no-auth-no-privacy** specifies no authentication and no privacy (encryption) are required.

The keyword **auth-no-privacy** specifies authentication is required but no privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication**.

The keyword **privacy** specifies both authentication and privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication** and **privacy**.

**Values** no-auth-no-privacy, auth-no-privacy, privacy

**Default** no-auth-no-privacy. This parameter can only be configured if SNMPv3 is also configured.

### **replay**

Enable replay of missed events to target. If replay is applied to an SNMP trap target address, the address is monitored for reachability. Reachability is determined by whether or not there is a route in the routing table by which the target address can be reached. Before sending a trap to a target address, the SNMP module asks the PIP module if there is either an in-band or out-of-band route to the target address. If there is no route to the SNMP target address, the SNMP module saves the sequence-id of the first event that will be missed by the trap target. When the routing table changes again so that there is now a route by which the SNMP target address can be reached, the SNMP module replays (for example, retransmits) all events generated to the SNMP notification log while the target address was removed from the route table. Because of route table change convergence time, it is possible that one or more events may be lost at the beginning or end of a replay sequence. The cold-start-wait and route-recovery-wait timers under config>log>app-route-notifications can help reduce the probability of lost events.

### **Platforms**

All

## trap-target

### **Syntax**

```
trap-target name [address ip-address] [port port] [snmpv1 | snmpv2c | snmpv3] notify-community
communityName | snmpv3SecurityName [security-level {no-auth-no-privacy | auth-no-privacy |
privacy}] [replay]
```

**no trap-target** *name*

## Context

[Tree] (config>log>snmp-trap-group trap-target)

## Full Context

configure log snmp-trap-group trap-target

## Description

This command configures a trap receiver and configures the operational parameters for the trap receiver. A trap reports significant events that occur on a network device such as errors or failures.

Before an SNMP trap can be issued to a trap receiver, the **log-id**, **snmp-trap-group** and at least one **trap-target** must be configured.

The **trap-target** command is used to add/remove a trap receiver from an **snmp-trap-group**. The operational parameters specified in the command include:

- The IP address of the trap receiver
- The UDP port used to send the SNMP trap
- SNMP version
- SNMP community name for SNMPv1 and SNMPv2c receivers.
- Security name and level for SNMPv3 trap receivers.

A single **snmp-trap-group** *log-id* can have multiple trap-receivers. Each trap receiver can have different operational parameters.

An address can be configured as a trap receiver more than once as long as a different port is used for each instance.

To prevent resource limitations, only configure a maximum of 10 trap receivers.

### Note:

If the same **trap-target** *name* **port** *port* parameter value is specified in more than one SNMP trap group, each trap destination should be configured with a different *notify-community* value. This allows a trap receiving an application, such as NMS, to reconcile a separate event sequence number stream for each router event log when multiple event logs are directed to the same IP address and port destination.

The **no** form of this command removes the SNMP trap receiver from the SNMP trap group.

## Parameters

### *name*

Specifies the name of the trap target, up to 28 characters.

### *ip-address*

Specifies the IP address of the trap receiver in dotted decimal notation. Only one IP address destination can be specified per trap destination group. ipv6 applies to the 7750 SR only.

### Values

ipv4-address    a.b.c.d (host bits must be 0)

ipv6-address    x:x:x:x:x:x[-interface]  
                   x:x:x:x:x:d.d.d[-interface]  
                   x: [0..FFFF]H  
                   d: [0..255]D  
                   interface: 32 characters maximum,  
                   mandatory for link local addresses

**port**

Specifies the destination UDP port used for sending traps to the destination, expressed as a decimal integer. Only one port can be specified per **trap-target** statement. If multiple traps need to be issued to the same address then multiple ports must be configured.

**Default**    162

**Values**    1 to 65535

**snmpv1 | snmpv2c | snmpv3**

Specifies the SNMP version format to use for traps sent to the trap receiver.

The keyword **snmpv1** selects the SNMP version 1 format. When specifying **snmpv1**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv1**, then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv2c** selects the SNMP version 2c format. When specifying **snmpv2c**, the **notify-community** must be configured for the proper SNMP community string that the trap receiver expects to be present in alarms and traps messages. If the SNMP version is changed from **snmpv3** to **snmpv2c**, then the **notify-community** parameter must be changed to reflect the community string rather than the *security-name* that is used by **snmpv3**.

The keyword **snmpv3** selects the SNMP version 3 format. When specifying **snmpv3**, the **notify-community** must be configured for the SNMP *security-name*. The security name is the name of a locally configured user. If the SNMP version is changed from **snmpv1** or **snmpv2c** to **snmpv3**, then the **notify-community** parameter must be changed to reflect the *security-name* rather than the community string used by **snmpv1** or **snmpv2c**.

The following conditions must all be met before traps will be issued using an SNMPv3 trap-target:

The user name must be configured, and must be configured with an snmp group that exists.

The v3 access group must be configured, or be one of the built-in SR OS views.

The v3 notification view must be configured, or be one of the built-in SR OS views.

**Default**    snmpv3

**Values**    snmpv1, snmpv2c, snmpv3

**community | security-name**

Specifies the community string for **snmpv1** or **snmpv2c** or the **snmpv3 security-name**. If the **notify-community** is not configured, then no alarms or traps will be issued for the trap destination. If the SNMP version is modified, the **notify-community** must be changed to the proper form for the SNMP version.

**community-name**

Specifies the community string as required by the **snmpv1** or **snmpv2c** trap receiver. Allowed values are any string up to 31 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, \$, spaces), the entire string must be enclosed within double quotes.

**security-name**

For SNMPv3 trap targets, specifies the *security-name* as defined in the **config>system>security>user** context. The *security-name* can be an ASCII string up to 31 characters in length.

**security-level {no-auth-no-privacy | auth-no-privacy | privacy}**

Specifies the required authentication and privacy levels required to access the views configured on this node when configuring an **snmpv3** trap receiver.

The keyword **no-auth-no-privacy** specifies no authentication and no privacy (encryption) are required.

The keyword **auth-no-privacy** specifies authentication is required but no privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication**.

The keyword **privacy** specifies both authentication and privacy (encryption) is required. When this option is configured the *security-name* must be configured for **authentication** and **privacy**.

**Default** **no-auth-no-privacy**. This parameter can only be configured if SNMPv3 is also configured.

**Values** no-auth-no-privacy, auth-no-privacy, privacy

**replay**

Enables the replay of missed events to target. If replay is applied to an SNMP trap target address, the address is monitored for reachability. Reachability is determined by whether or not there is a route in the routing table by which the target address can be reached. Before sending a trap to a target address, the SNMP module asks the PIP module if there is either an in-band or out-of-band route to the target address. If there is no route to the SNMP target address, the SNMP module saves the sequence-id of the first event that will be missed by the trap target. When the routing table changes again so that there is now a route by which the SNMP target address can be reached, the SNMP module replays (for example, retransmits) all events generated to the SNMP notification log while the target address was removed from the route table.

**Note:**

Due to route table change convergence time, it is possible that one or more events may be lost at the beginning or end of a replay sequence. The cold-

start-wait and route-recovery-wait timers under the **config>log>app-route-notifications** context can help reduce the probability of lost events.

```

### Context

[\[Tree\]](#) (tree)

### Full Context

tree

### Description

This command displays the command hierarchy structure of the current working context.

### Parameters

**detail**

Displays parameter information for each command shown in the tree output.

**flat**

Displays the full context on each line.

## Platforms

All

## 24.188 trigger

```
trigger
```

### Syntax

```
trigger trigger-type
```

## Context

[\[Tree\]](#) (config>subscr-mgmt>shcv-policy trigger)

## Full Context

configure subscriber-mgmt shcv-policy trigger

## Description

This command enables to context to configure SHCV triggers.

## Parameters

### *trigger-type*

Specifies the trigger SHCV properties for the subscriber management group-interface.

**Values** **ip-conflict** — Upon detecting an IP conflict for the new host, a trigger SHCV is sent using a unicast ARP/NS. The request verifies the old host's connectivity to the BNG. An unresponsive host is removed from the system, allowing the new host to connect. The new host must resend its address request in order to be created as an ESM host in the system.

**host-limit-exceeded** — Upon exceeding the limit for (**sla-profile host-limits** or **session-limits**, **sub-profile host-limits** or **session-limits**, **ipoe-session sap-session-limit**, **ipoe-session session-limit**, and **arp-host host-limit**), a trigger SHCV is sent. The request verifies the old host's connectivity to the BNG. An unresponsive host is removed from the system, allowing the new host to connect. The new host must resend its address request in order to be created as an ESM host in the system.

**inactivity** — A trigger SHCV is sent to the idle host to verify the host's connectivity to the BNG. An unresponsive host is removed from the system.

**mobility** — Detects an IP or MAC conflict between different SAPs. Upon detecting a MAC or an IP conflict, a trigger SHCV is sent. The request verifies the old host's connectivity to the BNG. An unresponsive host is removed from the system, allowing the new host to connect. The new host must resend its address request in order to be created as an ESM host in the system.

**mac-learning** — Specifies the trigger SHCV properties to learn the MAC address of static hosts. Upon a **no shutdown**, a trigger SHCV is sent to the host to learn the host's MAC address.

### Full Context

configure service vprn subscriber-interface group-interface wlan-gw mobility trigger

configure service ies subscriber-interface group-interface wlan-gw mobility trigger

### Description

This command specifies the type of packet used as a mobility trigger.

The **no** form of this command removes the parameters from the configuration and disables data-plane mobility.

### Parameters

#### **data**

Specifies that data traffic be used as a trigger.

#### **iapp**

Specifies that Inter Access Point Protocol (IAPP) messages be used as a trigger.

#### **control**

Specifies that control traffic can be used as a trigger.

### Platforms

## 24.189 trigger-alarm-msg

trigger-alarm-msg

## Syntax

trigger-alarm-msg *message-string*

no trigger-alarm-msg

## Context

[\[Tree\]](#) (config>system>alarm-contact-input trigger-alarm-msg)

## Full Context

configure system alarm-contact-input trigger-alarm-msg

## Description

This command configures a message string to send with SNMP trap and log event messages that are generated when the system generates an alarm. The system generates the default message "Alarm Input Triggered" if no message is configured. The **trigger-alarm-msg** string is included in the log event when the pin changes from the normal state.

The **no** form of this command reverts to the default message "Alarm Input Triggered".

## Default

no-trigger-alarm-msg

## Parameters

### *message-string*

Specifies a printable character string, up to 160 characters.

## Platforms

7750 SR-a

## 24.190 trigger-entry

### trigger-entry

## Syntax

[no] **trigger-entry** *entry-id*

## Context

[\[Tree\]](#) (config>log>event-trigger>event trigger-entry)

## Full Context

configure log event-trigger event trigger-entry

## Description

This command configures an instance of a trigger for an EHS handler. A trigger entry binds a set of matching criteria for a log event to a particular handler. If the log event occurs in the system and matches the criteria configured in the associated log filter then the handler will be executed.

The **no** form of this command removes the specified trigger entry.

**Parameters*****entry-id***

Specifies the identifier of the EHS event trigger entry.

**Values** 1 to 1500

**Platforms**

All

## 24.191 trigger-fault

### trigger-fault

**Syntax**

**trigger-fault** {**dying-gasp** | **critical-event**}

**no trigger-fault**

**Context**

[\[Tree\]](#) (config>port>ethernet>efm-oam trigger-fault)

**Full Context**

configure port ethernet efm-oam trigger-fault

**Description**

This command configures the appropriate flag field in the Information OAM PDU, bursting three consecutive packets during the off cycle. If the local port state is operational, this command changes the local port state to "Link Up". If the local port state is not operational, this configuration is installed as an EFM reason to prevent the port from returning to an Up operational state. This command can be used as a precursor to a port shutdown. This terminates the peering relationship without having to wait for protocol timeouts, assuming the peer supports the necessary action when receiving the dying gasp or critical event flag setting.

The **no** form of this command disables this functionality.

**Default**

no trigger-fault

**Parameters****dying-gasp**

Keyword to set the dying gasp flag.

**critical-event**

Keyword to set the critical event flag.

## Platforms

All

## 24.192 trigger-packet

### trigger-packet

#### Syntax

**trigger-packet** [dhcp] [pppoe] [arp] [dhcp6] [rtr-solicit] [data]

**no trigger-packet**

#### Context

[\[Tree\]](#) (config>service>vpls>sap trigger-packet)

#### Full Context

configure service vpls sap trigger-packet

#### Description

This command enables triggering packet to initiate RADIUS authentication that provides a service context. The authentication, together with the service context for this request, creates a managed SAP. The VLAN is the same as the triggering packet. This SAP behaves as a regular SAP but the configuration is not user-editable and not maintained in the configuration file. The managed SAP remains active as long as the session is active.

The **no** form of this command reverts to the default.

#### Parameters

##### dhcp

Specifies whether the receipt of DHCP trigger packets on this VPLS SAP when the keyword **capture-sap** is specified in the **sap** command creation string, will result in a RADIUS authentication that will provide a service context and the creation of a SAP with a value of managed.

##### pppoe

Specifies whether the receipt of PPPoE trigger packets on this VPLS SAP when the keyword **capture-sap** is specified in the **sap** command creation string, will result in a RADIUS authentication that will provide a service context and the creation of a SAP with a value of managed.

##### arp

Indicates that ARP is the type of trigger packets for this entry.

##### dhcp6

Indicates that DHCP6 is the type of trigger packets for this entry.

##### rtr-solicit

Indicates that router solicit is the type of trigger packets for this entry.

**data**

Indicates that data is the type of trigger packets for this entry.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**trigger-packet****Syntax**

[no] trigger-packet

**Context**

[\[Tree\]](#) (config>subscr-mgmt>git trigger-packet)

**Description**

This command configures the router to process the specified types of trigger packets on dynamic SAPs.

The **no** form of this command disables the processing of trigger packets.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 24.193 triggered-policy

**triggered-policy****Syntax**

[no] triggered-policy

**Context**

[\[Tree\]](#) (config>router triggered-policy)

**Full Context**

configure router triggered-policy

**Description**

This command triggers route policy re-evaluation.

By default, when a change is made to a policy in the **config router policy options** context and then committed, the change is effective immediately. There may be circumstances when the changes should or must be delayed; for example, if a policy change is implemented that would affect every BGP peer on a router, the consequences could be dramatic. It is more effective to control changes on a peer by peer basis.

If the **triggered-policy** command is enabled, and a given peer is established, and you want the peer to remain up, then, in order for a change to a route policy to take effect, a **clear** command with the **soft** or **soft-inbound** option must be used. In other words, when a **triggered-policy** is enabled, any routine policy change or policy assignment change within the protocol will not take effect until the protocol is reset or a clear command is issued to re-evaluate route policies; for example, **clear router bgp neighbor x.x.x.x soft**. This keeps the peer up and the change made to a route policy is applied only to that peer, or group of peers.

### Default

no triggered-policy

### Platforms

- configure service vprn interface dhcp trusted
- configure service ies interface dhcp trusted

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface dhcp trusted

## 24.198 trusted-mac-time

### trusted-mac-time

#### Syntax

**trusted-mac-time** *range*

#### Context

[\[Tree\]](#) (config>service>vpls>bgp-evpn>mac-duplication trusted-mac-time)

#### Full Context

configure service vpls bgp-evpn mac-duplication trusted-mac-time

#### Description

This command determines how long a MAC address needs to stay in the FDB as type learned without being flushed or changed in its type so that the MAC is declared as trusted for the mac-duplication procedures. If the MAC changes from SAP to SAP within the same VPLS service and node, the MAC does not reset its trusted MAC timer.

#### Default

trusted-mac-time 5

#### Parameters

***range***

Specifies the time, in minutes, before the MAC address can be flushed from the FDB.

**Values** 1 to 15

#### Platforms

All

## 24.199 trusted-server

### trusted-server

#### Syntax

**trusted-server** *address* [**create**]

configure system security tech-support ts-location

### Description

The **ts-location** command is used (along with an automatic system generated file name) when no *file-url* parameter is provided for the **admin tech-support** command. If **no ts-location** is defined then the operator must provide a file-url with the **admin tech-support** command itself.

The directory specified for the `ts-location` is not auto-created by SR OS. The operator must ensure that it exists.

See the **admin tech-support** command for more details about the system generated file name.

## Default

no `ts-location`

## Parameters

### *file-url*

Specifies the destination directory for auto-named tech-support files (when no *file-url* is specified with the **admin tech-support** command). The *file-url* for the **ts-location** must be a directory (no filename or extension). The root directory (for example, `cf1:\`) is blocked for local compact flash destinations. A sub-directory (for example, `cf2:\tech-support`) must be used if local cf is the location.

### Values

*local-url* | *remote-url*

*local-url*

[*cf-flash-id*]/[*file-path*] 200 chars max, including *cf-flash-id*

directory length 99 chars max each

*remote-url*

[ftp://*login:pswd@remote-locn*]/[*file-path*]

247 chars max

directory length 99 chars max each

*remote-locn*

[*hostname* | *ipv4-address* | "["*ipv6-address*"]" ]

*ipv4-address*

*a.b.c.d*

*ipv6-address*

*x:x:x:x:x:x:x[-interface]*

*x:x:x:x:x:d.d.d.d[-interface]*

*x* - [0 to FFFF]H

*d* - [0 to 255]D

interface - 32 chars max, for link local addresses

*cf-flash-id*

cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

## 24.202 ts-negotiation

### ts-negotiation

#### Syntax

**ts-negotiation ts-list** *list-name*

**no ts-negotiation**

#### Context

[\[Tree\]](#) (config>ipsec>client-db>client ts-negotiation)

#### Full Context

configure ipsec client-db client ts-negotiation

#### Description

This command specifies the traffic selector (TS) to be used for tunnel setup.

The no form of this command reverts to the default.

#### Default

no ts-negotiation

#### Parameters

***list-name***

Specifies the TS list used by this tunnel, up to 32 characters.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### ts-negotiation

#### Syntax

**ts-negotiation ts-list** *list-name*

**no ts-negotiation**

#### Context

[\[Tree\]](#) (config>service>vpn>if>sap>ipsec-gw ts-negotiation)

[\[Tree\]](#) (config>service>ies>if>sap>ipsec-gw ts-negotiation)

#### Full Context

configure service vpn interface sap ipsec-gw ts-negotiation

```
configure service ies interface sap ipsec-gw ts-negotiation
```

### Description

This command enables the IKEv2 traffic selector negotiation with the specified ts-list.

### Parameters

*list-name*

Specifies the ts-list name

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.203 ts-sync-loss

```
ts-sync-loss
```

### Syntax

```
[no] ts-sync-loss
```

### Context

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>bundle>video>analyzer>alarms ts-sync-loss)

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>bundle>channel>source-override>video>analyzer>alarms ts-sync-loss)

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>bundle>channel>video>analyzer>alarms ts-sync-loss)

### Full Context

```
configure mcast-management multicast-info-policy bundle video analyzer alarms ts-sync-loss
```

```
configure mcast-management multicast-info-policy bundle channel source-override video analyzer alarms ts-sync-loss
```

```
configure mcast-management multicast-info-policy bundle channel video analyzer alarms ts-sync-loss
```

### Description

This command configures the analyzer to check for synchronization loss errors.

### Default

```
no ts-sync-loss
```

### Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 24.204 ttl

```
ttl
```

### Syntax

```
ttl value
```

### Context

[\[Tree\]](#) (config>subscr-mgmt>pfcp-association>tx ttl)

### Full Context

```
configure subscriber-mgmt pfcp-association tx ttl
```

### Description

This command configures initial TTL value that is sent in the IP header.

### Default

```
ttl 255
```

### Parameters

*value*

Specifies the TTL value, in seconds.

This value must be identical on both the BNG UPF and CPF. For information about the BNG CUPS CPF configuration, refer to the *CMG BNG CUPS Control Plane Function Guide* and the *7750 SR MG and CMG CLI Reference Guide*.

**Values** 1 to 255

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
ttl
```

### Syntax

```
ttl label-ttl
```

```
no ttl
```

### Context

[\[Tree\]](#) (config>saa>test>type-multi-line>lsp-ping ttl)

[\[Tree\]](#) (config>saa>test>type-multi-line>lsp-ping>sr-policy ttl)

## Full Context

```
configure saa test type-multi-line lsp-ping ttl
configure saa test type-multi-line lsp-ping sr-policy ttl
```

## Description

This command configures a time-to-live value for the MPLS label.  
The **no** form of this command reverts to the default value.

## Default

```
ttl 255
```

## Parameters

### *label-ttl*

Specifies the time-to-live value.

**Values** 1 to 255

**Default** 255

## Platforms

All

```
ttl
```

## Syntax

```
ttl min-ttl min-label-ttl max-ttl max-label-ttl
```

```
no ttl
```

## Context

[\[Tree\]](#) (config>saa>test>type-multi-line>lsp-trace>sr-policy ttl)

## Full Context

```
configure saa test type-multi-line lsp-trace sr-policy ttl
```

## Description

This command configures minimum and maximum time-to-live values.  
The **no** form of this command removes the configuration.

## Parameters

### *min-label-ttl*

Specifies the minimum TTL value in the MPLS label for the LSP trace test, expressed as a decimal integer.

**Values** 1 to 255

**Default** 1

### ***max-label-ttl***

Specifies the maximum TTL value in the MPLS label for the LDP tree trace test, expressed as a decimal integer.

**Values** 1 to 255

**Default** 30

## **Platforms**

All

**ttl**

## **Syntax**

**ttl** *time-to-live*

**no ttl**

## **Context**

[\[Tree\]](#) (config>oam-pm>session>ip ttl)

## **Full Context**

configure oam-pm session ip ttl

## **Description**

This command defines the value of the TTL field of the packet header.

The **no** form of this command restores the default value.

## **Default**

ttl 225

## **Parameters**

### ***time-to-live***

Specifies the value to be used in the TTL field.

**Values** 1 to 255

**Default** 255

## **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

---

```
t
```

### Syntax

```
tll time-to-live
```

```
no tll
```

### Context

```
[Tree] (config>oam-pm>session>mpls tll)
```

### Full Context

```
configure oam-pm session mpls tll
```

### Description

This command defines the value of the MPLS TTL for DM packets.

The **no** form of this command reverts the default value.

### Default

```
tll 255
```

### Parameters

*time-to-live*

Specifies the value to be used in the TTL field.

**Values** 1 to 255

**Default** 255

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

no tll
```

### Context

```
[Tree] (config>test-oam>icmp>ping-template tll)
```

### Full Context

```
configure test-oam icmp ping-template tll
```

## Description

This command configures the TTL value used in the outgoing ping packet. The interface being tested must be directly connected on the same subnet.

The **no** form of this command reinstates the default value for TTL.

## Default

tll 1

## Parameters

**value**

Specifies the value to be used in the TTL field.

**Values** 1 to 255

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tll

## Syntax

## Context

[\[Tree\]](#) (config>test-oam>link-meas>template>twl tll)

## Full Context

configure test-oam link-measurement measurement-template twamp-light tll

## Description

This command configures the Time to Live (TTL) value in the TWAMP Light test packet.

## Default

tll 1

## Parameters

**time-to-live**

Specifies the value to be used in the TTL field.

**Values** 1 to 255

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## tll

### Syntax

```
tll {lt | gt | eq} ttl-value
tll range ttl-value ttl-value
no tll
```

### Context

[\[Tree\]](#) (config>filter>ip-filter>entry>match tll)

### Full Context

```
configure filter ip-filter entry match tll
```

### Description

This command configures the Time To Live (TTL) match criteria.  
The **no** form of this command removes the configuration.

### Default

```
no tll
```

### Parameters

**lt**

Specifies "less than". The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.

**gt**

Specifies "greater than". The **gt** parameter cannot be used with the highest possible numerical value for the parameter.

**eq**

Specifies "equal to".

**ttl-value**

Specifies the maximum TTL value.

**Values** 0 to 255

### Platforms

## 24.205 tll-expired

## ttl-expired

### Syntax

**ttl-expired** *number seconds*  
**no ttl-expired** [*number seconds*]

### Context

**[Tree]** (config>service>ies>if>icmp ttl-expired)

### Full Context

configure service ies interface icmp ttl-expired

### Description

This command configures the rate Internet Control Message Protocol (ICMP) TTL expired messages are issued by the IP interface.

By default, generation of ICMP TTL expired messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of this command disables the limiting the rate of TTL expired messages on the router interface and reverts to the default values.

### Default

ttl-expired 100 10

### Parameters

#### *number*

The maximum number of ICMP TTL expired messages to send, expressed as a decimal integer. This parameter must be specified with the *seconds* parameter.

**Values** 10 to 2000

#### *seconds*

The time frame in seconds used to limit the *number* of ICMP TTL expired messages that can be issued, expressed as a decimal integer.

**Values** 1 to 60

### Platforms

All

## ttl-expired

### Syntax

## 24.208 ttl-security

### ttl-security

#### Syntax

**ttl-security** *min-ttl-value*

**no ttl-security**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>bgp-prng-plcy ttl-security)

#### Full Context

configure subscriber-mgmt bgp-peering-policy ttl-security

#### Description

This command configures the TTL security parameters for incoming packets.

The **no** form of this command reverts to the default.

#### Parameters

*min-ttl-value*

Specifies the minimum TTL value for an incoming BGP packet.

**Values** 1 to 255

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### ttl-security

#### Syntax

**ttl-security** *min-ttl-value*

**no ttl-security**

#### Context

[\[Tree\]](#) (config>service>vprn>bgp>group ttl-security)

[\[Tree\]](#) (config>service>vprn>bgp>group>neighbor ttl-security)

#### Full Context

configure service vprn bgp group ttl-security

configure service vprn bgp group neighbor ttl-security

## Description

Configure TTL security parameters for incoming packets.

## Parameters

### *min-ttl-value*

Specifies the minimum TTL value for an incoming BGP packet.

**Values** 1 to 255

**Default** 1

## Platforms

All

## ttl-security

## Syntax

**ttl-security** *min-ttl-value*

**no ttl-security**

## Context

[\[Tree\]](#) (config>router>ldp>tcp-session-params>peer-transport ttl-security)

[\[Tree\]](#) (config>router>bgp>group>neighbor ttl-security)

[\[Tree\]](#) (config>system>login-control>ssh ttl-security)

[\[Tree\]](#) (config>router>bgp>group ttl-security)

[\[Tree\]](#) (config>system>login-control>telnet ttl-security)

## Full Context

configure router ldp tcp-session-parameters peer-transport ttl-security

configure router bgp group neighbor ttl-security

configure system login-control ssh ttl-security

configure router bgp group ttl-security

configure system login-control telnet ttl-security

## Description

This command configures TTL security parameters for incoming packets. When the feature is enabled, LDP will accept incoming IP packets from a peer only if the TTL value in the packet is greater than or equal to the minimum TTL value configured for that peer. Per-peer-queueing must be enabled in order for TTL protection to operate.

The **no** form of this command disables TTL security.

## Parameters

### *min-ttl-value*

Specifies the minimum TTL value for an incoming BGP packet.

**Values** 1 to 255

## Platforms

All

## 24.209 tunnel

### tunnel

## Syntax

**tunnel** *tunnel-name* [**create**]

**no tunnel** *tunnel-name*

## Context

[\[Tree\]](#) (config>service>vprn>l2tp>group tunnel)

[\[Tree\]](#) (config>router>l2tp>group tunnel)

## Full Context

configure service vprn l2tp group tunnel

configure router l2tp group tunnel

## Description

This command configures an L2TP tunnel. A tunnel exists between a LAC-LNS pair and consists of a Control Connection and zero or more L2TP sessions. The tunnel carries encapsulated PPP datagrams and control messages between the LAC and the L2TP Network Server (LNS).

The **no** form of this command removes the tunnel name from the configuration.

## Parameters

### *tunnel-name*

Specifies a valid string to identify an L2TP, up to 32 characters.

### **create**

Mandatory keyword to create a new tunnel.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## tunnel

### Syntax

**tunnel** *connection-id*

### Context

[\[Tree\]](#) (debug>router>l2tp tunnel)

### Full Context

debug router l2tp tunnel

### Description

This command enables debugging for an L2TP tunnel.

### Parameters

***connection-id***

Specifies the connection ID of the L2TP session associated with this session.

**Values** 1 to 4294967295

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## tunnel

### Syntax

**tunnel** *service-id* **backbone-dest-mac** *mac-name* **isid** *ISID*

**tunnel** *service-id* **backbone-dest-mac** *ieee-address* **isid** *ISID*

**no tunnel**

### Context

[\[Tree\]](#) (config>service>epipe>pbb tunnel)

### Full Context

configure service epipe pbb tunnel

### Description

This command configures a Provider Backbone Bridging (PBB) tunnel with Backbone VPLS (B-VPLS) service information.

### Parameters

***service-id***

Specifies the B-VPLS service for the PBB tunnel associated with this service.

**Values** *service-id*: 1 to 2147483648  
*svc-name*: 64 characters maximum

**backbone-dest-mac *mac-name***

Specifies the backbone destination MAC name for PBB packets up to 32 characters in length.

**backbone-dest-mac *ieee-address***

Specifies the backbone destination MAC-address for PBB packets as xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx.

**isid *ISID***

Specifies a 24 bit service instance identifier for the PBB tunnel associated with this service. As part of the PBB frames, it is used at the destination PE as a demultiplexer field.

**Values** 0 to 16777215

**Platforms**

All

tunnel

**Syntax**

**tunnel** *ipsec-tunnel-name* [**detail**] [**no-dpd-debug**] [**display-keys**]  
**no tunnel** *ipsec-tunnel-name*

**Context**

[\[Tree\]](#) (debug>ipsec tunnel)

**Full Context**

debug ipsec tunnel

**Description**

This command enables debugging for specified IPsec tunnel.

**Note:**

Up to 16 IPsec tunnels are allowed, to enable debugging, at a time.

**Parameters**

***ipsec-tunnel-name***

Specifies the name of ipsec-tunnel, up to 32 characters.

**detail**

Displays detailed debug information.

**no-dpd-debug**

Stops logging IKEv1 and IKEv2 DPD events for less noise during debug.

### display-keys

Specifies the IKE-SA and CHILD-SA keys for inclusion in the debug output.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## tunnel

### Syntax

[no] **tunnel** *ip-address*

### Context

[\[Tree\]](#) (debug>router>rib-api tunnel)

### Full Context

debug router rib-api tunnel

### Description

This command enables debugging for the specified RIB-API tunnel.

### Parameters

#### *ip-address*

Specifies the IPv4 or IPv6 address of the RIB-API tunnel.

#### Values

ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

#### Full Context

configure router ldp tunnel-down-damp-time

#### Description

This command specifies the time interval (in s), that LDP waits before posting a tunnel down event to the Tunnel Table Manager (TTM).

When LDP can no longer resolve a FEC and de-activates it, it de-programs the NHLFE in the data path. It will however delay deleting the LDP tunnel entry in the TTM until the tunnel-down-damp-time timer expires. This means users of the LDP tunnel, such as SDPs (all services) and BGP (L3 VPN), will not be notified immediately. Traffic is still blackholed because the forwarding engine NHLFE has been de-programmed.

If the FEC gets resolved before the tunnel-down-damp-time timer expires, then LDP programs the forwarding engine with the new NHLFE and performs a tunnel modify event in TTM updating the dampened entry in TTM with the new NHLFE information. If the FEC does not get resolved and the tunnel-down-damp-time timer expires, LDP posts a tunnel down event to TTM which deletes the LDP tunnel.

When there is an upper layer (user of LDP) which depends of LDP control plane for failover detection then label withdrawal delay and tunnel-down-damp-time options must be set to 0.

An example is pseudowire redundancy where the primary PW does not have its own fast failover detection mechanism and the node depends on LDP tunnel down event to activate the standby PW.

The **no** form of this command resumes the default value of this command.

#### Default

no tunnel-down-damp-time (which equals a value of 3 seconds)

#### Parameters

##### **seconds**

Specifies the time interval (in s), that LDP waits before posting a tunnel down event to the Tunnel Table Manager.

#### Platforms

All

## 24.213 tunnel-elmi

```
tunnel-elmi
```

### Syntax

```
[no] tunnel-elmi
```

### Context

[\[Tree\]](#) (config>service>vpls tunnel-elmi)

### Full Context

```
configure service vpls tunnel-elmi
```

### Description

This command enables the tunneling of E-LMI packets in a VPLS service. The following must also be the case for this command to function:

- the **configure port ethernet elmi mode uni-n** command is not configured
- the **configure service vpls tunnel-elmi true** command is enabled
- the E-LMI packets map to that VPLS service

This command configures E-LMI packets in a VPLS service to be tunneled when the **configure port ethernet elmi mode uni-n** is not configured and the **configure service vpls tunnel-elmi** is enabled and the E-LMI packets map to that VPLS service.

The **no** form of this command disables tunneling of the E-LMI packets for a VPLS service.

### Default

```
no tunnel-elmi
```

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

debug oam build-packet packet field-override header gtp-user tunnel-endpoint-id

### Description

This command debugs the GTP tunnel endpoint ID for the GTP user header.

The **no** form of this command removes the tunnel endpoint ID value.

### Default

no override

### Parameters

***tunnel-endpoint-id***

Specifies the GTP tunnel endpoint ID to be used in the test GTP header.

**Values** 0 to 4294967295

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 24.218 tunnel-far-end

## tunnel-far-end

### Syntax

**tunnel-far-end** *ip-address* | *ipv6-address*

**no tunnel-far-end** [*ip-address* | *ipv6-address*]

### Context

[\[Tree\]](#) (config>service>sdp tunnel-far-end)

## Full Context

```
configure service sdp tunnel-far-end
```

## Description

This command enables the user to specify an SDP tunnel destination address that is different from the configuration in the SDP far-end option. The SDP must be shutdown first to add or change the configuration of the **tunnel-far-end** option.

When this option is enabled, service packets are encapsulated using an LDP LSP with a FEC prefix matching the value entered in ip-address. By default, service packets are encapsulated using an LDP LSP with a FEC prefix matching the address entered in the SDP far-end option.

The T-LDP session to the remote PE is still targeted to the address configured under the **far-end option**. This means that targeted hello messages are sent to the far-end address, which is also the LSR-ID of the remote node. TCP based LDP messages, such as initialization and label mapping messages, are sent to the address specified in the transport-address field of the "hello" message received from the remote PE. This address can be the same as the remote PE LSR-ID, or a different address. This feature works, however, if the signaling option in the SDP is set to off instead of tldp, in which case, the service labels are statically configured.

This feature operates on an SDP of type LDP only. It can be used with VLL, VPLS, and VPRN services when an explicit binding to an SDP with the **tunnel-far-end** is specified. It also operates with a spoke interface on an IES or VPRN service. Finally, this feature operates with a BGP AD based VPLS service when the **use-provisioned-sdp** option is enabled in the pseudowire template.

This feature is not supported in an SDP of type MPLS when an RSVP LSP name is configured under the SDP. It also does not work with a mixed-lsp SDP.

The **no** form of this command disables the use of the **tunnel-far-end** option and returns to using the address specified in the far-end.

## Default

```
no tunnel-far-end
```

## Parameters

***ip-address* | *ipv6-address***

Specifies the system address of the far-end router for the SDP in dotted decimal notation.

## Platforms

All

```

## Description

Allows the individual service SAPs to react to changes in the tunnel MEP state. When tunnel-fault accept is configured at the service level, the SAP will react according to the service type, Epipe will set the operational flag and VPLS, IES and VPRN SAP operational state will become down on failure or up on clear. This command triggers the OAM mapping functions to mate SAPs and bindings in an Epipe service as well as setting the operational flag. If AIS generation is the requirement for the Epipe services this command is not required. See the **ais-enable** command under the **config>service>epipe>sap>eth-cfm>ais-enable** context for more details. This works in conjunction with the tunnel-fault accept on the individual SAPs. Both must be set to accept to react to the tunnel MEP state. By default the service level command is "ignore" and the SAP level command is "accept". This means simply changing the service level command to "accept" will enable the feature for all SAPs. This is not required for Epipe services that only wish to generate AIS on failure.

**Default**

tunnel-fault ignore (Service Level)

tunnel-fault accept (SAP Level for Epipe and VPLS)

**Parameters****accept**

Shares fate with the facility tunnel MEP.

**ignore**

Does not share fate with the facility tunnel MEP.

**Platforms**

**no tunnel-group** *tunnel-group-id*

**Context**

[\[Tree\]](#) (config>isa tunnel-group)

## Full Context

configure isa tunnel-group

## Description

This command allows a tunnel group to be created or edited. A tunnel group is a set of one or more MS-ISAs that support the origination and termination of IPsec and IP/GRE tunnels. All of the MS-ISAs in a tunnel group must have **isa-tunnel** as their configured mda-type. On VSR, **isa-scale-mode** must be specified, which defines the number of tunnels on each ISA.

The **no** form of this command deletes the specified tunnel group from the configuration

## Parameters

### *tunnel-group-id*

Identifies the tunnel group.

**Values** 1 to 16

### *isa-scale-mode*

Defines the maximum number of tunnels (all types combined) which can be established on each ISA of the tunnel group and for the whole tunnel-group.

**Values** tunnel-limit-32k, where k equals 1024

### **create**

Mandatory keyword used when creating tunnel group in the ISA context. The create keyword requirement can be enabled or disabled in the **environment>create** context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

[Tree] (config>router tunnel-interface)

### Full Context

configure router igmp tunnel-interface

configure router tunnel-interface

### Description

This command creates a tunnel interface associated with an RSVP P2MP LSP. IPv4 multicast packets are forwarded over the P2MP LSP at the ingress LER based on a static join configuration of the multicast group against the tunnel interface associated with the originating P2MP LSP. At the egress LER, packets of a multicast group are received from the P2MP LSP via a static assignment of the specific <S,G> to the tunnel interface associated with a terminating LSP.

At ingress LER, the tunnel interface identifier consists of a string of characters representing the LSP name for the RSVP P2MP LSP. The user can create one or more tunnel interfaces and associate each to a different RSVP P2MP LSP.

At egress LER, the tunnel interface identifier consists of a couple of string of characters representing the LSP name for the RSVP P2MP LSP followed by the system address of the ingress LER. The LSP name must correspond to a P2MP LSP name configured by the user at the ingress LER. The LSP name string must not contain "::" (two :s) nor contain ":" (single ":") at the end of the LSP name. However, a ":" (single ":") can appear anywhere in the string except at the end of the name.

### Parameters

#### **rsvp-p2mp** *lsp-name*

Specifies the LSP. The LSP name can be up to 32 characters long and must be unique.

#### **ldp-p2mp** *p2mp-id*

Identifier used for signaling MLDP P2MP LSP.

**Values** 1 to 4294967296 (on leaf node)  
1 to 8192 (on root node)

#### **sender** *sender-address*

Specifies the sender IP address: a.b.c.d.

### Full Context

configure router pim tunnel-interface

## Description

This command creates a tunnel interface associated with an RSVP P2MP LSP. IPv4 multicast packets are forwarded over the P2MP LSP at the ingress LER based on a static join configuration of the multicast group against the tunnel interface associated with the originating P2MP LSP. At the egress LER, packets of a multicast group are received from the P2MP LSP via a static assignment of the specific <S,G> to the tunnel interface associated with a terminating LSP.

At ingress LER, the tunnel interface identifier consists of a string of characters representing the LSP name for the RSVP P2MP LSP. The user can create one or more tunnel interfaces in PIM and associate each to a different RSVP P2MP LSP.

At egress LER, the tunnel interface identifier consists of a couple of string of characters representing the LSP name for the RSVP P2MP LSP followed by the system address of the ingress LER. The LSP name must correspond to a P2MP LSP name configured by the user at the ingress LER. The LSP name string must not contain ":::" (two :s) nor contain ":" (single ":") at the end of the LSP name. However, a ":" (single ":") can appear anywhere in the string except at the end of the name.

The **no** form of this command removes the tunnel parameters.

## Parameters

**Full Context**

configure service vprn nat inside dual-stack-lite address tunnel-mtu

configure router nat inside dual-stack-lite address tunnel-mtu

**Description**

This command configures the DS-Lite tunnel MTU for this DS-Lite address.

The **no** form of this command reverts the default.

**Default**

tunnel-mtu 1500

**Parameters*****mtu-bytes***

Specifies the DS-Lite tunnel MTU.

**Values** 512 to 9212

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## tunnel-mtu

### Syntax

**tunnel-mtu** *mtu-bytes*

**no tunnel-mtu**

### Context

**[Tree]** (config>router>nat>inside>dual-stack-lit>address tunnel-mtu)

### Full Context

configure router nat inside dual-stack-lit address tunnel-mtu

### Description

This command sets the size of the payload in IPv6 packet in downstream DS-Lite direction. The payload is, in essence, the tunneled IPv4 packet.

## tunnel-mtu

### Syntax

**tunnel-mtu** *bytes*

**no tunnel-mtu**

### Context

**[Tree]** (config>router>isis>segment-routing tunnel-mtu)

### Full Context

configure router isis segment-routing tunnel-mtu

### Description

This command configures the MTU of all SR tunnels within each IGP instance.

The MTU of a SR tunnel populated into TTM is determined like in the case of an IGP tunnel; for example, LDP LSP, based on the outgoing interface MTU minus the label stack size. Remote LFA can add, at most, one more label to the tunnel for a total of two labels. There is no default value for this command. If the user does not configure an SR tunnel MTU, the MTU is determined by IGP as explained below.

The MTU of the SR tunnel in bytes is then determined as follows:

$$SR\_Tunnel\_MTU = MIN \{Cf\_g\_SR\_MTU, IGP\_Tunnel\_MTU - (1 + frr-overhead) * 4\}$$

Where:

*Cfg\_SR\_MTU* is the MTU configured by the user for all SR tunnels within a given IGP instance using the above CLI. If no value was configured by the user, the SR tunnel MTU will be determined by the IGP interface calculation explained next.

*IGP\_Tunnel\_MTU* is the minimum of the IS-IS or OSPF interface MTU among all the ECMP paths or among the primary and LFA backup paths of this SR tunnel.

*frr-overhead* is set to 1 if **segment-routing** and **remote-lfa** options are enabled in the IGMP instance. Otherwise, it is set to 0.

The SR tunnel MTU is dynamically updated anytime any of the above parameters used in its calculation changes. This includes when the set of the tunnel next-hops changes or the user changes the configured SR MTU or interface MTU value.

## Default

no tunnel-mtu

## Parameters

### *bytes*

Specifies the size of the Maximum Transmission Unit (MTU) in bytes.

**Values** 512 to 9786

## Platforms

All

## tunnel-mtu

## Syntax

**tunnel-mtu** *bytes*

**no tunnel-mtu**

configure router ospf3 segment-routing tunnel-mtu

## Description

This command configures the MTU of all SR tunnels within each IGP instance.

The MTU of a SR tunnel populated into the TTM is determined as the same as an IGP tunnel; for example, for an LDP LSP, based on the outgoing interface MTU minus the label stack size. Remote LFA can add, at most, one more label to the tunnel for a total of two labels. There is no default value for this command. If the user does not configure an SR tunnel MTU, the MTU will be determined by IGP as follows:

The MTU of the SR tunnel in bytes is then determined as follows:

$$SR\_Tunnel\_MTU = MIN \{ Cfg\_SR\_MTU, IGP\_Tunnel\_MTU - (1 + frr-overhead) \times 4 \}$$

Where:

- *Cfg\_SR\_MTU* is the MTU configured by the user for all SR tunnels within an IGP instance using the `tunnel-mtu` command. If no value is configured by the user, the SR tunnel MTU is determined by the IGP interface calculation explained in the next bullet point.
- *IGP\_Tunnel\_MTU* is the minimum of the IS-IS or OSPF interface MTU among all the ECMP paths or among the primary and LFA backup paths of this SR tunnel.
- *frr-overhead* is set to 1 if the **segment-routing** and **remote-lfa** options are enabled in the IGMP instance. Otherwise, it is set to 0.

The SR tunnel MTU is dynamically updated whenever any of the above parameters used in its calculation changes. This includes if the set of the tunnel next-hops changes or the user changes the configured SR MTU or interface MTU value.

### Default

no tunnel-mtu

### Parameters

#### *bytes*

Specifies the size of the MTU in bytes.

**Values** 512 to 9786

### Platforms

All

## 24.226 tunnel-nearest-bridge

### tunnel-nearest-bridge

### Syntax

[no] **tunnel-nearest-bridge**

### Context

**[Tree]** (cfg>port>eth>lldp>dstmac tunnel-nearest-bridge)

### Full Context

configure port ethernet lldp dest-mac tunnel-nearest-bridge

### Description

This command allows LLDP packets received on the port with the destination address of the nearest bridge to be tunneled without being intercepted on the local port. The `dest-mac nearest-bridge` must be disabled for tunneling to occur. This is applicable to NULL SAP Epipe and VPLS services only.

**Default**

no tunnel-nearest-bridge

**Platforms**

All

tunnel-next-hop
```

**Syntax**

```
tunnel-next-hop
```

**Context**

[\[Tree\]](#) (config>router>isis>igp-shortcut tunnel-next-hop)

**Full Context**

```
configure router isis igp-shortcut tunnel-next-hop
```

**Description**

Commands in this context configure the resolution of IGP IPv4 prefix families, IGP IPv6 prefix families, SR-ISIS IPv4 tunnel families, SR-ISIS IPv6 tunnel families, and SR-OSPF IPv4 tunnel families using IGP shortcuts.

The **resolution** node is introduced to provide flexibility in the selection of the tunnel types for each of the IP prefix and SR tunnel families.

The IPv4 **family** option causes the IS-IS or OSPF SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv4 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv4 prefixes owned by this node or for which this node is the IPv4 next hop.

The IPv6 **family** option causes the IS-IS or OSPFv3 SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv6 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv6 prefixes owned by this node or for which this node is the IPv6 next-hop. The resolution of IPv6 prefixes is supported in OSPFv3 and in both IS-IS MT=0 and MT=2.

The IS-IS and OSPFv3 IPv6 routes resolved to IPv4 IGP shortcuts are used to:

- forward packets of IS-IS or OSPFv3 prefixes matching these routes
- forward CPM-originated IPv6 packets
- resolve the BGP next hop of BGP IPv6 prefixes
- resolve the indirect next hop of static IPv6 routes

In the data path, a packet for an IPv6 prefix has a label stack that consists of the IPv6 Explicit-Null label value of 2 at the bottom of the label stack followed by the label stack of the IPv4 RSVP-TE LSP.

There is no default behavior for IPv4 prefixes to automatically resolve to RSVP-TE or SR-TE LSPs used as IGP shortcuts by only enabling the **igp-shortcut** context. Instead, the user must enable the **ipv4 family** or **ipv6 family** and set the resolution to the value of **rsvp-te** to select the RSVP-TE tunnel type, or to the value of **sr-te** to select the SR-TE tunnel type.

Setting the **resolution** to the **any** value means that IGP selects the tunnels used as IGP shortcuts according to the TTM preference for the tunnel type. The RSVP-TE LSP type is of higher priority than the SR-TE LSP type.

An IP prefix of family=ipv4 or family=ipv6 always resolves to a single type of tunnel **rsvp-te** or **sr-te**. **Rsvp-te** type is preferred if both types are allowed by the prefix family resolution and both types exist in the set of tunnel next-hops of the prefix. The feature does not support mixing tunnel types per prefix.

If **resolution** for the IPv4 or IPv6 family is set to **disabled**, the corresponding prefixes are resolved to IP next-hops in the multicast routing table.

The **srv4 family** enables the resolution of SR-OSPF IPv4 tunnels and SR-ISIS IPv4 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-OSPF or an SR-ISIS IPv4 tunnel.

The **srv6 family** enables the resolution of SR-ISIS IPv6 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-ISIS IPv6 tunnel.

One or more RSVP-TE LSPs can be selected if **resolution=match-family-ip** and the corresponding IPv4 or IPv6 prefix resolves to RSVP-TE LSPs.

**Note:**

An SR tunnel cannot resolve to SR-TE IGP shortcuts.

If **resolution** for the SRv4 or SRv6 tunnel family is set to **disabled**, the corresponding tunnels are resolved to IP next-hops in the multicast routing table.

To enable (disable) IGP shortcuts in the IGP instance, the user must perform a **shutdown** or **no shutdown** in the **igp-shortcut** context.

## tunnel-next-hop

### Syntax

**tunnel-next-hop**

### Context

**[Tree]** (config>router>ospf3>igp-shortcut tunnel-next-hop)

**[Tree]** (config>router>ospf>igp-shortcut tunnel-next-hop)

### Full Context

configure router ospf3 igp-shortcut tunnel-next-hop

configure router ospf igp-shortcut tunnel-next-hop

### Description

Commands in this context configure the resolution of IGP IPv4 prefix families, IGP IPv6 prefix families, SR-ISIS IPv4 tunnel families, SR-ISIS IPv6 tunnel families, and SR-OSPF IPv4 tunnel families using IGP shortcuts.

The **resolution** node is introduced to provide flexibility in the selection of the tunnel types for each of the IP prefix and SR tunnel families.

The IPv4 **family** option causes the IS-IS or OSPF SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv4 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv4 prefixes owned by this node or for which this node is the IPv4 next hop.

The IPv6 **family** option causes the IS-IS or OSPFv3 SPF to include the IPv4 IGP shortcuts in the IP reach calculation of IPv6 nodes and prefixes. RSVP-TE or SR-TE LSPs terminating on a node identified by its router ID can be used to reach IPv6 prefixes owned by this node or for which this node is the IPv6 next hop. The resolution of IPv6 prefixes is supported in OSPFv3 and in both IS-IS MT=0 and MT=2.

The IS-IS and OSPFv3 IPv6 routes resolved to IPv4 IGP shortcuts are used to:

- forward packets of IS-IS or OSPFv3 prefixes matching these routes
- forward CPM-originated IPv6 packets
- resolve the BGP next hop of BGP IPv6 prefixes
- resolve the indirect next hop of static IPv6 routes

In the data path, a packet for an IPv6 prefix has a label stack that consists of the IPv6 Explicit-Null label value of 2 at the bottom of the label stack followed by the label stack of the IPv4 RSVP-TE LSP.

There is no default behavior for IPv4 prefixes to automatically resolve to RSVP-TE or SR-TE LSPs used as IGP shortcuts by only enabling the **igp-shortcut** context. Instead, the user must enable the **ipv4 family** or **ipv6 family** and set the resolution to the value of **rsvp-te** to select the RSVP-TE tunnel type, or to the value of **sr-te** to select the SR-TE tunnel type.

Setting the **resolution** to the **any** value means that IGP selects the tunnels used as IGP shortcuts according to the TTM preference for the tunnel type. The RSVP-TE LSP type is of higher priority than the SR-TE LSP type.

An IP prefix of family=ipv4 or family=ipv6 always resolves to a single type of tunnel **rsvp-te** or **sr-te**. **Rsvp-te** type is preferred if both types are allowed by the prefix family resolution and both types exist in the set of tunnel next-hops of the prefix. The feature does not support mixing tunnel types per prefix.

If **resolution** for the IPv4 or IPv6 family is set to **disabled**, the corresponding prefixes are resolved to IP next-hops in the multicast routing table.

The **srv4 family** enables the resolution of SR-OSPF IPv4 tunnels and SR-ISIS IPv4 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-OSPF or an SR-ISIS IPv4 tunnel.

The **srv6 family** enables the resolution of SR-ISIS IPv6 tunnels in MT=0 over RSVP-TE IPv4 IGP shortcuts. A maximum of 32 ECMP tunnel next-hops can be programmed for an SR-ISIS IPv6 tunnel.

One or more RSVP-TE LSPs can be selected if **resolution=match-family-ip** and the corresponding IPv4 or IPv6 prefix resolves to RSVP-TE LSPs.

**Note:**

An SR tunnel cannot resolve to SR-TE IGP shortcuts.

If **resolution** for the SRv4 or SRv6 tunnel family is set to **disabled**, the corresponding tunnels are resolved to IP next-hops in the multicast routing table.

To enable or disable IGP shortcuts in the IGP instance, the user must perform a **shutdown** or **no shutdown** in the **igp-shortcut** context.

## 24.228 tunnel-port-policy

### tunnel-port-policy

**Syntax**

**tunnel-port-policy** [*tunnel-port-policy*]

**no tunnel-port-policy**

**Context**

**[Tree]** (config>isa>wlan-gw-group tunnel-port-policy)

**Full Context**

configure isa wlan-gw-group tunnel-port-policy

## Description

This command configures the tunnel port policy of this WLAN Gateway ISA group. If a tunnel port policy is associated with a WLAN Gateway ISA group, ports created for this group can take applicable configuration from that policy. This policy is applicable to those ports that take part in the per-tunnel QoS processing.

The **no** form of the command removes the **tunnel-port-policy** name from the configuration.

## Default

no-tunnel-policy

## Parameters

### *tunnel-port-policy*

Specifies the tunnel port policy of this WLAN Gateway ISA group, up to 32 characters.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.229 tunnel-qinq

```
tunnel-qinq
```

## Syntax

```
[no] tunnel-qinq
```

## Context

[\[Tree\]](#) (config>port>ethernet>dot1x tunnel-qinq)

## Full Context

```
configure port ethernet dot1x tunnel-qinq
```

## Description

This command configures the tunneling of double tagged (QinQ) dot1x packets. When enabled, the router extracts the packets to the CPM.

The **no** form of this command disables the tunneling of the QinQ dot1x packets on the port.

## Default

tunnel-qinq

## Platforms

All

## 24.230 tunnel-query

### tunnel-query

#### Syntax

**tunnel-query** *query-id* [**name** *name*] [**create**]

**no tunnel-query** *query-id*

#### Context

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw tunnel-query)

#### Full Context

configure subscriber-mgmt wlan-gw tunnel-query

#### Description

This command creates a tunnel query where filter criteria over WLAN-GW tunnels are defined. This query can later be used to retrieve the state of the tunnels and Layer 2 access points (which are modeled as tunnels) matching the configured criteria.

The **no** form of this command removes the query.

#### Parameters

##### *query-id*

Specifies the ID assigned to a query.

**Values** 1 to 1024

##### *name*

Specifies the name assigned to a query, up to 32 characters.

##### **create**

Creates a tunnel query.

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.231 tunnel-remote-address

### tunnel-remote-address

#### Syntax

**tunnel-remote-address** *ip-address*

**no tunnel-remote-address****Context**

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>ue-query tunnel-remote-address)

**Full Context**

configure subscriber-mgmt wlan-gw ue-query tunnel-remote-address

**Description**

This command enables matching on UEs that are active on a tunnel with the specified source IP address. The **no** form of this command disables matching on the remote tunnel address.

**Default**

no tunnel-remote-address

**Parameters*****ip-address***

Specifies the IPv4 or IPv6 address of the remote tunnel.

Values		
ipv4-address		a.b.c.d
ipv6-address		x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x.d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

**24.232 tunnel-resource-limit****tunnel-resource-limit****Syntax**

**tunnel-resource-limit** *direction* [*direction*] [**create**]

**no tunnel-resource-limit** *direction* [*direction*]

**Context**

[\[Tree\]](#) (config>app-assure>group>statistics>tca>gtp-filter tunnel-resource-limit)

## Full Context

configure application-assurance group statistics threshold-crossing-alert gtp-filter tunnel-resource-limit

## Description

This command configures a TCA for the counter capturing the usage of the total number of GTP tunnel resources. A tunnel-resource-limit TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or from the network side (**to-sub**). The **create** keyword is mandatory when creating a TCA.

## Parameters

### *direction*

Specifies the traffic direction.

**Values** from-sub, to-sub

### **create**

Keyword used to create the TCA.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.233 tunnel-router

### tunnel-router

## Syntax

**tunnel-router** *router-instance*

**no tunnel-router**

## Context

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>ue-query tunnel-router)

## Full Context

configure subscriber-mgmt wlan-gw ue-query tunnel-router

## Description

This command enables matching on UEs that are active on a tunnel which is terminated in the specified router instance.

The **no** form of this command disables matching on the tunnel router instance.

## Default

no tunnel-router

## Parameters

### *router-instance*

Specifies the routing instance.

**Values** *router-name* - Base  
*vprn-svc-id* - 1 to 2147483647

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

[\[Tree\]](#) (config>subscr-mgmt>auth-policy>include-radius-attribute tunnel-server-attrs)

## Full Context

configure subscriber-mgmt radius-accounting-policy include-radius-attribute tunnel-server-attrs

configure subscriber-mgmt authentication-policy include-radius-attribute tunnel-server-attrs

## Description

This command enables the generation of the tunnel-server RADIUS attribute.

The **no** form of this command disables the generation of the **tunnel-server-attrs** RADIUS attribute.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 24.236 tunnel-session-limit

### tunnel-session-limit

## Syntax

**tunnel-session-limit** *session-limit*

**tunnel-session-limit** **unlimited**

**no tunnel-session-limit**

## Context

[\[Tree\]](#) (config>router>l2tp tunnel-session-limit)

[\[Tree\]](#) (config>service>vprn>l2tp tunnel-session-limit)

## Full Context

configure router l2tp tunnel-session-limit

configure service vprn l2tp tunnel-session-limit

## Description

This command configures the L2TP session limit for each tunnel of the specified router.

The **no** form of this command removes the tunnel session limit value from the configuration.

## Default

no tunnel-session-limit

**Parameters*****session-limit***

Specifies the allowed number of sessions within the given context.

**Values** 1 to 65535

**unlimited**

Specifies to use the maximum number of sessions available.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**24.237 tunnel-source-ip****tunnel-source-ip****Syntax**

**tunnel-source-ip** *ipv6-address/prefix-length*

**no tunnel-source-ip**

**Context**

**[Tree]** (config>router>wlan-gw>xconnect tunnel-source-ip)

**[Tree]** (config>service>vprn>wlan-gw>xconnect tunnel-source-ip)

**Full Context**

configure router wlan-gw xconnect tunnel-source-ip

configure service vprn wlan-gw xconnect tunnel-source-ip

**Description**

This command configures the IPv6 address and prefix for the tunnel source.

The **no** form of this command removes IPv6 address and prefix length from the cross-connect configuration.

**Parameters*****ipv6-address/prefix-length***

Specifies the tunnel source IPv6 address and prefix length of the cross-connect.

**Values** ipv6-address/prefix: ipv6-address x:x:x:x:x:x:x (eight 16-bit pieces)  
 x:x:x:x:x:d.d.d.d  
 x [0..FFFF]H  
 d [0..255]D

(no multicast address)  
prefix-length [1 to 128]

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.238 tunnel-table

### tunnel-table

## 24.239 tunnel-table-pref

### tunnel-table-pref

#### Syntax

**tunnel-table-pref** *preference*  
**no tunnel-table-pref**

#### Context

[\[Tree\]](#) (config>router>ldp tunnel-table-pref)

#### Full Context

configure router ldp tunnel-table-pref

## Description

This command configures the tunnel table preference for LDP tunnel type away from its default value.

The tunnel table preference applies to the next-hop resolution of BGP routes of the following families: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPv6 in the tunnel table.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The tunnel preference in such an SDP is fixed and is controlled by the service manager. The configuration of the tunnel table preference parameter does not modify the behavior of such an SDP and the services that bind to it.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default value.

## Default

tunnel-table-pref 9

## Parameters

### *preference*

Specifies the preference value.

**Values** 1 to 255

**Default** 9

## Platforms

All

## tunnel-table-pref

## Syntax

tunnel-table-pref

## Context

[\[Tree\]](#) (config>router>mpls tunnel-table-pref)

## Full Context

configure router mpls tunnel-table-pref

## Description

Commands in this context configure the tunnel table preference for RSVP-TE LSP and SR-TE LSP tunnel types.

## Platforms

All

## tunnel-table-pref

### Syntax

**tunnel-table-pref** *preference-value*  
**no tunnel-table-pref**

### Context

[\[Tree\]](#) (config>router>mpls>fwd-policies>fwd-policy tunnel-table-pref)

### Full Context

configure router mpls forwarding-policies forwarding-policy tunnel-table-pref

### Description

This command configures the TTM preference value of an MPLS forwarding policy.

The *preference-value* parameter is used by applications to select one tunnel type to bind to in TTM when multiple tunnel types are enabled for the application.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command removes the configured TTM preference parameter value of the MPLS forwarding policy and assigns the default value.

### Default

no tunnel-table-pref

### Parameters

#### *preference-value*

Specifies the preference value.

**Values** 1 to 255

**Default** 4

### Platforms

All

## tunnel-table-pref

### Syntax

**tunnel-table-pref** *preference*  
**no tunnel-table-pref**

## Context

[Tree] (config>router>isis>segment-routing tunnel-table-pref)

## Full Context

```
configure router isis segment-routing tunnel-table-pref
```

## Description

This command configures the TTM preference of SR tunnels created by the IGP instance. This is used in the case of BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the new tunnel binding commands are configured to the **any** value which parses the TTM for tunnels in the protocol preference order. The user can choose to either go with the global TTM preference or list explicitly the tunnel types they want to use. When they list the tunnel types explicitly, the TTM preference will still be used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected one fails. Also, a reversion to a more preferred tunnel type is performed as soon as one is available.

The segment routing module adds to TTM a SR tunnel entry for each resolved remote node SID prefix and programs the data path with the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs.

The default preference for SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the setting of the default preference of the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as **SR-ISIS** and **SR-OSPF**).

The global default TTM preference for the tunnel types is as follows:

- ROUTE\_PREF\_RSVP 7
- ROUTE\_PREF\_SR\_TE 8
- ROUTE\_PREF\_LDP 9
- ROUTE\_PREF\_OSPF\_TTM 10
- ROUTE\_PREF\_ISIS\_TTM 11
- ROUTE\_PREF\_BGP\_TTM 12
- ROUTE\_PREF\_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more IS-IS or OSPF instances programmed a tunnel for the same prefix. The selection of a SR tunnel in this case will be based on lowest IGP instance-id.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

## Default

```
tunnel-table-pref 11
```

## Parameters

### *preference*

Specifies the integer value to represent the preference of IS-IS or OSPF SR tunnels in TTM.

**Values** 1 to 255**Platforms**

All

**tunnel-table-pref****Syntax****tunnel-table-pref** *preference***no tunnel-table-pref****Context****[Tree]** (config>router>ospf3>segm-rtng tunnel-table-pref)**[Tree]** (config>router>ospf>segm-rtng tunnel-table-pref)**Full Context**

configure router ospf3 segment-routing tunnel-table-pref

configure router ospf segment-routing tunnel-table-pref

**Description**

This command configures the TTM preference of shortest path SR tunnels created by the IGP instance. This is used for BGP shortcuts, VPRN auto-bind, or BGP transport tunnel when the tunnel binding commands are configured to the **any** value, which parses the TTM for tunnels in the protocol preference order. The user can choose to either accept the global TTM preference or explicitly list the tunnel types they want to use. If the user lists the tunnel types explicitly, the TTM preference is still used to select one type over the other. In both cases, a fallback to the next preferred tunnel type is performed if the selected type fails. A reversion to a more preferred tunnel type is performed as soon as one is available.

The segment routing module adds to the TTM an SR tunnel entry for each resolved remote node SID prefix and programs the data path having the corresponding LTN with the push operation pointing to the primary and LFA backup NHLFEs.

The default preference for shortest path SR tunnels in the TTM is set lower than LDP tunnels but higher than BGP tunnels to allow controlled migration of customers without disrupting their current deployment when they enable segment routing. The following is the value of the default preference for the various tunnel types. This includes the preference of SR tunnels based on shortest path (referred to as SR-ISIS and SR-OSPF).

**Note:**

The preference of an SR-TE LSP is not configurable and is the second most preferred tunnel type after RSVP-TE. The preference is the same whether if the SR-TE LSP was resolved in IS-IS or OSPF.

The global default TTM preference for the tunnel types is as follows:

- ROUTE\_PREF\_RSVP 7
- ROUTE\_PREF\_SR\_TE 8

- ROUTE\_PREF\_LDP 9
- ROUTE\_PREF\_OSPF\_TTM 10
- ROUTE\_PREF\_ISIS\_TTM 11
- ROUTE\_PREF\_BGP\_TTM 12
- ROUTE\_PREF\_GRE 255

The default value for SR-ISIS or SR-OSPF is the same regardless if one or more IS-IS or OSPF instances programmed a tunnel for the same prefix. The selection of a SR tunnel in this case will be based on the lowest IGP instance ID. Similarly, IPv6 SR-ISIS and SR-OSPF3 tunnels are programmed into TTMv6 with the same default preference value as IPv4 SR-ISIS and IPv4 SR-OSPF respectively.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

### Default

tunnel-table-pref 10

### Parameters

#### *preference*

Specifies the integer value to represent the preference of IS-IS, OSPF, or OSPF3 SR tunnels in the TTM.

**Values** 1 to 255

### Platforms

### Description

This command creates a tunnel template. Up to 2000 templates are allowed.

### Parameters

#### ***ipsec-template-identifier***

Specifies the template identifier.

**Values** 1 to 2048

#### **create**

Mandatory keyword used when creating a tunnel-template in the IPsec context. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.241 tunnel-termination

### tunnel-termination

#### Syntax

**tunnel-termination** {*ip-address* | *ipv6-address*} **fpe** *fpe-id* [**create**]

**no tunnel-termination** {*ip-address* | *ipv6-address*}

#### Context

[\[Tree\]](#) (config>service>vprn>vxlan tunnel-termination)

#### Full Context

configure service vprn vxlan tunnel-termination

#### Description

This command instructs the system to redirect traffic to the corresponding PXC interface associated with the configured FPE when the destination IP address matches the configured tunnel termination IP address. Because the IP address is registered, the system can respond to ICMP packets directed to it.

The **no** form of this command removes the non-system IP address as the tunnel termination IP address.

#### Parameters

##### *ip-address* | *ipv6-address*

Specifies the non-system IPv4 or IPv6 address that terminates the VXLAN.

**Values** ip-address: a.b.c.d  
ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
where:  
x: [0 to FFFF]H  
d: [0 to 255]D

##### *fpe-id*

Specifies the FPE identifier associated with the PXC port or LAG that processes and terminates the VXLAN.

**Values** 1 to 64

##### **create**

Mandatory keyword to create the FPE.

#### Platforms

All

## tunnel-termination

### Syntax

**tunnel-termination** *ip-address* **fpe** *fpe-id* [**create**]

**no tunnel-termination** *ip-address*

### Context

[\[Tree\]](#) (config>service>system>vxlan tunnel-termination)

### Full Context

configure service system vxlan tunnel-termination

### Description

This command instructs the system to redirect traffic to the corresponding PXC interface associated with the configured Forwarding Path Extension (FPE) when the destination IP address matches the configured tunnel-termination IP address. The IP address is also registered, which enables the system to respond to ICMP packets directed to it.

### Parameters

#### *ip-address*

Specifies the non-system IPv4 or IPv6 address that terminates the VXLAN.

#### *fpe-id*

Specifies the FPE identifier associated with the PXC port or LAG that processes and terminates the VXLAN.

**Values** 1 to 64

#### **create**

Creates the FPE.

### Platforms

All

## tunnel-termination

### Syntax

**tunnel-termination** [*ip-address* | *ipv6-address*] **fpe** *fpe-id* [**create**]

**no tunnel-termination** [*ip-address* | *ipv6-address*]

### Context

[\[Tree\]](#) (config>service>system>gre-eth-bridged tunnel-termination)

## Full Context

configure service system gre-eth-bridged tunnel-termination

## Description

This command configures an end-point IP address for a GRE tunnel carrying Ethernet payload that is to be terminated on a PW SAP. It also associates this IP address with the FPE object that is providing cross-connect logic between the tunnel and the PW port. This IP address fully supports ICMP protocols such as PING, traceroute, and others.

## Parameters

### *ip-address*

The tunnel end-point IP address in the SR OS node.

### *ipv6-address*

The tunnel end-point IPv6 address in the SR OS node.

### *fpe id*

The FPE ID that is providing cross-connect service between the GRE tunnel and the PW port.

**Values** 1 to 64

## Platforms

All

## 24.242 tunnel-type

### tunnel-type

## Syntax

tunnel-type {gre | l2tp | l2 | vxlan | not-specified}

no tunnel-type

## Context

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>ue-query tunnel-type)

## Full Context

configure subscriber-mgmt wlan-gw ue-query tunnel-type

## Description

This command enables matching on UEs that are active on a tunnel of the specified type. The **not-specified** value disables matching on the tunnel type.

The **no** form of this command reverts to the default.

**Default**

tunnel-type not-specified

**Parameters****gre**

Specifies that the tunnel is of type GRE.

**l2tp**

Specifies that the tunnel is of type L2TPv3.

**l2**

Specifies that the UE is connected over a Layer 2 access point.

**vxlan**

Specifies that the tunnel is of type VXLAN.

**not-specified**

Specifies that no tunnel type matches on UEs.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 24.243 tunneling

### tunneling

**Syntax**

[no] tunneling

**Context**

[\[Tree\]](#) (config>port>ethernet>efm-oam tunneling)

**Full Context**

configure port ethernet efm-oam tunneling

**Description**

This command enables EFM OAM PDU tunneling. Enabling tunneling will allow a port mode Epipe SAP to pass OAM frames through the pipe to the far end.

The **no** form of this command disables tunneling.

**Default**

no tunneling

## Platforms

All

## tunneling

### Syntax

[no] tunneling

### Context

[\[Tree\]](#) (config>port>ethernet>dot1x tunneling)

### Full Context

configure port ethernet dot1x tunneling

### Description

This command enables the tunneling of untagged 802.1x frames received on a port and is supported only when **dot1x port-control** is set to **force-auth**. 802.1x tunneling is applicable to both Epipe and VPLS services using either a null SAP or a default SAP on a dot1q port. When configured, untagged 802.1x frames will be switched into the service with the corresponding supported SAP.

The **no** form of this command disables tunneling of untagged 802.1x frames.

### Default

no tunneling

## Platforms

All

## tunneling

### Syntax

[no] tunneling

[\[Tree\]](#) (config>router>ldp>targ-session>peer tunneling)

### Full Context

configure router ldp targeted-session peer-template tunneling

configure router ldp targeted-session peer tunneling

### Description

This command enables LDP over tunnels.

The **no** form of this command disables tunneling.

**Default**

no tunneling

**Platforms**

All

## tunneling

**Syntax**

[no] tunneling

**Context**

[\[Tree\]](#) (config>router>ldp>targ-session>auto-rx>ipv4 tunneling)

[\[Tree\]](#) (config>router>ldp>targ-session>auto-tx>ipv4 tunneling)

**Full Context**

configure router ldp targeted-session auto-rx ipv4 tunneling

configure router ldp targeted-session auto-tx ipv4 tunneling

**Description**

This command enables the local system to use the targeted LDP session to send FEC/label bindings that it has advertised to other LDP peers. For LDP rLFA, the source node requires the PQ node's label binding information in order to reach the destination. Therefore, this command must be enabled for the **auto-rx** context. However, because **auto-rx** has lower precedence, **tunneling** must be enabled under the **auto-tx** command, in case **auto-rx** is in a **no shutdown** state on the same system.

The **no** form of this command disables the local system from sending FEC/label bindings.

**Default**

no tunneling

**Platforms**

All

## 24.244 twamp

## twamp

### Syntax

**twamp**

### Context

[\[Tree\]](#) (config>test-oam twamp)

## 24.245 twamp-light

## twamp-light

### Syntax

**twamp-light** [**test-id** *test-id*] [**create**]

**no twamp-light**

### Context

[\[Tree\]](#) (config>oam-pm>session>ip twamp-light)

### Full Context

configure oam-pm session ip twamp-light

### Description

This command assigns an identifier to the TWAMP Light test and creates the individual test.

The **no** form of this command removes the TWAMP Light test function from the OAM-PM session.

### Parameters

***test-id***

Specifies the value of the 4-byte local test identifier not sent in the TWAMP Light packets.

**Values** 0 to 2147483647 | **auto**

**auto** - automatically assigns a *test-id*

**create**

Creates the test.

## 24.246 two-way-delay-test

### two-way-delay-test

#### Syntax

```
two-way-delay-test {mac-address | remote-mepid mep-id} mep mep-id domain md-index association
ma-index [priority priority]
```

#### Context

[\[Tree\]](#) (oam>eth-cfm two-way-delay-test)

#### Full Context

```
oam eth-cfm two-way-delay-test
```

#### Description

This command issues an ETH-CFM two-way delay test.

#### Parameters

##### ***mac-address***

Specifies a unicast destination MAC address.

**Values** xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

##### **remote-mepid** *mep-id*

Specifies the remote MEP ID of the peer within the association. The domain and association information are derived from the **source mep** for the session. The Layer 2 IEEE MAC address is resolved from previously-learned remote MAC addressing, derived from the reception and processing of the ETH-CC PDU. The local MEP must be administratively enabled.

**Values** 1 to 8191

##### **mep** *mep-id*

Specifies the local MEP ID.

**Values** 1 to 8191

##### ***md-index***

Specifies the MD index.

**Values** 1 to 4294967295

##### ***ma-index***

Specifies the MA index.

**Values** 1 to 4294967295

##### ***priority***

Specifies the priority.

**Values** 0 to 7

**Default** 7

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 24.247 two-way-slm-test

### two-way-slm-test

#### Syntax

**two-way-slm-test** {*mac-address* | **remote-mepid** *mep-id*} **mep** *mep-id* **domain** *md-index* **association** *ma-index* [**priority** *priority*] [**send-count** *send-count*] [**size** *data-size*] [**timeout** *timeout*] [**interval** *interval*]

#### Context

[\[Tree\]](#) (oam>eth-cfm two-way-slm-test)

#### Full Context

oam eth-cfm two-way-slm-test

#### Description

This command configures an Ethernet CFM two-way SLM test in SAA.

#### Parameters

##### **mac-address**

Specifies a unicast destination MAC address in the format xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx.

##### **remote-mepid** *mep-id*

Specifies the remote MEP ID of the peer within the association. The domain and association information are derived from the **source mep** for the session. The Layer 2 IEEE MAC address is resolved from previously-learned remote MAC addressing, derived from the reception and processing of the ETH-CC PDU. The local MEP must be administratively enabled.

**Values** 1 to 8191

##### **mep** *mep-id*

Specifies the local MEP ID.

**Values** 1 to 8191

***md-index***

Specifies the MD index.

**Values** 1 to 4294967295

***ma-index***

Specifies the MA index.

**Values** 1 to 4294967295

***priority***

Specifies the priority.

**Values** 0 to 7

**Default** 7

***send-count***

Specifies the number of messages to send, expressed as a decimal integer. The count parameter is used to override the default number of message requests sent. The message interval value must be expired before the next message request is sent.

**Values** 1 to 1000

**Default** 1

***data-size***

Specifies the size of the data portion of the data TLV. If 0 is specified, no data TLV is added to the packet.

**Values** 0 to 1500

**Default** 0

***timeout***

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of message time out, the requesting router assumes that the message response is not received. Any response received after the request times out is silently discarded. The *timeout* value must be less than the interval.

**Values** 1 to 10

**Default** 5

***interval***

Specifies the **interval** parameter in seconds, expressed as a decimal integer. This parameter is used to configure the spacing between probes within a test run.

**Values** 0.1 to 0.9, 1 to 10

**Default** 5

```
tx
```

### Syntax

```
tx auto-generated
```

```
tx bytes byte-string [byte-string...(up to 64 byte-strings max, 64 bytes max)]
```

```
tx string identifier
```

```
no tx
```

### Context

[\[Tree\]](#) (config>port>otu>pm-tti tx)

### Full Context

```
configure port otu pm-tti tx
```

## Description

This command enables the user to configure the transmit (tx) trail trace identifier (TTI) for path monitoring (PM) in the ODU overhead. This identifier can be a string or a non-printable sequence of bytes. The length of the string or sequence of bytes cannot exceed 64 bytes.

The **no** form of this command reverts to the default TTI value.

## Default

Auto-generated in the format of *nodename:iomnum/mdanum/portnum/dwdmchan*

The auto-generated value has five sections:

- **Nodename** — The first section is the name of the node.
- **iomnum** — The second section contains the IOM slot number.
- **mdanum** — The third section contains the MDA slot number.
- **portnum** — The fourth section contains the port number.
- **dwdmchan** — The fifth section contains the DWDM channel number (see the table "DWDM Channel Numbers" in the **channel** command [**config>port>dwdm channel**, **config>port>dwdm>coherent channel**, **config>port>dwdm>tdcm channel**]).

## Parameters

### **auto-generated**

Specifies to use the system generated (default) TTI.

### **identifier**

Sets the PM TTI to the string provided by the user. If the string is less than 64 bytes, the remaining bytes will be set to 0.

### **byte-string**

Sets the PM TTI to the sequence of bytes provided by the user. If the user provides less than 64 bytes, the remaining bytes will be set to 0. A 1 byte sequence of 0xFF will set the default strings. Up to 64 byte strings can be specified in a single statement.

**Values** 0 to FF, in hexadecimal byte notation

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx

## Syntax

**tx** *byte*

**tx** **auto**

## Context

[\[Tree\]](#) (config>port>otu>psi-payload tx)

## Full Context

```
configure port otu psi-payload tx
```

## Description

This command allows the user to configure the transmit payload type value in byte 0 of the payload structure identifier (PSI) of the OPU overhead.

## Default

3 for 10GE-LAN/WAN or OC192 with OTU encapsulation; 5 for GFP framed 10GE-LAN with OTU encapsulation.

## Parameters

### auto

Transmits the standard value in the payload type field.

### byte

Specifies the transmit payload type value in bytes.

**Values** [00 to FF] Hexadecimal notation

**Default** 00

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx

## Syntax

**tx auto-generated**

**tx bytes** *byte-string* [*byte-string*]

**tx string** *identifier*

**no tx**

## Context

[\[Tree\]](#) (config>port>otu>sm-tti tx)

## Full Context

```
configure port otu sm-tti tx
```

## Description

This command allows the user to configure the transmit (tx) trail trace identifier (TTI) for section monitoring (SM) in the OTU overhead. This identifier can be a string or a non-printable sequence of bytes. The length of the string or sequence of bytes cannot exceed 64 bytes.

The **no** form of this command reverts to the default TTI value.

## Default

Auto-generated in the format of *nodename:iomnum/mdanum/portnum/dwdmchan*

The auto-generated value has five sections:

- **Nodename** — The first section is the name of the node.
- **iomnum** — The second section contains the IOM slot number.
- **mdanum** — The third section contains the MDA slot number.
- **portnum** — The fourth section contains the port number.
- **dwdmchan** — The fifth section contains the DWDM channel number (see the table "DWDM Channel Numbers" in the **channel** command [**config>port>dwdm channel**, **config>port>dwdm>coherent channel**, **config>port>dwdm>tdcm channel**]).

## Parameters

### **auto-generated**

Specifies to use the system generated (default) TTI.

### **identifier**

Sets the SM TTI to the string provided by the user. If the string is less than 64 bytes, the remaining bytes will be set to 0. Up to 64 byte strings can be specified in a single statement.

### **byte-string**

Sets the SM TTI to the sequence of bytes provided by the user. If the user provides less than 64 bytes, the remaining bytes will be set to 0. A 1 byte sequence of 0xFF will set the default strings.

**Values** 0 to FF, in hexadecimal byte notation

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

tx

## Syntax

**tx** {**string** *identifier* | **bytes** *byte-sequence* | **auto-generated**}

## Context

[\[Tree\]](#) (config>port>otu>psi-trace tx)

## Full Context

configure port otu psi-trace tx

## Description

This command allows the user to configure the transmit trace in bytes 1 to 255 (skipping byte 0) of the payload structure identifier (PSI) of the OPU overhead. This identifier can be a string or a non-printable sequence of bytes. The length of the string or sequence of bytes cannot exceed 255 bytes.

## Default

Blank (all zeros)

## Parameters

### **auto-generated**

Sets the default PSI trace.

### **identifier**

Sets the PSI trace to the string provided by the user. If the string is less than 255 bytes, the remaining bytes will be set to 0.

### **byte-sequence**

[byte1 byte2 to byte64] Sets the PSI trace to the sequence of bytes provided by the user. If the user provides less than 64 bytes, the remaining bytes will be set to 0. A 1 byte sequence of 0xFF will set the default strings.

**Values** 0 to FF, in hexadecimal byte notation

### tx-mgmt-address

#### Syntax

```
tx-mgmt-address [system] [system-ipv6] [oob] [oob-ipv6]
no tx-mgmt-address
```

#### Context

[\[Tree\]](#) (config>port>ethernet>lldp>dstmac tx-mgmt-address)

#### Full Context

```
configure port ethernet lldp dest-mac tx-mgmt-address
```

#### Description

This command specifies which management address to transmit. The operator can choose to send the system IPv4 address, the system IPv6 address, the out-of-band IPv4 address, the out-of-band IPv6 address, or any combination of these. The system address is sent only once. The address must be configured for the specific version of the protocol in order to send the management address.

The **no** form of the command resets value to the default.

#### Default

```
no tx-mgmt-address
```

#### Parameters

##### system

Specifies to use the system IP address. The system address will only be transmitted once it has been configured if this parameter is specified.

##### system-ipv6

Specifies to use the system IPv6 address. The system address will only be transmitted once it has been configured if this parameter is specified.

##### oob

Specifies to use the out-of-band IPv4 address for active CPM.

##### oob-ipv6

Specifies to use the out-of-band IPv6 address for active CPM.

## Platforms

## 24.256 tx-timer

tx-timer

### Syntax

**tx-timer** *seconds*

**no tx-timer**

### Context

**[Tree]** (config>subscr-mgmt>diameter-application-policy tx-timer)

### Full Context

configure subscriber-mgmt diameter-application-policy tx-timer

### Description

This command defines the time-out period for the application's request messages (CCR-I/U/T).

The **on-failure** configuration determines the action that taken once the message times out.

The **no** form of this command reverts to the default value.

### Default

tx-timer 10

### Parameters

*seconds*

Specifies the Tx Timer value (in seconds) for this policy.

**Values** 10 to 1000

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 24.257 tx-tlvs

tx-tlvs

### Syntax

**tx-tlvs** [*port-desc*] [*sys-name*] [*sys-desc*] [*sys-cap*]

**no tx-tlvs**

## Context

[\[Tree\]](#) (config>port>ethernet>lldp>dstmac tx-tlvs)

## Full Context

```
configure port ethernet lldp dest-mac tx-tlvs
```

## Description

This command specifies which LLDP TLVs to transmit. The TX TLVs, defined as a bitmap, includes the basic set of LLDP TLVs whose transmission is allowed on the local LLDP agent by the network management. Each bit in the bitmap corresponds to a TLV type associated with a specific optional TLV. Organizationally-specific TLVs are excluded from this bitmap.

There is no bit reserved for the management address TLV type since transmission of management address TLVs are controlled by another object.

The **no** form of this command resets the value to the default.

## Default

```
no tx-tlvs
```

## Parameters

### port-desc

Indicates that the LLDP agent should transmit port description TLVs.

### sys-name

Indicates that the LLDP agent should transmit system name TLVs.

### sys-desc

Indicates that the LLDP agent should transmit system description TLVs.

### sys-cap

Indicates that the LLDP agent should transmit system capabilities TLVs.

## Platforms

tx-while-sync-uncertain

## Syntax

```
[no] tx-while-sync-uncertain
```

## Context

[\[Tree\]](#) (config>system>ptp tx-while-sync-uncertain)

## Full Context

```
configure system ptp tx-while-sync-uncertain
```

## Description

This command configures the local PTP clock to transmit Announce messages to downstream clocks, indicating it has not yet stabilized on the recovered synchronization source (upstream clocks or GM clock). While the PTP clock is unsynchronized, the SyncUncertain state is true.

The **no** form of this command prevents the local PTP clock from sending Announce messages to downstream clocks to indicate it is not synchronized to a valid timing source. If the **no** form of this command is used while the clock's SyncUncertain state is true, unicast negotiation grant requests are not granted and current grants are canceled.

## Default

```
tx-while-sync-uncertain
```

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

type
```

## Syntax

```
type {sr-mpls | srv6}
```

## Context

```
[Tree] (conf>router>segment-routing>sr-policies>policy type)
```

## Full Context

```
configure router segment-routing sr-policies static-policy type
```

## Description

This command configures the type of the static policy. Only commands relevant to the type of the static policy (SRv6 or SR-MPLS) can be executed. The type of the static policy can only be changed to a new type if there is no configuration present for the old type, or if all configuration for the old type is deleted.

## Default

```
type sr-mpls
```

## Parameters

### sr-mpls

Specifies segment routing MPLS.

**srv6**

Specifies segment routing IPv6.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

**type****Syntax**

**type** *reflector-type*

**Context**

**[Tree]** (config>service>vprn>twamp-light>refl type)

**[Tree]** (config>router>twamp-light>reflector type)

**Full Context**

configure service vprn twamp-light reflector type

configure router twamp-light reflector type

**Description**

This command configures the processing behavior of the TWAMP Light reflector. When the value is **twamp-light**, the reflector does not check the received PDU as a traditional base TWAMP Light packet without TLV processing. When the value is **stamp**, the reflector attempts to find and process supported STAMP TLVs that follow the base STAMP packet.

In mixed environments where different types of session senders may be targeting a common TWAMP Light reflector, the value should be set to stamp. When the reflector is operating in stamp mode, the primary parsing is based on STAMP, checking and processing known TLVs, and also determining when TLVs are not present and the arriving PDU is a TWAMP Light PDU. A session sender launching a TWAMP Light-based packet must use all zeros and a padding pattern zero when the pad size is non zero.

**Default**

type twamp-light

**Parameters*****reflector-type***

Specifies the type of processing behavior for the reflector.

**Values** stamp, twamp-light

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

```

## Description

This command designates the type of VPRN instance being configured for hub and spoke topologies. Use the **no** form to reset to the default of a fully meshed VPRN.

## Default

```
no type
```

## Parameters

### hub

Specifies a hub VPRN which allows all traffic from the hub SAPs to be routed to the destination directly, while all traffic from spoke VPRNs or network interfaces can only be routed to a hub SAP.

### spoke

Specifies a spoke VPRN which allows traffic from associated SAPs or spoke terminations to only be forwarded through routes learned from separate VPRN, which should be configured as a type Hub VPRN.

### subscriber-split-horizon

Controls the flow of traffic for wholesale subscriber applications.

## Platforms

All

## type

## Syntax

```
[no] type
```

## Context

```
[Tree] (config>saa>test type)
```

## Full Context

```
configure saa test type
```

## Description

This command creates the context to provide the test type for the named test. Only a single test type can be configured.

A test can only be modified while the test is in shut down mode.

Once a test type has been configured, the command can be modified by re-entering the command. However, the test type must be the same as the previously entered test type.

To change the test type, the old command must be removed using the **config>saa>test>no type** command.

The **no** form of this command removes the test type parameters from the configuration.

## Platforms

## type

## Syntax

**type** *filter-type*

**no type**

## Context

[\[Tree\]](#) (config>qos>sap-ingress>ip-criteria type)

[\[Tree\]](#) (config>qos>sap-ingress>ipv6-criteria type)

## Full Context

configure qos sap-ingress ip-criteria type

configure qos sap-ingress ipv6-criteria type

## Description

This command sets the **ip-criteria** and **ipv6-criteria** type to control the type of match entries configurable in this context.

## Default

type normal

## Parameters

### *filter-type*

Specifies which type of entries that the **ip-criteria** and **ipv6-criteria** statements can contain.

**Values**    **normal** — Regular match criteria are allowed; VXLAN VNI matching is not allowed.

**tagged-entries** — Specifies that entries within that criteria statement are tagged. Tagged entries are not populated by default, they are only populated when their tag value is activated using the criteria override under an Ethernet SAP.

The **type** can only be changed from **normal** to **tagged-entries** if there are no **ip-criteria** or **ipv6-criteria** entries configured and the SAP ingress QoS policy is not applied to any object.

A SAP ingress QoS policy configured with a criteria statement with **type tagged-entries** is not supported within an SLA profile, sub profile or MSAP policy, or under an IES/VP RN group interface SAP.

The configuration of **type tagged-entries** is mutually exclusive with the configuration of the **match dst-port** in the same criteria statement.

**vxlan-vni** — Matching is allowed on a VXLAN VNI for VXLAN and VXLAN GPE frames.

The type cannot be changed when **ip-criteria** or **ipv6-criteria** entries are configured. If there are no **ip-criteria** or **ipv6-criteria** entries configured, the type can be changed from **vxlan-vni** to **normal**. The type can only be changed from **normal** to **vxlan-vni** if there are no **ip-criteria** or **ipv6-criteria** entries configured but it is necessary that the SAP ingress QoS policy is also not applied to any object in order to change from **normal** to **vxlan-vni**.

A SAP ingress QoS policy configured with **type vxlan-vni** can be applied to any Ethernet SAPs, except for a PW-SAP, B-VPLS SAP, or CCAG SAP, in any applicable service.

debug system grpc type

### Description

This command enables debugging for all RPCs or a particular RPC.

The **no** form of this command deactivates debugging for all RPCs.

## Parameters

### all

Specifies that debugging is enabled for all RPCs.

### gnmi-capabilities

Specifies that debugging is enabled for gNMI capability RPC.

### gnmi-get

Specifies that debugging is enabled for gNMI get RPC.

### gnmi-set

Specifies that debugging is enabled for gNMI set RPC.

### gnmi-subscribe

Specifies that debugging is enabled for gNMI subscribe RPC.

### gnoi-cert-mgmt-rpcs

Specifies that debugging is enabled for gNOI certificate management RPCs.

## Platforms

All

## type

## Syntax

[no] type {internal | external}

## Context

[\[Tree\]](#) (config>router>bgp>group>neighbor type)

[\[Tree\]](#) (config>router>bgp>group type)

## Full Context

configure router bgp group neighbor type

configure router bgp group type

## Description

**This command designates** the BGP peer as type internal or external.

The type of **internal** indicates the peer is an IBGP peer while the type of **external** indicates that the peer is an EBGp peer.

By default, the router derives the type of neighbor based on the local AS specified. If the local AS specified is the same as the AS of the router, the peer is considered **internal**. If the local AS is different, then the peer is considered **external**.

The **no** form of this command used at the group level reverts to the default value.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

**Default**

no type

**Parameters****internal**

Configures the peer as internal.

**external**

Configures the peer as external.

**Platforms**

All

**type****Syntax**

**type** {1 | 2}

**no type**

**Context**

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from type)

**Full Context**

configure router policy-options policy-statement entry from type

**Description**

This command configures an OSPF type metric as a match criterion in the route policy statement entry.

If no type is specified, any OSPF type is considered a match.

The **no** form of this command removes the OSPF type match criterion.

**Default**

no type

**Parameters****1**

Matches OSPF routes with type 1 LSAs.

**2**

Matches OSPF routes with type 2 LSAs.

**Platforms**

All

## type

### Syntax

**type** {*type* | *param-name*}

**no type**

### Context

**[Tree]** (config>router>policy-options>policy-statement>entry>action type)

**[Tree]** (config>router>policy-options>policy-statement>default-action type)

### Full Context

configure router policy-options policy-statement entry action type

configure router policy-options policy-statement default-action type

### Description

This command sets the subtype for the Type 5 LSA (external LSA).

The **no** form of this command disables assigning a type in the route policy entry.

### Default

type 2

### Parameters

#### *type*

Specifies the type metric.

**Values** Subtype 1 — The external metric in the external LSA is comparable with the internal metric, and thus one can sum up all the metrics along the path (both internal and external) to get the total cost to the destination.

Subtype 2 — The metric in the external LSA is much more important than the internal metric, so the internal metrics should only be considered when comparing two external routes that have the same external metric.

#### *param-name*

The type parameter variable name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@".

## 25 u Commands

### 25.1 ua

```
ua
```

#### Syntax

```
[no] ua function-value
```

#### Context

```
[Tree] (config>router>segment-routing>srv6>inst>ms-loc>func ua)
```

#### Full Context

```
configure router segment-routing segment-routing-v6 base-routing-instance micro-segment-locator function ua
```

#### Description

Commands in this context configure the attributes of the uA micro-SID function associated with a P2P interface. The uA micro-SID function encodes the behavior of an adjacency SID.

The range of allowed configurable values is [1, max-entries]. This draws the Nth value (where N = function-value) of the local micro-SID range [1024\*global-sid-entries, 2^sid-length – 1] to form a uA micro-SID.

Static micro-SID values range in [1024\*global-sid-entries, 1024\*global-sid-entries + max-entries – 1].

A static function value can be configured for each combination of SRH mode and protection type.

For a specified interface, the static function value associated with the same combination of protection type and SRH mode overrides any corresponding automatically allocated function value (**ua-auto-allocate** command configuration).

If more than one value is configured for an interface and combination of SRH mode and protection type, they are all advertised in IS-IS.

When used in remote TI-LFA repair tunnel programming, IS-IS uses rules to select one uA value from the multiple values received in IS-IS link advertisements.

The values assigned to loopback and system interfaces are not advertised in IS-IS.

The uA micro-SID functions for adjacencies over broadcast interfaces are always automatically allocated based on the configuration of the following command:

```
configure router segment-routing segment-routing-v6 base-routing-instance micro-segment-locator function ua-auto-allocate
```

The **no** form of this command removes the function value from the configuration.

## Parameters

### *function-value*

Specifies the SRv6 uA function.

**Values** 1 to 1048575

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 25.2 ua-auto-allocate

### ua-auto-allocate

## Syntax

[no] **ua-auto-allocate** **srh-mode** *srh-mode* **protection** *protection*

## Context

**[Tree]** (config>router>segment-routing>srv6>inst>ms-loc>func ua-auto-allocate)

## Full Context

```
configure router segment-routing segment-routing-v6 base-routing-instance micro-segment-locator function
ua-auto-allocate
```

## Description

This command configures a list entry for the automatic allocation of the uA micro-SID function for all adjacencies over all network interfaces on the router (P2P and broadcast interfaces).

Auto-allocated uA function value (N) is drawn by the system from the following range [max-entries + 1, 2<sup>sid-length</sup> – 1024\*global-sid-entries] and the effective micro-SID value is the Nth value of the local micro SID range [1024\*global-sid-entries, 2<sup>sid-length</sup> – 1]. Dynamic micro-SID values range in [1024\*global-sid-entries + max-entries, 2<sup>sid-length</sup> – 1].

A list entry is a combination of the protection type and the SRH mode. Any combinations in addition to the maximum number of entries supported by this command must be allocated statically for each P2P interface. The maximum number of entries in this list is two.

When no list entries are configured, no uA function values are automatically allocated by default for a micro-segment locator.

### Note:

Any change to this list causes a re-allocation of new function values to all interfaces on the router that results in flooding them to the network and triggers a new SPF in all routers.

The **no** form of this command removes the function value from the configuration.

**Parameters***srh-mode*

Specifies the SRH mode for the SID.

**Values**    psp — Penultimate Segment Pop (PSP) of the SRH  
               usp — Ultimate Segment Pop (USP) of the SRH  
               psp-udp — Supports both PSP of the SRH and Ultimate Segment Decapsulation (USD) on the same SID  
               usp-udp — Supports both USP of the SRH and USD on the same SID  
               psp-usp-udp — Supports PSP and USP of the SRH with USD on the same SID

*protection*

Specifies whether the adjacency SID is protected.

**Values**    protected, unprotected

**Platforms**

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 25.3 udp

```
udp
```

**Syntax**

```
[no] udp
```

**Context**

**[Tree]** (config>service>vprn>bgp-ipvpn>mpls>auto-bind-tunnel>resolution-filter udp)

**[Tree]** (config>service>vprn>bgp-evpn>mpls>auto-bind-tunnel>resolution-filter udp)

[\[Tree\]](#) (config>service>nat>nat-policy udp-inbound-refresh)

[\[Tree\]](#) (config>service>nat>up-nat-policy udp-inbound-refresh)

### Full Context

```
configure service nat firewall-policy udp-inbound-refresh
configure service nat nat-policy udp-inbound-refresh
configure service nat up-nat-policy udp-inbound-refresh
```

### Description

This command enables UDP session timeout extended on inbound traffic.

The **no** form of the command disables UDP session timeout extended on inbound traffic.

### Default

```
no udp-inbound-refresh
```

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat firewall-policy udp-inbound-refresh

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat nat-policy udp-inbound-refresh
- configure service nat up-nat-policy udp-inbound-refresh

## 25.8 udp-initial

### udp-initial

#### Syntax

```
udp-initial [min minutes] [sec seconds]
```

```
no udp-initial
```

#### Context

**[Tree]** (config>service>nat>firewall-policy>timeouts udp-initial)

**[Tree]** (config>service>nat>up-nat-policy>timeouts udp-initial)

**[Tree]** (config>service>nat>nat-policy>timeouts udp-initial)

#### Full Context

```
configure service nat firewall-policy timeouts udp-initial
```

```
configure service nat up-nat-policy timeouts udp-initial
```

```
configure service nat nat-policy timeouts udp-initial
```

## Description

This command configures the UDP mapping timeout applied to new sessions.

## Default

udp-initial sec 15

## Parameters

### *minutes*

Specifies the timeout minutes field.

**Values** 1 to 59

### *seconds*

Specifies the timeout seconds field.

**Values** 1 to 59

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat firewall-policy timeouts udp-initial
- 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR
- configure service nat nat-policy timeouts udp-initial
  - configure service nat up-nat-policy timeouts udp-initial

## 25.9 udp-port

### udp-port

## Syntax

**udp-port** *udp-port-number*

## Context

[\[Tree\]](#) (config>service>vprn>mtrace2 udp-port)

[\[Tree\]](#) (config>router>mtrace2 udp-port)

## Full Context

configure service vprn mtrace2 udp-port

configure router mtrace2 udp-port

## Description

This command specifies the destination and listening port for the **mtrace2** command. When it is configured, this command generates Mtrace2 packets with the configured UDP port, and also listens on the same port for any incoming Mtrace2 packets.

Port 33435 is the IANA-assigned port for Mtrace2. On several operating systems (for example, Linux OS, SR OS), this port is also used by traceroute. On SR OS, if port 33435 is configured as the Mtrace2 port, SR OS does not respond to traceroute on this port.

## Default

5000

## Parameters

### *udp-port-number*

Specifies the UDP port for the test.

**Values** 1024 to 49151

## Platforms

All

## 25.10 udp-protocols

### udp-protocols

## Syntax

`udp-protocols protocol-set`

## Context

[\[Tree\]](#) (config>app-assure>group>tether-detect>tcl-mon udp-protocols)

## Full Context

configure application-assurance group tethering-detection ttl-monitoring udp-protocols

## Description

This command configures whether AA analyzes all UDP traffic or only traffic from standard applications that generate consistent TTL values. Configuring AA to analyze only standard UDP traffic is recommended.

## Default

udp-protocols standard

## Parameters

### *protocol-set*

Specifies the scope of analysis for UDP traffic.

**Values** standard, all

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 25.11 udp-return-object

### udp-return-object

#### Syntax

**udp-return-object** *ip-address*

**no udp-return-object**

#### Context

**[Tree]** (config>oam-pm>session>mpls>lsp>rsvp-auto udp-return-object)

**[Tree]** (config>oam-pm>session>mpls>lsp>rsvp udp-return-object)

#### Full Context

configure oam-pm session mpls lsp rsvp-auto udp-return-object

configure oam-pm session mpls lsp rsvp udp-return-object

#### Description

This command configures the destination IP address used by the far end of the test to send a test response. The UDP port in the UDP-Return Object is set to 64353 for MPLS DM PDUs.

RSVP tunnels are unidirectional and must include a configured local address for the responder can route the response back by the IP control plane. If the configuration is absent, the DN test fails to activate. If the configured IP address is not a local address, the command fails.

The **no** form of this command removes the udp-return-object IP address.

#### Parameters

##### *ip-address*

Specifies the destination IP.

##### Values

ipv4-address -a.b.c.d

ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x: [0..FFFF]H

d: [0..255]D

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 25.12 udp-src

udp-src

### Syntax

**udp-src** *udp-port*

**no udp-src**

### Context

[\[Tree\]](#) (config>li>mirror-dest-template>layer-3-encap udp-src)

### Full Context

configure li mirror-dest-template layer-3-encap udp-src

### Description

This command configures the source UDP port to be used in the UDP header of the routable LI encapsulation.

### Parameters

*udp-port*

Specifies the source UDP port.

**Values** 1 to 65535

### Platforms

All

## 25.13 udt2m

udt2m

### Syntax

**udt2m** [*function-value*]

**no udt2m**

### Context

[\[Tree\]](#) (config>service>vpls>srv6>ms-locator>function udt2m)

### Full Context

configure service vpls segment-routing-v6 micro-segment-locator function udt2m

### Description

This command configures the SRv6 uDT2M behavior and function value that is associated with the SRv6 instance in the service. This means that decapsulation and table lookup for IPv6 prefixes occurs in the VPLS service.

The range of allowed configurables values is [1, max-entries]. This draws the Nth value (where N = function-value) of the local micro-SID range [1024\*global-sid-entries, 2<sup>sid-length</sup> - 1] to form a uDT2M micro-SID. Static micro-SID values range in [1024\*global-sid-entries, 1024\*global-sid-entries + max-entries - 1].

If no value is configured, the system draws a function value (N) from the following range [max-entries + 1, 2<sup>sid-length</sup> - 1024\*global-sid-entries] and the effective micro-SID value is the Nth value of the local micro-SID range [1024\*global-sid-entries, 2<sup>sid-length</sup> - 1]. Dynamic micro-SID values range in [1024\*global-sid-entries + max-entries, 2<sup>sid-length</sup> - 1].

The **no** form of this command removes the function behavior and value from the configuration.

### Parameters

#### *function-value*

Specifies the SRv6 micro-segment uDT2M function value.

**Values** 1 to 1048575

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 25.14 udt2u

udt2u

### Syntax

**udt2u** [*function-value*]

**no udt2u**

### Context

[\[Tree\]](#) (config>service>vpls>srv6>ms-locator>function udt2u)

## Full Context

```
configure service vpls segment-routing-v6 micro-segment-locator function udt2u
```

## Description

This command configures the SRv6 uDT2U behavior and function value that is associated with the SRv6 instance in the service. This means that decapsulation and table lookup for IPv6 prefixes occurs in the VPLS service.

The range of allowed configurables values is [1, max-entries]. This draws the Nth value (where N = function-value) of the local micro-SID range [1024\*global-sid-entries, 2^sid-length – 1] to form a uDT2U micro-SID. Static micro-SID values range in [1024\*global-sid-entries, 1024\*global-sid-entries + max-entries – 1].

If no value is configured, the system draws a function value (N) from the following range [max-entries + 1, 2^sid-length – 1024\*global-sid-entries] and the effective micro-SID value is the Nth value of the local micro-SID range [1024\*global-sid-entries, 2^sid-length – 1]. Dynamic micro-SID values range in [1024\*global-sid-entries + max-entries, 2^sid-length – 1].

The **no** form of this command removes the function behavior and value from the configuration.

## Parameters

### *function-value*

Specifies the SRv6 micro-segment uDT2U function value.

**Values** 1 to 1048575

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 25.15 udt4

```
udt4
```

## Syntax

```
udt4 [function-value]
```

```
no udt4
```

## Context

[\[Tree\]](#) (config>router>segment-routing>srv6>inst>ms-loc>func udt4)

## Full Context

```
configure router segment-routing segment-routing-v6 base-routing-instance micro-segment-locator function udt4
```

## Description

This command configures the SRv6 micro-segment uDT4 behavior and function value associated with the base routing instance. This implies that decapsulation and table lookup for IPv4 prefixes occurs in the base routing table. These prefixes can be static routes or routes advertised in BGP.

The range of allowed configurables values is [1, max-entries]. This draws the Nth value (where N = function-value) of the local micro-SID range [1024\*global-sid-entries, 2^sid-length - 1] to form a uDT4 micro-SID. Static micro-SID values range in [1024\*global-sid-entries, 1024\*global-sid-entries + max-entries - 1].

When unconfigured, the system draws a function value (N) from the following range [max-entries + 1, 2^sid-length - 1024\*global-sid-entries] and the effective micro-SID value is the Nth value of the local micro-SID range [1024\*global-sid-entries, 2^sid-length - 1]. Dynamic micro-SID values range in [1024\*global-sid-entries + max-entries, 2^sid-length - 1].

The **no** form of this command removes the function behavior and value from the configuration.

## Parameters

### *function-value*

Specifies the SRv6 micro-segment uDT4 function value.

**Values** 1 to 1048575

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

**no ue-query** *query-id*

#### Context

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw ue-query)

#### Full Context

configure subscriber-mgmt wlan-gw ue-query

#### Description

This command creates a UE query where filter criteria over WLAN-GW ISA UEs are defined. This query can later be used to retrieve state of the UEs matching the configured criteria.

The **no** form of this command removes the query.

#### Parameters

##### *query-id*

Specifies the ID assigned to a query.

**Values** 1 to 1024

##### *name*

Specifies the name assigned to a query, up to 32 characters.

##### **create**

Creates a UE query.

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 25.22 ue-state

### ue-state

#### Syntax

[**no**] **ue-state**

## Context

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>tunnel-query ue-state)

## Full Context

configure subscriber-mgmt wlan-gw tunnel-query ue-state

## Description

This command enables matching on a specific UE state. Multiple states can be provisioned. If no UE state specifier is configured, UE state matching is disabled (all UEs match).

This match criteria can be combined with minimum and maximum match criteria, which will then apply only to UEs of the specified state.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

**Full Context**

configure service vprn mvpn provider-tunnel selective umh-rate-monitoring

configure service vprn mvpn provider-tunnel inclusive umh-rate-monitoring

**Description**

Commands in this context configure bandwidth monitoring for UMH redundancy.

**Platforms**

All

## 25.28 umh-selection

### umh-selection

**Syntax**

**umh-selection** {**highest-ip** | **hash-based** | **tunnel-status** | **unicast-rt-pref**}

**no umh-selection**

**Context**

[\[Tree\]](#) (config>service>vprn>mvpn umh-selection)

## Full Context

```
configure service vprn mvpn umh-selection
```

## Description

This command specifies which UMH selection mechanism to use, highest IP address, hash based or provider tunnel status.

The **no** form of this command resets it back to default.

## Default

```
umh-selection highest-ip
```

## Parameters

### highest-ip

Specifies that the highest next-hop IP address is selected as UMH. The RTM may have just one next-hop to the source, but **highest-ip** uses all of the next-hops available to BGP that appear in the BGP database.

### hash-based

Specifies that the UMH selection is based on hash-based procedures set out in RFC6513, section 5.1.3. The RTM may have just one next-hop to the source, but **hash-based** uses all of the next-hops available to BGP that appear in the BGP database.

### tunnel-status

Specifies that UMH selection is based on the state of the tunnel as well as the available unicast routes through the tunnel. Not supported for IPv6.

### unicast-rt-pref

When selected, best unicast route will decide which UMH is chosen. All PE routers shall prefer the same route to the UMH for the UMH selection criterion (for example BGP path selection criteria must not influence one PE to choose different UMH from another PE).

## 25.30 unavailability-event

### unavailability-event

#### Syntax

```
unavailability-event {forward | backward | aggregate} threshold raise-threshold [clear clear-threshold]
no unavailability-event {forward | backward | aggregate}
```

#### Context

**[Tree]** (config>oam-pm>session>ethernet>slm>loss-events unavailability-event)

**[Tree]** (config>oam-pm>session>ip>twamp-light>loss-events unavailability-event)

**[Tree]** (config>oam-pm>session>ethernet>lmm>loss-events unavailability-event)

#### Full Context

```
configure oam-pm session ethernet slm loss-events unavailability-event
```

```
configure oam-pm session ip twamp-light loss-events unavailability-event
```

```
configure oam-pm session ethernet lmm loss-events unavailability-event
```

#### Description

This command sets the threshold to be applied to the overall count of the unavailability indicators, not transitions, per configured direction. This value is compared to the 32 bit unavailability counter specific to the direction which tracks the number of individual delta-ts that have been recorded as unavailable. The aggregate is a function of summing forward and backward. This value is only used as a threshold mechanism and is not part of the stored statistics. If the optional **clear** *clear-threshold* parameter is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and regardless of any previous window. Each unique event can only be raised once within measurement interval. If the optional **clear** *clear-threshold* parameter is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to following measurement intervals. If a threshold crossing event is raised another is raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.

The **no** form of this command removes the event threshold for frame loss ratio. The direction must be included with the **no** command.

## Default

no unavailability-event forward  
no unavailability-event backward  
no unavailability-event aggregate

## Parameters

### **forward**

Specifies the threshold is applied to the forward direction count.

### **backward**

Specifies the threshold is applied to the backward direction count.

### **aggregate**

Specifies the threshold is applied to the aggregate count (sum of forward and backward).

### ***raise-threshold***

Specifies a numerical value compared to the unavailability counter that is the rising threshold that determines when the event is to be generated, when value reached.

**Values** 1 to 864000

### ***clear-threshold***

Specifies an optional value used for stateful behavior that allows the operator to configure a percentage of loss value lower than the rising percentage to indicate when the clear event should be generated.

**Values** 0 to 863999

A value of zero means that the unavailability counter must be 0.

## 25.34 unconstrained-bw

### unconstrained-bw

**Syntax**

**unconstrained-bw** *bandwidth* **mandatory-bw** *mandatory-bw*

**no unconstrained-bw**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>sub-mcac-plcy unconstrained-bw)

[\[Tree\]](#) (config>subscr-mgmt>msap-policy>vpls-only>igmp-snp>mcac unconstrained-bw)

**Full Context**

configure subscriber-mgmt sub-mcac-policy unconstrained-bw

configure subscriber-mgmt msap-policy vpls-only-sap-parameters igmp-snooping mcac unconstrained-bw

**Description**

This command configures the bandwidth for the interface or subscriber's multicast CAC policy traffic. When disabled (**no unconstrained-bw**), there is no checking of bandwidth constraints on the interface or subscriber level. When enabled and a policy is defined, enforcement is performed. The allocated bandwidth for optional channels should not exceed the **unconstrained-bw** minus the **mandatory-bw** and the mandatory channels have to stay below the specified value for the **mandatory-bw**. After this interface and subscriber check, the bundle checks are performed.

The **no** form of this command reverts to the default.

**Parameters*****bandwidth***

Specifies bandwidth assigned for interface's MCAC policy traffic, in kilobits per second (kb/s).

**Values** 0 to 2147483647

***mandatory-bw***

Specifies the bandwidth pre-reserved for all the mandatory channels on a given interface in kilobits per second (kb/s).

If the *bandwidth* value is 0, no mandatory channels are allowed. If the value of *bandwidth* is '-1', then all mandatory and optional channels are allowed.

If the value of *mandatory-bw* is equal to the value of *bandwidth*, then all the unconstrained bandwidth on a given interface is allocated to mandatory channels configured through multicast CAC policy on that interface and no optional groups (channels) are allowed.

The value of *mandatory-bw* should always be less than or equal to that of *bandwidth*. An attempt to set the value of *mandatory-bw* greater than that of *bandwidth*, will result in inconsistent value error.

**Values** 0 to 2147483647

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

configure router pim interface mcac unconstrained-bw

configure router mld interface mcac unconstrained-bw

configure router mld group-interface mcac unconstrained-bw

configure router igmp interface mcac unconstrained-bw

### Description

This command enables MCAC (or HMCAC) function on the corresponding level (subscriber, group-interface or redirected interface). When MCAC (or HMCAC) is enabled and a channel definition policy is referenced, admission control is performed. The allocated bandwidth for optional channels should not exceed the unconstrained-bw minus the mandatory-bw. The mandatory channels have to stay below the specified value for the mandatory-bw.

In HMCAC, the subscriber is checked first against its bandwidth limits followed by the check on the redirected interface or the group-interface against the bandwidth limits defined there.

In case that redirection is enabled and HMCAC enabled, the channel definition policy must be referenced under the redirected interface level. If it is referenced under the group-interface level, it will be ignored.

Subscriber MCAC (only subscriber is checked for available resources) is supported only with direct subscriber replication (no redirection). In this case the channel definition policy must be referenced under the group-interface.

If the redirection is enabled but the policy is referenced only under the group-interface, no admission control is executed (HMCAC or MCAC).

The **no** form of this command removes the values from the configuration.

## Default

no unconstrained-bw

## Parameters

### *bandwidth*

Specifies the unconstrained bandwidth in kb/s for the MCAC policy.

**Values** 0 to 2147483647

### *mandatory-bw*

Specifies the mandatory bandwidth in kb/s for the MCAC policy.

**Values** 0 to 2147483647

## 25.35 unconsumed-aggrate

### unconsumed-aggrate

## Syntax

**unconsumed-aggrate percent** *percent-of-unconsumed-aggrate*

**no unconsumed-aggrate**

## Context

**[Tree]** (config>qos>adv-config-policy>child-control>bandwidth-distribution>above-offered-allowance  
unconsumed-aggrate)

## Full Context

configure qos adv-config-policy child-control bandwidth-distribution above-offered-allowance unconsumed-aggrate

## Description

This command configures the percentage of the unconsumed aggregate rate that can be given to a queue at the end of an H-QoS below CIR pass and above CIR pass. This command is only applicable when the port scheduler is configured to use the **above-offered-allowance-control** algorithm, otherwise it is ignored.

The **no** form of this command reverts the **unconsumed-agg-rate percent** to its default value.

## Default

unconsumed-agg-rate 100.00

## Parameters

### *percent-of-unconsumed-agg-rate*

Specifies the percentage of the unconsumed aggregate rate that can be given to a queue.

**Values** 0.00 to 100.00

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 25.36 unconsumed-higher-tier-rate

### unconsumed-higher-tier-rate

## Syntax

**unconsumed-higher-tier-rate percent** *percent-of-unconsumed-higher-tier-rate*

**no unconsumed-higher-tier-rate**

## Context

**[Tree]** (config>qos>adv-config-policy>child-control>bandwidth-distribution>above-offered-allowance  
unconsumed-higher-tier-rate)

## Full Context

configure qos adv-config-policy child-control bandwidth-distribution above-offered-allowance unconsumed-higher-tier-rate

## Description

This command configures the percentage of the unconsumed higher tier rate that can be given to a queue at the end of an H-QoS below CIR pass and above CIR pass. Higher tier refers to the Vport aggregate rate and port scheduler level, group, and maximum rates.

This command is only applicable when the port scheduler is configured to use the **above-offered-allowance-control** algorithm, otherwise it is ignored.

The **no** form of this command reverts the **unconsumed-higher-tier-rate percent** to its default value.

**Default**

unconsumed-higher-tier-rate 100.00

**Parameters*****percent-of-unconsumed-higher-tier-rate***

Specifies the percentage of the unconsumed higher tier rate that can be given to a queue.

**Values** 0.00 to 100.00

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 25.37 underflow-limit

### underflow-limit

**Syntax**

**underflow-limit** *number threshold percent* [**bw** *bandwidth-in-mbps*]

**no underflow-limit**

**Context**

**[Tree]** (config>router>mpls>lsp>auto-bandwidth underflow-limit)

**[Tree]** (config>router>mpls>lsp-template>auto-bandwidth underflow-limit)

**Full Context**

configure router mpls lsp auto-bandwidth underflow-limit

configure router mpls lsp-template auto-bandwidth underflow-limit

**Description**

This command configures underflow-triggered auto-bandwidth adjustment. An underflow auto-bandwidth adjustment can occur any time during the adjust-interval; it is triggered when the number of consecutive underflow samples reaches the threshold N configured as part of this command. The new bandwidth of the LSP after a successful underflow adjustment is the maximum data rate observed in the last N consecutive underflow samples.

A sample interval is counted as an underflow if the average data rate during the sample interval is lower than the currently reserved bandwidth by at least the thresholds configured as part of this command.

The **no** form of this command disables underflow-triggered automatic bandwidth adjustment.

**Default**

no underflow-limit

## Parameters

### *number*

Specifies the number of consecutive underflow samples that triggers an underflow auto-bandwidth adjustment attempt.

**Values** 0 to 10

### *percent*

Specifies the minimum difference between the current bandwidth of the LSP and the sampled data rate, expressed as a percentage of the current bandwidth, for counting an underflow sample.

**Values** 0 to 100

### *bandwidth-in-mbps*

Specifies the minimum difference between the current bandwidth of the LSP and the sampled data rate, expressed as an absolute bandwidth (Mb/s) relative to the current bandwidth, for counting an underflow sample.

**Values** 0 to 6400000

## Platforms

All

## 25.38 undet-availability-event

### undet-availability-event

#### Syntax

**undet-availability-event** {**forward** | **backward** | **aggregate**} **threshold** *raise-threshold* [**clear** *clear-threshold*]

**no undet-availability-event** {**forward** | **backward** | **aggregate**}

#### Context

**[Tree]** (config>oam-pm>session>ethernet>slm>loss-events undet-availability-event)

**[Tree]** (config>oam-pm>session>ip>twamp-light>loss-events undet-availability-event)

**[Tree]** (config>oam-pm>session>ethernet>lmm>loss-events undet-availability-event)

#### Full Context

configure oam-pm session ethernet slm loss-events undet-availability-event

configure oam-pm session ip twamp-light loss-events undet-availability-event

configure oam-pm session ethernet lmm loss-events undet-availability-event

## Description

This command sets the threshold to be applied to the overall count of the undetermined availability indicators, not transitions, per configured direction. This value is compared to the 32 bit unavailability counter specific to the direction which tracks the number of individual delta-ts that have been recorded as undetermined available. The aggregate is a function of summing forward and backward. This value is only used as a threshold mechanism and is not part of the stored statistics. If the optional **clear clear-threshold** parameter is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and regardless of any previous window. Each unique event can only be raised once within measurement interval. If the optional **clear clear-threshold** parameter is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to following measurement intervals. If a threshold crossing event is raised another is raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.

The **no** form of this command removes the event threshold for frame loss ratio. The direction must be included with the **no** command.

## Default

no undet-availability-event forward  
no undet-availability-event backward  
no undet-availability-event aggregate

## Parameters

### **forward**

Specifies the threshold is applied to the forward direction count.

### **backward**

Specifies the threshold is applied to the backward direction count.

### **aggregate**

Specifies the threshold is applied to the aggregate count (sum of forward and backward).

### **raise-threshold**

Specifies the rising threshold that determines when the event is to be generated, when value reached.

**Values** 1 to 864000

### **clear-threshold**

Specifies an optional value used for stateful behavior that allows the operator to configure a percentage of loss value lower than the rising percentage to indicate when the clear event should be generated.

**Values** 0 to 863999

A value of zero means that the undetermined availability counter must be 0.

## Platforms

All

- configure oam-pm session ip twamp-light loss-events undet-availability-event

## 25.39 undet-unavailability-event

### undet-unavailability-event

#### Syntax

**undet-unavailability-event** {forward | backward | aggregate} threshold *raise-threshold* [**clear** *clear-threshold*]

**no undet-unavailability-event** {forward | backward | aggregate}

#### Context

**[Tree]** (config>oam-pm>session>ethernet>slm>loss-events undet-unavailability-event)

**[Tree]** (config>oam-pm>session>ip>twamp-light>loss-events undet-unavailability-event)

**[Tree]** (config>oam-pm>session>ethernet>lmm>loss-events undet-unavailability-event)

#### Full Context

configure oam-pm session ethernet slm loss-events undet-unavailability-event

configure oam-pm session ip twamp-light loss-events undet-unavailability-event

configure oam-pm session ethernet lmm loss-events undet-unavailability-event

#### Description

This command sets the threshold to be applied to the overall count of the undetermined unavailability indicators, not transitions, per configured direction. This value is compared to the 32 bit unavailability counter specific to the direction which tracks the number of individual delta-ts that have been recorded as undetermined unavailable. The aggregate is a function of summing forward and backward. This value is only used as a threshold mechanism and is not part of the stored statistics. If the **clear** *clear-threshold* parameter is not specified the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and without regard to any previous window. Each unique event can only be raised once within measurement interval. If the optional clear threshold is specified the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to following measurement intervals. If a threshold crossing event is raised another is not raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.

The **no** form of this command removes the event threshold for frame loss ratio. The direction must be included with the **no** command.

**Default**

no undet-unavailable-event forward  
 no undet-unavailable-event backward  
 no undet-unavailable-event aggregate

**Parameters****forward**

Specifies the threshold is applied to the forward direction count.

**backward**

Specifies the threshold is applied to the backward direction count.

**aggregate**

Specifies the threshold is applied to the aggregate count (sum of forward and backward).

***raise-threshold***

Specifies the rising threshold that determines when the event is to be generated, when value reached.

**Values** 1 to 864000

***clear-threshold***

Specifies an optional value used for stateful behavior that allows the operator to configure a percentage of loss value lower than the rising percentage to indicate when the clear event should be generated.

**Values** 0 to 863999

A value of zero means that the undetermined availability counter must be 0.

**25.40 undo**

undo

**Syntax**

**undo** [*count*]

## Context

[\[Tree\]](#) (candidate undo)

## Full Context

candidate undo

## Description

This command removes the most recent change(s) done to the candidate. The changes can be reapplied using the **redo** command. All undo or redo history is lost when the operator exits the **edit-cfg** mode. Undo can not be used to recover a candidate that has been discarded with **candidate discard**.

An **undo** command is blocked if another user has made changes in the same CLI branches that would be impacted during the undo.

## Parameters

### *count*

Specifies the number of previous changes to remove.

**Values** 1 to 50

**Default** 1

## 25.42 unicast-address

### unicast-address

#### Syntax

**[no] unicast-address** *ip-address*

#### Context

**[Tree]** (config>service>vprn>rip>group>neighbor unicast-address)

#### Full Context

configure service vprn rip group neighbor unicast-address

#### Description

This command configures the unicast IPv4 address, RIP updates messages will be sent to if the RIP **send** command is set to **send unicast**.

Multiple unicast-address entries can be configured, in which case unicast messages will be sent to each configured unicast IPv4 address.

The **no** form of this command deletes the specified IPv4 unicast address from the configuration.

#### Parameters

*ip-address*

Specifies the unicast IPv4 address in a.b.c.d format.

#### Platforms

All

### unicast-address

#### Syntax

**[no] unicast-address** *ipv6-address*

#### Context

**[Tree]** (config>service>vprn>ripng>group>neighbor unicast-address)

#### Full Context

configure service vprn ripng group neighbor unicast-address

## Description

This command configures the unicast IPv6 address, RIPng updates messages will be sent to if the RIPng **send** command is set to **send unicast**.

Multiple unicast-address entries can be configured, in which case unicast messages will be sent to each configured unicast IPv6 address.

The **no** form of this command deletes the specified IPv6 unicast address from the configuration.

## Parameters

### *ipv6-address*

Specifies the unicast IPv6 address.

#### Values

ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x [0 to FFFF]H
	d [0 to 255]D

#### Full Context

configure test-oam link-measurement measurement-template unidirectional-measurement

## Description

This command specifies the method used to compute the unidirectional delay value.

## Default

unidirectional-measurement derived

## Parameters

### *measurement-type*

Specifies the method to compute a unidirectional delay measurement.

- Values**
- actual** — Keyword to use the forward delay as the unidirectional measurement. The forward delay is calculated using T2-T1 timestamps.
  - derived** — Keyword to compute the unidirectional measurement using the round trip delay divided by two. This option should be used when the nodal clocks are not synchronized using an accurate time synchronization method or protocol, like PTP.

## Platforms

## 25.46 unique-sid-per-sap

### unique-sid-per-sap

## Syntax

**unique-sid-per-sap** [**per-msap**]

**no unique-sid-per-sap**

## Context

[\[Tree\]](#) (config>subscr-mgmt>ppp-policy unique-sid-per-sap)

## Full Context

configure subscriber-mgmt ppp-policy unique-sid-per-sap

## Description

This command assigns a unique session ID to each PPPoE session active on a single SAP.

On a capture SAP, a unique session ID is assigned per capture SAP: multiple sessions that are active on the same or different MSAP have a unique session ID per capture SAP.

With the optional parameter **per-msap**, a unique session ID is assigned per MSAP:

- multiple sessions that are active on the same MSAP have a unique session ID per MSAP

- multiple sessions that are active on different MSAPs are not guaranteed to have a unique session ID  
The session ID range is 1 to 8191.

By default, all PPPoE sessions with a different client MAC address and active on a given SAP or MSAP have a session ID of 1 (**sid-allocation sequential**) or a random value in the range 1 to 8191 (**sid-allocation random**).

The **no** form of this command reverts to the default.

### Parameters

#### **per-msap**

Assigns a unique session ID for PPPoE sessions that are active on the same MSAP. This parameter has no effect on regular SAPs.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 25.47 unknown-arp-request-flood-evpn

### unknown-arp-request-flood-evpn

#### Syntax

[no] unknown-arp-request-flood-evpn

#### Context

[\[Tree\]](#) (config>service>vpls>proxy-arp unknown-arp-request-flood-evpn)

#### Full Context

configure service vpls proxy-arp unknown-arp-request-flood-evpn

#### Description

This command controls whether unknown ARP-requests are flooded into the EVPN network. By default, the system floods ARP-requests, including EVPN (with source squelching), if there is no active proxy-arp entry for the requested IP.

The **no** form of the command will only flood to local SAPs/SDP-bindings and not to EVPN destinations.

#### Default

unknown-arp-request-flood-evpn

#### Platforms

All

## 25.48 unknown-mac-route

### unknown-mac-route

#### Syntax

**[no] unknown-mac-route**

#### Context

**[Tree]** (config>service>vpls>bgp-evpn unknown-mac-route)

#### Full Context

configure service vpls bgp-evpn unknown-mac-route

#### Description

This command enables the advertisement of the unknown-mac-route in BGP. This will be coded in an EVPN MAC route where the MAC address is zero and the MAC address length 48. By using this unknown-mac-route advertisement, the user may decide to optionally turn off the advertisement of MAC addresses learned from SAPs and SDP-bindings, hence reducing the control plane overhead and the size of the FDB tables in the data center. All the receiving NVEs supporting this concept will send any unknown-unicast packet to the owner of the unknown-mac-route, as opposed to flooding the unknown-unicast traffic to all other nodes part of the same VPLS. Although the 7750 SR, 7450 ESS, or 7950 XRS can be configured to generate and advertise the unknown-mac-route, the router will never honor the unknown-mac-route and will flood to the vpls flood list when an unknown-unicast packet arrives to an ingress SAP/SDP-binding.

Use of the unknown-mac-route is only supported for BGP-EVPN VXLAN.

#### Default

no unknown-mac-route

#### Platforms

All

## 25.49 unknown-message-rate

### unknown-message-rate

#### Syntax

**unknown-message-rate** *integer*

**no unknown-message-rate**

#### Context

```

### Context

[\[Tree\]](#) (config>service>vpls>proxy-nd unknown-ns-flood-evpn)

### Full Context

```
configure service vpls proxy-nd unknown-ns-flood-evpn
```

## Description

This command controls whether unknown Neighbor Solicitation messages are flooded into the EVPN network. By default, the system floods NS (with source squelching) to SAPs/SDP-bindings including EVPN, if there is no active proxy-nd entry for the requested IPv6.

The **no** form of the command will only flood to local SAPs/SDP-bindings but not to EVPN destinations.

## Default

unknown-ns-flood-evpn

## Platforms

All

## 25.51 unknown-policer

### unknown-policer

#### Syntax

**unknown-policer** *policer-id* [**fp-redirect-group**]

**no unknown-policer**

#### Context

[\[Tree\]](#) (config>qos>sap-ingress>fc unknown-policer)

#### Full Context

configure qos sap-ingress fc unknown-policer

#### Description

Within a **sap-ingress** QoS policy forwarding class context, the **unknown-policer** command is used to map packets that match the forwarding class and are considered unknown in nature to the specified policer-id. The specified policer-id must already exist within the **sap-ingress** QoS policy. While the system is determining the forwarding class of a packet, it is also looking up its forwarding destination based on the ingress service type and the service instance forwarding records. If the service type is VPLS and the destination MAC address is unicast, but the MAC has not been learned and populated within the VPLS services FDB, the packet is classified into the unknown forwarding type.

Unknown forwarding type packets are mapped to either an ingress multipoint queue (using the **unknown queue-id** or **unknown queue-id group ingress-queue-group** commands) or an ingress policer (**unknown-policer policer-id**). The **unknown** and **unknown-policer** commands within the forwarding class context are mutually exclusive. By default, the unknown forwarding type is mapped to the SAP ingress default multipoint queue. If the **unknown-policer policer-id** command is executed, any previous policer mapping or queue mapping for the unknown forwarding type within the forwarding class is overridden if the policer mapping is successful.

A policer defined within the **sap-ingress** policy is not actually created on an ingress SAP or a subscriber using an **sla-profile** where the policy is applied until at least one forwarding type (unicast, broadcast,

unknown, or multicast) from one of the forwarding classes is mapped to the policer. If insufficient policer resources exist to create the policer for a SAP or subscriber or multiservice site, or ingress policing is not supported on the port associated with the SAP or subscriber or multiservice site, the initial forwarding class forwarding type mapping will fail.

The **unknown-policer** command is ignored for instances of the policer applied to SAPs or subscribers' multiservice site where unknown packets are not supported.

When the unknown forwarding type within a forwarding class is mapped to a policer, the unknown packets classified to the subclasses within the forwarding class are also mapped to the policer.

The **no** form of this command is used to restore the mapping of the unknown forwarding type within the forwarding class to the default multipoint queue. If all forwarding class forwarding types had been removed from the default multipoint queue, the queue will not exist on the SAPs or subscriber or multiservice site associated with the QoS policy and the **no broadcast-policer** command will cause the system to attempt to create the default multipoint queue on each object. If the system cannot create the queue on each instance, the **no unknown-policer** command will fail and the unknown forwarding type within the forwarding class will continue its mapping to the existing *policer-id*. If the **no unknown-policer** command results in a policer without any current mappings, the policer will be removed from the SAPs and subscribers associated with the QoS policy. All statistics associated with the policer on each SAP and subscriber will be lost.

## Parameters

### *policer-id*

When the forwarding class **unknown-policer** command is executed, a valid *policer-id* must be specified. The parameter *policer-id* references a *policer-id* that has already been created within the **sap-ingress** QoS policy.

**Values** 1 to 63

### **fp-redirect-group**

Redirects a forwarding class to a forwarding plane queue-group as specified in a SAP QoS policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

```
configure service nat firewall-policy unknown-protocols
```

## Description

Commands in this context configure the treatment of flows of unknown Layer 4 protocols, which are protocols that cannot be natively handled by the system.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 25.54 unknown-queue

### unknown-queue

#### Syntax

**unknown-queue** *queue-id* [**group** *queue-group-name*]

**no unknown-queue**

#### Context

**[Tree]** (config>qos>sap-ingress>fc unknown-queue)

#### Full Context

configure qos sap-ingress fc unknown-queue

#### Description

This command overrides the default unknown unicast forwarding type queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy as a multipoint queue before the mapping can be made. When the forwarding class mapping is executed, all unknown traffic on a SAP using this policy is forwarded using the *queue-id*.

The unknown forwarding type usually tracks the multicast forwarding type definition. This command overrides that default behavior.

The **no** form of this command sets the unknown forwarding type *queue-id* back to the default of tracking the multicast forwarding type queue mapping.

#### Parameters

##### *queue-id*

Specifies an existing multipoint queue defined in the **config>qos>sap-ingress** context.

**Values** Any valid multipoint *queue-id* in the policy including 2 through 32.

**Default** 11

##### **group** *queue-group-name*

This optional parameter is used to redirect the forwarding type within the forwarding class to the specified *queue-id* within the *queue-group-name*. When the policy is applied, all packets matching the forwarding class and forwarding type will be redirected to the

queue within the specified queue group. The *queue-group-name* are configured in the **config>qos>queue-group-templates** egress and ingress contexts.

## Platforms

All

## unknown-queue

## Syntax

**unknown-queue** *queue-id*

**no unknown-queue**

## Context

[\[Tree\]](#) (config>qos>shared-queue>fc unknown-queue)

## Full Context

configure qos shared-queue fc unknown-queue

## Description

This command configures the unknown unicast forwarding type queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy as a multipoint queue before the mapping can be made. When the forwarding class mapping is executed, all unknown traffic on a SAP using this policy is forwarded using the *queue-id*.

The unknown forwarding type usually tracks the multicast forwarding type definition. This command overrides that default behavior.

The **no** form of this command sets the unknown forwarding type *queue-id* back to the default of tracking the multicast forwarding type queue mapping.

## Parameters

*queue-id*

The *queue-id* must be an existing, multipoint queue defined in the **config>qos>sap-ingress** context policer-output-queues profile. For the 7950 XRS, this is not configurable in the policer-output-queues profile.

**Values** 25 to 32

## 25.55 unnumbered

## unnumbered

### Syntax

**unnumbered** [*ip-int-name* | *ip-address*]

**no unnumbered**

### Context

[\[Tree\]](#) (config>service>vprn>sub-if unnumbered)

[\[Tree\]](#) (config>service>ies>sub-if unnumbered)

### Full Context

configure service vprn subscriber-interface unnumbered

configure service ies subscriber-interface unnumbered

### Description

This command can be configured only for subscriber interfaces that do not have an IPv4 address explicitly configured and is therefore operationally in a DOWN state. By configuring this command, the subscriber interface borrows the IPv4 address from the referenced interface (directly or indirectly via IP address) that must be operationally UP and located in the same routing instance as the subscriber interface. This allows the subscriber interface to be operationally UP and consequently allow forwarding of the subscriber traffic.

Such interface is referred as unnumbered interface, since it does not have explicitly configured a unique IP address. Subscriber hosts under the unnumbered subscriber interface are installed in the fib as /32 hosts.

Without this command the subscriber interface is operationally DOWN and subscriber-host instantiation is not possible.

This command is mutually exclusive with the `allow-unmatched-subnets` command under the same CLI hierarchy.

The operation of IPv6 host is not affected by this command.

The **no** form of this command reverts to the default.

### Parameters

#### *ip-int-name*

Specifies the interface name from which an IPv4 address is borrowed.

#### *ip-address*

Specifies the IP address from an optionally up interface that is used for subscriber interface.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## no unnumbered

### Context

[Tree] (config>router>if unnumbered)

### Full Context

configure router interface unnumbered

### Description

This command sets an IP interface as an unnumbered interface and specifies the IP address to be used for the interface.

To conserve IP addresses, unnumbered interfaces can be configured. The address used when generating packets on this interface is the *ip-addr* parameter configured.

An error message will be generated if an **unnumbered** interface is configured, and an IP address already exists on this interface.

The **no** form of this command removes the IP address from the interface, effectively removing the unnumbered property. The interface must be **shutdown** before **no unnumbered** is issued to delete the IP address from the interface, or an error message will be generated.

### Default

no unnumbered

### Parameters

*ip-int-name* | *ip-address*

Optional. Specifies the IP address or IP interface name to associate with the unnumbered IP interface in dotted decimal notation. The configured IP address must exist on this node. It is recommended to use the system IP address as it is not associated with a specific interface and is therefore always reachable. The system IP address is the default if no *ip-addr* or *ip-int-name* is configured.

### Platforms

All

 configure service ies subscriber-interface group-interface icmp unreachablees  
 configure service vprn subscriber-interface group-interface icmp unreachablees  
 configure service ies interface icmp unreachablees  
 configure service vprn interface icmp unreachablees

## Description

This command configures the rate for ICMP host and network destination unreachable messages issued on the router interface.

The **unreachables** command enables the generation of ICMP destination unreachablees on the router interface. The rate at which ICMP unreachablees is issued can be controlled with the optional *number* and *seconds* parameters by indicating the maximum number of destination unreachable messages which can be issued on the interface for a given time interval.

By default, generation of ICMP destination unreachablees messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of this command disables the generation of ICMP destination unreachable messages on the router interface and reverts to the default values.

## Default

unreachables 100 10

## Parameters

### *number*

Specifies the maximum number of ICMP unreachable messages to send. This parameter must be specified with the *seconds* parameter.

**Values** 10 to 2000

### *seconds*

Specifies the time frame, in seconds, used to limit the *number* of ICMP unreachable messages that can be issued.

**Values** 1 to 60

## Platforms

```

```
no untrusted
```

## Context

[\[Tree\]](#) (config>router>if untrusted)

## Full Context

```
configure router interface untrusted
```

## Description

This command configures the state of untrusted for a network IP interface.

The untrusted state identifies the participating interfaces in the label security feature for prefixes of a VPN family at an inter-AS boundary. The router supports a maximum of 15 network interfaces that can participate in this feature.

The user normally applies this command to an inter-AS interface. PIP keeps track of the untrusted status of each interface. In the data path, such an interface causes the default forwarding to be set to the *default-forwarding* value.

For backward compatibility reasons, the interface **default-forwarding** is set to the **forward** value; this means that labeled packets are checked in the normal way against the table of programmed ILMs to decide if they should be dropped or forwarded in a GRT, a VRF, or a L2 service context.

If the user sets the *default-forwarding* value to **drop**, all labeled packets received on that interface are automatically dropped.

This command sets the default behavior for an untrusted interface in the data path and for all ILMs. When enabling the label security for VPN IPv4 or VPN IPv6 prefixes, BGP programs the data path to provide an exception to the normal way of forwarding handling away from the default for those VPRN ILMs.

The **no** form of this command returns the interface into the default state of trusted.

## Default

no untrusted

## Parameters

### *default-forwarding*

Specifies the default forwarding behavior of labeled packets received on this interface.

**Values** forward, drop

**Default** forward

All

## 25.59 unzip

unzip

## Syntax

**unzip** *source-file-url* [*dest-file-url*] **list**

**unzip** *source-file-url* *dest-file-url* [**create-destination**] [**force**]

**Context****[Tree]** (file unzip)**Full Context**

file unzip

**Description**

This command expands the contents of a ZIP file to the local file system. Any file that is zipped using the store, deflate, or zip64 compression methods can be unzipped. The source ZIP file location can be a locally installed solid-state storage device or a remote FTP or TFTP server. Files can only be unzipped to the active CPM.

**Parameters*****source-file-url, dest-file-url***

Specifies the source or destination file URL.

**Values**

local-url	<i>[cflash-id]/file-path</i> 200 chars max, including cflash-id directory length 99 chars max each
remote-url	{ftp   tftp}://[ <i>login:pswd@</i> ] <i>remote-locn</i> / [ <i>file-path</i> ] 247 chars max, <i>file-path</i> 199 chars max
remote-locn	{ <i>hostname</i>   <i>ipv4-address</i>   "[ <i>ipv6-address</i> "]}[: <i>port</i> ]
ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x[- <i>interface</i> ] x:x:x:x:x:d.d.d.d[- <i>interface</i> ] x: [0 to FFFF]H d: [0 to 255]D interface - 32 characters max, for link local addresses
port	[0 to 65535]
cflash-id	cf1:   cf1-A:   cf2:   cf2-A:   cf3:   cf3-A:

***create-destination***

Specifies that a non-existent directory structure that is explicitly entered as the destination file URL is created as part of the unzip operation. This parameter is required to create new directories.

***list***

Lists the content of the ZIP file without performing the unzip operation.

**force**

Overwrites without prompting, any file or directory contained within the ZIP file that already exists in the destination URL. This keyword does not automatically create new directories explicitly specified by *dest-file-url*. To create these directories, use the **create-destination** flag.

## 25.62 up-nat-policy

### up-nat-policy

### Syntax

```
up-nat-policy name [create]
```

### Context

[\[Tree\]](#) (config>service>nat up-nat-policy)

### Full Context

```
configure service nat up-nat-policy
```

## Description

This command creates a NAT policy template for BNG CUPS UPF. This template is instantiated for a set of subscribers sharing in a NAT pool. The policy includes parameters that define the BNG CUPS UPF NAT behavior, such as, but not limited to, the following:

- ALGs
- filtering mode
- watermarks
- ports and NAT flow limits
- priority NAT flows
- protocol timers

When the BNG CPF does not receive the NAT policy template, a default template takes effect if it is configured on the BNG UPF. The name of the default NAT policy template on the BNG UPF must equal default.

## Parameters

### **create**

Keyword required to create a new NAT policy for BNG CUPS UPF.

### **name**

Specifies the UP NAT policy name, up to 32 characters. The name default has a special meaning representing the default NAT policy template. The system uses the default template when the BNG CPF does not receive a more specific name when the subscriber is instantiated.

## 25.64 up-threshold

## up-threshold

## Syntax

**up-threshold** *percent-change* [**bw** *absolute-change*]

## Context

[\[Tree\]](#) (config>router>rsvp>dbw-accounting up-threshold)

## Full Context

configure router rsvp dbw-accounting up-threshold

## Description

This command sets the minimum change (in percent of the latest advertised value) above which an increase in MRLB (IS-IS TE sub-TLV 10) or MRB (OSPF TE sub-TLV 7) triggers an IGP-TE update. This configuration only applies to a change in MRLB or MRB caused by dark bandwidth. Other events affecting MRLB or MRB (such as the change of the subscription factor or the loss of link in a LAG over which the RSVP interface is defined) trigger an immediate TE update, regardless of the importance of the impact.

Optionally, the threshold can also be expressed as an absolute value. In this case, the evaluation of the change is made using the percent change and the absolute change. An IGP-TE update is sent if both of these thresholds are crossed. Changing this parameter in the course of dark bandwidth accounting does not affect the accounting cycle.

## Default

up-threshold 0

## Parameters

### *percent-change*

Specifies the minimum increase in MRLB/MRB, expressed in percent.

**Values** 0 to 100

### *absolute-change*

Specifies the minimum increase in MRLB/MRB, expressed in Mb/s.

**Values** 0 to 1000000

## Platforms

7750 SR, 7750 SR-s, 7950 XRS, VSR

## 25.66 update-fault-tolerance

### update-fault-tolerance

#### Syntax

```
[no] update-fault-tolerance
```

#### Context

```
[Tree] (config>service>vprn>bgp>error-handling update-fault-tolerance)
```

```
[Tree] (config>service>vprn>bgp>group>neighbor>error-handling update-fault-tolerance)
```

[\[Tree\]](#) (config>service>vprn>bgp>group>error-handling update-fault-tolerance)

### Full Context

```
configure service vprn bgp error-handling update-fault-tolerance
configure service vprn bgp group neighbor error-handling update-fault-tolerance
configure service vprn bgp group error-handling update-fault-tolerance
```

### Description

This command enables **treat-as-withdraw** and other similarly non-disruptive approaches for handling a wide range of UPDATE message errors, as long as there are no length errors that prevent all of the NLRI fields from being correctly identified and parsed.

### Default

no update-fault-tolerance

### Platforms

All

## update-fault-tolerance

### Syntax

[no] **update-fault-tolerance**

### Context

[\[Tree\]](#) (config>router>bgp>group>error-handling update-fault-tolerance)

[\[Tree\]](#) (config>router>bgp>error-handling update-fault-tolerance)

[\[Tree\]](#) (config>router>bgp>group>neighbor>error-handling update-fault-tolerance)

### Full Context

```
configure router bgp group error-handling update-fault-tolerance
configure router bgp error-handling update-fault-tolerance
configure router bgp group neighbor error-handling update-fault-tolerance
```

### Description

This command enables **treat-as-withdraw** and other similarly non-disruptive approaches for handling a wide range of UPDATE message errors, as long as there are no length errors that prevent all of the NLRI fields from being correctly identified and parsed.

### Default

no update-fault-tolerance

## Platforms

All

## 25.67 update-interval

### update-interval

#### Syntax

**update-interval** [**hrs** *hours*] [**min** *minutes*] [**days** *days*]

**no update-interval**

#### Context

**[Tree]** (config>service>dynsvc>acct-2 update-interval)

**[Tree]** (config>service>dynsvc>acct-1 update-interval)

#### Full Context

configure service dynamic-services dynamic-services-policy accounting-2 update-interval

configure service dynamic-services dynamic-services-policy accounting-1 update-interval

#### Description

This command specifies the interval between each RADIUS Accounting Interim-Update message (minimum 5 minutes; maximum 180 days).

The **no** form of this command disables the sending of Accounting Interim-Update messages.

A RADIUS specified Accounting Interim Interval overrides the CLI configured value.

#### Default

no update-interval (do not send Accounting Interim-Update messages)

#### Parameters

##### *hrs*

specifies the interval in hours.

**Values** 1 to 23

##### *min*

Specifies the interval in minutes.

**Values** 1 to 59

##### *days*

specifies the interval in days.

**Values** 1 to 180

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## update-interval

## Syntax

**update-interval** [*hrs hours*] [*min minutes*] [*days days*]

**no update-interval**

## Context

[\[Tree\]](#) (config>service>dynsvc>ladb>user>idx>acct update-interval)

## Full Context

configure service dynamic-services local-auth-db user-name index accounting update-interval

## Description

This command specifies the time between each dynamic data service accounting interim update for this accounting destination. This command overrides the local configured value in the dynamic services policy.

The **no** form of this command disables the generation of interim accounting updates to this destination.

The minimum update interval is 5 minutes.

## Parameters

### *hours*

Specifies the interval in hours.

**Values** 1 to 23

### *minutes*

Specifies the interval in minutes.

**Values** 1 to 59

### *days*

Specifies the interval in days.

**Values** 1 to 180

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## update-interval

### Syntax

**update-interval** *minutes*

**no update-interval**

### Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy update-interval)

### Full Context

configure subscriber-mgmt radius-accounting-policy update-interval

### Description

This command specifies the interval at which accounting data of subscriber hosts is updated in a RADIUS Accounting Interim-Update message. Requires interim-update to be enabled when specifying the accounting mode in the radius accounting policy.

A RADIUS specified interim interval (attribute [85] Acct-Interim-Interval) overrides the CLI configured value.

The **no** form of this command reverts to the default.

### Parameters

*minutes*

Specifies the interval, in minutes, at which accounting data of subscriber hosts is updated.

**Values** 5 to 259200

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## update-interval

### Syntax

**update-interval** *minutes* [*jitter seconds*]

**no update-interval**

### Context

[\[Tree\]](#) (config>ipsec>rad-acct-plcy update-interval)

### Full Context

configure ipsec radius-accounting-policy update-interval

## Description

This command enables the system to send RADIUS interim-update packets for IKEv2 remote-access tunnels. The RADIUS attributes in the interim-update packet are the same as acct-start. The value of the Acct-status-type in the interim-update message is 3.

## Default

update-interval 10

## Parameters

### *minutes*

Specifies the interval in minutes.

**Values** 5 to 259200

### *seconds*

Specifies the jitter as the number of seconds when the system sends each interim-update packet.

**Values** 0 to 3600

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## update-interval

## Syntax

**update-interval** *seconds*

## Context

[\[Tree\]](#) (config>test-oam>link-meas>template>twl>ipv6-dest-disc update-interval)

## Full Context

```
configure test-oam link-measurement measurement-template twamp-light ipv6-destination-discovery
update-interval
```

## Description

This command configures the transmission frequency used to maintain the peer address. IPv6 discovery packets are generated to ensure that the peer address has not changed. After the **discovery-timer** expires or a peer is discovered during the **discovery-timer** phase the value of **update-interval** is used to continue to monitor the address of the peer. When set to zero, maintaining the peer address is disabled after the initial discovery phase. If the peer has not been discovered during that phase, disabling and enabling the IPv6 protocol can be used to restart the discovery process.

## Default

update-interval 600

## Parameters

### *seconds*

Specifies the frequency used for probe packets once **discovery-timer** expires.

**Values** 0 to 3600

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 25.68 update-interval-jitter

### update-interval-jitter

## Syntax

**update-interval-jitter absolute** *seconds*

**no update-interval-jitter**

## Context

**[Tree]** (config>service>dynsvc>acct-2 update-interval-jitter)

**[Tree]** (config>service>dynsvc>acct-1 update-interval-jitter)

## Full Context

configure service dynamic-services dynamic-services-policy accounting-2 update-interval-jitter

configure service dynamic-services dynamic-services-policy accounting-1 update-interval-jitter

## Description

This command specifies the absolute maximum random delay introduced on the update interval between two RADIUS Accounting Interim Update messages. The effective maximum random delay value is the minimum of the configured absolute jitter value and 10% of the configured update-interval.

A value of zero sends the accounting interim update message without introducing an additional random delay.

The **no** form of this command sets the default to 10% of the configured update-interval.

## Default

no update-interval-jitter (10% of the configured update-interval)

## Parameters

### *seconds*

Specifies the absolute maximum jitter value in seconds.

**Values** 0 to 3600

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**update-interval-jitter****Syntax**

**update-interval-jitter** *absolute* *seconds*

**no** **update-interval-jitter**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy update-interval-jitter)

**Full Context**

configure subscriber-mgmt radius-accounting-policy update-interval-jitter

**Description**

This command specifies the absolute maximum random delay introduced on the update interval between two accounting interim update messages. The effective maximum random delay value is the minimum of the configured absolute jitter value and 10% of the configured update-interval.

A value of zero will send the accounting interim update message without introducing an additional random delay.

The **no** form of this command sets the default to 10% of the configured update-interval.

**Parameters**

*seconds*

Specifies the absolute maximum jitter value in seconds.

**Values** 0 to 36000

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 25.70 update-timer

### update-timer

#### Syntax

**update-timer** *seconds*  
**no update-timer**

#### Context

[\[Tree\]](#) (config>router>rsvp>te-threshold-update update-timer)

#### Full Context

configure router rsvp te-threshold-update update-timer

#### Description

This command is to control timer-based IGP TE updates. Timer-based IGP updates can be enabled by specifying a non-zero time value. Default value of update-timer is 0.

The **no** form of this command should reset update-timer to the default value and disable timer-based IGP update.

#### Default

no update-timer

#### Parameters

**seconds**

Specifies the time in seconds.

**Values** 0 to 300

#### Platforms

All

## 25.71 updated-error-handling

### updated-error-handling

#### Syntax

[no] updated-error-handling

#### Context

[\[Tree\]](#) (config>service>vprn>bgp>group updated-error-handling)

[\[Tree\]](#) (config>service>vprn>bgp>group>neighbor updated-error-handling)

#### Full Context

configure service vprn bgp group updated-error-handling

configure service vprn bgp group neighbor updated-error-handling

#### Description

This command controls whether SR OS utilizes the new neighbor-complete bit when processing optional transitive path attributes and advertising them to the associated BGP neighbor.

This command also control if SR OS utilizes the error handling mechanism for optional-transitive path attributes.

#### Default

no updated-error-handling

#### Platforms

All

## 25.72 updates

### updates

#### Syntax

[no] updates [neighbor *ip-int-name* | *ip-address*]

#### Context

[\[Tree\]](#) (debug>router>rip updates)

#### Full Context

debug router rip updates

## Description

This command enables debugging for RIP updates.

## Parameters

***ip-int-name* | *ip-address***

Debugs the RIP updates sent on the neighbor IP address or interface.

## Platforms

All

updates

## Syntax

**[no] updates [neighbor *ip-int-name* | *ipv6-address*]**

## Context

**[Tree]** (debug>router>ripng updates)

## Full Context

debug router ripng updates

## Description

This command enables debugging for RIP updates.

## Parameters

***ip-int-name* | *ipv6-address***

Debugs the RIP updates sent on the neighbor IP address or interface.

## Platforms

All

## 25.73 upf-data-endpoint

upf-data-endpoint

## Syntax

**upf-data-endpoint interface *interface-name* fpe *fep-id***

**no upf-data-endpoint**

## Context

[\[Tree\]](#) (config>service>vprn>gtp upf-data-endpoint)

[\[Tree\]](#) (config>router>gtp upf-data-endpoint)

## Full Context

configure service vprn gtp upf-data-endpoint

configure router gtp upf-data-endpoint

## Description

This command configures the GTP - User Plane (GTP-U) endpoint used by BNG CUPS FWA sessions.

The **no** form of the command disables GTP-U termination for BNG CUPS FWA sessions.

## Default

no upf-data-endpoint

## Parameters

### *interface-name*

Specifies an interface name on which GTP-U packets terminate. The name must start with a letter and can be up to 32 characters.

### *fpe-id*

Specifies the forwarding path extension (FPE) ID used to encapsulate and decapsulate GTP-U traffic.

**Values** 1 to 64

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 25.74 upgrade

### upgrade

## Syntax

**upgrade** *index path upgrade-name*

**no upgrade** *index*

## Context

[\[Tree\]](#) (config>card upgrade)

[\[Tree\]](#) (config>card>xiom upgrade)

[\[Tree\]](#) (config>card>mda upgrade)

## Full Context

configure card upgrade  
configure card xiom upgrade  
configure card mda upgrade

## Description

This command assigns a license level upgrade to the card, XIOM, or XMA. There can be multiple upgrades applied to a card, XIOM, or XMA. The first upgrade must use index 1 and then next index 2 and so on. Also, when removing upgrades, the largest index must be removed first and then the next largest removed and so on.

The path indicates the starting level and the new level that will apply due to the upgrade. For example, "cr1200g-cr1600g" can be applied to an XMA that is currently at the cr1200g level and after application of the upgrade, the operational level of the XMA shall be cr1600g.

There must be an upgrade license available for the path specified. Available upgrades can be checked using the **show licensing entitlements** command.

### Note:

Some upgrades require a hard reset of the card or MDA to take effect. In general, this is required when the Full Duplex bandwidth is being changed.

## Parameters

### *index*

Specifies the order of the upgrade.

**Values** 1 to 6

### *upgrade-name*

Specifies the upgrade name to be applied, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-1se

- configure card upgrade

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

- configure card xiom upgrade

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

- configure card mda upgrade

## upgrade

## Syntax

**upgrade**

**Context**

[\[Tree\]](#) (admin>app-assure upgrade)

**Full Context**

admin application-assurance upgrade

**Description**

Use this command to load a new isa-aa.tim file as part of a router-independent signature upgrade. An AA ISA reboot is required.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 25.75 uplink

### uplink

**Syntax**

[no] uplink

**Context**

[\[Tree\]](#) (config>service>vprn>gtp uplink)

[\[Tree\]](#) (config>router>gtp uplink)

**Full Context**

configure service vprn gtp uplink

configure router gtp uplink

**Description**

This command enables GTP configuration related to a GTP uplink using the Gn, S2a, or S2b interface.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

### uplink

**Syntax**

uplink arbiter *arbiter-name*

uplink policer *policer-id*

uplink queue *queue-id*

**uplink scheduler** *scheduler-name*  
**no uplink**

## Context

[\[Tree\]](#) (config>subscr-mgmt>gtp>apn-policy>apn>ambr-qos-mapping uplink)

## Full Context

configure subscriber-mgmt gtp apn-policy apn ambr-qos-mapping uplink

## Description

When enabled, the uplink rate in the APN-AMBR IE in an incoming GTP message is interpreted as a rate override for the specified ingress QoS object. For queues and policers, the PIR is overridden.

This override uses standard SR OS QoS overrides. Therefore, a subsequent Gx/RADIUS-based override removes this override.

The **no** form of this command disables the override mechanism.

## Default

no uplink

## Parameters

### ***arbiter-name***

Specifies the name of the arbiter to be overridden, up to 32 characters.

### ***policer-id***

Specifies the ID of the policer to be overridden.

**Values** 1 to 63

### ***queue-id***

Specifies the ID of the queue to be overridden.

**Values** 1 to 32

### ***scheduler-name***

Specifies the name of the scheduler to be overridden, up to 32 characters.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

**uplink**

## Syntax

**uplink** *port-id*

**uplink system-default**

**uplink none**

## Context

[\[Tree\]](#) (config>system>satellite>port-template>port uplink)

## Full Context

configure system satellite port-template port uplink

## Description

This command configures the uplink association to be used for the associated satellite port.

## Parameters

### *port-id*

Specifies the satellite physical port ID. This must use the format *slot/mda/port*. All satellites have a single slot and a single MDA, so these values will always be 1. For example, port 10 would be specified as 1/1/10.

### **system-default**

Specifies that the uplink association is returned to the system default.

### **none**

Clears the uplink association.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 25.76 uplink-forwarding-while-standby

### uplink-forwarding-while-standby

## Syntax

**[no] uplink-forwarding-while-standby**

## Context

[\[Tree\]](#) (config>subscr-mgmt>up-resiliency>fsg-template uplink-forwarding-while-standby)

## Full Context

configure subscriber-mgmt up-resiliency fate-sharing-group-template uplink-forwarding-while-standby

## Description

This command allows a standby BNG-UP to forward uplink traffic. To prevent the possibility of packet replication toward the network, only enable this command if the access network is provisioned not to replicate unicast packets to the BNG-UP.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 25.77 uplink-initial-wait

### uplink-initial-wait

**Syntax**

**uplink-initial-wait** *seconds*

**Context**

**[Tree]** (config>subscr-mgmt>vrgw>brg>brg-profile uplink-initial-wait)

**Full Context**

configure subscriber-mgmt vrgw brg brg-profile uplink-initial-wait

**Description**

This command specifies how long to wait for the uplink to fully establish when using a non-routed uplink such as a PPPoE client. During this initial wait time, setup of devices in the home is blocked.

After the timer expires, if an uplink was successful on only one of two IP stacks, devices continue to be configured with the successful IP stack. Control plane message for the failed IP stack are dropped.

**Default**

uplink-initial-wait 30

**Parameters**

***seconds***

Specifies the timeout in seconds.

**Values** 10 to 300

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 25.78 uplink-mbr-gbr

## uplink-mbr-gbr

### Syntax

```
uplink-mbr-gbr arbiter arbiter-name
uplink-mbr-gbr policer policer-id
uplink-mbr-gbr queue queue-id
uplink-mbr-gbr scheduler scheduler-name
no uplink-mbr-gbr
```

### Context

[\[Tree\]](#) (config>subscr-mgmt>sla-prof>pfc>seq uplink-mbr-gbr)

### Full Context

```
configure subscriber-mgmt sla-profile pfc-mappings session-qer uplink-mbr-gbr
```

### Description

This command configures the uplink MBR/GBR to QoS override mapping.

The **no** form of the command disables the uplink MBR/GBR mapping.

### Default

```
no uplink-mbr-gbr
```

### Parameters

#### ***arbiter-name***

Specifies the arbiter target of the MBR/GBR override. The arbiter name can be up to 32 characters.

#### ***policer-id***

Specifies the policer ID target of the MBR/GBR override.

**Values** 1 to 63

#### ***queue-id***

Specifies the queue ID target of the MBR/GBR override.

**Values** 1 to 8

#### ***scheduler-name***

Specifies the scheduler name target of the MBR/GBR override. The scheduler name can be up to 32 characters.

### Platforms

## 25.79 upnp

upnp

### Syntax

upnp

### Context

[\[Tree\]](#) (config>service upnp)

### Full Context

configure service upnp

### Description

Commands in this context configure UPnP parameters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 25.80 upnp-mappings

upnp-mappings

### Syntax

upnp-mappings [*upnp-mappings*]

no upnp-mappings

### Context

[\[Tree\]](#) (config>isa>wlan-gw-group>nat>session-limits upnp-mappings)

### Full Context

configure isa wlan-gw-group nat session-limits upnp-mappings

### Description

This command limits the number of Universal Plug 'n Play mappings per member

The **no** form of this command reverts to the default value.

### Default

upnp-mappings 524288

## Parameters

### *upnp-mappings*

specifies, for each MDA in this ISA group, the maximum number of Universal Plug 'n Play (UPnP) mappings.

**Values** 1 to 524288

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## upnp-mappings

## Syntax

**upnp-mappings** *limit* no upnp-mappings

## Context

[\[Tree\]](#) (config>isa>nat-group>session-limits upnp-mappings)

## Full Context

configure isa nat-group session-limits upnp-mappings

## Description

This command specifies the maximum number of UPnP mappings per ISA.

## Default

524288

## Parameters

### *limit*

Specifies the maximum number of UPnP mappings.

**Values** 1 to 524288

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 25.81 upnp-policy

## upnp-policy

### Syntax

**upnp-policy** *policy-name* [**create**]

**no upnp-policy** *policy-name*

### Context

[\[Tree\]](#) (config>service>upnp upnp-policy)

### Full Context

configure service upnp upnp-policy

### Description

This command creates a new upnp-policy or enters the configuration context of an existing upnp-policy. The **no** form of the command removes the upnp-policy *policy-name* from the configuration.

### Parameters

*policy-name*

Specifies the name of the UPnP policy up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## upnp-policy

### Syntax

**upnp-policy** *policy-name*

**no upnp-policy**

### Context

[\[Tree\]](#) (config>subscr-mgmt>sub-prof upnp-policy)

### Full Context

configure subscriber-mgmt sub-profile upnp-policy

### Description

This command enables UPnP IGD services for the subscriber. All ESM hosts of the subscriber could use the UPnP protocol to create port mapping. This feature only support L2-Aware NAT host.

UPnP parameters are defined in the referenced upnp-policy configured in the **config> service>upnp** context.

**Default**

no upnp-policy

**Parameters*****policy-name***

Specifies the UPnP policy associated with this subscriber profile up to 32 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 25.82 upstream-ip-filter

### upstream-ip-filter

**Syntax**

**upstream-ip-filter** *filter-id*

**no upstream-ip-filter**

**Context**

[\[Tree\]](#) (config>service>vprn>nat>outside upstream-ip-filter)

[\[Tree\]](#) (config>router>nat>outside upstream-ip-filter)

**Full Context**

configure service vprn nat outside upstream-ip-filter

configure router nat outside upstream-ip-filter

**Description**

This command configures the ip-filter for upstream traffic. This filter is applied to the upstream traffic after the NAT function and before it enters the outside virtual router instance; it is useful for traffic that bypasses the ingress filters applied in the inside virtual router instance, such as DS-Lite traffic.

**Default**

no upstream-ip-filter

**Parameters*****filter-id***

Specifies the identifier of an IP filter.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 25.83 upstream-ipv6-filter

### upstream-ipv6-filter

#### Syntax

```
upstream-ipv6-filter filter-id
no upstream-ipv6-filter
```

#### Context

[\[Tree\]](#) (config>router>nat>outside upstream-ipv6-filter)

[\[Tree\]](#) (config>service>vprn>nat>outside upstream-ipv6-filter)

#### Full Context

configure router nat outside upstream-ipv6-filter

configure service vprn nat outside upstream-ipv6-filter

#### Description

This command configures the ipv6-filter for upstream traffic. This filter is applied to the upstream traffic after the NAT function and before it enters the outside virtual router instance. This is useful for shared v6 filters that apply to all v6 DSM hosts.

#### Default

no upstream-ipv6-filter

#### Parameters

*filter-id*

Specifies the identifier of an ipv6-filter.

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 25.84 url

### url

#### Syntax

```
url rdr-url-string
no url
```

## Context

[\[Tree\]](#) (config>subscr-mgmt>http-rdr-plcy url)

## Full Context

configure subscriber-mgmt http-redirect-policy url

## Description

This command configures the HTTP URL to re-direct the matching traffic to. It also can specify inclusion of original URL, MAC address and IP address of the subscriber in the redirect URL.

## Parameters

### *rdr-url-string*

Specifies the URL to redirect to.

#### Values

*rdr-url-string*

Up to 255 characters

macro substitutions:

\$URL

Request-URI in the HTTP GET Request received

\$MAC

A string that represents the MAC address of the subscriber host

\$IP

A string that represents the IP address of the subscriber host

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

url

## Syntax

url *url-string* [**service-id** *service-id*]

url *url-string* [**service-name** *service-name*]

no url

## Context

[\[Tree\]](#) (config>system>security>pki>ca-profile>cmpv2 url)

## Full Context

configure system security pki ca-profile cmpv2 url

## Description

This command specifies HTTP URL of the CMPv2 server. The URL must be unique across all configured ca-profiles.

The URL will be resolved by the DNS server configured (if configured) in the corresponding router context.

If the *service-id* is 0 or omitted, then system will try to resolve the FQDN via DNS server configured in bof.cfg. After resolution, the system will connect to the address in management routing instance first, then base routing instance.

If the service is VPRN, then the system only allows HTTP ports 80 and 8080.

## Default

no url

## Parameters

### *url-string*

Specifies the HTTP URL of the CMPv2 server up to 180 characters.

### *service-id service-id*

Specifies the service instance that used to reach CMPv2 server.

**Values**    Service ID: 1 to 2147483647  
              base-router: 0

## Platforms

All

url

## Syntax

url *url*

no url

## Context

[\[Tree\]](#) (config>system>security>pki>ca-prof>auto-crl-update>crl-urls>url-entry url)

## Full Context

configure system security pki ca-profile auto-crl-update crl-urls url-entry url

## Description

This command specifies the HTTP URL of the CRL file for the **url-entry**. The system supports both IPv4 and IPv6 HTTP connections.

### Note:

The URL must point to a DER encoded CRL.

## Default

no url

## Parameters

*url*

Specifies the URL, which specifies the location, where an updated CRL can be downloaded from.

## Platforms

All

url

## Syntax

**url** *url-string* [**service-id** *service-id*]

**url** *url-string* [**service-name** *service-name*]

**no url**

## Context

**[Tree]** (config>system>security>pki>ca-profile>cmp2 url)

## Full Context

configure system security pki ca-profile cmp2 url

## Description

This command specifies HTTP URL of the CMPv2 server. The URL must be unique across all configured ca-profiles.

The URL will be resolved by the DNS server configured (if configured) in the corresponding router context.

If the *service-id* is 0 or omitted, then system will try to resolve the FQDN via DNS server configured in bof.cfg. After resolution, the system will connect to the address in management routing instance first, then base routing instance.

### Note:

If the service is VPRN, then the system only allows HTTP ports 80 and 8080.

## Parameters

*url-string*

Specifies the HTTP URL of the CMPv2 server, up to 180 characters.

**service-id** *service-id*

Specifies the service instance that used to reach CMPv2 server.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **url** *url-string* **service-name** *service-name* variant can be used in all configuration modes.

**Values** service-id: 1 to 2147483647 base-router: 0

***service-name service-name***

Identifies the service, up to 64 characters.

## 25.85 url-entry

### url-entry

#### Syntax

**url-entry** *entry-id* [ **create**]

**no url-entry** *entry-id*

#### Context

[\[Tree\]](#) (config>system>security>pki>ca-prof>auto-crl-update>crl-urls url-entry)

#### Full Context

configure system security pki ca-profile auto-crl-update crl-urls url-entry

#### Description

This command creates a new **crl-url** entry with the **create** parameter, or enters an existing url-entry configuration context without **create** parameter.

The **no** form of this command removes the specified entry.

#### Parameters

***entry-id***

Specifies a URL configured on this system.

**Values** 1 to 8

**create**

Creates an auto URL entry.

#### Platforms

All

## 25.86 url-filter

## url-filter

### Syntax

**url-filter** *url-filter-name* [**characteristic** *characteristic-name*]

**no url-filter**

### Context

**[Tree]** (config>app-assure>group>aqp>entry>action url-filter)

### Full Context

configure application-assurance group app-qos-policy entry action url-filter

### Description

This command configures a url-filter action for flows matching this entry.

### Parameters

***url-filter-name***

Specifies the name of the url-filter policy.

***characteristic-name***

Specifies the name of the characteristic.

## url-filter

### Syntax

**url-filter** *url-filter-name* [**create**]

**no url-filter** *url-filter-name*

### Context

**[Tree]** (config>app-assure>group url-filter)

### Full Context

configure application-assurance group url-filter

### Description

This command configures a URL filter action for flows of a specific type matching this entry.

If no URL filters are specified then no URL filters will be evaluated.

### Parameters

***url-filter-name***

Specifies the Application-Assurance URL filter that will be evaluated.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 25.87 url-list

### url-list

#### Syntax

**url-list** *url-list-name* [**create**]

**no url-list** *url-list-name*

#### Context

[\[Tree\]](#) (config>app-assure>group url-list)

#### Full Context

configure application-assurance group url-list

#### Description

This command configures a url-list object. The url-list points to a file containing a list of URLs located on the system Compact Flash. The url-list is then referenced in a url-filter object in order to filter and redirect subscribers when a URL from this file is accessed.

The **no** form of this command removes the url-list object.

#### Parameters

***url-list-name***

Specify the Application-Assurance url-list

**create**

Keyword used to create the URL list.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### url-list

#### Syntax

**url-list** *url-list-name* **upgrade**

#### Context

[\[Tree\]](#) (admin>app-assure>group url-list)

**Full Context**

admin application-assurance group url-list

**Description**

This command upgrades the URL list.

**Parameters*****url-list-name***

Specifies the application assurance URL list, up to 32 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 25.88 urpf-check

### urpf-check

**Syntax**

[no] urpf-check

**Context**

**[Tree]** (config>service>ies>sub-if>grp-if>ipv6 urpf-check)

**[Tree]** (config>service>vprn>nw-if urpf-check)

**[Tree]** (config>service>vprn>if urpf-check)

**[Tree]** (config>service>vprn>if>ipv6 urpf-check)

**[Tree]** (config>service>vprn>sub-if>grp-if urpf-check)

**[Tree]** (config>service>ies>if urpf-check)

**[Tree]** (config>service>ies>if>ipv6 urpf-check)

**Full Context**

configure service ies subscriber-interface group-interface ipv6 urpf-check

configure service vprn network-interface urpf-check

configure service vprn interface urpf-check

configure service vprn interface ipv6 urpf-check

configure service vprn subscriber-interface group-interface urpf-check

configure service ies interface urpf-check

configure service ies interface ipv6 urpf-check

## Description

This command enables unicast RPF (uRPF) check on this interface.

The **no** form of this command disables unicast RPF (uRPF) Check on this interface.

## Default

no urpf-check

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface ipv6 urpf-check
- configure service vprn subscriber-interface group-interface urpf-check

All

- configure service vprn network-interface urpf-check
- configure service ies interface ipv6 urpf-check
- configure service ies interface urpf-check
- configure service vprn interface ipv6 urpf-check
- configure service vprn interface urpf-check

## urpf-check

## Syntax

[no] urpf-check

## Context

[\[Tree\]](#) (config>subscr-mgmt>git>ipv4 urpf-check)

## Full Context

configure subscriber-mgmt group-interface-template ipv4 urpf-check

## Description

This command enables the uRPF check on this interface.

The **no** form of this command disables the uRPF check on this interface.

## Default

no urpf-check

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## urpf-check

### Syntax

**urpf-check**  
**no urpf-check**

### Context

[\[Tree\]](#) (config>service>vprn>network>ingress urpf-check)

### Full Context

configure service vprn network ingress urpf-check

### Description

This command enables the unicast RPF (uRPF) check of network ingress traffic to include traffic associated with the VPRN if the incoming network interface is configured with the **urpf-selected-vprns** command

If the command is not configured, then traffic associated with this VPRN that arrives on a network interface with **urpf-selected-vprns** configured bypasses the uRPF checking options specified for that network interface.

### Default

no urpf-check

### Platforms

All

## urpf-check

### Syntax

**[no] urpf-check**

### Context

[\[Tree\]](#) (config>router>if>ipv6 urpf-check)

[\[Tree\]](#) (config>router>if urpf-check)

### Full Context

configure router interface ipv6 urpf-check

configure router interface urpf-check

### Description

This command enables unicast RPF (uRPF) Check on this interface.

The **no** form of this command disables unicast RPF (uRPF) Check on this interface.

## Platforms

All

## 25.89 urpf-selected-vprns

### urpf-selected-vprns

#### Syntax

[no] **urpf-selected-vprns**

#### Context

[\[Tree\]](#) (config>router>if urpf-selected-vprns)

#### Full Context

configure router interface urpf-selected-vprns

#### Description

This command enables uRPF checking of incoming traffic on the network interface for the following packets.

- Packets associated with the global routing table (base router) context.
- Packets associated with VPRNs that have enabled the uRPF check using the **config>service>vprn>network> ingress>urpf-check** command.

If the command is not configured, the default action is to perform uRPF checks for all ingress traffic on the network interface (associated with the base router and all VPRNs) based on the IPv4 and IPv6 **urpf-check** configuration options of the network interface.

#### Default

no urpf-selected-vprns

## Platforms

All

## 25.90 usage-monitoring

### usage-monitoring

#### Syntax

[no] **usage-monitoring**

## Context

**[Tree]** (config>app-assure>group>statistics>aa-sub usage-monitoring)

## Full Context

configure application-assurance group statistics aa-sub usage-monitoring

## Description

This command enables Gx usage monitoring the given AA group/partition. It can only be enabled if there is enough usage monitoring resources for all existing subs. Once disabled, all monitoring instances for AA subscribers are silently removed (no PCRF notifications) and all subsequent AA Gx usage monitoring messages are ignored.

## Default

no usage-monitoring

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 25.91 use-arp

### use-arp

## Syntax

**[no] use-arp**

## Context

**[Tree]** (config>service>vprn>if>dhcp use-arp)

**[Tree]** (config>service>ies>if>dhcp use-arp)

## Full Context

configure service vprn interface dhcp use-arp

configure service ies interface dhcp use-arp

## Description

This command enables the use of ARP to determine the destination hardware address.

The **no** form of this command disables the use of ARP to determine the destination hardware address.

## Platforms

All

## 25.92 use-bgp-routes

### use-bgp-routes

#### Syntax

**[no] use-bgp-routes**

#### Context

**[Tree]** (config>service>vprn>bgp>next-hop-res use-bgp-routes)

#### Full Context

configure service vprn bgp next-hop-resolution use-bgp-routes

#### Description

This command enables the use of BGP routes to resolve BGP next hops. When this command is enabled, any unlabeled IPv4 or IPv6 BGP route received from a VPRN BGP peer becomes resolvable by up to four other BGP routes in order to resolve the route to a VPRN IP interface.

This command also allows unlabeled IPv4 or IPv6 BGP routes leaked from the GRT with unresolved next hops (in the GRT) to be resolvable by BGP-VPN routes (of the VPRN).

The **no** form of this command reverts to the default behavior. By default, a VPRN BGP route is not resolvable by another VPRN BGP route or by a BGP-VPN route.

#### Default

no use-bgp-routes

#### Platforms

All

### use-bgp-routes

#### Syntax

**[no] use-bgp-routes**

#### Context

**[Tree]** (config>router>bgp>next-hop-res use-bgp-routes)

#### Full Context

configure router bgp next-hop-resolution use-bgp-routes

#### Description

This command specifies whether to use BGP routes to recursively resolve the BGP next-hop of unlabeled IPv4 and unlabeled IPv6 routes. Up to four levels of recursion are supported.

The **no** form of this command reverts to the default behavior. By default, a BGP route is not resolvable by another BGP route.

**Default**

no use-bgp-routes

**Platforms**

All

**use-bgp-routes****Syntax**

**use-bgp-routes**

**Context**

[\[Tree\]](#) (config>router>bgp>next-hop-res>lbl-routes use-bgp-routes)

**Full Context**

configure router bgp next-hop-resolution labeled-routes use-bgp-routes

**Description**

Commands in this context configure labeled route options for next-hop resolution.

**Platforms**

All

## 25.93 use-broadcast-address

**use-broadcast-address****Syntax**

[no] **use-broadcast-address**

**Context**

[\[Tree\]](#) (config>port>ethernet>dwl use-broadcast-address)

**Full Context**

configure port ethernet down-when-looped use-broadcast-address

## Description

This command specifies whether or not the down when looped destination MAC address is the broadcast address, or the local port MAC address, as specified in the port's MAC address.

## Platforms

All

## 25.94 use-broadcast-mac

### use-broadcast-mac

## Syntax

[no] use-broadcast-mac

## Context

[\[Tree\]](#) (config>service>ipipe>sap use-broadcast-mac)

## Full Context

configure service ipipe sap use-broadcast-mac

## Description

This command enables the user of a of broadcast MAC on SAP.

An Ipipe VLL service with the command enabled forwards unicast IP packets using the broadcast MAC address until the ARP cache is populated with a valid entry for the CE IP and MAC addresses.

The **no** form of this command enables the user of a of broadcast MAC on SAP.

## Default

no use-broadcast-mac

## Platforms

All

## 25.95 use-def-mcast

### use-def-mcast

## Syntax

[no] use-def-mcast

## Context

[\[Tree\]](#) (config>service>vpls>isid-policy>entry use-def-mcast)

## Full Context

configure service vpls isid-policy entry use-def-mcast

## Description

The **use-def-mcast** option prevents local installation of the ISIDs in the range in the MFIB and uses the default multicast tree instead for a B-VPLS. In a node that does not have I-VPLS or static-isids, this command prevents the building of an MFIB entry for this ISID when received in a SPBM TLV and allows the broadcast of ISID based traffic on the default multicast tree. If an **isid-policy** exists, the core nodes can have this policy to prevent connectivity problems when some nodes are advertising an ISID and others are not. In a I-VPLS service if the customer MAC (C-MAC) is unknown, a frame will have the Multicast DA for an ISID (PBB-OUI + ISID) flooded on the default multicast tree and not pruned.

## Default

no use-def-mcast

## Platforms

All

## 25.96 use-default-template

### use-default-template

## Syntax

[no] use-default-template

## Context

[\[Tree\]](#) (config>service>vprn>aaa>remote-servers>radius use-default-template)

[\[Tree\]](#) (config>service>vprn>aaa>rmt-srv>tacplus use-default-template)

## Full Context

configure service vprn aaa remote-servers radius use-default-template

configure service vprn aaa remote-servers tacplus use-default-template

## Description

This command specifies whether the RADIUS default user template is actively applied to the RADIUS user if no VSAs are returned with the auth-accept from the RADIUS server. When enabled, the radius\_default user-template is actively applied if no VSAs are returned with the auth-accept from the RADIUS server and radius authorization is enabled.

The no form of this command disables the use of the RADIUS default template.

**Default**

no use-default-template

**Platforms**

All

**use-default-template****Syntax**

[no] use-default-template

**Context**

[\[Tree\]](#) (config>system>security>tacplus use-default-template)

**Full Context**

configure system security tacplus use-default-template

**Description**

This command specifies whether the **user-template tacplus\_default** is actively applied to the TACACS+ user. When enabled, some parameters of the **user-template tacplus\_default** are actively applied to all users that authenticate via TACACS+. See the **user-template tacplus\_default** command for more details.

When disabled, the parameters of the template are not applied to TACACS+ users, and TACACS+ users can not connect to an SR OS router since the user access parameters are not available. In this case, TACACS+ can only be used for accounting.

**Default**

use-default-template

**Platforms**

All

**use-default-template****Syntax**

[no] use-default-template

**Context**

[\[Tree\]](#) (config>system>security>radius use-default-template)

**Full Context**

configure system security radius use-default-template

## Description

This command specifies whether the RADIUS default user template is actively applied to the RADIUS user if no VSAs are returned with the auth-accept from the RADIUS server. When enabled, the radius\_default user-template is actively applied if no VSAs are returned with the auth-accept from the RADIUS server and radius authorization is enabled.

The **no** form of this command disables the use of the RADIUS default template.

configure subscriber-mgmt sub-ident-policy sub-profile-map use-direct-map-as-default

configure subscriber-mgmt sub-ident-policy sla-profile-map use-direct-map-as-default

## Description

This command enables direct mapping of the profiles as default. With this flag, a string returned in authentication is used as the named profile. If the named profiled cannot be found, the default profile is used.

The **no** form of this command disables direct mapping.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 25.98 use-es-bmac

## use-es-bmac

### Syntax

[no] use-es-bmac

### Context

[\[Tree\]](#) (config>service>vpls>pbb use-es-bmac)

### Full Context

configure service vpls pbb use-es-bmac

### Description

This command is only supported in B-VPLS instances where BGP-EVPN is enabled and controls the source B-MAC used by the system for packets coming from the SAP or spoke-SDPs when they belong to an EVPN Ethernet-Segment.

If enabled, the system will use a source B-MAC derived from the source-bmac (high order four bytes) and the least significant two bytes configured in **config>service>system>bgp-evpn>eth-seg>source-bmac-lsb** for all the packets coming from the local ethernet-segment.

If **no use-es-bmac** is configured, the system will use the regular source-bmac (provided by the **config>service>vpls>pbb>source-bmac** command, or the chassis bmac if the source-bmac is not configured).

### Default

no use-es-bmac

### Platforms

All

## 25.99 use-gi-address

## use-gi-address

### Syntax

use-gi-address [scope scope]

### Context

[\[Tree\]](#) (config>service>vprn>dhcp>server use-gi-address)

[\[Tree\]](#) (config>router>dhcp>server use-gi-address)

### Full Context

configure service vprn dhcp local-dhcp-server use-gi-address

```
configure router dhcp local-dhcp-server use-gi-address
```

### Description

This command enables the use of gi-address matching. If the gi-address flag is enabled, a pool can be used even if a subnets is not found. If the **local-user-db-name** is not used, the gi-address flag is used and addresses are handed out by GI only. If a user must be blocked from getting an address the server maps to a local user database and configures the user with no address.

A pool can include multiple subnets. Since the GI is shared by multiple subnets in a subscriber interface the pool may provide IP addresses from any of the subnets included when the GI is matched to any of its subnets. This allows a pool to be created that represents a sub-int.

The **no** form of the reverts to the default.

### Parameters

#### *scope*

Specifies if addresses are handed out for a certain subnet where the gi-address belongs to only or for all subnets part of the pool.

**Values**    **subnet** — Addresses are only handed out for the subnet where the gi-address is part.

**pool** — All subnets part of the pool which contain subnet where the gi-address is part of can hand out addresses.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 25.100 use-global-sampling-rate

### use-global-sampling-rate

#### Syntax

```
[no] use-global-sampling-rate
```

#### Context

**[Tree]** (config>mirror>mirror-dest use-global-sampling-rate)

#### Full Context

```
configure mirror mirror-dest use-global-sampling-rate
```

#### Description

This command configures each mirror destination service to use the global sampling rate, which allows a single high-rate sampling rate for the entire system.

The **no** form of this command disables use of the global sampling rate for the mirror destination service. Disabling the global sampling rate causes each mirror destination to mirror either at the full rate (all packets) or to mirror at the mirror destination sampling rate if the sampling rate is specified under the **sampling-rate** command.

**Default**

no use-global-sampling-rate

**Platforms**

All

## 25.101 use-ingress-l2tp-dscp

```
use-ingress-l2tp-dscp
```

**Syntax**

[no] use-ingress-l2tp-dscp

**Context**

[\[Tree\]](#) (config>subscr-mgmt>sla-prof>egress use-ingress-l2tp-dscp)

**Full Context**

configure subscriber-mgmt sla-profile egress use-ingress-l2tp-dscp

**Description**

This command enables the use of the DSCP marking taken from the L2TP header received on an L2TP Access Concentrator (LAC) for egress classification for the subscriber host using the associated sla-profile.

This command is ignored if the ingress packet is not identified as an L2TP packet.

The **no** form of this command reverts to the default.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 25.102 use-lag-port-weight

```
use-lag-port-weight
```

**Syntax**

[no] use-lag-port-weight

## Context

[\[Tree\]](#) (config>subscr-mgmt>msap-policy>vpls-only>igmp-snp>mcac>mc-constraints use-lag-port-weight)

## Full Context

```
configure subscriber-mgmt msap-policy vpls-only-sap-parameters igmp-snooping mcac mc-constraints use-lag-port-weight
```

## Description

This command enables port weight to be used when determining available bandwidth per level when LAG ports go down/come up. The command is required for proper operation on mixed port-speed LAGs and can be used for non-mixed port-speed LAGs as well.

The **no** form of this command reverts to the default.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## use-lag-port-weight

## Syntax

**use-lag-port-weight**

**no use-lag-port-weight**

## Context

[\[Tree\]](#) (config>service>vpls>sap>igmp-snooping>mcac>mc-constraints use-lag-port-weight)

## Full Context

```
configure service vpls sap igmp-snooping mcac mc-constraints use-lag-port-weight
```

## Description

This command enables port weight to be used when determining available bandwidth per level when LAG ports go down/come up. The command is required for correct operation on mixed port-speed LAGs and can be used for non-mixed port-speed LAGs as well.

## Default

**no use-lag-port-weight** — The port number is used when determining available BW per level when LAG ports go down/come up.

## Platforms

## 25.105 use-link-address

### use-link-address

#### Syntax

**use-link-address** [**scope** *scope*]

**no use-link-address**

#### Context

[\[Tree\]](#) (config>router>dhcp6>server use-link-address)

[\[Tree\]](#) (config>service>vprn>dhcp6>server use-link-address)

#### Full Context

configure router dhcp6 local-dhcp-server use-link-address

configure service vprn dhcp6 local-dhcp-server use-link-address

## Description

This command configures the local pool selection for IPv6 address or prefix assignment for the configured link-address under relay configuration. The selected pool will contain a prefix covering the link-address. The scope option defines the scope for the match. With scope **subnet**, the prefix or address selection is limited to the prefix in the pool that covers the link-address. With scope **pool**, all the prefixes in the selected pool are eligible for assignment.

The **no** form of the reverts to the default.

## Default

scope subnet

## Parameters

### **scope**

Specifies the scope of the IP address selection.

**Values** **subnet** — Specifies that the prefix or address selection is limited to the prefix in the pool that covers the link address.

**pool** — Specifies that all prefixes in the selected pool are eligible for assignment.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 25.106 use-outside-ip-address

### use-outside-ip-address

## Syntax

[no] use-outside-ip-address

## Context

[\[Tree\]](#) (config>li use-outside-ip-address)

## Full Context

configure li use-outside-ip-address

## Description

This command enables LI to be performed on an L2-Aware NAT subscriber after NAT. The LI traffic will contain the subscriber's outside public IP address instead of the default private IP address.

The **no** form of this command disables the use of the outside public IP address for the L2-Aware NAT subscriber.

## Platforms

All

## 25.107 use-policer-result-marking-dot1p-inner

```
use-policer-result-marking-dot1p-inner
```

### Syntax

```
[no] use-policer-result-marking-dot1p-inner
```

### Context

[\[Tree\]](#) (config>qos>sap-egress use-policer-result-marking-dot1p-inner)

### Full Context

```
configure qos sap-egress use-policer-result-marking-dot1p-inner
```

### Description

This command enables using the egress policer value as a criteria with which to mark dot1p-inner bits. The **no** form of this command disables this feature.

### Default

```
no use-policer-result-marking-dot1p-inner
```

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS

## 25.108 use-pool-from-client

```
use-pool-from-client
```

### Syntax

```
use-pool-from-client delimiter delimiter
```

```
use-pool-from-client
```

```
no use-pool-from-client
```

### Context

[\[Tree\]](#) (config>router>dhcp>server use-pool-from-client)

[\[Tree\]](#) (config>service>vprn>dhcp>server use-pool-from-client)

## Full Context

```
configure router dhcp local-dhcp-server use-pool-from-client
configure service vprn dhcp local-dhcp-server use-pool-from-client
```

## Description

This command enables the use of the pool indicated by DHCP client. When enabled, the IP address pool to be used by this server is the pool indicated by the vendor-specific sub-option 13 of the DHCP option 82. When disabled or if there is no sub-option 13 in the DHCP message, the pool selection falls back to the **use-gi-address** configuration.

The **no** form of this command disables the use of the pool indicated by DHCP client.

## Parameters

### *delimiter*

A single ASCII character specifies the delimiter of separating primary and secondary pool names in Option82 VSO.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 25.109 use-sap-bmac

### use-sap-bmac

## Syntax

```
[no] use-sap-bmac
```

## Context

[\[Tree\]](#) (config>service>vpls>pbb use-sap-bmac)

## Full Context

```
configure service vpls pbb use-sap-bmac
```

## Description

This command enables on a per BVPLS basis the use of source B-MACs allocated to multi-homed SAPs (assigned to an MC-LAG) in the related IVPLS or Epipe service. The command will fail if the value of the source-bmac assigned to the BVPLS is the hardware (chassis) B-MAC. That is, the **source-bmac** must be a configured one.

## Default

```
no use-sap-bmac
```

**Platforms**

All

**25.110 use-sdp-bmac**`use-sdp-bmac`**Syntax**`[no] use-sdp-bmac`**Context**`[Tree] (config>service>epipe>spoke-sdp use-sdp-bmac)`**Full Context**`configure service epipe spoke-sdp use-sdp-bmac`**Description**

This command indicates that this spoke SDP is expected to be part of a redundant pseudowire connected to a PBB Epipe service. Enabling this parameter will cause traffic forwarded from this spoke SDP into the B-VPLS domain to use a virtual backbone MAC as its source MAC address when both this, and the control pseudowire, are in the active state on this BEB. This virtual backbone MAC is derived from the SDP source-bmac-lsb configuration.

This command will fail when configuring it under a spoke SDP within a PBB-Epipe that is connected to a B-VPLS with mac-notification enabled.

**Default**`no use-sdp-bmac`**Platforms**

All

**25.111 use-virtual-mac**`use-virtual-mac`**Syntax**`[no] use-virtual-mac`

## Context

[\[Tree\]](#) (config>service>vprn>router-advert>if use-virtual-mac)

## Full Context

configure service vprn router-advertisement interface use-virtual-mac

## Description

This command enables sending router advertisement messages using the VRRP virtual MAC address, provided that the virtual router is currently the master.

If the virtual router is not the master, no router advertisement messages are sent.

The **no** form of this command disables sending router advertisement messages.

## Default

no use-virtual-mac

## Platforms

## 25.112 use-vrtr-if-index

### use-vrtr-if-index

#### Syntax

[no] **use-vrtr-if-index**

#### Context

[\[Tree\]](#) (config>cflowd use-vrtr-if-index)

#### Full Context

configure cflowd use-vrtr-if-index

#### Description

This command is used to export flow data using interface indexes (ifIndex values), which can be used directly as the index into the IF-MIB tables for retrieving interface statistics. Specifically, if this command is enabled, the ingressInterface (ID=10) and egressInterface (ID= 14) fields in IP flow templates used to export the flow data to cflowd version 9 and version 10 collectors will be populated with the IF-MIB ifIndex of that interface. In addition, for version 10 templates, two fields are available in the IP flow templates to specify the virtual router ID associated with the ingress and egress interfaces.

The **no** form of this command removes the command from the active configuration and causes cflowd to return to the default behavior of populating the ingress and egress interface ID with the global IF index IDs.

#### Default

no use-vrtr-if-index

#### Platforms

All

## 25.113 user

### user

#### Syntax

[no] **user** *user-name*

#### Context

[\[Tree\]](#) (config>system>security user)

#### Full Context

configure system security user

## Description

This command creates a local user and a context to edit the user configuration.

If a new *user-name* is entered, the user is created. When an existing *user-name* is specified, the user parameters can be edited.

When creating a new user and then entering the **info** command, the system displays a password in the output. This is expected behavior in the hash2 scenario. However, when using that user name, there will be no password required. The user can login to the system and then <ENTER> at the password prompt, the user will be logged in.

Unless an administrator explicitly changes the password, it will be null. The hashed value displayed uses the username and null password field, so when the username is changed, the displayed hashed value will change.

The **no** form of this command deletes the user and all configuration data. Users cannot delete themselves.

## Parameters

*user-name*

Specifies the name of the user up to 32 characters.

## Platforms

All

## 25.114 user-db

user-db

### Syntax

**user-db** *local-user-db-name*

**no user-db**

### Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp>host user-db)

### Full Context

configure subscriber-mgmt local-user-db ppp host user-db

## Description

This command specifies local user database for PPP PAP/CHAP access.

With this configuration, system will access the specified DB again during PPP PAP/CHAP phase.

This configuration only becomes effective when system is accessing parent DB during PPPoE discovery phase.

The **no** form of this command removes the name from the configuration.

## Parameters

### *local-user-db-name*

Specifies the name of the local user database for PAP/CHAP access.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
configure service ies interface ipv6 dhcp6-relay user-db
configure service vprn interface ipv6 dhcp6-relay user-db
```

## Description

This command enables access to the LUDB for DHCPv6 messages under a routed interface. The name of this LUDB must match the name of the LUDB configured by the **config>sub-gmt>local-user-db** command.

The **no** form of this command reverts to the default.

## Parameters

### *local-user-db-name*

Specifies the name of the local user database, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## user-db

## Syntax

```
user-db local-user-database-name
no user-db
```

## Context

[\[Tree\]](#) (config>subscr-mgmt>gtp>apn-policy>apn user-db)

## Full Context

```
configure subscriber-mgmt gtp apn-policy apn user-db
```

## Description

This command configures the LUDB with which the GTP connection is authenticated.

The **no** form of this command removes the user database for authentication with this APN. Only new session setups are affected.

## Default

```
no user-db
```

## Parameters

### *local-user-database-name*

Specifies the name of the LUDB to be used, up to 32 characters.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## user-db

### Syntax

### Full Context

configure service vprn l2tp group tunnel ppp user-db

configure router l2tp group tunnel ppp user-db

configure service vprn l2tp group ppp user-db

configure router l2tp group ppp user-db

### Description

This command configures the local user database to use for PPP PAP/CHAP authentication.

### Default

no user-db

### Parameters

***local-user-db-name***

Specifies the local user database name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## user-db

### Syntax

**user-db** *local-user-db-name*

**no user-db**

## Context

**[Tree]** (config>service>ies>sub-if>grp-if>wpp user-db)

**[Tree]** (config>service>vprn>sub-if>grp-if>wpp user-db)

## Full Context

configure service ies subscriber-interface group-interface wpp user-db

configure service vprn subscriber-interface group-interface wpp user-db

## Description

This command configures the user database.

### Note:

If configured, the values configured under grp-if will only be used if there is no corresponding value returned from LUDB lookup.

This command specifies the LUDB system use to lookup while creating initial host before WPP authentication. LUDB could return WPP attributes such as portal name, **initial-sla-profile**, **initial-sub-profile**, and so on LUDB is configured in **config>subscr-mgmt>local-user-db** context.

The **no** form of this command reverts to the default.

## Parameters

### *local-user-db-name*

Specifies the Local User Database name up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

user-db

## Syntax

**[no] user-db**

## Context

**[Tree]** (config>service>ies>sub-if>grp-if>ipv6>rtr-sol user-db)

## Full Context

configure service ies subscriber-interface group-interface ipv6 router-solicit user-db

## Description

This command enables the use of the local-user-database for authentication.

The **no** form of this command reverts to the default.

## Parameters

### *local-user-db-name*

Specifies the name of the local-user-database to authenticate the router-solicit. The local-user-database can also return a static prefix or a pool name for address assignment.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## user-db

## Syntax

**user-db** *local-user-db-name*

**no user-db**

## Context

**[Tree]** (config>service>vprn>sub-if>grp-if>ipoe-session user-db)

**[Tree]** (config>service>vpls>sap>ipoe-session user-db)

**[Tree]** (config>service>ies>sub-if>grp-if>ipoe-session user-db)

## Full Context

configure service vprn subscriber-interface group-interface ipoe-session user-db

configure service vpls sap ipoe-session user-db

configure service ies subscriber-interface group-interface ipoe-session user-db

## Description

This command configures the local user database to use for IPoE session authentication.

When configured on a capture SAP, the group interface must have the same local user database configured.

On a wlan-gw group interface, the **no** form of this command indicates that the user database is picked from the following sources in the order shown:

1. dhcp
2. ipv6>dhcp6
3. ipv6>router-solicit

If no user database can be found in any of these locations, processing continues as if no user database was configured. This behavior is for backwards compatibility reasons only; when using a LUDB, it should be explicitly added to the IPoE session configuration.

The **no** form of this command reverts to the default.

## Parameters

### *local-user-db-name*

Specifies the local user database name up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## user-db

### Syntax

**[Tree]** (config>service>ies>sub-if>grp-if>ipv6>dhcp6 user-ident)

**Full Context**

```
configure service vprn subscriber-interface group-interface ipv6 dhcp6 user-ident
configure service ies subscriber-interface group-interface ipv6 dhcp6 user-ident
```

## Description

This feature is only applicable when DHCPv6-snooping is enabled. The Ethernet header MAC address on DHCPv6 is used as the default key host identification. This command allows addition the keys for identifying the DHCPv6 host. The *interface-id* can be included in addition to the MAC key to further differentiate each DHCPv6 host.

The **no** form of this command reverts to the default.

## Default

user-ident mac

## Parameters

### *user-ident*

Specifies the DHCP6 user-identification for this interface.

- Values**
- mac** — Specifies to use only the Ethernet MAC of the DHCPv6 message to identify the host.
  - mac-interface-id** — Specifies to additionally use the interface-id to identify the DHCPv6 host.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## user-ident

## Syntax

**user-ident** *user-ident*

**no user-ident**

## Context

[\[Tree\]](#) (config>router>dhcp>server user-ident)

[\[Tree\]](#) (config>service>vprn>dhcp>server user-ident)

## Full Context

configure router dhcp local-dhcp-server user-ident

configure service vprn dhcp local-dhcp-server user-ident

## Description

This command configures the user identification method for the DHCPv4 server.

The **no** form of the reverts to the default.

## Default

user-ident mac-circuit-id

## Parameters

### *user-ident*

Specifies the user identification method

- Values**
- client-id** — Specifies to use the DHCPv4 client identifier as the user identification method.
  - circuit-id** — Specifies to use the circuit identifier of the DHCPv4 client as the user identification method.
  - mac** — Specifies to use the MAC address of the DHCPv4 client as the user identification method.
  - mac-circuit-id** — Specifies to use the MAC address and circuit identifier of the DHCPv4 client as the user identification method.
  - remote-id** — Specifies to use the MAC address of the remote end as the user identification method.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## user-ident

## Syntax

**user-ident** *user-ident*

**no user-ident**

## Context

[\[Tree\]](#) (config>router>dhcp6>server user-ident)

[\[Tree\]](#) (config>service>vprn>dhcp6>server user-ident)

## Full Context

configure router dhcp6 local-dhcp-server user-ident

configure service vprn dhcp6 local-dhcp-server user-ident

## Description

This command configures the keys for identification of the DHCPv6 lease being held in the lease-database (for configured period after lease timeout). Subscriber requesting a lease via DHCPv6 that matches an existing lease based on this configured key is handed the matched prefix or address. This allows address and prefix "stickiness" for DHCPv6 assigned prefixes (IA\_NA or PD).

The **no** form of the reverts to the default.

## Default

user-ident duid

## Parameters

### *user-ident*

Specifies the user identification method.

- Values**
- duid** — Specifies the IPv6 DHCP unique identifier from DHCPv6.
  - interface-id** — Specifies the IPv6 interface-id option.
  - interface-id-link-local** — Specifies the interface-id and link-local address.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 25.117 user-location-info

### user-location-info

## Syntax

[no] **user-location-info**

## Context

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>nasreq>include-avp user-location-info)

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>gx>include-avp user-location-info)

## Full Context

configure subscriber-mgmt diameter-application-policy nasreq include-avp user-location-info

configure subscriber-mgmt diameter-application-policy gx include-avp user-location-info

## Description

This command enables the inclusion of the 3GPP-User-Location-Information AVP as signaled in the incoming GTP setup message.

The **no** form of this command disables the inclusion of the AVP.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 25.118 user-name

## user-name

### Syntax

**user-name** *name* [**create**]

**no user-name** *name*

### Context

[\[Tree\]](#) (config>service>dynsvc>ladb user-name)

### Full Context

configure service dynamic-services local-auth-db user-name

### Description

This command creates a user name entry in the local authentication database. The user name entry is used to match with the user name of a local authenticated dynamic service data trigger. The user name of a dynamic service data trigger is fixed to the **sap-id**. When matched, the corresponding authentication data is used to set up the dynamic data services.

The **no** form of this command removes the user name entry from the local authentication database configuration.

### Parameters

*name*

Specifies the user name entry name, up to 64 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## user-name

### Syntax

[**no**] **user-name**

### Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>include-radius-attribute user-name)

### Full Context

configure subscriber-mgmt radius-accounting-policy include-radius-attribute user-name

### Description

This command enables the inclusion of the **user-name** attribute.

The **no** form of this command disables the inclusion of the **user-name** attribute.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### user-name

## Syntax

**user-name** *user-name*

**no user-name**

## Context

[\[Tree\]](#) (config>aaa>radius-srv-plcy>servers>health-check>test-account user-name)

## Full Context

configure aaa radius-server-policy servers health-check test-account user-name

## Description

This command specifies the username that the test account will use to send its access requests to probe the RADIUS servers.

The **no** form of this command removes the username from the test-account configuration.

## Parameters

***user-name***

Specifies the probing username, up to 64 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### user-name

## Syntax

**[no] user-name**

## Context

[\[Tree\]](#) (config>aaa>isa-radius-plcy>acct-include-attributes user-name)

## Full Context

configure aaa isa-radius-policy acct-include-attributes user-name

## Description

This command enables the inclusion of user name attributes.

The **no** form of the command excludes user name attributes.

**Default**

no user-name

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 25.119 user-name-format

### user-name-format

**Syntax**

**user-name-format** *format* [**mac-format** *mac-format*]

**user-name-format** *format* **append** [*domain-name*] [**mac-format** *mac-format*]

**user-name-format** *format* **append** *domain-name*

**user-name-format** *format* **default-domain** *domain-name* [**mac-format** *mac-format*]

**user-name-format** *format* **replace** *domain-name* [**mac-format** *mac-format*]

**user-name-format** *format* **strip** [**mac-format** *mac-format*]

**no user-name-format**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>auth-policy user-name-format)

**Full Context**

configure subscriber-mgmt authentication-policy user-name-format

**Description**

This command defines the format of the "user-name" field in the session authentication request sent to the RADIUS server.

The **no** form of this command switches to the default format, **mac**.

**Default**

By default, the MAC source address of the DHCPv4 DISCOVER or DHCPv6 SOLICIT message is used in the user-name field.

**Parameters*****format***

Specifies the user name format in RADIUS message.

**Values**   ascii-converted-circuit-id, ascii-converted-tuple, circuit-id, dhcp-client-vendor-opts, mac, mac-giaddr, tuple

**ascii-converted-circuit-id** — Identical to `circuit-id`, but the user name is sent to the RADIUS server as a string of hex digits, for use if there is binary data in the `circuit-id`

**ascii-converted-tuple** — Identical to `tuple`, but the `circuit-id` part of the user name is sent to the RADIUS server as a string of hex digits, for use if there is binary data in the `circuit-id`

**circuit-id** — If the system serves as a DHCP relay server which inserts option 82 info, the user name is formatted as defined under DHCP information option. If the system is not a DHCP relay server, the `circuit-id` is taken from option 82 in the received DHCP message. If no `circuit-id` can be found, the DHCP-msg is rejected.

**dhcp-client-vendor-opts** — IpoEv4 host (IPoE session enabled or disabled on group-interface) — The RADIUS user-name is a concatenation of the DHCPv4 Client Identifier Option 61, an "@" delimiter, and the DHCPv4 Vendor Class Identifier Option 60. Non-printing characters in the DHCP option values are converted as described below.

IpoEv6 host (IPoE session enabled on group-interface) — The RADIUS user-name is a concatenation of the identifier field of a type 2 DUID in the DHCPv6 Client Identifier Option 1, the "@" delimiter, and the opaque data field of the first vendor class data in the DHCPv6 Vendor Class Option 16. Non-printing characters in the DHCP option values are converted as described below.

IpoEv6 host (IPoE session disabled on group-interface) — The MAC source address of the DHCPv6 SOLICIT message.

In the absence of a DHCPv4 Client Identifier Option 61 or a DHCPv6 Client Identifier Option 1 containing a DUID type 2, the DHCP client MAC address is used.

In the absence of a DHCPv4 Vendor Class Identifier Option 60 or a DHCPv6 Vendor Class Option 16, the "@" delimited is omitted and nothing is appended.

Non-printing characters, that is, characters outside the ASCII range hex 21 through hex 7E, are converted into an underscore (hex 5F) character.

**mac** — The MAC source address of the DHCPv4 DISCOVER or DHCPv6 SOLICIT message is used in the user-name field. The format of the MAC address string used as the user name in the RADIUS authentication requests uses lowercase hex digits, and ":" as the inter-digit separator, for example, 00:11:22:aa:bb:cc is valid but 00-11-22-AA-BB-CC will return an error. The RADIUS server must be configured accordingly, otherwise the authentication request will fail.

**mac-giaddr** — A concatenation of the MAC address and the Relay Agent IP address (giaddr)

**tuple** — Specifies that the concatenation of MAC source address and circuit-ID are used in the user-name field

### mac-format

Specifies how a MAC address is represented when contacting a RADIUS server. This is only used while the value of `mac-format` is equal to the DHCP client vendor options and if the MAC address is used by default of the DHCP client vendor options.

Examples:	ab:	00:0c:f1:99:85:b8	7xxx style
	XY-	00-0C-F1-99-85-B8	IEEE canonical style
	mmmm.	0002.03aa.abff	Cisco style

### append

Specifies the data type which is an enumerated integer that indicates what needs to be appended to the user-name sent to the RADIUS server.

**Values** 1 — nothing 2 — domain name

### domain

Specifies to use the domain name. In some instances it is desired to add a domain only to usernames which have omitted the domain (@domain). In these instances a default-domain can be appended to usernames which lack a @domain.

### append

Adds a "@" delimiter and the specified string after the PAP/CHAP username. No allowance is made for the presence of an existing domain or @ delimited.

### replace

Replaces the character-string after the "@" delimiter with the string specified.

### strip

Removes all characters after and including the "@" delimiter.

For example:

```
Command: append
String: domainA-1.com
PAP/CHAP User: someuser
Resulting User: someuser@domainA-1.com

Command: append
String: domainA-1.com
PAP/CHAP User: someuser@existing-domain.net
Resulting User: someuser@existing-domain.net@domainA-1.com

Command: strip
String:
PAP/CHAP User: someuser@existing-domain.net
Resulting User: someuser

Command: replace
String: domainA-1.com
PAP/CHAP User: someuser@existing-domain.net
Resulting User: someuser@domainA-1.com

Command: default-domain
String: domainA-1.com
PAP/CHAP User: someuser@existing-domain.net
Resulting User: someuser@existing-domain.net

Command: default-domain
String: domainA-1.com
PAP/CHAP User: someuser
Resulting User: someuser@domainA-1.com
```

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## user-name-format

### Syntax

**user-name-format** *format*

**no user-name-format**

### Context

**[Tree]** (config>subscr-mgmt>diam-appl-plcy>nasreq user-name-format)

### Full Context

configure subscriber-mgmt diameter-application-policy nasreq user-name-format

### Description

This command defines the format of the User-Name AVP value in Diameter NASREQ AA-Requests for IPoE hosts.

The **no** form of this command reverts to the default.

### Parameters

#### *format*

Specifies the format of the User-Name AVP value.

- Values**
- mac** — Specifies to use the MAC source address of the DHCPv4 DISCOVER or DHCPv6 SOLICIT message in the user-name field. The format of the MAC address string is defined with the **mac-format** CLI command.
  - circuit-id** — Specifies to use the circuit ID to identify the user toward the server. If the system serves as a DHCP relay server which inserts option 82 info, the user name is formatted as defined under DHCP information option. If the system is not a DHCP relay server, the circuit-id is taken from option 82 in the received DHCP message. If no circuit-id can be found, the DHCP-msg is rejected.
  - tuple** — Specifies to use a concatenation of MAC source address and circuit-ID.
  - ascii-converted-circuit-id** — Identical to circuit-id, but the user name is a string of hex digits, for use if there is binary data in the circuit-id.
  - ascii-converted-tuple** — Specifies a string of hex digits, for use if there is binary data in the circuit-id.
  - dhcp-client-vendor-opts** — Specifies to use a concatenation of the DHCPv4 Client Identifier Option 61, the "@" delimiter, and the DHCPv4 Vendor Class Identifier Option 60. Non-printing characters in the DHCP option values are converted as described below.  
  
In the absence of a DHCPv4 Client Identifier Option 61, the DHCP client MAC address is used.  
  
In the absence of a DHCPv4 Vendor Class Identifier Option 60, the "@" delimiter is omitted and nothing is appended.

Non-printing characters, that is, characters outside the ASCII range hex 21 through hex 7E, are converted into an underscore (hex 5F) character.

**mac-giaddr** — Specifies to use a concatenation of MAC source address and DHCP GI address.

**nas-port-id** — Specifies to use a value of the nas-port-id with format defined in the include-avp section.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## user-name-format

### Syntax

**user-name-format** *user-name-format* [**mac-format** *mac-format*]

**no user-name-format**

### Context

[\[Tree\]](#) (config>aaa>isa-radius-plcy user-name-format)

### Full Context

configure aaa isa-radius-policy user-name-format

### Description

This command defines the format of the user-name field in the session authentication request sent to the RADIUS server. For authentication of IPv6 triggers (ICMPv6, DHCPv6, IPv6 data-trigger) the user-name format will always fall back to mac only.

The **no** form of the command switches to the default format, **mac**.

### Default

user-name-format mac mac-format alu (the MAC source address of the DHCP DISCOVER message is used in the user-name field)

### Parameters

#### ***user-name-format***

Specifies the user name format in RADIUS message.

#### ***mac-format***

Specifies how a MAC address is represented when contacting a RADIUS server. This is only used while the value of is equal to the DHCP client vendor options and if the MAC address is used by default of the DHCP client vendor options.

Examples:      ab:                      00:0c:f1:99:85:b8 Nokia 7xxx style

XY-	00-0C-F1-99-85-B8 IEEE canonical style
mmmm.	0002.03aa.abff Cisco style

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 25.120 user-name-operation

### user-name-operation

#### Syntax

**user-name-operation** *operation* [**domain** *domain-name*]

**no user-name-operation**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>nasreq user-name-operation)

#### Full Context

configure subscriber-mgmt diameter-application-policy nasreq user-name-operation

#### Description

This command enables domain name manipulation of the user name, such as append, strip, replace or add as default.

For IPoE, this command only applies when **user-name-format** is configured to **dhcp-client-vendor-opts**.

The **no** form of this command reverts to the default.

#### Parameters

##### *operation*

Specifies the user name manipulations with respect to domain name values.

- Values**
- append-domain** – appends an "@" delimiter with the specified domain-name at the end of the user-name, independent if a domain name was already present
  - strip-domain** – removes all characters after and including the "@" delimiter
  - default-domain** – adds an "@" delimiter and the specified domain name to user-names that have no domain name present
  - replace-domain** – replaces the characters after the "@" delimiter with the specified domain-name

##### *domain-name*

Specifies the domain name string to be used in the specified operation, up to 128 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 25.121 user-srlg-db

### user-srlg-db

**Syntax**

**user-srlg-db** [enable | disable]

**Context**

[\[Tree\]](#) (config>router>mpls user-srlg-db)

**Full Context**

configure router mpls user-srlg-db

**Description**

This command enables the use of CSPF by the user SRLG database. When the MPLS module makes a request to CSPF for the computation of an SRLG secondary path, CSPF will query the local SRLG and compute a path after pruning links that are members of the SRLG IDs of the associated primary path. When MPLS makes a request to CSPF for an FRR bypass or detour path to associate with the primary path, CSPF queries the user SRLG database and computes a path after pruning links that are members of the SRLG IDs of the PLR outgoing interface.

If an interface was not entered into the user SRLG database, it is assumed that it does not have any SRLG membership. CSPF will not query the TE database for IGP advertised interface SRLG information.

The disable keyword disables the use of the user SRLG database. CSPF will then resume queries into the TE database for SRLG membership information. The user SRLG database is maintained.

**Default**

user-srlg-db disable

**Platforms**

All

## 25.122 user-template

## user-template

### Syntax

**user-template** {**tacplus\_default** | **radius\_default** | **ldap-default**}

### Context

**[Tree]** (config>system>security user-template)

### Full Context

configure system security user-template

### Description

This command configures default security user template parameters.

### Parameters

#### **tacplus\_default**

Specifies the default TACACS+ user template. All parameters of the **tacplus\_default** template except the "profile" are actively applied to all TACACS+ users if **tacplus use-default-template** is enabled. The **profile** parameter is used for AAA command authorization if TACACS+ authorization is disabled, or if the TACACS+ server does not return a **priv-lvl** for a user when **use-priv-lvl** is enabled under **tacplus authorization**. See the **tacplus authorization** command for more details.

#### **radius\_default**

Specifies the default RADIUS user template. The **radius\_default** template is actively applied to a RADIUS user if radius authorization is enabled, **radius use-default-template** is enabled, and no VSAs are returned with the **auth-accept** from the RADIUS server.

#### **ldap\_default**

Specifies the default LDAP user template.

### Platforms

All

## 25.123 username

## username

### Syntax

**username** *user-name*

**username** *user-name* **no-domain**

**username** *user-name* **domain-only**

**no username**

## Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp>host>host-ident username)

## Full Context

configure subscriber-mgmt local-user-db ppp host host-identification username

## Description

This command specifies the PPPoE username to match for a host lookup. When **no-domain** or **domain-only** is specified, the username "user[@domain]" is converted to a user and a domain entity by splitting it on the first @-sign before matching on the specific entity.

### Note:

This command is only used when **username** is configured as one of the **match-list** parameters.

The **no** form of this command removes the username from the configuration.

## Parameters

### *username*

Specifies the user name, up to 253 characters, of this host. For example, "jane@nokia.com".

### **no-domain**

Only the user part of the username is specified and used for matching. For example "jane".

### **domain-only**

Only the domain part of the username is specified and used for matching, for example, nokia.com.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

username

## Syntax

[no] **username** *username*

## Context

[\[Tree\]](#) (debug>service>id>ppp username)

## Full Context

debug service id ppp username

## Description

This command enable PPP debug for the specified username. since not all PPP packets contain username, so a MAC debug filter is created automatically when system sees a PPP packet contain the specified username.

Multiple username filters can be specified in the same debug command.

The **no** form of this command disables debugging.

## Parameters

***user-name***

Specifies the PPP username.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 25.124 usm-community

### usm-community

## Syntax

**usm-community** *community-string* [**hash** | **hash2** | **custom**] **group** *group-name* [**src-access-list** *list-name*]

**no usm-community** *community-string* [**hash** | **hash2** | **custom**]

## Context

[\[Tree\]](#) (config>system>security>snmp usm-community)

## Full Context

configure system security snmp usm-community

## Description

This command is used to associate a community string with an SNMPv3 access group and its view. The access granted with a community string is restricted to the scope of the configured group.

Nokia's SR OS implementation of SNMP uses SNMPv3. In order to implement SNMPv1 and SNMPv2c configurations, several access groups are predefined. In order to implement SNMP with security features (Version 3), security models, security levels, and USM communities must be explicitly configured. Optionally, additional views which specify more specific OIDs (MIB objects in the subtree) can be configured.

The **no** form of this command removes a community string.

## Parameters

***community-string***

Specifies the SNMPv1/SNMPv2c community string to determine the SNMPv3 access permissions to be used. Allowed values are any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, \$, spaces), the entire string must be enclosed within double quotes.

**group**

Specifies the group that governs the access rights of this community string. This group must be configured first in the **config>system>security>snmp> access group** context. Nokia does not recommend associating a **usm-community** with an SNMP access group that is configured with the **li** (lawful intercept) context.

**list-name**

Specifies the usm-community to reference a specific src-access-list that will be used to validate the source IP address of all received SNMP requests that use this usm-community. Multiple **community**, **usm-community**, or **vprn snmp community** instances can reference the same **src-access-list**.

**Platforms**

All

## 25.125 util-stats-interval

### util-stats-interval

**Syntax****util-stats-interval** *seconds***Context**[\[Tree\]](#) (config>port>ethernet util-stats-interval)**Full Context**

configure port ethernet util-stats-interval

**Description**

This command configures the interval used to calculate the utilization statistics.

Port utilization statistics are only available for physical Ethernet ports on a host system. These statistics are not available for the following:

- Ethernet ports on an Ethernet satellite
- Ethernet ports on a VSR
- PXC ports
- vsm-cca-xp ports

**Parameters*****seconds***

Specifies the size of the interval, in seconds.

**Values** 30 to 600

**Default** 300

**Platforms**

All

## 26 v Commands

### 26.1 v4-routed-override-filter

#### v4-routed-override-filter

##### Syntax

**v4-routed-override-filter** *ip-filter-id*  
**no v4-routed-override-filter**

##### Context

**[Tree]** (config>service>ies>if>vpls>egress v4-routed-override-filter)

##### Full Context

configure service ies interface vpls egress v4-routed-override-filter

##### Description

This command configures an IPv4 filter ID that are applied to packets egressing the IES R-VPLS interface. The filter overrides existing egress IPv4 filter applied to VPLS service endpoints such as SAPs or SDPs, if configured.

The **no** form of this command removes the IPv4 routed override filter from the egress IES R-VPLS interface. When removed, egress IPv4 packets will use the IPv4 egress filter applied to the VPLS endpoint, if configured.

##### Parameters

###### *ip-filter-id*

Specifies the IP filter ID. This parameter is required when executing the **v4-routed-override-filter** command. The specified filter ID must exist as an IPv4 filter within the system or the override command fails.

##### Platforms

All

#### v4-routed-override-filter

##### Syntax

**v4-routed-override-filter** *ip-filter-id*  
**no v4-routed-override-filter**

## Context

[\[Tree\]](#) (config>service>ies>if>vpls>ingress v4-routed-override-filter)

## Full Context

configure service ies interface vpls ingress v4-routed-override-filter

## Description

This command configures an IPv4 filter ID that is applied to all ingress packets entering the VPLS or I-VPLS service. The filter overrides any existing ingress IPv4 filter applied to SAPs or SDP bindings for packets associated with the routing IP interface. The override filter is optional and when it is not defined or it is removed. The IPv4 routed packets use any existing ingress IPv4 filter on the VPLS virtual port.

The **no** form of this command removes the IPv4 routed override filter from the ingress IP interface. When removed, the IPv4 ingress routed packets within a VPLS service attached to the IP interface use the IPv4 ingress filter applied to the packets virtual port, when defined.

## Parameters

### *ip-filter-id*

Specifies the IP filter ID. This parameter is required when executing the **v4-routed-override-filter** command. The specified filter ID must exist as an IPv4 filter within the system or the override command fails.

## Platforms

All

## v4-routed-override-filter

## Syntax

**v4-routed-override-filter** *ip-filter-id*

**no v4-routed-override-filter**

## Context

[\[Tree\]](#) (config>service>vprn>if>vpls>egress v4-routed-override-filter)

## Full Context

configure service vprn interface vpls egress v4-routed-override-filter

## Description

This command configures an IPv4 filter ID that is applied to packets egressing the VPRN R-VPLS interface. The filter overrides the existing egress IPv4 filter applied to VPLS service endpoints such as SAPs or SDPs, if configured.

The **no** form of this command removes the IPv4 routed override filter from the egress VPRN R-VPLS interface. When removed, egress IPv4 packets will use the IPv4 egress filter applied to VPLS endpoint, if configured.

## Parameters

### *ip-filter-id*

Specifies the IP filter ID. This parameter is required when executing the **v4- routed-override-filter** command. The specified filter ID must exist as an IPv4 filter within the system or the override command fails.

## Platforms

configure subscriber-mgmt radius-accounting-policy include-radius-attribute v6-aggregate-stats

### Description

This command enables reporting of IPv6 aggregated forwarded octet and packet counters using RADIUS VSAs. Disabled by default. It requires **stat-mode v4-v6** for policers and queues for which the IPv6 aggregate forwarded packets should be counted.

The **no** form of this command reverts to the default.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 26.3 v6-frag-header

## v6-frag-header

### Syntax

[no] v6-frag-header

### Context

[\[Tree\]](#) (config>service>nat>map-domain>ip-fragmentation v6-frag-header)

### Full Context

configure service nat map-domain ip-fragmentation v6-frag-header

### Description

This command enables and disables the insertion of the fragmentation header in an IPv6 packet when translating non-fragmented IPv4 packet with DF=0. This option is disabled by default and the size of the IPv6 packet is reduced by 8 bytes.

### Default

no v6-frag-header

## Platforms

VSR

## 26.4 v6-routed-override-filter

### v6-routed-override-filter

#### Syntax

**v6-routed-override-filter** *ipv6-filter-id*  
**no v6-routed-override-filter**

#### Context

[\[Tree\]](#) (config>service>ies>if>vpls>egress v6-routed-override-filter)

#### Full Context

configure service ies interface vpls egress v6-routed-override-filter

#### Description

This command configures an IPv6 filter ID that is applied to packets egressing the IES R-VPLS interface. The filter overrides existing egress IPv6 filter applied to VPLS service endpoints such as SAPs or SDPs, if configured.

The **no** form of this command removes the IPv4 routed override filter from the egress IES R-VPLS interface. When removed, egress IPv6 routed packets uses the IPv6 egress filter applied to VPLS endpoint, if configured

#### Parameters

##### *ipv6-filter-id*

Specifies the IPv6 filter ID. This parameter is required when executing the **v6-routed-override-filter** command. The specified filter ID must exist as an IPv6 filter within the system or the override command fails.

## Platforms

All

### v6-routed-override-filter

#### Syntax

**v6-routed-override-filter** *ipv6-filter-id*  
**no v6-routed-override-filter**

## Context

[\[Tree\]](#) (config>service>ies>if>vpls>ingress v6-routed-override-filter)

## Full Context

configure service ies interface vpls ingress v6-routed-override-filter

## Description

This command configures an IPv6 filter ID that is applied to all ingress packets entering the VPLS or I-VPLS service. The filter overrides any existing ingress IPv6 filter applied to SAPs or SDP bindings for packets associated with the routing IP interface. The override filter is optional and when it is not defined or it is removed, the IPv6 routed packets use any existing ingress IPv6 filter on the VPLS virtual port.

The `no v6-routed-override-filter` command is used to remove the IPv6 routed override filter from the ingress IP interface. When removed, the IPv6 ingress routed packets within a VPLS service attached to the IP interface will use the IPv6 ingress filter applied to the packet's virtual port, when defined.

## Parameters

### *ipv6-filter-id*

Specifies the IPv6 filter ID. This parameter is required when executing the **v6-routed-override-filter** command. The specified filter ID must exist as an IPv6 filter within the system or the override command fails.

## Platforms

All

## v6-routed-override-filter

## Syntax

**v6-routed-override-filter** *ipv6-filter-id*

**no v6-routed-override-filter**

## Context

[\[Tree\]](#) (config>service>vprn>if>vpls>egress v6-routed-override-filter)

## Full Context

configure service vprn interface vpls egress v6-routed-override-filter

## Description

This command configures an IPv6 filter ID that is applied to packets egressing the VPRN R-VPLS interface. The filter overrides existing egress IPv6 filter applied to VPLS service endpoints such as SAPs or SDPs, if configured.

The **no** form of the command removes the IPv4 routed override filter from the egress VPRN R-VPLS interface. When removed, egress IPv6 packets will use the IPv6 egress filter applied to the VPLS endpoint, if configured.

## Parameters

### *ipv6-filter-id*

Specifies the IPv6 filter ID. This parameter is required when executing the **v6-routed-override-filter** command. The specified filter ID must exist as an IPv6 filter within the system or the override command fails.

## Platforms

### Full Context

configure service vprn subscriber-interface group-interface ipv6 dhcp6 relay lease-split valid-lifetime

configure service ies subscriber-interface ipv6 dhcp6 relay lease-split valid-lifetime

configure service vprn subscriber-interface ipv6 dhcp6 relay lease-split valid-lifetime

configure service ies subscriber-interface group-interface ipv6 dhcp6 relay lease-split valid-lifetime

### Description

This command configures the DHCPv6 lease split valid lifetime (short lease time). DHCPv6 lease split is active when enabled and for all IA\_NA and IA\_PD options in the transaction the configured lease split valid lifetime (short lease time) is less than or equal to the renew time T1 committed by the server (long renew time) or 50 percent of the preferred lifetime committed by the server when T1 committed by the server equals zero.

The **no** form of this command reverts to the default value.

### Default

valid-lifetime hrs 1

### Parameters

**[days days] [hrs hours] [min minutes] [sec seconds]**

Specifies the valid lifetime values.

Values		
days:	0 to 3650	
hours:	0 to 23	
minutes:	0 to 59	
seconds	0 to 59	

### Platforms

**[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host>ipv6-lease-times valid-lifetime)

### Full Context

configure service vprn subscriber-interface group-interface ipv6 dhcp6 proxy-server valid-lifetime

configure service ies subscriber-interface group-interface ipv6 dhcp6 proxy-server valid-lifetime

configure subscriber-mgmt local-user-db ppp host ipv6-lease-times valid-lifetime

configure subscriber-mgmt local-user-db ipoe host ipv6-lease-times valid-lifetime

### Description

This command configured valid-lifetime for DHCPv6 lease (address/prefix).

The valid lifetime is the length of time an address/prefix remains in the valid state (for example, the time until invalidation). The valid lifetime must be greater than or equal to the preferred lifetime. When the valid lifetime expires, the address/prefix becomes invalid and must not be used in communications. RFC 2461, sec 6.2.1 recommends default value of 30 days.

Each address/prefix assigned to the client has associated preferred and valid lifetimes specified by the address assignment authority (DHCP server, RADIUS, ESM). To request an extension of the lifetimes assigned to an address, the client sends a Renew message to the addressing authority. The addressing authority sends a Reply message to the client with the new lifetimes, allowing the client to continue to use the address/prefix without interruption.

The lifetimes are transmitted from the addressing authority to the client in the IA option on the top level (not the address or prefix level).

The **no** form of this command reverts to the default.

### Default

valid-lifetime days 1

### Parameters

*infinite*

Specifies that the valid lifetime is infinite.

Values		
	days:	0 to 49710
	hours:	0 to 23
	minutes:	0 to 59
	seconds	0 to 59

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 26.6 validate

### validate

#### Syntax

**validate** [*file-url*]

#### Context

**[Tree]** (admin>system>license validate)

#### Full Context

admin system license validate

#### Description

This command performs a validation on the license file pointed to by the command line argument. A validation ensures that the license is compatible with the current state of the target system but it does not change the existing license. Aspects that can cause a failure in the validation include:

- The license file was created for a different target system. The UUID encoded into the file must match that defined by the specific hardware platform.
- The license file does not include license information for the release of software currently running on the system.
- The current date/time reported to system is outside the validity period encoded in the license.
- The system is currently using a hardware upgrade license that is not included in the new file being validated.

#### Note:

If the CLM tool is being used for license management, it shall perform the validation and activation and there is no need to enter these commands manually.

#### Parameters

##### *file-url*

Specifies the file URL location to read the license file.

**Values** local-url, remote-url

#### Note:

IPv6 addresses apply only to 7750 SR and 7950 XRS.

#### Platforms

All

## validate

### Syntax

[no] validate

### Context

[\[Tree\]](#) (configure>system>security>profile>netconf>base-op-authorization validate)

## 26.7 validate-dest-prefix

### validate-dest-prefix

#### Syntax

**validate-dest-prefix**

**no validate-dest-prefix**

#### Context

[\[Tree\]](#) (config>service>vprn>bgp>flowspec validate-dest-prefix)

#### Full Context

configure service vprn bgp flowspec validate-dest-prefix

## Description

This command enables or disables validation of received IPv4 and IPv6 FlowSpec routes that contain a destination-prefix subcomponent.

A FlowSpec route with a destination-prefix subcomponent is considered invalid if both of the following are true:

- it was originated outside the local AS of the receiving BGP router
- the neighbor AS of the FlowSpec route does not match the neighbor AS of the best match BGP (unicast) route for the destination prefix or the neighbor AS of any longer match BGP (unicast) route for the destination prefix

An invalid route is retained in the BGP but it is not used for filtering traffic or propagated to other BGP routers.

The **no** form of this command disables the validation procedure based on destination-prefix.

## Default

no validate-dest-prefix

## Platforms

All

## validate-dest-prefix

## Syntax

[no] validate-dest-prefix

## 26.8 validate-gtp-tunnels

### validate-gtp-tunnels

**Syntax**

**validate-gtp-tunnels direction** *direction* [**create**]

**no validate-gtp-tunnels direction** *direction*

**Context**

[\[Tree\]](#) (config>app-assure>group>statistics>tca>gtp-filter validate-gtp-tunnels)

**Full Context**

configure application-assurance group statistics threshold-crossing-alert gtp-filter validate-gtp-tunnels

**Description**

This command configures a TCA for the counter capturing drops because of the validation of GTP tunnel check. A validate-gtp-tunnels drop TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a validate-gtp-tunnels TCA.

**Parameters*****direction***

Specifies the traffic direction.

**Values** from-sub, to-sub

**create**

Keyword used to create the TCA.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## validate-gtp-tunnels

### Syntax

[no] **validate-gtp-tunnels**

### Context

### Full Context

configure application-assurance group gtp gtp-filter gtp-tunnel-database validate-gtp-tunnels

### Description

This command configures GTP tunnel validation. This allows for validation of TEIDs and is a prerequisite for sequence checking and UE IP address validation. This command applies only when AA GTP FW is deployed on S8/S5/Gp/Gn interfaces.

The **gtpc-inspection** command must be enabled before using this command.

The **no** form of this command disables GTP tunnel validation.

### Default

no validate-gtp-tunnels

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 26.9 validate-next-hop

## validate-next-hop

### Syntax

[no] **validate-next-hop**

### Context

[\[Tree\]](#) (config>service>vprn>static-route-entry>next-hop validate-next-hop)

### Full Context

configure service vprn static-route-entry next-hop validate-next-hop

### Description

This optional command tracks the state of the next hop in the IPv4 ARP cache or IPv6 Neighbor Cache. When the next hop is not reachable and is removed from the ARP or Neighbor Cache, the next hop will no longer be considered valid and the associated static route state removed from the active route-table.

When the next hop is reachable again and present in the ARP/Neighbor Cache, the static route is considered valid and is subject to being placed into the active route-table.

**Default**

no validate-next-hop

**Platforms**

All

**validate-next-hop****Syntax**

## 26.10 validate-redirect-ip

**validate-redirect-ip****Syntax**

validate-redirect-ip

no validate-redirect-ip

## Context

[\[Tree\]](#) (config>service>vprn>bgp>flowspec validate-redirect-ip)

## Full Context

configure service vprn bgp flowspec validate-redirect-ip

## Description

This command enables procedures to validate the redirect-to-IPv4 action attached to FlowSpec-IPv4 routes received by the BGP instance.

The SR OS FlowSpec implementation supports the redirect-to-IPv4 action encoded as an IPv4-address-specific BGP extended community.

When this command is configured, a FlowSpec-IPv4 route is considered invalid and not installed as a filter rule if the FlowSpec-IPv4 route is deemed to have originated in a different AS than the IP route that resolves the redirection IPv4 address. The originating AS of a flow-spec route is determined from its AS path.

The **no** form of this command disables the check described above.

## Default

no validate-redirect-ip

## Platforms

All

## validate-redirect-ip

## Syntax

[no] validate-redirect-ip

## Context

[\[Tree\]](#) (config>router>bgp>flowspec validate-redirect-ip)

## Full Context

configure router bgp flowspec validate-redirect-ip

## Description

This command enables procedures to validate the **redirect-to-IPv4** action attached to FlowSpec IPv4 routes received by the BGP instance.

The SR OS FlowSpec implementation supports the **redirect-to-IPv4** action encoded as an IPv4-address-specific BGP extended community.

When this command is configured, a FlowSpec IPv4 route is considered invalid and not installed as a filter rule if the FlowSpec IPv4 route is deemed to have originated in a different AS than the IP route that resolves the redirection IPv4 address. The originating AS of a FlowSpec route is determined from its AS path.

The **no** form of this command disables the check described above.

## 26.11 validate-sequence-number

### validate-sequence-number

#### Syntax

**validate-sequence-number** *direction* *direction* [**create**]

**no validate-sequence-number** *direction* *direction*

#### Context

[\[Tree\]](#) (config>app-assure>group>statistics>tca>gtp-filter validate-sequence-number)

#### Full Context

configure application-assurance group statistics threshold-crossing-alert gtp-filter validate-sequence-number

#### Description

This command configures a TCA for the counter capturing drops because of the GTP filter invalid GTP sequence number. A validate-sequence-number drop TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a validate-sequence-number TCA.

#### Parameters

##### *direction*

Specifies the traffic direction.

**Values** from-sub, to-sub

##### **create**

Keyword used to create the TCA.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## validate-sequence-number

### Syntax

[no] validate-sequence-number

### Context

[\[Tree\]](#) (config>app-assure>group>gtp>gtp-fltr>gtp-tunnel-database validate-sequence-number)

### Full Context

configure application-assurance group gtp gtp-filter gtp-tunnel-database validate-sequence-number

### Description

This command configures GTP sequence number checking. GTP packets that fail the sequence number check are discarded.

The **validate-gtp-tunnels** command must be enabled before using this command.

The **no** form of this command disables GTP sequence number checking.

### Default

no validate-sequence-number

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 26.12 validate-source-ip-addr

## validate-source-ip-addr

### Syntax

[no] validate-source-ip-addr

### Context

[\[Tree\]](#) (config>app-assure>group>gtp>gtp-fltr>gtp-tunnel-database validate-source-ip-addr)

### Full Context

configure application-assurance group gtp gtp-filter gtp-tunnel-database validate-source-ip-addr

### Description

This command configures the checking for spoofed or invalid UE IP addresses. Upstream GTP packets that contain invalid UE IP addresses are discarded. When a packet is dropped because of the **source-ip-address** "invalid source IP add", the statistics counter is updated.

The **validate-gtp-tunnels** command must be enabled before using this command.

The **no** form of this command disables the checking for spoofed or invalid UE IP addresses.

### Default

no validate-source-ip-addr

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 26.13 validate-src-ip-addr

### validate-src-ip-addr

#### Syntax

**validate-src-ip-addr** *direction* *direction* [**create**]

**no validate-src-ip-addr** *direction* *direction*

#### Context

[\[Tree\]](#) (config>app-assure>group>statistics>tca>gtp-filter validate-src-ip-addr)

#### Full Context

configure application-assurance group statistics threshold-crossing-alert gtp-filter validate-src-ip-addr

#### Description

This command configures a TCA for the counter capturing drops due to the GTP filter anti-spoofing of the UE IP address check. A validate-src-ip-addr drop TCA can be created for traffic generated from the subscriber side of AA (**from-sub**). The **create** keyword is mandatory when creating a validate-src-ip-addr TCA.

#### Parameters

##### *direction*

Specifies the traffic direction.

**Values** from-sub

##### **create**

Keyword used to create the TCA.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 26.14 validity-time

### validity-time

#### Syntax

**validity-time** *seconds*

**no validity-time**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>gy>efh>interim-c validity-time)

#### Full Context

configure subscriber-mgmt diameter-application-policy gy extended-failure-handling interim-credit validity-time

#### Description

This command configures the validity time for the interim credit allocated to rating groups of a Diameter Gy session when Extended Failure Handling (EFH) is active. When either the allocated interim credit is consumed or the validity time expires, a new attempt is made to establish a Diameter Gy session with the Online Charging Server (OCS). The validity time applies to all interim credit allocated via the **config>subscr-mgmt>diam-appl-plcy** *application-policy-name*>**gy>extended-failure-handling>interim-credit>volume** and **config>subscr -mgmt>category-map** *category-map-name*>**category** *category-name*>**default-credit** CLI commands.

A validity time value of 0 (zero) disables the validity time for the assigned interim credit.

The **no** form of this command resets the value to the default value.

#### Default

validity-time 1800

#### Parameters

**seconds**

Specifies the validity time, in seconds, applicable to the interim credit.

**Values** 0 to 4294967295

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 26.15 value

## value

### Syntax

**value** *value*

### Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg>service-carving>manual>preference value)

### Full Context

configure service system bgp-evpn ethernet-segment service-carving manual preference value

### Description

This command modifies the default preference value used for the PE in the ES. An ES shutdown is not required to modify this value during maintenance operations.

### Default

value 32767

### Parameters

**value**

Determines the preference value used in the preference-based DF election algorithm.

**Values** 0 to 65535

### Platforms

All

## value

### Syntax

**value** *function-value*

**no value**

### Context

[\[Tree\]](#) (conf>router>segment-routing>srv6>ms-locator>un value)

### Full Context

configure router segment-routing segment-routing-v6 micro-segment-locator un value

### Description

This command configures the function value for uN. This draws the Nth value (where N = function-value) of the global micro-SID range (0 excluded) to form a unique uN micro SID. The configured value must be a unique network-wide permicro-SID block.

## Parameters

### *function-value*

Specifies the function value for uN.

**Values** 1 to 1048575

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## value

## Syntax

[no] **value** *value-name*

## Context

[\[Tree\]](#) (config>app-assure>group>policy>aso>char value)

## Full Context

configure application-assurance group policy app-service-options characteristic value

## Description

This command configures a characteristic value.

The **no** form of this command removes the value for the characteristic.

## Parameters

### *value-name*

Specifies a string of up to 32 characters uniquely identifying this characteristic value.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## value

## Syntax

**value** *value*

**no value**

## Context

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>ipv6>dhcp6>relay>asel>pref-opt value)

[\[Tree\]](#) (config>service>vprn>sub-if>ipv6>dhcp6>relay>asel>pref-opt value)

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>ipv6>dhcp6>relay>asel>pref-opt value)

## Full Context

```
configure service ies subscriber-interface group-interface ipv6 dhcp6 relay advertise-selection preference-
option value
```

```
configure service vprn subscriber-interface ipv6 dhcp6 relay advertise-selection preference-option value
```

```
configure service vprn subscriber-interface group-interface ipv6 dhcp6 relay advertise-selection
preference-option value
```

## Description

This command configures the default preference option value. A DHCPv6 preference option with specified value is inserted in the DHCPv6 advertise message for DHCPv6 clients for which no per DHCPv6 server or per client-mac solicit delay or preference option value is configured.

The **no** form of this command removes the configuration.

## Parameters

**value**

Specifies the default preference option value.

**Values** 0 to 255

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

value

## Syntax

**value** *value*

**no value**

## Context

**[Tree]** (config>service>vprn>sub-if>grp-if>ipv6>dhcp6>relay>asel>clnt-mac>pref-opt value)

**[Tree]** (config>service>ies>sub-if>grp-if>ipv6>dhcp6>relay>asel>clnt-mac>pref-opt value)

## Full Context

```
configure service vprn subscriber-interface ipv6 dhcp6 relay advertise-selection client-mac preference-
option value
```

```
configure service vprn subscriber-interface group-interface ipv6 dhcp6 relay advertise-selection client-mac
preference-option value
```

```
configure service ies subscriber-interface group-interface ipv6 dhcp6 relay advertise-selection client-mac
preference-option value
```

## Description

This command configures the preference option value for DHCPv6 clients with an odd or an even source MAC address. A DHCPv6 preference option with specified value is inserted in the DHCPv6 advertise message for these DHCPv6 clients.

The **no** form of this command removes the configuration.

## Parameters

### *value*

Specifies the preference option value for DHCPv6 clients with an odd or an even source MAC address.

**Values** 0 to 255

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## value

## Syntax

**value** *value*

**no value**

## Context

preference-option value
```

```
configure service vprn subscriber-interface ipv6 dhcp6 relay advertise-selection server preference-option
value
```

```
configure service ies subscriber-interface group-interface ipv6 dhcp6 relay advertise-selection server
preference-option value
```

## Description

This command configures the preference option value. A DHCPv6 preference option with specified value is inserted in the DHCPv6 advertise message from the server.

The **no** form of this command removes the configuration.

## Parameters

### *value*

Specifies the preference option value for DHCPv6 advertise messages from the server.

**Values** 0 to 255

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 26.16 vas-filter

### vas-filter

#### Syntax

**vas-filter** *name* [**create**]

**no vas-filter** *name*

#### Context

[\[Tree\]](#) (config>subscr-mgmt>isa-svc-chain vas-filter)

#### Full Context

configure subscriber-mgmt isa-service-chaining vas-filter

#### Description

This command configures a Value Added Service filter.

The **no** form of this command removes the VAS filter name from the configuration.

#### Default

This command configures a value added service (VAS) filter that can be associated to an L2-aware NAT host, and is matched on the NAT ISA to select flows for a host that needs to be steered to remote value-added services.

#### Parameters

##### *name*

Specifies a VAS filter name, up to 32 characters.

##### **create**

Keyword used to create the VAS filter instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 26.17 vas-if-type

### vas-if-type

#### Syntax

**vas-if-type** {**to-from-access** | **to-from-network** | **to-from-both**}

**no vas-if-type**

#### Context

[\[Tree\]](#) (config>service>ies>if vas-if-type)

#### Full Context

configure service ies interface vas-if-type

#### Description

This command configures the type of a Value Added Service (VAS) facing interface. To change the **vas-if-type**, the **shutdown** command is required. The **vas-if-type** and **loopback** commands are mutually exclusive.

The **no** form of this command removes the VAS interface type configuration.

#### Default

no vas-if-type

#### Parameters

##### **to-from-access**

Used when two separate (**to-from-access** and **to-from-network**) interfaces are used for VAS connectivity. For service chaining, traffic arriving from access interfaces (upstream) is redirected to a PBR target reachable over this interface for upstream VAS processing. Downstream traffic after VAS processing must arrive on this interface, so that the traffic is subject to regular routing but is not subject to AA divert, nor egress subscriber PBR.

##### **to-from-network**

Used when two separate (**to-from-access** and **to-from-network**) interfaces are used for VAS connectivity. For service chaining, traffic arriving from network interfaces (downstream) is redirected to a PBR target reachable over this interface for downstream VAS processing. Upstream traffic after VAS processing must arrive on this interface, so that regular routing can be applied.

##### **to-from-both**

Used when a single interface is used for VAS connectivity (no local-to-local traffic). For service chaining, both traffic arriving from access interfaces and from network interfaces is redirected to a PBR target reachable over this interface for upstream/downstream VAS processing. Traffic after VAS processing must arrive on this interface, so that the traffic is subject to regular routing but is not subject to AA divert, nor egress subscriber PBR.

## Platforms

All

## vas-if-type

### Syntax

**vas-if-type** {**to-from-access** | **to-from-network** | **to-from-both**}

**no vas-if-type**

### Context

[\[Tree\]](#) (config>service>vprn>if vas-if-type)

### Full Context

configure service vprn interface vas-if-type

### Description

This command configures the type of a Value Added Service (VAS) facing interface. To change the **vas-if-type**, the **shutdown** command is required. The **vas-if-type** and **loopback** commands are mutually exclusive.

The **no** form of this command removes the VAS interface type configuration.

### Default

no vas-if-type

### Parameters

#### **to-from-access**

Used when two separate (**to-from-access** and **to-from-network**) interfaces are used for VAS connectivity. For service chaining, traffic arriving from access interfaces (upstream) is redirected to a PBR target reachable over this interface for upstream VAS processing. Downstream traffic after VAS processing must arrive on this interface, so that the traffic is subject to regular routing but is not subject to AA divert, nor egress subscriber PBR.

#### **to-from-network**

Used when two separate (**to-from-access** and **to-from-network**) interfaces are used for VAS connectivity. For service chaining, traffic arriving from network interfaces (downstream) is redirected to a PBR target reachable over this interface for downstream VAS processing. Upstream traffic after VAS processing must arrive on this interface, so that regular routing can be applied.

#### **to-from-both**

Used when a single interface is used for VAS connectivity (no local-to-local traffic). For service chaining, both traffic arriving from access and from network is redirected to a PBR target reachable over this interface for upstream/downstream VAS processing. Traffic after VAS processing must arrive on this interface, so that the traffic is subject to regular routing but is not subject to AA divert, nor egress subscriber PBR.

## Platforms

All

## vas-if-type

### Syntax

**vas-if-type** {**to-from-access** | **to-from-network** | **to-from-both**}

**no vas-if-type**

### Context

[\[Tree\]](#) (config>router>if vas-if-type)

### Full Context

configure router interface vas-if-type

### Description

This command configures the type of a Value Added Service (VAS) facing interface. To change the **vas-if-type**, the **shutdown** command is required. The **vas-if-type** and **loopback** commands are mutually exclusive.

The **no** form of this command removes the VAS interface type configuration.

### Default

no vas-if-type

### Parameters

#### **to-from-access**

Used when two separate (**to-from-access** and **to-from-network**) interfaces are used for VAS connectivity. For service chaining, traffic arriving from access interfaces (upstream) is redirected to a PBR target reachable over this interface for upstream VAS processing. Downstream traffic after VAS processing must arrive on this interface, so that the traffic is subject to regular routing but is not subject to AA divert, nor egress subscriber PBR.

#### **to-from-network**

Used when two separate (**to-from-access** and **to-from-network**) interfaces are used for VAS connectivity. For service chaining, traffic arriving from network interfaces (downstream) is redirected to a PBR target reachable over this interface for downstream VAS processing. Upstream traffic after VAS processing must arrive on this interface, so that regular routing can be applied.

#### **to-from-both**

Used when a single interface is used for VAS connectivity (no local-to-local traffic). For service chaining, both traffic arriving from access interfaces and from network interfaces is redirected to a PBR target reachable over this interface for upstream/downstream VAS processing. Traffic after VAS processing must arrive on this interface, so that the traffic is subject to regular routing but is not subject to AA divert, nor to egress subscriber PBR.

## 26.18 vc-id

vc-id

### Syntax

**vc-id** *vc-id*

**no vc-id**

### Context

[\[Tree\]](#) (config>service>vpls>sap>l2tpv3-session vc-id)

[\[Tree\]](#) (config>service>epipe>sap>l2tpv3-session vc-id)

### Full Context

configure service vpls sap l2tpv3-session vc-id

configure service epipe sap l2tpv3-session vc-id

### Description

This command specifies the VC-ID for the L2TPv3 session.

The **no** form of this command deletes the VC-ID configuration.

### Parameters

*vc-id*

Specifies the VC-ID, up to 64 characters.

**Values** 1 to 4294967295

## Platforms

All

## 26.19 vc-id-range

vc-id-range

### Syntax

**vc-id-range** *from* [**to** *vc-id*]

**no vc-id-range** *from*

### Context

[\[Tree\]](#) (config>service>system>bgp-evpn>ethernet-segment vc-id-range)

### Full Context

configure service system bgp-evpn ethernet-segment vc-id-range

### Description

This command determines the VC-IDs associated with the virtual Ethernet Segment on a specific SDP based on the following considerations:

- VC-IDs for manual spoke-SDP and BGP-AD are included in the range.
- Th mesh-sdp VC-IDs are not allowed on a SDP used by a virtual ES.
- A maximum of 8 ranges are allowed.
- A range can be comprised of a single VC-ID.
- A **vc-id-range** can be comprised of a single VC-ID.
- Shutting down the ES is not required prior to making changes.

The **no** form of the command removes the configured range. Only the first VC-ID value is required to remove the range.

### Parameters

#### **vc-id**

Specifies the VC-ID. When configuring a range of VC-IDs (and not a single value), the value of the second VC-ID must be greater than the first VC-ID.

**Values** 1 to 4294967295

### Platforms

All

## 26.20 vc-label

**vc-label**

### Syntax

**vc-label** *egress-vc-label*

**no vc-label** [*egress-vc-label*]

### Context

### Full Context

```
configure service vprn redundant-interface spoke-sdp egress vc-label
configure service vprn interface spoke-sdp egress vc-label
```

### Description

This command configures the egress VC label.

### Parameters

#### *vc-label*

A VC egress value that indicates a specific connection.

**Values** 16 to 1048575

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn redundant-interface spoke-sdp egress vc-label

All

- configure service vprn interface spoke-sdp egress vc-label

## vc-label

### Syntax

*vc-label ingress-vc-label*

*no vc-label [ingress-vc-label]*

### Context

## 26.21 vc-type

### vc-type

#### Syntax

**vc-type** {**ether** | **vlan**}

**no vc-type**

#### Context

[\[Tree\]](#) (config>service>sdp>binding>pw-port vc-type)

#### Full Context

configure service sdp binding pw-port vc-type

#### Description

This command sets the forwarding mode for the pseudowire port. The **vc-type** is signaled to the peer, and must be configured consistently on both ends of the pseudowire. **vc-type VLAN** is only configurable with dot1q encapsulation on the pseudowire port. The tag with **vc-type vlan** only has significance for transport, and is not used for service delineation or ESM. The top (provider tag) is stripped while forwarding out of the pseudowire, and a configured **vlan-tag** (for **vc-type vlan**) is inserted when forwarding into the pseudowire. With **vc-type ether**, the tags if present (max 2), are transparently preserved when forwarding in or out of the pseudowire.

The **no** form of the command reverts to the default value.

#### Default

vc-type ether

#### Parameters

##### **ether**

Specifies **ether** as the virtual circuit (VC) associated with the SDP binding.

##### **vlan**

Specifies **vlan** as the virtual circuit (VC) associated with the SDP binding.

## Platforms

All

## vc-type

### Syntax

**vc-type** {ether | vlan}

### Context

[\[Tree\]](#) (config>service>pw-template vc-type)

### Full Context

configure service pw-template vc-type

### Description

This command overrides the default VC type signaled for the binding to the far end SDP. The VC type is a 15 bit-quantity containing a value which represents the type of VC. The actual signaling of the VC type depends on the signaling parameter defined for the SDP. If signaling is disabled, the **vc-type** command can still be used to define the dot1q value expected by the far-end provider equipment. A change of the bindings VC type causes the binding to signal the new VC type to the far end when signaling is enabled. VC types are derived according to IETF *draft-martini-l2circuit-trans-mpls*.

- The VC type value for Ethernet is 0x0005.
- The VC type value for an Ethernet VLAN is 0x0004.

### Parameters

#### ether

Defines the VC type as Ethernet. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings. Defining Ethernet is the same as executing **no vc-type** and restores the default VC type for the spoke SDP binding. (hex 5)

#### vlan

Defines the VC type as VLAN. The top VLAN tag, if a VLAN tag is present, is stripped from traffic received on the pseudowire, and a vlan-tag is inserted when forwarding into the pseudowire. The **ethernet** and **vlan** keywords are mutually exclusive. When the VC type is not defined then the default is Ethernet for spoke SDP bindings.

#### Note:

The system expects a symmetrical configuration with its peer, specifically it expects to remove the same number of VLAN tags from received traffic as it adds to transmitted traffic. As some of the related configuration parameters are local and not communicated in the signaling plane, an asymmetrical behavior cannot always be detected and so cannot be blocked. Consequently, protocol extractions will not necessarily function for asymmetrical configurations as they would with a symmetrical configurations resulting in an unexpected operation.

#### Context

[**Tree**] (config>saa>test>type vccv-ping)

[**Tree**] (oam vccv-ping)

#### Full Context

configure saa test type vccv-ping

oam vccv-ping

#### Description

This command configures a Virtual Circuit Connectivity Verification (VCCV) ping test. A VCCV ping test checks the connectivity of a VLL inband. This test verifies that the destination (target) PE is the egress for the Layer 2 Forwarding Equivalence Class (FEC), and provides a cross-check between the dataplane and the control plane. This test is inband, which means that the **vccv-ping** message is sent using the same encapsulation and along the same path as user packets in the VLL. The VCCV ping test is the equivalent of the LSP ping test for a VLL service. This command reuses an LSP ping message format and can be used to test a VLL configured over both an MPLS and a GRE SDP.

**Note:** A VCCV ping can be initiated on T-PE or S-PE. If initiated on the S-PE, the **reply-mode** parameter must be used with the **ip-routed** value. The ping from the T-PE can either have values or be omitted, in which case the default value is used.

If a VCCV ping is initiated from T-PE to a neighboring S-PE (one segment only), it is sufficient to use only the **spoke-sdp-fec-id** parameter. However, if the ping is across two or more segments, at least the **spoke-sdp-fec-id**, **src-ip-address** *ip-addr*, **dst-ip-address** *ip-addr*, **ttl** *vc-label-ttl* parameters are used

where:

- The **src-ip-address** is the system IP address of the router preceding the destination router.
- The **vc-label-ttl** parameter must have a value equal to or higher than the number of PW segments.

**Note:** VCCV ping is a multi-segment PW. For a single-hop PW, only the peer VCCV CC bit of the control word is advertised when the control word is enabled on the PW.

VCCV ping on multi-segment PWs requires that the control word is enabled in all segments of the VLL. If the control word is not enabled on a spoke SDP, it is signaled peer VCCV CC bits to the far end, consequently the **vccv-ping** command cannot be successfully initiated on the specific spoke SDP.

If the **saii-type-2** and **taii-type-2** parameters are specified for a FEC 129 PW, these values are used by the VCCV ping echo request message instead of the source access individual identifiers (SAII) and target attachment individual identifier (TAII) of the spoke-SDP indexed by the **spoke-sdp-fec** parameter, or any SAII and TAIL received in a switching point TLV for the PW. Furthermore, the user must enter the SAII and TAIL in accordance with the direction of the PW as seen from the node on which the **vccv-ping** command is executed. However, the values of the SAII and TAIL sent in the echo request message are swapped with respect to the user-entered values to match the order in the installed FEC on the targeted node. The output of the command for a FEC 129 type 2 PW reflects the order of the SAII and TAIL stored on the targeted node.

When used with the **static** option, this command configures a VCCV ping test for static MPLS-TP PWs used in a VLL service. The test verifies that the destination (target) PE is the egress for the static PW FEC, and provides a cross-check between the dataplane and the configuration. The **vccv-ping static** command reuses an **isp-ping** message format and can be used to test an MPLS-TP PW VLL configured over an MPLS SDP. VCCV ping for MPLS-TP PWs always use the VCCV control word (associated channel header) with either an IPv4 channel type (0x0021) or on-demand CV message channel type (0x0025).

**Note:** **vccv-ping static** can only be initiated on a T-PE. Both the echo request and reply messages are sent using the same, in-band, encapsulation. If the **target-fec-type** option is not specified, the target FEC stack contains a static PW FEC TLV. The contents of this TLV are populated based on the source node ID, source global ID, destination global ID, and destination node ID in the **vccv-ping** command (or taken from the PW context, if omitted from the command).

The **target-fec-type** option allows the user to test a segment of a MS-PW that does not have the same FEC type as the local segment from the T-PE where the **vccv-ping** command is issued. This is applicable for performing VCCV ping on an MS-PW that consists of static PW FEC segments and dynamically signaled PW ID FEC segments.

The timestamp format that is sent, and is expected when received in a PDU, is configured using the **config>test-oam>mpls-time-stamp-format** command. If RFC 4379 (obsoleted by RFC 8029) is selected, the timestamp is in seconds and microseconds since 1900, otherwise it is in seconds and microseconds since 1970.

## Parameters

### fec-128

Keyword to specify that the VCCV ping test is of the type FEC 128.

**sdp-id:vc-id**

Specifies that if a FEC 128 PW is tested, its VC ID must be indicated with this parameter. The VC ID must exist on the local router and the far-end peer must indicate that it supports VCCV to allow the user to send a VCCV ping message.

**Values** sdp-id: 1 to 32767  
vc-id: 1 to 4294967295

**reply-mode {ip-routed | control-channel}**

Indicates to the far end the method to send the reply message. The **ip-routed** option specifies an out-of-band reply mode using the VCCV control channel. The **control-channel** option specifies an in-band reply mode using the VCCV control channel.

**Default** control-channel

**src-ip-address ip-addr**

Specifies the source IP address.

**Values** a.b.c.d

**dst-ip-address ip-addr**

Specifies the destination IP address.

**Values** a.b.c.d

**pw-id**

Specifies the PW ID for performing a VCCV ping operation. The PW ID is a non-zero 32-bit connection ID required by FEC 128, as defined in RFC 8029, *Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures*.

**Values** 1 to 4294967295

**target-fec-type**

Specifies the FEC type for a remote PW segment targeted by a VCCV ping echo request. This parameter is used if VCCV ping is used with an MS-PW, where a static MPLS-TP PW segment using the static PW FEC is switched to a T-LDP signaled segment using the PW ID FEC (FEC 128), or vice versa, which requires the user to explicitly specify a target FEC that is different from the local segment FEC.

**Values** **pw-id-fec** — Specifies that the FEC element for the remote target PW segment is of the type PW ID (FEC 128).

**static-pw-fec** — Specifies that the FEC element for the remote target PW segment is of the type static PW FEC.

**attachment-group-identifier**

Specifies the attachment group identifier for the target FEC. This parameter is valid only in combination with the **target-fec-type static-pw-fec** options.

**Values** 0 to 4294967295

**pw-path-id-saii global-id:node-id:ac-id**

Specifies the SAll of the target FEC. This parameter is valid only in combination with the **target-fec-type** *static-pw-fec* options.

*global-id* — Specifies the global ID for the SAll of the targeted static PW FEC element.

**Values** 0 to 4294967295

*node-id* — Specifies the node ID on far end T-PE that the PW being tested is associated with.

**Values** ipv4-formatted address: a.b.c.d  
1 to 4294967295

*ac-id* — Specifies an unsigned integer representing a locally unique SAll for the PW being tested at the far end T-PE.

**Values** 1 to 4294967295

**pw-path-id-taii** *global-id:node-id:ac-id*

Specifies the TAll of the target FEC. This parameter is valid only in combination with the **target-fec-type** *static-pw-fec* options.

*global-id* — Specifies the global ID of the TAll of the targeted static PW FEC element.

**Values** 0 to 4294967295

*node-id* — Specifies the node ID on the far end T-PE that the PW being tested is associated with.

**Values** ipv4-formatted address: a.b.c.d  
1 to 4294967295

*ac-id* — Specifies an unsigned integer representing a locally unique TAll for the PW being tested at the far end T-PE.

**Values** 1 to 4294967295

**saii-type2** *global-id:prefix:ac-id*

Specifies that if a FEC 129 All type 2 PW is tested, the SAll must be indicated. The **saii-type2** parameter is mutually exclusive with *sdp-id:vc-id*.

**taii-type2** *global-id:prefix:ac-id*

Specifies that if a FEC 129 All type 2 PW is tested, the TAll must be indicated. The **taii-type2** parameter is mutually exclusive with *sdp-id:vc-id*.

*global-id* — Specifies the global ID of the far end T-PE of the FEC129 PW.

**Values** 0 to 4294967295

**Default** 0

*node-id* — Specifies the node ID on the far end T-PE that the PW being tested is associated with.

**Values**        ipv4-formatted address: a.b.c.d  
                   1 to 4294967295

*ac-id* — Specifies an unsigned integer representing a locally unique TAlI for the PW being tested at the far end T-PE.

**Values**        1 to 4294967295

### ***spoke-sdp-fec-id***

Specifies that if a FEC 129 PW is tested, the *spoke-sdp-fec-id* option must be indicated using this parameter. The *spoke-sdp-fec-id* must already exist on the local router and the far-end peer must indicate that it supports VCCV to allow the user to send a message using the **vccv-ping** command.

**spoke-sdp-fec** is mutually exclusive with the *sdp-id:vc-id* parameter.

**Values**        1 to 4294967295

### **assoc-channel {ipv4 | non-ip}**

Specifies the associated channel encapsulation format to use for the VCCV ping echo request and echo reply packet for a PW that uses the static PW FEC. An associated channel type of ipv4 must be used if a VCCV ping is performed to a remote segment of a different FEC type.

**Values**        **ipv4**

IPv4 encapsulation in an IPv4 PW associated channel (channel type 0x0021)

**non-ip**

MPLS-TP encapsulation without UDP/IP headers, in a PW associated channel using the channel type 0x025.

**Default**       non-ip

### ***global-id***

Specifies the MPLS-TP global ID for the far end node of the PW under test. If this is not entered, the *dest-global-id* is taken from the PW context.

**Values**        0 to 4294967295

**Default**       0

### ***node-id***

Specifies the MPLS-TP node ID of the far end node for the PW under test. If this is not entered, then the *dest-global-id* is taken from the PW context.

**Values**        ipv4-formatted address: a.b.c.d  
                   1 to 4294967295

**Default**       0

### ***sender-src-address ip-addr***

Specifies the 4-octet IPv4 address of the node originating the VCCV Ping echo request. This parameter is only valid in combination with the **target-fec-type** *pw-id-fec*.

**Values** a.b.c.d

#### ***remote-dst-address ip-addr***

Specifies the 4-octet IPv4 address of the far end node that is a target of the VCCV Ping echo request. This parameter is only valid in combination with the **target-fec-type** *pw-id-fec*.

**Values** a.b.c.d

#### ***pw-type***

Specifies the PW type value of the PW segment targeted on the far end node. This field must be included to populate the PW type field of the PW ID FEC in the FEC static TLV, when the far end FEC type is different from the local FEC type and the **target-fec-type** *pw-id-fec*.

**Values** atm-cell (=3), atm-sdu (=2), atm-vcc (=9), atm-vpc (=10), cesopsn (=21), cesopsn-cas (=23), ether (=5), satop-e1 (=17), satop-t1 (=18), 1 to 65535

#### ***send-count***

Specifies the number of messages to send, expressed as a decimal integer. The count parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message interval value must have expired before the next message request is sent.

**Values** 1 to 100

**Default** 1

#### ***fc-name***

Specifies the **fc** parameter be used to indicate the forwarding class of the MPLS echo request packets. The actual forwarding class encoding is controlled by the network egress LSP-EXP mappings.

The LSP-EXP mappings on the receive network interface controls the mapping back to the internal forwarding class used by the far-end 7750 SR that receives the message request. The egress mappings of the egress network interface on the far-end router controls the forwarding class markings on the return reply message. The LSP-EXP mappings on the receive network interface controls the mapping of the message reply at the originating SR.

**Values** be, l2, af, l1, h2, ef, h1, nc

**Default** be

The ToS byte is not modified. [Table 183: vccv-ping Request Packet and Behavior](#) summarizes this behavior.

Table 183: vccv-ping Request Packet and Behavior

CPM (sender node)	Echo request packet: <ul style="list-style-type: none"> <li>packet {tos=1, fc1, profile1}</li> <li>fc1 and profile1 are as entered by user in OAM command or default values</li> <li>tos1 as per mapping of {fc1, profile1} to IP precedence in network egress QoS policy of outgoing interface</li> </ul>
Outgoing interface (sender node)	Echo request packet: <ul style="list-style-type: none"> <li>packet queued as {fc1, profile1}</li> <li>ToS field=tos1 not remarked</li> <li>EXP=exp1, as per mapping of {fc1, profile1} to EXP in network egress QoS policy of outgoing interface</li> </ul>
Incoming interface (responder node)	Echo request packet: <ul style="list-style-type: none"> <li>packet {tos1, exp1}</li> <li>exp1 mapped to {fc2, profile2} as per classification in network QoS policy of incoming interface</li> </ul>
CPM (responder node)	Echo reply packet: <ul style="list-style-type: none"> <li>packet {tos=1, fc2, profile2}</li> </ul>
Outgoing interface (responder node)	Echo reply packet: <ul style="list-style-type: none"> <li>packet queued as {fc2, profile2}</li> <li>ToS field= tos1 not remarked (reply inband or out-of-band)</li> <li>EXP=exp2, if reply is inband, remarked as per mapping of {fc2, profile2} to EXP in network egress QoS policy of outgoing interface</li> </ul>
Incoming interface (sender node)	Echo reply packet: <ul style="list-style-type: none"> <li>packet {tos1, exp2}</li> <li>exp2 mapped to {fc1, profile1} as per classification in network QoS policy of incoming interface</li> </ul>

**profile {in | out}**

Specifies the profile state of the MPLS echo request encapsulation.

**Default** out

**interval**

Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the interval is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

**Values** 1 to 10

**Default** 1

### **octets**

Specifies the size, in octets, expressed as a decimal integer, of the MPLS echo request packet, including the IP header but not the label stack. The request pay-load is padded with zeros to the specified size. Note that an OAM command is not failed if the user entered a size lower than the minimum required to build the packet for the echo request message. The payload is automatically padded to meet the minimum size.

**Values** 1 to 9786

**Default** 1

### **timeout**

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of message time out, the requesting router assumes that the message response is not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

**Values** 1 to 10

**Default** 5

### **vc-label-ttl**

Specifies the time-to-live value for the vc-label of the echo request message. The outer label TTL is still set to the default of 255 regardless of this value.

**Values** 1 to 255

**Default** 1

## **Platforms**

[**Tree**] (config>saa>test>type vccv-trace)

## Full Context

```
oam vccv-trace
configure saa test type vccv-trace
```

## Description

This command configures a Virtual Circuit Connectivity Verification (VCCV) automated trace test. The automated VCCV-trace can trace the entire path of a PW with a single command issued at the T-PE or at an S-PE. This is equivalent to LSP-Trace and is an iterative process by which the source T-PE or S-PE node sends successive VCCV-Ping messages with incrementing the TTL value, starting from TTL=1. In each iteration, the T-PE builds the MPLS echo request message in a way like VCCV-Ping. The first message with TTL=1 has the next-hop S-PE T-LDP session source address in the Remote PE Address field in the PW FEC TLV. Each S-PE which terminates and processes the message includes in the MPLS echo reply message the FEC 128 TLV corresponding the PW segment to its downstream node. The source T-PE or S-PE node can then build the next echo reply message with TTL=2 to test the next-next hop for the MS-PW. It copies the FEC TLV it received in the echo reply message into the new echo request message. The process is terminated when the reply is from the egress T-PE or when a time out occurs.

The user can specify to display the result of the VCCV-trace for a fewer number of PW segments of the end-to-end MS-PW path. In this case, the **min-ttl** and **max-ttl** parameters are configured accordingly. However, the T-PE/S-PE node still probes all hops up to **min-ttl** to correctly build the FEC of the subset of segments.

Note that if the **saii-type-2** and **taii-type-2** parameters are specified this command for a FEC129 pseudowire, then these values are used by the vccv-ping echo request message instead of the saii and taii of the spoke SDP indexed by the **spoke-sdp-fec** parameter, or any saii and taii received in a switching point TLV for the pseudowire. Furthermore, the user must enter the saii and taii in accordance with the direction of pseudowire as seen from the node on which the **vccv-trace** command is executed. However, the values of the saii and taii sent in the echo request message are swapped with respect to the user-entered values to match the order in the installed FEC on the targeted node. The output of the command for a FEC129 type 2 pseudowire reflects the order of the saii and taii stored on the targeted node.

This command, when used with the **static** option, configures a VCCV-automated trace test for static MPLS-TP pseudowires used in a VLL service. VCCV trace for MPLS-TP pseudowires always uses the VCCV control word (associated channel header) with either an IPv4 channel type (0x0021) or on-demand CV message channel type (0x0025).

Note that **vccv-trace static** can only be initiated on a T-PE. Both the echo request and reply messages are sent using the same, in-band, encapsulation. The target FEC stack contains a static PW FEC TLV. The contents of this TLV are populated based on the source Node ID, source global ID, and destination global ID and destination node ID taken from the pseudowire context.

The **target-fec-type** option allows the user to perform a vccv-trace to a segment of a MS-PW that does not have the same FEC type as the local segment from the T-PE where the **vccv-trace** command is issued. This is applicable for performing VCCV ping on an MS-PW consists of static PW FEC segments and dynamically signaled PW ID FEC segments.

## Parameters

### **sdp-id:vc-id**

Specifies that if a FEC 128 PW is being tested, then its VC ID must be indicated with this parameter. The VC ID needs to exist on the local router and the far-end peer needs to indicate that it supports VCCV to allow the user to send vccv-ping message.

**Values** sdp-id: 1 to 32767  
vc-id: 1 to 4294967295

### **reply-mode {ip-routed | control-channel}**

Indicates to the far end, the method to send the reply message. The option **ip-routed** indicates an out-of-band reply mode using the vccv control channel. The option **control-channel** indicates an in-band reply mode using the vccv control channel.

**Default** control-channel

### **target-fec-type**

Specifies the FEC type for a remote PW segment targeted by a VCCV Ping echo request. This parameter is used if VCCV Ping is used along a MS-PW where a static MPLS-TP PW segment using the static PW FEC is switched to a T-LDP signaled segment using the PW ID FEC (FEC128), or vice versa, thus requiring the user to explicitly specify a target FEC that is different from the local segment FEC.

**Values** **pw-id-fec** — Indicates that FEC element for the remote target PW segment is of type PW ID (FEC128).  
**static-pw-fec** — Indicates that FEC element for the remote target PW segment is of type Static PW FEC.

### **attachment-group-identifier**

Specifies the attachment group identifier for the target FEC. This parameter is only valid in combination with the **target-fec-type static-pw-fec**.

**Values** 0 to 4,294,967,295

### **pw-path-id-saii global-id:node-id:ac-id**

Specifies the SAII of the target FEC. This parameter is only valid in combination with the **target-fec-type static-pw-fec**.

*global-id* — Specifies the global ID of the SAII of the targeted static PW FEC element.

**Values** 0 to 4294967295

**Default** 0

*node-id* — Specifies the node ID on far end T-PE that the pseudowire being tested is associated with.

**Values** ipv4-formatted address: a.b.c.d  
1 to 4294967295

*ac-id* — Specifies an unsigned integer representing a locally unique SAII for the pseudowire being tested at the far end T-PE.

**Values** 1 to 4294967295

### **pw-path-id-taii global-id:node-id:ac-id**

Specifies the SAll of the target FEC. This parameter is only valid in combination with the **target-fec-type static-pw-fec**.

*global-id* — Specifies the global ID of the SAll of the targeted static PW FEC element.

**Values** 0 to 4294967295

**Default** 0

*node-id* — Specifies the node ID of the far-end T-PE that the pseudowire being tested is associated with.

**Values** ipv4-formatted address: a.b.c.d  
1 to 4294967295

*ac-id* — Specifies an unsigned integer representing a locally unique SAll for the pseudowire being tested at the far end T-PE.

**Values** 1 to 4294967295

#### **saii-type2 global-id:prefix:ac-id**

If a FEC129 All Type 2 pseudowire is being tested, then the source attachment individual identifier (SAll) must be indicated.

The **saii-type2** parameter is mutually exclusive with the **sdp-id:vc-id** parameter.

*global-id* — Specifies the global ID of this T-PE node.

**Values** 1 to 4294967295

*prefix* — Specifies the prefix on this T-PE node that the spoke SDP is associated with.

*ac-id* — Specifies an unsigned integer representing a locally unique identifier for the spoke SDP.

**Values** 1 to 4294967295

#### **taii-type2 global-id:prefix:ac-id**

Specifies that if a FEC129 All Type 2 pseudowire is being tested, then the target attachment individual identifier (TAII) must be indicated. The **taii-type2** parameter is mutually exclusive with *sdp-id:vc-id*.

*global-id* — Specifies the global ID of the far end T-PE of the FEC129 pseudowire.

**Values** 0 to 4294967295

*node-id* — Specifies the node ID on far end T-PE that the pseudowire being tested is associated with.

**Values** ipv4-formatted address: a.b.c.d  
1 to 4294967295

*ac-id* — Specifies an unsigned integer representing a locally unique TAIL for the pseudowire being tested at the far end T-PE.

**Values** 1 to 4294967295

#### ***spoke-sdp-fec-id***

Specifies that if a FEC 129 PW is being tested, then its *spoke-sdp-fec-id* must be indicated with this parameter. The **spoke-sdp-fec-id** needs to exist on the local router and the far-end peer needs to indicate that it supports VCCV to allow the user to send vccv-ping message.

**spoke-sdp-fec** is mutually exclusive with the *sdp-id:vc-id* parameter.

**Values** 1 to 4294967295

#### **assoc-channel {ipv4 | non-ip}**

Specifies the associated channel encapsulation format to use for the VCCV trace echo request and echo reply packet for a PW that uses the static PW FEC. An associated channel type of ipv4 must be used if a vccv-ping is performed to a remote segment of a different FEC type.

**Values** ipv4 – IPv4 encapsulation in an IPv4 pseudowire associated channel (channel type 0x0021)

non-ip – MPLS-TP encapsulation without UDP/IP headers, in pseudowire associated channel using channel type 0x025.

**Default** non-ip

#### **src-ip-address ipv4-address**

Specifies the 4-octet IPv4 address of the source node.

**Values** a.b.c.d

#### **sender-src-address ipv4-address**

Specifies the 4-octet IPv4 address of the node originating the VCCV trace.

**Values** a.b.c.d

#### **remote-dst-address ipv4-address**

Specifies the 4-octet IPv4 address of the far end node that is a target of the VCCV Ping echo request. This parameter is only valid in combination with the **target-fec-type pw-id-fec**.

**Values** a.b.c.d

#### ***pw-id***

Specifies the pseudowire ID to be used for performing a VCCV ping operation. The pseudowire ID is a non-zero 32-bit connection ID required by the FEC 128, as defined in RFC 8029, Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures.

**Values** 1 to 4294967295

#### ***pw-type***

Specifies the PW type of the PW segment targeted on the far end node. This field must be included to populate the PW type field of the PW ID FEC in the FEC static TLV, when the far end FEC type is different from the local FEC type and the **target-fec-type** is **pw-id-fec**.

**Values** atm-cell (=3), atm-sdu (=2), atm-vcc (=9), atm-vpc (=10), cesopsn (=21), cesopsn-cas (=23), ether (=5), satop-e1 (=17), satop-t1 (=18), 1 to 65535

### **fc-name**

Specifies the FC and profile parameters are used to indicate the forwarding class of the VCCV trace echo request packets. The actual forwarding class encoding is controlled by the network egress LSP-EXP mappings.

The LSP-EXP mappings on the receive network interface controls the mapping back to the internal forwarding class used by the far-end router that receives the message request. The egress mappings of the egress network interface on the far-end router controls the forwarding class markings on the return reply message. The LSP-EXP mappings on the receive network interface controls the mapping of the message reply at the originating router.

**Values** be, l2, af, l1, h2, ef, h1, nc

**Default** be

When an MPLS echo request packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the specified FC and profile parameter values. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface. When the MPLS echo request packet is received on the responding node, The FC and profile parameter values are dictated by the LSP-EXP mappings of the incoming interface.

When an MPLS echo reply packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the FC and profile parameter values determined by the classification of the echo request packet, which is being replied to, at the incoming interface. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface.

The ToS byte is not modified. [Table 184: vccv trace Request Packet and Behavior](#) summarizes this behavior.

*Table 184: vccv trace Request Packet and Behavior*

CPM (sender node)	Echo request packet: <ul style="list-style-type: none"> <li>packet {tos=1, fc1, profile1}</li> <li>fc1 and profile1 are as entered by user in OAM command or default values</li> <li>tos1 as per mapping of {fc1, profile1} to IP precedence in network egress QoS policy of outgoing interface</li> </ul>
Outgoing interface (sender node)	Echo request packet: <ul style="list-style-type: none"> <li>packet queued as {fc1, profile1}</li> </ul>

	<ul style="list-style-type: none"> <li>ToS field=tos1 not remarked</li> <li>EXP=exp1, as per mapping of {fc1, profile1} to EXP in network egress QoS policy of outgoing interface</li> </ul>
Incoming interface (responder node)	Echo request packet: <ul style="list-style-type: none"> <li>packet {tos1, exp1}</li> <li>exp1 mapped to {fc2, profile2} as per classification in network QoS policy of incoming interface</li> </ul>
CPM (responder node)	Echo reply packet: <ul style="list-style-type: none"> <li>packet{tos=1, fc2, profile2}</li> </ul>
Outgoing interface (responder node)	Echo reply packet: <ul style="list-style-type: none"> <li>packet queued as {fc2, profile2}</li> <li>ToS filed= tos1 not remarked (reply inband or out-of-band)</li> <li>EXP=exp2, if reply is inband, remarked as per mapping of {fc2, profile2} to EXP in network egress QoS policy of outgoing interface</li> </ul>
Incoming interface (sender node)	Echo reply packet: <ul style="list-style-type: none"> <li>packet {tos1, exp2}</li> <li>exp2 mapped to {fc1, profile1} as per classification in network QoS policy of incoming interface</li> </ul>

**profile {in | out}**

Specifies the profile state of the VCCV trace echo request packet.

**Default** out

**interval-value**

Specifies the interval parameter in seconds, expressed as a decimal integer. This parameter is used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the interval is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

**Values** 1 to 255

**Default** 1

**no-response-count**

Specifies the maximum number of consecutive VCCV trace echo requests, expressed as a decimal integer that do not receive a reply before the trace operation fails for a given TTL value.

**Values** 1 to 255

**Default** 5

#### ***max-vc-label-ttl***

Specifies the TTL value for the VC label of the echo request message for the last hop of the MS-PW for which the results are to be displayed. This is expressed as a decimal integer. The outer label TTL is still set to the default regardless of the value of the VC label.

**Values** 1 to 255

**Default** 8

#### ***min-vc-label-ttl***

Specifies the TTL value for the VC label of the echo request message for the first hop of the MS-PW for which the results are to be displayed. This is expressed as a decimal integer. Note that the outer label TTL is still set to the default regardless of the value of the VC label.

**Values** 1 to 255

**Default** 1

#### ***probe-count***

Specifies the number of VCCV trace echo request messages to send per TTL value.

**Values** 1 to 10

**Default** 1

#### ***octets***

Specifies the size in octets, expressed as a decimal integer, of the MPLS echo request packet, including the IP header but not the label stack. The request pay-load is padded with zeros to the specified size. An OAM command is not failed if the user enters a size lower than the minimum required to build the packet for the echo request message. The payload is automatically padded to meet the minimum size.

**Values** 1 to 9786

**Default** 1

#### ***timeout-value***

Specifies the *timeout* parameter, in seconds, expressed as a decimal integer. This value is used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response are not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

**Values** 1 to 60

**26.24 ve-id****ve-id****Syntax****ve-id** *value***no ve-id**

## Context

**[Tree]** (config>service>epipe>bgp-vpws>remote-ve-name ve-id)

**[Tree]** (config>service>epipe>bgp-vpws>ve-name ve-id)

## Full Context

configure service epipe bgp-vpws remote-ve-name ve-id

configure service epipe bgp-vpws ve-name ve-id

## Description

This command configures a ve-id for either the local VPWS instance when configured under the ve-name, or for the remote VPWS instance when configured under the remote-ve-name.

A single ve-id can be configured per ve-name or remote-ve-name. The ve-id can be changed without shutting down the VPWS instance. When the ve-name ve-id changes, BGP withdraws the previously advertised route and sends a route-refresh to all the peers which would result in reception of all the remote routes again. The old PWs are removed and new ones are instantiated for the new ve-id value.

When the remote-ve-name ve-id changes, BGP withdraws the previously advertised route and send a new update matching the new ve-id. The old pseudowires are removed and new ones are instantiated for the new ve-id value.

NLRIs received whose advertised ve-id does not match the list of ve-ids configured under the remote ve-id will not have a spoke SDP binding auto-created but will remain in the BGP routing table but not in the Layer 2 route table. A change in the locally configured ve-ids may result in auto-sdp-bindings either being deleted or created, based on the new matching results.

Each ve-id configured within a service must be unique.

The **no** form of this command removes the configured ve-id. It can be used just when the BGP VPWS status is shutdown. The **no shutdown** command cannot be used if there is no ve-id configured.

## Default

no ve-id

## Parameters

### *value*

A two bytes identifier that represents the local or remote VPWS instance and is advertised through the BGP NLRI.

**Values** 1 to 65535

## Platforms

All

ve-id

## Syntax

**ve-id** *ve-id-value*

## no ve-id

### Context

[\[Tree\]](#) (config>service>vpls>bgp-vpls>ve-name ve-id)

### Full Context

configure service vpls bgp-vpls ve-name ve-id

### Description

This command configures a ve-id. Just one ve-id can be configured per BGP VPLS instance. The VE-ID can be changed without shutting down the VPLS Instance. When the VE-ID changes, BGP is withdrawing its own previously advertised routes and sending a route-refresh to all the peers which would result in reception of all the remote routes again. The old pseudowires are removed and new ones are instantiated for the new VE-ID value.

The **no** form of this command removes the configured ve-id. It can be used just when the BGP VPLS status is shutdown. The **no shutdown** command cannot be used if there is no ve-id configured.

### Default

no ve-id

### Parameters

#### *value*

Specifies a two-byte identifier that represents the local instance in a VPLS and is advertised through the BGP NLRI. Must be lower or equal with the max-ve-id.

**Values** 1 to 65535

#### Full Context

configure subscriber-mgmt msap-policy vpls-only-sap-parameters igmp-snooping version

## Description

This command specifies the version of IGMP which is running on an MSAP. This object can be used to configure a router capable of running either value. For IGMP to function correctly, all routers on a LAN must be configured to run the same version of IGMP on that LAN.

When the **send-query** command is configured, all type of queries generated are of the configured **version**. If a report of a version higher than the configured version is received, the report gets dropped and a new "wrong version" counter is incremented.

If the **send-query** command is not configured, the **version** command has no effect. The version used on that SAP or SDP is the version of the querier. This implies that, for example, when there is a v2 querier, a v3 group or group-source specific query when a host wants to leave a certain group will never be sent.

## Default

version 3

## Parameters

### *version*

Specifies the IGMP version.

**Values** 1, 2, 3

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

 configure mcast-management multicast-info-policy bundle video video-group  
 configure mcast-management multicast-info-policy bundle channel source-override video video-group

**Description**

This command assigns a video group ID to the channel.

**Parameters*****video-group-id***

specifies the identifier for this video group. The video group must have been configured in the **config>isa** context.

**Values** 1 to 4

**disable**

Explicitly disables the video group within the policy.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 26.34 video-interface

### video-interface

**Syntax**

**video-interface** *ip-address* [**create**]

**no video-interface** *ip-address*

**Context**

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>video-policy video-interface)

**Full Context**

configure mcast-management multicast-info-policy video-policy video-interface

**Description**

This command creates a video interface policy context that correlates to the IP address assigned for a video interface. This interface is created in a subscriber service to which the multicast information policy is assigned. If the specified IP address does not correlate to a video interface ip address, the parameters defined within this context have no effect.

The **no** form of the command deletes the video interface policy context.

## Parameters

### *ip-address*

The IP address of a video interface provisioned within the context of a service to which the Multicast Information Policy is assigned. If the IP address does not match the IP address assigned to a video interface, the parameters defined within this context have no effect.

### **create**

Mandatory keyword needed when creating a new video interface within the video policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## video-interface

## Syntax

**video-interface** *ip-int-name* [**create**]

**no video-interface** *ip-int-name*

## Context

[\[Tree\]](#) (config>service>ies video-interface)

[\[Tree\]](#) (config>service>vprn video-interface)

## Full Context

configure service ies video-interface

configure service vprn video-interface

## Description

This command creates a video interface within the service. The video interface and associated IP addresses are the addresses to which clients within the service will send requests. The video interface must be associated with an ISA group using the video-sap command and have IP addresses for it to be functional.

The **no** form of the command deletes the video interface. The video interface must be administratively shut down before issuing the **no video-interface** command.

## Parameters

### *ip-int-name*

Specifies the name of the video interface, up to 32 characters. An interface name cannot be in the form of an IP address. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### **create**

This keyword is mandatory when creating a video interface.

## Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## Full Context

admin view

## Description

The context to configure administrative system viewing parameters. Only authorized users can execute the commands in the **admin** context.

## Parameters

### **bootup-cfg**

Specifies the bootup configuration.

### **active-cfg**

Specifies current running configuration.

### **candidate-cfg**

Specifies candidate configuration.

### **latest-rb**

Specifies the latest configuration.

### **checkpoint-id**

Specifies a specific checkpoint file configuration.

**Values** 1 to 9

### **rescue**

Specifies a rescue checkpoint configuration.

## Platforms

## view

## Syntax

**view** *view-name* **subtree** *oid-value*

**no view** *view-name* [**subtree** *oid-value*]

## Context

[\[Tree\]](#) (config>system>security>snmp view)

## Full Context

configure system security snmp view

## Description

This command configures a view. Views control the accessibility of a MIB object within the configured MIB view and subtree. Object identifiers (OIDs) uniquely identify MIB objects in the subtree. OIDs are organized hierarchically with specific values assigned by different organizations.

Once the subtree (OID) is identified, a mask can be created to select the portions of the subtree to be included or excluded for access using this particular view. See the **mask** command.

The view(s) configured with this command can subsequently be used in read, write, and notify commands which are used to assign specific access group permissions to created views and assigned to particular access groups.

Multiple subtrees can be added or removed from a view name to tailor a view to the requirements of the user access group.

A subtree statement matches (covers) any OID that is a descendant of the specified OID value. For example, the subtree 1.3.6.1 matches 1.3.6.1.x (for any value of x), 1.3.6.1.x.y (for any values of x & y), and so on.

Subtrees that are not covered by **view** statements are not accessible in the view.

Per RFC 2575, *View-based Access Control Model (VACM) for the Simple Network Management Protocol (SNMP)*, each MIB view is defined by two sets of view subtrees, the included view subtrees, and the excluded view subtrees (see the **included** and **excluded** parameters of the **mask** command). Every such view subtree, both the included and the excluded ones, are defined in this table. To determine if a particular object instance is in a particular MIB view, compare the object instance's OID with each of the MIB view's active entries in this table. If none match, then the object instance is not in the MIB view. If one or more match, then the object instance is included in, or excluded from, the MIB view according to the value of `vacmViewTreeFamilyType` in the entry whose value of `vacmViewTreeFamilySubtree` has the most sub-identifiers.

The **no view *view-name*** command removes a view and all subtrees.

The **no view *view-name* subtree *oid-value*** removes a sub-tree from the view name.

## Parameters

### ***view-name***

Specifies a view name, up to 32 characters.

### ***oid-value***

Specifies the object identifier (OID) value for the *view-name*. This value, for example, 1.3.6.1.6.3.11.2.1, combined with the mask and include and exclude statements, configures the access available in the view.

It is possible to have a view with different subtrees with their own masks and include and exclude statements. This allows for customizing visibility and write capabilities to specific user requirements.

configure service vprn ospf area virtual-link

## Description

This command configures a virtual link to connect area border routers to the backbone via a virtual link.

The *router-id* specified in this command must be associated with the virtual neighbor. The transit area cannot be a stub area or a Not So Stubby Area (NSSA).

The **no** form of this command deletes the virtual link.

## Default

No virtual link is defined.

## Parameters

### *router-id*

The router ID of the virtual neighbor in IP address dotted decimal notation.

### **transit-area** *area-id*

The *area-id* specified identifies the transit area that links the backbone area with the area that has no physical connection with the backbone.

## Platforms

All

## virtual-link

## Syntax

```
[no] virtual-link router-id transit-area area-id
```

## Context

```
[Tree] (config>router>ospf3>area virtual-link)
```

```
[Tree] (config>router>ospf>area virtual-link)
```

## Full Context

```
configure router ospf3 area virtual-link
```

```
configure router ospf area virtual-link
```

## Description

This command configures a virtual link to connect area border routers to the backbone via a virtual link.

The *router-id* specified in this command must be associated with the virtual neighbor. The transit area cannot be a stub area or a Not So Stubby Area (NSSA).

The **no** form of this command deletes the virtual link.

By default, no virtual link is defined.

## Default

no virtual-link

**Parameters*****router-id***

Specifies the router ID of the virtual neighbor in IP address dotted-decimal notation.

***area-id***

Specifies the area-id that identifies the transit area that links the backbone area with the area that has no physical connection with the backbone.

**Platforms**

All

## 26.41 virtual-neighbor

### virtual-neighbor

**Syntax**

**virtual-neighbor** [*router-id*]

**no virtual-neighbor**

**Context**

[\[Tree\]](#) (debug>router>ospf3 virtual-neighbor)

[\[Tree\]](#) (debug>router>ospf virtual-neighbor)

**Full Context**

debug router ospf3 virtual-neighbor

debug router ospf virtual-neighbor

**Description**

This command enables debugging for an OSPF virtual neighbor.

**Parameters*****router-id***

Specifies the router ID of the virtual neighbor.

**Platforms**

All

## 26.42 virtual-scheduler-adjustment

## virtual-scheduler-adjustment

### Syntax

**virtual-scheduler-adjustment**

### Context

[\[Tree\]](#) (config>card virtual-scheduler-adjustment)

### Full Context

configure card virtual-scheduler-adjustment

### Description

Commands in this context configure the virtual scheduler processing on the card. This is only applicable to queues and to policers parented to a scheduler.

### Platforms

All

## 26.43 virtual-subnet

## virtual-subnet

### Syntax

**[no] virtual-subnet**

### Context

[\[Tree\]](#) (config>service>vprn>sub-if>dhcp virtual-subnet)

[\[Tree\]](#) (config>service>ies>sub-if>dhcp virtual-subnet)

### Full Context

configure service vprn subscriber-interface dhcp virtual-subnet

configure service ies subscriber-interface dhcp virtual-subnet

### Description

This command enables a virtual-subnet for DHCPv4 hosts under the subscriber interface. With this command configured, the system will snoop and record the default router address in the DHCP ACK message for the DHCPv4 ESM host. The system could answer ping or traceroute request even if the default router address is not configured on the subscriber-interface.

The **no** form of this command reverts to the default.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 26.44 vlan

vlan

### Syntax

vlan [*vlan-encap*]

### Context

[\[Tree\]](#) (config>redundancy>mc>peer>mcr>l3ring>node>cv vlan)

### Full Context

configure redundancy multi-chassis peer mc-ring l3-ring ring-node connectivity-verify vlan

### Description

This command specifies the VLAN tag of the SAP used for ring-node connectivity verification of this ring node. It is only meaningful if the value of is not zero.

The **no** form of this command reverts to the default.

### Parameters

*vlan-encap*

Specifies the node cc VLAN IP.

### Platforms

All

vlan

### Syntax

vlan *tag*

no vlan

### Context

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>ue-query vlan)

### Full Context

configure subscriber-mgmt wlan-gw ue-query vlan

## Description

This command enables matching on UEs, based on the VLAN tag within the tunnel, which typically used to indicate an SSID.

The **no** form of this command disables matching on the VLAN.

## Default

no vlan

## Parameters

### **tag**

Specifies the VLAN tag.

**Values** 0 to 4096

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## vlan

## Syntax

**vlan start** [*value*] **end** [*value*] **retail-svc-id** *service-id*

**no vlan start** [*value*] **end** [*value*]

## Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>wlan-gw>retailer vlan)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>wlan-gw>retailer vlan)

## Full Context

configure service vprn subscriber-interface group-interface wlan-gw retailer vlan

configure service ies subscriber-interface group-interface wlan-gw retailer vlan

## Description

This command creates a mapping from a range of VLANs (appearing in the wlan-gw encapsulated Layer 2 frame) to a retail service ID.

The **no** form of this command removes the parameters from the configuration.

## Parameters

### **start**

Specifies the start VLAN tag of this range.

**Values** 0 to 4095

### **end**

Specifies the end VLAN tag of this range.

**Values** 0 to 4095

#### **retail-svc-id *service-id***

Specifies the identifier of the retail service to be used by default of a value in the retail service map of this interface.

**Values** 1 to 2147483650  
svc-name: up to 64 characters

## vlan

### Syntax

**vlan** *vlan-encap*

**no vlan**

### Context

[\[Tree\]](#) (config>redundancy>mc>peer>mcr>node>cv vlan)

### Full Context

configure redundancy multi-chassis peer mc-ring ring ring-node connectivity-verify vlan

### Description

This command specifies the VLAN tag used for the Ring-node Connectivity Verification of this ring node. It is only meaningful if the value of service ID is not zero. A zero value means that no VLAN tag is configured.

### Default

no vlan

### Parameters

#### ***vlan-encap***

Specifies the VLAN tag.

<b>Values</b>	vlan-encap:		
	dot1q		qtag, *
	qinq		qtag1.qtag2, qtag1.*, 0.*
	qtag		0 to 4094
	qtag1		1 to 4094
	qtag2		0 to 4094

## Platforms

All

## vlan

## Syntax

**vlan** *vlan-id*

**no vlan**

## Context

[\[Tree\]](#) (cfg>eth-cfm>domain>assoc>bridge vlan)

## Full Context

configure eth-cfm domain association bridge-identifier vlan

## Description

This command configures the bridge identifier primary VLAN ID. This is informational only, and no verification is done to ensure MEPs on this association are on the configured VLAN.

The **no** form of this command reverts to the default value.

## Default

no vlan

## Parameters

***vlan-id***

Specifies a VLAN ID monitored by MA.

**Values** 1 to 4094

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 26.45 vlan-id

## vlan-id

## Syntax

**vlan-id** *service-port-vlan-id*

**no vlan-id**

## Context

[\[Tree\]](#) (config>app-assure>group>evt-log>syslog vlan-id)

## Full Context

configure application-assurance group event-log syslog vlan-id

## Description

This command configures the service port VLAN ID to be used by application assurance to inject the syslog events inband. This VLAN ID needs also to be configured for application assurance interface.

## Default

no vlan-id

## Parameters

### *service-port-vlan-id*

Specifies the service port VLAN identifier.

**Values** 1 to 4094

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

vlan-id

## Syntax

vlan-id *service-port-vlan-id*

no vlan-id

## Context

[\[Tree\]](#) (config>app-assure>group>http-redirect>captive-redirect vlan-id)

## Full Context

configure application-assurance group http-redirect captive-redirect vlan-id

## Description

This command configures the VLAN ID for captive redirect. Captive redirect uses the provisioned VLAN ID to send the HTTP response to subscribers; therefore this VLAN ID must be properly assigned in the same VPN as the subscriber.

## Parameters

### *service-port-vlan-id*

Specifies the VLAN ID.

**Values** 1 to 4094

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

vlan-id

### Syntax

**vlan-id** *service-port-vlan-id*

**no vlan-id**

### Context

[\[Tree\]](#) (config>app-assure>group>url-filter>icap vlan-id)

### Full Context

configure application-assurance group url-filter icap vlan-id

### Description

This command configures the VLAN ID on which the ISA-AA is expected to be emitting traffic mapping to a pre-configured aa-interface.

### Default

no vlan-id

### Parameters

***service-port-vlan-id***

Specifies the VLAN ID.

**Values** 1 to 4094

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

vlan-id

### Syntax

**vlan-id** *vlan-id*

**no vlan-id**

### Context

[\[Tree\]](#) (config>app-assure>group>url-filter>web-service vlan-id)

## Full Context

configure application-assurance group url-filter web-service vlan-id

## Description

This command configures the VLAN ID on which the AA ISA emits the traffic mapping to a preconfigured AA interface.

The **no** form of this command removes the VLAN ID configuration.

## Default

no vlan-id

## Parameters

### *vlan-id*

Specifies the VLAN ID to connect to the web service.

**Values** 1 to 4094

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## vlan-id

## Syntax

**vlan-id** *vlan-id*

**no vlan-id**

## Context

**[Tree]** (config>test-oam>build-packet>header>dot1q vlan-id)

**[Tree]** (debug>oam>build-packet>packet>field-override>header>dot1q vlan-id)

## Full Context

configure test-oam build-packet header dot1q vlan-id

debug oam build-packet packet field-override header dot1q vlan-id

## Description

This command defines the Dot1Q VLAN ID to be used in the test Dot1Q header.

The **no** form of this command removes the VLAN ID value.

## Parameters

### *vlan-id*

Specifies the Dot1Q VLAN ID to be used in the test Dot1Q header.

**Values** 0 to 4095

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

vlan-id

### Syntax

**vlan-id** *service-port-vlan-id*

**no vlan-id**

### Context

[\[Tree\]](#) (config>app-assure>group>cflowd>dir-exp vlan-id)

### Full Context

configure application-assurance group cflowd direct-export vlan-id

### Description

This command configures the VLAN ID on which the ISA-AA is expected to be emitting traffic.

The **no** form of this command removes the VLAN ID from the configuration.

### Default

no vlan-id

### Parameters

***service-port-vlan-id***

Specifies the VLAN ID of the service port.

**Values** 1 to 4094

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 26.46 vlan-mismatch-timeout

vlan-mismatch-timeout

### Syntax

**vlan-mismatch-timeout** *seconds*

## no vlan-mismatch-timeout

### Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>authentication vlan-mismatch-timeout)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>authentication vlan-mismatch-timeout)

### Full Context

```
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range authentication
vlan-mismatch-timeout
```

```
configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range authentication
vlan-mismatch-timeout
```

### Description

This command configures the timeout value for the RADIUS proxy cache if a packet is received with a non-matching VLAN tag. The new timeout value is the lesser of the **vlan-mismatch-timeout** value and the currently remaining proxy cache timeout value.

The **no** form of this command disables the timeout behavior. The cache timeout value will remain unchanged.

### Parameters

#### *seconds*

Specifies the timeout value for the RADIUS proxy cache, in seconds.

**Values** 5 to 60

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 26.47 vlan-range

### vlan-range

### Syntax

```
[no] vlan-range [vlan-range]
```

### Context

[\[Tree\]](#) (config>service>vpls>stp>mst-instance vlan-range)

### Full Context

```
configure service vpls stp mst-instance vlan-range
```

## Description

This command specifies a range of VLANs associated with a certain mst-instance. This range applies to all SAPs of the M-VPLS.

Every VLAN range that is not assigned within any of the created **config>service>vpls>stp mst-instance** is automatically assigned to mst-instance 0. This instance is automatically maintained by the software and cannot be modified. Changing the VLAN range value can be performed only when the specified mst-instance is shutdown.

The **no** form of this command removes the **vlan-range** from the specified **config>service>vpls>stp mst-instance**.

## Parameters

### *vlan-range*

The first VLAN range specifies the left-bound (i.e., minimum value) of a range of VLANs that are associated with the M-VPLS SAP. This value must be smaller than (or equal to) the second VLAN range value. The second VLAN range specifies the right-bound (i.e., maximum value) of a range of VLANs that are associated with the M-VPLS SAP.

**Values** 1 to 4094 to 1 to 4094

## Platforms

All

## vlan-range

## Syntax

**vlan-range** *from* [**to** *to*]

**no vlan-range** *from*

## Context

[\[Tree\]](#) (config>connection-profile-vlan vlan-range)

## Full Context

configure connection-profile-vlan vlan-range

## Description

This command allows the user to configure different ranges in the connection-profile-vlan. The ranges have the following characteristics:

- Ranges can contain a single VID or start-and-end values. When the *to-vid* is not specified, the end vid value is the same as the start vid value.
- On the fly addition/removal of ranges is allowed.
- When removing an entry, the **no vlan-range vid to vid** must be configured by the user.
- Multiple ranges are allowed under the same connection-profile-vlan. No VLAN values should overlap within the same connection-profile-vlan.

- The index for connection-profile and connection-profile-vlan must be unique between the two. For example, if **connection-profile 100** is present, then **connection-profile-vlan 100** is disallowed.

Each connection-profile-vlan must be explicitly configured.

## Parameters

### *from*

Specifies the beginning of the **vlan-range** associated to the **connection-profile-vlan**.

**Values** 1 to 4094

### *to*

Specifies the end of the **vlan-range** associated to the **connection-profile-vlan**. If not specified, the **vlan-range** is comprised of only the *from* VLAN ID.

**Values** 1 to 4094

## Platforms

All

## 26.48 vlan-tag-ranges

### vlan-tag-ranges

## Syntax

**vlan-tag-ranges**

## Context

**[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw vlan-tag-ranges)

**[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw vlan-tag-ranges)

## Full Context

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges

## Description

Commands in this context configure VLAN-to-retail-map parameters to map dot1q tags to the retail service ID. The WIFI AP inserts a dot1Q tag in the Layer 2 frame within the GRE tunnel to indicate the retail service provider for the subscriber.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 26.49 vlan-translation

### vlan-translation

#### Syntax

**vlan-translation** {*vlan-id* | **copy-outer**}

**no vlan-translation**

#### Context

**[Tree]** (config>service>vpls>sap>ingress vlan-translation)

**[Tree]** (config>service>epipe>sap>ingress vlan-translation)

#### Full Context

configure service vpls sap ingress vlan-translation

configure service epipe sap ingress vlan-translation

#### Description

This command configures ingress VLAN translation. If enabled with an explicit VLAN value, the preserved VLAN ID is overwritten with this value. This setting is applicable to dot1q encapsulated ports. If enabled with the **copy-outer** keyword, the outer VLAN ID is copied to inner position on QinQ encapsulated ports. The feature is not supported on:

- Dot1q saps
- QinQ saps with qinq-vlan-translation
- Connection profile VLAN SAPs if the **copy-outer** option is configured

The **no** version of the command disables VLAN translation.

#### Default

no vlan-translation

#### Parameters

##### **vlan-id**

Specifies the VLAN id.

**Values** 0 to 4094

##### **copy-outer**

Specifies to use the outer VLAN id.

#### Platforms

All

## 26.50 vlan-vc-etype

### vlan-vc-etype

#### Syntax

**vlan-vc-etype** *ethernet-type*  
**no vlan-vc-etype** [*ethernet-type*]

#### Context

[\[Tree\]](#) (config>service>sdp vlan-vc-etype)

#### Full Context

configure service sdp vlan-vc-etype

#### Description

This command configures the VLAN VC EtherType.  
The **no** form of this command returns the value to the default.

#### Default

no vlan-vc-etype

#### Parameters

***ethernet-type***

Specifies a valid VLAN etype identifier.

**Values** 0x0600 to 0xffff

#### Platforms

All

## 26.51 vlan-vc-tag

### vlan-vc-tag

#### Syntax

**vlan-vc-tag** *vlan-id*  
**no vlan-vc-tag** [*vlan-id*]

## Context

[\[Tree\]](#) (config>service>vpls>mesh-sdp vlan-vc-tag)

[\[Tree\]](#) (config>service>vpls>spoke-sdp vlan-vc-tag)

## Full Context

configure service vpls mesh-sdp vlan-vc-tag

configure service vpls spoke-sdp vlan-vc-tag

## Description

This command specifies an explicit dot1q value used when encapsulating to the SDP far end. When signaling is enabled between the near and far end, the configured dot1q tag can be overridden by a received TLV specifying the dot1q value expected by the far end. This signaled value must be stored as the remote signaled dot1q value for the binding. The provisioned local dot1q tag must be stored as the administrative dot1q value for the binding.

When the dot1q tag is not defined, the default value of zero is stored as the administrative dot1q value. Setting the value to zero is equivalent to not specifying the value.

The **no** form of this command disables the command.

## Default

no vlan-vc-tag

## Parameters

### *vlan-id*

Specifies a valid VLAN identifier to bind an 802.1Q VLAN tag ID.

**Values** 0 to 4094

## Platforms

All

## vlan-vc-tag

## Syntax

**vlan-vc-tag** *vlan-id*

**no vlan-vc-tag**

## Context

[\[Tree\]](#) (config>service>sdp>binding>pw-port vlan-vc-tag)

## Full Context

configure service sdp binding pw-port vlan-vc-tag

## Description

This command sets tag relevant for vc-type vlan mode. This tag is inserted in traffic forwarded into the pseudowire.

The **no** form of the command reverts to the default value.

## Default

no vlan-vc-tag

## Parameters

### *vlan-id*

Specifies the VLAN ID value.

**Values** 0 to 4094

## Platforms

All

## vlan-vc-tag

## Syntax

**vlan-vc-tag** *tag*

**no vlan-vc-tag** *tag*

## Context

[\[Tree\]](#) (config>service>epipe>spoke-sdp vlan-vc-tag)

## Full Context

configure service epipe spoke-sdp vlan-vc-tag

## Description

This command specifies an explicit dot1q value used when encapsulating to the SDP far end. When signaling is enabled between the near and far end, the configured dot1q tag can be overridden by a received TLV specifying the dot1q value expected by the far end. This signaled value must be stored as the remote signaled dot1q value for the binding. The provisioned local dot1q tag must be stored as the administrative dot1q value for the binding.

When the dot1q tag is not defined, the default value of zero is stored as the administrative dot1q value. Setting the value to zero is equivalent to not specifying the value.

The **no** form of this command disables the command.

## Default

no vlan-vc-tag

## Parameters

### *tag*

Specifies a valid VLAN identifier to bind an 802.1Q VLAN tag ID.

**Values** 0 to 4094

## Platforms

All

## vlan-vc-tag

## Syntax

**vlan-vc-tag** *vlan-id*

**no vlan-vc-tag**

## Context

[\[Tree\]](#) (config>service>pw-template vlan-vc-tag)

## Full Context

configure service pw-template vlan-vc-tag

## Description

This command specifies an explicit dot1q value used when encapsulating to the SDP far end. When signaling is enabled between the near and far end, the configured dot1q tag can be overridden by a received TLV specifying the dot1q value expected by the far end. This signaled value must be stored as the remote signaled dot1q value for the binding. The provisioned local dot1q tag must be stored as the administrative dot1q value for the binding.

When the dot1q tag is not defined, the default value of zero is stored as the administrative dot1q value. Setting the value to zero is equivalent to not specifying the value.

The **no** form of this command disables the command.

## Default

no vlan-vc-tag

## Parameters

### *vlan-id*

Specifies a valid VLAN identifier to bind an 802.1Q VLAN tag ID.

**Values** 0 to 4094

## Platforms

## 26.52 vm

```
vm
```

### Syntax

```
vm vm-id [create]
```

```
no vm vm-id
```

### Context

```
[Tree] (config>esa vm)
```

### Full Context

```
configure esa vm
```

### Description

This command configures or creates an ESA-VM instance.

The **no** form of this command removes the ESA-VM from the system.

### Parameters

***vm-id***

Specifies the VM identifier.

**Values** 1 to 4

**create**

Mandatory keyword used when creating an ESA-VM in the config context

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

## 26.53 vm-traffic-distribution-by-ip

```
vm-traffic-distribution-by-ip
```

### Syntax

```
[no] vm-traffic-distribution-by-ip
```

### Context

```
[Tree] (config>isa>aa-grp vm-traffic-distribution-by-ip)
```

## Full Context

```
configure isa application-assurance-group vm-traffic-distribution-by-ip
```

## Description

This command enables the distribution of packets by IP address across virtual CPUs of a data plane VM. This allows support for AA subscribers whose bandwidth exceeds the processing throughput of a single vCPU.

The **no** form of this command enables traffic distribution by AA subscriber.

## Default

```
no vm-traffic-distribution-by-ip
```

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 26.54 vm-traffic-distribution-by-teid

### vm-traffic-distribution-by-teid

## Syntax

```
[no] vm-traffic-distribution-by-teid
```

## Context

[\[Tree\]](#) (config>isa>aa-grp vm-traffic-distribution-by-teid)

## Full Context

```
configure isa application-assurance-group vm-traffic-distribution-by-teid
```

## Description

This command configures AA in VSR mode to load-balance traffic across different VM cores using TEID. Load-balancing is required when VSR is deployed on 3GPP S5/S8 (Gn/Gp) interfaces to provide GTP firewalling.

The **no** form of this command disables load-balancing of the traffic across the VM cores.

## Default

```
no vm-traffic-distribution-by-teid
```

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 26.55 vm-type

### vm-type

#### Syntax

**vm-type** *vm-type*

**no vm-type**

#### Context

[\[Tree\]](#) (config>esa>vm vm-type)

#### Full Context

configure esa vm vm-type

#### Description

This command configures the type of ESA-VM instance.

The **no** form of this command removes the specified VM type.

#### Parameters

**vm-type**

Specifies the VM type.

**Values**

- aa** — Specifies Application Assurance feature support.
- bb** — Specifies broadband feature support, such as NAT.
- tunnel** — Specifies tunnel feature support, such as IPsec tunnels.
- video** — Specifies video feature support, such as FCC and RET (for 7750 SR and 7750 SR-12e only).

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

## 26.56 vmep-filter

### vmep-filter

#### Syntax

**[no] vmep-filter**

## Context

**[Tree]** (config>service>vpls>spoke-sdp>eth-cfm vmep-filter)

**[Tree]** (config>service>vpls>mesh-sdp>eth-cfm vmep-filter)

**[Tree]** (config>service>vpls>sap>eth-cfm vmep-filter)

## Full Context

configure service vpls spoke-sdp eth-cfm vmep-filter

configure service vpls mesh-sdp eth-cfm vmep-filter

configure service vpls sap eth-cfm vmep-filter

## Description

Suppress eth-cfm PDUs based on level lower than or equal to configured Virtual MEP. This command is not supported under a B-VPLS context. This will also delete any MIP configured on the SAP or Spoke-SDP.

The **no** form of this command reverts to the default values.

## Default

no vmep-filter

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 26.57 voice-template

### voice-template

## Syntax

**voice template**

## Context

**[Tree]** (config>app-assure>group>cflowd>rtp-perf voice-template)

## Full Context

configure application-assurance group cflowd rtp-performance voice-template

## Description

Commands in this context configure the voice template for cflowd fields.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 26.58 volume

### volume

#### Syntax

**volume** *credits* {**bytes** | **kilobytes** | **megabytes** | **gigabytes**}

**no volume**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>gy>efh>interim-c volume)

#### Full Context

configure subscriber-mgmt diameter-application-policy gy extended-failure-handling interim-credit volume

#### Description

This command configures the default volume interim credit that is allocated to all rating groups of a Diameter Gy session when Extended Failure Handling (EFH) is active and for which no default credit is configured at the category map category level.

The **no** form of this command resets the value to the default value.

#### Default

volume 500 megabytes

#### Parameters

##### *credits*

Specifies the amount of volume credit that is allocated by default to all rating groups of a Diameter Gy session when EFH is active.

**Values** 1 to 4294967295

##### **bytes** | **kilobytes** | **megabytes** | **gigabytes**

Specifies whether credits are in bytes, kilobytes, megabytes, or gigabytes.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### volume

#### Syntax

**volume**

**Context**

**[Tree]** (config>app-assure>group>cflowd volume)

**Full Context**

configure application-assurance group cflowd volume

**Description**

This command configures the cflowd volume export.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 26.59 volume-quota-direction

### volume-quota-direction

**Syntax**

**volume-quota-direction {both | ingress | egress}**

**no volume-quota-direction**

**Context**

**[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>dsm volume-quota-direction)

**[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>dsm volume-quota-direction)

**Full Context**

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt volume-quota-direction

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt volume-quota-direction

**Description**

This command specifies whether volume quota is applied in the egress (downstream), ingress (upstream), or both directions. Configuration changes apply only to new DSM UEs and not to existing UEs.

**Parameters****both**

Enforces the volume quota on the packets ingressing and egressing the WLAN-GW combined.

**ingress**

Enforces the volume quota on packets ingressing the WLAN-GW from the UE (upstream).

**egress**

Enforces the volume quota on packets egressing the WLAN-GW to the UE (downstream).

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 26.60 volume-stats-type

### volume-stats-type

#### Syntax

**volume-stats-type** {ip | default}

**no volume-stats-type**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>sub-prof volume-stats-type)

#### Full Context

configure subscriber-mgmt sub-profile volume-stats-type

#### Description

This command enables the reporting of Layer 3 (IP) based subscriber host volume accounting data.

By default, subscriber host volume accounting data includes Layer 2 header octets and can be configured to include a fixed packet byte offset or last-mile encapsulation overhead.

The **no** form of this command reverts to the default.

#### Default

volume-stats-type default

#### Parameters

##### default

Specifies that the subscriber host volume accounting data is reported including the Layer 2 header octets and optional delta's introduced by configuration (for example: packet byte offset, last mile aware shaping, and so on).

##### ip

Specifies that the subscriber host volume accounting data reporting is based on Layer 3 (IP) packet sizes. This includes subscriber host ingress/egress queue and policer stats in snmp, CLI show commands, RADIUS and XML accounting, and Diameter Gx usage monitoring. RADIUS and Diameter (DCCA) based credit control volume quota are interpreted as Layer 3 (IP).

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 26.61 vpls

### vpls

#### Syntax

```
vpls service-id [customer customer-id] [create] [vpn vpn-id] [m-vpls] [b-vpls | i-vpls] [etree] [name name]
```

```
no vpls service-id
```

#### Context

**[Tree]** (config>service vpls)

#### Full Context

```
configure service vpls
```

#### Description

This command creates or edits a Virtual Private LAN Services (VPLS) instance. The **vpls** command is used to create or maintain a VPLS service. If the *service-id* does not exist, a context for the service is created. If the *service-id* exists, the context for editing the service is entered.

A VPLS service connects multiple customer sites together acting like a zero-hop, Layer 2 switched domain. A VPLS is always a logical full mesh.

When a service is created, the **create** keyword must be specified if the **create** command is enabled in the **environment** context. When creating a service, you must enter the **customer** keyword and specify a *customer-id* to associate the service with a customer. The *customer-id* must already exist, having been created using the **customer** command in the **service** context. The *customer-id* must already exist having been created using the **customer** command in the service context. Once a service has been created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association.

To create a management VPLS on the 7450 ESS, the **m-vpls** keyword must be specified. See section **Hierarchical VPLS Redundancy** for an introduction to the concept of management VPLS.

Once a service is created, the use of the **customer** *customer-id* is optional for navigating into the service configuration context. Attempting to edit a service with the incorrect *customer-id* specified will result in an error.

More than one VPLS service may be created for a single customer ID.

By default, no VPLS instances exist until they are explicitly created.

The **no** form of this command deletes the VPLS service instance with the specified *service-id*. The service cannot be deleted until all SAPs and SDPs defined within the service ID have been shut down and deleted, and the service has been shut down.

## Parameters

### *service-id*

Specifies unique service identification number identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every router on which this service is defined.

**Values** *service-id*: 1 to 2147483647  
*svc-name*: 64 characters maximum

### **customer** *customer-id*

Specifies the customer ID number to be associated with the service. This parameter is required on service creation and optional for service editing or deleting.

**Values** 1 to 2147483647

### *vpn* *vpn-id*

Specifies the VPN ID number which allows you to identify virtual private networks (VPNs) by a VPN identification number

**Values** 1 to 2147483647

**Default** null (0)

### **create**

Keyword used to create the service ID. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

### **m-vpls**

Specifies a management VPLS

### **e-tree**

Specifies a VPLS service as an E-Tree VPLS. E-Tree VPLS services have root and leaf attachment circuit (AC) and root leaf tag SAPs/SDP bindings for E-Tree interconnection. The access root AC SAP behaves as a SAP in non-E-tree VPLS services. The leaf AC SAP communicates only with root-connected services. Leaf and root AC SAPs behave externally the same as SAPs in non-E-Tree VPLS services.

The root AC SDP bind behaves as an SDP bind in non-E-tree VPLS services. The leaf AC SDP bind communicates only with root-connected services.

In the E-Tree VPLS, the root AC SAP/SDP bindings can communicate with other root and leaf AC SAP/SDP bind services locally and remotely. Root-originated traffic is marked internally with a root indication and the root is tagged externally on tag SAP/SDP binds. The leaf AC SAP/SDP bindings can communicate with other root SAP/SDP bindings locally and remotely. Leaf-originated traffic is marked internally with a leaf indication and tagged externally on leaf tag SAP/SDP bindings.

Any number of root or leaf AC SAPs can be used, up to the configured SAP limits in the E-Tree VPLS.

Network-side root leaf tag SAPs use additional SAP resources. These tag SAPs used two tags; one for root and one for leaf. Network-side tag SDPs use a hard coded tag of 1 for

root and 2 for leaf. AC SDP bindings are designated as root or leaf SDP bindings but carry no tags marking traffic on the egress frames.

The E-Tree SAP type must be specified when the SAP is created. To change the SAP type, the SAP must be removed and recreated.

### **b-vpls | i-vpls**

Creates a backbone-vpls or ISID-vpls

#### ***name name***

Configures an optional service name identifier, up to 64 characters, to a given service. This service name can then be used in configuration references, display, and show commands throughout the system. A defined service name can help the service provider or administrator to identify and manage services within the SR OS platforms.

To create a service, you must assign a service ID; however, after it is created, either the service ID or the service name can be used to identify and reference a service.

If a name is not specified at creation time, then SR OS assigns a string version of the *service-id* as the name.

## **Platforms**

All

## **vpls**

## **Syntax**

**vpls** *service-name*

**no vpls**

## **Context**

[\[Tree\]](#) (config>service>ies>if vpls)

## **Full Context**

configure service ies interface vpls

## **Description**

The **vpls** command, within the IP interface context, is used to bind the IP interface to the specified service name (VPLS or I-VPLS).

The system does not attempt to resolve the service name provided until the IP interface is placed into the administratively up state (**no shutdown**). Once the IP interface is administratively up, the system will scan the available VPLS services that have the **allow-ip-int-bind** flag set for a VPLS service associated with the name. If the service name is bound to the service name when the IP interface is already in the administratively up state, the system will immediately attempt to resolve the given name.

If a VPLS service is found associated with the name and with the **allow-ip-int-bind** flag set, the IP interface is attached to the VPLS service allowing routing to and from the service virtual ports once the IP interface is operational.

A VPLS service associated with the specified name that does not have the **allow-ip-int-bind** flag set or a non-VPLS service associated with the name is ignored and will not be attached to the IP interface.

If the service name is applied to a VPLS service after the service name is bound to an IP interface and the VPLS service **allow-ip-int-bind** flag is set at the time the name is applied, the VPLS service is automatically resolved to the IP interface if the interface is administratively up or when the interface is placed in the administratively up state.

If the service name is applied to a VPLS service without the **allow-ip-int-bind** flag set, the system will not attempt to resolve the applied service name to an existing IP interface bound to the name. To rectify this condition, the flag must first be set and then the IP interface must enter or reenter the administratively up state.

While the specified service name may be assigned to only one service context in the system, it is possible to bind the same service name to more than one IP interface. If two or more IP interfaces are bound to the same service name, the first IP interface to enter the administratively up state (if currently administratively down) or to reenter the administratively up state (if currently administratively up) when a VPLS service is configured with the name and has the **allow-ip-int-bind** flag set is attached to the VPLS service. Only one IP interface is allowed to attach to a VPLS service context. No error is generated for the remaining non-attached IP interfaces using the service name.

Once an IP interface is attached to a VPLS service, the name associated with the service cannot be removed or changed until the IP interface name binding is removed. Also, the **allow-ip-int-bind** flag cannot be removed until the attached IP interface is unbound from the service name.

Unbinding the service name from the IP interface causes the IP interface to detach from the VPLS service context. The IP interface may then be bound to another service name or a SAP or SDP binding may be created for the interface using the **sap** or **spoke-sdp** commands on the interface.

### IP Interface MTU and Fragmentation

A VPLS service is affected by two MTU values; port MTUs and the VPLS service MTU. The MTU on each physical port defines the largest Layer 2 packet (including all DLC headers and CRC) that may be transmitted out a port. The VPLS itself has a service level MTU that defines the largest packet supported by the service. This MTU does not include the local encapsulation overhead for each port (QinQ, Dot1Q, TopQ or SDP service delineation fields and headers) but does include the remainder of the packet. As virtual ports are created in the system, the virtual port cannot become operational unless the configured port MTU minus the virtual port service delineation overhead is greater than or equal to the configured VPLS service MTU. Thus, an operational virtual port is ensured to support the largest packet traversing the VPLS service. The service delineation overhead on each Layer 2 packet is removed before forwarding into a VPLS service. VPLS services do not support fragmentation and must discard any Layer 2 packet larger than the service MTU after the service delineation overhead is removed.

IP interfaces have a configurable up MTU that defines the largest packet that may egress the IP interface without being fragmented. This MTU encompasses the IP portion of the packet and does not include any of the egress DLC header or CRC. This MTU does not affect the size of the largest ingress packet on the IP interface. If the egress IP portion of the packet is larger than the IP interface MTU and the IP header do not fragment flag is not set, the packet is fragmented into smaller packets that will not exceed the configured MTU size. If the do not fragment bit is set, the packet is silently discarded at egress when it exceeds the IP MTU.

When the IP interface is bound to a VPLS service, the IP MTU must be at least 18 bytes less than the VPLS service MTU. This allows for the addition of the minimal Ethernet encapsulation overhead; 6 bytes for the DA, 6 bytes for the SA, 2 bytes for the Etype and 4 bytes for the trailing CRC. Any remaining egress virtual port overhead (Dot1P, Dot1Q, QinQ, TopQ or SDP) required above the minimum is known to be less than the egress ports MTU since the virtual port would not be operational otherwise.

If the IP interface IP MTU value is too large based on the VPLS service MTU, the IP interface will enter the operationally down state until either the IP MTU is adequately lowered or the VPLS service MTU is sufficiently increased.

The **no** form of this command on the IP interface is used to remove the service name binding from the IP interface. If the service name has been resolved to a VPLS service context and the IP interface has been attached to the VPLS service, the IP interface will also be detached from the VPLS service.

## Parameters

### *service-name*

The *service-name* parameter is required when using the IP interface `vpls` command and specifies the service name that the system will attempt to resolve to an **allow-ip-int-bind** enabled VPLS service associated with the name. The specified name is expressed as an ASCII string comprised of up to 32 characters. It does not need to already be associated with a service and the system does not check to ensure that multiple IP interfaces are not bound to the same name.

## Platforms

## 26.62 vpls-group

## vpls-group

### Syntax

**vpls-group** *vpls-group-id* [**create**]

**no vpls-group** *vpls-group-id*

### Context

[\[Tree\]](#) (config>service>vpls vpls-group)

### Full Context

configure service vpls vpls-group

### Description

This command defines a vpls-group index. Multiple vpls-group commands can be specified to allow the use of different VPLS and SAP templates for different ranges of service ids. A vpls-group can be deleted only in shutdown state. Multiple commands under different vpls-group ids can be issued and can be in progress at the same time.

### Default

no vpls-group

### Parameters

***vpls-group-id***

Specifies the ID associated with the VPLS group

**Values** 1 to 4094

### Platforms

All

## 26.63 vpls-id

## 26.65 vpls-sap-template

### vpls-sap-template

#### Syntax

**vpls-sap-template** *name/id* **create**

[no] **vpls-sap-template** *name/id*

#### Context

**[Tree]** (config>service>template vpls-sap-template)

#### Full Context

configure service template vpls-sap-template

#### Description

This is the command used to create a SAP template to be used in a vpls-template. Only certain existing VPLS SAP attributes can be changed in the vpls-sap-template, not in the instantiated VPLS SAP

The following SAP attributes are set in the instantiated saps (no configuration allowed):

description: "Sap <sap-id> controlled by MVRP service <svc id>" – auto generated

shutdown: no shutdown

#### Parameters

*name/id*

Specifies the name in ASCII or the template ID

**Values** 1 to 2147483647

#### Platforms

All

## 26.66 vpls-template

### vpls-template

#### Syntax

**vpls-template** *name/id* **create**

[no] **vpls-template** *name/id*

**Context**

[\[Tree\]](#) (config>service>template vpls-template)

**Full Context**

configure service template vpls-template

**Description**

This command is used to create a vpls-template to be used to auto-instantiate a range of VPLS services. Only certain existing VPLS attributes specified in the command reference section can be changed in the vpls-template, not in the instantiated VPLS. The following attributes are automatically set in the instantiated VPLSs (no template configuration necessary) and the operator cannot change these values.

vpn-id: none

description: "Service <svc id> auto-generated by control VPLS <svc-id>"

service-name: "Service <svc id>" (Auto-generated)

shutdown: no shutdown

Following existing attributes can be set by the user in the instantiated VPLSs:

[no] sap

All the other VPLS attributes are not supported.

**Parameters*****name/id***

Specifies the name in ASCII or the template ID

**Values** name: ASCII string

**Values** ID: [1 to 2147483647]

**Platforms**

All

## 26.67 vpls-template-binding

### vpls-template-binding

**Syntax**

**vpls-template-binding** *name/id*

**no vpls-template-binding**

**Context**

[\[Tree\]](#) (config>service>vpls>vpls-group vpls-template-binding)

## Full Context

```
configure service vpls vpls-group vpls-template-binding
```

## Description

This command configures the binding to a VPLS template to be used to instantiate pre-provisioned data VPLS using as input variables the service IDs generated by the vid-range command.

The **no** form of this command removes the binding and deletes the related VPLS instances. The command will fail if any of the affected VPLS instances have either a provisioned SAP or an active MVRP declaration/registration or if the related vpls-group id is in no shutdown state. Any changes to the vpls-template-binding require the vpls-group to be in shutdown state.

## Default

```
no vpls-template-binding
```

## Parameters

*name/id*

Specifies the name or the ID of the VPLS template

**Values** 1 to 1024

## Platforms

All

## 26.68 vpn-apply-export

### vpn-apply-export

## 26.70 vpn-domain

### vpn-domain

#### Syntax

```
vpn-domain [type {0005 | 0105 | 0205 | 8005}] id id
no vpn-domain
```

#### Context

**[Tree]** (config>service>vprn>ospf vpn-domain)

#### Full Context

```
configure service vprn ospf vpn-domain
```

#### Description

This command specifies type of the extended community attribute exchanged using BGP to carry the OSPF VPN domain ID. This applies to VPRN instances of OSPF only. An attempt to modify the value of this object will result in an inconsistent value error when is not a VPRN instance. The parameters are mandatory and can be entered in either order. This command is not applicable in the **config>service>vprn>ospf3** context.

This command is not supported in OSPF3.

#### Default

```
no vpn-domain
```

#### Parameters

##### *id*

Specifies the OSPF VPN domain in the "xxx.xxxx.xxx" format. This is exchanged using BGP in the extended community attribute associated with a prefix. This object applies to VPRN instances of OSPF only.

##### *type*

Specifies the type of the extended community attribute exchanged using BGP to carry the OSPF VPN domain ID.

**Values** 0005, 0105, 0205, 8005

#### Platforms

All

## 26.71 vpn-family-policy

### vpn-family-policy

#### Syntax

**vpn-family-policy** *policy-name*

**no vpn-family-policy**

#### Context

[\[Tree\]](#) (config>router>bgp>next-hop-resolution vpn-family-policy)

#### Full Context

configure router bgp next-hop-resolution vpn-family-policy

#### Description

This command specifies the VPN family policy that is applied when filtering routes for consideration for next-hop resolution process for EVPN and IP-VPN families.

This policy is supported by the following families:

- VPN-IPv4 and VPN-IPv6
- EVPN (all routes types 1-6, although AD per-ES and AD per-EVI routes are always shown as resolved)
- MCAST-VPN-IPv4 and MCAST-VPN-IPv6

In a VPN family policy:

- only prefix-lists are used to match the next hop of a resolving route. No other policy qualifiers are supported.
- the route resolving the next hop is accepted or rejected

In other words, if an imported route's next hop is resolved by route N (N is the preferred entry in tunnel-table for MPLS or the longest prefix match in the route-table for VXLAN), and route N is rejected by vpn-family-policy, then the route next hop is unresolved. This is irrespective of the existence of a route M that could potentially resolve the next hop in the tunnel-table or route-table.

The **no** form of this command removes the VPN family policy.

#### Default

no vpn-family-policy

#### Parameters

##### *policy-name*

Specifies the route policy name. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. Route policies are configured in the **config>router>policy-options** context.

## Platforms

All

## 26.72 vpn-gre-source-ip

### vpn-gre-source-ip

#### Syntax

**vpn-gre-source-ip** *ip-address*

**no vpn-gre-source-ip**

#### Context

[\[Tree\]](#) (config>service>system vpn-gre-source-ip)

#### Full Context

configure service system vpn-gre-source-ip

#### Description

This command configures a single system-wide alternate source IPv4 address of the GRE tunnels in all VPRN services using the **auto-bind-tunnel** or an explicit SDP binding (**config>service>vprn>spoke-sdp**) with a tunnel of encapsulation GRE.

A change to the value of the **vpn-gre-source-ip** parameter can be performed without disabling the service. Once the new value is configured, the system address is not used in services which bind to the GRE tunnel.

The primary IPv4 address of any local network IP interface, loopback or otherwise, may be used.

The address of the following interfaces are not supported, and the configuration is rejected:

- unnumbered network IP interface
- IES interface
- VPRN interface
- CSC VPRN interface

The **vpn-gre-source-ip** parameter value adheres to the following rules:

- This single source address counts towards the maximum of 15 distinct address values per system that are used by all GRE SDPs under the **config>service>sdp>local-end** context and all L2oGRE SDPs under the **config>service>system>gre-eth-bridged>tunnel-termination** context.
- The same source address can be used in both **vpn-gre-source-ip** and **config>service>sdp>local-end** contexts.
- The same source address cannot be used in both **vpn-gre-source-ip** and **config>service>system>gre-eth-bridged>tunnel-termination** contexts because an address configured for a L2oGRE SDP matches an internally created interface which is not available to other applications.

- The **vpn-gre-source-ip** address, when different from system, need not match the primary address of an interface which has the MPLS-over-GRE termination subnet configured, unless a GRE SDP or tunnel from the far-end router terminates on this address.

The **no** form of the command reverts to the default value.

### Default

vpn-gre-source-ip ip-address (System interface primary IPv4 address)

### Parameters

#### *ip-address*

Specifies the IPv4 address (a.b.c.d).

### Platforms

All

## 26.73 vpn-ipv4

### vpn-ipv4

### Syntax

**vpn-ipv4 send** *send-limit* **receive** [**none**]

**vpn-ipv4 send** *send-limit*

**no vpn-ipv4**

### Context

[\[Tree\]](#) (config>router>bgp>add-paths vpn-ipv4)

[\[Tree\]](#) (config>router>bgp>group>neighbor>add-paths vpn-ipv4)

[\[Tree\]](#) (config>router>bgp>group>add-paths vpn-ipv4)

### Full Context

configure router bgp add-paths vpn-ipv4

configure router bgp group neighbor add-paths vpn-ipv4

configure router bgp group add-paths vpn-ipv4

### Description

This command configures the add-paths capability for VPN-IPv4 routes. By default, add-paths is not enabled for VPN-IPv4 routes.

The maximum number of paths per VPN-IPv4 NLRI to send is the configured **send-limit**, which is a mandatory parameter. The capability to receive multiple paths per prefix from a peer is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command the receive capability is enabled by default.

The **no** form of this command disables add-paths support for VPN-IPv4 routes, causing sessions established using add-paths for VPN-IPv4 to go down and come back up without the add-paths capability.

### Default

no vpn-ipv4

### Parameters

#### *send-limit*

Specifies the maximum number of paths per VPN-IPv4 NLRI that are allowed to be advertised to add-paths peers (the actual number of advertised routes may be less depending on the next-hop diversity requirement, other configuration options, route policies, or route advertisement rules). If the value is **multipaths**, then BGP advertises all of the used BGP multipaths for each VPN-IPv4 NLRI if the peer has signaled support for receiving multiple add paths. If the router has not installed any of the routes in its FIB then all BGP add-paths qualify for advertisement.

**Values** 1 to 16, none, multipaths

#### **receive**

Specifies that the router negotiates the add-paths receive capability for VPN-IPv4 routes with its peers.

#### **none**

Specifies that the router does not negotiate the add-paths receive capability for VPN-IPv4 routes with its peers.

### Platforms

All

## 26.74 vpn-ipv6

### vpn-ipv6

#### Syntax

**vpn-ipv6 send** *send-limit* **receive** [**none**]

**vpn-ipv6 send** *send-limit*

**no vpn-ipv6**

#### Context

**[Tree]** (config>router>bgp>group>add-paths vpn-ipv6)

**[Tree]** (config>router>bgp>group>neighbor>add-paths vpn-ipv6)

**[Tree]** (config>router>bgp>add-paths vpn-ipv6)

## Full Context

```
configure router bgp group add-paths vpn-ipv6
configure router bgp group neighbor add-paths vpn-ipv6
configure router bgp add-paths vpn-ipv6
```

## Description

This command configures the add-paths capability for VPN-IPv6 routes. By default, add-paths is not enabled for VPN-IPv6 routes.

The maximum number of paths per VPN-IPv6 NLRI to send is the configured send-limit, which is a mandatory parameter. The capability to receive multiple paths per prefix from a peer is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command the receive capability is enabled by default.

The **no** form of this command disables add-paths support for VPN-IPv6 routes, causing sessions established using add-paths for VPN-IPv6 to go down and come back up without the add-paths capability.

## Default

```
no vpn-ipv6
```

## Parameters

### *send-limit*

Specifies the maximum number of paths per VPN-IPv6 NLRI that are allowed to be advertised to add-paths peers (the actual number of advertised routes may be less depending on the next-hop diversity requirement, other configuration options, route policies, or route advertisement rules). If the value is **multipaths**, then BGP advertises all of the used BGP multipaths for each VPN-IPv6 NLRI if the peer has signaled support for receiving multiple add paths. If the router has not installed any of the routes in its FIB then all BGP add-paths qualify for advertisement.

**Values** 1 to 16, none, multipaths

### **receive**

Specifies that the router negotiates the add-paths receive capability for VPN-IPv6 routes with its peers.

### **none**

Specifies that the router does not negotiate the add-paths receive capability for VPN-IPv6 routes with its peers.

## Platforms

## 26.75 vpn-tag

## vpn-tag

### Syntax

**vpn-tag** *vpn-tag*

**no vpn-tag**

### Context

[\[Tree\]](#) (config>service>vprn>ospf vpn-tag)

### Full Context

configure service vprn ospf vpn-tag

### Description

This command specifies the route tag for an OSPF VPN on a PE router. This field is set in the tag field of the OSPF external LSAs generated by the PE. This is mainly used to prevent routing loops. This applies to VPRN instances of OSPF only. An attempt to modify the value of this object will result in an inconsistent value error when is not a VPRN instance.

This command is not supported in OSPF3.

### Default

vpn-tag 0

## 26.76 vport

## vport

### Syntax

**vport** *name* [create]

**no vport** *name*

### Context

[\[Tree\]](#) (config>port>ethernet>access>egress vport)

### Full Context

configure port ethernet access egress vport

## Description

This command configures a scheduling node, referred to as virtual port, within the context of an egress Ethernet port. The Vport scheduler operates either like a port scheduler with the difference that multiple Vport objects can be configured on the egress context of an Ethernet port, or it can be an aggregate rate when an egress port-scheduler policy is applied to the port.

The Vport is always configured at the port level even when a port is a member of a LAG.

When a port scheduler policy is applied to a Vport the following command is used:

```
config>port>ethernet>access>egress>vport>port-scheduler-policy
port-scheduler-policy-name
```

The CLI will not allow the user to apply a port scheduler policy to a Vport if one has been applied to the port. Conversely, the CLI will not allow the user to apply a port scheduler policy to the egress of an Ethernet port if one has been applied to any Vport defined on the access egress context of this port. The **agg-rate**, along with an egress port-scheduler, can be used to ensure that a given Vport does not oversubscribe the port's rate.

SAP and subscriber host queues can be port-parented to a Vport scheduler in a similar way they port-parent to a port scheduler or can be port-parented directly to the egress port-scheduler if the **agg-rate** is used.

When the Vport uses an aggregate rate, the following command is used:

```
configure>port>ethernet>access>egress>vport>agg-rate-limit
```

The **no** form of this command removes the Vport name from the configuration.

## Parameters

### *name*

Specifies the name of the Vport scheduling node and can be up to 32 ASCII characters. This does not need to be unique within the system but is unique within the port or a LAG.

## Platforms

All

## vport

## Syntax

```
vport vport-name
```

## 26.77 vport-hashing

### vport-hashing

#### Syntax

[no] vport-hashing

#### Context

[\[Tree\]](#) (config>subscr-mgmt>sub-prof vport-hashing)

#### Full Context

configure subscriber-mgmt sub-profile vport-hashing

#### Description

This command enables LAG Vport ID hashing. When enabled, Vport ID hashing can span multiple forwarding complexes on egress LAG. The default is to perform Vport ID hashing on egress and requires all active LAG members to be on the same forwarding complex.

#### Note:

LAG hashing parameters that are configured under **config>lag**, for example, **per-link-hash**, take precedence and are incompatible with the **vport-hashing** command.

The **no** form of this command enables the default behavior.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 26.78 vprn

## vprn

### Syntax

**vprn** *service-id* [**name** *name*] [**customer** *customer-id*] [**create**]

**no vprn** *service-id*

### Context

[\[Tree\]](#) (config>service vprn)

### Full Context

configure service vprn

### Description

This command creates or edits a Virtual Private Routed Network (VPRN) service instance.

If the *service-id* does not exist, a context for the service is created. If the *service-id* exists, the context for editing the service is entered.

VPRN services allow the creation of customer-facing IP interfaces in the same routing instance used for service network core routing connectivity. VPRN services require that the IP addressing scheme used by the subscriber must be unique between it and other addressing schemes used by the provider and potentially the entire Internet.

IP interfaces defined within the context of an VPRN service ID must have a SAP created as the access point to the subscriber network.

When a service is created, the **customer** keyword and *customer-id* must be specified and associates the service with a customer. The *customer-id* must already exist having been created using the customer command in the service context. When a service is created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association.

When a service is created, the use of the **customer** *customer-id* is optional to navigate into the service configuration context. If attempting to edit a service with the incorrect *customer-id* results in an error.

Multiple VPRN services are created to separate customer-owned IP interfaces. More than one VPRN service can be created for a single customer ID. More than one IP interface can be created within a single VPRN service ID. All IP interfaces created within an VPRN service ID belongs to the same customer.

The **no** form of this command deletes the VPRN service instance with the specified *service-id*. The service cannot be deleted until all the IP interfaces and all routing protocol configurations defined within the service ID have been shut down and deleted.

### Parameters

#### *service-id*

Specifies the unique service identification number identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every 7750 SR on which this service is defined.

#### Values

*service-id*: 1 to 2147483648

*svc-name:* 64 characters maximum

### **customer-id**

Specifies an existing customer identification number to be associated with the service. This parameter is required on service creation and optional for service editing or deleting.

**Values** 1 to 2147483647

### **name name**

This parameter configures an optional VPRN name, up to 64 characters, which adds a name identifier to a given vprn to then use that vprn name in configuration references as well as display and use vprn names in show commands throughout the system. This helps the service provider/administrator to identify and manage vprn within the SR OS platforms.

All services are required to assign a service ID to initially create a service. However, either the service ID or the service name can be used to identify and reference a given service once it is initially created.

If a name is not specified at creation time, then SR OS assigns a string version of the service-id as the name.

Service names may not begin with an integer (0 to 9).

### **create**

Keyword used to create a service ID. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## **Platforms**

All

## **vprn**

## **Syntax**

**vprn** *service-id* **interface** *ip-int-name* [**direction** {**ingress** | **egress** | **both**}]

**no vprn** *service-id* **interface** *ip-int-name*

**no vprn** *service-id* **network-interface** *ip-int-name*

**no vprn** *service-id* **subscriber-interface** *ip-int-name* **group-interface** *ip-int-name*

**vprn** *service-id* **network-interface** *ip-int-name* [**direction** {**ingress** | **egress** | **both**}]

## **Context**

[\[Tree\]](#) (config>cflowd>collector>exp-filter>if-list>svc vprn)

## **Full Context**

configure cflowd collector export-filter interface-list service vprn

## Description

This command configures the VPRN service interfaces flow data sent to this collector.

The **no** form of the command removes the values from the configuration.

## Parameters

### *service-id*

Specifies the unique service identification number or string identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every SR OS on which this service is defined.

**Values**    *service-id*: 1 to 2147483647  
              *svc-name*: 64 characters maximum

### **interface** *ip-int-name*

Specifies the name of an IP interface. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be from 1 to 32 alphanumeric characters and must start with a letter. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### **network-interface** *ip-int-name*

Specifies the name of a network interface. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be from 1 to 32 alphanumeric characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes and must start with a letter.

### **subscriber-interface** *ip-int-name*

Specifies an interface name of a subscriber interface. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes and must start with a letter.

### **group-interface** *ip-int-name*

Specifies an interface name of a group interface. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes and must start with a letter.

### **ingress**

Keyword to specify that ingress flows are sent to the associated Cflowd Collector.

**Default**    both

### **egress**

Keyword to specify that egress flows are sent to the associated Cflowd Collector.

**Default**    both

### **both**

Keyword to specify that both ingress and egress flows are sent to the associated Cflowd Collector.

**Default** both

## Platforms

**no vprn**

## Context

[\[Tree\]](#) (config>open-flow>of-switch>of-controller vprn)

## Full Context

configure open-flow of-switch of-controller vprn

## Description

This command specifies the *service-id* of the VPRN to use for the OpenFlow control channel. The loopback address for the OF control channel in the VPRN is specified using the **ofc-loopback** option.

The **no** form of this command reverts the control channel to using base routing.

## Parameters

### *service-id*

Specifies the service ID for a VPRN instance.

**Values** {*service-id* | *service-name*}  
*service-id*: 1 to 2147483647

*service-name*: up to 64 characters (*service-name* is an alias for input only. The *service-name* gets replaced with an id automatically by SR OS in the configuration).

### *ip-address*

Specifies the loopback IP address in the VPRN for the OpenFlow channel to the controller.

**Values** ip-address: a.b.c.d

```

## Context

[\[Tree\]](#) (config>router>mpls>lsp-template vprn-auto-bind)

[\[Tree\]](#) (config>router>mpls>lsp vprn-auto-bind)

## Full Context

```
configure router mpls lsp-template vprn-auto-bind
```

```
configure router mpls lsp vprn-auto-bind
```

## Description

This command determines whether the associated names LSP can be used or not as part of the auto-bind feature for VPRN services. By default, a names LSP is available for inclusion to be used for the auto-bind feature.

By configuring the command vprn-auto-bind exclude, the associated LSP will not be used by the auto-bind feature within VPRN services.

The **no** form of this command resets the flag back to the default value.

## Default

```
vprn-auto-bind include
```

## Parameters

### include

Allows an associated LSP to be used by auto-bin for vprn services

### exclude

Disables the use of the associated LSP to be used with the auto-bind feature for VPRN services.

## Platforms

All

## 26.81 vprn-local

### vprn-local

#### Syntax

```
vprn-local [{none | all | vc-only}]
```

#### Context

[\[Tree\]](#) (config>router>ttn-propagate vprn-local)

#### Full Context

```
configure router ttl-propagate vprn-local
```

#### Description

This command configures the TTL propagation for locally generated packets which are forwarded over a MPLS LSPs in all VPRN service contexts.

For vpn-ipv4 and vpn-ipv6 packets forwarded in the context of all VPRN services in the system, including 6VPE packets, the all value of the command enables TTL propagation from the IP header into all labels in the stack:

The user can enable the TTL propagation behavior separately for locally generated packets by CPM (vprn-local) and for user and control packets in transit at the node (vprn-transit).

The vc-only value reverts to the default behavior by which the IP TTL is propagated into the VC label but not to the transport labels in the stack. The user can explicitly set the default behavior by configuring the vc-only value. This command does not have a no version.

The value none allows the user to disable the propagation of the IP TTL to all labels in the stack, including the VC label. This is needed for a transparent operation of UDP traceroute in VPRN inter-AS option B such that the ingress and egress ASBR nodes are not traced.

The user can override the global configuration within each VPRN instance using the following commands:

- config service vprn ttl-propagate local [inherit | none | vc-only | all]
- config service vprn ttl-propagate transit [inherit | none | vc-only | all]

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value.

When a packet is received in a VPRN context but is looked up in the Global Routing Table (GRT), for example, leaking to GRT is enabled, the behavior of the TTL propagation is governed by the RSVP or LDP shortcut configuration when the matching routing is a LSP shortcut route. It is governed by the BGP label route configuration when the matching route is a RFC 8277 label route or a 6PE route.

When a packet is received on one VPRN instance and is redirected using Policy Based Routing (PBR) to be forwarded in another VPRN instance, the TTL propagation is governed by the configuration of the outgoing VPRN instance.

### Default

vprn-local vc-only

### Parameters

#### none

Specifies that the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack

#### all

Specifies that the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

#### vc-only

Specifies that the TTL of the IP packet is propagated into the VC label and not into the labels in the transport label stack.

### Platforms

All

## 26.82 vprn-network-exceptions

### vprn-network-exceptions

#### Syntax

**vprn-network-exceptions** *number seconds*

**no vprn-network-exceptions**

#### Context

[\[Tree\]](#) (config>system>security vprn-network-exceptions)

#### Full Context

configure system security vprn-network-exceptions

#### Description

This command configures the rate to limit the processing of packets with label TTL expiry received within an LSP shortcut, or within all VPRN instances in the system, and from all network IP interfaces. This includes labeled user and control plane packets, ping and traceroute packets within GRT and VPRN, and ICMP replies. Packets over the configured rate are dropped.

This feature does not rate limit MPLS and service OAM packets (vprn-ping, vprn-trace, lsp-ping, lsp-trace, vccv-ping, and vccv-trace).

The **no** form of this command disables the rate limiting of the reply to these packets.

### Parameters

#### *number*

Specifies the number limit of MPLS exception messages.

**Values** 10 to 10,000

#### *seconds*

Specifies the rate limit of MPLS exception messages, in seconds.

**Values** 1 to 60

### Platforms

All

## 26.83 vprn-next-hop

### vprn-next-hop

#### Syntax

**vprn-next-hop** *ip-address*

**no vprn-next-hop**

#### Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg vprn-next-hop)

#### Full Context

configure service system bgp-evpn ethernet-segment vprn-next-hop

#### Description

This command configures the IPv4 or IPv6 address associated with an Ethernet Segment (ES). A virtual ES using this VPRN next-hop association represents a Layer 3 ES as described in *draft-sajassi-bess-evpn-ip-aliasing*. This IP address must be installed in the route table of the VPRN service identified by the EVI so that the Auto-Discovery per-ES or EVI routes for the ES are advertised. Only one VPRN next hop is supported per ES.

The **no** form of this command removes the IPv4 or IPv6 address association.

#### Default

no vprn-next-hop

#### Parameters

*ip-address*

Specifies the IPv4 or IPv6 address associated with an Ethernet Segment.

**Values**    *ipv4-address* - a.b.c.d  
                  *ipv6-address* - x:x:x:x:x:x:x (eight 16-bit pieces)  
                  x:x:x:x:x:d.d.d.d  
                  x - [0..FFFF]H  
                  d - [0..255]D

 [**profile** {*in* | *out*}] [**size** *size*] [**ttl** *vc-label-ttl*] [**count** *send-count*] [**return-control**] [**timeout** *timeout*]  
 [**interval** *interval*]

#### Context

**[Tree]** (config>saa>test>type vprn-ping)

**[Tree]** (oam vprn-ping)

#### Full Context

configure saa test type vprn-ping

oam vprn-ping

#### Description

This command performs a VPRN ping and applies only to the 7750 SR and 7950 XRS.

#### Parameters

##### *service-id*

Specifies the VPRN service ID to diagnose or manage.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **configure saa test type vprn-ping service** *service-name* variant can be used in all configuration modes.

**Values**    1 to 2147483647

##### *service-name*

Specifies the VPRN service name to diagnose or manage, up to 64 characters.

**source ip-address**

Specifies an unused IP address in the same network that is associated with the VPRN.

<b>Values</b>	ipv4-address:	a.b.c.d
	ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D

**destination ip-address**

Specifies the IP address to be used as the destination for performing a VPRN ping operation.

<b>Values</b>	ipv4-address:	a.b.c.d
	ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D

**fc-name**

Specifies the forwarding class of the MPLS echo request encapsulation.

**Values** be, l2, af, l1, h2, ef, h1, nc

**Default** be

**profile {in | out}**

Specifies the profile state of the MPLS echo request encapsulation.

**Default** out

**size**

Specifies the OAM request packet size in bytes, expressed as a decimal integer.

**Values** 1 to 9786

**Default** 72

**vc-label-ttl**

Specifies the TTL value in the VC label for the OAM request, expressed as a decimal integer.

**Values** 1 to 255

**Default** 255

### **send-count**

Specifies the number of messages to send. The **count** parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message **interval** value must have expired before the next message request is sent.

**Values** 1 to 100

**Default** 1

### **return-control**

Specifies the response to come on the control plane.

### **timeout**

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response was not received. Any response received after the request times out is silently discarded.

**Values** 1 to 100

**Default** 5

### **interval**

Specifies the interval time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the **interval** is set to 1 second where the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

**Values** 1 to 10

**Default** 1

## 26.85 vprn-trace

### vprn-trace

#### Syntax

```

vprn-trace {service-id | service service-name} source ip-address destination ip-address [fc fc-name
[profile {in | out}]] [size size] [min-ttl min-vc-label-ttl] [max-ttl max-vc-label-ttl] [probe-count send-
count] [return-control] [timeout timeout] [interval interval]

```

#### Context

**[Tree]** (config>saa>test>type vprn-trace)

**[Tree]** (oam vprn-trace)

#### Full Context

configure saa test type vprn-trace

oam vprn-trace

#### Description

This command is used to perform a VPRN trace.

#### Parameters

##### *service-id*

Specifies the VPRN service ID to diagnose or manage.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **configure saa test type vprn-trace service service-name** variant can be used in all configuration modes.

**Values** 1 to 2147483647

##### *service-name*

Specifies the VPRN service name to diagnose or manage, up to 64 characters.

##### *source ip-address*

Specifies the IP address for the source IP address in dotted decimal notation.

**Values**

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

### **destination ip-address**

Specifies the IP address to be used as the destination for performing an vprn-trace operation.

<b>Values</b>		
ipv4-address:	a.b.c.d	
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x:d.d.d.d	
	x: [0 to FFFF]H	
	d: [0 to 255]D	

### **fc-name**

Specifies the forwarding class of the MPLS echo request encapsulation.

**Values** be, l2, af, l1, h2, ef, h1, nc

**Default** be

### **profile {in | out}**

Specifies the profile state of the MPLS echo request encapsulation.

**Default** out

### **size**

Specifies the OAM request packet size in bytes.

**Values** 1 to 9786

**Default** 1

### **min-vc-label-ttl**

Specifies the minimum TTL value in the VC label for the trace test.

**Values** 1 to 255

**Default** 1

### **max-vc-label-ttl**

Specifies the maximum TTL value in the VC label for the trace test.

**Values** 1 to 255

**Default** 4

### **send-count**

Specifies the number of OAM requests sent for a TTL value.

**Values** 1 to 10

**Default** 1

### **return-control**

Specifies the OAM reply to a data plane OAM request be sent using the control plane instead of the data plane.

### **timeout**

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response was not received. Any response received after the request times out is silently discarded.

**Values** 1 to 60

**Default** 3

### **interval**

Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the **interval** is set to 1 second where the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

**Values** 1 to 10

**Default** 1

## 26.86 vprn-transit

### vprn-transit

#### Syntax

```
vprn-transit [{none | all | vc-only}]
```

#### Context

**[Tree]** (config>router>ttd-propagate vprn-transit)

#### Full Context

```
configure router ttl-propagate vprn-transit
```

#### Description

This command configures the TTL propagation for in transit packets which are forwarded over a MPLS LSPs in all VPRN service contexts. For vpn-ipv4 and vpn-ipv6 packets forwarded in the context of all VPRN services in the system, including 6VPE packets, the all value of the command enables TTL propagation from the IP header into all labels in the stack:

The user can enable the TTL propagation behavior separately for locally generated packets by CPM (vprn-local) and for user and control packets in transit at the node (vprn-transit).

The vc-only value reverts to the default behavior by which the IP TTL is propagated into the VC label but not to the transport labels in the stack. The user can explicitly set the default behavior by configuring the vc-only value. This command does not have a no version.

The value none allows the user to disable the propagation of the IP TTL to all labels in the stack, including the VC label. This is needed for a transparent operation of UDP trace-route in VPRN inter-AS option B such that the ingress and egress ASBR nodes are not traced.

The user can override the global configuration within each VPRN service instance using the following commands:

- config service vprn ttl-propagate local [inherit | none | vc-only | all]

- `config service vprn ttl-propagate transit [inherit | none | vc-only | all]`

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value.

When a packet is received in a VPRN context but is looked up in the Global Routing Table (GRT), for example, leaking to GRT is enabled, the behavior of the TTL propagation is governed by the RSVP or LDP shortcut configuration when the matching routing is a LSP shortcut route. It is governed by the BGP label route configuration when the matching route is a RFC 8277 label route or a 6PE route.

When a packet is received on one VPRN instance and is redirected using Policy Based Routing (PBR) to be forwarded in another VPRN instance, the TTL propagation is governed by the configuration of the outgoing VPRN instance

### Default

vprn-transit vc-only

### Parameters

#### none

Specifies that the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack

#### all

Specifies that the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

#### vc-only

Specifies that the TTL of the IP packet is propagated into the VC label and not into the labels in the transport label stack.

### Platforms

All

## 26.87 vrf-export

### vrf-export

#### Syntax

**vrf-export** *plcy-or-long-expr* [*plcy-or-expr*]

**no vrf-export**

#### Context

**[Tree]** (config>service>vprn>bgp-ipvpn>srv6 vrf-export)

**[Tree]** (config>service>vprn>bgp-evpn>mpls vrf-export)

**[Tree]** (config>service>vprn>bgp-ipvpn>mpls vrf-export)

## Full Context

```
configure service vprn bgp-ipvpn segment-routing-v6 vrf-export
configure service vprn bgp-evpn mpls vrf-export
configure service vprn bgp-ipvpn mpls vrf-export
```

## Description

This command configures route policies that control how routes are exported from the local VRF to other VRFs on the same or remote PE routers (using MP-BGP). Route policies are configured in the **config>router>policy-options** context.

The **vrf-export** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine final action to accept or reject the route.

Only one of the 15 objects referenced by the **vrf-export** command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters while the remaining 14 objects have a maximum length of 64 characters each.

When multiple **vrf-export** commands are issued, the last command entered overrides the previous command.

Aggregate routes are not advertised using MP-BGP protocols to the other MP-BGP peers.

The **no** form of this command removes all route policy names from the **vrf-export** list.

## Default

```
no vrf-export
```

## Parameters

### *plcy-or-long-expr*

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters).

### *plcy-or-expr*

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters). Up to 14 policies may be entered.

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

- `configure service vprn bgp-ipvpn segment-routing-v6 vrf-export`

## vrf-export

### Syntax

**vrf-export** {unicast | *plcy-or-long-expr* [*plcy-or-expr* [*plcy-or-expr*]]}

**no vrf-export**

### Context

**[Tree]** (config>service>vprn>mvpn vrf-export)

### Full Context

configure service vprn mvpn vrf-export

### Description

This command specifies the export policy to control MVPN routes exported from the local VRF to other VRFs on the same or remote PE routers.

### Default

vrf-export unicast

### Parameters

#### **unicast**

Specifies to use unicast VRF export policy for the MVPN.

#### ***plcy-or-long-expr***

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters). Allowed values are any string up to 255 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed between double quotes.

#### ***plcy-or-expr***

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters). Allowed values are any string up to 64 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed between double quotes. Up to 14 policies can be specified in a single statement.

## Full Context

configure service vprn bgp-ipvpn mpls vrf-import

configure service vprn bgp-ipvpn segment-routing-v6 vrf-import

configure service vprn bgp-evpn mpls vrf-import

## Description

This command configures route policies that control how VPN-IP and EVPN-IFL routes exported by other VRFs, on the same or remote PEs, are imported into the local VRF. Route policies are configured in the **config>router>policy-options** context.

The **vrf-import** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine final action to accept or reject the route

Only one of the 15 objects referenced by the **vrf-import** command is allowed to be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR,

NOT). The first of the 15 objects has a maximum length of 255 characters while the remaining 14 objects have a maximum length of 64 characters each.

When multiple **vrf-import** commands are issued, the last command entered overrides the previous command.

The **no** form of this command removes all route policy names from the import list

**Note:**

Unless the preference value is changed by the policy, BGP-VPN and EVPN-IFL routes imported with a **vrf-import** policy have the preference value of 170 when imported from remote PE routers, or retain the protocol preference value of the exported route when imported from other VRFs on the same router.

**Default**

no vrf-import

**Parameters*****plcy-or-long-expr***

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters).

***plcy-or-expr***

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters).

configure service vprn mvpn vrf-import

## Description

This command specifies the import policy to control MVPN routes imported to the local VRF from other VRFs on the same or remote PE routers.

## Default

vrf-import unicast

## Parameters

### unicast

Specifies to use a unicast VRF import policy for the MVPN.

### *plcy-or-long-expr*

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters). Allowed values are any string up to 255 characters in length composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed between double quotes.

### *plcy-or-expr*

Specifies the route policy statement name or a policy logical expression. Allowed values are any string up to 64 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed between double quotes. Up to 14 policies can be specified in a single statement.

## 26.89 vrf-target

### vrf-target

#### Syntax

**vrf-target** {*ext-community* | **export** *ext-community* | **import** *ext-community* | **export** *ext-community* **import** *ext-community*}

**no vrf-target**

#### Context

[Tree] (config>service>vprn>bgp-ipvpn>mpls vrf-target)

[Tree] (config>service>vprn>bgp-ipvpn>srv6 vrf-target)

[Tree] (config>service>vprn>bgp-evpn>mpls vrf-target)

#### Full Context

configure service vprn bgp-ipvpn mpls vrf-target

configure service vprn bgp-ipvpn segment-routing-v6 vrf-target

configure service vprn bgp-evpn mpls vrf-target

#### Description

This command provides a simplified method to configure the route target added to advertised routes or compared against received routes from other VRFs on the same or remote PE routers (using MP-BGP).

BGP-VPN and EVPN-IFL routes imported with a VRF target policy use the BGP preference value of 170 when imported from remote PE routers, or retain the protocol preference value of the exported route when imported from other VRFs in the same router.

Specified VRF import or VRF export policies override the VRF target policy.

The **no** form of this command removes the VRF target policy.

#### Default

no vrf-target

#### Parameters

##### *ext-comm*

Specifies an extended BGP community in the *type:x:y* format. The value *x* can be an integer or IP address. The *type* can be the target or origin. *y* can be 16-bit integers.

##### Values

<ext-community> : target:{<ip-addr:comm-val> | <2byte-asnumber:ext-comm-val> | <4byte-asnumber:comm-val>}

ip-addr: a.b.c.d

comm-val: [0 to 65535]

2byte-asnumber:	[0 to 65535]
ext-comm-val:	[0 to 4294967295]
4byte-asnumber:	[0 to 4294967295]

**import *ext-community***

Specifies communities allowed to be received from remote PE neighbors.

**export *ext-community***

Specifies communities allowed to be sent to remote PE neighbors.

**Platforms**

All

- configure service vprn bgp-evpn mpls vrf-target
  - configure service vprn bgp-ipvpn mpls vrf-target

[\[Tree\]](#) (config>service>vprn>mvpn vrf-target)

**Full Context**

configure service vprn mvpn vrf-target

**Description**

This command specifies the route target to be added to the advertised routes or compared against the received routes from other VRFs on the same or remote PE routers. vrf-import or vrf-export policies override the vrf-target policy.

The **no** form of this command removes the vrf-target.

**Default**

no vrf-target

**Parameters****unicast**

Specifies to use unicast vrf-target ext-community for the multicast VPN.

**ext-comm**

An extended BGP community in the **type:x:y** format. The value **x** can be an integer or IP address. The **type** can be the target or origin. **x** and **y** are 16-bit integers.

**Values**

target:{*ip-address:comm-val* | *2byte-asnumber:ext-comm-val* | *4byte-asnumber:comm-val*}

<i>ip-address:</i>	a.b.c.d
<i>comm-val:</i>	0 to 65535
<i>2byte-asnumber:</i>	1 to 65535
<i>4byte-asnumber</i>	0 to 4294967295

**import ext-community**

Specifies communities allowed to be accepted from remote PE neighbors.

**export ext-community**

Specifies communities allowed to be sent to remote PE neighbors.

## 26.91 vrrp

vrrp

## Syntax

**vrrp** *virtual-router-id* [**owner**] [**passive**] [ **monitor-oper-group** *group-name*]

**no vrrp** *virtual-router-id*

## Context

[\[Tree\]](#) (config>service>ies>if vrrp)

[\[Tree\]](#) (config>service>ies>if>ipv6 vrrp)

## Full Context

configure service ies interface vrrp

configure service ies interface ipv6 vrrp

## Description

This command configures the router to create or edit a Virtual Router ID (VRID) on the service IP interface. A VRID is internally represented in conjunction with the IP interface name. This allows the VRID to be used on multiple IP interfaces while representing different virtual router instances.

Two VRRP nodes can be defined on an IP interface. The **vrrp** *virtual-router-id* command is used to define the configuration parameters for the VRID.

The **no** form of this command removes the specified VRID from the IP interface. This terminates VRRP participation for the virtual router and deletes all references to the VRID. The VRID does not need to be shutdown to remove the virtual router instance.

## Parameters

### **virtual-router-id**

Specifies a virtual router ID or an ID that can be modified on the IP interface.

**Values** 1 to 255

### **owner**

Keyword used to identify this virtual router instance as owning the virtual router IP addresses. If the **owner** keyword is not specified at the time of *vrid* creation, the **vrrp backup** commands must be specified to define the virtual router IP addresses. The **owner** keyword is not required when entering the *vrid* for editing purposes. When created as **owner**, a *vrid* on an IP interface cannot have the **owner** parameter removed. The *vrid* must be deleted, and then recreated without the **owner** keyword, to remove ownership.

### **passive**

Keyword used to identify this virtual router instance as **passive**, and therefore, owning the virtual router IP addresses. A **passive vrid** does not send or receive VRRP advertisement messages, and is always in either the **master** state (if the interface is operationally up), or the **init** state (if the interface is operationally down). The **passive** keyword is not required when entering the *vrid* for editing purposes. When a *vrid* on an IP interface is created as **passive**, the parameter cannot be removed from the *vrid*. The *vrid* must be deleted, and then recreated without the **passive** keyword, to remove parameter.

### **group-name**

Specifies the name of the **oper-group**, up to 32 characters to establish the associated VRRP instance as a following instance to the specified operational group. As a result of this association, the VRRP instance state follows that of the VRRP instance (the lead instance) associated with the specified operation group.

## Platforms

## Context

[\[Tree\]](#) (config>service>vprn>if vrrp)

## Full Context

configure service vprn interface vrrp

## Description

This command creates or edits a Virtual Router ID (VRID) on the service IP interface. A VRID is internally represented in conjunction with the IP interface name. This allows the VRID to be used on multiple IP interfaces while representing different virtual router instances.

Two VRRP nodes can be defined on an IP interface. One, both, or none may be defined as owner. The nodal context of **vrrp** *virtual-router-id* is used to define the configuration parameters for the VRID.

The **no** form of this command removes the specified VRID from the IP interface. This terminates VRRP participation for the virtual router and deletes all references to the VRID. The VRID does not need to be shut down in order to remove the virtual router instance.

## Parameters

### *virtual-router-id*

Specifies a new virtual router ID or one that can be modified on the IP interface.

**Values** 1 to 255

### **owner**

Identifies this virtual router instance as owning the virtual router IP addresses. If the **owner** keyword is not specified at the time of *vrld* creation, the **vrrp backup** commands must be specified to define the virtual router IP addresses. The **owner** keyword is not required when entering the *vrld* for editing purposes. Once created as **owner**, a *vrld* on an IP interface cannot have the **owner** parameter removed. The *vrld* must be deleted, and then recreated without the **owner** keyword, to remove ownership.

### **passive**

Identifies this virtual router instance as **passive**, and therefore, owning the virtual router IP addresses. A **passive** *vrld* does not send or receive VRRP advertisement messages, and is always in either the **master** state (if the interface is operational-up), or the **init** state (if the interface is operational-down). The **passive** keyword is not required when entering the *vrld* for editing purposes. Once a *vrld* on an IP interface is created as **passive**, the

parameter cannot be removed from the *vrld*. The *vrld* must be deleted, and then recreated without the **passive** keyword, to remove parameter.

### **group-name**

Specifies the name of the **oper-group**, up to 32 characters to establish the associated VRRP instance as a following instance to the specified operational group. As a result of this association, the VRRP instance state follows that of the VRRP instance (the lead instance) associated with specified operation group.

configure service vprn interface vrrp

## Description

This command configures the router to create or edit a Virtual Router ID (VRID) on the service IP interface. A VRID is internally represented in conjunction with the IP interface name. This allows the VRID to be used on multiple IP interfaces while representing different virtual router instances.

Two VRRP nodes can be defined on an IP interface. The **vrrp** *virtual-router-id* command is used to define the configuration parameters for the VRID.

The **no** form of this command removes the specified VRID from the IP interface. This terminates VRRP participation for the virtual router and deletes all references to the VRID. The VRID does not need to be shutdown to remove the virtual router instance.

## Parameters

### **virtual-router-id**

Specifies a virtual router ID or an ID that can be modified on the IP interface.

**Values** 1 to 255

### **owner**

Keyword used to identify this virtual router instance as owning the virtual router IP addresses. If the **owner** keyword is not specified at the time of *vrld* creation, the **vrrp backup** commands must be specified to define the virtual router IP addresses. The **owner** keyword is not required when entering the *vrld* for editing purposes. When created as

**owner**, a *vrid* on an IP interface cannot have the **owner** parameter removed. The *vrid* must be deleted, and then recreated without the **owner** keyword, to remove ownership.

#### **passive**

Keyword used to identify this virtual router instance as **passive**, and therefore, owning the virtual router IP addresses. A **passive vrid** does not send or receive VRRP advertisement messages, and is always in either the **master** state (if the interface is operationally up), or the **init** state (if the interface is operationally down). The **passive** keyword is not required when entering the *vrid* for editing purposes. When a *vrid* on an IP interface is created as **passive**, the parameter cannot be removed from the *vrid*. The *vrid* must be deleted, and then recreated without the **passive** keyword, to remove parameter.

#### **group-name**

Specifies the name of the **oper-group**, up to 32 characters to establish the associated VRRP instance as a following instance to the specified operational group. As a result of this association, the VRRP instance state follows that of the VRRP instance (the lead instance) associated with the specified operation group.

**no vrrp** *virtual-router-id*

### **Context**

[\[Tree\]](#) (config>router>if vrrp)

[\[Tree\]](#) (config>router>if>ipv6 vrrp)

### **Full Context**

configure router interface vrrp

configure router interface ipv6 vrrp

### **Description**

This command creates the context to configure a VRRP virtual router instance. A virtual router is defined by its virtual router identifier (VRID) and a set of IP addresses.

The optional **owner** keyword indicates that the **owner** controls the IP address of the virtual router and is responsible for forwarding packets sent to this IP address. The **owner** assumes the role of the master virtual router.

All other virtual router instances participating in this message domain must have the same *vrid* configured and cannot be configured as **owner**. Once created, the **owner** keyword is optional when entering the *vrid* for configuration purposes.

A *vrld* is internally associated with the IP interface. This allows the *vrld* to be used on multiple IP interfaces while representing different virtual router instances.

For IPv4, up to four VRRP VRID nodes can be configured on a router interface. Each virtual router instance can manage up to 16 backup IP addresses. For IPv6, only one VRID can be configured on a router interface.

The optional **passive** keyword indicates that a *vrld* can be configured as **passive**, in which case, the VRRP advertisement messages are suppressed on transmission and reception, and all routers configured with the same *vrld* become master. Passive VRIDs can exceed the limit of four VRRP VRID nodes on a router interface.

The **no** form of the command removes the specified *vrld* from the IP interface. This terminates VRRP participation and deletes all references to the *vrld* in conjunction with the IP interface. The *vrld* does not need to be shut down to remove the virtual router instance.

## Default

no vrrp — No VRRP virtual router instance is associated with the IP interface.

## Parameters

### *virtual-router-id*

The virtual router ID for the IP interface expressed as a decimal integer.

**Values** 1 to 255

### **owner**

Keyword used to identify this virtual router instance as owning the virtual router IP addresses. If the **owner** keyword is not specified at the time of *vrld* creation, the **vrrp backup** commands must be specified to define the virtual router IP addresses. The **owner** keyword is not required when entering the *vrld* for editing purposes. When created as **owner**, a *vrld* on an IP interface cannot have the **owner** parameter removed. The *vrld* must be deleted, and then recreated without the **owner** keyword, to remove ownership.

### **passive**

Keyword used to identify this virtual router instance as **passive**, therefore owning the virtual router IP addresses. A **passive** *vrld* does not send or receive VRRP advertisement messages and is always in either the **master** state (if the interface is operationally up), or the **init** state (if the interface is operationally down). The **passive** keyword is not required when entering the *vrld* for editing purposes. When a *vrld* on an IP interface is created as **passive**, the parameter cannot be removed from the *vrld*. The *vrld* must be deleted, and then recreated without the **passive** keyword, to remove the parameter.

### *group-name*

Specifies the name of the **oper-group**, up to 32 characters to establish the associated VRRP instance as a following instance to the specified operational group. As a result of this association, the VRRP instance state follows that of the VRRP instance (the lead instance) associated with the specified operation group.

### Full Context

configure service epipe bgp-evpn vxlan

configure service vpls bgp-evpn vxlan

### Description

Commands in this context configure the VXLAN parameters when BGP EVPN is used as the control plane. In VPLS services, instance BGP 1 or BGP 2 can be configured, as well as VXLAN instances 1 or 2. Up to two instances of this command can be configured in the same service, as long as the BGP instance and the VXLAN instance are different in both commands. In Epipe services, only BGP instance 1 and VXLAN instance 1 is supported. If the BGP or VXLAN instance are not specified, the instances are by default set to 1.

The **no** version of this command will remove the vxlan instance from the service.

### Parameters

#### bgp

Indicates the BGP instance identifier.

**Values** 1 to 2

#### vxlan-instance

Indicates the VXLAN instance identifier.

**Values** 1 to 2

### Platforms

## Context

[\[Tree\]](#) (config>fwd-path-ext>fpe vxlan)

## Full Context

configure fwd-path-ext fpe vxlan

## Description

This command informs the system about the cross-connect type that is required for non-system IPv4 and IPv6 VXLAN termination. Internally, it triggers the automatic creation of two internal IP interfaces in the PXC ports and enables those internal interfaces to process and terminate VXLAN.

If no parameters are used, the VXLAN termination occurs in the base router; however, when the FPE is used for static VXLAN termination (no BGP-EVPN services), non-system IPv4 and IPv6 VXLAN can be terminated in a VPRN service. In this case, the VPRN router instance or service name must be configured with the **vxlan-termination** command.

The **no** form of this command disables the cross-connect type from the configuration.

### Default

no vxlan-termination

### Parameters

#### *router-name*

Specifies the router instance for VXLAN termination.

#### Values

*router-name*: *router-name* or *vprn-svc-id*

*router-name* "Base"

*vprn-svc-id* 1 to 2147483647

**Default** Base

#### *service-name*

Specifies the service name that identifies the VPRN for VXLAN termination, up to 64 characters.

### Platforms

## 26.96 vxlan-ipv4-tep-ecmp

vxlan-ipv4-tep-ecmp

### Syntax

[no] vxlan-ipv4-tep-ecmp

### Context

[\[Tree\]](#) (config>service>vpls>allow-ip-int-bind vxlan-ipv4-tep-ecmp)

### Full Context

configure service vpls allow-ip-int-bind vxlan-ipv4-tep-ecmp

### Description

This command enables and disables ECMP on VXLAN IPv4 destinations for R-VPLS services. When this command is enabled, packets entering a VPRN connected to an R-VPLS that is terminating on a VXLAN IPv4 destination are looked up in the routing table. If the next hop is a VXLAN IPv4 TEP, the packets are distributed based on per-flow load-balancing.

This command can only be used in FP3- (or higher) routers. R-VPLS per-flow load-balancing for VXLAN IPv6 destinations works by default without this command.

The **no** version of this command reverts the process to the default behavior of per-remote VTEP load-balancing.

### Default

no vxlan-ipv4-tep-ecmp

```

#### Context

[\[Tree\]](#) (oam vxlan-ping)

#### Full Context

oam vxlan-ping

#### Description

Operational command used to validate the VXLAN Tunnel Endpoint (VXLAN) connectivity between peers.

#### Parameters

##### *test-id*

Specifies a value to identify the originator handle of the specific request. Each active test requires a unique test identifier.

**Values** 1 to 2147483647

##### *vpls-service-id*

Specifies the VPLS service used to launch the request and by extension pick up the source VNI information.

**Values** *service-id:* 1 to 2147483647

*svc-name*: up to 64 characters

***vxlan-network-id***

Specifies the target Vxlan network identifier on the terminating VTEP.

**Values** 1 to 16777215

***outer-ip-destination ipv4-address***

Specifies the IPv4 address of the terminating VTEP.

**Values** a.b.c.d

***udp-port-number***

Optional outer source UDP port number.

**Values** 1 to 65535

**Default** System-generated UDP port number

***time-to-live***

Specifies the optional outer time to live.

**Values** 1 to 255

**Default** 255

***inner-l2 ieee-address***

Specifies the destination MAC address used in the inner VXLAN header.

**Values** xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

**Default** 00:00:00:00:00:00

***inner-ip-source ipv4-address***

Specifies the inner source IPv4 address.

**Values** a.b.c.d

**Default** System IPv4 Address

***inner-ip-destination ipv4-address***

Specifies the inner destination IPv4 address. Must be in the range 127/8.

**Values** 127.0.0.0 to 127.0.0.8

**Default** 127.0.0.1

***i-flag-on***

Sets the VNI Validation bit to 1, indicating that the OAMPDU contains a valid VNI.

**Default** i-flag set to "0" which prevents the OAMPDU form being forwarded beyond the terminating VTEP.

#### **end-system *ieee-address***

Optional command to include the sub TLV to validate an end system MAC address in the FDB. Only one MAC address may be included.

**Values** xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

**Default** 00:00:00:00:00:00

#### ***packets***

Specifies the number of VXLAN ping requests to transmit.

**Values** 1 to 1024

**Default** 1

#### ***interval-time***

Specifies the probe interval, in seconds.

**Values** 0.1, 1 to 10

**Default** 1

#### ***timeout-time***

Specifies the packet time out value, in seconds.

**Values** 1 to 10

**Default** 5

#### ***tlv-size***

Specifies whether to include the Pad TLV and specifies the number of octets that defines the entire size of the pad TLV, including the type (2B), the length field (2B), the padding (variable).

**Values** 0, 5 to 2000

**Default** 0

#### **reflect-pad**

Instructs the responder to include the pad-tlv in the echo response. This option is not supported when the reply mode is "UDP".

#### ***fc-name***

Indicates the forwarding class that is exposed to the QoS policy as input into generating the outer CoS.

**Values** be, l2, af, l1, h2, ef, h1, nc

**Default** be

**profile {in | out}**

Defines the frame's disposition that is exposed to the QoS policy as input into generating the outer CoS.

**Default** in

**reply-mode {overlay | udp}**

Instructs the responder how to route the VXLAN response.

**Values** **udp**: responds using UDP over the IP network. The default must be changed if the VTEP uses anything other than an IPv4 System Address as the source.

**overlay**: responds using the VXLAN overlay for the service

**Default** udp

**Platforms**

[\[Tree\]](#) (config>qos>sap-ingress>ipv6-criteria>entry>match vxlan-vni)

#### Full Context

configure qos sap-ingress ip-criteria entry match vxlan-vni

configure qos sap-ingress ipv6-criteria entry match vxlan-vni

#### Description

This command configures a VXLAN or VXLAN GPE VNI to be used as a SAP QoS policy match criterion. A range of VNIs to be matched can be specified by including the keyword **range** with a *start* and *end* VNI. This command requires the **type** to be set to **vxlan-vni** in the related **ip-criteria** or **ipv6-criteria** context.

See Virtual Network Identifier (VNI) Classification for the list of restrictions for this command.

#### Default

no vxlan-vni

#### Parameters

##### **eq** *vxlan-vni-id*

Specifies the VXLAN or VXLAN GPE VNI to be matched in the SAP ingress QoS classification. The VNI can be specified in any of the available formats but is always shown in decimal.

**Values** 1 to 16777215 (Decimal)  
0x1 to 0xFFFFFFFF (Hexadecimal)  
[0b1 to 0b11111111111111111111111111111111] (Binary)

##### **range** *startend*

Identifies a range of VNIs to be used as matching criteria. The *start* value must be lower than the *end* value. The VNI can be specified in any of the available formats but is always shown in decimal.

**Values** 1 to 16777215 (Decimal)  
0x1 to 0xFFFFFFFF (Hexadecimal)  
[0b1 to 0b11111111111111111111111111111111] (Binary)

### vxlan-vtep-range

#### Syntax

**vxlan-vtep-range start** [*ip-address* | *ipv6-address*] **end** [*ip-address* | *ipv6-address*]

**no vxlan-vtep-range**

#### Context

[\[Tree\]](#) (config>router>isa-svc-chain vxlan-vtep-range)

#### Full Context

configure router isa-service-chaining vxlan-vtep-range

#### Description

This command specifies the address range to be used as the local VXLAN VTEP on the ISA for service chaining. The system allocates one address for each ISA in the NAT group out of the specified range. The allocated address appears as /32 or /128 routes in the global routing table with the route type **nat**.

The **no** form of this command removes the IP or IPv6 addresses from the configuration.

#### Parameters

##### **start**

Specifies the start address of the VXLAN VTEP range.

##### **end**

Specifies the end address of the VXLAN VTEP range.

##### ***ip-address***

Specifies an IPv4 address start and end range.

**Values**    *ipv4-address* - a.b.c.d

##### ***ipv6-address***

Specifies an IPv6 address start and end range

*ipv6-address*:        x:x:x:x:x:x:x (eight 16-bit pieces)

                      x:x:x:x:x:d.d.d.d

                      x - [0..FFFF]H

                      d - [0..255]D

**[Tree]** (config>router>vrgw>lanext vxlan-vtep-range)

### Full Context

configure router vrgw lanext vxlan-vtep-range

### Description

This command specifies the address range to be used as the local VXLAN VTEP on the ISA for HLE services. The system allocates one address for each ISA in the WLAN GW group out of the specified range. The allocated address appears as /32 or /128 routes in the global routing table with the route type **nat**.

The **no** form of this command removes the values from the configuration.

### Parameters

#### **start**

Specifies the start of the VXLAN VTEP range.

#### **end**

Specifies the end of the VXLAN VTEP range.

#### ***ip-address* | *ipv6-address***

Specifies the range of VXLAN VTEP addresses.

<b>Values</b>	< <i>ip-address</i>   <i>ipv6-address</i> : <i>ipv4-address</i> - a.b.c.d <i>ipv6-address</i> - x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x - [0..FFFF]H d - [0..255]D

## 27 w Commands

### 27.1 wa-shared-high-wmark

#### wa-shared-high-wmark

##### Syntax

**wa-shared-high-wmark** *percent*

**no wa-shared-high-wmark**

##### Context

**[Tree]** (config>isa>aa-grp>qos>egress>to-sub wa-shared-high-wmark)

**[Tree]** (config>isa>aa-grp>qos>egress>from-sub wa-shared-high-wmark)

##### Full Context

configure isa application-assurance-group qos egress to-subscriber wa-shared-high-wmark

configure isa application-assurance-group qos egress from-subscriber wa-shared-high-wmark

##### Description

This command configures the high watermark for the weighted average utilization of the shared buffer space in the **from-subscriber** buffer pool for each ISA. When a buffer pool is not in the overload state and the wa-shared buffer utilization for an ISA crosses above the high watermark value in the ISA **from-subscriber** buffer pool enters an overload state and an overload notification is raised.

The **no** form of this command reverts to the default.

##### Default

wa-shared-high-wmark max

##### Parameters

***percent***

Specifies the weighted average shared buffer utilization high watermark.

**Values** 1 to 100, **max** percent (disabled)

##### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 27.2 wa-shared-low-wmark

### wa-shared-low-wmark

#### Syntax

**wa-shared-low-wmark** *percent*  
**no wa-shared-low-wmark**

#### Context

**[Tree]** (config>isa>aa-grp>qos>egress>from-sub wa-shared-low-wmark)

**[Tree]** (config>isa>aa-grp>qos>egress>to-sub wa-shared-low-wmark)

#### Full Context

configure isa application-assurance-group qos egress from-subscriber wa-shared-low-wmark  
configure isa application-assurance-group qos egress to-subscriber wa-shared-low-wmark

#### Description

This command configures the low watermark for the weighted average utilization of the shared buffer space in the **from-subscriber** buffer pool. When a buffer pool is in an overloaded state and the wa-shared buffer utilization for an ISA drops below low watermark value ISA **from-subscriber** buffer pool leaves the overload state and a is sent to indicate the overload state has cleared.

The **no** form of this command reverts to the default.

#### Default

wa-shared-low-wmark 0

#### Parameters

*percent*

Specifies the weighted average shared buffer utilization low watermark.

**Values** 0 to 99

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 27.3 wait

## wait

### Syntax

**wait** *seconds*

### Context

**[Tree]** (bof wait)

### Full Context

bof wait

### Description

This command configures a pause, in seconds, at the start of the boot process which allows system initialization to be interrupted at the console.

When system initialization is interrupted the operator is allowed to manually override the parameters defined in the boot option file (BOF).

Only one **wait** command can be defined in the BOF.

### Default

wait 3

### Parameters

**seconds**

Specifies the time to pause at the start of the boot process, in seconds.

**Values** 1 to10

### Platforms

All

## 27.4 wait-for-up-timer

### wait-for-up-timer

### Syntax

**wait-for-up-timer** *seconds*

**no wait-for-up-timer**

### Context

**[Tree]** (config>router>mpls>lsp>secondary>bfd wait-for-up-timer)

**[Tree]** (config>router>mpls>lsp>primary>bfd wait-for-up-timer)

**[Tree]** (config>router>mpls>lsp-template>bfd wait-for-up-timer)

**[Tree]** (config>router>mpls>lsp>bfd wait-for-up-timer)

### Full Context

configure router mpls lsp secondary bfd wait-for-up-timer

configure router mpls lsp primary bfd wait-for-up-timer

configure router mpls lsp-template bfd wait-for-up-timer

configure router mpls lsp bfd wait-for-up-timer

### Description

This command configures the time to wait for a BFD to come up in seconds. This timer is applicable to SR-TE LSPs, including auto-LSPs and PCE-initiated LSPs, as well as RSVP-TE LSPs. In case of SR-TE LSPs, this timer takes effect if BFD does not come up, or BFD goes from up to down. The timer is started when BFD is first enabled on a path or BFD transitions from up to down. When the timer expires if BFD is not yet come up, then the path is torn down by removing it from the TTM and the IOM and the retry timer is started.

In case of RSVP-TE LSPs, the timer controls the following:

- a path undergoing MBB when BFD is up on the original path
- the initial administrative enable of an LSP
- signaling retry of non-standby secondary paths

The **no** form of this command sets the timer to its default value.

### Default

no wait-for-up-timer

### Parameters

#### *seconds*

Specifies the BFD wait for up timer in seconds.

**Values** 0 to 60

**Default** 4

### Platforms

All

- configure router mpls lsp primary bfd wait-for-up-timer
  - configure router mpls lsp bfd wait-for-up-timer
  - configure router mpls lsp secondary bfd wait-for-up-timer
- 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS
- configure router mpls lsp-template bfd wait-for-up-timer

## wait-for-up-timer

### Syntax

**wait-for-up-timer** *seconds*

**no wait-for-up-timer**

### Context

**[Tree]** (config>service>epipe>spoke-sdp>bfd wait-for-up-timer)

**[Tree]** (config>service>vprn>interface>spoke-sdp>bfd wait-for-up-timer)

**[Tree]** (config>service>ies>interface>spoke-sdp>bfd wait-for-up-timer)

**[Tree]** (config>service>vpls>spoke-sdp>bfd wait-for-up-timer)

### Full Context

configure service epipe spoke-sdp bfd wait-for-up-timer

configure service vprn interface spoke-sdp bfd wait-for-up-timer

configure service ies interface spoke-sdp bfd wait-for-up-timer

configure service vpls spoke-sdp bfd wait-for-up-timer

### Description

This command configures the time interval, in seconds, that is used to wait for a BFD session to come up.

This command is triggered when a spoke-SDP is first administratively enabled and a VCCV BFD session transitions from up to down. The command is required to allow time for BFD sessions to come up, and for BFD to settle before selecting the active spoke-SDP to use in a redundant set. In the case where a VCCV BFD session is bouncing, the timer prevents excessive flapping of the operational state of a spoke-SDP.

The **no** form of this command disables the timer.

### Default

no wait-for-up-timer

### Parameters

***seconds***

Specifies the wait interval, in seconds, for the BFD up timer.

**Values** 1 to 60

### Platforms

All

## 27.5 wait-to-restore

## wait-to-restore

### Syntax

**wait-to-restore** *interval*

**no wait-to-restore**

### Context

[\[Tree\]](#) (config>router>mpls>mpls-tp>protection-template wait-to-restore)

### Full Context

configure router mpls mpls-tp protection-template wait-to-restore

### Description

This command configures the WTR timer. It determines how long to wait until the active path of an MPLS-TP LSP is restored to the working path following the clearing of a defect on the working path. It is applicable to revertive mode, only.

### Default

wait-to-restore 300

### Parameters

*interval*

Specifies the WTR timer interval in 1 second increments.

**Values** 0 to 720 seconds

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## wait-to-restore

### Syntax

**wait-to-restore** *minutes*

**no wait-to-restore**

### Context

[\[Tree\]](#) (config>system>sync-if-timing wait-to-restore)

### Full Context

configure system sync-if-timing wait-to-restore

## Description

This command configures the time for the Wait to Restore timer. A previously failed input reference must be valid for the time specified before it is used for either the BITSout or the central clock input reference.

The **no** form of this command disables the timer.

## Default

no wait-to-restore

## Parameters

### *minutes*

Specifies a value representing the number of minutes for the wait to restore timeout.

**Values** 1 to 12

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 27.7 warm-standby

## warm-standby

### Syntax

**warm-standby**

### Context

**[Tree]** (config>redundancy>multi-chassis>peer warm-standby)

### Full Context

configure redundancy multi-chassis peer warm-standby

### Description

This command enables Oversubscribed Multi-Chassis Redundancy (OMCR) model where subscriber hosts are synchronized between the two chassis only in the control plane and are kept there (as part of the Multi-Chassis Synchronization (MCS) state) until the switchover occurs. Link or nodal failure will trigger the switchover at which point the subscriber hosts are being fully instantiated in the control and the forwarding plane. This approach allows oversubscription of the resources in the central standby (or protecting) node that is backing-up several active nodes. The total number of protected subscribers in the OMCR cluster exceeds the forwarding capacity of the protecting node. This is achievable by not fully occupying the resources for the subscriber hosts until the failure occurs.

The restoration times depend on the amount of the subscriber hosts that are affected by the switchover and it is related to the time needed for the full instantiation of the subscribers in the forwarding plane.

Although this command is configured on a peer level, the warm-standby property is a nodal characteristic. In other words, mixing of N:1 and 1:1 (hot standby) mode in the central standby node is not supported. Consequently all peers on the central standby node must be configured for warm-standby (N:1), or all peers must be configured for hot-standby (1:1) by omitting the warm-standby keyword from the configuration.

The peer of the central backup node is not aware of the redundancy model supported. In other words, the peer of the central-backup node does not know whether it peers with a warm-standby peer or hot-standby-peer.

## 27.9 watchdog-timer

### watchdog-timer

## Syntax

**watchdog-timer** *seconds*

**no watchdog-timer**

## Context

[\[Tree\]](#) (config>aaa>diam>node>peer watchdog-timer)

## Full Context

configure aaa diameter node peer watchdog-timer

## Description

Watchdog messages are used to verify liveness of a Diameter peer. A single watchdog message is sent to a peer in case that no traffic is received from it within a configured watchdog-timer. This watchdog request message solicits a watchdog answer message from the peer. If no traffic (watchdog answer or otherwise) is received from the peer in response to watchdog request while the watchdog timer is running, the peer is put in suspicious state and a peer failover routine is triggered.

The peer closes after it has been in suspicious mode for the duration of one more watchdog-timer interval without receiving any traffic from it.

After the peer is recovered, it takes three successful exchanges of diameter watchdog messages (DWR/DWA) for the peer to become used again in Diameter forwarding. This behavior is described in RFC 3539, §3.4.1, *Authentication, Authorization and Accounting (AAA) Transport Profile*.

This command is not applicable to legacy implementations of Diameter base in the SR OS.

The **no** form of this command removes the watchdog timer value from the configuration.

### Default

watchdog-timer 30

### Parameters

#### *seconds*

Specifies the device watchdog timer, in seconds, used on all connections by this peer.

**Values** 1 to 1000

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[\[Tree\]](#) (config>service>ies>sub-if>wlan-gw>pool-manager watermarks)

### Full Context

configure service vprn subscriber-interface wlan-gw pool-manager watermarks

configure service ies subscriber-interface wlan-gw pool-manager watermarks

### Description

This command configures the watermarks used to determine if a new prefix should be allocated or an old prefix should be removed. A new prefix is allocated when the total usage level for the ISA reaches the high watermark. A prefix is freed if no addresses are currently in use and the usage level without this prefix would be below the low watermark.

The **no** form of this command resets the watermarks to its default values of 95% high and 90% low.

### Default

watermarks high 95 low 90

## Parameters

### *high-percentage*

Specifies the high watermark.

**Values** 80 to 99

### *low-percentage*

Specifies the low watermark. The value must be lower than the high percentage value.

**Values** 50 to 98

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## watermarks

## Syntax

**watermarks high *percentage-high* low *percentage-low***

**no watermarks**

## Context

**[Tree]** (config>service>vprn>nat>outside>pool watermarks)

**[Tree]** (config>router>nat>outside>pool watermarks)

## Full Context

configure service vprn nat outside pool watermarks

configure router nat outside pool watermarks

## Description

This command configures the watermarks for ports or port-block utilization in a NAT pool.

For CGN and L2-aware NAT, the port and port-block watermarks are used to monitor ports or port-block utilization in a NAT pool. High and low thresholds are configured in percentages of total available port-blocks or ports per protocol in a pool.

For LSN44 pools with flexible port allocation, the watermarks represent the port utilization per outside IP address if paired address pooling is enabled. If an arbitrary address pooling is enabled, then the watermarks represent the port utilization per pool.

For port-block based pools where flexible port allocation is disabled, the watermarks represent port-block occupancy per pool. These watermarks cover combined initial and extended port-blocks in a NAT pool. If the extended port blocks are not enabled in L2-aware NAT, then the L2-aware pool contains only the initial port-blocks.

For the system to generate those events, the NAT event ID is configured as follows:

- 2001 is enabled for L2-aware pools which do not use L2-aware port-block-extensions
- 2003 is enabled for port-blocks based LSN pools

- 2044 is enabled for L2-aware pools which use I2aware port-block-extension
  - 2046 is enabled for port based LSN pools for flexible-port-allocation
- Event IDs are enabled via log event control configuration.

### Default

no watermarks

### Parameters

#### ***high percentage-high***

Specifies the high percentage.

**Values** 1 to 100

#### ***low percentage-low***

Specifies the low percentage.

**Values** 0 to 99

## watermarks

### Syntax

**watermarks high** *high-percentage* **low** *low-percentage*

**no watermarks**

### Context

[\[Tree\]](#) (config>service>nat>up-nat-policy>port-block-extensions watermarks)

### Full Context

configure service nat up-nat-policy port-block-extensions watermarks

### Description

This command configures the extended port block watermarks used to monitor utilization of the port block space per outside IP in a NAT pool reserved for extended port blocks. Configure extended port blocks in addition to the initial port blocks optionally allocated to each NAT subscriber.

The high and low thresholds are configured in percentages of the total extended port blocks per outside IP in a NAT pool. Both values represent extended port-block utilization or occupancy per outside IP in a NAT pool.

**Note:** For the system to generate these events, you must enable the NAT event ID 2045 using the configuration in the log event-control.

The **no** form of this command reverts the watermarks to the default value.

### Default

no watermarks

### Parameters

#### *high-percentage*

Specifies the high threshold value in the percentages of the total extended port-block space per outside IP in a NAT pool .

**Values** 1 to 100

#### *low-percentage*

Specifies the low threshold value in the percentage of the total extended port-block space per outside IP in a NAT pool.

**Values** 0 to 99

## 27.14 weekday

```
weekday
```

## Syntax

```
weekday {weekday-number [..weekday-number] | day-name [..day-name] | all}
```

```
no weekday
```

## Context

[\[Tree\]](#) (config>system>cron>sched weekday)

## Full Context

```
configure system cron schedule weekday
```

## Description

This command specifies which days of the week that the schedule will fire on. Multiple days of the week can be specified. When multiple days are configured, each of them will cause the schedule to occur. If a weekday is configured without configuring the month, weekday, day-of-month, and minute, the event will not execute.

Using the **weekday** command as well as the **day-of month** command will cause the script to run twice. For example, consider that today is Monday January 1. If Tuesday January 5 is configured, the script will run on Tuesday (tomorrow) as well as January 5 (Friday).

The **no** form of this command removes the specified weekday from the configuration.

**Default**

no weekday

**Parameters*****weekday-number***

Specifies a weekday number.

**Values** 1 to 7 (maximum 7 weekday-numbers)

***day-name***

Specifies a day by name.

**Values** sunday, monday, tuesday, wednesday, thursday, friday, saturday  
(maximum 7 weekday names)

**all**

Specifies all days of the week.

**Platforms**

All

## 27.15 weight

### weight

**Syntax**

**weight** *initial-weight-percentage* *weight-change-percentage*

**no weight**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>sla-profile>egress>bonding-selection weight)

**Full Context**

configure subscriber-mgmt sla-profile egress bonding-selection weight

**Description**

This command configures the initial (and also the maximum) weight of the preferred connection and the value with which it can change.

The **no** form of this command resets the weight to the default.

**Default**

weight 100 5

## Parameters

### *initial-weight-percentage*

Specifies the initial or maximum weight, as a percentage of the offered weight.

**Values** 1 to 100

### *weight-change-percentage*

Specifies the weight change, as a percentage.

**Values** 0 to 10

## Platforms

## weight

## Syntax

**weight** *weight*

**no weight**

## Context

[\[Tree\]](#) (conf>router>segment-routing>sr-policies>policy>seg-list weight)

## Full Context

configure router segment-routing sr-policies static-policy segment-list weight

## Description

This command associates a weight value with a segment list of a statically-defined segment routing policy to achieve weighted ECMP behavior. Weight is an optional parameter.

When any segment-list in the active policy has a weight greater than 1, traffic matching the policy is load-balanced across the segment lists according to their relative weight values.

The **no** form of this command reverts to the default value.

## Default

weight 1

## Parameters

### *weight*

Specifies the weight value.

**Values** 1 to 4294967295

## Platforms

All

## 27.16 weight-down

### weight-down

#### Syntax

[no] **weight-down** *lag-ports-down-weight*

#### Context

[\[Tree\]](#) (config>vrrp>policy>priority-event>lag-port-down weight-down)

#### Full Context

configure vrrp policy priority-event lag-port-down weight-down

#### Description

This command creates a context to configure an event set threshold within a lag-port-down priority control event. The weight-down command defines a sub-node within the lag-port-down event and is uniquely identified with the lag-ports-down-weight parameter. Each weight-down node within the same lag-port-down event node must have a unique lag-ports-down-weight value. Each weight-down node has its own priority command that takes effect whenever that node represents the current threshold. A single LAG can use either weight-based (**weight-down**) or port-based (**number-down**) thresholds. The weight-based thresholds are required for correct operation on mixed port-speed LAGs, but can be used for non mixed port-speed LAGs as well. The weights for the **weight-down** node are normalized from the **hash-weight** values of the LAG member ports to fit a 1 to 64 range for 64-link capable LAGs and a 1 to 32 range for other LAGs.

The total number of sub-nodes (uniquely identified by the lag-ports-down-weight parameter) allowed in the system is 2048.

A **weight-down** node is not required for each possible number of ports that could be down. The active threshold is always the closest lower threshold.

The **no** form of the command deletes the event set threshold. The threshold may be removed at any time. If the removed threshold is the current active threshold, the event set thresholds must be re-evaluated after removal.

#### Default

no weight-down

#### Parameters

##### *lag-ports-down-weight*

The total weight of LAG ports down to create a set event threshold. This is the active threshold when the weight of down ports in the LAG equals or exceeds *lag-ports-down-weight*, but does not equal or exceed the next highest configured *lag-ports-down-weight*.

**Values** 1 to 64 (for 64-link capable LAGs)  
1 to 32 (for other LAGs)

configure service vprn bgp-ipvpn mpls auto-bind-tunnel weighted-ecmp

configure service epipe bgp-evpn mpls auto-bind-tunnel weighted-ecmp

configure service vprn bgp-evpn mpls auto-bind-tunnel weighted-ecmp

#### Description

This command enables weighted ECMP for packets using tunnels that a VPRN, VPLS, or Epipe automatically binds to. When weighted ECMP is enabled, packets are sprayed across LSPs in the ECMP according to the outcome of the hash algorithm and the configured load balancing weight of each LSP.

The **no** form of this command disables weighted ECMP for next hop tunnel selection.

#### Default

no weighted-ecmp

## Platforms

All

### weighted-ecmp

#### Syntax

[no] **weighted-ecmp**

## Full Context

configure service vprn bgp-evpn segment-routing-v6 evpn-link-bandwidth weighted-ecmp

configure service vprn bgp-evpn mpls evpn-link-bandwidth weighted-ecmp

configure service vpls bgp-evpn ip-route-link-bandwidth weighted-ecmp

## Description

This command enables the processing of the EVPN link bandwidth extended community when installing an ECMP set for an EVPN IP-Prefix route in the VPRN route-table.

Flows to an IP Prefix received with a weight and a zero ESI value are sprayed according to the weight.

If the EVPN IP Prefix route received with the weight has a non-zero ESI, the weight is divided into the number of PEs attached to the Ethernet Segment (and rounded up if the result is not an integer).

This command also enables the weighted ECMP functionality for BGP CEs where the weight is configured with the **evpn-link-bandwidth add-to-received-bgp** command.

The **no** form of this command disables EVPN link bandwidth extended community.

## Default

no weighted-ecmp

**weighted-ecmp** [strict]

**no weighted-ecmp**

## Context

[\[Tree\]](#) (config>service>vprn weighted-ecmp)

## Full Context

```
configure service vprn weighted-ecmp
```

## Description

This command enables weighted load-balancing for IS-IS, OSPF, and static ECMP routes in the VPRN instance. Weighted ECMP can be performed when all next hops are configured with non-zero load-balancing weights. Weighted ECMP support for IS-IS, OSPF, and static ECMP routes applies to both IPv4 and IPv6.

The **no** form of this command restores regular ECMP spraying of packets to IS-IS, OSPF and static route destinations.

## Default

```
no weighted-ecmp
```

## Parameters

### strict

Enables strict enforcement for a load balancing weight to be configured on each interface within a wECMP interface bundle before the interface is taken into wECMP operation. However, when **strict** enforcement is not enabled, then, when **load-balancing-weight** is not configured on one or more interfaces within the wECMP interface bundle, the wECMP load-balancing falls back to classic ECMP operation and equally share the traffic load across the ECMP interface bundle. A special case is when none of the available paths or next-hops have a load balancing weight associated. Then, the load balancing falls back to classic ECMP.

Strict load balancing is only applied on IS-IS, OSPF, and static route entries.

## weighted-ecmp

## Syntax

**weighted-ecmp** [strict]

**no weighted-ecmp**

## Context

[\[Tree\]](#) (config>router weighted-ecmp)

## Full Context

configure router weighted-ecmp

## Description

This command enables the weighted load-balancing, or weighted ECMP, over MPLS LSP.

When this command is enabled, packets of IGP, BGP, and static route prefixes resolved to a set of ECMP tunnel next-hops are sprayed proportionally to the weights configured for each MPLS LSP in the ECMP set.

Weighted load-balancing over MPLS LSP is supported in the following forwarding contexts:

- IGP prefix resolved to IGP shortcuts in RTM (**igp-shortcut** or **advertise-tunnel-link** enabled in the IGP instance).
- BGP prefix with the BGP next-hop resolved to IGP shortcuts in RTM (**igp-shortcut** or **advertise-tunnel-link** enabled in the IGP instance).
- Static route prefix resolved to an indirect next-hop, which itself is resolved to a set of equal-metric MPLS LSPs in TTM. The user can allow automatic selection or specify the names of the equal-metric MPLS LSPs in TTM to be used in the ECMP set.
- Static route prefix resolved to an indirect next-hop, which is resolved to IGP shortcuts in RTM.
- BGP prefix with a BGP next-hop resolved to a static route, which resolves to a set of tunnel next-hops toward an indirect next-hop in RTM or TTM.
- BGP prefix resolving to another BGP prefix, whose next-hop is resolved to a set of ECMP tunnel next-hops with a static route in RTM or TTM or to IGP shortcuts in RTM.

IGP computes the normalized weight for each prefix tunnel next-hop. IGP updates the route in RTM with the set of tunnel next-hops and normalized weights. RTM downloads the information to IOM for inclusion in the FIB.

If one or more LSPs in the ECMP set of a prefix do not have a weight configured, the regular ECMP spraying for the prefix will be performed.

The weight assigned to an LSP impacts only the forwarding decision, not the routing decision. In other words, it does not change the selection of the set of ECMP tunnel next-hops of a prefix when more next-hops exist than the value of the router **ecmp** option. Once the set of tunnel next-hops is selected, the LSP weight is used to modulate the amount of packets forwarded over each next-hop. It also does not change the hash routine, but only the spraying of the flows over the tunnel next-hops is modified to reflect the normalized weight of each tunnel next-hop.

The **no** form of this command resumes regular ECMP spraying of packets of IGP, BGP, and static route prefixes over MPLS LSP.

## Default

no weighted-ecmp

## Parameters

### strict

Enables strict enforcement for a load balancing weight to be configured on each interface withing a wECMP interface bundle before the interface is taken into wECMP operation. However, when **strict** enforcement is not enabled, then, when **load-balancing-weight** is not configured on one or more interfaces within the wECMP interface bundle, the wECMP load-balancing falls back to classic ECMP operation and equally share the traffic load across the ECMP interface bundle. A special case is when none of the available paths or next-hops have a load balancing weight associated. Then, the load balancing falls back to classic ECMP.

Strict load balancing is only applied on IS-IS, OSPF, and static route entries.

[\[Tree\]](#) (config>service>vpls>provider-tunnel>selective wildcard-spmsi)

#### Full Context

configure service vprn mvpn provider-tunnel inclusive wildcard-spmsi

configure service vpls provider-tunnel selective wildcard-spmsi

#### Description

This command enables RFC 6625 (C-\*, C-\*) S-PMSI functionality for NG-MVPN, EVPN VPLS, or R-VPLS services. When enabled, (C-\*, C-\*) S-PMSI is used instead of I-PMSI for this MVPN, EVPN VPLS, or R-VPLS service. When used in MVPN services, wildcard S-PMSI uses the I-PMSI LSP template.

The **configure service vprn pim rp auto-rp-discovery** command and the following commands are mutually exclusive:

```
configure service vprn mvpn md-type sender-only
configure service vprn mvpn md-type receiver-only
configure service vprn mvpn provider-tunnel inclusive wildcard-spmsi
configure service vpls provider-tunnel selective wildcard-spmsi
```

The **no** form of this command disables the (C-\*, C-\*) S-PMSI functionality.

#### Default

no wildcard-spmsi

## 27.25 window-integrity

### window-integrity

#### Syntax

**window-integrity** *percentage*

**no window-integrity**

#### Context

[\[Tree\]](#) (config>oam-pm>streaming>delay-template window-integrity)

#### Full Context

configure oam-pm streaming delay-template window-integrity

#### Description

This command specifies the integrity of the sample window. A percentage value that suggests the measurement has enough samples (integrity) to be considered representative for that sample window. The configured percentage considers the interval of the test PDUs, and the length of the sample window to determine the number of packets required in the sample.

$((\text{window-integrity } \%) \times (\text{sample-window length (s)} \times \text{pps per test (interval)}))$ .

Ensure that the percentage and the combination of sample window and packet per second per test interval produces the desired results.

If the number of samples in the sample window are equal to or greater than the computed number of required samples, then the value has integrity and the suspect flag is set to false for that streamed result.

If the count is less than the computed number of required samples, then the suspect flag is set to true for that streamed result.

Regardless of the integrity, the average values are streamed. It is up to the higher level systems to interrogate the suspect flag and determine if the value that is set should be used, discarded, or reported separately.

The **no** form of this command reverts to the default.

#### Default

window-integrity 50

## Parameters

### *percentage*

Specifies the window integrity percentage.

**Values** 1 to 100

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## window-integrity

## Syntax

**window-integrity** *percent*

**no window-integrity**

## Context

[\[Tree\]](#) (config>test-oam>link-meas>template>asw window-integrity)

## Full Context

configure test-oam link-measurement measurement-template aggregate-sample-window window-integrity

## Description

This command determines whether the aggregate sample window is integral based on the number of samples received from the sample window, comparing the number of samples to the percentage configured.

The configured percentage translates to a required sample window count that must be included in the aggregate sample window. The range is from 0 to 100. The number of samples is computed as follows:

$(\text{window-integrity } (\%)) \times (((\text{aggregate-sample-window length } (s)) / (\text{sample-window length } (s))))$

For an aggregate sample window that does not reach the integrity, the value is not considered as representative and is used for threshold comparison.

If the number of samples in the aggregate sample window are equal to or greater than the computed number of required samples, the sample window has integrity and the aggregate sample window result is compared to configured sample window thresholds.

If the count is less than the computed number of required samples, the aggregate sample window does not have integrity and the aggregate sample window results are compared to configured sample window thresholds.

If this parameter is not configured, integrity checking is disabled and all results are compared to the configured thresholds.

The **no** form of this command disables integrity checking.

## Default

window-integrity 0

## Parameters

### *percent*

Specifies the percentage of successful sent and received request-response pairs.  
Zero indicates any amount of integrity is acceptable for report to the routing engine.

**Values** 0 to 100

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## window-integrity

### Syntax

**window-integrity** *percent*

**no window-integrity**

### Context

[\[Tree\]](#) (config>test-oam>link-meas>template>sw window-integrity)

### Full Context

configure test-oam link-measurement measurement-template sample-window window-integrity

### Description

This command specifies the integrity of the sample window. A percentage value indicates when the sample window has enough samples to be considered representative for that window (integrity). The configured percentage considers the interval of probes and the length of the sample window to determine the number of packets required in the sample:

$(\text{window-integrity } (\%)) \times (((\text{sample-window length (s)}) / \text{pps per test (interval)}))$

Ensure that the percentage and the combination of sample window and the packet-per-second per test interval produces the desired results.

If the number of samples in the sample window are equal to or greater than the computed number of required samples, the sample window has integrity and the sample window result is compared to the configured sample window thresholds.

If the count is less than the computed number of required samples, the sample window does not have integrity and the sample window results are not compared to configured sample window thresholds.

If this parameter is not configured, integrity checking is disabled and all results are compared to the configured thresholds.

The **no** form of this command disables integrity checking.

### Default

window-integrity 0

## Parameters

### *percent*

Specifies the percentage of successful sent and received request-response pairs.

A value of 0 indicates any amount of integrity acceptable for report to the routing engine.

**Values** 0 to 100

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 27.26 window-size

### window-size

## Syntax

**window-size** *seconds*

**no window-size**

## Context

[\[Tree\]](#) (config>port>ethernet>sym-mon window-size)

## Full Context

configure port ethernet symbol-monitor window-size

## Description

This command specifies sliding window size over which the symbols are sampled to detect signal failure or signal degraded conditions.

## Default

window-size 10

## Parameters

### *seconds*

Specifies the size of the sliding window in seconds over which the errors are measured.

**Values** 5 to 60

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## window-size

### Syntax

**window-size** *seconds*

**no window-size**

### Context

[\[Tree\]](#) (config>port>ethernet>crc-monitor window-size)

### Full Context

configure port ethernet crc-monitor window-size

### Description

This command specifies sliding window size over which the Ethernet frames are sampled to detect signal fail or signal degrade conditions. The command is used jointly with the *sf-threshold* and the *sd-threshold* to configure the sliding window size.

The **no** version of this command reverts to the default value of 10 seconds.

### Default

no window-size

### Parameters

*seconds*

The size of the sliding window in seconds over which the errors are measured.

**Values** 5 to 60

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 27.27 wlan-gw

### Full Context

```
configure service vprn subscriber-interface group-interface wlan-gw
configure router wlan-gw
configure subscriber-mgmt wlan-gw
configure service ies subscriber-interface group-interface wlan-gw
configure service vprn radius-proxy server wlan-gw
configure service vprn wlan-gw
configure service vpls wlan-gw
configure router radius-proxy server wlan-gw
```

### Description

Commands in this context configure WLAN GW parameters.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## wlan-gw

### Syntax

[no] wlan-gw

### Context

**[Tree]** (debug wlan-gw)

### Full Context

```
debug wlan-gw
```

### Description

This node contains all the parameters to set up specific call-trace debug sessions for WLAN-GW. The **no** form of this command will stop all configured WLAN-GW traces.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## wlan-gw

### Syntax

**wlan-gw**

### Context

[\[Tree\]](#) (config>li>li-source wlan-gw)

### Full Context

configure li li-source wlan-gw

### Description

This command enables the **wlan-gw** context to configure li-source related parameters.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 27.28 wlan-gw-group

## wlan-gw-group

### Syntax

**wlan-gw-group** *nat-group-id*

**no wlan-gw-group**

### Context

[\[Tree\]](#) (config>router>wlan-gw>xconnect wlan-gw-group)

[\[Tree\]](#) (config>service>vprn>wlan-gw>xconnect wlan-gw-group)

### Full Context

configure router wlan-gw xconnect wlan-gw-group

configure service vprn wlan-gw xconnect wlan-gw-group

### Description

This command configures the identifier of the WLAN Gateway ISA group that processes the cross-connect.

The **no** form of this command removes the NAT group IP from the cross-connect configuration.

### Parameters

***nat-group-id***

Specifies the identifier of the ISA group.

**Values** 1 to 4

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## wlan-gw-group

### Syntax

**wlan-gw-group** *group-id*

**no wlan-gw-group**

### Context

[\[Tree\]](#) (config>router>vrgw>lanext wlan-gw-group)

### Full Context

configure router vrgw lanext wlan-gw-group

### Description

This command specifies the WLAN GW group that is used for HLE services.

The **no** form of this command removes the group from the configuration.

### Parameters

***group-id***

Specifies the WLAN GW group ID.

**Values** 1 to 4

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## wlan-gw-group

### Syntax

**wlan-gw-group** *wlan-gw-group-id* [**member** *member-id*]

**no wlan-gw-group**

### Context

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>ue-query wlan-gw-group)

### Full Context

configure subscriber-mgmt wlan-gw ue-query wlan-gw-group

## Description

This command enables matching on UEs, based on the WLAN-GW group ID and, optionally, the specific ISA member they are installed on.

The **no** form of this command disables matching on the WLAN-GW group.

## Default

no wlan-gw-group

## Parameters

### *wlan-gw-group-id*

Specifies the WLAN-GW group ID.

**Values** 1 to 4

### *member-id*

Specifies the ISA member ID within the group.

**Values** 1 to 255

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## wlan-gw-group

## Syntax

**wlan-gw-group** *group-id* [**create**] [**redundancy** *unit*]

**no wlan-gw-group** *group-id*

## Context

[\[Tree\]](#) (config>isa wlan-gw-group)

## Full Context

configure isa wlan-gw-group

## Description

This command creates a WLAN GW group that contains a set of ISAs to be used in WLAN-GW functionality. A WLAN-GW group can also be used where a NAT group is expected. The WLAN-GW group ID shares the same number space with the NAT group.

At most, one WLAN-GW group may be configured.

The optional redundancy parameter determines the provisioning and redundancy mode.

- IOM mode

A whole IOM is added to the group. The IOM must be fully provisioned with BB ISA modules. In IOM mode, when a single ISA fails, the entire IOM is considered to have failed and all subscribers are recovered on a backup IOM.

- **ISA mode**

BB ISA modules are added separately with no restriction put on other MDAs in the IOM. When a single ISA fails, a backup ISA will try to recover as many subscribers as possible but may run out of resources (for example, queues, policers, host entries) during the recovery process. It is recommended to pair ISAs with MDAs and services that do not consume many IOM resources.

The **no** form of this command removes the group.

## Parameters

### *group-id*

Specifies WLAN Gateway Integrated Service Adaptor (ISA) Groups.

**Values** 1 to 4

### *unit*

Specifies the provisioning and redundancy mode.

**Values** mda or iom

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## wlan-gw-group

## Syntax

**wlan-gw-group** *group-id*

**no wlan-gw-group**

## Context

## Full Context

configure service vprn subscriber-interface wlan-gw pool-manager wlan-gw-group

configure service ies subscriber-interface wlan-gw pool-manager wlan-gw-group

## Description

This command specifies the ISA WLAN gateway group.

## Parameters

### *nat-group-id*

Specifies the identifier of the WLAN gateway group.

**Values** 1 to 4

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## wlan-gw-group

## Syntax

**wlan-gw-group** *nat-group-id*

**no wlan-gw-group**

## Context

[\[Tree\]](#) (config>service>vpls>wlan-gw wlan-gw-group)

## Full Context

configure service vpls wlan-gw wlan-gw-group

## Description

This command configures a WLAN-GW group to be used as an endpoint within the VPLS. This feature is used in conjunction with the **configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range dynamic-service** command for a VPRN service and the **configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range dynamic-service** command for an IES service.

The **no** form of the command removes the WLAN-GW group as the endpoint.

See "Dynamic VPLS service" in the *7450 ESS, 7750 SR, and VSR Triple Play Service Delivery Architecture Guide* for more information about the dynamic VPLS service feature.

## Parameters

### *nat-group-id*

Specifies the NAT group ID of the WLAN-GW group to be used as an endpoint.

**Values** 1 to 4

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 27.29 working-circuit

### working-circuit

## Syntax

**working-circuit** *port-id* [**number** *number*]

**no work-circuit** [**number** *number*]

## Context

[\[Tree\]](#) (config>port>aps working-circuit)

## Full Context

configure port aps working-circuit

## Description

This command configures a physical port that will act as the working circuit for this APS group. The working circuit port must contain only the default configuration and cannot be part of another APS group. The working circuit must be created before the protection circuit.

When a port is a working circuit of an APS group, the configuration available under **config>port** *port-id* context (including submenus) is not allowed for that port unless it is a part of the noted exceptions.

When a port is being configured as a working circuit of an APS group, all common configuration as described above and all service configurations related to the APS port is operationally inherited by the working circuit from the *aps- group-id*. If the working circuit cannot inherit that configuration, for example, due to resource limitations, the configuration attempt fails and an error is returned to the user.

Before a working circuit can be removed from an APS group, the working circuit port must be shutdown. The inherited configuration for the circuit and APS operational commands for that circuit are not preserved when the circuit is removed from the APS group.

Note that all configurations for *aps-group-id* under the **config>port** context and its submenus and all configuration for services that use this *aps- group-id* is preserved as a non-activated configuration since the APS group no longer has any physical circuits assigned.

The **no** form of this command removes the working-circuit. The working circuit can only be removed from the configuration after the protect circuit has been removed.

## Parameters

### *port-id*

Specifies the physical port that will act as the working circuit for this APS group in the following format:

<i>port-id</i>	<i>slot/mda/port</i>		
	eth-sat-id	<i>esat-id/slot/port</i>	
		esat	keyword
		<i>id</i>	1 to 20
	pxc-id	<i>pxc-id.sub-port</i>	
		pxc	keyword
		<i>id</i>	1 to 64
		<i>sub-port</i>	a, b

### *number*

Specifies the APS channel number; value is 1 or 2.

### Modifying Hold-Down Timer Values

Note that for APS configurations, the **config>port>sonet-sdh hold-time down** and **config>port>sonet-sdh hold-time up** default values are 100 ms and 500 ms respectively. But, if there is a large difference in the transmission delay between the APS working () and protect line ( **config>port>aps protect-circuit**), it is highly recommended that you increase the default timer on the working line accordingly with the transmission delay present on the protect line.

The following output shows an example of the timers on POS interfaces.

## 27.30 working-tp-path

### working-tp-path

#### Syntax

[no] working-tp-path

#### Context

[\[Tree\]](#) (config>router>mpls>lsp working-tp-path)

#### Full Context

configure router mpls lsp working-tp-path

#### Description

This command creates or edits the working path for an MPLS-TP LSP. At least one working path (but not more than one working path) must be created for an MPLS-TP LSP. If MPLS-TP linear protection is also configured, then this is the path that is used as the default working path for the LSP, and it must be created prior to the protect path. The working-tp-path can only be deleted if no protect-tp-path exists for the LSP.

The following commands are applicable to the working-tp-path: **lsp-num**, **in-label**, **out-label**, **mep**, **shutdown**.

#### Default

no working-tp-path

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 27.32 wrap-around

wrap-around

**Syntax**

[no] wrap-around

**Context**

[\[Tree\]](#) (config>filter>log wrap-around)

**Full Context**

configure filter log wrap-around

**Description**

This command configures a memory filter log to log until full or to store the most recent log entries (circular buffer).

Specifying **wrap-around** configures the memory filter log to store the most recent filter log entries (circular buffer). When the log is full, the oldest filter log entries are overwritten with new entries.

The **no** form of the command configures the memory filter log to accept filter log entries until full. When the memory filter log is full, filter logging for the log filter ID ceases.

### Default

wrap-around

### Platforms

All

## 27.33 wred-queue

### wred-queue

#### Syntax

**wred-queue** [**policy** *slope-policy-name*] [**mode** *mode*] [**slope-usage** *slope-usage*]

**no wred-queue**

#### Context

[\[Tree\]](#) (config>qos>sap-egress>queue wred-queue)

#### Full Context

configure qos sap-egress queue wred-queue

#### Description

This command allows the configuration of WRED per queue with the following options:

- Native hardware WRED

This uses the hardware per queue WRED capabilities of FP3- and higher-based hardware and is configured with the **native** keyword.

- Pool per queue WRED

This implements each queue in its own pool and uses the WRED capabilities of the pool to provide WRED per queue. This is configured with the **pool-per-queue** keyword.

#### Native Hardware WRED

When the **wred-queue mode native** command is configured, the queue uses the WRED capabilities of FP3- and higher-based hardware. In this case, the out-of-profile and exceed-profile traffic map to the low and exceed WRED slopes specified within the slope policy, and the in-plus-profile and in-profile traffic uses the MBS drop tail; this requires the **slope-usage** to be configured as **exceed-low**. The instantaneous queue depth is compared against the low and exceed slopes so the time average factor in the slope policy is ignored.

When a policy is not explicitly defined, the default slope policy is used.

When **native** mode is enabled for a queue, the **pool** and **drop-tail** commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

This is only supported on FP3 hardware.

The **no** form of this command restores the queue default congestion control behavior to the queue.

### Pool-per-queue WRED

When the **wred-queue mode pool-per-queue** command is defined and the queue ID is created, a buffer pool is created specifically for the queue and the queue obtains all buffers from that pool. The size of the pool is the same as the size of the queue. In this manner, the WRED slopes that operate based on the pool's buffer utilization are also reacting to the congestion depth of the queue.

The size of the buffer pool is dictated by the queue's MBS parameter. The size of the reserved CBS portion of the buffer pool is dictated by the queue's CBS parameter. The provisioning characteristics of the **mbs** and **cbs** commands are not changed.

In the case where this is applied with WRED queue support shutdown (**config>card>fp>egress>wred-queue-control>shutdown**), the queue will continue to map to its default pool. If the **no shutdown** command is executed in the **wred-queue-control** context, the queue is automatically moved to its own WRED pool.

Each pool created for a queue using the **wred-queue** command shares buffers with all other **wred-queue** enabled queues on the same forwarding plane. The WRED pool buffer management behavior is defined within the **config>card>fp>egress>wred-queue-control** CLI context.

The WRED slopes within the pool are defined by the slope policy associated with the queue. When a policy is not explicitly defined, the default slope policy is used. The slope policy enables, disables, and defines the relative geometry of the highplus, high, low, and exceed WRED slopes in the pool. The policy also specifies the time average factor used by the pool when calculating the weighted average pool depth.

As packets attempt to enter the egress queue, they are associated with the highplus, high, low, or exceed WRED slope based on the packet's profile. If the packet is inplus-profile, the highplus slope is used. If the packet is in-profile, the high slope is used. If the packet is out-of-profile, the low slope is used. If the packet is exceed-profile, the exceed slope is used. This mapping of packet profile to slope is enabled using the **slope-usage default** parameter. Each WRED slope performs a probability discard based on the current weighted average pool depth.

When **wred-queue** is enabled for a SAP egress queue, the queue **pool** and **drop-tail** commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

The resource usage for the WRED queue pool-per-queue per forwarding plane can be seen in the **tools dump resource-usage card [ slot-num ] fp [fp-number]** output under *Dynamic Q2 Wred Pools*.

The **no** form of this command restores the generic buffer pool behavior to the queue. The WRED pool is removed from the system. The queue will be moved to the default buffer pool. The queue then uses the default congestion control behavior.

### Default

no wred-queue

### Parameters

#### **slope-policy-name**

Specifies an existing slope policy that is used to override the default WRED slope policy.

#### **mode**

Specifies whether the WRED per queue is using the native FP3- and higher-based hardware WRED capabilities or pool per queue.

**Values** **native** — uses the hardware per queue WRED capabilities of the FP3- and higher-based hardware and requires **slope-usage exceed-low**.

**pool-per-queue** — each queue uses its own pool and the WRED capabilities of the pool to provide WRED per queue. This is supported on both FP2- and higher-based hardware and requires **slope-usage default**.

**Default** native

### **slope-usage**

Specifies congestion control to be used.

**Values** **default** — maps the inplus, in, out, and exceed-profile traffic to the highplus, high, low, and exceed WRED slopes, respectively; this is only supported for **pool-per-queue** mode.

**exceed-low** — maps the out and exceed-profile traffic to the low and exceed WRED slopes with the inplus and in-profile traffic using the MBS drop tail. This is only supported for **native** mode.

**Default** exceed-low

## **Platforms**

All

## wred-queue

### **Syntax**

```
wred-queue [policy slope-policy-name] [mode {native | pool-per-queue}] [slope-usage {default | exceed-low}]
```

```
no wred-queue
```

### **Context**

[\[Tree\]](#) (config>qos>qgrps>egr>qgrp>queue wred-queue)

### **Full Context**

```
configure qos queue-group-templates egress queue-group queue wred-queue
```

### **Description**

This command allows the configuration of WRED per queue with the following options:

- Native hardware WRED

This uses the hardware per queue WRED capabilities of FP3- and higher-based hardware and is configured with the **native** keyword.

- Pool per queue WRED

This implements each queue in its own pool and uses the WRED capabilities of the pool to provide WRED per queue. This is configured with the **pool-per-queue** keyword.

### Native Hardware WRED

When the **wred-queue mode native** command is configured, the queue uses the WRED capabilities of FP3- and higher-based hardware. In this case, the out and exceed-profile traffic map to the low and exceed WRED slopes specified within the slope policy, and the inplus and in-profile traffic uses the MBS drop tail; this requires the **slope-usage** to be configured as **exceed-low**. The instantaneous queue depth is compared against the low and exceed slopes so the time average factor in the slope policy is ignored.

When a policy is not explicitly defined, the default slope policy is used.

When **native** mode is enabled for a queue, the drop-tail commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

Native hardware WRED is supported on FP3- and higher-based hardware and is ignored on FP2 hardware.

The **no** form of this command restores the queue default congestion control behavior to the queue.

### Pool-per-queue WRED

When the **wred-queue mode pool-per-queue** command is defined and the queue ID is created, a buffer pool is created specifically for the queue and the queue obtains all buffers from that pool. The size of the pool is the same as the size of the queue. In this manner, the WRED slopes that operate based on the pool's buffer utilization are also reacting to the congestion depth of the queue.

The size of the buffer pool is dictated by the queue's **mbs** parameter. The size of the reserved CBS portion of the buffer pool is dictated by the queue's **cbs** parameter. The provisioning characteristics of the **mbs** and **cbs** commands are not changed.

In the case where this is applied with WRED queue support shut down (**config>card>fp>egress>wred-queue-control>shutdown**), the queue will continue to map to its default pool. If the **no shutdown** command is executed in the **wred-queue-control** context, the queue will be automatically moved to its own WRED pool.

Each pool created for a queue using the **wred-queue** command shares buffers with all other **wred-queue** enabled queues on the same forwarding plane. The WRED pool buffer management behavior is defined within the **config>card>fp>egress>wred-queue-control** CLI context.

The WRED slopes within the pool are defined by the slope policy associated with the queue. When a policy is not explicitly defined, the default slope policy is used. The slope policy enables, disables, and defines the relative geometry of the highplus, high, low, and exceed WRED slopes in the pool. The policy also specifies the time average factor used by the pool when calculating the weighted average pool depth.

As packets attempt to enter the egress queue, they are associated with the highplus, high, low, or exceed WRED slope based on the packet's profile. If the packet is inplus-profile, the highplus slope is used. If the packet is in-profile, the high slope is used. If the packet is out-of-profile, the low slope is used, and if the packet is exceed-profile, the exceed slope is used. This mapping of packet profile to slope is enabled using the **slope-usage default** parameter. Each WRED slope performs a probability discard based on the current weighted average pool depth.

When **wred-queue** is enabled for an egress queue group queue, the queue pool and drop-tail commands are ignored; traffic mapped to a slope that is shut down will use the MBS drop tail.

The resource usage for the **wred-queue pool-per-queue** per forwarding plane can be seen in the **tools dump resource-usage card [ slot-num ] fp [fp-number]** output under *Dynamic Q2 Wred Pools*.

The **no** form of this command restores the generic buffer pool behavior to the queue. The WRED pool is removed from the system. The queue will be moved to the default buffer pool. The queue then uses the default congestion control behavior.

## Default

no wred-queue

## Parameters

### *slope-policy-name*

Specifies an existing slope policy that is used to override the default WRED slope policy.

### mode {native | pool-per-queue}

Specifies whether the WRED per queue is using the native FP3- and higher-based hardware WRED capabilities or pool per queue.

**Values**    **native** - Each queue uses the hardware per queue WRED capabilities of the FP3- and higher-based hardware and requires **slope-usage exceed-low**.

**pool-per-queue** - Each queue uses its own pool and the WRED capabilities of the pool to provide WRED per queue. This requires **slope-usage default**.

**Default**    native

### slope-usage {default | exceed-low}

Specifies the type of congestion control to be used.

**Values**    **default** - Maps the inplus-profile, in-profile, out-of-profile, and exceed-profile traffic to the highplus, high, low, and exceed WRED slopes, respectively; this is only supported for **pool-per-queue** mode.

**exceed-low** - Maps the out-of-profile and exceed-profile traffic to the low and exceed WRED slopes, with the inplus-profile and in-profile traffic using the MBS drop tail. This option is only supported for **native** mode.

**Default**    exceed-low

## Platforms

## 27.34 wred-queue-control

## wred-queue-control

### Syntax

**wred-queue-control**

### Context

[\[Tree\]](#) (config>card>fp>egress wred-queue-control)

### Full Context

configure card fp egress wred-queue-control

### Description

Commands in this context configure the aggregate WRED queue parameters for all WRED queues on an egress forwarding plane.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 27.35 write

## write

### Syntax

**write** {*user-name* | *broadcast*} *message*

### Context

[\[Tree\]](#) (write)

### Full Context

write

### Description

This command sends a console message to a specific user or to all users with active console sessions.

### Parameters

#### *user-name*

Specifies the name of a user, up to 32 characters, with an active console session to which to send a console message.

**Values** any valid CLI username

#### *broadcast*

Sends the *message-string* to all users logged into the router.

**message**

Specifies the message string to send. Allowed values are any string, up to 256 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

**Platforms**

All

## 27.36 write-algorithm

### write-algorithm

**Syntax**

**write-algorithm** {**hash** | **hash2** | **custom** | **cleartext**}

**no write-algorithm**

**Context**

[\[Tree\]](#) (config>system>security>management-interface>classic-cli write-algorithm)

**Full Context**

configure system security management-interface classic-cli write-algorithm

**Description**

This command specifies how encrypted configuration secrets are output from the system. For example, how encrypted secrets are displayed in the output of the info command, and how they are written to the saved configuration file.

The **no** form of this command reverts to the default value.

**Default**

write-algorithm hash2

**Parameters****hash**

Specifies hash. Use this option to transport a phrase between modules and nodes. In this case the read-algorithm should be **hash** as well.

**hash2**

Specifies hash2 which is module-specific.

**custom**

Specifies the custom encryption to management interface.

**cleartext**

Specifies that the phrase is displayed as cleartext everywhere.

## Platforms

All

## 27.37 wrr-group

### wrr-group

#### Syntax

**wrr-group** *group-id* **sched-class** *class-id*

**wrr-group** *group-id* **unattached**

**no wrr-group** *group-id*

#### Context

[\[Tree\]](#) (config>qos>hs-attachment-policy wrr-group)

#### Full Context

```
configure qos hs-attachment-policy wrr-group
```

#### Description

This command defines how the specified group ID is attached to the scheduler. A WRR group may have one of two attachment states:

- directly attached to a scheduler class
- unattached

A WRR group provides a weighted scheduling context for its member queues, collapsing the queues into a single scheduling class.

The following WRR membership restrictions apply:

- Two groups are supported: WRR-group 1 and WRR-group 2.
- Up to six of the eight queues can become members of WRR groups (the sum of the membership of both groups cannot exceed six queues). All six queues can be placed in a single WRR group or they can be spread between the two groups.
- All queues within a group must have contiguous queue IDs.
- When both groups are configured to have queue members, the queue IDs in group 1 must be lower than the queue IDs in group 2.

The **queue** *queue-id* attachment command is used to define WRR group membership.

The **no** form of the command reverts to the default unattached attachment state for the group ID.

#### Default

```
wrr-group group-id unattached
```

## Parameters

### *group-id*

Specifies the WRR group identifier. The *group-id* parameter is required when executing the **wrr-group** attachment command.

**Values** 1, 2

### **sched-class**

Specifies a direct attachment between the WRR group and one of the six scheduling classes. The **sched-class** and **unattached** keywords are mutually exclusive. One of the keywords must be specified when the **wrr-group** attachment command is executed.

### *class-id*

Specifies the scheduling class associated with this WRR group. The **sched-class** keyword specifies the attachment between the group ID and one of the six scheduling classes. A value of 1 through 6 must accompany the **sched-class** keyword representing the WRR group's attached scheduling class. Only one queue or WRR group can be attached to a given scheduling class. If another queue or a WRR group is currently attached to the specified scheduling class, the **wrr-group** attachment command fails and the current attachment for the *group-id* is unchanged.

**Values** 1 to 6

### **unattached**

Indicates that the group ID is not attached to any scheduling class or WRR group. Queues that are members of the unattached WRR group do not forward any packets. The **sched-class** and **unattached** keywords are mutually exclusive. One of the keywords must be specified when the **wrr-group** attachment command is executed.

## Platforms

7750 SR-7/12/12e

## 27.38 wtr-annexb

### wtr-annexb

#### Syntax

**wtr-annexb** *minutes*

#### Context

[\[Tree\]](#) (config>port>aps wtr-annexb)

#### Full Context

configure port aps wtr-annexb

**Description**

This command waits to restore for Annex B mode operation. The delay after which the newly active section becomes the primary section after a switch-over from the primary section to the secondary section occurs and the switch request clears normally.

**Parameters*****minutes***

Specifies the time, in minutes, to wait to restore for Annex B mode operation.

**Values** 0 to 60

**Default** 5

**Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

**Syntax**

x3

**Context**

[\[Tree\]](#) (config>li>x-interfaces x3)

**Full Context**

configure li x-interfaces x3

**Description**

Commands in this context configure the LI X3 interface.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 28.5 xc

### XC

#### Syntax

**xc** [detail]

**no xc**

#### Context

[\[Tree\]](#) (debug>router>mpls>event xc)

#### Full Context

debug router mpls event xc

#### Description

This command debugs cross connect events.

The **no** form of the command disables the debugging.

#### Parameters

**detail**

Displays detailed information about cross connect events.

#### Platforms

All

## 28.6 xcon

### XCON

#### Syntax

[no] **xcon**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>tunnel-query>ue-state xcon)

**Full Context**

```
configure subscriber-mgmt wlan-gw tunnel-query ue-state xcon
```

**Description**

This command enables matching on tunnels with cross-connect UEs.

The **no** form of this command disables matching on cross-connect UEs, unless UE state matching is disabled altogether.

**Default**

```
no xcon
```

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 28.7 xconnect

### xconnect

**Syntax**

```
xconnect
```

**Context**

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>wlan-gw>vlan-tag-ranges>range xconnect)

[\[Tree\]](#) (config>router>wlan-gw xconnect)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>wlan-gw>vlan-tag-ranges>range xconnect)

**Full Context**

### Full Context

configure card xiom mda xconnect

configure card mda xconnect

### Description

This command creates a loopback (cross-connect) in the MAC chip and does not require a faceplate port.

### Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

- configure card xiom mda xconnect

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

- configure card mda xconnect

## 28.8 xconnect-tunnel-home-address

### xconnect-tunnel-home-address

### Syntax

**[no] xconnect-tunnel-home-address**

### Context

**[Tree]** (config>subscr-mgmt>acct-plcy>include-radius-attribute xconnect-tunnel-home-address)

**[Tree]** (config>subscr-mgmt>auth-plcy>include xconnect-tunnel-home-address)

### Full Context

configure subscriber-mgmt radius-accounting-policy include-radius-attribute xconnect-tunnel-home-address

configure subscriber-mgmt authentication-policy include-radius-attribute xconnect-tunnel-home-address

## Description

This command enables the generation of the Cross Connect Tunnel Home Address RADIUS attribute. The **no** form of the command reverts to the default value.

## Default

no xconnect-tunnel-home-address

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## xconnect-tunnel-home-address

## Syntax

[no] xconnect-tunnel-home-address

## Context

**[Tree]** (config>aaa>isa-radius-plcy>acct-include-attributes xconnect-tunnel-home-address)

**[Tree]** (config>aaa>isa-radius-plcy>auth-include-attributes xconnect-tunnel-home-address)

## Full Context

configure aaa isa-radius-policy acct-include-attributes xconnect-tunnel-home-address

configure aaa isa-radius-policy auth-include-attributes xconnect-tunnel-home-address

## Description

This command enables the cross connect tunnel home address RADIUS attribute.

## Default

no xconnect-tunnel-home-address

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 28.9 xconnect-tunnel-local-ipv6-address

## xconnect-tunnel-local-ipv6-address

## Syntax

[no] xconnect-tunnel-local-ipv6-address

**Context**

[\[Tree\]](#) (config>aaa>isa-radius-plcy>acct-include-attributes xconnect-tunnel-local-ipv6-address)

**Full Context**

configure aaa isa-radius-policy acct-include-attributes xconnect-tunnel-local-ipv6-address

**Description**

This command enables the generation of the cross connect tunnel local IPv6 address RADIUS attribute.

**Default**

no xconnect-tunnel-local-ipv6-address

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 28.10 xconnect-tunnel-remote-ipv6-address

xconnect-tunnel-remote-ipv6-address

**Syntax**

[no] xconnect-tunnel-remote-ipv6-address

**Context**

[\[Tree\]](#) (config>aaa>isa-radius-plcy>acct-include-attributes xconnect-tunnel-remote-ipv6-address)

**Full Context**

configure aaa isa-radius-policy acct-include-attributes xconnect-tunnel-remote-ipv6-address

**Description**

This command enables the generation of the cross connect tunnel remote IPv6 address RADIUS attribute.

**Default**

no xconnect-tunnel-remote-ipv6-address

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 28.11 xconnect-tunnel-service

## xconnect-tunnel-service

### Syntax

[no] xconnect-tunnel-service

### Context

[\[Tree\]](#) (config>aaa>isa-radius-plcy>acct-include-attributes xconnect-tunnel-service)

### Full Context

configure aaa isa-radius-policy acct-include-attributes xconnect-tunnel-service

### Description

This command enables the generation of the cross connect tunnel service RADIUS attribute.

### Default

no xconnect-tunnel-service

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 28.12 xconnect-tunnel-type

## xconnect-tunnel-type

### Syntax

[no] xconnect-tunnel-type

### Context

[\[Tree\]](#) (config>aaa>isa-radius-plcy>acct-include-attributes xconnect-tunnel-type)

### Full Context

configure aaa isa-radius-policy acct-include-attributes xconnect-tunnel-type

### Description

This command enables the generation of the cross connect tunnel type RADIUS attribute.

### Default

no xconnect-tunnel-type

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 28.13 xgig

xgig

### Syntax

**xgig** {lan | wan}

### Context

[\[Tree\]](#) (config>port>ethernet xgig)

### Full Context

configure port ethernet xgig

### Description

This command configures a 10 Gb/s interface to be in Local or Wide Area Network (LAN or WAN) mode. When configuring the port to be in WAN mode certain SONET/SDH parameters can be changed to reflect the SONET/SDH requirements for this port.

When the port is configured for LAN mode, all SONET/SDH parameters are pre-determined and not configurable.

### Default

xgig lan

### Parameters

**lan**

Sets the port to operate in LAN mode.

**wan**

Sets the port to operate in WAN mode.

### Platforms

All

## 28.14 xiom

xiom

### Syntax

[no] xiom

## Context

[\[Tree\]](#) (config>card xiom)

## Full Context

configure card xiom

## Description

This command configures an XIOM in one of the slots of an XCM. An XIOM can be used instead of an XMA and operates as a carrier module to support MDA-s modules.

## Parameters

### *xiom-slot*

Specifies the XIOM identifier.

**Values** x1 or x2

## Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

## 28.15 xiom-type

### xiom-type

## Syntax

**xiom-type** *xiom-type* [ **level** *xiom-level* ]

**no xiom-type**

## Context

[\[Tree\]](#) (config>card>xiom xiom-type)

## Full Context

configure card xiom xiom-type

## Description

This command adds an XIOM to the device configuration for the slot. The XIOM type can be preprovisioned, which means that the XIOM does not have to be installed in the chassis.

An XIOM must be provisioned before an MDA-s, connector, or port can be configured.

An XIOM can only be provisioned in a slot that is vacant. No other XIOM or XMA can be provisioned (configured) for that particular slot. To reconfigure a slot position, use the **no** form of this command to remove the current information.

An XIOM can only be provisioned in a slot if the XIOM type is allowed in the slot. An error message is generated if an attempt is made to provision an XIOM type that is not allowed.

If an XIOM is inserted that does not match the configured XIOM type for the slot, then a log event and a facility alarm are raised. The alarm is cleared when the correct XIOM type is installed or the configuration is modified.

A log event and a facility alarm are raised if an administratively enabled XIOM is removed from the chassis. The alarm is cleared when the correct XIOM type is installed or the configuration is modified. A log event is issued when a XIOM is removed that is administratively disabled.

XIOMs are controlled by hardware and software licensing. For these cards, the license level must be provisioned in addition to the XIOM type. An XIOM cannot become operational unless the provisioned license level matches the license level of the card installed into the slot. The set of license levels varies by XIOM type.

The provisioned license level controls aspects related to connector provisioning and the consumption of hardware egress queues and egress policers. Changes to the provisioned license level may be blocked if a configuration exists that would not be permitted with the new target license level.

If the license level is not specified, the level is set to the highest license level for that XIOM.

The **no** form of this command removes the XIOM from the configuration.

## Parameters

### ***xiom-type***

Specifies the type of XIOM to be configured and installed in the slot. Values for this attribute vary by platform and release. The release notes include a listing of all supported xiom-types and their CLI strings. In addition, the command can be queried to check which xiom-types are relevant for the active platform type.

### ***xiom-level***

Specifies the license level of the XIOM, up to 32 characters. Possible values vary by XIOM type.

## Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

## 29 y Commands

### 29.1 yang-modules

#### yang-modules

##### Syntax

**yang-modules**

##### Context

**[Tree]** (config>system>management-interface yang-modules)

##### Full Context

configure system management-interface yang-modules

##### Description

Commands in this context configure YANG module parameters.

The **yang-modules** settings affect the data sent in a NETCONF <hello>, data populated in the RFC 6022 /netconf-state/schemas list, data returned in a <get-schema> request, and data populated in the RFC 8525 /yang-library. See the *7450 ESS*, *7750 SR*, *7950 XRS*, and *VSR System Management Guide*, sections "NETCONF Monitoring" and "YANG Library" for more information.

##### Platforms

All

## 30 z Commands

### 30.1 zone

#### zone

##### Syntax

**zone** {*std-zone-name* | *non-std-zone-name*} [ *hh* [:*mm*]]

**no zone**

##### Context

[\[Tree\]](#) (config>system>time zone)

##### Full Context

configure system time zone

##### Description

This command sets the time zone and/or time zone offset for the device.

The SR-series router OS supports system-defined and user-defined time zones. The system-defined time zones are listed in the Time Zones section.

For user-defined time zones, the zone and the UTC offset must be specified.

The **no** form of the command reverts to the default of Coordinated Universal Time (UTC). If the time zone in use was a user-defined time zone, the time zone will be deleted. If a **dst-zone** command has been configured that references the zone, the summer commands must be deleted before the zone can be reset to UTC.

##### Default

zone UTC 00

##### Parameters

###### **std-zone-name**

Specifies the standard time zone name. The standard name must be a system-defined zone in the Time Zones section. For zone names in the table that have an implicit summer time setting, for example MDT for Mountain Daylight Saving Time, the remaining **start-date**, **end-date** and **offset** parameters do not need to be provided unless it is necessary to override the system defaults for the time zone.

For system-defined time zones, a different offset cannot be specified. If a new time zone is needed with a different offset, the user must create a new time zone. Note that some system-defined time zones have implicit summer time settings which causes the

switchover to summer time to occur automatically; configuring the **config>system>time dst-zone** command is not required.

A user-defined time zone name is case-sensitive and can be up to 5 characters in length.

**Values** A user-defined value can be up to 5 characters or one of the following values: GMT, WET, CET, EET, EEST, MSK, MSD, AST, NST, EST, CST, MST, PST, HST, AKST, AWST, ACST, AEST, NZST, UTC

#### ***non-std-zone-name***

Specifies the non-standard time zone name. The name can be up to 5 characters.

#### ***hh [:mm]***

Specifies the hours and minutes offset from UTC time, expressed as integers. Some time zones do not have an offset that is an integral number of hours. In these instances, the *minutes-offset* must be specified. For example, the time zone in Pirlanngimpi, Australia UTC + 9.5 hours.

**Values** hours: -11 to 12 minutes: 0 to 59

**Default** hours: 0 minutes: 0

### **Platforms**

All

## **30.2 zone-channel**

### **zone-channel**

#### **Syntax**

**zone-channel** *mcast-address* **source** *ip-address* **adi-channel-name** *channel-name*

**no zone-channel** *mcast-address* **source** *ip-address*

#### **Context**

**[Tree]** (config>service>ies>video-interface>channel zone-channel)

**[Tree]** (config>service>vprn>video-interface>channel zone-channel)

#### **Full Context**

configure service ies video-interface channel zone-channel

configure service vprn video-interface channel zone-channel

#### **Description**

This command configures zone-channel parameters or ad insertion. The channel configuration along with the zone-channel configuration associates a network channel to a zone-channel and builds the store and forward relationship.

**Parameters*****mcast-address***

Specifies the IP multicast group address for which this entry contains information.

***source ip-address***

Specifies the type of address to be used for a source address.

***adi-channel-name channel-name***

Specifies the name for this zone channel.
