**no client-cipher-list** *name*

## Context

[\[Tree\]](#) (config>system>security>tls client-cipher-list)

## Full Context

configure system security tls client-cipher-list

## Description

This command creates a cipher list that the client sends to the server in the client Hello message. It is a list of ciphers that are supported and preferred by the SR OS to be used in the TLS session. The server matches this list against the server cipher list. The most preferred cipher found in both lists is chosen.

## Parameters

### *name*

Specifies the name of the client cipher list, up to 32 characters in length.

### **create**

Keyword used to create the client cipher list.

## Platforms

All

## 7.121 client-db

## client-db

## Syntax

**client-db** *db-name* [**create**]

**no client-db** *db-name*

## Context

[\[Tree\]](#) (config>ipsec client-db)

## Full Context

configure ipsec client-db

## Description

This command creates a new IPsec client-db or enters the configuration context of an existing client-db.

An IPsec client-db can be used for IKEv2 dynamic LAN-to-LAN tunnel authentication and authorization. When a new tunnel request is received, the system will match the request to the client entries configured in client-db and use credentials returned by the matched client entry for authentication. If authentication succeeds, the system could also use the IPsec configuration parameters (such as **private-service-id**) returned by the matched entry to set up the tunnel.

The configured client-db is referenced under the ipsec-gw configuration context using the **client-db** command.

The **no** form of this command removes the *db-name* from the configuration.

## Parameters

### **db-name**

Specifies the name of this IPsec client up to 32 characters.

### **create**

Keyword used to create the security policy instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## client-db

## Syntax

**client-db** *name*

**client-db** *name* **fallback**

**client-db** *name* **no-fallback**

**no client-db**

## Context

[\[Tree\]](#) (config>service>ies>if>sap>ipsec-gw client-db)

[\[Tree\]](#) (config>service>vprn>if>sap>ipsec-gw client-db)

## Full Context

configure service ies interface sap ipsec-gw client-db

configure service vprn interface sap ipsec-gw client-db

## Description

This command enables the use of an IPsec client database. The system uses the specified client database to authenticate IKEv2 dynamic LAN-to-LAN tunnel.

## Default

no client-db

## Parameters

### *name*

Specifies the name of the client database.

### *fallback*

Specifies whether or not this IPsec gateway falls back to the default authentication policy when the IPsec tunnel authentication request fails to match any clients in the IPsec database.

### *no-fallback*

Specifies that if the client database lookup fails to return a matched result, the system will fail the tunnel setup.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## client-db

## Syntax

[no] no client-db *db-name*

## Context

[\[Tree\]](#) (debug>ipsec client-db)

## Full Context

debug ipsec client-db

## Description

This command enables debugging for the specified IPsec client-db.

## Parameters

### *db-name*

Specifies the IPsec client database name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 7.122 client-down-delay

### client-down-delay

#### Syntax

**client-down-delay** *client-down-delay*

**no client-down-delay**

#### Context

**[Tree]** (config>system>satellite>eth-sat client-down-delay)

#### Full Context

configure system satellite eth-sat client-down-delay

#### Description

This command sets the delay between the last available uplink becoming unavailable and the disabling of associated Ethernet satellite client ports.

The **no** form of this command disables the delay and reverts to the current behavior.

#### Default

no client-down-delay

#### Parameters

***client-down-delay***

Sets the number of seconds to wait between the last available uplink becoming unavailable and the disabling of associated ethernet satellite client ports.

**Values** 0 to 1800

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 7.123 client-group-list

### client-group-list

#### Syntax

**client-group-list** *name* [**create**]

**no client-group-list** *name*

**Context**

[\[Tree\]](#) (config>system>security>tls client-group-list)

**Full Context**

configure system security tls client-group-list

**Description**

This command configures a list of group suite codes that the client sends in a client Hello message. The **no** form of this command removes the client group list.

**Parameters**

*name*

Specifies the name of the client group list, up to 32 characters.

**create**

Keyword used to create the client group list.

**Platforms**

All

## 7.124 client-id

client-id

**Syntax**

client-id {mac-pppoe-session-id}

no client-id

**Context**

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>pppoe>dhcp-client client-id)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>pppoe>dhcp-client client-id)

**Full Context**

configure service vprn subscriber-interface group-interface pppoe dhcp-client client-id

configure service ies subscriber-interface group-interface pppoe dhcp-client client-id

**Description**

This command inserts a DHCP client identifier option 61 in DHCP client messages for PPPoE sessions that obtain IPv4 addresses from a third party DHCP server. By default, a DHCP client identifier option 61 is not included.

The **no** form of this command reverts to the default.

**Default**

no client-id

**Parameters****mac-pppoe-session-id**

Specifies that the DHCP client identifier option 61 contains a type value with type set to zero (1 octet) and value set to the PPPoE client MAC address (6 octets) and the PPPoE session ID (2 octets). For example:

Opt 61 (hex) = 00 00 10 94 A0 45 E5 00 01

where:

00 = type

00 10 94 A0 45 E5 = PPPoE client MAC address

00 01 = PPPoE session ID

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 7.125 client-identification

### client-identification

**Syntax**

**client-identification**

**Context**

[\[Tree\]](#) (config>ipsec>client-db>client client-identification)

**Full Context**

configure ipsec client-db client client-identification

**Description**

Commands in this context configure client ID information of this IPsec client.

If there are multiple match input are configured in the match-list of the client-db, then all corresponding match criteria must be configured for the client-entry.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 7.126 client-ip

### client-ip

#### Syntax

**client-ip** {**eq** | **neq**} *ip-address*

**no client-ip**

#### Context

[\[Tree\]](#) (debug>app-assure>group>traffic-capture>match client-ip)

#### Full Context

debug application-assurance group traffic-capture match client-ip

#### Description

This command configures debugging of a client IP.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 7.127 client-kex-list

### client-kex-list

#### Syntax

**client-kex-list**

#### Context

[\[Tree\]](#) (config>system>security>ssh client-kex-list)

#### Full Context

configure system security ssh client-kex-list

#### Description

Commands in this context configure SSH KEX algorithms for SR OS as a client.

An empty list is the default list that the SSH KEX advertises. The default list contains the following:

diffie-hellman-group16-sha512

diffie-hellman-group14-sha256

diffie-hellman-group14-sha1

diffie-hellman-group1-sha1

## Platforms

All

## 7.128 client-mac

### client-mac

#### Syntax

**client-mac** {**odd** | **even**}

**no client-mac**

#### Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>dhcp>osel client-mac)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>dhcp>osel client-mac)

[\[Tree\]](#) (config>service>vprn>sub-if>dhcp>osel client-mac)

#### Full Context

configure service vprn subscriber-interface group-interface dhcp offer-selection client-mac

configure service ies subscriber-interface group-interface dhcp offer-selection client-mac

configure service vprn subscriber-interface dhcp offer-selection client-mac

#### Description

Commands in this context configure a delay for the Discover message from the designated client MAC addresses.

The **no** form of this command removes the client MAC configuration.

#### Parameters

##### **odd**

Specifies to use the odd client MAC address.

##### **even**

Specifies to use the even client MAC address.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## client-mac

### Syntax

**client-mac** {odd | even}

**no client-mac**

### Context

**[Tree]** (config>service>vprn>sub-if>grp-if>ipv6>dhcp6>relay>advertise-selection client-mac)

**[Tree]** (config>service>vprn>sub-if>ipv6>dhcp6>relay>advertise-selection client-mac)

**[Tree]** (config>service>ies>sub-if>grp-if>ipv6>dhcp6>relay>advertise-selection client-mac)

### Full Context

configure service vprn subscriber-interface group-interface ipv6 dhcp6 relay advertise-selection client-mac

configure service vprn subscriber-interface ipv6 dhcp6 relay advertise-selection client-mac

configure service ies subscriber-interface group-interface ipv6 dhcp6 relay advertise-selection client-mac

### Description

Commands in this context configure a solicit delay or preference option value in function of the source MAC address of the solicit message.

The **no** form of this command removes the client MAC configuration.

### Parameters

**odd**

Specifies to use the odd client MAC address.

**even**

Specifies to use the even client MAC address.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 7.129 client-mac-address

## client-mac-address

### Syntax

## 7.131 client-meg-level

### client-meg-level

#### Syntax

**client-meg-level** *[[/level [/level]]*

**no client-meg-level**

#### Context

**[Tree]** (config>port>ethernet>eth-cfm>mep>ais-enable client-meg-level)

**[Tree]** (config>lag>eth-cfm>mep>ais-enable client-meg-level)

#### Full Context

configure port ethernet eth-cfm mep ais-enable client-meg-level

configure lag eth-cfm mep ais-enable client-meg-level

#### Description

This command configures the client maintenance entity group (MEG) level(s) to use for AIS message generation. Up to 7 levels can be provisioned with the restriction that the client MEG level must be higher than the local MEG level. Only the lowest client MEG level will be used for facility MEPs.

The **no** form of this command reverts to the default values.

#### Parameters

*level*

Specifies the client MEG level.

**Values** 1 to 7

**Default** 1

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### client-meg-level

#### Syntax

**client-meg-level** *[[/level [/level ...]]*

**no client-meg-level**

## Context

[\[Tree\]](#) (config>service>epipe>spoke-sdp>eth-cfm>ais-enable client-meg-level)

[\[Tree\]](#) (config>service>epipe>sap>eth-cfm>mep client-meg-level)

## Full Context

configure service epipe spoke-sdp eth-cfm ais-enable client-meg-level

configure service epipe sap eth-cfm mep client-meg-level

## Description

This command configures the client maintenance entity group (MEG) level or levels to use for AIS message generation. Up to 7 levels can be provisioned with the restriction that the client MEG level must be higher than the local MEG level.

## Parameters

### *level*

Specifies the client MEG level.

**Values** 1 to 7

**Default** 1

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## client-meg-level

## Syntax

**client-meg-level** *[[/level [/level ...]]*

**no client-meg-level**

## Context

[\[Tree\]](#) (config>service>vpls>mesh-sdp>eth-cfm>mep>ais-enable client-meg-level)

## Full Context

configure service vpls spoke-sdp eth-cfm mep ais-enable client-meg-level

configure service vpls mesh-sdp eth-cfm mep ais-enable client-meg-level

## Description

This command configures the client maintenance entity group (MEG) level(s) to use for AIS message generation. Up to 7 levels can be provisioned with the restriction that the client MEG level must be higher than the local MEG level.

**Parameters*****level***

Specifies the client MEG level

**Values** 1 to 7

**Default** 1

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 7.132 client-name

client-name

**Syntax**

client-name *name*

no client-name

**Context**

[\[Tree\]](#) (config>ipsec>client-db>client client-name)

**Full Context**

configure ipsec client-db client client-name

**Description**

This command specifies the name of the client entry. The client name can be used in CLI navigation or in show commands.

**Default**

no client-name

**Parameters*****name***

Specifies the name of the client.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 7.133 client-port

### client-port

#### Syntax

**client-port** {**eq** | **neq**} *port-num*

**no client-port**

#### Context

[\[Tree\]](#) (debug>app-assure>group>traffic-capture>match client-port)

#### Full Context

debug application-assurance group traffic-capture match client-port

#### Description

This command configures debugging of a client port.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 7.134 client-signature-list

### client-signature-list

#### Syntax

**client-signature-list** *name* [**create**]

**no client-signature-list** *name*

#### Context

[\[Tree\]](#) (config>system>security>tls client-signature-list)

#### Full Context

configure system security tls client-signature-list

#### Description

This command configures a list of TLS 1.3-supported signature suite codes that the client sends in a client Hello message.

The **no** form of this command removes the client signature list.

**Parameters***name*

Specifies the name of the client signature list, up to 32 characters.

**create**

Keyword used to create the client signature list.

**Platforms**

All

## 7.135 client-tls-profile

### client-tls-profile

**Syntax****client-tls-profile** *name***no client-tls-profile****Context**

[\[Tree\]](#) (config>system>security>pki>est-profile client-tls-profile)

**Full Context**

configure system security pki est-profile client-tls-profile

**Description**

This command configures the TLS client profile to be assigned to applications for encryption. The profile creates the TLS connection to the EST server.

The **no** form of this command removes the name from the configuration.

**Default**

no client-tls-profile

**Parameters***name*

Specifies the name of the client TLS profile, up to 32 characters

**Platforms**

All

## client-tls-profile

### Syntax

**client-tls-profile** *name* [**create**]

**no client-tls-profile** *name*

### Context

[\[Tree\]](#) (config system security tls client-tls-profile)

### Full Context

configure system security tls client-tls-profile

### Description

This command configures the TLS client profile to be assigned to applications for encryption.

### Parameters

**name**

Specifies the name of the client TLS profile, up to 32 characters in length.

**create**

Keyword used to create the client TLS profile.

### Platforms

All

## client-tls-profile

### Syntax

**client-tls-profile** *name*

**no client-tls-profile**

### Context

[\[Tree\]](#) (config system management-interface remote-management client-tls-profile)

### Full Context

configure system management-interface remote-management client-tls-profile

### Description

This command configures the TLS client profile used for encryption by all remote managers. This command and **allow-unsecure-connection** are mutually exclusive.

If this command is also configured for a specific manager in the **config>system> management-interface>remote-management>manager** context, that configuration takes precedence.

The **no** form of this command causes the profile configuration not to be used.

## Parameters

*name*

Specifies the name of the client TLS profile, up to 32 characters.

## Platforms

All

## client-tls-profile

## Syntax

**client-tls-profile** *name*

**no client-tls-profile**

## Context

[\[Tree\]](#) (config system management-interface remote-management manager client-tls-profile)

## Full Context

configure system management-interface remote-management manager client-tls-profile

## Description

This command configures the TLS client profile used for encryption by this remote manager. This command and **allow-unsecure-connection** are mutually exclusive.

This command takes precedence over the same command configured in the global context (**config>system>management-interface>remote-management**).

The **no** form of this command causes the profile configuration to be inherited from the global context (**config>system>management-interface>remote-management**).

## Parameters

*name*

Specifies the name of the client TLS profile, up to 32 characters.

## Platforms

All

## 7.136 cli-code

## cli-code

## Syntax

**cli-code** *cli-code*

## no cli-code

### Context

[\[Tree\]](#) (config>system cli-code)

### Full Context

configure system cli-code

### Description

This command creates a Common Language Location Identifier (CLLI) code string for the SR-series router. A CLLI code is an 11-character standardized geographic identifier that uniquely identifies geographic locations and certain functional categories of equipment unique to the telecommunications industry.

No CLLI validity checks other than truncating or padding the string to eleven characters are performed.

Only one CLLI code can be configured, if multiple CLLI codes are configured the last one entered overwrites the previous entry.

The **no** form of the command removes the CLLI code.

### Default

no cli-code

### Parameters

#### *cli-code*

Specifies the 11 character string CLLI code. Any printable, seven bit ASCII characters can be used within the string. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. If more than 11 characters are entered, the string is truncated. If less than 11 characters are entered the string is padded with spaces.

### Platforms

## 7.137 clock-offset

### clock-offset

### Syntax

**clock-offset** *seconds*

**no clock-offset**

### Context

[\[Tree\]](#) (config>oam-pm>session>meas-interval clock-offset)

## Full Context

```
configure oam-pm session meas-interval clock-offset
```

## Description

This command allows measurement intervals with a boundary-type of clock aligned to be offset from the default time of day clock. The configured offset must be smaller than the size of the measurement interval. As an example, an offset of 120 (seconds) shifts the start times of the measurement intervals by two minutes from their default alignments with respect to the time of day clock.

The **no** form of this command sets the offset to 0.

## Default

```
clock-offset 0
```

## Parameters

### *seconds*

Specifies the number of seconds to offset a clock-alignment measurement interval from its default.

**Values** 0 to 86399

**Default** 0

## Platforms

All

## 7.138 clock-source

### clock-source

## Syntax

```
clock-source {loop-timed | node-timed}
```

## Context

[\[Tree\]](#) (config>port>sonet-sdh clock-source)

## Full Context

```
configure port sonet-sdh clock-source
```

## Description

This command configures the clock to be used for transmission of data out towards the line. The options are to use the locally recovered clock from the line's receive data stream or the node central reference.

When changing the clock source for a port on an OC-48 MDA, a brief transmit interruption can occur on all ports of that MDA. Note that all SONET/SDH MDAs support loop timing.

The **node-timed** parameter in this command is supported by TDM satellite.

## Parameters

### loop-timed

The link recovers the clock from the received data stream.

### node-timed

The link uses the internal clock when transmitting data.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## clock-source

## Syntax

**clock-source** {**loop-timed** | **node-timed** | **adaptive** | **differential**}

## Context

**[Tree]** (config>port>tdm>e3 clock-source)

**[Tree]** (config>port>tdm>ds1 clock-source)

**[Tree]** (config>port>tdm>ds3 clock-source)

## Full Context

configure port tdm e1 clock-source

configure port tdm e3 clock-source

configure port tdm ds1 clock-source

configure port tdm ds3 clock-source

## Description

This command configures the clock to be used for transmission of data out towards the line. The options are to use the locally recovered clock from the line's receive data stream, the node central reference, or an adaptively recovered clock using the received packets.

The following table shows MDAs that support loop timing at DS3/E3 channelization options.

*Table 26: MDA Support for Loop Timing at DS3/E3 Channelization Options*

| TDM DS3/E3        | LoopTimed | Default    |
|-------------------|-----------|------------|
| Channelized OC-12 | No        | node-timed |

| TDM DS3/E3              | LoopTimed | Default    |
|-------------------------|-----------|------------|
| Channelized OC-3        | No        | node-timed |
| Channelized DS3/E3      | No        | node-timed |
| Channelized ASAP OC-12  | Yes       | node-timed |
| Channelized ASAP OC-3   | Yes       | node-timed |
| Channelized ASAP DS3/E3 | Yes       | node-timed |
| CES OC-3                | Yes       | node-timed |

The following table shows MDAs that support loop timing at DS1/E1 channelization options.

*Table 27: MDA Support for Loop Timing at DS1/E1 Channelization Options*

| TDM DS1/E1              | LoopTimed | Default    |
|-------------------------|-----------|------------|
| Channelized OC-12       | Yes       | loop-timed |
| Channelized OC-3        | Yes       | loop-timed |
| Channelized DS3/E3      | Yes       | loop-timed |
| Channelized ASAP OC-12  | Yes       | loop-timed |
| Channelized ASAP OC-3   | Yes       | loop-timed |
| Channelized ASAP DS3/E3 | Yes       | loop-timed |
| CES OC-3                | Yes       | loop-timed |

## Parameters

### **loop-timed**

The link recovers the clock from the received data stream.

### **node-timed**

The link uses the internal clock when transmitting data.

### **adaptive**

The clock is adaptively recovered from the rate at which data is received and not from the physical layer. Adaptive timing is only supported on ds1 and e1 channels.

### **differential**

The clock is recovered from differential RTP timestamp header. Differential timing is only supported on ds1 and e1 channels.

## Platforms

### clock-type

#### Syntax

**clock-type boundary**

**clock-type ordinary** {**master** | **slave**}

#### Context

[\[Tree\]](#) (config>system>ptp clock-type)

#### Full Context

configure system ptp clock-type

#### Description

This command configures the type of clock. The clock type can only be changed when PTP is shutdown.

The clock type cannot be changed to ordinary timeTransmitter if the PTP reference is **no shutdown**. In addition, the clock type cannot be changed to ordinary timeTransmitter if there are peers configured. The clock type is restricted based on the profile. See the **profile** command description for the details of the restrictions.

When enabling a PTP with clock-type boundary, at least one reference into the central frequency clock must be enabled using the **configure system sync-if-timing [bits |ref1 |ref2 | ptp] syncce** command.

#### Default

clock-type ordinary slave

#### Parameters

##### boundary

Specifies that the system is a boundary clock, which may be anywhere in the PTP clock hierarchy. It can obtain timing from a timeTransmitter clock, and provide timing to multiple timeReceiver clocks concurrently.

##### ordinary master

Specifies that the system is a grandmaster clock in the PTP hierarchy. The system provides timing to multiple timeReceiver clocks in the network.

##### ordinary slave

Specifies that the system is always a timeReceiver clock in the PTP hierarchy. The system derives its timing from one or more timeTransmitter clocks in the network.

#### Platforms

cluster

### Syntax

cluster *cluster-id*

no cluster

### Context

[\[Tree\]](#) (config>subscr-mgmt>bgp-prng-plcy cluster)

### Full Context

configure subscriber-mgmt bgp-peering-policy cluster

## Description

This command configures the cluster ID for a route reflector server.

Route reflectors are used to reduce the number of IBGP sessions required within an AS. Normally, all BGP speakers within an AS must have a BGP peering with every other BGP speaker in an AS. A route reflector and its clients form a cluster. Peers that are not part of the cluster are considered to be non-clients.

When a route reflector receives a route, first it must select the best path from all the paths received. If the route was received from a non-client peer, then the route reflector sends the route to all clients in the cluster. If the route came from a client peer, the route reflector sends the route to all non-client peers and to all client peers except the originator.

For redundancy, a cluster can have multiple route reflectors.

Confederations can also be used to remove the full IBGP mesh requirement within an AS.

The **no** form of this command deletes the cluster ID and effectively disables the Route Reflection for the given group.

## Parameters

### *cluster-id*

Specifies the route reflector cluster ID is expressed in dot decimal notation.

**Values** Any 32 bit number in dot decimal notation. (0.0.0.1 to 255.255.255.255)

## Platforms

```
cluster cluster-id orr-location location-id [allow-local-fallback]
```

## Context

[\[Tree\]](#) (config>router>bgp cluster)

## Full Context

```
configure router bgp cluster
```

## Description

This command configures the cluster ID for a route reflector server ID and implicitly configures the associated BGP sessions as route reflector clients of the BGP instance. If an ORR location ID is specified with the cluster ID, the clients in that cluster receive routes optimal for that specific location; refer to *draft-ietf-idr-bgp-optimal-route-reflection* for more information.

Route reflectors are used to reduce the number of IBGP sessions required within an AS. Normally, all BGP speakers within an AS must have a BGP peering with every other BGP speaker in an AS. A route reflector and its clients form a cluster. Peers that are not part of the cluster are considered to be non-clients.

When a route reflector receives best path from a non-client peer, it sends the route to all clients. When the route reflector receives a best path from a client peer it sends the route to all non-client and all client peers except the originator.

With optimal route reflection, the best path advertised to a client takes location ID into account, which means that if the tie-break for best path (or Add-Paths) comes down to next-hop IGP cost, the IGP costs will be calculated relative to the specified location. In the SR OS implementation, the IGP costs from arbitrary ORR locations are calculated using OSPF/OSPFv3, IS-IS, or BGP-LS information in the TE DB.

## Default

no cluster

## Parameters

### *ip-address*

Specifies the route reflector cluster ID is expressed in dot decimal notation.

**Values** Any 32 bit number in dot decimal notation. (0.0.0.1 to 255.255.255.255)

### *orr-location location-id*

Specifies the optimal route reflection location index for this set of route reflector clients.

**Values** 1 to 255

### *allow-local-fallback*

Controls the behavior when there are no BGP routes to advertise to the RR clients that are reachable from the perspective of their ORR location. If this option is configured, the RR is allowed (in this circumstance only), to advertise the best reachable BGP path from its own topology location. If this option is not configured and this situation applies, then no route is advertised to the clients.

### Description

This command configures the cluster ID for a route reflector server ID and implicitly configures the associated BGP sessions as route reflector clients of the BGP instance. If an ORR location ID is specified with the cluster ID, the clients in that cluster receive routes optimal for that specific location; see *draft-ietf-idr-bgp-optimal-route-reflection* for more information.

Route reflectors are used to reduce the number of IBGP sessions required within an AS. Normally, all BGP speakers within an AS must have a BGP peering with every other BGP speaker in an AS. A route reflector and its clients form a cluster. Peers that are not part of the cluster are considered to be non-clients.

When a route reflector receives best path from a non-client peer, it sends the route to all clients. When the route reflector receives a best path from a client peer it sends the route to all non-client and all client peers except the originator.

With optimal route reflection, the best path advertised to a client takes location ID into account, which means that if the tie-break for best path (or Add-Paths) comes down to next-hop IGP cost, the IGP costs will be calculated relative to the specified location. In the SR OS implementation, the IGP costs from arbitrary ORR locations are calculated using OSPF/OSPFv3, IS-IS, or BGP-LS information in the TE DB.

The **no** form of this command deletes the cluster ID and effectively disables route reflection for the group.

### Default

no cluster

### Parameters

#### *ip-address*

Specifies the route reflector cluster ID is expressed in dot decimal notation.

**Values** Any 32 bit number in dot decimal notation. (0.0.0.1 to 255.255.255.255)

#### *orr-location location-id*

Specifies the optimal route reflection location index for this set of route reflector clients.

**Values** 1 to 255

#### *allow-local-fallback*

Controls the behavior when there are no BGP routes to advertise to the RR clients that are reachable from the perspective of their ORR location. If this option is configured, the RR is allowed (in this circumstance only), to advertise the best reachable BGP path from its own topology location. If this option is not configured and this situation applies, then no route is advertised to the clients.

### Platforms

All

## 7.142 cluster-id

## cluster-id

### Syntax

**cluster-id** *ip-address/mask* [*ip-address/mask*]

**cluster-id none**

**no cluster-id**

### Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from cluster-id)

### Full Context

configure router policy-options policy-statement entry from cluster-id

### Description

This command enables BGP routes to be matched based on the IP addresses encoded in the CLUSTER\_LIST attribute.

The first *ip-address/mask pair* is matched against the most recently added cluster ID. Each subsequent *ip-address/mask pair* is tested against the next most recent cluster ID.

For example, to match all routes reflected by the RR with cluster ID 1.1.1.1 and then any other RR before reaching the router where the policy is applied, use the command **cluster-id 0.0.0.0/0 1.1.1.1/32**.

#### Note:

The command matches routes with two or more cluster IDs; the third and older cluster IDs are not evaluated and are automatically considered matching.

The **cluster-id none** form of this command only matches BGP routes without any CLUSTER\_LIST attribute.

A non-BGP route does not match a policy entry if it contains the **cluster-id** command.

### Default

no cluster-id

### Parameters

#### *ip-address*

Specifies the 32-bit cluster ID in dotted decimal notation.

**Values** a.b.c.d

#### *mask*

Specifies a bit mask to apply to the *ip-address* parameter.

**Values** 0 to 32 (0 is only allowed if the *ip-address* is 0.0.0.0)

#### **none**

Specifies that only BGP routes without a CLUSTER\_LIST attribute should be matched.

configure service vpls sap eth-cfm collect-lmm-stats
configure service epipe spoke-sdp eth-cfm collect-lmm-stats
configure service ipipe sap eth-cfm collect-lmm-stats
```

## Description

This command enables the collection of statistics on the SAP or MPLS SDP binding on which the ETH-LMM test is configured. The collection of LMM statistics must be enabled if a MEP is launching or responding to ETH-LMM packets. If LMM statistics collection is not enabled, the counters in the LMM and LMR PDU do not represent accurate measurements and all measurements should be ignored. The **show sap-using eth-cfm collect-lmm-stats** command and the **show sdp-using eth-cfm collect-lmm-stats command** can be used to display entities that are collecting stats.

The **no** form of this command disables and deletes the counters for this SAP or MPLS SDP binding.

## Default

```
no collect-lmm-stats
```

## Platforms

## collect-lmm-stats

## Syntax

**collect-lmm-stats**

**no collect-lmm-stats**

## Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>sap>eth-cfm collect-lmm-stats)

[\[Tree\]](#) (config>service>vprn>if>spoke-sdp>eth-cfm collect-lmm-stats)

[\[Tree\]](#) (config>service>vprn>if>sap>eth-cfm collect-lmm-stats)

## Full Context

configure service vprn subscriber-interface group-interface sap eth-cfm collect-lmm-stats

configure service vprn interface spoke-sdp eth-cfm collect-lmm-stats

configure service vprn interface sap eth-cfm collect-lmm-stats

## Description

This command enables the collection of statistics on the SAP or MPLS SDP binding on which the ETH-LMM test is configured. The collection of LMM statistics must be enabled if a MEP is launching or responding to ETH-LMM packets. If LMM statistics collection is not enabled, the counters in the LMM and LMR PDU do not represent accurate measurements and all measurements should be ignored.

The **show>service>sap-using>eth-cfm>collect-lmm-stats** command and the **show>service>sdp-using>eth-cfm>collect-lmm-stats** command can be used to display which entities are collecting stats.

The **no** form of this command disables and deletes the counters for this SAP or MPLS SDP binding.

## Default

no collect-imm-stats

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

### Full Context

configure application-assurance group cflowd collector

### Description

This command defines a flow data collector for cflowd data. The IP address of the flow collector must be specified. The UDP port number is an optional parameter. If it is not set, the default of 2055 is used.

### Parameters

#### *ip-address*

Specifies the IP address of the flow data collector in dotted decimal notation.

#### *port*

Specifies the UDP port of flow data collector.

**Values** 1 to 65535

**Default** 2055

#### **create**

Keyword used to create the flow data collector.

## collector

### Syntax

**collector router** *router-instance* **ip** *ip-address* [**create**]

**no collector router** *router-instance* **ip** *ip-address*

### Context

[\[Tree\]](#) (config>service>ipfix>export-policy collector)

### Full Context

configure service ipfix ipfix-export-policy collector

### Description

This command defines an external collector node that will collect IPFIX records sent by 7750 SR node. The IPFIX records will be streamed to the collector node using UDP transport. Traffic is originated from

a random ephemeral UDP port to the destination port 4739. Up to two collector nodes can be defined for redundancy purposes.

UDP streams are stateless due to the significant volume of transactions. However they do contain 32bit sequence numbers such that packet loss can be identified.

Multiple IPFIX records are sent in a single UDP packet. UDP packet transmission is triggered when the packet size containing IPFIX records exceeds the configured MTU value or the internal timer which is set to 250ms, whichever occurs first.

## Parameters

### **router *router-instance***

Router instance from which the collector node is reachable.

#### **Values**

<router-name> | <service-id>

router-name: "Base"

service-id: 1 to 2147483647

### **ip *ip-address***

IPv4 address of the external collector node to which IPFIX records will be sent.

### **create**

Keyword used to create the collector instance.

## Platforms

All

## collector

## Syntax

**collector router *router-name* ip *ip-address* [create]**

**collector service-name *service-name* ip *ip-address* [create]**

**no collector router *router-name* ip *ip-address***

**no collector service-name *service-name* ip *ip-address***

## Context

**[Tree]** (config>service>nat>syslog>syslog-export-policy collector)

## Full Context

configure service nat syslog syslog-export-policy collector

## Description

This command defines an external collector node that collects syslog records. The syslog records are streamed to the collector node using UDP transport. Traffic is originated from a random ephemeral UDP port to the destination port 514. Up to two collector nodes can be defined for redundancy purposes.

Stateless UDP streams are used as transport due to the significant volume of transactions. However, they do contain 32-bit sequence numbers so packet loss can be identified. The sequence numbers are generated per BB-ISA per collector, and within each stream they are monotonically increased by 1. Overlapping sequence numbers between BB-ISAs can be differentiated by the MDA ID field carried in the syslog message.

Multiple syslog records are sent in a single UDP packet. UDP packet transmission is triggered when the packet size containing syslog records exceeds the configured MTU value or the configurable timer, whichever occurs first.

The **no** form of the command removes the parameters from the configuration.

## Parameters

### ***router-name***

Specifies the router instances from which the collector node is reachable.

### ***ip-address***

Specifies the IPv4 address of the external collector node to which the syslog records are sent.

### ***service-name***

Specifies the service name from which the collector node is reachable.

### ***create***

Keyword used to create the collector instance.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## collector

## Syntax

**collector** *ip-address[:port]* [**version** *version*]

**no collector** *ip-address[:port]*

## Context

[\[Tree\]](#) (config>cflowd collector)

## Full Context

configure cflowd collector

## Description

This command defines a flow data collector for cflowd data. The IP address and version of the flow collector must be specified. The UDP port number is an optional parameter. If it is not set, the default of 2055 is used for all collector versions. To connect to an IPFIX (version 10) collector using the IPFIX default port, specify port 4739 when defining the collector. A maximum of eight collectors can be configured.

The **no** form of this command removes the flow collector definition from the config and stops the export of data to the collector. The collector needs to be shut down to be deleted.

## Parameters

### *ip-address*

Specifies the address of a remote cflowd collector host to receive the exported cflowd data.

| Values |              |                           |
|--------|--------------|---------------------------|
|        | ipv4-address | a.b.c.d                   |
|        | ipv6-address | x:x:x:x:x:x-x-[interface] |

### *port*

Specifies the UDP port number on the remote cflowd collector host to receive the exported cflowd data.

|                |            |
|----------------|------------|
| <b>Values</b>  | 1 to 65535 |
| <b>Default</b> | 2055       |

### *version*

Specifies the version of the flow data collector.

|                |             |
|----------------|-------------|
| <b>Values</b>  | 5, 8, 9, 10 |

## collector

## Syntax

**collector** *collector-id* [**create**]

**no collector** *collector-id*

## Context

[\[Tree\]](#) (config>app-assure>group>cflowd>direct-export collector)

## Full Context

configure application-assurance group cflowd direct-export collector

## Description

This command configures the Cflowd direct export collector.

The system uses the collectors when the Cflowd admin state shuts down and then re-enabled (**no shutdown** state). The system re-assigns the collectors to the groups or AA-ISAs or when a Cflowd collector ID is created. The collector IDs are used when a new group is added later.

When a collector ID is removed, the groups (AA-ISAs) that are assigned to this collector are removed and assigned to another available collector. The affected ISAs reset their collector statistics as they change to the new collector.

In addition, a Cflowd collector assignment to a group or AA-ISA is done only in the following conditions:

- the admin state is in a **no shutdown** state for the AA group or the AA group Cflowd
- a collector is available under the AA group with at least one address in a **no shutdown** admin state

If an AA group or AA-ISA is assigned a collector, shutting down, or the group unassigns the group from the cflowd collector.

The **no** form of this command removes the collector ID from the configuration.

## Parameters

### *collector-id*

Specifies the Cflowd direct export collector ID.

**Values** 1 to 65535

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### Context

[\[Tree\]](#) (config>system>security>management-interface>md-cli command-accounting-during-load)

### Full Context

configure system security management-interface md-cli command-accounting-during-load

### Description

This command controls command accounting performed on the contents of a file loaded using the MD-CLI **load** or **rollback** command.

When enabled, all commands in the loaded file are logged, which may decrease the system response time with large files.

When disabled, command accounting is not performed during a load or rollback operation, which may increase the system response time by reducing the number of command accounting messages, especially when remote AAA servers are used.

The **load** or **rollback** command itself is always logged.

The **no** form of this command disables command accounting during a load or rollback operation.

### Default

command-accounting-during-load

```
commit
```

**Syntax**

```
commit
```

## Context

[\[Tree\]](#) (config>app-assure>group>policy commit)

## Full Context

configure application-assurance group policy commit

## Description

This command commits changes made during the current editing session. None of the policy changes done will take effect until commit command is issued. If the changes can be successfully committed, no errors detected during the commit during cross-reference verification against exiting application assurance configuration, the editing session will also be closed.

The newly committed policy takes effect immediately for all new flows, existing flows will transition onto the new policy shortly after the commit.

```

```
commit no-checkpoint [confirmed timeout]
```

## Context

[\[Tree\]](#) (candidate commit)

## Full Context

```
candidate commit
```

## Description

This command applies the changes in the candidate configuration to the active running configuration. The candidate changes will take operational effect.

If a commit operation is successful then all of the candidate changes will take operational effect and the candidate is cleared. If there is an error in the processing of the commit, or a 'commit confirmed' is not confirmed and an auto-revert occurs, then the router will return to a configuration state with none of the candidate changes applied. The operator can then continue editing the candidate and try a commit later.

By default, the SR OS will automatically create a new rollback checkpoint after a commit operation. The rollback checkpoint will contain the new configuration changes made by the commit. An optional **no-checkpoint** keyword can be used to avoid the auto-creation of a rollback checkpoint after a commit.

A commit operation is blocked if a rollback revert is currently being processed.

## Parameters

### confirmed

specifies that the commit operation (if successful) should be automatically reverted (undone) at the end of the timeout period unless the operator issues the confirm command before the timeout period expires. A rollback checkpoint is created after the commit operation (if successful) and will remain available whether the commit is auto-reverted or not. The contents of the candidate will remain visible (candidate view) and changes to the

candidate are blocked until the timeout is completed or the **candidate confirm** command is executed. If the timeout expires and an auto-revert occurs, then the original candidate config will be available in edit-cfg mode.

Standard line-by-line non-transactional configuration commands (including via SNMP) are not blocked during the countdown period and any changes made to the configuration during the countdown period will be rolled back if the timeout expires. The confirmed option is useful when changes are being made that could impact management reachability to the router.

A rollback revert is blocked during the countdown period until the commit has been confirmed.

**timeout**

Specifies the auto-revert timeout period, in minutes.

**Values** 1 to 168

**no-checkpoint**

Specifies to avoid the automatic creation of a rollback checkpoint for a successful commit.

**comment *comment***

Adds a comment up to 255 characters to the automatic rollback checkpoint.

[**src-access-list** *list-name*]

**no community** *community-name* [**hash** | **hash2** | **custom**]

#### Context

[\[Tree\]](#) (config>service>vprn>snmp community)

#### Full Context

configure service vprn snmp community

## Description

This command sets the SNMP community name(s) to be used with the associated VPRN instance. These VPRN community names are used to associate SNMP v1/v2c requests with a particular vprn context and to return a reply that contains VPRN-specific data or limit SNMP access to data in a specific VPRN instance.

VPRN snmp communities configured with an access permission of 'r' are automatically associated with the default access group "snmp-vprn-ro" and the "vprn-view" view (read only). VPRN snmp communities configured with an access permission of 'rw' are automatically associated with the default access group "snmp-vprn" and the "vprn-view" view (read/write).

The community in an SNMP v1/v2 request determines the SNMP context (i.e., the vprn# for accessing SNMP tables) and not the VPRN of the incoming interface on which the request was received. When an SNMP request arrives on VPRN 5 interface "ringo" with a destination IP address equal to the "ringo" interface, but the community in the SNMP request is the community configured against VPRN 101, then the SNMP request will be processed using the VPRN 101 context. (the response will contain information about VPRN 101). It is recommended to avoid using a simple series of vprn snmp-community values that are similar to each other (for example, avoid my-vprncomm-1, my-vprn-comm-2, etc).

The **no** form of this command removes the SNMP community name from the given VPRN context.

## Parameters

### **community-name**

Specifies the SNMP v1/v2c community name. This is a secret/confidential key used to access SNMP and specify a context (base vs vprn1 vs vprn2).

### **hash**

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### **hash2**

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### **custom**

Specifies the custom encryption to management interface.

### **version SNMP-version**

Specifies the SNMP version.

**Values** v1, v2c, both

### **access-permissions**

Specifies the access rights to MIB objects.

**Values** **r** — Grants only read access to MIB objects. Creates an association of the community-name with the **snmp-vprn-ro** access group. **rw** —

Grants read and write access to MIB objects. Creates an association of the community-name with the **snmp-vprn** access group.

### *list-name*

Configures the **community** to reference a specific **src-access-list** (created under **configure system security snmp**), which will be used to validate the source IP address of all received SNMP requests that use this **community**. Multiple **community** (vprn or base router) and **usm-community** instances can reference the same **src-access-list**.

## Platforms

configure service vprn static-route-entry community

## Description

This command associates a list of up to 12 BGP communities (any mix of standard, extended, and large communities) with the static route. These communities can be matched in route policies and are automatically added to BGP routes that are created from the static route.

The communities specified at this level of the static route causes communities configured under the next-hop, black-hole, and indirect contexts of the static route to be ignored.

The **no** form of this command removes the association.

## Default

no community

## Parameters

### *comm-id*

Specifies a BGP community value, up to 72 characters.

**Values** [*as-num:comm-val* | *well-known-comm* | *ext-comm* | *large-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535

- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **llgr-stale** | **no-llgr** | **blackhole**
- *ext-comm* — the extended community, defined as one of the following:
  - *{target | origin}:ip-address:comm-val*
  - *{target | origin}:asnum:ext-comm-val*
  - *{target | origin}:ext-asnum:comm-val*
  - **bandwidth:asnum:val-in-mbps**
  - **ext:4300:ovstate**
  - **ext:value1:value2**
  - *color:co-bits:color-value*
 where:
  - *target* — route target
  - *origin* — route origin
  - *ip-address* — a.b.c.d
  - *ext-comm-val* — 0 to 4294967295
  - *ext-asnum* — 0 to 4294967295
  - *val-in-mbps* — 0 to 16777215
  - *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
  - *value1* — 0000 to FFFF
  - *value2* — 0 to FFFFFFFFFFFF
  - *co-bits* — 00, 01, 10 or 11
  - *color-value* — 0 to 4294967295
- *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

```

## Description

This command associates one BGP community (standard, extended or large) with a next-hop of the static route. This community can be matched in route policies and automatically added to BGP routes that are created from the static route.

Any community specified in one of these contexts is overridden by any communities specified at the prefix level of the static route entry.

The **no** form of this command removes the association.

## Default

no community

## Parameters

### *comm-id*

Specifies a BGP community value, up to 72 characters.

**Values** *[as-num:comm-val | well-known-comm | ext-comm | large-comm]*

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **llgr-stale** | **no-llgr** | **blackhole**
- *ext-comm* — the extended community, defined as one of the following:

- *{target | origin}:ip-address:comm-val*
- *{target | origin}:asnum:ext-comm-val*
- *{target | origin}:ext-asnum:comm-val*
- **bandwidth:asnum:val-in-mbps**
- **ext:4300:ovstate**
- **ext:value1:value2**
- **color:co-bits:color-value**

where:

- *target* — route target
- *origin* — route origin
- *ip-address* — a.b.c.d
- *ext-comm-val* — 0 to 4294967295

- *ext-asnum* — 0 to 4294967295
- *val-in-mbps* — 0 to 16777215
- *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
- *value1* — 0000 to FFFF
- *value2* — 0 to FFFFFFFFFF
- *co-bits* — 00, 01, 10 or 11
- *color-value* — 0 to 4294967295
- *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

## Platforms

All

## community

### Syntax

**community** *comm-id*

**no community** [*comm-id*]

### Context

[\[Tree\]](#) (config>service>vprn>static-route-entry>ip-sec-tunnel community)

### Full Context

configure service vprn static-route-entry ip-sec-tunnel community

### Description

This configuration option associates a BGP community with the static route. The community can be matched in route policies and is automatically added to BGP routes exported from the static route.

The **no** form of this command removes the community association.

### Default

no community

### Parameters

***comm-id***

Specifies community IDs, up to 72 characters.

**Values** [2 byte asnumber:comm-val | well-known-comm]

where:

- *2 byte as-number* — 0 to 65535
- *comm-val* — 0 to 65535

- *well-known-comm* — **no-export** | **no-export-subconfed** | **no-advertise**

## community

### Syntax

**community** *community-name*

**no community**

### Context

**[Tree]** (config>router>ldp>session-params>peer community)

**[Tree]** (config>router>ldp>targeted-session>peer-template community)

### Full Context

configure router ldp session-parameters peer community

configure router ldp targeted-session peer-template community

### Description

This command configures a community name associated with a targeted session to a specified peer. The community is a local configuration for a targeted session. FECs received over a session of a given community are taken to belong to that community, and are redistributed over sessions of the same community.

The SR OS router uses the following rules for community:

- If both the session parameters for a specified peer and targeted peer template that is applied to session have the default configuration then no community applies.
- If the session parameters for a peer have the default configuration, but targeted session peer template has an explicit configuration for community, then the targeted peer template configuration will be used.
- If the session parameters have an explicit configuration for community, and the targeted session peer template has the default configuration, then the session parameter configuration applies.
- If both session parameters and targeted peer template have an explicit configuration for community, then the session parameter configuration is used.

The **no** form of this command removes the community from the session to the peer. FEC subsequently received over the session are treated as having no community.

### Default

no community

### Parameters

***community-name***

Specifies the string defining the LDP community assigned to the session. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters

excluding double quotes. If the string contains spaces, use double quotes to delimit the start and end of the string.

**community** *community-string* [**hash** | **hash2** | **custom**] *access-permissions* [**version** *SNMP-version*] [**src-access-list** *list-name*]

**no community** *community-string* [**hash** | **hash2** | **custom**]

### Context

[\[Tree\]](#) (config>system>security>snmp community)

### Full Context

configure system security snmp community

### Description

This command creates SNMP community strings for SNMPv1 and SNMPv2c access. This command is used in combination with the predefined access groups and views. To create custom access groups and views and associate them with SNMPv1 or SNMPv2c access use the **usm-community** command.

When configured, community implies a security model for SNMPv1 and SNMPv2c only.

For SNMPv3 security, the **access group** command must be configured.

The **no** form of the command removes the specified community string.

### Parameters

#### **community-string**

Configures the SNMPv1 and/or SNMPv2c community string.

**Values** *community-string* — Specifies the community string. Allowed values are any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, \$, spaces), the entire string must be enclosed within double quotes.

*hash-key* — Up to 33 characters

*hash2-key* — Up to 96 characters

**hash**

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**hash2**

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**custom**

Specifies the custom encryption to management interface.

**access-permissions**

Configures the access permissions for objects in the MIB.

**r** — Grants only read access to objects in the MIB, except security objects, using the internal "snmp-ro" access group and the "no-security" snmp view.

**rw** — Grants read and write access to all objects in the MIB, using the internal "snmp-rw" access group and the "no-security" snmp view.

**rwa** — Grants read and write access to all objects in the MIB, including security, using the internal snmp-rwa access group and the iso snmp view.

**mgmt** — Assigns a unique SNMP community string for SNMP access via the management router instance. This community uses the internal snmp-mgmt access group and the mgmt snmp view.

**vpls-mgmt** — Assigns a unique SNMP community string for SNMP access via the vpls-management router instance. This community uses the internal snmp-vpls-mgmt access group and mgmt-view snmp view.

**version {v1 | v2c | both}**

Configures the scope of the community string to be for SNMPv1, SNMPv2c, or both SNMPv1 and SNMPv2c access.

**Default**    both

**list-name**

Configures the **community** to reference a specific **src-access-list**, which will be used to validate the source IP address of all received SNMP requests that use this community. Multiple community, usm-community, or VPRN SNMP community instances can reference the same src-access-list.

**Platforms**

All

## community

### Syntax

[no] **community** *name*

### Context

[\[Tree\]](#) (config>router>policy-options community)

### Full Context

configure router policy-options community

### Description

This command creates a route policy community list or expression to use in route policy entries. A community list is an unordered set of community values (members). In general a route matches a community list if it has any of the member values. A community expression is a set of community values that are arranged in a logical expression using operators such as AND, OR, and NOT. A route matches a community expression if it satisfies the logic of the expression.

For additional information, see the **expression** and **members** commands in the **config> router>policy-options>community** context.

The **no** form of this command deletes the community list or the provided community ID.

### Default

no community

### Parameters

*name*

Specifies the community list name. Allowed values are any string up to 64 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (for example, #, \$, spaces), the entire string must be enclosed within double quotes.

### Platforms

## Full Context

configure router policy-options policy-statement default-action community

configure router policy-options policy-statement entry action community

## Description

This command adds or removes a BGP community list to or from routes matching the route policy statement entry.

If no community list is specified, the community path attribute is not changed.

The community list changes the community path attribute according to the **add** and **remove** keywords.

The **no** form of this command disables the action to edit the community path attribute for the route policy entry.

## Default

no community

## Parameters

### *name*

Specifies up to 28 names.

### **add**

The specified community list is added to any existing list of communities.

### **remove**

The specified community list is removed from the existing list of communities.

### **replace**

The specified community list replaces any existing community attribute. *name* — The community list name. Allowed values are any string up to 64 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must be enclosed by at-signs (@) and may be midstring; for example, "@variable@," "start@variable@end", "@variable@end", or "start@variable@".

## 7.164 community-count

### community-count

**Syntax**

**community-count** *count* [equal | or-higher | or-lower] [standard | extended | large]

**no community-count**

## Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from community-count)

## Full Context

configure router policy-options policy-statement entry from community-count

## Description

This command matches BGP routes based on community length (that is, the number of community members in the COMMUNITY, EXTENDED\_COMMUNITY, or LARGE\_COMMUNITY the attributes).

If no comparison qualifiers are present (**equal**, **or-higher**, **or-lower**), then **equal** is the implied default.

Without the optional **standard**, **extended**, or **large** keyword, the community length applies to the total number of communities, of all types. If some keywords are present, then only the types specified are counted against the limit.

A non-BGP route does not match a policy entry if it contains the **community-count** command.

## Default

no community-count

## Parameters

### *count*

Specifies the number of community members.

**Values** 0 to 1024, or a parameter, up to 32 characters, name delimited by a starting and ending at-sign (@) character

### **equal**

Specifies that matched routes should have the same number of AS path elements as the value specified.

### **or-higher**

Specifies that matched routes should have the same or a greater number of community members as the value specified.

### **or-lower**

Specifies that matched routes should have the same or a lower number of community members as the value specified.

### **standard**

Specifies that only communities in the COMMUNITY attribute should be counted.

### **extended**

Specifies that only communities in the EXTENDED\_COMMUNITY attribute should be counted.

### **large**

Specifies that only communities in the LARGE\_COMMUNITY attribute should be counted.

All

## 7.165 compare

### compare

#### Syntax

**compare** *source1 to source2*

#### Context

[\[Tree\]](#) (admin compare)

#### Full Context

admin compare

#### Description

This command displays the differences between rollback checkpoints and the active operational configuration, with *source1* as the base/first file to which *source2* is compared.

A compare operation does not check authorization of each line of output. Permission to execute the compare operation from the admin branch of CLI (authorization for the **admin rollback compare** or **admin compare** command itself) should only be given to users who are allowed to view the entire configuration, similar to permissions for **admin display-config**.

#### Default

The defaults for *source1* and *source2* are context aware and differ based on the branch in which the command is executed. In general, the default for *source1* matches the context from which the command is issued.

- In the admin node: No defaults. *source1* and *source2* must be specified.
- In the admin>rollback node:
  - source1 default = active-cfg, source2 default = latest-rb
  - compare: equivalent to "compare active-cfg to latest-rb"
  - compare to source2: equivalent to "compare active-cfg to source2"
- In a config>xx node:
  - compare to source2: equivalent to "compare active-cfg to source2"

#### Parameters

***source1, source2***

Specifies comparison information.

**Values** **active-cfg** — The current operational configuration that is active in the node.  
**latest-rb** — The most recent rollback checkpoint (the checkpoint file at the configured rollback-location with "\*.rb" as the suffix).

**rescue** — The rescue configuration (at the configured rescue-location).

*checkpoint-id* — An ID indicating a specific rollback checkpoint.  
A checkpoint-id of 1 indicates the rollback checkpoint file (at the configured rollback-location) with ".rb.1" as the suffix, 2 for file ".rb.2", and so on.

## Platforms

All

## compare

### Syntax

**compare** [*to checkpoint2*]

**compare** *checkpoint1 to checkpoint2*

### Context

[\[Tree\]](#) (admin>rollback compare)

### Full Context

admin rollback compare

### Description

This command can be used in any branch under configure, but not with configure itself. The command syntax, parameter names, and default values are context aware and will differ based on the branch in which the command is executed.

This command displays the differences between rollback checkpoints and the active operational configuration, with checkpoint1 as the base/first file to which checkpoint2 is compared. This command displays the comparison for the configuration context where it is entered and all branches below that context level.

A compare operation does not check authorization of each line of output. Permission to execute the compare operation from the admin branch of CLI (authorization for the **admin rollback compare** or **admin compare** command itself) should only be given to users who are allowed to view the entire configuration, similar to permissions for **admin display-config**.

### Default

The defaults for checkpoint1 and checkpoint2 are context-aware and differ based on the branch in which the command is executed. In general, the default for checkpoint1 matches the context from which the command is issued.

- In the admin node: No defaults. checkpoint1 and checkpoint2 must be specified.
- In the admin>rollback node:
  - checkpoint1 default = active-cfg, checkpoint2 default = latest-rb
  - compare: equivalent to "compare active-cfg to latest-rb"
  - compare to checkpoint2: equivalent to "compare active-cfg to checkpoint2"

- In a config>xx node:  
compare to checkpoint2: equivalent to "compare active-cfg to checkpoint2"

## Parameters

### *checkpoint1, checkpoint2*

Specifies comparison information.

**Values**

- active-cfg** — The current operational configuration that is active in the node.
- latest-rb** — The most recent rollback checkpoint (the checkpoint file at the configured rollback-location with ".rb" as the suffix).
- rescue** — The rescue configuration (at the configured rescue-location).
- checkpoint-id** — An ID indicating a specific rollback checkpoint. A checkpoint-id of 1 indicates the rollback checkpoint file (at the configured rollback-location) with ".rb.1" as the suffix, 2 for file ".rb.2", and so on.

## 7.166 compare-chain-include

### compare-chain-include

#### Syntax

**compare-chain-include** *ca-profile-name*

**no compare-chain-include**

#### Context

[\[Tree\]](#) (config>ipsec>cert-profile>entry compare-chain-include)

#### Full Context

configure ipsec cert-profile entry compare-chain-include

#### Description

This command configures the Certificate Authority (CA) profile that needs to be included in the compare-chain for the entry. This configuration is required in instances where there are multiple overlapping compare-chains, for example, the configured root CA is cross-signed by another CA.

#### Default

no compare-chain-include

## Parameters

### *ca-profile-name*

Specifies the name of the CA profile.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 7.167 compare-origin-validation-state

### compare-origin-validation-state

## Syntax

[no] compare-origin-validation-state

## Context

[\[Tree\]](#) (config>service>vprn>bgp>best-path-selection compare-origin-validation-state)

## Full Context

```
configure service vprn bgp best-path-selection compare-origin-validation-state
```

## Description

This command enables the comparison of origin validation states during the BGP decision process. When this command is configured, a new step is inserted in the BGP decision process after the removal of invalid routes and before the comparison of Local Preference. This step compares the origin validation state so a BGP route with a "Valid" state is preferred over a BGP route with a "Not-Found" state. A BGP route with a "Not-Found" state is preferred over a BGP route with an "Invalid" state assuming that these routes are considered "usable".

This comparison only applies to BGP routes learned from VPRN BGP peers. It does not apply to any comparison involving BGP-VPN routes that have been imported into the VPRN.

The **no** form of this command causes the new step to be skipped during the BGP decision process.

## Default

no compare-origin-validation-state

## Platforms

All

### compare-origin-validation-state

## Syntax

[no] compare-origin-validation-state

## Context

[\[Tree\]](#) (config>router>bgp>best-path-selection compare-origin-validation-state)

## Full Context

configure router bgp best-path-selection compare-origin-validation-state

## Description

When this command is configured, a new step is inserted in the BGP decision process after removal of invalid routes and before the comparison of Local Preference. The new step compares the RPKI origin validation state so that a BGP route with a 'Valid' state is preferred over a BGP route with a 'Not-Found' state, and a BGP route with a 'Not-Found' state is preferred over a BGP route with an 'Invalid' state assuming that these routes are considered 'usable'.

The new step is skipped when **no compare-origin-validation-state** is configured.

## Default

no compare-origin-validation-state

## Platforms

All

## 7.168 compatibility

### compatibility

## Syntax

**compatibility** *mode*

## Context

[\[Tree\]](#) (config>port>dwdm>coherent compatibility)

## Full Context

configure port dwdm coherent compatibility

## Description

This command configures the optical mode and rate of operation.

## Parameters

**mode**

Specifies the optical mode.

**Values** **long-haul** - The port operates in the native long-haul mode.

**long-haul-non-diff** - The port operates in the native long-haul mode using non-differential encoding.

**metro** - The port operates in the native metro regional mode.

**access** - The port operates in the native access mode (80km reach).

**interop** - The port operates in the third party interop mode.

**interop2** - The port operates in the third party interop mode with alternate differential encoding.

**interop3** - The port operates in the CFP2-DCO Rev A0 Staircase FEC interop mode.

**oif-400g-zr** - The port operates in compliance with the OIF 400G ZR implementation agreement (IA). This parameter is only supported for use with 400G ZR and 400G ZR+ pluggable transceiver modules.

**open-zrp-ofec1** - The port operates in compliance with the OpenZR+ multi-source agreement (MSA) (100GHz spacing). This parameter is only supported for use with 400G ZR and 400G ZR+ pluggable transceiver modules.

**open-zrp-ofec2** - The port operates in compliance with the OpenZR+ MSA (75 GHz spacing). This parameter is only supported for use with 400G ZR and 400G ZR+ pluggable transceiver modules.

**Default** long-haul

## 7.169 compatible-rfc1583

### compatible-rfc1583

#### Syntax

[no] **compatible-rfc1583**

#### Context

**[Tree]** (config>service>vprn>ospf compatible-rfc1583)

#### Full Context

configure service vprn ospf compatible-rfc1583

#### Description

This command enables OSPF summary and external route calculations in compliance with RFC 1583 and earlier RFCs.

RFC 1583 and earlier RFCs use a different method to calculate summary and external route costs. To avoid routing loops, all routers in an OSPF domain should perform the same calculation method.

Although it would be favorable to require all routers to run a more current compliance level, this command allows the router to use obsolete methods of calculation.

This command is not supported in OSPF3.

The **no** form of this command enables the post-RFC1583 method of summary and external route calculation.

### Default

`compatible-rfc1583` — RFC 1583 compliance is enabled.

### Platforms

All

## compatible-rfc1583

### Syntax

`[no] compatible-rfc1583`

### Context

## 7.170 compatible-version

### compatible-version

#### Syntax

**compatible-version** *version*

**no compatible-version**

#### Context

[\[Tree\]](#) (config>eth-ring compatible-version)

#### Full Context

configure eth-ring compatible-version

#### Description

This command configures eth-ring compatibility version for the G.8032 state machine and messages. The default is version 2 and all router switches use this version. If there is a need to interwork with third party devices that only support version 1 this can be set to version 1.

The **no** form of this command set the compatibility version to 2.

#### Default

compatible-version 2

#### Parameters

**version**

Specifies the version of the G.8032 state machine.

**Values** 1, 2

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 7.174 confederation

## confederation

### Syntax

**confederation** *confed-as-num* [**members** *as-number* [*as-number*]]

**no confederation** *confed-as-num* **members** *as-number* [*as-number*]

**no confederation**

### Context

[\[Tree\]](#) (config>service>vprn confederation)

### Full Context

configure service vprn confederation

### Description

This command configures the VPRN BGP instance to participate in a BGP confederation. BGP confederations can be used to reduce the number of IBGP sessions required within an AS.

When a VPRN BGP instance is part of a confederation, it can form confederation-EBGP sessions with CE router peers in a different sub-autonomous systems of the same confederation as well as regular EBGP sessions with CE router peers outside the confederation. A VPRN BGP instance that is part of a confederation cannot import or export its routes to the base router instance (as VPN-IP routes).

The **no** form of this command deletes the specified member AS from the confederation. When members are not specified in the no statement, the entire list is removed and confederations is disabled. When the last member of the list is removed, confederations is disabled.

## Default

no confederation

## Parameters

### *confed-as-num*

The confederation AS number defined as a decimal value.

**Values** 1 to 4294967295

### *members as-number*

The AS number(s) that are members of the confederation, each expressed as a decimal integer. Configure up to 15 members per confed-as-num.

**Values** 1 to 4294967295

## Platforms

All

## confederation

## Syntax

**confederation** *confed-as-num* [**members** *as-number* [*as-number*]]

**no confederation** *confed-as-num* **members** *as-number* [*as-number*]

**no confederation**

## Context

[\[Tree\]](#) (config>router confederation)

## Full Context

configure router confederation

## Description

This command creates confederation autonomous systems within an AS.

This technique is used to reduce the number of IBGP sessions required within an AS. Route reflection is another technique that is commonly deployed to reduce the number of IBGP sessions.

The **no** form of this command deletes the specified member AS from the confederation.

When no members are specified in the **no** statement, the entire list is removed and **confederation** is disabled.

When the last member of the list is removed, **confederation** is disabled.

## Default

no confederation - no confederations are defined.

## Parameters

### *confed-as-num*

Specifies the confederation AS number expressed as a decimal integer.

**Values** 1 to 65535

### *as-number*

Specifies the AS number of members that are part of the confederation, expressed as a decimal integer. Up to 15 members per *confed-as-num* can be configured.

**Values** 1 to 65535

## Platforms

All

## 7.175 confidence

### confidence

## Syntax

**confidence eq** *equal-value*

**confidence gte** *greater-than-or-equal-value*

**confidence lt** *less-than-value*

## Context

**[Tree]** (config>app-assure>group>policy>aqp>entry>match>flow-attribute confidence)

**[Tree]** (config>app-assure>group>policy>charging-filter>entry>match>flow-attribute confidence)

## Full Context

configure application-assurance group policy app-qos-policy entry match flow-attribute confidence

configure application-assurance group policy charging-filter entry match flow-attribute confidence

## Description

This command configures the confidence level of the flow attribute for use as match criteria.

## Parameters

### **eq** *equal-value*

Specifies that a successful match occurs when the flow attribute confidence level is equal to the specified value.

**Values** 0 to 100

**gte *greater-than-or-equal-value***

Specifies that a successful match occurs when the flow attribute confidence level is greater than or equal to the specified value.

**Values** 0 to 100

**lt *less-than-value***

Specifies that a successful match occurs when the flow attribute confidence level is less than the specified value.

**Values** 1 to 100

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 7.176 config-backup

### config-backup

**Syntax**

**config-backup** *count*

**no config-backup**

**Context**

[\[Tree\]](#) (config>system config-backup)

**Full Context**

configure system config-backup

**Description**

This command configures the maximum number of backup versions maintained for configuration files and BOF.

For example, assume the **config-backup** *count* is set to 5 and the configuration file is called *xyz.cfg*. When the configuration is saved, the file *xyz.cfg* is saved with a 1 extension. Each configuration save increments the numeric extension until the maximum count is reached.

*xyz.cfg xyz.cfg.1 xyz.cfg.2 xyz.cfg.3 xyz.cfg.4 xyz.cfg.5*

Each classic CLI persistent index file is updated at the same time as the associated configuration file. When the index file is updated, then the save is performed to *xyz.cfg* and the index file is created as *xyz.ndx*. Synchronization between the active and standby CPM is performed for all configurations and their associated persistent index files.

The **no** form of the command returns the configuration to the default value.

**Default**

config-backup 50

**Parameters****count**

Specifies the maximum number of backup revisions.

**Values** 1 to 200

**Platforms**

All

## 7.177 configuration-mode

configuration-mode

**Syntax**

configuration-mode {classic | mixed | model-driven}

**Context**

[\[Tree\]](#) (config>system>management-interface configuration-mode)

**Full Context**

configure system management-interface configuration-mode

**Description**

This command controls which management interfaces are used for editing and changing the configuration of the router.

Any management interface can be used in any configuration mode (to gather state information or perform operations, for example), but only specific management interfaces (CLI, NETCONF, and so on) are allowed to edit the configuration of the router in different modes. For example, only classic CLI and SNMP can be used to edit the configuration when in classic mode.

**Default**

configuration-mode model-driven

**Parameters****classic**

Enables editing of router configuration via classic CLI and SNMP management interfaces, but not using model-driven interfaces.

**model-driven**

Enables editing of router configuration via model-driven management interfaces (NETCONF with 'Nokia' YANG models, MD-CLI or gRPC), but not using classic interfaces.

**mixed**

Enables editing of router configuration using a mix of classic CLI and/or model-driven management interfaces (with some restrictions and limitations).

**Platforms**

All

## 7.179 confirm

confirm

**Syntax**

confirm

**Context**

[\[Tree\]](#) (candidate confirm)

## Full Context

candidate confirm

## Description

This command is used to stop an automatic reversion to the previous configuration after the **candidate commit confirmed** command was used. If the **confirm** command is not executed before the commit confirmed timeout period expires then the previous commit changes will be undone and the previous candidate configuration will be available for editing and a subsequent commit.

During the countdown the contents of the candidate will remain visible (candidate view) and changes to the candidate are blocked until the timeout is completed or the candidate confirm command is executed. Executing the **confirm** command clears the contents of the candidate and allows editing of the candidate.

## Platforms

All

## 7.180 cong-priority-threshold

### cong-priority-threshold

## Syntax

**cong-priority-threshold** *preference-level*

**no cong-priority-threshold**

## Context

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>bundle cong-priority-threshold)

## Full Context

configure mcast-management multicast-info-policy bundle cong-priority-threshold

## Description

This command defines the preference level threshold where records change from low congestion priority to high congestion priority. Congestion priority is used by the ingress multicast path queues to map packets entering the queue to either the low drop-tail or the MBS drop-tail threshold. If congestion occurs on the queue, the queue depth increases. As the queue depth increases beyond the low drop-tail, packets with low priority congestion priority are discarded. This leaves room in the queue for packets with high congestion priority until the queue reaches the MBS threshold.

The default congestion priority threshold is 4. This means that multicast channels with a preference level of 0 to 3 are treated as having low congestion priority and channels with preference level of 4 to 7 are treated as having a high congestion priority. The **cong-priority-threshold** command can be used to change the default threshold. Any multicast channel with a preference equal to or higher than the configured threshold is treated with high congestion priority.

The **cong-priority-threshold** value is also used by the multicast CAC manager to derive the class of a channel matched by the multicast information policy. Channels with a preference less than the configured

threshold are treated as low class and channels with a preference equal to or greater than the threshold is treated as high class.

Changing the **cong-priority-threshold** value causes all channels congestion priority to be reevaluated. Both the ingress multicast path managers and multicast CAC managers must be updated.

The **no** form of this command restores the default congestion priority preference threshold value.

## Default

cong-priority-threshold 4

## Parameters

### *preference-level*

Specifies the **cong-priority-threshold** where records change from low congestion priority to high congestion priority.

**Values** 0 to 7

## Platforms

7450 ESS, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

#### Description

This command configures the congestion threshold for the hardware aggregate shaper scheduler policy, which, if exceeded, triggers the hardware aggregate scheduler algorithm.

#### Default

congestion-threshold 90

**Parameters*****percent***

Specifies the congestion threshold as a percentage of the scheduler rate.

**Values** 0 to 100

**Platforms**

7750 SR-1, 7750 SR-s

## 7.184 connect-retry

### connect-retry

**Syntax**

**connect-retry** *seconds*

**no connect-retry**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>bgp-prng-plcy connect-retry)

**Full Context**

configure subscriber-mgmt bgp-peering-policy connect-retry

**Description**

This command configures the BGP connect retry timer value in seconds.

When this timer expires, BGP tries to reconnect to the configured peer.

The **no** form of this command used at the global level reverts to the default value.

**Default**

connect-retry 120

**Parameters*****seconds***

The BGP Connect Retry timer value in seconds, expressed as a decimal integer.

**Values** 1 to 65535

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## connect-retry

### Syntax

**connect-retry** *seconds*

**no connect-retry**

### Context

**[Tree]** (config>service>vprn>bgp>group connect-retry)

**[Tree]** (config>service>vprn>bgp>group>neighbor connect-retry)

**[Tree]** (config>service>vprn>bgp connect-retry)

### Full Context

configure service vprn bgp group connect-retry

configure service vprn bgp group neighbor connect-retry

configure service vprn bgp connect-retry

### Description

This command configures the BGP connect retry timer value in seconds.

When this timer expires, BGP tries to reconnect to the configured peer. This configuration parameter can be set at three levels: global level (applies to all peers), peer-group level (applies to all peers in group) or neighbor level (only applies to specified peer). The most specific value is used.

The **no** form of this command used at the global level reverts to the default value.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

### Default

120 seconds

### Parameters

***seconds***

Specifies the BGP connect retry timer value in seconds, expressed as a decimal integer.

**Values** 1 to 65535

### Platforms

All

## connect-retry

### Syntax

**connect-retry** *seconds*

## no connect-retry

configure router bgp group neighbor connect-retry

configure router bgp connect-retry

### Description

This command configures the BGP connect retry timer value in seconds.

When this timer expires, BGP tries to reconnect to the configured peer. This configuration parameter can be set at three levels: global level (applies to all peers), peer-group level (applies to all peers in group) or neighbor level (only applies to specified peer). The most specific value is used.

The **no** form of this command used at the global level reverts to the default value.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

## Default

connect-retry 120

## Parameters

### *seconds*

The BGP Connect Retry timer value in seconds expressed as a decimal integer.

**Values** 1 to 65535

## Platforms

All

## connect-retry

## Syntax

**connect-retry** *seconds*

**no connect-retry**

## Context

[\[Tree\]](#) (config>bmp>station>connection connect-retry)

## Full Context

configure bmp station connection connect-retry

## Description

This command configures the BMP connect retry timer value. When this timer expires, BMP tries to reconnect to the configured monitoring station. This timer is applicable when the connection to the monitoring station is not yet established.

The **no** form of this command reverts to the default value.

## Default

connect-retry 120

## Parameters

### *seconds*

Specifies the BMP connect retry timer in seconds.

**Values** 1 to 65535

## Platforms

All

## 7.185 connection

### connection

#### Syntax

**connection** *connection-id* [**create**]

**no connection** *connection-id*

#### Context

**[Tree]** (config>service>ies>sub-if>grp-if>bonding-parameters connection)

**[Tree]** (config>service>vprn>sub-if>grp-if>bonding-parameters connection)

#### Full Context

configure service ies subscriber-interface group-interface bonding-parameters connection

configure service vprn subscriber-interface group-interface bonding-parameters connection

#### Description

This command configures a node where per-connection parameters can be defined. The ID is used as a connection identifier for bonding whenever differentiation between connections is required.

The **no** form of this command removes the connection configuration from this bonding context, which can only be done when bonding is administratively disabled.

#### Parameters

##### *connection-id*

Specifies the connection ID to be assigned to connections matching the node's parameters.

**Values** 1,2

### connection

#### Syntax

**connection** *connection-id*

**connection use-incoming**

## Context

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>bonding-parameters>mcast connection)

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>bonding-parameters>mcast connection)

## Full Context

configure service ies subscriber-interface group-interface bonding-parameters mcast connection

configure service vprn subscriber-interface group-interface bonding-parameters mcast connection

## Description

This command configures the connection that should be used for sending out multicast traffic in a bonding context. Traffic can either be forced to use one *connection-id* or follow the connection where the setup message (IGMP/MLD) was received first (**use-incoming**).

The **no** form of this command removes the connection configuration from this bonding context, which can only be done when bonding is administratively disabled.

## Default

connection use-incoming

## Parameters

### *connection-id*

Specifies the connection ID.

**Values** 1, 2

## connection

## Syntax

**connection**

## Context

[\[Tree\]](#) (config>bmp>station connection)

## Full Context

configure bmp station connection

## Description

Commands in this context configure connection parameters for the BMP monitoring station.

**7.186 connection-profile-vlan****connection-profile-vlan****Syntax**

**connection-profile-vlan** *conn-prof-id* [**create**]

**no connection-profile-vlan** *conn-prof-id*

**Context**

[\[Tree\]](#) (config connection-profile-vlan)

**Full Context**

configure connection-profile-vlan

**Description**

Commands in this context configure the VLAN ranges that will be associated with a service SAP.

Each connection-profile-vlan must be explicitly configured.

**Parameters*****conn-prof-id***

Specifies the connection-profile identifier. This value will be configured in the service along with the SAP when the user associates a VLAN bundle to a single SAP. For example, a

SAP defined in a dot1q port 1/1/1 that matches all the VLANs defined in the connection-profile-vlan 1 will be created as '**sap 1/1/1:cp-1 create**'.

**Values** 1 to 8000

## 7.187 connection-timeout

### connection-timeout

#### Syntax

**connection-timeout** *seconds*

**no connection-timeout**

#### Context

[\[Tree\]](#) (config>system>management-interface>remote-management connection-timeout)

#### Full Context

configure system management-interface remote-management connection-timeout

#### Description

This command configures the amount of time that all remote managers cannot be reached before they are considered to be down.

If this command is also configured for a specific manager in the **config>system> management-interface>remote-management>manager** context, that configuration takes precedence.

The **no** form of this command reverts to the default.

#### Default

connection-timeout 60

#### Parameters

**seconds**

Specifies the connection timeout in seconds.

**Values** 1 to 3600

## Platforms

All

## connection-timeout

### Syntax

**connection-timeout** *seconds*

**no connection-timeout**

### Context

[\[Tree\]](#) (config>system>management-interface>remote-management>manager connection-timeout)

### Full Context

configure system management-interface remote-management manager connection-timeout

### Description

This command configures the amount of time that this remote manager cannot be reached before it is considered to be down.

This command takes precedence over the same command configured in the global context (**config>system>management-interface>remote-management**).

The **no** form of this command reverts to the default.

### Default

connection-timeout 60

### Parameters

*seconds*

Specifies the connection timeout in seconds.

**Values** 1 to 3600

### Platforms

All

## 7.188 connection-timer

## connection-timer

### Syntax

**connection-timer** *seconds*

**no connection-timer**

### Context

**[Tree]** (config>aaa>diam>node connection-timer)

### Full Context

```
configure aaa diameter node peer connection-timer
configure aaa diameter node connection-timer
```

### Description

This command configures the Diameter node connection timer that defines the time the systems waits before attempting to reconnect to a peer after the connection was lost.

The **no** form of this command reverts to the default.

### Default

```
connection-timer 30
```

### Parameters

#### *seconds*

Specifies the Diameter node connection timer.

**Values** 1 to 1000

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 7.189 connectivity-association

### connectivity-association

### Syntax

```
connectivity-association ca-name [create]
```

```
no connectivity-association ca-name
```

### Context

**[Tree]** (config>macsec connectivity-association)

### Full Context

```
configure macsec connectivity-association
```

### Description

This command configures a connectivity association. MACsec connectivity associations are applied to a port dot1x configuration to enable MACsec on that port.

The **no** form of this command removes the connectivity association.

## Parameters

### *ca-name*

The name of the connectivity association, a string up to 32 characters long.

### **create**

Mandatory while creating an entry.

## Platforms

All

## 7.190 connectivity-verification

### connectivity-verification

## Syntax

**connectivity-verification** [**count** *nr-of-attempts*] [**timeout** *timeout-seconds*] [**retry-time** *retry-seconds*]

**no connectivity-verification**

## Context

[\[Tree\]](#) (config>subscr-mgmt>vrgw>brg>brg-profile connectivity-verification)

## Full Context

configure subscriber-mgmt vrgw brg brg-profile connectivity-verification

## Description

This command configures the BRG connectivity verification. The system uses ICMP Echo request messages for connectivity verification.

When the last host associated with a BRG is removed, a ping mechanism is used to verify if the BRG is still active. This command specifies the parameters used in this mechanism.

The **no** form of this command disables the BRG ping mechanism and removes the BRG without verification. Any configured hold time still applies.

## Default

connectivity-verification count 3 timeout 30 retry-time 900

## Parameters

### *nr-of-attempts*

Specifies the number of connectivity verification attempts this system makes before a BRG is considered down.

**Values** 1 to 5

### *timeout-seconds*

Specifies the time, in seconds, after which an unanswered ping is considered failed.

**Values** 5 to 60

#### ***retry-seconds***

Specifies the time, in seconds, that the system waits while it considers a BRG down before it starts a new connectivity verification cycle. If a ping succeeds, the mechanism will be retried after this time.

**Values** 300 to 3600

### **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## **7.191 connectivity-verify**

### **connectivity-verify**

#### **Syntax**

## 7.193 consider-system-ip-in-gep

## consider-system-ip-in-gep

### Syntax

**[no] consider-system-ip-in-gep**

### Context

[\[Tree\]](#) (config>router>ldp consider-system-ip-in-gep)

### Full Context

configure router ldp consider-system-ip-in-gep

### Description

When this command is enabled, the system interprets the presence or absence of the system IP and its associated action in the applied Global Export Policies in the same way as for other interfaces' IP addresses. In that case:

- if the system IP is not present, its FEC will not be exported or it will be withdrawn if it has been exported
- if the system IP is present with "accept", its FEC will be exported
- if the system IP is present with "deny", its FEC will not be exported or it will be withdrawn if it had been exported

Enabling or disabling this command leads to the applied Global Export Policies being reevaluated.

The **no** form of this command causes the system to not interpret the presence or absence of the system IP in applied Global Export Policies, and the FEC for the system IP is exported (default behavior).

**Default**

no consider-system-ip-in-gep

**Platforms**

All

## 7.194 console

console

**Syntax**

console

**Context**

[\[Tree\]](#) (config>system>management-interface>cli>md-cli>environment console)

[\[Tree\]](#) (config>system>security>user console)

**Full Context**

configure system security user-template console

configure system security user console

## Description

This command creates the context to configure user profile membership for the console (either Telnet or CPM serial port user).

## Platforms

All

## 7.195 console-speed

### console-speed

## Syntax

**console-speed** *baud-rate*

**no console-speed**

## Context

[\[Tree\]](#) (bof console-speed)

## Full Context

bof console-speed

## Description

This command configures the console port baud rate.

When this command is issued while editing the BOF file used for the most recent boot, both the BOF file and the active configuration are changed immediately.

The **no** form of this command reverts to the default value.

## Default

console-speed 115200

## Parameters

### *baud-rate*

Specifies the console port baud rate, expressed as a decimal integer.

**Values** 9600, 19200, 38400, 57600, 115200

## Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s, 7950 XRS, VSR

## 7.196 constellation

### constellation

#### Syntax

**constellation** *gps* [*galileo*]

#### Context

[\[Tree\]](#) (config>port>gnss constellation)

#### Full Context

configure port gnss constellation

#### Description

This command configures the GNSS systems used by the GNSS receiver on platforms containing one or more embedded GNSS receivers.

The GNSS receiver uses GPS by default. GPS must always be enabled when the GNSS receiver is used, and the GNSS receiver can be configured to use additional GNSS systems simultaneously.

#### Default

*gps*

#### Parameters

##### **gps**

Enables the use of the American GPS GNSS system. This keyword is always required when using the GNSS receiver.

##### **galileo**

Enables the use of the European Galileo GNSS system. This keyword is only supported on 7750 SR FP5 GNSS platforms.

#### Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se, 7750 SR-2se

## 7.197 contact

### contact

#### Syntax

**contact** *contact-information*

**no contact** *contact-information*

### Context

[\[Tree\]](#) (config>service>cust contact)

### Full Context

configure service customer contact

### Description

This command configures contact information for a customer.

Include any customer-related contact information such as a technician's name or account contract name.

The **no** form of this command removes the contact information from the customer ID.

### Default

no contact

### Parameters

#### ***contact-information***

Specifies customer contact information entered as an ASCII character string up to 80 characters in length. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. Any printable, seven bit ASCII characters may be used within the string.

### Platforms

All

## contact

### Syntax

**contact** *contact-name*

**no contact**

### Context

[\[Tree\]](#) (config>system contact)

### Full Context

configure system contact

### Description

This command creates a text string that identifies the contact name for the device.

Only one contact can be configured, if multiple contacts are configured the last one entered will overwrite the previous entry.

The **no** form of the command reverts to default.

### Default

no contact

### Parameters

#### *contact-name*

Specifies the contact name character string. The string can be up to 80 characters long. Any printable, seven-bit ASCII characters can be used within the string. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

## 7.199 continuous

### continuous

#### Syntax

[no] continuous

#### Context

[\[Tree\]](#) (config>saa>test continuous)

#### Full Context

configure saa test continuous

#### Description

This command specifies whether the SAA test is continuous. Once a test is configured as continuous, it cannot be started or stopped with the **oam saa test-name {start | stop}** command.

This option is not applicable to all SAA test types. Support is included for the following types:

- **cpe-ping**
- **dns**
- **eth-cfm-loopback**
- **eth-cfm-two-way-delay**
- **eth-cfm-two-way-slm**
- **icmp-ping** (not applicable to **rapid** type)
- **lsp-ping**
- **mac-ping**
- **sdp-ping**
- **vccv-ping**
- **vprn-ping**

The **no** form of this command disables the continuous execution of the test.

**[Tree]** (config>service>vpls>spoke-sdp control-channel-status)

**[Tree]** (config>service>epipe>spoke-sdp control-channel-status)

### Full Context

configure service cpipe spoke-sdp control-channel-status

configure service vpls spoke-sdp control-channel-status

configure service epipe spoke-sdp control-channel-status

### Description

This command enables the configuration of static pseudowire status signaling on a spoke SDP for which signaling for its SDP is set to OFF.

A control-channel-status **no shutdown** is allowed only if all of the following are true:

- SDP signaling is off.
- The control-word is enabled (the control-word is disabled by default)
- The service type is Epipe, Apipe, VPLS, Cpipe, or IES/VP RN
- Mate SDP signaling is off (in vc-switched services)
- The pw-path-id is configured for this spoke SDP.

The **no** form of this command removes control channel status signaling from a spoke SDP. It can only be removed if control channel status is shut down.

### Default

no control-channel-status

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 7.202 control-mep

### control-mep

#### Syntax

[no] control-mep

#### Context

[\[Tree\]](#) (config>eth-tunnel>path>eth-cfm>mep control-mep)

#### Full Context

configure eth-tunnel path eth-cfm mep control-mep

#### Description

This command enables the Ethernet tunnel control on the MEP. The use of control-mep command is mandatory for an Ethernet tunnel. MEP detection of failure using CCM may be enabled or disabled independently of the control mep.

The **no** form of this command disables Ethernet ring control.

#### Default

no control-mep

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### control-mep

#### Syntax

[no] control-mep

#### Context

[\[Tree\]](#) (config>eth-ring>path>eth-cfm>mep control-mep)

#### Full Context

configure eth-ring path eth-cfm mep control-mep

## Description

This command enables the Ethernet ring control on the MEP. The use of control-mep command is mandatory for a ring. MEP detection of failure using CCM may be enabled or disabled independently of the control mep.

The **no** form of this command disables Ethernet ring control.

## Default

no control-mep

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 7.203 control-tag

### control-tag

## Syntax

**control-tag** *qtag* [*.qtag*]

**no control-tag**

## Context

**[Tree]** (config>eth-tunnel>path control-tag)

## Full Context

configure eth-tunnel path control-tag

## Description

This command specifies the VLAN-ID to be used for Ethernet CFM and G.8031 control plane exchanges. If the operator wants to replace an existing control-tag, the parent path needs to be in shutdown state, then deleted and recreated before a new control-tag can be specified.

The **no** form of this command is used just to indicate that a control-tag is not configured. The procedure described above, based on 'no path' command must be used to un-configure/change the control-tag assigned to the path.

## Default

no control-tag

## Parameters

***qtag*** [*.qtag*]

Specifies the value of the VLAN ID to be used for the control tag.

**Values** 0 to 4094, untagged option is not supported, \*

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure service vpls bgp-evpn mpls control-word

#### Description

This command enables the transmission and reception of the **control-word**. As defined in RFC7432, the use of the control-word helps avoid frame disordering.

It is enabled or disabled for all EVPN-MPLS destinations at the same time.

#### Default

no control-word

## Platforms

### control-word

#### Syntax

[no] control-word

#### Context

[\[Tree\]](#) (config>service>sdp>binding>pw-port control-word)

#### Full Context

configure service sdp binding pw-port control-word

## Description

This command enables the setting of the control word bit in the label message. Control words are used to distinguish a PW payload (Ethernet) from an IP payload (identified by the first nibble past the bottom MPLS label, either 4 or 6) carried over an MPLS network.

Based on the payload type, the transit MPLS node can make an appropriate load balancing decision. Load balancing can rely on the MPLS labels, or rely on additional fields that are available only in IP header (source and destination IP addresses and ports).

The presence of a control word indicates that the header following the last MPLS label in the frame is not an IP header.

The **no** form of this command disables setting the control word bit in the label message.

## Default

no control-word

[\[Tree\]](#) (config>service>epipe>spoke-sdp control-word)

## Full Context

configure service cpipe spoke-sdp control-word

configure service ipipe spoke-sdp control-word

configure service epipe spoke-sdp control-word

## Description

The control word command provides the option to add a control word as part of the packet encapsulation for pseudowire types for which the control word is optional. These are Ethernet pseudowires (Epipe). For the 7750 SR only, ATM N:1 cell mode pseudowires (apipe vc-types atm-vcc and atm-vpc) and VT pseudowire (apipe vc-type atm-cell).

The configuration for the two directions of the pseudowire must match because the control word negotiation procedures described in Section 6.2 of RFC 4447 are not supported. The C-bit in the pseudowire FEC sent in the label mapping message is set to 1 when the control word is enabled. Otherwise, it is set to 0.

The service will only come up if the same C-bit value is signaled in both directions. If a spoke-sdp is configured to use the control word but the node receives a label mapping message with a C-bit clear, the

node releases the label with the an "Illegal C-bit" status code as per Section 6.1 of RFC 4447. As soon as the user also enabled the control the remote peer, the remote peer will withdraw its original label and will send a label mapping with the C-bit set to 1 and the VLL service will be up in both nodes. The control word must be enabled to allow MPLS-TP OAM to be used on a static spoke-sdp in a Apipe, Epipe and Cpipe service.

## Platforms

**[Tree]** (config>service>vpls>mesh-sdp control-word)

### Full Context

configure service vpls spoke-sdp control-word

configure service vpls mesh-sdp control-word

### Description

This command enables the use of the control word on pseudowire packets in VPLS and enables the use of the control word individually on each mesh SDP or spoke-SDP. By default, the control word is disabled. When the control word is enabled, all VPLS packets, including the BPDU frames, are encapsulated with the control word when sent over the pseudowire. The T-LDP control plane behavior is the same as in the implementation of control word for VLL services. The configuration for the two directions of the Ethernet pseudowire should match. The **no** form of this command reverts the mesh SDP or spoke-SDP to the default behavior of not using the control word. The control word must be enabled to use MPLS-TP OAM on a static spoke-sdp terminating in a VPLS.

### Syntax

convert-file *filename* to *output-file-name* format {secure | legacy} [force]

### Context

[\[Tree\]](#) (admin>certificate convert-file)

### Full Context

admin certificate convert-file

## Description

This command converts imported certificates and keys in the `cf3:/system-pki` directory between secure and legacy format.

## Parameters

### *filename*

Specifies an existing filename, up to 95 characters.

### *output-file-name*

Specifies the output file name, up to 95 characters. If the output filename already exists, and the **force** keyword is not selected, the system prompts to proceed or abort.

### **format**

Specifies the target format.

**Values**    `secure` — Specifies the enhanced secure format  
               `legacy` — Specifies the legacy format

### **force**

Forces the conversion even if there is an existing file with the same output filename.

**[Tree]** (config>service>epipe>spoke-sdp>ingress>l2tpv3 cookie)

## Full Context

configure service epipe spoke-sdp egress l2tpv3 cookie

configure service epipe spoke-sdp ingress l2tpv3 cookie

## Description

This command configures the RX/TX cookie for L2TPv3 spoke SDPs for Epipe services. The RX cookie must match the configured TX cookie on a far-end node, while the TX cookie must match the configured

RX cookie on a far-end node. If a mismatch is detected between the configured (far-end binding cookie) to what is received by the local IP address of the SDP a flag is set and must be manually cleared by an operator.

The purpose of the cookie is to provide validation against misconfiguration of service endpoints, and to ensure that the right service egress is being used.

One egress cookie and up to two ingress cookies may be configured per spoke SDP binding. One or two cookies can be configured for matching ingress packets from the far-end node, in order to support cookie rollover without dropping packets. When a cookie is not configured, SR OS assumes a value of 00:00:00:00:00:00:00:00.

A cookie is not mandatory. An operator may delete an egress cookie or either or both ingress cookies.

## Default

no cookie1 cookie2

## Parameters

### *cookie1*

Specifies the first cookie, in the form of a 64-bit colon-separated hex value.

### *cookie2*

Specifies the second cookie, in the form of a 64-bit colon-separated hex value.

## Platforms

All

## cookie

## Syntax

**cookie** *cookie1-value* [*cookie2-value*]

**no cookie**

## Context

## Full Context

configure mirror mirror-dest remote-source spoke-sdp ingress l2tpv3 cookie

configure mirror mirror-dest spoke-sdp ingress l2tpv3 cookie

configure mirror mirror-dest spoke-sdp egress l2tpv3 cookie

## Description

This command configures the RX/TX cookie for L2TPv3 spoke SDPs for the mirror destination. The command can configure L2TPv3 a single cookie for the egress spoke SDP or one or two cookies for the remote source ingress spoke SDP.

The purpose of the cookie is to provide validation against misconfiguration of service endpoints, and to ensure that the right service egress is being used.

When a cookie is not configured, SR OS assumes a value of 00:00:00:00:00:00:00:00. A cookie is not mandatory. An operator may delete the egress cookie or either or both ingress cookies.

## Parameters

### *cookie1-value*

Specifies a 64-bit colon separated hex value.

**Values** xx-xx-xx-xx-xx-xx-xx-xx or xx:xx:xx:xx:xx:xx:xx:xx

### *cookie2-value*

Specifies a second 64-bit colon separated hex value.

**Values** xx-xx-xx-xx-xx-xx-xx-xx or xx:xx:xx:xx:xx:xx:xx:xx

## Full Context

configure router l2tp l2tpv3 cookie-length

configure service vprn l2tp group l2tpv3 cookie-length

configure service vprn l2tp l2tpv3 cookie-length

## Description

This command configures the length of the optional cookie field.

The **no** form of this command returns the **cookie-length** to a default of **none**.

## Default

no cookie-length

## Parameters

**4**

Specifies the cookie length as 4 bytes.

**8**

Specifies the cookie length as 8 bytes.

**default**

When specified within the **config>service>vprn>l2tp>group>l2tpv3** context, this is referencing to the **cookie-length** configuration within the **config>service>vprn>l2tp>l2tpv3** context.

## 7.210 cooling-profile

### cooling-profile

## Syntax

**cooling-profile {default | aggressive}**

**no cooling-profile**

## Context

[\[Tree\]](#) (config system fan-control cooling-profile)

## Full Context

configure system fan-control cooling-profile

## Description

This command configures the cooling profile used to determine the fan speed.

Nokia recommends that the default setting be used unless aggressive cooling is explicitly required.

The **no** form of this command sets the cooling profile back to the default value.

**Default**

no cooling-profile

**Parameters****default**

Specifies the fan speed operates at its default speed.

**aggressive**

Sets the control point optics temperature to 65 C, which requires a higher fan speed.

**Platforms**

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se

## 7.211 coordinates

### coordinates

**Syntax**

**coordinates** *coordinates*

**no coordinates**

**Context**

[\[Tree\]](#) (config>system coordinates)

**Full Context**

configure system coordinates

**Description**

This command creates a text string that identifies the system coordinates for the device location. For example, the command **coordinates "37.390 -122.0550"** is read as latitude 37.390 north and longitude 122.0550 west.

Only one set of coordinates can be configured. If multiple coordinates are configured, the last one entered overwrites the previous entry.

The **no** form of the command reverts to the default value.

**Parameters*****coordinates***

Specifies the coordinates describing the device location character string. The string may be up to 80 characters long. Any printable, seven-bit ASCII characters can be used within the string. If the string contains special characters (**#**, **\$**, spaces, and so on), the entire string must be enclosed within double quotes. If the coordinates are subsequently used

by an algorithm that locates the exact position of this node then the string must match the requirements of the algorithm.

## Context

[\[Tree\]](#) (file copy)

## Full Context

file copy

## Description

This command copies a file or all files in a directory from a source URL to a destination URL. At least one of the specified URLs should be a local URL. The optional wildcard (\*) can be used to copy multiple files that share a common (partial) prefix and/or (partial) suffix.

When a file is copied to a destination with the same file name, the original file is overwritten by the new file specified in the operation. The following prompt appears if the destination file already exists:

"Overwrite destination file (y/n)?"

For example:

To copy a file named `srcfile` in a directory called `test` on `cf2` in slot B to a file called `destfile` in a directory called `production` on `cf1` in slot A, the syntax is:

```
srl>file cf2:\ # copy cf2-B/test/srcfile cf1-A/production/destfile
```

To FTP a file named `121201.cfg` in directory `mydir` stored on `cf1` in slot A to a network FTP server with IP address `192.0.2.79` in a directory called `backup` with a destination file name of `121201.cfg`, the FTP syntax is:

```
copy cf1-A/mydir/121201.cfg 192.0.2.79/backup/121201.cfg
```

## Parameters

### **source-file-url**

Specifies the location of the source file or directory to be copied.

#### Values

|                           |                                                                                                                                                                                            |

### core-mvpn

#### Syntax

[no] **core-mvpn** *service-id*

#### Context

[\[Tree\]](#) (config>service>vprn>mvpn>rpf-select core-mvpn)

#### Full Context

configure service vprn mvpn rpf-select core-mvpn

#### Description

This command enables context for VRF extranet mapping for C-instance receivers in this receiver MVPN instance to multicast streams in the specified P-instance core MVPN instance.

## Platforms

All

## 7.217 cores

### cores

#### Syntax

**cores** *core-count*

**no cores**

#### Context

[\[Tree\]](#) (config>esa>vm cores)

#### Full Context

configure esa vm cores

## Description

This command configures the number of CPU physical cores to be allocated to the ESA-VM instance. If an invalid value is configured for the number of cores, the VM remains in a failed state.

The **no** form of this command removes the core allocation. To modify the number of cores, you must use the **no core** command first.

## Parameters

### *core-count*

Specifies the number of cores.

**Values** 0 to 128

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

**7.220 cpe-check**

## cpe-check

### Syntax

**cpe-check** *cpe-ip-address*

**no cpe-check** [*cpe-ip-address*]

### Context

**[Tree]** (config>service>vprn>static-route-entry>next-hop cpe-check)

**[Tree]** (config>service>vprn>static-route-entry>indirect cpe-check)

### Full Context

configure service vprn static-route-entry next-hop cpe-check

configure service vprn static-route-entry indirect cpe-check

### Description

This command enables CPE-check and specifies the IP address of the target CPE device.

This option initiates a background ICMP ping test to the configured target IP address. The IP address can either be an IPv4 address for IPv4 static routes or an IPv6 address for IPv6 static routes. The target-ip-address cannot be in the same subnet as the static route subnet itself to avoid possible circular references. This option is mutually exclusive with BFD support on a given static route.

#### Note:

A node that is sourcing CPE-check packets waits an additional full interval before taking action, which gives the CPE time to respond. For example, with a **drop-count** of 3 and an interval of 1s, three CPE-check packets are sent out and the node waits for the duration of another interval before acting on the loss. Failure declaration may take extra time depending on the load, interval, and other factors. In line with multitasking, multi-priority operating principles of the node, and the relative priority of **cpe-ping**, the node paces these minor events.

The **no** form of this command disables the **cpe-check** option.

### Default

no cpe-check

### Parameters

***cpe-ip-address***

Specifies the IP address of the CPE device.

### Platforms

All

## cpe-check

### Syntax

**cpe-check** *cpe-ip-address*

**no cpe-check** [*cpe-ip-address*]

## 7.221 cpe-ping

## cpe-ping

### Syntax

**cpe-ping service** *service-id* **destination** *ip-address* **source** *ip-address* [**source-mac** *ieee-address*] [**fc** *fc-name*] [**profile** {**in** | **out**}] [**ttl** *vc-label-ttl*] [**count** *send-count*] [**return-control**] [**interval** *interval*]

### Context

**[Tree]** (oam cpe-ping)

**[Tree]** (config>saa>test>type cpe-ping)

### Full Context

oam cpe-ping

configure saa test type cpe-ping

### Description

This ping utility determines the IP connectivity to a CPE within a specified VPLS service.

### Parameters

#### *service-id*

Specifies the service ID of the service to diagnose or manage.

#### Values

*service-id*: 1 to 2147483647

*svc-name*: 64 characters maximum

#### **destination** *ip-address*

Specifies the IP address to be used as the destination for performing an OAM ping operations.

**Values** a.b.c.d

#### **source** *ip-address*

Specifies an unused IP address in the same network that is associated with the VPLS or PBB Epipe.

**Values** a.b.c.d

#### *ieee-address*

Specifies the source MAC address that is sent to the CPE. If not specified or set to 0, the MAC address configured for the CPM or CFM is used. This parameter is not applicable to CPE ping on Epipes.

**Values** xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

All zeros and multicast is not allowed.

#### **fc-name**

Specifies the forwarding class of the MPLS echo request encapsulation.

**Values** be, l2, af, l1, h2, ef, h1, nc

**Default** be

**profile {in | out}**

Specifies the profile state of the MPLS echo request encapsulation for VPLS and the ARP packet for PBB Epipe and Epipe VLLs.

**Default** out

**vc-label-ttl**

Specifies the TTL value in the VC label for the OAM MAC request, expressed as a decimal integer.

**Values** 1 to 255

**Default** 255

**send-count**

Specifies the number of messages to send to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message **interval** value must have expired before the next message request is sent.

**Values** 1 to 100

**Default** 1

**return-control**

Specifies the MAC OAM reply to a data plane MAC OAM request be sent using the control plane instead of the data plane. This parameter is only valid for VPLS services.

**interval**

Specifies the *interval* parameter in seconds, expressed as a decimal integer. This parameter is used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the *interval* is set to 1 second where the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

**Values** 1 to 10

**Default** 1

**Platforms**

All

## 7.222 cpipe

### cpipe

#### Syntax

```
cpipe service-id [customer customer-id] [vpn vpn-id] [vc-type {satop-e1 | satop-t1 | [vc-switching] | cesopsn | cesopsn-cas}] [vc-switching] [test] [create] [name name]
```

```
no cpipe service-id
```

#### Context

[\[Tree\]](#) (config>service cpipe)

#### Full Context

configure service cpipe

#### Description

This command configures a Circuit Emulation Services instance.

When creating a service, you must enter the **customer** keyword and specify a *customer-id* to associate the service with a customer. The *customer-id* must already exist, having been created using the **customer** command in the **service** context. After a service has been created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association.

After a service is created, the use of the **customer** *customer-id* parameter is optional for navigating into the service configuration context. Attempting to edit a service with the incorrect *customer-id* specified results in an error.

By default, no services exist until they are explicitly created with this command.

The **no** form of this command deletes the service instance with the specified *service-id*. The service cannot be deleted until the service has been shutdown.

#### Parameters

##### *service-id*

The unique service identification number or string identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every router on which this service is defined.

**Values** *service-id*: 1 to 2147483647

*svc-name*: Specifies an existing service name up to 64 characters in length.

##### *customer-id*

Specifies the customer ID number to be associated with the service. This parameter is required on service creation and optional for service editing or deleting.

**Values** 1 to 2147483647

### **vpn vpn-id**

Specifies the VPN ID number which allows you to identify virtual private networks (VPNs) by a VPN ID. If this parameter is not specified, the VPN ID uses the same service ID number.

**Values** 1 to 2147483647

**Default** null (0)

### **vc-type**

The vc-type defines the type of unstructured or structured circuit emulation service to be configured.

**Values** **satop-e1**: Unstructured E1 circuit emulation service.

**satop-t1**: Unstructured DS1 circuit emulation service.

**cesopsn**: Basic structured N\*64 kb/s circuit emulation service.

**cesopsn-cas**: Structured N\*64 kb/s circuit emulation service with signaling.

**Default** satop-e1

### **vc-switching**

Specifies if the pseudowire switching signaling is used for the spoke SDPs configured in this service.

### **test**

Specifies a unique test service type for the service context which contains only a SAP configuration. The test service can be used to test the throughput and performance of a path for MPLS-TP PWs. This parameter applies to the 7450 ESS and 7750 SR only.

### **create**

Keyword used to create the service. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

### **name name**

Configures an optional service name identifier, up to 64 characters, to a given service. This service name can then be used in configuration references, display, and show commands throughout the system. A defined service name can help the service provider or administrator to identify and manage services within the SR OS platforms.

To create a service, you must assign a service ID; however, after it is created, either the service ID or the service name can be used to identify and reference a service.

If a name is not specified at creation time, then SR OS assigns a string version of the *service-id* as the name.

**Values** *name*: up to 64 characters

## **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 7.223 cpm-filter

```
cpm-filter
```

### Syntax

```
cpm-filter
```

### Context

[\[Tree\]](#) (config>system>security cpm-filter)

### Full Context

```
configure system security cpm-filter
```

### Description

Commands in this context configure a CPM filter. A CPM filter is a hardware filter done by the P chip on the CPM and CFM that applies to all the traffic going to the CPM CPU. It can be used to drop, accept packets, as well as allocate dedicated hardware queues for the traffic.

The **no** form of this command disables the CPM filter.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**no cpu-alarm**

**Context**

[\[Tree\]](#) (config>li>x-interfaces>x3>alarms cpu-alarm)

**Full Context**

configure li x-interfaces x3 alarms cpu-alarm

**Description**

This command configures the thresholds for raising the CPU alarm. The low threshold value must be configured with a smaller value than the high threshold.

The **no** form of this command reverts to the default values.

**Parameters*****high-percentage***

Specifies the high threshold value, as a percentage.

**Values** 1 to 100

**Default** 100

***low-percentage***

Specifies the low threshold value, as a percentage.

**Values** 0 to 99

**Default** 0

configure service vprn subscriber-interface group-interface sap cpu-protection
configure service vpls sap cpu-protection
configure service vprn interface spoke-sdp cpu-protection
configure service ies interface spoke-sdp cpu-protection
```

### Description

This command assigns an existing CPU protection policy to the SAP or interface. The CPU protection policies are configured in the **config>sys>security>cpuprotection>policy** *cpu-protection-policy-id* context.

If no CPU-protection policy is assigned to a SAP, then a default policy is used to limit the overall-rate according to the default policy. The default policy is policy number 254 for access interfaces, 255 for network interfaces and no policy for video interfaces.

The **no** form of this command removes the association of the CPU protection policy from the associated SAP or interface configuration and reverts to the default policy values.

### Default

cpu-protection 254 (for access interfaces)

cpu-protection 255 (for network interfaces)

The configuration of no cpu-protection returns the msap-policy to the default policies as shown above.

### Parameters

#### mac-monitoring

Enables per SAP + source MAC address rate limiting using the per-source-rate from the associated cpu-protection policy.

#### ip-src-monitoring

Enables per SAP + IP source address rate limiting for certain protocol packets using the per-source-rate and include-protocols from the associated cpu-protection policy. The ip-src-monitoring is useful in subscriber management architectures that have routers between the subscriber and the BNG (router). In Layer 3 aggregation scenarios all packets from all subscribers behind the same aggregation router arrives with the same source MAC address and as such the mac-monitoring functionality can not differentiate traffic from different subscribers.

#### eth-cfm-monitoring

Enables the Ethernet Connectivity Fault Management cpu-protection extensions on the associated SAP, SDP, or template.

#### aggregate

applies the rate limit to the sum of the per-peer packet rates.

**car**

(Committed Access Rate (CAR) causes Eth-CFM packets to be ignored when enforcing the overall-rate.

**Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s

- configure service vprn subscriber-interface group-interface sap cpu-protection

configure service vpls spoke-sdp cpu-protection

configure service vpls mesh-sdp cpu-protection

configure service vpls sap cpu-protection

configure service epipe spoke-sdp cpu-protection

configure service epipe sap cpu-protection

## Description

Use this command to apply a specific CPU protection policy to the associated SAP, SDP or template. If the `mac-monitoring` keyword is given then per-MAC-rate limiting should be performed, using the per-source-rate from the associated CPU protection policy.

The CPU protection policies are configured in the `config>sys>security>cpu-protection>policy cpu-protection-policy-id` context.

If no CPU protection policy is assigned to a SAP, then a default policy is used to limit the overall-rate according to the default policy. The default policy is policy number 254 for access interfaces, 255 for network interfaces and no policy for video interfaces.

The `no` form of this command reverts to the default values.

## Default

`cpu-protection 254` (for access interfaces)

`cpu-protection 255` (for network interfaces)

## Parameters

### `mac-monitoring`

Enables per SAP + source MAC address rate limiting using the per-source-rate from the associated `cpu-protection` policy.

### `eth-cfm-monitoring`

Enables the Ethernet Connectivity Fault Management `cpu-protection` extensions on the associated SAP/SDP/template.

### `aggregate`

applies the rate limit to the sum of the per-peer packet rates.

### `car`

(Committed Access Rate) Ignores Eth-CFM packets when enforcing overall-rate.

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## cpu-protection

## Syntax

`cpu-protection policy-id`

`no cpu-protection`

## Context

[\[Tree\]](#) (config>service>ies>interface `cpu-protection`)

[\[Tree\]](#) (config>service>vprn>interface `cpu-protection`)

[\[Tree\]](#) (config>service>vprn>network-interface `cpu-protection`)

[\[Tree\]](#) (config>router>interface `cpu-protection`)

[\[Tree\]](#) (config>service>vprn>video-interface cpu-protection)

[\[Tree\]](#) (config>service>ies>video-interface cpu-protection)

### Full Context

```
configure service ies interface cpu-protection
configure service vprn interface cpu-protection
configure service vprn network-interface cpu-protection
configure router interface cpu-protection
configure service vprn video-interface cpu-protection
configure service ies video-interface cpu-protection
```

### Description

This command assigns an existing CPU protection policy to the associated interface. For these interface types, the per-source rate limit is not applicable.

The CPU protection policies are configured in the **config>sys>security>cpu-protection>policy** *cpu-protection-policy-id* context.

If no CPU-protection policy is assigned to an interface, then the default policy is used to limit the overall-rate. The default policy is policy number 254 for access interfaces, 255 for network interfaces and no policy for video interfaces.

The **no** form of this command reverts to the default values.

### Default

```
cpu-protection 254 (for access interfaces)
cpu-protection 255 (for network interfaces)
no cpu-protection (for video interfaces)
```

### Parameters

#### *policy-id*

Specifies an existing CPU protection policy.

**Values** 1 to 255

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

- configure service ies interface cpu-protection
- configure service vprn network-interface cpu-protection
- configure router interface cpu-protection
- configure service vprn interface cpu-protection

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

- configure service ies video-interface cpu-protection

- configure service vprn video-interface cpu-protection

## cpu-protection

### Syntax

**cpu-protection** *policy-id* [**mac-monitoring**] [**ip-src-monitoring**]

**no cpu-protection**

### Context

[\[Tree\]](#) (config>subscr-mgmt>msap-policy cpu-protection)

### Full Context

configure subscriber-mgmt msap-policy cpu-protection

### Description

Use this command to apply a specific CPU protection policy to the associated MSAP policy. The specified CPU protection policy is automatically applied to any MSAPs that are create using the MSAP policy.

If no CPU protection policy is assigned to a SAP, then a default policy is used to limit the overall-rate according to the default policy. The default policy is policy number 254 for access interfaces, 255 for network interfaces and no policy for video interfaces.

The **no** form of this command reverts to the default values.

### Default

cpu-protection 254 (for access interfaces)

cpu-protection 255 (for network interfaces)

The configuration of no cpu-protection returns the msap-policy to the default policies as shown above.

### Parameters

#### *policy-id*

Specifies an existing CPU protection policy.

**Values** 1 to 255

#### **mac-monitoring**

Enables per SAP + source MAC address rate limiting using the per-source-rate from the associated cpu-protection policy.

#### **ip-src-monitoring**

Enables per SAP + IP source address rate limiting for certain protocol packets using the per-source-rate and included-protocols from the associated cpu-protection policy. The ip-src-monitoring is useful in subscriber management architectures that have routers between the subscriber and the BNG (router). In Layer 3 aggregation scenarios all packets from all subscribers behind the same aggregation router arrives with the same source MAC address and as such the mac-monitoring functionality can not differentiate traffic from different subscribers.

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s

## cpu-protection

### Syntax

**cpu-protection**

**cpu-protection** *policy-id* [**ip-src-monitoring**] [**mac-monitoring**]

### Context

[\[Tree\]](#) (config>subscr-mgmt>sap-template cpu-protection)

### Full Context

configure subscriber-mgmt sap-template cpu-protection

### Description

This command assigns an existing CPU protection policy to the SAP or interface.

CPU protection policies are configured in the **config>sys>security>cpu-protection** context.

### Default

cpu-protection 254

### Parameters

#### *policy-id*

Specifies an existing CPU protection policy is assigned to the SAP or interface.

**Values** 1 to 255

#### **ip-src-monitoring**

Specifies to enable IP source monitoring.

#### **mac-monitoring**

Specifies to enable MAC monitoring.

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s

## 7.229 crc

## CRC

### Syntax

```
crc {16 | 32}
```

### Context

[\[Tree\]](#) (config>port>sonet-sdh>path crc)

### Full Context

```
configure port sonet-sdh path crc
```

### Description

A 16 bit CRC can only be configured on an OC-3 channel, all other channel speeds must use a 32 bit CRC except for the paths configured with encap-type atm at OC3 speed.

### Default

crc 16 for OC-3, DS-1, DS-3 crc 32 for OC-12, OC-48, ATM-OC12/3, AT-MOC-3, and so on

#### Note:

The CRC default is 32 when the encap-type is set to ATM and also, the default cannot be changed when the encap-type is set to ATM.

### Parameters

**16**

Use 16 bit checksum for the associated port/channel.

**32**

Use 32 bit checksum for the associated port/channel.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## CRC

### Syntax

```
crc {16 | 32}
```

### Context

[\[Tree\]](#) (config>port>tdm>ds3 crc)

[\[Tree\]](#) (config>port>tdm>e3 crc)

### Full Context

```
configure port tdm ds3 crc
```

```
configure port tdm e3 crc
```

**Description**

This command configures the precision of the cyclic redundancy check (CRC).

**Default**

crc 16 for non-ATM E-3 and DS-3 channel/ports.

crc 32 for ATM E-3 and DS-3 channels/ports. The default cannot be changed.

**Parameters**

**16**

Uses 16 bit checksum for the associated port/channel.

**32**

Uses 32 bit checksum for the associated port/channel.

**Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 7.230 crc-monitor

crc-monitor

**Syntax**

crc-monitor

**Context**

[\[Tree\]](#) (config>port>ethernet crc-monitor)

**Full Context**

configure port ethernet crc-monitor

**Description**

This command configures Ethernet CRC Monitoring parameters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 7.231 create

## create

### Syntax

[no] create

### Context

[\[Tree\]](#) (environment create)

### Full Context

environment create

### Description

By default, the **create** command is required to create a new OS entity.

The **no** form of the command disables requiring the **create** keyword.

### Default

create

### Platforms

All

## 7.232 create-mpls-tunnel

## create-mpls-tunnel

### Syntax

[no] create-mpls-tunnel

### Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>action create-mpls-tunnel)

### Full Context

configure router policy-options policy-statement entry action create-mpls-tunnel

### Description

This command enables the creation of an MPLS tunnel to the BGP next-hop. It is supported for the following address families:

- vpn-ipv4
- vpn-ipv6
- evpn

- label-ipv4
- label-ipv6
- ipv4
- ipv6

The **no** form of the command disables the creation of an MPLS tunnel.

### Default

no create-mpls-tunnel

### Platforms

All

## 7.233 create-subscription

### create-subscription

#### Syntax

[no] create-subscription

#### Context

[\[Tree\]](#) (configure>system>security>profile>netconf>base-op-authorization create-subscription)

#### Full Context

configure system security profile netconf base-op-authorization create-subscription

#### Description

This command enables the NETCONF create-subscription operation in the default user profile.

The **base-op-authorization create-subscription** configuration is not pre-emptive, which means that it is checked only at the time of the initial subscription. Configuration changes to the **base-op-authorization** do not cancel any in-progress subscriptions and operators who successfully subscribed continue to receive messages.

The **no** form of this command disables the operation.

#### Default

no create-subscription

#### Note:

The operation is enabled by default in the built-in system-generated administrative profile.

#### Platforms

All

## 7.234 create-udp-tunnel

```
create-udp-tunnel
```

### Syntax

```
create-udp-tunnel
no create-udp-tunnel
```

### Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>action create-udp-tunnel)

[\[Tree\]](#) (config>router>policy-options>policy-statement>default-action create-udp-tunnel)

### Full Context

```
configure router policy-options policy-statement entry action create-udp-tunnel
```

```
configure router policy-options policy-statement default-action create-udp-tunnel
```

### Description

This command instructs the router to create an MPLS-over-UDP tunnel upon receiving BGP routes that match the import policy.

### Default

```
no create-udp-tunnel
```

### Platforms

All

## 7.235 credential

```
credential
```

### Syntax

```
credential
```

### Context

[\[Tree\]](#) (config>ipsec>client-db>client credential)

### Full Context

```
configure ipsec client-db client credential
```

## Description

Commands in this context configure the parameters used to authenticate peers.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 7.236 credit-control-policy

### credit-control-policy

## Syntax

```
credit-control-policy policy-name [create]
credit-control-policy diameter policy-name
no credit-control-policy policy-name
```

## Context

[\[Tree\]](#) (config>subscr-mgmt credit-control-policy)

## Full Context

```
configure subscriber-mgmt credit-control-policy
```

## Description

This command creates, configures or deletes a credit control policy.

The **no** form of this command reverts to the default.

## Parameters

### *policy-name*

Specifies the policy name, up to 32 characters.

### **create**

Keyword used to create the credit control policy. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### credit-control-policy

## Syntax

```
credit-control-policy policy-name
```

## no credit-control-policy

### Context

[\[Tree\]](#) (config>subscr-mgmt>sla-prof credit-control-policy)

### Full Context

configure subscriber-mgmt sla-profile credit-control-policy

### Description

This command configures the credit policy for this SLA profile.

### Default

no credit-control-policy

### Parameters

*policy-name*

Specifies the credit control policy name, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 7.237 credit-control-quota

### credit-control-quota

### Syntax

[no] credit-control-quota

### Context

[\[Tree\]](#) (config>aaa>isa-radius-plcy>acct-include-attributes credit-control-quota)

### Full Context

configure aaa isa-radius-policy acct-include-attributes credit-control-quota

### Description

This command includes any unconsumed volume quota in the Alc-Credit-Control-Quota attribute.

The **no** form of this command excludes the Alc-Credit-Control-Quota attribute.

### Default

no credit-control-quota

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 7.238 credit-control-server

```
credit-control-server
```

### Syntax

**credit-control-server radius**

**no credit-control-server**

### Context

[\[Tree\]](#) (config>subscr-mgmt>credit-control-policy credit-control-server)

### Full Context

configure subscriber-mgmt credit-control-policy credit-control-server

### Description

This command configures the credit control server to use. In case of RADIUS, the servers defined in the authentication policy are used. For Diameter, the peers defined in the specified Diameter policy are used.

The **no** form of this command reverts to the default.

### Default

credit-control-server radius

### Parameters

#### radius

Specifies to use the RADIUS authentication servers defined in the RADIUS authentication policy in the group interface to report credit usage and obtain new credit.

#### diameter *policy-name*

Specifies to use the diameter peers specified in the diameter policy to report credit usage and obtain new credit.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 7.239 credit-exhaust-threshold

## credit-exhaust-threshold

### Syntax

**credit-exhaust-threshold** *threshold-percentage*  
**no credit-exhaust-threshold**

### Context

[\[Tree\]](#) (config>subscr-mgmt>cat-map credit-exhaust-threshold)

### Full Context

configure subscriber-mgmt category-map credit-exhaust-threshold

### Description

This command specifies the credit exhaust threshold considered to act.  
The **no** form of this command reverts the configured value to the default.

### Default

credit-exhaust-threshold 100

### Parameters

#### *threshold-percentage*

Specifies the percentage to use for the credit exhaust threshold.

**Values** 50 to 100

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 7.240 credit-mcs-interval

## credit-mcs-interval

### Syntax

**credit-mcs-interval** *interval*  
**no credit-mcs-interval**

### Context

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>gx credit-mcs-interval)

### Full Context

configure subscriber-mgmt diameter-application-policy gx credit-mcs-interval

## Description

This command configures the usage monitoring between the redundant chassis that is synchronized periodically per Gx session, from the active Gx session to the standby Gx session.

The **no** form of this command reverts to the default value.

## Default

credit-mcs-interval 10

## Parameters

### *interval*

Specifies the interval time, in minutes, between synchronization moments for syncing volume to the multi-chassis redundant chassis in case of Gx usage monitoring on a CCI that belongs to a multi-chassis redundant host.

**Values** 5 to 60

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 7.241 credit-type

### credit-type

## Syntax

**credit-type** {volume | time}

**no credit-type**

## Context

[\[Tree\]](#) (config>subscr-mgmt>cat-map credit-type)

## Full Context

configure subscriber-mgmt category-map credit-type

## Description

This command specifies whether volume or time based accounting is performed.

The **no** form of this command reverts to the default.

## Default

credit-type volume

## Parameters

### volume

Specifies volume-based accounting.

### time

Specifies time-based accounting.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 7.242 credit-type-override

### credit-type-override

## Syntax

**credit-type-override** {**volume** | **time**}

**no credit-type-override**

## Context

[\[Tree\]](#) (config>subscr-mgmt>cat-map>category credit-type-override)

## Full Context

configure subscriber-mgmt category-map category credit-type-override

## Description

This command overrides the **credit-type** configured in the **config>subscr-mgmt>cat-map** context for the given category.

The **no** form of this command reverts to the default.

## Parameters

### volume

If different than the value specified in the **credit-type** command, the value overrides the credit-type.

### time

If different than the value specified in the **credit-type** command, the value overrides the credit-type.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 7.243 credits

credits

### Syntax

**credits** [**lowercase** *credits*] [**uppercase** *credits*] [**numeric** *credits*] [**special-character** *credits*]  
**no credits**

### Context

[\[Tree\]](#) (config>system>security>password>complexity-rules credits)

### Full Context

configure system security password complexity-rules credits

### Description

The maximum credits given for usage of the different character classes in the local passwords.  
The **no** form of this command resets to default.

### Default

no credits

### Parameters

**credits**

Specifies the number of credits that can be used for each characters class.

**Values** 0 to 10

### Platforms

All

## 7.244 criteria-overrides

criteria-overrides

### Syntax

**criteria-overrides**

### Context

[\[Tree\]](#) (config>service>vprn>if>sap>ingress criteria-overrides)

**[Tree]** (config>service>epipe>sap>ingress criteria-overrides)

**[Tree]** (config>service>ies>if>sap>ingress criteria-overrides)

**[Tree]** (config>service>vpls>sap>ingress criteria-overrides)

**[Tree]** (config>service>ipipe>sap>ingress criteria-overrides)

**[Tree]** (config>service>cpipe>sap>ingress criteria-overrides)

### Full Context

configure service vprn interface sap ingress criteria-overrides

configure service epipe sap ingress criteria-overrides

configure service ies interface sap ingress criteria-overrides

configure service vpls sap ingress criteria-overrides

configure service ipipe sap ingress criteria-overrides

configure service cpipe sap ingress criteria-overrides

### Description

Commands in this context configure IPv4 and IPv6 criteria overrides.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 7.245 critical-event

critical-event

### Syntax

[no] critical-event

### Context

**[Tree]** (config>port>ethernet>efm-oam>link-mon>local-sf-action>info-notification critical-event)

### Full Context

configure port ethernet efm-oam link-monitoring local-sf-action info-notification critical-event

### Description

This command sets the critical event Flag field in the Information OAMPDU when the local signal failure (sf-threshold) threshold is reached. This is maintained in all subsequent Information OAM PDUs until the situation is cleared.

Interactions: The signal failure threshold triggers these actions.

**Default**

no critical-event

**Platforms**

All

**critical-event****Syntax**

**critical-event local-port-action {log-only | out-of-service}**

**Context**

[\[Tree\]](#) (config>port>ethernet>efm-oam>peer-rdi-rx critical-event)

**Full Context**

configure port ethernet efm-oam peer-rdi-rx critical-event

**Description**

This command defines how to react to the reception of a critical event Flag field set in the informational OAMPDU.

**Default**

critical-event local-port-action out-of-service

**Parameters****local-port-action**

Defines whether or not the local port will be affected when a critical event is received from a peer.

**log-only**

Keyword that prevents the port from being affected when the local peer receives a critical event. The critical event will be logged but the port will remain operational.

**out-of-service**

Keyword that causes the port to enter a non-operation down state with a port state of link up. The error is logged upon reception of critical event. The port is not available to service data but continues to carry Link OAM traffic to ensure the link is monitored.

**Platforms**

All

## 7.246 cri-expiration-warning

## crl-expiration-warning

### Syntax

**crl-expiration-warning** *hours* [**repeat** *repeat-hours*]

**no crl-expiration-warning**

### Context

**[Tree]** (config>system>security>pki crl-expiration-warning)

### Full Context

configure system security pki crl-expiration-warning

### Description

This command specifies when the systems issues a **BeforeExp** message before a CRL expires. For example, with **certificate-expiration-warning 5**, the system issues a **BeforeExp** message 5 hours before a CRL expires. An optional **repeat repeat-hour** parameter enables the system to repeat the **BeforeExp** message every hour until the CRL expires.

If the user only wants **AfterExp**, then **certificate-expiration-warning 0** can be used to achieve this.

**BeforeExp** and **AfterExp** warnings can be cleared in following cases:

- The CRL is reloaded by the **admin certificate reload** command. In this case, if the reloaded file is not expired, then **AfterExp** is cleared. And, if the reloaded file is outside of configured warning window, then the **BeforeExp** is also cleared.
- When the **ca-profile** is shutdown, then **BeforeExp** and **AfterExp** of corresponding certificates are cleared.
- When **no crl-expiration-warning** command is configured, then all existing **BeforeExp** and **AfterExp** are cleared.
- Users may change the configuration of the **crl-expiration-warning** so that certain CRL are no longer in the warning window. **BeforeExp** of corresponding CRL are cleared.
- If the system time changes so that the new time causes the CRL to no longer be in the warning window, then **BeforeExp** is cleared. If the new time causes an expired CRL to come non-expired, then **AfterExp** is cleared.

### Default

**no crl-expiration-warning**

### Parameters

#### *hours*

Specifies the amount of time before a CRL expires when system issues **BeforeExp**

**Values** 0 to 8760

#### *repeat-hour*

Specifies that the system repeats **BeforeExp** every repeat-hour

**Values** 0 to 8760

## Platforms

All

## 7.247 `crl-file`

### `crl-file`

#### Syntax

`crl-file filename`

`no crl-file`

#### Context

[\[Tree\]](#) (config>system>security>pki>ca-profile crl-file)

#### Full Context

configure system security pki ca-profile crl-file

#### Description

This command specifies the name of a file in `cf3:\system-pki\crl` as the Certification Revoke List file of the **ca-profile**.

Notes:

- The system performs following checks against configured `crl-file` when a **no shutdown** command is issued:
  - A valid cert-file of the ca-profile must be already configured.
  - Configured `crl-file` must be a DER formatted CRLv2 file.
  - All non-optional fields defined in section 5.1 of RFC5280 must exist and conform to the RFC5280 defined format.
  - Check the version field to see if its value is 0x1.
  - Delta CRL Indicator must not exist (delta CRL is not supported).
  - CRL's signature must be verified by using the cert-file of ca-profile.

If any of above checks fail, the **no shutdown** command fails.

- Changing or removing the **crl-file** is only allowed when the **ca-profile** is in a **shutdown** state.

The **no** form of this command removes the filename from the configuration.

#### Parameters

**filename**

Specifies the name of CRL file stored in `cf3:\system-pki\crl`.

## Platforms

All

## 7.248 `crl-update`

```
crl-update
```

### Syntax

```
crl-update ca ca-profile-name
```

### Context

[\[Tree\]](#) (admin>certificate `crl-update`)

### Full Context

admin certificate `crl-update`

### Description

This command manually triggers the Certificate Revocation List file (CRL) update for the specified `ca-profile`.

Using this command requires shutting down the **auto-crl-update**.

### Parameters

***ca-profile-name***

Specifies the name of the Certificate Authority profile.

## Platforms

All

## 7.249 `crl-urls`

```
crl-urls
```

### Syntax

```
crl-urls
```

### Context

[\[Tree\]](#) (config>system>security>pki>ca-prof>auto-crl-update `crl-urls`)

## Full Context

configure system security pki ca-profile auto-crl-update crl-urls

## Description

Commands in this context configure **crl-urls** parameters. The system allows up to eight URL entries to be configured and tries each URL in order and stop when a qualified CRL is successfully downloaded. A qualified CRL is a valid CRL signed by the CA and is more recent than the existing CRL.

If none of the configured URLs returns a qualified CRL, then:

- If the schedule-type is next-update-based, system will wait for configure retry-interval before it start from beginning of the list again.
- If the schedule-type is periodic, then system will wait till next periodic update time.

If the user wants to manually stop the download, shutting down of auto-crl-retrieval could be used to achieve this.

## Platforms

All

## 7.250 cron

cron

## Syntax

cron

## Context

[\[Tree\]](#) (config>system cron)

## Full Context

configure system cron

## Description

This command creates the context to create scripts, script parameters and schedules which support the Service Assurance Agent (SAA) functions.

CRON features are saved to the configuration file on both primary and backup control modules. If a control module switchover occurs, CRON events are restored when the new configuration is loaded. If a control module switchover occurs during the execution of a cron script, the failover behavior will be determined by the contents of the script.

## Platforms

All

## cron

### Syntax

**cron**

### Context

[\[Tree\]](#) (config>system>security>cli-script>authorization cron)

### Full Context

configure system security cli-script authorization cron

### Description

Commands in this context configure authorization for the Cron job-scheduler.

### Platforms

## 7.253 csnp-authentication

### csnp-authentication

#### Syntax

**[no] csnp-authentication**

#### Context

**[Tree]** (config>service>vprn>isis csnp-authentication)

**[Tree]** (config>service>vprn>isis>level csnp-authentication)

#### Full Context

configure service vprn isis csnp-authentication

configure service vprn isis level csnp-authentication

#### Description

This command enables authentication of individual ISIS packets of complete sequence number PDUs (CSNP) type for the VPRN instance.

#### Platforms

All

### csnp-authentication

#### Syntax

**[no] csnp-authentication**

#### Context

**[Tree]** (config>router>isis>level csnp-authentication)

**[Tree]** (config>router>isis csnp-authentication)

#### Full Context

configure router isis level csnp-authentication

configure router isis csnp-authentication

#### Description

This command enables authentication of individual IS-IS packets of complete sequence number PDUs (CSNP) type.

The **no** form of this command suppresses authentication of CSNP packets.

**Default**

csnp-authentication

**Platforms**

All

## 7.254 csnp-interval

### csnp-interval

**Syntax****csnp-interval** *seconds***no csnp-interval****Context**[\[Tree\]](#) (config>service>vprn>isis>if csnp-interval)**Full Context**

configure service vprn isis interface csnp-interval

**Description**

This command configures the time interval, in seconds, to send complete sequence number (CSN) PDUs from the interface. IS-IS must send CSN PDUs periodically.

The **no** form of this command reverts to the default value.

**Default**

csnp-interval 10 — CSN PDUs are sent every 10 seconds for LAN interfaces.

csnp-interval 5 — CSN PDUs are sent every 5 seconds for point-to-point interfaces.

**Parameters*****seconds***

The time interval, in seconds between successive CSN PDUs sent from this interface expressed as a decimal integer.

**Values** 1 to 65535**Platforms**

All

## csnp-interval

### Syntax

**csnp-interval** *seconds*

**no csnp-interval**

### Context

[\[Tree\]](#) (config>router>isis>interface csnp-interval)

### Full Context

configure router isis interface csnp-interval

### Description

This command configures the time interval, in seconds, to send complete sequence number (CSN) PDUs from the interface. IS-IS must send CSN PDUs periodically.

The **no** form of this command reverts to the default value.

### Default

csnp-interval 10 — CSN PDUs are sent every 10 seconds for LAN interfaces.

csnp-interval 5 — CSN PDUs are sent every 5 seconds for point-to-point interfaces.

### Parameters

*seconds*

Specifies the time interval, in seconds, between successive CSN PDUs sent from this interface expressed as a decimal integer.

**Values** 1 to 65535

## 7.255 cspf

## cspf

### Syntax

**[no] cspf**

### Context

[\[Tree\]](#) (debug>router>isis cspf)

## Full Context

```
debug router isis cspf
```

## Description

This command enables debugging for IS-IS cspf.

The **no** form of the command disables debugging.

## Platforms

All

```
cspf
```

## Syntax

```
cspf [ip-address]
```

```
no cspf
```

## Context

[\[Tree\]](#) (debug>router>ospf cspf)

## Full Context

```
debug router ospf cspf
```

## Description

This command enables debugging for an OSPF constraint-based shortest path first (CSPF).

## Parameters

*ip-address*

Specifies the IP address for the range used for CSPF.

## Platforms

All

## 7.256 cspf-on-loose-hop

```
cspf-on-loose-hop
```

## Syntax

```
[no] cspf-on-loose-hop
```

## Context

[\[Tree\]](#) (config>router>mpls cspf-on-loose-hop)

## Full Context

configure router mpls cspf-on-loose-hop

## Description

This command enables the option to do CSPF calculations until the next loose hop or the final destination of LSP on LSR. On receiving a PATH message on LSR and processing of all local hops in the received ERO, if the next hop is loose, then the LSR node will first do a CSPF calculation until the next loose hop. On successful completion of CSPF calculation, ERO in PATH message is modified to include newly calculated intermediate hops and propagate it forward to the next hop. This allows setting up inter-area LSPs based on ERO expansion method.

### Note:

The LSP may fail to set up if this option is enabled on an LSR that is not an area border router and receives a PATH message without proper next loose hop in ERO. The 'cspf-on-loose-hop' configuration is allowed to change dynamically and applied to new LSP setup after change.

## Default

no cspf-on-loose-hop

## Platforms

All

## 7.257 cspf-pkt

cspf-pkt

## Syntax

**cspf-pkt** *cspf-pkt* [**detail**]

### Full Context

```
configure service vpls mac-move primary-ports cumulative-factor
configure service template vpls-template mac-move primary-ports cumulative-factor
configure service template vpls-template mac-move secondary-ports cumulative-factor
configure service vpls mac-move secondary-ports cumulative-factor
```

### Description

This command defines a factor defining how many mac-relearn measurement periods can be used to measure mac-relearn rate. The rate must be exceeded during the defined number of consecutive periods before the corresponding port is blocked by the mac-move feature. The cumulative-factor of primary ports must be higher than cumulative-factor of secondary ports.

### Default

cumulative-factor 2 — secondary ports  
cumulative-factor 3 — primary ports

### Parameters

#### *factor*

Specifies the factor defining the number of mac-relearn measurement periods can be used to measure mac-relearn rate

**Values** 2 to 10

configure router dhcp local-dhcp-server pool options custom-option  
configure subscriber-mgmt local-user-db ppp host options custom-option  
configure subscriber-mgmt local-user-db ipoe host options custom-option

### Description

This command configures specific DHCP options. The options defined here can overrule options in the local user database.

The **no** form of the removes the custom option parameters from the configuration.

### Parameters

#### ***option-number***

Specifies up to four option numbers that the DHCP server uses to send the identification strings to the DHCP client.

**Values** 1 to 254

#### ***ip-address***

Specifies the IP address of a host.

**Values** a.b.c.d

#### ***ipv6-address***

Specifies the IPv6 address of a host. Applicable to DHCP6 only.

## custom-option

### Syntax

**custom-option** *protocol option-number address ip-address*

**custom-option** *protocol option-number hex hex-string*

**custom-option** *protocol option-number string ascii-string*

**no custom-option** *protocol option-number*

### Context

[\[Tree\]](#) (config>subscr-mgmt>ppp-policy>options custom-option)

### Full Context

configure subscriber-mgmt ppp-policy ppp-options custom-option

### Description

This command provides the ability to configure custom PPP options.

**Note:**

Standard options such as the DNS name is returned from DHCP or RADIUS and be converted to PPP automatically. Compression is not supported.

The **no** form of this command removes the custom options from the configuration.

### Parameters

***protocol***

Specifies a protocol for the custom option.

**Values** lcp, ipcp, ipv6cp

***option-number***

Assigns an identifying number for the custom option.

**Values** 0 to 255

***ip-address***

Specifies the IP address in the a.b.c.d format.

***ascii-string***

Specifies an ASCII format string for the custom option up to 127 characters.

***hex-string***

Specifies a hex value for the custom option.

**Values** [0x0 to 0xFFFFFFFF (up to 254 hex nibbles)]

### Platforms

## 7.263 custom-protocol

## custom-protocol

### Syntax

**custom-protocol** *custom-protocol-id* **ip-protocol-num** *protocol-id* [**create**]

**custom-protocol** *custom-protocol-id*

**no custom-protocol** *custom-protocol-id*

### Context

[\[Tree\]](#) (config>app-assure>group>policy custom-protocol)

### Full Context

configure application-assurance group policy custom-protocol

### Description

This command creates and enters configuration context for custom protocols. Custom protocols allow the creation of TCP and UDP-based custom protocols (based on the *ip-protocol-num* option) that employ pattern-match at offset in protocol signature definition.

Operator-configurable custom-protocols are evaluated ahead of any Nokia-provided protocol signature in order of **custom-protocol-id** (the lower ID is matched first in case of flow matching multiple custom-protocols) within the context the protocol is defined.

Custom protocols must be created before they can be used in application definition but do not have to be enabled. To reference a custom protocol in application definition, or any other CLI configuration one must use protocol name that is a concatenation of "custom\_" and <custom-protocol-id>, (for example custom\_01, custom\_02 ... custom\_10, and so on). This concatenation is also used when reporting custom protocol statistics.

### Parameters

#### *custom-protocol-id*

Specifies the index into the protocol list that defines a custom protocol for application assurance.

**Values** 1 to 10

#### *protocol-id*

Specifies the IP protocol to match against for the custom protocol.

**Values** 6, 17, Protocol numbers accepted in DHB, keywords: tcp, udp

#### **create**

Mandatory keyword used when creating custom protocol. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 7.264 custom-record

### custom-record

#### Syntax

## 7.265 custom-x-header

### custom-x-header

#### Syntax

**custom-x-header** *x-header-name*

**no custom-x-header**

#### Context

[\[Tree\]](#) (config>app-assure>group>url-filter>icap custom-x-header)

#### Full Context

configure application-assurance group url-filter icap custom-x-header

#### Description

This command configures the url-filter ICAP policy to include a new x-header field; the content of the x-header is populated based on AQP url-filter action which can optionally specify the ASO characteristic value to include in the x-header.

#### Default

no custom-x-header

#### Parameters

***x-header-name***

Specifies the name of the x-header added to the ICAP request.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 7.266 customer

### customer

#### Syntax

**customer** *customer-id* [**create**] [**name** *name*]

**no customer** *customer-id*

#### Context

[\[Tree\]](#) (config>service customer)

## Full Context

configure service customer

## Description

This command creates a customer ID and customer context used to associate information with a particular customer. Services can later be associated with this customer at the service level.

Each *customer-id* must be unique. The **create** keyword must follow each new **customer** *customer-id* entry.

Enter an existing **customer** *customer-id* (without the *create* keyword) to edit the customer's parameters.

An optional customer **name** can be specified and is tied to the **customer-name** in the customer context (setting either **customer-name** or **name** will cause the other to change as well).

The **no** form of this command removes a *customer-id* and all associated information. Before removing a *customer-id*, all references to that customer in all services must be deleted or changed to a different customer ID.

## Default

customer 1 always exists on the system and cannot be deleted.

## Parameters

### *customer-id*

Specifies the ID number to be associated with the customer, expressed as an integer.

**Values**    *customer-id*: 1 to 2147483647  
              *customer-name*: 64 characters maximum

### **create**

This keyword is required when first creating the configuration context. Once the context is created, it is possible to navigate into the context without the **create** keyword.

### *name name*

This parameter configures an optional customer name, up to 64 characters in length, which adds a name identifier to a given customer to then use that customer name in configuration references as well as display and use customer names in show commands throughout the system. This helps the service provider/administrator to identify and manage services within the SR OS platforms.

All services are required to assign a customer ID to initially create a customer. However, either the customer ID or the customer name can be used to identify and reference a given customer once it is initially created.

If a name is not specified at creation time, then SR OS assigns a string version of the *customer-id* as the name.

**Values**    *name*: 64 characters maximum

## Platforms

All

## 7.267 customer-id-range

### customer-id-range

#### Syntax

**customer-id-range start** *customer-id* **end** *customer-id*  
**no customer-id-range**

#### Context

[\[Tree\]](#) (config>service>md-auto-id customer-id-range)

#### Full Context

configure service md-auto-id customer-id-range

#### Description

This command specifies the range of IDs used by SR OS to automatically assign an ID to customers that are created in model-driven interfaces without an ID explicitly specified by the user or client.

A customer created with an explicitly-specified ID cannot use an ID in this range. In the classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD interfaces, the range can be changed, which causes any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **config>service md-auto-id** command for further details.

#### Default

no customer-id-range

#### Parameters

##### **start** *customer-id*

Specifies the lower value of the ID range. The value must be less than or equal to the **end** value.

**Values** 2 to 2147483647

##### **end** *customer-id*

Specifies the upper value of the ID range. The value must be greater than or equal to the **start** value.

**Values** 2 to 2147483647

#### Description

This command records cut-through packet conditions.

#### Parameters

##### *cut-through-packets*

Indicates whether to capture cut-through only packets or cut-through and other packets, or to exclude them all together.

**Values** exclude, include, only

**Default** include

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8 d Commands

### 8.1 d-path-ignore

#### d-path-ignore

##### Syntax

[no] d-path-ignore

##### Context

**[Tree]** (config>service>system>bgp-evpn>ad-per-evi-routes d-path-ignore)

##### Full Context

configure service system bgp-evpn ad-per-evi-routes d-path-ignore

##### Description

This command makes the router ignore the Domain PATH attribute (D-PATH) when BGP computes the best path selection for received routes.

The **no** form of this command considers the D-PATH length and value as a tiebreaker in determining the best-path selection. In accordance with *draft-sr-bess-evpn-dpath*, the router compares the D-PATH attribute received in AD per-EVI routes with the same key as follows:

- The routes with the shortest D-PATH are preferred; therefore, routes not tied for the shortest D-PATH are removed. Routes without D-PATH are considered zero-length D-PATH.
- The routes with the numerically lowest left-most Domain-ID are preferred; therefore, routes not tied for the numerically lowest left-most Domain-ID are removed from consideration.

##### Default

no d-path-ignore

##### Platforms

All

### 8.2 d-path-length-ignore

## d-path-length-ignore

### Syntax

[no] d-path-length-ignore

### Context

**[Tree]** (config>service>vprn>bgp>path-selection d-path-length-ignore)

**[Tree]** (config>service>vprn d-path-length-ignore)

**[Tree]** (config>router>bgp>path-selection d-path-length-ignore)

### Full Context

configure service vprn bgp best-path-selection d-path-length-ignore

configure service vprn d-path-length-ignore

configure router bgp best-path-selection d-path-length-ignore

### Description

This command enables and disables the ability of the router to ignore D-PATH domain segment length during best-path selection. At the base router level (or **vprn>bgp** level for PE-CE routers), this command allows BGP to ignore the D-PATH domain segment length for best-path selection purposes. The D-PATH length is ignored when comparing two VPN routes or two IFL routes within the same RD. However, these VPN/IFL routes are processed in Main-BGP instance.

At the VPRN router level, this command allows the VPRN RTM to ignore the D-PATH domain segment length for best path selection purposes (for routes in VPRN). The user can control whether the D-PATH length is considered when two VPN routes with different RDs are compared.

Best-path selection for EVPN-IFF routes against other owners (for example, EVPN-IFL or IPVPN) still relies on RTM preference. When EVPN-IFF RTM preference matches the RTM preference of another BGP owner, the existing RTM selection applies and D-PATH is not considered, irrespective of the **d-path-length-ignore** configuration.

The **no** form of this command disables the ability to ignore the D-PATH domain segment length.

### Default

no d-path-length-ignore

### Platforms

## 8.3 dack-timeout

## dack-timeout

### Syntax

**dack-timeout** *dack-timeout*

**no dack-timeout**

### Context

**[Tree]** (config>app-assure>group>tcp-optimizer dack-timeout)

### Full Context

configure application-assurance group tcp-optimizer dack-timeout

### Description

This command configures a delayed ACK (DACK) timeout for the TCP optimizer. By entering this command a default of 200 ms timeout is enabled for delayed acknowledgment. This value is not configurable.

The **no** form of this command disables the delayed acknowledgment timeout.

### Default

no dack-timeout

### Parameters

***dack-timeout***

Specifies the delayed acknowledgment timeout in ms.

**Default** 200

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.4 dad-disable

### dad-disable

### Syntax

**[no] dad-disable**

### Context

**[Tree]** (config>router>if>ipv6 dad-disable)

**[Tree]** (config>service>ies>if>ipv6 dad-disable)

**[Tree]** (config>service>vprn>if>ipv6 dad-disable)

## Full Context

```
configure router interface ipv6 dad-disable
configure service ies interface ipv6 dad-disable
configure service vprn interface ipv6 dad-disable
```

## Description

This command disables duplicate address detection (DAD) on the interface. When **dad-disable** is configured on the interface, the router does not perform a DAD check and all IPv6 addresses on the interface immediately enter a preferred state without checking for uniqueness on the interface. This command is useful when an interface enters a looped state during troubleshooting and becomes operationally disabled when the loop is detected; a manual intervention is required to clear the DAD violation.

The **no** form of this command enables duplicate address detection (DAD) on the interface.

## Default

```
no dad-disable
```

## Platforms

All

## 8.5 dad-snooping

### dad-snooping

## Syntax

```
[no] dad-snooping
```

## Context

```
[Tree] (config>service>ies>sub-if>grp-if>ipv6>nd dad-snooping)
```

```
[Tree] (config>service>vprn>sub-if>grp-if>ipv6>nd dad-snooping)
```

## Full Context

```
configure service ies subscriber-interface group-interface ipv6 nd dad-snooping
configure service vprn subscriber-interface group-interface ipv6 nd dad-snooping
```

## Description

This command allows the router to populate the neighbor discovery table through snooping subscribers' duplicate address detection messages.

The **no** form of this command reverts to the default.

## 8.6 damp-peer-oscillations

### damp-peer-oscillations

#### Syntax

**damp-peer-oscillations** [**idle-hold-time** *initial-wait second-wait max-wait*] [**error-interval** *minutes*]

#### Context

**[Tree]** (config>service>vprn>bgp>group damp-peer-oscillations)

**[Tree]** (config>service>vprn>bgp damp-peer-oscillations)

**[Tree]** (config>service>vprn>bgp>group>neighbor damp-peer-oscillations)

#### Full Context

configure service vprn bgp group damp-peer-oscillations

configure service vprn bgp damp-peer-oscillations

configure service vprn bgp group neighbor damp-peer-oscillations

#### Description

This command controls how long a BGP peer session remains in the idle-state after some type of error causes the session to reset. In the idle state, BGP does not initiate or respond to attempts to establish a new session. Repeated errors that occur a short while after each session reset cause longer and longer hold times in the idle state. This command supports the DampPeerOscillations FSM behavior described in section 8.1 of RFC 4271, *A Border Gateway Protocol 4 (BGP-4)*.

The default behavior, which applies when no damp-peer-oscillations is configured, is to immediately transition out of the idle-state after every reset.

#### Default

no damp-peer-oscillations

#### Parameters

##### *initial-wait*

Specifies the amount of time, in minutes, that a session remains in the idle-state after it has been stable for a while.

**Values** 0 to 2048

**Default** 0

##### *second-wait*

Specifies the period of time, in minutes, that is doubled after each repeated session failure that occurs within a relatively short span of time.

**Values** 0 to 2048

**Default** 5

#### ***max-wait***

Specifies the maximum amount of time, in minutes, that a session remains in the idle-state after it has experienced repeated instability.

**Values** 0 to 2048

**Default** 60

#### ***minutes***

Specifies the interval of time, in minutes after a session reset, during which the session must be error-free in to reset the penalty counter and return to idle-hold-time to initial-wait.

**Values** 0 to 2048

**Default** 30

### **Platforms**

**Values** 1 to 2048

**Default** 60

### *minutes*

The interval of time, in minutes after a session reset, during which the session must be error-free in order to reset the penalty counter and return from idle-hold-time to initial-wait.

**Values** 0 to 2048

**Default** 30

## Platforms

All

## 8.7 dampening

## dampening

### Syntax

**dampening**

### Context

[\[Tree\]](#) (config>port>ethernet dampening)

### Full Context

configure port ethernet dampening

### Description

Commands in this context configure exponential port dampening for an Ethernet port.

Exponential Port Dampening (EPD) reduces the number of physical link transitions reported to upper layer protocols, potentially reducing upper layer protocol churn caused by a faulty link. Penalties are added against a port whenever the port's physical link state transitions from a link up state to a link down state. When the penalties exceed a configurable threshold, port-up and port-down transitions are no longer advertised to upper layers and the port's operational state will remain down until the penalty amount drops below a configurable reuse threshold. Each transition of link up state to link down state increments the accumulated penalty value by 1000. The accumulated penalties for a port are reduced at an exponential decay rate according to a configurable half-life parameter.

## 8.10 data-delay-interval

## data-delay-interval

### Syntax

**data-delay-interval** *seconds*

**no data-delay-interval**

### Context

**[Tree]** (config>service>vpls>provider-tunnel>inclusive data-delay-interval)

**[Tree]** (config>service>vpls>provider-tunnel>selective data-delay-interval)

### Full Context

configure service vpls provider-tunnel inclusive data-delay-interval

configure service vpls provider-tunnel selective data-delay-interval

### Description

This command configures the I-PMSI or S-PMSI data delay timer.

When used in I-PMSI trees, this delay timer allows time for the RSVP control plane to signal and bring up the S2L sub-LSP to each destination PE participating in the VPLS or B-VPLS service. The delay timer starts as soon as the P2MP LSP instance becomes operationally up under the inclusive node, for example, as soon as the first S2L sub-LSP is up. This occurs after configuring the **configure service vpls provider-tunnel inclusive no shutdown** command.

In general, it is started when the P2MP LSP instance transitions from the operationally down state to the up state.

For a mLDP P2MP LSP, the delay timer is started as soon as the P2MP FEC corresponding to the I-PMSI is resolved and installed at the root node. The user must factor in the value configured in the **data-delay-interval** at the root node, as well as any delay configured in the IGP-LDP sync timer on interfaces over the network, using the **configure router interface ldp-sync-timer** command.

This is because the mLDP P2MP LSP may move to a different interface at the expiry of this timer since the routing upstream of the LDP Label Mapping message may change when this timer expires and the interface metric is restored.

At the expiry of this timer, the VPLS or B-VPLS begins forwarding of BUM packets over the P2MP LSP instance even if not all the S2L paths are up.

When used for EVPN S-PMSI trees, the data delay interval determines the time the router takes to switch over the traffic from the Ingress Replication binds to the wildcard S-PMSI or from the wildcard S-PMSI to the S-PMSI, after the S-PMSI is created. This time should account for the time it takes for BGP to propagate the S-PMSI A-D route to the downstream PEs and the time it takes the downstream PEs to join the tree all the way up to the root.

The **no** form of this command reinstates the default value for this delay timer.

### Parameters

**seconds**

Specifies the delay time value in seconds

**Values** 3 to 180

**Default** 15 (inclusive)  
3 (selective)

## Platforms

## 8.13 data-threshold

### data-threshold

**Syntax**

**data-threshold** {*c-grp-ip-addr/mask* | *c-grp-ip-addr netmask*} *s-pmsi-threshold* [**pe-threshold-add** *pe-threshold-add*] [**pe-threshold-delete** *pe-threshold-delete*]

**data-threshold** *c-grp-ipv6-addr/prefix-length* *s-pmsi-threshold* [**pe-threshold-add** *pe-threshold-add*] [**pe-threshold-delete** *pe-threshold-delete*]

**no data-threshold** {*c-grp-ip-addr/mask* | *c-grp-ip-addr netmask*}

**no data-threshold** *c-grp-ipv6-addr/prefix-length*

**Context**

**[Tree]** (config>service>vprn>mvpn>pt>selective data-threshold)

**[Tree]** (config>service>vpls>provider-tunnel>selective data-threshold)

**Full Context**

configure service vprn mvpn provider-tunnel selective data-threshold

configure service vpls provider-tunnel selective data-threshold

**Description**

When used along with MVPN, this command specifies the data rate threshold that triggers the switch from the inclusive provider tunnel to the selective provider tunnel for (C-S, C-G) within the group range. Optionally, PE thresholds to create or delete ng-MVPN S-PMSI may also be specified. Omitting the PE thresholds, preserves the currently set value (or defaults if never set). Multiple statements (one per a unique group) are allowed in the configuration.

This command is not applicable to multi-stream S-PMSI.

This command for S-PMSI trees can also be used in EVPN services. The **data-threshold** command options are used in the same way as in MVPN when applied to EVPN, in particular the rate and PE thresholds.

The **no** form of this command removes the values from the configuration.

## Default

no data-threshold

## Parameters

### **group-address/mask**

Specifies a multicast group address and netmask length.

### **c-grp-ip-addr/mask | c-grp-ip-addr netmask**

Specifies an IPv4 multicast group address and netmask length or network mask.

### **c-grp-ipv6-addr/prefix-length**

Specifies an IPv6 multicast group address and prefix length.

### **s-pmsi-threshold**

Specifies the rate, in kb/s. If the rate for a (C-S, C-G) within the specified group range exceeds the threshold, traffic for the (C-S, C-G) is switched to the selective provider tunnel. Threshold 0 is supported. When threshold 0 is configured, the (C-S, C-G) switches to S-PMSI as soon as it is learned in the MVPN and without traffic flowing for that (C-S, C-G).

### **s-pmsi-threshold-add**

Specifies the number of receiver PEs for creating S-PMSI. When the number of receiver PEs for a specified multicast group configuration is non-zero and below the threshold and BW threshold is satisfied, S-PMSI is created.

### **s-pmsi-threshold-delete**

Specifies the number of receiver PEs for deleting S-PMSI. When the number of receiver PEs for a specified multicast group configuration is above the threshold, S-PMSI is deleted and the multicast group is moved to I-PMSI or a wildcard S-PMSI. It is recommended that the delete threshold be significantly larger than the add threshold, to avoid re-signaling of S-PMSI as the receiver PE count fluctuates.

### Values

*c-grp-ip-addr* : multicast group address a.b.c.d

*mask* [4 to 32]

*netmask* : a.b.c.d (network bits all 1 and host bits all 0)

*s-pmsi-threshold* : [0 to 4294967294] (threshold in kb/s)

*c-grp-ipv6-addr* : multicast ipv6-address x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x [0 to FFFF]H

d [0 to 255]D

|                     |   |                                                                              |
|---------------------|---|------------------------------------------------------------------------------|
|                     |   | prefix-length [1 to 128]                                                     |
| pe-threshold-add    | : | [1 to 65535], if never specified, 65535 is used (add threshold always met)   |

## Platforms

All

## data-threshold

### Syntax

**data-threshold** {*c-grp-ip-addr/mask* | *c-grp-ip-addr netmask*} *s-psmi-threshold* [**pe-threshold-add** *pe-threshold-add*] [**pe-threshold-delete** *pe-threshold-delete*]

**data-threshold** *c-grp-ipv6-addr/prefix-length* *s-psmi-threshold* [**pe-threshold-add** *pe-threshold-add*] [**pe-threshold-delete** *pe-threshold-delete*]

**no data-threshold** {*c-grp-ip-addr/mask* | *c-grp-ip-addr netmask*}

**no data-threshold** *c-grp-ipv6-addr/prefix-length*

### Context

[\[Tree\]](#) (config>router>gtm>provider-tunnel>selective data-threshold)

### Full Context

configure router gtm provider-tunnel selective data-threshold

### Description

This command specifies the data rate threshold that triggers the switch from the inclusive provider tunnel to the selective provider tunnel for (C-S, C-G) within the group range. Optionally, PBR thresholds for creating or deleting NG-MVPN S-PMSI may also be specified. Omitting the PBR thresholds preserves currently set values (or defaults if never set). Multiple statements (one per a unique group) are allowed in the configuration.

This command is not applicable to multi-stream S-PMSIs.

The **no** form of this command removes the values from the configuration.

### Default

no data-threshold

### Parameters

***c-grp-ip-addr/mask* | *c-grp-ip-addr netmask***

Specifies an IPv4 multicast group address and netmask length or network mask.

**Values** mask: 4 to 32

***c-grp-ipv6-addr/prefix-length***

Specifies an IPv6 multicast group address and prefix length.

***s-pmsi-threshold***

Specifies the rate, in kb/s. If the rate for a (C-S, C-G) within the specified group range exceeds the threshold, traffic for the (C-S, C-G) is switched to the selective provider tunnel.

***s-pmsi-threshold-add***

Specifies the number of receiver PBRs for creating S-PMSI. When the number of receiver PBRs for a specified multicast group configuration is non-zero and below the threshold and BW threshold is satisfied, S-PMSI is created.

***s-pmsi-threshold-delete***

Specifies the number of receiver PBRs for deleting S-PMSI. When the number of receiver PBRs for a specified multicast group configuration is above the threshold, S-PMSI is deleted and the multicast group is moved to I-PMSI or a wildcard S-PMSI. It is recommended that the delete threshold be significantly larger than the add threshold to avoid re-signaling of S-PMSI as the receiver PBR count fluctuates.

**Values**

|                            |                                                          |
|----------------------------|----------------------------------------------------------|
| <i>c-grp-ip-addr</i>       | multicast group address a.b.c.d                          |
| <i>mask</i>                | 4 to 32                                                  |
| <i>netmask</i>             | a.b.c.d (network bits all 1 and host bits all 0)         |
| <i>s-pmsi-threshold</i>    | 1 to 4294967294 (threshold in kb/s)                      |
| <i>c-grp-ipv6-addr</i>     | multicast ipv6-address x:x:x:x:x:x (eight 16-bit pieces) |
|                            | x:x:x:x:x:d.d.d.d                                        |
|                            | x [0 to FFFF]H                                           |
|                            | d [0 to 255]D                                            |
|                            | prefix-length [1 to 128]                                 |
| <i>pe-threshold-add</i>    | 1 to 65535 Default: 65535 (delete threshold always met)  |
| <i>pe-threshold-delete</i> | 2 to 65535 Default: 65535:(delete threshold always met)  |

## 8.14 data-tlv-size

### data-tlv-size

#### Syntax

**data-tlv-size** *octets*

**no data-tlv-size**

#### Context

**[Tree]** (config>oam-pm>session>ethernet>slm data-tlv-size)

**[Tree]** (config>oam-pm>session>ethernet>dmm data-tlv-size)

#### Full Context

configure oam-pm session ethernet slm data-tlv-size

configure oam-pm session ethernet dmm data-tlv-size

#### Description

This command allows the operator to add an optional Data TLV to PDU and increase the frame on the wire by the specified amount. Note that this command only configures the size of the padding added to the PDU, and does not configure the total size of the frame on the wire.

The **no** form of this command removes the optional TLV.

#### Parameters

**octets**

Specifies the size, in octets, of the optional Data TLV.

**Values** 0, 3 to 2000

**Default** 0

#### Platforms

All

## 8.15 data-trigger

### data-trigger

#### Syntax

**data-trigger**

**Context**

**[Tree]** (config>service>vprn>sub-if>grp-if data-trigger)

**[Tree]** (config>service>ies>sub-if>grp-if data-trigger)

**Full Context**

configure service vprn subscriber-interface group-interface data-trigger

configure service ies subscriber-interface group-interface data-trigger

**Description**

Commands in this context configure data-triggered subscriber management entities.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.16 data-triggered

### data-triggered

**Syntax**

[no] data-triggered

**Context**

**[Tree]** (config>service>ies>sub-if>grp-if>sap>static-host-mgmt>mac-learning-options data-triggered)

**[Tree]** (config>service>vprn>sub-if>grp-if>sap>static-host-mgmt>mac-learning-options data-triggered)

**Full Context**

configure service ies subscriber-interface group-interface sap static-host-mgmt mac-learning-options data-triggered

configure service vprn subscriber-interface group-interface sap static-host-mgmt mac-learning-options data-triggered

**Description**

This command enables learning of MAC addresses from data packets.

The **no** form of this command disables learning of MAC addresses from data packets.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## data-triggered

### Syntax

[no] data-triggered

### Context

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>ue-query>state data-triggered)

### Full Context

configure subscriber-mgmt wlan-gw ue-query state data-triggered

### Description

This command enables matching on UEs currently in a data-triggered state. This query only filters UEs that are currently authenticating due to a data trigger, not UEs that were originally authenticated due to data trigger, such as those in an ESM, DSM, or portal state.

The **no** form of this command disables matching on UEs in a data-triggered state, unless all state matching is disabled.

### Default

no data-triggered

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.17 data-triggered-ue-creation

## data-triggered-ue-creation

### Syntax

data-triggered-ue-creation [arp] [ospf]

no data-triggered-ue-creation

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range data-triggered-ue-creation)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range data-triggered-ue-creation)

### Full Context

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range data-triggered-ue-creation

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range data-triggered-ue-creation

## Description

This command enables data-triggered subscriber creation for Wi-Fi subscribers. Data-triggered UE creation only works upon receipt of TCP and UDP packets.

The **no** form of this command disables the data-triggered subscriber creation for Wi-Fi subscribers.

## Default

no data-triggered-ue-creation

## Parameters

### arp

Keyword to enable the router to authenticate ARP packets from an unknown UE.

### ospf

Keyword to enable the system to trigger UE authentication based on OSPFv2 or OSPFv3 packets.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.18 data-triggers

### data-triggers

## Syntax

[no] data-triggers

## Context

[\[Tree\]](#) (debug>dynsvc data-triggers)

## Full Context

debug dynamic-services data-triggers

## Description

Commands in this context configure dynamic services data trigger capture SAP debugging. The **no** form of this command removes all dynamic services data trigger capture SAP debug configurations.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.19 database

### database

#### Syntax

**database** [**group** *grp-ip-address*] [**source** *ip-address*] [**detail**]

**no database**

#### Context

[\[Tree\]](#) (debug>service>id>pim-snooping database)

#### Full Context

debug service id pim-snooping database

#### Description

This command enables or disables debugging for the PIM database.

#### Parameters

##### ***grp-ip-address***

Debugs information associated with all PIM modules

**Values** multicast group address (IPv4 or IPv6) or zero

##### ***ip-address***

Debugs information associated with the specified database

#### Platforms

All

## 8.20 database-export

### database-export

#### Syntax

**database-export** [**identifier** *id*] [**bgp-ls-identifier** *bgp-ls-id*]

**no database-export**

#### Context

[\[Tree\]](#) (config>router>isis database-export)

## Full Context

```
configure router isis database-export
```

## Description

This command enables the population of the extended TE Database (TE-DB) with the link-state information from a given IGP instance.

The extended TE-DB is used as a central point for importing all link-state information, link, node, and prefix, from IGP instances on the router or the vSROS controller of the NSP and to exporting it to BGP-LS on the router and to Java-VM proxy on the vSROS controller. This information includes the IGP, TE, and the SR information, prefix SID sub-TLV, adjacency SID sub-TLV, and router SR capability TLV.

The **no** form of this command disables database exportation.

## Parameters

### identifier

This parameter is used to uniquely identify the IGP instance in the BGP-LS NLRI when a router has interfaces participating in multiple IGP instances. This parameter defaults to the IGP instance ID assigned by SR OS. However, given that the concept of instance ID defined in IS-IS (RFC 6822) is unique within a routing domain while the one specified for OSPF is local subnet significant (RFC 6549), the user can remove any overlap by configuring the new **identifier** value to be unique within a given IGP domain when this router sends the IGP link-state information using BGP-LS.

### *id*

Specifies an entry ID to export.

**Values** 0 to 18446744073709551615

### **bgp-ls-identifier**

This parameter is used, along with the Autonomous System Number (ASN) to correlate the BGP-LS NLRI advertisements of multiples BGP-LS speakers of the same IGP domain. If an NRC-P network domain has multiple IGP domains, BGP-LS speakers within each IGP domain must be configured with the same unique {**bgp-ls-identifier**, asn} tuple.

The BGP-LS identifier is optional and is only sent in a BGP-LS NLRI if configured in the IGP instance of an IGP domain.

Note that if this IGP instance participates in traffic engineering with RSVP-TE or SR-TE, the **traffic-engineering** option is not strictly required because enabling the extended TE-DB populates this information automatically. It is, however, recommended to enable it to make the configuration consistent with other routers in the network that do not require the enabling of the extended TE-DB.

### *bgp-ls-id*

Specifies a BGP LS ID to export.

**Values** 0 to 4294967295

## Platforms

All

## database-export

### Syntax

```
database-export [identifier id] [bgp-ls-identifier bgp-ls-id]
no database-export
```

### Context

**[Tree]** (config>router>ospf3 database-export)

**[Tree]** (config>router>ospf database-export)

### Full Context

configure router ospf3 database-export

configure router ospf database-export

### Description

This command enables the population of the extended TE Database (TE-DB) with the link-state information from a given IGP instance.

The extended TE-DB is used as a central point for importing all link-state information, link, node, and prefix, from IGP instances on the router or the vSROS controller of the NSP and to exporting it to BGP-LS on the router and to Java-VM proxy on the vSROS controller. This information includes the IGP, TE, and the SR information, prefix SID sub-TLV, adjacency SID sub-TLV, and router SR capability TLV.

The **no** form of this command disables database exportation.

### Default

no database-export

### Parameters

#### identifier

Identifies the IGP instance in the BGP-LS NLRI when a router has interfaces participating in multiple IGP instances. This parameter defaults to the IGP instance ID assigned by SR OS. The concept of instance ID specified for OSPF is local subnet significant (RFC 6549). The user can remove router specific overlap by configuring the new **identifier** value to be unique within a given IGP domain when this router sends the IGP link-state information using BGP-LS.

#### *id*

Specifies an entry ID to export.

**Values** 0 to 18446744073709551615

#### bgp-ls-identifier

This parameter is used, along with the Autonomous System Number (ASN), to correlate the BGP-LS NLRI advertisements of multiples BGP-LS speakers of the same IGP domain. If an NRC-P network domain has multiple IGP domains, BGP-LS speakers within each IGP domain must be configured with the same unique {bgp-ls-identifier, asn} tuple.

The BGP-LS identifier is optional and is only sent in a BGP-LS NLRI if configured in the IGP instance of an IGP domain.

Note that if this IGP instance participates in traffic engineering with RSVP-TE or SR-TE, the **traffic-engineering** option is not strictly required because enabling the extended TE-DB populates this information automatically. It is, however, recommended to enable it to make the configuration consistent with other routers in the network that do not require the enabling of the extended TE-DB.

## 8.22 datapath-cpu-high-wmark

## datapath-cpu-high-wmark

### Syntax

**datapath-cpu-high-wmark** *high-watermark*

**datapath-cpu-high-wmark** max

### Context

**[Tree]** (config>app-assure datapath-cpu-high-wmark)

### Full Context

configure application-assurance datapath-cpu-high-wmark

## Description

This command configures the system-wide high watermark threshold as a percentage of the per-ISA datapath core CPU utilization, where an alarm will be raised by the agent. CPU usage is the average usage across all datapath cores.

## Default

datapath-cpu-high-wmark 95

## Parameters

### *high-watermark*

Specifies the high watermark for datapath CPU usage alarms.

**Values** 1 to 100

### **max**

Disables the high watermark for datapath CPU usage alarms

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.23 datapath-cpu-low-wmark

### datapath-cpu-low-wmark

## Syntax

**datapath-cpu-low-wmark** *low-watermark*

## Context

[\[Tree\]](#) (config>app-assure datapath-cpu-low-wmark)

## Full Context

configure application-assurance datapath-cpu-low-wmark

## Description

This command configures the system-wide low watermark threshold as a percentage of the per-ISA datapath core CPU utilization, where an alarm will be raised by the agent. CPU usage is the average usage across all datapath cores.

## Default

datapath-cpu-low-wmark 90

## Parameters

### *low-watermark*

Specifies the low watermark for datapath CPU usage alarms.

**Values** 1 to 100

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.24 day-of-month

### day-of-month

#### Syntax

**day-of-month** {*day-number* [*..day-number*] **all**}

**no day-of-month**

#### Context

[\[Tree\]](#) (config>system>cron>sched day-of-month)

#### Full Context

configure system cron schedule day-of-month

#### Description

This command specifies which days of the month that the schedule will occur. Multiple days of the month can be specified. When multiple days are configured, each of them will cause the schedule to trigger. If a day-of-month is configured without configuring month, weekday, hour, and minute, the event will not execute.

Using the **weekday** command as well as the **day-of-month** command will cause the script to run twice. For example, consider that today is Monday January 1. If Tuesday January 5 is configured, the script will run on Tuesday (tomorrow) as well as January 5 (Friday).

The **no** form of this command removes the specified day-of-month from the list.

#### Default

no day-of-month

#### Parameters

##### *day-number*

Specifies the positive integers specify the day of the month counting from the first of the month. The negative integers specify the day of the month counting from the last day of the month. For example, configuring **day-of-month -5, 5** in a month that has 31 days will specify the schedule to occur on the 27th and 5th of that month.

Integer values must map to a valid day for the month in question. For example, February 30 is not a valid date.

**Values** 1 to 31, -31 to -1 (maximum 62 day-numbers)

**all**

Specifies all days of the month.

**Platforms**

All

Keyword used to specify detailed information about PCE or connection database events.

## Platforms

VSR-NRC

## 8.26 dbw-accounting

### dbw-accounting

## Syntax

[no] dbw-accounting

## Context

[\[Tree\]](#) (config>router>rsvp dbw-accounting)

## Full Context

configure router rsvp dbw-accounting

## Description

This command enables dark bandwidth accounting and enters the context to configure the associated parameters. When dark bandwidth accounting is enabled, the system polls the dark bandwidth counters, performs sample and average rate computations, and generates IGP-TE updates if required. To enable dark bandwidth accounting, auxiliary MPLS statistics must first be enabled using the command **config>router>mpls>aux-stats**.

The **no** form of this command disables dark bandwidth accounting, resets all global parameters to their default values, and results in an immediate IGP-TE update for which dark bandwidth is null.

## Default

no dbw-accounting

## Platforms

7750 SR, 7750 SR-s, 7950 XRS, VSR

## 8.27 dbw-down-threshold

### dbw-down-threshold

#### Syntax

**dbw-down-threshold** *percent-change* [**bw** *absolute-change*]

**no dbw-down-threshold**

#### Context

[Tree] (config>router>rsvp>interface dbw-down-threshold)

#### Full Context

configure router rsvp interface dbw-down-threshold

#### Description

This command sets the minimum change (in percent of the latest advertised value) above which an decrease in MRLB (IS-IS TE sub-TLV 10) or MRB (OSPF TE sub-TLV 7) triggers an IGP-TE update. This configuration only applies to a change in MRLB or MRB caused by dark bandwidth. Other events affecting MRLB/MRB (such as the change of the subscription factor or the loss of link in a LAG over which the RSVP interface is defined) trigger an immediate TE update, regardless of the importance of the impact.

Optionally, the threshold can also be expressed as an absolute value. In this case, the evaluation of the change is made using the percent change and the absolute change. An IGP-TE update is sent if both thresholds are crossed. Changing this parameter in the course of dark bandwidth accounting does not affect the accounting cycle.

By default, the multiplier inherits the global value, unless it is specifically set using this command. The **no** form of this command sets this parameter to inherit the value of the corresponding global parameter.

#### Parameters

##### *percent-change*

Specifies the minimum decrease in MRLB/MRB, expressed in percent.

**Values** 0 to 100

##### *absolute-change*

Specifies the minimum decrease in MRLB/MRB, expressed in Mb/s.

**Values** 0 to 1000000

#### Platforms

7750 SR, 7750 SR-s, 7950 XRS, VSR

## Syntax

[no] ddm-events

## Context

[\[Tree\]](#) (config>port ddm-events)

## Full Context

configure port ddm-events

## Description

This command enables Digital Diagnostic Monitoring (DDM) events for the port.

The **no** form of this command disables DDM events.

## Platforms

All

## 8.31 de-1-out-profile

### de-1-out-profile

## Syntax

[no] de-1-out-profile

## Context

[\[Tree\]](#) (config qos sap-ingress fc de-1-out-profile)

## Full Context

```
configure qos sap-ingress fc de-1-out-profile
```

## Description

This command, when enabled on a parent forwarding class, applies a color profile mode to the packets stored in the queue associated with this forwarding class. The queue associated with the parent forwarding class must be of type **profile-mode**.

When this QoS policy is applied to the ingress of a Frame Relay VLL SAP, the system will treat the received FR frames with DE bit set as out-of-profile, regardless of their previous marking as the result of the default classification or on a match with an IP filter. It also adjusts the CIR of the ingress SAP queue to consider out-of-profile frames that were sent while the SAP queue was in the "< CIR" state of the bucket. This makes sure that the CIR of the SAP is achieved.

All received DE = 0 frames that are classified into this parent forwarding class or any of its subclasses have their profile unchanged by enabling this option. That is, the DE = 0 frame profile could be undetermined (default), in-profile, or out-of-profile as per previous classification. The DE = 0 frames that have a profile of undetermined will be evaluated by the system CIR marking algorithm and will be marked appropriately.

The **priority** option, if used, has no effect. All FR VLL DE = 1 frames have their priority automatically set to low while DE = 0 frames have their priority set to high. Furthermore, DE = 1 frames have the drop-preference bit set in the internal header. The internal settings of the priority bit and of the drop-preference bit of the frame is independent of the use of the profile mode.

All other capabilities of the Fpipe service are maintained. This includes remarking of the DE bit on egress SAP, and FR PW control word on egress network port for the packets that were classified into "out-of-profile" at ingress SAP.

This **de-1-out-profile** keyword has an effect when applied to the ingress of a SAP that is part of an Fpipe service. It can also be used on the ingress of an Epipe or VPLS SAP.

The **no** form of this command disables the color profile mode of operation on all SAPs to which this ingress QoS policy is applied.

## Default

```
no de-1-out-profile
```

## Platforms

All

## 8.32 de-mark

## de-mark

### Syntax

**de-mark** [**force** *de-value*]

**no demark**

### Context

[\[Tree\]](#) (config>qos>sap-egress>fc de-mark)

### Full Context

configure qos sap-egress fc de-mark

### Description

This command is used to explicitly define the marking of the DE bit for **fc** *fc-name* according to the inplus-profile/in-profile or out-of-profile/exceed-profile status of the packet (*fc-name* may be used to identify the dot1p-value).

If no DE value is present, the default values are used for the marking of the DE bit; for example, 0 for inplus-profile or in-profile packets, 1 for out-of-profile or exceed-profile packets. For more information, refer to the *IEEE 802.1ad-2005 standard*.

In the PBB case, for a Backbone SAP (B-SAP) and for packets originated from a local I-VPLS/PBB-Epipe, the command dictates the marking of the DE bit for both the BVID and ITAG.

If this command is not used, the DE bit should be preserved if an ingress TAG exist; otherwise, set to zero.

If the DE value is included in the command line, this value is to be used for all the packets of this forwarding class regardless of their profile status.

The commands **de-mark-inner** and **de-mark-outer** take precedence over the **de-mark** command if both are specified in the same policy.

### Parameters

#### **de-value**

Specifies the DE marking value.

**Values** 0 or 1

### Platforms

All

## de-mark

### Syntax

**de-mark** [**force** *de-value*]

**no de-mark**

**Context**

**[Tree]** (config>qos>network>egress>fc de-mark)

**Full Context**

configure qos network egress fc de-mark

**Description**

This command is used to explicitly define the marking of the DE bit for **fc** *fc-name* according to the inplus-profile or in-profile and out-of-profile or exceed-profile status of the packet (*fc-name* may be used to identify the dot1p value).

**Parameters*****de-value***

Specifies that this value is to be used for all the packets of this forwarding class regardless of their profile status.

If no DE value is present, the default values are used for the marking of the DE bit; that is, 0 for inplus-profile and in-profile packets, 1 for out-of-profile and exceed-profile packets. For more information, refer to the *IEEE 802.1ad-2005 standard*.

In the PBB case, use the following rules for a network port (B-SDP):

- the outer VID follows the rules for regular SDP
- for packets originating from a local I-VPLS/PBB-Epipe, this command dictates the marking of the DE bit for both the outer (link level) BVID and ITAG; if the command is not used, the DE bit is set to zero.
- for transit packets (B-SAP/B-SDP to B-SDP), the related ITAG bits are preserved, the same as for BVID.

**Values** 0, 1

**Platforms**

All

**8.33 de-mark-inner****de-mark-inner****Syntax**

**de-mark-inner** [**force** *de-value*]

**no de-mark-inner**

**Context**

**[Tree]** (config>qos>sap-egress>fc de-mark-inner)

## Full Context

```
configure qos sap-egress fc de-mark-inner
```

## Description

This command is used to explicitly define the marking of the DE bit in the inner VLAN tag for **fc** *fc-name* on a QinQ SAP, according to the in- and out-of-profile status of the packet.

If no DE value is present, the default values are used for the marking of the DE bit; for example, 0 for in-plus-profile or in-profile packets, 1 for out-of-profile or exceed-profile packets. For more information, refer to the *IEEE 802.1ad-2005 standard*.

If the DE value is included in the command line, this value is used for all the inner tags of packets of this forwarding class, regardless of their profile status.

This command takes precedence over the **de-mark** command if both are specified in the same policy and over the default action.

The configuration of **qinq-mark-top-only** under the SAP egress takes precedence over the use of the **de-mark-inner** in the policy. That is, the inner VLAN tag is not remarked when **qinq-mark-top-only** is configured (the marking used for the inner VLAN tag is based on the current default, which is governed by the marking of the packet received at the ingress to the system).

If no de-mark commands are used, the DE bit is preserved if an ingress inner tag exists; otherwise, set to 0.

Remarking the inner DE bit is not supported based on the profile result of egress policing.

## Parameters

### *de-value*

Specifies the DE marking value.

**Values** 0 or 1

## Platforms

All

## 8.34 de-mark-outer

```
de-mark-outer
```

## Syntax

```
de-mark-outer [force de-value]
```

```
no de-mark-outer
```

## Context

**[Tree]** (config>qos>sap-egress>fc de-mark-outer)

## Full Context

```
configure qos sap-egress fc de-mark-outer
```

## Description

This command is used to explicitly define the marking of the DE bit in the outer or single VLAN tag on a qinq or dot1q SAP, respectively, according to the in, out, or exceed-profile status of the packet.

If no DE value is present, the default values are used for the marking of the DE bit; for example, 0 for inplus-profile/in-profile packets, 1 for out-of-profile/exceed-profile packets. For more information, refer to the *IEEE 802.1ad-2005 standard*.

If the DE value is included in the command line, this value is used for all the outer or single tags of packets of this forwarding class, regardless of their profile status.

In the PBB case, for a Backbone SAP (B-SAP) and for packets originated from a local I-VPLS/PBB-Epipe, the command dictates the marking of the DE bit for both the BVID and ITAG.

This command takes precedence over the **de-mark** command if both are specified in the same policy and over the default action.

If no de-mark commands are used, the DE bit is preserved if an ingress outer or single tag exists; otherwise, set to 0.

## Parameters

### **de-value**

Specifies the DE marking value.

```
[Tree] (config>router>pcep>pcc dead-timer)
```

### Full Context

```
configure router pcep pce dead-timer
```

```
configure router pcep pcc dead-timer
```

### Description

This command configures the PCEP session dead timer value, which is the amount of time a PCEP speaker (PCC or PCE) will wait after the receipt of the last PCEP message before declaring its peer down.

The keep-alive mechanism is asymmetric, meaning that each PCEP speaker can propose a different dead timer value to its peer to use to detect session timeout.

The **no** form of the command returns the dead timer to the default value.

### Default

dead-timer 120

### Parameters

#### *seconds*

the dead timer value, in seconds

**Values** 1 to 255

### Platforms

## debug-output

### Syntax

[no] debug-output

### Context

[\[Tree\]](#) (config>call-trace>trace-profile debug-output)

### Full Context

configure call-trace trace-profile debug-output

### Description

This command enables output to the debug log. Traced messages are decoded as text and sent to debug logging. This allows for real-time debugging but is not recommended on live systems because of the decode overhead.

This command disables logging to the compact flash. The **debug-output** and **live-output** commands are mutually exclusive.

The **no** form of this command disables output to the debug log.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.40 debug-save

### debug-save

#### Syntax

**debug-save** [*file-url*]

#### Context

[\[Tree\]](#) (admin debug-save)

#### Full Context

admin debug-save

#### Description

This command saves existing debug configuration (configuration done under the debug branch of CLI). Debug configurations are not saved by the **admin save** command and not preserved across a node reboot or CPM switchover. The **debug-save** command makes the debug configuration available for the operator to execute after a reboot by using the **exec** command or after a CPM switchover by using the **switchover-exec** command, if desired.

#### Parameters

##### *file-url*

Specifies the file URL location to save the debug configuration. If no file-url is specified then the debug configuration is saved at the same location as the standard configuration file (**bof>primary-config/bof>secondary-config/bof>tertiary-config**) with the same file name as the standard configuration file but with a .dbg suffix.

#### Note:

IPv6-address applies only to 7750 SR and 7950 XRS.

#### Values

|                     |                                                                                                                                |

#### Syntax

**decrypt-key** *key* | *hash-key* | *hash2-key* [**hash** | **hash2** | **custom**]

**no decrypt-key**

#### Context

[\[Tree\]](#) (config>app-assure>group>url-list decrypt-key)

#### Full Context

configure application-assurance group url-list decrypt-key

#### Description

In case the file is encrypted this command is used to configure the decryption key used to read the file.

The **no** form of this command removes the url-list object.

#### Default

no decrypt-key

#### Parameters

**key** | **hash-key** | **hash2-key**

Specifies the Application-Assurance url-list decryption key.

**hash**

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys

are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

#### hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

#### custom

Specifies the custom encryption to management interface.

def-instance-sharing {per-sap | per-session}
```

### Context

[\[Tree\]](#) (config>subscr-mgmt>sla-prof def-instance-sharing)

### Full Context

configure subscriber-mgmt sla-profile def-instance-sharing

## Description

This command configures the default SPI sharing method for IPoE or PPPoE sessions from the same subscriber, having the same SLA profile associated, that are active on the same SAP. SPI sharing can be per-SAP or a dedicated SPI per-session.

## Default

def-instance-sharing per-sap

## Parameters

### per-sap

Specifies that IPoE or PPP sessions from the same subscriber, having the same SLA profile associated, and active on the same SAP share an SPI.

### per-session

Specifies that IPoE or PPP sessions from the same subscriber, having the same SLA profile associated, and active on the same SAP obtain a dedicated SPI per session.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.44 def-inter-dest-id

### def-inter-dest-id

configure subscriber-mgmt msap-policy sub-sla-mgmt def-inter-dest-id

configure service vprn subscriber-interface group-interface sap sub-sla-mgmt def-inter-dest-id

## Description

This command specifies a default destination string for all subscribers associated with the SAP. The command also accepts the **use-top-q** flag that automatically derives the string based on the top most delineating Dot1Q tag from the SAP's encapsulation.

The **no** form of this command removes the default subscriber identification string from the configuration.

## Parameters

### *string*

A RADIUS VSA (Alc-Int-Dest-Id-Str, type 28) obtained during the subscriber authentication phase contains the destination string name that is matched against the string defined under the Vport. In this fashion the subscriber host is associated with the corresponding Vport.

Alternatively, the destination string can be defined in LUDB.

### **use-top-q**

This is applicable only to Ethernet ports.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## def-inter-dest-id

## Syntax

**def-inter-dest-id** {**string** *string* | **use-top-q**}

**no def-inter-dest-id**

## Context

[\[Tree\]](#) (config>service>vpls>sap>sub-sla-mgmt def-inter-dest-id)

## Full Context

configure service vpls sap sub-sla-mgmt def-inter-dest-id

## Description

This command specifies a default destination string for all subscribers associated with the SAP. The command also accepts the **use-top-q** flag that automatically derives the string based on the top most delineating Dot1Q tag from the SAP's encapsulation.

The **no** form of this command removes the default subscriber identification string from the configuration.

no def-sub-id

## Default

no def-inter-dest-id

## Parameters

### **use-top-q**

Specifies to derive the string based on the top most delineating Dot1Q tag from the SAP's encapsulation

### **string *string***

Specifies the subscriber identification applicable for a subscriber host.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
configure router bgp group neighbor def-recv-evpn-encap
```

```
configure router bgp group def-recv-evpn-encap
```

## Description

This command defines how the BGP will treat a received EVPN route without RC5512 BGP encapsulation extended community. If no encapsulation is received, BGP will validate the route as MPLS or VXLAN depending on how this command is configured.

## Default

```
no def-recv-evpn-encap
```

## Parameters

### **mpls**

Specifies that **mpls** is the default encapsulation value in the case where no RFC5512 extended community is received in the incoming BGP-EVPN route.

### **vxlan**

Specifies that **vxlan** is the default encapsulation value.

## 8.46 def-sla-profile

### def-sla-profile

#### Syntax

**def-sla-profile** *default-sla-profile-name*

**no def-sla-profile**

#### Context

**[Tree]** (config service vprn sub-if grp-if sap sub-sla-mgmt def-sla-profile)

**[Tree]** (config subscr-mgmt msap-policy sub-sla-mgmt def-sla-profile)

**[Tree]** (config service ies sub-if grp-if sap-parameters sub-sla-mgmt def-sla-profile)

**[Tree]** (config service ies sub-if grp-if sap sub-sla-mgmt def-sla-profile)

**[Tree]** (config service vprn sub-if grp-if sap-parameters sub-sla-mgmt def-sla-profile)

**[Tree]** (config service vpls sap sub-sla-mgmt def-sla-profile)

#### Full Context

configure service vprn subscriber-interface group-interface sap sub-sla-mgmt def-sla-profile

configure subscriber-mgmt msap-policy sub-sla-mgmt def-sla-profile

configure service ies subscriber-interface group-interface sap-parameters sub-sla-mgmt def-sla-profile

configure service ies subscriber-interface group-interface sap sub-sla-mgmt def-sla-profile

configure service vprn subscriber-interface group-interface sap-parameters sub-sla-mgmt def-sla-profile

configure service vpls sap sub-sla-mgmt def-sla-profile

#### Description

This command specifies a default SLA profile for this SAP. The SLA profile must be defined prior to associating the profile with a SAP in the config>subscr-mgmt>sla-profile context.

If a subscriber is not explicitly associated with an SLA profile during the authentication phase, a default profile will be assigned to it.

The **no** form of this command removes the default SLA profile from the SAP configuration.

#### Parameters

***default-sla-profile-name***

Specifies a default SLA profile for this SAP.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface sap sub-sla-mgmt def-sla-profile
- configure subscriber-mgmt msap-policy sub-sla-mgmt def-sla-profile
- configure service vprn subscriber-interface group-interface sap sub-sla-mgmt def-sla-profile
- configure service vpls sap sub-sla-mgmt def-sla-profile

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface sap-parameters sub-sla-mgmt def-sla-profile
- configure service vprn subscriber-interface group-interface sap-parameters sub-sla-mgmt def-sla-profile

## 8.47 def-sub-id

### def-sub-id

#### Syntax

**def-sub-id use-auto-id**

**def-sub-id use-sap-id**

**def-sub-id string** *sub-id*

**no def-sub-id**

#### Context

**[Tree]** (config>subscr-mgmt>msap-policy>sub-sla-mgmt def-sub-id)

**[Tree]** (config>service>ies>sub-if>grp-if>sap>sub-sla-mgmt def-sub-id)

**[Tree]** (config>service>vpls>sap>sub-sla-mgmt def-sub-id)

**[Tree]** (config>service>vprn>sub-if>grp-if>sap>sub-sla-mgmt def-sub-id)

#### Full Context

configure subscriber-mgmt msap-policy sub-sla-mgmt def-sub-id

configure service ies subscriber-interface group-interface sap sub-sla-mgmt def-sub-id

configure service vpls sap sub-sla-mgmt def-sub-id

configure service vprn subscriber-interface group-interface sap sub-sla-mgmt def-sub-id

#### Description

This command specifies the explicit default sub-id for dynamic subscriber hosts (including ARP hosts) in case that the sub-id string is not supplied through RADIUS or LUDB.

The sub-id is assigned to a new subscriber host in the following order of priority:

- RADIUS
- LUDB

- Explicit default – The **def-sub-id** command is used to explicitly set the *sub-id* name of the host as one of the following:
  - The SAP ID to which the new host is associated
  - An explicit string
  - An auto-generated string consisting of the concatenated subscriber identification fields defined under the **subscr-mgmt>auto-sub-id-key** node. The fields are taken in the order in which they are configured and are separated by a '|' character. The subscriber host identification fields are separately defined for IPoE and PPPoE host types.
- Implicit default – If the *sub-id* string is not returned via RADIUS or LUDB and there is no *def-sub-id* configured, the *sub-id* name is generated as a random 10 character encoded string based on the *auto-sub-id-keys*. This 10 characters encoded string is unique per chassis as well as in dual-homed environment. It is generated based on *auto-sub-id-keys*. If *auto-sub-id-keys* are not explicitly configured, the default ones are:
  - mac, sap-id, or session-id for PPP type hosts
  - mac or sap-id for IPoE type hosts.

This command does not apply to static subscribers.

The **no** form of this command reverts to the default.

## Parameters

### **use-sap-id**

Specifies the *sub-id* name-id on which the original request for host creation arrived (DHCP Discover, or PADI or ARP Request).

### **sub-id**

Explicitly configured *sub-id* name up to 32 characters.

### **use-auto-id**

Specifies the concatenated string of *auto-sub-id-keys* separated by a '|' character.

**Default** no *def-sub-id*

**Implicit default** If the *sub-id string* is not supplied through RADIUS, LUDB, or **def-sub-id** configuration, then a random 10 character encoded *sub-id* name is generated. This random *sub-id* name is based on the subscriber identification keys defined under the **subscr-mgmt>auto-sub-id-key** node. In case that the *auto-sub-id-keys* are not defined explicitly, the default ones are:

- mac, sap-id, or session-id for PPPoE type hosts
- mac or sap-id for IPoE type hosts

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## def-sub-id

### Syntax

**def-sub-id** string *sub-id*

**def-sub-id** use-auto-id

**no** def-sub-id

### Context

**[Tree]** (config>service>ies>sub-if>grp-if>sap-parameters>sub-sla-mgmt def-sub-id)

**[Tree]** (config>service>vprn>sub-if>grp-if>sap-parameters>sub-sla-mgmt def-sub-id)

### Full Context

configure service ies subscriber-interface group-interface sap-parameters sub-sla-mgmt def-sub-id

configure service vprn subscriber-interface group-interface sap-parameters sub-sla-mgmt def-sub-id

### Description

This command configures the default subscriber ID. The default is used if no other source (like RADIUS) provides a subscriber identification string.

### Parameters

#### *sub-id*

Specifies the default subscriber identification up to 32 characters.

#### **use-auto-id**

Specifies that the auto-generated subscriber identification string, is used as the default subscriber identification string.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.48 def-sub-profile

## def-sub-profile

### Syntax

**def-sub-profile** *default-subscriber-profile-name*

### Context

**[Tree]** (config subscr-mgmt msap-policy sub-sla-mgmt def-sub-profile)

## Full Context

```
configure subscriber-mgmt msap-policy sub-sla-mgmt def-sub-profile
```

## Description

This command specifies a default subscriber profile for an MSAP.

A subscriber profile defines the aggregate QoS for all hosts within a subscriber context. This is done through the definition of the egress and ingress scheduler policies that govern the aggregate SLA for subscriber using the subscriber profile.

The **no** form of this command removes the default SLA profile from the SAP configuration.

## Parameters

### *default-sub-profile*

Specifies a default subscriber profile for this SAP up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```

## Description

This command specifies a default subscriber profile for this SAP. The subscriber profile must be defined prior to associating the profile with a SAP in the **config>subscr-mgmt>sub-profile** context.

A subscriber profile defines the aggregate QoS for all hosts within a subscriber context. This is done through the definition of the egress and ingress scheduler policies that govern the aggregate SLA for subscriber using the subscriber profile. Subscriber profiles also allow for specific SLA profile definitions when the default definitions from the subscriber identification policy must be overridden.

The **no** form of this command removes the default SLA profile from the SAP configuration.

## Parameters

### *default-sub-profile*

Specifies a default subscriber profile for this SAP. The subscriber profile must be defined prior to associating the profile with a SAP in the **config>subscr-mgmt>sub-profile** context.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface sap-parameters sub-sla-mgmt def-sub-profile
- configure service vprn subscriber-interface group-interface sap-parameters sub-sla-mgmt def-sub-profile

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface sap sub-sla-mgmt def-sub-profile

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.49 default

### default

#### Syntax

[no] default

#### Context

[\[Tree\]](#) (config>log>accounting-policy default)

#### Full Context

configure log accounting-policy default

#### Description

This command configures the default accounting policy to be used with all SAPs that do not have an accounting policy.

If no access accounting policy is defined on a SAP, accounting records are produced in accordance with the default access policy. If no default access policy is created, then no accounting records will be collected other than the records for the accounting policies that are explicitly configured.

If no network accounting policy is defined on a network port, accounting records will be produced in accordance with the default network policy. If no network default policy is created, then no accounting records will be collected other than the records for the accounting policies explicitly configured.

Only one access accounting policy ID can be designated as the default access policy. Likewise, only one network accounting policy ID can be designated as the default network accounting policy.

The record name must be specified prior to assigning an accounting policy as default.

If a policy is configured as the default policy, then a **no default** command must be issued before a new default policy can be configured.

The **no** form of this command removes the default policy designation from the policy ID. The accounting policy will be removed from all SAPs or network ports that do not have this policy explicitly defined.

```

### Full Context

```
configure subscriber-mgmt isa-filter default-action
configure subscriber-mgmt isa-filter ipv6 default-action
```

### Description

This command specifies what should happen to packets that do not match any of the configured entries. The **no** form of this command reverts to the default value.

### Default

```
default-action drop
```

### Parameters

#### drop

Specifies that packets matching the filter entry are dropped.

#### forward

Specifies that packets matching the filter entry are forwarded.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## default-action

### Syntax

```
default-action {block | allow}
```

### Context

```
[Tree] (config>service>mrp>mrp-policy default-action)
```

### Full Context

```
configure service mrp mrp-policy default-action
```

## Description

This command specifies the action to be applied to the MMRP attributes (Group B-MACs) whose ISIDs do not match the specified criteria in all of the entries of the mrp-policy.

When multiple **default-action** commands are entered, the last command will overwrite the previous command.

## Default

default-action allow

## Parameters

### block

Specifies that all MMRP attributes will not be declared or registered unless there is a specific mrp-policy entry which causes them to be allowed on this SAP or SDP.

### allow

Specifies that all MMRP attributes will be declared and registered unless there is a specific mrp-policy entry which causes them to be blocked on this SAP or SDP.

## Platforms

All

## default-action

## Syntax

**default-action** {drop | forward}

**no default-action**

## Context

[\[Tree\]](#) (config>service>vprn>log>filter default-action)

## Full Context

configure service vprn log filter default-action

## Description

The default action specifies the action that is applied to events when no action is specified in the event filter entries or when an event does not match the specified criteria.

When multiple **default-action** commands are entered, the last command overwrites the previous command.

The **no** form of this command reverts the default action to the default value (forward).

## Default

default-action forward — The events which are not explicitly dropped by an event filter match are forwarded.

## Parameters

### drop

The events which are not explicitly forwarded by an event filter match are dropped.

### forward

The events which are not explicitly dropped by an event filter match are forwarded.

## Platforms

All

## default-action

## Syntax

```
default-action {permit | deny} [event-log event-log-name]
```

configure application-assurance group policy app-qos-policy entry action url-filter default-action

## Description

This command configures the default action to take when the ICAP server is unreachable.

## Default

no default-action

## Parameters

### allow

Allows all requests.

### block-all

Blocks all requests.

### block-http-redirect *http-redirect-name*

Blocks and redirects requests.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## default-action

### Syntax

```
default-action {dnat | forward} [ip-address ip-address]
```

### Context

[\[Tree\]](#) (config>service>nat>nat-classifier default-action)

### Full Context

```
configure service nat nat-classifier default-action
```

### Description

This command specifies the default action to take for packets in this nat-classifier. The default-action will apply to packet that do not match any configured criteria within nat-classifier. The **no** form of this command equals action forward.

### Default

```
default-action forward
```

### Parameters

#### dnat

Performs the DNAT function. The destination IP address of the packet traversing the router in the direction from inside to outside is replaced by the configured IP address. Destination port is not translated. In the opposite direction (from outside to inside), the source address in the returning packet is restored to the original value.

#### forward

The forward action will ensure that the packet is transparently passed through the nat-classifier.

#### ip-address *ip-address*

The destination IP address that will replace the original IP address in the packet traveling from inside to outside.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

```

## Context

[\[Tree\]](#) (config>qos>network>ingress default-action)

## Full Context

configure qos network ingress default-action

## Description

This command defines or edits the default action to be taken for packets that have an undefined DSCP or MPLS EXP bit set. The **default-action** command specifies the forwarding class to which such packets are assigned.

Multiple default-action commands will overwrite each previous default-action command.

## Default

default-action fc be profile out

## Parameters

### *fc-name*

Specifies the forwarding class name. All packets with DSCP value or MPLS EXP or dot1p bits that are not defined will be placed in this forwarding class.

**Values** be, l2, af, l1, h2, ef, h1, nc

### **profile {in | out}**

All packets that are assigned to this forwarding class will be considered in-profile or out-of-profile based on this command. In case of congestion, the in-profile packets are preferentially queued over the out-of-profile packets.

**Values** in, out

## Platforms

All

## default-action

## Syntax

**default-action {drop | forward}**

## Context

[\[Tree\]](#) (config>filter>ip-filter default-action)

[\[Tree\]](#) (config>filter>mac-filter default-action)

[\[Tree\]](#) (config>filter>ipv6-filter default-action)

## Full Context

configure filter ip-filter default-action

configure filter mac-filter default-action

configure filter ipv6-filter default-action

## Description

This command defines the default action to be applied to packets not matching any entry in this ACL filter policy or to packets for that match a PBF/PBR filter entry for which the PBF/PBR target is down and **pbr-down-action-override** per-entry is set to **filter-default-action**.

## Default

default-action drop

## Parameters

### **drop**

Specifies the default action is to drop a packet.

**forward**

Specifies the default action is to forward a packet.

**Platforms**

All

**default-action****Syntax**

**default-action** {**drop** | **forward**}

**no default-action**

**Context**

[\[Tree\]](#) (config>log>filter default-action)

**Full Context**

configure log filter default-action

**Description**

The default action specifies the action that is applied to events when no action is specified in the event filter entries or when an event does not match the specified criteria.

When multiple **default-action** commands are entered, the last command overwrites the previous command.

The **no** form of this command reverts the default action to the default value (forward).

**Default**

default-action forward

**Parameters****drop**

The events which are not explicitly forwarded by an event filter match are dropped.

**forward**

The events which are not explicitly dropped by an event filter match are forwarded.

**Platforms**

All

**default-action****Syntax**

**default-action** {**permit** | **deny** | **deny-host-unreachable**}

## Context

[\[Tree\]](#) (config>system>security>mgmt-access-filter>mac-filter default-action)

[\[Tree\]](#) (config>system>security>mgmt-access-filter>ip-filter default-action)

[\[Tree\]](#) (config>system>security>mgmt-access-filter>ipv6-filter default-action)

## Full Context

configure system security management-access-filter mac-filter default-action

configure system security management-access-filter ip-filter default-action

configure system security management-access-filter ipv6-filter default-action

## Description

This command creates the default action for management access in the absence of a specific management access filter match.

The **default-action** is applied to a packet that does not satisfy any match criteria in any of the management access filters. Whenever management access filters are configured, the **default-action** must be defined.

## Parameters

### permit

Specifies that packets not matching the configured selection criteria in any of the filter entries will be permitted.

### deny

Specifies that packets not matching the selection criteria be denied and that an ICMP host unreachable message will not be issued.

### deny-host-unreachable

Specifies that packets not matching the selection criteria be denied access and that an ICMP host unreachable message will be issued.

The **deny-host-unreachable** only applies to ip-filter and ipv6filter.

## Platforms

All

## default-action

## Syntax

**default-action** {**accept** | **drop**}

## Context

[\[Tree\]](#) (config>system>security>cpm-filter default-action)

## Full Context

configure system security cpm-filter default-action

## Description

This command specifies the action to take on the traffic when there are no filter entry matches. If there are no filter entries defined, the packets received are either dropped or forwarded based on that default action.

## Default

default-action accept

## Parameters

### accept

Specifies that packets matching the filter entry are forwarded.

### drop

Specifies that packets matching the filter entry are dropped.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## default-action

## Syntax

default-action {deny-all | permit-all | none | read-only-all}

## Context

[\[Tree\]](#) (config>system>security>profile default-action)

## Full Context

configure system security profile default-action

## Description

This command specifies the default action to be applied when no match conditions are met.

## Parameters

### deny-all

Sets the default of the profile to deny access to all commands.

### permit-all

Sets the default of the profile to permit access to all commands.

### Note:

In classic CLI but not in MD-CLI the **permit-all** parameter does not change access to **security** commands. Specific entries must be created in a command authorization profile in order to give access to **security** commands. The system populated "administrative" profile contains rules to access **security** commands.

### none

Sets the default of the profile to no-action. This option is useful to assign multiple profiles to a user.

**read-only-all**

Sets the default of the profile to allow read-only access to all commands.

**Platforms**

All

**default-action****Syntax**

**default-action** {**accept** | **next-entry** | **next-policy** | **drop** | **reject**}

**no default-action**

**Context**

[\[Tree\]](#) (config>router>policy-options>policy-statement default-action)

**Full Context**

configure router policy-options policy-statement default-action

**Description**

Commands in this context configure actions to apply to routes that do not match any entries of a route policy statement.

The **no** form of this command deletes the **default-action** context for the policy statement.

**Default**

no default-action

**Parameters****accept**

Specifies that routes not matched by any entry should be allowed or accepted. This parameter provides a context for modifying route properties.

**next-entry**

Specifies that routes not matched by any entry should be evaluated by the next sequential entry in the policy chain, after route properties are possibly modified by the default action of the current policy.

**next-policy**

Specifies that routes not matched by any entry should be evaluated by the next sequential policy in the policy chain, after route properties are possibly modified by the default action of the current policy.

**drop**

Specifies that routes not matched by any entry should be disallowed or rejected. This parameter provides a context for modifying route properties.

### **reject**

Specifies that routes not matched by any entry should be disallowed or rejected. This parameter does not provide a context for modifying route properties.

## **Platforms**

All

## **default-action**

### **Syntax**

**default-action allow**

**default-action block-all**

**default-action block-http-redirect** *http-redirect-name*

**no default-action**

### **Context**

[\[Tree\]](#) (config>app-assure>group>url-filter>web-service default-action)

[\[Tree\]](#) (config>app-assure>group>url-filter>local-filtering default-action)

[\[Tree\]](#) (config>app-assure>group>url-filter>icap default-action)

### **Full Context**

configure application-assurance group url-filter web-service default-action

configure application-assurance group url-filter local-filtering default-action

configure application-assurance group url-filter icap default-action

### **Description**

This command configures a default action for the URL filter. The default action takes effect when the URL filter cannot be used. This may happen in the following scenarios.

- In the case of a local URL list, when the URL list is shutdown or the file is not loaded due to an error.
- In the case of ICAP or web filtering, when all TCP connections are busy or down.

The **no** form of this command removes the **default-action** for the URL filter.

### **Default**

no default-action

### **Parameters**

#### **allow**

Specifies to allow traffic.

#### **block-all**

Specifies to block traffic.

**block-http-redirect *http-redirect-name***

Specifies to block traffic and redirect the user to an information page, which can be different than the page the user is redirected to when the site they attempted to access was found in the URL filter; this page is configured using the **config>aa>group>url-filter>http-redirect** command.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.52 default-authentication-server-policy

### default-authentication-server-policy

**Syntax**

**default-authentication-server-policy** *policy-name*

**no default-authentication-server-policy**

**Context**

**[Tree]** (config>service>vpn>radius-proxy>server default-authentication-server-policy)

**[Tree]** (config>router>radius-proxy>server default-authentication-server-policy)

**Full Context**

configure service vpn radius-proxy server default-authentication-server-policy

configure router radius-proxy server default-authentication-server-policy

**Description**

This command specifies the default radius-server-policy for RADIUS authentication. This policy is used when there is no specific match based on username.

The **no** form of this command removes the policy name from the configuration.

**Parameters**

***policy-name***

Specifies the name of the default RADIUS server policy associated with this RADIUS proxy server for authentication purposes.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.53 default-brg-profile

### default-brg-profile

#### Syntax

**default-brg-profile** *profile-name*

**no default-brg-profile**

#### Context

**[Tree]** (config service ies sub-if grp-if wlan-gw vlan-ranges range vrgw brg default-brg-profile)

**[Tree]** (config service vprn sub-if grp-if brg default-brg-profile)

**[Tree]** (config service vprn sub-if grp-if wlan-gw vlan-ranges range vrgw brg default-brg-profile)

**[Tree]** (config service ies sub-if grp-if wlan-gw ranges range brg default-brg-profile)

**[Tree]** (config service vprn sub-if grp-if wlan-gw ranges range brg default-brg-profile)

#### Full Context

configure service ies subscriber-interface group-interface wlan-gw vlan-ranges range vrgw brg default-brg-profile

configure service vprn subscriber-interface group-interface brg default-brg-profile

configure service ies subscriber-interface group-interface brg default-brg-profile

configure service vprn subscriber-interface group-interface wlan-gw vlan-ranges range vrgw brg default-brg-profile

configure service ies subscriber-interface group-interface wlan-gw ranges range brg default-brg-profile

configure service vprn subscriber-interface group-interface wlan-gw ranges range brg default-brg-profile

#### Description

This command indicates that the default BRG profile must be used for new BRGs. This profile can be overridden by RADIUS.

#### Parameters

***profile-name***

Specifies the name of the brg-profile to be applied.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.54 default-category-map

### default-category-map

#### Syntax

**default-category-map** *category-map-name*

**no default-category-map**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>credit-control-policy default-category-map)

#### Full Context

configure subscriber-mgmt credit-control-policy default-category-map

#### Description

This command configures the default category map.

The **no** form of this command reverts to the default.

#### Parameters

*category-map-name*

Specifies the category map name, up to 32 characters.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.55 default-charging-group

### default-charging-group

#### Syntax

**default-charging-group** *charging-group-name*

**no default-charging-group**

#### Context

[\[Tree\]](#) (config>app-assure>group>policy default-charging-group)

#### Full Context

configure application-assurance group policy default-charging-group

## Description

This command associates a charging group to any applications or app-groups that are not explicitly assigned to a charging group, for an application assurance policy.

The **no** form of this command deletes the default charging group from the configuration.

## Default

no default-charging-group

## Parameters

### *charging-group-name*

A string of up to 32 characters uniquely identifying an existing charging group in the system.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.56 default-credit

### default-credit

## Syntax

**default-credit volume** *credits* [*bytes* | *kilobytes* | *megabytes* | *gigabytes*]

**default-credit time** *seconds*

**no default-credit**

## Context

[\[Tree\]](#) (config>subscr-mgmt>cat-map>category default-credit)

## Full Context

configure subscriber-mgmt category-map category default-credit

## Description

This command configures the default credit values for RADIUS credit control and Diameter Gy application credit control.

For RADIUS credit control, this command configures the default time or volume credit for this category. The default credit is used during initial setup when no quota is received from the RADIUS server.

For Diameter Gy credit control, this command specifies the interim credit assigned to this category (rating group) when Extended Failure Handling (EFH) is enabled. This command is ignored when EFH is disabled.

The **no** form of this command reverts to the default.

## Parameters

### **volume *credits* [bytes | kilobytes | megabytes | gigabytes]**

Specifies the default value for the volume credit and the unit in which the default value is expressed.

**Values** 1 to 4294967295 (minimum 1 byte)

### **time *seconds***

Specifies the default value for the time credit, in seconds.

**Values** 1 to 4294967295 (minimum 1 second)

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.57 default-dnat-ip-address

### default-dnat-ip-address

## Syntax

**default-dnat-ip-address** *ip-address*

**no default-dnat-ip-address**

## Context

**[Tree]** (config>service>nat>nat-classifier default-dnat-ip-address)

## Full Context

configure service nat nat-classifier default-dnat-ip-address

## Description

This command configures the IP address to substitute for the destination IP address of the packets

## Default

no default-dnat-ip-address

## Parameters

### ***ip-address***

Specifies the default DNAP IP address.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.58 default-dns

### default-dns

#### Syntax

**default-dns** *ip-address* [**secondary** *ip-address*]

**no default-dns**

#### Context

[\[Tree\]](#) (config>service>vprn>sub-if default-dns)

[\[Tree\]](#) (config>service>ies>sub-if default-dns)

#### Full Context

configure service vprn subscriber-interface default-dns

configure service ies subscriber-interface default-dns

#### Description

This command configures last resort IP DNS addresses that can be used for name resolution by IPoE hosts (IA\_NA, IA\_PD and SLAAC) and PPPoE hosts (IA\_NA, IA\_PD and SLAAC).

The **no** form of this command reverts to the default.

#### Parameters

##### *ip-address*

Specifies the IP address of the primary DNS server.

##### *secondary ip-address*

Specifies the IP address of the secondary DNS server (optional).

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### default-dns

#### Syntax

**default-dns** *ipv6-address* [**secondary** *ipv6-address*]

**no default-dns**

#### Context

[\[Tree\]](#) (config>service>ies>sub-if>ipv6 default-dns)

[\[Tree\]](#) (config>service>vprn>sub-if>ipv6 default-dns)

### Full Context

```
configure service ies subscriber-interface ipv6 default-dns
configure service vprn subscriber-interface ipv6 default-dns
```

### Description

This command configures last resort IPv6 DNS addresses that can be used for name resolution by IPoEv6 hosts (IA\_NA, IA\_PD and SLAAC) and PPPoEv6 hosts (IA\_NA, IA\_PD and SLAAC).

The **no** form of this command reverts to the default.

### Parameters

#### *ipv6-address*

Specifies the IPv6 address of the primary DNS server.

#### *secondary ipv6-address*

Specifies the IPv6 address of the secondary DNS server (optional).

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.59 default-domain

### default-domain

### Syntax

```
default-domain dns-name
```

```
no default-domain
```

### Context

[\[Tree\]](#) (config>service>vprn>dns default-domain)

### Full Context

```
configure service vprn dns default-domain
```

### Description

This command configures the DNS domain name to be added in DNS retries when a DNS query is not replied or an empty DNS reply is received.

The **no** form of this command prevents DNS retries when the DNS query is not replied or an empty DNS reply is received.

### Parameters

#### *dns-name*

Specifies the name of the default domain, up to 255 characters. Allowed values for characters are alphabetical (A-Z), numeric (0-9), the minus sign (-), and the period (.). For example, "3gpp-network.org".

### Platforms

All

## default-domain

### Syntax

**default-domain**

### Context

[\[Tree\]](#) (config>eth-cfm default-domain)

### Full Context

configure eth-cfm default-domain

### Description

Commands in this context configure MIP creation parameters per index (**bridge-identifier** *bridge-id* **vlan** *vlan-id*) if the MIP creation statement exists as part of the service connection. The mip creation statement must be present on the connection before any configuration can occur for a MIP under this context. The determining factor for MIP creation is based on the authoritative properties of the **eth-cfm domain association** configuration. The individual indexes in this table are used for MIP creation only when the association context is not authoritative; this includes the lack of association for a matching index.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 8.60 default-fc

## default-fc

### Syntax

**default-fc** *fc-name*

**no default-fc**

### Context

[\[Tree\]](#) (config>qos>sap-ingress default-fc)

## Full Context

```
configure qos sap-ingress default-fc
```

## Description

This command configures the default forwarding class for the policy. If an ingress packet does not match a higher priority (more explicit) classification command, the default forwarding class or subclass if associated with the packet. Unless overridden by an explicit forwarding class classification rule, all packets received on an ingress SAP using this ingress QoS policy are classified to the default forwarding class. Optionally, the default ingress enqueueing priority for the traffic can be overridden as well.

The default forwarding class is best effort (be). The **default-fc** settings are displayed in the **show configuration** and **save** output regardless of inclusion of the **detail** keyword.

## Default

```
default-fc "be"
```

## Parameters

### *fc-name*

Specify the forwarding class name for the queue. The value specified for *fc-name* must be one of the predefined forwarding classes in the system.

The subclass-name parameter is optional and used with the *fc-name* parameter to define a preexisting subclass. The *fc-name* and subclass-name parameters must be separated by a period (dot). If subclass-name does not exist in the context of *fc-name*, an error will occur. If subclass-name is removed using the **no fc *fc-name*.subclass-name force** command, the **default-fc** command will automatically drop the *subclass-name* and only use *fc-name* (the parent forwarding class for the subclass) as the forwarding class.

### Values

fc: *class[.subclass]*

*class*: be, l2, af, l1, h2, ef, h1, nc

*subclass*: 29 characters max

## Platforms

All

## 8.61 default-filter-action

```
default-filter-action
```

## Syntax

```
default-filter-action default-action
```

**Context**

**[Tree]** (debug>app-assure>group>http-host>filter default-filter-action)

**Full Context**

debug application-assurance group http-host-recorder filter default-filter-action

**Description**

This command configures the recorder filter default action to either record or no-record. This parameter applies to http-host values not matching any expressions defined in the filter context.

**Parameters*****default-action***

Specifies the default action.

**Values** record, no-record

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.62 default-group-interface

### default-group-interface

**Syntax**

**default-group-interface** *ip-int-name* **service-id** *service-id*

**default-group-interface** *ip-int-name* **service-name** *svc-name*

**no default-group-interface**

**Context**

**[Tree]** (config>service>vprn>l2tp>group>ppp default-group-interface)

**[Tree]** (config>router>l2tp>group>tunnel>ppp default-group-interface)

**[Tree]** (config>router>l2tp>group>ppp default-group-interface)

**[Tree]** (config>service>vprn>l2tp>group>tunnel>ppp default-group-interface)

**Full Context**

configure service vprn l2tp group ppp default-group-interface

configure router l2tp group tunnel ppp default-group-interface

configure router l2tp group ppp default-group-interface

configure service vprn l2tp group tunnel ppp default-group-interface

## Description

This command configures the group interface where the PPP sessions are established when the authentication server does not specify the group interface.

The **no** form of this command removes the interface name or service ID from the configuration.

## Parameters

### *ip-int-name*

Specifies an IP interface name, up to 32 characters.

### *service-id service-id*

Specifies an existing service identification number.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **default-group-interface ip-int-name service-name svc-name** variant can be used in all configuration modes.

### Values {*id* | *svc-name*}

|                   |                                                                                                                                                              |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>id</i> :       | 1 to 2147483647                                                                                                                                              |
| <i>svc-name</i> : | up to 64 characters ( <i>svc-name</i> is an alias for input only. The <i>svc-name</i> gets replaced with an id automatically by SR OS in the configuration). |

### *service-name svc-name*

Specifies an existing service name up to 64 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.63 default-gtp-tunnel-endpoint-limit

### default-gtp-tunnel-endpoint-limit

## Syntax

**default-gtp-tunnel-endpoint-limit** *direction* [**create**]

**no default-gtp-tunnel-endpoint-limit** *direction*

## Context

[\[Tree\]](#) (config>app-assure>group>statistics>tca>gtp-filter default-gtp-tunnel-endpoint-limit)

## Full Context

configure application-assurance group statistics threshold-crossing-alert gtp-filter default-gtp-tunnel-endpoint-limit

## Description

This command configures a TCA for the counter capturing drops because the GTP endpoint limits create requests exceeding the configured allowed limit (set by the **default-tunnel-endpoint-limit** command). A default-gtp-tunnel-endpoint-limit drop TCA can be created for traffic generated from the subscriber side of AA (**from-sub**). The **create** keyword is mandatory when creating a TCA.

## Parameters

### *direction*

Specifies the traffic direction.

**Values** from-sub

### **create**

Keyword used to create the TCA.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.64 default-host

### default-host

## Syntax

**default-host** *ipv4-prefix/mask* | *ipv6-prefix/prefix-length* **next-hop** *ipv4-address* | *ipv6-address*  
**no default-host** *ipv4-prefix/mask* | *ipv6-prefix/prefix-length*

## Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>sap default-host)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>sap default-host)

## Full Context

configure service vprn subscriber-interface group-interface sap default-host  
 configure service ies subscriber-interface group-interface sap default-host

## Description

This command configures the default-host. More than one default host can be configured per SAP. The **no** form of this command removes the values from the configuration.

**Parameters*****ipv4prefix/prefix-length***

Specifies an IPv4 prefix and prefix length.

**Values**            ipv4-prefix      a.b.c.d (host bits must be 0  
                         prefix-length 0 to 32

***ipv6-prefix/prefix-length***

Specifies an IPv6 prefix and prefix length.

**Values**            ipv6-prefix      x:x:x:x:x:x:x (eight 16-bit pieces)  
                         x:x:x:x:x:d.d.d.d  
                         x - [0 to FFFF]H  
                         d - [0 to 255]D  
                         prefix-length - [0 to 128]

**next-hop**

Assigns the next hop IP address.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.65 default-instance

### default-instance

**Syntax**

[no] default-instance

**Context**

[\[Tree\]](#) (config>service>vprn>isis>if default-instance)

**Full Context**

configure service vprn isis interface default-instance

**Description**

This command enables a non-MI capable router to establish an adjacency and operate with an SR OS in a non-zero instance. If the router does not receive IID-TLVs, it establishes an adjacency in a single instance. Instead of establishing an adjacency in the standard instance 0, the router establishes an adjacency in

the configured non-zero instance. The router then operates in the configured non-zero instance so that it appears to be in the standard instance 0 to its neighbor. This feature is supported on point-to-point interfaces, broadcast interfaces are not supported.

The **no** form of this command disables the functionality so that the router can only establish adjacencies in the standard instance 0.

### Default

no default-instance

### Platforms

All

## default-instance

### Syntax

[no] default-instance

### Context

[\[Tree\]](#) (config>router>isis>interface default-instance)

### Full Context

configure router isis interface default-instance

### Description

This command enables a non-MI capable router to establish an adjacency and operate with a router in a non-zero instance. If the router does not receive IID-TLVs, it will establish an adjacency in a single instance. Instead of establishing an adjacency in the standard instance 0, the router will establish an adjacency in the configured non-zero instance. The router will then operate in the configured non-zero instance so that it appears to be in the standard instance 0 to its neighbor. This feature is supported on point-to-point interfaces, broadcast interfaces are not supported.

This feature must be configured on the router connected to non-MI capable routers and on all other SR OS routers in the area, so that they receive non-MI LSPs in the correct instance and not in the base instance.

The **no** form of this command disables the functionality so that the router can only establish adjacencies in the standard instance 0.

**[Tree]** (config>router>bgp default-label-preference)

## Full Context

configure router bgp group default-label-preference

configure router bgp group neighbor default-label-preference

configure router bgp default-label-preference

## Description

This command specifies a route-table preference value to use for EBGp or IBGP routes carrying labeled-unicast prefixes and received from peers covered by the context of the command. Route-table preference comes into play when the route-table has multiple routes for the same IP prefix. In this case the route with the numerically lowest preference value is usually the route that is activated and installed into the IP FIB. By default all BGP routes have a route-table preference value of 170.

This command overrides the preference value assigned by the **label-preference** command; that other command does not distinguish between EBGP and IBGP routes. Overriding happens even when the default-label-preference value is inherited from a higher level of configuration and competes with an explicitly configured label-preference value at a lower level of configuration in the BGP hierarchy.

**Note:**

The preference value assigned by the **default-label-preference** command can always be overwritten by a route policy entry that accepts the route with a **preference** command in the action.

The **no** form of the command lets BGP route-table preference for labeled-unicast routes to be controlled by other means.

**Default**

no default-label-preference

**Parameters*****ebgp label preference***

Specifies the EBGP default preference label value.

**Values** 0 to 255

***ibgp label preference***

Specifies the IBGP default preference label value.

**Values** 0 to 255

## 8.71 default-msap-policy

### default-msap-policy

## Syntax

**default-msap-policy** *policy-name*

**no default-msap-policy**

## Context

[\[Tree\]](#) (config>service>vpls>sap default-msap-policy)

## Full Context

configure service vpls sap default-msap-policy

## Description

This command specifies the default managed SAP policy to use to create MSAPs when the response from the RADIUS server does not specify a managed SAP policy.

The *policy-name* parameter is only valid for a SAP with the keywords **capture-sap** specified in the SAP's configuration. The **capture-sap** keyword in the SAP configuration captures the SAP where triggering packets is sent to the CPM. Non-triggering packets captured by the capture SAP is dropped.

The managed SAP policy must already be defined in the **config>subscr-mgmt>msap-policy** context.

The **no** form of this command removes the policy-name from the configuration.

## Parameters

### *policy-name*

Specifies an existing default managed SAP policy.

## Platforms

All

## 8.72 default-pap-password

### default-pap-password

#### Syntax

**default-pap-password** *password* [**hash** | **hash2** | **custom**]

**no default-pap-password**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>ppp-policy default-pap-password)

#### Full Context

configure subscriber-mgmt ppp-policy default-pap-password

#### Description

This command configures the default PAP password for RADIUS authentication when the Password-Length=0 in the PAP Authenticate-Request.

RADIUS authentication cannot be initiated when the Password-Length=0 in the PAP Authenticate-Request and no default-pap-password is configured. The PPP session terminates in this case.

#### Parameters

##### *password*

Specifies a default PAP password up to 64 characters.

##### **hash**

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

##### **hash2**

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

##### **custom**

Specifies the custom encryption to management interface.

```
default-peer
```

### Syntax

```
[no] default-peer
```

### Context

[\[Tree\]](#) (config>aaa>diam>node>peer default-peer)

### Full Context

```
configure aaa diameter node peer default-peer
```

## Description

This command designates a peer as a default peer. Traffic that is destined to realms that are not associated with locally configured peers, is sent to the default-peer. In effect, the default peer becomes a default route for Diameter realms.

This command is mandatory in multi-chassis redundancy where the inter-chassis peer is designated as default peer. Then, the SR with no open connections towards agents or servers, forwards all traffic to the inter-peer which maintains, as part of MCS, open connections with agents and servers.

The **no** form of this command reverts to the default.

## Default

no default-peer

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

[\[Tree\]](#) (config>service>vprn>msdp>group>peer default-peer)

## Full Context

configure service vprn msdp peer default-peer

configure service vprn msdp group peer default-peer

## Description

Using the default peer mechanism, a peer can be selected as the default Multicast Source Discovery Protocol (MSDP) peer. As a result, all source-active messages from the peer will be accepted without the usual peer-reverse-path-forwarding (RPF) check.

The MSDP peer-RPF check is different from the normal multicast RPF checks. The peer-RPF check is used to stop source-active messages from looping. A router validates source-active messages originated from other routers in a deterministic fashion.

A set of rules is applied in order to validate received source-active messages, and the first rule that applies determines the peer-RPF neighbor. All source-active messages from other routers are rejected. The rules applied to source-active messages originating at Router S received at Router R from Router N are as follows:

- If Router N and router S are one and the same, then the message is originated by a direct peer-RPF neighbor and will be accepted.

- If Router N is a configured peer, or a member of the Router R mesh group then its source-active messages are accepted.
- If Router N is the Border Gateway Protocol (BGP) next hop of the active multicast RPF route toward Router S then Router N is the peer-RPF neighbor and its source-active messages are accepted.
- If Router N is an external BGP peer of Router R and the last autonomous system (AS) number in the BGP AS-path to Router S is the same as Router N's AS number, then Router N is the peer-RPF neighbor, and its source-active messages are accepted.
- If Router N uses the same next hop as the next hop to Router S, then Router N is the peer-RPF neighbor, and its source-active messages are accepted.
- If Router N fits none of the above rules, then Router N is not a peer-RPF neighbor, and its source-active messages are rejected.

## 8.77 default-priority

### default-priority

**Syntax**

**default-priority** {**high** | **low**}

**no default-priority**

**Context**

[\[Tree\]](#) (config>qos>sap-ingress default-priority)

**Full Context**

configure qos sap-ingress default-priority

**Description**

This command configures the default enqueueing priority for all packets received on an ingress SAP using this policy. To change the default priority for the policy, the **fc-name** must be defined whether it is being changed or not.

**Default**

default-priority low

**Parameters****high**

Setting the enqueueing parameter to **high** for a packet increases the likelihood of enqueueing the packet when the ingress queue is congested. Ingress enqueueing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueueing priority is lost.

**low**

Setting the enqueueing parameter to **low** for a packet decreases the likelihood of enqueueing the packet when the ingress queue is congested. Ingress enqueueing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueueing priority is lost.

configure service vprn bgp-ipvpn segment-routing-v6 default-route-tag

configure service vpls bgp-evpn segment-routing-v6 default-route-tag

configure service vpls bgp-evpn vxlan default-route-tag

## Description

This command configures a route tag that EVPN and IP-VPN use when sending a route to the BGP application (for the corresponding service and BGP instance). If the corresponding BGP EVPN instance is enabled, the command cannot be changed. Additionally, EVPN services can add tags to routes with **proxy-arp/nd>evpn-route-tag** or the route table tag (added using the import policy). Only one tag is passed from EVPN to the BGP for matching on export policies. In case of a conflict with other route tags pushed by EVPN, the default route tag has the least priority.

The following are examples of the conflict priority handling:

- If a service is configured with both **default-route-tag X** and **proxy-arp>evpn-route-tag Y**, EVPN uses route tag Y when sending EVPN proxy-arp routes to the BGP RIB for advertisement.
- If a given IP-prefix route is tagged in the route-table with tag A and the R-VPLS, in which the route is advertised, uses B as the **default-route-tag**, then EVPN keeps tag A when sending the route to the BGP RIB.

The **default-route-tag** configuration is only supported on EVPN and IP-VPN service routes. The route tag for ES and AD per-ES routes is always zero.

The **no** form of this command removes the **default-route-tag** (that is, it sets the route tag to zero).

## Default

no default-route-tag

## Parameters

### *tag*

Specifies the route tag.

**Values** 1 to 255

## Platforms

All

- configure service epipe bgp-evpn vxlan default-route-tag
  - configure service epipe bgp-evpn mpls default-route-tag
  - configure service vpls bgp-evpn vxlan default-route-tag

#### Full Context

configure qos fp-resource-policy aggregate-shapers queue-sets default-size

#### Description

Commands in this context configure the default queue-set size for individual object types.

#### Platforms

7750 SR-1, 7750 SR-s

## 8.88 default-tag

### default-tag

#### Syntax

**default-tag** *tag*

**no default-tag**

#### Context

[\[Tree\]](#) (config>aaa>route-downloader default-tag)

#### Full Context

configure aaa route-downloader default-tag

#### Description

This command sets the default tag that routes processed by the AAA route downloader will take.

#### Note:

Any route received with a specific tag retains the specific tag. The tag value is passed to the Route Table Manager and is available as match condition on the export statement of other routing protocols.

The **no** form of this command reverts to the default.

**Default**

default-tag 0

**Parameters****tag**

Specifies the default tag of the routes imported.

**Values** 0 to 4294967295

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.89 default-tunnel-endpoint-limit

### default-tunnel-endpoint-limit

**Syntax**

**default-tunnel-endpoint-limit** *default-endpoint*

**no default-tunnel-endpoint-limit**

**Context**

**[Tree]** (config>app-assure>group>gtp>gtp-fltr>gtp-tunnel-database default-tunnel-endpoint-limit)

**Full Context**

configure application-assurance group gtp gtp-filter gtp-tunnel-database default-tunnel-endpoint-limit

**Description**

This command configures the maximum number of GTP endpoints requested in GTP-C messages by using, for example, the PDP Context Create message type.

The **validate-gtp-tunnels** command must be enabled before using this command.

The **no** form of this command sets the limit to 4294967295 (the maximum number of GTP endpoints supported by AA FW minus one).

**Default**

no default-tunnel-endpoint-limit

**Parameters****default-endpoint**

Specifies the limit.

**Values** 1 to 4294967295

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.90 default-tunnel-template

### default-tunnel-template

#### Syntax

**default-tunnel-template** *ipsec-template-identifier*

**no default-tunnel-template**

#### Context

**[Tree]** (config>service>ies>if>sap>ipsec-gateway default-tunnel-template)

**[Tree]** (config>service>vprn>if>sap>ipsec-gateway default-tunnel-template)

#### Full Context

configure service ies interface sap ipsec-gateway default-tunnel-template

configure service vprn interface sap ipsec-gateway default-tunnel-template

#### Description

This command configures a default tunnel policy template for the gateway.

## 8.91 default-user-name

### default-user-name

#### Syntax

**default-user-name** *ppp-username*

**no default-user-name**

#### Context

**[Tree]** (config>subscr-mgmt>ppp-policy default-user-name)

#### Full Context

configure subscriber-mgmt ppp-policy default-user-name

## Description

This command configures the default username for authentication when not provided in PAP/CHAP authentication (no Name field in CHAP Response message or Peer-Id-Length=0 in PAP Authenticate-Request).

The PPP session terminates when no username is provided in PAP/CHAP authentication and no default-user-name is configured.

## Parameters

### *ppp-username*

Specifies a default username up to 253 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.92 default-value

### default-value

## Syntax

**default-value** *value-name*

**no default-value**

## Context

[\[Tree\]](#) (config>app-assure>group>policy>aso>char default-value)

## Full Context

configure application-assurance group policy app-service-options characteristic default-value

## Description

This command assigns one of the characteristic values as default.

When a default value is specified, app-profile entries that do not explicitly include this characteristic inherit the default value and use it as part of the AQP match criteria based on that app-profile.

A default-value is required for each characteristic. This is evaluated at commit time.

The **no** form of this command removes the default value for the characteristic.

## Parameters

### *value-name*

Specifies the name of an existing characteristic value.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.93 defaults

### defaults

#### Syntax

**defaults**

#### Context

[\[Tree\]](#) (config>router>dhcp6>server defaults)

#### Full Context

configure router dhcp6 local-dhcp-server defaults

#### Description

Commands in this context configure server default timer and option parameters. These can be overridden on a per-pool and per-prefix basis.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### defaults

#### Syntax

**defaults**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>gtp>apn-policy>apn defaults)

#### Full Context

configure subscriber-mgmt gtp apn-policy apn defaults

#### Description

Commands in this context configure default parameters for the GTP connection that can be used when the parameters are not returned in authentication.

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.94 delay

delay

### Syntax

delay

### Context

[\[Tree\]](#) (config>router>if>if-attribute delay)

### Full Context

configure router interface if-attribute delay

### Description

Commands in this context configure or apply delay interface attributes such as static delay.

### Platforms

delay

### Syntax

delay *interval*

### Context

[\[Tree\]](#) (config>system>management-interface>cli>md-cli>environment>progress-indicator delay)

### Full Context

configure system management-interface cli md-cli environment progress-indicator delay

### Description

This command sets the delay before the progress indicator is displayed in the MD-CLI.

### Default

delay 500

### Parameters

*interval*

Specifies the delay interval, in milliseconds.

**Values** 1 to 10000

## Platforms

All

## delay

## Syntax

**delay** *delay-measurement-type*

## Context

[\[Tree\]](#) (config>test-oam>link-meas>template delay)

## Full Context

configure test-oam link-measurement measurement-template delay

## Description

This command configures the type of delay measurement statistic used in both the sample window and aggregate sample window.

The **no** form of this command reverts to the default value.

## Default

delay min

## Parameters

### *delay-measurement-type*

Specifies the type of delay measurement that is used for comparison and reporting.

- Values**
- min** — Keyword to take the minimum of a series of measurements for comparison and reporting.
  - max** — Keyword to take the maximum of a series of measurements for comparison and reporting.
  - avg** — Keyword to compute the average of a series of measurements for comparison and reporting.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 8.95 delay-event

## delay-event

### Syntax

**delay-event** {**forward** | **backward** | **round-trip**} **lowest-bin** *bin-number* **threshold***raise-threshold* [**clear** *clear-threshold*]

**no delay-event** {**forward** | **backward** | **round-trip**}

### Context

**[Tree]** (config>oam-pm>bin-group>bin-type delay-event)

### Full Context

configure oam-pm bin-group bin-type delay-event

### Description

This command sets the bin number, the threshold and the direction that is monitored to determine if a delay metric threshold crossing event has occurred or has cleared. It requires a bin number, a rising threshold value and a direction. If the *clear-threshold* value is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and without regard to any previous window. When a raise threshold is reached, the log event is generated. Each unique threshold can only be raised once for the threshold within measurement interval. If the optional clear threshold is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to following measurement intervals. If a threshold crossing event is raised another is not raised until a measurement interval completes, and the clear threshold has not been exceeded. A clear event is raised under that condition. In general, alarms are generated when there is a state change. The thresholds configured are applied to the count in specified bin and all higher number bins.

The **no** form of this command removes thresholding for this delay metric. The complete command must be configured in order to remove the specific threshold.

### Parameters

#### **forward**

Specifies the threshold is applied to the forward direction bin.

#### **backward**

Specifies the threshold is applied to the backward direction bin.

#### **round-trip**

Specifies the threshold is applied to the roundtrip direction bin.

#### ***bin-number***

Specifies the number of the bin that the threshold is applied to. This bin and all higher bins are monitored to determine if the sum total results in these bins have reached or crossed the configured threshold.

**Values** 0 to 9

#### ***raise-threshold***

Specifies the rising numerical value in the range that determines when the event is to be generated, when value reached.

**Values** 1 to 864000

### ***clear-threshold***

Specifies an optional numerical value in the range threshold used to indicate stateful behavior that allows the operator to configure a lower value than the rising threshold that determines when the clear event should be generated. Clear is generated when the end of measurement interval count is less than or equal to the configured value. If this option is not configured the behavior is stateless. Zero means no results can exist in the lower bin or any higher.

**Values** 0 to 863999

**Default** Clear threshold disabled

### **Platforms**

All

## 8.96 delay-event-exclusion

### delay-event-exclusion

#### **Syntax**

**delay-event-exclusion** {**forward** | **backward** | **round-trip**} **lowest-bin** *bin-number*  
**no delay-event-exclusion** {**forward** | **backward** | **round-trip**}

#### **Context**

[\[Tree\]](#) (config>oam-pm>bin-group>bin-type delay-event-exclusion)

#### **Full Context**

configure oam-pm bin-group bin-type delay-event-exclusion

#### **Description**

This optional command allows results from probes that map to the specified bin and higher bins to be excluded from the TCA count. The TCA count is used to determine if a threshold has been reached by the event monitoring function. Individual counters are incremented in the bin, but the counts in the specified bin and higher bins are not included in the TCA threshold computation. A **delay-event** must be configured in the same direction, and the **lowest-bin** configured as part of the **delay-event-exclusion** command must be higher than the lowest bin specified by the corresponding **delay-event** command.

The bin group allows this optional command to be added, modified, or deleted while tests are actively referencing the bin group. The bin group does not need to be shut down during **delay-event-exclusion** configuration. If the values are modified while the active tests are executing, all configured TCAs for the specified direction within the bin group enters a pending (p) state until the start of the next measurement interval. Any existing stateful TCAs that were raised are cleared without creating a log event, and no further

processing for the affected TCAs occur in the active window. Depending on timing, the pending state may continue past the adjacent measurement interval until the start of the following measurement interval.

The **no** form of this command does not exclude any values from the configured TCA threshold.

### Default

no delay-event-exclusion forward

no delay-event-exclusion backward

no delay-event-exclusion round-trip

### Parameters

#### **forward**

Specifies the forward direction bin.

#### **backward**

Specifies the backward direction bin.

#### **round-trip**

Specifies the round-trip direction bin.

#### ***bin-number***

Specifies the number of the lowest bin that the exclusion is applied to. This bin and all higher bins are excluded from the **delay-event** (TCA) count. If no bin numbers are configured, this command is ignored.

**Values** 1 to 9

### Platforms

All

## 8.97 delay-events

### delay-events

#### Syntax

[no] delay-events

#### Context

[\[Tree\]](#) (config>oam-pm>session>measurement-interval>event-mon delay-events)

#### Full Context

configure oam-pm session measurement-interval event-mon delay-events

## Description

This enables the monitoring of all configured delay events. Adding this functionality starts the monitoring of the configured delay events at the start of the next measurement interval. If the function is removed using the **no** command, all monitoring of configured delay events, logging, and recording of new events for that session are suspended. Any existing events at the time of the shut down are maintained until the active measurement window in which the removal was performed has completed. The state of this monitoring function can be changed without having to shutdown all the tests in the session.

The **no** form of this command disables the monitoring of all configured delay events.

## 8.98 delay-on-boot

### delay-on-boot

#### Syntax

**delay-on-boot** *delay*

**no delay-on-boot**

#### Context

[\[Tree\]](#) (config>system>grpc delay-on-boot)

#### Full Context

configure system grpc delay-on-boot

#### Description

This command configures the delay timer for gRPC connections. When the timer expires, gRPC becomes operational and connections are accepted. This delay prevents automation from managing the system while it is still converging. This delay prevents automation from managing the system while it is still converging.

The **no** form of this command specifies that connections are accepted after the system boots and gRPC becomes operational.

#### Default

no delay-on-boot

#### Parameters

***delay***

Specifies the delay, in seconds.

**Values** 1 to 3600

#### Platforms

All

## delay-on-boot

## Full Context

configure system telemetry persistent-subscriptions delay-on-boot

## Description

This command configures the delay timer for gRPC telemetry persistent subscriptions. When the timer expires, gRPC telemetry persistent subscriptions become operational and connections are initiated. This delay prevents the system from trying to establish gRPC persistent subscriptions while it is still converging.

The **no** form of this command specifies that gRPC telemetry persistent subscriptions are initiated after the system boots and gRPC is operational.

## Default

no delay-on-boot

## Parameters

### *delay*

Specifies the delay, in seconds.

**Values** 1 to 3600

## Platforms

All

## 8.99 delay-selection

### delay-selection

#### Syntax

**delay-selection** {static | dynamic | static-preferred | dynamic-preferred}

**no delay-selection**

#### Context

[\[Tree\]](#) (config>router>if>if-attr>delay delay-selection)

#### Full Context

configure router interface if-attribute delay delay-selection

#### Description

This command selects the delay source to be advertised by the IGP for this interface.

The **no** form of this command reverts to the default value.

#### Default

delay-selection static-preferred

#### Parameters

##### static

Keyword to use only statically configured delay and ignore dynamic delay measurements generated by **link-measurement**.

##### dynamic

Keyword to use only dynamic delay measurements generated by **link-measurement** and ignore statically configured delay.

##### static-preferred

Keyword to prefer the configured static delay over the dynamic delay. If static delay is not configured, the delay reported using **link-measurement** is used.

##### dynamic-preferred

Keyword to prefer the dynamic reported delay over the statically configured delay. If no dynamic delay has been reported using **link-measurement**, the statically configured delay is used.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 8.100 delay-start-time

### delay-start-time

#### Syntax

**delay-start-time** *delay*

**no delay-start-time**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy delay-start-time)

#### Full Context

configure subscriber-mgmt radius-accounting-policy delay-start-time

#### Description

It is recommended to only use this command when **session-accounting** is used. By default, a dual stack subscriber generates a RADIUS accounting interim message for each new host update (IPv4, IPv6 WAN, and IPv6 PD). This command delays the trigger of a RADIUS accounting start message and allows all hosts to connect first. When the delay timer expires, a single RADIUS accounting start message containing all the host currently connected to the BNG is sent to the server. Subsequent host connections will trigger interim-updates if host-update is enabled on session-accounting. For all other accounting modes, this command will delay the trigger of an accounting start when a host connects.

The **no** form of this command reverts to the default.

#### Default

no delay-start-time

#### Parameters

*delay*

Specifies the accounting start delay, in seconds.

**Values** 1 to 10

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.101 delay-template

## delay-template

### Syntax

**delay-template** *delay-template-name*

**no delay-template**

### Context

[\[Tree\]](#) (config>oam-pm>session>ethernet>dmm delay-template)

### Full Context

configure oam-pm session ethernet dmm delay-template

### Description

This command specifies a reference to a **config>oam-pm>streaming delay-template** for the Ethernet DMM test. It is possible to include a delay template reference that is not configured under **config>oam-pm>streaming**. In this case, the streaming of the results is not in effect. Refer to the **config>oam-pm>streaming delay-template** command for session to template interaction behaviors.

The **no** form of this command deletes the delay template from the test.

### Default

no delay-template

### Parameters

***delay-template-name***

Specifies the delay template name, up to 64 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## delay-template

### Syntax

**delay-template** *delay-template-name*

**no delay-template**

### Context

[\[Tree\]](#) (config>oam-pm>session>ip>twamp-light delay-template)

### Full Context

configure oam-pm session ip twamp-light delay-template

## Description

This command specifies a reference to a **config>oam-pm>streaming delay-template** for the IP TWAMP LIGHT test. It is possible to include a delay template reference that is not configured under **config>oam-pm>streaming**. In this case, streaming of results are not in effect. Refer to the **config>oam-pm>streaming delay-template** command for session to template interaction behaviors.

The **no** form of this command deletes the delay template from the test.

## Default

no delay-template

## Parameters

### *delay-template-name*

Specifies the delay template name, up to 64 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## delay-template

## Syntax

**delay-template** *delay-template-name*

**no delay-template**

## Context

[\[Tree\]](#) (config>oam-pm>session>mpls>dm delay-template)

## Full Context

configure oam-pm session mpls dm delay-template

## Description

This command specifies a reference to a **config>oam-pm>streaming delay-template** for the MPLS DM test. It is possible to include a delay template reference that is not configured under **config>oam-pm>streaming**. In this case, streaming of results are not in effect. Refer to the **config>oam-pm>streaming delay-template** command for session to template interaction behaviors.

The **no** form of this command deletes the delay template from the test.

## Default

no delay-template

## Parameters

### *delay-template-name*

Specifies the delay template name, up to 64 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## delay-template

### Syntax

**delay-template** *template-name* [**create**]

**no delay-template** *template-name*

### Context

[\[Tree\]](#) (config>oam-pm>streaming delay-template)

### Full Context

configure oam-pm streaming delay-template

### Description

This command specifies a template for streaming delay metrics that can be referenced under the **oam-pm>session** technology delay style test.

The **delay-template** must be configured under the technology delay test **oam-pm>session** to allow the delay specific test to stream results using the configured template attributes.

The **no** form of this command deletes the specified delay template.

### Parameters

#### *template-name*

Specifies the template name, up to 64 characters.

#### **create**

Creates the template.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 8.102 delay-threshold

## delay-threshold

### Syntax

**delay-threshold** *microseconds*

**no delay-threshold**

## Context

**[Tree]** (config>test-oam>sath>accept-crit-tmpl delay-threshold)

## Full Context

configure test-oam service-activation-testhead acceptance-criteria-template delay-threshold

## Description

This command configures a delay value that is compared to the measured delay at the end of the test to declare the test result. If the measured value is greater than the configured value, the test fails; otherwise, it passes. A measured delay value of zero also causes the test to fail.

The **no** form of this command disables the comparison and ignores the threshold value when declaring the test result.

## Default

no delay-threshold

## Parameters

### *microseconds*

Specifies the delay value, in microseconds, to compare with the measured value.

**Values** 1 to 100000000

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 8.103 delay-var-threshold

delay-var-threshold

## Syntax

**delay-var-threshold** *microseconds*

**no delay-var-threshold**

## Context

**[Tree]** (config>test-oam>sath>accept-crit-tmpl delay-var-threshold)

## Full Context

configure test-oam service-activation-testhead acceptance-criteria-template delay-var-threshold

## Description

This command configures a delay variation value that is compared to the measured delay variation at the end of the test to declare the test result. If the measured value is greater than the configured value, the test fails; otherwise, it passes.

The **no** form of this command disables the comparison ignores the threshold value when declaring the test result.

## Default

no delay-var-threshold

## Parameters

### *microseconds*

Specifies the delay variation value, in microseconds, to compare with the measured value.

**Values** 1 to 100000000

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 8.104 delegated-ipv6-prefix

delegated-ipv6-prefix

## Syntax

[no] delegated-ipv6-prefix

## Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>include-radius-attribute delegated-ipv6-prefix)

## Full Context

configure subscriber-mgmt radius-accounting-policy include-radius-attribute delegated-ipv6-prefix

## Description

This command enables the generation of the **delegated-ipv6-prefix** RADIUS attribute.

The **no** form of this command disables the generation of the **delegated-ipv6-prefix** RADIUS attribute.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.105 delegated-prefix-length

### delegated-prefix-length

#### Syntax

**delegated-prefix-length** [**minimum** *prefix-length*] [**maximum** *prefix-length*]

**no delegated-prefix-length**

#### Context

**[Tree]** (config>service>vprn>dhcp6>server>pool delegated-prefix-length)

**[Tree]** (config>router>dhcp6>server>pool delegated-prefix-length)

#### Full Context

configure service vprn dhcp6 local-dhcp-server pool delegated-prefix-length

configure router dhcp6 local-dhcp-server pool delegated-prefix-length

#### Description

This command configures the delegated prefix length that is used if the DHCPv6 client does not specify a prefix length hint.

The DHCPv6 client prefix length hint is limited by the range specified by the **minimum** and **maximum** parameters. If the hint is smaller than the minimum, the allocated prefix length is equal to the minimum length. If the hint is larger than the maximum, the allocated prefix length is equal to the maximum length.

The **no** form of this command reverts to the default.

#### Default

delegated-prefix-length 64 minimum 48 maximum 64

#### Parameters

##### *prefix-length*

Specifies the minimum or maximum allowed prefix length, in bits.

**Values** 48 to 127

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### delegated-prefix-length

#### Syntax

**delegated-prefix-length** *bits*

**delegated-prefix-length** *variable*

## no delegated-prefix-length

### Context

[\[Tree\]](#) (config>service>vprn>sub-if>ipv6 delegated-prefix-length)

[\[Tree\]](#) (config>service>ies>sub-if>ipv6 delegated-prefix-length)

### Full Context

configure service vprn subscriber-interface ipv6 delegated-prefix-length

configure service ies subscriber-interface ipv6 delegated-prefix-length

### Description

This command configures the subscriber interface level setting for delegated prefix length. The delegated prefix length for a subscriber- interface can be either set to a fixed value that is explicitly configured under the subscriber interface CLI hierarchy or a variable value that can be obtained from various sources. This command can be changed only when no IPv6 prefixes are configured under the **subscriber-interface** context.

The **no** form of this command reverts to the default.

### Default

no delegated-prefix-length (the delegated prefix length is 64)

### Parameters

#### *bits*

Specifies the delegated prefix length in bits. This value is applicable to the entire subscriber interface. In case that the delegated prefix length is also supplied via other means (LUDB, RADIUS or DHCP Server), such supplied value must match the value configured under the **subscriber-interface** context. Otherwise, the prefix instantiation in the router fails.

**Values** 48 to 64

#### *variable*

Specifies that the delegated prefix value can be of any length between 48 to 64. The value itself can vary between the prefixes and is provided at the time of prefix instantiation. The order of priority for the source of the delegated prefix length is:

- LUDB
- RADIUS
- DHCPv6 server

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.106 delete

### delete

#### Syntax

**delete** *file-url* [**force**] [**no-redirect**] [**client-tls-profile** *profile*] [**proxy** *proxy-url*]

#### Context

**[Tree]** (file delete)

#### Full Context

file delete

#### Description

This command deletes the specified file.

The optional wildcard (\*) can be used to delete multiple files that share a common (partial) prefix and/or (partial) suffix. When the wildcard is entered, the following prompt displays for each file that matches the wildcard:

"Delete file <filename> (y/n)?"

#### Parameters

##### *file-url*

Specifies the file name to delete.

##### Values

|                     |                                                                                                                                                                                         |

*cf1ash-id* cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

**force**

Forces an immediate deletion of the specified file(s). The command **file delete \* force** deletes all the wildcard matching files without displaying a user prompt message. This command also automatically accepts HTTP redirects unless overridden by the **no-redirect** parameter.

**profile**

Specifies the TLS client profile configured under **config>system>security>tls>client-tls-profile** to use.

**proxy-url**

Specifies the URL of an HTTP proxy. For example, `http://proxy.mydomain.com:8000`. This URL must be an HTTP URL and not an HTTPS URL.

**no-redirect**

Specifies to automatically refuse any HTTP redirects without prompting the user.

**Platforms**

All

**delete****Syntax**

**delete** [*line*]

**Context**

[\[Tree\]](#) (candidate delete)

**Full Context**

candidate delete

**Description**

This command deletes the selected CLI node (which includes all sub-branches). The deleted lines are also copied into a temporary buffer that can be used for a subsequent insert.

**Parameters****line**

Indicates which line to delete.

**Values**

line, offset, **first**, **edit-point**, **last**

line

absolute line number

|                   |                                                                      |
|-------------------|----------------------------------------------------------------------|
| <b>offset</b>     | relative line number to current edit point. Prefixed with '+' or '-' |
| <b>first</b>      | keyword - first line                                                 |
| <b>edit-point</b> | keyword - current edit point                                         |
| <b>last</b>       | keyword - last line that is not 'exit'                               |

## Platforms

All

## delete

### Syntax

**delete** [*checkpoint-id* | **rescue** | **latest-rb**]

### Context

[\[Tree\]](#) (admin>rollback delete)

### Full Context

admin rollback delete

### Description

This command deletes a rollback checkpoint and causes the suffixes to be adjusted (decremented) for all checkpoints older than the one that was deleted (to close the hole in the list of checkpoint files and create room to create another checkpoint).

If **config redundancy rollback-sync** is enabled, a rollback delete will also delete the equivalent checkpoint on the standby CF and shuffle the suffixes on the standby CF.

It is not advised to manually delete a rollback checkpoint (for example, using a **file delete** command). If a rollback checkpoint file is manually deleted without using the **admin rollback delete** command then the suffixes of the checkpoint files are not shuffled, nor is the equivalent checkpoint file deleted from the standby CF. This manual deletion creates a hole in the checkpoint file list until enough new checkpoints have been created to roll the hole off the end of the list.

### Parameters

#### *checkpoint-id*

An ID indicating a specific rollback checkpoint. A checkpoint-id of 1 indicates the rollback checkpoint file (at the configured rollback location) with \*.rb.1 as the suffix, 2 for file \*.rb.2, and so on.

**Values** 1 to 9

#### **latest-rb**

Specifies the most recently created rollback checkpoint (corresponds to the file-url.rb rollback checkpoint file).

**rescue**

Deletes the rescue checkpoint. No checkpoint suffix numbers are changed.

**Platforms**

All

## 8.107 delete-config

### delete-config

**Syntax**

[no] delete-config

**Context**

[\[Tree\]](#) (configure>system>security>profile>netconf>base-op-authorization delete-config)

**Full Context**

configure system security profile netconf base-op-authorization delete-config

**Description**

This command enables the NETCONF delete-config operation.

The **no** form of this command disables the operation.

**Default**

no delete-config

**Note:**

The operation is enabled by default in the built-in system-generated administrative profile.

**Platforms**

## 8.108 delete-pending

## delete-pending

### Syntax

[no] delete-pending

### Context

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>ue-query>state delete-pending)

### Full Context

configure subscriber-mgmt wlan-gw ue-query state delete-pending

### Description

This command enables matching on UEs that are in a delete-pending state.

The **no** form of this command disables matching on UEs in a delete pending-state, unless all state matching is disabled.

### Default

no delete-pending

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.109 delivery-service

## delivery-service

### Syntax

**delivery-service** *service-id*

**delivery-service name** *service-name*

**no delivery-service**

### Context

[\[Tree\]](#) (config>service>vprn>if>sap>ip-tunnel delivery-service)

[\[Tree\]](#) (config>service>ies>if>sap>ip-tunnel delivery-service)

### Full Context

configure service vprn interface sap ip-tunnel delivery-service

configure service ies interface sap ip-tunnel delivery-service

## Description

This command sets the delivery service for GRE encapsulated packets associated with a particular GRE tunnel. This is the IES or VPRN service where the GRE encapsulated packets are injected and terminated. The delivery service may be the same service that owns the private tunnel SAP associated with the GRE tunnel. The GRE tunnel does not come up until a valid delivery service is configured.

The **no** form of this command deletes the delivery-service from the GRE tunnel configuration.

## Parameters

### *service-id*

Identifies the service used to originate and terminate the GRE encapsulated packets belonging to the GRE tunnel.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **delivery-service name** *service-name* variant can be used in all configuration modes.

**Values** {*id* | *svc-name*}

*id*: 1 to 2147483647

*svc-name*: up to 64 characters (*svc-name* is an alias for input only. The *svc-name* gets replaced with an id automatically by SR OS in the configuration).

### *service-name*

Identifies the service used to originate and terminate the GRE encapsulated packets belonging to the GRE tunnel.

**Values** 1 to 64 characters

## Platforms

All

## 8.110 delta-consumed-agg-rate

delta-consumed-agg-rate

### Syntax

**delta-consumed-agg-rate percent** *percent-of-delta-consumed-agg-rate*

**no delta-consumed-agg-rate**

### Context

[\[Tree\]](#) (config>qos>adv-config-policy>child-control>bandwidth-distribution>above-offered-allowance delta-consumed-agg-rate)

## Full Context

configure qos adv-config-policy child-control bandwidth-distribution above-offered-allowance delta-consumed-agg-rate

## Description

This command configures the percentage of the delta (from the beginning to the end of the current H-QoS below CIR or above CIR pass) of the aggregate rate consumed by its other members that can be given to a queue at the end of an H-QoS below CIR pass and above CIR pass. This command is only applicable when the port scheduler is configured to use the **above-offered-allowance-control** algorithm, otherwise it is ignored.

The **no** form of this command reverts the **delta-consumed-agg-rate percent** to its default value.

## Default

delta-consumed-agg-rate 20.00

## Parameters

### *percent-of-delta-consumed-agg-rate*

Specifies the percentage of the delta (over the current H-QoS below CIR or above CIR pass) consumed aggregate rate that can be given to a queue.

**Values** 0.00 to 100.00

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 8.111 delta-consumed-higher-tier-rate

delta-consumed-higher-tier-rate

## Syntax

**delta-consumed-higher-tier-rate percent** *percent-of-delta-consumed-high-tier-rate*

**no delta-consumed-higher-tier-rate**

## Context

**[Tree]** (config>qos>adv-config-policy>child-control>bandwidth-distribution>above-offered-allowance delta-consumed-higher-tier-rate)

## Full Context

configure qos adv-config-policy child-control bandwidth-distribution above-offered-allowance delta-consumed-higher-tier-rate

## Description

This command configures the percentage of the delta (from the beginning to the end of the current H-QoS below CIR or above CIR pass) of the higher tier rate consumed by its other members that can be given to a queue at the end of an H-QoS below CIR pass and above CIR pass. Higher tier refers to the Vport aggregate rate and port scheduler level, group, and maximum rates.

This command is only applicable when the port scheduler is configured to use the **above-offered-allowance-control** algorithm, otherwise it is ignored.

The **no** form of this command reverts the **delta-consumed-higher-tier-rate percent** to its default value.

## Default

delta-consumed-higher-tier-rate 5.00

## Parameters

### *percent-of-delta-consumed-high-tier-rate*

Specifies the percentage of the delta (over the current H-QoS below CIR or above CIR pass) consumed higher tier rate that can be given to a queue.

**Values** 0.00 to 100.00

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 8.112 delta-in-use-limit

### delta-in-use-limit

## Syntax

**delta-in-use-limit** *limit*

**no delta-in-use-limit**

## Context

[\[Tree\]](#) (config>vrrp>policy delta-in-use-limit)

## Full Context

configure vrrp policy delta-in-use-limit

## Description

This command sets a lower limit on the virtual router in-use priority that can be derived from the delta priority control events.

Each *vrrp-priority-id* places limits on the delta priority control events to define the in-use priority of the virtual router instance. Setting this limit prevents the sum of the delta priority events from lowering the in-use priority value of the associated virtual router instances below the configured value.

The limit has no effect on explicit priority control events. Explicit priority control events are controlled by setting the in-use priority to any value between 1 and 254.

Only non-owner virtual router instances can be associated with VRRP priority control policies and their priority control events.

Once the total sum of all delta events is calculated and subtracted from the base **priority** of the virtual router instance, the result is compared to the **delta-in-use-limit** value. If the result is less than the limit, the **delta-in-use-limit** value is used as the virtual router in-use priority value. If an explicit priority control event overrides the delta priority control events, the **delta-in-use-limit** has no effect.

Setting the limit to a higher value than the default of 1 limits the effect of the delta priority control events on the virtual router instance base **priority** value. This allows for multiple priority control events while minimizing the overall effect on the in-use priority.

Changing the *in-use-priority-limit* causes an immediate re-evaluation of the in-use priority values for all virtual router instances associated with this *vrrp-policy-id* based on the current sum of all active delta control policy events.

The **no** form of the command reverts to the default value.

### Default

delta-in-use-limit 1 — Specifies the lower limit of 1 for the in-use priority, as modified, by delta priority control events.

### Parameters

#### *limit*

Specifies the lower limit of the in-use priority base, as modified by priority control policies. The *in-use-priority-limit* has the same range as the non-owner virtual router instance base-priority parameter. If the result of the total delta priority control events minus the virtual router instances base-priority, is less than the *in-use-priority-limit*, the *in-use-priority-limit* value is used as the virtual router instances in-use priority value.

Setting the *in-use-priority-limit* to a value equal to or larger than the virtual router instance *base-priority* prevents the delta priority control events from having any effect on the virtual router instance in-use priority value.

**Values** 1 to 254

### Platforms

All

## 8.113 dent-threshold

dent-threshold

### Syntax

dent-threshold *threshold*

**no dent-threshold****Context**

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if>hd dent-threshold)

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if>sd dent-threshold)

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if>pip dent-threshold)

**Full Context**

configure mcast-management multicast-info-policy video-policy video-interface hd dent-threshold

configure mcast-management multicast-info-policy video-policy video-interface sd dent-threshold

configure mcast-management multicast-info-policy video-policy video-interface pip dent-threshold

**Description**

This command sets the threshold value below which the FCC server will dent/drop unicast data sent to the FCC client during a fast channel change. Within the RTP extension header, the packet priority (PRI) (2 bits) and the fine-grained priority (FPRI) (3 bits) indicate the "importance" of the frame as to how essential it is to the video stream.

This parameter is only applicable if the FCC server mode is **dent**.

The **no** form of the command returns the parameter to the default value.

**Default**

dent-threshold 16 (only B frames are dropped)

**Parameters*****threshold***

Specifies the threshold value is used by the FCC server to compare with the concatenation of the PRI and FPRI to determine whether to send the packet to the FCC client. If the PRI and FPRI expressed as a decimal integer is greater than or equal to the threshold value, the packet will be sent.

**Values** 1 to 31

**Platforms**

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 8.114 deny-list

**deny-list****Syntax**

**[no] deny-list** *deny-list-name*

## Context

[\[Tree\]](#) (config>app-assure>group>url-filter>local-filtering deny-list)

## Full Context

configure application-assurance group url-filter local-filtering deny-list

## Description

This command adds a **deny-list** URL list to the local URL filter policy.

The **no** form of this command removes the URL list object.

## Default

no deny-list

## Parameters

### *deny-list-name*

Specifies the URL list name.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.115 depleted-event

### depleted-event

## Syntax

[no] depleted-event

## Context

[\[Tree\]](#) (config>router>dhcp6>server>pool>prefix>thresholds>minimum-free depleted-event)

[\[Tree\]](#) (config>service>vprn>dhcp6>server>pool>prefix>thresholds>minimum-free depleted-event)

## Full Context

configure router dhcp6 local-dhcp-server pool prefix thresholds minimum-free depleted-event

configure service vprn dhcp6 local-dhcp-server pool prefix thresholds minimum-free depleted-event

## Description

This command enables the system to send out a warning when the prefix with a configured length is no longer available in the provisioned prefix.

For example, if the prefix 2001:0:0:ffe0::/50 is created at the pool level using the **pd** and **wan-host** parameters, and the threshold for the prefix length is 64, configuring this command enables the system to send out a warning when there is no available /64 that can be allocated out of 2001:0:0:ffe0::/50.

The **no** form of this command disables the warnings.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**[Tree]** (config>service>vprn>dhcp6>server>pool>thresholds>minimum-free depleted-event)

### Full Context

configure router dhcp6 local-dhcp-server pool thresholds minimum-free depleted-event

configure service vprn dhcp6 local-dhcp-server pool thresholds minimum-free depleted-event

### Description

This command enables the system to send out warnings when the prefix with the configured length is no longer available in the pool.

The **no** form of this command disables the warnings.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.116 derived-id

## derived-id

### Syntax

**derived-id** *derived-id-string*

**no derived-id**

### Context

**[Tree]** (config>subscr-mgmt>loc-user-db>ppp>host>host-ident derived-id)

**[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident derived-id)

### Full Context

configure subscriber-mgmt local-user-db ppp host host-identification derived-id

configure subscriber-mgmt local-user-db ipoe host host-identification derived-id

### Description

This command configures an ASCII string that uniquely identifies a host and is derived by a Python script from packet content available during a DHCP transaction or PPPoE session establishment.

#### Note:

This command is only used when **derived-id** is configured as one of the **match-list** parameters.

The **no** form of this command removes the derived-id from the configuration.

### Parameters

#### *derived-id-string*

Specifies the host ID to be derived by a python script from DHCP or PPPoE packets, up to 255 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.117 description

### description

### Syntax

**description** *tiny-description-string*

**no description**

### Context

[\[Tree\]](#) (config>ipsec>static-sa description)

### Full Context

configure ipsec static-sa description

### Description

This command configures a text description that is stored in the configuration file. The text string is associated with a configuration context to identify the content in the configuration file.

The **no** form of this command removes the string from the configuration.

### Parameters

#### *tiny-description-string*

Specifies the description character string. Allowed values are any string, up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special

characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

## Platforms

### Description

This command configures a text description that is stored in the configuration file. The text string is associated with a configuration context to identify the content in the configuration file.

The **no** form of this command removes the string from the configuration.

### Default

no description

## Parameters

### *short-description-string*

Specifies the description entered as a character string up to 80 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

## Description

This command configures a text description that is stored in the configuration file. The text string is associated with a configuration context to identify the content in the configuration file.

The **no** form of this command removes the string from the configuration.

## Parameters

### *short-description-string*

Specifies the description character string. Allowed values are any string, up to 80 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

## Platforms

All

- configure qos network egress ip-criteria entry description
- configure service vpls mesh-sdp description
- configure qos network ingress ipv6-criteria entry description
- configure service vprn gsmp group neighbor description

## Description

This command configures a text description that is stored in the configuration file. The text string is associated with a configuration context to identify the content in the configuration file.

The **no** form of this command removes the string from the configuration.

## Default

No description is associated with the configuration context.

## Parameters

### ***short-description-string***

Specifies the description character string. Allowed values are any string, up to 80 characters long composed of printable, 7-bit ASCII characters. If the string contains special

characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

## Platforms

All

### Context

[\[Tree\]](#) (config>system>alarm-contact-input description)

### Full Context

configure system alarm-contact-input description

### Description

This command configures a text description of an alarm contact input pin. The description is stored in the CLI configuration file. It indicates the usage or attribute of the pin, and helps the user to identify the purpose of the pin. The description is included in the log event when the pin changes state.

The **no** form of this command reverts the description string to the default.

### Parameters

***description-string***

Specifies a printable character string, up to 80 characters.

**Default** "Pin x", where x is the alarm contact input pin number.

### Platforms

7750 SR-a

## 8.118 designated-role

## designated-role

### Syntax

**designated-role** {**standby** | **active**}

**no designated-role**

### Context

[\[Tree\]](#) (config>redundancy>multi-chassis>ipsec-domain designated-role)

### Full Context

configure redundancy multi-chassis ipsec-domain designated-role

## Description

This command sets the designated role for the tunnel group in the IPsec domain.  
The **no** form of this command reverts to the default value.

## Default

designated-role standby

## Parameters

### standby

Sets the designated role to standby.

### active

Sets the designated role to active.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.119 dest-class

### dest-class

## Syntax

**dest-class** *dest-class*

**no dest-class**

## Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>default-action dest-class)

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry dest-class)

## Full Context

configure router policy-options policy-statement default-action dest-class

configure router policy-options policy-statement entry dest-class

## Description

This command specifies the policy accounting destination class index to associate with matched routes.

## Default

no dest-class

## Parameters

***dest-class***

Specifies the destination class.

**Values** 1 to 255

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

- configure router policy-options policy-statement default-action dest-class
- All
- configure router policy-options policy-statement entry dest-class

## 8.120 dest-global-id

### dest-global-id

#### Syntax

**dest-global-id** *dest-global-id*

**no dest-global-id**

#### Context

[\[Tree\]](#) (config>router>mpls>lsp dest-global-id)

#### Full Context

configure router mpls lsp dest-global-id

#### Description

This optional command configures the MPLS-TP Global ID of the far end node of the MPLS-TP LSP. This command is only allowed for MPLS-TP LSPs. Global ID values of 0 indicate that the local node's configured global ID is used. If the local global-id is 0, then the dest-global-id must also be 0. The dest-global-id cannot be changed if an LSP is in use by an SDP.

#### Default

dest-global-id 0

#### Parameters

***dest-global-id***

Specifies the destination global ID.

**Values** 0 to 4294967295

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 8.121 dest-ip

### dest-ip

#### Syntax

[no] **dest-ip** *ip-address*

#### Context

**[Tree]** (config>service>vprn>if>sap>ip-tunnel dest-ip)

**[Tree]** (config>service>ies>if>sap>ip-tunnel dest-ip)

**[Tree]** (config>service>vprn>sap>ipsec-tunnel dest-ip)

#### Full Context

configure service vprn interface sap ip-tunnel dest-ip

configure service ies interface sap ip-tunnel dest-ip

configure service vprn sap ipsec-tunnel dest-ip

#### Description

This command configures a private IPv4 or IPv6 address of the remote tunnel endpoint. A tunnel can have up to 16 **dest-ip** commands. At least one **dest-ip** address is required in the configuration of a tunnel. A tunnel does not come up operationally unless all **dest-ip** addresses are reachable (part of a local subnet).

Unnumbered interfaces are not supported.

The **no** form of this command deletes the destination IP of the tunnel.

#### Parameters

##### *ip-address*

Specifies the private IPv4 or IPv6 address of the remote IP tunnel endpoint. If this remote IP address is not within the subnet of the IP interface associated with the tunnel then the tunnel will not come up.

##### Values

|              |              |                                     |
|--------------|--------------|-------------------------------------|
| <ip-address> | ipv4-address | a.b.c.d                             |
|              | ipv6-address | x:x:x:x:x:x:x (eight 16-bit pieces) |
|              |              | x:x:x:x:x:d.d.d.d                   |
|              |              | x - [0 to FFFF]H                    |
|              |              | d - [0 to 255]D                     |

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.122 dest-ip-addr

```
dest-ip-addr
```

### Syntax

```
dest-ip-addr ip-address
```

```
no dest-ip-addr
```

### Context

```
[Tree] (config>mcast-mgmt>mcast-rprt-dest dest-ip-addr)
```

### Full Context

```
configure mcast-management mcast-reporting-dest dest-ip-addr
```

### Description

This command specifies the IP address of the external node to which IGMP events are exported. The destination IP address can only be reachable from the global routing table (no vrf access).

The **no** form of this command removes the destination address from the configuration.

### Parameters

*ip-addr*

Specifies the IP address of the multicast reporting destination.

### Platforms

All

## 8.123 dest-mac

```
dest-mac
```

### Syntax

```
dest-mac {nearest-bridge | nearest-non-tpmr | nearest-customer}
```

### Context

```
[Tree] (config>port>ethernet>lldp dest-mac)
```

### Full Context

```
configure port ethernet lldp dest-mac
```

## Description

This command configures destination MAC address parameters.

## Default

dest-mac nearest-bridge

## Parameters

### nearest-bridge

Specifies to use the nearest bridge.

### nearest-non-tpmr

Specifies to use the nearest non-Two-Port MAC Relay (TPMR).

### nearest-customer

Specifies to use the nearest customer.

## Platforms

All

## dest-mac

## Syntax

**dest-mac** *ieee-address*

**no dest-mac**

## Context

[\[Tree\]](#) (config>oam-pm>session>ethernet dest-mac)

## Full Context

configure oam-pm session ethernet dest-mac

## Description

This command defines the destination MAC address of the peer MEP and sets the destination MAC address in the layer two header to match. This must be a unicast address.

The **no** form of this command removes session parameter.

## Parameters

### *ieee-address*

Specifies the Layer 2 unicast MAC address of the destination MEP.

**Values** xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

## Platforms

All

## 8.124 dest-mac-address

### dest-mac-address

#### Syntax

**dest-mac-address** *mac-address* [**create**]

**no dest-mac-address** *mac-address*

#### Context

[\[Tree\]](#) (config>macsec>mac-policy dest-mac-address)

#### Full Context

configure macsec mac-policy dest-mac-address

#### Description

This command specifies the destination MAC address.

The **no** form of this command removes the MAC address.

#### Parameters

##### *mac-address*

Specifies the value of the MAC address policy.

**Values** xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

##### **create**

Mandatory to create the configuration.

#### Platforms

All

## 8.125 dest-mac-rewrite

### dest-mac-rewrite

#### Syntax

**dest-mac-rewrite** *ieee-address*

**no dest-mac-rewrite**

**Context**

[\[Tree\]](#) (config>service>vpls>sap>egress dest-mac-rewrite)

**Full Context**

configure service vpls sap egress dest-mac-rewrite

**Description**

This commands enables the overwriting of a destination MAC address to an operator-configured value for all unicast packets egressing the specified SAP. The command is intended to be deployed with L2 PBF SAP redirect when a remote end of the SAP interface is an L3 interface with a MAC address different from the MAC address of the non-PBF-ed L3 interface. See Filter Policy in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for more details.

The **no** form disables the option.

**Default**

no dest-mac-rewrite

**Parameters*****ieee-address***

Specifies the MAC address

**Values** 1xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx  
Cannot be all zeros

**Platforms**

All

**8.126 dest-realm-learning****dest-realm-learning****Syntax**

[no] dest-realm-learning

**Context**

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>gy dest-realm-learning)

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>gx dest-realm-learning)

**Full Context**

configure subscriber-mgmt diameter-application-policy gy dest-realm-learning

configure subscriber-mgmt diameter-application-policy gx dest-realm-learning

## Description

This command configures destination realm learning that is used in outgoing Gx and Gy Credit Control Request (CCR) messages. Destination realm is a mandatory configuration parameter.

The configured destination realm is always used in the initial CCR-I message. The consecutive request message of a Gx or Gy session can use the destination realm as learned from replies within a DIAMETER session (if learning is enabled), or they can ignore the realm from the reply and always use the configured destination realm in Gx and Gy request messages (learning is disabled).

The **no** form of this command ignores the realm from the reply.

## Default

dest-realm-learning

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.127 dest-tunnel-number

### dest-tunnel-number

## Syntax

**dest-tunnel-number** *dest-tunnel-number*

**no dest-tunnel-number**

## Context

[\[Tree\]](#) (config>router>mpls>lsp dest-tunnel-number)

## Full Context

configure router mpls lsp dest-tunnel-number

## Description

This optional command configures the MPLS-TP tunnel number of the LSP at the far end node of the MPLS-TP LSP. This command is only allowed for MPLS-TP LSPs. If it is not entered, then the system will take the dest-tunnel-number to be the same as the src-tunnel-num for the LSP.

## Default

The default value is the configured *src-tunnel-num*.

## Parameters

***dest-tunnel-number***

Specifies the destination tunnel number.

**Values** 1 to 61440

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 8.128 dest-udp-port

dest-udp-port

### Syntax

**dest-udp-port** *udp-port-number*

**no dest-udp-port**

### Context

[\[Tree\]](#) (config>oam-pm>session>ip dest-udp-port)

### Full Context

configure oam-pm session ip dest-udp-port

### Description

This command defines the destination UDP port on outbound TWAMP Light packets sent from the session controller. The destination UDP port must match the UDP port value configured on the TWAMP Light reflector that is responding to this specific TWAMP Light test.

The **no** form of this command removes the destination UDP port setting.

### Parameters

*udp-port-number*

Specifies the UDP source port.

**Values** 1 to 65535

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

dest-udp-port

### Syntax

**dest-udp-port** *port-number*

### Context

[\[Tree\]](#) (config>test-oam>link-meas>template>twl dest-udp-port)

**Full Context**

```
configure test-oam link-measurement measurement-template twamp-light dest-udp-port
```

**Description**

This command configures the destination UDP port used by the link measurement tests.

**Default**

```
dest-udp-port 862
```

**Parameters*****port-number***

Specifies the destination UDP port copied into the UDP header of each Echo request packet launched for each link measurement test belonging to the specified template.

**Values** 1 to 65535

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 8.129 destination

```
destination
```

**Syntax**

```
destination ip-address
```

```
no destination
```

**Context**

[\[Tree\]](#) (config>oam-pm>session>ip destination)

**Full Context**

```
configure oam-pm session ip destination
```

**Description**

This command defines the destination IP address that is assigned to the TWAMP Light packets. The destination address must be included in the prefix list on the session reflector within the configured context in order to allow the reflector to process the inbound TWAMP Light packets.

The **no** form of this command removes the destination parameters.

**Parameters**

***ip-address***

Specifies the IP address of the IP peer to which the packet is directed.

| Values        |                                     |              |
|---------------|-------------------------------------|--------------|
| ipv4-address: | a.b.c.d                             |              |
| ipv6-address: | x:x:x:x:x:x:x (eight 16-bit pieces) |              |
|               | x:x:x:x:x:d.d.d.d                   |              |
|               | x:                                  | [0 to FFFF]H |
|               | d:                                  | [0 to 255]D  |

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## destination

### Syntax

**destination** *ip-address* [**create**]

**no destination** *ip-address*

### Context

[\[Tree\]](#) (config>filter>redirect-policy destination)

### Full Context

configure filter redirect-policy destination

### Description

This command defines a destination in a redirect policy. More than one destination can be configured. Whether a destination IPv4/IPv6 address will receive redirected packets depends on the effective priority value after evaluation.

The most preferred destination is programmed in hardware as action forward next-hop. If all destinations are down (as determined by the supported tests), action forward is programmed in hardware. All destinations within a given policy must be either IPv4 or (exclusive) IPv6. The redirect policy with IPv4 destinations configured can only be used by IPv4 filter policies. The redirect policy with IPv6 destinations configured can only be used by IPv6 filter policies.

### Default

no destination

### Parameters

#### *ip-address*

Specifies the IPv4 address (in dotted decimal notation) or IPv6 address to send the redirected traffic to.

**Values** IPv4 address: ip-address: a.b.c.d  
 IPv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)  
 x:x:x:x:x:d.d.d.d  
 x: [0..FFFF]H  
 d: [0..255]D

## Platforms

All

## destination

### Syntax

**destination memory** *num-entries*

**destination syslog** *syslog-id*

**no destination**

### Context

[\[Tree\]](#) (config>filter>log destination)

### Full Context

configure filter log destination

### Description

This command configures the destination for filter log entries for the filter log ID.

Filter logs can be sent to either memory (**memory**) or to an existing Syslog server definition (**syslog**).

If the filter log destination is **memory**, the maximum number of entries in the log must be specified.

The **no** form of the command deletes the filter log association.

### Default

destination memory 1000

### Parameters

#### **memory** *num-entries*

Specifies the destination of the filter log ID is a memory log. The *num-entries* value is the maximum number of entries in the filter log expressed as a decimal integer.

**Values** 10 to 50000

#### **syslog** *syslog-id*

Specifies the destination of the filter log ID is a Syslog server. The *syslog-id* parameter is the number of the Syslog server definition.

**Values** 1 to 10

## Platforms

All

## destination

## Syntax

**destination** *{ip-address | fqdn}* **port** *port* [**create**]

**no destination** *{ip-address | fqdn}* **port** *port*

## Context

**[Tree]** (config>system>telemetry>destination-group destination)

**[Tree]** (config>system>grpc-tunnel>destination-group destination)

## Full Context

configure system telemetry destination-group destination

configure system grpc-tunnel destination-group destination

## Description

This command configures a destination IP address and port for a specific destination within a destination group. Up to two destinations can be defined within a destination group. Each destination is an IPv4 address, an IPv6 address, or the Fully Qualified Domain Name (FQDN).

The **no** form of this command removes the destination from the destination group.

## Parameters

### *ip-address*

Specifies the IPv4 address (in dotted decimal notation) or IPv6 address.

**Values** IPv4 address: ip-address: a.b.c.d  
 IPv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)  
 x:x:x:x:x:d.d.d.d  
 x: [0..FFFF]H  
 d: [0..255]D

### *fqdn*

Specifies the FQDN.

### *port*

Specifies the TCP destination port number.

**Values** 1 to 65535

### *create*

Keyword used to create a destination.

## Platforms

All

## destination

## Syntax

**destination** *ip-address*

**no destination**

## Context

[\[Tree\]](#) (config>router>if>if-attr>delay>dyn>twamp>ipv4 destination)

## Full Context

configure router interface if-attribute delay dynamic twamp-light ipv4 destination

## Description

This command configures the unicast IPv4 destination address for the TWAMP Light test packet. When this command is not configured, the destination IPv4 address is auto-assigned for interfaces configured with a prefix length of 30 and 31. All other interface prefix lengths and unnumbered interfaces are unable to auto-assign the destination IPv4 address. If the interface does not use a prefix length of 30 or 31, the destination must be configured.

Deleting a configured destination removes the specified address and causes the source address to be auto-assigned for prefix length of 30 and 31.

Configuration modifications are allowed without administratively disabling the IPv4 protocol.

The **no** form of this command removes the IPv4 address from the configuration.

## Default

no destination

## Parameters

*ip-address*

Specifies the IPv4 destination address.

**Values** a.b.c.d

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## destination

### Syntax

**destination** *ipv6-address*

**no destination**

### Context

[\[Tree\]](#) (config>router>if>if-attr>delay>dyn>twamp>ipv6 destination)

### Full Context

configure router interface if-attribute delay dynamic twamp-light ipv6 destination

### Description

This command configures the IPv6 destination address of the TWAMP Light test packet. When this command is not configured, no destination address is present and an error is raised to prevent the transmission of the test packet.

The IPv6 protocol can be enabled without addressing. However, the test does not transmit packets.

The link local address must be in the form fe80::/60 in accordance with RFC 4291, *IP Version 6 Addressing Architecture*.

The **no** form of this command removes the IPv6 address from the configuration.

### Default

no destination

### Parameters

***ipv6-address***

Specifies the TWAMP Light IPv6 destination address

#### Values

ipv6-address: x:x:x:x:x:x

x - [0 to FFFF]H

unicast and link local IPv6 address only

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 8.130 destination-address

## destination-address

### Syntax

**[no] destination-address** *ip-address*

### Context

**[Tree]** (config>filter>gre-tun-tmp>ipv4 destination-address)

### Full Context

configure filter gre-tunnel-template ipv4 destination-address

### Description

This command defines one or more destinations for the GRE IP header used to encapsulate the matching IPv4/IPv6 packet.

Traffic matching the associated IPv4 or IPv6 filter are hashed across all available destination address. If no destination address is available, then matching traffic follows the configured **pbr-down-action-override** action, if configured.

The **no** form of this command removes the specified destination IP address configuration from the associated GRE tunnel template.

### Parameters

***ip-address***

Specifies up to 16 IPv4 addresses to be used as the destination address.

### Platforms

All

## destination-address

### Syntax

**destination-address** *ip-address*

**no destination-address**

### Context

**[Tree]** (config>service>ies>if>ping-template destination-address)

**[Tree]** (config>service>vprn>if>ping-template destination-address)

### Full Context

configure service ies interface ping-template destination-address

configure service vprn interface ping-template destination-address

## Description

This command configures the address to where the ICMP echo requests are directed to test connectivity. The source of the ICMP echo request is the primary IPv4 address of the interface under which the ping-template is configured. The destination address must be on the same subnet as the source IP address. A configuration warning message displays if the primary IPv4 address and the destination are not on the same subnet, INFO: PIP #2092 Ping template misconfiguration - destination-address and primary IP address should fall in the same subnet. Unnumbered interfaces and loopback addresses are not supported.

The **config>service>ies|vprn>interface>ping-template** must be in the no shutdown state to remove or change the **destination-address** *ip-address*.

The **no** form of this command removes the destination address from the configuration.

## Parameters

### *ip-address*

Specifies the destination address to where the ICMP echo requests are directed to test connectivity, in a.b.c.d format.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 8.131 destination-class

### Full Context

configure service vprn static-route-entry ipsec-tunnel destination-class

configure service vprn static-route-entry indirect destination-class

### Description

This command configures the policy accounting destination-class index to be used when incrementing accounting statistic for traffic matching the associated static route.

The **no** form of this command removes the associated destination-class from the associated static route nexthop.

### Default

no destination-class

### Parameters

***dest-index***

The destination index integer value.

**Values** 1 to 255

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## destination-class

### Syntax

**destination-class** *dest-index*

**no destination-class**

### Context

**[Tree]** (config>filter>ipv6-filter>entry>match destination-class)

**[Tree]** (config>filter>ip-filter>entry>match destination-class)

### Full Context

configure filter ipv6-filter entry match destination-class

configure filter ip-filter entry match destination-class

### Description

This command configures the BGP destination-class value match criterion. Filtering egress traffic on **destination-class** requires the **destination-class-lookup** command to be enabled on the interface that the packet ingresses on.

The **no** form of the command removes the destination-class value match criterion.

### Default

no destination-class

### Parameters

***dest-index***

Specifies the destination index integer value.

**Values** 1 to 255

### Platforms

All

## destination-class

[no] **destination-class-lookup**

**Context**

[\[Tree\]](#) (config>router>if>ingress destination-class-lookup)

**Full Context**

configure router interface ingress destination-class-lookup

## Description

This command enables BGP destination-class lookup for packets on this interface ingress. It is used in combination with an IP filter or IPv6 filter **destination-class** to filter traffic egress of the router based on BGP destination classes.

The command is supported on network, IES, VPRN and R-VPLS interfaces. It is not supported on subscriber interfaces, tunnel interfaces or VPRN network interfaces.

The **no** form of this command reverts to the default value.

## Default

no destination-class-lookup

## Platforms

All

## 8.133 destination-group

### destination-group

## Syntax

**destination-group** *name* [**create**]

**no destination-group** *name*

## Context

[\[Tree\]](#) (config>system>telemetry destination-group)

[\[Tree\]](#) (config>system>grpc-tunnel destination-group)

## Full Context

configure system telemetry destination-group

configure system grpc-tunnel destination-group

## Description

Commands in this context configure commands for destination groups.

The **no** form of this command removes the destination group name.

## Parameters

### *name*

Specifies the destination group name, up to 32 characters.

### *create*

Keyword used to create a destination group.

## Platforms

All

## destination-group

### Syntax

**destination-group** *name*

**no destination-group**

### Context

[\[Tree\]](#) (config>system>grpc-tunnel>tunnel destination-group)

### Full Context

configure system grpc-tunnel tunnel destination-group

### Description

This command assigns the specified destination group to a gRPC tunnel.

The **no** form of this command removes the specified destination group from the gRPC tunnel.

### Default

no destination-group

### Parameters

***name***

Specifies the destination group name, up to 32 characters

## Platforms

All

## destination-group

### Syntax

**destination-group** *name*

**no destination-group**

### Context

[\[Tree\]](#) (config>system>telemetry>persistent-subscriptions>subscription destination-group)

### Full Context

configure system telemetry persistent-subscriptions subscription destination-group

## Description

This command assigns an existing destination group to the specified persistent subscription. The assigned **destination-group** must already exist before the configured persistent subscription can be activated.

The **no** form of this command removes the destination group name from the persistent subscription.

## Parameters

*name*

Specifies the destination group name, up to 32 characters.

## Platforms

All

## 8.134 destination-ip

destination-ip

### Syntax

[no] destination-ip

### Context

[\[Tree\]](#) (config>service>nat>syslog>syslog-export-policy>include destination-ip)

### Full Context

configure service nat syslog syslog-export-policy include destination-ip

### Description

This command includes the destination IP address in the flow log. The **destination-ip** is significant in Destination Based NAT (DNAT) where the foreign IP address is translated. A foreign IP address is the original IP address toward the destination node and in DNAT it is replaced by the **destination-ip**. More clearly, on the inside (private side), the IP address of the destination node is referred to as foreign IP (original destination IP), and once this address is translated by DNAT, it is referred to as destination IP (translated destination IP) on the outside (public side).

The **no** form of the command disables the feature.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.135 destination-port

## destination-port

### Syntax

**destination-port** [*destination-port*]

### Context

[\[Tree\]](#) (config>service>nat>syslog>syslog-export-policy>collector destination-port)

### Full Context

configure service nat syslog syslog-export-policy collector destination-port

### Description

This command configures the destination port (collector port) to which UDP stream containing the syslog flow records are sent.

### Default

destination-port 514

### Parameters

#### ***destination-port***

Specifies the destination port to which UDP streams are sent.

**Values** 1 to 65535

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.136 destination-prefix

## destination-prefix

### Syntax

**destination-prefix** *ip-prefix/length* [**nat-policy** *nat-policy-name*]

**no destination-prefix** *ip-prefix/length*

### Context

[\[Tree\]](#) (config>service>vprn>nat>inside destination-prefix)

[\[Tree\]](#) (config>router>nat>inside destination-prefix)

### Full Context

configure service vprn nat inside destination-prefix

configure router nat inside destination-prefix

### Description

This command configures a destination prefix. An (internal) static route will be created for this prefix. All traffic that hits this route will be subject to NAT. The system will not allow a destination-prefix to be configured if the configured nat-policy refers to an IP pool that resides in the same service (as this would result in a routing loop).

### Parameters

#### *ip-prefix*

Specifies the IP prefix; host bits must be zero (0).

**Values** a.b.c.d

#### *length*

Specifies the prefix length.

**Values** 0 to 32

#### *nat-policy-name*

Specifies the NAT policy name, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## destination-prefix

### Syntax

[no] destination-prefix

### Context

[\[Tree\]](#) (config>cflowd>collector>aggregation destination-prefix)

### Full Context

configure cflowd collector aggregation destination-prefix

### Description

This command specifies that the aggregation data is based on destination prefix information. The **no** form removes this type of aggregation from the collector configuration.

### Platforms

All

## 8.137 detail-level

### detail-level

#### Syntax

**detail-level** {**low** | **medium** | **high**}

**no detail-level**

#### Context

**[Tree]** (debug>router>ip>dhcp6 detail-level)

**[Tree]** (debug>router>ip>dhcp detail-level)

**[Tree]** (debug>router>local-dhcp-server detail-level)

#### Full Context

debug router ip dhcp6 detail-level

debug router ip dhcp detail-level

debug router local-dhcp-server detail-level

#### Description

This command debugs the DHCP tracing detail level.

#### Parameters

##### low

Displays a low detail level for DHCP debugging.

##### medium

Displays a medium detail level for DHCP debugging.

##### high

Displays a high detail level for DHCP debugging.

#### Platforms

All

- debug router ip dhcp6 detail-level
- debug router ip dhcp detail-level

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- debug router local-dhcp-server detail-level

## detail-level

### Syntax

**[Tree]** (debug>router>l2tp>group>packet detail-level)

**[Tree]** (debug>router>l2tp>assignment-id>packet detail-level)

### Full Context

debug router l2tp packet detail-level

debug router l2tp group packet detail-level

debug router l2tp assignment-id packet detail-level

### Description

This command configures the L2TP packet debugging level of detail.

### Parameters

***detail-level***

Specifies the detail level.

**Values** low, high

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## detail-level

### Syntax

**detail-level** {**low** | **medium** | **high**}

**no detail-level**

### Context

**[Tree]** (debug>service>id>ppp>packet detail-level)

### Full Context

debug service id ppp packet detail-level

### Description

This command specify the detail level of PPP packet debug output.

The **no** form of this command disables debugging.

### Parameters

**low | medium | high**

Specifies the detail level of PPP packet debug output.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## detail-level

### Syntax

**detail-level {low | medium | high}**

**no detail-level**

### Context

**[Tree]** (debug>router>radius detail-level)

### Full Context

debug router radius detail-level

### Description

This command specifies the output detail level of command **debug router radius**.

### Default

detail-level medium

### Parameters

**low**

Specifies that the output includes packet type, server address, length, radius-server-policy name.

**medium**

Specifies all output in low level including the RADIUS attributes in the packet.

**high**

Specifies all output in medium level including the hex packet dump.

### Platforms

All

**detail-level** {**low** | **medium** | **high**}

### Context

**[Tree]** (debug>subscr-mgmt>vrgw>brg>pppoe-client>brg-id detail-level)

### Full Context

debug subscriber-mgmt vrgw brg pppoe-client brg-id detail-level

### Description

This command specifies the amount of detail present in debugging the specified PPPoE client.

### Default

detail-level high

## Parameters

### low

Specifies a low level of detail during debugging.

### medium

Specifies a medium level of detail during debugging.

### high

Specifies a high level of detail during debugging.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## detail-level

### Syntax

**detail-level** {**low** | **medium** | **high**}

**no detail-level**

### Context

[\[Tree\]](#) (debug>service>id>igmp-snooping detail-level)

### Full Context

debug service id igmp-snooping detail-level

### Description

This command enables and configures the IGMP tracing detail level.

The **no** form of this command disables the IGMP tracing detail level.

## Platforms

All

## detail-level

### Syntax

**detail-level** {**low** | **medium** | **high**}

**no detail-level**

### Context

[\[Tree\]](#) (debug>service>id>mld detail-level)

### Full Context

debug service id mld-snooping detail-level

## Description

This command enables and configures the MLD tracing detail level.  
The **no** form of this command disables the MLD tracing detail level.

## Platforms

All

## detail-level

## Syntax

**detail-level** {*low* | *medium* | *high*}  
**no detail-level**

## Context

**[Tree]** (debug>service>id>dhcp detail-level)

## Full Context

debug service id dhcp detail-level

## Description

This command configures the DHCP tracing detail level.  
The **no** form of the command disables debugging.

## Parameters

### low

Displays a low detail level for DHCP debugging.

### medium

Displays a medium detail level for DHCP debugging.

### high

Displays a high detail level for DHCP debugging.

## Platforms

All

## detail-level

## Syntax

**detail-level** *detail-level*

## Context

**[Tree]** (debug>router>pcp>pcp-server>packet detail-level)

## Full Context

```
debug router pcp pcp-server packet detail-level
```

## Description

This command configures the packet debugging level of detail.

## Parameters

### *detail-level*

Specifies the detail level.

**Values** low, high

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.138 detailed-acct-attributes

### detailed-acct-attributes

## Syntax

```
[no] detailed-acct-attributes
```

## Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>include detailed-acct-attributes)

## Full Context

```
configure subscriber-mgmt radius-accounting-policy include-radius-attribute detailed-acct-attributes
```

## Description

This command enables detailed reporting of per queue and per policer octet and packet counters using RADIUS VSAs. Enabled by default. It can be enabled simultaneously with aggregate counters (std-acct-attributes).

The **no** form of this command excludes the detailed counter VSAs from the RADIUS accounting messages.

## Default

```
detailed-acct-attributes
```

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.139 detect

```
detect
```

### Syntax

```
detect num-moves num-moves window minutes [trusted-mac-move-factor factor]
```

### Context

[Tree] (config>service>vpls>bgp-evpn>mac-duplication detect)

### Full Context

```
configure service vpls bgp-evpn mac-duplication detect
```

### Description

This command modifies the behavior of the **mac-duplication** command, which is always enabled by default. It monitors the number of moves of a MAC address for a period of time (window).

### Default

```
detect num-moves 5 window 3 trusted-mac-move-factor 1
```

### Parameters

#### *num-moves*

Identifies the number of MAC moves in a VPLS service. The counter is incremented when a specified MAC is locally relearned in the FDB or flushed from the FDB due to the reception of a better remote EVPN route for that MAC.

**Values** 3 to 10

**Default** 5

#### *minutes*

Specifies the length of the window in minutes.

**Values** 1 to 15

**Default** 3

#### *factor*

Specifies the multiplying value used to calculate a MAC duplication event. The *num-moves* value is multiplied by this value to determine the number of moves needed to declare a trusted MAC as duplicate.

For example, if *num-moves*=5 and *factor*=3, five moves within the window is enough to declare a non-trusted MAC as duplicate. However, 15 moves are needed to declare a trusted MAC as duplicate.

By default, the value of *factor* is 1, which means the factor for a trusted MAC is the same as for a non-trusted MAC. This provides a backwards compatible solution upon upgrade of the node.

**Values** 1 to 10

**Default** 1

### Platforms

All

## 8.140 detect-seen-ip

detect-seen-ip

### Syntax

[no] detect-seen-ip

### Context

[\[Tree\]](#) (config>app-assure>group>transit-ip-policy detect-seen-ip)

### Full Context

configure application-assurance group transit-ip-policy detect-seen-ip

### Description

This command enables the detection of transit subscribers based on the IP address.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.141 detection-time

detection-time

### Syntax

detection-time *seconds*

no detection-time

## Context

[\[Tree\]](#) (config>sys>security>dist-cpu-protection>policy>protocol>dynamic-parameters detection-time)

## Full Context

configure system security dist-cpu-protection policy protocol dynamic-parameters detection-time

## Description

When a dynamic enforcing policer is instantiated, it remains allocated until at least a contiguous conforming period of detection-time passes.

## Default

detection-time 30

## Parameters

### *seconds*

Specifies the detection time.

**Values** 1 to 128000

## Platforms

All

## detection-time

## Syntax

**detection-time** *seconds*

## Context

[\[Tree\]](#) (config>sys>security>dist-cpu-protection>policy>static-policer detection-time)

## Full Context

configure system security dist-cpu-protection policy static-policer detection-time

## Description

When a policer is declared as in an "exceed" state, it remains as exceeding until a contiguous conforming period of **detection-time** passes. The **detection-time** only starts after the exceed-action hold-down is complete. If the policer detects another exceed during the detection count down then a hold-down is once again triggered before the policer re-enters the detection time (that is, the countdown timer starts again at the configured value). During the hold-down (and the detection-time), the policer is considered as in an "exceed" state.

## Default

detection-time 30

**Parameters*****seconds***

Specifies the detection time.

**Values** 1 to 128000

**Platforms**

All

## 8.142 deterministic

### deterministic

**Syntax**

**deterministic**

**Context**

[\[Tree\]](#) (config>router>nat>inside deterministic)

[\[Tree\]](#) (config>service>vprn>nat>inside deterministic)

**Full Context**

configure router nat inside deterministic

configure service vprn nat inside deterministic

**Description**

Commands in this context configure deterministic NAT.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### deterministic

**Syntax**

**deterministic**

**Context**

[\[Tree\]](#) (config>service>vprn>nat>outside>pool deterministic)

**Full Context**

configure service vprn nat outside pool deterministic

## Description

This command configures deterministic NAT for this pool.

## Platforms

## 8.143 deterministic-med

### deterministic-med

## Syntax

[no] **deterministic-med**

## Context

[\[Tree\]](#) (config>service>vprn>bgp>best-path-selection deterministic-med)

## Full Context

configure service vprn bgp best-path-selection deterministic-med

## Description

This command controls how the BGP decision process compares routes on the basis of MED. When **deterministic-med** is configured, BGP groups paths that are equal up to the MED comparison step based on neighbor AS, and then compares the best path from each group to arrive at the overall best path. This change to the BGP decision process makes best path selection completely deterministic in all cases. Without **deterministic-med**, the overall best path selection is sometimes dependent on the order of the route arrival because of the rule that MED cannot be compared in routes from different neighbor AS.

## Default

no deterministic-med

## Platforms

All

### deterministic-med

## Syntax

[no] **deterministic-med**

## Context

[\[Tree\]](#) (config>router>bgp>best-path-selection deterministic-med)

## 8.145 device

## device

### Syntax

**device** *ieee-address* [**create**]

**no device** *ieee-address*

### Context

[\[Tree\]](#) (config>system>bluetooth device)

### Full Context

configure system bluetooth device

### Description

This command is used to add and remove devices from the Bluetooth allowlist or to enter the context to configure the MAC. The router only accepts pairing requests with devices that are in the allowlist. The devices are identified through their IEEE 802 MAC addresses. Up to six devices can be defined in the allowlist.

The **create** keyword must be used to add a new device.

The **no** form of this command removes the indicated device from the allowlist.

### Parameters

#### *ieee-address*

Specifies the MAC address of the external Bluetooth device.

**Values** 6-byte unicast MAC address (*xx:xx:xx:xx:xx:xx* or *xx-xx-xx-xx-xx-xx*)

### Platforms

7750 SR-1, 7750 SR-s, 7950 XRS-20e

## 8.146 device-label

## device-label

### Syntax

**device-label** *name*

**no device-label**

### Context

[\[Tree\]](#) (config>system>management-interface>remote-management device-label)

## Full Context

configure system management-interface remote-management device-label

## Description

This command configures the metadata label that is supplied to all remote managers. This label can be used to group devices (network-nodes) that serve a common purpose or role.

If this command is also configured for a specific remote manager in the **config>system> management-interface>remote-management>manager** context, that configuration takes precedence.

The **no** form of this command causes an empty string to be used.

## Parameters

### *name*

Specifies the device-label name, up to 64 characters.

## Platforms

All

## device-label

## Syntax

**device-label** *name*

**no device-label**

## Context

[\[Tree\]](#) (config>system>management-interface>remote-management>manager device-label)

## Full Context

configure system management-interface remote-management manager device-label

## Description

This command configures the metadata label that is supplied to this remote manager. This label can be used to group devices (network-nodes) with a common purpose/role.

This command takes precedence over the same command configured in the global context (**config>system>management-interface>remote-management**).

The **no** form of this command causes the device-label name to be inherited from the global context (**config>system>management-interface>remote-management**).

## Parameters

### *name*

Specifies the device-label name, up to 64 characters.

## Platforms

All

## 8.147 device-name

device-name

### Syntax

**device-name** *name*

**no device-name**

### Context

[\[Tree\]](#) (config>system>management-interface>remote-management device-name)

### Full Context

configure system management-interface remote-management device-name

### Description

This command configures a device name that is supplied to all remote managers. This name identifies the specified SR OS node in the network.

If this command is also configured for a specific manager in the **config>system>management-interface>remote-management> manager** context, that configuration takes precedence.

The **no** form of this command causes the system to use the default device name (system-name).

### Default

system-name

### Parameters

***name***

Specifies the device name, up to 64 characters.

## Platforms

All

device-name

### Syntax

**device-name** *name*

**no device-name**

## Context

**[Tree]** (config>system>management-interface>remote-management>manager device-name)

## Full Context

configure system management-interface remote-management manager device-name

## Description

This command configures a device name that is supplied to the specific manager. This name identifies the specified SR OS node in the network.

This command takes precedence over the same command configured in the global context (**config>system>management-interface>remote-management**).

The **no** form of this command causes the device name to be inherited from the global context (**config>system>management-interface>remote-management**).

## Default

system-name

## Parameters

*name*

Specifies the device name, up to 64 characters.

## Platforms

All

## 8.148 df-bit-lac

df-bit-lac

## Syntax

**df-bit-lac** {always | never}

**no df-bit-lac**

## Context

**[Tree]** (config>router>l2tp df-bit-lac)

**[Tree]** (config>service>vprn>l2tp df-bit-lac)

## Full Context

configure router l2tp df-bit-lac

configure service vprn l2tp df-bit-lac

## Description

By default, the LAC `df-bit-lac` is always set and sends all L2TP packets with the DF bit set to 1. The DF bit is configurable to allow downstream routers to fragment the L2TP packets. The LAC itself will not fragment L2TP packets. L2TP packets that have a larger MTU size than what the LAC egress ports allows are dropped.

The **no** form of this command reverts to the default.

## Default

`df-bit-lac always`

## Parameters

### **always**

Specifies that the LAC sends all L2TP packets with the DF bit set to 1.

### **never**

Specifies that the LAC sends all L2TP packets with the DF bit set to 0.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## df-bit-lac

## Syntax

`df-bit-lac {always | never | default}`

`no df-bit-lac`

## Context

[\[Tree\]](#) (config>service>vprn>l2tp>group df-bit-lac)

[\[Tree\]](#) (config>router>l2tp>group>tunnel df-bit-lac)

[\[Tree\]](#) (config>service>vprn>l2tp>group>tunnel df-bit-lac)

[\[Tree\]](#) (config>router>l2tp>group df-bit-lac)

## Full Context

configure service vprn l2tp group df-bit-lac

configure router l2tp group tunnel df-bit-lac

configure service vprn l2tp group tunnel df-bit-lac

configure router l2tp group df-bit-lac

## Description

By default, the LAC `df-bit-lac` is set to default and sends all L2TP packets with the DF bit set to 1. The DF bit is configurable to allow downstream routers to fragment the L2TP packets. The LAC will not fragment L2TP packets. L2TP packets that have a larger MTU size than what the LAC egress ports allows are dropped. The configuration of the `df-bit` can be overridden at different levels: l2tp, tunnel, and group.

The configuration at the tunnel level overrides the configuration on both the group and I2tp levels. The configuration at the group level overrides the configuration on I2tp.

The **no** form of this command reverts to the default.

### Default

df-bit-lac default

### Parameters

#### **always**

Specifies that the LAC sends all L2TP packets with the DF bit set to 1.

#### **never**

Specifies that the LAC sends all L2TP packets with the DF bit set to 0.

#### **default**

Follows the DF-bit configuration specified on upper levels.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.149 dh-group

### dh-group

#### Syntax

**dh-group** {1 | 2 | 5 | 14 | 15 | 19 | 20 | 21}

#### Context

[\[Tree\]](#) (config>ipsec>ike-transform dh-group)

#### Full Context

configure ipsec ike-transform dh-group

#### Description

This command specifies the Diffie-Hellman group to be used in this IKE transform instance.

#### Default

dh-group 2 (1024-bit — More Modular Exponential (MODP))

#### Parameters

**dh-group** {1 | 2 | 5 | 14 | 15 | 19 | 20 | 21}

Specifies which Diffie-Hellman group to use for calculating session keys. More bits provide a higher level of security, but require more processing. Three groups are supported with IKE-v1:

Group 1: 768 bits

Group 2: 1024 bits

Group 5: 1536 bits

Group 14: 2048 bits

Group 15: 3072 bits

Group 19: P-256 ECC Curve, 256 bits

Group 20: P-384 ECC Curve, 384 bits

Group 21: P-512 ECC Curve, 512 bits

### Platforms

## dhcp

### Syntax

[no] dhcp [interface *ip-int-name*]

[no] dhcp mac *ieee-address*

[no] dhcp sap *sap-id*

### Context

[\[Tree\]](#) (debug>router>ip dhcp)

### Full Context

debug router ip dhcp

### Description

This command enables DHCP debugging.

The **no** form of this command disables debugging.

### Parameters

#### *ip-int-name*

Specifies the name of the IP interface, up to 32 characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

#### *ieee-address*

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

#### *sap-id*

Specifies the physical port identifier portion of the SAP definition.

### Platforms

All

## dhcp

### Syntax

dhcp *type* direction {**ingress** | **egress**} script *script*

no dhcp *type* direction {**ingress** | **egress**}

## Context

[\[Tree\]](#) (config>python>py-policy dhcp)

## Full Context

configure python python-policy dhcp

## Description

This command specifies the Python script for the specified DHCPv4 packet type in the specified direction.

Multiple **dhcp** command configurations are allowed in the same Python policy.

The **no** form of this command reverts to the default.

## Parameters

### *type*

Specifies the message type of the event.

**Values** discover, offer, request, decline, ack, nak, release, inform, force-renew, lease-query, lease-unassigned, lease-unknown, lease-active

### **direction {ingress | egress}**

Specifies whether the packet is being received by the system or being sent by the system.

### **script script**

Specifies the name of the Python script, up to 32 characters, that is used to handle the specified message.

## Platforms

All

## dhcp

## Syntax

**dhcp**

## Context

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>wlan-gw>ranges dhcp)

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>wlan-gw>ranges dhcp)

## Full Context

configure service ies subscriber-interface group-interface wlan-gw ranges dhcp

configure service vprn subscriber-interface group-interface wlan-gw ranges dhcp

## Description

Commands in this context create DHCP configuration for WLAN-GW ISA subscribers (such as migrant subscribers).

## dhcp

### Syntax

[no] dhcp

### Context

[\[Tree\]](#) (debug>service>id dhcp)

### Full Context

debug service id dhcp

### Description

Commands in this context perform DHCP debugging.

The **no** form of the command disables DHCP debugging.

### Platforms

All

## dhcp

### Syntax

dhcp

### Context

[\[Tree\]](#) (config>app-assure>group>transit-ip-policy dhcp)

### Full Context

configure application-assurance group transit-ip-policy dhcp

### Description

This command enables dynamic DHCP-based management of transit aa-subnets for the transit-ip-policy. This is mutually exclusive to other types of management of transit subnets for a given transit-ip-policy.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## dhcp

### Syntax

[no] dhcp

## Context

[\[Tree\]](#) (config>service>ies>if>sap>ipsec-gateway dhcp)

[\[Tree\]](#) (config>service>vpn>if>sap>ipsec-gateway dhcp)

## Full Context

configure service ies interface sap ipsec-gateway dhcp

configure service vpn interface sap ipsec-gateway dhcp

## Description

Commands in this context configure DHCPv4-based address assignment for IKEv2 remote-access tunnels.

The system acts as a DHCPv4 client on behalf of the IPsec client, and also a relay agent to relay DHCPv4 packets to the DHCPv4 server.

DHCPv4 DORA(Discovery/Offer/Request/Ack) exchange happens during IKEv2 remote-access tunnel setup. The system also supports standard renew.

In order to use this feature, the **relay-proxy** must be enabled on the corresponding interface (either the private interface or the interface that has the gi-address as the interface address).

## Default

no dhcp

dhcp

## Syntax

dhcp

## Context

[\[Tree\]](#) (config>router>if dhcp)

## Full Context

configure router interface dhcp

## Description

Commands in this context configure DHCP parameters.

## Platforms

All

dhcp

## Syntax

dhcp [**include-user-class**] [**timeout** *timeout*]

```
dhcp client-id [string ascii-string] [hex hex-string] [include-user-class] [timeout timeout]
no dhcp
```

## Context

[\[Tree\]](#) (bof>autoconfigure>ipv4 dhcp)

## Full Context

```
bof autoconfigure ipv4 dhcp
```

## Description

This command configures the IPv4 DHCP client for OOB management. The OOB management IPv4 can be set using a DHCP server offer.

The **no** form of this command disables IPv4 DHCP OOB management.

## Default

```
no dhcp
```

## Parameters

### **include-user-class**

Specifies to include Option 77 user class data in the offer.

### **client-id**

Specifies to include the client ID for IPv4 Option 61 for auto-discovery. The identifier is opaque and is in string format. By default, this is the chassis serial number.

### **timeout**

Specifies the DHCP offer timeout, in seconds.

**Values** 1 to 65535

**Default** 30

### **ascii-string**

Specifies the string format for this option, up to 127 characters.

### **hex-string**

Specifies the hexadecimal format for this option, up to 254 hex nibbles.

**Values** 0x0 to 0xFFFFFFFF

## Platforms

7450 ESS-7, 7750 SR-1, 7750 SR-7, 7750 SR-1e, 7750 SR-2e, 7750 SR-s

## dhcp

### Syntax

**dhcp** [**include-user-class**] [**timeout** *timeout*]

**dhcp client-id** *duid-type* [**string** *ascii-string*] [**hex** *hex-string*] [**include-user-class**] [**timeout** *timeout*]

**no dhcp**

### Context

[\[Tree\]](#) (bof>autoconfigure>ipv6 dhcp)

### Full Context

bof autoconfigure ipv6 dhcp

### Description

This command configures the IPv6 DHCP client for out-of-band (OOB) management. The OOB management IPv6 can be set using a DHCP server offer.

The **no** form of this command disables IPv6 DHCP client OOB management.

### Default

no dhcp

### Parameters

#### **include-user-class**

Specifies to include Option 15 user class data in the offer.

#### **client-id**

Specifies to include the client ID for IPv6 DHCP Option 1 for auto-discovery. The identifier is opaque and is in string format. By default, this is the chassis serial number.

#### **seconds**

Specifies the DHCP client ID timeout, in seconds.

**Values** 1 to 65535

#### **duid-type**

Specifies the type code of the server DUID.

**Values** duid-link-local, duid-enterprise

#### **ascii-string**

Specifies the string format for this option, up to 124 characters.

#### **hex-string**

Specifies the hexadecimal format for this option, up to 248 hex nibbles.

**Values** 0x0 to 0xFFFFFFFF

#### **timeout**

Specifies the DHCP offer timeout, in seconds.

**Values** 1 to 65535

**Default** 30

### Platforms

7450 ESS-7, 7750 SR-1, 7750 SR-7, 7750 SR-1e, 7750 SR-2e, 7750 SR-s

## dhcp

### Syntax

[no] dhcp

### Context

[\[Tree\]](#) (config>sys>security>cpu-protection>ip>included-protocols dhcp)

### Full Context

configure system security cpu-protection ip-src-monitoring included-protocols dhcp

### Description

This command includes the extracted IPv4 DHCP packets for ip-src-monitoring. IPv4 DHCP packets will be subject to the per-source-rate of CPU protection policies.

### Default

dhcp (Note this is different from the other protocols)

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## 8.151 dhcp-client

## dhcp-client

### Syntax

[no] dhcp-client

### Context

[\[Tree\]](#) (debug>router>l2tp>group>packet dhcp-client)

[\[Tree\]](#) (debug>router>l2tp>packet dhcp-client)

[\[Tree\]](#) (debug>router>l2tp>assignment-id>packet dhcp-client)

[\[Tree\]](#) (debug>router>l2tp>peer>packet dhcp-client)

### Full Context

```
debug router l2tp group packet dhcp-client
debug router l2tp packet dhcp-client
debug router l2tp assignment-id packet dhcp-client
debug router l2tp peer packet dhcp-client
```

### Description

This command enables debugging for DHCP client packet.  
The **no** form of this command disables debugging for DHCP client packet.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## dhcp-client

### Syntax

```
dhcp-client [terminate-only]
no dhcp-client
```

### Context

[\[Tree\]](#) (debug>service>id>ppp>event dhcp-client)

### Full Context

```
debug service id ppp event dhcp-client
```

### Description

This command enable PPP event debug for DHCP client.  
The **no** form of this command disables PPP event debugging for the DHCP client.

### Parameters

**terminate-only**  
Enables debug for local terminated PPP session.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## dhcp-client

### Syntax

[no] dhcp-client

### Context

[\[Tree\]](#) (debug>service>id>ppp>packet dhcp-client)

### Full Context

debug service id ppp packet dhcp-client

### Description

This command enables debugging for specific DHCP client packets.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## dhcp-client

### Syntax

dhcp-client

### Context

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>pppoe dhcp-client)

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>pppoe dhcp-client)

### Full Context

configure service ies subscriber-interface group-interface pppoe dhcp-client

configure service vprn subscriber-interface group-interface pppoe dhcp-client

### Description

Commands in this context configure the PPPoE-to-DHCP options.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.152 dhcp-filter

## dhcp-filter

### Syntax

**dhcp-filter** *filter-id* [**create**]  
**no dhcp-filter**

### Context

[\[Tree\]](#) (config>filter dhcp-filter)

### Full Context

configure filter dhcp-filter

### Description

Commands in this context create and configure the specified DHCP filter policy.

### Parameters

#### *filter-id*

Specifies the DHCP filter policy ID expressed as a decimal integer.

**Values** 1 to 65535

#### **create**

Keyword required to create the configuration context.

### Platforms

All

## 8.153 dhcp-lease-time-threshold

## dhcp-lease-time-threshold

### Syntax

**dhcp-lease-time-threshold** [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]  
**no dhcp-lease-time-threshold**

### Context

[\[Tree\]](#) (config>system>persistence>options dhcp-lease-time-threshold)

### Full Context

configure system persistence options dhcp-lease-time-threshold

## Description

This command configures Dynamic Data Persistence (DDP) compact flash access optimization for DHCP leases.

The DHCP lease-time threshold controls the eligibility of a DHCP lease for persistency updates when no data other than the lease expiry time is to be updated. When the offered lease time of the DHCP lease is less than the configured threshold, the lease is flagged to skip persistency updates and will be installed with its full lease time upon a persistency recovery after a reboot.

The **dhcp-lease-time-threshold** command controls persistency updates for DHCPv4 and DHCPv6 leases for a DHCP relay or proxy and DHCPv4 leases for DHCP snooping (enabled with **subscriber-mgmt**) and a DHCP server (enabled with **dhcp-server**).

The **no** form of the command disables the DHCP lease time threshold.

## Default

no dhcp-lease-time-threshold

## Parameters

### *days*

Specifies the threshold in days.

**Values** 0 to 7305

### *hours*

Specifies the threshold in hours.

**Values** 0 to 23

### *minutes*

Specifies the threshold in minutes.

**Values** 0 to 59

### *seconds*

Specifies the threshold in seconds.

**Values** 0 to 59

## Platforms

All

**dhcp-lease-time-threshold**

## Syntax

**dhcp-lease-time-threshold** [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]

**no dhcp-lease-time-threshold**

## Context

[\[Tree\]](#) (config>redundancy>multi-chassis>options>sub-mgmt dhcp-lease-time-threshold)

## Full Context

configure redundancy multi-chassis options sub-mgmt dhcp-lease-time-threshold

## Description

This command configures the DHCP lease time threshold to be eligible for MCS synchronization.

DHCP leases for the **sub-mgmt** MCS applications are eligible to skip synchronization if the committed lease time is less than the active threshold on a multi-chassis peer. The active threshold is the minimum value of the thresholds configured on the nodes at each end of a multi-chassis peer. The threshold is inactive when it is unconfigured on at least one end of the multi-chassis peer.

The **no** form of the command disables the DHCP lease time threshold.

## Default

no dhcp-lease-time-threshold

No threshold is active and all **sub-mgmt** DHCP leases are synchronized.

## Parameters

### *days*

Specifies the threshold in days.

**Values** 0 to 1

### *hours*

Specifies the threshold in hours.

**Values** 0 to 23

### *minutes*

Specifies the threshold in minutes.

**Values** 0 to 59

### *seconds*

Specifies the threshold in seconds.

**Values** 0 to 59

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.154 dhcp-options

## dhcp-options

### Syntax

[no] dhcp-options

### Context

[\[Tree\]](#) (config>subscr-mgmt>auth-plcy>include-radius-attribute dhcp-options)

### Full Context

configure subscriber-mgmt authentication-policy include-radius-attribute dhcp-options

### Description

This command enables insertion of RADIUS VSA containing all DHCP options from DHCP discover (or DHCP request) message. The VSA contains all DHCP options in a form of the string. If required (the total length of all DHCP options exceeds 255B), multiple VSAs are included.

The **no** form of this command reverts to the default.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## dhcp-options

### Syntax

[no] dhcp-options

### Context

[\[Tree\]](#) (config>aaa>isa-radius-plcy>acct-include-attributes dhcp-options)

[\[Tree\]](#) (config>aaa>isa-radius-plcy>auth-include-attributes dhcp-options)

### Full Context

configure aaa isa-radius-policy acct-include-attributes dhcp-options

configure aaa isa-radius-policy auth-include-attributes dhcp-options

### Description

This command enables insertion of RADIUS VSA containing all dhcp-options from dhcp-discover (or dhcp-request) message. The VSA contains all dhcp-options in a form of the string. If required (the total length of all dhcp-options exceeds 255B), multiple VSAs are included.

### Default

no dhcp-options

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.155 dhcp-pool

### dhcp-pool

#### Syntax

**dhcp-pool**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>vrgw>brg>brg-profile dhcp-pool)

#### Full Context

configure subscriber-mgmt vrgw brg brg-profile dhcp-pool

#### Description

Commands in this context configure per-subscriber IPv4 address pool parameters to be used for address allocation. Pools for different subscribers can overlap. Specific pool parameters can be overridden by RADIUS.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.156 dhcp-python-policy

### dhcp-python-policy

#### Syntax

**dhcp-python-policy** *policy-name*

**no dhcp-python-policy**

#### Context

[\[Tree\]](#) (config>service>vpls>sap dhcp-python-policy)

#### Full Context

configure service vpls sap dhcp-python-policy

#### Description

This command specifies the name of the Python policy. The Python policy is created in the **config>python>python-policy** *name* context.

The **no** form of this command reverts to the default.

**Parameters*****policy-name***

Specifies a Python policy name, up to 32 characters.

**Platforms**

All

## 8.157 dhcp-server

**dhcp-server****Syntax****dhcp-server****Context**[\[Tree\]](#) (config>system>persistence dhcp-server)**Full Context**

configure system persistence dhcp-server

**Description**

This command configures DHCP server persistence parameters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.158 dhcp-triggered

**dhcp-triggered****Syntax****[no] dhcp-triggered****Context**[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>ue-query>state dhcp-triggered)**Full Context**

configure subscriber-mgmt wlan-gw ue-query state dhcp-triggered

## Description

This command enables matching on UEs currently in a DHCP-triggered state. This query only filters UEs that are currently authenticating due to a DHCP, DHCPv6, or RS trigger, not RADIUS-authenticated UEs in an ESM, DSM, or portal state that were originally authenticated due to a DHCP, DHCPv6, or RS trigger.

The **no** form of this command disables matching on UEs in a DHCP-triggered state, unless all state matching is disabled.

## Default

no dhcp-triggered

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.159 dhcp-user-db

### dhcp-user-db

## Syntax

**dhcp-user-db** *local-user-db-name*

**no dhcp-user-db**

## Context

[\[Tree\]](#) (config>service>vpls>sap dhcp-user-db)

## Full Context

configure service vpls sap dhcp-user-db

## Description

This command enabled access to LUDB for DHCPv4 hosts under the capture SAP. The name of this local user database must match the name of local user database configured under the **config>service>vprn/ies>sub-if>group-if>dhcp** context.

## Parameters

***local-user-db***

Specifies the name of the local user database name up to 32 characters.

## Platforms

All

## 8.160 dhcp-vendor-class-id

```
dhcp-vendor-class-id
```

### Syntax

```
[no] dhcp-vendor-class-id
```

### Context

```
[Tree] (config>subscr-mgmt>acct-plcy>include-radius-attribute dhcp-vendor-class-id)
```

```
[Tree] (config>subscr-mgmt>auth-plcy>include-radius-attribute dhcp-vendor-class-id)
```

### Full Context

```
configure subscriber-mgmt radius-accounting-policy include-radius-attribute dhcp-vendor-class-id
```

```
configure subscriber-mgmt authentication-policy include-radius-attribute dhcp-vendor-class-id
```

### Description

This command includes the [26-6527-36] Alc-DHCP-Vendor-Class-Id attribute in authentication or RADIUS accounting messages. The content of the DHCP Vendor-Class-Identifier option (60) is mapped in this attribute.

The **no** form of this command reverts to the default.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
dhcp-vendor-class-id
```

### Syntax

```
[no] dhcp-vendor-class-id
```

### Context

```
[Tree] (config>aaa>isa-radius-plcy>auth-include-attributes dhcp-vendor-class-id)
```

```
[Tree] (config>aaa>isa-radius-plcy>acct-include-attributes dhcp-vendor-class-id)
```

### Full Context

```
configure aaa isa-radius-policy auth-include-attributes dhcp-vendor-class-id
```

```
configure aaa isa-radius-policy acct-include-attributes dhcp-vendor-class-id
```

### Description

This command includes the "[26-6527-36] Alc-DHCP-Vendor-Class-Id" attribute in authentication or RADIUS accounting messages. The content of the DHCP Vendor-Class-Identifier option (60) is mapped in this attribute.

**Default**

no dhcp-vendor-class-id

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## dhcp6

## Syntax

```
dhcp6
```

## Context

[\[Tree\]](#) (config>system dhcp6)

## Full Context

```
configure system dhcp6
```

## Description

Commands in this context configure system-wide DHCPv6 parameters.

## Platforms

All

## dhcp6

### Syntax

```
[no] dhcp6 [ip-int-name]
[no] dhcp6 client-identifier duid duid-hex-string [mask mask-hex-string]
[no] dhcp6 client-identifier link-layer-address lla-hex-string
[no] dhcp6 interface ip-int-name
[no] dhcp6 sap sap-id
```

### Context

[\[Tree\]](#) (debug>router>ip dhcp6)

### Full Context

debug router ip dhcp6

### Description

This command enables DHCPv6 debugging with optional interface, SAP, and client-identifier match criteria to filter the debug output.

The **no** form of this command disables debugging.

### Parameters

#### ***ip-int-name***

Specifies the name of an existing IP interface, up to 32 characters. Up to four DHCPv6 interface match criteria can be specified per routing instance.

#### ***client-identifier***

Specifies a client identifier option match criteria.

#### ***duid duid-hex-string***

Specifies a hexadecimal value for an opaque match on the client DUID in the client identifier option. When the actual length of the client DUID is longer than the length of the specified hex-string, only the left most octets are matched. Up to four DHCPv6 client-identifier match criteria can be specified per routing instance.

**Values** 0x0 to 0xFFFFFFFF (maximum 260 hex nibbles)

#### ***mask mask-hex-string***

Specifies an optional substring match criteria. When a mask is specified, both hex-string lengths must be equal.

**Values** 0x0 to 0xFFFFFFFF (maximum 260 hex nibbles)

#### ***link-layer-address lla-hex-string***

Specifies a hexadecimal value for a link layer address field match of a type 1 (DUID-LLT) or type 3 (DUID-LL) client DUID in the client identifier option. When the actual length of the link layer address field is longer than the length of the specified hex-string, only the

left most octets are matched. Up to four DHCPv6 client-identifier match criteria can be specified per routing instance.

**Values** 0x0 to 0xFFFFFFFF (maximum 252 hex nibbles)

### ***sap-id***

Specifies an existing SAP identifier. Up to four DHCPv6 SAP match criteria can be specified per routing instance.

## **Platforms**

All

## **dhcp6**

### **Syntax**

**dhcp6** *type* **direction** {**ingress** | **egress**} **script** *script*

**no dhcp6** *type* **direction** {**ingress** | **egress**}

### **Context**

[\[Tree\]](#) (config>python>py-policy dhcp6)

### **Full Context**

configure python python-policy dhcp6

### **Description**

This command specifies the Python script for the specified DHCPv6 packet type in the specified direction.

Multiple **dhcps** command configurations are allowed in the same Python policy.

The **no** form of this command reverts to the default.

### **Parameters**

#### ***type***

Specifies the message type of the event.

**Values** solicit, advertise, request, confirm, renew, rebind, reply, release, decline, reconfigure, info-request, relay-forward, relay-reply

#### **direction {ingress | egress}**

Specifies whether the event is incoming or outgoing.

#### ***script***

Specifies the name of the Python script, up to 32 characters, that will be used to handle the specified message.

## **Platforms**

All

## dhcp6

### Syntax

dhcp6

### Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>wlan-gw>ranges dhcp6)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>wlan-gw>ranges dhcp6)

### Full Context

configure service vprn subscriber-interface group-interface wlan-gw ranges dhcp6

configure service ies subscriber-interface group-interface wlan-gw ranges dhcp6

### Description

Commands in this context create DHCPv6 configuration for WLAN-GW ISA subscribers.

## dhcp6

### Syntax

[no] dhcp6

### Context

[\[Tree\]](#) (config>service>vprn>if>sap>ipsec-gateway dhcp6)

[\[Tree\]](#) (config>service>ies>if>sap>ipsec-gateway dhcp6)

### Full Context

configure service vprn interface sap ipsec-gateway dhcp6

configure service ies interface sap ipsec-gateway dhcp6

### Description

Commands in this context configure DHCPv6-based address assignment for IKEv2 remote-access tunnels.

The system acts as a DHCPv6 client on behalf of the IPsec client, and also acts as a relay agent to relay DHCPv6 packets to the DHCPv6 server.

DHCPv6 exchange happens during IKEv2 remote-access tunnel setup. The system also supports standard renew.

### Default

no dhcp6

## 8.162 dhcp6-address

### dhcp6-address

#### Syntax

**dhcp6-address** *ipv6-address*

**no dhcp6-address**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>ue-query dhcp6-address)

#### Full Context

configure subscriber-mgmt wlan-gw ue-query dhcp6-address

#### Description

This command enables matching on UEs with the specified DHCPv6 IA-NA address.

The **no** form of this command disables matching on the IA-NA address.

#### Default

no dhcp6-address

#### Parameters

##### *ipv6-address*

Specifies the IA-NA address.

##### Values

|              |                                     |
|--------------|-------------------------------------|
| ipv6-address | x:x:x:x:x:x:x (eight 16-bit pieces) |
|              | x:x:x:x:x:d.d.d.d                   |
|              | x: [0 to FFFF]H                     |
|              | d: [0 to 255]D                      |

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.163 dhcp6-filter

## dhcp6-filter

### Syntax

**dhcp6-filter** *filter-id* [**create**]

**no dhcp6-filter**

### Context

[\[Tree\]](#) (config>filter dhcp6-filter)

### Full Context

configure filter dhcp6-filter

### Description

Commands in this context create and configure the specified DHCPv6 filter policy.

The **no** form of this command reverts to the default.

### Parameters

#### *filter-id*

Specifies the DHCPv6 filter policy ID expressed as a decimal integer.

**Values** 1 to 65535

#### **create**

Keyword required to create the configuration context.

### Platforms

All

## 8.164 dhcp6-options

## dhcp6-options

### Syntax

[**no**] **dhcp6-options**

### Context

[\[Tree\]](#) (config>subscr-mgmt>auth-plcy>include dhcp6-options)

### Full Context

configure subscriber-mgmt authentication-policy include-radius-attribute dhcp6-options

## Description

This command copies DHCPv6 options from received DHCPv6 messages on ingress access and pass them to the RADIUS server in Accept-Request. The messages is carried in the RADIUS VSA Alc-ToServer-Dhcp6-Options.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## dhcp6-options

## Syntax

[no] dhcp6-options

## Context

[\[Tree\]](#) (config>aaa>isa-radius-plcy>acct-include-attributes dhcp6-options)

## Full Context

configure aaa isa-radius-policy acct-include-attributes dhcp6-options

## Description

If a DHCPv6 stack is active for a UE, this attribute defines if options received in the last DHCPv6 message should be reflected.

## Default

no dhcp6-options

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## dhcp6-options

## Syntax

[no] dhcp6-options

## Context

[\[Tree\]](#) (config>aaa>isa-radius-plcy>auth-include-attributes dhcp6-options)

## Full Context

configure aaa isa-radius-policy auth-include-attributes dhcp6-options

### Description

If authentication was triggered by DHCPv6, this knob defines if options received in that DHCPv6 message should be reflected in the radius Access-Request.

### Default

no dhcp6-options

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.165 dhcp6-python-policy

### dhcp6-python-policy

#### Syntax

**dhcp6-python-policy** *policy-name*

**no dhcp6-python-policy**

#### Context

[\[Tree\]](#) (config>service>vpls>sap dhcp6-python-policy)

#### Full Context

configure service vpls sap dhcp6-python-policy

#### Description

This command specified the Python policy for DHCPv6 packets sent/received on the capture SAP. The **no** form of this command removes the policy name from the configuration.

#### Parameters

*policy name*

Specifies an existing Python policy name, up to 256 characters.

#### Platforms

All

## 8.166 dhcp6-relay

## dhcp6-relay

### Syntax

[no] dhcp6-relay

### Context

[\[Tree\]](#) (config>service>ies>if>ipv6 dhcp6-relay)

[\[Tree\]](#) (config>service>vprn>if>ipv6 dhcp6-relay)

### Full Context

configure service ies interface ipv6 dhcp6-relay

configure service vprn interface ipv6 dhcp6-relay

### Description

Commands in this context configure DHCPv6 relay parameters for the interface.

The **no** form of this command disables DHCPv6 relay.

### Platforms

All

## 8.167 dhcp6-server

## dhcp6-server

### Syntax

[no] dhcp6-server

### Context

[\[Tree\]](#) (config>service>vprn>if>ipv6 dhcp6-server)

[\[Tree\]](#) (config>service>ies>if>ipv6 dhcp6-server)

### Full Context

configure service vprn interface ipv6 dhcp6-server

configure service ies interface ipv6 dhcp6-server

### Description

Commands in this context configure DHCPv6 server parameters for the interface.

The **no** form of this command disables the DHCP6 server.

## Platforms

All

## 8.168 dhcp6-user-db

```
dhcp6-user-db
```

### Syntax

```
dhcp6-user-db local-user-db
```

```
no dhcp6-user-db
```

### Context

[\[Tree\]](#) (config>service>vpls>sap dhcp6-user-db)

### Full Context

```
configure service vpls sap dhcp6-user-db
```

### Description

This command enabled access to LUDB for DHCPv6 hosts under the capture SAP. The name of this LUDB must match the name of the LUDB configured under the **config>service>vprn/ies>sub-if>grp-if>dhcp** hierarchy.

The **no** form of this command reverts to the default.

### Parameters

*local-user-db*

Specifies the name of the local-user-database, up to 32 characters.

## Platforms

All

## 8.169 dhcpv4

```
dhcpv4
```

### Syntax

```
dhcpv4
```

### Context

[\[Tree\]](#) (config>service>vprn>subscriber-mgmt dhcpv4)

[\[Tree\]](#) (config>router>subscriber-mgmt dhcpv4)

### Full Context

```
configure service vprn subscriber-mgmt dhcpv4
configure router subscriber-mgmt dhcpv4
```

### Description

Commands in this context configure DHCPv4 parameters that apply to this routing instance.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.170 dhcpv4-nat

dhcpv4-nat

### Syntax

```
dhcpv4-nat
```

### Context

[\[Tree\]](#) (config>service>ies>sub-if>wlan-gw>pool-manager>dhcp6-client dhcpv4-nat)

[\[Tree\]](#) (config>service>vprn>sub-if>wlan-gw>pool-manager>dhcp6-client dhcpv4-nat)

### Full Context

```
configure service ies subscriber-interface wlan-gw pool-manager dhcpv6-client dhcpv4-nat
configure service vprn subscriber-interface wlan-gw pool-manager dhcpv6-client dhcpv4-nat
```

### Description

This node enables address pools for DHCPv4 NAT inside addresses. This configuration is only available in wholesale interfaces.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.171 dhcpv6-client

## dhcpv6-client

### Syntax

**dhcpv6-client**

### Context

**[Tree]** (config>service>vprn>sub-if>wlan-gw>pool-manager dhcpv6-client)

**[Tree]** (config>service>ies>sub-if>wlan-gw>pool-manager dhcpv6-client)

### Full Context

configure service vprn subscriber-interface wlan-gw pool-manager dhcpv6-client

configure service ies subscriber-interface wlan-gw pool-manager dhcpv6-client

### Description

This command configures the DHCPv6 client for the pool manager.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.172 diameter

## diameter

### Syntax

**diameter** *type* **direction** {**ingress** | **egress**} **script** *script*

**no diameter** *type* **direction** {**ingress** | **egress**}

### Context

**[Tree]** (config>python>py-policy diameter)

### Full Context

configure python python-policy diameter

### Description

This command specifies the Python script to use for the specified Diameter message type in the specified direction.

Multiple diameter command configurations are allowed in the same Python policy.

The **no** form of this command reverts to the default.

## Parameters

### *type*

Specifies the message type.

| Message type                        | Application | Direction      |
|-------------------------------------|-------------|----------------|
| aaa – AA Answer                     | Nasreq      | ingress        |
| aar – AA Request                    | Nasreq      | egress         |
| asa – Abort Session Answer          | Gx, Gy      | egress         |
| asr – Abort Session Request         | Gx, Gy      | ingress        |
| cca – Credit Control Answer         | Gx, Gy      | ingress        |
| ccr – Credit Control Request        | Gx, Gy      | egress         |
| cea – Capabilities Exchange Answer  | Base        | ingress        |
| cer – Capabilities Exchange Request | Base        | egress         |
| dpa – Disconnect Peer Answer        | Base        | ingress/egress |
| dpr – Disconnect Peer Request       | Base        | ingress/egress |
| dwa – Device Watchdog Answer        | Base        | ingress/egress |
| dwr – Device Watchdog Request       | Base        | ingress/egress |
| raa – Re-Authentication Answer      | Gx, Gy      | egress         |
| rar – Re-Authentication Request     | Gx, Gy      | ingress        |

### **direction {ingress | egress}**

Specifies if the message is incoming or outgoing.

### *script*

Specifies the name of the Python script, up to 32 characters, that is used to handle the specified message.

## Platforms

All

## diameter

## Syntax

**diameter**

## Context

**[Tree]** (config>aaa diameter)

## Full Context

configure aaa diameter

## Description

Commands in this context configure Diameter parameters.

## Syntax

diameter

## Context

[\[Tree\]](#) (config>app-assure>group>transit-ip diameter)

## Full Context

configure application-assurance group transit-ip-policy diameter

## Description

Commands in this context configure dynamic Diameter-based management of transit AA subs for the transit IP policy. This is mutually exclusive to other types of management of transit subs for a given transit IP policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.173 diameter-application-policy

### diameter-application-policy

#### Syntax

**diameter-application-policy** *policy-name*

**no diameter-application-policy**

#### Context

**[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host diameter-application-policy)

**[Tree]** (config>service>vpls>sap diameter-application-policy)

**[Tree]** (config>subscr-mgmt>loc-user-db>ppp>host diameter-application-policy)

**[Tree]** (config>service>vprn>sub-if>grp-if diameter-application-policy)

**[Tree]** (config>service>ies>sub-if>grp-if diameter-application-policy)

#### Full Context

configure subscriber-mgmt local-user-db ipoe host diameter-application-policy

configure service vpls sap diameter-application-policy

configure subscriber-mgmt local-user-db ppp host diameter-application-policy

configure service vprn subscriber-interface group-interface diameter-application-policy

configure service ies subscriber-interface group-interface diameter-application-policy

#### Description

This command applies the **diameter-application-policy** to the processing of the host attachment requests.

The **no** form of this command reverts to the default value.

#### Parameters

***policy-name***

Specifies the name of the diameter policy, up to 32 characters.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn subscriber-interface group-interface diameter-application-policy
- configure subscriber-mgmt local-user-db ipoe host diameter-application-policy

- configure subscriber-mgmt local-user-db ppp host diameter-application-policy
- configure service ies subscriber-interface group-interface diameter-application-policy

All

- configure service vpls sap diameter-application-policy

## diameter-application-policy

### Syntax

**diameter-application-policy** *application-policy-name* [**create**]

**no diameter-application-policy** *application-policy-name*

### Context

[\[Tree\]](#) (config>subscr-mgmt diameter-application-policy)

### Full Context

configure subscriber-mgmt diameter-application-policy

### Description

Commands in this context create and configure diameter application policy.

The **no** form of this command reverts to the default.

### Parameters

***application-policy-name***

Specifies the name of the diameter policy, up to 32 characters.

**create**

Specifies the keyword used to create a diameter application policy. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.174 diameter-auth-policy

## diameter-auth-policy

### Syntax

**diameter-auth-policy** *name*

**no diameter-auth-policy**

## Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe>host diameter-auth-policy)

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp>host diameter-auth-policy)

## Full Context

configure subscriber-mgmt local-user-db ipoe host diameter-auth-policy

configure subscriber-mgmt local-user-db ppp host diameter-auth-policy

## Description

This command is used to configure the Diameter NASREQ application policy to use for authentication.

The **no** form of this command reverts to the default.

## Parameters

### *name*

Specifies the name of the Diameter NASREQ application policy, up to 32 characters, to use for authentication.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## diameter-auth-policy

## Syntax

**diameter-auth-policy** *diameter-authentication-policy-name*

**no diameter-auth-policy**

## Context

[\[Tree\]](#) (config>subscr-mgmt>gtp>apn-policy>apn diameter-auth-policy)

## Full Context

configure subscriber-mgmt gtp apn-policy apn diameter-auth-policy

## Description

This command configures the Diameter authentication policy with which the GTP connection is authenticated.

The **no** form of this command removes the authentication policy. Only new session setups are affected.

## Default

no diameter-auth-policy

## Parameters

*diameter-authentication-policy-name*

Specifies the name of the authentication policy to be used, up to 32 characters.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## diameter-auth-policy

### Syntax

**diameter-auth-policy** *name*

**no diameter-auth-policy**

### Context

[\[Tree\]](#) (config>service>vpls>sap diameter-auth-policy)

### Full Context

configure service vpls sap diameter-auth-policy

### Description

This command is used to configure the Diameter NASREQ application policy to use for authentication.

The **no** form of this command reverts to the default value.

### Parameters

*name*

Specifies the name of the Diameter NASREQ application policy, up to 32 characters, to use for authentication.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## diameter-auth-policy

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if diameter-auth-policy)

### Full Context

configure service ies subscriber-interface group-interface diameter-auth-policy

```
configure service vprn subscriber-interface group-interface diameter-auth-policy
```

### Description

This command is used to configure the Diameter NASREQ application policy to use for authentication. The **no** form of this command reverts to the default.

### Parameters

#### *name*

Specifies the name of the Diameter NASREQ application policy, up to 32 characters, to use for authentication.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.175 diameter-node

### diameter-node

### Syntax

```
diameter-node origin-host-string destination-realm destination-realm-string
no diameter-node
```

### Context

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy diameter-node)

### Full Context

```
configure subscriber-mgmt diameter-application-policy diameter-node
```

### Description

This command configures the Diameter node for this Diameter application policy.

### Parameters

#### *origin-host-string*

Specifies the Origin-Host AVP used by this Diameter policy, up to 80 characters.

#### *destination-realm-string*

Specifies the Destination-Realm AVP used by this Diameter policy peer, up to 80 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.176 diff

```
diff
```

### Syntax

```
diff
```

### Context

[\[Tree\]](#) (config>app-assure>group>policy diff)

### Full Context

```
configure application-assurance group policy diff
```

### Description

This command compares the newly configured policy against the operational policy.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.177 diffserv-te

```
diffserv-te
```

### Syntax

```
diffserv-te [mam | rdm]
```

```
no diffserv-te
```

### Context

[\[Tree\]](#) (config>router>rsvp diffserv-te)

### Full Context

```
configure router rsvp diffserv-te
```

### Description

This command enabled Diff-Serv TE on the node.

When this command is enabled, IS-IS and OSPF will start advertising available bandwidth for each TE class configured under the diffserv-te node. This command will only have effect if the operator has already enabled TE at the IS-IS and/or OSPF routing protocol levels:

**config>router>isis>traffic-engineering**

and/or:

**config>router>ospf>traffic-engineering**

IGP will advertise for each RSVP interface in the system the available bandwidth in each TE class in the unreserved bandwidth TE parameter for that class. In addition, IGP will continue to advertise the existing Maximum Reservable Link Bandwidth TE parameter to mean the maximum bandwidth that can be booked on a given interface by all classes. The value advertised is adjusted with the link **subscription percentage** factor configured in the **config>router>rsvp>interface** context.

The user configures the following parameters for the operation of Diff-Serv:

- Definition of TE classes, TE Class = {Class Type (CT), LSP priority}.
- Mapping of the system forwarding classes to the Diff-Serv Class Type (CT).
- Configuration of the percentage of RSVP interface bandwidth each CT shares, that is, the Bandwidth Constraint (BC).

When Diff-Serv TE is enabled, the system will automatically enable the Max Allocation Model (MAM) Admission Control Policy. MAM represents the bandwidth constraint model for the admission control of an LSP reservation to a link. This is the only Admission Control Policy supported in this release.

Each CT shares a percentage of the Maximum Reservable Link Bandwidth through the user-configured Bandwidth Constraint (BC) for this CT. The Maximum Reservable Link Bandwidth is the link bandwidth multiplied by the RSVP interface subscription factor.

The sum of all BC values across all CTs will not exceed the Maximum Reservable Link Bandwidth. In other words, the following rule is enforced:

$$\text{SUM (BCc)} \leq \text{Max-Reservable-Bandwidth}, 0 \leq c \leq 7$$

An LSP of class-type CT<sub>c</sub>, setup priority p, holding priority h (h=<p), and bandwidth B is admitted into a link if the following condition is satisfied:

$$B \leq \text{Unreserved Bandwidth for TE-Class}[i]$$

where TE-Class [i] maps to < CT<sub>c</sub>, p > in the definition of the TE classes on the node. The bandwidth reservation is effected at the holding priority, that is, in TE-class [j] = <CT<sub>c</sub>, h>. Thus, the reserved bandwidth for CT<sub>c</sub> and the unreserved bandwidth for the TE classes using CT<sub>c</sub> are updated as follows:

$$\text{Reserved}(CT_c) = \text{Reserved}(CT_c) + B$$

$$\text{Unreserved TE-Class [j]} = BC_c - \text{SUM} (\text{Reserved}(CT_c, q)) \text{ for } 0 \leq q \leq h$$

$$\text{Unreserved TE-Class [i]} = BC_c - \text{SUM} (\text{Reserved}(CT_c, q)) \text{ for } 0 \leq q \leq p$$

The same is done to update the unreserved bandwidth for any other TE class making use of the same CT<sub>c</sub>. These new values are advertised to the rest of the network at the next IGP-TE flooding.

The Russian Doll Model (RDM) LSP admission control policy allows bandwidth sharing across Class Types. It provides a hierarchical model by which the reserved bandwidth of a CT is the sum of the reserved bandwidths of the numerically equal and higher CTs.

The RDM model is defined using the following equations:

$$\text{SUM} (\text{Reserved} (CT_c)) \leq BC_b,$$

where the SUM is across all values of c in the range  $b \leq c \leq (\text{MaxCT} - 1)$ , and BC<sub>b</sub> is the bandwidth constraint of CT<sub>b</sub>.

BC<sub>0</sub>= Max-Reservable-Bandwidth, so that

$SUM (Reserved(CTc)) \leq \text{Max-Reservable-Bandwidth}$ ,

where the SUM is across all values of c in the range  $0 \leq c \leq (\text{MaxCT} - 1)$ .

When Diff-Serv is disabled on the node, this model degenerates into a single default CT internally with eight preemption priorities and a non-configurable BC equal to the Maximum Reservable Link Bandwidth. This would behave exactly like CT0 with eight preemption priorities and BC= Maximum Reservable Link Bandwidth if Diff-Serv was enabled.

The enabling or disabling of Diff-Serv TE on the system requires the RSVP and MPLS protocol be shutdown.

The **no** form of this command reverts to the default value.

### Default

no diffserv-te

### Parameters

**mam**

Defines the default admission control policy for Diff-Serv LSPs.

**rdm**

Defines Russian doll model for the admission control policy of Diff-Serv LSPs.

### Platforms

All

## 8.178 digest-type

### digest-type

#### Syntax

**digest-type** {**default** | **none** | **md5** | **sha1**}

**no digest-type**

#### Context

**[Tree]** (config>service>vprn>l2tp>l2tpv3 digest-type)

**[Tree]** (config>service>vprn>l2tp>group>l2tpv3 digest-type)

#### Full Context

configure service vprn l2tp l2tpv3 digest-type

configure service vprn l2tp group l2tpv3 digest-type

#### Description

This command configures the hashing algorithm used to calculate the message digest.

The **no** form of this command returns the **digest-type** to **none**.

### Default

no digest-type

### Parameters

#### none

Specifies that no digest should be used.

#### md5

Specifies that the MD5 algorithm should be used.

#### sha1

Specifies that the SHA1 algorithm should be used.

#### default

When specified within the **config>service>vprn>l2tp>group>l2tpv3** context, this is referencing to the **digest-type** configuration within the **config>service>vprn>l2tp>l2tpv3** context.

## 8.179 digital-coherent-optics

### digital-coherent-optics

### Syntax

[no] digital-coherent-optics

### Context

[\[Tree\]](#) (config>port>transceiver digital-coherent-optics)

### Full Context

configure port transceiver digital-coherent-optics

### Description

This command specifies if a digital coherent optics module is used for this port.

The **no** form of this command specifies that the optical module used in this port is not a digital coherent optics module.

### Default

no digital-coherent-optics

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**8.180 dir****dir****Syntax****dir** [*file-url*] [**sort-order** { **d** | **n** | **s**}] [**reverse**]**Context**[\[Tree\]](#) (file dir)**Full Context**

file dir

**Description**

This command displays a list of files and subdirectories in a directory.

**Parameters*****file-url***

Specifies the path or directory name.

Use the *file-url* with the optional wildcard (\*) to reduce the number of files to list.**sort-order {d | n | s}**

Specifies the sort order.

|               |          |
|---------------|----------|
| <b>Values</b> | d — date |
|               | n — name |
|               | s — size |

**reverse**

Reverses the sort order.

**Default** Lists all files in the current working directory.

|            |                                                                                                                                           |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| local-url  | [ <i>cflash-id</i> ][ <i>file-path</i> ] up to 200 characters, including <i>cflash-id</i> directory length up to 99 each                  |

## Output

The following output is an example of directory information.

### Output Example

```
A:cses-E12>file cf3:\ # dir
- dir [<file-url>] [sort-order { d | n | s}] [reverse]

<file-url> : <local-url> | <remote-url>
local-url - [<cflash-id>][<file-path>]
 200 chars max, including cflash-id
 directory length 99 chars max each
remote-url - [ftp://<login>:<pswd>@<remote-locn>/
][<file-path>]
 255 chars max
 directory length 99 chars max each
remote-locn - [<hostname> | <ipv4-address> |
 [<ipv6-address>]]
ipv4-address - a.b.c.d
ipv6-address - x:x:x:x:x:x:x:x[-interface]
 x:x:x:x:x:x:d.d.d.d[-interface]
 x - [0..FFFF]H
 d - [0..255]D
 interface - 32 chars max, for link
 local addresses
cflash-id - cf1:|cf1-A:|cf1-B:|cf2:|cf2-A:|
 cf2-B:|cf3:|cf3-A:|cf3-B:

< d | n | s> : Sort order: d - date, n - name, s - size
<reverse> : keyword - reverse order
A:cses-E12>file cf3:\ # dir
```

## 8.181 direction

### direction

#### Syntax

**direction** *direction*

#### Context

**[Tree]** (debug>router>l2tp>peer>packet direction)

**[Tree]** (debug>router>l2tp>assignment-id>packet direction)

**[Tree]** (debug>router>l2tp>packet direction)

**[Tree]** (debug>router>l2tp>group>packet direction)

#### Full Context

debug router l2tp peer packet direction

debug router l2tp assignment-id packet direction

debug router l2tp packet direction

debug router l2tp group packet direction

#### Description

This command enables debugging for packet direction.

#### Parameters

***direction***

Specifies the packet direction.

**Values** ingress, egress, both

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### direction

#### Syntax

**direction** {**ingress** | **egress** | **both**}

#### Context

**[Tree]** (debug>subscr-mgmt>vrgw>brg>pppoe-client>brg-id direction)

## Full Context

```
debug subscriber-mgmt vrgw brg pppoe-client brg-id direction
```

## Description

This command specifies if debugging should only include ingress, egress or all messages.

## Default

```
direction both
```

## Parameters

### ingress

Specifies that debugging only includes ingress messages.

### egress

Specifies that debugging only includes egress messages.

### both

Specifies that debugging includes both ingress and egress messages.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## direction

## Syntax

```
direction ipsec-direction
```

```
no direction
```

## Context

[\[Tree\]](#) (config>ipsec>static-sa direction)

## Full Context

```
configure ipsec static-sa direction
```

## Description

This command configures the direction for an IPsec manual SA.

The **no** form of this command reverts to the default value.

## Default

```
direction bidirectional
```

## Parameters

### *ipsec-direction*

Identifies the direction to which this static SA entry can be applied.

**Values** inbound, outbound, bidirectional

## Platforms

All

## direction

## Syntax

**direction** *direction*

## Context

[\[Tree\]](#) (debug>router>pcp>pcp-server>packet direction)

## Full Context

debug router pcp pcp-server packet direction

## Description

This command enables debugging for packet direction.

## Parameters

***direction***

Specifies the packet direction.

**Values** ingress, egress, both

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## direction

## Syntax

**direction**

## Context

[\[Tree\]](#) (config>system>security>keychain direction)

## Full Context

configure system security keychain direction

## Description

This command specifies the data type that indicates the TCP stream direction to apply the keychain.

## Platforms

## 8.182 direction-bit

### direction-bit

#### Syntax

[no] direction-bit

#### Context

[\[Tree\]](#) (config>mirror>mirror-dest>encap>layer-3-encap direction-bit)

#### Full Context

configure mirror mirror-dest encap layer-3-encap direction-bit

#### Description

This command is used to steal one bit from the intercept-id in the LI-Shim and use it to indicate the direction of traffic flow for an LI session. Using a direction bit may be used by a LI Mediation Gateway to distinguish between the two directions of traffic flow for an LI session when both directions share a common mirror-dest, intercept-id and session-id. If the direction bit is enabled then the Mirror Header Version (2 bit mhv) in the LI-Shim will be set to binary 01, and the next bit after the mhv is set to 0 for ingress traffic and 1 for egress traffic.

For NAT based LI, ingress means the traffic is arriving at the node from the subscriber host (applies to the 7450 ESS and 7750 SR).

No changes are allowed to the **direction-bit** configuration once a gateway is configured.

## Platforms

All

### direction-bit

#### Syntax

[no] direction-bit

#### Context

[\[Tree\]](#) (config>li>mirror-dest-template>layer-3-encap direction-bit)

#### Full Context

configure li mirror-dest-template layer-3-encap direction-bit

## Description

This command enables and disables the use of one bit from the interception ID field in the LI-Shim header to be used to indicate the direction of mirrored traffic flow for an LI session. An LI Mediation Gateway can use a direction bit to distinguish between the two directions of traffic flow for an LI session when both directions share a common mirror destination, interception ID, and session ID. If the direction bit is enabled, the Mirror Header Version (2-bit MHV) in the LI-Shim header will be set to binary 01, and the next bit after the MHV is set to 0 for ingress traffic and 1 for egress traffic.

For NAT-based LI, ingress traffic arrives at the node from the subscriber host. No changes are allowed to the direction bit configuration after a gateway is configured.

The **no** form of this command disables the use of the bit as a direction indicator.

## 8.183 disable

disable

### Syntax

[no] disable

### Context

[\[Tree\]](#) (config>call-trace>location disable)

### Full Context

configure call-trace location disable

### Description

When configured, the specified compact flash will not be used by call-trace. The **no** form of this command enables the compact flash for use by call-trace.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.184 disable-4byte-asn

## disable-4byte-asn

### Syntax

[no] disable-4byte-asn

### Context

[\[Tree\]](#) (config>subscr-mgmt>bgp-prng-plcy disable-4byte-asn)

### Full Context

configure subscriber-mgmt bgp-peering-policy disable-4byte-asn

### Description

This command disables the use of 4-byte ASNs. It can be configured at all 3 level of the hierarchy so it can be specified down to the per peer basis.

If this command is enabled 4-byte ASN support should not be negotiated with the associated remote peer.

The **no** form of this command resets the behavior to the default which is to enable the use of 4-byte ASN.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## disable-4byte-asn

### Syntax

[no] disable-4byte-asn

### Context

## 8.185 disable-aging

## disable-aging

### Syntax

[no] disable-aging

## Context

- [Tree] (config>service>vpls>sap disable-aging)
- [Tree] (config>service>template>vpls-template disable-aging)
- [Tree] (config>service>vpls>spoke-sdp disable-aging)
- [Tree] (config>service>vpls>vxlan disable-aging)
- [Tree] (config>service>vpls disable-aging)

## Full Context

```
configure service vpls sap disable-aging
configure service template vpls-template disable-aging
configure service vpls spoke-sdp disable-aging
configure service vpls vxlan disable-aging
configure service vpls disable-aging
```

## Description

This command disables MAC address aging across a VPLS service, on a VPLS service SAP or spoke-SDP, or VXLAN instance with static binds. Learned MACs can be aged out if no packets are sourced from the MAC address for a period of time (aging time). In each VPLS service instance, there are independent aging timers for local learned MAC and remote learned MAC entries in the VPLS forwarding database (FDB).

The **disable-aging** command turns off aging for local and remote learned MAC addresses. When **no disable-aging** is specified for a VPLS, aging can be disabled for specific SAPs, spoke-SDPs, and VXLAN instances (or any combination) by entering the **disable-aging** command at the appropriate level.

When the **disable-aging command** is entered at the VPLS level, the aging state of individual SAPs or SDPs or VXLAN instance is ignored.

The **no** form of this command enables aging on the VPLS service.

## Default

```
no disable-aging
```

Except for VXLAN instances, where the **disable-aging** is the default mode

## Platforms

All

- configure service template vpls-template disable-aging
- configure service vpls disable-aging

## 8.188 disable-communities

**disable-communities****Syntax**

**disable-communities** [standard] [extended]

**no disable-communities**

## Context

[\[Tree\]](#) (config>subscr-mgmt>bgp-prng-plcy disable-communities)

## Full Context

configure subscriber-mgmt bgp-peering-policy disable-communities

## Description

This command configures BGP to disable sending communities.

The **no** form of this command reverts to the default.

## Parameters

### standard

Specifies standard communities that existed before VPRNs or 2547.

### extended

Specifies BGP communities used were expanded after the concept of 2547 was introduced, to include handling the VRF target.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## disable-communities

## Syntax

**disable-communities** [**standard**] [**extended**] [**large**]

**no disable-communities**

## Context

[\[Tree\]](#) (config>service>vprn>bgp>group>neighbor disable-communities)

[\[Tree\]](#) (config>service>vprn>bgp>group disable-communities)

[\[Tree\]](#) (config>service>vprn>bgp disable-communities)

## Full Context

configure service vprn bgp group neighbor disable-communities

configure service vprn bgp group disable-communities

configure service vprn bgp disable-communities

## Description

This command configures BGP to disable sending standard, extended, or large communities to specific peers.

By default, all communities that are attached to a BGP route (any address family) are not stripped from the route when it is advertised to any type of peer: IBGP, EBGP or confed-EBGP.

## Default

no disable-communities

## Parameters

### standard

Specifies that standard 4-byte communities should be removed.

### extended

Specifies that 8-byte extended communities (of all types) should be removed.

### large

Specifies that 12-byte large communities should be removed.

## Platforms

All

## disable-communities

## Syntax

**disable-communities** [**standard**] [**extended**] [**large**]

**no disable-communities**

## Context

[\[Tree\]](#) (config>router>bgp disable-communities)

## 8.189 disable-cookies

### disable-cookies

**Syntax**

[no] disable-cookies

**Context**

[\[Tree\]](#) (config>subscr-mgmt>ppp-policy disable-cookies)

**Full Context**

configure subscriber-mgmt ppp-policy disable-cookies

**Description**

This command disables the use of cookies.

The **no** form of this command enables cookies.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.190 disable-explicit-null

### disable-explicit-null

**Syntax**

[no] disable-explicit-null

**Context**

[\[Tree\]](#) (config>router>bgp>label-allocation>label-ipv6 disable-explicit-null)

## Full Context

```
configure router bgp label-allocation label-ipv6 disable-explicit-null
```

## Description

This command controls the allocation and use of explicit null MPLS labels with labeled-unicast ipv6 routes.

When this command is enabled (**no disable-explicit-null**), the following behaviors apply:

- during the times when the router is required to act as the BGP next-hop of a label-unicast IPv6 route that it is advertising, it sets the BGP label value to IPv6 explicit null (value 2), forcing a POP behavior for received packets.
- received label-unicast IPv6 routes never create tunnels in TTM that can be used to resolve other BGP routes (with an IPv6 next-hop).
- a received label-unicast IPv6 route can be resolved by a label-ipv4 BGP tunnel that is transported over a stacked tunnel (SR-TE LSP or LDPoRSVP LSP)

When this command is disabled (**disable-explicit-null**), the following behaviors apply:

- during those times when the router is required to act as the BGP next-hop of a label-unicast IPv6 route that it is advertising, it sets the BGP label value to a proper value in the dynamic label range and programs a POP or SWAP operation for that label, depending on the origin of the route and various import policy actions that could apply to the route
- received label-unicast IPv6 routes that have a prefix length of 128 bits are automatically installed in TTM so that they can be used to resolve other (non-labeled-unicast) BGP routes (with an IPv6 next-hop)
- a received label-unicast ipv6 route cannot be resolved by a label-ipv4 BGP tunnel that is transported over a stacked tunnel (SR-TE LSP or LDPoRSVP LSP)
- the label-ipv6 routes used for ECMP towards an IPv6 destination cannot be a mix of routes with regular label values and routes with special (IPv6 explicit null) label values

Changes in the operational status do not cause the BGP sessions of the base router to reset.

## 8.193 disable-ldp-sync

## disable-ldp-sync

### Syntax

[no] disable-ldp-sync

### Context

[\[Tree\]](#) (config>router>isis disable-ldp-sync)

### Full Context

configure router isis disable-ldp-sync

### Description

This command disables the IGP-LDP synchronization feature on all interfaces participating in the OSPF or IS-IS routing protocol. When this command is executed, IGP immediately advertises the actual value of the link cost for all interfaces which have the IGP-LDP synchronization enabled if the currently advertised cost is different. It will then disable IGP-LDP synchronization for all interfaces. This command does not delete the interface configuration. The **no** form of this command has to be entered to re-enable IGP-LDP synchronization for this routing protocol.

The **no** form of this command restores the default settings and re-enables IGP-LDP synchronization on all interfaces participating in the OSPF or IS-IS routing protocol and for which the ldp-sync-timer is configured.

### Default

no disable-ldp-sync

### Platforms

All

## disable-ldp-sync

## 8.194 disable-learning

### disable-learning

#### Syntax

[no] **disable-learning**

#### Context

**[Tree]** (config>service>vpls>sap disable-learning)

**[Tree]** (config>service>vpls>vxlan disable-learning)

**[Tree]** (config>service>vpls disable-learning)

**[Tree]** (config>service>template>vpls-template disable-learning)

**[Tree]** (config>service>vpls>spoke-sdp disable-learning)

#### Full Context

configure service vpls sap disable-learning

configure service vpls vxlan disable-learning

configure service vpls disable-learning

configure service template vpls-template disable-learning

configure service vpls spoke-sdp disable-learning

#### Description

This command disables learning of new MAC addresses in the VPLS forwarding database (FDB) for the service instance, SAP instance, spoke-SDP instance, or VXLAN instance.

When **disable-learning** is enabled, new source MAC addresses are not entered in the VPLS service forwarding database. This applies for both local and remote MAC addresses.

When **no disable-learning** is specified for a VPLS on a 7450 ESS, it is possible to disable learning for specific SAPs and/or spoke SDPs by entering the **disable-learning command at the appropriate level**.

When **disable-learning** is disabled, new source MAC addresses are learned and entered into the VPLS forwarding database.

This parameter is mainly used in conjunction with the **discard-unknown** command.

The **no** form of this command enables learning of MAC addresses.

## Default

no disable-learning

Normal MAC learning is enabled. The default mode for VXLAN instances is **disable-learning**.

## Platforms

All

- configure service template vpls-template disable-learning
- configure service vpls sap disable-learning
- configure service vpls disable-learning
- configure service vpls spoke-sdp disable-learning

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure service vpls vxlan disable-learning

## disable-learning

[no] **disable-learning**

## Context

[\[Tree\]](#) (config>service>pw-template disable-learning)

## Full Context

configure service pw-template disable-learning

## Description

This command enables learning of new MAC addresses.

This parameter is mainly used in conjunction with the **discard-unknown** command.

The **no** form of this command enables learning of MAC addresses.

## Default

no disable-learning (Normal MAC learning is enabled)

## Platforms

All

## 8.195 disable-route-table-install

```
disable-route-table-install
```

### Syntax

**[no] disable-route-table-install**

### Context

**[Tree]** (config>router>bgp disable-route-table-install)

### Full Context

```
configure router bgp disable-route-table-install
```

### Description

This command disables the installation of all IPv4, label-ipv4, IPv6 and label-ipv6 routes into the route table and tunnel table associated with the BGP instance.

Configuring this command prevents the advertisement of all IPv4, label-ipv4, IPv6 and label-ipv6 routes if there is a change of the BGP next-hop to one of the router's own addresses. Typically, this is only useful on a router that is a control-plane route reflector (not in the datapath).

The **no** form of the command enables the installation of all IPv4, label-ipv4, IPv6 and label-ipv6 routes into the route table and tunnel table associated with the BGP instance.

### Default

```
no disable-route-table-install
```

## Platforms

All

```
disable-route-table-install
```

### Syntax

**[no] disable-route-table-install**

### Context

**[Tree]** (config>router>policy-options>policy-statement>default-action disable-route-table-install)

**[Tree]** (config>router>policy-options>policy-statement>entry>action disable-route-table-install)

**Full Context**

```
configure router policy-options policy-statement default-action disable-route-table-install
configure router policy-options policy-statement entry action disable-route-table-install
```

**Description**

This command specifies that BGP routes (IPv4, IPv6, label-ipv4, label-ipv6) matching the policy entry (or, depending on the context, the policy's default-action) should not be installed in the route table, tunnel table (in the case of label-ipv4 routes), or IP FIB table.

This policy action has an effect only in BGP peer import policies. This policy action does not prevent the matched routes from contributing toward aggregate routes and does not prevent the matched routes from being advertised, even if next-hop-self has been applied. This means that incorrect use of this feature can blackhole traffic.

Marking label-ipv4 routes with this action does not prevent label-swap (ILM) entries from being programmed when such routes are re-advertised with a new BGP next-hop and label.

The **no** form of this command provides the default behavior of installing routes that are selected as the best path, ECMP path or backup path, depending on the circumstances.

**Default**

```
no disable-route-table-install
```

**Platforms**

All

## 8.198 disable-send-bvpls-evpn-flush

disable-send-bvpls-evpn-flush

**Syntax**

**[no] disable-send-bvpls-evpn-flush**

**Context**

[\[Tree\]](#) (config>service>vpls>sap disable-send-bvpls-evpn-flush)

[\[Tree\]](#) (config>service>vpls>spoke-sdp disable-send-bvpls-evpn-flush)

**Full Context**

configure service vpls sap disable-send-bvpls-evpn-flush

configure service vpls spoke-sdp disable-send-bvpls-evpn-flush

**Description**

This command disables the ISID-based C-MAC flush indication when the corresponding SAP or spoke-SDP enters the operationally down state.

If the **send-bvpls-evpn-flush** is properly enabled, the **no** version of the command enables B-MAC/ISID route updates to be sent when the SAP or spoke-SDP is operationally down.

**Default**

no disable-send-bvpls-evpn-flush

## Platforms

All

## 8.199 disable-shcv

### disable-shcv

#### Syntax

[no] disable-shcv [alarm] [hold-time seconds]

#### Context

[\[Tree\]](#) (config>subscr-mgmt>ancp>policy>port-dwn disable-shcv)

#### Full Context

configure subscriber-mgmt ancp ancp-policy port-down disable-shcv

#### Description

When this command is configured, the node suspends SHCV for the hosts defined with this ANCP policy until the access node sends a port-up message. When the **hold-time** parameter is used, the node suspends SHCV for the period of time defined. If the **hold-time** parameter is not defined the node will suspend SHCV until a port-up message is received.

If the optional alarm flag is used, the node sends a SHCV alarm before suspending.

The **no** form of this command reverts to the default.

#### Parameters

##### alarm

Specifies that the node sends an alarm before suspending SHCV.

##### seconds

Specifies the time that the node suspends SHCV.

**Values** 0 to 7200

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.200 disable-soft-reset-extension

## disable-soft-reset-extension

### Syntax

[no] **disable-soft-reset-extension**

### Context

[\[Tree\]](#) (config>lag>bfd disable-soft-reset-extension)

### Full Context

configure lag bfd disable-soft-reset-extension

### Description

This command disables the automatic extension of BFD timers during an IOM/IMM soft-reset. Normally, BFD session timers are automatically extended during a soft-reset operation on the IOMs and IMM to avoid BFD sessions timing out and causing protocol events. However, in some cases this behavior is not desired as it could delay fast re-route transitions if the timers are in place. The **disable-soft-reset-extension** command controls this behavior.

### Default

no disable-soft-reset-extension

### Platforms

All

## 8.201 disable-stickness

## disable-stickness

### Syntax

[no] **disable-stickness**

### Context

[\[Tree\]](#) (config>aaa>radius-srv-plcy>servers disable-stickness)

### Full Context

configure aaa radius-server-policy servers disable-stickness

### Description

This command disables a subscriber RADIUS accounting session from sticking with a single server under normal working conditions. If a direct algorithm is used, all subscriber RADIUS sessions will go directly to the server with the lowest configured index. If a failure occurs, a new in-service server with the next lowest index is used. When the original server recovers, if stickiness is not disabled, all existing sessions will

continue to use the new server. This command disables stickiness, and as a result, the recovered original RADIUS server will again service every subscriber. If a round-robin algorithm is used and stickiness is not disabled, an accounting session for a particular subscriber (or host, depending on the accounting mode) will stay with the same server. This command removes the stickiness and all subscriber accounting messages will go through the list of servers in a round-robin manner.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.202 disable-targeted-session

disable-targeted-session

### Syntax

[no] disable-targeted-session

### Context

[\[Tree\]](#) (config>router>ldp>targ-session disable-targeted-session)

### Full Context

configure router ldp targeted-session disable-targeted-session

### Description

This command disables support for SDP triggered automatic generated targeted sessions. Targeted sessions are LDP sessions between non-directly connected peers. The discovery messages for an indirect LDP session are addressed to the specified peer and not to the multicast address.

The **no** form of this command enables the set up of any targeted sessions.

### Default

no disable-targeted-session

### Platforms

All

## 8.203 disallow-igmp

disallow-igmp

### Syntax

[no] disallow-igmp

## Context

[\[Tree\]](#) (config>router>static-route-entry>indirect>tunnel-next-hop disallow-igp)

## Full Context

configure router static-route-entry indirect tunnel-next-hop disallow-igp

## Description

This optional command determines if the associated static route can be resolved via an IGP next-hop in the RTM if no tunnel next-hops are found in TTM.

When configured, the associated static route will not be resolved to an available IGP route in the RTM.

The **no** form of this command returns the behavior to the default, which allows the static route to be resolved via an IGP route in the RTM if no tunnel next-hop can be found in the TTM.

## Default

no disallow-igp

## Platforms

All

## 8.204 discard

discard

## Syntax

discard [now]

## Context

[\[Tree\]](#) (candidate discard)

## Full Context

candidate discard

## Description

This command deletes the entire contents of the candidate configuration and exits the edit-cfg mode. Undo cannot be used to recover a candidate that has been discarded with **candidate discard**.

## Parameters

**now**

Avoids a confirmation prompt for the discard.

## Platforms

All

## 8.205 discard-changes

discard-changes

### Syntax

[no] discard-changes

### Context

**[Tree]** (configure>system>security>profile>netconf>base-op-authorization discard-changes)

### Full Context

configure system security profile netconf base-op-authorization discard-changes

### Description

This command enables the NETCONF discard-changes operation.

The **no** form of this command disables the operation.

### Default

no discard-changes

#### Note:

The operation is enabled by default in the built-in system-generated administrative profile.

## Platforms

All

## 8.206 discard-eligible

discard-eligible

### Syntax

discard-eligible {true | false}

### Context

**[Tree]** (config>test-oam>sath>svc-test>svc-stream>frm-payl>eth>s-tag discard-eligible)

configure test-oam service-activation-testhead service-test service-stream frame-payload ethernet s-tag discard-eligible
```

```
configure test-oam service-activation-testhead service-test service-stream frame-payload ethernet c-tag discard-eligible
```

### Description

This command configures the marking of the discard eligibility (DEI) bit in the VLAN header.

### Default

```
discard-eligible false
```

### Parameters

#### true

Keyword to indicate that the frame is discard eligible.

#### false

Keyword to indicate that the frame is not discard eligible.

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 8.207 discard-rx-pause-frames

```
discard-rx-pause-frames
```

### Syntax

```
[no] discard-rx-pause-frames
```

### Context

[\[Tree\]](#) (config>port>ethernet discard-rx-pause-frames)

### Full Context

```
configure port ethernet discard-rx-pause-frames
```

### Description

This command discards received pause frames. Pause frames are used for local link flow control.

The **no** form of this command processes pause frames upon reception and the transmit side of the receiving port pauses in its transmissions.

### Default

```
no discard-rx-pause-frames
```

## Platforms

All

## 8.208 discard-unknown

```
discard-unknown
```

### Syntax

[no] discard-unknown

### Context

**[Tree]** (config>service>template>vpls-template discard-unknown)

**[Tree]** (config>service>vpls discard-unknown)

### Full Context

```
configure service template vpls-template discard-unknown
```

```
configure service vpls discard-unknown
```

### Description

By default, packets with unknown destination MAC addresses are flooded. If **discard-unknown** is enabled at the VPLS level, packets with unknown destination MAC address will be dropped instead (even when configured FDB size limits for VPLS or SAP are not yet reached).

The **no** form of this command allows flooding of packets with unknown destination MAC addresses in the VPLS.

### Default

no discard-unknown

## Platforms

All

## 8.209 discard-unknown-source

```
discard-unknown-source
```

### Syntax

[no] discard-unknown-source

## Context

**[Tree]** (config>service>template>vpls-template discard-unknown-source)

**[Tree]** (config>service>vpls>sap discard-unknown-source)

**[Tree]** (config>service>vpls>vxlan discard-unknown-source)

**[Tree]** (config>service>vpls>spoke-sdp discard-unknown-source)

**[Tree]** (config>service>template>vpls-sap-template discard-unknown-source)

## Full Context

configure service template vpls-template discard-unknown-source

configure service vpls sap discard-unknown-source

configure service vpls vxlan discard-unknown-source

configure service vpls spoke-sdp discard-unknown-source

configure service template vpls-sap-template discard-unknown-source

## Description

When this command is enabled, packets received on a SAP, a spoke-SDP, or a static VXLAN instance with an unknown source MAC address will be dropped only if the maximum number of MAC addresses for that SAP or spoke-SDP (see **max-nbr-mac-addr** [**config>service>vpls>sap max-nbr-mac-addr**, **config>service>vpls>spoke-sdp max-nbr-mac-addr**]) has been reached. If **max-nbr-mac-addr** has not been set for the SAP or spoke-SDP, enabling **discard-unknown-source** has no effect.

When disabled, the packets are forwarded based on the destination MAC addresses.

The **no** form of this command causes packets with an unknown source MAC addresses to be forwarded by destination MAC addresses in VPLS.

## Default

no discard-unknown-source

## Platforms

All

- configure service vpls sap discard-unknown-source
- configure service template vpls-template discard-unknown-source
- configure service template vpls-sap-template discard-unknown-source
- configure service vpls spoke-sdp discard-unknown-source

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure service vpls vxlan discard-unknown-source

## discard-unknown-source

## Syntax

**[no] discard-unknown-source**

## Context

[\[Tree\]](#) (config>service>pw-template discard-unknown-source)

## Full Context

configure service pw-template discard-unknown-source

## Description

When this command is enabled, packets received with an unknown source MAC address will be dropped only if the maximum number of MAC addresses have been reached.

When disabled, the packets are forwarded based on the destination MAC addresses.

The **no** form of this command causes packets with an unknown source MAC addresses to be forwarded by destination MAC addresses.

## Default

no discard-unknown-source

## Platforms

All

## 8.210 disconnect

### disconnect

## Syntax

**disconnect** [**address** *ip-address* | **session-id** *session-id* | **username** *user-name* | {**console** | **bluetooth** | **telnet** | **ftp** | **ssh** | **netconf** | **grpc**}]

## Context

[\[Tree\]](#) (admin disconnect)

## Full Context

admin disconnect

## Description

This command disconnects a user from a session.

Issuing the **disconnect** command without any parameters will disconnect the session in which the command was executed.

If any of the session type options (for example, **console**, **bluetooth**, **telnet**, **FTP**, **SSH**) are specified, then only the respective sessions are affected.

If no session type options are specified, then all sessions from the IP address or from the specified user are disconnected.

Any task that the user is executing is terminated. FTP files accessed by the user will not be removed. A major severity security log event is created specifying what was terminated and by whom.

## Parameters

### *ip-address*

Specifies the IP address to disconnect, specified in dotted decimal notation.

#### **Note:**

IPv6 is supported on the 7750 SR and 7950 XRS.

#### **Values**

|                     |                                            |
|---------------------|--------------------------------------------|
| <i>ipv4-address</i> | <i>a.b.c.d</i>                             |

### *session-id*

The model-driven session ID. Can be obtained using the **show system management-interface datastore-locks [detail]** command.

### *user-name*

Specifies the name of the user. The name can be up to 32 characters.

### **console**

Disconnects the console session.

### **bluetooth**

Disconnects the bluetooth session.

### **telnet**

Disconnects the Telnet session.

### **ftp**

Disconnects the FTP session.

### **ssh**

Disconnects the SSH session.

### **netconf**

Disconnects the NETCONF session.

### **grpc**

Disconnects the GRPC session.

## 8.211 discover-delay

### discover-delay

#### Syntax

**discover-delay** *delay*

**no discover-delay**

#### Context

**[Tree]** (config>service>ies>sub-if>grp-if>dhcp>osel discover-delay)

**[Tree]** (config>service>vprn>sub-if>grp-if>dhcp>osel discover-delay)

**[Tree]** (config>service>vprn>sub-if>dhcp>osel discover-delay)

#### Full Context

configure service ies subscriber-interface group-interface dhcp offer-selection discover-delay

configure service vprn subscriber-interface group-interface dhcp offer-selection discover-delay

configure service vprn subscriber-interface dhcp offer-selection discover-delay

#### Description

This command configures the default time to delay DHCP Discover messages. The delay is applied to all DHCP Discover messages for which no per DHCP server or per client MAC delay is configured.

The **no** form of this command removes the delay.

#### Parameters

**delay**

Specifies the default time to delay DHCP Discover messages, in deciseconds.

**Values** 1 to 100

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### discover-delay

#### Syntax

**discover-delay** *delay*

**no discover-delay**

#### Context

**[Tree]** (config>service>vprn>sub-if>grp-if>dhcp>osel>clnt-mac discover-delay)

**[Tree]** (config>service>ies>sub-if>grp-if>dhcp>osel>clnt-mac discover-delay)

**[Tree]** (config>service>vprn>sub-if>dhcp>osel>clnt-mac discover-delay)

### Full Context

configure service vprn subscriber-interface group-interface dhcp offer-selection client-mac discover-delay

configure service ies subscriber-interface group-interface dhcp offer-selection client-mac discover-delay

configure service vprn subscriber-interface dhcp offer-selection client-mac discover-delay

### Description

This command configures the amount of time to delay DHCP Discover messages from odd or even source MAC addresses.

The **no** form of this command removes the delay.

### Parameters

#### *delay*

Specifies the amount of time to delay DHCP Discover messages from odd or even source MAC addresses, in deciseconds.

**Values** 1 to 100

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## discover-delay

### Syntax

**discover-delay** *delay*

**no discover-delay**

### Context

**[Tree]** (config>service>vprn>sub-if>grp-if>dhcp>osel>svr discover-delay)

**[Tree]** (config>service>ies>sub-if>grp-if>dhcp>osel>svr discover-delay)

**[Tree]** (config>service>vprn>sub-if>dhcp>osel>svr discover-delay)

### Full Context

configure service vprn subscriber-interface group-interface dhcp offer-selection server discover-delay

configure service ies subscriber-interface group-interface dhcp offer-selection server discover-delay

configure service vprn subscriber-interface dhcp offer-selection server discover-delay

### Description

This command configures the amount of time to delay DHCP Discover messages relayed to the server.

The **no** form of this command removes the delay.

### Parameters

#### **delay**

Specifies the amount of time to delay DHCP Discover messages relayed to the server, in deciseconds.

**Values** 1 to 100

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.212 discovery

### discovery

### Syntax

**discovery [padi] [pado] [padr] [pads] [padt]**

**no discovery**

### Context

[\[Tree\]](#) (debug>service>id>ppp>packet discovery)

### Full Context

debug service id ppp packet discovery

### Description

This command enables debugging for specific PPP discovery packets.

### Parameters

#### **padi**

Enables debugging for PADI PPP discovery packets.

#### **pado**

Enables debugging for PADO PPP discovery packets.

#### **padr**

Enables debugging for PADR PPP discovery packets.

#### **pads**

Enables debugging for PADS PPP discovery packets.

#### **padt**

Enables debugging for PADT PPP discovery packets.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## discovery

### Syntax

**discovery** [**padi**] [**pado**] [**padr**] [**pads**] [**padt**]

### Context

**[Tree]** (debug>subscr-mgmt>vrgw>brg>pppoe-client>brg-id discovery)

### Full Context

debug subscriber-mgmt vrgw brg pppoe-client brg-id discovery

### Description

This command, limits debugging only to the specified messages in the discovery phase.

### Parameters

#### padi

Limits debugging only to padi messages.

#### pado

Limits debugging only to pado messages.

#### padr

Limits debugging only to padr messages.

#### pads

Limits debugging only to pads messages.

#### padt

Limits debugging only to padt messages.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## discovery

### Syntax

**discovery**

### Context

**[Tree]** (config>port>ethernet>efm-oam discovery)

## Full Context

configure port ethernet efm-oam discovery

## Description

This is the top level of the hierarchy containing various discovery parameters that allow the operator to control certain aspects of the negotiation process as well as what action to take when there is a mismatch in peer capabilities.

## Platforms

All

## 8.213 discovery-interval

### discovery-interval

## Syntax

**discovery-interval** *interval-secs* [**boot** *interval-secs*]

**no discovery-interval**

## Context

[\[Tree\]](#) (config>redundancy>multi-chassis>peer>mc-ipsec discovery-interval)

## Full Context

configure redundancy multi-chassis peer mc-ipsec discovery-interval

## Description

This command specifies the time interval of tunnel-group stays in the Discovery state. Interval-1 is used as discovery-interval when a new tunnel-group is added to multi-chassis redundancy (mp-ipsec); interval-2 is used as discovery-interval when the system boots up, it is optional, when it is not specified, the interval-1 will be used.

## Default

discovery-interval 300 boot 300

## Parameters

### *interval-secs*

Specifies the maximum duration, in seconds, of the discovery interval during which a newly activated multi-chassis IPsec tunnel-group will remain dormant while trying to contact its redundant peer. Groups held dormant in this manner will neither pass traffic nor negotiate security keys. This interval ends when either the redundant peer is contacted and a master election occurs, or when the maximum duration expires.

**Values** 1 to 1800

### **boot *interval-secs***

Specifies the maximum duration of an interval immediately following system startup. When the normal discovery interval for a group would expire while the post-boot discovery interval is still active, then the group's discovery interval is extended until the post-boot discovery interval expires. This allows an extension to the normal discovery stage of groups following a chassis reboot, to account for the larger variance in routing.

**Values** 1 to 1800

## **Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## discovery-interval

### **Syntax**

**discovery-interval** *seconds*

### **Context**

[\[Tree\]](#) (config>test-oam>link-meas>template>twl>ipv6-dest-disc discovery-interval)

### **Full Context**

```
configure test-oam link-measurement measurement-template twamp-light ipv6-destination-discovery
discovery-interval
```

### **Description**

This command configures the frequency at which IPv6 peer discovery packets are transmitted when the discovery-timer is active.

The **no** form of the command reverts to the default value.

### **Default**

discovery-interval 10

### **Parameters**

***seconds***

Specifies transmission frequency of the discovery packet.

**Values** 1 to 10

## **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 8.214 discovery-timer

### discovery-timer

#### Syntax

**discovery-timer** *seconds*

#### Context

[\[Tree\]](#) (config>test-oam>link-meas>template>twl>ipv6-dest-disc discovery-timer)

#### Full Context

configure test-oam link-measurement measurement-template twamp-light ipv6-destination-discovery  
discovery-timer

#### Description

This command configures the amount of time to transmit peer discovery packets at the **discovery-interval**. The timer starts when the IPv6 protocols is enabled under the **config>router>if>if-attribute>delay>dynamic> twamp-light>ipv6** context. At the expiration of the **discovery-interval** or when a peer is discovered, the probe interval changes to the value configured for the **update-interval**.

The **no** form of the command reverts to the default value.

#### Default

discovery-interval 60

#### Parameters

***seconds***

Specifies transmission frequency of the discovery packet.

**Values** 1 to 1800

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 8.215 discriminator

### discriminator

#### Syntax

**discriminator** *discriminator*

**no discriminator**

## Context

[\[Tree\]](#) (config>bfd>seamless-bfd>reflector discriminator)

## Full Context

configure bfd seamless-bfd reflector discriminator

## Description

This command specifies the S-BFD discriminator.

The **no** form of this command removes the discriminator.

## Parameters

### *discriminator*

Specifies the discriminator value.

**Values** 524288 to 526335

## Platforms

All

## discriminator

## Syntax

**discriminator** *discriminator*

**no discriminator**

## Context

[\[Tree\]](#) (config>router>bfd>seamless-bfd>peer discriminator)

## Full Context

configure router bfd seamless-bfd peer discriminator

## Description

This command specifies the seamless BFD reflector discriminator for the remote peer node in the mapping table used by seamless BFD sessions initiated on the router.

The **no** form of this command removes the discriminator.

## Parameters

### *discriminator*

Specifies the discriminator of the remote node.

**Values** 1 to 4294967295

## Platforms

All

## 8.216 disjointness-reference

```
disjointness-reference
```

### Syntax

```
[no] disjointness-reference
```

### Context

```
[Tree] (config>router>pcep>pcc>pce-assoc>div disjointness-reference)
```

### Full Context

```
configure router pcep pcc pce-associations diversity disjointness-reference
```

### Description

This command configures the value conveyed in the P-flag of the DISJOINTNESS-CONFIGURATION TLV. When enabled, it indicates that this LSP path is the reference path for the disjoint set of paths. The PCE must first compute the path of this LSP and then apply the requested disjointness type to compute the path of all other paths in the same diversity association ID.

The **no** form of this command sets the P-flag to false.

### Default

P-flag to false

## Platforms

All

## 8.217 disjointness-type

```
disjointness-type
```

### Syntax

```
disjointness-type {loose | strict}
```

```
no disjointness-type
```

### Context

```
[Tree] (config>router>pcep>pcc>pce-assoc>div disjointness-type)
```

**Full Context**

configure router pcep pcc pce-associations diversity disjointness-type

**Description**

This command configures the disjointness type for the association group.

The **no** form of this command reverts to the default value.

**Default**

disjointness-type loose

**Parameters****loose**

Keyword to specify the loose disjointness type.

**strict**

Keyword to specify the strict disjointness type.

**Platforms**

All

## 8.218 dispersion

dispersion

**Syntax**

**dispersion** *dispersion*

**Context**

[\[Tree\]](#) (config>port>dwdm>coherent dispersion)

**Full Context**

configure port dwdm coherent dispersion

**Description**

This command configures the residual chromatic dispersion to be compensated when the coherent receiver is operating in manual dispersion control mode.

**Default**

0

**Parameters**

***dispersion***

Specifies the dispersion compensation.

**Values** -50000 to 50000

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 8.219 display

### display

#### Syntax

**display type** {*type*} **url-string format** {*format*} [**password** [32 chars max]]

#### Context

**[Tree]** (admin>certificate display)

#### Full Context

admin certificate display

#### Description

This command displays the content of an input file in plain text.

#### Note:

When displaying the key file content, only the key size and type are displayed.

The following list summarizes the formats supported by this command:

- System
  - system format
  - PKCS #12
  - PKCS #7 PEM encoded
  - PKCS #7 DER encoded
  - RFC4945
- Certificate Request
  - PKCS #10
- Key
  - system format
  - PKCS #12
- CRL
  - system format

- PKCS #7 PEM encoded
- PKCS #7 DER encoded
- RFC4945

## Parameters

### *url-string*

Specifies the local CF card url of the input file.

|               |            |                                   |
|---------------|------------|-----------------------------------|
| <b>Values</b> | url-string | <local-url> [up to 99 characters] |
|               | local-url  | <cflash-id>/<file-path>           |
|               | cflash-id  | cf1:   cf2:   cf3:                |

### **type**

Specifies the type of input file.

**Values** cert, key, crl, cert-request

### **format**

Specifies the format of input file.

**Values** pkcs10, pkcs12, pkcs7-der, pkcs7-pem, pem, der

### **password**

Specifies the password to decrypt the input file in case that it is an encrypted PKCS#12 file, up to 99 characters.

## Platforms

All

## 8.220 display-config

### display-config

#### Syntax

**display-config** [detail | index]

#### Context

[\[Tree\]](#) (admin display-config)

#### Full Context

admin display-config

## Description

This command displays the system's running configuration.

By default, only non-default settings are displayed.

Specifying the **detail** option displays all default and non-default configuration parameters.

## Parameters

### detail

Displays default and non-default configuration parameters.

### index

Displays only persistent-indices.

## Platforms

All

## 8.221 display-key

### display-key

## Syntax

**display-key type** {ike | esp} **gateway name** *name* **dynamic-tunnel** *ip-address: port*

**display-key type** {ike | esp} **tunnel** *ipsec-tunnel-name*

## Context

[\[Tree\]](#) (admin>ipsec display-key)

## Full Context

admin ipsec display-key

## Description

This command displays existing IKE-SA or CHILD-SA keys..

### Note:

This command does not work if **config>ipsec>no show-ipsec-keys** or **no max-history-{esp|ike}-key-records** is configured under corresponding **ipsec-gw** or **ipsec-tunnel**.

## Parameters

### *name*

The name, up to 32 characters.

### *ip-address*

The IP address of the remote client.

|               |              |              |                   |
|---------------|--------------|--------------|-------------------|
| <b>Values</b> | <ip-address> | ip-address   | a.b.c.d           |
|               |              | ipv6-address | x:x:x:x:x:x:x     |
|               |              |              | x:x:x:x:x:d.d.d.d |
|               |              |              | x - [0 to FFFF]H  |
|               |              |              | d - [0 to 255]D   |

**port**

The port of the remote client.

**Values** 0 to 65535

**ipsec-tunnel-name**

The IPsec tunnel name, up to 32 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**Output**

The following outputs are examples of the **admin ipsec display-key** command.

**Output Example**

```
admin ipsec display-key type ike gateway name "rw" dynamic-tunnel 11.1.1.100:500
=====

## 8.222 dist-cpu-protection

```
dist-cpu-protection
```

### Syntax

```
dist-cpu-protection policy-name
```

```
no dist-cpu-protection
```

### Context

**[Tree]** (config>service>vprn>sub-if>grp-if>sap dist-cpu-protection)

**[Tree]** (config>subscr-mgmt>msap-policy dist-cpu-protection)

### Full Context

```
configure service vprn subscriber-interface group-interface sap dist-cpu-protection
```

```
configure subscriber-mgmt msap-policy dist-cpu-protection
```

### Description

This command assigns a Distributed CPU Protection (DCP) policy to an MSAP policy. The DCP policy is automatically assigned to MSAPs created with this policy. A non-existent DCP policy can be assigned to an **msap-policy** because an MSAP policy is similar to a template that is applied in the MSAP creation. The DCP policy is validated at the time that the MSAP is created, and the MSAP creation is blocked (and an appropriate log event created) if the DCP policy does not exist.

#### Note:

For other types of objects (for example, normal non-MSAP SAPs and network interfaces) the DCP policy must exist before it can be assigned to the SAP.

The **no** form of this command removes the policy name from the configuration.

If no `dist-cpu-protection` policy is assigned to an MSAP policy, then the default access DCP policy (`_default-access-policy`) is used.

If no DCP functionality is required on the MSAP policy, then an empty DCP policy can be created and explicitly assigned to the MSAP policy.

### Parameters

***policy-name***

Specifies the name of the DCP policy, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## dist-cpu-protection

### Syntax

**dist-cpu-protection** *policy-name*

**no dist-cpu-protection**

### Context

**[Tree]** (config>subscr-mgmt>sap-template dist-cpu-protection)

### Full Context

configure subscriber-mgmt sap-template dist-cpu-protection

### Description

This command assigns a DCP policy to a SAP template. The policy is automatically assigned to SAPs that are autocreated with this SAP template. The **dist-cpu-protection** policy must exist before it is assigned to a SAP template.

The **no** form of this command removes the policy name from the configuration.

If a DCP policy is not assigned to an SAP template, the default access DCP policy (\_defaultaccess-policy) is used.

If no DCP functionality is required on the autocreated SAPs, an empty DCP policy can be created and explicitly assigned to the SAP template.

### Default

no dist-cpu-protection

### Parameters

*policy-name*

Specifies the name of the DCP policy, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## dist-cpu-protection

### Syntax

**dist-cpu-protection** *policy-name*

**no dist-cpu-protection**

### Context

**[Tree]** (config>service>ipipe>sap dist-cpu-protection)

**[Tree]** (config>service>epipe>sap dist-cpu-protection)

[\[Tree\]](#) (config>service>cpipe>sap dist-cpu-protection)

### Full Context

```
configure service ipipe sap dist-cpu-protection
configure service epipe sap dist-cpu-protection
configure service cpipe sap dist-cpu-protection
```

### Description

This command assigns a Distributed CPU Protection (DCP) policy to the SAP. Only a valid existing DCP policy can be assigned to a SAP or a network interface (this rule does not apply to templates, such as an **msap-policy** template).

If no dist-cpu-protection policy is assigned to a SAP, then the default access DCP policy (`_default-access-policy`) is used.

If no DCP functionality is required on the SAP, then an empty DCP policy can be created and explicitly assigned to the SAP.

### Parameters

#### *policy-name*

Specifies the name of the DCP policy, up to 32 characters in length

### Platforms

All

- configure service epipe sap dist-cpu-protection
  - configure service ipipe sap dist-cpu-protection
- 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS
- configure service cpipe sap dist-cpu-protection

## dist-cpu-protection

**[Tree]** (config>service>ies>if>sap dist-cpu-protection)

## Full Context

configure service ies subscriber-interface group-interface sap dist-cpu-protection

configure service ies interface sap dist-cpu-protection

## Description

This command assigns a Distributed CPU Protection (DCP) policy to the SAP. Only a valid DCP policy can be assigned to a SAP or a network interface. This rule does not apply to templates such as an msap-policy.

## Default

If no dist-cpu-protection policy is assigned to an SAP, then the default access DCP policy (`default-access-policy`) is used. If no DCP functionality is required on the SAP, then an empty DCP policy can be created and explicitly assigned to the SAP policy.

## Parameters

### *policy-name*

Specifies the name of the DCP policy, up to 32 characters in length

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface sap dist-cpu-protection

All

- configure service ies interface sap dist-cpu-protection

## dist-cpu-protection

### Syntax

**dist-cpu-protection** *policy-name*

**no dist-cpu-protection**

### Context

**[Tree]** (config>service>vprn>nw-if dist-cpu-protection)

### Full Context

configure service vprn network-interface dist-cpu-protection

### Description

This command assigns a Distributed CPU Protection (DCP) policy to the network interface. Only a valid created DCP policy can be assigned to a network interface (this rule does not apply to templates such as an msap-policy).

### Default

If no dist-cpu-protection policy is assigned to the VPRN network interface, then the default network DCP policy (`_default-network-policy`) is used.

If no DCP functionality is required on the VPRN network interface then an empty DCP policy can be created and explicitly assigned to the VPRN network interface.

### Parameters

***policy-name***

Specifies the name of the DCP policy, up to 32 characters in length

## Platforms

All

## dist-cpu-protection

### Syntax

**dist-cpu-protection** *policy-name*

**no dist-cpu-protection**

## Context

[\[Tree\]](#) (config>service>vprn>if>sap dist-cpu-protection)

## Full Context

configure service vprn interface sap dist-cpu-protection

## Description

This command assigns a Distributed CPU Protection (DCP) policy to the SAP. Only a valid created DCP policy can be assigned to a SAP or a network interface (This rule does not apply to templates such as an msap-policy).

## Default

If no dist-cpu-protection policy is assigned to an SAP policy, then the default access DCP policy (default-access-policy) is used. If no DCP functionality is required on the SAP policy, then an empty DCP policy can be created and explicitly assigned to the SAP policy.

## Parameters

### *policy-name*

Specifies the name of the DCP policy, up to 32 characters in length

## Platforms

All

## dist-cpu-protection

## Syntax

**dist-cpu-protection** *policy-name*

**no dist-cpu-protection**

## Context

[\[Tree\]](#) (config>router>if dist-cpu-protection)

## Full Context

configure router interface dist-cpu-protection

## Description

This command assigns a Distributed CPU Protection (DCP) policy to the SAP. Only a valid created DCP policy can be assigned to a SAP or a network interface (note that this rule does not apply to templates such as an msap-policy).

If the user does not assign a DCP policy to a router interface, the system uses the default network DCP policy.

**Default**

no dist-cpu-protection

**Parameters*****policy-name***

Specifies the name of the DCP policy, up to 32 characters in length

**Platforms**

All

dist-cpu-protection

**Syntax**

dist-cpu-protection

**Context**

[\[Tree\]](#) (config>system>security dist-cpu-protection)

**Full Context**

configure system security dist-cpu-protection

**Description**

Commands in this context configure the Distributed CPU Protection (DCP) feature.

**Platforms**

All

## 8.223 dist-lag-rate-shared

dist-lag-rate-shared

**Syntax**

[no] dist-lag-rate-shared

**Context**

[\[Tree\]](#) (config>qos>port-scheduler-policy dist-lag-rate-shared)

**Full Context**

configure qos port-scheduler-policy dist-lag-rate-shared

## Description

This command enables sharing of rates when the port on which this port-scheduler-policy is configured is part of a LAG configured in **distribute** mode.

When enabled, the absolute rate values configured as part of the max-rate, PIR/CIR group rates and PIR/CIR level rates are shared across the member ports of the LAG when configured in **distribute** mode.

This command does not have any effect when the port on which this **port-scheduler-policy** is configured is part of a LAG in **link** or **port-fair** mode. Similarly, when rates are configured as a **percent-rate**, this parameter is ignored.

## Platforms

All

## 8.224 distinguisher

distinguisher

### Syntax

**distinguisher** *id*

**no distinguisher**

### Context

[\[Tree\]](#) (conf>router>segment-routing>sr-policies>policy distinguisher)

### Full Context

configure router segment-routing sr-policies static-policy distinguisher

### Description

This command associates a distinguisher value with a statically defined segment routing policy. This is a mandatory parameter and configuration command for non-local segment routing policies (for which the **head-end** parameter is set to a value other than "local"). Every non-local segment routing policy must have a unique distinguisher value. When a non-local static segment routing policy is imported into BGP and originated as a BGP route, the configured distinguisher value is copied into the NLRI of the route.

The **no** form of this command removes the distinguisher association.

### Default

no distinguisher

### Parameters

*id*

Specifies the distinguisher ID.

**Values** 1 to 4294967295

## Platforms

All

## distinguisher

### Syntax

**distinguisher** *distinguisher-id*

**no distinguisher**

### Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from distinguisher)

### Full Context

configure router policy-options policy-statement entry from distinguisher

### Description

This command configures an SR Policy distinguisher as a route policy match criterion. This match criterion is only used in import policies.

The **no** form of this command removes the distinguisher ID match criterion from the configuration.

### Parameters

***distinguisher-id***

Specifies the SR policy distinguisher ID.

**Values** 0 to 4294967295

## Platforms

All

## 8.225 distributed-sub-mgmt

## distributed-sub-mgmt

### Syntax

**distributed-sub-mgmt**

### Context

[\[Tree\]](#) (config>service>vprn>wlan-gw distributed-sub-mgmt)

## Full Context

```
configure service vprn wlan-gw distributed-sub-mgmt
```

## Description

Commands in this context configure Distributed Subscriber Management (DSM) for soft GRE group interface and for ranges of IEEE 802.1q VLAN tags in soft GRE group interfaces.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

[\[Tree\]](#) (config>router>wlan-gw distributed-sub-mgmt)

## Full Context

```
configure service vprn wlan-gw distributed-sub-mgmt
```

```
configure subscriber-mgmt wlan-gw distributed-sub-mgmt
```

```
configure router wlan-gw distributed-sub-mgmt
```

## Description

Commands in this context configure profiles, templates and policies that can be applied to DSM subscribers.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## distributed-sub-mgmt

## Syntax

```
[no] distributed-sub-mgmt
```

## Context

[\[Tree\]](#) (config>isa>wlan-gw-group distributed-sub-mgmt)

### Full Context

```
configure isa wlan-gw-group distributed-sub-mgmt
```

### Description

This command configures the WLAN gateway distributed subscriber management.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## distributed-sub-mgmt

### Syntax

```
distributed-sub-mgmt
```

### Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range distributed-sub-mgmt)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range distributed-sub-mgmt)

### Full Context

```
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt
```

```
configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt
```

### Description

Commands in this context configure distributed-sub-mgmt configuration per vlan-range. This also includes vlan-range default, which makes this configuration applicable to the **wlan-gw group-interface**.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.226 diversity

## diversity

### Syntax

```
[no] diversity association-name
```

### Context

[\[Tree\]](#) (config>router>pcep>pcc>pce-assoc diversity)

## Full Context

```
configure router pcep pcc pce-associations diversity
```

## Description

This command creates a named diversity association from which the parameters for the specified diversity association are configured.

The **no** form of the command deletes the specified diversity association.

## Parameters

### ***association-name***

Specifies the name of the diversity association, up to 32 characters.

## Platforms

All

diversity

## Syntax

```
[no] diversity diversity-assoc-name
```

## Context

**[Tree]** (config>router>mpls>lsp-template>pce-assoc diversity)

**[Tree]** (config>router>mpls>lsp>pce-assoc diversity)

## Full Context

```
configure router mpls lsp-template pce-associations diversity
```

```
configure router mpls lsp pce-associations diversity
```

## Description

This command binds the LSP to a named diversity association. The diversity association must exist under the PCC. Up to five diversity associations can be configured per LSP.

The **no** form of the command removes the LSP binding from the specified diversity association.

## Parameters

### ***diversity-assoc-name***

Specifies the name of an existing diversity association, up to 32 characters.

## Platforms

All

## 8.227 diversity-type

### diversity-type

#### Syntax

**diversity-type** {link | node | srlg-link | srlg-node}

**no diversity-type**

#### Context

[\[Tree\]](#) (config>router>pcep>pcc>pce-assoc>div diversity-type)

#### Full Context

configure router pcep pcc pce-associations diversity diversity-type

#### Description

This command configures the diversity type for the association group. This command is mandatory. If the command is not configured, the system does not validate the association configuration.

The **no** form of the command reverts to the default value.

#### Default

no diversity-type

#### Parameters

##### link

Keyword to specify the link diversity type.

##### node

Keyword to specify the node diversity type.

##### srlg-link

Keyword to specify the SRLG-link diversity type.

##### srlg-node

Keyword to specify the SRLG-node diversity type.

#### Platforms

All

## 8.228 divert

## divert

### Syntax

[no] divert

### Context

[\[Tree\]](#) (config>app-assure>group>policy>app-profile divert)

### Full Context

configure application-assurance group policy app-profile divert

### Description

This command enables the redirection of traffic to AA ISA for the system-wide forwarding classes diverted to application assurance (**divert-fc**) for AA subscribers using this application profile.

The **no** form of this command stops redirect of traffic to AA ISAs for the AA subscribers using this application profile.

### Default

no divert

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.229 divert-fc

## divert-fc

### Syntax

[no] divert-fc *fc-name*

### Context

[\[Tree\]](#) (config>isa>aa-grp divert-fc)

### Full Context

configure isa application-assurance-group divert-fc

### Description

This command selects a forwarding class in the system to be diverted to an application assurance engine for this application assurance group. Only traffic to/from subscribers with application assurance enabled is diverted.

To divert multiple forwarding classes, the command needs to be executed multiple times specifying each forwarding class to be diverted at a time.

The **no** form of this command stops diverting of the traffic to an application assurance engine for this application assurance group.

### Parameters

#### *fc-name*

Creates a class instance of the forwarding class *fc-name*.

**Values** be, l2, af, l1, h2, ef, h1, nc

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.230 dm

```
dm
```

### Syntax

```
dm [test-id test-id] [create]
```

```
no dm
```

### Context

```
[Tree] (config>oam-pm>session>mpls dm)
```

### Full Context

```
configure oam-pm session mpls dm
```

### Description

This command assigns an identifier to the DM test and creates the individual test.

The **no** form of this command removes the DM test function from the OAM-PM session.

### Parameters

#### *test-id*

Specifies the value of the 26-bit test identifier sent as session identifier in the DM PDU.

**Values** 0 to 67108863

#### **create**

Creates the DM test. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 8.231 dmm

dmm

### Syntax

**dmm** [**test-id** *test-id*] [**create**]

**no dmm**

### Context

[\[Tree\]](#) (config>oam-pm>session>ethernet dmm)

### Full Context

configure oam-pm session ethernet dmm

### Description

This command defines the test ID to be assigned to the delay test and creates the container to allow the individual test parameters to be configured.

The **no** form of this command removes the DMM test function from the PM Session.

### Parameters

#### *test-id*

Specifies the value to be placed in the 4-byte test ID field of an ETH-DMM PDU.

**Values** 0 to 2147483647 | **auto**

**auto** - automatically assigns a *test-id*

#### **create**

Creates the test.

### Platforms

All

## 8.232 dmr-prefix

## dmr-prefix

### Syntax

**dmr-prefix** *dmr-prefix*

**no dmr-prefix**

### Context

**[Tree]** (config>service>nat>map-domain dmr-prefix)

### Full Context

configure service nat map-domain dmr-prefix

### Description

This command configures the IPv6 prefix of the BR (dmr-prefix), which is used as a default MAP rule (route) in the CEs. Each MAP domain in the VSR has a unique dmr-prefix.

### Parameters

#### *dmr-prefix*

Specifies the IPv6 prefix associated with a MAP domain in the BR. The prefix represents a dmr-rule in the CE.

**Values** <*ipv6-prefix/prefix-length*> :  
*ipv6-prefix*: *x:x:x:x:x:x:x* (eight 16-bit pieces)  
*x:x:x:x:x:d.d.d.d*  
*x* - [0 to FFFF]H  
*d* - [0 to 255]D  
*prefix-length*: [0 to 96]

### Platforms

VSR

## 8.233 dnat

## dnat

### Syntax

[no] **dnat**

### Context

**[Tree]** (config>service>nat>nat-policy dnat)

## Full Context

```
configure service nat nat-policy dnat
```

## Description

This command defines context for destination NAT (DNAT) specific configuration under the nat-policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.234 dnat-only

### dnat-only

## Syntax

```
dnat-only router router-instance nat-group nat-group-id
no dnat-only
```

## Context

[\[Tree\]](#) (config>service>nat>nat-policy>dnat dnat-only)

## Full Context

```
configure service nat nat-policy dnat dnat-only
```

## Description

This command configures outside routing context and nat-group in which DNAT translation should take place. This command is mutually exclusive with the pool command in nat-policy. When DNAT-only is enabled, no source and port NAT (SNAPT) is performed. In other words, only the destination IP address (going from inside to outside) is translated while the source IP address and port are not translated.

## Parameters

**router** *router-instance*

Specifies the routing context on the outside (public side).

**nat-group** *nat-group-id*

Specifies the NAT group IP.

**Values** 1 to 4

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## dnat-only

### Syntax

**dnat-only**

### Context

[\[Tree\]](#) (config>service>vprn>nat>outside dnat-only)

[\[Tree\]](#) (config>router>nat>outside dnat-only)

[\[Tree\]](#) (config>service>vprn>nat>inside dnat-only)

[\[Tree\]](#) (config>router>nat>inside dnat-only)

### Full Context

configure service vprn nat outside dnat-only

configure router nat outside dnat-only

configure service vprn nat inside dnat-only

configure router nat inside dnat-only

### Description

Commands in this context configure the dnat-only parameters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.235 dns

## dns

### Syntax

**[no] dns**

### Context

[\[Tree\]](#) (config>service>vprn dns)

### Full Context

configure service vprn dns

### Description

Commands in this context configure domain name servers.

The **no** form of this command disables DNS for this service.

## Platforms

All

## dns

## Syntax

```
dns target-addr dns-name name-server ip-address [source ip-address] [count send-count] [timeout timeout] [interval interval] [record-type {ipv4-a-record | ipv6-aaaa-record}] [router-instance router-instance]
```

## Context

[\[Tree\]](#) (oam dns)

[\[Tree\]](#) (config>saa>test>type dns)

## Full Context

oam dns

configure saa test type dns

## Description

This command performs DNS name resolution. If **ipv4-a-record** is specified, DNS target addresses are queried for A records only. If **ipv6-aaaa-record** is specified, AAAA records are queried first, and if a successful response is not received, the DNS server is queried for A records (applies to the 7750 SR and 7950 XRS).

## Parameters

### *dns-name*

Specifies the DNS domain name, up to 255 characters.

### *interval*

Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the **interval** is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message response corresponding to the outstanding message request.

**Values** 1 to 10

**Default** 1

### *ip-address*

Specifies the IP address of the primary DNS server.

ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x: 0 to FFFF]H

d: [0 to 255]D

### record-type

Specifies a record type (applies to the 7750 SR and 7950 XRS only).

**Values** **ipv4-a-record** — A record-specific mapping of a host name to an IPv4 address.

**ipv6-aaaa-record** — A record-specific mapping to the Internet class that stores a single IPv6 address.

### send-count

Specifies the number of messages to send. The **send-count** parameter overrides the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message **interval** value must have expired before the next message request is sent.

**Values** 1 to 100

**Default** 1

### timeout

Specifies the time, in seconds, to override the default *timeout* value and is the amount of time that the router waits for a message response after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response is not received. Any response received after the request times out is silently discarded.

**Values** 1 to 120

**Default** 5

### router-instance

Specifies the preferred method to enter a service name or routing instance from which to launch the DNS query. This value is stored as the service name. This is the only service-linking function allowed for both mixed-mode and model-driven configuration modes.

|               |                                |                                                                                                                                                       |
|---------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Values</b> | <i>router-name</i> Base        | Specifies a base routing instance                                                                                                                     |
|               | management                     | Specifies a management routing instance                                                                                                               |
|               | <u>Base_and_</u><br>management | Specifies a base routing instance and a management routing instance: if no response is received from the base, a management routing instance is used. |

*vprn-svc-  
name*

Specifies a service name, up to 64  
characters

**Default**    `_Base_and_management`

### dns-domain

#### Syntax

**dns-domain** *dns-name*

**no dns-domain**

#### Context

[\[Tree\]](#) (bof dns-domain)

#### Full Context

bof dns-domain

#### Description

This command configures the domain name used when performing DNS address resolution. This is a required parameter if DNS address resolution is required. Only a single domain name can be configured. If multiple domain statements are configured, the last one encountered is used.

The **no** form of this command removes the domain name from the configuration.

#### Default

no dns-domain

#### Parameters

*dns-name*

Specifies the DNS domain name, up to 178 characters.

#### Platforms

All

## 8.237 dns-ip-cache

### dns-ip-cache

#### Syntax

**dns-ip-cache** *dns-ip-cache-name* [**create**]

**no dns-ip-cache** *dns-ip-cache-name*

### Context

[\[Tree\]](#) (config>app-assure>group dns-ip-cache)

### Full Context

configure application-assurance group dns-ip-cache

### Description

This command configures a DNS IP cache used to snoop DNS requests generated by subscribers to populate a cache of IP addresses matching a specified list of domain names. In the context of URL content charging strengthening, it is also mandatory to specify a list of trusted DNS servers to populate the DNS IP cache.

### Parameters

#### ***dns-ip-cache-name***

Specifies the Application Assurance DNS IP cache name, up to 32 characters.

#### **create**

Specifies a keyword used to create the DNS IP cache.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## dns-ip-cache

### Syntax

**dns-ip-cache** *dns-ip-cache-name*

### Context

[\[Tree\]](#) (config>app-assure>group>sess-fltr>entry>match dns-ip-cache)

### Full Context

configure application-assurance group session-filter entry match dns-ip-cache

### Description

This command configures a DNS IP cache using session filter DST IP match criteria. It is typically combine with an allow action in the context of captive-redirect.

### Parameters

#### ***dns-ip-cache-name***

Specifies the name of the DNS IP cache name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.238 dns-match

### dns-match

#### Syntax

**dns-match**

#### Context

[\[Tree\]](#) (config>app-assure>group>dns-ip-cache dns-match)

#### Full Context

configure application-assurance group dns-ip-cache dns-match

#### Description

Commands in this context configure match parameters in the DNS IP cache.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.239 dns-options

### dns-options

#### Syntax

**[no] dns-options**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>rtr-adv-plcy dns-options)

#### Full Context

configure subscriber-mgmt router-advertisement-policy dns-options

#### Description

Commands in this context configure IPv6 DNS options for SLAAC hosts.

The **no** form of this command returns the command to the default setting.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## dns-options

### Syntax

[no] dns-options

### Context

**[Tree]** (config>service>vprn>router-advert dns-options)

### Full Context

configure service vprn router-advertisement dns-options

configure service vprn subscriber-interface group-interface ipv6 router-advertisements dns-options

configure service vprn router-advertisement interface dns-options

configure service vprn subscriber-interface ipv6 router-advertisements dns-options

configure service ies subscriber-interface ipv6 router-advertisements dns-options

configure service ies subscriber-interface group-interface ipv6 router-advertisements dns-options

### Description

Commands in this context configure DNS information for Stateless Address Auto-Configuration (SLAAC) hosts.

When specified at the router-advertisement level in the routing context, this command allows configuration of service-wide parameters. These can then be inherited at the interface level by specifying the **config>service>vprn>router-advert>if>dns-options>include-dns** command.

The **no** form of this command disables configuration of DNS information for Stateless Address Auto-Configuration (SLAAC) hosts.

### Platforms

All

[\[Tree\]](#) (config>router>router-advert dns-options)

### Full Context

configure router router-advertisement interface dns-options

configure router router-advertisement dns-options

### Description

Commands in this context configure DNS information for Stateless Address Auto-Configuration (SLAAC) hosts. When specified at the router-advertisement level in the routing context, this command allows configuration of service-wide parameters. These can then be inherited at the interface level by specifying the **config>router>router-advert>if>dns-options>include-dns** command.

The **no** form of this command disables configuration of DNS information for Stateless Address Auto-Configuration (SLAAC) hosts.

### Platforms

```

### Context

```
[Tree] (config>router>ldp>session-params>peer dod-label-distribution)
```

### Full Context

```
configure router ldp session-parameters peer dod-label-distribution
```

## Description

This command enables the use of the LDP Downstream-on-Demand (DoD) label distribution procedures.

When this option is enabled, LDP will set the A-bit in the Label Initialization message when the LDP session to the peer is established. When both peers set the A-bit, they will both use the DoD label distribution method over the LDP session (RFC 5036).

This feature can only be enabled on a link-level LDP session and therefore will apply to prefix labels only, not service labels.

As soon as the link LDP session comes up, the router will send a label request to its DoD peer for the FEC prefix corresponding to the peer's LSR-id. The DoD peer LSR-id is found in the basic Hello discovery messages the peer used to establish the Hello adjacency with the router.

Similarly if the router and the directly attached DoD peer entered into extended discovery and established a targeted LDP session, the router will immediately send a label request for the FEC prefix corresponding to the peer's LSR-id found in the extended discovery messages.

However, the router will not advertise any <FEC, label> bindings, including the FEC of its own LSR-id, unless the DoD peer requested it using a Label Request Message.

When the DoD peer sends a label request for any FEC prefix, the router will reply with a <FEC, label> binding for that prefix if the FEC was already activated on the router. If not, the router replies with a notification message containing the status code of "no route." The router will not attempt in the latter case to send a label request to the next-hop for the FEC prefix when the LDP session to this next-hop uses the DoD label distribution mode. Hence the reference to single-hop LDP DoD procedures.

As soon as the link LDP session comes up, the router will send a label request to its DoD peer for the FEC prefix corresponding to the peer's LSR-id. The DoD peer LSR-id is found in the basic Hello discovery messages the peer used to establish the Hello adjacency with the router.

Similarly if the router and the directly attached DoD peer entered into extended discovery and established a targeted LDP session, the router immediately sends a label request for the FEC prefix corresponding to the peer's LSR-id found in the extended discovery messages. Peer address has to be the peer LSR-ID address.

The **no** form of this command disables the DoD label distribution with an LDP neighbor.

**Full Context**

configure service nat firewall-policy domain

**Description**

This command specifies a router and domain to which the firewall policy will be applied. All associated traffic must be part of the prefixes specified by this domain.

The **no** form of the command removes the domain association from the firewall policy.

**Default**

no domain

**Parameters****domain-name**

Specifies the name of the firewall domain in the specified router instance. 32 characters maximum.

**router-name**

Specifies the name of the router instance to use.

**Values** *router-name* | *vprn-svc-id*  
*router-name* — "Base", "management"  
*vprn-svc-id* — 1 to 2147483647

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## domain

### Syntax

**domain** *md-index* [**format** *md-name-format*] [**name** *md-name*] **level** *level* [**admin-name** *admin-name*]

**domain** *md-index*

**no domain** *md-index*

### Context

[\[Tree\]](#) (config>eth-cfm domain)

### Full Context

configure eth-cfm domain

### Description

This command configures Connectivity Fault Management (CFM) Maintenance Domain (MD) parameters. The **no** form of this command removes the MD index parameters from the configuration.

### Parameters

*md-index*

Specifies the MD index value.

**Values** 1 to 4294967295

*md-name-format*

Specifies a value that represents the type (format).

**Values**

**dns** — Specifies the DNS name format.

**mac** — X:X:X:X:X-u

X — 0 to FF (hexadecimal)

u — 0 to 65535 (decimal)

**none** — Specifies a Y.1731 domain format and the only format allowed to execute Y.1731 specific functions.

**string** — Specifies an ASCII string.

**Default** string

*md-name*

Specifies a generic MD name, up to 43 characters.

*level*

Specifies the integer identifying the MD level. Higher numbers correspond to higher maintenance domains, those with the greatest physical reach, with the highest values for customer CFM packets. Lower numbers correspond to lower maintenance domains, those with more limited physical reach, with the lowest values for single bridges or physical links.

**Values** 0 to 7

*admin-name*

Specifies a creation time required parameter that allows the operator to assign a name value to the domain container. This is used for information and migration purposes. This value cannot be modified without destroying the domain. If no *admin-name* exists, the configured *md-index* value is converted into a character string to become the *admin-name* reference. When upgrading from a release that does not include the **admin-name** configuration option, the *md-index* is converted into a character string. After an *admin-name* value is assigned, it cannot be modified.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**domain****Syntax**

**domain** *domain*

**no domain**

**Context**

[\[Tree\]](#) (config>system>ptp domain)

**Full Context**

configure system ptp domain

**Description**

This command configures the PTP domain.

**Note:**

Some profiles may require a domain number in a restricted range. The operator must ensure that the value aligns with the expected range for the profile.

The domain cannot be changed unless PTP is shutdown. If the PTP profile setting is changed, the domain is changed to the default domain for the new PTP profile.

The **no** form of this command reverts to the default configuration. The default value is dependent upon the configured profile, as detailed below.

**Default**

domain 0 — profile ieee1588-2008

domain 4 — profile g8265dot1-2010  
domain 24 — profile g8275dot1-2014  
domain 44 — profile g8275dot2-2016

## Parameters

### *domain*

Specifies the PTP domain.

|               |                             |
|---------------|-----------------------------|
| <b>Values</b> | 0 to 255 for ieee1588-2008  |
|               | 0 to 255 for g8265dot1-2010 |
|               | 24 to 43 for g8275dot1-2014 |
|               | 0 to 255 for g8275dot2-2016 |

configure service vprn bgp-evpn segment-routing-v6 domain-id
configure service vprn bgp-ipvpn mpls domain-id
configure service vprn bgp-evpn mpls domain-id
```

## Description

This command specifies the domain ID that identifies the network from which a BGP route was received before that route is exported to a different neighbor. The domain ID is part of a domain, represented as *domain-id:isf\_safi\_type* in the D-PATH attribute, as described in *draft-ietf-bess-evpn-ipvpn-interworking*. The D-PATH attribute is modified by gateway routers, where a gateway is defined as a PE where a VPRN is instantiated, and that VPRN advertises or receives routes from multiple BGP owners (for example, EVPN-IFL and BGP-IPVPN) or multiple instances of the same owner (for example, VPRN with two BGP-IPVPN instances).

In the following example, consider that a gateway receives prefix P in an EVPN-IFL instance with the following D-PATH from neighbor N:

```
Seg Len=1 / 65000:1:128
```

If the router imports the route in VPRN-1, BGP-EVPN SRv6 instance with domain 65000:2, it readvertises it to its BGP-IPVPN MPLS instance as follows:

```
Seg Len=2 / 65000:2:70 / 65000:1:128
```

That is, the gateway prepends the local domain ID and family to the D-PATH before readvertising the route into a different instance.

The D-PATH attribute is used on gateways to detect loops (for received routes where the D-PATH contains a local domain ID) and to make BGP best-path selection decisions based on the D-PATH length (shorter D-PATH is preferred).

The command is also supported in Epipe services with two instances. As in the case of multi-instance VPRN services, the configured domain ID in an Epipe instance is prepended to the AD per EVI route redistributed to the other instance.

The **no** form of this command removes the configured domain ID.

**Default**

no domain-id

**Parameters*****global-field:local-field***

Specifies the domain ID.

**Values***4byte-GlobalAdminValue:2byte-LocalAdminValue**4byte-GlobalAdminValue:* 0 to 4294967295*2byte-LocalAdminValue* 0 to 65535**Platforms**

## 8.247 dot1p

## dot1p

### Syntax

```
dot1p dot1p-priority [fc fc-name] [priority {low | high}]
```

```
no dot1p dot1p-priority
```

### Context

[\[Tree\]](#) (config>qos>sap-ingress dot1p)

### Full Context

```
configure qos sap-ingress dot1p
```

### Description

This command explicitly sets the forwarding class or subclass or enqueueing priority when a packet is marked with a *dot1p-priority* specified. Adding a dot1p rule on the policy forces packets that match the *dot1p-priority* specified to override the forwarding class and enqueueing priority based on the parameters included in the dot1p rule. When the forwarding class is not specified in the rule, a matching packet preserves (or inherits) the existing forwarding class derived from earlier matches in the classification hierarchy. When the enqueueing priority is not specified in the rule, a matching packet preserves (or inherits) the existing enqueueing priority derived from earlier matches in the classification hierarchy.

The *dot1p-priority* is derived from the most significant three bits in the IEEE 802.1q or IEEE 802.1p header. The three dot1p bits define 8 Class-of-Service (CoS) values commonly used to map packets to per-hop QoS behavior.

The **no** form of this command removes the explicit dot1p classification rule from the SAP ingress policy. Removing the rule on the policy immediately removes the rule on all ingress SAPs using the policy.

### Parameters

#### *dot1p-priority*

This value is a required parameter that specifies the unique IEEE 802.1p value that will match the dot1p rule. If the command is executed multiple times with the same *dot1p-value*, the previous forwarding class and enqueueing priority is completely overridden by the new parameters or defined to be inherited when a forwarding class or enqueueing priority parameter is missing.

A maximum of eight dot1p rules are allowed on a single policy.

**Values** 0 to 7

#### **fc** *fc-name*

Specifies the value given for the *fc-name* parameter must be one of the predefined forwarding classes in the system. Specifying the *fc-name* is optional. When a packet matches the rule, the forwarding class is only overridden when the **fc** *fc-name* parameter is defined on the rule. If the packet matches and the forwarding class is not explicitly defined in the rule, the forwarding class is inherited based on previous rule matches.

#### **priority**

This parameter overrides the default enqueueing priority for all packets received on an ingress SAP using this policy that match this rule. Specifying the priority is optional. When

a packet matches the rule, the enqueueing priority is only overridden when the priority parameter is defined on the rule. If the packet matches and priority is not explicitly defined in the rule, the enqueueing priority is inherited based on previous rule matches.

**Default** Inherits the priority defined by the default-priority statement.

### high

This parameter is used in conjunction with the **priority** parameter. Setting the enqueueing parameter to **high** for a packet increases the likelihood of enqueueing the packet when the ingress queue is congested. Ingress enqueueing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueueing priority is lost.

### low

This parameter is used in conjunction with the **priority** parameter. Setting the enqueueing parameter to **low** for a packet decreases the likelihood of enqueueing the packet when the ingress queue is congested. Ingress enqueueing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueueing priority is lost.

## **dot1p**

### **Syntax**

**dot1p** *dot1p-value* [**fc** *fc-name*] [**profile** {**in** | **out** | **use-de** | **exceed** | **inplus**}]

**no dot1p** *dot1p-value*

### **Context**

[\[Tree\]](#) (config>qos>sap-egress dot1p)

### **Full Context**

configure qos sap-egress dot1p

### **Description**

This command defines a specific dot1p value that must be matched to perform the associated reclassification actions. If an egress packet on the SAP matches the specified dot1p value, the forwarding class or profile may be overridden. By default, the forwarding class and profile of the packet is derived from ingress classification and profiling functions.

The dot1p priority is derived from the most significant three bits in the IEEE 802.1q or IEEE 802.1p header. The three dot1p bits define 8 Class-of-Service (CoS) values commonly used to map packets to per-hop QoS behavior.

The reclassification actions from a dot1p reclassification rule may be overridden by a DSCP, IP precedence, or IP flow matching event.

The **fc** keyword is optional. When specified, the egress classification rule will overwrite the forwarding class derived from ingress. The new forwarding class is used for egress remarking and queue mapping decisions. If a DSCP, IP precedence, IPv6 criteria, or IP criteria match occurs after the dot1p match, the new forwarding class may be overridden by the higher priority match actions. If the higher priority match actions do not specify a new FC, the FC from the dot1p match will be used.

The **profile** keyword is optional. When specified, the egress classification rule will overwrite the profile of the packet derived from ingress. The new profile value is used for egress remarking and queue congestion behavior. If a DSCP, IP precedence, IPv6 criteria, or IP criteria match occurs after the dot1p match, the new profile may be overridden by the higher priority match actions. If the higher priority match actions do not specify a new profile, the profile from the dot1p match will be used.

The **no** form of this command removes the reclassification rule from the SAP egress QoS policy.

## Parameters

### **dot1p-value**

This value is a required parameter that specifies the unique IEEE 802.1p value that will match the dot1p rule. If the command is executed multiple times with the same *dot1p-value*, the previous forwarding class and enqueueing priority is completely overridden by the new parameters or defined to be inherited when a forwarding class or enqueueing priority parameter is missing.

A maximum of eight dot1p rules are allowed on a single policy.

**Values** 0 to 7

### **fc fc-name**

Specifies the value given for the *fc-name* parameter must be one of the predefined forwarding classes in the system. Specifying the FC name is optional. When a packet matches the rule, the forwarding class is only overridden when the **fc fc-name** parameter is defined on the rule. If the packet matches and the forwarding class is not explicitly defined in the rule, the forwarding class is inherited based on previous rule matches.

### **profile {in | out | use-de | exceed | inplus}**

Specifies the profile reclassification action is optional. When specified, packets matching the dot1p value will be explicitly reclassified to the profile specified regardless of the ingress profiling decision. The explicit profile reclassification may be overwritten by a DSCP, IP precedence, IPv6 criteria, or IP criteria reclassification match. To remove the profile reclassification action for the specified dotp1 value, the **dot1p** command must be re-executed without the profile reclassification action defined.

**Values** **in** — Specifies that any packets matching the reclassification rule will be treated as in-profile by the egress forwarding plane.

**out** — Specifies that any packets matching the reclassification rule will be treated as out-of-profile by the egress forwarding plane.

**use-de** — Specifies that the DE bit is used to determine the profile of the packet (in-profile is used when DE = 0 and out-of-profile is used when DE = 1).

**exceed** — Specifies that any packets matching the reclassification rule will be treated as exceed-profile by the egress forwarding plane.

**inplus** — Specifies that any packets matching the reclassification rule will be treated as inplus-profile by the egress forwarding plane.

## Platforms

no dot1p
```

## Context

[\[Tree\]](#) (config>qos>sap-egress>fc dot1p)

## Full Context

```
configure qos sap-egress fc dot1p
```

## Description

This command explicitly defines the egress IEEE 802.1p (dot1p) bits marking for *fc-name*. When the marking is set, all packets of *fc-name* that have either an IEEE 802.1q or IEEE 802.1p encapsulation use the explicitly defined *dot1p-value*. If the egress packets for *fc-name* are not IEEE 802.1q or IEEE 802.1p encapsulated, the dot1p command has no effect.

The optional **in-profile** *dot1p-value* **out-profile** *dot1p-value* [**exceed-profile** *dot1p-value*] parameters added to the existing **dot1p** command adds the capability to mark on an egress SAP the in, out, and exceed-profile status via a certain dot1p combination, similarly with the DE options. All inplus-profile traffic is marked with the same value as in-profile traffic.

When the **in-profile** keyword is added, the **out-profile** keyword must be specified; however, **exceed-profile** is optional. If the optional **exceed-profile** *dot1p-value* is not included, any exceed-profile traffic will be marked with the same dot1p value as configured for the out-of-profile traffic.

The command with the additional structure may be used on the SAP when the internal in, out, and exceed-profile status needs to be communicated to an access network or customer device that does not support the DE bit.

When these commands are used, the DE bit or the equivalent field is left unchanged by the egress processing if a tag exists. If a new tag is added, the related DE bit is set to 0.

When the previous command (**dot1p** *dot1p-value*) is used without the new structure, it means that the dot1p value is used for the entire forwarding class, as it did before. The two versions of the command are mutually exclusive.

The in-profile or out-of-profile/exceed-profile status may be indicated via the DE bit setting if the **de-mark** command is used. The DE value used for exceed-profile is the same as that used for out-of-profile.

In the PBB case, for a Backbone SAP (B-SAP) and for packets originated from a local I-VPLS/PBB-Epipe, the command dictates the marking of the dot1p bits for both the BVID and ITAG.

The commands **dot1p-inner** and **dot1p-outer** take precedence over the **dot1p** command if both are specified in the same policy.

The **no** form of this command sets the IEEE 802.1p or IEEE 802.1q priority bits to 0.

## Default

no dot1p

## Parameters

### in-profile *dot1p-value*

Specifies the 802.1p value to set for in-profile frames in this forwarding class.

**Values** 0 to 7

### out-profile *dot1p-value*

Specifies the 802.1p value to set for out-profile frames in this forwarding class.

**Values** 0 to 7

### exceed-profile *dot1p-value*

Specifies the 802.1p value to set for exceed-profile frames in this forwarding class.

**Values** 0 to 7

## Platforms

**no dot1p**

## Context

[\[Tree\]](#) (config>qos>network>ingress dot1p)

## Full Context

configure qos network ingress dot1p

## Description

This command explicitly sets the forwarding class or enqueueing priority and profile of the packet when a packet is marked with a *dot1p-priority* specified. Adding a dot1p rule on the policy forces packets that match the *dot1p-priority* specified to override and be assigned to the forwarding class and enqueueing priority and profile of the packet, based on the parameters included in the dot1p rule. When the forwarding class is not specified in the rule, a matching packet preserves (or inherits) the existing forwarding class derived from earlier matches in the classification hierarchy. When the enqueueing priority is not specified

in the rule, a matching packet preserves (or inherits) the existing enqueueing priority derived from earlier matches in the classification hierarchy.

The *dot1p-priority* is derived from the most significant three bits in the IEEE 802.1q or IEEE 802.1p header. The three dot1p bits define 8 Class-of-Service (CoS) values commonly used to map packets to per-hop Quality of Service (QoS) behavior.

The **no** form of this command removes the explicit dot1p classification rule from the policy. Removing the rule on the policy immediately removes the rule on all ingress SAPs using the policy.

## Parameters

### *dot1p-priority*

This value is a required parameter that specifies the unique IEEE 802.1p value that will match the dot1p rule. If the command is executed multiple times with the same *dot1p-value*, the previous forwarding class and enqueueing priority is completely overridden by the new parameters or defined to be inherited when a forwarding class or enqueueing priority parameter is missing.

A maximum of eight dot1p rules are allowed on a single policy.

**Values** 0 to 7

### *fc-name*

Specifies the value given for the *fc-name* parameter must be one of the predefined forwarding classes in the system. Specifying the *fc-name* is optional. When a packet matches the rule, the forwarding class is only overridden when the **fc** *fc-name* parameter is defined on the rule. If the packet matches and the forwarding class is not explicitly defined in the rule, the forwarding class is inherited based on previous rule matches.

**Values** be, l2, af, l1, h2, ef, h1, nc

### **profile {in | out | use-de}**

All packets that are assigned to this forwarding class will be considered in-profile or out-of-profile based on this command or will use the DE bit to determine the profile of the packets (in-profile is used when DE = 0 and out-of-profile is used when DE = 1). In case of congestion, the in-profile packets are preferentially queued over the out-of-profile packets.

## Platforms

All

## dot1p

## Syntax

**dot1p** *dot1p-priority*

**no dot1p**

## Context

**[Tree]** (config>qos>network>egress>fc dot1p)

## Full Context

```
configure qos network egress fc dot1p
```

## Description

This command is used whenever the dot1p bits are set to a common value regardless of the internal profile of the packets. Although it is not mandatory, this command should be used in combination with the **de-mark** command to enable the marking of the DE bit according to the internal profile of the packet.

This command acts as a shortcut for configuring the two existing commands with the same dot1p priority.

The **dot1p** *dot1p-priority* command is saved in the configuration as **dot1p-in-profile** *dot1p-priority* and **dot1p-out-profile** *dot1p-priority*. The in-plus-profile traffic is marked with the same value as in-profile traffic. The exceed-profile traffic is marked with the same value as out-of-profile traffic.

## Platforms

All

## dot1p

## Syntax

```
dot1p dot1p-value [dot1p-mask]
```

```
no dot1p
```

## Context

[\[Tree\]](#) (config>filter>mac-filter>entry>match dot1p)

## Full Context

```
configure filter mac-filter entry match dot1p
```

## Description

Configures an IEEE 802.1p value or range to be used as a MAC filter match criterion.

When a frame is missing the 802.1p bits, specifying an dot1p match criterion will fail for the frame and result in a non-match for the MAC filter entry.

The **no** form of the command removes the criterion from the match entry.

Egress **dot1p** value matching will only match if the customer payload contains the 802.1p bits. For example, if a packet ingresses on a null encapsulated SAP and the customer packet is IEEE 802.1Q or 802.1p tagged, the 802.1p bits will be present for a match evaluation. On the other hand, if a customer tagged frame is received on a dot1p encapsulated SAP, the tag will be stripped on ingress and there will be no 802.1p bits for a MAC filter match evaluation; in this case, any filter entry with a dot1p match criterion specified will fail.

## Default

```
no dot1p
```

## Parameters

### *dot1p-value*

Specifies the IEEE 802.1p value in decimal.

**Values** 0 to 7

### *dot1p-mask*

Specifies a 3-bit mask that can be configured using the decimal integer, hexadecimal or binary format.

Table 29: Format Styles to Configure Mask

| Format Style | Format Syntax | Example |
|--------------|---------------|---------|
| Decimal      | D             | 4       |
| Hexadecimal  | 0xH           | 0x4     |
| Binary       | 0bBBB         | 0b100   |

To select a range from 4 up to 7 specify *dot1p-value* of 4 and a *dot1p-mask* of 0b100 for value and mask.

**Default** 7 (decimal)

**Values** 1 to 7 (decimal)

## dot1p-inner

### Syntax

**dot1p-inner** *dot1p-value*

**dot1p-inner in-profile***dot1p-value* **out-profile** *dot1p-value* [**exceed-profile** *dot1p-value*]

**no dot1p-inner**

## Context

[\[Tree\]](#) (config>qos>sap-egress>fc dot1p-inner)

## Full Context

```
configure qos sap-egress fc dot1p-inner
```

## Description

This command explicitly configures the egress inner VLAN tag IEEE 802.1p (dot1p) bits marking for the forwarding class name. When the marking is set, all packets of the forwarding class name that have either an inner IEEE 802.1q or IEEE 802.1p encapsulation on a QinQ SAP will use the explicitly defined *dot1p-value*. If the egress packets for the forwarding class are not IEEE 802.1q or IEEE 802.1p QinQ encapsulated, this command has no effect.

The optional **in-profile** *dot1p-value*, **out-profile** *dot1p-value*, and **exceed-profile** *dot1p-value* parameters on the **dot1p-inner** command add the capability to mark the in-profile and out-of-profile status on an egress QinQ SAP. The command with the additional parameters may be used on the SAP when the internal in-profile, out-of-profile, and exceed-profile status needs to be communicated to an access network or customer device that does not support the DE bit. When the in-profile keyword is added, the rest of the structure must be specified. All inplus-profile traffic is marked with the same value as in-profile traffic.

When these commands are used, the DE bit or the equivalent field is left unchanged by the egress processing if an inner tag exists. If a new inner tag is added, the related DE bit is set to 0. The inplus/in, out, or exceed-profile status may be indicated using the DE bit setting if the **de-mark** or **de-mark-inner** command is used.

The two versions of the command (with and without parameters) are mutually exclusive.

This command takes precedence over the **configure qos sap-ingress dot1p** command if both are specified in the same policy, and over the default action where the marking is taken from a packet received at ingress.

The configuration of **qinq-mark-top-only** under the SAP egress takes precedence over the use of the **dot1p-inner** command in the policy; that is, the inner VLAN tag is not remarked when **qinq-mark-top-only** is configured. The marking used for the inner VLAN tag is based on the current default, which is governed by the marking of the packet received at the ingress to the system.

The **no** form of this command sets the inner IEEE 802.1p or IEEE 802.1q priority bits to 0.

## Default

```
no dot1p-inner
```

## Parameters

### **dot1p-value**

Specifies the 802.1p value to set for in-profile frames in this forwarding class.

**Values** 0 to 7

### **in-profile dot1p-value**

Specifies the 802.1p value to set for in-profile frames in this forwarding class.

**Values** 0 to 7

### **out-profile dot1p-value**

Specifies the 802.1p value to set for out-of-profile frames in this forwarding class.

**Values** 0 to 7

#### **exceed-profile *dot1p-value***

Specifies the 802.1p value to set for exceed-profile frames in this forwarding class.

## 8.251 dot1p-outer

### dot1p-outer

#### Syntax

```
dot1p-outer {dot1p-value | in-profile dot1p-value out-profile dot1p-value [exceed-profile dot1p-value]}
no dot1p-outer
```

#### Context

[\[Tree\]](#) (config>qos>sap-egress>fc dot1p-outer)

#### Full Context

```
configure qos sap-egress fc dot1p-outer
```

#### Description

This command explicitly defines the egress outer or single VLAN tag IEEE 802.1p (dot1p) bits marking for *fc-name*. When the marking is set, all packets of *fc-name* that have either an outer or single IEEE 802.1q or IEEE 802.1p encapsulation on a qinq or a dot1p SAP, respectively, will use the explicitly defined *dot1p-value*. If the egress packets for *fc-name* are not IEEE 802.1q or IEEE 802.1p encapsulated, this command has no effect.

The optional **in-profile** *dot1p-value* **out-profile** *dot1p-value* [**exceed-profile** *dot1p-value*] parameters on the dot1p-outer command add the capability to mark the in, out, and exceed-profile status on an egress qinq or dot1p SAP. The command with the additional parameters may be used on the SAP when the internal in, out, and exceed-profile status needs to be communicated to an access network or customer device that does not support the DE bit.

When the **in-profile** keyword is added, the **out-profile** keyword must be specified; however, **exceed-profile** is optional. If the optional **exceed-profile** *dot1p-value* is not included, any exceed-profile traffic will be marked with the same dot1p value as configured for the out-of-profile traffic. All inplus-profile traffic is marked with the same value as in-profile traffic.

When these commands are used, the DE bit or the equivalent field is left unchanged by the egress processing if a single or outer tag exists. If a new tag is added, the related DE bit is set to 0. The in, out, or exceed-profile status may be indicated via the setting of the DE bit setting if the **de-mark(-outer)** command is used. The DE value used for inplus is the same as that used for in-profile and the one used for exceed-profile is the same as that used for out of profile.

In the PBB case, for a Backbone SAP (B-SAP) and for packets originated from a local I-VPLS/PBB-Epipe, the command dictates the marking of the dot1p bits for both the BVID and ITAG.

The two versions of the command (with and without parameters) are mutually exclusive.

This command takes precedence over the **dot1p** command if both are specified in the same policy, and over the default action where the marking is taken from a packet received at ingress.

The **no** form of the command sets the IEEE 802.1p or IEEE 802.1q priority bits to 0.

### Default

no dot1p-outer

### Parameters

#### *dot1p-value*

Specifies the 802.1p value to set for in-profile frames in this forwarding class.

**Values** 0 to 7

#### *in-profile dot1p-value*

Specifies the 802.1p value to set for in-profile frames in this forwarding class.

**Values** 0 to 7

#### *out-profile dot1p-value*

Specifies the 802.1p value to set for out-of-profile frames in this forwarding class.

**Values** 0 to 7

#### *exceed-profile dot1p-value*

Specifies the 802.1p value to set for exceed-profile frames in this forwarding class.

configure router interface hold-time down

configure service vpls interface hold-time down

configure service ies interface hold-time down

configure service ies subscriber-interface hold-time down

configure service vprn subscriber-interface hold-time down

configure service vprn redundant-interface hold-time down

configure service vprn network-interface hold-time down

configure service vprn interface hold-time down

#### Description

This command causes a delay in the activation of the associated IP interface by the specified number of seconds. The delay is invoked whenever the system attempts to bring the associated IP interface up, unless the **init-only** option is configured. If the **init-only** option is configured, the delay is only applied when the IP interface is first configured or after a system reboot.

The **no** form of this command removes the command from the active configuration and removes the delay in activating the associated IP interface. If the configuration is removed during a delay period, the currently running delay will continue until it completes.

### Default

no down ip

### Parameters

#### **seconds**

The time delay, in seconds, to make the interface operational.

**Values** 1 to 1200

#### **init-only**

Specifies that the **down** delay is only applied when the interface is configured or after a reboot.

**Values** 1 to 1200

### Platforms

## 8.256 down-link

### down-link

#### Syntax

**down-link** *gbr rate mbr rate*

**no down-link**

## Context

[\[Tree\]](#) (config>subscr-mgmt>gtp>peer-profile>ggsn>qos down-link)

[\[Tree\]](#) (config>subscr-mgmt>gtp>peer-profile>pgw>qos down-link)

[\[Tree\]](#) (config>subscr-mgmt>gtp>peer-profile>mme>qos down-link)

## Full Context

configure subscriber-mgmt gtp peer-profile ggsn qos down-link

configure subscriber-mgmt gtp peer-profile pgw qos down-link

configure subscriber-mgmt gtp peer-profile mme qos down-link

## Description

This command configures the down-link bitrate in kb/s to be used in the GTP messages.

The **no** form of this command reverts to the default.

## Default

down-link gbr 2000 mbr 2000

down-link gbr 2000 mbr 2000 - for ggsn

down-link gbr 0 mbr 0 - for mme and pgw

## Parameters

### **gbr rate**

Specifies the downlink Guaranteed Bit Rate (GBR) to be used in the GTP messages as QOS IE (GTPv1) or Bearer QOS (GTPv2).

### **mbr rate**

Specifies the downlink Maximum Bit Rate (MBR) to be used in the GTP messages as QOS IE (GTPv1) or Bearer QOS (GTPv2).

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.257 down-on-internal-error

### down-on-internal-error

## Syntax

**down-on-internal-error** [tx-disable]

**no down-on-internal-error**

## Context

[\[Tree\]](#) (config>port>ethernet down-on-internal-error)

## Full Context

configure port ethernet down-on-internal-error

## Description

This command configures the system to bring a port operationally down in the event the system has detected internal MAC transmit errors (Int MAC Tx Errs).

## Default

no down-on-internal-error

## Parameters

### tx-disable

Specifies that the laser should be disabled if an internal MAC transmit error is encountered. When used, this option requires that the operator explicitly cycle the admin state of the port to clear the error and re-enable the laser.

## Platforms

All

## 8.258 down-on-peer-tldp-pw-status-faults

### down-on-peer-tldp-pw-status-faults

## Syntax

**down-on-peer-tldp-pw-status-faults**

**no down-on-peer-tldp-pw-status-faults**

## Context

[\[Tree\]](#) (config>service>epipe>pw-port down-on-peer-tldp-pw-status-faults)

## Full Context

configure service epipe pw-port down-on-peer-tldp-pw-status-faults

## Description

This command enables the PW port configured on an Epipe to go locally operationally down if any of the following status bits are received on a mate spoke-SDP across an FPE:

- 0x00000001 - Pseudowire Not Forwarding
- 0x00000002 - Local Attachment Circuit (ingress) Receive Fault
- 0x00000004 - Local Attachment Circuit (egress) Transmit Fault
- 0x00000008 - Local PSN-facing PW (ingress) Receive Fault

- 0x00000010 - Local PSN-facing PW (egress) Transmit Fault

The **no** form of the command specifies that the mate PW status fault bits are not taken into account in the operational state of the PW port.

### Default

no down-on-peer-tldp-pw-status-faults

### Platforms

All

## 8.259 down-threshold

### down-threshold

#### Syntax

**down-threshold** *percent-change* [**bw** *absolute-change*]

#### Context

[\[Tree\]](#) (config>router>rsvp>dbw-accounting down-threshold)

#### Full Context

configure router rsvp dbw-accounting down-threshold

#### Description

This command sets the minimum change (in percent of the latest advertised value) above which a decrease in Maximum Reservable Link Bandwidth (MRLB) (IS-IS TE sub-TLV 10) or Maximum Reservable Bandwidth (MRB) (OSPF TE sub-TLV 7) triggers an IGP-TE update. This configuration only applies to a change in MRLB or MRB caused by dark bandwidth. Other events affecting MRLB/MRB (such as the change of the subscription factor or the loss of link in a LAG over which the RSVP interface is defined) trigger an immediate TE update, regardless of the importance of the impact.

Optionally, the threshold can also be expressed as an absolute value. In this case, the evaluation of the change is made using the percent change and the absolute change. An IGP-TE update is sent if both of these thresholds are crossed. Changing this parameter in the course of dark bandwidth accounting does not affect the accounting cycle.

#### Default

down-threshold 0

#### Parameters

*percent-change*

Specifies the minimum decrease in MRLB/MRB, expressed in percent.

**Values** 0 to 100

***absolute-change***

Specifies the minimum decrease in MRLB/MRB, expressed in Mb/s.

**Values** 0 to 1000000

**Platforms**

7750 SR, 7750 SR-s, 7950 XRS, VSR

## 8.260 down-timeout

### down-timeout

**Syntax**

[no] down-timeout

**Context**

[Tree] (config>aaa>radius-srv-plcy>servers>health-check down-timeout)

**Full Context**

configure aaa radius-server-policy servers health-check down-timeout

**Description**

This command determines the interval to wait for a RADIUS reply message from the RADIUS server before a RADIUS server is declared out-of-service. By default, the value of the down-timeout is the number of retries multiplied by the timeout interval. Each host will use the configured timeout and retry value under the AAA RADIUS server policy.

**timeout** refers to the waiting period before the next retry attempt.

**retry** refers the number of times the host will attempt to contact the RADIUS server.

If a RADIUS server is declared out-of-service, the host pending retry attempts will move on to the next RADIUS server.

The **no** form of this command reverts to the default.

**Parameters**

***minutes***

Specifies the timer to wait, in minutes, before declaring the RADIUS server that is down.

**Values** 1 to 5

***seconds***

Specifies the timer to wait, in seconds, before declaring the RADIUS server that is down.

**Values** 1 to 59

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.261 down-when-looped

### down-when-looped

#### Syntax

**down-when-looped**

#### Context

[\[Tree\]](#) (config>port>ethernet down-when-looped)

#### Full Context

configure port ethernet down-when-looped

#### Description

This command configures Ethernet loop detection attributes.

### Platforms

All

## 8.262 downlink

### downlink

#### Syntax

**downlink aggregate-rate**

**downlink arbiter** *arbiter-name*

**downlink policer** *policer-id*

**downlink queue** *queue-id*

**downlink scheduler** *scheduler-name*

**no downlink**

## Context

[\[Tree\]](#) (config>subscr-mgmt>gtp>apn-policy>apn>ambr-qos-mapping downlink)

## Full Context

configure subscriber-mgmt gtp apn-policy apn ambr-qos-mapping downlink

## Description

When enabled, the downlink rate in the APN-AMBR IE in an incoming GTP message is interpreted as a rate override for the specified egress QoS object. For queues and policers, the PIR is overridden.

This override uses standard SR OS QoS overrides. Therefore, a subsequent Gx/RADIUS-based override removes this override.

The **no** form of this command disables the override mechanism.

## Default

no downlink

## Parameters

### **aggregate-rate**

Specifies the aggregate rate.

### **arbiter-name**

Specifies the name of the arbiter to be overridden, up to 32 characters.

### **policer-id**

Specifies the ID of the policer to be overridden.

**Values** 1 to 63

### **queue-id**

Specifies the ID of the queue to be overridden.

**Values** 1 to 8

### **scheduler-name**

Specifies the name of the scheduler to be overridden, up to 32 characters.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.263 downlink-mbr-gbr

## downlink-mbr-gbr

### Syntax

```
downlink-mbr-gbr aggregate-rate
downlink-mbr-gbr arbiter arbiter-name
downlink-mbr-gbr policer policer-id
downlink-mbr-gbr queue queue-id
downlink-mbr-gbr scheduler scheduler-name
no downlink-mbr-gbr
```

### Context

[\[Tree\]](#) (config>subscr-mgmt>sla-prof>pfcp>seq downlink-mbr-gbr)

### Full Context

configure subscriber-mgmt sla-profile pfcp-mappings session-qer downlink-mbr-gbr

### Description

This command configures the downlink MBR/GBR to QoS override mapping.

The **no** form of the command disables the downlink MBR/GBR mapping.

### Default

no downlink-mbr-gbr

### Parameters

#### **aggregate-rate**

Maps the MBR/GBR to a rate override for the aggregate rate.

#### **arbiter-name**

Specifies the arbiter target of the MBR/GBR override. The arbiter name can be up to 32 characters.

#### **policer-id**

Specifies the policer ID target of the MBR/GBR override.

**Values** 1 to 63

#### **queue-id**

Specifies the queue ID target of the MBR/GBR override.

**Values** 1 to 8

#### **scheduler-name**

Specifies the scheduler name target of the MBR/GBR override. The scheduler name can be up to 32 characters.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.264 download-interval

### download-interval

#### Syntax

**download-interval** *minutes*

**no download-interval**

#### Context

[\[Tree\]](#) (config>aaa>route-downloader download-interval)

#### Full Context

configure aaa route-downloader download-interval

#### Description

This command sets the time interval, in minutes, that the system waits for between two consecutive runs of the route-download process. The time is counted from the start-time of the run, thus, if an route-download process is still ongoing by the time the timer expires, the process will restart from count=1.

The **no** form of this command reverts to the default value.

#### Default

download-interval 720

#### Parameters

*minutes*

Specifies the time interval, in minutes, between the start of the last route downloader run and the start of the next route downloader run.

**Values** 1 to 1440

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.265 downstream-ip-filter

## downstream-ip-filter

### Syntax

**downstream-ip-filter** *filter-id*

**no downstream-ip-filter**

### Context

[\[Tree\]](#) (config>service>vprn>nat>inside downstream-ip-filter)

### Full Context

configure service vprn nat inside downstream-ip-filter

### Description

This command assigns an IPv4 filter policy to the downstream NAT interface. This filter is applied to downstream traffic after the NAT function is applied but before it enters the inside VPRN instance.

The **no** form of the command removes the filter from the configuration.

### Default

no downstream-ip-filter

### Parameters

*filter-id*

Specifies an existing IPv4 filter policy. Values can be expressed either as a decimal integer or as an ASCII string of up to 64 characters.

**Values** 1 to 65535, or ASCII string of up to 64 characters

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## downstream-ip-filter

### Syntax

**downstream-ip-filter** *filter-id*

**no downstream-ip-filter**

### Context

[\[Tree\]](#) (config>router>nat>outside downstream-ip-filter)

[\[Tree\]](#) (config>service>vprn>nat>outside downstream-ip-filter)

### Full Context

configure router nat outside downstream-ip-filter

```
configure service vprn nat outside downstream-ip-filter
```

### Description

This command specifies a filter to apply to the downstream traffic after routing in the outside virtual router instance and before the NAT function; it is useful for traffic that bypasses the egress filters applied in the inside virtual router instance, such as DS-Lite traffic.

The **no** form of the command removes the filter from the configuration.

### Default

```
no downstream-ip-filter
```

### Parameters

*filter-id*

Specifies a filter up to 64 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.266 downstream-ipv6-filter

```
downstream-ipv6-filter
```

### Syntax

```
downstream-ipv6-filter filter-id
```

```
no downstream-ipv6-filter
```

### Context

[\[Tree\]](#) (config>router>nat>outside downstream-ipv6-filter)

[\[Tree\]](#) (config>service>vprn>nat>outside downstream-ipv6-filter)

### Full Context

```
configure router nat outside downstream-ipv6-filter
```

```
configure service vprn nat outside downstream-ipv6-filter
```

### Description

This command configures the ipv6-filter for downstream traffic. This filter is applied to downstream traffic after it leaves the outside virtual router instance but before the NAT function is applied. This is useful for shared v6 filters that apply to all v6 DSM hosts.

The **no** form of the command removes the filter from the configuration.

**Default**

no downstream-ipv6-filter

**Parameters*****filter-id***

Specifies an IPv6 filter up to 64 characters in length.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.267 downstream-map-tlv

### downstream-map-tlv

**Syntax**

**downstream-map-tlv** *downstream-map-tlv*

**no downstream-map-tlv**

**Context**

[\[Tree\]](#) (config>saa>test>type-multi-line>lsp-trace>sr-policy downstream-map-tlv)

**Full Context**

configure saa test type-multi-line lsp-trace sr-policy downstream-map-tlv

**Description**

This command configures the downstream mapping TLV that provides a mechanism for the sender and responder nodes to exchange and validate interface and label stack information for each downstream hop in the path of the LDP FEC an RSVP LSP, or a BGP IPv4 or IPv6 label route.

The following downstream mapping TLVs are supported: the original Downstream Mapping (DSMAP) TLV defined in RFC 4379 (obsoleted by RFC 8029) and the Downstream Detailed Mapping (DDMAP) TLV defined in RFC 6424.

The **no** form of this command removes the configuration.

**Parameters*****downstream-map-tlv***

Specifies which format of the downstream mapping TLV to use in the LSP trace packet. The DSMAP TLV is the original format in RFC 4379 (obsoleted by RFC 8029). The DDMAP is the new enhanced format specified in RFC 6424. The user can also choose not to include the downstream mapping TLV by entering the value **none**. When **lsp-trace** is used on a MPLS-TP LSP (static option), it can only be executed if the control-channel is set to none. In addition, the DSMAP/DDMAP TLV is only included in the echo request

message if the egress interface is either a numbered IP interface or an unnumbered IP interface. The TLV is not included if the egress interface is of type **unnumbered-mpls-tp**.

**Values**    dmap: Sends a detailed downstream mapping TLV.  
               dsmap: Sends a downstream mapping TLV.  
               none: No mapping TLV is sent.

**Default**    Inherited from global configuration of downstream mapping TLV in option **mpls-echo-request-downstream-map {dsmap | dmap}**.

## Platforms

All

## 8.268 dpd

dpd

### Syntax

**dpd** [*interval interval*] [*max-retries max-retries*] [*reply-only*]  
**no dpd**

### Context

[\[Tree\]](#) (config>ipsec>ike-policy dpd)

### Full Context

configure ipsec ike-policy dpd

### Description

This command controls the dead peer detection mechanism.

The **no** form of this command removes the parameters from the configuration.

### Default

no dpd

### Parameters

#### *interval*

Specifies the DPD interval, in seconds. Since more time is necessary to determine if there is incoming traffic, the actual time needed to bring down the tunnel is larger than the DPD interval multiplied by max-retries.

**Values**    10 to 300

**Default** 30

#### ***max-retries***

Specifies the maximum number of retries before the tunnel is removed.

**Values** 2 to 5

**Default** 3

#### **reply-only**

Specifies whether to initiate a DPD request if there is an incoming ESP or IKE packet. Issuing the command without the reply-only keyword does not initiate a DPD request if there is an incoming ESP packet.

#### **Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.269 dr-activation-timer

### dr-activation-timer

#### **Syntax**

**dr-activation-timer** *seconds*

#### **Context**

[\[Tree\]](#) (config>service>vpls>bind>evpn-mcast-gateway dr-activation-timer)

#### **Full Context**

configure service vpls allow-ip-int-bind evpn-mcast-gateway dr-activation-timer

#### **Description**

This command configures the designated router (DR) activation timer for the EVPN gateway.

After the DR activation timer expires, each provider edge router (PE) runs the MEG or PEG DR election. The timer allows the PE to collect Inclusive Multicast Ethernet Tag routes from other MEG/PEG gateways and avoid running the DR election multiple times. The DR triggers the MEG/PEG first-hop and last-hop router actions on the router.

#### **Default**

dr-activation-timer 3

#### **Parameters**

***seconds***

Specifies DR election wait time, in seconds.

**Values** 0 to 100

### Platforms

All

## 8.270 drain

drain

### Syntax

[no] drain

### Context

**[Tree]** (config>service>vprn>dhcp>server>pool>subnet drain)

### Full Context

configure service vprn dhcp local-dhcp-server pool subnet drain

### Description

This command means no new leases can be assigned from this subnet and existing leases are cleaned up upon renew/rebind.

The **no** form of this command means the subnet is active and new leases can be assigned from it.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

drain

### Syntax

[no] drain

### Context

**[Tree]** (config>router>nat>outside>pool>address-range drain)

**[Tree]** (config>service>vprn>nat>outside>pool>address-range drain)

### Full Context

configure router nat outside pool address-range drain

configure service vprn nat outside pool address-range drain

## Description

This command starts or stops draining this NAT address range. When an address-range is being drained, it will not be used to serve new hosts. Existing hosts, however, will still be able to use the address that was assigned to them even if it is being drained. An address-range can only be deleted if the parent pool is shut down or if the range itself is effectively drained (hosts are no longer using the addresses).

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.271 drop

drop

## Syntax

[no] drop

## Context

[\[Tree\]](#) (config>app-assure>group>policy>aqp>entry>action drop)

## Full Context

configure application-assurance group policy app-qos-policy entry action drop

## Description

This command configures the drop action on flows matching this AQP entry. When enabled, all flow traffic matching this AQP entry will be dropped. When drop action is part of a set of multiple actions to be applied to a single flow as result of one or more AQP entry match, drop action will be performed first and no other action will be invoked on that flow.

The **no** form of this command disables the drop action on flows matching this AQP entry.

## Default

no drop

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

drop

## Syntax

drop

drop packet-length {lt | gt | eq} *packet-length-value*

drop packet-length range *packet-length-value* *packet-length-value*

**drop pattern expression** *expression mask mask offset-type offset-type offset-value offset-value*  
**drop ttl** {*lt* | *gt* | *eq*} *tll-value*  
**drop ttl range** *tll-value tll-value*

## Context

[\[Tree\]](#) (config>filter>ip-filter>entry>action drop)

## Full Context

configure filter ip-filter entry action drop

## Description

This command configures the drop action for the traffic that matches this filter entry.

Traffic can, also, be dropped based on *pkt-length*, *packet-length range*, *tll*, *tll range*, or a pattern of conditional match criteria.

Packets that match the filter entry match criteria, and not the conditional match criteria value, are implicitly forwarded with no further match in the following filter entries.

For pattern match:

- the expression is left-aligned for odd number bytes, for example, the expression 0xABC is programmed 0x0ABC in the line card
- the 'data' offset requires protocol UDP or TCP to be selected in the filter entry match criteria.

## Parameters

### packet-length

Specifies drop packets matching both the filter entry match criteria and the *packet-length value* defined in the **drop** action statement. Packets matching the filter entry match criteria and not matching the *packet-length* value, as defined in the **drop** action statement, are implicitly forwarded with no further match in the following filter entries.

- Values**
- lt* — Specifies "less than". The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.
  - gt* — Specifies "greater than". The **gt** parameter cannot be used with the highest possible numerical value for the parameter.
  - eq* — Specifies "equal to".

### packet-length-value

Specifies the packet length value for the rate limit action.

- Values** 0 to 65535

### range

Specifies an inclusive range. When **range** is used, the start of the range (the first value entered) must be smaller than the end of the range (the second value entered).

### expression

Specifies the hexadecimal pattern to match; up to eight bytes.

**Values** 0x0000000000000001 to 0xffffffffffffff

#### **mask**

Specifies the mask for the pattern expression, up to eight bytes.

**Values** 0x0000000000000001 to 0xffffffffffffff

#### **offset-type**

Specifies the starting point reference for the offset-value of this pattern.

**Values** layer-3, layer-4, data, dns-qtype

#### **offset-value**

Specifies the offset value for the pattern expression. Dns-qtype supports offset value of 0.

**Values** 0 to 255

#### **ttl-value**

Specifies drop packets matching both the filter entry match criteria and the TTL value defined in the drop action statement. Packets matching the filter entry match criteria and not matching the TTL value, as defined in the drop action statement, are implicitly forwarded with no further match in the following filter entries.

**Values** 0 to 255

### **Platforms**

All

## drop

### **Syntax**

**drop**

**drop hop-limit** {lt | gt | eq} *hop-limit-value*

**drop hop-limit range** *hop-limit-value* *hop-limit-value*

**drop pattern expression** *expression* **mask** *mask* **offset-type** *offset-type* **offset-value** *offset-value*

**drop payload-length** {lt | gt | eq} *payload-length-value*

**drop payload-length range** *payload-length-value* *payload-length-value*

### **Context**

[\[Tree\]](#) (config>filter>ipv6-filter>entry>action drop)

### **Full Context**

configure filter ipv6-filter entry action drop

### **Description**

This command configures the drop action for the traffic that matches this filter entry.

Traffic can, also, be dropped based on *payload-length*, *payload-length range*, *hop-limit*, *hop-limit range*, or a pattern of conditional match criteria.

Packets that match the filter entry match criteria, but do not match the conditional match criteria value, are implicitly forwarded with no further match in the following filter entries.

For pattern match:

- the expression is left-aligned for the odd number bytes, for example, the expression 0xABC is programmed 0x0ABC in the line card
- the 'data' offset requires protocol UDP or TCP to be selected in the filter entry match criteria

## Parameters

### hop-limit

Specifies the hop-limit value for the drop action.

- Values** It — Specifies "less than". The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.
- eq — Specifies "equal to".
- gt — Specifies "greater than". The **gt** parameter cannot be used with the highest possible numerical value for the parameter.

### hop-limit-value

Specifies the hop-limit value for the drop action.

- Values** 0 to 255

### range

Specifies an inclusive range. When the **range** parameter is used, the start of the range (the first value entered) must be smaller than the end of the range (the second value entered).

### expression

Specifies the hexadecimal pattern to match; up to eight bytes.

- Values** 0x0000000000000001 to 0xffffffffffffff

### mask

Specifies the mask for the pattern expression, up to eight bytes.

- Values** 0x0000000000000001 to 0xffffffffffffff

### offset-type

Specifies the starting point reference for the offset-value of this pattern.

- Values** layer-3, layer-4, data, dns-qtype

### offset-value

Specifies the offset value for the pattern expression. Dns-qtype supports offset value of 0.

- Values** 0 to 255

### payload-length

Specifies drop packets matching both the filter entry match criteria and the payload-length-value defined in the drop action statement. Packets matching the filter entry match criteria and not matching the payload-length-value, as defined in the drop action statement, are implicitly forwarded with no further match in the following filter entries.

- Values**
- lt — Specifies "less than". The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.
  - gt — Specifies "greater than". The **gt** parameter cannot be used with the highest possible numerical value for the parameter.
  - eq — Specifies "equal to".

#### ***payload-length-value***

Specifies the payload length value for the drop action.

- Values** 0 to 65535

### Full Context

configure service vprn static-route-entry indirect cpe-check drop-count

configure service vprn static-route-entry next-hop cpe-check drop-count

### Description

This optional parameter specifies the number of consecutive ping-replies that must be missed to declare the CPE down and to deactivate the associated static route.

### Default

drop-count 3

### Parameters

#### *count*

An integer count value.

**Values** 1 to 255

### Platforms

All

## drop-count

### Syntax

**drop-count** *consecutive-failures* [**hold-down** *seconds*]

**no drop-count**

### Context

[\[Tree\]](#) (config>filter>redirect-policy>dest>ping-test drop-count)

### Full Context

configure filter redirect-policy destination ping-test drop-count

### Description

This command specifies the number of consecutive requests that must fail for the destination to be declared unreachable and the time to hold destination unreachable before repeating tests.

## Default

drop-count 3 hold-down 0

## Parameters

### *consecutive-failures*

Specifies the number of consecutive ping test failures before declaring the destination down.

**Values** 1 to 60

### *hold-down seconds*

Specifies the amount of time, in seconds, that the system should be held down if any of the test has marked it unreachable.

**Values** 0 to 86400

## Platforms

configure service vprn subscriber-interface group-interface sap static-host managed-routes route-entry cpe-check drop-count

## Description

This command configures the number of consecutive ping replies that must be missed to declare the CPE down.

## Default

drop-count 3

## Parameters

**count**

Specifies the count value.

**Values** 1 to 255

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## drop-count

### Syntax

**drop-count** *count*

**no drop-count**

### Context

**[Tree]** (config>vrrp>policy>priority-event>host-unreachable drop-count)

### Full Context

configure vrrp policy priority-event host-unreachable drop-count

### Description

This command configures the number of consecutively sent ICMP echo request messages that must fail before the host unreachable priority control event is set.

The **drop-count** command is used to define the number of consecutive message send attempts that must fail for the **host-unreachable** priority event to enter the set state. Each unsuccessful attempt increments the event's consecutive message drop counter. With each successful attempt, the event's consecutive message drop counter resets to zero.

If the event's consecutive message drop counter reaches the **drop-count** value, the **host-unreachable** priority event enters the set state.

The event's **hold-set** value defines how long the event must stay in the set state even when a successful message attempt clears the consecutive drop counter. The event is not cleared until the consecutive drop counter is less than the **drop-count** value and the **hold-set** timer has a value of zero (expired).

The **no** form of the command reverts to the default value.

### Default

drop-count 3 — 3 consecutive ICMP echo request failures are required before the host unreachable priority control event is set.

### Parameters

**count**

The number of ICMP echo request message attempts that must fail for the event to enter the set state. It also defines the threshold so a lower consecutive number of failures can clear the event state.

**Values** 1 to 60

### Platforms

All

## 8.273 drop-extracted-traffic

### drop-extracted-traffic

#### Syntax

**drop-extracted-traffic**

#### Context

**[Tree]** (config>filter>ipv6-filter>entry>action drop-extracted-traffic)

## 8.276 drop-unidentified-traffic

### drop-unidentified-traffic

#### Syntax

[no] drop-unidentified-traffic

#### Context

[\[Tree\]](#) (config>service>vprn>nat>inside>subscriber-identification drop-unidentified-traffic)

[\[Tree\]](#) (config>router>nat>inside>subscriber-identification drop-unidentified-traffic)

#### Full Context

configure service vprn nat inside subscriber-identification drop-unidentified-traffic

configure router nat inside subscriber-identification drop-unidentified-traffic

#### Description

When this command denies address translation to subscribers that have not been identified via accounting messages sent by BNG and received by Radius accounting proxy. This command has effect only in Subscriber Aware Application.

#### Default

no drop-unidentified-traffic

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.277 drop-zero-ipv4-checksum

### drop-zero-ipv4-checksum

#### Syntax

[no] drop-zero-ipv4-checksum

#### Context

[\[Tree\]](#) (config>service>vprn>nat>inside>nat64 drop-zero-ipv4-checksum)

#### Full Context

configure service vprn nat inside nat64 drop-zero-ipv4-checksum

## Description

This command specifies if UDP datagrams with zero IPv4 checksum are dropped.  
If this command is disabled, the system calculates the IPv6 checksum for each such datagram.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## drop-zero-ipv4-checksum

## Syntax

[no] drop-zero-ipv4-checksum

## Context

[\[Tree\]](#) (config>router>nat>inside>nat64 drop-zero-ipv4-checksum)

[\[Tree\]](#) (config>service>vprn>nat>inside>nat64 drop-zero-ipv4-checksum)

## Full Context

configure router nat inside nat64 drop-zero-ipv4-checksum

configure service vprn nat inside nat64 drop-zero-ipv4-checksum

## Description

This command enables the NAT64 node to drop received UDP datagrams with zero IPv4 checksum. By default, checksum is re-calculated for non-fragmented datagrams.

The **no** form of the command disables the command.

## Default

disabled

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.278 dropped-only

## dropped-only

## Syntax

[no] dropped-only

## Context

[\[Tree\]](#) (debug>subscr-mgmt>vrgw>brg>pppoe-client>brg-id dropped-only)

### Full Context

```
debug subscriber-mgmt vrgw brg pppoe-client brg-id dropped-only
```

### Description

This command specifies that only packets that are dropped by the vRGW will be shown in debugging.

### Default

dropped-only

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.279 ds1

```
ds1
```

### Syntax

```
[no] ds1 ds1-id
```

### Context

[\[Tree\]](#) (config>port>tdm ds1)

### Full Context

```
configure port tdm ds1
```

### Description

Commands in this context configure digital signal level 1 (DS-1) frame parameters. The T-Carrier system was the first successful system that supported digitized voice transmission. The original transmission rate (1.544 Mb/s) in the T-1 (DS-1) line is commonly used by Internet service providers (ISPs) to connect to the Internet.

North America uses the T-Carrier system while Europe uses the E-Carrier system of transmission, using multiples of the DS- system. Digital signals are carried inside the carrier systems.

T-1 transmits DS-1-formatted data at 1.544 Mb/s through the network. The corresponding European carrier is E-1 with a data rate of 2.048 Mb/s. E-1 and T-1 (DS-1) can be interconnected for international use.

The **no** form of this command disables DS-1 capabilities.

### Parameters

#### *ds1-id*

Identifies the DS-1 channel being created.

**Values** DS1: 1 to 28, ds1-sonet-sdh-index

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 8.280 ds3

### ds3

#### Syntax

[no] ds3 [*sonet-sdh-index*]

#### Context

[\[Tree\]](#) (config>port>tdm ds3)

#### Full Context

configure port tdm ds3

#### Description

Commands in this context configure DS-3 parameters. DS-3 lines provide a speed of 44.736 Mb/s and is also frequently used by service providers. DS-3 lines carry 28 DS-1 signals and a 44.736 Mb/s data rate.

A DS-3 connection typically supports data rates of about 43 Mb/s. A T-3 line actually consists of 672 individual channels, each supporting 64 kb/s. T-3 lines are used mainly by Service Providers to connect to the Internet backbone and for the backbone itself.

Depending on the MDA type, the DS-3 parameters must be disabled if clear channel is enabled by default (for example, on the m12-ds3 MDA). Clear channel is a channel that uses out-of-band signaling, not in-band signaling, so the channel's entire bit rate is available. Channelization must be explicitly specified.

Note that if DS-3 nodes are provisioned on a channelized SONET/SDH MDA you must provision the parent STS-1 SONET/STM0 SDH path first.

North America uses the T-Carrier system while Europe uses the E-Carrier system of transmission, using multiples of the DS system. Digital signals are carried inside the carrier systems.

The **no** form of this command disables DS-3 capabilities.

#### Parameters

##### *sonet-sdh-index*

Specifies the components making up the specified SONET/SDH Path. Depending on the type of SONET/SDH port the *sonet-sdh-index* must specify more path indexes to specify the payload location of the path. The *sonet-sdh-index* differs for SONET and SDH ports.

#### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 8.281 dsap

```
dsap
```

### Syntax

```
dsap dsap-value [dsap-mask]
```

```
no dsap
```

### Context

[\[Tree\]](#) (config>qos>sap-ingress>mac-criteria>entry>match dsap)

### Full Context

```
configure qos sap-ingress mac-criteria entry match dsap
```

### Description

Configures an Ethernet 802.2 LLC DSAP value or range for an ingress SAP QoS policy match criterion.

This is a 1-byte field that is part of the 802.2 LLC header of the IEEE 802.3 Ethernet Frame.

The snap-pid field, etype field, ssap, and dsap fields are mutually exclusive and cannot be part of the same match criteria.

Use the **no** form of this command to remove the dsap value as the match criterion.

### Default

```
no dsap
```

### Parameters

#### **dsap-value**

The 8-bit dsap match criteria value in hexadecimal.

**Values** 0x00 to 0xFF (hex)

#### **dsap-mask**

This is optional and can be used when specifying a range of dsap values to use as the match criteria.

This 8-bit mask can be configured using the following formats.

Table 31: Format Styles to Configure Mask

| Format Style | Format Syntax | Example    |
|--------------|---------------|------------|
| Decimal      | DDD           | 240        |
| Hexadecimal  | 0xHH          | 0xF0       |
| Binary       | 0bBBBBBBBB    | 0b11110000 |

**Values** 0x00 to 0xFF (hex)

**Default** FF

## Platforms

All

## dsap

## Syntax

**dsap** *dsap-value* [*dsap-mask*]

**no dsap**

## Context

[\[Tree\]](#) (config>filter>mac-filter>entry>match dsap)

## Full Context

configure filter mac-filter entry match dsap

## Description

Configures an Ethernet 802.2 LLC DSAP value or range for a MAC filter match criterion.

This is a one-byte field that is part of the 802.2 LLC header of the IEEE 802.3 Ethernet Frame.

The snap-pid field, etype field, ssap and dsap fields are mutually exclusive and may not be part of the same match criteria.

Use the **no** form of the command to remove the dsap value as the match criterion.

## Default

no dsap

## Parameters

### *dsap-value*

Specifies the 8-bit dsap match criteria value which can be expressed in decimal integer, hexadecimal or binary format.

**Values** 0 to 255

### *dsap-mask*

Specifies an optional parameter that may be used when specifying a range of dsap values to use as the match criteria.

This 8 bit mask can be configured using the decimal integer, hexadecimal or binary formats described in the following table.

Table 32: Format Styles to Configure Mask

| Format Style | Format Syntax | Example    |
|--------------|---------------|------------|
| Decimal      | DDD           | 240        |
| Hexadecimal  | 0xHH          | 0xF0       |
| Binary       | 0BBBBBBBB     | 0b11110000 |

**Default** 255 (exact match)  
0x00 to 0xFF

**Values** 0 to 255

## Platforms

All

## dsap

## Syntax

**dsap** *dsap-value* [*dsap-mask*]

## Context

[\[Tree\]](#) (config>system>security>mgmt-access-filter>mac-filter>entry>match dsap)

## Full Context

configure system security management-access-filter mac-filter entry match dsap

## Description

This command configures DSAP match conditions.

## Parameters

### *dsap-value*

Specifies the 8-bit DSAP match criteria value in hexadecimal.

**Values** 0x00 to 0xFF (hex)

### *mask*

Specifies a range of DSAP values to use as the match criteria.

This 8 bit mask can be configured using the formats described in [Table 33: Format Styles:](#)

Table 33: Format Styles

| Format Style | Format Syntax | Example    |
|--------------|---------------|------------|
| Decimal      | DDD           | 240        |
| Hexadecimal  | 0xHH          | 0xF0       |
| Binary       | 0bBBBBBBBB    | 0b11110000 |

**Default** FF (hex) (exact match)

**Values** 0x00 to 0xFF

entry match dscp

## Description

This command configures DSCP match conditions.

The **no** form of this command reverts to the default.

## Parameters

### *dscp-name*

Specifies the DSCP name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## dscp

## Syntax

**dscp** *dscp-name*

**no dscp**

## Context

[\[Tree\]](#) (config>service>ies>if>sap>ip-tunnel dscp)

## Full Context

configure service ies interface sap ip-tunnel dscp

## Description

This command sets the DSCP code-point in the outer IP header of encapsulated packets associated with a particular tunnel.

The **no** form of this command copies the DSCP value from the inner IP header (after remarking by the private tunnel SAP egress qos policy) to the outer IP header.

## Default

no dscp

## Parameters

### *dscp*

Specifies the DSCP code-point to be used.

**Values** be, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cs1, cp9, af11, cp11, af12, cp13, af13, cp15, cs2, cp17, af21, cp19, af22, cp21, af23, cp23, cs3, cp25, af31, cp27, af32, cp29, af33, cp31, cs4, cp33, af41, cp35, af42, cp37, af43, cp39, cs5, cp41, cp42, cp43, cp44, cp45, ef, cp47, nc1, cp49, cp50, cp51, cp52, cp53, cp54, cp55, nc2, cp57, cp58, cp59, cp60, cp61, cp62, cp63

## dscp

## Syntax

**dscp** *dscp-name* **fc** *fc-name*

**no dscp** *dscp-name*

## Context

**[Tree]** (config>service>vprn>sgt-qos dscp)

**[Tree]** (config>router>sgt-qos dscp)

## Full Context

configure service vprn sgt-qos dscp

configure router sgt-qos dscp

## Description

This command creates a mapping between the DiffServ Code Point (DSCP) of the self-generated traffic and the forwarding class.

Self-generated traffic that matches the specified DSCP will be assigned to the corresponding forwarding class. Multiple commands can be entered to define the association of some or all 64 DSCPs to the forwarding class.

All DSCP names that define a DSCP value must be explicitly defined.

The **no** form of this command removes the DSCP-to-forwarding class association.

## Parameters

### *dscp-name*

Specifies the name of the DSCP to be associated with the forwarding class. DiffServ code point can only be specified by its name and only an existing DiffServ code point can be specified. The software provides names for the well-known code points.

**Values** be, ef, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cp9, cs1, cs2, cs3, cs4, cs5, nc1, nc2, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, cp11, cp13, cp15, cp17, cp19, cp21, cp23, cp25, cp27, cp29, cp31, cp33, cp35, cp37, cp39, cp41, cp42, cp43, cp44, cp45, cp47, cp49, cp50, cp51, cp52, cp53, cp54, cp55, cp57, cp58, cp59, cp60, cp61, cp62, cp63

### **fc** *fc-name*

Specifies the forwarding class name. All packets with a DSCP value or MPLS EXP bit that are not defined will be placed in this forwarding class.

**Values** be, l2, af, l1, h2, ef, h1, nc

## Platforms

All

## Syntax

**dscp** *dscp-name*

**no dscp**

## Context

[\[Tree\]](#) (config>service>vprn>if>sap>ip-tunnel dscp)

## Full Context

configure service vprn interface sap ip-tunnel dscp

## Description

This command sets the DSCP code-point in the outer IP header of GRE encapsulated packets associated with a particular GRE tunnel. The default, set using the **no** form of this command, is to copy the DSCP value from the inner IP header (after remarking by the private tunnel SAP egress qos policy) to the outer IP header.

## Default

no dscp

## Parameters

**dscp**

Specifies the DSCP code-point to be used.

**Values** be, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cs1, cp9, af11, cp11, af12, cp13, af13, cp15, cs2, cp17, af21, cp19, af22, cp21, af23, cp23, cs3, cp25, af31, cp27, af32, cp29, af33, cp31, cs4, cp33, af41, cp35, af42, cp37, af43, cp39, cs5, cp41, cp42, cp43, cp44, cp45, ef, cp47, nc1, cp49, cp50, cp51, cp52, cp53, cp54, cp55, nc2, cp57, cp58, cp59, cp60, cp61, cp62, cp63

## Context

[\[Tree\]](#) (config>app-assure>group>policy>aqp>entry>action>remark dscp)

## Full Context

configure application-assurance group policy app-qos-policy entry action remark dscp

## Description

Commands in this context configure DSCP remark action or actions on flows matching this AQP entry. When enabled, all packets for all flows matching this AQP entry will be remarked to the configured DSCP name.

DSCP remark can only be applied when the entry remarks forwarding class or forwarding class and priority. In-profile and out-of profile of a given packet for DSCP remark is assessed after all AQP policing and priority remarking actions took place.

The **no** form of this command stops DSCP remarking action on flows matching this AQP entry.

## Default

no dscp

## Parameters

### **in-profile *dscp-name***

Specifies the DSCP name to use to remark in-profile flows that match this policy.

### **out-profile *dscp-name***

Specifies the DSCP name to use to remark out-of-profile flows that match this policy.

**Values** be, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cs1, cp9, af11, cp11, af12, cp13, af13, cp15, cs2, cp17, af21, cp19, af22, cp21, af23, cp23, cs3, cp25, af31, cp27, af32, cp29, af33, cp31, cs4, cp33, af41, cp35, af42, cp37, af43, cp39, cs5, cp41, cp42, cp43, cp44, cp45, ef, cp47, nc1, cp49, cp50, cp51, cp52, cp53, cp54, cp55, nc2, cp57, cp58, cp59, cp60, cp61, cp62, cp63

## dscp

### Syntax

**dscp** *dscp-name*

**no dscp**

### Context

[\[Tree\]](#) (config>oam-pm>session>mpls dscp)

### Full Context

configure oam-pm session mpls dscp

### Description

This command can be used to explicitly configure the DSCP value that is carried in the DM PDU. This value is not used on the launch point or the reflector to influence the QoS behavior on the network elements. The frame itself has no IP information because it uses the General Associated Channel Header (G-Ach). The fc and profile values are used to influence QoS behavior on the launch point and the responder.

The **no** form of this command reverts the dscp carried in the DM PDU to default.

### Default

dscp be

### Parameters

#### *dscp-name*

Specifies the Diffserv code point name.

**Values** be, ef, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cp9, cs1, cs2, cs3, cs4, cs5,nc1, nc2, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41,af42, af43, cp11, cp13, cp15, cp17, cp19, cp21, cp23, cp25, cp27, cp29, cp31, cp33, cp35, cp37, cp39, cp41, cp42, cp43, cp44, cp45, cp47, cp49, cp50, cp51, cp52, cp53, cp54, cp55, cp57, cp58, cp59, cp60, cp61, cp62, cp63

configure qos sap-ingress dscp
```

### Description

This command explicitly sets the forwarding class or subclass or enqueueing priority when a packet is marked with the DiffServ Code Point (DSCP) value contained in the *dscp-name*. A list of up to eight *dscp-names* can be entered on a single command. The lists of *dscp-names* within the configuration are managed by the system to ensure that each list does not exceed eight names. Entering more than eight *dscp-names* with the same parameters (**fc**, **priority**) will result in multiple lists being created. Conversely, multiple lists with the same parameters (**fc**, **priority**) are merged and the lists repacked to a maximum of eight per list if DSCP names are removed or the parameters changed so the multiple lists use the same parameters. Also, if a subset of a list is entered with different parameters, then a new list will be created for the subset. When the list is stored in the configuration, the DSCP names are sorted by their DSCP value in ascending numerical order; consequently, the order in the configuration may not be exactly what the user entered.

Adding a DSCP rule on the policy forces packets that match the DSCP value specified to override the forwarding class and enqueueing priority based on the parameters included in the DSCP rule. When the forwarding class is not specified in the rule, a matching packet preserves (or inherits) the existing forwarding class derived from earlier matches in the classification hierarchy. When the enqueueing priority is not specified in the rule, a matching packet preserves (or inherits) the existing enqueueing priority derived from earlier matches in the classification hierarchy.

The DSCP value (referred to here by *dscp-name*) is derived from the most significant six bits in the IPv4 header ToS byte field (DSCP bits) or the Traffic Class field from the IPv6 header. If the packet does not have an IP header, DSCP-based matching is not performed. The six DSCP bits define 64 DSCP values used to map packets to per-hop Quality of Service (QoS) behavior. The most significant three bits in the IP header ToS byte field are also commonly used in a more traditional manner to specify an IP precedence value, causing an overlap between the precedence space and the DSCP space. Both IP precedence and DSCP classification rules are supported.

DSCP rules have a higher match priority than IP precedence rules and where a *dscp-name* DSCP value overlaps an *ip-prec-value*, the DSCP rule takes precedence.

The **no** form of this command removes the specified the *dscp-names* from the explicit DSCP classification rule in the SAP ingress policy. As *dscp-names* are removed, the system repacks the lists of *dscp-names* with the same parameters (up to eight per list). As the **no** command does not have any additional parameters, it is possible to remove multiple *dscp-names* from multiple DSCP statements having different parameters with one command. If a *dscp-name* specified in a **no** command does not exist in any DSCP statement, then the command is aborted at that point with an error message displayed; any DSCP names in the list before the failed entry will be processed as normal but the processing will stop at the failed entry so that the remainder of the list is not processed.

Removing the *dscp-name* from the policy immediately removes the DSCP name on all ingress SAPs using the policy.

## Parameters

### *dscp-name*

The DSCP name is a required parameter that specifies the unique IP header ToS byte DSCP bits value that will match the DSCP rule. If the command is executed multiple times with the same *dscp-name*, the previous forwarding class and enqueueing priority is completely overridden by the new parameters or defined to be inherited when a forwarding class or enqueueing priority parameter is missing.

A maximum of 64 DSCP rules are allowed on a single policy and a maximum of eight *dscp-names* can be specified in a single statement.

The specified name must exist as a *dscp-name*. SR OS software provides names for the well-known code points; these can be shown using the **show qos dscp-table** command.

### **fc** *fc-name*

The value given for *fc-name* must be one of the predefined forwarding classes in the system. Specifying the *fc-name* is optional. When a packet matches the rule, the forwarding class is only overridden when the **fc** *fc-name* parameter is defined on the rule. If the packet class matches and the forwarding class is not explicitly defined in the rule, the forwarding class is inherited based on previous rule matches.

The *subclass-name* parameter is optional and used with the *fc-name* parameter to define a preexisting subclass. The *fc-name* and *subclass-name* parameters must be separated by a period (.). If *subclass-name* does not exist in the context of *fc-name*, an error will occur. If *subclass-name* is removed using the **no fc fc-name subclass-name force** command, the **default-fc** command will automatically drop the *subclass-name* and only use *fc-name* (the parent forwarding class for the subclass) as the forwarding class.

#### Values

**fc:**        *class[.subclass]*

*class:* be, l2, af, l1, h2, ef, h1, nc

*subclass:* 29 characters max

**Default**    Inherit (when **fc** *fc-name* is not defined, the rule preserves the previous forwarding class of the packet).

### **priority**

This parameter overrides the default enqueueing priority for all packets received on an ingress SAP using this policy that match this rule. Specifying the priority is optional. When a packet matches the rule, the enqueueing priority is only overridden when the priority parameter is defined on the rule. If the packet matches and priority is not explicitly defined in the rule, the enqueueing priority is inherited based on previous rule matches.

**Default**    Inherits the priority defined by the default-priority statement.

### **high**

This parameter is used in conjunction with the **priority** parameter. Setting the enqueueing parameter to **high** for a packet increases the likelihood of enqueueing the packet when

the ingress queue is congested. Ingress enqueueing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueueing priority is lost.

### low

This parameter is used in conjunction with the **priority** parameter. Setting the enqueueing parameter to **low** for a packet decreases the likelihood of enqueueing the packet when the ingress queue is congested. Ingress enqueueing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueueing priority is lost.

## Context

[\[Tree\]](#) (config>qos>sap-egress dscp)

## Full Context

configure qos sap-egress dscp

## Description

This command defines IP Differentiated Services Code Point (DSCP) names that must be matched to perform the associated reclassification actions. The specified name must exist as a DSCP name. SR OS software provides names for the well-known code points. A list of up to eight DSCP names can be entered on a single command. The lists of DSCP names within the configuration are managed by the system to ensure that each list does not exceed eight names. Entering more than eight DSCP names with the same parameters (**fc** and **profile**) results in multiple lists being created. Conversely, multiple lists with the same parameters (**fc** and **profile**) are merged and the lists repacked to a maximum of eight per list if DSCP names are removed or the parameters changed so the multiple lists use the same parameters. Also, if a subset of a list is entered with different parameters, a new list is created for the subset. When the list is stored in the configuration, the DSCP names are sorted by their DSCP value in ascending numerical order; consequently, the order in the configuration may not be exactly what the user entered.

If an egress packet on the SAP matches an IP DSCP value corresponding to a specified DSCP name, the forwarding class, profile egress queue accounting behavior may be overridden. By default, the forwarding class and profile of the packet is derived from ingress classification and profiling functions. Matching a DSCP-based reclassification rule will override all IP precedence-based reclassification rule actions.

The IP DSCP bits used to match against DSCP reclassification rules come from the Type of Service (ToS) field within the IPv4 header or the traffic class field from the IPv6 header. If the packet does not have an IP header, DSCP-based matching is not performed.

The reclassification actions from a DSCP reclassification rule may be overridden by an IP flow match event.

The **fc** keyword is optional. When specified, the egress classification rule will overwrite the forwarding class derived from ingress. The new forwarding class is used for egress remarking and queue mapping

decisions. If an IP criteria match occurs after the DSCP match, the new forwarding class may be overridden by the higher priority match actions. If the higher priority match actions do not specify a new *fc*, the *fc* from the *dscp* match will be used.

The **profile** keyword is optional. When specified, the egress classification rule will overwrite the profile of the packet derived from ingress. The new profile value is used for egress remarking and queue congestion behavior. If an IP criteria match occurs after the DSCP match, the new profile may be overridden by the higher priority match actions. If the higher priority match actions do not specify a new profile, the profile from the DSCP match will be used.

The **no** form of this command removes the specified the *dscp-names* from the reclassification rule in the SAP egress QoS policy. As *dscp-names* are removed, the system repacks the lists of *dscp-names* with the same parameters (up to 8 per list). As the **no** command does not have any additional parameters, it is possible to remove multiple *dscp-names* from multiple DSCP statements having different parameters with one command. If a *dscp-name* specified in a **no** command does not exist in any DSCP statement, the command is aborted at that point with an error message displayed. Any *dscp-names* in the list before the failed entry will be processed as normal but the processing will stop at the failed entry so that the remainder of the list is not processed.

## Parameters

### *dscp-name*

The *dscp-name* parameter is required when defining a DSCP reclassification rule. The specified name must exist as a DSCP name. A maximum of eight DSCP names can be specified in a single statement. SR OS software provides names for the well-known code points, which can be shown using the **show qos dscp-table** command.

### *fc-name*:

The **fc** reclassification action is optional. When specified, packets matching the IP DSCP value corresponding to a specified *dscp-name* will be explicitly reclassified to the forwarding class specified as *fc-name* regardless of the ingress classification decision. The explicit forwarding class reclassification may be overwritten by an IP criteria reclassification match. The **fc** name defined must be one of the eight forwarding classes supported by the system. To remove the forwarding class reclassification action for the specified DSCP value, the **dscp** command must be re-executed without the **fc** reclassification action defined.

**Values** be, l1, af, l2, h1, ef, h2 or nc

### *counter-id*

Specifies the counter ID.

### **profile**

The profile reclassification action is optional. When specified, packets matching the IP DSCP value corresponding to a specified *dscp-name* will be explicitly reclassified to the specified profile regardless of the ingress profiling decision. The explicit profile reclassification may be overwritten by an IPv6 criteria or IP criteria reclassification match. To remove the profile reclassification action for the specified *dscp-name*, the **dscp** command must be re-executed without the profile reclassification action defined.

### **in**

Specifies that any packets matching the reclassification rule will be treated as in-profile by the egress forwarding plane.

### **out**

Specifies that any packets matching the reclassification rule will be treated as out-of-profile by the egress forwarding plane.

#### **exceed**

Specifies that when **exceed** is specified, any packets matching the reclassification rule will be treated as exceed-profile by the egress forwarding plane.

#### **inplus**

Specifies that any packets matching the reclassification rule will be treated as inplus-profile by the egress forwarding plane.

### Platforms

## dscp

### Syntax

**dscp** {*dscp-name* | **in-profile** *dscp-name* **out-profile** *dscp-name* [**exceed-profile** *dscp-name*]}

**no dscp**

### Context

[\[Tree\]](#) (config>qos>sap-egress>fc dscp)

### Full Context

configure qos sap-egress fc dscp

### Description

This command configures a DSCP to be used for remarking packets from the specified FC. If the optional **exceed-profile**, **in-profile**, or **out-profile** keyword is specified, the command will remark different DSCP depending on whether the packet was classified to be exceed, in-profile, or out-of-profile ingress to the node. All inplus-profile traffic is marked with the same value as in-profile traffic.

### Default

no dscp

### Parameters

#### **dscp-name**

Specifies a DSCP name that has been previously mapped to a value using the **dscp-name** command. The DSCP can only be specified by its name.

**Values** be, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cs1, cp9, af11, cp11, af12, cp13, af13, cp15, cs2, cp17, af21, cp19, af22, cp21, af23, cp23, cs3, cp25, af31, cp27, af32, cp29, af33, cp31, cs4, cp33, af41, c p35, af42, cp37, af43, cp39, cs5, cp41, cp42, cp43, cp44, cp45, ef, cp47, nc1, cp49, cp50, cp51, cp52, cp53, cp54, cp55, nc2, cp57, cp58, cp59, cp60, cp61, cp62, cp63

**exceed-profile *dscp-name***

This optional parameter specifies the DSCP name to be used to remark the traffic that is exceed-profile. If not specified, this defaults to the same value configured for **out-profile** parameter.

**in-profile *dscp-name***

Specifies the DSCP name to be used to remark the traffic that is in-profile.

**out-profile *dscp-name***

Specifies the DSCP name to be used to remark the traffic that is out-of-profile.

**Platforms**

**Context**

[\[Tree\]](#) (config>qos>network>ingress dscp)

**Full Context**

configure qos network ingress dscp

**Description**

This command creates a mapping between the DiffServ Code Point (DSCP) of the network ingress traffic and the forwarding class.

Ingress traffic that matches the specified DSCP will be assigned to the corresponding forwarding class. Multiple commands can be entered to define the association of some or all 64 DiffServ code points to the forwarding class. For undefined code points, packets are assigned to the forwarding class specified under the **default-action** command.

The **no** form of this command removes the DiffServ code point-to-forwarding class association. The **default-action** then applies to that code point value.

**Parameters*****dscp-name***

The name of the DiffServ code point to be associated with the forwarding class. DiffServ code point can only be specified by its name and only an existing DiffServ code point can be specified. The software provides names for the well-known code points.

The system-defined names available are as follows. The system-defined names must be referenced as all lowercase, exactly as shown in the first column in [Table 34: Default DSCP Names to DSCP Value Mapping](#) and [Table 35: Default Class Selector Code Points to DSCP Value Mapping](#).

Additional names-to-code point value associations can be added using the '**dscp-name dscp-name dscp-value**' command.

The actual mapping is being done on the *dscp-value*, not the *dscp-name* that references the *dscp-value*. If a second *dscp-name* that references the same *dscp-value* is mapped within the policy, an error will occur. The second name will not be accepted until the first name is removed.

Table 34: Default DSCP Names to DSCP Value Mapping

| DSCP Name | DSCP Value Decimal | DSCP Value Hexadecimal | DSCP Value Binary |
|-----------|--------------------|------------------------|-------------------|
| nc1       | 48                 | 0x30                   | 0b110000          |

***fc-name***

Enter this required parameter to specify the *fc-name* with which the code point will be associated.

**Values** be, l2, af, l1, h2, ef, h1, nc

**profile {in | out}**

Enter this required parameter to indicate whether the DiffServ code point value is the in-profile or out-of-profile value. For every DSCP value defined, the profile must be indicated. If a DSCP value is not mapped, the default-action forwarding class and profile state will be used for that value.

DSCP values mapping to forwarding classes Expedited (ef), High-1 (h1) and Network-Control (nc) can only be set to in-profile.

DSCP values mapping to forwarding class "be" can only be set to out-of-profile.

**Values** in, out

**Platforms**

All

**dscp****Syntax**

**dscp** *dscp-name* **fc** *fc-name* **profile** {in | out | exceed | inplus}

**no dscp** *dscp-name*

**Context**

[\[Tree\]](#) (config>qos>network>egress dscp)

**Full Context**

configure qos network egress dscp

## Description

This command configures an IP Differentiated Services Code Point (DSCP) value that must be matched to perform the associated reclassification actions. If an egress packet on an IES/VPDN interface spoke SDP, on a CSC network interface in a VPRN, or on a network interface that the network QoS policy is applied to, matches the specified IP DSCP value, the forwarding class and profile may be overridden.

By default, the forwarding class and profile of the packet are derived from ingress classification and profiling functions. Matching a DHCP-based reclassification rule will override all IP precedence-based reclassification rule actions.

The IP DSCP bits used to match against DSCP reclassification rules come from the Type of Service (ToS) field within the IPv4 header or the Traffic Class field from the IPv6 header. If the packet does not have an IP header, DSCP-based matching is not performed.

The configuration of egress DSCP classification and the configuration of an egress IP criteria or IPv6 criteria entry statement within a network QoS policy are mutually exclusive.

The IP precedence- and DSCP-based reclassification are supported on a network interface, on a CSC network interface in a VPRN, and on a PW used in an IES or VPRN spoke interface. The CLI will block the application of a network QoS policy with the egress reclassification commands to the spoke SDP part of a Layer 2 service.

Conversely, the CLI will not allow the user to add the egress reclassification commands to a network QoS policy if the policy is being used by a Layer 2 spoke SDP.

The egress reclassification commands will only take effect if the redirection of the spoke SDP or CSC interface to use an egress port queue group succeeds. For example, the following CLI command would be successful:

```
config>service>vprn>if>spoke-sdp>egress> qos network-policy-id port-redirect-group queue-group-name instance instance-id
```

```
config>service>ies>if>spoke-sdp>egress> qos network-policy-id port-redirect-group queue-group-name instance instance-id
```

```
config>service>vprn>nw-if>qos network-policy-id port-redirect-group queue-group-name instance instance-id
```

If the redirection command fails, the PW will use the network QoS policy assigned to the network IP interface, however any reclassification in the network QoS policy applied to the network interface will be ignored.

The **no** form of this command removes the egress reclassification rule.

## Parameters

### **dscp-name**

be, ef, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cp9, cs1, cs2, cs3, cs4, cs5, nc1, nc2, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, cp11, cp13, cp15, cp17, cp19, cp21, cp23, cp25, cp27, cp29, cp31, cp33, cp35, cp37, cp39, cp41, cp42, cp43, cp44, cp45, cp47, cp49, cp50, cp51, cp52, cp53, cp54, cp55, cp57, cp58, cp59, cp60, cp61, cp62, cp63

### **fc fc-name**

be, l2, af, l1, h2, ef, h1, nc

### **profile {in | out | exceed | inplus}**

The profile reclassification action is mandatory. When specified, packets matching the DSCP value will be explicitly reclassified to the profile specified regardless of the ingress profiling decision. To remove the profile reclassification action for the specified DSCP value, the **no dscp** command must be executed.

**in** - Specifies that any packets matching the reclassification rule will be treated as in-profile by the egress forwarding plane.

**out** - Specifies that any packets matching the reclassification rule will be treated as out-of-profile by the egress forwarding plane.

**exceed** - Specifies that any packets matching the reclassification rule will be treated as exceed-profile by the egress forwarding plane.

**inplus** - Specifies that any packets matching the reclassification rule will be treated as inplus-profile by the egress forwarding plane.

## 8.283 dscp-in-profile

### dscp-in-profile

#### Syntax

**dscp-in-profile** *dscp-name*

**no dscp-in-profile**

#### Context

[\[Tree\]](#) (config qos network egress fc dscp-in-profile)

#### Full Context

configure qos network egress fc dscp-in-profile

#### Description

This command specifies the in-profile DSCP name for the forwarding class. The corresponding DSCP value will be used for all IP packets that require marking at egress on this forwarding class queue, and that are in-profile. The in-plus-profile traffic is marked with the same value as in-profile traffic.

When multiple DSCP names are associated with the forwarding class at network egress, the last name entered will overwrite the previous value.

The **no** form of this command resets the configuration to the factory default in-profile DSCP name setting for *policy-id* 1.

#### Parameters

### *dscp-name*

Specifies the system- or user-defined, case-sensitive *dscp-name*.

**Values** Any defined system- or user-defined *dscp-name*

## Platforms

All

## 8.284 dscp-out-profile

### dscp-out-profile

#### Syntax

**dscp-out-profile** *dscp-name*

**no dscp-out-profile**

#### Context

[\[Tree\]](#) (config qos network egress fc dscp-out-profile)

#### Full Context

configure qos network egress fc dscp-out-profile

#### Description

This command specifies the out-of-profile DSCP name for the forwarding class. The corresponding DSCP value will be used for all IP packets requiring marking the egress on this forwarding class queue that are out-of-profile. The exceed-profile traffic is marked with the same value as out-of-profile traffic.

When multiple DSCP names are associated with the forwarding class at network egress, the last name entered will overwrite the previous value.

The **no** form of this command resets the configuration to the factory default out-of-profile DSCP name setting for *policy-id* 1.

#### Default

Policy-id 1: Factory setting

Policy-id 2 to 65535: Policy-id setting

#### Parameters

***dscp-name***

Specifies the system- or user-defined, case-sensitive *dscp-name*.

**Values** Any defined system- or user-defined *dscp-name*

## 8.286 dslite-max-subscriber-limit

### dslite-max-subscriber-limit

#### Syntax

**dslite-max-subscriber-limit** *max*

**no dslite-max-subscriber-limit**

#### Context

**[Tree]** (config>router>nat>inside>dslite dslite-max-subscriber-limit)

**[Tree]** (config>service>vprn>nat>inside dslite-max-subscriber-limit)

#### Full Context

configure router nat inside dslite dslite-max-subscriber-limit

configure service vprn nat inside dslite-max-subscriber-limit

#### Description

This command sets the value for the number of high order bits of the source IPv6 address that will be considered as DS-Lite subscriber. The remaining bits of the source IPv6 address will be masked off, effectively aggregation all IPv6 source addresses under the configured prefix length into a single DS-Lite subscriber. Source IPv4 addresses/ports of the traffic carried within the DS-Lite subscriber will be translated into a single outside IPv4 address and the corresponding deterministic port-block (port-blocks can be extended).

The range of values for subscriber-prefix-length in non-deterministic DS-Lite is limited from 32 to 64 (a prefix will be considered as a DS-Lite subscriber) or it can be set to a value of 128 (the source IPv6 address is considered as a DS-Lite subscriber).

In cases where deterministic DS-Lite is enabled in a given inside routing context, the range of values of the subscriber-prefix-length depends on the value of dslite-max-subscriber-limit parameter as follows:

**subscriber-prefix-length – n = [32..64,128]**

**where n = log2(dslite-max-subscriber-limit)**

[or in an alternate form: dslite-max-subscriber-limit = 2<sup>n</sup>.]

In other words the largest prefix length for the deterministic DS-Lite subscriber will be 32+n, where n = log2(dslite-max-subscriber-limit). The subscriber prefix length can extend up to 64 bits. Beyond 64 bits for the subscriber prefix length, there only one value is allowed: 128. In the case n must be 0, which means that the mapping between B4 elements (or IPv6 address) and the IPv4 outside addresses is in 1:1 ratio (no sharing of outside IPv4 addresses).

This parameter can be changed only when there are no deterministic prefixes configured in the same routing context.

#### Default

128

## Parameters

### *max*

In non-deterministic DS-Lite this value can be 32 to 64,128, assuming that the deterministic DS-Lite is not concurrently enabled in the same inside routing context.

In case that deterministic DS-Lite is enabled, this value can be within the range  $[(32+n)..64,128]$  where  $n = \log_2(\text{dslite-max-subscriber-limit})$ . The value of 128 is allowed only when  $n=0$  (each subscriber is mapped to a single outside IPv4 IP address).

## Description

This command enables matching on UEs in a DSM state.

The **no** form of this command disables matching on UEs in a DSM state, unless all state matching is disabled.

## Default

no dsm

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.288 dsm-ip-filter

### dsm-ip-filter

## Syntax

**dsm-ip-filter** *dsm-ip-filter-name*

**no dsm-ip-filter**

## Context

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>dsm dsm-ip-filter)

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>dsm dsm-ip-filter)

## Full Context

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt dsm-ip-filter

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt dsm-ip-filter

## Description

This command configures an IP filter that is distributed on ISA cards.

This command specifies the IP filter applied to all UEs corresponding to default vlan-range (such as a group-interface) or the specified vlan-range. The IP filter can be created in the **config>subscr-mgmt>isa-filter** context, and can contain up to 1024 match entries. The IP filter can be overridden per UE from RADIUS via access-accept or COA.

The **no** form of this command reverts to the default.

### Parameters

#### *dsm-ip-filter-name*

Specifies the identifier of the distributed-sub-mgmt IP filter.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.289 dsm-subscriber

### dsm-subscriber

### Syntax

[no] **dsm-subscriber** mac *mac-address*

### Context

[\[Tree\]](#) (config>li>li-source>wlan-gw dsm-subscriber)

### Full Context

configure li li-source wlan-gw dsm-subscriber

### Description

This command configures the DSM UE source.

### Parameters

#### *mac-address*

Specifies the MAC address.

**Values** mac-addr: xx:xx:xx:xx:xx:xx **example:** 00:0c:f1:99:85:b8  
or XX:XX:XX:XX:XX:XX **example:** 00-0C-F1-99-85-B8

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.290 dsmap

## dsmap

### Syntax

**dsmap** *if-num*

**no dsmap**

### Context

**[Tree]** (config>router>mpls>lsp>protect-tp-path>mep dsmap)

**[Tree]** (config>router>mpls>lsp>working-tp-path>mep dsmap)

**[Tree]** (config>router>mpls>lsp>transit-path>forward-path>mip dsmap)

**[Tree]** (config>router>mpls>lsp>transit-path>reverse-path>mip dsmap)

### Full Context

configure router mpls lsp protect-tp-path mep dsmap

configure router mpls lsp working-tp-path mep dsmap

configure router mpls lsp transit-path forward-path mip dsmap

configure router mpls lsp transit-path reverse-path mip dsmap

### Description

This command is used to configure the values to use in the DSMAP TLV sent by a node in an LSP Trace echo request for a static MPLS-TP LSP. A node sending a DSMAP TLV will include the in-if-num and out-if-num values. Additionally, it will include the out-label for the LSP in the Label TLV for the DSMAP in the echo request message.

The **no** form of this command equals to a value 0 (this means no interface validation will be performed).

### Default

no dsmap

### Parameters

*if-num*

This is a 32-bit value corresponding to the expected ingress interface if-num used by an MPLS-TP LSP for the next hop downstream.

**Values** 0 to 4294967295

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 8.291 dst-ip

## dst-ip

### Syntax

**dst-ip** {*ipv6-address* | *prefix-length*}

**dst-ip** {*ip-address/mask* | *ip-address netmask*}

**no dst-ip**

### Context

**[Tree]** (config>subscr-mgmt>cat-map>category>exh-lvl>ingr-ip>entry>match dst-ip)

**[Tree]** (config>subscr-mgmt>cat-map>category>exh-lvl>ingr-ipv6>entry>match dst-ip)

### Full Context

configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ip-filter-entries  
entry match dst-ip

configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ipv6-filter-entries  
entry match dst-ip

### Description

This command configures the destination IP match condition.

The **no** form of this command reverts to the default.

### Parameters

#### *ip-address/mask*

Specifies the IPv4 address and mask.

| Values |            |         |
|--------|------------|---------|
|        | ip-address | a.b.c.d |
|        | mask       | 0 to 32 |

#### *netmask*

Specifies the mask, expressed as a dotted quad.

| Values |         |
|--------|---------|
|        | a.b.c.d |

#### *ipv6-address*

Specifies the IPv6 address (applies only to the 7750 SR).

| Values |              |                                           |
|--------|--------------|-------------------------------------------|
|        | ipv6-address | x:x:x:x:x:x:x (where x is [0 to FFFF]H)   |
|        |              | :x:x:x:x:d.d.d.d (where d is [0 to 255]D) |

#### *prefix-length*

Specifies the prefix length (applies only to the 7750 SR).

| Values |          |
|--------|----------|
|        | 1 to 128 |

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## dst-ip

### Syntax

**dst-ip** *ip-address*

**no dst-ip**

### Context

configure redundancy multi-chassis peer mc-ring ring ring-node connectivity-verify dst-ip

configure redundancy multi-chassis peer mc-ring ring in-band-control-path dst-ip

configure redundancy multi-chassis peer multi-chassis l3-ring in-band-control-path dst-ip

### Description

This command specifies the destination IP address used in the inband control connection. If the address is not configured, the ring cannot become operational.

### Default

no dst-ip

### Parameters

***ip-address***

Specifies the destination IP address.

**Values** a.b.c.d (no multicast address)

## Platforms

All

## dst-ip

### Syntax

**dst-ip** *ip-prefix/length*

**no dst-ip**

## Context

**[Tree]** (config>subscr-mgmt>isa-filter>ipv6>entry>match dst-ip)

**[Tree]** (config>subscr-mgmt>isa-filter>entry>match dst-ip)

## Full Context

configure subscriber-mgmt isa-filter ipv6 entry match dst-ip

configure subscriber-mgmt isa-filter entry match dst-ip

## Description

This command specifies that the packet's destination IP address must match the specified IP prefix and mask.

The **no** form of this command disables the match on the destination IP.

## Parameters

***ip-prefix/length***

Specifies the IP prefix to match.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## dst-ip

## Syntax

**dst-ip** *ip-address protocol ip-protocol dst-port port-number*

**dst-ip** *ip-address protocol ip-protocol dst-port port-number prefix-length prefix-length*

**no dst-ip** *ip-address protocol ip-protocol dst-port port-number*

## Context

**[Tree]** (config>subscr-mgmt>http-rdr-plcy>fwd-entries dst-ip)

## Full Context

configure subscriber-mgmt http-redirect-policy forward-entries dst-ip

## Description

This command configures traffic flow to be forwarded via match in the redirect policy.

## Parameters

***ip-address***

Specifies the IPv4 or IPv6 address to match the destination address in the IP header of the traffic received from the subscriber.

***prefix-length***

Specifies the length of the prefix specified by the ip-address.

**Values** 1 to 128 for IPv6  
1 to 32 for IPv4

### ***ip-protocol***

Specifies the protocol to match the IP protocol in the IP header of the traffic received from the subscriber.

**Values** tcp, udp

### ***port-number***

Specifies the port to match the destination port in the HTTP request.

**Values** 1 to 65535

## **Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## **dst-ip**

### **Syntax**

**dst-ip** {**eq** | **neq**} *ip-address*

**dst-ip** {**eq** | **neq**} **ip-prefix-list** *ip-prefix-list-name*

**no dst-ip**

### **Context**

[\[Tree\]](#) (config>app-assure>group>policy>aqp>entry>match dst-ip)

### **Full Context**

configure application-assurance group policy app-qos-policy entry match dst-ip

### **Description**

This command specifies a destination IP address to use as match criteria.

### **Default**

no dst-ip

### **Parameters**

#### **eq**

Specifies that a successful match occurs when the flow matches the specified address or prefix.

#### **neq**

Specifies that a successful match occurs when the flow does not match the specified address or prefix.

***ip-address***

Specifies a valid unicast address.

**Values**

|              |                                                                                                               |
|--------------|---------------------------------------------------------------------------------------------------------------|
| ipv4-address | a.b.c.d[/mask]<br>mask - [1..32]                                                                              |
| ipv6-address | x:x:x:x:x:x/x/prefix-length<br>x:x:x:x:x:d.d.d.d<br>x - [0..FFFF]H<br>d - [0..255]D<br>prefix-length [1..128] |

***ip-prefix-list-name***

Specifies the name of an IP prefix list, up to 32 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**dst-ip****Syntax**

**dst-ip** *ip-address*

**no dst-ip**

### **Context**

[\[Tree\]](#) (debug>app-assure>group>traffic-capture>match dst-ip)

### **Full Context**

debug application-assurance group traffic-capture match dst-ip

### **Description**

This command configures debugging on a destination IP address.

### **Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## **dst-ip**

### **Syntax**

**dst-ip** {*ip-address/mask* | *ip-address ipv4-address-mask*}

## Context

[\[Tree\]](#) (config>li>li-filter>li-ip-filter>entry>match dst-ip)

## Full Context

configure li li-filter li-ip-filter entry match dst-ip

## Description

This command configures destination IP address LI filter match criterion.

The **no** form of this command removes any configured destination IP address. The match criterion is ignored.

## Parameters

### *ip-address*

Specifies any address specified as dotted quad.

**Values** a.b.c.d

### *mask*

Specifies eight 16-bit hexadecimal pieces representing bit match criteria.

**Values** 1 to 32

### *ipv4-address-mask*

Specifies a mask expressed in dotted quad notation.

**Values** 0.0.0.0 to 255.255.255.255

## Platforms

All

## dst-ip

## Syntax

**dst-ip** {*ipv6-address/prefix-length* | *ipv6-address ipv6-address-mask*}

## Context

[\[Tree\]](#) (config>li>li-filter>li-ipv6-filter>entry>match dst-ip)

## Full Context

configure li li-filter li-ipv6-filter entry match dst-ip

## Description

This command configures destination IPv6 address LI filter match criterion.

The **no** form of this command removes any configured destination IPv6 address. The match criterion is ignored.

## Parameters

### *ipv6-address*

Specifies any IPv6 address entered as:

**Values** x:x:x:x:x:x:x (eight 16-bit pieces)  
 x:x:x:x:x:d.d.d.d  
 x - [0 to FFFF]H  
 d - [0 to 255]D

### *prefix-length*

Specifies the prefix length.

**Values** 1 to 128

### *ipv6-address-mask*

Specifies any IPv6 address mask expressed as:

**Values** x:x:x:x:x:x:x (eight 16-bit pieces)  
 x:x:x:x:x:d.d.d.d  
 x - [0 to FFFF]H  
 d - [0 to 255]D

## Platforms

## Context

**[Tree]** (config>qos>sap-egress>ip-criteria>entry>match dst-ip)

**[Tree]** (config>qos>sap-ingress>ip-criteria>entry>match dst-ip)

## Full Context

configure qos sap-egress ip-criteria entry match dst-ip

configure qos sap-ingress ip-criteria entry match dst-ip

## Description

This command configures a destination address range to be used as a SAP QoS policy match criterion.

To match on the IPv4 destination address, specify the address and its associated mask, e.g., 10.1.0.0/16. The conventional notation of 10.1.0.0 255.255.0.0 can also be used for IPv4.

The **no** form of this command removes the destination IPv4 address match criterion.

## Default

no dst-ip

## Parameters

### *ip-address*

Specifies the destination IPv4 address specified in dotted decimal notation.

**Values** ip-address: a.b.c.d

### *mask*

Specifies the length in bits of the subnet mask.

**Values** 1 to 32

### *ipv4-address-mask*

Specifies the subnet mask in dotted decimal notation.

**Values** a.b.c.d (dotted quad equivalent of mask length)

### *prefix-list-name*

Specifies the IPv4 prefix list name, a string of up to 32 printable ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

## Platforms

All

## dst-ip

## Syntax

**dst-ip** {*ipv6-address/prefix-length* | *ipv6-address ipv6-address-mask* | **ipv6-prefix-list** *ipv6-prefix-list-name*}

**no dst-ip**

## Context

[\[Tree\]](#) (config>qos>sap-ingress>ipv6-criteria>entry>match dst-ip)

[\[Tree\]](#) (config>qos>sap-egress>ipv6-criteria>entry>match dst-ip)

## Full Context

configure qos sap-ingress ipv6-criteria entry match dst-ip

```
configure qos sap-egress ipv6-criteria entry match dst-ip
```

### Description

This command configures a destination address range to be used as a SAP QoS policy match criterion.

To match on the IPv6 destination address, specify the address and its associated mask, e.g. 2001:db8:1000::/64.

The **no** form of this command removes the destination IPv6 address match criterion.

### Default

```
no dst-ip
```

### Parameters

#### *ipv6-address*

Specifies the IPv6 address for the IP match criterion in hexadecimal digits (applies to the 7750 SR and 7950 XRS).

**Values** x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x: [0 to FFFF]H  
d: [0 to 255]D

#### *prefix-length*

Specifies the IPv6 prefix length for the IPv6 address expressed as a decimal integer (applies to the 7750 SR and 7950 XRS).

**Values** 1 to 128

#### *ipv6-address-mask*

Specifies the IPv6 address mask.

**Values** x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x: [0 to FFFF]H  
d: [0 to 255]D

#### *ipv6-prefix-list-name*

Specifies the IPv6 prefix list name, a string of up to 32 printable ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### Platforms

All

configure qos network egress ip-criteria entry match dst-ip

configure qos network ingress ip-criteria entry match dst-ip

configure qos network egress ipv6-criteria entry match dst-ip

configure qos network ingress ipv6-criteria entry match dst-ip

### Description

This command configures a destination address range to be used as a network QoS policy match criterion.

To match on the destination address, specify the address and its associated mask, for example, when specifying an IPv4 address, 10.1.0.0/16 or 10.1.0.0 255.255.0.0 can be used.

The **no** form of this command removes the destination IP address match criterion.

### Parameters

#### *ip-address*

Specifies the source IPv4 address specified in dotted decimal notation.

**Values** ip-address: a.b.c.d

#### *mask*

Specifies the length in bits of the subnet mask.

**Values** 1 to 32

#### *ipv4-address-mask*

Specifies the subnet mask in dotted decimal notation.

**Values** a.b.c.d (dotted quad equivalent of mask length)

#### *ip-prefix-list-name*

Specifies an IPv4 prefix list which contains IPv4 address prefixes to be matched.

**Values** A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

### ***ipv6-address***

Specifies the IPv6 prefix for the IP match criterion in hex digits.

**Values**

ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)  
 x:x:x:x:x:d.d.d.d  
 x: [0 to FFFF]H  
 d: [0 to 255]D

### ***mask***

Specifies the length of the IPv6 address expressed as a decimal integer.

**Values** 1 to 128

### ***ipv6-address-mask***

Specifies the eight 16-bit hexadecimal pieces representing bit match criteria.

**Values** x:x:x:x:x:x (eight 16-bit pieces)

### ***ipv6-prefix-list-name***

Specifies an IPv6 prefix list which contains IPv6 address prefixes to be matched.

**Values** A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

## **Platforms**

All

### Full Context

```
configure filter ip-exception entry match dst-ip
configure filter ipv6-filter entry match dst-ip
configure filter ip-filter entry match dst-ip
configure filter ipv6-exception entry match dst-ip
```

### Description

This command configures a destination address range to be used as a filter policy match criterion.

To match on the destination address, specify the address and its associated mask, e.g., 10.1.0.0/16. The conventional notation of 10.1.0.0 255.255.0.0 can also be used for IPv4.

The **no** form of this command removes the destination IPv4 or IPv6 address match criterion.

### Default

```
no dst-ip
```

### Parameters

#### *ip-address*

Specifies the destination IPv4 address in dotted decimal notation.

**Values** a.b.c.d

#### *mask*

Specifies the length in bits of the subnet mask.

**Values** 1 to 32

#### *ipv4-address-mask*

Specifies the subnet mask in dotted decimal notation.

**Values** a.b.c.d (dotted quad equivalent of mask length)

#### *ip-prefix-listor ipv6-prefix-list prefix-list-name*

Specifies to use a list of IP prefixes referred to by *prefix-list-name*, which is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

#### *ipv6-address*

Specifies the IPv6 prefix for the IP match criterion in hex digits.

**Values** x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x: [0..FFFF]H  
d: [0..255]D

#### *prefix-length*

Specifies the IPv6 prefix length for the *ipv6-address* as a decimal integer.

**Values** 1 to 128

### ***ipv6-address-mask***

Specifies the eight 16-bit hexadecimal pieces representing bit match criteria.

**Values** x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x: [0..FFFF]H  
d: [0..255]D

## **Platforms**

VSR

configure system security cpm-filter ip-filter entry match dst-ip

### **Description**

This command configures a destination IP address range to be used as an IP filter match criterion.

To match on the destination IP address, specify the address and its associated mask, for example, 10.1.0.0/16. The conventional notation of 10.1.0.0 255.255.0.0 may also be used.

The **no** form of this command removes the destination IP address match criterion.

## Default

no dst-ip

## Parameters

### *ip-address*

Specifies the IP address for the IP match criterion in dotted decimal notation.

**Values** 0.0.0.0 to 255.255.255.255

### *ip-prefix-list*

Creates a list of IPv4 prefixes for match criteria in IPv4 ACL and CPM filter policies.

### *ip-prefix-list-name*

A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

### *mask*

Specifies the subnet mask length expressed as a decimal integer.

**Values** 1 to 32

### *netmask*

Specifies the dotted quad equivalent of the mask length.

**Values** 0.0.0.0 to 255.255.255.255

## dst-ip

## Syntax

**dst-ip** [*ipv6-address /prefix-length*] [**ipv6-prefix-list** *ipv6-prefix-list-name*]

**no dst-ip**

## Context

[\[Tree\]](#) (cfg>sys>sec>cpm>ipv6-filter>entry>match dst-ip)

## Full Context

configure system security cpm-filter ipv6-filter entry match dst-ip

## Description

This command configures a destination IPv6 address range to be used as an IPv6 filter match criterion.

To match on the destination IPv6 address, specify the address.

The **no** form of this command removes the destination IP address match criterion.

This command only applies to the 7750 SR and 7950 XRS.

**Default**

no dst-ip

**Parameters*****ipv6-address/prefix-length***

Specifies the IPv6 address for the IPv6 match criterion in dotted decimal notation. An IPv6 IP address is written as eight 4-digit (16-bit) hexadecimal numbers separated by colons. One string of zeros per address can be left out, so that 2001:db8::0:217A is the same as 2001:db8:0:0:0:0:217A.

**Values**

x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x: [0 to .FFFF]H

d: [0 to 255]D

prefix-length: 1 to 128

***ipv6-prefix-list***

Creates a list of IPv4 prefixes for match criteria in IPv4 ACL and CPM filter policies.

***ipv6-prefix-list-name***

Specifies a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 8.292 dst-ipv4-address

### dst-ipv4-address

**Syntax****dst-ipv4-address** *a.b.c.d***no dst-ipv4-address****Context****[Tree]** (debug>oam>build-packet>packet>field-override>header>ipv4 dst-ipv4-address)**[Tree]** (config>test-oam>build-packet>header>ipv4 dst-ipv4-address)**Full Context**

debug oam build-packet packet field-override header ipv4 dst-ipv4-address

```
configure test-oam build-packet header ipv4 dst-ipv4-address
```

### Description

This command defines the destination IPv4 address to be used in the IPv4 header.

The **no** form of this command removes the destination IPv4 address value.

### Default

```
dst-ipv4-address 0.0.0.0
```

### Parameters

*a.b.c.d*

Specifies the IPv4 destination address to be used in the IPv4 header.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 8.293 dst-ipv6-address

```
dst-ipv6-address
```

### Syntax

```
dst-ipv6-address ipv6-address
```

```
no dst-ipv6-address
```

### Context

[\[Tree\]](#) (config>test-oam>build-packet>header>ipv6 dst-ipv6-address)

[\[Tree\]](#) (debug>oam>build-packet>packet>field-override>header>ipv6 dst-ipv6-address)

### Full Context

```
configure test-oam build-packet header ipv6 dst-ipv6-address
```

```
debug oam build-packet packet field-override header ipv6 dst-ipv6-address
```

### Description

This command defines the destination IPv6 address to be used in the IPv6 header.

The **no** form of this command removes the IPv6 address.

### Parameters

*ipv6-address*

Specifies the IPv6 destination address to be used in the IPv6 header.

|               |                                                   |
|---------------|---------------------------------------------------|
| <b>Values</b> | ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces) |
|               | x:x:x:x:x:d.d.d.d                                 |
|               | x: 0 to FFFF]H                                    |
|               | d: [0 to 255]D                                    |

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 8.294 dst-mac

### dst-mac

#### Syntax

**dst-mac** *ieee-address* [*ieee-address-mask*]

**no dst-mac**

#### Context

[\[Tree\]](#) (config>li>li-filter>li-mac-filter>entry>match dst-mac)

#### Full Context

configure li li-filter li-mac-filter entry match dst-mac

#### Description

This command configures a destination MAC address or range to be used as a MAC filter match criterion.

The **no** form of this command removes the destination mac address as the match criterion.

#### Parameters

##### *ieee-address*

Specifies the 48-bit IEEE mac address to be used as a match criterion.

**Values** HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit

##### *ieee-address-mask*

Specifies a 48-bit mask. The following table describes the format styles to configure the 48-bit mask.

Table 36: Format Styles to Configure Mask

| Format Style | Format Syntax    | Example         |
|--------------|------------------|-----------------|
| Decimal      | DDDDDDDDDDDDDDDD | 281474959933440 |
| Hexadecimal  | 0xHHHHHHHHHHHHH  | 0x0FFFFFF000000 |
| Binary       | 0bBBBBBBB...B    | 0b11110000...B  |

To configure so that all packets with a destination MAC OUI value of 00-03-FA are subject to a match condition then the entry should be specified as: 003FA000000 0xFFFFFFFF000000

**Default** 0xFFFFFFFFFFFFFF (exact match)

**Values** 0x0000000000000000 — 0xFFFFFFFFFFFFFF

## Platforms

All

## dst-mac

### Syntax

**dst-mac** *ieee-address* [*ieee-address-mask*]

**no dst-mac**

### Context

**[Tree]** (config>qos>sap-ingress>mac-criteria>entry>match dst-mac)

### Full Context

configure qos sap-ingress mac-criteria entry match dst-mac

### Description

Configures a destination MAC address or range to be used as a Service Ingress QoS policy match criterion.

The **no** form of this command removes the destination MAC address as the match criterion.

### Default

no dst-mac

### Parameters

***ieee-address***

The MAC address to be used as a match criterion.

**Values** HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit

### ***ieee-address-mask***

A 48-bit mask to match a range of MAC address values.

This 48-bit mask can be configured using the following formats.

*Table 37: Format Styles to Configure Mask*

| Format Style | Format Syntax    | Example          |
|--------------|------------------|------------------|
| Decimal      | DDDDDDDDDDDDDDDD | 281474959933440  |
| Hexadecimal  | 0xHHHHHHHHHHHHH  | 0xFFFFFFFF000000 |
| Binary       | 0bBBBBBBB...B    | 0b11110000...B   |

All packets with a source MAC OUI value of 00-03-FA, subject to a match condition, should be specified as: 0003FA000000 0xFFFFFFFF000000

**Values** 0x00000000000000 to 0xFFFFFFFFFFFFFFF (hex)

**Default** 0xFFFFFFFFFFFFFFF

## **Platforms**

All

## **dst-mac**

### **Syntax**

**dst-mac** *ieee-address* [*ieee-address-mask*]

**no dst-mac**

### **Context**

[\[Tree\]](#) (config>filter>mac-filter>entry>match dst-mac)

### **Full Context**

configure filter mac-filter entry match dst-mac

### **Description**

Configures a destination MAC address or range to be used as a MAC filter match criterion.

The **no** form of the command removes the destination mac address as the match criterion.

### **Default**

no dst-mac

## Parameters

### *ieee-address*

Specifies the MAC address to be used as a match criterion.

**Values** HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit. Note that both upper and lower case are supported.

### *ieee-address-mask*

Specifies a 48-bit mask to match a range of MAC address values.

To configure so that all packets with a destination MAC OUI value of 00:03:FA are subject to a match condition then the entry should be specified as: 00:03:FA:00:00:00 FF:FF:FF:00:00:00.

**Default** ff:ff:ff:ff:ff:ff (exact match)

**Values** HH:HH:HH:HH:HH:HH or HH-HH-HH-HH-HH-HH where H is a hexadecimal digit. to 0xFFFFFFFFFFFF  
Note that both upper and lower case are supported.

## Platforms

## Full Context

configure test-oam service-activation-testhead service-test service-stream frame-payload ethernet dst-mac

## Description

This command configures the unicast destination MAC address to use in the frame generated by the service activation testhead.

The **no** form of this command indicates that the MAC address is not used by the testhead.

## Default

no dst-mac

## Parameters

***ieee-address***

Specifies the unicast destination MAC address as a hexadecimal string.

**Values** 6-byte unicast MAC address using the notation xx:xx:xx:xx:xx:xx, in the range of 0 to 9 and a to f

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ipv6-filter-entries  
entry match dst-port

## Description

This command configures the destination port match condition.

The **no** form of this command reverts to the default.

## Parameters

***lt | gt | eq***

Specifies the operator.

***dst-port-number***

Specifies the destination port number as a decimal hex or binary.

**Values** 0 to 65535

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**dst-port**

## Syntax

**dst-port** *operator port-number*

**no dst-port**

## Context

**[Tree]** (config>subscr-mgmt>isa-filter>ipv6>entry>match dst-port)

**[Tree]** (config>subscr-mgmt>isa-filter>entry>match dst-port)

## Full Context

```
configure subscriber-mgmt isa-filter ipv6 entry match dst-port
configure subscriber-mgmt isa-filter entry match dst-port
```

## Description

This command specifies that the packet's UDP/TCP dst-port must match a specific value. This command is not valid in a match context that is not specific to UDP or TCP.

The **no** form of this command removes matching of the layer-4 port.

## Parameters

### *operator*

Specifies that the only supported value is eq (equal to). The destination port value must be equal to the *port-number* value.

### *port-number*

Specifies the number of the port to match.

**Values** 0 to 65535

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## dst-port

## Syntax

```
dst-port tcp-port
no dst-port
```

## Context

[\[Tree\]](#) (config>subscr-mgmt>http-rdr-plcy dst-port)

## Full Context

```
configure subscriber-mgmt http-redirect-policy dst-port
```

## Description

This command specifies the port to match the destination port in the HTTP request.

HTTP traffic that does not match this port, is not redirected.

The **no** form of this command reverts to the default.

## Default

```
dst-port 80
```

## Parameters

### *tcp-port*

Specifies the TCP port.

**Values** 1 to 65535

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## dst-port

## Syntax

**dst-port** {*eq* | *neq*} *port-num*

**dst-port** {*eq* | *neq*} **port-list** *port-list-name*

**dst-port** {*eq* | *neq*} **range** *start-port-num end-port-num*

**no dst-port**

## Context

[\[Tree\]](#) (config>app-assure>group>policy>aqp>entry>match dst-port)

## Full Context

configure application-assurance group policy app-qos-policy entry match dst-port

## Description

This command specifies a destination TCP/UDP port, destination port list, or destination range to use as match criteria.

The **no** form of this command removes the parameters from the configuration.

## Default

no dst-port

## Parameters

### *eq*

Specifies that a successful match occurs when the flow matches the specified port.

### *neq*

Specifies that a successful match occurs when the flow does not match the specified port.

### *port-num*

Specifies the destination port number.

**Values** 0 to 65535

### *start-port-num end-port-num*

Specifies the start or end destination port number.

**Values** 0 to 65535

***port-list-name***

Specifies a named port-list, up to 32 characters, containing a set of ports or ranges of ports.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## dst-port

**Syntax**

**dst-port** {*eq* | *gt* | *lt*} *port-num*

**dst-port port-list** *port-list-name*

**dst-port range** *start-port-num end-port-num*

**no dst-port**

**Context**

[\[Tree\]](#) (config>app-assure>group>sess-fltr>entry>match dst-port)

**Full Context**

configure application-assurance group session-filter entry match dst-port

**Description**

This command specifies a destination TCP/UDP port, destination port list, or destination range to use as match criteria.

The **no** form of this command removes the parameters from the configuration.

**Default**

no dst-port

**Parameters**

**eq**

Specifies that a successful match occurs when the flow matches the specified port.

**gt**

Specifies all port numbers greater than the port-number match.

**lt**

Specifies all port numbers less than the port-number match.

***port-num***

Specifies the destination port number.

**Values** 0 to 65535

***start-port-num end-port-num***

Specifies the start or end destination port number.

**Values** 0 to 65535

***port-list-name***

Specifies a named port-list, up to 32 characters, containing a set of ports or ranges of ports.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Full Context

```
configure li li-filter li-ipv6-filter entry match dst-port
configure li li-filter li-ip-filter entry match dst-port
```

## Description

This command configures a destination TCP or UDP port number or port range for an IP LI filter match criterion. Note that an entry containing Layer 4 match criteria will not match non-initial (second, third, and so on) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

The **no** form of this command removes the destination port match criterion.

## Parameters

**lt**

Specifies all port numbers less than *dst-port-number* match.

**gt**

Specifies all port numbers greater than *dst-port-number* match.

**eq**

Specifies that *dst-port-number* must be an exact match.

***dst-port-number***

Specifies an inclusive range of port numbers to be used as a match criteria. The destination port numbers *start-port* and *end-port* are expressed as decimal integers.

**Values** [0..65535]D  
[0x0..0xFFFF]H  
[0b0..0b1111111111111111]B

```

## Description

This command configures a destination TCP or UDP port number or port range for a SAP QoS policy match criterion.

The **no** form of this command removes the destination port match criterion.

## Default

```
no dst-port
```

## Parameters

**{lt | gt | eq} *dst-port-number***

The TCP or UDP port numbers to match, specified as less than (**lt**), greater than (**gt**), or equal to (**eq**) to the destination port value, specified as a decimal integer.

**Values** 1 to 65535 (decimal)

**range *startend***

The range of TCP or UDP port values to match, specified as between the *start* and *end* destination port values inclusive.

**Values** 1 to 65535 (decimal)

## Platforms

### Description

This command configures a destination TCP or UDP port number, port range, or a port list for a network QoS policy match criterion.

The **no** form of this command removes the destination port match criterion.

### Parameters

#### lt

Keyword used to specify TCP or UDP port numbers to match that are less than the destination port value.

#### gt

Keyword used to specify TCP or UDP port numbers to match that are greater than the destination port value.

#### eq

Keyword used to specify TCP or UDP port numbers to match that are equal to the destination port value.

#### *dst-port-number*

Specifies the TCP or UDP port numbers to match, specified as less than (lt), greater than (gt), or equal to (eq) the destination port value, specified as a decimal integer.

**Values** 1 to 65535

#### *port-list-name*

Specifies a port list name, up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

#### *start*

Specifies the starting range of TCP or UDP port values to match.

**Values** 1 to 65535

#### *end*

Specifies the end range of TCP or UDP port values to match.

**Values** 1 to 65535

### Platforms

All

## dst-port

### Syntax

**dst-port** {**lt** | **gt** | **eq**} *dst-port-number*  
**dst-port** **port-list** *port-list-name*  
**dst-port** **range** *dst-port-number dst-port-number*  
**no dst-port**

### Context

**[Tree]** (config>filter>ip-filter>entry>match dst-port)  
**[Tree]** (config>filter>ipv6-exception>entry>match dst-port)  
**[Tree]** (config>filter>ip-exception>entry>match dst-port)  
**[Tree]** (config>filter>ipv6-filter>entry>match dst-port)

### Full Context

configure filter ip-filter entry match dst-port  
configure filter ipv6-exception entry match dst-port  
configure filter ip-exception entry match dst-port  
configure filter ipv6-filter entry match dst-port

### Description

This command configures a destination TCP, UDP, or SCTP port number or port range for an IP filter or IP exception match criterion. An entry containing Layer 4 non-zero match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the Layer 4 information. Similarly an entry containing the "**dst-port eq 0**" match criterion, may match non-initial fragments when the destination port value is not present in a packet fragment and other match criteria are also met.

The **no** form of the command removes the destination port match criterion.

### Default

no dst-port

### Parameters

**lt**

Specifies that all port numbers less than the *dst-port-number* match.

**gt**

Specifies that all port numbers greater than the *dst-port-number* match.

**eq**

Specifies that the *dst-port-number* must be an exact match.

***dst-port-number***

Specifies the destination port number to be used as a match criteria expressed as a decimal integer, as well as in hexadecimal or binary format. The following value is for decimal integer format only.

**Values** 0 to 65535

#### ***port-list-name***

Specifies to use a list of ports referred to by *port-list-name*, which is a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

#### ***dst-port-number dst-port-number***

Specifies inclusive port range between two *dst-port-number* values.

### **Platforms**

All

- configure filter ipv6-filter entry match dst-port
- configure filter ip-filter entry match dst-port

VSR

- configure filter ip-exception entry match dst-port
- configure filter ipv6-exception entry match dst-port

## **dst-port**

### **Syntax**

**dst-port** *value* [*mask*]

**no dst-port**

### **Context**

**[Tree]** (config>system>security>mgmt-access-filter>ipv6-filter>entry dst-port)

**[Tree]** (config>system>security>mgmt-access-filter>ip-filter>entry dst-port)

### **Full Context**

configure system security management-access-filter ipv6-filter entry dst-port

configure system security management-access-filter ip-filter entry dst-port

### **Description**

This command configures a destination TCP or UDP port number or port range for a management access filter match criterion.

The **no** form of this command removes the destination port match criterion.

### **Parameters**

*value*

Specifies the destination TCP or UDP port number as match criteria.

**Values** 1 to 65535 (decimal)

### **mask**

Specifies the mask used to specify a range of destination port numbers as the match criterion.

This 16 bit mask can be configured using the formats described in [Table 38: Format Styles to Configure Mask](#):

Table 38: Format Styles to Configure Mask

| Format Style | Format Syntax      | Example            |
|--------------|--------------------|--------------------|
| Decimal      | DDDDD              | 63488              |
| Hexadecimal  | 0xHHHH             | 0xF800             |
| Binary       | 0bBBBBBBBBBBBBBBBB | 0b1111100000000000 |

To select a range from 1024 up to 2047, specify 1024 0xFC00 for value and mask.

**Default** 65535 (exact match)

**Values** 1 to 65535 (decimal)

## Platforms

## dst-port

### Syntax

**dst-port** [*tcp/udp port-number*] [*mask*]

**dst-port port-list** *port-list-name*

**dst-port range** *tcp/udp port-number tcp/udp port-number*

**no dst-port**

### Context

**[Tree]** (cfg>sys>sec>cpm>ipv6-filter>entry>match dst-port)

**[Tree]** (cfg>sys>sec>cpm>ip-filter>entry>match dst-port)

### Full Context

configure system security cpm-filter ipv6-filter entry match dst-port

configure system security cpm-filter ip-filter entry match dst-port

## Description

This command specifies the TCP/UDP port or port name to match the destination-port of the packet.

### Note:

An entry containing Layer 4 match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

The **no** form of this command removes the destination port match criterion.

## Default

no dst-port

## Parameters

### *tcp/udp port-number*

Specifies the destination port number to be used as a match criteria expressed as a decimal integer.

**Values** 0 to 65535 (accepted in decimal hex or binary)

### *port-list-name*

Specifies the port list name to be used as a match criteria for the destination port.

### *mask*

Specifies the 16 bit mask to be applied when matching the destination port.

**Values** [0x0000 to 0xFFFF] | [0 to 65535] | [0b0000000000000000 to 0b1111111111111111]

**dst-port-range start** *port-number* **end** *port-number*

**no dst-port-range**

## Context

[\[Tree\]](#) (config>service>nat>nat-classifier>entry>match dst-port-range)

## Full Context

configure service nat nat-classifier entry match dst-port-range

## Description

This command configures a destination TCP or UDP port number or port range.

Note that an entry containing Layer 4 match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

The **no** form of the command removes the destination port match criterion.

## Default

dst-port-range start 0 end 65535

## Parameters

### **start port-number**

Specifies the start of the port range expressed as a decimal integer.

**Values** 0 to 65535

### **end port-number**

Specifies the end of the port range expressed as a decimal integer.

**Values** 0 to 65535

## 8.300 dst-zone

### dst-zone

## Syntax

[no] **dst-zone** {*std-zone-name* | *non-std-zone-name*}

## Context

**[Tree]** (config>system>time dst-zone)

## Full Context

configure system time dst-zone

## Description

This command configures the start and end dates and offset for summer time or daylight savings time to override system defaults or for user defined time zones.

When configured, the time is adjusted by adding the configured offset when summer time starts and subtracting the configured offset when summer time ends.

If the time zone configured is listed in the Time Zones section, then the starting and ending parameters and offset do not need to be configured with this command unless it is necessary to override the system defaults. The command returns an error if the start and ending dates and times are not available either the Time Zones section on or entered as optional parameters in this command.

Up to five summer time zones may be configured, for example, for five successive years or for five different time zones. Configuring a sixth entry will return an error message. If no summer (daylight savings) time is supplied, it is assumed no summer time adjustment is required.

The **no** form of the command removes a configured summer (daylight savings) time entry.

### Parameters

#### *std-zone-name*

Specifies the standard time zone name. The standard name must be a system-defined zone in the Time Zones section. For zone names in the table that have an implicit summer time setting, for example MDT for Mountain Daylight Saving Time, the remaining **start-date**, **end-date** and **offset** parameters need to be provided unless it is necessary to override the system defaults for the time zone.

**Values** ADT, NDT, AKDT, CDT, CEST, EDT, EEST, MDT, NZDT, PDT, WEST

#### *non-std-zone-name*

Specifies the non-standard time zone name. Create a user-defined name created using the zone. The name can be a maximum of 5 characters in length.

## dup-detect

### Syntax

**dup-detect** [**anti-spoof-mac** *mac-address*] **window** *minutes* **num-moves** *count* **hold-down** [*minutes* | **max**]

**dup-detect anti-spoof-mac** *mac-address* **window** *minutes* **num-moves** *count* **hold-down** [*minutes* | **max**] [**static-black-hole**]

## Context

[Tree] (config>service>vpls>proxy-nd dup-detect)

[Tree] (config>service>vpls>proxy-arp dup-detect)

## Full Context

configure service vpls proxy-nd dup-detect

configure service vpls proxy-arp dup-detect

## Description

This command enables a mechanism that detects duplicate IPs and ARP/ND spoofing attacks. Attempts (relevant to dynamic and EVPN entry types) to add the same IP (different MAC) are monitored for **window** *<minutes>*. When *<count>* is reached within that **window**, the proxy-ARP/ND entry for the suspected IP is marked as duplicate. An alarm is also triggered. This condition is cleared when **hold-down** time expires (max does not expire) or a **clear** command is issued.

If the **anti-spoof-mac** is configured, the proxy-ARP/ND offending entry's MAC is replaced with this *<mac-address>* and advertised in an unsolicited GARP/NA for local SAP/SDP-bindings, and in EVPN to remote PEs. This mechanism assumes that the same **anti-spoof-mac** is configured in all the PEs for the same service and that traffic with destination **anti-spoof-mac** received on SAPs/SDP-bindings will be dropped. An ingress **mac-filter** may be configured to drop traffic to the **anti-spoof-mac**.

The **anti-spoof-mac** can also be combined with the **static-black-hole** option. To use a black-hole MAC entry for the **anti-spoof-mac** function in a proxy-ARP/ND service, the following must be configured:

- **static-black-hole** option for the **anti-spoof-mac**
- a static black-hole MAC using the same MAC address used for the **anti-spoof-mac: static-mac mac** *<mac-address>* **create black-hole** command.

When both **anti-spoof-mac** and **static-black-hole** commands are configured, the MAC is advertised in EVPN as Static. Locally, the MAC will be shown in the FDB as CStatic and associated with a black-hole.

The combination of the **anti-spoof-mac** and the **static-black-hole** options ensures that any frame arriving in the system with MAC DA=**anti-spoof-mac** will be discarded, regardless of the ingress endpoint type (SAP/SDP-binding or EVPN) and without the need for a filter.

If the user wants to redirect the traffic with MAC DA=**anti-spoof-mac** instead of discarding it, redirect filters should be configured on SAPs/SDP-bindings instead of the **static-black-hole** option.

If the **static-black-hole** option is not configured for the **anti-spoof-mac**, the behavior is as follows:

- The **anti-spoof-mac** is not programmed in the FDB.
- Any attempt to add a Static MAC (or any other MAC) with the **anti-spoof-mac** value will be rejected by the system.
- A mac-filter is needed to discard traffic with MAC DA=**anti-spoof-mac**.

Any changes to the configuration of **anti-spoof-mac** require proxy-arp or proxy-nd to first be shut down. Refer to "ARP/ND Snooping and Proxy Support" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Layer 2 Services and EVPN Guide: VLL, VPLS, PBB, and EVPN* for more information.

## Default

dup-detect window 3 num-moves 5 hold-down 9

## Parameters

### **window *minutes***

Specifies the window size in minutes.

**Values** 1 to 15

**Default** 3

### **count**

Specifies the number of moves required so that an entry is declared duplicate.

**Values** 3 to 10

**Default** 5

### **hold-down *minutes***

Specifies the hold-down time for a duplicate entry.

**Values** 2 to 60

**Default** 9

### **hold-down max**

Specifies permanent hold-down time for a duplicate entry.

### **mac-address**

Specifies the optional anti-spoof-mac to use.

### Context

[\[Tree\]](#) (config>port>ethernet>efm-oam>peer-rdi-rx dying-gasp)

### Full Context

configure port ethernet efm-oam peer-rdi-rx dying-gasp

### Description

This command defines how to react to the reception of a dying gasp Flag field set in the informational OAMPDU.

### Default

dying-gasp local-port-action out-of-service

### Parameters

#### local-port-action

Defines whether or not the local port will be affected when a dying gasp event is received from a peer.

#### log-only

Keyword that prevents the port from being affected when the local peer receives a dying gasp. The dying gasp will be logged but the port will remain operational.

#### out-of-service

Keyword that causes the port to enter a non-operation down state with a port state of link up. The error will be logged upon reception of dying gasp. The port will not be available to service data but will continue to carry Link OAM traffic to ensure the link is monitored.

### Platforms

## 8.308 dying-gasp-tx-on-reset

### dying-gasp-tx-on-reset

#### Syntax

[no] dying-gasp-tx-on-reset

#### Context

**[Tree]** (config>system>ethernet>efm-oam dying-gasp-tx-on-reset)

**[Tree]** (config>port>ethernet>efm-oam dying-gasp-tx-on-reset)

#### Full Context

configure system ethernet efm-oam dying-gasp-tx-on-reset

configure port ethernet efm-oam dying-gasp-tx-on-reset

#### Description

This command enables generation of the Information OAM PDU off-cycle when the soft reset notification is received by the EFM application. The local port state remains under the control of the Soft Reset application and does not change based on this EFM function. If the port is operationally up then the local node will continue to consider the port as available for service data and forwarding. If the upstream node requires notification to route around the local node undergoing the soft reset, notification must be sent to those nodes. This is a disruptive function.

This command is disabled by default at the system level and enabled by default at the port level. The combination of the system-level and port-level configuration determines if the dying gasp on soft reset function is active on individual ports. Both the system-level and port-level commands must be enabled in order to support generation of the Information OAM PDU for soft reset. If either is disabled, dying gasp is not active on those ports. This functionality must be enabled prior to the soft reset.

When both **grace-tx-enable** and **dying-gasp-tx-on-reset** are active on the same port, **grace-tx-enable** takes precedence when a soft reset is invoked if the Peer Vendor OUI being received is 00:16:4d (ALU) or the configured **config>port>ethernet>efm-oam grace-vendor-oui** value. The **grace-tx-enable** command should not be configured if the Nokia Vendor Specific Grace TLV is not supported on the remote peer, including Nokia 7750 SR equipment prior to release 11.0 R4.

#### Default

## 8.309 dynamic

### dynamic

#### Syntax

**dynamic** *ip-address* [**create**]

**no dynamic** *ip-address*

#### Context

[\[Tree\]](#) (config>service>vpls>proxy-nd dynamic)

[\[Tree\]](#) (config>service>vpls>proxy-arp dynamic)

#### Full Context

configure service vpls proxy-nd dynamic

configure service vpls proxy-arp dynamic

#### Description

This command creates a dynamic IP that can be associated to a MAC list. The configured dynamic IP is only converted to a dynamic entry when the resolve process for the IP has passed successfully.

A summary of the IP resolution process is as follows:

- A resolve message is sent for the configured IP as soon as the dynamic IP is configured. The message is sent with a configurable frequency of 1 to 60 minutes (using the **resolve** command); the default value is 5 minutes. The actual resolve interval is a "tittered" value of the configured interval.
- The resolve message is an ARP-request or NS message flooded to all the non-EVPN endpoints in the service, irrespective of the status of the **unknown-arp-request-flood-evpn** or **unknown-ns-flood-evpn** commands. The router sends resolve messages at the configured frequency until a dynamic entry for the IP is created in the proxy-ARP or proxy-ND table. The IP entry is created only if all of the following conditions are true.
  - An ARP, GARP, or NA message is received for the configured IP.
  - The associated MAC exists in the configured MAC list for the IP.
    - If the MAC list is empty or not configured, the router does not create an entry for the IP.
- After a dynamic entry is created in the proxy-ARP or proxy-ND table, the IP->MAC entry is advertised in the EVPN.

The **no** form of the command deletes the dynamic IP and the associated proxy-ARP or proxy-ND entry, if it exists.

#### Parameters

##### *ip-address*

Specifies the IPv4 or IPv6 address.

**Values** ip-address: a.b.c.d  
ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

## 8.313 dynamic-cost

## dynamic-cost

### Syntax

[no] **dynamic-cost**

### Context

[\[Tree\]](#) (config>lag dynamic-cost)

### Full Context

configure lag dynamic-cost

### Description

This command enables OSPF or ISIS costing of a Link Aggregation Group (LAG) based on the available aggregated, operational bandwidth.

The path cost is dynamically calculated based on the interface bandwidth. OSPF path cost can be changed through the interface metric or the reference bandwidth.

If dynamic cost is configured, then costing is applied based on the total number of links configured and the cost advertised is inversely proportional to the number of links available at the time. This is provided that the number of links that are up exceeds the configured LAG threshold value at which time the configured threshold action determines if, and at what cost, this LAG will be advertised.

For example: Assume a physical link in OSPF has a cost associated with it of 100, and the LAG consists of four physical links. The cost associated with the logical link is 25. If one link fails then the cost would automatically be adjusted to 33.

If dynamic cost is not configured and OSPF autocost is configured, then costing is applied based on the total number of links configured. This cost will remain static provided the number of links that are up exceeds the configured LAG threshold value at which time the configured threshold action determines if and at what cost this LAG will be advertised.

If dynamic-cost is configured and OSPF autocost is not configured, the cost is determined by the cost configured on the OSPF metric provided the number of links available exceeds the configured LAG threshold value at which time the configured threshold action determines if this LAG will be advertised.

If neither dynamic-cost nor OSPF autocost are configured, the cost advertised is determined by the cost configured on the OSPF metric provided the number of links available exceeds the configured LAG threshold value at which time the configured threshold action determines if this LAG will be advertised.

The **no** form of this command removes dynamic costing from the LAG.

### Default

no dynamic-cost

```
configure service vpls bgp-evpn mpls dynamic-egress-label-limit
configure service vprn bgp-evpn mpls dynamic-egress-label-limit
```

### Description

This command relaxes the egress MPLS label limit check when resolving BGP next hops in the tunnel table.

For VPRN services, the OAM label is never computed and, therefore, one more egress label is allowed.

For EVPN (Epipe and VPLS) services, the system only computes the control word and ESI label if they are used. For the control word, the system reduces the egress label limit by one label if the control word is configured in the service. When configured, the ESI label is not counted for Epipes or VPLS services without an ES.

The **no** form of this command, for EVPN, Epipe, and VPLS services, always accounts for the ESI label and control word.

### Default

```
no dynamic-egress-label-limit
```

### Platforms

All

## 8.315 dynamic-enforcement-policer-pool

```
dynamic-enforcement-policer-pool
```

### Syntax

```
[no] dynamic-enforcement-policer-pool number-of-policers
```

### Context

```
[Tree] (config>card>fp>ingress>dist-cpu-protection dynamic-enforcement-policer-pool)
```

### Full Context

```
configure card fp ingress dist-cpu-protection dynamic-enforcement-policer-pool
```

### Description

This command reserves a set of policers for use as dynamic enforcement policers for the Distributed CPU Protection (DCP) feature. Policers are allocated from this pool and instantiated as per-object-per-protocol dynamic enforcement policers after a local monitor is triggered for an object (such as a SAP or Network Interface). Any change to this configured value automatically clears the high water mark, timestamp, and failed allocation counts as seen under "show card x fp y dist-cpu-protection" and in the tmnxFpDcpDynEnfrcPlcrStatTable in the TIMETRA-CHASSIS-MIB. Decreasing this value to below the currently used/allocated number causes all dynamic policers to be returned to the free pool (and traffic returns to the local monitors).

**Default**

no dynamic-enforcement-policer-pool

**Parameters*****number-of-policers***

specifies the number of policers to be reserved.

**Values** 1000 to 32000

**Platforms**

All

configure service vprn interface sap ipsec-tunnel dynamic-keying

configure router interface ipsec ipsec-tunnel dynamic-keying

configure ipsec ipsec-transport-mode-profile dynamic-keying

configure service ies interface ipsec ipsec-tunnel dynamic-keying

**Description**

This command enables dynamic keying for the IPsec tunnel.

The **no** form of this command disables dynamic keying.

**Platforms**

VSR

- configure router interface ipsec ipsec-tunnel dynamic-keying
- configure service vprn interface ipsec ipsec-tunnel dynamic-keying
- configure service ies interface ipsec ipsec-tunnel dynamic-keying

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure ipsec ipsec-transport-mode-profile dynamic-keying
- configure service vprn interface sap ipsec-tunnel dynamic-keying

## 8.318 dynamic-mbs

### dynamic-mbs

#### Syntax

[no] dynamic-mbs

#### Context

[\[Tree\]](#) (config>qos>qgrps>egr>qgrp>queue dynamic-mbs)

#### Full Context

configure qos queue-group-templates egress queue-group queue dynamic-mbs

#### Description

This command enables support for dynamically modifying the MBS size of a queue using HQoS in order to maintain the maximum latency for traffic in the queue based on the queue's configured MBS and the ratio of its operational PIR to its administrative PIR. As the HQoS algorithm updates the operational PIR, by reducing or increasing it, the MBS of the queue is adjusted accordingly.

The configuration of dynamic MBS and the configuration of queue depth monitoring (**monitor-queue-depth** command) are mutually exclusive. Queue depth monitoring is an override on the queue where the queue group is applied.

The **no** form of this command disables dynamic MBS resizing.

#### Default

no dynamic-mbs

#### Platforms

All

## 8.319 dynamic-nd-populate

### dynamic-nd-populate

#### Syntax

[no] dynamic-nd-populate

## Context

[\[Tree\]](#) (config>service>vpls>proxy-nd dynamic-nd-populate)

## Full Context

```
configure service vpls proxy-nd dynamic-nd-populate
```

## Description

This command enables the addition of dynamic entries to the proxy-ND table. The command is disabled by default. When executed, the system will populate proxy-ND entries from snooped Neighbor Advertisement (NA) messages on SAPs/SDP-bindings, in addition to the entries coming from EVPN (if the EVPN is enabled). These entries will be shown as dynamic, as opposed to EVPN entries or static entries.

When disabled, dynamic-ND entries will be flushed from the proxy-ND table. Enabling **dynamic-nd-populate** is only recommended in networks with a consistent configuration of this command in all the PEs.

## Default

```
no dynamic-nd-populate
```

## Platforms

**no dynamic-neighbor-limit**

### Context

[\[Tree\]](#) (config>service>vprn>bgp>group dynamic-neighbor-limit)

[\[Tree\]](#) (config>service>vprn>bgp dynamic-neighbor-limit)

### Full Context

configure service vprn bgp group dynamic-neighbor-limit

configure service vprn bgp dynamic-neighbor-limit

### Description

This command configures the maximum number of dynamic BGP sessions that are accepted from remote peers associated with the entire BGP instance or a specific peer group. If accepting a new dynamic session would cause either the group limit or the instance limit to be exceeded, then the new session attempt is rejected and a Notification message is sent back to the remote peer.

The **no** form of this command removes the limit on the number of dynamic sessions.

**Default**

no dynamic-neighbor-limit

**Parameters*****peers***

Specifies the maximum number of dynamic BGP sessions.

**Values** 1 to 8192

**Platforms**

All

**dynamic-neighbor-limit****Syntax**

**dynamic-neighbor-limit** *peers*

### dynamic-parameters

#### Syntax

**dynamic-parameters**

#### Context

[\[Tree\]](#) (config>sys>security>dist-cpu-protection>policy>protocol dynamic-parameters)

#### Full Context

configure system security dist-cpu-protection policy protocol dynamic-parameters

#### Description

The dynamic-parameters are used to instantiate a dynamic enforcement policer for the protocol when the associated **local-monitoring-policer** is considered as exceeding its rate parameters (at the end of a minimum monitoring time of 60 seconds).

## Platforms

All

## 8.323 dynamic-policer

### dynamic-policer

#### Syntax

**dynamic-policer**

#### Context

[\[Tree\]](#) (config>qos>sap-ingress dynamic-policer)

[\[Tree\]](#) (config>qos>sap-egress dynamic-policer)

#### Full Context

configure qos sap-ingress dynamic-policer

configure qos sap-egress dynamic-policer

## Description

Commands in this context configure common properties for dynamic-policers. Dynamic policers are instantiated and terminated on demand due to an action request submitted by the policy server (for example, using a Gx interface). The actions types behind dynamic policers are typically related to rate-limiting or volume monitoring. The dynamic-policers can be instantiated on demand at any time during the lifetime of the sla-profile instance.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.324 dynamic-ports

### dynamic-ports

#### Syntax

[no] **dynamic-ports**

#### Context

[\[Tree\]](#) (config>service>nat>nat-policy>port-limits dynamic-ports)

#### Full Context

configure service nat nat-policy port-limits dynamic-ports

#### Description

This command specifies the maximum number of ports per outside IP address for an LSN44 pool with flexible port allocation. This command limits the number of ports per protocol on an outside IP address for a subscriber regardless of the pool pairing mode.

The **no** form of this command removes the limit on the number of dynamic ports.

#### Default

65536

#### Parameters

##### *num-ports*

Specifies the maximum number of ports per outside IP address for an LSN44 pool with flexible port allocation.

**Values** 1 to 65536

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.325 dynamic-queue

### dynamic-queue

#### Syntax

**dynamic-queue**

#### Context

[\[Tree\]](#) (config>qos>sap-egress dynamic-queue)

#### Full Context

configure qos sap-egress dynamic-queue

#### Description

Commands in this context configure dynamically-created queues for subscriber-management applications such as 5G FWA sessions. The configuration options in this context are the same as for static queues configured in the **configure qos sap-egress queue** context, but they are automatically applied to dynamically-created queues.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.326 dynamic-service

### dynamic-service

#### Syntax

**[no] dynamic-service**

#### Context

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range dynamic-service)

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range dynamic-service)

#### Full Context

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range dynamic-service

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range dynamic-service

## Description

This command configures the router to dynamically assign the WLAN-GW subscriber to a VPLS service, based on RADIUS authentication reply attributes. This feature is used in conjunction with the **configure service vpls wlan-gw wlan-gw-group** command.

The **no** form of the command disables the router from dynamically assigning the WLAN-GW subscriber to a VPLS service.

See "Dynamic VPLS service" in the *7450 ESS, 7750 SR, and VSR Triple Play Service Delivery Architecture Guide* for more information about the dynamic VPLS service feature.

## Default

no dynamic-service

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.327 dynamic-services

### dynamic-services

#### Syntax

**dynamic-services**

#### Context

## 8.328 dynamic-services-policy

## dynamic-services-policy

## Syntax

**dynamic-services-policy** *dynsrv-policy-name* [create]

**no dynamic-services-policy** *dynsrv-policy-name*

## Context

[\[Tree\]](#) (config>service>dynsvc dynamic-services-policy)

## Full Context

```
configure service dynamic-services dynamic-services-policy
```

## Description

This command creates a new dynamic services policy that can be used to create dynamic data services.

The **no** form of this command removes the dynamic services policy from the configuration. This is only allowed when there are no active dynamic data services referencing this policy.

## Parameters

### *dynsrv-policy-name*

Specifies a unique name of a dynamic services policy up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## dynamic-services-policy

## Syntax

```
dynamic-services-policy name
```

```
no dynamic-services-policy
```

## Context

[\[Tree\]](#) (config>service>vpls>sap>dyn-svc dynamic-services-policy)

[\[Tree\]](#) (config>service>dynsvc>ladb>user>idx dynamic-services-policy)

## Full Context

```
configure service vpls sap dynamic-services dynamic-services-policy
```

```
configure service dynamic-services local-auth-db user-name index dynamic-services-policy
```

## Description

This command specifies the local configured dynamic data service policy to use for provisioning (local authentication database context) or authentication (**capture-sap** context) of this dynamic service. If not specified, the dynamic services policy with the name **default** is used. If the default policy does not exist, then the dynamic data service setup or authentication fails.

The **no** form of this command removes the dynamic services policy from the configuration.

## Parameters

### *name*

Specifies a dynamic services policy name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 8.329 dynamic-topology-discover

```
dynamic-topology-discover
```

### Syntax

```
[no] dynamic-topology-discover
```

### Context

```
[Tree] (config>service>vpls>gsmp>group>ancc dynamic-topology-discover)
```

```
[Tree] (config>service>vprn>gsmp>group>ancc dynamic-topology-discover)
```

### Full Context

```
configure service vpls gsmp group ancc dynamic-topology-discover
```

```
configure service vprn gsmp group ancc dynamic-topology-discover
```

### Description

This command enables the ANCC dynamic topology discovery capability.

The **no** form of this command disables the feature.

### Platforms

All

## 8.330 dynamic-tunnel-redundant-next-hop

```
dynamic-tunnel-redundant-next-hop
```

### Syntax

```
dynamic-tunnel-redundant-next-hop ip-address
```

```
no dynamic-tunnel-redundant-next-hop
```

### Context

```
[Tree] (config>service>ies>if dynamic-tunnel-redundant-next-hop)
```

```
[Tree] (config>service>vprn>if dynamic-tunnel-redundant-next-hop)
```

### Full Context

```
configure service ies interface dynamic-tunnel-redundant-next-hop
```

```
configure service vprn interface dynamic-tunnel-redundant-next-hop
```

## Description

This command specifies redundant next-hop address on a public or private IPsec interface (with public or private tunnel-sap) for dynamic IPsec tunnel. The specified next-hop address is used by a standby node to shunt traffic to master in case it receives the address.

The next-hop address is resolved in the routing table of a corresponding service.

## Default

no dynamic-tunnel-redundant-next-hop

## Parameters

### *ip-address*

Specifies the dynamic ISA tunnel redundant next-hop address.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 8.331 dynmldp

dynmldp

## Syntax

dynmldp [detail]

no dynmldp

## Context

[\[Tree\]](#) (debug>router>pim dynmldp)

## Full Context

debug router pim dynmldp

## Description

This command enables debugging for dynamic MLDP.

The **no** form of this command disables dynamic MLDP debugging.

## Parameters

### **detail**

Debugs detailed dynamic MLDP information.

## Platforms

All

## 8.332 dynsvc-password

```
dynsvc-password
```

### Syntax

```
dynsvc-password password [hash | hash2]
```

```
no dynsvc-password
```

### Context

```
[Tree] (config>system>security>password dynsvc-password)
```

### Full Context

```
configure system security password dynsvc-password
```

### Description

**Note:**

See also the description for the **enable-dynamic-services-config** command.

This command allows a user with admin permissions to configure a system wide password which enables a user to enter a special dynamic services configuration mode.

The minimum length of the password is determined by the **minimum-length** command. The complexity requirements for the password are determined by the **complexity** command.

The **no** form of this command removes the dynsvc password from the configuration.

### Parameters

***password***

Configures the password which enables a user to enter a special dynamic services configuration mode. The maximum length can be up to 20 characters if unhashed, 32 characters if hashed, 54 characters if the **hash2** keyword is specified.

**hash**

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**hash2**

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

## **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure log accounting-policy custom-record policer e-counters

configure log accounting-policy custom-record queue e-counters

configure log accounting-policy custom-record ref-queue e-counters

configure log accounting-policy custom-record ref-policer e-counters

## Description

This command configures egress counter parameters for this custom record.

The **no** form of this command reverts all egress counters to their default value.

## Default

e-counters

## Parameters

**all**

Specifies that all egress counters should be included.

## Platforms

All

## 9.2 e1

**e1**

## Syntax

**e1** [*e1-id*]

## Context

**[Tree]** (config>port>tdm e1)

## Full Context

configure port tdm e1

## Description

Commands in this context configure E-1 parameters. E-1 is a basic time division multiplexing scheme used to carry digital circuits. It is also a standard WAN digital communication format designed to operate over copper facilities at a rate of 2.048 Mb/s.

North America uses the T-Carrier system while Europe uses the E-Carrier system of transmission, using multiples of the DS system. Digital signals are carried inside the carrier systems.

The **no** form of this command disables E-1 capabilities.

## Parameters

### *e1-id*

Specifies the E-1 channel being created.

**Values** E1: 1 to 21, e1-sonet-sdh-index

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 9.3 e3

### e3

## Syntax

[no] e3 [sonet-sdh-index]

## Context

[\[Tree\]](#) (config>port>tdm e3)

## Full Context

configure port tdm e3

## Description

Commands in this context configure E-3 parameters. E-3 lines provide a speed of 44.736 Mb/s and is also frequently used by service providers. E-3 lines carry 16 E-1 signals with a data rate of 34.368 Mb/s.

An E-3 connection typically supports data rates of about 43 Mb/s. An E-3 line actually consists of 672 individual channels, each supporting 64 kb/s. E-3 lines are used mainly by Service Providers to connect to the Internet backbone and for the backbone itself.

Depending on the MDA type, the E-3 parameters must be disabled if clear channel is enabled by default (for example, on the m12-ds3e3 MDA). Clear channel is a channel that uses out-of-band signaling, not in-band signaling, so the channel's entire bit rate is available. Channelization must be explicitly specified. Note that if E-3 nodes are provisioned on the channelized SONET/SDH MDA you must provision the parent STS-1 SONET/STM0 SDH path first.

North America uses the T-Carrier system while Europe uses the E-Carrier system of transmission, using multiples of the DS system. Digital signals are carried inside the carrier systems.

The **no** form of this command disables E-3 capabilities.

### Parameters

#### *sonet-sdh-index*

Specifies the components making up the specified SONET/SDH Path. Depending on the type of SONET/SDH port the *sonet-sdh-index* must specify more path indexes to specify the payload location of the path. The *sonet-sdh-index* differs for SONET and SDH ports.

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 9.4 ea-length

### ea-length

#### Syntax

**ea-length** *ea-bits-length*

**no ea-length**

#### Context

[\[Tree\]](#) (config>service>nat>map-domain>mapping-rule ea-length)

#### Full Context

configure service nat map-domain mapping-rule ea-length

#### Description

This command configures the length of EA bits in the MAP rule. The **no ea-length** statement sets the **ea-length** to 0.

#### Default

no ea-length

#### Parameters

##### *ea-bits-length*

Specifies the length of the EA bits.

**Values** 1 to 48

#### Platforms

VSR

## 9.5 eapol-destination-address

### eapol-destination-address

#### Syntax

**eapol-destination-address** *mac*

**no eapol-destination-address**

#### Context

[\[Tree\]](#) (config>port>ethernet>dot1x>macsec>sub-port eapol-destination-address)

#### Full Context

configure port ethernet dot1x macsec sub-port eapol-destination-address

#### Description

The EAPoL destination MAC address uses a destination multicast MAC address of 01:80:C2:00:00:03. Some networks cannot tunnel this packet over the network and consume these packets, causing the MKA session to fail. This command can change the destination MAC of the EAPoL to the unicast address of the MACsec peer, and as such, the EAPoL and MKA signaling will be unicasted between two peers.

The **no** form of this command returns the value to the default.

#### Default

no eapol-destination-address

#### Parameters

*mac*

Specifies the desired destination MAC address to be used by the EAPoL MKA packets of this sub-port.

**Values** aa:bb:cc:dd:ee:ff where aa, bb, cc, dd, ee and ff are hexadecimal numbers.

#### Platforms

All

## 9.6 ebgp-default-reject-policy

## 9.7 ebgp-ibgp-equal

ebgp-ibgp-equal

### Syntax

```
ebgp-ibgp-equal [ipv4] [ipv6] [label-ipv4] [label-ipv6]
no ebgp-ibgp-equal
```

### Context

[\[Tree\]](#) (config>service>vprn>bgp>best-path-selection ebgp-ibgp-equal)

### Full Context

```
configure service vprn bgp best-path-selection ebgp-ibgp-equal
```

## Description

This command instructs the BGP decision process to ignore the difference between EBGP and IBGP routes in selecting the best path and eligible multipaths (if multipath and ECMP are enabled). The result is a form of EIBGP load-balancing in a multipath scenario.

The operator can apply the behavior selectively to only certain types of routes by specifying one or more address family names in the command.

The **no** form of this command configures the router in the BGP decision process to prefer an EBGP learned route over an IBGP learned route.

## Default

no ebgp-ibgp-equal

## Parameters

### ipv4

Specifies that the command should be applied to unlabeled unicast IPv4 routes.

### ipv6

Specifies that the command should be applied to unlabeled unicast IPv6 routes.

### label-ipv4

Specifies that the command should be applied to labeled IPv4 routes.

### label-ipv6

Specifies that the command should be applied to labeled IPv6 routes.

## Platforms

All

## ebgp-ibgp-equal

## Syntax

```
ebgp-ibgp-equal [ipv4] [ipv6] [label-ipv4] [label-ipv6] [vpn-ipv4] [vpn-ipv6]
[evpn]
no ebgp-ibgp-equal
```

## Context

[\[Tree\]](#) (config>router>bgp>best-path-selection ebgp-ibgp-equal)

## Full Context

```
configure router bgp best-path-selection ebgp-ibgp-equal
```

## Description

This command instructs the BGP decision process to ignore the difference between EBGP and IBGP routes in selecting the best path and eligible multipaths (if multipath and ECMP are enabled). The result is a form of EIBGP load balancing in a multipath scenario.

The behavior can be applied selectively to only certain types of routes by specifying one or more address family names in the command. If no families are specified, this command applies to IPv4, IPv6, label-IPv4, label-IPv6, VPN-IPv4, VPN-IPv6, and EVPN routes.

The **no** form of this command configures the router in the BGP decision process to prefer an EBGP learned route over an IBGP learned route.

### Default

no ebgp-ibgp-equal

### Parameters

#### ipv4

Specifies that the command should be applied to unlabeled unicast IPv4 routes.

#### ipv6

Specifies that the command should be applied to unlabeled unicast IPv6 routes.

#### label-ipv4

Specifies that the command should be applied to labeled unicast IPv4 routes.

#### label-ipv6

Specifies that the command should be applied to labeled unicast IPv6 routes.

#### vpn-ipv4

Specifies that the command should be applied to IPv4 VPN routes.

#### vpn-ipv6

Specifies that the command should be applied to IPv6 VPN routes.

#### evpn

Specifies that the command should be applied to EVPN routes.

configure service epipe bgp-evpn mpls auto-bind-tunnel ecmp

configure service epipe bgp-evpn vxlan ecmp

configure service vpls bgp-evpn mpls ecmp

#### Description

When configured in a VPLS service, this command controls the number of paths that are allowed to reach a specified MAC address when that MAC in the FDB is associated to a remote all-active multi-homed ES.

The configuration of two or more ECMP paths to a specified MAC enables the aliasing function described in RFC 7432.

When used in an Epipe service, this command controls the number of paths that are allowed to reach a specified remote Ethernet tag that is associated to an ES destination.

#### Default

ecmp 1

#### Parameters

*max-ecmp-routes*

Specifies the number of paths allowed to the same multi-homed MAC address or Ethernet tag.

**Values** 1 to 32

## Platforms

All

- configure service vpls bgp-evpn mpls ecmp

## ecmp

### Syntax

**ecmp** *max-ecmp-routes*

**no ecmp**

### Context

[\[Tree\]](#) (config>service>vprn>bgp-ipvpn>mpls>auto-bind-tunnel ecmp)

[\[Tree\]](#) (config>service>vprn>bgp-evpn>mpls>auto-bind-tunnel ecmp)

### Full Context

configure service vprn bgp-ipvpn mpls auto-bind-tunnel ecmp

configure service vprn bgp-evpn mpls auto-bind-tunnel ecmp

### Description

This command configures the maximum number of tunnels that may be used as ECMP next-hops for the VPRN. This value overrides any values that are configured using the **config>service>vprn>ecmp** command.

The **no** form of this command removes the configured overriding value, and the value configured using the **config>service>vprn>ecmp** command is used.

### Default

ecmp 1

## Parameters

### *max-ecmp-routes*

Specifies the maximum number of tunnels that may be used as ECMP next-hops for the VPRN.

**Values** 1 to 32

**Default** 1

## Platforms

All

## ecmp

## Syntax

**ecmp** *max-ecmp-routes*

**no ecmp**

## Context

[\[Tree\]](#) (config>router ecmp)

## Full Context

configure router ecmp

## Description

This command enables ECMP and configures the number of routes for path sharing; for example, the value 2 means two equal cost routes are used for cost sharing.

ECMP can be used only for routes with the same preference and same protocol.

If available ECMP routes at the best preference exceed the maximum ECMP routes allowed, the system selects using the following criteria:

1. The system selects the lowest next hop router ID.
2. If the next hop goes to the same neighbor, the system selects the next hop with the lowest interface index.

The **no** form of this command disables ECMP path sharing. If ECMP is disabled and multiple routes are available at the best preference and equal cost, the route with the lowest next-hop IP address is used.

## Default

no ecmp

## Parameters

### *max-ecmp-routes*

Specifies the maximum number of equal cost routes allowed on this routing table instance, expressed as a decimal integer. Setting ECMP *max-ecmp-routes* to 1 yields the same result as entering **no ecmp**.

**Values** 1 to 64

## Platforms

All

## ecmp

## Syntax

**ecmp** *max-ecmp-routes*

**no ecmp**

## Context

[\[Tree\]](#) (config>service>vprn ecmp)

## Full Context

configure service vprn ecmp

## Description

This command enables equal-cost multipath (ECMP) and configures the number of routes for path sharing. For example, the value of 2 means that 2 equal cost routes are used for cost sharing.

ECMP groups form when the system routes to the same destination with equal cost values. Routing table entries can be entered manually (as static routes), or they can be formed when neighbors are discovered and routing table information is exchanged by routing protocols. The system can balance traffic across the groups with equal costs.

ECMP can only be used for routes learned with the same preference and same protocol.

If available ECMP routes at the best preference exceed the maximum ECMP routes allowed, the system selects using the following criteria:

1. The system selects the lowest next hop router ID.
2. If the next hop goes to the same neighbor, the system selects the next hop with the lowest interface index.

The **no** form of this command disables ECMP path sharing. If ECMP is disabled and multiple routes are available at the best preference and equal cost, the newly updated route is used.

## Default

no ecmp

## Parameters

***max-ecmp-routes***

Specifies the maximum number of routes for path sharing.

**Values** 1 to 64

## 9.15 ecmp-opt-threshold

ecmp-opt-threshold

## Syntax

ecmp-opt-threshold *preference-level*

no ecmp-opt-threshold

## Context

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>bundle ecmp-opt-threshold)

## Full Context

configure mcast-management multicast-info-policy bundle ecmp-opt-threshold

## Description

This command defines the preference level threshold where multicast ECMP path management can dynamically optimize channels based on topology or bandwidth events. If the channels preference is

equal to or less than the `ecmp-opt-threshold`, ECMP can move the channel between ECMP paths when bandwidth distribution events happen. Channels with a preference level higher than the threshold are moved during these events.

The default ECMP optimization limit threshold is 7. This means that multicast channels with a preference level of 0 to 7 (all channels) are allowed to move between ECMP paths. The `ecmp-opt-threshold` command can be used to change the default threshold.

Changing the threshold causes all channels ECMP optimization eligibility to be reevaluated.

The **no** form of this command restores the default ECMP optimization preference threshold value.

## Default

`ecmp-opt-threshold 7`

## Parameters

### *preference-level*

The `preference-level` parameter is required when specifying the `ecmp-opt-threshold`. An integer value from 0 to 7 must be specified.

**Values** 0 to 7

## Platforms

All

## 9.16 `ecmp-unequal-cost`

### `ecmp-unequal-cost`

## Syntax

`[no] ecmp-unequal-cost`

## Context

[\[Tree\]](#) (`config>service>vprn ecmp-unequal-cost`)

## Full Context

`configure service vprn ecmp-unequal-cost`

## Description

This command relaxes the constraint that ECMP multipaths must have the same IGP cost to reach the BGP next-hop. When VPN routes for the same IP prefix are imported into a VPRN service, they are eligible to be used as multipaths. The resulting route is programmed as an ECMP IP route.

The BGP best path selection algorithm is the basis for choosing the set of imported VPN routes that can be combined to form an ECMP route. Normally (unless an **ignore-nh-metric** command is configured), the BGP decision process gives higher preference to VPN routes with a lower next-hop cost if other,

more significant criteria, are tied. In these circumstances, a VPN route cannot be an eligible multipath if it does not have the same next-hop cost as the best VPN route. Configuring this command removes this restriction and allows the multipaths to have different (meaning lower) next-hop costs than the best route. This broadens the applicability of multipath and can result in better load balancing in the network.

This command applies only to the following types of routes imported by a VPRN.

- vpn-ipv4
- vpn-ipv6
- mcast-vpn-ipv4
- mcast-vpn-ipv6

The **no** form of this command restores the default behavior that requires next-hop costs of multipaths to be equal, unless the next-hop cost is completely removed from the BGP decision process.

### Default

## 9.17 ect-algorithm

### ect-algorithm

#### Syntax

```
ect-algorithm fid-range fid-range {low-path-id| high-path-id}
```

#### Context

[\[Tree\]](#) (config>service>vpls>spb>level ect-algorithm)

#### Full Context

```
configure service vpls spb level ect-algorithm
```

#### Description

This command configures the ect-algorithm associated with a FID. Names are:

- low-path-id
- high-path-id

The algorithm for low-path-id chooses the path with the lowest metric and uses the sum of each Bridge-ID to break-ties (in this case preferring the lowest bridge identifiers).

The algorithm for high-path-id choose the path with the lowest metric and the sum of each Bridge-ID (after each one is modified by the algorithm mask) to break-ties (in this case preferring the highest bridge identifiers).

A Forwarding Identifier (FID) is an abstraction of the IEEE 802.1 SPB Base VID and represents the VLAN (B-VPLS) in IS-IS LSPs. B-VPLS services with the same FID share B-MACs and I-SIDs. (the SAP encapsulation VLAN tag may be set to the same value as the FID or to any other valid VLAN tag). One or more FIDs can be associated with an ECT-algorithm by using the FID range. User B-VPLS services may share the same FID as the control B-VPLS or use independent FIDs where each FID has an assigned ect-algorithm. B-VPLS services with i-vpls services must have an independent FID. B-VPLS services with only PBB Epipes may share FIDs with other B-VPLS services including the control B-VPLS service.

The ect-algorithm is associated with the FID and can only be changed only when there are no VPLS, SAPs or SDP bindings associated with the FID. The FID must be independent from the FID assigned to other services.

## Default

ect-algorithm fid-range 1-4095 low-path-id

## Parameters

### *name*

low-path-id, high-path-id.

### *fid-range*

Range of Forwarding Identifier values.

**Values** 1 to 4095

[\[Tree\]](#) (config>service>vpls>sap>stp edge-port)

## Full Context

configure service template vpls-sap-template stp edge-port

configure service vpls spoke-sdp stp edge-port

configure service vpls sap stp edge-port

## Description

This command configures the SAP or SDP as an edge or non-edge port. If **auto-edge** is enabled for the SAP, this value will be used only as the initial value.

### Note:

The function of the **edge-port** command is similar to the **rapid-start** command. It tells RSTP that it is on the edge of the network (for example, there are no other bridges connected to that port) and, as a consequence, it can immediately transition to a forwarding state if the port becomes available.

RSTP, however, can detect that the actual situation is different from what **edge-port** may indicate.

Initially, the value of the SAP or spoke-SDP parameter is set to edge-port. This value will change if:

- A BPDU is received on that port. This means that after all there is another bridge connected to this port. Then the edge-port becomes disabled.
- If auto-edge is configured and no BPDU is received within a certain period of time, RSTP concludes that it is on an edge and enables the edge-port.

The **no** form of this command returns the edge port setting to the default value.

## Default

no edge-port

## Platforms

All

edge-port

## Syntax

[no] edge-port

## Context

**[Tree]** (config>service>pw-template>stp edge-port)

## Full Context

configure service pw-template stp edge-port

## Description

This command configures the SAP or SDP as an edge or non-edge port. If **auto-edge** is enabled for the SAP, this value will be used only as the initial value.

### Note:

On the 7750 SR and the 7950 XRS, the function of the **edge-port** command is similar to the **rapid-start** command. It tells RSTP that it is on the edge of the network (for example, there are no other bridges connected to that port) and, as a consequence, it can immediately transition to a forwarding state if the port becomes available.

RSTP, however, can detect that the actual situation is different from what **edge-port** may indicate.

Initially, the value of the SAP or spoke SDP parameter is set to edge-port. This value will change if:

- A BPDU is received on that port. This means that after all there is another bridge connected to this port. Then the edge-port becomes disabled.
- If auto-edge is configured and no BPDU is received within a certain period of time, RSTP concludes that it is on an edge and enables the edge-port.

The **no** form of this command returns the edge port setting to the default value.

### Default

no edge-port

## 9.19 edit

edit

### Syntax

edit [exclusive]

### Context

**[Tree]** (candidate edit)

### Full Context

candidate edit

### Description

This command enables the edit-cfg mode where changes can be made to the candidate configuration and sets the edit-point to the end of the candidate. In edit-cfg mode the CLI prompt contains **edit-cfg** near the root of the prompt. Commands in the **candidate** CLI branch, except **candidate edit**, are available only when in edit-cfg mode.

### Parameters

#### exclusive

Allows a user to exclusively create a candidate configuration by blocking other users (and other sessions of the same user) from entering edit-cfg mode. Exclusive edit-cfg mode can only be entered if the candidate configuration is empty and no user is in edit-cfg mode. Once a user is in exclusive edit-cfg mode no other users/sessions are allowed in edit-cfg mode. The user must either commit or discard the exclusive candidate before leaving exclusive edit-cfg mode. If the CLI session times out while a user is in exclusive edit-cfg mode then the contents of the candidate are discarded. The **admin disconnect** command

can be used to force a user to disconnect (and to clear the contents of the candidate) if they have the candidate locked.

#### Syntax

efm *port-id* local-loopback {start | stop}

efm *port-id* remote-loopback {start | stop}

## Context

[\[Tree\]](#) (oam efm)

## Full Context

oam efm

## Description

This command enables Ethernet in the First Mile (EFM) OAM tests loopback tests on the specified port. The EFM OAM remote loopback OAMPDU is sent to the peering device to trigger remote loopback.

When EFM OAM is disabled or shutdown on a port, the dying gasp flag for the OAMPDU is set for the OAMPDUs sent to the peer. This speeds up the peer loss detection time.

## Parameters

### *port-id*

Specifies the port ID.

### Note:

On the 7950 XRS, The XMA ID takes the place of the MDA.

|                   |                                 |  |         |
|-------------------|---------------------------------|--|---------|
| <i>port-id</i>    | <i>slot/mda/port [.channel]</i> |  |         |
| <i>eth-sat-id</i> | <i>esat-id/slot/port</i>        |  |         |
|                   | <i>esat</i>                     |  | keyword |
|                   | <i>id</i>                       |  | 1 to 20 |
| <i>pxc-id</i>     | <i>pxc-id.sub-port</i>          |  |         |
|                   | <i>pxc</i>                      |  | keyword |
|                   | <i>id</i>                       |  | 1 to 64 |
|                   | <i>sub-port</i>                 |  | a, b    |

### **local-loopback {start | stop}**

Specifies whether to start or stop local loopback tests on the specified port.

### **remote-loopback {start | stop}**

Specifies whether to start or stop remote Ethernet in the First Mile (EFM) OAM loopback tests on the specified port. The EFM OAM remote loopback OAMPDU is sent to the peering device to trigger remote loopback.

For EFM OAM tunneling to function properly, EFM OAM tunneling should be configured for VLL services or a VPLS service with two SAPs only.

## Parameters

### **source**

Specifies using the source address and (if I4-load balancing is enabled) source port in the hash, ignore destination address/port.

**destination**

Specifies using the destination address and (if I4-load balancing is enabled) destination port in the hash, ignore source address/port.

**inner-ip**

Specifies use of the inner IP header parameters instead of outer IP header parameters in LAG/ECMP hash for IPv4 encapsulated traffic.

**Platforms**

All

## egr-ip-load-balancing

**Syntax**

**egr-ip-load-balancing** {**source** | **destination** | **inner-ip**}

**no egr-ip-load-balancing**

**Context**

[\[Tree\]](#) (config>router>if>load-balancing egr-ip-load-balancing)

**Full Context**

configure router interface load-balancing egr-ip-load-balancing

**Description**

This command specifies whether to include source address or destination address or both in LAG/ECMP hash on IP interfaces. Additionally, when I4-load-balancing is enabled the command applies also to inclusion of source/destination port in the hash inputs.

The **no** form of this command includes both source and destination parameters.

**Default**

no egr-ip-load-balancing

**Parameters****source**

Specifies using source address and (if I4-load balancing is enabled) source port in the hash, ignore destination address/port

**destination**

Specifies using destination address and (if I4-load balancing is enabled) destination port in the hash, ignore source address/port.

**inner-ip**

Specifies use of the inner IP header parameters instead of outer IP header parameters in LAG/ECMP hash for IPv4 encapsulated traffic.

## 9.24 egr-percentage-of-rate

### egr-percentage-of-rate

#### Syntax

**egr-percentage-of-rate** *egr-rate-percentage*

**no egr-percentage-of-rate**

#### Context

[\[Tree\]](#) (config>port>modify-buffer-allocation-rate egr-percentage-of-rate)

#### Full Context

configure port modify-buffer-allocation-rate egr-percentage-of-rate

#### Description

The **egr-percentage-of-rate** command increases or decreases the active bandwidth associated with the egress port that affects the amount of egress buffer space managed by the port. Changing a ports active bandwidth using the **egr-percentage-of-rate** command is an effective means of artificially lowering the buffers managed by one egress port and giving them to other egress ports on the same MDA.

The **egr-percentage-of-rate** command accepts a percentage value that increases or decreases the active bandwidth based on the defined percentage. A value of 50% causes the active bandwidth to be reduced by 50%. A value of 150% causes the active bandwidth to be increased by 50%. Values from 1 to 1000 percent are supported.

A value of 100 (the default value) is equivalent to executing the **no egr-percentage-of-rate** command and restores the egress active rate to the normal value.

The **no** form of this command removes any artificial increase or decrease of the egress active bandwidth used for egress buffer space allocation to the port. The **no egr-percentage-of-rate** command sets the egress rate percentage to 100%.

#### Parameters

##### *egr-rate-percentage*

The *egr-rate-percentage* parameter is required and specifies the percentage value used to modify the current egress active bandwidth of the port. This does not actually change the bandwidth available on the port in any way. The defined *egr-rate-percentage* parameter is multiplied by the egress active bandwidth of the port. A value of 150 results in an increase of 50% (1.5 x Rate).

|                |                                |
|----------------|--------------------------------|
| <b>Values</b>  | 1 to 1000                      |
| <b>Default</b> | 100 (no change to active rate) |

## 9.25 egr-vtep

### egr-vtep

#### Syntax

**egr-vtep** {*ip-address* | *ipv6-address*}

**no egr-vtep**

#### Context

**[Tree]** (config>service>epipe>vxlan egr-vtep)

**[Tree]** (config>service>vpls>vxlan egr-vtep)

#### Full Context

configure service epipe vxlan egr-vtep

configure service vpls vxlan egr-vtep

#### Description

This command configures the static destination VTEP IP used when originating VXLAN packets for the service.

#### Parameters

##### *ip-address*

Specifies the IPv4 address used as the destination VTEP when originating VXLAN packets for the service.

##### *ipv6-address*

Specifies the IPv6 address used as the destination VTEP when originating VXLAN packets for the service.

#### Platforms

All

- configure service epipe vxlan egr-vtep

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure service vpls vxlan egr-vtep

## 9.26 egr-weight

### egr-weight

#### Syntax

**egr-weight access** *access-weight* **network** *network-weight*

**no egr-weight**

#### Context

**[Tree]** (config>port>hybrid-buffer-allocation egr-weight)

#### Full Context

configure port hybrid-buffer-allocation egr-weight

#### Description

This command configures the sharing of the egress buffers allocated to a hybrid port among the access and network contexts. By default, it is split equally between network and access.

The **no** form of this command reverts to the default values for the egress access and network weights.

#### Parameters

##### *access-weight*

Specifies the access weight as an integer.

**Values** 0 to 100

**Default** 50

##### *network-weight*

Specifies the network weight as an integer.

**Values** 0 to 100

**Default** 50

### Syntax

**[no] egress**

### Context

**[Tree]** (config>mirror>mirror-dest>sap egress)

### Full Context

configure mirror mirror-dest sap egress

### Description

This command enables access to the context to associate an egress SAP Quality of Service (QoS) policy with a mirror destination SAP.

If no QoS policy is defined, the system default SAP egress QoS policy is used for egress processing.

### Platforms

All

## egress

### Syntax

**egress**

### Context

[\[Tree\]](#) (config>qos>network egress)

### Full Context

configure qos network egress

### Description

This command is used to enter the CLI node that creates or edits egress policy entries that specify the forwarding class queues to be instantiated when this policy is applied to the network port.

The forwarding class and profile state mapping to in- and out-of-profile DiffServ Code Points (DSCPs), dot1p, and MPLS EXP bits mapping for all labeled packets are also defined in this context.

All service packets are aggregated into DiffServ-based egress queues on the network interface. The service packets are transported either with IP GRE encapsulation or over a MPLS LSP. The exception is with the IES service. In this case, the actual customer IP header has the DSCP field mapped.

All out-of-profile service packets are marked with the corresponding out-of-profile DSCP, dot1p, or the EXP bit value at network egress. All the in-profile service ingress packets are marked with the corresponding in-profile DSCP, dot1p, or EXP bit value based on the forwarding class to which they belong. The exceed-profile traffic is marked with the same value as out-of-profile traffic and the inplus-profile traffic is marked with the same value as in-profile traffic.

### Platforms

All

## egress

### Syntax

**egress**

### Context

[\[Tree\]](#) (config>qos>queue-group-templates egress)

### Full Context

configure qos queue-group-templates egress

### Description

Commands in this context configure QoS egress queue groups. Egress queue group templates can be applied to egress Ethernet ports to create an egress queue group.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 9.28 egress-amplifier-gain

## egress-amplifier-gain

### Syntax

**egress-amplifier-gain** *egress-amplifier-gain*

**no egress-amplifier-gain****Context**

[\[Tree\]](#) (configure>port>transceiver>optical-line-system egress-amplifier-gain)

**Full Context**

configure port transceiver optical-line-system egress-amplifier-gain

**Description**

This command configures the gain for the egress amplifier.

The **no** form of this command sets the gain for the egress amplifier to the default.

**Default**

no egress-amplifier-gain

**Parameters*****egress-amplifier-gain***

Specifies the gain for the amplifier in decibels.

**Values** 0 to 25.00 dB

**Default** 25.00 dB

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 9.29 egress-counter-map

### egress-counter-map

**Syntax**

**egress-counter-map** policer *policer-id* traffic-type {unicast | multicast | broadcast} [create]

**egress-counter-map** queue *queue-id* traffic-type {unicast | multicast | broadcast} [create]

**no egress-counter-map** policer *policer-id*

**no egress-counter-map** queue *queue-id*

**Context**

[\[Tree\]](#) (config>sflow egress-counter-map)

**Full Context**

configure sflow egress-counter-map

## Description

This command configures the egress counter map for sFlow. The map must be configured so sFlow agent understands how to interpret data collected against SAP queues and policers. Multiple queues and policers can be mapped to the same **traffic-type** using separate line entries.

The **no** form of this command deletes a SAP policy queue/policer from the map.

## Parameters

### *policer-id*

Specifies the policer ID in a SAP egress QoS policy. If the SAP policy does not have a policer with the specified ID, the map entry will be ignored for this SAP.

**Values** 1 to 8

### *queue-id*

Specifies the queue ID in a SAP egress QoS policy. If the SAP policy does not have a queue with the specified ID, the map entry will be ignored for this SAP.

**Values** 1 to 8

## Platforms

7750 SR, 7750 SR-s, 7950 XRS

## 9.30 egress-engineering

### egress-engineering

## Syntax

**egress-engineering**

**no egress-engineering**

## Context

[\[Tree\]](#) (config>router>bgp>group egress-engineering)

[\[Tree\]](#) (config>router>bgp>group>neighbor egress-engineering)

## Full Context

configure router bgp group egress-engineering

configure router bgp group neighbor egress-engineering

## Description

Commands in this context configure egress engineering on a specific neighbor or all neighbors in a BGP group.

If egress engineering is not configured in the neighbor context, the configuration is inherited from the group context.

The **no** form of this command removes the egress engineering configuration.

### Default

no egress-engineering

### Platforms

All

## 9.31 egress-fc

### egress-fc

#### Syntax

**egress-fc** *fc-name*

**no egress-fc**

#### Context

[\[Tree\]](#) (config>qos>sap-ingress>fc egress-fc)

#### Full Context

configure qos sap-ingress fc egress-fc

#### Description

This command configures the forwarding class to be used by the egress QoS processing. It overrides the forwarding class determined by ingress classification but not the QoS Policy Propagation via BGP.

The forwarding class or forwarding subclass can be overridden.

The new egress forwarding class is applicable to both SAP egress and network egress.

#### Default

no egress-fc

#### Parameters

***fc-name***

Specifies the forwarding class name to be used by the egress QoS processing.

**Values** be, l2, af, l1, h2, ef, h1, nc

#### Platforms

All

## 9.32 egress-ip-filter-entries

### egress-ip-filter-entries

[no] egress-ip-filter-entries

#### Context

[\[Tree\]](#) (config>subscr-mgmt>cat-map>category>exh-lvl egress-ip-filter-entries)

#### Full Context

configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ip-filter-entries

#### Description

Commands in this context configure the egress IP filter parameters.

The **no** form of this command reverts to the default.

#### Default

egress-ip-filter-entries

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 9.33 egress-ipv6-filter-entries

### egress-ipv6-filter-entries

#### Syntax

[no] egress-ipv6-filter-entries

#### Context

[\[Tree\]](#) (config>subscr-mgmt>cat-map>category>exh-lvl egress-ipv6-filter-entries)

#### Full Context

configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ipv6-filter-entries

#### Description

Commands in this context configure the egress IPv6 filter parameters.

The **no** form of this command reverts to the default.

### Default

egress-ipv6-filter-entries

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 9.34 egress-pbr

### egress-pbr

#### Syntax

**egress-pbr** {**default-load-balancing** | **I4-load-balancing**}

**no egress-pbr**

#### Context

[\[Tree\]](#) (config>filter>ipv6-filter>entry egress-pbr)

[\[Tree\]](#) (config>filter>ip-filter>entry egress-pbr)

#### Full Context

configure filter ipv6-filter entry egress-pbr

configure filter ip-filter entry egress-pbr

#### Description

This command specifies that the configured PBR action is applicable to egress processing. The command should only be enabled in ACL policies used by residential subscribers. Enabling **egress-pbr** on filters not deployed for residential subscribers is not blocked but may lead to unexpected behavior and should be avoided.

The **no** form of this command removes the **egress-pbr** designation of the filter entry's action.

#### Default

no egress-pbr

#### Parameters

##### **default-load-balancing**

Sets load-balancing to the default (hash based on SA/DA of the packet).

##### **I4-load-balancing**

Includes TCP/UDP port (if available) in the hash.

## Platforms

All

## 9.35 egress-peer-engineering

egress-peer-engineering

### Syntax

**egress-peer-engineering**

**no egress-peer-engineering**

### Context

[\[Tree\]](#) (config>router>bgp egress-peer-engineering)

### Full Context

configure router bgp egress-peer-engineering

### Description

Commands in this context configure EPE parameters in BGP.

The **no** form of this command removes the EPE parameters from the BGP context.

### Default

no egress-peer-engineering

## Platforms

All

## 9.36 egress-peer-engineering-label-unicast

egress-peer-engineering-label-unicast

### Syntax

**[no] egress-peer-engineering-label-unicast**

### Context

[\[Tree\]](#) (config>router>bgp>group egress-peer-engineering-label-unicast)

[\[Tree\]](#) (config>router>bgp>group>neighbor egress-peer-engineering-label-unicast)

**Full Context**

```
configure router bgp group egress-peer-engineering-label-unicast
configure router bgp group neighbor egress-peer-engineering-label-unicast
```

**Description**

This command enables the generation of a label-unicast route for each /32 or /128 prefix that corresponds to the BGP neighbor or group address in the scope of the command. These routes can be advertised to other routers to recursively resolve unlabeled BGP routes for AS external destinations. They support the Egress Peer Engineering (EPE) use case.

The **no** form of this command disables the generation of EPE label-unicast routes.

**Default**

```
no egress-peer-engineering-label-unicast
```

## 9.37 egress-policer

### egress-policer

**Syntax**

```
egress-policer [policer-name]
no egress-policer
```

**Context**

**[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>dsm egress-policer)

**[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>dsm egress-policer)

**Full Context**

```
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-
mgmt egress-policer
```

```
configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-
mgmt egress-policer
```

**Description**

This command specifies the egress policer applied to all UEs corresponding to default vlan-range (such as, group-interface) or the specified vlan-range. The policer can be created in the **config>subscr-mgmt>isa-policer** context. The egress policer can be overridden per UE from RADIUS via access-accept or COA.

The **no** form of this command reverts to the default.

## Parameters

### *policer-name*

Specifies the identifier of the distributed-sub-mgmt policer for egress traffic up to 256 characters.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 9.38 egress-port-queue-overrides

## Syntax

**egress-rate-modify** [**agg-rate-limit** | **scheduler** *scheduler-name*]

**no egress-rate-modify**

## Context

[\[Tree\]](#) (config>subscr-mgmt>igmp-policy egress-rate-modify)

## Full Context

configure subscriber-mgmt igmp-policy egress-rate-modify

## Description

This command is used to apply HQoS Adjustment to a subscriber. HQoS Adjustment is needed when multicast traffic flow for the subscriber is dissociated from subscriber host queues. Multicast redirection is typical such case although it can be applied in direct IPoE subscriber per-sap replication mode.

The channel bandwidth definition policy is defined in the mcac policy under the **config>router>mcac>policy** context. The policy is applied under the redirected interface or under the group-interface.

In order for HQoS Adjustment to take effect, sub-mcac-policy must be in a no shutdown mode and applied under the sub-profile even if mcac is not deployed.

The **no** form of this command reverts to the default value.

## Parameters

### **agg-rate-limit**

Specifies the aggregate14 rate modification to be applied. The subscriber's bandwidth is capped via the **agg-rate-limit** command in the sub-profile or with a Change of Authorization (CoA) request. This bandwidth cap is dynamically adjusted according to the multicast channel definition and channel association with the host via IGMP.

### **scheduler-name**

Specifies the schedule name. The subscriber's bandwidth is capped via the scheduling-policy in the sub-profile or with a Change of Authorization (CoA) request. HQoS Adjustment will modify the rate of the scheduler defined in the scheduling policy or configured via CoA.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## egress-rate-modify

### Syntax

**egress-rate-modify** **agg-rate-limit**  
**egress-rate-modify** scheduler *scheduler-name*  
**no egress-rate-modify**

### Context

[\[Tree\]](#) (config>subscr-mgmt>mld-policy egress-rate-modify)

### Full Context

configure subscriber-mgmt mld-policy egress-rate-modify

### Description

This command configures the egress rate modification.

The **no** form of this command removes the values from the configuration.

### Parameters

#### **agg-rate-limit**

Specifies that the maximum total rate for all subscriber egress queues for each subscriber associated with the policy.

#### **scheduler-name**

Specifies the scheduler to be applied for egress rate modification.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## egress-rate-modify

### Syntax

**[no] egress-rate-modify**

### Context

[\[Tree\]](#) (config>port>ethernet>access>egress>vport egress-rate-modify)

### Full Context

configure port ethernet access egress vport egress-rate-modify

## Description

This command applies HQoS Adjustment to a Vport. HQoS Adjustment refers to the dynamic adjustment of the rate limit at an QoS enforcement point within a Nokia router when the multicast traffic stream is disjointed from the unicast traffic stream. This QoS enforcement point within the router represents the physical point further down in the access part of the network where the two streams join each other and potentially can cause congestion.

An example would be a PON port which is shared amongst subscriber's multicast traffic (single copy of each channel) and subscriber's unicast traffic. The bandwidth control point for this PON port resides in the upstream Nokia BNG node in the form of a Vport. In the case where the multicast delivery method of the BNG utilizes redirection, the multicast traffic in the BNG will flow outside of the subscriber or the Vport context and thus will bypass any bandwidth enforcement in the Nokia router. To correct this, a Vport bandwidth adjustment is necessary in the router that will account for the multicast bandwidth consumption that is bypassing Vport in the router but is present in the PON port whose bandwidth is controlled by Vport.

An estimate of the multicast bandwidth consumption on the PON port can be made at the Vport level based on the IGMP messages sourced from the subscribers behind the PON port. This process is called HQoS Adjustment.

A multicast channel bandwidth is subtracted from or added to the Vport rate limit according to the received IGMP Join/Leave messages and the channel bandwidth definition policy associated with the Vport (indirectly through a group-interface). Since the multicast traffic on the PON port is shared amongst subscribers behind this PON port, only the first IGMP Join or the last IGMP Leave per multicast channel is tracked for the purpose of the Vport bandwidth modification.

The Vport rate that will be affected by this functionality depends on the configuration:

- In case the **agg-rate** within the Vport is configured, its value will be modified based on the IGMP activity associated with the subscriber under this Vport.
- In case the **port-scheduler-policy** within the Vport is referenced, the **max-rate** defined in the corresponding **port-scheduler-policy** will be modified based on the IGMP activity associated with the subscriber under this Vport.

The channel bandwidth definition policy is defined in the **mcac** policy in the **config>router>mcac>policy** context. The policy is applied under the group-interface or in case of redirection under the redirected-interface.

The rates in effect can be displayed with the following two commands:

```
show port 1/1/5 vport name
qos scheduler-hierarchy port port-id vport vport-name
```

The configuration of a scheduler policy under a Vport, which is only applicable to Ethernet interfaces, is mutually exclusive with the configuration of the **egress-rate-modify** parameter.

Context: HQoS Adjustment for Vport is disabled.

## Platforms

## 9.41 egress-scheduler-override

## egress-scheduler-override

### Syntax

**egress-scheduler-override** [create]

**no egress-scheduler-override**

### Context

**[Tree]** (config>port>tdm>ds3 egress-scheduler-override)

**[Tree]** (config>port>tdm>e3 egress-scheduler-override)

**[Tree]** (config>port>sonet-sdh>path egress-scheduler-override)

**[Tree]** (config>port>tdm>e1>channel-group egress-scheduler-override)

**[Tree]** (config>port>ethernet egress-scheduler-override)

**[Tree]** (config>port>tdm>ds1>channel-group egress-scheduler-override)

### Full Context

configure port tdm ds3 egress-scheduler-override

configure port tdm e3 egress-scheduler-override

configure port sonet-sdh path egress-scheduler-override

configure port tdm e1 channel-group egress-scheduler-override

configure port ethernet egress-scheduler-override

configure port tdm ds1 channel-group egress-scheduler-override

### Description

This command applies egress scheduler overrides. When a port scheduler is associated with an egress port, it is possible to override the following parameters:

- The **max-rate** allowed for the scheduler.
- The maximum **rate** for each priority level 8 through 1.
- The CIR associated with each priority level 8 through 1.

See the *7450 ESS, 7750 SR, 7950 XRS, and VSR Quality of Service Guide* for command syntax and usage for the **port-scheduler-policy** command.

The **no** form of this command removes all override parameters from the egress port or channel scheduler context. Once removed, the port scheduler reverts all rate parameters back to the parameters defined on the port-scheduler-policy associated with the port.

### Parameters

**create**

Mandatory while creating an entry.

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

- configure port tdm ds1 channel-group egress-scheduler-override
  - configure port tdm ds3 egress-scheduler-override
  - configure port tdm e1 channel-group egress-scheduler-override
  - configure port tdm e3 egress-scheduler-override
- 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS
- configure port sonet-sdh path egress-scheduler-override
- All
- configure port ethernet egress-scheduler-override

## 9.42 egress-scheduler-policy

### egress-scheduler-policy

#### Syntax

**egress-scheduler-policy** *port-sched-plcy*  
**no egress-scheduler-policy**

#### Context

[\[Tree\]](#) (config>port-policy egress-scheduler-policy)

#### Full Context

configure port-policy egress-scheduler-policy

#### Description

This command references a port scheduler policy that is defined under the **config>qos>port-scheduler-policy>** hierarchy. Port schedulers are instantiated on carrier IOMs towards all ISAs that are part of the Ins-group.

The no form of the command removes the port scheduler policy from the configuration.

#### Default

no egress-scheduler-policy

#### Parameters

***port-sched-plcy***

Specifies the egress scheduler policy, up to 32 characters.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## egress-scheduler-policy

### Syntax

**egress-scheduler-policy** *port-scheduler-policy-name*

**no egress-scheduler-policy**

### Context

**[Tree]** (config>port>tdm>e1>channel-group egress-scheduler-policy)

**[Tree]** (config>port>sonet-sdh>path egress-scheduler-policy)

**[Tree]** (config>port>tdm>ds3 egress-scheduler-policy)

**[Tree]** (config>port>tdm>e3 egress-scheduler-policy)

**[Tree]** (config>port>ethernet egress-scheduler-policy)

### Full Context

configure port tdm ds1 channel-group egress-scheduler-policy

configure port tdm e1 channel-group egress-scheduler-policy

configure port sonet-sdh path egress-scheduler-policy

configure port tdm ds3 egress-scheduler-policy

configure port tdm e3 egress-scheduler-policy

configure port ethernet egress-scheduler-policy

### Description

This command enables the provisioning of an existing port-scheduler-policy to a port or channel.

The egress-scheduler-override node allows for the definition of the scheduler overrides for a specific port or channel.

When a port scheduler is active on a port or channel, all queues and intermediate service schedulers on the port are subject to receiving bandwidth from the scheduler. Any policers, queues, or schedulers with port-parent associations are mapped to the appropriate port priority levels based on the port-parent command parameters. Any policers, queues, or schedulers that do not have a port-parent or valid intermediate scheduler parent defined are treated as orphaned and are handled based on the port scheduler policies default or explicit orphan behavior.

The port scheduler maximum rate and priority level rate parameters may be overridden to allow unique values separate from the port-scheduler-policy-name attached to the port or channel. Use the **egress-scheduler-override** command to specify the port or channel specific scheduling parameters.

The **no** form of this command removes a port scheduler policy from an egress port or channel. Once the scheduler policy is removed, all orphaned policers, queues, and schedulers revert to a free running state governed only by the local queue or scheduler parameters. This includes any queues or schedulers with a port-parent association.

### Parameters

*port-scheduler-policy-name*

Specifies an existing port-scheduler-policy configured in the **config>qos** context. The name can be up to 32 characters.

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

[\[Tree\]](#) (config>router>mpls>lsp-template egress-statistics)

## Full Context

configure router mpls lsp egress-statistics

configure router mpls lsp-template egress-statistics

## Description

This command configures statistics in the egress data path of an originating LSP at a head-end node. The user must execute the no shutdown for this command to effectively enable statistics.

### Note:

SR-TE LSP egress statistics are not supported on VSR.

The same set of counters is updated for packets forwarded over any path of the RSVP-TE LSP and over the lifetime of the LSP. In steady state, the counters are updated for packets forwarded over the active path of the LSP. The active path can be the primary path, one of the secondary paths, the FRR detour path, or the FRR bypass path when the head-end node is also the PLR.

For SR-TE LSPs, egress statistics are collected independently for each path (primary, backup standby or not), and are preserved on switchover (except for non-standby).

LSP egress statistics are collected if the head-end node is also the Penultimate-Popping Hop (PHP) node for a single-hop LSP using an implicit null egress label.

RSVP-TE LSP statistics are not collected on a dynamic or a static bypass tunnel itself.

Statistics collection on two labels of the stack is possible. Please refer to **config>system>ip>mpls>label-stack-statistics-count**.

The **no** form of this command disables the statistics in the egress data path and removes the accounting policy association from the LSP.

## Default

no egress-statistics

## 9.46 elevation-mask-angle

### elevation-mask-angle

#### Syntax

**elevation-mask-angle** *degrees*

#### Context

[\[Tree\]](#) (config>port>gnss elevation-mask-angle)

#### Full Context

configure port gnss elevation-mask-angle

#### Description

This command configures the elevation mask angle, which provides a method of filtering satellites used by the system. This command is supported on platforms that have one or more embedded GNSS receivers.

Satellites with low elevation may provide degraded accuracy because of the long signal path through the atmosphere. Signals from satellites below the configured minimum satellite elevation are not used.

#### Note:

Nokia recommends not to configure an elevation mask angle below 10°.

#### Default

10

#### Parameters

*degrees*

Specifies the elevation mask angle in degrees from the horizon.

**Values** 0 to 89

#### Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se, 7750 SR-2se

[\[Tree\]](#) (config>filter>ip-filter embed-filter)

### Full Context

configure filter ipv6-filter embed-filter

configure filter ip-filter embed-filter

## Description

This command embeds a previously defined IPv4, IPv6, or MAC embedded filter policy or Hybrid OpenFlow switch instance into this exclusive, template, or system filter policy at the specified offset value. Rules derived from the BGP FlowSpec can also be embedded into template filter policies only.

The **embed-filter open-flow** *ofs-name* form of this command enables OpenFlow (OF) in GRT either by embedding the specified OpenFlow switch (OFS) instance with **switch-defined-cookie** disabled, or by embedding rules with `sros-cookie:type "grt-cookie"`, value 0, from the specified OFS instance with **switch-defined-cookie** enabled. The embedding filter can only be deployed in GRT context or be unassigned.

The **embed-filter open-flow** *ofs-name system* form of this command enables OF in system filters by embedding rules with `sros-cookie:type "system-cookie"`, value 0, from the specified OFS instance with **switch-defined-cookie** enabled. The embedding filter can only be of scope **system**.

The **embed-filter open-flow** *ofs-name service* {*service-id* | *service-name*} form of this command enables OF in VPRN/VPLS filters by embedding rules with `sros-cookie:type "service-cookie"`, value **service-id**, from the specified OFS instance with **switch-defined-cookie** enabled—per service rules. The embedding filter can only be deployed in the specified VPRN/VPLS service. A single VPLS service can only support OF rules per SAP or per service.

The **embed-filter open-flow** *ofs-name sap* *sap-id* form of this command enables OF in VPLS SAP filters by embedding rules with `sros-cookie:type "service-cookie"`, value *service-id* and flow match conditions specifying the *sap-id* from the specified OFS instance with **switch-defined-cookie** enabled—per SAP OF rules. The embedding filter must be of type exclusive and can only be deployed on the specified SAP in the context of the specified VPLS service. A single VPLS service can only support OF rules per SAP or per service.

The **no embed-filter open-flow** *ofs-name* form of this command removes the OF embedding for the GRT context.

The **embed-filter flowspec** form of this command enables the embedding of rules derived from BGP FlowSpec routes into the filter policy that is being configured. The optional **group** parameter specifies that only FlowSpec routes tagged with an interface-set extended community containing this group ID should be selected for embedding. The optional **router** parameter specifies the routing instance source of the BGP FlowSpec routes; if the parameter is not specified, the routing instance is derived automatically from the context in which the filter policy is applied.

The **no embed-filter flowspec** form of this command removes the FlowSpec filter embedding from this filter policy.

The **no embed-filter** *filter-id* form of this command removes the embedding from this filter policy.

See the description of embedded filter policies in this guide for further operational details.

## Parameters

### *ip-filter-id*

Specifies a previously defined IPv4 policy for embedding in this filter.

### *ipv6-filter-id*

Specifies a previously defined IPv6 policy for embedding in this filter.

### *offset*

Specifies that an embedded filter entry X will have an entry X + offset in the embedding filter.

**Values** 0 to 2097151

**Default** 0

**active**

Specifies that embedded filter entries are to be included in this embedding filter policy and activated on applicable line cards—default if no keyword is specified and omitted from **info** command output (but not **info detail**), or when saving the configuration.

**inactive**

Specifies that no embedded filter policy entries are to be included in this embedding filter policy. The embedding is configured but will not do anything.

**flowspec**

This keyword indicates that rules derived from BGP FlowSpec routes should be embedded into (or removed from, in case of the **no** form) the filter.

**group-id**

Specifies that only FlowSpec routes with an interface-set extended community with this value of *group-id* should be selected for embedding.

**Values** 0 to 16383

**router-instance**

Specifies a router instance.

**vprn-service-name**

Specifies the VPRN service name used for embedding FlowSpec rules.

**open-flow**

Indicates that rules derived from OpenFlow should be embedded into (or removed from, in case of the **no** form) the filter.

**ofs-name**

Specifies the name of the currently configured Hybrid OpenFlow Switch (OFS) instance.

Not including the **system**, **service** or **sap** parameters will specify OF in a GRT instance context by default. This allows embedding of OF rules into filters deployed in GRT instances from OFS with **switch-defined-cookie** disabled, or embedding rules from OFS with **switch-defined-cookie** enabled, when the FlowTable cookie encodes sros-cookie:type "grt-cookie".

**system**

Used for OF control of system filters. Allows embedding of OF rules into system filters from OFS with **switch-defined-cookie** enabled. Only the rules with cookie value encoding "system-cookie" are embedded.

**service-id**

Specifies an existing VPRN or VPLS service ID that the embedding filter can be used for.

**service-name** — Specifies an existing VPRN or VPLS service name that the embedding filter can be used for.

**Values** 1 to 2147483647

**service-name**

Specifies an existing VPRN or VPLS service name up to 64 characters that the embedding filter can be used for.

**sap-id**

Used for OF control of VPLS services when a PortID and VLAN ID match is required. Allows embedding of OF rules with a PortID and VLAN ID match into exclusive VPLS SAP filters. Only the rules with cookie value encoding the VPLS service, and flow table match encoding the specified SAP, are embedded into the filter. The embedding filter can only be deployed in the context of the specified SAP.

*sap-id* — Specifies an existing SAP that the embedding filter can be used for.

## 9.49 embedded-rp

### embedded-rp

**Syntax**

**embedded-rp**

**Context**

[\[Tree\]](#) (config>service>vprn>pim>rp>ipv6 embedded-rp)

**Full Context**

configure service vprn pim rp ipv6 embedded-rp

**Description**

This command enables context to configure IPv6 embedded RP parameters.

**Platforms**

All

### embedded-rp

**Syntax**

**[no] embedded-rp**

**Context**

[\[Tree\]](#) (config>router>pim>rp>ipv6 embedded-rp)

## Full Context

```
configure router pim rp ipv6 embedded-rp
```

## Description

Commands in this context configure embedded RP parameters.

Embedded RP is required to support IPv6 inter-domain multicast because there is no MSDP equivalent in IPv6.

The detailed protocol specification is defined in RFC 3956, *Embedding the Rendezvous Point (RP) Address in an IPv6 Multicast Address*. This RFC describes a multicast address allocation policy in which the address of the RP is encoded in the IPv6 multicast group address, and specifies a PIM-SM group-to-RP mapping to use the encoding, leveraging, and extending unicast-prefix-based addressing. This mechanism not only provides a simple solution for IPv6 inter-domain ASM but can be used as a simple solution for IPv6 intra-domain ASM with scoped multicast addresses as well. It can also be used as an automatic RP discovery mechanism in those deployment scenarios that would have previously used the Bootstrap Router protocol (BSR).

The **no** form of this command disables embedded RP.

configure service vpls sap dhcp proxy-server emulated-server
configure service ies subscriber-interface group-interface dhcp proxy-server emulated-server

```

## Description

This command configures the IP address which is used as the DHCP server address in the context of the SAP. Typically, the configured address should be in the context of the subnet represented by the service.

The **no** form of this command reverts to the default setting. The local proxy server will not become operational without the emulated-server address being specified.

The **no** form of this command reverts to the default.

## Parameters

### *ip-address*

Specifies the emulated server's IP address. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vpls sap dhcp proxy-server emulated-server

## 9.51 enable

enable

## Syntax

[no] enable

## Context

[\[Tree\]](#) (config>app-assure>group>ip-id-asst>pos-app-id enable)

## Full Context

configure application-assurance group ip-identification-assist positive-app-id enable

## Description

This command configures the router to use the positive application identification mechanism. This mechanism causes the router to add the IP addresses of the global applications learned through AA analysis into the IP identification assist cache. The router uses the harvested IP addresses to build its internal application-IP database.

The **no** form of this command configures the router to use only DNS to harvest IP addresses.

## Default

enable

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 9.52 enable-admin

### enable-admin

## Syntax

**enable-admin**

## Context

[\[Tree\]](#) (enable-admin)

## Full Context

enable-admin

## Description

See the description for the **admin-password** command. If the **admin-password** is configured in the **config>system>security>password** context, then any user can enter a special administrative mode by entering the **enable-admin** command.

**enable-admin** is in the default profile. By default, all users are given access to this command.

Once the **enable-admin** command is entered, the user is prompted for a password. If the password matches, the user is given unrestricted access to all the commands.

The minimum length of the password is determined by the **minimum-length** command. The complexity requirements for the password are determined by the **complexity** command.

The following shows a password configuration example:

```
A:ALA-1>config>system>security# info

...
 password
 aging 365
 minimum-length 8
 attempts 5 time 5 lockout 20
 admin-password "rUYUz9XMo6I" hash
 exit
...

A:ALA-1>config>system>security#
```

There are two ways to verify that a user is in the enable-admin mode:

- show users — administrator can know which users are in this mode
- Enter the **enable-admin** command again at the root prompt and an error message will be returned.

```
*A:node-1# show users
=====
User Type Login time Idle time
 Session ID From
=====

## 9.53 enable-admin-control

### enable-admin-control

#### Syntax

**enable-admin-control**

#### Context

[\[Tree\]](#) (config>system>security>password enable-admin-control)

### Full Context

configure system security password enable-admin-control

### Description

Enable the user to become a system administrator.

**Note:**

This command applies to users on RADIUS, TACACS, and LDAP.

### Platforms

All

## 9.54 enable-asm-mdt

```
enable-asm-mdt
```

### Syntax

[no] enable-asm-mdt

### Context

[\[Tree\]](#) (config>service>vprn>mvpn>pt>selective enable-asm-mdt)

### Full Context

configure service vprn mvpn provider-tunnel selective enable-asm-mdt

### Description

This command enables Data MDT with PIM-ASM mode on the receiver PE node. PIM-ASM or PIM-SSM operation mode is derived based on the locally configured SSM range on the node.

If asm-mode is disabled using this command, then PIM-SSM mode is enabled for all groups, independent of the configured SSM range on the node.

### Platforms

All

## 9.55 enable-bfd-leaf

## enable-bfd-leaf

### Syntax

[no] enable-bfd-leaf

### Context

[\[Tree\]](#) (config>service>vprn>mvpn>pt>inclusive>rsvp enable-bfd-leaf)

### Full Context

configure service vprn mvpn provider-tunnel inclusive rsvp enable-bfd-leaf

### Description

This command enables unidirectional multi-point BFD session on a receiver (leaf) PE node for upstream fast failure detection over RSVP-TE P2MP LSP.

### Platforms

All

## enable-bfd-leaf

### Syntax

[no] enable-bfd-leaf

### Context

[\[Tree\]](#) (configure>service>vprn>mvpn>provider-tunnel>inclusive>p2mp-sr enable-bfd-leaf)

### Full Context

configure service vprn mvpn provider-tunnel inclusive p2mp-sr enable-bfd-leaf

### Description

This command enables unidirectional multipoint BFD sessions on a receiver (leaf) PE node for upstream fast failure detection over P2MP SR tree LSP.

The **no** form of this command disables unidirectional multipoint BFD sessions.

### Default

no enable-bfd-leaf

### Platforms

All

## 9.56 enable-bfd-root

```
enable-bfd-root
```

### Syntax

```
enable-bfd-root transmit-interval [multiplier multiplier]
```

```
no enable-bfd-root
```

### Context

[\[Tree\]](#) (config>service>vprn>mvpn>pt>inclusive>rsvp enable-bfd-root)

### Full Context

```
configure service vprn mvpn provider-tunnel inclusive rsvp enable-bfd-root
```

### Description

This command enables unidirectional multi-point BFD session on a sender (Root) PE node for upstream fast failure detection over RSVP-TE P2MP LSP.

### Parameters

#### *transmit-interval*

Sets the transmit interval, in milliseconds.

**Values** 10 to 100000

**Default** 100

#### *multiplier*

Sets the multiplier for the BFD session.

**Values** 3 to 20

**Default** 3

### Platforms

All

```
enable-bfd-root
```

### Syntax

```
enable-bfd-root transmit-interval [multiplier multiplier]
```

```
no enable-bfd-root
```

## Context

**[Tree]** (configure>service>vpn>mvpn>pt>inclusive>p2mp-sr enable-bfd-root)

## Full Context

configure service vpn mvpn provider-tunnel inclusive p2mp-sr enable-bfd-root

## Description

This command enables a unidirectional multi-point BFD session on a sender (Root) PE node for upstream fast failure detection over P2MP SR tree LSP. The node uses the multiplier and the transmit interval parameters to calculate the detection time, which is the period of time without receiving BFD packets after which the session failure is determined.

## Default

no enable-bfd-root

## Parameters

### *transmit-interval*

Sets the transmit interval, in milliseconds.

**Values** 10 to 100000

**Default** 300

### *multiplier*

Sets the multiplier for the transmit interval of the BFD session.

**Values** 3 to 20

**Default** 3

enable-bgp-vpn-backup

## Syntax

enable-bgp-vpn-backup [ipv4] [ ipv6]

no enable-bgp-vpn-backup

## Context

**[Tree]** (config>service>vpn enable-bgp-vpn-backup)

## Full Context

```
configure service vprn enable-bgp-vpn-backup
```

## Description

This command allows BGP-VPN routes imported into the VPRN to be used as backup paths for IPv4 or IPv6 BGP-learned prefixes.

## Parameters

### ipv4

Allows BGP-VPN routes to be used as backup paths for IPv4 prefixes.

### ipv6

Allows BGP-VPN routes to be used as backup paths for IPv6 prefixes.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 9.58 enable-console-access

```
enable-console-access
```

## Syntax

```
[no] enable-console-access
```

## Context

[\[Tree\]](#) (config>system>satellite>eth-sat enable-console-access)

## Full Context

```
configure system satellite eth-sat enable-console-access
```

## Description

This command enables access to a satellite console interface for additional debugging purposes.

When configured through the 7750 SR, 7450 ESS, and 7950 XRS host CLI, the 7210 SAS console port is enabled to perform the debug function. Console commands are limited to specific show commands and no configuration or operational changes can be made using the 7210 console.

The **no** form of this command disables satellite console interface access.

## Default

```
no enable-console-access
```

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 9.59 enable-dscp-prec-remarking

```
enable-dscp-prec-remarking
```

### Syntax

```
[no] enable-dscp-prec-remarking
```

### Context

[\[Tree\]](#) (config>qos>sap-egress>policer enable-dscp-prec-remarking)

### Full Context

```
configure qos sap-egress policer enable-dscp-prec-remarking
```

### Description

This command enables DSCP/precedence remarking based on the profile state of a packet being forwarded by a SAP or subscriber egress policer. The DSCP/precedence can be remarked to a value independent of, or separately based on, the packet's profile, if the packet has an exceed, in-profile, or out-of-profile state.

### Default

```
no enable-dscp-prec-remarking
```

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## 9.60 enable-dynamic-services-config

```
enable-dynamic-services-config
```

### Syntax

```
[no] enable-dynamic-services-config
```

### Context

[\[Tree\]](#) (enable-dynamic-services-config)

### Full Context

```
enable-dynamic-services-config
```

## Description

**Note:**

See also the description for the **dynsvc-password** command.

If the **dynsvc-password** is configured in the **config>system>security>password** context, then any user can enter a special dynamic services configuration mode by entering the **enable-dynamic-services-config** command.

The **enable-dynamic-services-config** command is not in the default profile. To give access to this command, the user must belong to the administrative profile or a new profile should be created.

Once the **enable-dynamic-services-config** command is entered, the user is prompted for a password. If the password matches, the user is given access to the dynamic services configuration. Access to static configuration is in this case prohibited.

To verify that a user is in the **enable-dynamic-services-config** mode, use the **show users** command. Users in the **enable-dynamic-services-config** mode lists the letter "D" next to the user's CLI session.

The **no** form of this command disables the dynamic services configuration mode for this user.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 9.61 enable-exceed-pir

### enable-exceed-pir

#### Syntax

[no] enable-exceed-pir

#### Context

[\[Tree\]](#) (config>qos>sap-egress>policer enable-exceed-pir)

#### Full Context

configure qos sap-egress policer enable-exceed-pir

#### Description

This command enables the forwarding of packets with an exceed-profile state and traffic exceeding the PIR for a SAP egress or a network egress queue group (configured in the egress queue group template) policer. This traffic is forwarded as exceed-profile instead of being dropped. This parameter is not supported when **policers-hqos-manageable** is configured in the SAP egress QoS policy.

#### Default

no enable-exceed-pir

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## enable-exceed-pir

### Syntax

[no] enable-exceed-pir

[\[Tree\]](#) (cfg>qos>qgrps>egr>qgrp>policer enable-exceed-pir)

### Full Context

configure qos queue-group-templates egress queue-group policer enable-exceed-pir

### Description

This command enables the forwarding of traffic exceeding the PIR for a SAP egress or a network egress queue group (configured in the egress queue group template) policer. This traffic is forwarded as exceed-profile instead of being dropped.

### Default

no enable-exceed-pir

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## 9.62 enable-fc-collection

## enable-fc-collection

### Syntax

[no] enable-fc-collection

### Context

[\[Tree\]](#) (config>oam-pm>session>ethernet>lmm enable-fc-collection)

### Full Context

configure oam-pm session ethernet lmm enable-fc-collection

### Description

This command enables the ETH-LMM test within the OAM-PM session to collect per-FC counters. This command must be used in combination with the **collect-lmm-fc-stats** command for the entity over which

the source MEP is defined. The **config>oam-pm>session>ethernet>priority** value must match the numerical value that represents the FC name (7 = NC, 6 = H1, 5 = EF, 4 = H2, 3 = L1, 2 = AF, 1 = L2, 0 = BE).

The OAM-PM infrastructure does not validate that the proper counting mode has been configured on the entity that is linked to the source MEP, and does not validate that the FC and priority have been configured. The **show>eth-cfm>collect-lmm-fc-stats** command may be used to display the entities and the FCs on those entities that have established individual FC counters.

Sessions that launch from the same source MEP must use the same counting model; either **collect-lmm-fc-stats** for individual counters for the defined FCs, or **collect-lmm-stats** for a single all-encompassing counter.

Individual OAM-PM sessions must be configured if multiple Ethernet LMM tests are required for different FCs. Cross-session validation occurs to ensure that a source MEP does not include multiple tests that are using the same priority.

The **no** form of this command removes all previously defined FCs and stops counting for those FCs.

## Platforms

All

## 9.63 enable-graceful-shutdown

### enable-graceful-shutdown

## 9.64 enable-grt

```
enable-grt
```

### Syntax

```
[no] enable-grt
```

### Context

```
[Tree] (config>service>vprn>grt-lookup enable-grt)
```

### Full Context

```
configure service vprn grt-lookup enable-grt
```

### Description

This command enables the functions required for looking up routes in the Global Route Table (GRT) when the lookup in the local VRF fails. If this command is enabled without the use of a **static-route** option (as subcommand to this parent), a lookup in the local VRF is preferred over the GRT. When the local VRF returns no route table lookup matches, the result from the GRT is preferred.

The **no** form of this command disables the lookup in the GRT when the lookup in the local VRF fails.

### Default

```
no enable-grt
```

### Platforms

```
All
```

## 9.65 enable-icmp-vse

**no enable-origin-validation**

### Context

**[Tree]** (config>service>vprn>bgp>group>neighbor enable-origin-validation)

**[Tree]** (config>service>vprn>bgp>group enable-origin-validation)

### Full Context

configure service vprn bgp group neighbor enable-origin-validation

configure service vprn bgp group enable-origin-validation

## Description

When this command is added to the configuration of a group or neighbor, it causes every inbound IPv4, IPv6, and label-IPv4 route from that peer to be marked with one of the following origin validation states:

- Valid (0)
- Not-Found (1)
- Invalid (2)

By default (when no family parameter is present in the command) or when all the family options are specified, all unicast IPv4 (AFI1/SAFI1), label-IPv4 (AFI1/SAFI4), and unicast IPv6 (AFI2/SAFI1) routes are evaluated to determine their origin validation states. When only a subset of the family options are present, then only the corresponding address family routes are evaluated.

This command applies to all types of VPRN BGP peers, generally, it should only be applied to EBGP peers and groups that contain only EBGP peers.

The **no** form of this command disables the inspection of received routes from the peer to determine origin validation state.

## Default

no enable-origin-validation

## Parameters

### ipv4

Enables origin validation processing for unlabeled unicast IPv4 routes.

### ipv6

Enables origin validation processing for unlabeled unicast IPv6 routes.

### label-ipv4

Enables origin validation processing for labeled IPv4 routes.

## Platforms

All

## enable-origin-validation

## Syntax

**enable-origin-validation** [ipv4] [ipv6] [ label-ipv4] [label-ipv6]

**no enable-origin-validation**

## Context

**[Tree]** (config>router>bgp>group enable-origin-validation)

**[Tree]** (config>router>bgp>group>neighbor enable-origin-validation)

## Full Context

configure router bgp group enable-origin-validation

```
configure router bgp group neighbor enable-origin-validation
```

### Description

When the **enable-origin-validation** command is added to the configuration of a group or neighbor, it causes every inbound IPv4 or IPv6 route from that peer to be marked with one of the following origin validation states:

- Valid (0)
- Not-Found (1)
- Invalid (2)

By default (when neither the `ipv4` or `ipv6` option is present in the command) or when both the `ipv4` and `ipv6` options are specified, all unicast IPv4 (AFI1/SAFI1), label-IPv4 (AFI1/SAFI4), unicast IPv6 (AFI2/SAFI1), and label-IPv6 (AFI2/SAFI4) routes are evaluated to determine their origin validation states. When only the `ipv4` or `ipv6` option is present, only the corresponding address family routes (unlabeled and labeled) are evaluated.

The **enable-origin-validation** command applies to all types of BGP peers, but as a general rule, it should only be applied to EBGP peers and groups that contain only EBGP peers.

### Default

```
no enable-origin-validation
```

### Parameters

#### **ipv4**

Enables origin validation processing for unlabeled unicast IPv4 routes.

#### **ipv6**

Enables origin validation processing for unlabeled unicast IPv6 routes.

#### **label-ipv4**

Enables origin validation processing for labeled IPv4 routes.

#### **label-ipv6**

Enables origin validation processing for labeled IPv6 routes.

configure service vprn bgp group enable-peer-tracking

## Description

This command enables BGP peer tracking.

## Default

no enable-peer-tracking

## Platforms

All

## enable-peer-tracking

## Syntax

**[no] enable-peer-tracking**

## Context

**[Tree]** (config>router>bgp enable-peer-tracking)

**[Tree]** (config>router>bgp>group enable-peer-tracking)

**[Tree]** (config>router>bgp>group>neighbor enable-peer-tracking)

## Full Context

configure router bgp enable-peer-tracking

configure router bgp group enable-peer-tracking

configure router bgp group neighbor enable-peer-tracking

## Description

This command enables BGP peer tracking. BGP peer tracking allows a BGP peer to be dropped immediately if the route used to resolve the BGP peer address is removed from the IP routing table and there is no alternative available. The BGP peer will not wait for the holdtimer to expire; therefore, the BGP re-convergence process is accelerated.

The **no** form of this command disables peer tracking.

**Default**

no enable-peer-tracking

All

## 9.73 enable-rr-vpn-forwarding

### enable-rr-vpn-forwarding

**Syntax**

[no] enable-rr-vpn-forwarding

**Context**

[\[Tree\]](#) (config>router>bgp enable-rr-vpn-forwarding)

**Full Context**

configure router bgp enable-rr-vpn-forwarding

**Description**

When this command is configured all received VPN-IP routes, regardless of route target, are imported into the dummy VRF, where the BGP next-hops are resolved. The **label-route-transport-tunnel** under **config>router>bgp>next-hop-resolution** determines what types of tunnels are eligible to resolve the next-hops. If a received VPN-IP route from IBGP peer X is resolved and selected as best so that it can be re-advertised to an IBGP peer Y, and the BGP next-hop is modified towards peer Y (by using the next-hop-self command in Y's group or neighbor context or by using a next-hop action in an export policy applied to Y) then BGP allocates a new VPRN service label value for the route, signals that new label value to Y and programs the IOM to do the corresponding label swap operation. The supported combinations of X and Y are outlined below:

- from X (client) to Y (client)
- from X (client) to Y (non-client)
- from X (non-client) to Y (client)

The **no** form of this command causes the re-advertisement of a VPN-IP route between one IBGP peer and another IBGP peer does not cause a new VPRN service label value to be signaled and programmed even if the BGP next-hop is changed through group/neighbor configuration or policy.

Nokia recommends leaving this command disabled for scaling and convergence reasons.

**Default**

no enable-rr-vpn-forwarding

## 9.74 enable-subconfed-vpn-forwarding

### enable-subconfed-vpn-forwarding

#### Syntax

[no] enable-subconfed-vpn-forwarding

#### Context

[\[Tree\]](#) (config>router>bgp enable-subconfed-vpn-forwarding)

#### Full Context

configure router bgp enable-subconfed-vpn-forwarding

#### Description

This command configures BGP to keep VPN-IPv4 and VPN-IPv6 routes within a subconfederation and allow a **next-hop-self** command to create label swap forwarding entries.

When this is enabled, the base router BGP instance retains all received VPN-IPv4 and VPN-IPv6 routes, even those with route targets not matching any VRF import policy of any locally configured VPRN. In addition, when this leaf is enabled and base router BGP is configured to apply a **next-hop-self** command to a peer of any type (EBGP, IBGP, or confed-EBGP), the VPN-IPv4 and VPN-IPv6 routes are advertised to the peer with a new BGP label and next-hop, and a label-swap forwarding entry is programmed. The preceding behaviors are applied when the **enable-inter-as-vpn** or the **enable-rr-vpn-forwarding** commands, both under the **configure router bgp** context, are also enabled in the same BGP instance and regardless of whether the base router has a confederation configuration.

The **no** form of this command disables subconfederation VPN forwarding.

## 9.78 encap-defined-qos

encap-defined-qos

### Syntax

encap-defined-qos

### Context

[\[Tree\]](#) (config>service>vpls>sap>egress encap-defined-qos)

### Full Context

configure service vpls sap egress encap-defined-qos

### Description

This command creates a new QoS sub-context in B-VPLS SAP egress context. The user can define encapsulation groups, referred to as encap-group, based on the ISID value in the packet's encapsulation and assign a QoS policy and a scheduler policy or aggregate rate limit to the group.

## Platforms

All

## 9.79 encap-group

### encap-group

#### Syntax

```
encap-group group-name [type group-type] [qos-per-member] [create]
no encap-group group-name
```

#### Context

[\[Tree\]](#) (config>service>vpls>sap>egress>encap-defined-qos encap-group)

#### Full Context

```
configure service vpls sap egress encap-defined-qos encap-group
```

#### Description

This command defines an encapsulation group which consists of a group of ISID values. All packets forwarded on the egress of a B-VPLS SAP which payload header matches one of the ISID value in the encap-group will use the same QoS policy instance and scheduler policy or aggregate rate limit instance.

The user adds or removes members to the encap-group one at a time or as a range of contiguous values using the member command. However, when the qos-per-member option is enabled, members must be added or removed one at a time. These members are also referred to as ISID contexts.

The user can configure one or more encap-groups in the egress context of the same B-SAP, therefore defining different ISID values and applying each a different SAP egress QoS policy, and optionally a different scheduler policy/**agg-rate**. ISID values are unique within the context of a B-SAP. The same ISID value cannot be re-used in another encap-group under the same B-SAP but can be re-used in an encap-group under a different B-SAP. Finally, if the user adds to an encap-group an ISID value which is already a member of this encap-group, the command causes no effect. The same if the user attempts to remove an ISID value which is not a member of this encap-group.

Once a group is created, the user will assign a SAP egress QoS policy, and optionally a scheduler policy or aggregate rate limit, using the following commands:

```
config>service>vpls>sap>egress>encap-defined-qos>encap-group>qos sap-egress-policy-id
```

```
config>service>vpls>sap>egress>encap-defined-qos>encap-group>scheduler-policy scheduler-policy-name
```

```
config>service>vpls>sap>egress>encap-defined-qos>encap-group>agg-rate kilobits-per-second
```

A SAP egress QoS policy must first be assigned to the created encap group before the user can add members to this group. Conversely, the user cannot perform the **no qos** command until all members are deleted from the encap-group.

An explicit or the default SAP egress QoS policy continues to be applied to the entire B-SAP but this will serve to create the set of egress queues which are used to store and forward a packet which does not match any of the defined ISID values in any of the encap-groups for this SAP.

Only the queue definition and fc-to-queue mapping from the encap-group SAP egress QoS policy is applied to the ISID members. All other parameters configurable in a SAP egress QoS policy must be inherited from egress QoS policy applied to the B-SAP.

Furthermore, any other CLI option configured in the egress context of the B-SAP continues to apply to packets matching a member of any encap-group defined in this B-SAP.

The keyword **qos-per-member** allows the user to specify that a separate queue set instance and scheduler/**agg-rate** instance will be created for each ISID value in the encap-group. By default, shared instances will be created for the entire encap-group.

When the B-SAP is configured on a LAG port, the ISID queue instances defined by all the encap-groups applied to the egress context of the SAP will be replicated on each member link of the LAG. The set of scheduler/**agg-rate** instances will be replicated per link or per IOM or XMA depending if the adapt-qos option is set to link/port-fair mode or distribute mode. This is the same behavior as that applied to the entire B-SAP in the current implementation.

The **no** form of this command deletes the encap-group.

## Parameters

### **group-name**

Specifies the name of the encap-group and can be up to 32 ASCII characters in length

### **type**

Specifies the type of the encapsulation ID used by this encap-group

**Values** isid

### **qos-per-member**

Specifies that a separate queue set instance and scheduler/**agg-rate** instance will be created for each ISID value in the encap-group

## 9.80 encap-match

### encap-match

#### Syntax

**encap-match** {**all-encap** | **double-tag** *encap-value* | **single-tag** *encap-value* | **untagged**}

**no encap-match**

## Context

[\[Tree\]](#) (config>port>ethernet>dot1x>macsec>sub-port encap-match)

## Full Context

configure port ethernet dot1x macsec sub-port encap-match

## Description

This command defines the sub-set of traffic on this port affected by this MACsec sub-port.

In order to establish an end-to-end communication between the remote MACsec peers encrypting VLAN-tagged traffic, the MKA packets have to be able to travel over the network following the same path as the encrypted traffic. MKA packets are generated with specific tags depending on the traffic match criteria configured, as shown in [Table 39: MKA Packet Generation](#).

The **no** form of this command removes all traffic sub-set definitions from the MACsec sub-port.

*Table 39: MKA Packet Generation*

## Default

encap-match all-encap

## Parameters

### all-encap

Specifies that all traffic patterns are matched including untagged, single-tag or double-tag, and all will be encrypted.

### untagged

Specifies that only untagged traffic are matched and encrypted.

### single-tag

Specifies that only dot1q traffic are matched. Either all single tag traffic can be matched, by using \*, or a specific dot1q tag can be matched.

### double-tag

Specifies that only qinq traffic are matched. The service tag can be specifically matched or a wild card match (\*.\*) can be used.

### encap-value

Specifies the type and value of the packet encapsulation to match for this MACsec sub-port.

| Type      | Parameter                           |

## 9.81 encap-offset

### encap-offset

#### Syntax

**encap-offset** [*type type*]

**no encap-offset**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>sub-profile>egress encap-offset)

#### Full Context

configure subscriber-mgmt sub-profile egress encap-offset

#### Description

This command enables the adjustment of the queue and subscriber aggregate rate based on the last mile Ethernet or ATM encapsulation.

The data path computes the adjusted frame size real-time for each serviced packet from a queue by adding the actual packet size to the fixed offset provided by CPM for this queue and variable AAL5 padding.

When this command is enabled, the fixed packet offset is derived from the encapsulation type value signaled in the Access-loop-encapsulation sub-TLV in the Vendor-Specific PPPoE Tags or DHCP Relay Options as per RFC 4679. If the user specifies an encapsulation type with the command, this value is used as the default value for all hosts of this subscriber until a host session signaled a valid value. The signaled value is applied to this host only and the remaining hosts of this subscriber continue to use the user entered default type value if configured, or no offset is applied. However, hosts of the same subscriber using the same SLA profile and which are on the same SAP will share the same instance of FC queues. In this case, the last valid encapsulation value signaled by a host of that same instance of the SAP egress QoS policy will override any previous signaled or configured value.

If the user manually applied a constant byte offset to each packet serviced by the queue by configuring the packet-byte-offset, it will have no effect on the net offset computed for the packet. This net offset is stored in the subscriber host table.

The procedures for handling signaling changes or configuration changes affecting the subscriber profile are as follows:

The avg-frame-size parameter in the subscriber profile is ignored.

If the user specifies an encapsulation type with the command, this value is used as the default value for all hosts of this subscriber until a host session signaled a valid value. The signaled value is applied to this host and other hosts of the same subscriber sharing the same SLA profile and which are on the same SAP. The remaining hosts of this subscriber continue to use the user entered default type value if configured, or no offset is applied.

If the user enables/disables the `encap-offset` option, or changes the parameter value of the `encap-offset` option, CPM immediately triggers a re-evaluation of subscribers hosts using the corresponding subscriber profile and an update the IOM with the new fixed offset value.

If a subscriber has a static host or an ARP host, the subscriber host continues to use the user-configured default encapsulation type value or the last valid encapsulation value signaled in the PPPoE tags or DHCP relay options by other hosts of the same subscriber which use the same SLA profile instance. If none was signaled or configured, then no rate adjustment is applied.

When the `encap-offset` option is configured in the subscriber profile, the subscriber host queue rates, that is, CLI and operational PIR and CIR as well as queue bucket updates, the queue statistics, that is, forwarded, dropped, and HCoS offered counters use the last-mile frame-over-the-wire format. The scheduler policy CLI and operational rates also use LM-FoW format. The port scheduler max-rate and the priority level rates and weights, if a Weighted Scheduler Group is used, are always entered in CLI and interpreted as local port frame-over-the-wire rates. The same is true for an `agg-rate-limit` applied to a Vport. Finally the subscriber `agg-rate-limit` is entered in CLI as last-mile frame-over-the-wire rate. The system maintains a running average frame expansion ratio for each queue to convert queue rates between these two formats.

The **no** form of this command reverts to the default.

## Parameters

### *type*

The name of the default encapsulation used for all host queues of a subscriber in the absence of a valid value signaled in the PPPoE tags.

**Values** pppoa-llc, pppoa-null, pppoeoa-llc, pppoeoa-llc-fcs, pppoeoa-llc-tagged, pppoeoa-llc-tagged-fcs, pppoeoa-null, pppoeoa-null-fcs, pppoeoa-null-tagged, pppoeoa-null-tagged-fcs, ipoa-llc, ipoa-null, ipoeoa-llc, ipoeoa-llc-fcs, ipoeoa-llc-tagged, ipoeoa-llc-tagged-fcs, ipoeoa-null, ipoeoa-null-fcs, ipoeoa-null-tagged, ipoeoa-null-tagged-fcs, pppoe, pppoe-tagged, ipoe, ipoe-tagged

## encap-offset

## Syntax

**encap-offset** [*type* *encap-type*]

**no encap-offset**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp>host>access-loop-encapsulation encap-offset)

**Full Context**

configure subscriber-mgmt local-user-db ppp host access-loop-encapsulation encap-offset

**Description**

This command is applicable within the LAC/LNS context. It provides the last mile link encapsulation information that is needed for proper (shaping) rate calculations and interleaving delay in the last mile.

The encapsulation value will be taken from the following sources in the order of priority:

- Statically provisioned value in local user database (LUDB).
- RADIUS
- PPPoE tags on LAC or ICRQ message (RFC 5515) on LNS

In case that the encapsulation information is not provided by any of the existing means (LUDB, RADIUS, AVP signaling, PPPoE Tags), then by default pppoea-null encapsulation will be in effect.

The following values are supported encapsulation values on LNS in the 7750 SR.

encap-type:

|                  |                                                                    |
|------------------|--------------------------------------------------------------------|
| pppoa-llc        | LLC (NLPID) PPPoA encapsulation.                                   |
| pppoa-null       | VC-MUX PPPoA encapsulation.                                        |

## 9.82 encap-tag-range

encap-tag-range

### Syntax

**encap-tag-range** **start-tag** *start-tag* **end-tag** *end-tag*

**no encap-tag-range**

### Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident encap-tag-range)

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp>host>host-ident encap-tag-range)

### Full Context

configure subscriber-mgmt local-user-db ipoe host host-identification encap-tag-range

configure subscriber-mgmt local-user-db ppp host host-identification encap-tag-range

### Description

This command specifies a range of encapsulation tags as the host identifications. The encapsulation tag is dot1q or qinq on Ethernet port.

For dot1q, the start/end-tag is single number, range from 0-4094; for QinQ, the start/end-tag format is x.y, x or y could be "\*", which means ignore inner or outer tag.

**Note:**

This command is only used when **encap-tag-range** is configured as one of the **match-list** parameters.

The **no** form of this command removes the encapsulation tag range from the configuration.

**Parameters****start-tag** *start-tag*

Specifies the value of the start label in the range of SAPs allowed on this host.

| Values | <i>start-tag</i> | dot1q | qtag1                             |
|--------|------------------|-------|-----------------------------------|
|        |                  | qinq  | (qtag1.qtag2   qtag1.*   *.qtag2) |

**end-tag** *end-tag*

Specifies the value of the end label in the range of SAPs allowed on this host.

| Values | <i>end-tag</i> | dot1q | qtag1                             |
|--------|----------------|-------|-----------------------------------|
|        |                | qinq  | (qtag1.qtag2   qtag1.*   *.qtag2) |

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 9.83 encap-tag-separate-range

### encap-tag-separate-range

**Syntax**

**encap-tag-separate-range** **outer** *outer-encap-range* **inner** *inner-encap-range*

**no encap-tag-separate-range**

**Context**

**[Tree]** (config>subscr-mgmt>loc-user-db>ppp>host>host-ident encap-tag-separate-range)

**[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident encap-tag-separate-range)

**Full Context**

configure subscriber-mgmt local-user-db ppp host host-identification encap-tag-separate-range

configure subscriber-mgmt local-user-db ipoe host host-identification encap-tag-separate-range

**Description**

This command specifies a range of encapsulation tags as the host identifications.

**Note:**

This command is only used when **encap-tag-separate-range** is configured as one of the **match-list** parameters.

The **no** form of this command removes the range of encapsulation tags from the configuration.

**Default**

no encap-tag-separate-range

**Parameters*****outer-encap-range***

Specifies the value of the outer encapsulation tag range.

**Values**    *start-qtag - end-qtag*  
                   *start-qtag*: 0 to 4094  
                   *end-qtag*: 0 to 4094

***inner-encap-range***

Specifies the value of the inner encapsulation tag range.

**Values**    *start-qtag - end-qtag*  
                   *start-qtag*: 0 to 4094  
                   *end-qtag*: 0 to 4094

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 9.84 encap-type

### encap-type

**Syntax**

**encap-type** {default | null | dot1q | qinq}  
**no encap-type**

**Context**

**[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw>l2-access-points>l2-ap encap-type)

**[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw>l2-access-points>l2-ap encap-type)

**Full Context**

configure service ies subscriber-interface group-interface wlan-gw l2-access-points l2-ap encap-type

configure service vprn subscriber-interface group-interface wlan-gw l2-access-points l2-ap encap-type

## Description

If different from default, this command overrides the value specified by **I2-ap-encap-type** on wlan-gw level. See the description of I2-ap-encap-type for more detail. This value can only be changed while the I2-ap is shut down.

The **no** form of this command sets the default value.

## Default

encap-type default

## Parameters

### default

Specifies to use the value specified by I2-ap-encap-type.

### null

Specifies to use both the SAP and the AP are not VLAN-tagged.

### dot1q

Specifies to use either the AP or the SAP uses one VLAN tag.

### qinq

Up to two VLAN tags are used by the AP or SAP.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## encap-type

## Syntax

**encap-type** {dot1q | null | qinq}

**no encap-type**

## Context

[\[Tree\]](#) (config>port>ethernet encap-type)

## Full Context

configure port ethernet encap-type

## Description

This command configures the encapsulation method used to distinguish customer traffic on an Ethernet access port, or different VLANs on a network port.

The **no** form of this command restores the default.

## Default

encap-type null

## Parameters

### dot1q

Ingress frames carry 802.1Q tags where each tag signifies a different service.

### null

Ingress frames will not use any tags to delineate a service. As a result, only one service can be configured on a port with a null encapsulation type.

### qinq

Specifies QinQ encapsulation.

## Platforms

All

## encap-type

## Syntax

```
encap-type {cem}
```

## Context

[\[Tree\]](#) (config>port>tdm>e3 encap-type)

[\[Tree\]](#) (config>port>tdm>ds1>channel-group encap-type)

[\[Tree\]](#) (config>port>tdm>ds3 encap-type)

[\[Tree\]](#) (config>port>tdm>e1>channel-group encap-type)

## Full Context

```
configure port tdm e3 encap-type
```

```
configure port tdm ds1 channel-group encap-type
```

```
configure port tdm ds3 encap-type
```

```
configure port tdm e1 channel-group encap-type
```

## Description

This command configures the encapsulation method used to on the specified port, path, or channel. This parameter can be set on both access and network ports.

The **no** form of this command restores the default.

## Default

```
encap-type bcp-null
```

## Parameters

### cem

Specifies that on circuit emulation MDAs, only the **cem** encap-type is supported. All other values are blocked with an appropriate warning. The **cem** encap-type is not supported on other MDAs and are blocked with an appropriate warning.

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## encap-type

### Syntax

**encap-type** {dot1q | null | qinq}

**no encap-type**

### Context

[\[Tree\]](#) (config>lag encap-type)

### Full Context

configure lag encap-type

### Description

This command configures the encapsulation method used to distinguish customer traffic on a LAG. The encapsulation type is configurable on a LAG port. The LAG port and the port member encapsulation types must match when adding a port member.

If the encapsulation type of the LAG port is changed, the encapsulation type on all the port members will also change. The encapsulation type can be changed on the LAG port only if there is no interface associated with it. If the MTU is set to a non-default value, it will be reset to the default value when the encap type is changed.

The **no** form of this command restores the default.

### Default

encap-type null — All traffic on the port belongs to a single service or VLAN.

### Parameters

#### dot1q

Ingress frames carry 802.1Q tags where each tag signifies a different service.

#### null

Ingress frames will not use any tags to delineate a service. As a result, only one service can be configured on a port with a null encapsulation type.

#### qinq

Specifies QinQ encapsulation.

### Platforms

All

## encap-type

### Syntax

```
encap-type {dot1q| qinq}
no encap-type
```

### Context

[\[Tree\]](#) (config>eth-tunnel>ethernet encap-type)

### Full Context

```
configure eth-tunnel ethernet encap-type
```

### Description

This command configures the encapsulation method used to distinguish customer traffic on a LAG. The encapsulation type is configurable on a LAG port. The LAG port and the port member encapsulation types must match when adding a port member.

If the encapsulation type of the LAG port is changed, the encapsulation type on all the port members will also change. The encapsulation type can be changed on the LAG port only if there is no interface associated with it. If the MTU is set to a non-default value, it will be reset to the default value when the encap type is changed.

The **no** form of this command reverts to the default.

### Default

```
encap-type dot1q
```

### Parameters

#### dot1q

Specifies that frames carry 802.1Q tags where each tag signifies a different service.

#### qinq

Specifies the qinq encapsulation method.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## encap-type

### Syntax

```
encap-type {dot1q | qinq}
no encap-type
```

## Context

[\[Tree\]](#) (config>pw-port encap-type)

## Full Context

configure pw-port encap-type

## Description

This command configures the encapsulation type on a PW port. Customer Ethernet frames can be single-tagged or double-tagged, and this command determines the number of tags that the SR OS will check (and strip) on PW-SAP ingress and insert on PW-SAP egress.

The **no** form of this command removes the configuration.

## Parameters

### dot1q

Specifies that the encapsulation type is dot1q; used when the customer's Ethernet frame is single-tagged.

### qinq

Specifies that the encapsulation type is qinq; used when the customer's Ethernet frame is double-tagged.

**Default** dot1q

## Platforms

All

## 9.85 encapsulated-ip-mtu

### encapsulated-ip-mtu

## Syntax

**encapsulated-ip-mtu** *bytes*

**no encapsulated-ip-mtu**

## Context

[\[Tree\]](#) (config>ipsec>tnl-temp encapsulated-ip-mtu)

[\[Tree\]](#) (config>service>ies>if>ipsec>ipsec-tunnel encapsulated-ip-mtu)

[\[Tree\]](#) (config>service>vprn>if>ipsec>ipsec-tunnel encapsulated-ip-mtu)

[\[Tree\]](#) (config>service>ies>if>sap>ip-tunnel encapsulated-ip-mtu)

[\[Tree\]](#) (config>service>vprn>if>sap>ipsec-tun encapsulated-ip-mtu)

[\[Tree\]](#) (config>router>if>ipsec>ipsec-tunnel encapsulated-ip-mtu)

[\[Tree\]](#) (config>service>vprn>if>sap>ip-tunnel encapsulated-ip-mtu)

### Full Context

```
configure ipsec tunnel-template encapsulated-ip-mtu
configure service ies interface ipsec ipsec-tunnel encapsulated-ip-mtu
configure service vprn interface ipsec ipsec-tunnel encapsulated-ip-mtu
configure service ies interface sap ip-tunnel encapsulated-ip-mtu
configure service vprn interface sap ipsec-tunnel encapsulated-ip-mtu
configure router interface ipsec ipsec-tunnel encapsulated-ip-mtu
configure service vprn interface sap ip-tunnel encapsulated-ip-mtu
```

### Description

This command specifies the maximum size of encapsulated tunnel packet for the ipsec-tunnel, ip-tunnel, or the dynamic tunnels terminated on the ipsec-gw. If the encapsulated IPv4 or IPv6 tunnel packet exceeds the **encapsulated-ip-mtu**, then the system fragments the packet against the encapsulated-ip-mtu.

The **no** form of this command reverts to the default.

### Default

```
no encapsulated-ip-mtu
```

### Parameters

#### *bytes*

Specifies the maximum size in bytes.

**Values** 512 to 9000

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn interface sap ip-tunnel encapsulated-ip-mtu
- configure service ies interface sap ip-tunnel encapsulated-ip-mtu
- configure service vprn interface sap ipsec-tunnel encapsulated-ip-mtu
- configure ipsec tunnel-template encapsulated-ip-mtu

VSR

- configure service vprn interface ipsec ipsec-tunnel encapsulated-ip-mtu
- configure router interface ipsec ipsec-tunnel encapsulated-ip-mtu
- configure service ies interface ipsec ipsec-tunnel encapsulated-ip-mtu

## encapsulated-ip-mtu

### Syntax

**encapsulated-ip-mtu** *octets*  
**no encapsulated-ip-mtu**

### Context

**[Tree]** (config>service>vprn>sap>ip-tunnel encapsulated-ip-mtu)

### Full Context

configure service vprn sap ip-tunnel encapsulated-ip-mtu

### Description

This command configures the tunnel encapsulated IP MTU.  
The **no** form of this command reverts to the default.

### Parameters

**octets**

Specifies the tunnel encapsulated IP MTU in octets.

## 9.86 encode

## encode

### Syntax

**encode type** *type* **key** *key*  
**encode type** *type* **key** *hash-key* **hash**  
**encode type** *type* **key** *hash2-key* **hash2**  
**encode type** *type* **key** *custom-key* **custom**  
**encode type** *type* **cert-profile** *cert-profile-name*  
**no encode**

### Context

**[Tree]** (config>app-assure>group>http-enrich>field encode)

### Full Context

configure application-assurance group http-enrich field encode

### Description

This command configures the encoding applied to the HTTP header enrichment field.

The **no** form of this command removes the encoding.

### Default

no encode

### Parameters

#### **type**

Specifies whether the parameters are hashed with MD5, encrypted with RC4 or AES using the configured key, or if certificate-based encryption is used with RSA.

**Values** md5, rc4, certificate, cert-base64, rc4md5-base64, aes128, aes256, aes128cbc, aes256cbc

#### **key**

Specifies the key string, 64 characters maximum.

#### **hash-key**

Specifies the first hashed key.

#### **hash-key2**

Specifies the second hashed key.

#### **hash**

Specifies that the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

#### **hash2**

Specifies that the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

#### **custom**

Specifies the custom encryption to management interface.

#### **cert-profile-name**

Specifies the name of the certificate profile to use. This profile must have already been created using the **certificate-profile** command.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 9.87 encoding

## encoding

### Syntax

**encoding** *encoding*

**no encoding**

### Context

**[Tree]** (config>system>telemetry>persistent-subscriptions>subscription encoding)

### Full Context

configure system telemetry persistent-subscriptions subscription encoding

### Description

This command configures the encoding type that is used for telemetry notifications in accordance with the definitions in the gNMI OpenConfig standard.

### Default

encoding json

### Parameters

***encoding***

Specifies the encoding type.

**Values** json, bytes, proto

### Platforms

All

## 9.88 encrypt

## encrypt

### Syntax

**encrypt** {on | off}

### Context

**[Tree]** (bof encrypt)

### Full Context

bof encrypt

**Description**

This command enables and disables encryption of the BOF using AES256 and SHA256.

When the BOF is encrypted on the compact flash, it is still reachable using the BOF interactive menu during node startup, and fields can be modified using the BOF interactive menu.

**Default**

encrypt off

**Parameters**

**on**

Enables BOF encryption

**off**

Disables BOF encryption

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 9.89 encryption-group

### encryption-group

**Syntax**

**encryption-group** *group-name* [**create**]

**no encryption-group** *group-name*

**Context**

[\[Tree\]](#) (config>anysec>tnl-enc encryption-group)

**Full Context**

configure anysec tunnel-encryption encryption-group

**Description**

This command creates an encryption group.

An encryption group is a group of LSPs that use the same CA and preshared keys (PSK). For ease of PSK management, SR OS allows a group of LSPs to use the same CA with same PSKs. The PSK is used to secure the SAK for distribution to other PEERs.

**Note:** Although the LSPs are unidirectional, ANYsec is a bidirectional concept where a pair of LSPs between two peers are encrypted and decrypted. Each pair of LSP uses its own SAK for maximum security, though they may share the same CA and PSK with all other LSPs in the encryption group to secure the SAK.

The **no** form of this command removes the encryption group.

### Parameters

#### ***group-name***

Specifies the encryption group name, up to 32 characters.

#### **create**

Keyword used to create an encryption group.

### Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se

## encryption-group

### Syntax

**encryption-group** *group-name* **peer** *ip-address* **detail**

### Context

[\[Tree\]](#) (debug>anysec encryption-group)

### Full Context

debug anysec encryption-group

### Description

This command debugs ANYsec encryption groups.

### Parameters

#### ***group-name***

Specifies the encryption group name, up to 32 characters.

#### ***ip-address***

Specifies a peer IP address.

|               |                                                                                                                                                                             |

#### **detail**

Keyword used to specify detailed information.

## Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se

## 9.90 encryption-key

### encryption-key

#### Syntax

**encryption-key** *key* [**hash** | **hash2** | **custom**]

**no encryption-key**

#### Context

[[Tree](#)] (bof encryption-key)

#### Full Context

bof encryption-key

#### Description

This command creates a key to be used by AES256 and SHA256 for configuration file encryption and hashing. This key is used for all configuration files (primary, secondary, and tertiary).

After creating or deleting a key, use the **admin save** command to save the configuration file with the current encryption key state.

The **no** form of this command deletes the encryption key.

#### Default

**no encryption-key**

#### Parameters

##### *key*

Specifies the encryption key.

If the **hash**, **hash2**, or **custom** parameter is not configured, the key is entered in plaintext and the key length must be between 8 and 32 characters. A plaintext key cannot contain embedded nulls or end with " hash", " hash2", or " custom".

If the **hash**, **hash2**, or **custom** parameter is configured, the key is hashed and the key length must be between 1 and 64 characters.

##### **hash**

Keyword to specify that the key is entered in an encrypted form.

##### **hash2**

Keyword to specify that the key is entered in a more complex encrypted form. The **hash2** encryption scheme is node-specific and the key cannot be transferred between nodes.

**custom**

Keyword to specify that the key uses custom encryption.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**encryption-key****Syntax**

**encryption-key** *key* [**hash** | **hash2** | **custom**]

**no encryption-key**

**Context**

[\[Tree\]](#) (config>log encryption-key)

**Full Context**

configure log encryption-key

**Description**

This command specifies the encryption key used by AES-256-CTR for log file encryption. The encryption key is used for all local log files on the system.

The **no** form of this command deletes the encryption key.

**Default**

no encryption-key

**Parameters****key**

Specifies the encryption key.

If the **hash**, **hash2**, or **custom** parameter is not configured, the key is entered in plaintext and the key length must be between 8 and 32 characters. A plaintext key cannot contain embedded nulls or end with " hash", " hash2", or " custom".

If the **hash**, **hash2**, or **custom** parameter is configured, the key is hashed and the key length must be between 1 and 64 characters.

**hash**

Keyword to specify that the key is entered in an encrypted form.

**hash2**

Keyword to specify that the key is entered in a more complex encrypted form. The **hash2** encryption scheme is node-specific and the key cannot be transferred between nodes.

**custom**

Keyword to specify that the key uses custom encryption.

## 9.91 encryption-keygroup

### encryption-keygroup

#### Syntax

**encryption-keygroup** *keygroup-id* **direction** *direction*

**no encryption-keygroup** **direction** *direction*

#### Context

**[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw>group-encryption encryption-keygroup)

**[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw>group-encryption encryption-keygroup)

#### Full Context

configure service ies subscriber-interface group-interface wlan-gw group-encryption encryption-keygroup

configure service vprn subscriber-interface group-interface wlan-gw group-encryption encryption-keygroup

#### Description

This command binds an encryption key-group to a WLAN-GW soft-GRE group interface. When configured in the inbound direction, received packets must be encrypted using one of the valid security-associations configured for the key-group. When configured in the outbound direction, L2oMPLSoGRE packets egressing the node use the "active-outbound-sa" associated with the key-group configured.

The **no** form of this command removes the encryption keygroup from the inbound or outbound group interface.

#### Parameters

##### *keygroup-id*

Specifies the ID number or name of the keygroup.

**Values** 1 to 127, *keygroup-name* up to 64 characters

##### *direction*

Applies the keygroup to the inbound or outbound direction of a service.

**Values** inbound | outbound

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## encryption-keygroup

### Syntax

```
encryption-keygroup keygroup-id direction {inbound | outbound}
no encryption-keygroup direction {inbound | outbound}
```

### Context

[\[Tree\]](#) (config>router>if>group-encryption encryption-keygroup)

### Full Context

```
configure router interface group-encryption encryption-keygroup
```

### Description

This command is used to bind a key group to a router interface for inbound or outbound packet processing. When configured in the outbound direction, packets egressing the router use the **active-outbound-sa** associated with the configured key group. When configured in the inbound direction, received packets must be encrypted using one of the valid security associations configured for the key group.

The **no** form of this command removes the key group from the router interface in the specified direction.

### Default

```
no encryption-keygroup direction inbound
no encryption-keygroup direction outbound
```

### Parameters

#### *keygroup-id*

The ID number of the key group being configured.

**Values** 1 to 127, *keygroup-name* (64 characters maximum)

#### **inbound**

Binds the key group in the inbound direction.

#### **outbound**

Binds the key group in the outbound direction.

### Platforms

VSR

## encryption-keygroup

### Syntax

```
encryption-keygroup keygroup-id [create]
no encryption-keygroup keygroup-id
```

## Context

[\[Tree\]](#) (config>grp-encryp encryption-keygroup)

## Full Context

configure group-encryption encryption-keygroup

## Description

This command is used to create a key group. Once the key group is created, use the command to enter the key group context or delete a key group.

The **no** form of the command removes the key group. Before using the **no** form, the key group association must be deleted from all services that are using this key group.

## Parameters

### *keygroup-id*

The number or name of the key group being referenced.

**Values** 1 to 15, or *keygroup-name* (up to 64 characters)

### **create**

Creates a key group.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## encryption-keygroup

## Syntax

**encryption-keygroup** *keygroup-id* **direction** {**inbound** | **outbound**}

**no encryption-keygroup** **direction** {**inbound** | **outbound**}

## Context

[\[Tree\]](#) (config>service>vprn encryption-keygroup)

[\[Tree\]](#) (config>service>pw-template encryption-keygroup)

[\[Tree\]](#) (config>service>sdp encryption-keygroup)

## Full Context

configure service vprn encryption-keygroup

configure service pw-template encryption-keygroup

configure service sdp encryption-keygroup

## Description

This command is used to bind a key group to an SDP, VPRN service, or PW template for inbound or outbound packet processing. When configured in the outbound direction, packets egressing the node

use the **active-outbound-sa** associated with the key group configured. When configured in the inbound direction, received packets must be encrypted using one of the valid security associations configured for the key group. Services using the SDP will be encrypted.

The encryption (enabled or disabled) configured on an SDP used to terminate a Layer 3 spoke SDP of a VPRN always overrides any VPRN-level configuration for encryption.

Encryption is enabled after the outbound direction is configured.

For PW template changes, the following **tools** command must be executed after the configuration changes are made: **tools>perform>service>eval-pw-template>allow-service-impact**. This command applies the changes to services that use the PW template.

The **no** form of the command removes the key group from the SDP or service in the specified direction (inbound or outbound).

## Parameters

### *keygroup-id*

Specifies the number of the key group being configured.

**Values** 1 to 15 or *keygroup-name* (up to 64 characters)

### **direction {inbound | outbound}**

Specifies the direction of the service that the key group will be bound to.

## Platforms

VSR

## 9.92 encryption-label

### encryption-label

## Syntax

**encryption-label** *label*

**no encryption-label**

## Context

**[Tree]** (config>anysec>tnl-enc>enc-grp encryption-label)

## Full Context

configure anysec tunnel-encryption encryption-group encryption-label

## Description

This command creates an encryption group label ID.

The encryption SID uniquely identifies the encrypting node within a network to avoid double encryption scenarios. The encryption SID can be assigned per encryption group. However, all encryption groups can

have the same encryption SID. To save label space, Nokia recommends limiting the number of encryption SIDs within a network. To configure the encryption SID, a **reserved-label-block** command must be configured under the **anysec** context. The encryption SID is programmed at the bottom of the stack with S bit set.

The **no** form of this command removes the encryption group label.

### Parameters

#### *label*

Specifies the encryption group label ID.

**Values** 0 to 1048575

### Platforms

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se

## 9.93 encryption-offset

### encryption-offset

#### Syntax

**encryption-offset** *encryption-offset*

**no encryption-offset**

#### Context

[\[Tree\]](#) (config>macsec>connectivity-association encryption-offset)

#### Full Context

configure macsec connectivity-association encryption-offset

#### Description

This command specifies the offset of the encryption in MACsec packet.

The encryption-offset is distributed by MKA (Key-server) to all parties.

It is signaled via MACsec capabilities. There are four basic settings for this. [Table 40: MACsec Basic Settings](#) breaks down the settings.

*Table 40: MACsec Basic Settings*

| Setting | Description                       |
|---------|-----------------------------------|
| 0       | MACsec is not implemented         |
| 1       | Integrity without confidentiality |

| Setting | Description                                                                                                                                                                                               |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2       | The following are supported: <ul style="list-style-type: none"> <li>• Integrity without confidentiality</li> <li>• Integrity and confidentiality with a confidentiality offset of 0</li> </ul>            |
| 3       | The following are supported: <ul style="list-style-type: none"> <li>• Integrity without confidentiality</li> <li>• Integrity and confidentiality with a confidentiality offset of 0, 30, or 50</li> </ul> |

**Note:**

1. SR OS supports setting (3) Integrity without confidentiality and Integrity and confidentiality with a confidentiality offset of 0, 30, or 50.

The **no** form of this command rejects all arriving traffic whether MACsec is secured or not.

**Default**

encryption-offset 0

**Parameters*****encryption-offset***

Specifies the encryption.

**Values** 0 — encrypt the entire payload  
30 — leave the IPv4 header in clear  
50 — leave the IPv6 header in clear

**Platforms**

All

**9.94 end**

end

**Syntax**

**end** *end-week end-day end-month hours-minutes*

**Context**

[\[Tree\]](#) (config>system>time>dst-zone end)

## Full Context

```
configure system time dst-zone end
```

## Description

This command configures start of summer time settings.

## Default

```
end first sunday january 00:00
```

## Parameters

### *end-week*

Specifies the starting week of the month when the summer time ends.

**Values** first, second, third, fourth, last

**Default** first

### *end-day*

Specifies the starting day of the week when the summer time ends.

**Values** sunday, monday, tuesday, wednesday, thursday, friday, saturday

**Default** sunday

### *end-month*

Specifies the starting month of the year when the summer time takes effect.

**Values** january, february, march, april, may, june, july, august, september, october, november, december

**Default** january

### *hours-minutes*

Specifies the time at which the summer time ends, in hh:mm format.

**Values** hours: 00 to 23  
minutes: 00 to 59

**Default** 00:00

## Platforms

All

```
end
```

## Syntax

```
[no] end function-value
```

## Context

[\[Tree\]](#) (config>router>segment-routing>srv6>inst>loc>func end)

## Full Context

configure router segment-routing segment-routing-v6 base-routing-instance locator function end

## Description

Commands in this context configure the value and attributes of SRv6 End SID function of a locator. The End SID function encodes the basic behavior of a prefix or a node SID.

The End SID function for each SRH mode must be statically allocated. The value is not automatically allocated by default.

The **no** form of this command removes the specified End function.

## Parameters

### *function-value*

Specifies an SRv6 End SID function value. Up to eight values can be configured per locator. Statically allocated functions of all SID types in a locator have their value upper range limited by parameter **locator function-length static-function max-entries**.

**Values** 1 to 1048575

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 9.95 end-dt2m

end-dt2m

## Syntax

**end-dt2m** [*function-value*]

**no end-dt2m**

## Context

[\[Tree\]](#) (config>service>vpls>srv6>locator>function end-dt2m)

## Full Context

configure service vpls segment-routing-v6 locator function end-dt2m

## Description

This command configures the SRv6 End.DT2M behavior and function value that is associated to the SRv6 instance in the service. This means that decapsulation and table lookup for IPv6 prefixes occurs in the VPLS service.

The **no** form of this command removes the function behavior and value from the configuration.

### Default

no end-dt2m

### Parameters

#### *function-value*

Specifies the optional static function value that is associated to the function behavior. Statically allocated functions of all SID types in a locator have their value upper range limited by parameter **locator function-length static-function max-entries**. If not configured, the system allocates a value dynamically. Auto-allocated service function values have an upper range limited by the maximum service function length of 20-bits that is used in the datapath lookup for service functions.

**Values** 1 to 1048575

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 9.96 end-dt2u

### end-dt2u

### Syntax

**end-dt2u** [*function-value*]  
**no end-dt2u**

### Context

[\[Tree\]](#) (config>service>vpls>srv6>locator>function end-dt2u)

### Full Context

configure service vpls segment-routing-v6 locator function end-dt2u

### Description

This command configures the SRv6 End.DT2U behavior and function value that is associated to the SRv6 instance in the service. This means that decapsulation and table lookup for IPv6 prefixes occurs in the VPLS service.

The **no** form of this command removes the function behavior and value from the configuration.

### Default

no end-dt2m

## Parameters

### *function-value*

Specifies the optional static function value that is associated to the function behavior. Statically allocated functions of all SID types in a locator have their value upper range limited by parameter **locator function-length static-function max-entries**. If not configured, the system allocates a value dynamically. Auto-allocated service function values have an upper range limited by the maximum service function length of 20-bits that is used in the datapath lookup for service functions.

**Values** 1 to 1048575

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 9.97 end-dt4

### end-dt4

## Syntax

**end-dt4** [*function-value*]

**no end-dt4**

## Context

[\[Tree\]](#) (config>service>vprn>srv6>locator>function end-dt4)

## Full Context

configure service vprn segment-routing-v6 locator function end-dt4

## Description

This command configures the SRv6 End.DT4 behavior and function value that is associated to the SRv6 instance in the service. This implies decapsulation and table lookup for IPv4 prefixes in the VPRN.

The **no** form of this command removes the function behavior and value from the configuration.

## Default

no end-dt4

## Parameters

### *function-value*

Specifies the optional static function value that is associated to the function behavior. Statically allocated functions of all SID types in a locator have their value upper range limited by parameter **locator function-length static-function max-entries**. If not configured, the system allocates a value dynamically. Auto-allocated service function

values have an upper range limited by the maximum service function length of 20 bits that is used in the datapath lookup for service functions.

**Values** 1 to 1048575

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## end-dt4

### Syntax

**end-dt4** [*function-value*]

**no end-dt4**

### Context

[\[Tree\]](#) (config>router>segment-routing>srv6>inst>loc>func end-dt4)

### Full Context

configure router segment-routing segment-routing-v6 base-routing-instance locator function end-dt4

### Description

This command configures the SRv6 End.DT4 behavior and function value associated with the base routing instance. This implies decapsulation and table lookup for IPv4 prefixes in the base routing table. These prefixes can be static routes or routes advertised in BGP.

The **no** form of this command removes the function behavior and value from the configuration.

### Default

no end-dt4

### Parameters

#### *function-value*

Specifies the SRv6 End.DT4 function value. Statically allocated functions of all SID types in a locator have their value upper range limited by parameter **locator function-length static-function max-entries**. Auto-allocated service function values have an upper range limited by the maximum service function length of 20-bits that is used in the datapath lookup for service functions.

**Values** 1 to 1048575

## Platforms

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 9.100 end-dx2

### end-dx2

## Syntax

**end-dx2** [*function-value*]

**no end-dx2**

## Context

[\[Tree\]](#) (config>service>epipe>srv6>locator>function end-dx2)

## Full Context

configure service epipe segment-routing-v6 locator function end-dx2

## Description

This command configures the SRv6 End.DX2 behavior and function value that is associated with the SRv6 instance in the service, which means that decapsulation and cross-connect to the egress SAP occurs in the Epipe service.

The **no** form of this command removes the function behavior and value from the configuration.

## Default

no end-dx2

## Parameters

### *function-value*

Specifies the optional static function value that is associated with the function behavior. Statically allocated functions of all SID types in a locator have their upper range limited by the **config>router>segment-routing>srv6>loc>static-function max-entries**. If not configured, the system allocates a value dynamically. Auto-allocated service function

values have an upper range limited by the maximum service function length of 20 bits that is used in the datapath lookup for service functions.

**Values** 1 to 1048575

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 9.101 end-marker-count

### end-marker-count

#### Syntax

**end-marker-count** *packets*

**no end-marker-count**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>gtp>peer-profile end-marker-count)

#### Full Context

configure subscriber-mgmt gtp peer-profile end-marker-count

#### Description

This command specifies the number of end marker packets that are sent when it is certain no more packets will be sent over the corresponding GTP-U tunnel, such as after a completed mobility event.

The **no** form of this command reverts the value to the default.

#### Default

end-marker-count 1

#### Parameters

***packets***

Specifies the number of end marker packets to send.

**Values** 0 to 5

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 9.102 end-of-data

### end-of-data

#### Syntax

[no] end-of-data

#### Context

[\[Tree\]](#) (debug>router>rpki-session>packet end-of-data)

#### Full Context

debug router rpki-session packet end-of-data

#### Description

This command enables debugging for end of data RPKI packets.

The **no** form of this command disables debugging for end of data RPKI packets.

#### Platforms

All

## 9.103 end-station-only

### end-station-only

#### Syntax

[no] end-station-only

#### Context

[\[Tree\]](#) (config>service>vpls>mrp>mmrp end-station-only)

#### Full Context

configure service vpls mrp mmrp end-station-only

#### Description

This command configures the end-station-only. This option prevents MMRP messages from being generated or processed. It is useful in case all the MMRP entries for the B-VPLS are static.

#### Platforms

All

## 9.104 end-time

### end-time

#### Syntax

**end-time** [*date* | *day-name*] *time*

**no end-time**

#### Context

**[Tree]** (config>system>cron>sched end-time)

#### Full Context

configure system cron schedule end-time

#### Description

This command is used concurrently with type **periodic** or **calendar**. Using the type of **periodic**, end-time determines at which interval the schedule will end. Using the type of **calendar**, end-time determines on which date the schedule will end.

When **no end-time** is specified, the schedule runs forever.

#### Default

no end-time

#### Parameters

##### *date*

Specifies the date to schedule a command.

**Values** YYYY:MM:DD in year:month:day number format

##### *day-name*

Specifies the day of the week to schedule a command.

**Values** sunday, monday, tuesday, wednesday, thursday, friday, saturday

##### *time*

Specifies the time of day to schedule a command.

**Values** hh:mm

#### Platforms

All

## end-time

### Syntax

**end-time** *date hours-minutes* [UTC]

**end-time** {now | forever}

**no end-time**

### Context

[\[Tree\]](#) (config>system>security>keychain>direction>uni>receive>entry end-time)

### Full Context

configure system security keychain direction uni receive entry end-time

### Description

This command specifies the calendar date and time after which the key specified by the authentication key is no longer eligible to sign or authenticate the protocol stream.

### Default

end-time forever

### Parameters

#### *date*

Specifies the calendar date after which the key specified by the authentication key is no longer eligible to sign or authenticate the protocol stream in the YYYY/MM/DD format. When no year is specified the system assumes the current year.

#### *hours-minutes*

Specifies the time after which the key specified by the authentication key is no longer eligible to sign or authenticate the protocol stream in the hh:mm[:ss] format. Seconds are optional, and if not included, assumed to be 0.

#### UTC

Indicates that time is given with reference to Coordinated Universal Time in the input.

#### now

Specifies a time equal to the current system time.

#### forever

Specifies that the key is always active.

### Platforms

All

## 9.105 end-x

end-x

### Syntax

[no] end-x *function-value*

### Context

**[Tree]** (config>router>segment-routing>srv6>inst>loc>func end-x)

### Full Context

configure router segment-routing segment-routing-v6 base-routing-instance locator function end-x

### Description

Commands in this context configure the attributes of the End.X SID function associated with a P2P interface. The End.X SID function encodes the behavior of an adjacency SID.

A static function value can be configured for each combination of SRH mode and protection type.

For a given interface, the static function value associated with the same combination of protection type and SRH mode overrides any corresponding automatically allocated function value (**end-x-auto-allocate** command configuration).

If more than one value is configured for an interface and combination of SRH mode and protection type, they are all advertised in IS-IS.

When used in remote TI-LFA repair tunnel programming, IS-IS uses rules to select one End.X value from the multiple values received in IS-IS link advertisements.

Values assigned to loopback and system interfaces are not advertised in IS-IS.

End.X SID functions for adjacencies over broadcast interfaces are always automatically allocated based on the configuration of the **end-x-auto-allocate** command.

The **no** form of this command removes the function value from the configuration.

### Parameters

#### *function-value*

Specifies the SRv6 End.X function. Statically allocated functions of all SID types in a locator have their value upper range limited by parameter **locator function-length static-function max-entries**.

**Values** 1 to 1048575

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 9.106 end-x-auto-allocate

### end-x-auto-allocate

#### Syntax

[no] end-x-auto-allocate *srh-mode* *srh-mode* **protection** *protection*

#### Context

**[Tree]** (config>router>segment-routing>srv6>inst>loc>func end-x-auto-allocate)

#### Full Context

configure router segment-routing segment-routing-v6 base-routing-instance locator function end-x-auto-allocate

#### Description

This command adds a list entry for the automatic allocation of the End.X SID function for all adjacencies over all network interfaces on the router (P2P and broadcast interfaces). Auto-allocated End.X SID function values have a range up to the maximum value of parameter **function-length** in a locator configuration.

A list entry is a combination of the protection type and the SRH mode. Any combinations in addition to the maximum number of entries supported by this command must be allocated statically for each P2P interface. The maximum number of entries in this list is two.

When no list entries are configured, no End.X function values are automatically allocated by default for a locator.

#### Note:

Any change to this list causes a reallocation of new function values to all interfaces on the router that results in flooding them to the network and triggers a new SPF in all routers.

The **no** form of this command removes a list entry.

#### Parameters

*srh-mode*

Specifies the SRH mode for the SID.

**Values**

- psp — Penultimate Segment Pop (PSP) of the SRH
- usp — Ultimate Segment Pop (USP) of the SRH
- psp-USD — Supports both PSP of the SRH and Ultimate Segment Decapsulation (USD) on the same SID
- usp-USD — Supports both USP of the SRH and USD on the same SID
- psp-usp-USD — Supports PSP and USP of the SRH with USD on the same SID

*protection*

Specifies if the adjacency SID is protected.

**Values** protected, unprotected

configure service vprn l2tp group tunnel mlppp endpoint

configure router l2tp group tunnel mlppp endpoint

configure service vprn l2tp group mlppp endpoint

configure router l2tp group mlppp endpoint

configure subscriber-mgmt ppp-policy mlppp endpoint

#### Description

When configured under the l2tp hierarchy, this command is applicable to LNS.

Within the ppp-policy, this command is applicable only to LAC.

The endpoint, according to RFC 1990, represents the system transmitting the packet. It is used during MLPPPoX negotiation phase to distinguish this peer from all others.

In the case that the client rejects the endpoint option during LCP negotiation, the LAC and the LNS must be able to negotiate the LCP session without the endpoint option.

The **no** form of this command disables sending endpoint option in LCP negotiation.

## Parameters

### *ip-address*

Specifies the IPv4 address (class 2).

### *system-ip*

Specifies to use the system IPv4 address (class 2).

### *ieee-address*

Specifies the MAC address of the interface (class 3).

### *system-mac*

Specifies to use the MAC address of the system (class 3).

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

## endpoint

## Syntax

**endpoint** *endpoint-name* [create]

**no endpoint** *endpoint-name*

## Context

[\[Tree\]](#) (config>service>epipe endpoint)

[\[Tree\]](#) (config>service>cpipe endpoint)

[\[Tree\]](#) (config>service>ipipe endpoint)

## Full Context

configure service epipe endpoint

configure service cpipe endpoint

configure service ipipe endpoint

## Description

This command configures a service endpoint.

## Parameters

### *endpoint-name*

Specifies an endpoint name.

## Platforms

All

- configure service ipipe endpoint
- configure service epipe endpoint

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure service cpipe endpoint

## endpoint

### Syntax

**endpoint** *endpoint-name* [**create**]

**no endpoint**

### Context

[\[Tree\]](#) (config>service>vpls endpoint)

### Full Context

configure service vpls endpoint

### Description

This command configures a service endpoint.

### Parameters

***endpoint-name***

Specifies an endpoint name up to 32 characters in length

**create**

This keyword is mandatory while creating a service endpoint

### Platforms

All

## endpoint

### Syntax

**endpoint** *ip-address*

**no endpoint**

### Context

[\[Tree\]](#) (config>router>mpls>fwd-policies>fwd-policy endpoint)

### Full Context

configure router mpls forwarding-policies forwarding-policy endpoint

### Description

This command configures the endpoint address for an MPLS forwarding policy.

The policy allows the user to forward unlabeled packets over a set of user-defined direct (with option to push a label stack) or indirect next hops. Routes are bound to an endpoint policy when their next hop matches the endpoint address of the policy.

The **no** form of the command removes the endpoint from the MPLS forwarding policy.

## Parameters

### *ip-address*

Specifies the destination IPv4 or IPv6 address.

#### Values

|              |                                     |
|--------------|-------------------------------------|
| ipv4-address | a.b.c.d                             |
| ipv6-address | x:x:x:x:x:x:x (eight 16-bit pieces) |
|              | x:x:x:x:x:d.d.d.d                   |
|              | x - [0..FFFF]H                      |
|              | d - [0..255]D                       |

## Context

[\[Tree\]](#) (config>mirror>mirror-dest>sdp endpoint)

[\[Tree\]](#) (config>mirror>mirror-dest endpoint)

[\[Tree\]](#) (config>mirror>mirror-dest>sap endpoint)

## Full Context

configure mirror mirror-dest sdp endpoint

configure mirror mirror-dest endpoint

configure mirror mirror-dest sap endpoint

## Description

This command configures a service end point. A mirror service supports two implicit endpoints managed internally by the system. The following applies to endpoint configurations.

Up to two named endpoints may be created per service mirror or LI service. The endpoint name is locally significant to the service mirror or LI service.

- Objects (SAPs or SDPs) may be created on the service mirror or LI with the following limitations:
  - two implicit endpoint objects (without explicit endpoints defined)
  - one implicit and multiple explicit object with the same endpoint name
  - multiple explicit objects each with one of two explicit endpoint names
- All objects become associated implicitly or indirectly with the implicit endpoints 'x' and 'y'.
- Objects may be created without an explicit endpoint defined.
- Objects may be created with an explicit endpoint defined.
- Objects without an explicit endpoint may have an explicit endpoint defined without deleting the object.
- Objects with an explicit endpoint defined may be dynamically moved to another explicit endpoint or may have the explicit endpoint removed.

Creating an object without an explicit endpoint:

- If an object on a mirror or LI service has no explicit endpoint name associated, the system attempts to associate the object with implicit endpoint 'x' or 'y'.
- The implicit endpoint cannot have an existing object association.
- If both 'x' and 'y' are available, 'x' is selected.
- If an 'x' or 'y' association cannot be created, the object cannot be created.

Creating an object with an explicit endpoint name:

- The endpoint name must exist on the mirror or LI service.
- If this is the first object associated with the endpoint name:
  - the object is associated with either implicit endpoint 'x' or 'y'
  - the implicit endpoint cannot have an existing object associated
  - if both 'x' and 'y' are available, 'x' is selected
  - if 'x' or 'y' is not available, the object cannot be created
  - the implicit endpoint is now associated with the named endpoint
- if this is not the first object associated with the endpoint name:
  - the object is associated with the named endpoint's implicit association

Changing an object's implicit endpoint to an explicit endpoint name

- If the explicit endpoint name is associated with an implicit endpoint, the object is moved to that implicit endpoint
- If the object is the first to be associated with the explicit endpoint name:
  - the object is associated with either implicit endpoint 'x' or 'y'
  - the implicit endpoint cannot have an existing object associated (except this one)
  - if both 'x' and 'y' are available, 'x' is selected
  - if 'x' or 'y' is not available, the object cannot be moved to the explicit endpoint
  - if moved, the implicit endpoint is now associated with the named endpoint

Changing an object's explicit endpoint to another explicit endpoint name

- If the new explicit endpoint name is associated with an implicit endpoint, the object is moved to that implicit endpoint

- If the object is the first to be associated with the new explicit endpoint name:
  - the object is associated with either implicit endpoint 'x' or 'y'
  - the implicit endpoint cannot have an existing object associated (except this one)
  - if both 'x' and 'y' are available, 'x' is selected
  - if 'x' or 'y' is not available, the object cannot be moved to the new endpoint
  - if moved, the implicit endpoint is now associated with the named endpoint

An explicitly named endpoint can have a maximum of one SAP and one ICB. Once a SAP is added to the endpoint, only one more object of type ICB sdp is allowed. The ICB sdp cannot be added to the endpoint if the SAP is not part of a MC-LAG instance. Conversely, a SAP which is not part of a MC-LAG instance cannot be added to an endpoint which already has an ICB sdp.

An explicitly named endpoint which does not have a SAP object can have a maximum of four SDPs which can include any of the following: a single primary SDP, one or many secondary SDPs with precedence, and a single ICB SDP.

The user can only add a SAP configured on a MC-LAG instance to this endpoint. Conversely, the user will not be able to change the mirror service type away from mirror service without first deleting the MC-LAG SAP.

The **no** form of this command removes the association of a SAP or an SDP with an explicit endpoint name. When removing an objects explicit endpoint association:

- The system attempts to associate the object with implicit endpoint 'x' or 'y'.
- The implicit endpoint cannot have an existing object association (except this one).
- If both 'x' and 'y' are available, 'x' is selected.
- If an 'x' or 'y' association cannot be created, the explicit endpoint cannot be removed.

## Parameters

### *endpoint-name*

Specifies the endpoint name.

### **create**

Mandatory keyword to create this entry.

## Platforms

All

## endpoint

## Syntax

**endpoint** *ip-address*

**no endpoint**

## Context

**[Tree]** (conf>router>segment-routing>sr-policies>policy endpoint)

## Full Context

configure router segment-routing sr-policies static-policy endpoint

## Description

This command associates an IPv4 or IPv6 endpoint address with a statically-defined segment routing policy. This association is mandatory when enabling an SR segment-routing policy.

The endpoint address 0.0.0.0 is a special value that matches all BGP next-hops. To use it, the BGP route must have a color-extended community with the color-only bits set to '01' or '10'.

The **no** form of this command removes the endpoint association.

## Default

no endpoint

## Parameters

### *ip-address*

Specifies the endpoint IP address to be associated with the statically-defined segment-routing policy.

### Values

|               |                   |
|---------------|-------------------|
| ipv4-address: | a.b.c.d           |
| ipv6-address: | x:x:x:x:x:x:x     |
|               | x:x:x:x:x:d.d.d.d |
| x:            | [0 to FFFF]H      |
| d:            | [0 to 255]D       |

## Platforms

All

## endpoint

## Syntax

**endpoint** *ip-address*

**no endpoint**

## Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from endpoint)

## Full Context

configure router policy-options policy-statement entry from endpoint

## Description

This command configures an SR Policy endpoint address as a route policy match criterion. This match criterion is only used in import policies.

The **no** form of this command removes the endpoint IP match criterion from the configuration.

## Parameters

### *ip-address*

Specifies the IPv4 or IPv6 address.

- |               |                                                                                                                                                                                                                                                                     |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Values</b> | ipv4-address: <ul style="list-style-type: none"> <li>• a.b.c.d</li> </ul> ipv6-address: <ul style="list-style-type: none"> <li>• x:x:x:x:x:x [-interface]</li> <li>• x:x:x:x:x:d.d.d.d [-interface]</li> <li>• x: [0 to FFFF]H</li> <li>• d: [0 to 255]D</li> </ul> |

## 9.108 endstation-vid-group

### endstation-vid-group

## Syntax

**endstation-vid-group** *id* **vlan-id** *startvid-endvid*

**no endstation-vid-group** *id*

## Context

[\[Tree\]](#) (config>service>vpls>mrp>mvrp endstation-vid-group)

## Full Context

configure service vpls mrp mvrp endstation-vid-group

## Description

This command specifies the range of VLAN IDs that are controlled by MVRP on the port associated with the parent SAP. When the command is present under a certain SAP, the MVRP will treat the associated virtual port as an end-station.

MVRP endstation behavior means that configuration of a new data SAP with the outer tag in the configured endstation-vid-group will generate down that virtual port a MVRP declaration for the new [outer] VLAN

attribute. Also registration received for the VLAN attribute in the range will be accepted but not propagated in the rest of MVRP context.

VPLS-groups are not allowed under the associated Management VPLS (M-VPLS) when the endstation is configured under one SAP. VPLS-groups can be supported in the chassis using a different M-VPLS.

The **no** form of this command removes the specified group id.

### Default

no endstation-vid-group

### Parameters

*id*

Specifies the range index

**Values** 1 to 4094

*startvid-endvid*

Specifies the range of VLANs to be controlled by MVRP

**Values** 1 to 4094

## 9.109 enforce-diffserv-lsp-fc

```
enforce-diffserv-lsp-fc
```

### Syntax

```
[no] enforce-diffserv-lsp-fc
```

### Context

[\[Tree\]](#) (config>service>sdp>class-forwarding enforce-diffserv-lsp-fc)

### Full Context

```
configure service sdp class-forwarding enforce-diffserv-lsp-fc
```

### Description

This command enables checking by RSVP that a Forwarding Class (FC) mapping to an LSP under the SDP configuration is compatible with the Diff-Serv Class Type (CT) configuration for this LSP.

When the user enables this option, the service manager inquires with RSVP if the FC is supported by the LSP. RSVP checks if the FC maps to the CT of the LSP, for example, the default class-type value or the class-type value entered at the LSP configuration level.

If RSVP did not validate the FC, then the service manager will return an error and the check has failed. In this case, packets matching this FC will be forwarded over the default LSP. Any addition of an LSP to an SDP that will not satisfy the FC check will also be rejected.

The service manager does not validate the default-lsp FC-to-CT mapping. Whether or not the FC is validated, the default-lsp will always end up being used in this case.

RSVP will not allow the user to change the CT of the LSP until no SDP with class-based forwarding enabled and the **enforce-diffserv-lsp-fc** option enabled is using this LSP. All other SDPs using this LSP are not concerned by this rule.

The SDP will continue to enforce the mapping of a single LSP per FC. However, when **enforce-diffserv-lsp-fc** enabled, RSVP will also enforce the use of a single CT per FC as per the user configured mapping in RSVP.

If class-forwarding is enabled but **enforce-diffserv-lsp-fc** is disabled, forwarding of the service packets will continue to be based on the user entered mapping of FC to LSP name without further validation as per the existing implementation. The CT of the LSP does not matter in this case.

If class-forwarding is not enabled on the SDP, forwarding of the service packets will continue to be based on the ECMP/LAG hash routine. The CT of the LSP does not matter in this case.

The **no** form of this command reverts to the default value which is to use the user entered mapping of FC to LSP name.

### Default

no enforce-diffserv-lsp-fc

#### Full Context

configure service vprn bgp group neighbor enforce-first-as

configure service vprn bgp enforce-first-as

configure service vprn bgp group enforce-first-as

## Description

When this command is configured so that it applies to an EBGp session, all routes (belonging to all address families) that are received from the EBGp peer are checked to ensure that the most recent autonomous system number (ASN) in the AS\_PATH attribute of each route matches the configured **peer-as** of the session; if it does not match, then either the session is reset (if **update-fault-tolerance** is not enabled) or the session is left up but the route is treated as withdrawn (if **update-fault-tolerance** is enabled).

Enabling or disabling this command on a session that is already up does not flap the session. When **enforce-first-as** is enabled, previously received routes are not checked for compliance with the rule. Enforcement applies only to routes received after the command is enabled and stops when the command is disabled.

## enforce-test-session-start-time

### Syntax

[no] **enforce-test-session-start-time**

### Context

**[Tree]** (config>test-oam>twamp>server enforce-test-session-start-time)

### Full Context

configure test-oam twamp server enforce-test-session-start-time

### Description

This command configures the router to check the signalled test-session start time against the server time and discard TWAMP test packets that arrive before the negotiated test-session start time.

The **no** form of this command configures the router to process all TWAMP test packets without checking the test-session start time against the server time.

### Default

enforce-test-session-start-time

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 9.113 enforce-unique-if-index

## enforce-unique-if-index

### Syntax

[no] **enforce-unique-if-index**

### Context

**[Tree]** (config>system>ip enforce-unique-if-index)

### Full Context

configure system ip enforce-unique-if-index

### Description

This command enables the options to force the creation of IP interface indexes so that they are globally unique across all routing contexts. In addition, the command ensures that any interface created using SNMP also has a system-wide unique IP interface index.

If this command is issued but the system has previously existing interface indexes that conflict, the command will be rejected until all the conflicts are removed. Pre-existing persistency tables should also be removed before enabling this system option.

The **no** form of the command disables this option and returns the system to the default behavior.

### Default

no enforce-unique-if-index

### Platforms

All

## 9.114 enforcement

### enforcement

#### Syntax

**enforcement** {**static** *policer-name* | **dynamic** {*mon-policer-name* | **local-mon-bypass**}}

#### Context

[\[Tree\]](#) (config>sys>security>dist-cpu-protection>policy>protocol enforcement)

#### Full Context

configure system security dist-cpu-protection policy protocol enforcement

#### Description

This command configures the enforcement method for the protocol.

#### Default

enforcement dynamic local-mon-bypass

#### Parameters

##### **static**

Specifies that the protocol is always enforced using a **static-policer**. Multiple protocols can reference the same **static-policer**. Packets of protocols that are statically enforced bypass any local monitors.

##### ***policer name***

Specifies which **static-policer** to use.

##### **dynamic**

Specifies that a specific enforcement policer for this protocol for this SAP/object is instantiated when the associated **local-monitoring-policer** is determined to be in a nonconforming state (at the end of a minimum monitoring time of 60 seconds to reduce thrashing).

***mon-policer-name***

Specifies which **local-monitoring-policer** to use.

**local-mon-bypass**

This parameter is used to not include packets from this protocol in the local monitoring function, and when the local-monitor "trips", do not instantiate a dynamic enforcement policer for this protocol.

**Platforms**

All

## 9.115 engineID

### engineID

**Syntax**

[no] **engineID** *engine-id*

**Context**

[\[Tree\]](#) (config>system>snmp engineID)

**Full Context**

configure system snmp engineID

**Description**

This command sets the SNMP engine ID that uniquely identifies the SNMPv3 node. If unconfigured, the system uses an engine ID based on the information from the system backplane. If the SNMP engine ID is changed, the current configuration must be saved and a reboot must be executed. Otherwise, the previously configured SNMP communities and logger trap-target notify communities will not be valid for the new engine ID.

**Note:**

Changing the SNMP engine ID invalidates all SNMPv3 MD5 and SHA security digest keys, which may render the node unmanageable.

When replacing a chassis, configure the new router to use the same engine ID as the previous router. This preserves SNMPv3 security keys and allows management stations to use their existing authentication keys for the new router.

Ensure that the engine ID of each router is unique. A management domain can only maintain one instance of a specific engine ID.

The **no** form of the command configures the router to use the default value.

**Parameters**

***engine-id***

Specifies an identifier from 10 to 64 hexadecimal digits (5 to 32 octet number), uniquely identifying this SNMPv3 node. This string is used to access this node from a remote host with SNMPv3.

**Platforms**

All

## 9.116 enhanced-distribution

### enhanced-distribution

**Syntax**`[no] enhanced-distribution`**Context**`[Tree] (config>cflowd enhanced-distribution)`**Full Context**`configure cflowd enhanced-distribution`**Description**

This command enables the inclusion of the ingress port ID into the hash algorithm used to distribute cflowd sample traffic to cflowd processes running on the 7950 XRS CPM. By including this new attribute, cflowd may see better distribution of flows across processing tasks if there is a limited number of IP interfaces on which sampling is performed, but those interfaces use LAGs with a large number of port members.

By enabling this option, the same flow may be captured multiple times if packets are received on multiple ingress ports.

This command is only applicable to cflowd running on a 7950 XRS platform.

The **no** form of this command removes the command from the configuration and disables the inclusion of the ingress port ID in the cflowd hash algorithm.

**Default**`no enhanced-distribution`**Platforms**`7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS`

## 9.117 enqueue-on-pir-zero

## enqueue-on-pir-zero

### Syntax

[no] enqueue-on-pir-zero

### Context

[\[Tree\]](#) (config>qos>adv-config-policy>child-control>bandwidth-distribution enqueue-on-pir-zero)

### Full Context

configure qos adv-config-policy child-control bandwidth-distribution enqueue-on-pir-zero

### Description

This command is used to enable queuing of new packets when H-QoS determines that a queue should stop forwarding (operational PIR set to zero). The default behavior is to allow the queue to continue to use the previously determined operational PIR and set the queue's MBS (Maximum Burst Size) to zero. This prevents new packets from being admitted to the queue until the PIR zero case terminates. The new behavior when **enqueue-on-pir-zero** is enabled is to set the operational PIR to zero and leave the queue's MBS set to the normal value.

This command overrides the **limit-pir-zero-drain** command.

The **no** form of this command reverts to default behavior.

### Platforms

All

## 9.118 enroll

## enroll

### Syntax

**enroll est-profile** *name* **key** *key-filename* **output** *output-cert-filename* [**hash-alg** *hash algorithm*] **subject-dn** *subject-dn* [**domain-name** *domain-names*] [**ip-addr** *ip-address* | *ipv6-address*] [**validate-cert-chain**] [**force**]

### Context

[\[Tree\]](#) (admin>certificate>est enroll)

### Full Context

admin certificate est enroll

### Description

This command enrolls a new certificate with Certificate Authority (CA) by the EST protocol specified with the **est-profile** *name* parameter with a imported private key specified by the **key** *key-filename* parameter.

The **est-profile** *name* specifies the authentication between the system and EST server.

The **hash-alg** *hash-algorithm*, **subject-dn** *subject-dn*, **domain-name** *domain-names*, and **ip-addr** *ip-address* parameters are used to generate the Certificate Signing Request (CSR) in the EST request message. The **domain-name** *domain-names* and **ip-addr** *ip-address* parameters are used as subject alternative names.

If **validate-cert-chain** is specified, the system validates the certificate's chain of result certificate before importing it. The "certificate chain" is the chain of all the certificates from the result certificate to the issuing CA. The "result certificate" is the new certificate returned by EST server.

The result certificate is imported and saved with the filename specified by the **output** *output-cert-filename*. If **force** is specified, the system overwrites the existing file with same name as the *output-cert-filename*.

## Parameters

### **name**

Specifies EST profile name, up to 32 characters

### **key-filename**

Specifies the filename of a key, up to 95 characters

### **output-cert-filename**

Specifies the output certificate filename, up to 200 characters

### **hash-algorithm**

Specifies the hash algorithm used in a certificate request.

**Values** sha1, sha224, sha256, sha384, sha512

### **subject-dn**

Specifies the distinguish name, up to 256 characters, used as the subject in a certificate request, including:

- C-Country
- ST-State
- O-Organization name
- OU-Organization Unit name
- CN-common name

This parameter is formatted as a text string including any of the preceding attributes. The attribute and its value is linked by using "=", and "," is used to separate different attributes.

For example: C=US,ST=CA,O=ALU,CN=SR12

**Values** attr1=val1,attr2=val2

where: attrN={C | ST | O | OU | CN}, up to 256 characters

### **domain-names**

Specifies domain names, up to 512 characters, separated by commas

### **ip-address**

Specifies an IPv4 or IPv6 address string, up to 64 characters

### **validate-cert-chain**

Specifies that the system validates the certificate's chain of result certificate before importing it

**force**

Specifies that the system overwrites the existing file with same *output-cert-filename*

**entropy-label**

**[no] entropy-label**

### Context

[\[Tree\]](#) (config>service>sdp>binding>pw-port entropy-label)

### Full Context

configure service sdp binding pw-port entropy-label

### Description

This command enables entropy label insertion on the PW port.

If this command is configured, the entropy label and ELI are inserted in packets for which at least one LSP in the stack for the far-end of the tunnel used by the service has advertised entropy label capability.

- If the tunnel is of type RSVP or SR-TE, the **entropy-label** must be enabled under the **config>router>mpls** or **config>router>mpls>lsp** contexts.
- If the tunnel is of type SR-ISIS, SR-OSPF or SR-TE, the **override-tunnel-elc** command must be configured under the **config>router>isis** or **config>router>ospf** contexts.
- If the tunnel is LDP, the entropy-level capability is configured under the **configure>router>ldp** context.

The entropy label is only applicable to PW ports bound to a static port, and not to ports using an FPE.

The **no** form of this command disables the entropy label insertion on the PW port.

### Default

no entropy-label

### Context

[\[Tree\]](#) (config>router>mpls entropy-label)

## Full Context

```
configure router mpls entropy-label
```

## Description

This command configures the use of entropy labels for MPLS.

The entropy label (EL) and entropy label indicator (ELI) require the insertion of two additional labels in the label stack. In some cases, this may result in an unsupported label stack depth or large changes in the label stack depth during the lifetime of an LSP (for example, due to switching from a primary path with ELC enabled to a secondary path for which the far end has not signaled ELC).

This command provides control at the head end of an RSVP LSP or SR-TE LSP as to whether an EL is inserted on an LSP by ignoring the ELC signaled from the far-end LER, and to control how the additional label stack depth is accounted for.

By default, regardless of the value set for entropy label capability at the egress node, the ingress LER considers the EL and ELI in the label stack while sending the information to the TTM and NHLFE. The application using the LSP does not insert an EL and ELI in the label stack unless the far-end signals ELC and the application is configured to insert an entropy label.

When **entropy-label** is set to **force-disable**, the ingress LER does not consider EL and ELC in the label stack when sending the information to the TTM and NHLFE. Therefore, the system marks the TTM and NHLFE as ELC not supported, and applications do not insert an EL or ELI.

The **entropy-label** command value changes at either the MPLS level or the LSP level. The new operational value does not take effect until the LSP is re-signaled. A **shutdown** and **no shutdown** of the LSP is required to enable the new value.

The user can use the **clear** command or bounce MPLS itself (**shutdown/no shutdown**) to force the new value to take effect for a large numbers of LSPs.

## Default

```
entropy-label rsvp-te enable
```

## Parameters

### rsvp-te

Applies the **entropy-label** command to RSVP LSPs.

### sr-te

Applies the **entropy-label** command applies to SR-TE LSPs.

### force-disable

Specifies that the ingress LER will not consider the EL and ELI in the label stack while sending the information to the TTM and NHLFE. The system marks the TTM and NHLFE as ELC not supported, and applications do not insert an EL or ELI in the label stack.

### enable

Specifies that the ingress LER will consider what is signaled from the egress node for ELC for marking the NHLFE, while the TTM is always marked. Although applications only insert the entropy label if the far end signals ELC, the additional two labels of the EL and ELI are always accounted for.

### Full Context

```
configure router mpls lsp entropy-label
```

```
configure router mpls lsp-template entropy-label
```

### Description

This command configures the use of entropy labels for an LSP.

The entropy label (EL) and entropy label indicator (ELI) require the insertion of two additional labels in the label stack. In some cases, this may result in an unsupported label stack depth or large changes in the label stack depth during the lifetime of an LSP (for example, due to switching from a primary path with ELC enabled to a secondary path for which the far end has not signaled ELC).

This command provides control at the head end of an RSVP LSP or SR-TE LSP over whether an entropy label is inserted on an LSP by overriding the ELC signaled from the far-end LER, and control over how the additional label stack depth is accounted for.

By default, the value of **entropy-label** is inherited from the MPLS level. The command under the LSP context provides a means to override the default MPLS behavior on a per-LSP basis. For auto-LSPs, it can only be configured in LSP templates of type one-hope-p2p and mesh-p2p.

Under the LSP context, when the value of **entropy-label** is set to **enable**, the ingress LER will take into consideration what is signaled from the egress node for ELC when marking the NHLFE as entropy-label-capable. Since the value of **entropy-label** is set to **enable** at the LSP level, the system will always mark it in the TTM as entropy-label-capable regardless of the signaled value, in order to ensure that the potential additional label stack depth is accounted for. In this scenario, the TTM and NHLFE can be out of synchronization based on what is configured at the egress node. That is, the application will always account for the entropy label and ELI in the label stack without taking into consideration the signaled value of ELC.

When **entropy-label** is set to **force-disable**, the ingress LER will not consider EL and ELI in the label stack while sending the information to the TTM and NHLFE, regardless of what the far end signals. Therefore, the system will mark the TTM and NHLFE as ELC not supported, and applications will not insert an EL or ELI.

When the value of **entropy-label** changes at either the MPLS level or the LSP level, the new operational value will not take effect until the LSP is re-signaled. A **shutdown** and **no shutdown** of the LSP is required to enable the new value.

The user can use the **clear** command or bounce MPLS itself (**shutdown** and **no shutdown**) to force the new value to take effect for a large numbers of LSPs.

## Default

entropy-label inherit

## Parameters

### force-disable

Indicates that the ingress LER will not consider the entropy label and ELI in the label stack while sending the information to the TTM and NHLFE. The system will mark the TTM and NHLFE as ELC not supported, and applications will not insert an EL or ELI in the label stack.

### enable

Indicates that the ingress LER will take into consideration what is signaled from the egress node for ELC for marking the NHLFE, while the TTM is always marked. Therefore, although applications will only insert the entropy label if the far end signals ELC, the additional two labels of the entropy label EL and ELI are always accounted for.

### inherit

Indicates that the value of **entropy-label** is inherited from the setting in the MPLS context.

## Platforms

All

## entropy-label

## Syntax

[no] entropy-label

## Context

[\[Tree\]](#) (config>router entropy-label)

## Full Context

configure router entropy-label

## Description

If **entropy-label** is configured, the Entropy label and Entropy Label Indicator is inserted on packets for which at least one LSP in the stack for the far-end of the LDP or RSVP tunnel used by an IGP or BGP shortcut has advertised entropy-label-capability. If the tunnel is of type RSVP, then **entropy-label** must also have been enabled under **config>router>mpls** or **config>router>mpls>isp**.

This configuration will result in other traffic that is forwarded over an LDP or RSVP LSP for which this router is the LER, and for which there is no explicit service endpoint on this router, to have the EL/ELI enabled, subject to the LSP far-end advertising entropy-label-capability. An example of such traffic includes packets arriving on a stitched LDP LSP forwarded over an RSVP LSP.

configure router ospf segment-routing entropy-label

## Description

This command instructs the system to ignore any received IGP advertisements of entropy label capability relating to remote nodes in the network. It also prevents a user from configuring **override-tunnel-elc** for the IGP instance.

The **no** version of this command enables the processing of any received IGP advertisements of entropy label capability.

## Default

entropy-label enable

## Parameters

### **force-disable**

Forces the system to ignore any received entropy label capability signaled in the IGP.

### **enable**

Enables the system to process any received entropy label capability signaled in the IGP.

## Platforms

All

## 9.121 entropy-label-capability

### entropy-label-capability

## Syntax

[no] **entropy-label-capability**

## Context

**[Tree]** (config>router>ldp entropy-label-capability)

**[Tree]** (config>router>rsvp entropy-label-capability)

## Full Context

configure router ldp entropy-label-capability

configure router rsvp entropy-label-capability

## Description

This command enables or disables ELC for RSV.

If **entropy-label-capability** is configured, then the system will signal (using the procedures specified in RFC 6790) that it is capable of receiving and processing the entropy label and ELI on incoming packets of RSVP and LDP LSPs.

If **no entropy-label-capability** is configured, then the system will not signal ELC. If an ELI is exposed on a packet where the tunnel label is popped at the termination of that LSP, and an entropy label is not configured, then the packet will be dropped.

**Default**

no entropy-label-capability

### Context

[\[Tree\]](#) (config>subscr-mgmt>ancp>static-map entry)

## Full Context

configure subscriber-mgmt ancp ancp-static-map entry

## Description

This command configures an ANCP name. When ANCP is configured to provide rate adaptation without the use of enhanced subscriber management, this command will define how to map an ANCP key (usually the circuit-id of the DSLAM port) to either a SAP and a scheduler name (when a Multi-Service Site (MSS) is not used) or a customer, site and scheduler name when MSS is used.

Different ANCP names may be used with the same SAPs or customer ID/MSS combinations to allow schedulers within the policy to be mapped to the ANCP names. An ANCP string and SAP combination may reference only one ancp-policy. An ANCP string and customer and site-name combination may reference a single ancp-policy.

The **no** form of this command reverts to the default.

## Parameters

### *ancp-string*

Specifies the ASCII representation of the DSLAM circuit-id name, up to 63 characters.

### *customer-id*

Specifies the associated existing customer ID.

**Values** 1 to 2147483647

### *customer-site-name*

Specifies the associated customer's configured MSS name, up to 32 characters.

### *policy-name*

Specifies an existing ANCP policy name, up to 32 characters.

### *sap-id*

Specifies the physical port identifier portion of the SAP definition.

## Platforms

**[Tree]** (config>subscr-mgmt>sub-prof>sla-profile-map entry)

### Full Context

configure subscriber-mgmt sub-ident-policy sla-profile-map entry

configure subscriber-mgmt sub-profile sla-profile-map entry

### Description

This command configures an SLA profile string. Each subscriber identification string can be provisioned into a subscriber mapping table providing an explicit mapping of the string to a specific subscriber profile. This allows certain subscribers to be directly mapped to the appropriate subscriber profile in the event that the default mappings are not desired for the subscriber.

An explicit mapping of a subscriber identification string to a subscriber profile cannot be defined with the subscriber profile name default. It is possible for the subscriber identification string to be entered in the mapping table without a defined subscriber profile which can result in the explicitly defined subscriber to be associated with the subscriber profile named default.

Explicitly mapping a subscriber identification string to a subscriber profile will cause an existing active subscriber associated with the string to be reassigned to the newly mapped subscriber profile. An explicit mapping overrides all default subscriber profile definitions.

Attempting to delete a subscriber profile that is currently defined as in an explicit subscriber identification string mapping will fail.

The system will fail the removal attempt of an explicit subscriber identification string mapping to a subscriber profile definition when an active subscriber is using the mapping and cannot be reassigned to a defined default non-provisioned subscriber profile.

The **no** form of this command reverts to the default.

### Parameters

#### ***sla-profile-string***

Identifies the SLA profile string, up to 32 characters.

#### ***sla-profile-name***

Identifies the SLA profile name, up to 32 characters.

### Platforms

**no entry** *entry-id*

### Context

[\[Tree\]](#) (config>service>mrp>mrp-policy entry)

### Full Context

configure service mrp mrp-policy entry

### Description

This command creates or edits an mrp-policy entry. Multiple entries can be created using unique entry-id numbers within the policy. The implementation exits the policy on the first match found and executes the actions in accordance with the accompanying action command. For this reason, entries must be sequenced correctly from most to least explicit. An entry may not have any match criteria defined (in which case, everything matches) but must have at least the keyword action for it to be considered complete. Entries without the action keyword will be considered incomplete and therefore will be rendered inactive.

The **no** form of this command removes the specified entry from the mrp-policy. Entries removed from the mrp-policy are immediately removed from all services where the policy is applied.

### Parameters

#### *entry-id*

An entry-id uniquely identifies a match criteria and the corresponding action. It is recommended that multiple entries be given entry-ids in staggered increments. This allows users to insert a new entry in an existing policy without requiring renumbering of all the existing entries.

**Values** 1 to 65535

#### **create**

Keyword; required when first creating the configuration context. When the context is created, one can navigate into the context without the create keyword.

### Platforms

## entry

### Syntax

**entry** *range-entry-id* [**create**]

**no entry** *range-entry-id*

### Context

[\[Tree\]](#) (config>service>vpls>isid-policy entry)

### Full Context

configure service vpls isid-policy entry

## Description

This command creates or edits an ISID policy entry. Multiple entries can be created using unique entry-id numbers within the ISID policy.

**entry-id** — Specifies an entry-id uniquely identifies a ISID range and the corresponding actions. This allows users to insert a new entry in an existing policy without requiring renumbering of all the existing entries.

The following rules govern the usage of multiple entry statements:

- overlapping values are allowed:
  - isid from 301 to 310
  - isid from 305 to 315
  - isid 316
- the minimum and maximum values from overlapping ranges are considered and displayed. The above entries will be equivalent with "isid from 301 to 316" statement.
- there is no consistency check with the content of ISID statements from other entries. The entries will be evaluated in the order of their IDs and the first match will cause the implementation to execute the associated action for that entry.

**no isid** - removes all the previous statements under one entry.

**no isid value | from value to higher-value** - removes a specific ISID value or range. Must match a previously used positive statement: for example, if the command "isid 16 to 100" was used using "no isid 16 to 50", it will not work but "no isid 16 to 100 will be successful.

Values 1 to 65535

## Default

no entry

## Parameters

### *range-entry-id*

Specifies the ID of the ISID policy to be created or edited

**Values** 1 to 8191

### **create**

Required when first creating the configuration context. Once the context is created, one can navigate into the context without the create keyword.

## Platforms

All

## entry

## Syntax

**entry** *entry-id* [**name** *entry-name*]

**no entry** *entry-id*

## Context

[\[Tree\]](#) (config>service>vprn>log>filter entry)

## Full Context

configure service vprn log filter entry

## Description

This command is used to create or edit an event filter entry. Multiple entries may be created using unique *entry-id* values. The SR OS implementation exits the filter on the first match found and executes the action in accordance with the action command.

Comparisons are performed in an ascending entry ID order. When entries are created, they should be arranged sequentially from the most explicit entry to the least explicit. Matching ceases when a packet matches an entry. The entry action is performed on the packet, either drop or forward. To be considered a match, the packet must meet all the conditions defined in the entry.

An entry may not have any match criteria defined (in which case, everything matches) but must have at least the keyword action for it to be considered complete. Entries without the action keyword will be considered incomplete and are rendered inactive.

By default, no filter entries are defined. Entries must be explicitly configured.

The **no** form of this command removes the specified entry from the event filter. Entries removed from the event filter are immediately removed from all log-id's where the filter is applied.

## Default

No event filter entries are defined. An entry must be explicitly configured.

## Parameters

### *entry-id*

The entry ID uniquely identifies a set of match criteria corresponding action within a filter. Entry ID values should be configured in staggered increments so you can insert a new entry in an existing policy without renumbering the existing entries.

**Values** 1 to 999

### *name entry-name*

Configures an optional entry name for the event filter, up to 64 characters, that can be used to refer to the entry after it is created.

## Platforms

All

## entry

## Syntax

**entry** *entry-id* [create]

**no entry** *entry-id*

## Context

[\[Tree\]](#) (config>app-assure>group>policy>app-filter entry)

## Full Context

configure application-assurance group policy app-filter entry

## Description

This command creates an application filter entry.

App filter entries are an ordered list, the lowest numerical entry that matches the flow defines the application for that flow.

An application filter entry or entries configures match attributes of an application.

The **no** form of this command deletes the specified application filter entry.

## Parameters

### *entry-id*

Specifies an integer that identifies an app-filter entry.

**Values** 1 to 65535

### **create**

Keyword used to create the entry.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## entry

## Syntax

**entry** *entry-id* [**create**]

**no entry** *entry-id*

## Context

[\[Tree\]](#) (config>app-assure>group>policy>aqp entry)

## Full Context

configure application-assurance group policy app-qos-policy entry

## Description

This command creates an application QoS policy entry. A flow that matches multiple Application QoS policies (AQP) entries will have multiple AQP entries actions applied. When a conflict occurs for two or more actions, the action from the AQP entry with the lowest numerical value takes precedence.

The **no** form of this command deletes the specified application QoS policy entry.

## Parameters

### *entry-id*

An integer identifying the AQP entry.

**Values** 1 to 65535

### **create**

Mandatory keyword creates the entry. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## entry

## Syntax

**entry** *entry-id* [**create**]

**no entry** *entry-id*

## Context

## Context

[\[Tree\]](#) (config>app-assure>group>gtp>gtp-fltr>msg entry)

## Full Context

configure application-assurance group gtp gtp-filter message-type entry

## Description

This command configures an entry for a specific GTPv1 message type value.

## Parameters

### *entry-id*

Specifies the index into the GTP message value list that defines a custom message-type action.

**Values** 1 to 255

### *gtp-message-value*

Specifies the GTPv1 message type, either as a numeric value or as a string.

**Values** 1 to 255 or 256 characters {echo-request, echo-response, error-indication, g-pdu, supported-extension-headers-notification}

**permit | deny**

Specifies the action to take for packets that match this GTP filter message entry.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## entry

### Syntax

## Full Context

configure li li-filter li-mac-filter entry

configure li li-filter li-ip-filter entry

configure li li-filter li-ipv6-filter entry

## Description

This command creates or edits a Lawful Interception filter entry. Multiple entries can be created using unique entry-id numbers within the filter.

An entry in an LI filter always has an implicit action of "forward".

The **no** form of this command removes the specified entry from the filter. Entries removed from the filter are immediately removed from all services or network ports where the associated filter is applied.

LI filter entries can be used as li-source entries.

The entry numbers for LI filters serve purely as keys for managing the entries (deleting entries, and so on). The order of LI filter entries is not guaranteed to match the entry numbers and the software may reorder entries. Operators must use LI entries in a manner such that relative order of the LI entries amongst themselves is not important.

The **no** form of this command removes the LI entry ID from the configuration.

## Parameters

### *li-entry-id*

Identifies the Lawful Interception filter entry.

**Values** 1 to 65536

## Platforms

All

## entry

configure qos sap-ingress mac-criteria entry

configure qos sap-ingress ipv6-criteria entry

configure qos sap-egress ip-criteria entry

configure qos sap-egress ipv6-criteria entry

configure qos sap-ingress ip-criteria entry

## Description

This command is used to create or edit an IP, IPv6, or MAC criteria entry for the policy. Multiple entries can be created using unique *entry-id* numbers.

The list of flow criteria is evaluated in a top-down manner with the lowest entry ID at the top and the highest entry ID at the bottom. If the defined match criteria for an entry within the list matches the information in the egress packet, the system stops matching the packet against the list and performs the matching entries reclassification actions. If none of the entries match the packet, the IP flow reclassification list has no effect on the packet.

An entry is not populated in the list unless the action command is executed for the entry. An entry that is not populated in the list has no effect on egress packets. If the action command is executed without any explicit reclassification actions specified, the entry is populated in the list allowing packets matching the entry to exit the list, preventing them from matching entries lower in the list. Since this is the only flow

reclassification entry that the packet matched and this entry explicitly states that no reclassification action is to be performed, the matching packet will not be reclassified.

The **no** form of this command removes the specified entry from the policy. Entries removed from the policy are immediately removed from all services where that policy is applied.

## Parameters

### *entry-id*

The *entry-id*, expressed as an integer, uniquely identifies a match criterion and the corresponding action. It is recommended that multiple entries be given *entry-ids* in staggered increments. This allows users to insert a new entry in an existing policy without requiring renumbering of all the existing entries.

An entry cannot have any match criteria defined (in which case, everything matches) but must have at least the keyword **action fc** *fc-name* for it to be considered complete. Entries without the action keyword will be considered incomplete and, therefore, will be rendered inactive.

**Values** 1 to 65535

### **create**

Required parameter when creating a flow entry when the system is configured to require the explicit use of the keyword to prevent accidental object creation. Objects may be accidentally created when this protection is disabled and an object name is mistyped when attempting to edit the object. This keyword is not required when the protection is disabled. The keyword is ignored when the flow entry already exists.

## Full Context

configure qos network egress ip-criteria entry

configure qos network egress ipv6-criteria entry

configure qos network ingress ip-criteria entry

configure qos network ingress ipv6-criteria entry

## Description

This command is used to create or edit an IP or IPv6 criteria entry for the policy. Multiple entries can be created using unique entry numbers.

The list of flow criteria is evaluated in a top-down manner with the lowest entry ID at the top and the highest entry ID at the bottom. If the defined match criteria for an entry within the list matches the information in the packet, the system stops matching the packet against the list and performs the matching entries reclassification actions. If none of the entries match the packet, the IP flow reclassification list has no effect on the packet.

An entry is not populated in the list unless the action command is executed for the entry. An entry that is not populated in the list has no effect on ingress packets. If the **action** command is executed without any explicit reclassification actions specified, the entry is populated in the list allowing packets matching the entry to exit the list, preventing them from matching entries lower in the list. Since this is the only flow reclassification entry that the packet matched, and this entry explicitly states that no reclassification action is to be performed, the matching packet will not be reclassified.

The configuration of egress prec/DSCP classification and the configuration of an egress IP criteria or IPv6 criteria entry statement within a network QoS policy are mutually exclusive.

Network QoS policies containing egress **ip-criteria** or **ipv6-criteria entry** statements are only applicable to network interfaces. Configuration of **ip-criteria** or **ipv6-criteria entry** statements in a network egress QoS policy and the application of the policy on any object other than a GRT network interface are mutually exclusive.

The **no** form of this command removes the specified entry from the policy. Entries removed from the policy are immediately removed from all services to which that policy is applied.

## Parameters

### *entry-id*

The entry identifier, expressed as an integer, uniquely identifies a match criterion and the corresponding action. It is recommended that multiple entries be given entry identifiers in staggered increments. This allows users to insert a new entry in an existing policy without requiring renumbering of all the existing entries.

An entry cannot have any match criteria defined (in which case, everything matches) but must have at least the keyword **action fc fc-name profile profile** for it to be considered complete. Entries without the action keyword will be considered incomplete and will be rendered inactive.

**Values** 1 to 65535

### **create**

Required parameter when creating a flow entry when the system is configured to require the explicit use of the keyword to prevent accidental object creation. Objects may be accidentally created when this protection is disabled, and an object name is mistyped when attempting to edit the object. This keyword is not required when the protection is disabled. The keyword is ignored when the flow entry already exists.

### Description

This command creates or edits an IPv4, IPv6, MAC, IP exception filter, or IPv6 exception filter entry. Multiple entries can be created using unique *entry-id* numbers within the filter. Entries must be sequenced from most to least explicit.

An entry may not have any match criteria defined (in which case everything matches) but must have at least the keyword **action** for it to be considered complete. Entries without the **action** keyword will be considered incomplete and hence will be rendered inactive.

The **no** form of the command removes the specified entry from the filter. Entries removed from the filter are immediately removed from all services or network ports where that filter is applied.

### Parameters

#### *entry-id*

Uniquely identifies a match criteria and the corresponding action. It is recommended that multiple entries be given *entry-id* in staggered increments. This allows users to insert a new entry in an existing policy without requiring to renumbering all the existing entries. The parameter is expressed as a decimal integer.

**Values** 1 to 2097151

#### **create**

This keyword is required to create the configuration context. Once the context is created, the user can enable the context with or without the **create** keyword.

## Platforms

VSR

- configure filter ipv6-exception entry
- configure filter ip-exception entry

All

- configure filter mac-filter entry
- configure filter ip-filter entry
- configure filter ipv6-filter entry

## entry

### Syntax

**entry** *entry-id* [**name** *entry-name*]

**no entry** *entry-id*

### Context

[\[Tree\]](#) (config>log>filter entry)

### Full Context

configure log filter entry

### Description

This command creates or edits an event filter entry. Multiple entries can be created using unique *entry-id* values. The SR OS implementation exits the filter on the first match found and executes the action in accordance with the **action** command.

Comparisons are performed in an ascending entry ID order. When entries are created, they should be arranged sequentially from the most explicit entry to the least explicit. Matching ceases when a packet matches an entry. The entry action is performed on the packet, either drop or forward. To be considered a match, the packet must meet all the conditions defined in the entry.

An entry may not have any match criteria defined (in which case, everything matches) but must have at least the keyword action for it to be considered complete. Entries without the action keyword will be considered incomplete and are rendered inactive.

By default, no filter entries are defined. Entries must be explicitly configured.

The **no** form of this command removes the specified entry from the event filter. Entries removed from the event filter are immediately removed from all log-id's where the filter is applied.

### Parameters

#### *entry-id*

The entry ID uniquely identifies a set of match criteria corresponding action within a filter. Entry ID values should be configured in staggered increments so you can insert a new entry in an existing policy without renumbering the existing entries.

**Values** 1 to 999

***name entry-name***

Configures an optional entry name for the event filter, up to 64 characters, that can be used to refer to the entry after it is created.

**Platforms**

All

entry

**Syntax**

[no] entry *entry-id*

**Context**

[\[Tree\]](#) (config>log>event-handling>handler>action-list entry)

**Full Context**

configure log event-handling handler action-list entry

**Description**

This command configures an EHS handler action-list entry. A handler can have multiple actions where each action, for example, could request the execution of a different script. When the handler is triggered it will walk through the list of configured actions.

The **no** form of this command removes the specified EHS handler action-list entry.

**Parameters**

***entry-id***

Specifies the identifier of the EHS handler entry.

**Values** 1 to 1500

**Platforms**

All

entry

**Syntax**

[no] entry *entry-id*

### Full Context

configure system security management-access-filter ip-filter entry

configure system security management-access-filter ipv6-filter entry

configure system security management-access-filter mac-filter entry

### Description

This command is used to create or edit a management access IP(v4), IPv6, or MAC filter entry. Multiple entries can be created with unique *entry-id* numbers. The OS exits the filter upon the first match found and executes the actions according to the respective action command. For this reason, entries must be sequenced correctly from most to least explicit.

An entry may not have any match criteria defined (in which case, everything matches) but must have at least the keyword **action** defined to be considered complete. Entries without the **action** keyword are considered incomplete and inactive.

The **no** form of this command removes the specified entry from the management access filter.

### Parameters

#### *entry-id*

Specifies an entry ID uniquely identifies a match criteria and the corresponding action. It is recommended that entries are numbered in staggered increments. This allows users to insert a new entry in an existing policy without having to renumber the existing entries.

**Values** 1 to 9999

### Platforms

### Full Context

configure system security cpm-filter mac-filter entry

configure system security cpm-filter ip-filter entry

configure system security cpm-filter ipv6-filter entry

### Description

This command specifies a particular CPM filter match entry. Every CPM filter must have at least one filter match entry. Entries are created and deleted by user.

The default match criteria is match none.

### Parameters

#### *entry-id*

Identifies a CPM filter entry as configured on this system.

**Values** 1 to 131072

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## entry

### Syntax

**entry** *entry levels levels opcodes opcodes rate packet-rate-limit*

**no entry**

### Context

[\[Tree\]](#) (config>sys>security>cpu-protection>policy>eth-cfm entry)

### Full Context

configure system security cpu-protection policy eth-cfm entry

### Description

Builds the specific match and rate criteria. Up to ten entries may exist in up to four CPU protection policies.

The **no** form of this command reverses the match and rate criteria configured.

### Default

no entry

### Parameters

#### *rate*

Specifies a packet rate limit in frames per second, where a "0" means drop all.

**Values** 1 to 100

#### *level*

Specifies a domain level.

**Values** all: Wildcard entry level  
range: 0 to 7: within specified range, multiple ranges allowed  
number: 0 to 7: specific level number, may be combined with range

### *opcode*

Specifies an operational code that identifies the application.

**Values** range: 0 to 255: within specified range, multiple ranges allowed  
number: 0 to 255: specific level number, may be combined with range

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## entry

### Syntax

[no] entry *entry-id*

### Context

[\[Tree\]](#) (config>system>security>profile entry)

### Full Context

configure system security profile entry

### Description

This command is used to create a user profile entry.

More than one entry can be created with unique *entry-id* numbers. Exits when the first match is found and executes the actions according to the accompanying **action** command. Entries should be sequenced from most explicit to least explicit.

An entry may not have any match criteria defined (in which case, everything matches) but must have at least the keyword **action** for it to be considered complete.

The **no** form of this command removes the specified entry from the user profile.

### Parameters

#### *entry-id*

Specifies an entry-id that uniquely identifies a user profile command match criteria and a corresponding action. If more than one entry is configured, the *entry-ids* should be numbered in staggered increments to allow users to insert a new entry without requiring renumbering of the existing entries.

**Values** 1 to 9999

## Platforms

## entry

### Syntax

**entry** *entry-id* [**key** *authentication-key* | *hash-key* | *hash2-key* | *custom-key*] [**hash** | **hash2** | **custom**]  
**algorithm** *algorithm*]

**no entry** *entry-id*

### Context

[Tree] (config>system>security>keychain>direction>bi entry)

[Tree] (config>system>security>keychain>direction>uni>receive entry)

[Tree] (config>system>security>keychain>direction>uni>send entry)

### Full Context

configure system security keychain direction bi entry

configure system security keychain direction uni receive entry

configure system security keychain direction uni send entry

### Description

This command defines a particular key in the keychain. Entries are defined by an entry ID. A keychain must have valid entries for the TCP Enhanced Authentication mechanism to work.

If the entry is the active entry for sending, then this causes a new active key to be selected (if one is available using the youngest key rule). If it is the only possible key to send, then the system rejects the command with an error indicating the configured key is the only available send key.

If the key is one of the eligible keys for receiving, it will be removed. If the key is the only possible eligible key, then the command is accepted, and an error indicating that this is the only eligible key will be generated.

The **no** form of this command removes the entry from the keychain.

### Parameters

#### **entry-id**

Specifies an entry that represents a key configuration to be applied to a keychain.

**Values** 0 to 63, null-key

#### **key**

Specifies a key ID which is used along with *keychain-name* and **direction** to uniquely identify this particular key entry.

#### **authentication-key**

Specifies the *authentication-key* that is used by the encryption algorithm. The key is used to sign and authenticate a protocol packet.

The *authentication-key* can be any combination of letters or numbers.

**Values** A key must be 160 bits for algorithm hmac-sha-1-96 and must be 128 bits for algorithm aes-128-cmac-96. If the key given with the entry command amounts to less than this number of bits, then it is padded internally with zero bits up to the correct length.

### **algorithm**

Specifies an enumerated integer that indicates the encryption algorithm to be used by the key defined in the keychain.

**Values** aes-128-cmac-96 — Specifies an algorithm based on the AES standard for TCP authentication as described in RFC 4494 for BGP and LDP.

aes-128-cmac-128 — Specifies an algorithm based on the AES standard as described in RFC 4493 for NTP.

aes-128-gcm-16 — Specifies an algorithm used for MCS.

hmac-sha-1-96 — Specifies an algorithm based on SHA-1 for RSVP-TE and TCP authentication.

message-digest — MD5 hash used for TCP authentication.

hmac-md5 — MD5 hash used for IS-IS and RSVP-TE.

password — Specifies a simple password authentication for OSPF, IS-IS, and RSVP-TE.

hmac-sha-1 — Specifies the sha-1 algorithm for OSPF, IS-IS, and RSVP-TE.

hmac-sha-256 — Specifies the sha-256 algorithm for OSPF and IS-IS.

### **hash-key | hash2-key | custom-key**

Specifies the hash key. The key can be any combination of ASCII characters up to 33 for the *hash-key* and 96 characters for the *hash2-key* (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

### **hash**

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### **hash2**

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### **custom**

Specifies a custom hash version is used while saving the configuration files.

## Platforms

All

**entry**

## Syntax

**entry** *entry-id* [**create**]

**no entry** *entry-id*

## Context

[\[Tree\]](#) (config>system>security>tls>cert-profile entry)

## Full Context

configure system security tls cert-profile entry

## Description

This command configures an entry for the TLS certificate profile. A certificate profile may have up to eight entries. Currently, TLS uses the entry with the smallest ID number when responding to server requests.

The **no** form of the command deletes the specified entry.

## Parameters

### *entry-id*

Specifies the identification number of the TLS certificate profile entry.

**Values** 1 to 8

### **create**

Keyword used to create the TLS certificate profile entry.

## Platforms

All

**entry**

## Syntax

**entry** *entry-id* **expression** *regular-expression*

**no entry** *entry-id*

## Context

[\[Tree\]](#) (config>router>policy-options>as-path-group entry)

## Full Context

configure router policy-options as-path-group entry

## Description

This command creates the context to edit route policy entries within an autonomous system path group.

Multiple entries can be created using unique entries. The router exits the filter when the first match is found and executes the action specified. For this reason, entries must be sequenced correctly from most to least explicit.

An entry does not require matching criteria defined (in which case, everything matches) but must at least define an action in order to be considered complete. Entries without an action are considered incomplete and will be rendered inactive.

The **no** form of this command removes the specified entry from the autonomous system path group.

## Parameters

### *entry-id*

Specifies the entry ID expressed as a decimal integer. An *entry-id* uniquely identifies match criteria and the corresponding action. Nokia recommends that multiple entries be given *entry-ids* in staggered increments. This allows users to insert a new entry in an existing policy without requiring renumbering of all the existing entries.

**Values** 1 to 128

### *regular-expression*

Specifies the AS path group regular expression. Allowed values are any string up to 255 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

An AS path in a BGP route matches an AS path group, if the pattern of the path matches the concatenation of all regular expressions in the group. A regular expression incorporates terms and operators that use the terms. An individual AS number is an elementary term in the AS path regular expression. More complex terms can be built from elementary terms. The following are key operators supported by SR OS:

- .
- \*
- ?
- {n}
- {m,n}
- {m, }

To reverse the match criteria when specifying a list of ranges or single values using square brackets, use the non-match operator (^) before the elements within the square brackets.

### Syntax

**entry** *entry-id*

**no entry**

### Context

[\[Tree\]](#) (config>router>policy-options>policy-statement entry)

### Full Context

configure router policy-options policy-statement entry

### Description

This command creates the context to edit route policy entries within the route policy statement.

Multiple entries can be created using unique entries. The router exits the filter when the first match is found and executes the action specified. For this reason, entries must be sequenced correctly from most to least explicit.

An entry does not require matching criteria defined (in which case, everything matches) but must have at least define an action in order to be considered complete. Entries without an action are considered incomplete and will be rendered inactive.

The **no** form of this command removes the specified entry from the route policy statement.

### Parameters

*entry-id*

Specifies the entry ID expressed as a decimal integer. An *entry-id* uniquely identifies match criteria and the corresponding action. It is recommended that multiple entries be given *entry-ids* in staggered increments. This allows users to insert a new entry in an existing policy without requiring renumbering of all the existing entries.

**Values** 1 to 128

## 9.125 epipe

## epipe

### Syntax

**epipe** *service-id* **customer** *customer-id* [**vpn** *vpn-id*] [**vc-switching**] [**create**] **name** [*name*]

**epipe** *service-id* [**test**] [**create**] [**name** *name*]

**no epipe** *service-id*

### Context

**[Tree]** (config>service epipe)

### Full Context

configure service epipe

### Description

This command configures an Epipe service instance. This command is used to configure a point-to-point epipe service. An Epipe connects two endpoints defined as Service Access Points (SAPs). Both SAPs may be defined in one 7450 ESS, 7750 SR, or 7950 XRS or they may be defined in separate devices connected over the service provider network. When the endpoint SAPs are separated by the service provider network, the far end SAP is generalized into a Service Distribution Point (SDP). This SDP describes a destination and the encapsulation method used to reach it.

No MAC learning or filtering is provided on an Epipe.

When creating a service, you must enter the **customer** keyword and specify a *customer-id* to associate the service with a customer. The *customer-id* must already exist, having been created using the **customer** command in the **service** context. After a service has been created with a customer association, it is not possible to edit the customer association. The service must be deleted and re-created with a new customer association.

After a service is created, the use of the **customer** *customer-id* is optional for navigating into the service configuration context. Attempting to edit a service with the incorrect *customer-id* specified will result in an error.

By default, no epipe services exist until they are explicitly created with this command.

The **no** form of this command deletes the epipe service instance with the specified *service-id*. The service cannot be deleted until the service has been shut down.

Epipe services are enabled on the 7450 ESS.

### Parameters

#### *service-id*

The unique service identification number or string identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every 7450 ESS, 7750 SR, or 7950 XRS on which this service is defined.

**Values**    *service-id*: 1 to 2147483647  
               *svc-name*: up to 64 characters

#### *customer-id*

Specifies the customer ID number to be associated with the service. This parameter is required on service creation and optional for service editing or deleting.

**Values** 1 to 2147483647

#### ***vpn vpn-id***

Specifies the VPN ID number which allows you to identify virtual private networks (VPNs) by a VPN ID. If this parameter is not specified, the VPN ID uses the same service ID number.

**Values** 1 to 2147483647

**Default** null (0)

#### ***vc-switching***

Specifies if the pseudowire switching signaling is used for the spoke SDPs configured in this service.

#### ***test***

Specifies a unique test service type for the service context which will contain only a SAP configuration. The test service can be used to test the throughput and performance of a path for MPLS-TP PWs. This parameter applies to the 7450 ESS and 7750 SR only.

#### ***create***

Keyword used to create the service instance. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

#### ***name name***

Configures an optional service name identifier, up to 64 characters, to a given service. This service name can then be used in configuration references, display, and show commands throughout the system. A defined service name can help the service provider or administrator to identify and manage services within the SR OS platforms.

To create a service, you must assign a service ID; however, after it is created, either the service ID or the service name can be used to identify and reference a service.

If a name is not specified at creation time, then SR OS assigns a string version of the *service-id* as the name.

**Values** *name*: up to 64 characters

## 9.130 error-handling

## error-handling

### Syntax

**error-handling**

### Context

[\[Tree\]](#) (config>service>vprn>bgp>group error-handling)

[\[Tree\]](#) (config>service>vprn>bgp>group>neighbor error-handling)

[\[Tree\]](#) (config>service>vprn>bgp error-handling)

### Full Context

```
configure service vprn bgp group error-handling
configure service vprn bgp group neighbor error-handling
configure service vprn bgp error-handling
```

### Description

This command specifies whether the error handling mechanism for optional transitive path attributes is enabled for this peer group.

### Platforms

All

## error-handling

### Syntax

```
error-handling
```

### Context

```
[Tree] (config>router>bgp error-handling)
[Tree] (config>router>bgp>group>neighbor error-handling)
[Tree] (config>router>bgp>group error-handling)
```

### Full Context

```
configure router bgp error-handling
configure router bgp group neighbor error-handling
configure router bgp group error-handling
```

### Description

This command specifies whether updated BGP error handling procedures should be applied.

### Platforms

All

## 9.131 error-handling-action

## error-handling-action

### Syntax

```
error-handling-action {continue | block}
```

## no error-handling-action

### Context

[\[Tree\]](#) (config>subscr-mgmt>credit-control-policy error-handling-action)

### Full Context

configure subscriber-mgmt credit-control-policy error-handling-action

### Description

This command configures the error handling action for the policy.

The **no** form of this command reverts to the default.

### Default

error-handling-action continue

### Parameters

#### continue

Specifies to continue when an error occurs in the CC determination.

#### block

Specifies to block when an error occurs in the CC determination.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 9.132 error-report

### error-report

### Syntax

[no] error-report

### Context

[\[Tree\]](#) (debug>router>rpki-session>packet error-report)

### Full Context

debug router rpki-session packet error-report

### Description

This command enables debugging for error report RPKI packets.

The **no** form of this command disables debugging for error report RPKI packets.

**Platforms**

All

**9.133 errored-frame****errored-frame****Syntax****errored-frame****Context**[\[Tree\]](#) (config>port>ethernet>efm-oam>link-monitoring errored-frame)**Full Context**

configure port ethernet efm-oam link-monitoring errored-frame

**Description**

The context used to define errored frame parameters including thresholds, and windows of time to which the error count will be compared. An errored frame is counted when there is any frame error detected by the Ethernet physical layer. This excludes jumbo frames above 9192 bytes which are dropped prior to this function.

**Platforms**

All

**9.134 errored-frame-period****errored-frame-period****Syntax****errored-frame-period****Context**[\[Tree\]](#) (config>port>ethernet>efm-oam>link-monitoring errored-frame-period)**Full Context**

configure port ethernet efm-oam link-monitoring errored-frame-period

## Description

The context used to define errored frame parameters including thresholds, and windows of received packets to which the error count will be compared. An errored frame is counted when there is any frame error detected by the Ethernet physical layer. This excludes jumbo frames above 9192 bytes which are dropped prior to this function. The received packet count will be checked every one second to see if the window has been reached.

## Platforms

All

## 9.135 errored-frame-seconds

### errored-frame-seconds

## Syntax

**errored-frame-seconds**

## Context

[\[Tree\]](#) (config>port>ethernet>efm-oam>link-monitoring errored-frame-seconds)

## Full Context

configure port ethernet efm-oam link-monitoring errored-frame-seconds

## Description

This command defines the errored frame seconds parameters including thresholds, and windows of time to which the error count will be compared. An errored second is any second in which a single frame error occurred. An errored frame is counted when there is any frame error detected by the Ethernet physical layer. This excludes jumbo frames above 9192 bytes that are dropped prior to this function.

## Platforms

All

## 9.136 errored-symbols

### errored-symbols

## Syntax

**errored-symbols**

**Context**

[\[Tree\]](#) (config>port>ethernet>efm-oam>link-monitoring errored-symbols)

**Full Context**

configure port ethernet efm-oam link-monitoring errored-symbols

**Description**

This command defines the symbol error parameters including thresholds, and windows of time (converted to symbols in that time) to which the error count will be compared. A symbol error occurs when any encoded symbol is in error and independent of frame counters.

**Platforms**

All

## 9.137 errors

### errors

**Syntax**

debug dynamic-services scripts event errors

debug dynamic-services scripts instance event errors

**Description**

This command enables/disables the generation of a specific dynamic data service script debugging event output: errors.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 9.138 es-activation-timer

### es-activation-timer

#### Syntax

**es-activation-timer** *seconds*

**no es-activation-timer**

#### Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg es-activation-timer)

#### Full Context

configure service system bgp-evpn ethernet-segment es-activation-timer

#### Description

This command configures the Ethernet Segment activation timer for a specified Ethernet Segment. The **es-activation-timer** delays the activation of a specified **ethernet-segment** on a specified PE that has been elected as DF (Designated Forwarder). Only when the **es-activation-timer** has expired, the SAP/SDP-binding associated to an **ethernet-segment** can be activated (in case of single-active multi-homing) or added to the default-multicast-list (in case of all-active multi-homing).

If **no es-activation-timer** is configured, the system uses the value configured in the **config>redundancy>bgp-evpn-multi-homing>es-activation-timer** context, if configured. Otherwise the system uses a default value of 3 seconds.

#### Default

no es-activation-timer

#### Parameters

**seconds**

Specifies the number of seconds for the **es-activation-timer**.

**Values** 0 to 100

**Default** 3

#### Platforms

All

### es-activation-timer

#### Syntax

**es-activation-timer** *seconds*

## Context

[\[Tree\]](#) (config>redundancy>bgp-evpn-multi-homing es-activation-timer)

## Full Context

configure redundancy bgp-evpn-multi-homing es-activation-timer

## Description

This command configures the global Ethernet-Segment activation timer. The **es-activation-timer** delays the activation of a specified Ethernet-Segment on a specified PE that has been elected as DF (Designated Forwarder). Only when the **es-activation-timer** has expired, the SAP/SDP-binding associated to an Ethernet-Segment can be activated (in case of single-active multi-homing) or added to the default-multicast-list (in case of all-active multi-homing).

The **es-activation-timer** configured at the Ethernet-Segment level supersedes this global **es-activation-timer**.

## Default

es-activation-timer 3

## Parameters

*seconds*

Specifies the number of seconds for the **es-activation-timer**.

**Values** 0 to 100

## Platforms

All

## 9.139 es-orig-ip

es-orig-ip

## Syntax

**es-orig-ip** *ip-address*

**no es-orig-ip**

## Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg es-orig-ip)

## Full Context

configure service system bgp-evpn ethernet-segment es-orig-ip

## Description

This command modifies the Originating IP field advertised in the ES route for a given Ethernet Segment. By default, the Originating IP is the system-ip of the PE. However, this value can be changed to the IPv4 or IPv6 address configured with this command.

With the **es-orig-ip** configured, ES shutdown is required, for the following cases:

- When adding Local ES routes, the command changes how the ES routes are added to the candidate list; the configured IP address is added, instead of the system-ip.
- When advertising local ES routes, the configured IP address is used for the orig-ip of the route.

The **no** form of the command changes the originating IP address back to the system-ip.

## Default

no es-orig-ip

## Parameters

### *ip-address*

Specifies an IPv4 or IPv6 address.

**Values** {*ip-address* | *ipv6-address*}

## Platforms

All

## 9.140 esa

esa

## Syntax

**esa** *esa-id* [**create**]

**no esa** *esa-id*

## Context

[\[Tree\]](#) (config esa)

## Full Context

configure esa

## Description

This command configures or creates an ESA instance with an identifier.

The **no** form of this command removes the ESA from the system.

## Parameters

### *esa-id*

Specifies the ESA identifier.

**Values** 1 to 16

### **create**

Mandatory keyword used when creating an ESA instance in the config context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

## 9.141 esa-vm

### esa-vm

## Syntax

[no] **esa-vm** [*esa-id/vm-id*]

## Context

[\[Tree\]](#) (config>isa>tunnel-group esa-vm)

## Full Context

configure isa tunnel-group esa-vm

## Description

This command specifies the tunnel ESA VM for the tunnel group. The ISA and ESA VM cannot co-exist in the same tunnel group.

## Parameters

### *esa-id*

Specifies the ESA id

**Values** 1 to 16

### *vm-id*

Specifies the VM id

**Values** 1 to 4

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

## esa-vm

### Syntax

[no] **esa-vm** [esa-id/vm-id]

### Context

[\[Tree\]](#) (config>isa>tunnel-mem-pool esa-vm)

### Full Context

configure isa tunnel-member-pool esa-vm

### Description

This command configures the tunnel ESA VM for the tunnel member pool. The ISA and ESA VM cannot coexist in the same tunnel member group.

The **no** form of this command removes the ESA VM from the tunnel member pool.

### Parameters

#### *esa-id*

Specifies the ESA ID.

**Values** 1 to 16

#### *vm-id*

Specifies the VM ID.

**Values** 1 to 4

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

## esa-vm

### Syntax

**esa-vm** vapp-id [drain]

**no esa-vm** vapp-id

### Context

[\[Tree\]](#) (config>isa>Ins-group esa-vm)

### Full Context

configure isa Ins-group esa-vm

## Description

This command specifies the ISA and ESA VM to be used in the LNS group.

## Parameters

### *vapp-id*

Displays the ID of the configured ESA and ESA VM.

| Values | vapp-id: | <i>esa-id/vm-id</i> |         |
|--------|----------|---------------------|---------|
|        |          | <i>esa-id</i>       | 1 to 16 |
|        |          | <i>vm-id</i>        | 1 to 4  |

### *drain*

Specifies the draining of the ESA VM. The drain function gracefully redirects subscribers to other ESA VMs as it does not allow new subscribers to use the ESA VM. Eventually, the ESA VM will not service any subscriber and can be decommissioned gracefully.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

## esa-vm

## Syntax

[no] **esa-vm** *vapp-id*

## Context

[\[Tree\]](#) (config>isa>wlan-group esa-vm)

## Full Context

configure isa wlan-group esa-vm

## Description

This command configures the ESA VM for the WLAN-GW group. It requires group redundancy to be configured in MDA mode.

## Parameters

### *vapp-id*

Specifies the ID of the ESA and ESA VM to configure.

| Values | vapp-id: | <i>esa-id/vm-id</i> |         |
|--------|----------|---------------------|---------|
|        |          | <i>esa-id</i>       | 1 to 16 |

*vm-id* 1 to 4

## esa-vm

### Syntax

[no] **esa-vm** *vapp-id*

### Context

[\[Tree\]](#) (config>isa>nat-group esa-vm)

### Full Context

configure isa nat-group esa-vm

### Description

This command assigns an ESA-VM to a NAT group.

### Parameters

***vapp-id***

Specifies the ESA and VM identifying a provisioned BB ISA.

#### Values

|                 |                     |         |
|-----------------|---------------------|---------|
| <i>vapp-id:</i> | <i>esa-id/vm-id</i> |         |
|                 | <i>esa-id</i>       | 1 to 16 |
|                 | <i>vm-id</i>        | 1 to 4  |

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

## esa-vm

### Syntax

[no] **esa-vm** *vapp-id*

### Context

[\[Tree\]](#) (config>isa>video-group esa-vm)

### Full Context

configure isa video-group esa-vm

**Description**

This command assigns an ESA-VM to a video group.

The **no** form of this command removes the specified ESA-VM from the video group.

**Default**

no esa-vm

**Parameters*****vapp-id***

Specifies the ESA and VM ID of the configured ESA-VM.

| Values | <i>vapp-id:</i> | <i>esa-id/vm-id</i> |         |
|--------|-----------------|---------------------|---------|
|        |                 | <i>esa-id</i>       | 1 to 16 |
|        |                 | <i>vm-id</i>        | 1 to 4  |

7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

**9.142 esi**

esi

**Syntax**

*esi value*

**no esi**

**Context**

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg esi)

**Full Context**

configure service system bgp-evpn ethernet-segment esi

**Description**

This command configures the 10-byte Ethernet Segment identifier (ESI) associated to the Ethernet-Segment that will be signaled in the BGP-EVPN routes. The ESI value cannot be changed unless the Ethernet-Segment is shutdown. Reserved esi values (0 and MAX-ESI) are not allowed.

**Default**

no esi

**Parameters****value**

Specifies the 10-byte esi.

**Values** 00-11-22-33-44-55-66-77-88-99  
Using any of these separators ('-',':')

**Platforms**

All

**9.143 esm**

esm

**Syntax**

[no] esm

**Context**

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>tunnel-query>ue-state esm)

**Full Context**

configure subscriber-mgmt wlan-gw tunnel-query ue-state esm

**Description**

This command enables matching on ESM UEs.

The **no** form of this command disables matching on DSM UEs, unless UE state matching is disabled altogether.

**Default**

no esm

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

esm

**Syntax**

[no] esm

**Context**

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>ue-query>state esm)

**Full Context**

configure subscriber-mgmt wlan-gw ue-query state esm

**Description**

This command enables matching on UEs in an ESM state.

The **no** form of this command disables matching on UEs in an ESM state, unless all state matching is disabled.

**Default**

no esm

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 9.144 esmc-tunnel

### esmc-tunnel

**Syntax**

[no] esmc-tunnel

**Context**

[\[Tree\]](#) (config>port>ethernet>ssm esmc-tunnel)

**Full Context**

configure port ethernet ssm esmc-tunnel

**Description**

This command allows ESMC frames that are received into the Ethernet port to be tunneled in an Epipe or VPLS service. This is not recommended because it breaks the concepts inherent in Synchronous Ethernet, however it is required for compliance to MEF 6.1.1 EPL Option 2.

The **no** form of this command extracts the ESMC frames upon reception by the port. The ESMC frames are not tunneled through the service.

**Default**

no esmc-tunnel

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 9.145 esp-auth-algorithm

### esp-auth-algorithm

#### Syntax

```
esp-auth-algorithm {null | md5 | sha1 | sha256 | sha384 | sha512 | aes-xcbc | auth-encryption}
no esp-auth-algorithm
```

#### Context

[\[Tree\]](#) (config>ipsec>transform esp-auth-algorithm)

#### Full Context

```
configure ipsec ipsec-transform esp-auth-algorithm
```

#### Description

This command specifies which hashing algorithm should be used for the authentication function Encapsulating Security Payload (ESP). Both ends of a manually configured tunnel must share the same configuration parameters for the IPsec tunnel to enter the operational state.

The **no** form of this command disables the authentication.

#### Default

```
esp-auth-algorithm sha1
```

#### Parameters

##### null

This is a very fast algorithm specified in RFC 2410, which provides no authentication.

##### md5

This parameter configures ESP to use the **hmac-md5** algorithm for authentication.

##### sha1

This parameter configures ESP to use the **hmac-sha1** algorithm for authentication.

##### sha256

This parameter configures ESP to use the **sha256** algorithm for authentication.

##### sha384

This parameter configures ESP to use the **sha384** algorithm for authentication.

##### sha512

This parameter configures ESP to use the **sha512** algorithm for authentication.

**aes-xcbc**

Specifies the **aes-xcbc** algorithm for authentication.

**auth-encryption**

This parameter must be configured when **esp-encryption-algorithm** is either **aes-gcm** or **aes-gmac**.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**esp-auth-algorithm****Syntax**

**esp-auth-algorithm** {**sha256** | **sha512**}

**no esp-auth-algorithm**

**Context**

[\[Tree\]](#) (config>grp-encryp>encryp-keygrp esp-auth-algorithm)

**Full Context**

configure group-encryption encryption-keygroup esp-auth-algorithm

**Description**

This command specifies the hashing algorithm used to perform authentication on the Encapsulating Security Payload (ESP) within NGE packets for services configured using this key group. All SPI entries must be deleted before the **no** form of the command may be entered or the **esp-auth-algorithm** value changed from its current value.

The **no** form of the command reverts to the default value.

**Default**

esp-auth-algorithm sha256

**Parameters****sha256**

Configures the ESP to use the HMAC-SHA-256 algorithm for authentication.

**sha512**

Configures the ESP to use the HMAC-SHA-512 algorithm for authentication.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 9.146 esp-encryption-algorithm

### esp-encryption-algorithm

#### Syntax

```
esp-encryption-algorithm {null | des | 3des | aes128 | aes192 | aes256| aes128-gcm8 | aes128-gcm12
| aes128-gcm16 | aes192-gcm8 | aes192-gcm12 | aes192-gcm16 | aes256-gcm8 | aes256-gcm12 |
aes256-gcm16 | null-aes128-gmac | null-aes192-gmac | null-aes256-gmac}
```

```
no esp-encryption-algorithm
```

#### Context

[\[Tree\]](#) (config>ipsec>ipsec-transform esp-encryption-algorithm)

#### Full Context

```
configure ipsec ipsec-transform esp-encryption-algorithm
```

#### Description

This command specifies the encryption algorithm to use for the IPsec session. Encryption only applies to esp configurations. If encryption is not defined, esp will not be used.

For IPsec tunnels to come up, both ends need to be configured with the same encryption algorithm.

The **no** form of this command removes the specified encryption algorithm.

#### Note:

When **aes-gcm** or **aes-gmac** is configured:

- **esp-auth-algorithm** must be set to **auth-encryption**
- the system will not include the authentication algorithm in the ESP proposal of the SA payload
- **ipsec-transform** cannot be used for manual keying

#### Default

```
esp-encryption-algorithm aes128
```

#### Parameters

##### null

This parameter configures the high-speed null algorithm, which does nothing. This is the same as not having encryption turned on.

##### des

This parameter configures the 56-bit des algorithm for encryption. This is an older algorithm, with relatively weak security. Although slightly better than no encryption, it should only be used where a strong algorithm is not available on both ends at an acceptable performance level.

##### 3des

This parameter configures the 3-des algorithm for encryption. This is a modified application of the des algorithm which uses multiple des operations to make things more secure.

**aes128**

This parameter configures the aes algorithm with a block size of 128 bits. This is the mandatory implementation size for aes. As of today, this is a very strong algorithm choice.

**aes192**

This parameter configures the aes algorithm with a block size of 192 bits. This is a stronger version of aes.

**aes256**

This parameter configures the aes algorithm with a block size of 256 bits. This is the strongest available version of aes.

**aes128-gcm8**

Configures ESP to use aes-gcm with a 128-bit key size and an 8-byte ICV for encryption and authentication.

**aes128-gcm12**

Configures ESP to use aes-gcm with a 128-bit key size and a 12-byte ICV for encryption and authentication.

**aes128-gcm16**

Configures ESP to use aes-gcm with a 128-bit key size and a 16-byte ICV for encryption and authentication.

**aes192-gcm8**

Configures ESP to use aes-gcm with a 192-bit key size and an 8-byte ICV for encryption and authentication.

**aes192-gcm12**

Configures ESP to use aes-gcm with a 192-bit key size and a 12-byte ICV for encryption and authentication.

**aes192-gcm16**

Configures ESP to use aes-gcm with a 192-bit key size and a 16-byte ICV for encryption and authentication.

**aes256-gcm8**

Configures ESP to use aes-gcm with a 256-bit key size and an 8-byte ICV for encryption and authentication.

**aes256-gcm12**

Configures ESP to use aes-gcm with a 256-bit key size and a 12-byte ICV for encryption and authentication.

**aes128-gcm16**

Configures ESP to use aes-gcm with a 256-bit key size and a 16-byte ICV for encryption and authentication.

**null-aes128gmac**

Configures ESP to use aes-gmac with a 128-bit key size for authentication only.

**null-aes192gmac**

Configures ESP to use aes-gmac with a 192-bit key size for authentication only.

**null-aes256gmac**

Configures ESP to use aes-gmac with a 256-bit key size for authentication only.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**esp-encryption-algorithm****Syntax**

**esp-encryption-algorithm** {**aes128** | **aes256**}  
**no esp-encryption-algorithm**

**Context**

[\[Tree\]](#) (config>grp-encryp>encryp-keygrp esp-encryption-algorithm)

**Full Context**

configure group-encryption encryption-keygroup esp-encryption-algorithm

**Description**

This command specifies the encryption algorithm used to perform encryption on the Encapsulating Security Payload (ESP) within NGE packets for services configured using this key group. All SPI entries must be deleted before the **no** form of the command may be entered or the **esp-encryption-algorithm** value changed from its current value.

The **no** form of the command resets the parameter to the default value.

**Default**

esp-encryption-algorithm aes128

**Parameters****aes128**

Configures the AES algorithm with a block size of 128 bits—a very strong algorithm choice.

**aes256**

Configures the AES algorithm with a block size of 256 bits—the strongest available version of AES.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 9.147 esp-ext-hdr

## esp-ext-hdr

### Syntax

**esp-ext-hdr** {true | false}

**no esp-ext-hdr**

### Context

[\[Tree\]](#) (config>filter>ipv6-filter>entry>match esp-ext-hdr)

### Full Context

configure filter ipv6-filter entry match esp-ext-hdr

### Description

This command enables match on existence of ESP Extension Header in the IPv6 filter policy.

The **no** form of this command ignores ESP Extension Header presence/absence in a packet when evaluating match criteria of a given filter policy entry.

### Default

no esp-ext-hdr

### Parameters

**true**

Matches a packet with an ESP Extension Header.

**false**

Matches a packet without an ESP Extension Header.

### Platforms

All

## 9.148 ess-system-type

## ess-system-type

### Syntax

**[no] ess-system-type**

### Context

[\[Tree\]](#) (bof ess-system-type)

## Full Context

bof ess-system-type

## Description

This command allows a new RoHS compliant 7750 SR-12 or 7750 SR-7 chassis to operate as an 7450 ESS-12 or 7450 ESS-7 system.

After entering this command, the system must be rebooted for the change to take effect.

If the RoHS compliant 7750 SR-12 or 7750 SR-7 chassis is operating as an 7450 ESS system, it can operate with either the 7750 SR or 7450 ESS CPM (subject to SR OS support) but both should always be the same type. See the SR OS release notes for information about the cards supported in 7750 SR and 7450 ESS.

In addition, the system can operate with supported 7450 ESS or 7750 SR IOMs, MDAs, and IMMs.

The **no** form of this command disables this mode of operation and returns the system to a 7750 SR chassis type operation on the next reboot.

## Default

no ess-system-type

## Description

Commands in this context configure Enrollment over Secure Transport (EST) parameters.

## Platforms

All

## 9.150 eth-bn

### eth-bn

#### Syntax

**eth-bn**

#### Context

[\[Tree\]](#) (config>port>ethernet>eth-cfm>mep eth-bn)

#### Full Context

configure port ethernet eth-cfm mep eth-bn

#### Description

Commands in this context configure Ethernet Bandwidth Notification (ETH-BN) message handling.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 9.151 eth-bn-egress-rate-changes

### eth-bn-egress-rate-changes

#### Syntax

**eth-bn-egress-rate-changes**  
**no eth-bn-egress-rate-changes**

#### Context

[\[Tree\]](#) (config>port>ethernet eth-bn-egress-rate-changes)

#### Full Context

configure port ethernet eth-bn-egress-rate-changes

#### Description

This command allows rate changes received in ETH-BN messages on a port-based MEP to update the egress rate used on the port. The egress rate is capped by the minimum of the configured **egress-rate** and the maximum port rate, and the minimum egress rate is 1 kb/s. The **no** form of this command returns the value to the default.

**Default**

no eth-bn-egress-rate-changes

**Platforms**

All

## 9.152 eth-cfm

### eth-cfm

**Syntax**

eth-cfm

**Context**

[\[Tree\]](#) (config>eth-tunnel>path eth-cfm)

**Full Context**

configure eth-tunnel path eth-cfm

**Description**

Commands in this context configure ETH-CFM parameters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### eth-cfm

**Syntax**

eth-cfm

**Context**

[\[Tree\]](#) (config>lag eth-cfm)

[\[Tree\]](#) (config>port>ethernet eth-cfm)

**Full Context**

configure lag eth-cfm

configure port ethernet eth-cfm

**Description**

Commands in this context configure 802.1ag CFM parameters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## eth-cfm

### Syntax

**eth-cfm**

### Context

[\[Tree\]](#) (config>service>epipe>sap eth-cfm)

[\[Tree\]](#) (config>service>epipe eth-cfm)

[\[Tree\]](#) (config>service>epipe>spoke-sdp eth-cfm)

[\[Tree\]](#) (config>service>ipipe>sap eth-cfm)

### Full Context

configure service epipe sap eth-cfm

configure service epipe eth-cfm

configure service epipe spoke-sdp eth-cfm

configure service ipipe sap eth-cfm

### Description

Commands in this context configure ETH-CFM parameters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## eth-cfm

### Syntax

**eth-cfm**

### Context

[\[Tree\]](#) (config>service>vpls eth-cfm)

[\[Tree\]](#) (config>service>vpls>spoke-sdp eth-cfm)

[\[Tree\]](#) (config>service>vpls>mesh-sdp eth-cfm)

[\[Tree\]](#) (config>service>vpls>sap eth-cfm)

### Full Context

configure service vpls eth-cfm

configure service vpls spoke-sdp eth-cfm

```
configure service vpls mesh-sdp eth-cfm
configure service vpls sap eth-cfm
```

### Description

Commands in this context configure ETH-CFM parameters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## eth-cfm

### Syntax

```
eth-cfm
```

### Context

**[Tree]** (config>service>ies>sub-if>grp-if>sap eth-cfm)

**[Tree]** (config>service>ies>if>spoke-sdp eth-cfm)

**[Tree]** (config>service>ies eth-cfm)

**[Tree]** (config>service>ies>if>sap eth-cfm)

### Full Context

```
configure service ies subscriber-interface group-interface sap eth-cfm
```

```
configure service ies interface spoke-sdp eth-cfm
```

```
configure service ies eth-cfm
```

```
configure service ies interface sap eth-cfm
```

### Description

Commands in this context configure ETH-CFM parameters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

- configure service ies subscriber-interface group-interface sap eth-cfm

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure service ies interface sap eth-cfm
- configure service ies interface spoke-sdp eth-cfm
- configure service ies eth-cfm

## eth-cfm

### Full Context

configure service vprn interface spoke-sdp eth-cfm

configure service vprn subscriber-interface group-interface sap eth-cfm

configure service vprn eth-cfm

configure service vprn interface sap eth-cfm

### Description

Commands in this context configure ETH-CFM parameters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure service vprn interface sap eth-cfm
- configure service vprn eth-cfm
- configure service vprn interface spoke-sdp eth-cfm

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

- configure service vprn subscriber-interface group-interface sap eth-cfm

## eth-cfm

### Syntax

**eth-cfm**

### Context

**[Tree]** (debug eth-cfm)

### Full Context

debug eth-cfm

**Description**

Commands in this context configure ETH-CFM debugging functions.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**eth-cfm****Syntax**

eth-cfm

**Context**

[\[Tree\]](#) (config>router>if eth-cfm)

**Full Context**

configure router interface eth-cfm

**Description**

Commands in this context configure ETH-CFM parameters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**eth-cfm****Syntax**

eth-cfm

**Context**

[\[Tree\]](#) (config>eth-ring>path eth-cfm)

**Full Context**

configure eth-ring path eth-cfm

**Description**

Commands in this context configure ETH-CFM parameters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## eth-cfm

### Syntax

**eth-cfm**

### Context

[\[Tree\]](#) (config eth-cfm)

### Full Context

configure eth-cfm

### Description

Commands in this context configure 802.1ag CFM parameters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## eth-cfm

### Syntax

**[no] eth-cfm**

### Context

[\[Tree\]](#) (config>sys>security>cpu-protection>policy eth-cfm)

### Full Context

configure system security cpu-protection policy eth-cfm

### Description

Provides the construct under which the different entries within CPU policy can define the match criteria and overall arrival rate of the Ethernet Configuration and Fault Management (ETH-CFM) packets at the CPU.

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## eth-cfm

### Syntax

**eth-cfm**

### Context

[\[Tree\]](#) (config>test-oam>sath>svc-test>svc-stream>frm-pay|>eth eth-cfm)

**Full Context**

configure test-oam service-activation-testhead service-test service-stream frame-payload ethernet eth-cfm

**Description**

Commands in this context configure the ETH-CFM source MEP for the service activation test stream.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

**9.153 eth-cfm-linktrace****eth-cfm-linktrace****Syntax**

```
eth-cfm-linktrace {mac-address | remote-mepid mep-id} mep mep-id domain md-index association
 ma-index [ttl ttl-value] [fc {fc-name}] [profile {in | out}] [count send-count] [timeout timeout] [interval
 interval]
```

**Context**

[\[Tree\]](#) (config>saa>test>type eth-cfm-linktrace)

**Full Context**

configure saa test type eth-cfm-linktrace

**Description**

This command configures a CFM linktrace test in SAA.

**Parameters*****mac-address***

Specifies the Layer 2 unicast MAC address of the destination MEP.

**Values** xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

***remote-mepid mep-id***

Specifies the remote MEP ID as an alternative to the static *mac-address*. When the **remote-mepid** parameter is used in place of the *mac-address*, the domain and association information of the **source mep** for the test is used to check for a locally-stored unicast MAC address for the peer. The local MEP must be administratively enabled.

**Values** 1 to 8191

***mep mep-id***

Specifies the local MEP ID.

**Values** 1 to 8191

***md-index***

Specifies the MD index.

**Values** 1 to 4294967295

***ma-index***

Specifies the MA index.

**Values** 1 to 4294967295

***ttl-value***

Specifies the maximum number of hops traversed in the linktrace.

**Values** 1 to 255

**Default** 64

***fc-name***

Specifies the forwarding class of the MPLS echo request packets. The actual forwarding class encoding is controlled by the network egress LSP-EXP mappings.

**Values** be, l2, af, l1, h2, ef, h1, nc

**Default** nc

***profile {in | out}***

Specifies the profile state of the MPLS echo request encapsulation.

**Default** in

***send-count***

Specifies the number of messages to send, expressed as a decimal integer. The **count** parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message **interval** value must be expired before the next message request is sent.

**Values** 1 to 10

**Default** 1

***timeout***

Specifies the time, to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the last probe for a specific test. Upon the expiration of the time out, the test is marked complete and no more packets are processed for any of those request probes.

**Values** 1 to 10

**Default** 5

***interval***

Specifies the time, in seconds, to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

**Values** 1 to 10

**Default** 5

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 9.154 eth-cfm-loopback

### eth-cfm-loopback

**Syntax**

**eth-cfm-loopback** {*mac-address* | **remote-mepid** *mep-id*} **mep** *mep-id* **domain** *md-index* **association** *ma-index* [**size** *data-size*] [**fc** {*fc-name*}] [**profile** {**in** | **out**}] [**count** *send-count*] [**timeout** *timeout*] [**interval** *interval*]

**Context**

[\[Tree\]](#) (config>saa>test>type eth-cfm-loopback)

**Full Context**

configure saa test type eth-cfm-loopback

**Description**

This command configures an Ethernet CFM loopback test in SAA.

**Parameters*****mac-address***

Specifies the Layer 2 unicast MAC address of the destination MEP.

**Values** xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

***remote-mepid mep-id***

Specifies the remote MEP ID as an alternative to the static *mac-address*. When the **remote-mepid** parameter is used in place of the *mac-address*, the domain and association information of the **source mep** for the test is used to check for a locally-stored unicast MAC address for the peer. The local MEP must be administratively enabled.

**Values** 1 to 8191

***mep mep-id***

Specifies the local MEP ID.

**Values** 1 to 8191

#### ***md-index***

Specifies the MD index.

**Values** 1 to 4294967295

#### ***ma-index***

Specifies the MA index.

**Values** 1 to 4294967295

#### ***data-size***

This is the size of the data portion of the data TLV. If 0 is specified, no data TLV is added to the packet.

**Values** 0 to 1500

**Default** 0

#### ***fc-name***

Specifies the **fc** parameter that is used to indicate the forwarding class of the MPLS echo request packets. The actual forwarding class encoding is controlled by the network egress LSP-EXP mappings.

**Values** be, l2, af, l1, h2, ef, h1, nc

**Default** nc

#### **profile {in | out}**

Specifies the profile state of the MPLS echo request encapsulation.

**Default** in

#### ***send-count***

Specifies the number of messages to send, expressed as a decimal integer. The **count** parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message **interval** value must be expired before the next message request is sent.

**Values** 1 to 100

**Default** 1

#### ***timeout***

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the last probe for a specific test. Upon the expiration of time out, the test is marked complete and no more packets are processed for any of those request probes.

**Values** 1 to 10

**Default** 5

### *interval*

Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

**Values** 1 to 10

**Default** 5

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 9.155 eth-cfm-two-way-delay

### eth-cfm-two-way-delay

#### Syntax

```
eth-cfm-two-way-delay {mac-address | remote-mepid mep-id} mep mep-id domain md-index
association ma-index [fc {fc-name}] [profile {in | out}] [count send-count] [timeout timeout] [interval
interval]
```

#### Context

[\[Tree\]](#) (config>saa>test>type eth-cfm-two-way-delay)

#### Full Context

```
configure saa test type eth-cfm-two-way-delay
```

#### Description

This command configures an Ethernet CFM two-way delay test in SAA.

#### Parameters

##### *mac-address*

Specifies the Layer 2 unicast MAC address of the destination MEP.

**Values** xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

##### remote-mepid *mep-id*

Specifies the remote MEP ID as an alternative to the static *mac-address*. When the **remote-mepid** parameter is used in place of the *mac-address*, the domain and association

information of the **source mep** for the test is used to check for a locally-stored unicast MAC address for the peer. The local MEP must be administratively enabled.

**Values** 1 to 8191

#### **mep mep-id**

Specifies the local MEP ID.

**Values** 1 to 8191

#### **md-index**

Specifies the MD index.

**Values** 1 to 4294967295

#### **ma-index**

Specifies the MA index.

**Values** 1 to 4294967295

#### **fc-name**

Specifies the **fc** parameter that is used to indicate the forwarding class of the MPLS echo request packets. The actual forwarding class encoding is controlled by the network egress LSP-EXP mappings.

**Values** be, l2, af, l1, h2, ef, h1, nc

**Default** nc

#### **send-count**

Specifies the number of messages to send, expressed as a decimal integer. The count parameter is used to override the default number of message requests sent. The message interval value must be expired before the next message request is sent.

**Values** 1 to 100

**Default** 1

#### **timeout**

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the last probe for a specific test. Upon the expiration of time out, the test is marked complete and no more packets are processed for any of those request probes.

**Values** 1 to 10

**Default** 5

#### **interval**

Specifies the time, in seconds, expressed as a decimal integer. This parameter is used to configure the spacing between probes within a test run.

**Values** 0.1 to 0.9, 1 to 10

**Default** 5

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 9.156 eth-cfm-two-way-slm

### eth-cfm-two-way-slm

#### Syntax

```
eth-cfm-two-way-slm {mac-address | remote-mepid mep-id} mep mep-id domain md-index association
ma-index [fc {fc-name}] [profile {in | out}] [count send-count] [size data-size] [timeout timeout]
[interval interval]
```

#### Context

[\[Tree\]](#) (config>saa>test>type eth-cfm-two-way-slm)

#### Full Context

```
configure saa test type eth-cfm-two-way-slm
```

#### Description

This command configures an Ethernet CFM two-way SLM test in SAA.

#### Parameters

##### *mac-address*

Specifies the Layer 2 unicast MAC address of the destination MEP.

**Values** xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

##### **remote-mepid** *mep-id*

Specifies the remote MEP ID as an alternative to the static *mac-address*. When the **remote-mepid** parameter is used in place of the *mac-address*, the domain and association information of the **source mep** for the test is used to check for a locally-stored unicast MAC address for the peer. The local MEP must be administratively enabled.

**Values** 1 to 8191

##### **mep** *mep-id*

Specifies the local MEP ID.

**Values** 1 to 8191

##### *md-index*

Specifies the MD index.

**Values** 1 to 4294967295

***ma-index***

Specifies the MA index.

**Values** 1 to 4294967295

***fc-name***

Specifies the **fc** parameter that is to indicate the forwarding class of the MPLS echo request packets. The actual forwarding class encoding is controlled by the network egress LSP-EXP mappings.

**Values** be, l2, af, l1, h2, ef, h1, nc

**Default** nc

**profile {in | out}**

The profile state of the MPLS echo request encapsulation.

**Default** in

***send-count***

Specifies the number of messages to send, expressed as a decimal integer. The count parameter is used to override the default number of message requests sent. The message interval value must be expired before the next message request is sent.

**Values** 1 to 1000

**Default** 1

***data-size***

Specifies the size of the data portion of the data TLV. If 0 is specified, no data TLV is added to the packet.

**Values** 0 to 1500

**Default** 0

***timeout***

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the last probe for a specific test. Upon the expiration of the time out, the test is marked complete and no more packets are processed for any of those request probes.

**Values** 1 to 10

**Default** 5

***interval***

Specifies the time, in seconds, used to configure the spacing between probes within a test run.

**Values** 0.1 to 0.9, 1 to 10

**Default** 5

## 9.159 eth-ring

eth-ring

### Syntax

**eth-ring** *ring-id*

**no eth-ring**

### Context

[\[Tree\]](#) (config>service>vpls eth-ring)

### Full Context

configure service vpls eth-ring

### Description

This command configures a VPLS SAP to be associated with an Ethernet ring. The SAP port ID is associated with the corresponding Ethernet ring path configured on the same port ID. The encapsulation type must be compatible with the Ethernet ring path encapsulation.

The **no** form of this command removes the Ethernet ring association from this SAP.

### Default

no eth-ring

### Parameters

***ring-id***

Specifies the ring ID.

**Values** 1 to 128

### Platforms

All

## eth-ring

### Syntax

**eth-ring** *ring-index*

**no eth-ring**

### Context

[\[Tree\]](#) (config eth-ring)

### Full Context

configure eth-ring

### Description

This command configures a G.8032 protected Ethernet ring. G.8032 Rings may be configured as major rings with two paths (a&b) or as sub-rings with two paths, or in the case of an interconnection node a single path.

The **no** form of this command deletes the Ethernet ring specified by the ring-id.

### Default

no eth-ring

### Parameters

*ring-index*

Specifies the ring ID.

**Values** 1 to 128

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 9.160 eth-sat

## eth-sat

### Syntax

**eth-sat** *sat-id* [**create**]

**no eth-sat** *sat-id*

### Context

[\[Tree\]](#) (config>system>satellite eth-sat)

## Full Context

configure system satellite eth-sat

## Description

This command enables the specified Ethernet satellite configuration context.

The **no** form of the command deletes the specified Ethernet satellite.

## Parameters

### *sat-id*

Specifies the satellite ID for the associated Ethernet satellite.

**Values** 1 to 20

### **create**

Creates a new Ethernet satellite context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## eth-sat

## Syntax

**eth-sat** *sat-id*

## Context

[\[Tree\]](#) (admin>satellite eth-sat)

## Full Context

admin satellite eth-sat

## Description

This command can be used to perform administrative functions on the specified Ethernet-satellite chassis.

## Parameters

### *sat-id*

Specifies the Ethernet-satellite chassis.

**Values** 1 to 20

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 9.161 eth-tag

### eth-tag

#### Syntax

**eth-tag** *tag-value*

**no eth-tag**

#### Context

[\[Tree\]](#) (config>service>epipe>bgp-evpn>remote-attachment-circuit eth-tag)

[\[Tree\]](#) (config>service>epipe>bgp-evpn>local-attachment-circuit eth-tag)

#### Full Context

configure service epipe bgp-evpn remote-attachment-circuit eth-tag

configure service epipe bgp-evpn local-attachment-circuit eth-tag

#### Description

This command configures the Ethernet tag value. When configured in the **local-attachment-circuit** context, the system uses the value in the advertised AD per-EVI route sent for the attachment circuit. When configured in the **remote-attachment-circuit** context the system compares that value with the eth-tag value of the imported AD per-EVI routes for the service. If there is a match, the system creates an EVPN destination for the Epipe.

#### Parameters

***tag-value***

Specifies the Ethernet tag value of the attachment circuit.

**Values** 1 to 16777215

#### Platforms

All

## 9.162 eth-test

### eth-test

#### Syntax

**eth-test** {*mac-address* | **remote-mepid** *mep-id*} **mep** *mep-id* **domain** *md-index* **association** *ma-index*  
[**priority** *priority*] [**data-length** *data-length*]

## Context

[\[Tree\]](#) (oam>eth-cfm eth-test)

## Full Context

oam eth-cfm eth-test

## Description

This command initiates an ETH-CFM test. The implementation supports a single ETH-TST PDU to check unidirectional reachability, launched from a source MEP and terminated on the remote MEP with no response PDU toward the source.

## Parameters

### *mac-address*

Specifies a unicast destination MAC address.

**Values** xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

### *remote-mepid mep-id*

Specifies the remote MEP ID of the peer within the association. The domain and association information are derived from the **source mep** for the session. The Layer 2 IEEE MAC address is resolved from previously-learned remote MAC addressing, derived from the reception and processing of the ETH-CC PDU. The local MEP must be administratively enabled.

**Values** 1 to 8191

### *mep mep-id*

Specifies the local MEP ID.

**Values** 1 to 8191

### *md-index*

Specifies the MD index.

**Values** 1 to 4294967295

### *ma-index*

Specifies the MA index.

**Values** 1 to 4294967295

### *priority*

Specifies the priority of the frame. The priority can be manipulated by QoS policies.

**Values** 0 to 7

**Default** 7

### *data-length*

Specifies the size of the padding to be added to the frame.

**Values** 64 to 1500

**Default** 64

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 9.163 eth-test-enable

### eth-test-enable

#### Syntax

[no] **eth-test-enable**

#### Context

**[Tree]** (config>eth-tunnel>path>eth-cfm>mep eth-test-enable)

#### Full Context

configure eth-tunnel path eth-cfm mep eth-test-enable

#### Description

This command enables eth-test functionality on MEP. For this test to work, operators need to configure ETH-test parameters on both sender and receiver nodes. The ETH-test is then performed using the following OAM commands:

**oam eth-cfm eth-test mac-address mep mep-id domain md-index association ma-index [priority priority] [data-length data-length]**

A check is done for both the provisioning and test to ensure the MEP is an Y.1731 MEP (MEP provisioned with domain format none, association format icc-based). If not, the operation fails. An error message in the CLI and SNMP will indicate the problem.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### eth-test-enable

#### Syntax

[no] **eth-test-enable**

#### Context

**[Tree]** (config>router>if>eth-cfm>mep eth-test-enable)

**[Tree]** (config>lag>eth-cfm>mep eth-test-enable)

**[Tree]** (config>port>ethernet>eth-cfm>mep eth-test-enable)

### Full Context

configure router interface eth-cfm mep eth-test-enable

configure lag eth-cfm mep eth-test-enable

configure port ethernet eth-cfm mep eth-test-enable

### Description

For this test to work, operators need to configure ETH-test parameters on both sender and receiver nodes. The ETH-test is then performed using the following OAM commands:

```
oam eth-cfm eth-test mac-address mep mep-id domain md-index association ma-index [priority priority]
[data-length data-length]
```

The **no** form of this command disables eth-test capabilities.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## eth-test-enable

### Syntax

## eth-tunnel

### Syntax

**[no] eth-tunnel** *tunnel-index*

### Context

**[Tree]** (config eth-tunnel)

### Full Context

configure eth-tunnel

### Description

This command configures a G.8031 protected Ethernet tunnel.

The **no** form of this command deletes the Ethernet tunnel specified by the tunnel-id.

### Parameters

***tunnel-index***

Specifies the tunnel index.

**Values** 1 to 1024

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## eth-tunnel

## Syntax

**eth-tunnel** *tunnel-id*

## Context

[\[Tree\]](#) (config>service>vpls eth-tunnel)

## Full Context

configure service vpls eth-tunnel

## Description

This command associates a BVPLS SAP with the global Ethernet tunnel object specified by *tunnel-id*. Only one-to-one mapping between SAP and Ethernet tunnel is supported in the initial implementation. The global *eth-tunnel tunnel-id* with at least a member port must be configured in advance for the command to be successful. A SAP will be instantiated using the active path components (member port and control-tag) for VPLS forwarding. The last member port in the Ethernet tunnel cannot be deleted if there is a SAP configured on that *eth-tunnel*. This command is only available in the BVPLS context.

The **no** form of this command removes the sap from the Ethernet tunnel object.

## Default

no sap is specified

## Parameters

***tunnel-id***

Specifies the value of the Ethernet tunnel identifier to be used for the SAP.

**Values** 1 to 64

## Platforms

All

configure oam-pm session ethernet

### Description

Commands in this context configure the Ethernet specific source and destination information, the priority, and the Ethernet tests tools on the launch point.

## Platforms

All

## ethernet

### Syntax

ethernet

### Context

[\[Tree\]](#) (config>test-oam>sath>svc-test>svc-stream>frm-payl ethernet)

### Full Context

configure test-oam service-activation-testhead service-test service-stream frame-payload ethernet

### Description

Commands in this context configure the Ethernet header parameters and ETH-CFM information used by the testhead tool.

Only the specified header information is included in the frame. At a minimum, the Ethernet destination MAC address and ETH-CFM information must be included.

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 9.167 ethernet-ctag

### ethernet-ctag

#### Syntax

[no] ethernet-ctag

#### Context

[\[Tree\]](#) (config>qos>sap-egress ethernet-ctag)

#### Full Context

configure qos sap-egress ethernet-ctag

#### Description

This command specifies that the top customer tag should be used for egress reclassification based on dot1p criteria. This command applies to all dot1p criteria configured in a given SAP egress QoS policy.

The **no** form of this command means that a service delimiting tag will be used for egress reclassification based on dot1p criteria.

#### Default

no ethernet-ctag

#### Platforms

All

## 9.168 ethernet-header

### ethernet-header

#### Syntax

ethernet-header [da *ieee-address*] [sa *ieee-address*] [etype *ethertype*]

no ethernet-header

#### Context

[\[Tree\]](#) (config>li>li-source>nat ethernet-header)

#### Full Context

configure li li-source nat ethernet-header

## Description

This command configures the Ethernet header for the NAT sources.

The **no** form of this command removes the values from the configuration.

## Parameters

### **da** *ieee-address*

Specifies the destination MAC address field of the of the Ethernet encapsulation used for the NAT subscribers associated with this mirror source up to 30 characters.

### **sa** *ieee-address*

Specifies the source MAC address field of the of the Ethernet encapsulation used for the NAT subscribers associated with this mirror source up to 30 characters.

### *ethertype*

Specifies the ethertype of the ethernet encapsulation used for the NAT subscribers associated with this mirror source that have an intercept identifier.

**Values** 1536 to 65535

## Platforms

## 9.169 ethernet-segment

### ethernet-segment

## Syntax

**ethernet-segment** *name* [**virtual**] [**create**]

**no ethernet-segment** *name*

## Context

[\[Tree\]](#) (config>service>system>bgp-evpn ethernet-segment)

## Full Context

configure service system bgp-evpn ethernet-segment

## Description

This command configures an Ethernet Segment instance and its corresponding name. The configuration of the dot1q or qinq nodes is only allowed if the Ethernet Segment (ES) is created as **virtual**.

For a virtual ES, a port, LAG, or SDP must be created for the ES before configuring a VLAN or vc-id association.

When a port or LAG is added, the **type** and **encap-type** values are checked. If the **encap-type** is **dot1q**, then only the dot1q node can be configured; the qinq context is not allowed. In the same way, if the **encap-**

**type** is **qinq**, then only the qinq node is allowed. A dot1q, qinq, or vc-id range is required for a virtual ES to be operationally active.

### Parameters

**name**

Specifies the 32-character ES name.

**virtual**

This keyword specifies that the ES is virtual and is associated to logical interfaces, in addition to ports, LAGs, or SDPs.

**create**

Mandatory keyword for creating an ES.

## 9.170 etype

### etype

#### Syntax

**etype** *etype-value*

**no etype**

#### Context

[\[Tree\]](#) (config>qos>sap-ingress>mac-criteria>entry>match etype)

#### Full Context

```
configure qos sap-ingress mac-criteria entry match etype
```

#### Description

Configures an Ethernet type II value to be used as a service ingress QoS policy match criterion.

The Ethernet type field is a 2-byte field used to identify the protocol carried by the Ethernet frame. For e.g. 0800 is used to identify the IPv4 packets.

The Ethernet type field is used by the Ethernet version-II frames. IEEE 802.3 Ethernet frames do not use the type field. For IEEE 802.3 frames, use the dsap, ssap, or snap-pid fields as match criteria.

The snap-pid field, etype field, ssap, and dsap fields are mutually exclusive and cannot be part of the same match criteria.

The no form of this command removes the previously entered etype field as the match criteria.

**Default**

no etype

**Parameters*****etype-value***

The Ethernet type II frame Ethertype value to be used as a match criterion expressed in hexadecimal.

**Values** 0x0600 to 0xFFFF

**Platforms**

All

**etype****Syntax**

**etype** *0x0600..0xffff*

**no etype**

**Context**

[\[Tree\]](#) (config>filter>mac-filter>entry>match etype)

**Full Context**

configure filter mac-filter entry match etype

**Description**

Configures an Ethernet type II Ethertype value to be used as a MAC filter match criterion.

The Ethernet type field is a two-byte field used to identify the protocol carried by the Ethernet frame. For example, 0800 is used to identify the IPv4 packets.

The Ethernet type field is used by the Ethernet version-II frames. IEEE 802.3 Ethernet frames do not use the type field. For IEEE 802.3 frames, use the dsap, ssap or snap-pid fields as match criteria.

The snap-pid field, etype field, ssap and dsap fields are mutually exclusive and may not be part of the same match criteria.

The **no** form of the command removes the previously entered etype field as the match criteria.

**Default**

no etype

**Parameters*****0x0600..0xffff***

Specifies the Ethernet type II frame Ethertype value to be used as a match criterion expressed in decimal integer or hexadecimal format.

**Values** 1536 to 65535 or 0x0600 to 0xFFFF

## Platforms

All

## etype

## Syntax

**etype** *0x0600xx0xffff*

**no etype**

## Context

[\[Tree\]](#) (config>system>security>mgmt-access-filter>mac-filter>entry>match etype)

## Full Context

configure system security management-access-filter mac-filter entry match etype

## Description

Configures an Ethernet type II Ethertype value to be used as a MAC filter match criterion.

The Ethernet type field is a two-byte field used to identify the protocol carried by the Ethernet frame. For example, 0800 is used to identify the IPv4 packets.

The Ethernet type field is used by the Ethernet version-II frames. IEEE 802.3 Ethernet frames do not use the type field. For IEEE 802.3 frames, use the dsap, ssap or snap-pid fields as match criteria.

The snap-pid field, etype field, ssap and dsap fields are mutually exclusive and may not be part of the same match criteria. Refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for information about MAC Match Criteria Exclusivity Rules fields that are exclusive based on the frame format.

The **no** form of this command removes the previously entered etype field as the match criteria.

## Default

no etype

## Parameters

### *ethernet-type*

Specifies the Ethernet type II frame Ethertype value to be used as a match criterion expressed in hexadecimal.

**Values** 0x0600 to 0xFFFF

debug dynamic-services scripts event

debug dynamic-services scripts script event

## Description

This command enables/disables the generation of all dynamic data service script debugging events output: cli, errors, executed-cmd, warnings, state-change.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## event

## Syntax

**event** *event-type* [**create**]

**no event** *event-type*

## Context

[\[Tree\]](#) (config>card>mda event)

## Full Context

configure card mda event

## Description

This command allows the user to control the action to be taken when a specific hardware error event is raised against the target MDA.

If no event action has been created for a specific event type, then the hardware errors related to that event type are ignored by the management plane of the router.

The **no** form of this command clears any action defined for the event.

## Parameters

### *event-type*

Specifies the event type, up to 32 characters.

|               |                                                                                                                                                             |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Values</b> | soft-error — Defines the action to be taken when soft errors are detected on the MDA                                                                        |
|               | internal-frame-loss — System detected frame loss in the traffic transiting the MDA.                                                                         |
|               | memory-error — Provides the user options to handle MDA memory error events on MDAs. This feature is supported on FP2- and FP3-based Ethernet MDAs and IMMs. |
|               | data-link-error — Provides the user options to handle datapath link errors on an MDA.                                                                       |

The **no** form of this command disables debugging for the specified IP events.

### Platforms

All

## event

### Syntax

**event** *rmon-event-id* [*event-type*] [**description** *description-string*] [**owner** *owner-string*]

**no event** *rmon-event-id*

### Context

[\[Tree\]](#) (config>system>thresholds>rmon event)

### Full Context

configure system thresholds rmon event

### Description

The event command configures an entry in the RMON-MIB event table. The event command controls the generation and notification of threshold crossing events configured with the alarm command. When a threshold crossing event is triggered, the **rmon>event** configuration optionally specifies if an entry in the RMON-MIB log table should be created to record the occurrence of the event. It may also specify that an SNMP notification (trap) should be generated for the event. The RMON-MIB defines two notifications for threshold crossing events: Rising Alarm and Falling Alarm.

Creating an event entry in the RMON-MIB log table does not create a corresponding entry in the SR OS event logs. However, when the **event-type** is set to trap, the generation of a Rising Alarm or Falling Alarm notification creates an entry in the SR OS event logs and that is distributed to all the SR OS log destinations that are configured: CONSOLE, session, memory, file, syslog, or SNMP trap destination.

The SR OS logger message includes a rising or falling threshold crossing event indicator, the sample type (absolute or delta), the sampled value, the threshold value, the RMON-alarm-id, the associated RMON-event-id and the sampled SNMP object identifier.

Use the **no** form of this command to remove an rmon-event-id from the configuration.

## Parameters

### *rmon-event-id*

Specifies an identifier for this event. Alarm ID values above 65400 are used for dynamic system threshold commands and should be avoided.

**Values** 1 to 65535

### *rmon-event-type*

Specifies the type of notification action to be taken when this event occurs.

**Values** **log** — An entry is made in the RMON-MIB log table for each event occurrence.

This does **not** create an SR OS logger entry. The RMON-MIB log table entries can be viewed using the **show>system>thresholds** CLI command.

**trap** — An SR OS logger event is generated. The SR OS logger utility then distributes the notification of this event to its configured log destinations which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.

**both** — Both an entry in the RMON-MIB logTable and an SR OS logger event are generated.

**none** — No action is taken.

**Default** both

### *description-string*

Specifies a user configurable string that can be used to identify the purpose of this event. This is an optional parameter and can be up to 80 characters long. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### *owner-string*

Specifies the owner string; the owner identifies the creator of this alarm. It defaults to "TiMOS CLI". This parameter is defined primarily to allow entries that have been created in the RMON-MIB alarmTable by remote SNMP managers to be saved and reloaded in a CLI configuration file. The owner will not normally be configured by CLI users and can be up to 80 characters long.

**Default** TiMOS CLI

### Configuration example:

```
event 5 rmon-event-type both description "alarm testing" owner "TiMOS CLI"
```

## Platforms

All

## event

## Syntax

[no] event *application-id event-name-id*

## Context

**[Tree]** (config>log>event-trigger event)

## Full Context

configure log event-trigger event

## Description

This command configures a specific log event as a trigger for one or more EHS handlers. Further matching criteria can be applied to only trigger certain handlers with certain instances of the log event.

The **no** form of this command removes the specified trigger event.

## Parameters

### *application-id*

Specifies the type of application that triggers the event.

**Values** adp, application\_assurance, auto\_prov, bfd, bgp, bier, bmp, calltrace, cflowd, chassis, cpmhwfilter, cpmhwqueue, debug, dhcp, dhcps, diameter, dot1x, dynsvc, efm\_oam, elmi, ering, eth\_cfm, etun, filter, fpe, gsmp, gtp, igmp, igmp\_snooping, ip, ipfix, ipsec, ipsec\_cpm, isis, l2tp, lag, ldap, ldp, li, lldp, logger, maffilter, macsec, mcac, mcp, mc\_redundancy, mgmt\_core, mirror, mld, mld\_snooping, mpls, mpls\_tp, mpls\_lmgr, mrp, msdp, nat, nge, ntp, oam, open\_flow, ospf, pcap, pcep, pfc, pim, pim\_snooping, port, pppoe, pppoe\_clnt, profile, ptp, pxc, python, qos, radius, rib\_api, rip, rip\_ng, route\_next\_hop, route\_policy, rpki, rsvp, satellite, security, sflow, snmp, sr\_mpls, sr\_policy, srv6, stp, subscr\_mgmt, sub\_host\_trk, svcmgr, system, telemetry, tip, tls, tree\_sid, user, user\_db, video, vrrp, vrtr, wlan\_gw, wpp

### *event-name-id*

Specifies the name or numerical identifier of the event.

**Values** 0 to 4294967295 | *event-name*: 32 characters max

## Platforms

All

## 9.172 event-control

### event-control

#### Syntax

**event-control** *application-id* [*event-name* | *event-number*] [**generate**] [*severity-level*] [**throttle**] [**specific-throttle-rate** *events-limit interval seconds* | **disable-specific-throttle**] [**repeat** | **no-repeat**]

**event-control** *application-id* [*event-name* | *event-number*] **suppress**

**no event-control** *application-id* [*event-name* | *event-number*]

#### Context

[\[Tree\]](#) (config>log event-control)

#### Full Context

configure log event-control

#### Description

This command is used to specify that a particular event or all events associated with an application is either generated or suppressed.

Events are generated by an application and contain an event number and description explaining the cause of the event. Each event has a default designation which directs it to be generated or suppressed.

Events are generated with a default severity level that can be modified by using the *severity-level* option.

Events that are suppressed by default are typically used for debugging purposes. Events are suppressed at the time the application requests the event's generation. No event log entry is generated regardless of the destination. While this feature can save processor resources, there may be a negative effect on the ability to troubleshoot problems if the logging entries are squelched. In reverse, indiscriminate application may cause excessive overhead.

The rate of event generation can be throttled by using the **throttle** parameter.

The **no** form of this command reverts the parameters to the default setting for events for the application or a specific event within the application. The severity, generate, suppress, and throttle options will also be reset to the initial values.

#### Default

Each event has a set of default settings. To display a list of all events and the current configuration use the **event-control** command.

#### Parameters

*application-id*

The application whose events are affected by this event control filter.

**Values** A valid application name. Use the **show log applications** command to display a list of valid application names. Examples of valid applications are **bgp**, **chassis**, **efm\_oam**, **filter**, **security**, **system**, and **vrp**.

#### **event-name**

To generate, suppress, or revert to default for a single event, enter the specific event short name up to 32 characters. If no event name is specified, the command applies to all events in the application. To display a list of all event short names use the **event-control** command.

#### **event-number**

To generate, suppress, or revert to default for a single event, enter the specific number. If no event number is specified, the command applies to all events in the application.

**Values** 0 to 4294967295

#### **generate**

Specifies that logger event is created when this event occurs. The generate keyword can be used with two optional parameters, *severity-level* and **throttle**.

**Default** generate

#### **severity-level**

An ASCII string representing the severity level to associate with the specified generated events

**Default** The system-assigned severity name

**Values** cleared, indeterminate, critical, major, minor, warning

#### **throttle**

Specifies whether or not events of this type will be throttled. By default, event throttling is on for most event types.

#### **suppress**

This keyword indicates that the specified events will not be logged. If the **suppress** keyword is not specified then the events are generated by default. For example on the 7750 SR, **event-control bgp suppress** will suppress all BGP events. If a log event is a raising event for a Facility Alarm, and the associated Facility Alarm is raised, then changing the log event to **suppress** clears the associated Facility Alarm.

**Default** generate

#### **specific-throttle-rate events-limit**

The log event throttling rate can be configured independently for each log event using this keyword. This specific-throttle-rate overrides the globally configured throttle rate (**config>log>throttle-rate**) for the specific log event.

**Values** 1 to 20000

#### **interval seconds**

Specifies the number of seconds that the specific throttling intervals lasts.

**Values** 1 to 1200

**disable-specific-throttle**

Specifies to disable the **specific-throttle-rate**.

**repeat**

Specifies that the log event should be repeated every minute until the underlying condition is cleared. Only supported for the following log events: BGP tBgpMaxNgPfxLmtThresholdReached and PORT tmnxEqPortEtherCrcAlarm (for **degrade** threshold only)

**Platforms**

All

## 9.173 event-damping

### event-damping

**Syntax**

[no] event-damping

**Context**

[\[Tree\]](#) (config>log event-damping)

**Full Context**

configure log event-damping

**Description**

This command allows the user to set the event damping algorithm to suppress QoS or filter change events.

The **no** form of this command removes the event damping algorithm.

**Note:**

While this event damping is original behavior for some modules such as service manager, QoS, and filters, it can result in the NMS system database being out of sync because of missed change events. On the other hand, if the damping is disabled (**no event-damping**), it may take much longer to **exec** a large CLI configuration file after system bootup.

**Platforms**

All

## 9.174 event-handler

### event-handler

#### Syntax

**event-handler** *event-handler*

**no event-handler**

#### Context

[\[Tree\]](#) (config>log>event-trigger>event>trigger-entry event-handler)

#### Full Context

configure log event-trigger event trigger-entry event-handler

#### Description

This command configures the event handler to be used for this trigger entry.

The **no** form of this command removes the event handler configuration.

#### Parameters

*event-handler*

Specifies the name of the event handler, up to 32 characters.

#### Platforms

All

### event-handler

#### Syntax

**event-handler**

#### Context

[\[Tree\]](#) (config>system>security>cli-script>authorization event-handler)

#### Full Context

configure system security cli-script authorization event-handler

#### Description

Commands in this context configure authorization for the Event Handling System (EHS). EHS allows user-controlled programmatic exception handling by allowing a CLI script to be executed upon the detection of a log event.

## Platforms

## 9.176 event-log

### event-log

#### Syntax

**event-log** *event-log-name* [**create**]

**no event-log** *event-log-name*

#### Context

[\[Tree\]](#) (config>app-assure>group event-log)

#### Full Context

configure application-assurance group event-log

#### Description

This command configures an event log.

## Parameters

### *event-log-name*

Specifies the name of the event log.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## event-log

## Syntax

**event-log** *event-log-name* [**all**]

**no event-log**

## Context

[\[Tree\]](#) (config>app-assure>group>tcp-validate event-log)

## Full Context

configure application-assurance group tcp-validate event-log

## Description

This command enables logging of traffic dropped by TCP validation.

The **no** form of this command disables logging of traffic dropped by TCP validation.

## Default

no event-log

## Parameters

### *event-log-name*

Specifies the name of the event log up to 32 characters.

### **all**

Logs all dropped traffic. Using the **all** option allows the operator to capture all discards made by the TCP validation policy, including those related to:

- packets that were received after an RST and discarded
- packets received before TCP session establishment (before SYN) and discarded

Without the **all** option, discards related to these cases are not captured in any event log.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## event-log

### Syntax

**event-log** *event-log-name*

**no event-log**

### Context

[\[Tree\]](#) (config>app-assure>group>gtp>gtp-filter event-log)

[\[Tree\]](#) (config>app-assure>group>gtp event-log)

### Full Context

configure application-assurance group gtp gtp-filter event-log

configure application-assurance group gtp event-log

### Description

This command allows AA to treat traffic on UDP port number 2152 as GTP-u. Without further specifying any other parameters within this GTP context, AA performs basic GTP-u header sanity checks and discards packets that are malformed. This GTP context allows the operator to configure various GTP filters (maximum of 128 GTP filters).

### Default

no event-log

### Parameters

#### ***event-log-name***

Specifies the event log name to be used to log discards due to GTP-u basic header sanity checks.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## event-log

### Syntax

**event-log** *event-log-name*

**no event-log**

### Context

[\[Tree\]](#) (config>app-assure>group>sctp-filter event-log)

### Full Context

configure application-assurance group sctp-filter event-log

**Description**

This command configures an event log for packets dropped by the SCTP filter.

**Default**

no event-log

**Parameters*****event-log-name***

Specifies the event log name to be used.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 9.177 event-mon

### event-mon

**Syntax**

event-mon

**Context**

[\[Tree\]](#) (config>oam-pm>session>measurement-interval event-mon)

**Full Context**

configure oam-pm session measurement-interval event-mon

**Description**

This command enables the different threshold events on a specific measurement interval. Only one measurement interval with a configured OAM PM session can have events enabled using the **no shutdown** command.

## 9.178 event-notification

### event-notification

**Syntax**

[no] event-notification

## Context

[\[Tree\]](#) (config>port>ethernet>efm-oam>link-mon>errored-frame-period event-notification)

[\[Tree\]](#) (config>port>ethernet>efm-oam>link-mon>errored-frame-seconds event-notification)

[\[Tree\]](#) (config>port>ethernet>efm-oam>link-mon>errored-frame event-notification)

## Full Context

configure port ethernet efm-oam link-monitoring errored-frame-period event-notification

configure port ethernet efm-oam link-monitoring errored-frame-seconds event-notification

configure port ethernet efm-oam link-monitoring errored-frame event-notification

## Description

Allows the frame error **sf-threshold** crossing events to transmit the Event Notification OAMPDU with the specific Link Event TLV information. The Event Notification OAM PDU will only be generated when the initial **sf-threshold** is reached. No subsequent notification will be sent until the event that triggered until the event is manually cleared. The burst parameter under the **local-sf-action** will determine the number of Event Notification OAMPDUs to generate when the event occurs. The reception of the event notification will be processed regardless of this parameter.

The **no** version of this command will disable the transmission of the Event Notification OAMPDU for this event type.

## Default

event-notification

## Platforms

All

## event-notification

## Syntax

**[no] event-notification**

## Context

[\[Tree\]](#) (config>port>ethernet>efm-oam>link-mon>errored-symbols event-notification)

## Full Context

configure port ethernet efm-oam link-monitoring errored-symbols event-notification

## Description

This command allows the symbol error event threshold crossing actions to transmit the Event Notification OAM PDU with the specific Link Event TLV information. The Event Notification OAM PDU will only be generated on the initial sf-threshold is reached. No subsequent notification will be sent until the event that triggered the notification clears, through manual intervention or a window where the configured sd-threshold is not reached. The burst parameter under the local-sf-action will determine the number of Event

Notification OAM PDUs to generate when the event occurs. The reception of the event notification will be processed regardless of this parameter.

The **no** version of this command will disable the transmission of the Event Notification OAM PDU for this event type.

## Default

event-notification

## Platforms

All

## event-notification

## Syntax

**event-notification local-port-action {log-only | out-of-service}**

## Context

[\[Tree\]](#) (config>port>ethernet>efm-oam>peer-rdi-rx event-notification)

## Full Context

configure port ethernet efm-oam peer-rdi-rx event-notification

## Description

This command defines how to react to the reception of event TLVs contained in the Event Notification OAMPDU. The event TLVs contained in the event notification OAMPDU will be analyzed to determine if the peer has crossed the error threshold for the window. The analysis does not consider any local signal degrades or signal failure threshold. The analysis is based solely on the information receive form the peer. The analysis is performed on all event TLVs contained in the Event Notification OAMPDU without regard for support of a specific error counters or local configuration of any thresholds. In the case of symbol errors only, a threshold below the error rate can be used to return the port to service.

## Default

event-notification local-port-action log-only

## Parameters

### local-port-action

Defines whether or not the local port will be affected when the Event Notification OAM PDU is received from a peer based on the threshold computation for the included TLVs.

### log-only

Keyword that prevents the port from being affected when the local peer receives an Event Notification OAM PDU. The event will be logged but the port will remain operational.

### out-of-service

Keyword that causes the port to enter a non-operation down state with a port state of link up. The error will be logged upon reception of Event Notification. The port will not be

available to service data but will continue to carry Link OAM traffic to ensure the link is monitored. All this assumes the error threshold exceeds the error rate in the TLV.

### Platforms

All

## 9.179 event-notification-burst

### event-notification-burst

#### Syntax

**event-notification-burst** *packets*

#### Context

[\[Tree\]](#) (config>port>ethernet>efm-oam>link-mon>local-sf-action event-notification-burst)

#### Full Context

configure port ethernet efm-oam link-monitoring local-sf-action event-notification-burst

#### Description

This command defines the number of the Event Notification OAM PDU to be send to the peer if the local signal failure threshold (sf-threshold) has been reached. The sending of the Event Notification OAMPDU is configured under the individual monitors.

Interactions: The **sf-thresh** threshold will trigger these actions.

#### Parameters

##### *packets*

Specifies the number of Event Notification OAM PDUs to send to a peer when the signal failure threshold has been reached.

**Values** 1 to 5

## Context

[\[Tree\]](#) (debug>router>bgp events)

## Full Context

debug router bgp events

## Description

This command logs all events changing the state of a BGP peer.

The **no** form of this command disables the debugging.

## Parameters

### **neighbor** *ip-address*

Debugs only events affecting the specified BGP neighbor.

**Values** ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address:

- x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

### **group** *name*

Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

## Platforms

All

[\[Tree\]](#) (config>service>epipe>bgp-evpn evi)

## Full Context

configure service vpls bgp-evpn evi

configure service epipe bgp-evpn evi

## Description

This command allows the configuration of a 2-byte EVPN instance (EVI) unique in the system. It is used for the service-carving algorithm for multi-homing and auto-deriving route target and route distinguishers.

If not specified, the value is zero and no route distinguisher or route targets are auto-derived from it. If the *evi* value is specified and no other **route-distinguisher** or **route-target** is configured in the service, the following rules apply:

- the route distinguisher is derived from <system\_ip>:evi
- the route target is derived from <autonomous-system>:evi

If VSI import and export policies are configured, the route target must be configured in the policies and those values take preference over the auto-derived route targets. If **bgp-ad>vpls-id** and **bgp-evpn>evi** are both configured on the same service, the VPLS ID auto-derived route target or route distinguisher takes precedence over the values auto-derived from the EVI. The operational route target for a service is displayed in the **show service id bgp** command.

The **no** form of this command sets the EVI value back to zero.

## Parameters

### *value*

Specifies the EVPN instance.

**Values** 1 to 16777215

## Platforms

All

evi

## Syntax

**evi start** [*to to*]

**no evi start**

## Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg>service-carving>manual evi)

## Full Context

configure service system bgp-evpn ethernet-segment service-carving manual evi

## Description

This command configures the EVI ranges for which the PE is the primary Designated Forwarder, or uses the lowest preference algorithm.

### **Note:**

Multiple individual EVI values and ranges are allowed.

There are two service-carving manual algorithms for DF election:

- manual non-preference

A **preference** command is not configured for this algorithm. The primary PE for the configured EVIs is determined by the EVI range. The manual non-preference algorithm only supports two PEs in the Ethernet Segment

- manual preference-based

If a **preference** command is configured, the algorithm uses the configured value to determine the DF election. For EVIs not defined in the range, the highest-preference algorithm is used. For configured EVIs, the lowest-preference algorithm is used.

The **no** form of this command removes the PE from the primary Designated Forwarder role for the range, or sets the preference algorithm back to highest preference.

## Parameters

### *start*

Specifies the initial EVI value of the range.

**Values** 1 to 65535

### *to*

Specifies the end EVI value of the range. If not configured, only the individual start value is considered.

**Values** 1 to 16777215

## Platforms

All

## evi

## Syntax

*evi value*

**no evi**

## Context

[\[Tree\]](#) (config>service>vprn>bgp-evpn>srv6 evi)

[\[Tree\]](#) (config>service>vprn>bgp-evpn>mpls evi)

## Full Context

configure service vprn bgp-evpn segment-routing-v6 evi

configure service vprn bgp-evpn mpls evi

## Description

This command configures a 2-byte EVPN instance (EVI) unique in the system.

The router uses the EVI to identify the BGP EVPN instance in a VPRN (for the EVPN-IFL model) or an R-VPLS (for the EVPN-IFF model) that is associated with the Layer 3 Ethernet Segment (ES), for the purpose of IP Aliasing. This configuration is required on the PEs attached to the ES as well as on the remote PEs that need to create ES destinations to the multihoming Layer 3 ES.

The **no** form of this command removes the EVI value.

## Default

no evi

## Parameters

### *value*

Specifies the EVPN instance.

**Values** 1 to 16777215

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

configure service vpls bgp-evpn vxlan evi-three-byte-auto-rt
configure service vpls bgp-evpn mpls evi-three-byte-auto-rt
```

## Description

This command specifies that the BGP-EVPN instance import and export route target is auto-derived as described in RFC 8365 (Global-Administrator:A/Type/D-ID/Service-ID).

Where:

- Global Administrator — is the configured 2-octet AS Number. If the configured ASN exceeds the 2 byte limit, the low order 16-bit value will be taken.
- A=0 (for auto-derivation)
- Type=4 (EVI-based route target)
- D-ID= [1..2] — encodes the BGP instance. This allows the auto-derivation of different route targets in multi-instance services. The value is inherited from the corresponding BGP instance.
- Service ID= 3-octet EVI

The **no** form of this command disallows the derivation of the route target.

## Default

```
no evi-three-byte-auto-rt
```

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

- configure service vpls bgp-evpn segment-routing-v6 evi-three-byte-auto-rt

## 9.186 evpn

## evpn

### Syntax

**evpn** *service-id* [**import-mode** *import-mode*] [**create**]

**no evpn** *service-id*

### Context

[\[Tree\]](#) (config>subscr-mgmt>isa-svc-chain evpn)

### Full Context

configure subscriber-mgmt isa-service-chaining evpn

### Description

This command configures the import mode for the service chaining EVPN service. The **import-mode** controls the EPVN route types that are imported by the EVPN system.

The **no** form of this command removes the configuration parameters.

### Parameters

#### *service-id*

Specifies the service ID of the EVPN.

**Values** 1 to 2147483647

#### *import-mode*

Specifies the import mode of the EVPN.

**Values** bridged — The specified EVPN instance imports EVPN route type-2 and type-1 from the peer.  
routed — The specified EVPN instance imports EVPN type-1, type-2 and type-5 routes from the peer. Also, the EVPN instance can be configured to export EVPN type-5 routes for NAT pools to the peer.  
none — The specified EVPN instance does not import any EVPN routes from the peer but can be configured with NAT pools that are exported to the peer in EVPN type-5 routes.

#### **create**

Keyword used to create the EVPN service instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**evpn send** *send-limit* **receive** [ **none**]

**no evpn**

### Context

**[Tree]** (config>router>bgp>add-paths evpn)

**[Tree]** (config>router>bgp>group>add-paths evpn)

**[Tree]** (config>router>bgp>group>neighbor>add-paths evpn)

### Full Context

configure router bgp add-paths evpn

configure router bgp group add-paths evpn

configure router bgp group neighbor add-paths evpn

### Description

This command configures the Add-Paths capability for EVPN routes.

The **no** form of this command disables Add-Paths support for EVPN routes. This causes sessions that are established using Add-Paths for EVPN to go down and come back up without the Add-Paths capability.

### Default

no evpn

### Parameters

#### **send-limit**

Specifies the maximum number of EVPN paths to send.

**Values** 1 to 16, none, multipaths

#### **receive**

Keyword used to allow multiple EVPN paths per prefix from a peer.

#### **none**

Keyword used to specify that the router does not negotiate to receive multiple unlabeled unicast routes per EVPN prefix.

## 9.187 evpn-etree-leaf-label

```
evpn-etree-leaf-label
```

### Syntax

```
evpn-etree-leaf-label [[32..524256]]
```

```
no evpn-etree-leaf-label
```

### Context

**[Tree]** (config>service>system>bgp-evpn evpn-etree-leaf-label)

### Full Context

```
configure service system bgp-evpn evpn-etree-leaf-label
```

### Description

This command enables EVPN Ethernet-Tree (E-Tree) VPLS services on the router (not B-VPLS). It allocates an E-Tree leaf label for the Provider Edge (PE) device and configures the ILM entry.

The command ensures that in-flight traffic can perform an ILM entry lookup at any time, and avoid the discards during **shutdown** or **no shutdown** services (or at least reduce the timing window so that it does not occur during normal operation or configuration).

The E-Tree leaf label can optionally be statically configured with a value. The label value must be in the static label range of the system.

#### Note:

The **evpn-etree-leaf-label** command must be configured to execute **bgp-evpn mpls no shutdown**.

The **no** form of this command removes the value from the configuration.

### Default

```
no evpn-etree-leaf-label
```

### Parameters

**32..524256**

Specifies the E-Tree leaf label

**Values** 32 to 524256

### Platforms

## 9.191 evpn-nd-advertise

## evpn-nd-advertise

### Syntax

```
evpn-nd-advertise {host | router | router-host}
```

### Context

[\[Tree\]](#) (config>service>vpls>proxy-nd evpn-nd-advertise)

### Full Context

```
configure service vpls proxy-nd evpn-nd-advertise
```

### Description

This command enables the advertisement of static or dynamic entries that are learned as host, router, or host and router, (only one option is possible in a specified service). It also determines the R flag (host or router) when sending Neighbor Advertisement (NA) messages for existing EVPN entries in the proxy-ND table.

The **router-host** command option is only possible when the ARP/ND extended community is advertised along with the MAC/IP routes. It determines that both host and router (dynamic and static) entries are advertised in MAC/IP routes, with an indication whether the entry is host or router in the R flag. These EVPN entries are installed as host or router entries depending on the R flag of the route, and NA messages for them are sent with the proper host or router indication.

To modify this command you must shutdown the proxy ND.

```
configure service vpls proxy-nd shutdown
```

### Default

```
evpn-nd-advertise router
```

### Parameters

#### host

Enables the advertisement of static or dynamic entries that are learned as host.

#### router

Enables the advertisement of static or dynamic entries that are learned as routers.

#### router-host

Enables the advertisement of static or dynamic entries that are learned as router or host.

## 9.193 evpn-route-tag

## evpn-route-tag

### Syntax

**evpn-route-tag tag**

**no evpn-route-tag**

### Context

**[Tree]** (config>service>vpls>proxy-nd evpn-route-tag)

**[Tree]** (config>service>vpls>proxy-arp evpn-route-tag)

### Full Context

configure service vpls proxy-nd evpn-route-tag

configure service vpls proxy-arp evpn-route-tag

### Description

This command configures a local route tag that can be used on export policies to match MAC/IP routes generated by the proxy-ARP or proxy-ND module. For example, if a new active dynamic proxy-ARP entry is added to the proxy-ARP table and **evpn-route-tag** is 10, an export policy that matches on tag 10 and

adds a site-of-origin community SOO-1, allows the router to advertise the MAC/IP route for the proxy-ARP entry with community SOO-1.

The **no** form of this command removes the route tag for the generated EVPN MAC/IP routes.

## Parameters

### *tag*

Specifies the route tag, in either decimal or hexadecimal form.

**Values** 1 to 255

## Platforms

All

## 9.194 evpn-tunnel

### evpn-tunnel

## Syntax

**evpn-tunnel** [**ipv6-gateway-address** {**ip** | **mac**}] [**supplementary-broadcast-domain**]

**no evpn-tunnel**

## Context

[\[Tree\]](#) (config>service>vprn>if>vpls evpn-tunnel)

## Full Context

configure service vprn interface vpls evpn-tunnel

## Description

This command sets the evpn-tunnel mode for the attached R-VPLS. When enabled for an IPv4 interface, no IPv4 address is required under the same interface. When enabled on an IPv6 interface, the **ipv6-gateway-address** parameter can be configured as **ip** or **mac**.

When configured as **evpn-tunnel ipv6-gateway-address ip** or simply **evpn-tunnel**, then:

- on transmission, the router populates the GW IP field of the route type 5 with a Link-Local-Address (LLA) if an explicit global IPv6 address is not configured. Otherwise, the configured IPv6 address is used.
- on reception of routes type 5 for IPv6 prefixes, only routes with non-zero GW IP are processed; the rest of the routes will be **treated-as-withdraw**.

When configured as **evpn-tunnel ipv6-gateway-address mac**, then:

- on transmission, the router sends routes type 5 with zero GW IP field, and a MAC extended community of the router, containing the VPRN interface MAC.

- on reception of IPv6 prefix routes, only routes with zero GW IP and non-zero router's MAC are processed; the rest of the routes will be **treated-as-withdraw**.

The **supplementary-broadcast-domain** option instructs the data path to exclude EVPN destinations in the Layer 3 lookup for packets coming from an RVPLS SAP and configures the entire set of VPRN as well as attached RVPLS services in OISM mode. Only one SBD RVPLS can exist in a given VPRN. In order to add or remove the **supplementary-broadcast-domain** option, the entire **evpn-tunnel** command must first be removed.

The configuration of **evpn-tunnel** without options is equivalent to the **ipv6-gateway-address ip** option.

The **no** form of this command disables the evpn-tunnel mode.

## Default

no evpn-tunnel

## Parameters

### ***ipv6-gateway-address***

Indicates whether the IPv6 Prefix route uses a GW IP or a GW MAC as gateway.

**Values** ip, mac

### ***supplementary-broadcast-domain***

Specifies to use the EVPN tunnel as a Supplementary Broadcast Domain (SBD). The SBD is used in EVPN OISM to advertise the SMET routes and receive the multicast traffic on egress PEs that are not attached to the source R-VPLS service.

**no evpn-type**

### Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from evpn-type)

### Full Context

configure router policy-options policy-statement entry from evpn-type

## Description

This command matches BGP routes based on the EVPN route type. The route types supported in SR OS are the following:

- Type 1 or Auto-Discovery Ethernet Tag route, including both the AD per-ES and AD per-EVI routes Type 2 or MAC/IP route
- Type 2 or MAC/IP route
- Type 3 or IMET route, including Multicast Ethernet Tag
- Type 4 or ES (Ethernet Segment) route Type 5 of IP-prefix route, including IPv4 and IPv6 prefixes
- Type 6 or Selective Multicast Ethernet Tag route, including IPv4 and IPv6 multicast groups
- Type 7 or Multicast Join Synch route, including IPv4 and IPv6 multicast group
- Type 8 or Multicast Leave Synch route, including IPv4 and IPv6 multicast groups

The **no** form of this command removes the **evpn-type** matching.

## Parameters

***name***

Specifies the EVPN route type.

**Values** 1 to 8

configure system security dist-cpu-protection policy static-policer exceed-action

## Description

This command controls the action performed upon the extracted control packets when the configured policer rates are exceeded.

## Default

exceed-action none

## Parameters

### discard

Discards packets that are nonconforming.

### low-priority

Marks packets that are nonconforming as low-priority (for example, discard eligible or out-profile). If there is congestion in the control plane of the SR OS then unmarked (for example, green, hi-prio or in-profile) control packets are given preferential treatment.

### hold-down seconds

When this optional parameter is specified, it causes the following "hold-down" behavior.

When the SR OS software detects that an enforcement policer has marked or discarded one or more packets (software may detect this some time after the packets are actually discarded), and an optional **hold-down seconds** value has been specified for the **exceed-action**, then the policer will be set into a "mark-all" or "drop-all" mode that cause the following:

- the policer state to be updated as normal
- all packets to be marked (if the action is "low-priority") or dropped (action = discard) regardless of the results of the policing decisions/actions/state.

The **hold-down** is cleared after approximately the configured time in seconds after it was set. The **hold-down seconds** option should be selected for protocols that receive more than one packet in a complete handshake/negotiation (for example, DHCP, PPP). **hold-down** is not applicable to a local monitoring policer. The "detection-time" will only start after any **hold-down** is complete. During the **hold-down** (and the detection-time), the policer is considered as in an "exceed" state. The policer may re-enter the hold-down state if an exceed packet is detected during the detection-time countdown.

Configuring the **indefinite** parameter value will cause hold down to remain in place until the operator clears it manually using a tools command (**tools perform security dist-cpu-protection release-hold-down**) or removes the dist-cpu-protection policy from the object.

Configuring the **none** parameter value will disable hold down.

**Values** 1 to 10080, indefinite, none

#### Syntax

exclude

#### Context

[\[Tree\]](#) (config>service>vprn>isis>loopfree-alternates exclude)

## Full Context

```
configure service vprn isis loopfree-alternates exclude
```

## Description

This command excludes from LFA SPF calculation prefixes that match a prefix entry or a tag entry in a prefix policy.

The user can exclude an interface in IS-IS or OSPF, an OSPF area, or an IS-IS level from the LFA SPF.

If a prefix is excluded from LFA, then it will not be included in LFA calculation regardless of its priority. The prefix tag will, however, be used in the main SPF.

### Note:

Prefix tags are defined for the IS-IS protocol but not for the OSPF protocol.

The default action of the **exclude** command, when not explicitly specified by the user in the prefix policy, is a "reject". Thus, regardless of whether the user has explicitly added the statement "default-action reject" to the prefix policy, a prefix that does not match any entry in the policy is accepted into LFA SPF.

The **no** form of this command deletes the exclude prefix policy.

```

## Full Context

```
configure service vprn ospf3 loopfree-alternates exclude
```

```
configure service vprn ospf loopfree-alternates exclude
```

## Description

This command excludes from LFA SPF calculation prefixes that match a prefix entry or a tag entry in a prefix policy.

The implementation already allows the user to exclude an interface in IS-IS or OSPF, an OSPF area, or an IS-IS level from the LFA SPF.

If a prefix is excluded from LFA, then it will not be included in LFA calculation regardless of its priority. The prefix tag will, however, be used in the main SPF.

**Note:**

Prefix tags are defined for the IS-IS protocol but not for the OSPF protocol.

The default action of the **exclude** command, when not explicitly specified by the user in the prefix policy, is a "reject". Thus, regardless if the user did or did not explicitly add the statement "default-action reject" to the prefix policy, a prefix that did not match any entry in the policy will be accepted into LFA SPF.

The **no** form of this command deletes the exclude prefix policy.

#### Description

This command configures the L2TP AVPs to exclude.

#### Default

no exclude-avps

#### Parameters

##### *calling-number*

Specifies to exclude the AVP calling-number.

##### *initial-rx-lcp-conf-req*

Specifies to exclude the AVP initial-rx-lcp-conf-req.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 9.209 exclude-from-avg

### exclude-from-avg

#### Syntax

**exclude-from-avg** {**forward** | **backward** | **round-trip**} **bins** *bin-numbers*

**no exclude-from-avg** (**forward** | **backward** | **round-trip**)

#### Context

[\[Tree\]](#) (config>oam-pm>bin-group>bin-type exclude-from-avg)

#### Full Context

configure oam-pm bin-group bin-type exclude-from-avg

#### Description

This optional command allows the results from probes that map to the specified bins within the bin type to be excluded from the average calculation. Individual counters are incremented in the bin, but the average is not affected by the value of the excluded delay metric for the individual probes in this bin. The bin group does not allow this command to be added, modified, or deleted when a test is actively referencing the bin group. Sessions that reference the bin group must have the bin group and tests shut down before changes can be made.

The **no** form of this command removes the exclusion, and all bins are included in the average calculation.

#### Default

no exclude-from-avg forward

no exclude-from-avg backward

no exclude-from-avg round-trip

#### Parameters

##### **forward**

Specifies the forward direction bin.

##### **backward**

Specifies the backward direction bin.

##### **round-trip**

Specifies the round-trip direction bin.

##### ***bin-numbers***

Specifies the bin numbers to be excluded from the average calculation. The values typically represent, but are not restricted to, the highest and lowest configured bins in order to eliminate outlying results that are not representative of network performance.

A hyphen can be entered between bin numbers to include a continuous sequence of bins; for example, entering 7-9 would specify bins 7, 8, and 9. Commas can be entered between bin numbers to include separate or non-continuous bins; for example, entering 0,8,9 would

specify bins 0, 8, and 9. Both hyphens and commas can be used in this manner in the same configuration; for example, entering 0,7-9 would include bins 0, 7, 8, and 9. All bin numbers specified as part of this command must be configured. If a specified bin does not exist, the command fails.

**Values** 0 to 9

## Platforms

All

## 9.210 exclude-group

### exclude-group

#### Syntax

[no] **exclude-group** *ip-admin-group-name*

#### Context

[\[Tree\]](#) (config>router>route-next-hop-policy>template exclude-group)

#### Full Context

configure router route-next-hop-policy template exclude-group

#### Description

This command configures the admin group constraint into the route next-hop policy template.

Each group is entered individually. The **include-group** statement instructs the LFA SPF selection algorithm to pick up a subset of LFA next-hops among the links that belong to one or more of the specified admin groups. A link that does not belong to at least one of the admin-groups is excluded. However, a link can still be selected if it belongs to one of the groups in an include-group statement but also belongs to other groups that are not part of any include-group statement in the route next-hop policy.

The **pref** option is used to provide a relative preference for the admin group to select. A lower preference value means that LFA SPF will first attempt to select an LFA backup next-hop that is a member of the corresponding admin group. If none is found, then the admin group with the next highest preference value is evaluated. If no preference is configured for a given admin group name, then it is supposed to be the least preferred, that is, numerically the highest preference value.

When evaluating multiple **include-group** statements within the same preference, any link that belongs to one or more of the included admin groups can be selected as an LFA next-hop. There is no relative preference based on how many of those included admin groups the link is a member of.

The **exclude-group** statement simply prunes all links belonging to the specified admin group before making the LFA backup next-hop selection for a prefix.

If the same group name is part of both include and exclude statements, the exclude statement will win. In other words, the exclude statement can be viewed as having an implicit preference value of zero (0).

The admin-group criteria are applied before running the LFA next-hop selection algorithm.

The **no** form deletes the admin group constraint from the route next-hop policy template.

### Parameters

#### *ip-admin-group-name*

Specifies the name of the group, up to 32 characters.

### Platforms

[\[Tree\]](#) (config>router>dhcp6>server>pool exclude-prefix)

#### Full Context

configure service vprn dhcp6 local-dhcp-server pool exclude-prefix

configure router dhcp6 local-dhcp-server pool exclude-prefix

## Description

This command defines a prefix that to be excluded from available prefix in the pool for DHCP6. The typical use case is to exclude the interface address.

- A held lease is deleted if it got excluded by an exclude prefix.
- An exclude range can never exclude only a part of an existing lease. If for example a /63 PD is assigned, an exclude of /64 which belongs to this /63 cannot be configured.
- A single exclude prefix can never exclude a whole include prefix.
- When applying or removing an exclude prefix, the threshold stats are adjusted to reflect the actual address space and its usage.

The **no** form of this command removes the prefix that is to be excluded from available prefix in the pool.

## Parameters

### *ipv6-prefix/prefix-length*

Specifies an IPv6 prefix and prefix length.

| Values        |                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------|
| ipv6-prefix   | x:x:x:x:x:x:x (eight 16-bit pieces)<br>x:x:x:x:x:d.d.d.d<br>x - [0 to FFFF]H<br>d - [0 to 255]D |
| prefix-length | 0 to 128                                                                                        |

## 9.214 exclude-protocol

### exclude-protocol

## Syntax

**[no] exclude-protocol** {*protocol-name*}

## Context

**[Tree]** (config>port>ethernet>dot1x>macsec exclude-protocol)

## Full Context

configure port ethernet dot1x macsec exclude-protocol

## Description

Specifies protocols whose packets are not secured using Media Access Control Security (MACsec) when MACsec is enabled on a port.

When this option is enabled in a connectivity association that is attached to an interface, MACsec is not enabled for all packets of the specified protocols that are sent and received on the link.

When this option is enabled on a port where MACsec is configured, packets of the specified protocols are sent and accepted in cleartext.

The **no** form of this command secures the packets of the specified protocol.

## Default

no exclude-protocol

## Parameters

*protocol-name*

Specifies the protocol name.

**Values** cdp, lACP, lldp, eapol-start, efm-oam, eth-cfm, ptp, ubfd

## Platforms

All

## 9.215 exclude-tcp-retrans

exclude-tcp-retrans

## Syntax

[no] exclude-tcp-retrans

## Context

[\[Tree\]](#) (config>app-assure>group>statistics>aa-sub exclude-tcp-retrans)

## Full Context

configure application-assurance group statistics aa-sub exclude-tcp-retrans

## Description

This command is only to EPC. When enabled, TCP errors and retransmission packets are not counted for the purpose of CBC. This setting has no impact on app/app-group aggregate AA stats.

## Default

no exclude-tcp-retrans

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 9.216 exclusive-lock-time

### exclusive-lock-time

#### Syntax

**exclusive-lock-time** *seconds*

**no exclusive-lock**

#### Context

[\[Tree\]](#) (config>router>policy-options exclusive-lock-time)

#### Full Context

configure router policy-options exclusive-lock-time

#### Description

This command specifies the inactivity timer for the exclusive lock time for policy editing. When a session is idle for greater than this time, the lock is removed and the configuration changes is aborted.

#### Default

exclusive-lock-time 300

#### Parameters

***seconds***

Specifies the duration the session with exclusive lock may be inactive.

**Values** Values: 1 to 3600

#### Platforms

All

## 9.217 exec

### exec

#### Syntax

**exec** [-echo] [-syntax] {*file-name* | *eof-marker-string*} [-argument [256 chars max] [[256 chars max]]]

## Context

[Tree] (exec)

## Full Context

exec

## Description

This command executes the contents of a text file as if they were CLI commands entered at the console.

**exec** commands do not have **no** versions.

### Related Commands:

**boot-bad-exec**: Use this command to configure a URL for a CLI script to exec following a failed configuration boot.

**boot-good-exec**: Use this command to configure a URL for a CLI script to exec following a successful configuration boot.

**stdin** can be used as the source of commands for the **exec** command. When **stdin** is used as the **exec** command input, the command list is terminated with <Ctrl-C>, "EOF<Return>" or "*eof\_string*<Return>".

If an error occurs entering an exec file sourced from stdin, all commands after the command returning the error will be silently ignored. The **exec** command will indicate the command error line number when the stdin input is terminated with an end-of-file input.

Example:

Assume the *test.cfg* file has the following commands:

```
echo $(1)
```

```
echo $(2)
```

```
echo $(3)
```

Enter the following command:

```
exec test.cfg -arguments 10 20 30
```

The output from this command will be:

```
10
20
30
```

## Parameters

### -echo

Echoes the contents of the **exec** file to the session screen as it executes.

**Default** echo disabled

### -syntax

Performs a syntax check of the file without executing the commands. Syntax checking will be able to find invalid commands and keywords, but it will not be able to validate erroneous user-supplied parameters.

**Default** execute file commands

***file-name***

Specifies the text file with CLI commands to execute, up to 256 characters.

***eof-marker-string***

Specifies the ASCII printable string used to indicate the end of the exec file when stdin is used as the exec file source. <Ctrl-C> and "EOF" can always be used to terminate an exec file sourced from stdin up to 254 characters.

**Default** EOF

**-argument**

Specifies up to five arguments, each up to 256 characters.

**Platforms**

All

## 9.218 executed-cmd

### executed-cmd

**Syntax**

[no] **executed-cmd**

**Context**

**[Tree]** (debug>dynsvc>scripts>script>event **executed-cmd**)

**[Tree]** (debug>dynsvc>scripts>event **executed-cmd**)

**[Tree]** (debug>dynsvc>scripts>inst>event **executed-cmd**)

**Full Context**

debug dynamic-services scripts script event **executed-cmd**

debug dynamic-services scripts event **executed-cmd**

debug dynamic-services scripts instance event **executed-cmd**

**Description**

This command enables/disables the generation of a specific dynamic data service script debugging event output: **executed-cmd**.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 9.219 exhausted-credit-service-level

exhausted-credit-service-level

### Syntax

[no] exhausted-credit-service-level

### Context

[\[Tree\]](#) (config>subscr-mgmt>cat-map>category exhausted-credit-service-level)

### Full Context

configure subscriber-mgmt category-map category exhausted-credit-service-level

### Description

Commands in this context configure the exhausted credit service level.

The **no** form of this command reverts to the default.

### Default

exhausted-credit-service-level

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 9.220 exit

exit

### Syntax

exit [all]

### Context

[\[Tree\]](#) (exit)

### Full Context

exit

## Description

This command returns to the context from which the current level was entered. For example, to navigate to the current level on a context by context basis, then the **exit** command only moves the cursor back one level.

```
A:ALA-1# configure
A:ALA-1>config# router
A:ALA-1>config>router# ospf
A:ALA-1>config>router>ospf# exit
A:ALA-1>config>router# exit
A:ALA-1>config# exit
```

When navigating to the current level by entering a command string, the **exit** command returns the cursor to the context in which the command was initially entered.

```
A:ALA-1# configure router ospf
A:ALA-1>config>router>ospf# exit
A:ALA-1#
```

The **exit all** command moves the cursor all the way back to the root level.

```
A:ALA-1# configure
A:ALA-1>config# router
A:ALA-1>config>router# ospf
A:ALA-1>config>router>ospf# exit all
A:ALA-1#
```

## Parameters

**all**

Exits back to the root CLI context.

## Platforms

All

## 9.221 expected

expected

### Syntax

**expected auto-generated**

**expected bytes** *byte-string* [*byte-string* (up to 64 bytes-strings max, 64 bytes max)]

**expected string** *identifier*

**expected use-rx**

### Context

[\[Tree\]](#) (config>port>otu>pm-tti expected)

## Full Context

```
configure port otu pm-tti expected
```

## Description

This command allows the user to configure the expected RX trail trace identifier (TTI) for path monitoring (PM) in the ODU overhead. This identifier can be a string or a non-printable sequence of bytes. The length of the string or sequence of bytes cannot exceed 64 bytes. This trace should match the far-end port's PM trace. When this trace does not match the received PM trace, the ODU-TIM alarm will be reported if enabled.

## Default

Blank (all zeros)

## Parameters

### **auto-generated**

Sets the default.

### **identifier**

Sets the PM TTI to the string provided by the user. If the string is less than 64 bytes, the remaining bytes will be set to 0. Up to 64 byte strings can be specified in a single statement.

### **byte-string**

[byte1 byte2 to byte64]. Sets the PM TTI to the sequence of bytes provided by the user. If the user provides less than 64 bytes, the remaining bytes will be set to 0.

### **use-rx**

Copies the received pm-tti to the expected either as a string or a sequence of bytes depending on the received pm-tti data.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

expected

## Syntax

```
expected byte
```

```
expected auto
```

## Context

[\[Tree\]](#) (config>port>otu>psi-payload expected)

## Full Context

```
configure port otu psi-payload expected
```

## Description

This command allows the user to configure the expected received payload type value in byte 0 of the Payload structure identifier (PSI) of the OPU overhead. When this values does not match the received value, the OPU-PLM alarm will be reported if it is enabled.

## Default

3 for 10GE-LAN/WAN or OC192 with OTU encapsulation; 5 for GFP framed 10GE-LAN with OTU encapsulation.

## Parameters

### **auto**

Sets the expected value to the standard value in the payload type field.

### **byte**

Specifies the expected received payload type value in bytes.

**Values** [00 to FF] Hexadecimal notation

**Default** 00

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## expected

## Syntax

**expected auto-generated**

**expected bytes** *byte-string* [*byte-string*...(up to 64 byte-strings max, 64 bytes max)]

**expected string** *identifier*

**expected use-rx**

## Context

[\[Tree\]](#) (config>port>otu>sm-tti expected)

## Full Context

configure port otu sm-tti expected

## Description

This command enables the user to configure the expected RX Trail Trace Identifier (TTI) for Section Monitoring (SM) in the OTU overhead. This identifier can be a string or a non-printable sequence of bytes. The length of the string or sequence of bytes cannot exceed 64 bytes. This trace should match the expected far-end port's SM trace. When this trace does not match the received SM trace, the OTU-TIM alarm will be reported if enabled.

**Default**

Blank (all zeros)

**Parameters****auto-generated**

Sets the default.

**identifier**

Sets the PM TTI to the string provided by the user. If the string is less than 64 bytes, the remaining bytes will be set to 0. Up to 64 byte strings can be specified in a single statement.

**byte-string**

[byte1 byte2 to byte64]. Sets the PM TTI to the sequence of bytes provided by the user. If the user provides less than 64 bytes, the remaining bytes will be set to 0.

**use-rx**

Copies the received pm-tti to the expected either as a string or a sequence of bytes depending on the received pm-tti data.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 9.222 expected-ttl

### expected-ttl

**Syntax**

**expected-ttl** *ttl-value*

**no expected-ttl** *ttl-value*

**Context**

[\[Tree\]](#) (config>app-assure>group>tether-detect>snl-dev expected-ttl)

**Full Context**

configure application-assurance group tethering-detection single-device expected-ttl

**Description**

This command configures the expected TTL values for single-device tethering detection.

**Parameters****ttl-value**

Specifies an expected TTL traffic value from host devices.

**Values** 1 to 255

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 9.223 expire-time

### expire-time

#### Syntax

**expire-time** {*seconds* | **forever**}

#### Context

[\[Tree\]](#) (config>system>script-control>script-policy expire-time)

#### Full Context

configure system script-control script-policy expire-time

#### Description

This command is used to configure the maximum amount of time to keep the run history status entry from a script run.

#### Default

expire-time 3600

#### Parameters

##### *seconds*

Specifies the time to keep the run history status entry, in seconds.

**Values** 0 to 21474836

**Default** 3600 (1 hour)

##### **forever**

Specifies to keep the run history status entry indefinitely.

#### Platforms

All

## 9.224 expiry-time

### expiry-time

#### Syntax

**expiry-time** *expiry-time*

**no expiry-time**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>msap-policy>igmp-host-tracking expiry-time)

#### Full Context

configure subscriber-mgmt msap-policy igmp-host-tracking expiry-time

#### Description

This command configures the time that the system continues to track inactive hosts.

The **no** form of this command removes the values from the configuration.

#### Parameters

**expiry-time**

Specifies the time, in seconds, that this system continues to track an inactive host.

**Values** 1 to 65535

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```

### Description

This command configures the time that the system continues to track inactive hosts.  
The **no** form of this command removes the values from the configuration.

### Default

```
no expiry-time
```

### Parameters

#### *expiry-time*

Specifies the time, in seconds, that this system continues to track an inactive host.

**Values** 1 to 65535

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 9.225 explicit-sf-path

### explicit-sf-path

### Syntax

```
explicit-sf-path {primary | secondary}
no explicit-sf-path
```

### Context

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>bundle>source-override explicit-sf-path)

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>bundle>channel explicit-sf-path)

### Full Context

```
configure mcast-management multicast-info-policy bundle source-override explicit-sf-path
configure mcast-management multicast-info-policy bundle channel explicit-sf-path
```

### Description

This command defines an explicit ingress switch fabric multicast path assigned to a multicast channel. When defined, the channel is setup with the explicit path as its inactive path. When an explicit path is not defined, all multicast channels are initialized on the secondary path and when they start to consume

bandwidth, they are moved to the appropriate path based on the channel attributes and path limitations. Explicit path channels are not allowed to move from their defined path.

The **explicit-sf-path** command in the bundle context defines the initial path for all channels associated with the bundle unless the channel has an overriding **explicit-sw-path** defined in the channel context. The channel context may also be overridden by the **explicit-sf-path** command in the **source-override** context. The channel and **source-override explicit-sf-path** settings default to null (undefined) and have no effect unless explicitly set.

The **no** form of this command restores default path association behavior (dynamic or null depending on the context).

## Parameters

### primary

The **primary** and **secondary** keywords are mutually exclusive to one another. One keyword must be specified when executing the explicit-sf-path command. The **primary** keyword specifies that the primary ingress multicast path should be used as the explicit path for the channel.

### secondary

The **primary** and **secondary** keywords are mutually exclusive to one another. One keyword must be specified when executing the explicit-sf-path command. The **secondary** keyword specifies that the secondary ingress multicast path should be used as the explicit path for the channel.

Override sequence — The channel setting overrides the bundle setting. The source-override setting overrides the channel and bundle settings.

## Platforms

7450 ESS, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

## 9.226 explicit-subscriber-map

### explicit-subscriber-map

#### Syntax

```
explicit-subscriber-map
```

#### Context

```
[Tree] (config>subscriber-mgmt explicit-subscriber-map)
```

#### Full Context

```
configure subscriber-mgmt explicit-subscriber-map
```

#### Description

This command configures an explicit subscriber mapping.

## Platforms

## 9.227 exponential-backoff

```
exponential-backoff
```

### Syntax

[no] exponential-backoff

### Context

[\[Tree\]](#) (config>system>login-control exponential-backoff)

### Full Context

configure system login-control exponential-backoff

### Description

This command enables the exponential-backoff of the login prompt. The exponential-backoff command is used to deter dictionary attacks, when a malicious user can gain access to the CLI by using a script to try **admin** with any conceivable password.

The **no** form of this command disables exponential-backoff.

### Default

no exponential-backoff

### Platforms

All

## 9.228 exponential-backoff-retry

```
exponential-backoff-retry
```

### Syntax

exponential-backoff-retry  
no exponential-backoff-retry

### Context

[\[Tree\]](#) (config>router>mpls exponential-backoff-retry)

## Full Context

```
configure router mpls exponential-backoff-retry
```

## Description

This command enables the use of an exponential back-off timer when re-trying an LSP. When an LSP path establishment attempt fails, the path is put into retry procedures and a new attempt will be performed at the expiry of the user-configurable retry timer (config>router>mpls>lsp>retry-timer). By default, the retry time is constant for every attempt. The exponential back-off timer procedures will double the value of the user configured retry timer value at every failure of the attempt to adjust to the potential network congestion that caused the failure. An LSP establishment fails if no Resv message was received and the Path message retry timer expired or a PathErr message was received before the timer expired.

## 9.229 export

```
export
```

## Syntax

```
[no] export
```

## Context

```
[Tree] (config>subscr-mgmt>isa-svc-chain>evpn export)
```

## Full Context

```
configure subscriber-mgmt isa-service-chaining evpn export
```

## Description

Commands in this context configure information related to the export of EVPN BGP routes related to service chaining.

The **no** form of this command disables exporting EVPN BGP routes related to service chaining

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

```
export
```

## Syntax

```
export policy [policy]
```

```
no export
```

## Context

[\[Tree\]](#) (config>subscr-mgmt>bgp-prng-plcy export)

## Full Context

configure subscriber-mgmt bgp-peering-policy export

## Description

This command specifies the export policies to be used to control routes advertised to BGP neighbors. When multiple policy names are specified, the policies are evaluated in the order they are specified. A maximum of five (5) policy names can be configured. The first policy that matches is applied.

### Note:

If a non-existent route policy is applied to a VPRN instance, the CLI generates a warning message. This message is only generated at an interactive CLI session and the route policy association is made. No warning message is generated when a non-existent route policy is applied to a VPRN instance in a configuration file or when SNMP is used.

The **no** form of this command removes all route policy names from the export list.

## Default

no export — BGP advertises routes from other BGP routes but does not advertise any routes from other protocols unless directed by an export policy.

## Parameters

*policy*

Specifies a route policy statement name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## export

## Syntax

**export** *ip-prefix/length*

**no export**

## Context

[\[Tree\]](#) (config>service>ies>sub-if>wlan-gw>redundancy export)

## Full Context

configure service ies subscriber-interface wlan-gw redundancy export

## Description

This command specifies an IPv4 route (prefix/length) per subscriber-interface to be exported (announced) to indicate liveness of the subscriber-interface on the WLAN-GW. This route is the one that is monitored in routing by the peer WLAN-GW to decide its state with respect.

The no form of this command reverts to the default.

## Parameters

### *ip-prefix/length*

Specifies the IP prefix and length.

**Values** ip-prefix:a.b.c.d  
ip-prefix-length: 0 to 32

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## export

## Syntax

**export** *plcy-or-long-expr* [*plcy-or-expr*]

**no export**

## Context

[\[Tree\]](#) (config>service>vprn>bgp>group export)

[\[Tree\]](#) (config>service>vprn>bgp>group>neighbor export)

[\[Tree\]](#) (config>service>vprn>bgp export)

## Full Context

configure service vprn bgp group export

configure service vprn bgp group neighbor export

configure service vprn bgp export

## Description

This command is used to specify route policies that control how outbound routes transmitted to certain peers are handled. Route policies are configured in the **config>router>policy-options** context.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in a peer-group) or neighbor level (only applies to the specified peer). The most specific level is used.

The **export** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine the modifications of each route and the final action to accept or reject the route.

Only one of the 15 objects referenced by the **export** command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters while the remaining 14 objects have a maximum length of 64 characters each.

When multiple **export** commands are issued, the last command entered overrides the previous command.

When an export policy is not specified, BGP-learned routes are advertised by default; non-BGP routes are not advertised.

The **no** form of this command removes the policy association.

## Default

no export

## Parameters

### *plcy-or-long-expr*

Specifies the route policy name, up to 64 characters in length, or a policy logical expression, up to 255 characters in length.

### *plcy-or-expr*

Specifies the route policy name, up to 64 characters in length, or a policy logical expression, up to 255 characters in length.

## Platforms

All

## export

## Syntax

[no] export *policy-name* [*policy-name ...up to 5 max*]

## Context

[\[Tree\]](#) (config>service>vprn>isis export)

## Full Context

configure service vprn isis export

## Description

This command configures export routing policies that determine the routes exported from the routing table to IS-IS.

If no export policy is defined, non IS-IS routes are not exported from the routing table manager to IS-IS.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple export commands are issued, the last command entered overrides the previous command. A maximum of five policy names can be specified.

If an **aggregate** command is also configured in the **config>router** context, then the aggregation is applied before the export policy is applied.

Routing policies are created in the **config>router>policy-options** context.

The **no** form of this command removes the specified *policy-name* or all policies from the configuration if no *policy-name* is specified.

## Default

no export — No export policy name is specified.

## Parameters

### *policy-name*

The export policy name. Up to five *policy-name* arguments can be specified.

## Platforms

configure service vprn msdp export

configure service vprn msdp peer export

configure service vprn msdp group export

## Description

This command specifies the policies to export source active state from the source active list into Multicast Source Discovery Protocol (MSDP).

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple export commands are issued, the last command entered will override the previous command. A maximum of five policy names can be specified.

The **no** form of this command removes all policies from the configuration.

**Default**

no export

**Parameters*****policy-name***

Specifies the export policy name, up to 32 characters. Up to five policy-name arguments can be specified.

If you configure an export policy at the global level, each individual peer inherits the global policy. If you configure an export policy at the group level, each individual peer in a group inherits the group's policy. If you configure an export policy at the peer level, then policy only applies to the peer where it is configured.

**export****Syntax****export** {unicast | *ext-community*}**Context**[\[Tree\]](#) (config>service>vprn>mvpn>vrf-target export)**Full Context**

configure service vprn mvpn vrf-target export

**Description**

This command specifies communities to be sent to peers.

**Parameters****unicast**

Specifies to use unicast vrf-target ext-community for the multicast VPN.

***ext-comm***

An extended BGP community in the **type:x:y** format. The value **x** can be an integer or IP address. The **type** can be the target or origin. **x** and **y** are 16-bit integers.

**Values**

target:{*ip-address:comm-val* | *2byte-asnumber:ext-comm-val* | *4byte-asnumber:comm-val*}

|                        |            |

**export** *ip-prefix/length*

**no export**

## Context

**[Tree]** (config>service>vprn>nat>outside>pool>redundancy export)

## Full Context

configure service vprn nat outside pool redundancy export

## Description

This command installs the export route in the routing table for active NAT pools.

Once the export route is in the routing table, it can be advertised in the network via a routing protocol. NAT pools in the standby or disabled state will not advertise the export route.

A NAT pool becomes active when it becomes operationally UP, and there is no monitoring route (which is also the export route from the peer) present in the routing node (as received from the network). The pool will transition into standby state in case that the monitoring route (or export route from the peer) is already present in the routing table. In other words, the monitoring route is already advertised as an export route from the peering node with active NAT pool.

The export route can be advertised only from:

- The active lead pool.
- Active pool for which fate-sharing is disabled.

## Default

no export

## Parameters

### *ip-prefix/length*

Specifies the IP prefix and length.

### Syntax:

|                   |                  |         |
|-------------------|------------------|---------|
| ip-prefix/length: | ip-prefix        | a.b.c.d |
|                   | ip-prefix-length | 0 to 32 |

**Values** 0, 4, 16

configure service vprn ospf area export

## Description

This command configures ABR export policies to filter OSPFv2 Type 3 Summary-LSAs or OSPFv3 Inter-Area-Prefix-LSA between areas, in to only permit the export of specified routes into an area.

This command cannot be used in OSPF area 0.

The **no** form of this command reverts to the default value.

## Default

no export

## Parameters

### *policy-name*

Specifies the export route policy name. A maximum of five policy names may be specified. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), enclose the entire string in double quotes.

The specified policy names must be predefined and already exist in the system.

## Platforms

[\[Tree\]](#) (config>service>vprn>ospf export)

### Full Context

configure service vprn ospf3 export

configure service vprn ospf export

### Description

This command associates export route policies to determine which routes are exported from the route table to OSPF. Export policies are only in effect if OSPF is configured as an ASBR.

If no export policy is specified, non-OSPF routes are not exported from the routing table manager to OSPF.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple export commands are issued, the last command entered will override the previous command. A maximum of five policy names can be specified.

The **no** form of this command removes all policies from the configuration.

### Default

**no export** — No export route policies specified.

### Parameters

#### *policy-name*

Specifies the export route policy name. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed between double quotes.

The specified policy name(s) must be predefined and already exist in the system.

configure service vprn ripng export

## Description

This command specifies the export route policies used to determine routes that are exported to RIP. If no export policy is specified, non-RIP routes will not be exported from the routing table manager to RIP; RIP-learned routes will be exported to RIP neighbors.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple export commands are issued, the last command entered will override the previous command. A maximum of five policy names can be specified.

The **no** form of this command removes all policies from the configuration.

## Default

no export

## Parameters

### *policy-name*

The export route policy name. Allowed values are any string up to 32 characters in length and composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the string must be enclosed between double quotes. The specified names must already be defined.

## Platforms

All

## export

### Syntax

**export** *policy-name* [*policy-name*]

**no export**

### Context

[\[Tree\]](#) (config>router>ldp export)

### Full Context

configure router ldp export

### Description

This command specifies the export route policies used to determine which routes are exported to LDP. Policies are configured in the **config>router>policy-options** context.

If no export policy is specified, non-LDP routes will not be exported from the routing table manager to LDP. LDP-learned routes will be exported to LDP neighbors. Present implementation of export policy (outbound filtering) can be used "only" to add FECs for label propagation. The export policy does not control propagation of FECs that an LSR receives from its neighbors.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple export commands are issued, the last command entered will override the previous command. A maximum of 5 policy names can be specified.

The **no** form of this command removes all policies from the configuration.

### Default

no export — No export route policies specified.

### Parameters

#### *policy-name*

Specifies up to five export route policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

The specified name(s) must already be defined.

### Syntax

**export** *ip-prefix/length*

**no export**

## Context

[\[Tree\]](#) (config>router>nat>outside>pool>redundancy export)

## Full Context

configure router nat outside pool redundancy export

## Description

This command configures the route to export to the peer. While the export prefix is configured and the value of the object `tmnxNatPILsnRedActive` is equal to true, the system exports this prefix in the realm of the virtual router instance associated with this pool; to the NAT redundancy peer, the presence of this prefix is an indication that the Large Scale NAT function in this virtual router instance is active; hence, the export prefix of this system is the monitor prefix of the peer.

The export prefix must be different from the monitor prefix.

## Default

no export

## Parameters

### *ip-prefix/length*

Specifies the IP address and length of the prefix to be exported.

| Values |                   |         |
|--------|-------------------|---------|
|        | ip-prefix:        | a.b.c.d |
|        | ip-prefix-length: | 0 to 32 |

configure router bgp group export

configure router bgp export

configure router bgp group neighbor export

**Description**

This command specifies route policies that control the handling of outbound routes transmitted to all peers. Route policies are configured in the **config>router>policy-options** context.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific level is used.

The export command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine the modifications of each route and the final action to accept or reject the route.

Only one of the 15 objects referenced by the command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters; the remaining 14 objects have a maximum length of 64 characters each.

When multiple export commands are issued, the last command entered overrides the previous command.

When an export policy is not specified, BGP-learned routes are advertised by default and non-BGP routes are not advertised.

The **no** form of this command removes the policy association.

## Default

no export

## Parameters

### *plcy-or-long-expr*

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters long). Allowed values are any string up to 255 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### *plcy-or-expr*

Specifies up to 14 route policy names (up to 64 characters each) or a policy logical expression (up to 64 characters long). Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### Syntax

[no] export

### Context

[\[Tree\]](#) (config>service>vprn>bgp-ipvpn>attribute-set export)

### Full Context

configure service vprn bgp-ipvpn attribute-set export

### Description

This command configures the router to add an ATTR\_SET path attribute to all VPN-IP routes that come from the VRF export of BGP routes advertised by PE-CE peers of the VPRN. This attribute contains an exact copy of all BGP path attributes (post-import policy) of the PE-CE BGP route, excluding the NEXT\_HOP, MP\_REACH, and MP\_UNREACH attributes, as well as the AS4\_PATH or AS4\_AGGREGATOR attributes. The origin AS in the ATTR\_SET encodes the ASN (or confederation ID, if configured) of the exporting VPRN service. Neither the VRF export policy nor a regular BGP export policy is allowed to modify the contents of the ATTR\_SET.

The **no** form of this command configures the router to not add an ATTR\_SET path attribute to VPN-IP routes exported by the VPRN. Nokia recommends using the **no** form of this command, unless there is a requirement for the VPRN to deliver an independent domain Layer 3 VPN service.

**[Tree]** (config>service>ies>subscriber-interface export-host-routes)

#### Full Context

configure service vprn subscriber-interface export-host-routes

configure service ies subscriber-interface export-host-routes

#### Description

This command controls the export of subscriber management host routes from a retail service to the corresponding forwarding wholesale VPRN service.

By default, subscriber management host routes are not exported.

The presence of retail subscriber management host routes in the wholesale VPRN service is required for downstream traffic forwarding in multi-chassis redundancy scenarios with a redundant interface and when the retail subscriber subnets are not leaked in the wholesale VPRN service (allow-unmatching-subnets or unnumbered retail subscriber interface).

This command fails if the subscriber interface is not associated with a forwarding wholesale service subscriber interface or if the subscriber interface is not configured to support address allocation outside the provisioned subnets (allow-unmatching-subnets or unnumbered subscriber interface).

The **no** form of this command reverts to the default.

## 9.235 export-inactive-bgp

export-inactive-bgp

## Syntax

[no] export-inactive-bgp

## Context

[\[Tree\]](#) (config>service>vprn export-inactive-bgp)

## Full Context

```
configure service vprn export-inactive-bgp
```

## Description

This command allows the preferred BGP route learned by a VPRN to be exported as the VPN route, even when it is inactive in the route table because a preferred BGP VPRN route from another PE is present. This overrides the default state in which the VPRN cannot export an inactive BGP route.

For the BGP route to be exported, the VRF export policy must accept it.

This command applies to both MPLS VPN and SRv6 VPN routes. In SRv6 VPN routes the advertised instruction is an End.DT, while in MPLS VPN routes the advertised label is a per-next-hop label.

This "best-external" type of route advertisement is useful in active/standby multi-homing scenarios because it ensures that all PEs know about the backup path provided by the standby PE.

## Default

```

## Context

```
[Tree] (config>service>vprn export-inactive-bgp-enhanced)
```

## Full Context

```
configure service vprn export-inactive-bgp-enhanced
```

## Description

This command configures the router to allow a BGP route that is inactive (because a better non-BGP route for the same prefix is present) to be exportable as a VPN-IP route.

A BGP route learned from a VPRN BGP peer is exportable as a VPN-IP route, only if it is the best route for the prefix and is installed in the route table of the VPRN. If the **export-inactive-bgp** command is enabled in the VPRN configuration, this rule is relaxed, and the best inactive VPRN BGP route is exportable as a VPN-IP route, provided that the active installed route for the prefix is an imported VPN-IP route.

The rule described in the preceding paragraph can be relaxed even further by enabling this command. When this command is enabled, the best inactive VPRN BGP route (best amongst all routes received from all CEs) is exportable as a VPN-IP route, regardless of the route type of the active installed route.

The configuration of this command overrides the **export-inactive-bgp** command. If this command is already enabled, do not enable the **export-inactive-bgp** command.

The **no** form of this command disables the router from allowing an inactive BGP route in the presence of a better non-BGP route to be exportable as a VPN-IP route.

### Default

no export-inactive-bgp-enhanced

## 9.237 export-limit

### export-limit

#### Syntax

**export-limit** *num-routes*

**no export-limit**

#### Context

[\[Tree\]](#) (config>service>vprn>ospf3 export-limit)

[\[Tree\]](#) (config>service>vprn>ospf export-limit)

[\[Tree\]](#) (config>service>vprn>grt-lookup export-limit)

#### Full Context

configure service vprn ospf3 export-limit

configure service vprn ospf export-limit

configure service vprn grt-lookup export-limit

#### Description

This command limits the total number of routes exported from the VRF to the GRT. Configuring **export-limit 0** disables the maximum limit for routes exported from the VRF to the GRT.

The **no** form of this command sets the export-limit to a default of five (5).

#### Default

export-limit 5

#### Parameters

*num-routes*

Specifies the maximum number of routes that can be exported. Configuring a num-routes value in a range of 1 to 1000 limits the number of routes to the specified value.

**Values** 0 to 1000

## Platforms

All

## export-limit

### Syntax

**export-limit** *number* [**log** *percentage*]

**no export-limit**

### Context

**[Tree]** (config>service>vprn>ripng export-limit)

**[Tree]** (config>service>vprn>rip export-limit)

### Full Context

configure service vprn ripng export-limit

configure service vprn rip export-limit

### Description

This command configures the maximum number of routes (prefixes) that can be exported into RIP from the route table.

The **no** form of this command removes the parameters from the configuration.

### Default

no export-limit

### Parameters

#### *number*

Specifies the maximum number of routes (prefixes) that can be exported into RIP from the route table.

**Values** 1 to 4294967295

#### **log** *percentage*

Specifies the percentage of the export-limit, at which a warning log message and SNMP notification would be sent.

**Values** 1 to 100

## Platforms

All

## export-limit

### Syntax

**export-limit** *number* [**log** *percentage*]

**no export-limit**

### Context

**[Tree]** (config>service>vprn>isis export-limit)

### Full Context

configure service vprn isis export-limit

### Description

This command configures the maximum number of routes (prefixes) that can be exported into IS-IS from the route table for the VPRN instance.

The **no** form of this command removes the parameters from the configuration.

### Default

no export-limit - The export limit for routes or prefixes is disabled.

### Parameters

#### *number*

Specifies the maximum number of routes (prefixes) that can be exported into RIP from the route table.

**Values** 1 to 4294967295

#### **log** *percentage*

Specifies the percentage of the export-limit, at which a warning log message and SNMP notification would be sent.

**Values** 1 to 100

## Platforms

## 9.238 export-mode

### export-mode

**Syntax**

**export-mode** {**automatic** | **manual**}

**Context**

[\[Tree\]](#) (config>cflowd export-mode)

**Full Context**

configure cflowd export-mode

**Description**

This command can be used to control how exports are generated by the cflowd process. The default behavior is for flow data to be exported automatically based on the active and inactive time-out values. The alternative mode is manual in which case flow data is only exported when the command "tools perform cflowd manual-export" is issued. The only exception is if the cflowd cache overflows, in which case the normal automatic export process is used.

**Default**

export-mode automatic

## Parameters

### **automatic**

cflowd flow data is automatically generated.

### **manual**

cflowd flow data is exported only when manually triggered.

## Platforms

All

## 9.239 export-override

### export-override

## Syntax

**export-override** *mode*

**no export-override**

## Context

[\[Tree\]](#) (configure>app-assure>group>cflowd export-override)

## Full Context

configure application-assurance group cflowd export-override

## Description

This command configures the AA sub-type used in cflowd record export. The cflowd stats exported to the cflowd collector to look identical to when AA is on the type of system defined by the mode. The following cflowd export fields are affected:

1. cflowd export observation point (field 138), the mode will be derived from the export-override category that is selected.
2. cflowd export AA\_Subscriber\_Type (field 12) modified as configured, using existing field types.
3. cflowd interface name is used as the sub-ID field, optionally modified to use the **export-override mode prefix** as a global identifier.

All AA cflowd record types are affected by export-override. To change any of the export-override or prefix, cflowd must be shutdown first. When the **export-override** is set back to default (**no export-override**) the prefix is set back to the default.

The **no** form of this command removes the export override.

## Default

no export-override

## Parameters

### *mode*

The type of system emulated by stats export.

**Values** mobile(mobile gateway mode, cflowd field 138 = 2)

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 9.240 export-prefixes

### export-prefixes

## Syntax

[no] **export-prefixes** *policy-name*

## Context

**[Tree]** (config>router>ldp>session-params>peer export-prefixes)

## Full Context

configure router ldp session-parameters peer export-prefixes

## Description

This command specifies the export route policy used to determine which prefixes received from other LDP and T-LDP peers are re-distributed to this LDP peer via the LDP/T-LDP session to this peer. A prefix that is filtered out (deny) is not exported. A prefix that is filtered in (accept) will be exported.

If no export policy is specified, all FEC prefixes learned will be exported to this LDP peer. This policy is applied in addition to the global LDP policy and targeted session policy.

Policies are configured in the **config>router>policy-options** context. A maximum of five policy names can be specified. Peer address has to be the peer LSR-ID address.

The **no** form of this command removes the policy from the configuration.

## Default

no export-prefixes - no export route policy is specified

## Parameters

### *policy-name*

Specifies up to five export-prefix route policy names. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains spaces, use double quotes to delimit the start and end of the string. The specified name(s) must already be defined.

## Platforms

All

## export-prefixes

### Syntax

**export-prefixes** *policy-name* [*policy-name*]

**no export-prefixes**

### Context

[\[Tree\]](#) (config>router>ldp>targeted-session export-prefixes)

### Full Context

configure router ldp targeted-session export-prefixes

### Description

This command specifies the export route policy used to determine which FEC prefix label bindings are exported from a targeted LDP session. A route that is filtered out (deny) will not be exported. A route that is filtered in (accept) will be exported.

If no export policy is specified, all bindings learned through a targeted LDP session will be exported to all targeted LDP peers. This policy is applied in addition to the global LDP policy.

Policies are configured in the **config>router>policy-options** context. A maximum of five policy names can be specified.

The **no** form of this command removes the policy from the configuration.

### Parameters

#### *policy-name*

Specifies up to five export policy names. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

## 9.241 export-tunnel-table

## export-tunnel-table

### Syntax

**export-tunnel-table** *policy-name* [*policy-name*...(up to 5 max)]

## no export-tunnel-table

### Context

[Tree] (config>router>ldp export-tunnel-table)

### Full Context

configure router ldp export-tunnel-table

### Description

This command enables exports BGP label route and SR tunnels from the TTM into LDP for the purpose of stitching an LDP FEC to a BGP or SR tunnel for the same destination prefix.

To enable route stitching between LDP and BGP, separately configure tunnel table route export policies in both protocols and enable the advertisement of RFC 8277, *Using BGP to Bind MPLS Labels to Address Prefixes*, formatted labeled routes for prefixes learned from LDP FECs.

The BGP route export policy instructs BGP to listen to LDP route entries in the CPM Tunnel Table. If a /32 LDP FEC prefix matches an entry in the export policy, BGP originates a BGP labeled route, stitches it to the LDP FEC, and re-distributes the BGP labeled route to its Interior Border Gateway Protocol (IBGP) neighbors.

Using the following commands to add LDP FEC prefixes with the **from protocol ldp** statement in the existing BGP export policy configuration at the global level, peer-group level, or peer level:

- **config>router>bgp>export** *policy-name*
- **config>router>bgp>group>export** *policy-name*
- **config>router>bgp>group>neighbor>export** *policy-name*

To indicate to BGP to evaluate the entries with the **from protocol ldp** statement in the export policy when applied to a specific BGP neighbor, use commands:

- **config>router>bgp>group>neighbor>family label-ipv4** and
- **config>router>bgp>group>neighbor>advertise-ldp-prefix**

Without the latter configuration, only core IPv4 routes learned from RTM are advertised as BGP labeled routes to the neighbor. No stitching of LDP FEC to the BGP labeled route will be performed for this neighbor even if the same prefix was learned from LDP.

The LDP tunnel table route export policy instructs LDP to listen to BGP route entries in the CPM Tunnel Table. If a /32 BGP labeled route matches a prefix entry in the export policy, LDP originates an LDP FEC for the prefix, stitches it to the BGP labeled route, and re-distributes the LDP FEC to its IBGP neighbors.

The user can add BGP labeled route prefixes with the **from protocol bgp** statement in the configuration of the LDP tunnel table export policy. The **from protocol** statement is applied only when the protocol value is **ldp**. Policy entries with protocol values of **rsvp**, **bgp**, or any value other than **ldp** are ignored at the time the policy is applied to LDP.

In the LDP-to-SR data path direction, LDP listens to SR tunnel entries in the TTM. The user can restrict the export of SR tunnels to LDP from a specific prefix list. The user can also restrict the export to a specific IGP instance by optionally specifying the instance ID in the "from protocol" statement. The statement has an effect only when the protocol value is **isis** or **bgp**. Policy entries with any other protocol value are ignored at the time the policy is applied. If the user configures multiple **from protocol** statements in the same policy or does not include the **from protocol** statement but adds a default action of accept, then LDP will follow the TTM selection rules to select a tunnel to which it will stitch the LDP ILM:

1. LDP selects the tunnel from the lowest TTM preference protocol.
2. If two or more of IS-IS or OSPF protocol instances and BGP protocol have the same preference, then LDP selects the protocol using the default TTM protocol preference.
3. Within the same IGP protocol, LDP selects the lowest instance ID.

If an LDP FEC primary next-hop cannot be resolved using an RTM route and a SR tunnel of type SR-ISIS to the same destination prefix matches a prefix entry in the export policy, LDP programs an LDP ILM and stitches it to the SR node-SID tunnel endpoint. LDP also originates an FEC for the prefix and re-distributes it to its LDP peers. When an LDP FEC is stitched to a SR tunnel, packets forwarded benefit from the protection of the LFA/remote LFA backup next-hop of the SR tunnel.

When resolving a FEC, LDP will prefer RTM over TTM when both resolutions are possible. That is, swapping the LDP ILM to a LDP NHLFE is preferred over stitching it to an SR tunnel endpoint.

Nokia recommends that the user should enable the `bfd-enable` option on the interfaces in LDP, IGP instance, and BGP contexts to speed up failure detection and activation of the SR LFA/remote-LFA backup next-hop or the BGP backup, depending on the stitching operation.

This feature is limited to IPv4 /32 prefixes in LDP, BGP and SR.

The **no** form of this command disables the export of BGP and SR tunnels to LDP.

## Default

no export-tunnel-table

## Parameters

### *policy-name*

Specifies up to five export-tunnel-table route policy names. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains spaces, use double quotes to delimit the start and end of the string. The specified name(s) must already be defined.

## Platforms

All

## export-tunnel-table

## Syntax

**export-tunnel-table** *ldp*

**no export-tunnel-table**

## Context

[\[Tree\]](#) (config>router>isis>segment-routing export-tunnel-table)

## Full Context

configure router isis segment-routing export-tunnel-table

## Description

This command exports the LDP tunnels to an IGP instance for the purpose of stitching a SR tunnel to a LDP FEC for the same destination IPv4 /32 prefix.

In the SR-to-LDP data path direction, the SR mapping server provides a global policy for the prefixes corresponding to the LDP FECs the SR stitches to.

When this command is enabled in the segment-routing context of an IGP instance, IGP listens to LDP tunnel entries in the TTM. Whenever a LDP tunnel destination matches a prefix for which IGP received a prefix-SID sub-TLV from a mapping server, it instructs the SR module to program the SR ILM and to stitch it to the LDP tunnel endpoint. The LDP FEC can be resolved via a static route, a IS-IS instance, or an OSPF instance.

When an SR tunnel is stitched to a LDP FEC, packets forwarded will benefit from the protection of the LFA backup next-hop of the LDP FEC.

When resolving a node SID, IGP will prefer resolution of prefix SID received in a IP Reach TLV over a prefix SID received via the mapping server. That is, swapping the SR ILM to a SR NHLFE is preferred over stitching it to a LDP tunnel endpoint.

Nokia recommends that the user should enable the `bfd-enable` option on the interfaces in both LDP and IGP instance contexts to speed up the failure detection and the activation of the LFA/remote-LFA backup next-hop in either direction of the stitching.

This feature is limited to IPv4 /32 prefixes in both LDP and SR.

The **no** form of this command disables the exporting of LDP tunnels to the IGP instance.

## Default

no export-tunnel-table

## Parameters

### ldp

Exports LDP tunnels from the tunnel table into an IGP instance.

## Platforms

All

## export-tunnel-table

## Syntax

**[no] export-tunnel-table ldp**

## Context

[\[Tree\]](#) (config>router>ospf>segm-rtng export-tunnel-table)

## Full Context

configure router ospf segment-routing export-tunnel-table

## Description

This command enables exporting, to an IGP instance, the LDP tunnels for the purpose of stitching a SR tunnel to a LDP FEC for the same destination IPv4 /32 prefix.

In the SR-to-LDP data path direction, the SR mapping server provides a global policy for the prefixes corresponding to the LDP FECs that the SR stitches to.

When this command is enabled in the segment-routing context of an IGP instance, IGP listens to LDP tunnel entries in the TTM. Whenever a LDP tunnel destination matches a prefix for which IGP received a prefix-SID sub-TLV from a mapping server, it instructs the SR module to program the SR ILM and to stitch it to the LDP tunnel endpoint. The LDP FEC can be resolved via a static route, a IS-IS instance, or an OSPF instance.

When an SR tunnel is stitched to a LDP FEC, packets forwarded will benefit from the protection of the LFA backup next hop of the LDP FEC.

When resolving a node SID, IGP will prefer resolution of prefix SID received in a IP Reach TLV over a prefix SID received via the mapping server. In other words, the swapping of the SR ILM to a SR NHLFE is preferred over stitching it to a LDP tunnel endpoint.

It is recommended to enable the **bfd-enable** option on the interfaces in both LDP and IGP instance contexts, to speed up the failure detection and the activation of the LFA/remote-LFA backup next hop in either direction of the stitching.

This feature is limited to IPv4 /32 prefixes in both LDP and SR.

The **no** form of this command disables the exporting of LDP tunnels to the IGP instance.

## 9.242 export-v6-limit

### export-v6-limit

#### Syntax

**export-v6-limit** *num-routes*

**no export-v6-limit**

#### Context

**[Tree]** (config>service>vprn>grt-lookup export-v6-limit)

#### Full Context

configure service vprn grt-lookup export-v6-limit

#### Description

This command limits the total number of IPv6 routes exported from the VPRN to the GRT. Configuring **export-v6-limit 0** disables the maximum limit for IPv6 routes exported from the VPRN to the GRT.

The **no** form of this command sets the export-limit to a default of 5.

### Default

export-v6-limit 5

### Parameters

#### *num-routes*

Specifies the maximum number of IPv6 routes that can be exported. Configuring a *num-routes* value in a range of 1 to 1000 limits the number of IPv6 routes to the specified value.

**Values** 0 to 1000

### Platforms

### Context

**[Tree]** (config>app-assure>group>policy>app-filter>entry expression)

### Full Context

configure application-assurance group policy app-filter entry expression

### Description

This command configures string values to use in the application definition.

### Parameters

#### *expr-index*

Specifies an index value which represents expression substrings.

**Values** 1 to 4

#### *expr-type*

Represents a type (and thereby the expression substring).

**http-host** — Matches the string against the HTTP Host field or TLS Server Name Indicator (SNI).

**http-uri** — Matches the string against the HTTP URI field.

**http-referer** — Matches the string against the HTTP Referer field.

**http-user-agent** — Matches the string against the HTTP User Agent field.

**sip-ua** — Matches the string against the SIP UA field.

**sip-uri** — Matches the string against the SIP URI field.

**sip-mt** — Matches the string against the SIP MT field.

**citrix-app** — Matches the string against the Citrix app field.

**h323-product-id** — Matches the string against the h323-product-id field.

**tls-cert-subj-org-name** — Matches the TLS Certificate Subject Organization Name substring.

**tls-cert-subj-common-name** — Matches the TLS Certificate Subject Common Name substring.

**rtsp-host** — Matches the Real Time Streaming Protocol (RTSP) substring host.

**rtsp-uri** — Matches the RTSP URI substring.

**rtsp-ua** — Matches the RTSP UA substring.

**rtmp-page-host** — Matches against the RTMP Page Host field

**rtmp-page-uri** — Matches against the RTMP Page URI field

**rtmp-swf-host** — Matches against the RTMP Swf Host field

**rtmp-swf-uri** — Matches against the RTMP Swf URI field

**dns-domain-name** — Matches the string against the DNS Name field.

**eq**

Specifies the equal to comparison operator to match the specified HTTP string.

**neq**

Specifies the not equal to comparison operator to match the specified HTTP string.

**expr-string**

Specifies an expression string, up to 64 characters, used to define a pattern match. Denotes a printable ASCII substring used as input to an application assurance filter match criteria object.

The following syntax is permitted within the substring to define the pattern match criteria:

**^<substring>\*** - matches when <substring> is at the beginning of the object.

**\*<substring>\*** - matches when <substring> is at any place within the object.

**\*<substring>\$** - matches when <substring> is at the end of the object.

**^<substring>\$** - matches when <substring> is the entire object.

**\*** - matches zero to many of any character. A single wildcard as infix in the expression is allowed.

**\.** - matches any single character

**\d** - matches any single decimal digit [0-9]

\l - forces case sensitivity (by default, the expression match are case insensitive), the \l can be specified anywhere between

the leading [^\*] and trailing [\$\*]

\\* - matches the asterisk character

Rules for <substring> characters:

<substring> must contain printable ASCII characters.

<substring> must not contain the "double quote" character or the " " (space) character on its own.

<substring> match is case in sensitive by default.

<substring> must not include any regular expression meta-characters other than "\*", "\l", "\.", "\\*" and "\d".

The "\" (slash) character is used as an ESCAPE sequence. The following ESCAPE sequences are permitted within the <substring>:

Character to match <substring> input

Hexadecimal Octet YY \xYY

A <substring> that uses the \" (backslash) ESCAPE character which is not followed by a \" or \"x\" and a 2-digit hex octet is not valid.

Operational notes:

- When matching a TCP flow against HTTP-string based applications, the HTTP header fields are collected from the first HTTP request (for example a GET or a POST) for a given TCP flow. The collected strings are then evaluated against each HTTP flow created within the given TCP flow to determine whether a given HTTP flow matches the application. By not specifying a protocol, the HTTP expressions are matched against all protocols in the HTTP family. By specifying a specific HTTP protocol (for example, http\_video) the expression match can be constrained to a subset of the HTTP protocols.
- To uniquely identify a SIP-based application a protocol match is not required in the app-filter entry with the SIP expression. The SIP expression match is performed against any protocol in the SIP family (such as sip and rtp\_sip). By specifying a specific SIP protocol (like rtp\_sip) the expression match can be constrained to a subset of the SIP protocols.

## Platforms

**no expression** *expr-index*

### Context

[\[Tree\]](#) (config>app-assure>group>policy>custom-protocol expression)

## Full Context

configure application-assurance group policy custom-protocol expression

## Description

This command configures an expression string value for pattern-based custom protocols match. A flow matches a custom protocol if the specified string is found at an offset of a TCP/UDP of the first payload packet.

Options:

- `client-to-server` — A pattern will be matched against a flow from a TCP client.
- `server-to-client` — A pattern will be matched against a flow from a TCP server.
- `any` – A pattern will be matched against a TCP/UDP flow in any direction (towards or from AA subscriber)

The **no** form of this command deletes a specified string expression from the definition.

## Parameters

### *expr-index*

Specifies the expression substring index.

**Values** 1

### *expr-string*

Denotes a printable ASCII string, up to 16 characters, used to define a custom protocol match. Rules for `expr-string` characters:

- Must contain printable ASCII characters.
- Must not contain the "double quote" character or the " " (space) character on its own.
- Match is case sensitive.
- Must not include any regular expression meta-characters.

The "\ (slash) character is used as an ESCAPE sequence. The following ESCAPE sequences are permitted within the `expr-string`:

Character to match `expr-string` input

Hexadecimal Octet YY \xYY

An `expr-string` that uses the \ (backslash) ESCAPE character which is not followed by a "\" or "\x" and a 2-digit hex octet is not valid.

### *offset payload-octet-offset*

specifies the offset (in octets) into the protocol payload, where the `expr-string` match criteria will start.

**Values** 0 to 127

### *direction direction*

Specifies the protocol direction to match against to resolve to a custom protocol.

**Values** `client-to-server`, `server-to-client`, `any`

**no expression**

## Context

**[Tree]** (config>router>policy-options>as-path expression)

## Full Context

configure router policy-options as-path expression

## Description

This command configures a route policy AS path regular expression statement to use in the route policy entries.

An AS path in a BGP route matches an AS path regular expression, if the path matches the pattern of the regular expression. A regular expression incorporates terms and operators that use the terms. An individual AS number is an elementary term in the AS path regular expression. More complex terms can be built from elementary terms. The following are key operators supported by SR OS:

- .
- \*
- ?
- {n}
- {m,n}
- {m, }

To reverse the match criteria when specifying a list of ranges or single values using square brackets, use the non-match operator (^) before the elements within the square brackets.

The **no** form of this command deletes the AS path regular expression statement.

## Parameters

### *regular-expression*

The AS path regular expression. Allowed values are any string up to 255 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must start and end with at signs (@); for example, "@variable@".

### *null*

The AS path expressed as an empty regular expression string.

## 9.244 expression-match

expression-match

**Syntax**

[no] expression-match

**Context**

[\[Tree\]](#) (config>app-assure>group>url-list expression-match)

### Full Context

configure application-assurance group url-list expression-match

### Description

This command configures a URL list that contains hostnames with wildcards.

The **no** form of this command removes the URL list containing hostnames with wildcards.

### Default

no expression-match

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 9.245 extended-action

### extended-action

### Syntax

[no] extended-action

### Context

[\[Tree\]](#) (config>filter>ipv6-filter>entry>action extended-action)

[\[Tree\]](#) (config>filter>ip-filter>entry>action extended-action)

### Full Context

configure filter ipv6-filter entry action extended-action

configure filter ip-filter entry action extended-action

### Description

Commands in this context configure an extended action for a filter entry's PBR action (configured under **config>filter>ip-filter>entry>action** and **config>filter>ipv6-filter>entry>action** contexts). The extended action is executed in addition to the configured PBR action.

The **no** form of the command removes the extended action.

### Default

no extended-action

### Platforms

All

## 9.246 extended-bw

extended-bw

### Syntax

[no] extended-bw

### Context

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>gx>features extended-bw)

### Full Context

configure subscriber-mgmt diameter-application-policy gx features extended-bw

### Description

This command specifies whether extended bandwidth AVPs are supported. Extended bandwidth AVPs are capable of supporting bandwidth values greater than  $(2^{32} - 1)$  b/s. The extended AVPs allow bitrates in kb/s and are as follows:

- Extended-GBR-DL (AVP code 2850)
- Extended-GBR-UL (AVP code 2851)
- Extended-Max-Requested-BW-DL (AVP code 554)
- Extended-Max-Requested-BW-UL (AVP code 555)
- Extended-APN-AMBR-DL (AVP code 2848)
- Extended-APN-AMBR-UL (AVP code 2849)

The **no** form of this command disables the extended bandwidth AVP support.

### Default

no extended-bw

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 9.247 extended-community

extended-community

### Syntax

[no] extended-community

## Context

**[Tree]** (config>router>bgp>group>neighbor>outbound-route-filtering extended-community)

**[Tree]** (config>router>bgp>outbound-route-filtering extended-community)

**[Tree]** (config>router>bgp>group>outbound-route-filtering extended-community)

## Full Context

configure router bgp group neighbor outbound-route-filtering extended-community

configure router bgp outbound-route-filtering extended-community

configure router bgp group outbound-route-filtering extended-community

## Description

The extended-community command opens the configuration tree for sending or accepting extended-community based BGP filters.

For the **no** version of the command to work, all sub-commands (**send-orf**, **accept-orf**) must be removed first.

## Default

no extended-community

## Platforms

All

## 9.248 extended-failure-handling

### extended-failure-handling

## Syntax

**extended-failure-handling**

## Context

**[Tree]** (config>subscr-mgmt>diam-appl-plcy>gy extended-failure-handling)

## Full Context

configure subscriber-mgmt diameter-application-policy gy extended-failure-handling

## Description

Commands in this context configure Extended Failure Handling (EFH), a mechanism to establish a new Diameter Gy session with the Online Charging Server (OCS) after Credit Control Failure Handling (CCFH) CONTINUE is triggered.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 9.249 extended-lsa

### extended-lsa

#### Syntax

**extended-lsa** {**sparse** | **only**}

**no extended-lsa**

#### Context

[\[Tree\]](#) (config>router>ospf3 extended-lsa)

#### Full Context

configure router ospf3 extended-lsa

#### Description

This command configures the use of extended LSA format in OSPFv3, as described in *draft-ietf-ospf-ospfv3-lsa-extend*.

Prior to this feature, SR OS used the fixed format LSA to carry the prefix and link information as described in RFC 5340, *OSPF for IPv6*. The fixed format is not extensible and the TLV format of the extended LSA must be used.

With this feature, the default mode of operation for OSPFv3 is referred to as **sparse** mode, meaning that the router will always advertise the fixed format for existing LSAs and will add the TLV-based extended LSA only when it needs to advertise new sub-TLVs. This mode of operation is similar to the way OSPFv2 advertises the segment routing information. It sends the prefix in the original fixed-format prefix LSA and then follows with the extended prefix TLV which is sent in an extended prefix opaque LSA containing the prefix SID sub-TLV.

The **extended-lsa only** value enables the full extended LSA mode. This causes all existing and new LSAs to use the extended LSA format.

The OSPFv3 instance must first be shut down before the user can change the mode of operation since the protocol must flush all LSAs and re-establish all adjacencies.

The **no** form of this command at the OSPFv3 instance level reverts the OSPFv3 instance to the default **sparse** mode of operation.

#### Default

extended-lsa sparse

#### Parameters

**sparse**

Enables the sparse mode of operation in an OSPFv3 instance.

**only**

Enables the full extended LSA mode of operation in an OSPFv3 instance.

**Platforms**

All

**extended-lsa****Syntax**

**extended-lsa** {**inherit** | **only**}

**no extended-lsa**

**Context**

[\[Tree\]](#) (config>router>ospf3>area extended-lsa)

**Full Context**

configure router ospf3 area extended-lsa

**Description**

This command configures the use of extended LSA format in a OSPFv3 area as described in *draft-ietf-ospf-ospfv3-lsa-extend*.

By default, the area inherits the instance-level configuration. The latter defaults to the **sparse** mode of operation. The **extended-lsa only** value enables the full extended LSA mode, which causes all existing and new LSAs to use the extended LSA format.

The OSPFv3 instance must first be shut down before the user can change the mode of operation since the protocol must flush all LSAs and reestablish all adjacencies.

The **no** form of this command at the area level returns the area to the default mode of inheriting the mode from the OSPFv3 instance level.

**Default**

extended-lsa inherit

**Parameters****inherit**

Configures the area to inherit the mode of operation enabled at the OSPFv3 instance level.

**only**

Enables the full extended LSA mode of operation in an OSPFv3 area.

**Platforms**

All

## 9.250 extended-nh-encoding

### extended-nh-encoding

#### Syntax

```
extended-nh-encoding [ipv4]
no extended-nh-encoding
```

#### Context

[\[Tree\]](#) (config>service>vprn>bgp>group>neighbor extended-nh-encoding)

[\[Tree\]](#) (config>service>vprn>bgp extended-nh-encoding)

[\[Tree\]](#) (config>service>vprn>bgp>group extended-nh-encoding)

#### Full Context

```
configure service vprn bgp group neighbor extended-nh-encoding
```

```
configure service vprn bgp extended-nh-encoding
```

```
configure service vprn bgp group extended-nh-encoding
```

#### Description

This command configures BGP to advertise (at session OPEN) the capability to receive IPv4 or IPv6 routes with IPv4 or IPv6 next hops from the VPRN BGP peers included in the scope of the command. These peers should not send these routes unless they receive the capability. If the SR OS router receives an IPv4 route from a peer to which it did not advertise the necessary capability, the UPDATE message will be considered malformed and causes either a session reset or treat as withdraw behavior depending on the error handling settings.

The **no** form of this command causes the sending of an extended NH encoding BGP capability to the associated BGP peers to be inherited from a higher configuration level or disabled (if configured at the BGP level).

#### Default

```
no extended-nh-encoding
```

#### Parameters

**ipv4**

Specifies that the command should be applied to unlabeled unicast IPv4 routes.

#### Platforms

All

## extended-nh-encoding

### Syntax

**extended-nh-encoding** [label-ipv4] [vpn-ipv4] [ipv4]

**no extended-nh-encoding**

### Context

**[Tree]** (config>router>bgp>group extended-nh-encoding)

**[Tree]** (config>router>bgp>group>neighbor extended-nh-encoding)

**[Tree]** (config>router>bgp extended-nh-encoding)

### Full Context

configure router bgp group extended-nh-encoding

configure router bgp group neighbor extended-nh-encoding

configure router bgp extended-nh-encoding

### Description

This command configures BGP to advertise (at session OPEN) the capability to receive label IPv4, VPN IPv4 routes, or IPv6 next hops from the peers. These peers should not send such routes unless they receive notification of this capability. If the SR OS router receives a label IPv4 or VPN IPv4 route from a peer to which it did not advertise the necessary capability, the UPDATE message will be considered malformed and this will cause either session reset or **treat-as-withdraw** behavior depending on the error handling settings.

The **no** form of this command causes the sending of an extended NH encoding BGP capability to the associated BGP peers to be inherited from a higher configuration level or disabled (if configured at the BGP level).

### Default

no extended-nh-encoding

### Parameters

#### label-ipv4

Instructs BGP to advertise an extended NH encoding capability for NLRI AFI=1, NLRI SAFI=4, and next-hop AFI=2.

#### vpn-ipv4

Instructs BGP to advertise an extended NH encoding capability for NLRI AFI=1, NLRI SAFI=128, and next-hop AFI=2.

#### ipv4

Instructs BGP to advertise an extended NH encoding capability for NLRI AFI=1, NLRI SAFI=1 and next-hop AFI=2.

### Platforms

All

## 9.251 extended-sequence-number

extended-sequence-number

### Syntax

[no] extended-sequence-number

### Context

[\[Tree\]](#) (config>ipsec>ipsec-transform extended-sequence-number)

### Full Context

configure ipsec ipsec-transform extended-sequence-number

### Description

This command enables 64-bit extended sequence numbering support. This numbering is used for high throughput CHILD\_SA to avoid frequent rekeying caused by sequence numbering wrap around.

The **no** form of this command disables extended sequence numbering support. Only 32-bit sequence numbering is supported.

### Default

no extended-seq-number

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 9.252 extended-unicast

extended-unicast

### Syntax

[no] extended-unicast

### Context

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if extended-unicast)

### Full Context

configure mcast-management multicast-info-policy video-policy video-interface extended-unicast

## Description

This command delays video unicast from switching over to multicast for 5 minutes. The unicast session can be extended further by sending an RTCP extension request, which resets the 5-minute timer. This is ideal for services that require unicast video and end devices that require extended time to switch over from unicast to multicast.

The **no** form of this command disables extended unicast. The unicast session switches over to multicast 1.5 seconds after the IGMP request is sent. Most Fast Channel Change deployments do not require a time extension.

## Default

no extended-unicast

## Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 9.253 extension

### extension

## Syntax

**[no] extension start [0 to 4095] end [0 to 4095]**

## Context

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>extensions extension)

## Full Context

```
configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range extensions
extension
```

## Description

This command configures an additional VLAN range extension that is used for matching. Any traffic within the extension range is considered part of the same VLAN range for purposes of intra-SSID mobility.

## Parameters

**start [0 to 4095]**

Specifies the start of the VLAN extension range

**Values** 0 to 4095

**end[0 to 4095]**

Specifies the end of VLAN extension range

**Values** 0 to 4095

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 9.257 external-db-overflow

```
external-db-overflow
```

### Syntax

external-db-overflow *limit interval*

no external-db-overflow

## Context

**[Tree]** (config>service>vprn>ospf3 external-db-overflow)

**[Tree]** (config>service>vprn>ospf external-db-overflow)

## Full Context

```
configure service vprn ospf3 external-db-overflow
```

```
configure service vprn ospf external-db-overflow
```

## Description

This command enables limits on the number of non-default AS-external-LSA entries that can be stored in the LSDB and specifies a wait timer before processing these after the limit is exceeded.

The *limit* value specifies the maximum number of non-default AS-external-LSA entries that can be stored in the link-state database (LSDB). Placing a limit on the non-default AS-external-LSAs in the LSDB protects the router from receiving an excessive number of external routes that consume excessive memory or CPU resources. If the number of routes reach or exceed the *limit*, the table is in an overflow state. When in an overflow state, the router does not originate any new AS-external-LSAs and it withdraws all self-originated non-default external LSAs.

The *interval* specifies the amount of time to wait after an overflow state before regenerating and processing non-default AS-external-LSAs. The waiting period acts like a dampening period, which prevents the router from continuously running Shortest Path First (SPF) calculations caused by the excessive number of non-default AS-external LSAs.

The **external-db-overflow** must be set identically on all routers attached to any regular OSPF area. OSPF stub areas and not-so-stubby areas (NSSAs) are excluded.

The **no** form of this command disables limiting the number of non-default AS-external-LSA entries.

## Default

no external-db-overflow — No limit on non-default AS-external-LSA entries.

## Parameters

### *limit*

The maximum number of non-default AS-external-LSA entries that can be stored in the LSDB before going into an overflow state expressed as a decimal integer.

**Values** -1 to 2147483647

### **Note:**

Setting a value of -1 is equivalent to **no external-db-overflow**.

### *interval*

The number of seconds after entering an overflow state before attempting to process non-default AS-external-LSAs expressed as a decimal integer.

**Values** 0 to 2147483647

## Platforms

All

## 9.258 external-preference

### external-preference

**Syntax**

**external-preference** *preference*

**no external-preference**

**Context**

**[Tree]** (config>service>vprn>isis>level external-preference)

**Full Context**

configure service vprn isis level external-preference

**Description**

This command configures the external route preference for the IS-IS level.

The **external-preference** command configures the preference level of either IS-IS level 1 or IS-IS level 2 external routes. By default, the preferences are as listed in the table below.

A route can be learned by the router by different protocols, in which case, the costs are not comparable. When this occurs, the preference decides the route to use.

Different protocols should not be configured with the same preference, if this occurs the tiebreaker is dependent on the default preference table. If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used. If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision of the route to use is determined by the configuration of the **ecmp** in the **config>router** context.

**Default**

Default preferences are listed in [Table 41: Default Preferences](#).

Table 41: Default Preferences

| Route Type             | Preference | Configurable |
|------------------------|------------|--------------|
| Direct attached        | 0          | No           |
| Static route           | 5          | Yes          |
| MPLS                   | 7          | —            |
| OSPF internal routes   | 10         | No           |
| IS-IS Level 1 internal | 15         | Yes          |
| IS-IS Level 2 internal | 18         | Yes          |
| OSPF external          | 150        | Yes          |
| IS-IS Level 1 external | 160        | Yes          |
| IS-IS Level 2 external | 165        | Yes          |
| BGP                    | 170        | Yes          |
| BGP                    | 170        | Yes          |

**Note:**

- Internal preferences are changed using the **preference** command in the **config>router>isis>level level-number** context.

**Parameters****preference**

The preference for external routes at this level as expressed.

**Values** 1 to 255

**Platforms**

All

**external-preference****Syntax**

[\[Tree\]](#) (config>service>vprn>ospf external-preference)

### Full Context

```
configure service vprn ospf3 external-preference
configure service vprn ospf external-preference
```

### Description

This command configures the preference for OSPF external routes.

A route can be learned by the router from different protocols, in which case the costs are not comparable. If this occurs, preference is used to decide which route is used.

Different protocols should not be configured with the same preference. If this occurs, the tiebreaker is per the default preference table as defined in [Table 42: Default External Route Preferences](#) . If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used.

If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, the decision of which route to use is determined by the configuration of the **ecmp** in the **config>router** context.

The **no** form of this command reverts to the default value.

*Table 42: Default External Route Preferences*

| Route Type             | Preference | Configurable     |
|------------------------|------------|------------------|
| Direct attached        | 0          | No               |
| Static routes          | 5          | Yes              |
| OSPF internal          | 10         | Yes <sup>2</sup> |
| IS-IS level 1 internal | 15         | Yes              |
| IS-IS level 2 internal | 18         | Yes              |
| RIP                    | 100        | Yes              |
| OSPF external          | 150        | Yes              |
| IS-IS level 1 external | 160        | Yes              |
| IS-IS level 2 external | 165        | Yes              |

### Default

external-preference 150 — OSPF external routes have a default preference of 150.

### Parameters

#### *preference*

The preference for external routes expressed as a decimal integer.

<sup>2</sup> Preference for OSPF internal routes is configured with the **preference** command.

**Values** 1 to 255

## Platforms

All

## external-preference

## Syntax

**external-preference** *preference*

**no external-preference**

## Context

[\[Tree\]](#) (config>router>isis>level external-preference)

## Full Context

configure router isis level external-preference

## Description

This command configures the external route preference for the IS-IS level.

The **external-preference** command configures the preference level of either IS-IS level 1 or IS-IS level 2 external routes. By default, the preferences are as listed in the table below.

A route can be learned by the router by different protocols, in which case, the costs are not comparable. When this occurs, the preference decides the route to use.

Different protocols should not be configured with the same preference, if this occurs the tiebreaker is dependent on the default preference table. If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used. If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision of the route to use is determined by the configuration of the **ecmp** in the **config>router** context.

The **no** form of this command reverts to the default value.

## Default

external-preference (Level 1) — 160

external-preference (Level 2) — 165

## Parameters

### *preference*

Specifies the preference for external routes at this level as expressed.

Default preferences are listed in the following table.

Table 43: Default External Route Preferences

| Route Type             | Preference | Configurable     |
|------------------------|------------|------------------|
| Direct attached        | 0          | —                |
| Static-route           | 5          | Yes              |
| OSPF internal routes   | 10         | —                |
| IS-IS Level 1 internal | 15         | Yes <sup>3</sup> |
| IS-IS Level 2 internal | 18         | Yes <sup>3</sup> |
| OSPF external          | 150        | Yes              |
| IS-IS Level 1 external | 160        | Yes              |
| IS-IS Level 2 external | 165        | Yes              |
| BGP                    | 170        | Yes              |

**Values** 1 to 255

## external-preference

### Syntax

**external-preference** *preference*

**no external-preference**

### Context

[\[Tree\]](#) (config>router>ospf3 external-preference)

[\[Tree\]](#) (config>router>ospf external-preference)

### Full Context

configure router ospf3 external-preference

configure router ospf external-preference

### Description

This command configures the preference for OSPF external routes.

<sup>3</sup> Internal preferences are changed using the preference command in the **config>router>isis>level level-number** context.

A route can be learned by the router from different protocols, in which case, the costs are not comparable. When this occurs, the preference is used to decide which route will be used.

Different protocols should not be configured with the same preference, if this occurs the tiebreaker is per the default preference table as defined in [Table 44: Route Preference Defaults by Route Type](#) . If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used.

If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision of what route to use is determined by the configuration of the **ecmp** in the **config>router** context.

The **no** form of this command reverts to the default value.

## Default

external-preference 150

## Parameters

### *preference*

Specifies the preference for external routes expressed as a decimal integer. Defaults for different route types are listed in [Table 44: Route Preference Defaults by Route Type](#) .

*Table 44: Route Preference Defaults by Route Type*

| Route Type             | Preference | Configurable     |
|------------------------|------------|------------------|
| Direct attached        | 0          | No               |
| Static routes          | 5          | Yes              |
| OSPF internal          | 10         | Yes <sup>4</sup> |
| IS-IS level 1 internal | 15         | Yes              |
| IS-IS level 2 internal | 18         | Yes              |
| RIP                    | 100        | Yes              |
| OSPF external          | 150        | Yes              |
| IS-IS level 1 external | 160        | Yes              |
| IS-IS level 2 external | 165        | Yes              |
| BGP                    | 170        | Yes              |

**Values** 1 to 255

## Platforms

# 10 f Commands

## 10.1 facility

facility

### Syntax

**facility** *syslog-facility*

**no facility**

### Context

[\[Tree\]](#) (config>service>vprn>log>syslog facility)

### Full Context

configure service vprn log syslog facility

### Description

This command configures the facility code for messages sent to the syslog target host.

Multiple syslog IDs can be created with the same target host but each syslog ID can only have one facility code. If multiple facility codes are entered, the last *facility-code* entered overwrites the previous facility-code.

If multiple facilities need to be generated for a single syslog target host, then multiple **log-id** entries must be created, each with its own filter criteria to select the events to be sent to the syslog target host with a given facility code.

The **no** form of this command reverts to the default value.

### Default

local7 — Syslog entries are sent with the local7 facility code.

### Parameters

#### *syslog-facility*

Specifies syslog facility name represents a specific numeric facility code. The code should be entered in accordance with the syslog RFC. However, the software does not validate if the facility code configured is appropriate for the event type being sent to the syslog target host.

**Values** kernel, user, mail, systemd, auth, syslogd, printer, netnews, uucp, cron, authpriv, ftp, ntp, logaudit, logalert, cron2, local0, local1, local2, local3, local4, local5, local6, local7

Valid responses per RFC3164, *The BSD syslog Protocol*, are listed in [Table 45: Syslog Facility Codes](#).

*Table 45: Syslog Facility Codes*

| Numerical Code | Facility Code |
|----------------|---------------|
| 0              | kernel        |
| 1              | user          |
| 2              | mail          |
| 3              | systemd       |
| 4              | auth          |
| 5              | syslogd       |
| 6              | printer       |
| 7              | net-news      |
| 8              | uucp          |
| 9              | cron          |
| 10             | auth-priv     |
| 11             | ftp           |
| 12             | ntp           |
| 13             | log-audit     |
| 14             | log-alert     |
| 15             | cron2         |
| 16             | local0        |
| 17             | local1        |
| 18             | local2        |
| 19             | local3        |
| 20             | local4        |
| 21             | local5        |
| 22             | local6        |
| 23             | local7        |

**Values:** 0 to 23

## Platforms

All

## facility

## Syntax

**facility** *syslog-facility*

## Context

[\[Tree\]](#) (config>app-assure>group>evt-log>syslog facility)

## Full Context

configure application-assurance group event-log syslog facility

## Description

This command configures the syslog facility. The syslog facility is an information field associated with a syslog message. It is defined by the syslog protocol and provides an indication of which part of the system originated the message.

## Default

facility local7

## Parameters

### ***syslog-facility***

Specifies the syslog facility keyword.

**Values** kernel, user, mail, systemd, auth, syslogd, printer, netnews, uucp, cron, authpriv, ftp, ntp, logaudit, logalert, cron2, local0, local1, local2, local3, local4, local5, local6, local7

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## facility

## Syntax

**facility** *syslog-facility*

## Context

[\[Tree\]](#) (config>service>nat>syslog>syslog-export-policy facility)

## Full Context

configure service nat syslog syslog-export-policy facility

## Description

This command configures a syslog facility. For more information, refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide*. The **config>log>syslog>level** hierarchy also applies to this context.

## Default

facility local0

## Parameters

### *syslog-facility*

Specifies a syslog facility name which represents a specific numeric facility code. The code must be entered in accordance with the syslog RFC. However, the software does not validate if the facility code configured is appropriate for the event type being sent to the syslog target host.

**Values** kernel, user, mail, systemd, auth, syslogd, printer, netnews, uucp, cron, authpriv, ftp, ntp, logaudit, logalert, cron2, local0, local1, local2, local3, local4, local5, local6, local7

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## facility

## Syntax

**facility** *syslog-facility*

**no facility**

## Context

[\[Tree\]](#) (config>log>syslog facility)

## Full Context

configure log syslog facility

## Description

This command configures the facility code for messages sent to the syslog target host.

Multiple syslog IDs can be created with the same target host but each syslog ID can only have one facility code. If multiple facility codes are entered, the last *facility-code* entered overwrites the previous facility-code.

If multiple facilities need to be generated for a single syslog target host, then multiple **log-id** entries must be created, each with its own filter criteria to select the events to be sent to the syslog target host with a given facility code.

The **no** form of this command reverts to the default value.

## Default

facility local7

## Parameters

### *syslog-facility*

Specifies a syslog facility name which represents a specific numeric facility code. The code must be entered in accordance with the syslog RFC. However, the software does not validate if the facility code configured is appropriate for the event type being sent to the syslog target host.

**Values** kernel, user, mail, systemd, auth, syslogd, printer, netnews, uucp, cron, authpriv, ftp, ntp, logaudit, logalert, cron2, local0, local1, local2, local3, local4, local5, local6, local7

Valid responses per RFC 3164, *The BSD syslog Protocol*, are listed in [Table 46: Syslog Protocol Valid Responses](#).

*Table 46: Syslog Protocol Valid Responses*

| Numerical Code | Facility Code |
|----------------|---------------|
| 0              | kernel        |
| 1              | user          |
| 2              | mail          |
| 3              | systemd       |
| 4              | auth          |
| 5              | syslogd       |

## 10.2 facility-fault

### facility-fault

#### Syntax

[no] facility-fault

#### Context

[\[Tree\]](#) (config>port>ethernet>eth-cfm>mep facility-fault)

[\[Tree\]](#) (config>lag>eth-cfm>mep facility-fault)

#### Full Context

configure port ethernet eth-cfm mep facility-fault

configure lag eth-cfm mep facility-fault

#### Description

Allows the facility MEP to move from alarming only to network actionable function. This means a facility MEP will not merely report the defect conditions but will be able to action based on the transition of the MEP state. Without this command the facility MEP will only monitor and report and conditions of the MEP do not affect related services.

**Default**

no facility-fault

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**facility-fault****Syntax**

[no] facility-fault

**Context**

[\[Tree\]](#) (config>router>if>eth-cfm>mep facility-fault)

**Full Context**

configure router interface eth-cfm mep facility-fault

**Description**

This command allows the facility MEP to move from alarming only to network actionable function. This means that a MEP facility reports both the defect conditions and the actions that are based on the transition of the MEP state.

The **no** form of this command causes the facility MEP to only monitor and report conditions on the MEPs that do not affect related services.

**Default**

no facility-fault

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 10.3 facility-id-permission

**facility-id-permission****Syntax**

facility-id-permission {chassis}

no facility-id-permission

**Context**

[\[Tree\]](#) (config>eth-cfm>domain>assoc facility-id-permission)

## Full Context

configure eth-cfm domain association facility-id-permission

## Description

This command allows the operator to include the sender-id TLV information that was specified under the **config>eth>system>sender-id** context for facility base MEPs. When this option is present under the maintenance association, the specific MPs in the association included the **sender-id** TLV information in ETH-CFM PDUs. MEPs include the **sender-id** TLV for CCM (not sub second CCM enabled MEPs), LBM/LBR, and LTM/LTR. MIPs include this value in the LBR and LTR PDUs.

### Note:

LBR functions reflect all TLVs received in the LBM unchanged including the SenderID TLV. This command produces an error when a bridge-identifier is configured under the association. Facility MEPs do not support the bridge-identifier. Transmission of the Management Domain and Management Address fields are not supported in this TLV.

## Parameters

### chassis

Sends the configured chassis information defined under **eth-cfm>system** using the **sender-id** option.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 10.4 fail-action

### fail-action

## Syntax

**fail-action** {continue | drop}

**no fail-action**

## Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe>host>match-radprox-cache fail-action)

## Full Context

configure subscriber-mgmt local-user-db ipoe host match-radius-proxy-cache fail-action

## Description

This command specifies the action to take when no match is found in the cache.

The **no** form of this command reverts to the default.

## Default

fail-action drop

## Parameters

### continue

Specifies to continue when no match is found.

### drop

Specifies to drop when no match is found.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## fail-action

## Syntax

**fail-action** *fail-action*

**no fail-action**

## Context

[\[Tree\]](#) (config>subscr-mgmt>isa-svc-chain>vas-filter>entry>action fail-action)

## Full Context

configure subscriber-mgmt isa-service-chaining vas-filter entry action fail-action

## Description

This command configures the fail action when a packet matches with a VAS filter entry in a specific direction, but no mapping exists for the specified SF-IP or ESI in the specified EVPN service.

The **no** form of this command removes the fail action from the configuration.

## Parameters

### *fail-action*

Specifies the fail action.

**Values** drop, forward

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## fail-action

### Syntax

**fail-action** {[**metric** *metric-value*] [**preference** *preference-value*] [**tag** *tag-value*] | **withdraw**}

**no fail-action**

### Context

**[Tree]** (config>service>vprn>sub-if>grp-if>sap>static-host>managed-routes>route-entry>cpe-check fail-action)

**[Tree]** (config>service>ies>sub-if>grp-if>sap>static-host>managed-routes>route-entry>cpe-check fail-action)

### Full Context

configure service vprn subscriber-interface group-interface sap static-host managed-routes route-entry cpe-check fail-action

configure service ies subscriber-interface group-interface sap static-host managed-routes route-entry cpe-check fail-action

### Description

This command configures the fail action based on specific criteria.

The **no** form of this command removes the fail action from the configuration.

### Parameters

#### *metric-value*

Specifies the route metric associated with the provisioned managed route if the CPE check fails.

**Values** 1 to 4294967295

#### *preference-value*

Specifies the route preference associated with the provisioned managed route if the CPE check fails.

**Values** 0 to 255

#### *tag-value*

Specifies the route tag used if the CPE check fails.

**Values** 1 to 4294967295

#### **withdraw**

Keyword to specify the withdrawal of the route entry if the CPE check fails.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 10.5 fail-on-error

### fail-on-error

#### Syntax

[no] fail-on-error

#### Context

[\[Tree\]](#) (config>card>xiom fail-on-error)

[\[Tree\]](#) (config>card fail-on-error)

#### Full Context

configure card xiom fail-on-error

configure card fail-on-error

#### Description

This command controls the behavior of the card when any one of a specific set of card level errors is encountered in the system. When the **fail-on-error** command is enabled, and any one (or more) of the specific errors is detected, then the Operational State of the card is set to Failed. This Failed state will persist until the clear card command is issued (reset) or the card is removed and re-inserted (re-seat). If the condition persists after re-seating the card, then Nokia support should be contacted for further investigation.

Enabling **fail-on-error** is only recommended when the network is designed to be able to route traffic around a failed card (redundant cards, nodes or other paths exist).

The list of specific errors includes:

- CHASSIS event ID# 2063 – tmnxEqCardPChipMemoryEvent
- CHASSIS event ID# 2076 – tmnxEqCardPChipCamEvent
- CHASSIS event ID# 2059 – tmnxEqCardPChipError (for ingress Ethernet only)
- CHASSIS event ID# 2098 tmnxEqCardQChipBufMemoryEvent
- CHASSIS event ID# 2099 tmnxEqCardQChipStatsMemoryEvent
- CHASSIS event ID# 2101 tmnxEqCardQChipIntMemoryEvent
- CHASSIS event ID# 2103 tmnxEqCardChipIfCellEvent

On platforms without independent IOM/IMM and CPM cards, the node is rebooted if fail-on-error is enabled and one of the card level errors is encountered.

The tmnxEqCardPChipError is only considered as a trigger for card fail-on-error for ingress FCS errors (not egress FCS errors), and only for Ethernet MDAs or IMMs.

Note that upon the detection of the event/error in the system, the reporting of the event (logs) and the **fail-on-error** behavior of the card are independent. Log event control configuration will determine whether the events are reported in logs (or SNMP traps, and so on) and the **fail-on-error** configuration will determine the behavior of the card. This implies that the card can be configured to **fail-on-error** even if the events are

suppressed (some may be suppressed in the system by default). In order to facilitate post-failure analysis, Nokia recommends that you enable the reporting of the specific events/errors ( **configure log event-control**) when **fail-on-error** is enabled.

### Default

no fail-on-error

### Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

- configure card xiom fail-on-error

All

- configure card fail-on-error

## fail-on-error

### Syntax

[no] fail-on-error

### Context

[\[Tree\]](#) (config>card>mda fail-on-error)

### Full Context

configure card mda fail-on-error

### Description

This command enables the fail-on-error feature. If an MDA is experiencing too many Egress XPL Errors, this feature causes the MDA to fail. This can force an APS switchover or **traffic re-route**. The purpose of this feature is to avoid situations where traffic is forced to use a physical link that suffers from errors but is still technically operational.

The feature uses values configured in the **config>card>mda>egress-xpl** context. When this feature is enabled on a MDA, if *window* consecutive minutes pass in which the MDA experiences more than *threshold* Egress XPL Errors per minute, then the MDA will be put in the *failed* state.

The **no** form of this command disables the feature on the MDA.

### Platforms

All

## 10.6 fail-to-open

## fail-to-open

### Syntax

[no] fail-to-open

### Context

[\[Tree\]](#) (config>isa>aa-grp fail-to-open)

### Full Context

configure isa application-assurance-group fail-to-open

### Description

This command configures the mode of operation during an operational failure of this application assurance group when no application assurance engines are available to service traffic. When enabled, all traffic that was to be inspected will be dropped. When disabled, all traffic that was to be inspected will be forwarded without any inspection as if the group was not configured at all.

### Default

no fail-to-open

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.7 failed-mda-limit

### failed-mda-limit

### Syntax

failed-mda-limit *number*

no failed-mda-limit

### Context

[\[Tree\]](#) (config>isa>nat-group failed-mda-limit)

### Full Context

configure isa nat-group failed-mda-limit

### Description

This command configures the maximum number of supported simultaneously failures in the active-active intra-chassis NAT redundancy model. Traffic from the failed ISAs is distributed over the remaining ISA in the system. Memory resources are reserved in every ISA to accommodate new mappings from the failed

ISA. However, bandwidth is not reserved and each ISA operates at max speed in all conditions (with failure or without the failure).

NAT translations are not preserved across switchovers and consequently they will have to be re-initiated by the clients.

For this command to take effect, the intra-chassis redundancy mode must be set to active-active (**config>isa>nat-group>redundancy active-active**).

### Default

no failed-mda-limit

### Parameters

#### *number*

Specifies the number of simultaneous ISA failures supported in active-active intra-chassis NAT redundancy model.

**Values** 1 to 2

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.8 failed-threshold

### failed-threshold

#### Syntax

**failed-threshold** [1 to 1000]

**failed-threshold all**

#### Context

**[Tree]** (config>service>vpls>site failed-threshold)

#### Full Context

configure service vpls site failed-threshold

#### Description

This command defines the number of objects should be down for the site to be declared down. Both administrative and operational status must be evaluated and if at least one is down, the related object is declared down.

#### Default

failed-threshold all

**Parameters****1 to 1000**

Specifies the threshold for the site to be declared down.

**Platforms**

All

## 10.10 failure-action

## failure-action

### Syntax

**failure-action down**

**no failure-action**

## Context

[\[Tree\]](#) (config>router>ldp>lsp-bfd failure-action)

## Full Context

configure router ldp lsp-bfd failure-action

## Description

This command configures the action to take when LSP BFD fails on an LDP LSP.

The system generates an SNMP trap if BFD goes down on an LSP, regardless of whether a failure action is configured or not.

The **no** form of this command removes the failure action.

## Default

no failure-action

## Parameters

### down

Specifies the LSP is marked as unusable in the TTM. If the LSP appears as a shortcut in RTM, then the route is removed.

## Platforms

All

## failure-action

## Syntax

[\[Tree\]](#) (config>service>ies>interface>spoke-sdp>bfd failure-action)

[\[Tree\]](#) (config>service>vprn>interface>spoke-sdp>bfd failure-action)

[\[Tree\]](#) (config>service>vpls>spoke-sdp>bfd failure-action)

## Full Context

configure service epipe spoke-sdp bfd failure-action

configure service ies interface spoke-sdp bfd failure-action

configure service vprn interface spoke-sdp bfd failure-action

configure service vpls spoke-sdp bfd failure-action

## Description

This command configures the ability to bind the operational state of a spoke-SDP to the state of its VCCV BFD session.

If **failure-action down** is configured, the spoke-SDP is taken operationally down if the associated VCCV BFD session goes down. This configuration also allows BFD packets to be forwarded on an otherwise operationally down spoke-SDP in order to test the spoke-SDP connectivity.

The **no** form of this command removes the failure action.

## Default

no failure-action

## Parameters

### down

Specifies that the spoke-SDP is taken operationally down if the associated VCCV BFD session goes down.

## Platforms

All

## failure-action

## Syntax

**failure-action** *failure-action*

**no failure-action**

## Context

[\[Tree\]](#) (config>router>mpls>lsp>bfd failure-action)

## Full Context

configure router mpls lsp bfd failure-action

## Description

This command configures what action occurs when LSP BFD fails on an RSVP or SR-TE LSP.

A failure action of **down** means an LSP is marked as unusable in TTM. If it appears as a shortcut in RTM, the route is removed. This failure action can only be configured on RSVP LSPs.

A failure action of **failover** causes the active path of an RSVP LSP to switch to the secondary or next-preference available secondary path. This option is only available for RSVP LSPs. It is not applicable to **one-hop-p2p** and **mesh-p2p** auto LSPs.

A failure action of **failover-or-down** means that a switchover from the active path is triggered on failure of the BFD session on the active path (primary or standby). If there is no available path to switch to, then the LSP is taken operationally down. For RSVP-TE LSPs, this failure action causes the two best-preference standby paths to be programmed in the data path, in addition to the primary.

The system generates an SNMP trap if BFD goes down on an LSP, regardless of whether a failure action is configured or not.

The **no** form of this command removes the failure action.

## Default

no failure-action

## Parameters

### down

Specifies that the LSP will be marked as unusable in the TTM. If it appears as a shortcut in RTM, then the route will be removed.

### failover

Specifies that the active path of an RSVP LSP will switch to the secondary path or next-preference available secondary path. This option is only available for RSVP LSPs. It is not applicable in the LSP template.

### failover-or-down

Specifies that the active path of an SR-TE or RSVP-TE LSP switches to the secondary or next-preference available secondary path, or for the LSP to go operationally down if no other path is available.

## Platforms

All

## failure-action

## Syntax

**failure-action** {**down** | **failover-or-down**}

**no failure-action**

## Context

[\[Tree\]](#) (config>router>mpls>lsp-template>bfd failure-action)

## Full Context

configure router mpls lsp-template bfd failure-action

## Description

This command configures the action to take when LSP BFD fails on an RSVP LSP.

The system generates an SNMP trap if BFD goes down on an LSP, regardless of whether or not a failure action is configured.

The **no** form of this command removes the failure action.

**Default**

no failure-action

**Parameters****down**

Specifies that the LSP is marked as unusable in the TTM. If it appears as a shortcut in RTM, then the route is removed.

**failover-or-down**

Specifies that the active path of an SR-TE LSP switches to the secondary or next-preference available secondary path, or for the LSP to go operationally down if no other path is available. This option is only available for SR-TE LSPs.

**Platforms**

All

## 10.11 failure-mode

### failure-mode

**Syntax**

**failure-mode** [discard | per-link-hash]

**no failure-mode**

**Context**

[\[Tree\]](#) (config>lag>link-map-profile failure-mode)

**Full Context**

configure lag link-map-profile failure-mode

**Description**

This command defines the failure mode for egress traffic of SAPs/network interfaces that use this link-map-profile when neither primary nor secondary links of this profile are available.

**Default**

failure-mode per-link-hash

**Parameters****discard**

Specifies egress traffic for SAPs/network interfaces using this link-map-profile is discarded to protect SAP/network interface traffic on other LAG links from impact of re-hashing the affected SAPs/network interfaces.

**per-link-hash**

Specifies egress traffic for SAPs/network interfaces using this link-map-profile is rehashed on remaining, available LAG links using per-link-hash algorithm. SAP/network interface QoS configurations dictate what traffic is discarded on any link that may become oversubscribed as result of the re-hash.

**Platforms**

All

## 10.12 failure-recovery

### failure-recovery

**Syntax**

[no] failure-recovery

**Context**

[\[Tree\]](#) (config>sys>switch-fabric failure-recovery)

**Full Context**

configure system switch-fabric failure-recovery

**Description**

Commands in this context configure attributes related to the automatic switch fabric recovery process.

The automatic switch fabric recovery process is triggered when there are two resets of an IOM/XCM due to ICC failures within a small time frame. The recovery process involves the sequential resetting of SFM in case the issues are due to one of the SFM in the ICC communication path. As the final step in the recovery process, a CPM switchover is triggered to reset the active CPM.

**Platforms**

7450 ESS, 7750 SR-7, 7750 SR-12e, 7950 XRS

## 10.13 failure-threshold

### failure-threshold

**Syntax**

failure-threshold *number*

no failure-threshold

## Context

[\[Tree\]](#) (config>test-oam>icmp>ping-template failure-threshold)

## Full Context

configure test-oam icmp ping-template failure-threshold

## Description

This command configures the count, when reached, that causes the transition of the IPv4 interface from operationally up to operationally down because of a ping template failure.

The **no** form of this command reverts to the default value.

## Default

failure-threshold 3

## Parameters

### *number*

Specifies a count that causes the transition of the IP interface from operationally up to operationally down because of ping template failure.

**Values** 2 to 10

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 10.14 fallback-action

### fallback-action

## Syntax

**fallback-action accept** [**force-probing**]

**fallback-action user-db** *local-user-db-name* [**force-probing**]

**no fallback-action**

## Context

[\[Tree\]](#) (config>subscr-mgmt>auth-plcy fallback-action)

## Full Context

configure subscriber-mgmt authentication-policy fallback-action

## Description

This command configures the action when no RADIUS server is available; servers are either out of service or are in a probing state.

The **no** form of this command removes the action from the configuration.

## Parameters

### **accept**

Specifies that all authentication requests are automatically accepted.

### **local-user-db-name**

Specifies that the LUDB is used to authenticate to the server.

### **force-probing**

Specifies that a subscriber or a test user Access-Request, depending which arrives first, is used to probe a RADIUS server before continuing with the configured **fallback-action**. This forces an out-of-service server to transition to a probing state.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 10.15 fallback-path-computation-method

### fallback-path-computation-method

## Syntax

**fallback-path-computation-method** {**none** | **local-cspf**}

**no fallback-path-computation-method**

## Context

[\[Tree\]](#) (config>router>mpls>lsp fallback-path-computation-method)

[\[Tree\]](#) (config>router>mpls>lsp-template fallback-path-computation-method)

## Full Context

configure router mpls lsp fallback-path-computation-method

configure router mpls lsp-template fallback-path-computation-method

## Description

This command specifies the fallback path computation method used if all configured PCEs are down or the signaling overload and the redelegation timer has expired. This method is used regardless of whether the LSP is PCE-controlled and PCE-computed, or just PCE-computed.

The **no** form of this command removes the fallback path computation method used.

## Default

fallback-path-computation-method none

## Parameters

### none

Specifies to fall back to using the named path for RSVP-TE LSPs.

### local-cspf

Specifies to fall back to using local CSPF computation.

## Platforms

All

## 10.16 falling-percent-reset

### falling-percent-reset

## Syntax

**falling-percent-reset** *percent-of-highest*

**no falling-percent-reset**

## Context

[\[Tree\]](#) (config>mcast-mgmt>bw-plcy falling-percent-reset)

## Full Context

configure mcast-management bandwidth-policy falling-percent-reset

## Description

This command is configured the percentage of bandwidth decrease that must occur to reset the dynamic bandwidth monitoring function for a multicast channel. When a channel is configured to use the ingress dynamic bandwidth as the in-use bandwidth for ingress multicast path management, the system maintains a sliding window in time that defines how long the last highest bandwidth value associated with the channel should be used. The sliding window duration is derived from the channels bw-activity dynamic falling-delay parameter within the multicast information policy. Each time the system detects a current bandwidth for a channel that is equal to or greater than the current highest bandwidth for the channel, the sliding window is reset and the highest value is used when managing the ingress multicast paths. If the system does not detect a higher or equal bandwidth value for the channel within the window period, the system resets the sliding window and uses the next highest rate seen during the duration of the window period. In this way, the system delays relinquishing bandwidth for a dynamic bandwidth channel for a configurable period. If a momentary fluctuation (decrease) in ingress bandwidth occurs, the system ignores the bandwidth change.

While this is useful for momentary fluctuations in bandwidth, it may be desirable to react faster when the current bandwidth monitored for a channel drops significantly relative to the currently in-use bandwidth. When the bandwidth decrease is equal to or greater than the falling-percent-reset value, the system

immediately stops using the highest bandwidth and starts using the current bandwidth while resetting the sliding window.

If falling-percent-reset is set to 50%, when the current ingress dynamic bandwidth is 50% of the current in-use highest bandwidth, the system immediately uses the current dynamic ingress bandwidth as the highest bandwidth for the channel.

By default, the falling-percent-reset is 50% when a new bandwidth policy is created. The default bandwidth policy also has a hard configured value of 50%. Setting falling-percent-reset to 100 is equivalent to specifying no falling-percent-reset.

The **no** form of this command restores the default value of 50%.

## Default

falling-percent-reset 50

## Parameters

### *percent-of-highest*

The percent-of-highest parameter is required and defines the percentage of decline between the current ingress dynamic bandwidth and the current in-use highest bandwidth at which the system resets the dynamic ingress bandwidth monitoring for the channel. When reset in this case, the system uses the current ingress dynamic bandwidth as the highest rate and continues monitoring. The parameter must be defined as an integer value representing a percentage.

**Values** 1 to 100 percent

## Platforms

7450 ESS, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

## 10.17 family

### family

## Syntax

**family** [ipv4 | ipv6]

## Context

[\[Tree\]](#) (config>lag>bfd family)

## Full Context

configure lag bfd family

## Description

This command specifies the address family for the micro-BFD session over the associated LAG links.

**Default**

family ipv4

**Parameters****ipv4**

Specifies that IPv4 encapsulation be used for the micro-BFD session.

**ipv6**

Specifies that IPv6 encapsulation be used for the micro-BFD session.

[\[Tree\]](#) (config>service>vprn>bgp>group family)

## Full Context

```
configure service vprn bgp group neighbor family
configure service vprn bgp family
configure service vprn bgp group family
```

## Description

This command configures the set of BGP address families (AFI plus SAFI) to be supported by the applicable VPRN BGP sessions.

The **no** form of this command restores the default, which corresponds to unlabeled IPv4 unicast routes (AFI 1, SAFI 1) only.

## Default

```
family ipv4
```

## Parameters

### ipv4

Adds support for the IPv4 unicast (unlabeled) address family.

### label-ipv4

Adds support for the IPv4 unicast (labeled) address family.

### ipv6

Adds support for the IPv6 unicast (unlabeled) address family.

### mcast-ipv4

Adds support for the IPv4 multicast SAFI address family.

### flow-ipv4

Adds support for the IPv4 FlowSpec address family.

### mcast-ipv6

Adds support for the IPv6 multicast SAFI address family.

### flow-ipv6

Adds support for the IPv6 FlowSpec address family.

family

## Syntax

```
family [ipv4 | ipv6]
```

## Context

[\[Tree\]](#) (config>router>mpls>lsp-template family)

## Full Context

configure router mpls lsp-template family

## Description

This command specifies if the lsp-template is for use in IPv4 or IPv6 SR-TE LSP.

This command is optional in a IPv4 SR-TE auto-LSP but must be set to **ipv6** value in a IPv6 SR-TE auto-LSP. By default, this command is set to **ipv4** value for backward compatibility.

When establishing both IPv4 and IPv6 SR-TE mesh auto-LSPs with the same parameters and constraints, a separate LSP template of type **mesh-p2p-srte** must be configured for each address family with the **family** CLI leaf set to the IPv4 or IPv6 value. SR-TE one-hop auto-LSPs can only be established for either IPv4 or IPv6 family, but not both. The **family** leaf in the LSP template of type **one-hop-p2p-srte** should be set to the desired IP family value.

The **no** form of this command reverts to the default value.

## Default

family ipv4

## Parameters

**ipv4**

Specifies the lsp-template is for use in IPv4 SR-TE LSP.

**ipv6**

Specifies the lsp-template is for use in IPv6 SR-TE LSP.

configure router bgp family

configure router bgp group family

## Description

This command configures the set of BGP address families (AFI/SAFI) to be supported by the base router BGP sessions.

The **no** form of this command restores the default, which corresponds to unlabeled IPv4 unicast routes (AFI 1, SAFI 1) only.

## Default

family ipv4

## Parameters

### **ipv4**

Advertises MP-BGP support for the IPv4 unicast (unlabeled) address family.

### **label-ipv4**

Advertises MP-BGP support for the IPv4 unicast (labeled) address family.

**vpn-ipv4**

Advertises MP-BGP support for the IPv4 VPN (SAFI 128) address family.

**ipv6**

Advertises MP-BGP support for the IPv6 unicast (unlabeled) address family.

**label-ipv6**

Advertises MP-BGP support for the IPv6 unicast (labeled) address family.

**vpn-ipv6**

Advertises MP-BGP support for the IPv6 VPN (SAFI 128) address family.

**mcast-ipv4**

Advertises MP-BGP support for the IPv4 multicast SAFI address family.

**l2-vpn**

Advertises MP-BGP support for the L2 VPN address family.

**mvpn-ipv4**

Advertises MP-BGP support for the IPv4 multicast VPN address family.

**mvpn-ipv6**

Advertises MP-BGP support for the IPv6 multicast VPN address family.

**mdt-safi**

Advertises MP-BGP support for the MDT SAFI address family.

**ms-pw**

Advertises MP-BGP support for the multi-segment pseudowire address family.

**flow-ipv4**

Advertises MP-BGP support for the IPv4 FlowSpec address family.

**flow-ipv6**

Advertises MP-BGP support for the IPv6 FlowSpec address family.

**route-target**

Advertises MP-BGP support for RT constraint routes.

**mcast-vpn-ipv4**

Advertises MP-BGP support for the IPv4 VPN multicast (SAFI 129) address family.

**evpn**

Advertises MP-BGP support for the EVPN address family.

**bgp-ls**

Enables the advertisement of BGP-LS address family to the associated BGP neighbors.

**mcast-ipv6**

Advertises MP-BGP support for the IPv6 multicast SAFI address family.

**mcast-vpn-ipv6**

Advertises MP-BGP support for the IPv6 multicast routes from a VPRN over the provider network. This family is only applicable in the base BGP routing context.

**sr-policy-ipv4**

Advertises MP-BGP support for AFI1/SAFI73 IP address families for BGP routes that encode a segment-routing policy to an IPv4 destination.

**sr-policy-ipv6**

Advertises MP-BGP support for AF12/SAFI73 IP address families for BGP routes that encode a segment-routing policy to an IPv6 destination.

**flow-vpn-ipv4**

Advertises support for the FlowSpec-VPN IPv4 address family (AFI 1, SAFI 134).

**flow-vpn-ipv6**

Advertises support for the FlowSpec-VPN IPv6 address family (AFI 2, SAFI 134).

**Platforms**

All

**family****Syntax**

**[no] family {ipv4 | ipv6 | label-ipv4 | label-ipv6 | vpn-ipv4 | vpn-ipv6 | l2-vpn | route-target | flow-ipv4 | flow-ipv6 | flow-vpn-ipv4 | flow-vpn-ipv6}**

configure bmp station family

## Description

This command configures the address families that are reported to a BMP monitoring station. The **no** form of this command reverts to the default value.

## Default

family ipv4

## Parameters

### ipv4

Keyword to add support for the IPv4 unicast (unlabeled) address family.

### ipv6

Keyword to add support for the IPv6 unicast (unlabeled) address family.

### label-ipv4

Keyword to add support for the IPv4 unicast (labeled) address family.

### label-ipv6

Keyword to add support for the IPv6 unicast (labeled) address family.

### mcast-ipv4

Keyword to add support for the IPv4 multicast address family.

### mcast-ipv6

Keyword to add support for the IPv6 multicast address family.

### vpn-ipv4

Keyword to add support for the IPv4 VPN (SAFI 128) address family.

### vpn-ipv6

Keyword to add support for the IPv6 VPN (SAFI 128) address family.

### mcast-vpn-ipv4

Keyword to add support for the IPv4 VPN multicast address family.

### mcast-vpn-ipv6

Keyword to add support for the IPv6 VPN multicast address family.

### evpn

Keyword to add support for the VPN address family.

### l2-vpn

Keyword to add support for the L2-VPN address family.

### sr-policy-ipv4

Keyword to add support for the SR policy IPv4 address family.

**sr-policy-ipv6**

Keyword to add support for the SR policy IPv6 address family.

configure router ospf3 igp-shortcut tunnel-next-hop family

## Description

Commands in this context configure the resolution of the IGP IPv6 prefix family using IGP shortcuts.

## Parameters

*ipv6*

Selects the IPv6 address family.

## Platforms

All

## family

## Syntax

**family** [ipv4] [label-ipv4] [vpn-ipv4] [ipv6] [ label-ipv6] [vpn-ipv6] [ mcast-ipv4] [ l2-vpn] [mvpn-ipv4] [mvpn-ipv6] [mdt-safi] [ ms-pw] [flow-ipv4] [flow-ipv6] [route-target] [ mcast-vpn-ipv4] [evpn] [bgp-ls] [mcast-ipv6] [mcast-vpn-ipv6] [sr-policy-ipv4] [sr-policy-ipv6] [ flow-vpn-ipv4] [flow-vpn-ipv6]

**no family**

## Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from family)

## Full Context

configure router policy-options policy-statement entry from family

## Description

This command specifies address families as matching conditions.

The **no** form of the command configures the router to use the default value.

**Default**

no family

**Parameters****ipv4**

Matches routes belonging to the IPv4 unicast (unlabeled) address family.

**label-ipv4**

Matches routes belonging to the IPv4 unicast (labeled) address family.

**vpn-ipv4**

Matches routes belonging to the IPv4 VPN (SAFI 128) address family.

**ipv6**

Matches routes belonging to the IPv6 unicast (unlabeled) address family.

**label-ipv6**

Matches routes belonging to the IPv6 unicast (labeled) address family.

**vpn-ipv6**

Matches routes belonging to the IPv6 VPN (SAFI 128) address family.

**mcast-ipv4**

Matches routes belonging to the IPv4 multicast SAFI address family.

**l2-vpn**

Matches routes belonging to the L2 VPN address family.

**mvpn-ipv4**

Matches routes belonging to the IPv4 multicast VPN address family.

**mvpn-ipv6**

Matches routes belonging to the IPv6 multicast VPN address family.

**mdt-safi**

Matches routes belonging to the MDT SAFI address family.

**ms-pw**

Matches routes belonging to the multi-segment pseudowire address family.

**flow-ipv4**

Matches routes belonging to the IPv4 FlowSpec address family.

**flow-ipv6**

Matches routes belonging to the IPv6 FlowSpec address family.

**route-target**

Matches routes belonging to the address family for RT constrain routes.

**mcast-vpn-ipv4**

Matches routes belonging to the IPv4 VPN multicast (SAFI 129) address family.

**evpn**

Matches routes belonging to the EVPN address family.

**bgp-ls**

Enables the advertisement of BGP-LS address family to the associated BGP neighbors.

**mcast-ipv6**

Matches routes belonging to the IPv6 multicast SAFI address family.

**mcast-vpn-ipv6**

Matches routes belonging to the IPv6 multicast routes from a VPRN over the provider network. This family is only applicable in the base BGP routing context.

**sr-policy-ipv4**

Matches routes belonging to the segment routing policy IPv4 address family (AFI1/SAFI73).

**sr-policy-ipv6**

Matches routes belonging to the segment routing policy IPv6 address family (AFI2/SAFI73).

**flow-vpn-ipv4**

Matches routes belonging to the FlowSpec-VPN IPv4 address family (AFI 1, SAFI 134).

**flow-vpn-ipv6**

Matches routes belonging to the FlowSpec-VPN IPv6 address family (AFI 2, SAFI 134).

**Platforms**

## 10.19 far-end

### far-end

## Syntax

**far-end** *ip-address* [**vc-id** *vc-id*] [{**ing-svc-label** *ingress-vc-label* | **tldp**}] [**icb**]

**no far-end** *ip-address*

## Context

[\[Tree\]](#) (config>mirror>mirror-dest>remote-source far-end)

## Full Context

configure mirror mirror-dest remote-source far-end

## Description

This command is used on a destination router in a remote mirroring solution. See the description for the **remote-source** command for additional information.

When using L2TPv3, MPLS-TP or LDP IPv6 LSP SDPs in the remote mirroring solution, the destination node should be configured with **remote-src>spoke-sdp** entries. For all other types of SDPs, **remote-source>far-end** entries are used.

Up to 50 far-end entries can be specified.

The **no** form of this command removes the IP address from the remote source configuration.

## Parameters

*ip-address*

Specifies the service IP address (system IP address) of the remote device sending mirrored traffic to this mirror destination service. If 0.0.0.0 is specified, any remote is allowed to send to this service.

**Values** 1.0.0.1 to 223.255.255.254

### ***vc-id***

Specifies the virtual circuit identifier of the remote source. For mirror services, the *vc-id* defaults to the *service-id*. However, if the *vc-id* is being used by another service a unique *vc-id* is required to create an SDP binding. For this purpose the mirror service SDP bindings accepts *vc-ids*. This VC ID must match the VC ID used on the spoke SDP that is configured on the source router.

### ***ingress-vc-label***

Specifies the ingress service label for mirrored service traffic on the **far end** device for manually configured mirror service labels.

The defined *ing-svc-label* is entered into the ingress service label table which causes ingress packet with that service label to be handled by this mirror destination service.

The specified *ing-svc-label* must not have been used for any other service ID and must match the egress service label being used on the spoke SDP that is configured on the source router. It must be within the range specified for manually configured service labels defined on this router. It may be reused for other far end addresses on this *mirror-dest-service-id*.

**Values** 2048 to 18431

### **tldp**

Specifies that the label is obtained through signaling via the LDP.

### **icb**

Specifies that the remote source is an inter-chassis backup SDP binding.

## **Platforms**

**no far-end** *ip-address* | *ipv6-address*

## **Context**

[\[Tree\]](#) (config>service>sdp far-end)

## **Full Context**

configure service sdp far-end

## Description

This command configures the system IP address of the far-end destination router for the Service Distribution Point (SDP) that is the termination point for a service.

The far-end IP address must be explicitly configured. The destination IP address must be that of an SR OS and for a GRE SDP it must match the system IP address of the far end router.

If the SDP uses GRE for the destination encapsulation, the IP address is checked against other GRE SDPs to verify uniqueness. If the IP address is not unique within the configured GRE SDPs, an error is generated and the IP address is not associated with the SDP. The local device may not know whether the IP address is actually a system IP interface address on the far-end device.

If the SDP uses MPLS encapsulation, the **far-end** address is used to check LSP names when added to the SDP. If the "to IP address" defined within the LSP configuration does not exactly match the SDP **far-end** address, the LSP will not be added to the SDP and an error will be generated. Alternatively, an SDP that uses MPLS can have an MPLS-TP node with an MPLS-TP node-id and (optionally) a global ID. In this case, the SDP must use an MPLS-TP LSP and the SDP **signaling** parameter must be set to **off**.

An SDP cannot be administratively enabled until a **far-end ip-address** or MPLS-TP node-id is defined. The SDP is operational when it is administratively enabled ( **no shutdown**) and the **far-end ip-address** is contained in the IGP routing table as a host route. OSPF ABRs should not summarize host routes between areas. This can cause SDPs to become operationally down. Static host routes (direct and indirect) can be defined in the local device to alleviate this issue.

On a tunnel configured as SDP with delivery type of eth-gre-bridged, this command designates L2oGRE tunnel end points. This is the only configuration option allowed for this type of SDP.

The **no** form of this command removes the currently configured destination IP address for the SDP. The *ip-address* parameter is not specified and will generate an error if used in the **no far-end** command. The SDP must be administratively disabled using the **config service sdp shutdown** command before the **no far-end** command can be executed. Removing the far-end IP address will cause all *lsp-name* associations with the SDP to be removed.

## Parameters

### **far-end**

Specifies the far-end termination point for the GRE tunnel.

### **ip-address | ipv6-address**

Specifies a IPv4 or IPv6 address of the far-end SR OS for the SDP in dotted decimal notation.

### **node-id**

Specifies the MPLS-TP Node ID of the far-end system for the SDP, either in dotted decimal notation (a.b.c.d) or an unsigned 32-bit integer (1 to 4294967295). This parameter is mandatory for an SDP using an MPLS-TP LSP.

### **global-id**

Specifies a MPLS-TP Global ID of the far-end system for the SDP, in an unsigned 32-bit integer (0 to 4294967295). This parameter is optional for an SDP using an MPLS-TP LSP. If not entered, a default value for the Global ID of '0' is used. A global ID of '0' indicates that the far-end node is in the same domain as the local node. The user must explicitly configure a Global ID if its value is non-zero.

configure service vpls spoke-sdp mld-snooping fast-leave

configure service vpls mesh-sdp mld-snooping fast-leave

configure service vpls spoke-sdp igmp-snooping fast-leave

configure service vpls sap igmp-snooping fast-leave

configure service vpls sap mld-snooping fast-leave

#### Description

This command enables fast leave.

When IGMP fast leave processing is enabled, the 7450 ESS or 7750 SR immediately removes a SAP or SDP from the IP multicast group when it detects an IGMP leave message on that SAP or SDP. Fast leave processing allows the switch to remove a SAP or SDP that sends a leave message from the forwarding table without first sending out group-specific queries to the SAP or SDP, which speeds up the process of changing channels.

Fast leave should only be enabled when there is a single receiver present on the SAP or SDP.

When fast leave is enabled, the configured **last-member-query-interval** value is ignored.

#### Default

no fast-leave

## 10.21 fast-reroute

### fast-reroute

## Syntax

```
fast-reroute [backup-sr-tunnel]
```

```
no fast-reroute
```

## Context

```
[Tree] (config>router>ldp fast-reroute)
```

## Full Context

```
configure router ldp fast-reroute
```

## Description

This command enables LDP Fast-Reroute (FRR) procedures. When enabled, LDP uses both the primary next-hop and LFA next-hop, when available, for resolving the next-hop of an LDP FEC against the corresponding prefix in the routing table. This will result in LDP programming a primary NHLFE and a backup NHLFE into the forwarding engine for each next-hop of a FEC prefix for the purpose of forwarding packets over the LDP FEC.

When any of the following events occurs, LDP instructs in the fast path the forwarding engines to enable the backup NHLFE for each FEC next-hop impacted by this event:

- An LDP interface goes operationally down, or is admin shutdown.
- An LDP session to a peer went down as the result of the Hello or Keep-Alive timer expiring.
- The TCP connection used by a link LDP session to a peer went down, due say to next-hop tracking of the LDP transport address in RTM, which brings down the LDP session.
- A BFD session, enabled on a T-LDP session to a peer, times-out and as a result the link LDP session to the same peer and which uses the same TCP connection as the T-LDP session goes also down.
- A BFD session enabled on the LDP interface to a directly connected peer, times out and brings down the link LDP session to this peer.

The **tunnel-down-dump-time** option or the **label-withdrawal-delay** option, when enabled, does not cause the corresponding timer to be activated for a FEC as long as a backup NHLFE is still available.

Because LDP can detect the loss of a neighbor/next-hop independently, it is possible that it switches to the LFA next-hop while IGP is still using the primary next-hop. Also, when the interface for the previous primary next-hop is restored, IGP may re-converge before LDP completed the FEC exchange with it neighbor over that interface. This may cause LDP to de-program the LFA next-hop from the FEC and blackhole traffic. In order to avoid this situation, it is recommended to enable IGP-LDP synchronization on the LDP interface.

When the SPF computation determines there is more than one primary next-hop for a prefix, it will not program any LFA next-hop in RTM. Thus, the LDP FEC will resolve to the multiple primary next-hops that provide the required protection.

The **backup-sr-tunnel** option enables the use of SR tunnel, as a remote LFA or TI-LFA backup tunnel next-hop by an LDP FEC.

As a pre-requisite, the user must enable the stitching of LDP and SR in the LDP-to-SR direction. That is because the LSR must perform the stitching of the LDP ILM to SR tunnel when the primary LDP next-hop of the FEC fails. Thus LDP must listen to SR tunnels programmed by the IGP in TTM but the mapping server feature is not required.

Assuming the following:

- the **backup-sr-tunnel** option is enabled in LDP
- the **{loopfree-alternates remote-lfa}** and/or the **{loopfree-alternates ti-lfa}** option is enabled in the IGP instance
- LDP was able to resolve the primary next-hop of the LDP FEC in RTM

IGP SPF will run both the base LFA and the TI-LFA algorithms and if it does not find a backup next-hop for a prefix of an LDP FEC, it will also run the remote LFA algorithm. If IGP finds a TI-LFA or a remote LFA tunnel next-hop, LDP programs the primary next-hop of the FEC using a LDP NHLFE and programs the LFA backup next-hop using a LDP NHLFE pointing to the SR tunnel endpoint. Note that the LDP packet is not "tunneled" over the SR tunnel. The LDP label is actually stitched to the segment routing label stack. LDP points both the LDP ILM and the LTN to the backup LDP NHLFE which itself uses the SR tunnel endpoint.

The behavior of the feature is thus similar to the LDP-to-SR stitching feature, except the behavior is augmented to allow the stitching of an LDP ILM/LTN to a SR tunnel also when the primary LDP next-hop of the FEC fails.

If the LDP FEC primary next-hop failed and LDP has pre-programmed a remote LFA or TI-LFA next-hop with a LDP backup NHLFE pointing to SR tunnel, the LDP ILM/LTN switches to it. Note that if for some reason the failure impacted only the LDP tunnel primary next-hop but not the SR tunnel primary next-hop, the LDP backup NHLFE will effectively point to the primary next-hop of the SR tunnel and traffic of the LDP ILM/LTN will follow this path instead of the TI-LFA or remote LFA next-hop of the SR tunnel until the latter is activated.

This feature is limited to IPv4 /32 prefixes in both LDP and SR.

The **no** form of this command disables the use of SR tunnels as backups for LDP FECs and disables LDP FRR.

**no fast-reroute**

## Context

[\[Tree\]](#) (config>router>mpls>lsp fast-reroute)

[\[Tree\]](#) (config>router>mpls>lsp-template fast-reroute)

## Full Context

configure router mpls lsp fast-reroute

configure router mpls lsp-template fast-reroute

## Description

This command creates a pre-computed detour LSP from each node in the path of the LSP. In case of failure of a link or LSP between two nodes, traffic is immediately rerouted on the pre-computed detour LSP, thus avoiding packet-loss.

When **fast-reroute** is enabled, each node along the path of the LSP tries to establish a detour LSP as follows:

- Each upstream node sets up a detour LSP that avoids only the immediate downstream node, and merges back on to the actual path of the LSP as soon as possible.

If it is not possible to set up a detour LSP that avoids the immediate downstream node, a detour can be set up to the downstream node on a different interface.

- The detour LSP may take one or more hops (see **config>router>mpls>lsp hop-limit**, **config>router>mpls>lsp>primary-p2mp-instance hop-limit**) before merging back on to the main LSP path.
- When the upstream node detects a downstream link or node failure, the ingress router switches traffic to a standby path if one was set up for the LSP.

Fast reroute is available only for the primary path. No configuration is required on the transit hops of the LSP. The ingress router will signal all intermediate routers using RSVP to set up their detours. TE must be enabled for fast-reroute to work.

If an LSP is configured with **fast-reroute** *frr-method* specified but does not enable CSPF, then global revertive will not be available for the LSP to recover.

The **no** form of the **fast-reroute** command removes the detour LSP from each node on the primary path. This command will also remove configuration information about the hop-limit and the bandwidth for the detour routes.

The **no** form of **fast-reroute hop-limit** command reverts to the default value.

**Note:**

A one-to-one detour backup LSP cannot be used at the PLR for ABR node protection. As a result, a PLR node does not signal a one-to-one detour LSP for ABR protection. In addition, the ABR node rejects a Path message that it has received from a third-party implementation configured with a detour object and a loose ERO next-hop. The Path message is rejected regardless of whether the **cspf-on-loose-hop** command is enabled on the node. When the router transits ABR for the detour path, the router rejects the signaling of an inter-area detour backup LSP.

**Default**

no fast-reroute — When fast-reroute is specified, the default fast-reroute method is one-to-one.

**Parameters*****frr-method***

Configures the fast-reroute method.

**Values** **one-to-one** — In the one-to-one technique, a label switched path is established which intersects the original LSP somewhere downstream of the point of link or node failure. For each LSP which is backed up, a separate backup LSP is established.

**Values** **facility** — This option, sometimes called many-to-one, takes advantage of the MPLS label stack. Instead of creating a separate LSP for every backed-up LSP, a single LSP is created which serves to backup up a set of LSPs. This LSP tunnel is called a bypass tunnel.

The bypass tunnel must intersect the path of the original LSP(s) somewhere downstream of the point of local repair (PLR). Naturally, this constrains the set of LSPs being backed-up through that bypass tunnel to those that pass through a common downstream node. All LSPs which pass through the PLR and through this common node which do not also use the facilities involved in the bypass tunnel are candidates for this set of LSPs.

## 10.22 fast-start

### fast-start

## Syntax

[no] fast-start

## Context

[\[Tree\]](#) (config>qos>adv-config-policy>child-control>offered-measurement fast-start)

## Full Context

configure qos adv-config-policy child-control offered-measurement fast-start

## Description

This command is used to enable fast detection of initial bandwidth on a child policer or queue associated with the policy. Multiple offered rate counter reads may be performed per the sampling interval. The system accumulates these counter values and evaluates the delta at the conclusion of the sampling interval. When fast-start is enabled, the system identifies all children associated with the policy that enter the inactive state (current offered rate is zero). Any inactive 'fast start' child that has a positive offered counter during a sampling period bypasses the normal sampling interval and does an immediate offered rate evaluation.

This option is intended for use with children that would benefit from faster than normal startup detection, typically those of a real-time nature.

When this parameter is not enabled, the system uses the normal sampling interval behavior of both newly active and currently active children.

The **no** form of this command is used to restore the sampling-interval-based offered rate evaluation for newly active children.

## Platforms

configure service vpls spoke-sdp fault-propagation-bmac

## Description

This command configures associated B-MAC addresses for fault propagation on a B-VPLS SAP or SDP binding. The statement can appear up to four times in the configuration to support four remote B-MAC addresses in the same remote B-VPLS. The configured VPLS must be a B-VPLS.

The **no** form of this command removes the specified MAC name or MAC address from the list of Fault Propagation B-MAC addresses associated with the SAP (or SDP).

## Parameters

### *mac-name*

Specifies a (predefined) MAC name to associate with the SAP or SDP, indirectly specifying a Fault Propagation B-MAC address. Up to 32 characters in length

### *ieee-address*

Specifies a MAC address to associate with the SAP or SDP, directly specifying a Fault Propagation B-MAC address. The value should be input in either a xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx format.

## Platforms

## 10.27 fc

fc

### Syntax

**fc** *fc-name* [*fc-name*]

**no fc**

### Context

**[Tree]** (config>service>epipe>spoke-sdp>eth-cfm>collect-lmm-fc-stats fc)

**[Tree]** (config>service>ipipe>sap>eth-cfm>collect-lmm-fc-stats fc)

**[Tree]** (config>service>epipe>sap>eth-cfm>collect-lmm-fc-stats fc)

### Full Context

configure service epipe spoke-sdp eth-cfm collect-lmm-fc-stats fc

```
configure service ipipe sap eth-cfm collect-lmm-fc-stats fc
configure service epipe sap eth-cfm collect-lmm-fc-stats fc
```

## Description

This command creates individual counters for the specified FCs without regard for profile. All countable packets that match a configured FC, regardless of profile, will be included in this counter.

A differential is performed when this command is re-entered. Omitted FCs will stop counting, newly added FCs will start counting, and unchanged FCs will continue to count.

Up to eight FCs may be specified. An FC that is specified as part of this command for this specific context cannot be specified as a profile-aware FC using the **fc-in-profile** command under the same context.

The **no** form of this command removes all previously defined FCs and stops counting for those FCs.

## Default

```
no fc
```

## Parameters

### *fc-name*

Specifies the name of the FC for which to create an individual profile-unaware counter. In order for the counter to be used, the **config>oam-pm>session>ethernet>priority** command must be configured with a numerical value representing the FC name (7 = NC, 6 = H1, 5 = EF, 4 = H2, 3 = L1, 2 = AF, 1 = L2, 0 = BE), and the **config>oam-pm>session>ethernet>lmm>enable-fc-collection** command must be enabled.

**Values** nc, h1, ef, h2, l1, af, l2, be

## Platforms

```

## Context

[\[Tree\]](#) (config>router>mpls>class-forwarding-policy fc)

## Full Context

configure router mpls class-forwarding-policy fc

## Description

This command configures the mapping of FCs to up to six forwarding sets for the class-based forwarding (CBF) of an LDP FEC or a BGP prefix over IGP shortcuts.

All FCs are mapped to set 1 as soon as the policy is created. The user can then make changes to the mapping of FCs as required. An FC that is not added to the class forwarding policy is thus always mapped to set 1. An FC can only be mapped to one forwarding set. One or more FCs can map to the same set. The user can indicate the initial default set by including the **default-set** option.

The default forwarding set forwards packets of an FC when all LSPs of the forwarding set that the FC maps to become operationally down. The router uses the user-configured default set as the initial default set if no default is configured; otherwise, it elects the lowest numbered set as the default forwarding set in a class forwarding policy. When the last LSP in a default forwarding set goes into an operationally down state, the router designates the next lowest numbered set as the new default forwarding set.

## Parameters

**{be | l2 | af | l1 | h2 | ef | h1 | nc}**

Specifies the name of the forwarding class.

**set-id**

Specifies the class forwarding set.

**Values** 1 to 4 (in system profile None/A)

1 to 6 (in system profile B)

```
configure router rsvp diffserv-te fc
```

## Description

This command maps one or more system forwarding classes to a Diff-Serv Class Type (CT). The default mapping is shown in [Table 47: Forwarding Classes Mapping](#).

*Table 47: Forwarding Classes Mapping*

| FC ID | FC Name         | FC Designation | Class Type (CT) |
|-------|-----------------|----------------|-----------------|
| 7     | Network Control | NC             | 7               |
| 6     | High-1          | H1             | 6               |
| 5     | Expedited       | EF             | 5               |
| 4     | High-2          | H2             | 4               |
| 3     | Low-1           | L1             | 3               |
| 2     | Assured         | AF             | 2               |
| 1     | Low-2           | L2             | 1               |
| 0     | Best Effort     | BE             | 0               |

The **no** form of this command reverts to the default mapping for the forwarding class name.

## Parameters

**class-type** *ct-number*

The Diff-Serv Class Type number. One or more system forwarding classes can be mapped to a CT.

**Values** 0 to 7

## Platforms

fc

## Syntax

**fc** *fc-name*

**no fc**

## Context

[\[Tree\]](#) (config>mirror>mirror-dest fc)

## Full Context

configure mirror mirror-dest fc

## Description

This command specifies a forwarding class for all mirrored packets transmitted to the destination SAP or SDP overriding the default (be) forwarding class. All packets are sent with the same class of service to

minimize out-of-sequence issues. The mirrored packet does not inherit the forwarding class of the original packet.

When the destination is on a SAP, a single egress queue is created that pulls buffers from the buffer pool associated with the *fc-name*.

When the destination is on an SDP, the *fc-name* defines the DiffServ-based egress queue that is used to reach the destination. The *fc-name* also defines the encoded forwarding class of the encapsulation.

The FC configuration also affects how mirrored packets are treated at the ingress queuing point on the line cards. One ingress queue is used per mirror destination (service) and that is an expedited queue if the configured FC is expedited (one of nc, h1, ef or h2). The ingress mirror queues have no CIR, but a line-rate PIR.

The **no** form of this command reverts the mirror-dest service ID forwarding class to the default forwarding class.

## Default

The best effort (be) forwarding class is associated with the mirror-dest service ID.

## Parameters

### *fc-name*

The name of the forwarding class with which to associate mirrored service traffic. The forwarding class name must already be defined within the system. If the *fc-name* does not exist, an error is returned and the **fc** command has no effect. If the *fc-name* does exist, the forwarding class associated with *fc-name* overrides the default forwarding class.

**Values** be, l2, af, l1, h2, ef, h1, nc

## Platforms

## Full Context

configure test-oam ldp-treetrace fc

## Description

This command indicates the forwarding class and profile of the MPLS echo request packet.

When an MPLS echo request packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the specified FC and profile parameter values. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface.

When the MPLS echo request packet is received on the responding node, The FC and profile parameter values are dictated by the LSP-EXP mappings of the incoming interface.

When an MPLS echo reply packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the FC and profile parameter values determined by the classification of the echo request packet, which is being replied to, at the incoming interface. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface. The ToS byte is not modified. [Table 48: fc Request Packet and Behavior](#) summarizes this behavior.

*Table 48: fc Request Packet and Behavior*

|                                     |                                                                                                                                                                                                                                                                                                                    |

**no fc** *fc-name profile profile*

## Context

[\[Tree\]](#) (config>qos>post-policer-mapping fc)

## Full Context

```
configure qos post-policer-mapping fc
```

## Description

This command specifies the forwarding class and profile state of an egress policed packet that is to be mapped to another forwarding class and profile, where the profile state is that of the resulting profile after the packet has been processed by the egress policer.

The new forwarding class and profile state is configured using the **maps-to** command.

The traffic remarking is based on the marking configured for the forwarding class and profile of the traffic after being policed but before it is remapped.

The **no** form of this command deletes the forwarding class and profile remapping statement, including the **maps-to** command.

## Parameters

### *fc-name*

Specifies one of the eight forwarding classes supported by the system.

**Values** be, l2, af, l1, h2, ef, h1, nc

### *profile*

Specifies one of the egress packet profile states.

**Values** exceed, in, inplus, out

## Platforms

fc

## Syntax

```
fc fc-name [create]
```

```
no fc fc-name
```

## Context

[\[Tree\]](#) (config>qos>sap-ingress fc)

## Full Context

```
configure qos sap-ingress fc
```

## Description

The **fc** command creates a class or subclass instance of the forwarding class *fc-name*. When the *fc-name* is created, classification actions can be applied and the subclass can be used in match classification criteria. Attempting to use an undefined subclass in a classification command will result in an execution error and the command will fail.

The **no** form of this command removes all the explicit queue mappings for *fc-name* forwarding types. The queue mappings revert to the default queues for *fc-name*. To successfully remove a subclass, all associations with the subclass in the classification commands within the policy must first be removed or diverted to another forwarding class or subclass.

## Parameters

### *fc-name*

The parameter *subclass-name* is optional and must be defined using a dot separated notation with a preceding valid system-wide forwarding class name. Creating a subclass follows normal naming conventions. Up to sixteen ASCII characters may be used. If the same sub-name is used with two or more forwarding class names, each is considered a different instance of subclass. A subclass must always be specified with its preceding forwarding class name. When a forwarding class is created or specified without the optional subclass, the parent forwarding class is assumed.

Within the SAP ingress QoS policy, up to 56 subclasses may be created. Each of the 56 subclasses may be created within any of the eight parental forwarding classes. When the limit of 56 is reached, any further subclass creations will fail and the subclass will not exist.

Successfully creating a subclass places the CLI within the context of the subclass for further subclass parameter definitions. Within the subclass context, commands may be executed that define subclass priority (within the parent forwarding class queue mapping), subclass color aware profile settings, subclass in-profile and out-of-profile precedence or DSCP markings.

The *subclass-name* parameter is optional and used with the *fc-name* parameter to define a pre-existing subclass. The *fc-name* and *subclass-name* parameters must be separated by a period (.). If *subclass-name* does not exist in the context of *fc-name*, an error will occur. If *subclass-name* is removed using the **no fc *fc-name*.*subclass-name* force** command, the **default-fc** command will automatically drop the *subclass-name* and only use *fc-name* (the parent forwarding class for the subclass) as the forwarding class.

### Values

fc: *class*[.*subclass*]

*class*: be, l2, af, l1, h2, ef, h1, nc

*subclass*: 29 characters max

### create

Required parameter when creating a SAP QoS ingress policy forwarding class.

## Platforms

All

---

**fc****Syntax****fc** *fc-name* [**create**]**no fc** *fc-name***Context****[Tree]** (config>qos>sap-egress fc)**Full Context**

configure qos sap-egress fc

**Description**

The **fc** *fc-name* node within the SAP egress QoS policy is used to contain the explicitly defined queue mapping and dot1p marking commands for *fc-name*. When the mapping for *fc-name* points to the default queue and the dot1p marking is not defined, the node for *fc-name* is not displayed in the **show configuration** or **save configuration** output unless the detail option is specified.

The **no** form of this command removes the explicit queue mapping and dot1p marking commands for *fc-name*. The queue mapping reverts to the default queue for *fc-name* and the dot1p marking (if appropriate) uses the default of 0.

**Default**

no fc

**Parameters*****fc-name***

This parameter specifies that the forwarding class queue mapping or dot1p marking is to be edited. The value given for *fc-name* must be one of the predefined forwarding classes in the system.

**Values** be, l2, af, l1, h2, ef, h1, nc**Platforms**

All

configure qos network egress fc
```

## Description

This command is used to enter the CLI node to configure QoS parameters for the specified forwarding class. The FC name represents a CLI parent node that contains parameters describing the egress marking criteria of packets flowing through it. This command overrides the default parameters for that forwarding class from the values defined in the network default policy. It can also be used to redirect packets to a policer or queue in a network egress queue group instance.

The **no** form of this command removes the forwarding class name configuration. The forwarding class reverts to the parameters defined in the default network policy.

## Parameters

### *fc-name*

The case-sensitive, system-defined forwarding class name for which policy entries will be created.

**Values** be, l2, af, l1, h2, ef, h1, nc

## Platforms

fc

## Syntax

**fc** *fc-name* [**create**]

**no fc** *fc-name*

## Context

[Tree] (cfg>qos>qgrps>egr>qgrp fc)

## Full Context

configure qos queue-group-templates egress queue-group fc

## Description

The **fc** command is used to enter the forwarding class mapping context for the given *fc-name*. Each forwarding class has a default mapping depending on the egress queue group template. The system-created policer-output-queue template contains queues 1 and 2 by default with queue 1 being best-effort and queue 2 expedited. Forwarding classes *be*, *l1*, *af* and *l2* all map to queue 1 by default. Forwarding classes *h1*, *ef*, *h2* and *nc* all map to queue 2 by default. More queues may be created within the policer-output-queues template and the default forwarding classes may be changed to any defined queue within the template.

When all other user-defined egress queue group templates are created, only queue 1 (best-effort) exists and all forwarding classes are mapped to that queue. Other queues may be created and the forwarding classes may be changed to any defined queue within the template.

Besides the default mappings within the templates, the egress queue group template forwarding class queue mappings operate the same as the forwarding class mappings in a sap-egress QoS policy.

The template forwarding class mappings are the default mechanism for mapping egress policed traffic to a queue within an egress port queue group associated with the template. If a *queue-id* is explicitly specified in the QoS policy forwarding class policer mapping, and that queue exists within the queue group, the template forwarding class mapping is ignored.

On the 7450 ESS and 7750 SR, egress policed subscriber traffic works in a slightly different way. The subscriber and subscriber host support destination and organization strings are used to identify the egress port queue group. In this instance, the forwarding class mappings are always used and any queue overrides in the QoS policy are ignored. If neither string exists for the subscriber host, the egress queue group *queue-id* can be derived from either the QoS policy policer mapping or the template forwarding class queue mappings.

The **no** form of this command is used to return the specified forwarding class to its default template queue mapping.

## Parameters

### *fc-name*

A valid forwarding class must be specified as *fc-name* when the **fc** command is executed. When the **fc *fc-name*** command is successfully executed, the system will enter the specified forwarding class context where the **queue *queue-id*** command may be executed.

**Values** **be, l1, af, l2, h1, ef, h2, nc**

## Description

This command creates individual counters for the specified FCs without regard for profile. All countable packets that match a configured FC, regardless of profile, will be included in this counter.

A differential is performed when this command is re-entered. Omitted FCs will stop counting, newly added FCs will start counting, and unchanged FCs will continue to count.

Up to eight FCs may be specified. An FC that is specified as part of this command for this specific context cannot be specified as a profile-aware FC using the **fc-in-profile** command under the same context.

The **no** form of this command removes all previously defined FCs and stops counting for those FCs.

## Default

```
no fc
```

## Parameters

### *fc-name*

Specifies the name of the FC for which to create an individual profile-unaware counter. A maximum of eight fc-names can be specified in a single statement. In order for the counter to be used, the **config>oam-pm>session>ethernet>priority** command must be configured with a numerical value representing the FC name (7 = NC, 6 = H1, 5 = EF, 4 = H2, 3 = L1, 2 = AF, 1 = L2, 0 = BE), and the **config>oam-pm>session>ethernet>Imm>enable-fc-collection** command must be enabled.

**Values** nc, h1, ef, h2, l1, af, l2, be

## Platforms

**no fc** {*fc*}

## Context

[\[Tree\]](#) (config>service>sdp>class-forwarding fc)

## Full Context

configure service sdp class-forwarding fc

## Description

This command makes an explicit association between a forwarding class and an LSP. The LSP name must exist and must have been associated with this SDP using the command config>service>sdp>lsp. Multiple forwarding classes can be associated with the same LSP. However, a forwarding class can only be associated with a single LSP in a given SDP. All subclasses will be assigned to the same LSP as the parent forwarding class.

## Parameters

### **lsp** *lsp-name*

Specifies the RSVP or static LSP to use to forward service packets which are classified into the specified forwarding class.

### *fc*

Specifies a forwarding class to LSP mapping.

**Values** be, l2, af, 1, h2, ef, h1, nc

## Platforms

All

```
fc
```

## Syntax

```
fc fc [priority {low | high}]
```

```
no fc
```

## Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>action fc)

## Full Context

```
configure router policy-options policy-statement entry action fc
```

## Description

This command associates a forwarding-class and optionally priority with the routes matched by a route policy entry. The command takes effect when the action of the route policy entry is accept, next-entry, or next-policy. It has no effect except in route policies applied as VRF import policies, BGP import policies, or RIP import policies.

The **no** form of this command removes the QoS association of the routes matched by the route policy entry.

## Default

```
no fc
```

## Parameters

*fc*

Specify the name of one of the predefined forwarding classes in the system.

**Values** be, l2, af, l1, h2, ef, h1, nc

**Default** none (no QoS information is associated with matched routes)

**priority {low | high}**

This parameter associates an enqueueing priority with routes matched by the policy entry. Specifying a priority is optional.

**Values** **high** — Setting the enqueueing parameter to **high** for a packet increases the likelihood of enqueueing the packet when the ingress queue is congested. Ingress enqueueing priority only affects ingress SAP queuing. After the packet is placed in a buffer on the ingress queue, the significance of the enqueueing priority is lost.

**low** — Setting the enqueueing parameter to **low** for a packet decreases the likelihood of enqueueing the packet when the ingress queue is congested. Ingress enqueueing priority only affects ingress SAP queuing. After the packet is placed in a buffer on the ingress queue, the significance of the enqueueing priority is lost.

**Default** low

### *fc-name*

Specifies the name of the FC for which to create an individual profile-aware counter. Up to eight FCs may be specified. In order for the counter to be used, the **config>oam-pm>session>ethernet>priority** command must be configured with a numerical value representing the FC name (7 = NC, 6 = H1, 5 = EF, 4 = H2, 3 = L1, 2 = AF, 1 = L2, 0 = BE), and the **config>oam-pm>session>ethernet>lmm>enable-fc-collection** command must be enabled.

**Values** nc, h1, ef, h2, l1, af, l2, be

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

- configure service ies subscriber-interface group-interface sap eth-cfm collect-lmm-fc-stats fc-in-profile

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure service ies interface sap eth-cfm collect-lmm-fc-stats fc-in-profile
- configure service ies interface spoke-sdp eth-cfm collect-lmm-fc-stats fc-in-profile

## fc-in-profile

### Syntax

**fc-in-profile** *fc-name* [*fc-name*]

**no fc-in-profile**

### Context

**[Tree]** (config service vprn sub-if grp-if sap eth-cfm collect-lmm-fc-stats fc-in-profile)

**[Tree]** (config service vprn if spoke-sdp eth-cfm collect-lmm-fc-stats fc-in-profile)

**[Tree]** (config service vprn if sap eth-cfm collect-lmm-fc-stats fc-in-profile)

### Full Context

configure service vprn subscriber-interface group-interface sap eth-cfm collect-lmm-fc-stats fc-in-profile

configure service vprn interface spoke-sdp eth-cfm collect-lmm-fc-stats fc-in-profile

configure service vprn interface sap eth-cfm collect-lmm-fc-stats fc-in-profile

### Description

This command creates individual counters for the specified FCs with regard for profile. All countable packets that match a configured FC and are deemed to be in profile will be included in this counter.

A differential is performed when this command is re-entered. Omitted FCs will stop counting, newly added FCs will start counting, and unchanged FCs will continue to count.

Up to eight FCs may be specified. An FC that is specified as part of this command for this specific context cannot be specified as a profile-unaware FC using the **fc** command under the same context.

The **no** form of this command removes all previously defined FCs and stops counting for those FCs.

### Default

no fc-in-profile

### Parameters

#### *fc-name*

Specifies the name of the FC for which to create an individual profile-aware counter. Up to 8 FCs can be named in a single statement. In order for the counter to be used, the **config>oam-pm>session>ethernet>priority** command must be configured with a numerical value representing the FC name (7 = NC, 6 = H1, 5 = EF, 4 = H2, 3 = L1, 2 = AF, 1 = L2, 0 = BE), and the **config>oam-pm>session>ethernet>lmm>enable-fc-collection** command must be enabled.

**Values** nc, h1, ef, h2, l1, af, l2, be

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

- configure service vprn subscriber-interface group-interface sap eth-cfm collect-lmm-fc-stats fc-in-profile

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure service vprn interface spoke-sdp eth-cfm collect-lmm-fc-stats fc-in-profile
- configure service vprn interface sap eth-cfm collect-lmm-fc-stats fc-in-profile

## fc-in-profile

### Syntax

**fc-in-profile** *fc-name* [*fc-name*]

**no fc-in-profile**

### Context

[\[Tree\]](#) (config router if eth-cfm mep collect-lmm-fc-stats fc-in-profile)

### Full Context

configure router interface eth-cfm mep collect-lmm-fc-stats fc-in-profile

### Description

This command creates individual counters for the specified FCs with regard for profile. All countable packets that match a configured FC and are deemed to be in-profile will be included in this counter.

A differential is performed when this command is re-entered. Omitted FCs will stop counting, newly added FCs will start counting, and unchanged FCs will continue to count.

Up to eight FCs may be specified. An FC that is specified as part of this command for this specific context cannot be specified as a profile-unaware FC using the **fc** command under the same context.

The **no** form of this command removes all previously defined FCs and stops counting for those FCs.

### Default

no fc-in-profile

### Parameters

#### *fc-name*

Specifies the name of the FC for which to create an individual profile-aware counter. A maximum of eight *fc-names* can be specified in a single statement. In order for the counter to be used, the **config>oam-pm>session> ethernet>priority** command must be configured with a numerical value representing the FC name (7 = NC, 6 = H1, 5 = EF, 4 = H2, 3 = L1, 2 = AF, 1 = L2, 0 = BE), and the **config>oam-pm>session>ethernet>lmm>enable-fc-collection** command must be enabled.

**Values** nc, h1, ef, h2, l1, af, l2, be

## 10.29 fcc

```
fcc
```

### Syntax

```
fcc percent
```

### Context

```
[Tree] (config>isa>video-group>watermark>bandwidth fcc)
```

```
[Tree] (config>isa>video-group>watermark>session fcc)
```

### Full Context

```
configure isa video-group watermark bandwidth fcc
```

```
configure isa video-group watermark session fcc
```

### Description

This command sets the watermark to trigger the SNMP trap if the FCC bandwidth or session exceeds the configured percentage. The bandwidth is the available egress bandwidth of the ISA. The SNMP trap is cleared when the consumption is lowered by 10%. For example, if the system resource of the available bandwidth is 10 Gb/s and the watermark is configured to be 90%, the SNMP trap is raised as the bandwidth exceeds 9 Gb/s (90% of 10 Gb/s). The SNMP trap is cleared when the bandwidth drops below 8.1 Gb/s (10% of 9 Gb/s = 0.9 Gb/s, and 9 Gb/s - 0.9 Gb/s = 8.1 Gb/s). The default value of the watermark is set at 90% of the system resources for both bandwidth and session.

### Default

```
fcc 90
```

### Parameters

*percent*

Specifies the percentage of the system resources per ISA.

**Values** 1 to 99

### Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 10.30 fcc-burst

## fcc-burst

### Syntax

**fcc-burst** *burst-percentage*

**no fcc-burst**

### Context

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if>sd fcc-burst)

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if>pip fcc-burst)

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if>hd fcc-burst)

### Full Context

configure mcast-management multicast-info-policy video-policy video-interface sd fcc-burst

configure mcast-management multicast-info-policy video-policy video-interface pip fcc-burst

configure mcast-management multicast-info-policy video-policy video-interface hd fcc-burst

### Description

This command sets the burst rate at which the Fast Channel Change (FCC) server will send unicast data to the FCC client above the received rate to allow the client to catchup to the multicast stream.

This parameter is only applicable if the FCC server mode is **burst**.

The **no** form of the command returns the parameter to the default value.

### Default

fcc-burst 25

### Parameters

#### *burst-percentage*

Specifies the percentage of nominal bandwidth used to catch up to the multicast stream.

| Values | HD:         | 0 to 100 |
|--------|-------------|----------|
|        | SD and PIP: | 0 to 600 |

**Default** 25

### Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 10.31 fcc-channel-type

## fcc-channel-type

### Syntax

**fcc-channel-type** {**hd** | **sd** | **pip**}

**no fcc-channel-type**

### Context

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>video fcc-channel-type)

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>channel>source-override>video fcc-channel-type)

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>channel>video fcc-channel-type)

### Full Context

configure mcast-management multicast-info-policy bundle video fcc-channel-type

configure mcast-management multicast-info-policy bundle channel source-override video fcc-channel-type

configure mcast-management multicast-info-policy bundle channel video fcc-channel-type

### Description

This command configures the channel type for the bundle/channel. The channel type is used in the video policy to set various Fast Channel Change (FCC) parameters including the type of FCC and various FCC rates.

The **no** form of this command returns the parameter to the default value.

### Default

no fcc-channel-type

### Parameters

**hd**

The channel type is High-Definition (HD) (Default).

**sd**

The channel type is Standard Definition (SD).

**pip**

The channel type is Picture in Picture (PIP).

### Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 10.32 fcc-min-duration

## fcc-min-duration

### Syntax

**fcc-min-duration** *time*

**no fcc-min-duration**

### Context

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>video fcc-min-duration)

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>channel>video fcc-min-duration)

### Full Context

configure mcast-management multicast-info-policy bundle video fcc-min-duration

configure mcast-management multicast-info-policy bundle channel video fcc-min-duration

### Description

This command configures the minimum time duration, in milliseconds, of the Fast Channel Change (FCC) burst. The value of this object determines the starting point of the FCC burst. If the current Group of Pictures (GOP) has less than the minimum duration worth of data, FCC burst begins from the previous GOP.

The **no** form of the command reverts to the default value.

### Default

fcc-min-duration 300

### Parameters

*time*

Specifies the FCC burst minimum duration, in milliseconds.

**Values** 300 to 8000

### Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 10.33 fcc-server

### fcc-server

### Syntax

**[no] fcc-server**

## Context

[\[Tree\]](#) (config>isa>video-group fcc-server)

## Full Context

configure isa video-group fcc-server

## Description

This command enables the FCC server capability for the ISA video group. FCC server cannot be enabled if ad insertion or the local RET server is enabled.

FCC server parameters can be configured in a multicast information policy or a service, but the parameters will have no effect if the FCC server is disabled or if the video group is administratively disabled (shutdown).

The **no** form of the command disables the FCC server.

## Default

no fcc-server

## Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## fcc-server

## Syntax

**fcc-server** [mode {**burst** | **dent** | **hybrid**}]

**no fcc-server**

## Context

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if>hd fcc-server)

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if>pip fcc-server)

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if>sd fcc-server)

## Full Context

configure mcast-management multicast-info-policy video-policy video-interface hd fcc-server

configure mcast-management multicast-info-policy video-policy video-interface pip fcc-server

configure mcast-management multicast-info-policy video-policy video-interface sd fcc-server

## Description

This command enables the Fast Channel Change (FCC) server and sets the mode to send the FCC unicast stream.

The mode indicates how the FCC server will send information to the client. When **burst** is specified, the FCC server will send the channel at a nominally faster rate than the channel was received based on the applicable fcc-burst setting. When **dent** is specified, the FCC server will selectively discard frames from the

original stream based on the applicable dent-threshold setting. If no mode is specified, burst is the default mode.

The **no** form of the command disables the FCC server at that context and subordinate contexts.

## Default

no fcc-server

## Parameters

### mode burst

Sets the mode of the FCC server to burst when sending the channel to the FCC client.

### mode dent

Sets the mode of the FCC server to dent when sending the channel to the FCC client.

### mode hybrid

Combines the burst and dent modes.

## Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## fcc-server

## Syntax

**fcc-server** [**disable**]

**no fcc-server**

## Context

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>bundle>channel>video fcc-server)

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>bundle>channel>source-override>video fcc-server)

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>bundle>video fcc-server)

## Full Context

configure mcast-management multicast-info-policy bundle channel video fcc-server

configure mcast-management multicast-info-policy bundle channel source-override video fcc-server

configure mcast-management multicast-info-policy bundle video fcc-server

## Description

This command enables Fast Channel Change (FCC) for a multicast bundle or channel. Additional parameters such as **fcc-channel-type** should also be configured to match the characteristics of the bundle/channel.

The **no** form of the command disables removes the FCC configuration for the bundle/channel context and implies the setting is inherited from a higher context or the default policy.

## Default

no fcc-server

## Parameters

### disable

Explicitly disables the FCC server within the policy. For the default bundle within the default multicast information policy, the **no** form of the command and the **disable** keyword have the same meaning and imply that the server is disabled.

## Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## fcc-server

## Syntax

**fcc-server** [**client** *client-ip* [ **source-port** *src-port*]]

**no fcc-server**

## Context

[\[Tree\]](#) (debug>service>id>video-interface fcc-server)

## Full Context

debug service id video-interface fcc-server

## Description

This command enables debugging the FCC server.

## Parameters

### client *client-ip*

Specifies the client IP address.

### source-port *src-port*

Specifies the source port's IP address.

## Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 10.34 fcc-session-timeout

## fcc-session-timeout

### Syntax

**fcc-session-timeout** *seconds*

**no fcc-session-timeout**

### Context

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if fcc-session-timeout)

### Full Context

configure mcast-management multicast-info-policy video-policy video-interface fcc-session-timeout

### Description

By default, the video ISA will wait for 5 minutes before closing the RTCP session from the subscriber. The RTCP session can be adjusted from 5 second to 5 minutes. The timeout is applicable to both RET and FCC RTCP sessions.

The **no** form of the command reverts to the default.

### Default

fcc-session-timeout 300

### Parameters

*seconds*

Specifies the FCC session timeout in seconds.

**Values** 5 to 300

### Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

### Context

[\[Tree\]](#) (config>oam-pm>streaming>delay-template fd-avg)

## Full Context

```
configure oam-pm streaming delay-template fd-avg
```

## Description

This command specifies the sending of average frame delay for a specified direction.

The **no** form of this command deletes the specified average direction.

### Note:

All directions can be specified if all directions are important for reporting. However, only enable those directions that are required.

## Parameters

### forward

Specifies the measurement in the forward direction.

### backward

Specifies the measurement in the backward direction.

### round-trip

Specifies the measurement for the round trip.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 10.38 fdb-table-size

### fdb-table-size

#### Syntax

**fdb-table-size** *table-size*

**no fdb-table-size** [*table-size*]

#### Context

**[Tree]** (config>service>vpls fdb-table-size)

**[Tree]** (config>service>template>vpls-template fdb-table-size)

#### Full Context

configure service vpls fdb-table-size

configure service template vpls-template fdb-table-size

#### Description

This command specifies the maximum number of MAC entries in the forwarding database (FDB) for the VPLS instance on this node.

The **fdb-table-size** specifies the maximum number of forwarding database entries for both learned and static MAC addresses for the VPLS instance.

The **no** form of this command returns the maximum FDB table size to default.

#### Default

fdb-table-size 250

#### Parameters

##### *table-size*

Specifies the number of entries permitted in the forwarding database for this VPLS instance.

**Values** 7450 ESS, 7950 XRS, or 7750 SR-7, SR-12, SR-12e: 1 to 511999  
7750 SR-e, SR-a: 1 to 250000

## Platforms

All

## fdb-table-size

### Syntax

**fdb-table-size** *table-size*

**no fdb-table-size**

### Context

**[Tree]** (config>service>system fdb-table-size)

### Full Context

configure service system fdb-table-size

### Description

This command configures the maximum system FDB table size, which is dependent on the chassis type. CPMs with at least 16 GB of memory are required when exceeding 500k MAC addresses in a system. The table size cannot be reduced below its default value, which is also chassis-dependent.

The maximum system FDB table size also limits the maximum FDB table size of any card within the system.

The **no** version of this command sets the table size to its default.

The command default depends on the chassis type and available memory.

### Parameters

***table-size***

Specifies the maximum system FDB table size.

**Values** 255999 to 2047999

### Platforms

## 10.42 fec

### fec

#### Syntax

**fec {g709 | enhanced}**

**no fec**

#### Context

[\[Tree\]](#) (config>port>otu fec)

#### Full Context

configure port otu fec

#### Description

This command enables the Forwarding Error Correction (FEC) encoder/decoder and specifies the FEC encoder/decoder mode to use when enabled.

The following rules must be followed:

- The port's OTU must be enabled to set or change the FEC mode.
- The port must be shut down before changing the FEC mode.
- The sf-sd-method must be changed to BIP8 before setting the FEC mode to disabled.

Note that FEC cannot be disabled on OTU3 encapsulated OC768 or 40-Gigabit Ethernet by the **no fec** command. Therefore, the default depends on the port type. The default for OTU3 encapsulated OC768 or 40-Gigabit Ethernet is **fec enhanced**.

The **no** form of this command disables FEC encoder and decoder.

### Default

no fec

### Parameters

#### enhanced

Enables the FEC encoder and decoder with a proprietary enhanced FEC algorithm.

#### g709

Enables the FEC encoder and decoder with the standard G.709 FEC algorithm.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 10.43 fec-limit

### fec-limit

### Syntax

**fec-limit** *limit* [**log-only**] [**threshold** *percentage*]

**no fec-limit**

### Context

[\[Tree\]](#) (config>router>ldp>session-params>peer fec-limit)

### Full Context

configure router ldp session-parameters peer fec-limit

### Description

This command configures a limit on the number of FECs which an LSR will accept from a given peer and add into the LDP label database. The limit applies to the aggregate count of all FEC types including service FEC. Once the limit is reached, any FEC received will be released back to the peer. This behavior is different from the per-peer import policy which will still accept the FEC into the label database but will not resolve it.

When the FEC limit for a peer is reached, the LSR performs the following actions:

1. Generates a trap and a syslog message.
2. Generates a LDP notification message with the LSR overload status TLV, for each LDP FEC type including service FEC, to this peer only if this peer advertised support for the LSR overload sub-TLV via the LSR Overload Protection Capability TLV at session initialization.
3. Releases, with LDP Status Code of "No\_Label\_Resources", any new FEC, including service FEC, from this peer which exceeds the limit.

If a legitimate FEC is released back to a peer, while the FEC limit was exceeded, the user must have a means to replay that FEC back to the router LSR once the condition clears. This is done automatically if the peer is an SR OS-based router and supports the LDP overload status TLV ( SR OS 11.0R5 and higher). Third-party peer implementations must support the LDP overload status TLV or provide a manual command to replay the FEC.

The **threshold** option allows to set a threshold value when a trap and an syslog message are generated as a warning to the user in addition to when the limit is reached. The default value for the threshold when not configured is 90%.

The **log-only** option causes a trap and syslog message to be generated when reaching the threshold and limit. However, LDP labels are not released back to the peer.

If the user decreases the limit value such that it is lower than the current number of FECs accepted from the peer, the LDP LSR raises the trap for exceeding the limit. In addition, it will set overload for peers which signaled support for LDP overload protection capability TLV. However, no existing resolved FECs from the peer which does not support the overload protection capability TLV should be de-programmed or released.

A different trap is released when crossing the threshold in the upward direction, when reaching the FEC limit, and when crossing the threshold in the downward direction. However the same trap will not be generated more often than 2 minutes apart if the number of FECs oscillates around the threshold or the FEC limit.

## Default

no fec-limit

## Parameters

### *limit*

Specifies the aggregate count of FECs of all types which can be accepted from this LDP peer.

### **log-only**

Specifies that only a trap and syslog message are generated when reaching the threshold and limit. However, LDP labels are not released back to the peer.

### *percentage*

Specifies the threshold value (as a percentage) that triggers a warning syslog message and trap to be sent.

## Platforms

All

## 10.44 fec-originate

### fec-originate

#### Syntax

**fec-originate** *ip-prefix/mask* [**advertised-label** *in-label*] [**swap-label** *out-label*] **interface** *interface-name*

**fec-originate** *ip-prefix/mask* [**advertised-label** *in-label*] **next-hop** *ip-address* [**swap-label** *out-label*]

**fec-originate** *ip-prefix/mask* [**advertised-label** *in-label*] **next-hop** *ip-address* [**swap-label** *out-label*]  
**interface** *interface-name*

**fec-originate** *ip-prefix/mask* [**advertised-label** *in-label*] **pop**

**no fec-originate** *ip-prefix/mask* **interface** *interface-name*

**no fec-originate** *ip-prefix/mask* **next-hop** *ip-address*

**no fec-originate** *ip-prefix/mask* **next-hop** *ip-address* **interface** *interface-name*

**no fec-originate** *ip-prefix/mask* **pop**

#### Context

[\[Tree\]](#) (config>router>ldp fec-originate)

#### Full Context

configure router ldp fec-originate

#### Description

This command defines a way to originate a FEC (with a swap action) for which the LSR is not egress, or to originate a FEC (with a pop action) for which the LSR is egress.

#### Parameters

##### *ip-prefix/mask*

Specifies information for the specified IP prefix and mask length.

##### Values

ipv4-prefix - a.b.c.d

ipv4-prefix-le - [0..32]

ipv6-prefix            x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x - [0..FFFF]H

d - [0..255]D

ipv6-prefix-le - [0..128]

##### **next-hop**

Specifies the IP address of the next hop of the prefix.

**advertised-label**

Specifies the label advertised to the upstream peer. If not configured, then the label advertised should be from the label pool. If the configured static label is not available then the IP prefix is not advertised.

**out-label**

Specifies the LSR to swap the label. If configured, then the LSR should swap the label with the configured swap-label. If not configured, then the default action is pop if the next-hop parameter is not defined.

The next-hop, advertised-label, swap-label parameters are all optional. If next-hop is configured but no swap label specified, it will be a swap with label 3, such as, pop and forward to the next-hop. If the next-hop and swap-label are configured, then it is a regular swap. If no parameters are specified, a pop and route is performed.

**Values** 16 to 1048575

**in-label**

Specifies the number of labels to send to the peer associated with this FEC.

**Values** 32 to 1023

**pop**

Specifies to pop the label and transmit without the label.

**interface *interface-name***

Specifies the name of the interface the label for the originated FEC is swapped to. For an unnumbered interface, this parameter is mandatory since there is no address for the next-hop. For a numbered interface, it is optional.

**Platforms**

All

## 10.45 fec-prefix

### fec-prefix

**Syntax**

**[no] fec-prefix** *ip-prefix*[*mask*]

**Context**

[\[Tree\]](#) (config>router>ldp>egr-stats fec-prefix)

**Full Context**

configure router ldp egress-statistics fec-prefix

## Description

This command configures statistics in the egress data path at the ingress LER or LSR for an LDP FEC. The user must execute the **no shutdown** command for this command to effectively enable statistics. The egress data path counters will be updated for both originating and transit packets. Originating packets may be service packets or IP user and control packets forwarded over the LDP LSP when used as an IGP shortcut. Transit packets of the FEC which are label switched on this node.

When ECMP is enabled and multiple paths exist for a FEC, the same set of counters are updated for each packet forwarded over any of the NHLFEs associated with this FEC and for as long as this FEC is active.

The statistics can be enabled on prefix FECs imported from both LDP neighbors and T-LDP neighbors (LDP over RSVP). LDP sets up egress statistics collection for the LDP tunnels whose FECs match the exact prefix specified in this command. Service FECs, that is, FEC 128 and FEC 129, are not valid. LDP FEC egress statistics are collected at the Penultimate-Popping Hop (PHP) node for a LDP FEC using an implicit null egress label.

The **no** form of this command disables the statistics in the egress data path and removes the accounting policy association from the LDP FEC.

## Parameters

### *ip-prefix*

Specifies the IP address representing the FEC.

| Values | IPv4 prefix: | <i>a.b.c.d</i>                             | <i>a, b, c, d</i> - 0 to 255; decimal |
|--------|--------------|--------------------------------------------|---------------------------------------|
|        | IPv6 prefix: | <i>x:x:x:x:x:x:x</i> (eight 16-bit pieces) | <i>x</i> - 0 to FFFF; hexadecimal     |
|        |              | <i>x:x:x:x:x:d.d.d.d</i>                   |                                       |

### *mask*

Specifies the mask of the IP address.

|        |                |
|--------|----------------|
| Values | IPv4: 0 to 32  |
|        | IPv6: 0 to 128 |

### Description

This command enables or disables the advertisement of a FEC type on a given LDP session or Hello adjacency to a peer.

### Platforms

All

## 10.47 fec129-cisco-interop

### fec129-cisco-interop

### Syntax

[no] fec129-cisco-interop

### Context

[\[Tree\]](#) (config>router>ldp>session-params>peer fec129-cisco-interop)

### Full Context

configure router ldp session-parameters peer fec129-cisco-interop

### Description

This command specifies whether LDP will provide translation between non-compliant FEC 129 formats of Cisco. Peer LDP sessions must be manually configured towards the non-compliant Cisco PEs.

When enabled, Cisco non-compliant format will be used to send and interpret received label release messages that is the FEC129 SAll and TAll fields will be reversed.

When the disabled, Cisco non-compliant format will not be used or supported. Peer address has to be the peer LSR-ID address.

The **no** form of this command returns the default.

**Default**

no fec129-cisco-interop

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure router fib-priority

### Description

This command specifies the FIB priority for VPRN BGP routes.

### Default

fib-priority standard

### Parameters

#### high

Specifies the high FIB priority.

#### standard

Specifies the standard FIB priority.

### Platforms

All

## 10.49 fib-telemetry

### fib-telemetry

### Syntax

[no] fib-telemetry

### Context

[\[Tree\]](#) (config>router fib-telemetry)

### Full Context

configure router fib-telemetry

### Description

This command enables the collection of extra state information related to the forwarding table state of certain IP routes, TTM tunnels, and MPLS LFIB entries. This extra state can be retrieved by gNMI telemetry subscriptions targeted to the following YANG paths:

- /state/router/route-fib
- /state/router/tunnel-fib
- /state/router/label-fib

If this command is not configured, no information is displayed by the following **show** commands:

- **show>router>fib-telemetry>route**

- **show>router>fib-telemetry>tunnel**

The **no** form of this command disables the collection of this extra state.

### Default

no fib-telemetry

**field**

## Syntax

[no] **field** *field-name*

## Context

[\[Tree\]](#) (config>app-assure>group>http-enrich field)

## Full Context

configure application-assurance group http-enrich field

## Description

This command specifies the fields to insert into the HTTP header. The command must be repeated for each field to be inserted. The same field cannot be inserted twice into the header under different header names.

### Note:

AA can insert two copies of the following fields in the same HTTP header (with a different header name): **imei-hyphenated**, **imei-hyphenated-2**, **imsi**, **imsi-2**, **static-string**, **static-string-2**, **user-location-raw**, and **user-location-raw2**.

The **no** form of this command removes the specified field so that it is not inserted into the HTTP header.

## Parameters

### *field-name*

Specifies the fields to insert into the HTTP header.

**Values** The following parameters are supported in any deployment:

- **static-string** — header name for the inserted string
- **static-string-2** — header name for the inserted string
- **subscriber-id** — header name for the subscriber ID
- **subscriber-ip** — header name for the subscriber IP address

The following parameters are supported in Fixed Wireless Access (FWA) deployments only:

- **apn** — APN used by the UE
- **apn-ni** — APN Network Identifier (APN-NI) used by the UE
- **billing-type** — UE charging type (charging characteristics)
- **dynamic-acr** — dynamic Anonymous Customer Record (ACR)
- **static-acr** — static ACR
- **imei-sv** — subscriber IMEI with format AABBBBBBCCCCCEE
- **imei-hyphenated** — subscriber IMEI with format AABBBBBB-CCCCC-EE
- **imei-hyphenated-2** — subscriber IMEI with format AABBBBBB-CCCCC-EE
- **imsi** — subscriber IMSI
- **imsi-2** — subscriber IMSI
- **msisdn** — subscriber MSISDN

- **msisdn-ts** — subscriber MSISDN appended with the UNIX timestamp
- **msisdn-without-cc** — subscriber MSISDN without a country code
- **pgw\_ggsn-address** — PGW/GGSN address serving the UE
- **plmn-id** — Public Land Mobile Network (PLMN) ID of the SGSN/MME
- **rat-type** — Radio Access Technology (RAT) type
- **timestamp** — timestamp inserted in UNIX time format Example: 1531204313
- **user-location** — UE LOCATION (ULI)
- **user-location-3gpp** — ULI encoded as defined in 3GPP 29.061
- **user-location-raw** — ULI in raw format <ULI-TYPE1>[+<ULI-TYPE2>]=<ULI HEX>  
Example: x-locinfo: TAI+ECGI=1300622c46130062014adf16
- **user-location-raw-2** — ULI in raw format <ULI-TYPE1>[+<ULI-TYPE2>]=<ULI HEX>  
Example: x-locinfo: TAI+ECGI=1300622c46130062014adf16

configure application-assurance group cflowd comprehensive template field-selection

configure application-assurance group cflowd tcp-performance template field-selection

#### Description

This command configures how fields included in the exported cflowd template are selected.

The **no** form of this command reverts to the **legacy** field selection type.

#### Default

field-selection legacy

#### Parameters

##### ***field-selection***

Specifies how fields are selected.

**legacy** Specifies that the fields within the cflowd template are set and fixed and as per SR OS release 17 (or earlier).

**dynamic** Specifies that the operator can select which fields are included in the cflowd template.

### file

#### Syntax

**file**

## Context

[Tree] (file)

## Full Context

file

## Description

Specifies the context to enter and perform file system operations. When entering the **file** context, the prompt changes to reflect the present working directory. Navigating the file system with the **cd ..** command results in a changed prompt.

The **exit all** command leaves the file system/file operation context and returns to the operational root CLI context. The state of the present working directory is maintained for the CLI session. Entering the **file** command returns the cursor to the working directory where the **exit** command was issued.

## Platforms

All

## 10.54 file-id

### file-id

## Syntax

[no] **file-id** *file-id* [ **name** *file-policy-name* ]

## Context

[Tree] (config>log file-id)

## Full Context

configure log file-id

## Description

This command creates the context to configure a file policy that is used as the destination for an event log or billing (accounting) file.

This command defines the file location and characteristics that are to be used as the destination for a log event message stream or accounting/billing information. The file defined in this context is subsequently specified in the **to** command under **log-id** or **accounting-policy** to direct specific logging or billing source streams to the file destination.

A file policy can only be assigned to either *one log-id* or *one accounting-policy*. It cannot be reused for multiple instances. A file policy and associated file definition must exist for each log and billing file that must be stored in the file system.

A file is created when the file policy defined in this command is selected as the destination type for a specific log or accounting record. Log files are collected in a "log" directory. Accounting files are collected in an "act" directory.

The file names for a log are created by the system as summarized in [Table 49: Log File Names](#).

Table 49: Log File Names

| File Type       | File Name                             |
|-----------------|---------------------------------------|
| Log File        | log// <i>lff</i> - <i>timestamp</i>   |
| Accounting File | acta// <i>aaff</i> - <i>timestamp</i> |

Where:

- *ll* is the *log-id*
- *aa* is the accounting *policy-id*
- *ff* is the file-id
- The *timestamp* is the actual timestamp when the file is created. The format for the timestamp is *yyyymmdd-hhmmss* where:
  - *yyyy* is the year (for example, 2006)
  - *mm* is the month number (for example, 12 for December)
  - *dd* is the day of the month (for example, 03 for the 3rd of the month)
  - *hh* is the hour of the day in 24 hour format (for example, 04 for 4 a.m.)
  - *mm* is the minutes (for example, 30 for 30 minutes past the hour)
  - *ss* is the number of seconds (for example, 14 for 14 seconds)
- The accounting file is compressed and has a gz extension.

When initialized, each file contains:

- The *log-id* description.
- The time the file was opened.
- The reason the file was created.
- If the event log file was closed properly, the sequence number of the last event stored on the log is recorded.

If the process of writing to a log file fails (for example, the compact flash card is full) and if a backup location is not specified or fails, the log file will not become operational even if the compact flash card is replaced. Enter either a **clear log** command or a **shutdown/no shutdown** command to reinitialize the file.

If the primary location fails (for example, the compact flash card fills up during the write process), a trap is sent and logging continues to the specified backup location. This can result in truncated files in different locations.

The **no** form of this command removes the file policy from the configuration. A file policy can only be removed from the configuration if the policy is not the designated output for a log destination. The actual log or accounting file remain on the file system when a file policy is deleted.

## Parameters

### *file-id*

The file identification number for the file policy, expressed as a decimal integer.

**Values** 1 to 99

### *name file-policy-name*

Configures an optional file policy name, up to 64 characters, that can be used to refer to the file policy after it is created. If the name begins with a numerical digit (from 1 to 9), the name is a number from 1 to 99.

### file-transfer

## Syntax

**file-transfer** *file-transfer-mode* [*file-transfer-mode*]

## no file-transfer

### Context

[\[Tree\]](#) (config>system>satellite file-transfer)

### Full Context

configure system satellite file-transfer

### Description

This command specifies the file transfer protocol to use between the 7750 SR or 7950 XRS host and 7210 SAS Ethernet satellite.

The **no** form of this command reverts to the default value.

### Default

file-transfer ftp

### Parameters

#### *file-transfer-mode*

Specifies up to two satellite secure file transfer protocols.

**Values** ftp – The file transfer FTP protocol is used between 7750 SR or 7950 XRS host and the 7210 SAS Ethernet satellite.

scp - The file transfer SCP protocol is used between the 7750 SR or 7950 XRS host and the 7210 SAS Ethernet satellite.

## 10.57 file-transmission-profile

### file-transmission-profile

### Syntax

**file-transmission-profile** *name* [**create**]

**no file-transmission-profile**

### Context

[\[Tree\]](#) (config>system file-transmission-profile)

### Full Context

configure system file-transmission-profile

## Description

This command creates a new file transmission profile or enters the configuration context of an existing file-transmission-profile.

The **file-transmission-profile** context defines transport parameters for protocol such as HTTP, include routing instance, source address, timeout value, and so on.

The **no** form of the command removes the profile name from the configuration.

## Default

no file-transmission-profile

## Parameters

### *name*

Specifies the file transmission profile name, up to 32 characters.

### **create**

Keyword used to create the transmission profile. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

## Platforms

All

## file-transmission-profile

## Syntax

**file-transmission-profile** *profile-name*

**no file-transmission-profile**

## Context

[\[Tree\]](#) (config>system>security>pki>ca-prof>auto-crl-update>crl-urls>url-entry file-transmission-profile)

## Full Context

configure system security pki ca-profile auto-crl-update crl-urls url-entry file-transmission-profile

## Description

This command specifies the file-transmission-profile for the **url-entry**. When the system downloads a CRL from the configured URL in the **url-entry** it will use the transportation parameter configured in the **file-transmission-profile**. **auto-crl-update** supports Base/Management/VRPN routing instance. **vpls-management** is not supported. In case of VRPN, the HTTP server port can only be 80 or 8080.

The **no** form of this command removes the specified profile name.

## Default

no file-transmission-profile

## Parameters

### *profile-name*

Specifies the name of the file transmission profile to be matched up to 32 characters. The profile name is configured in the **config>system>file-transmission-profile** context.

## Platforms

All

## 10.58 file-url

### file-url

## Syntax

**file-url** *file-url*

**no file-url**

## Context

[\[Tree\]](#) (config>mirror>mirror-dest>pcap file-url)

## Full Context

configure mirror mirror-dest pcap file-url

## Description

This command specifies a file URL for the FTP or TFTP server, including the filename for packet capture transfer. After the file URL is entered, the system attempts to establish a connection and creates a file using the filename specified. The command prompt displays an error and rejects the file URL if the session establishment fails, if write privilege to remote server fails, or if the session experiences a sudden termination. If the FTP or TFTP server is unreachable, the command prompt is halted for further input until the retries are timed out after 24 seconds (after four attempts of about six seconds each). This command overwrites any file on the FTP or TFTP server with the same filename.

The **no** form of this command removes the *file-url* instance and stops the packet capture and file transfer session.

## Parameters

### *file-url*

Specifies the URL for the file to direct the search.

**Values** [*local-url* | *remote-url*]

where:

- *local-url* — [*cflash-id*] [*file-path*]  
180 chars max, including *cflash-id*  
directory length 99 chars max each

configure service vprn redundant-interface spoke-sdp ingress filter

configure service vprn interface spoke-sdp egress filter

configure service vprn network-interface egress filter

configure service vprn interface spoke-sdp ingress filter

configure service vprn redundant-interface spoke-sdp egress filter

### Description

This command associates an IP filter policy with an ingress or egress Service Access Point (SAP) or IP interface. An IP filter policy can be associated with spoke SDPs. Filter policies control the forwarding and dropping of packets based on IP or MAC matching criteria.

The filter command is used to associate a filter policy with a specified ip-filter-id with an ingress or egress SAP. The ip-filter-id must already be defined before the filter command is executed. If the filter policy does not exist, the operation fails and an error message returned.

In general, filters applied to SAPs (ingress or egress) apply to all packets on the SAP. One exception is non-IP packets are not applied to IP match criteria, so the default action in the filter policy applies to these packets.

The **no** form of this command removes any configured filter ID association with the SAP or IP interface. The filter ID itself is not removed from the system unless the scope of the created filter is set to local. To avoid deletion of the filter ID and only break the association with the service object, use scope command within the filter definition to change the scope to local or global. The default scope of a filter is local.

### Parameters

**ip** *ip-filter-id*

Specifies IP filter policy. The filter ID must already exist within the created IP filters.

**Values** 1 to 65535

## Platforms

configure service ies subscriber-interface group-interface sap ingress filter

configure service vprn subscriber-interface group-interface sap egress filter

## Description

This command associates a filter policy with an ingress or egress Service Access Point (SAP). Filter policies control the forwarding and dropping of packets based on the matching criteria. MAC filters are only allowed on Epipe and Virtual Private LAN Service (VPLS) SAPs.

The **filter** command is used to associate a filter policy with a specified *ip-filter-id* or *ipv6-filter-id* (7750 SR) with an ingress or egress SAP. The filter policy must already be defined before the **filter** command is executed. If the filter policy does not exist, the operation fails and an error message returned.

In general, filters applied to SAPs (ingress or egress) apply to all packets on the SAP. One exception is non-IP packets are not applied to the match criteria, so the default action in the filter policy applies to these packets.

The **no** form of this command removes any configured filter ID association with the SAP. The filter ID itself is not removed from the system unless the scope of the created filter is set to local. To avoid deletion of the filter ID and only break the association with the service object, use **scope** command within the filter definition to change the scope to **local** or **global**. The default scope of a filter is **local**.

## Parameters

### **ip** *ip-filter-id*

Specifies the ID for the IP filter policy and corresponds to a previously created IP filter policy in the **config>filter>ip-filter** context.

**Values** 1 to 65535

### **ipv6** *ipv6-filter-id*

Specifies the IPv6 filter policy. The filter ID must already exist within the created IPv6 filters.

**Values** 1 to 65535

### Description

This command associates an IP filter policy or MAC filter policy with an ingress or egress Service Access Point (SAP) or IP interface.

Filter policies control the forwarding and dropping of packets based on IP or MAC matching criteria. There are two types of filter policies: IP and MAC. Only one type may be applied to a SAP at a time.

The **filter** command is used to associate a filter policy with a specified *filter ID* with an ingress or egress SAP. The *filter ID* must already be defined before the **filter** command is executed. If the filter policy does not exist, the operation will fail and an error message returned.

In general, filters applied to SAPs (ingress or egress) apply to all packets on the SAP. One exception is non-IP packets are not applied to IP match criteria, so the default action in the filter policy applies to these packets.

The **no** form of this command removes any configured filter ID association with the SAP or IP interface. The filter ID itself is not removed from the system unless the scope of the created filter is set to local. To avoid deletion of the filter ID and only break the association with the service object, use **scope** command within the filter definition to change the scope to **local** or **global**. The default scope of a filter is **local**.

## Parameters

## Description

This command associates a filter policy with an ingress or egress Service Access Point (SAP) or IP interface.

Filter policies control the forwarding and dropping of packets based on IP matching criteria. Only one filter can be applied to a SAP at a time.

The **filter** command is used to associate a filter policy with a specified *ip-filter-id* with an ingress or egress SAP. The *ip-filter-id* must already be defined before the **filter** command is executed. If the filter policy does not exist, the operation will fail and an error message returned.

IP filters apply only to RFC 2427-routed IP packets. Frames that do not contain IP packets will not be subject to the filter and will always be passed, even if the filter's default action is to drop.

The **no** form of this command removes any configured filter ID association with the SAP or IP interface. The filter ID itself is not removed from the system unless the scope of the created filter is set to local. To avoid deletion of the filter ID and only break the association with the service object, use **scope** command within the filter definition to change the scope to **local** or **global**. The default scope of a filter is **local**.

## Parameters

## Description

This command associates an IP filter policy with an ingress or egress Service Access Point (SAP) or IP interface.

Filter policies control the forwarding and dropping of packets based on IP matching criteria. Only one filter can be applied to a SAP at a time.

The **filter** command is used to associate a filter policy with a specified *filter-id* with an ingress or egress SAP. The *filter-id* must already be defined before the **filter** command is executed. If the filter policy does not exist, the operation will fail and an error message returned.

IP filters apply only to RFC 2427-routed IP packets. Frames that do not contain IP packets will not be subject to the filter and will always be passed, even if the filter's default action is to drop.

The **no** form of this command removes any configured filter ID association with the SAP or IP interface. The filter ID itself is not removed from the system unless the scope of the created filter is set to local. To avoid deletion of the filter ID and only break the association with the service object, use **scope** command within the filter definition to change the scope to **local** or **global**. The default scope of a filter is **local**.

IPv6 filters are only supported by the 7450 ESS and 7750 SR but are not supported on a Layer 2 SAP that is configured with QoS MAC criteria. Also, MAC filters are not supported on a Layer 2 SAP that is configured with QoS IPv6 criteria.

## Parameters

### *ip-filter-id*

Specifies IP filter policy. The filter ID must already exist within the created IP filters.

**Values** 1 to 65535

### *ipv6-filter-id*

Specifies the IPv6 filter policy for 7450 ESS or 7750 SR. The filter ID must already exist within the created IPv6 filters.

**Values** 1 to 65535

### *mac-filter-id*

Specifies the MAC filter policy. The specified filter ID must already exist within the created MAC filters. The filter policy must already exist within the created MAC filters.

configure service ies interface spoke-sdp ingress filter

configure service ies interface spoke-sdp egress filter

## Description

This command associates an IP filter policy filter policy with an ingress or egress spoke SDP.

Filter policies control the forwarding and dropping of packets based on matching criteria.

MAC filters are only allowed on Epipe and Virtual Private LAN Service (VPLS) SAPs.

The **filter** command is used to associate a filter policy with a specified *ip-filter-id* with an ingress or egress spoke SDP. The *ip-filter-id* must already be defined in the **config>filter** context before the **filter** command is executed. If the filter policy does not exist, the operation fails and an error message returned.

In general, filters applied to SAPs or spoke SDPs (ingress or egress) apply to all packets on the SAP or spoke SDPs. One exception is non-IP packets are not applied to IP match criteria, so the default action in the filter policy applies to these packets.

The **no** form of this command removes any configured filter ID association with the SAP or IP interface. The filter ID itself is not removed from the system unless the scope of the created filter is set to local. To avoid deletion of the filter ID and only break the association with the service object, use **scope** command within the filter definition to change the scope to **local** or **global**. The default scope of a filter is **local**.

## Parameters

### ip

Keyword indicating the filter policy is an IP filter.

### *ip-filter-id*

The filter name acts as the ID for the IP filter policy. Allowed values are an integer in the range of 1 and 65535 that corresponds to a previously created IP filter policy. The filter ID must already exist within the created IP filters.

## Description

This command associates an IP filter policy with an ingress or egress IP interface. Filter policies control the forwarding and dropping of packets based on IP matching criteria.

The *filter-id* must already be defined before the filter command is executed. If the filter policy does not exist, the operation fails and an error message returned.

IP filters apply only to RFC 2427-routed IP packets. Frames that do not contain IP packets will not be subject to the filter and will always be passed, even if the filter's default action is to drop.

The **no** form of this command removes any configured filter ID association with the IP interface. The filter ID itself is not removed from the system unless the scope of the created filter is set to local.

## Parameters

### *ip-filter-id*

Specifies the filter policy. The filter ID must already exist within the created IP filters.

**Values** 1 to 65535 or a string up to 64 characters

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## filter

### Syntax

**filter ip** *ip-filter-id*

**filter ipv6** *ipv6-filter-id*

**no filter** [**ip** *ip-filter-id*] [**ipv6** *ipv6-filter-id*]

### Context

**[Tree]** (config>service>vprn>if>sap>egress filter)

**[Tree]** (config>service>vprn>if>sap>ingress filter)

### Full Context

configure service vprn interface sap egress filter

configure service vprn interface sap ingress filter

### Description

This command associates an IP filter policy with an ingress or egress Service Access Point (SAP) or IP interface. Filter policies control the forwarding and dropping of packets based on IP matching criteria.

The **filter** command is used to associate a filter policy with a specified filter ID with an ingress or egress SAP. The filter ID must already be defined before the **filter** command is executed. If the filter policy does not exist, the operation fails and an error message returned.

In general, filters applied to SAPs (ingress or egress) apply to all packets on the SAP. One exception is non-IP packets are not applied to IP match criteria, so the default action in the filter policy applies to these packets.

The **no** form of this command removes any configured filter ID association with the SAP or IP interface. The filter ID itself is not removed from the system unless the scope of the created filter is set to local. To avoid deletion of the filter ID and only break the association with the service object, use **scope** command within the filter definition to change the scope to **local** or **global**. The default scope of a filter is **local**.

### Parameters

#### **ip** *ip-filter-id*

Specifies IP filter policy. The filter ID must already exist within the created IP filters.

**Values** ip-filter-id: 1 to 65535  
name: up to 64 characters

#### **ipv6** *ipv6-filter-id*

Specifies IPv6 filter policy. The filter ID must already exist within the created IP filters.

**Values** ip-filter-id: 1 to 65535

name: up to 64 characters

## Platforms

All

## filter

## Syntax

**filter** *filter-id* [**name** *filter-name*]

**no filter** *filter-id*

## Context

**[Tree]** (config>service>vprn>log filter)

**[Tree]** (config>service>vprn>log>log-id filter)

## Full Context

configure service vprn log filter

configure service vprn log log-id filter

## Description

This command creates a context for an event filter. An event filter specifies whether to forward or drop an event or trap based on the match criteria.

Filters are configured in the **filter** *filter-id* context and then applied to a log in the **log-id** *log-id* context. Only events for the configured log source streams destined to the log ID where the filter is applied are filtered.

Changes made to an existing filter using any of the sub-commands are immediately applied to the destinations where the filter is applied.

By default, no event filters are defined. Event filters must be explicitly configured.

The **no** form of this command removes the filter association from log IDs, which causes those logs to forward all events.

## Default

No event filters are defined.

## Parameters

### *filter-id*

Specifies the unique filter ID.

**Values** 1 to 1500

### *name filter-name*

Configures an optional filter name, up to 64 characters, that can be used to refer to the filter after it is created.

## Platforms

All

## filter

## Syntax

**filter ip** *ip-filter-id*

**filter ipv6** *ipv6-filter-id*

**no filter** [**ip** *ip-filter-id*] [**ipv6** *ipv6-filter-id*]

## Context

[\[Tree\]](#) (config>service>vprn>network>ingress filter)

## Full Context

configure service vprn network ingress filter

## Description

This command configures a network ingress filter for IPv4 or IPv6 traffic arriving over explicitly defined spokes or auto-bind network interfaces for the VPRN service.

The **no** form of this command removes an IPv4, IPv6, or both filters.

## Default

no filter

## Parameters

### *ip-filter-id/ipv6-filter-id*

Specifies an existing IP/IPv6 filter policy of a scope template.

**Values** 1 to 65535, *name*  
*name*: 64 characters maximum

## Platforms

All

## filter

## Syntax

**filter ip** *ip-filter-id*

**no filter** [**ip** *ip-filter-id*]

### Full Context

configure service vprn video-interface video-sap egress filter

configure service ies video-interface video-sap egress filter

configure service ies video-interface video-sap ingress filter

configure service vprn video-interface video-sap ingress filter

### Description

This command associates an existing IP filter policy with an ingress or egress video SAP. Filter policies control the forwarding and dropping of packets based on the matching criteria.

Filters applied to SAPs (ingress or egress) apply to all packets on the SAP. One exception is non-IP packets are not applied to the match criteria, so the default action in the filter policy applies to these packets.

The **no** form of this command removes any configured filter ID association with the SAP. The filter ID itself is not removed from the system.

### Parameters

**ip ip-filter-id**

Specifies the ID for the IP filter policy.

**Values** 1 to 65535

### Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## filter

### Syntax

**filter ip** *ip-filter-id*

**no filter**

## Context

[\[Tree\]](#) (config>service>vprn>ipmirrorif>spoke-sdp filter)

## Full Context

configure service vprn ipmirrorif spoke-sdp filter

## Description

This command places a filter on the IP mirror interface spoke SDP. It is recommended to configure this filter with a PBR filter to redirect the mirror traffic to the proper egress interface.

The **no** form of this command removes the filter ID from the configuration.

## Parameters

### *ip-filter-id*

Specifies the IP filter ID.

**Values** 1 to 65525 or a name, up to 64 characters.

## filter

## Syntax

**filter** *filter-id*

**no filter**

## Context

[\[Tree\]](#) (config>li>log>log-id filter)

## Full Context

configure li log log-id filter

## Description

This command adds an event filter policy with the log destination.

The **filter** command is optional. If no event filter is configured, all events, alarms and traps generated by the source stream will be forwarded to the destination.

An event filter policy defines (limits) the events that are forwarded to the destination configured in the log-id. The event filter policy can also be used to select the alarms and traps to be forwarded to a destination **snmp-trap-group**.

The application of filters for debug messages is limited to application and subject only.

Accounting records cannot be filtered using the **filter** command.

Only one filter-id can be configured per log destination.

The **no** form of this command removes the specified event filter from the *log-id*.

## Parameters

### *filter-id*

Specifies the event filter policy ID used to associate the filter with the *log-id* configuration. The event filter policy ID must already be defined in **config>log>filter** *filter-id*.

**Values** 1 to 1000

## Platforms

All

## filter

## Syntax

**filter ip** *ip-filter-id*

**filter ipv6** *ipv6-filter-id*

**no filter** [**ip** *ip-filter-id*] [**ipv6** *ipv6-filter-id*]

## Context

[\[Tree\]](#) (config>router>if>egress filter)

[\[Tree\]](#) (config>router>if>ingress filter)

## Full Context

configure router interface egress filter

configure router interface ingress filter

## Description

This command associates an IP filter policy with an IP interface.

Filter policies control packet forwarding and dropping based on IP match criteria.

The *ip-filter-id* must have been preconfigured before this **filter** command is executed. If the filter ID does not exist, an error occurs.

Only one filter ID can be specified.

The **no** form of this command removes the filter policy association with the IP interface.

## Default

no filter

## Parameters

### *ip-filter-id*

The filter name acts as the ID for the IP filter policy expressed as a decimal integer. The filter policy must already exist within the **config>filter>ip** context.

**Values** 1 to 16384

***ipv6-filter-id***

The filter name acts as the ID for the IPv6 filter policy expressed as a decimal integer. The filter policy must already exist within the **config>filter>ipv6** context. This parameter only applies to the 7750 SR and 7950 XRS.

**Values** 1 to 65535

**Platforms**

All

**filter****Syntax**

**filter ip** *ip-filter-id*

**filter ipv6** *ipv6-filter-id*

**filter mac** *mac-filter-id*

**no filter** [**ip** *ip-filter-id*] [**mac** *mac-filter-id*] [**ipv6** *ipv6-filter-id*]

**Context**

[\[Tree\]](#) (config>service>pw-template>ingress filter)

[\[Tree\]](#) (config>service>pw-template>egress filter)

**Full Context**

configure service pw-template ingress filter

configure service pw-template egress filter

**Description**

This command associates an IP filter policy or MAC filter policy on egress or ingress. Filter policies control the forwarding and dropping of packets based on IP or MAC matching criteria. There are two types of filter policies: IP and MAC. Only one type may be applied to a SAP at a time.

The **filter** command is used to associate a filter policy with a specified *filter ID* with an ingress or egress SAP. The *filter ID* must already be defined before the **filter** command is executed. If the filter policy does not exist, the operation will fail and an error message returned.

This command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **filter-name** command can be used in all configuration modes.

This command is mutually exclusive with the **filter-name** command. Only one or the other can be configured.

The **no** form of this command removes any configured filter ID association with the SAP or IP interface. The filter ID itself is not removed from the system unless the scope of the created filter is set to local. To avoid deletion of the filter ID and only break the association with the service object, use **scope** command within the filter definition to change the scope to **local** or **global**. The default scope of a filter is **local**.

## Parameters

### *ip-filter-id*

Specifies the IP filter policy.

**Values** 1 to 65535

### *ipv6-filter-id*

Specifies the IPv6 filter policy.

**Values** 1 to 65535

### *mac-filter-id*

Specifies the MAC filter policy.

**Values** 1 to 65535

## 10.61 filter-id-range

### filter-id-range

## Syntax

```
filter-id-range start filter-id end filter-id
```

```
no filter-id-range
```

## Context

[\[Tree\]](#) (config>filter>md-auto-id filter-id-range)

## Full Context

```
configure filter md-auto-id filter-id-range
```

## Description

This command specifies the range of IDs used by SR OS to automatically assign an ID to filters that are created in model-driven interfaces without an ID explicitly specified by the user or client.

A filter created with an explicitly-specified ID cannot use an ID in this range. In classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD interfaces, the range can be changed, which causes any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **config>filter md-auto-id** command for further details.

### Default

no filter-id-range

### Parameters

#### **start filter-id**

Specifies the lower value of the ID range. The value must be less than or equal to the **end** value.

**Values** 1 to 2147483647

#### **end filter-id**

Specifies the upper value of the ID range. The value must be greater than or equal to the **start** value.

**Values** 1 to 2147483647

**[Tree]** (config>service>pw-template>ingress filter-name)

### Full Context

configure service pw-template egress filter-name

configure service pw-template ingress filter-name

### Description

This command associates an IP filter policy or MAC filter policy on egress or ingress. Filter policies control the forwarding and dropping of packets based on IP or MAC matching criteria. There are two types of filter policies: IP and MAC. Only one type may be applied to a SAP at a time.

The **filter-name** command is used to associate a filter policy with a specified *filter name* with an ingress or egress SAP. The *filter name* must already be defined before the **filter-name** command is executed. If the filter policy does not exist, the operation will fail and an error message returned.

This command is mutually exclusive with the **filter** command. Only one or the other can be configured.

The **no** form of this command removes any configured filter name association with the SAP or IP interface. The filter name itself is not removed from the system unless the scope of the created filter is set to local. To avoid deletion of the filter name and only break the association with the service object, use **scope** command within the filter definition to change the scope to **local** or **global**. The default scope of a filter is **local**.

### Parameters

#### *ip-name*

Specifies the IP filter policy. The filter name must already exist within the created IP filters, up to 64 characters.

***ipv6-name***

Specifies the IPv6 filter policy. The filter name must already exist within the created IPv6 filters, up to 64 characters.

***mac-name***

Specifies the MAC filter policy. The specified filter name must already exist within the created MAC filters. The filter policy must already exist within the created MAC filters, up to 64 characters.

configure service nat firewall-policy

### Description

This command configures a firewall policy that can be used in contexts where basic protection from outside attack vectors is required.

The **no** form of the command removes the policy, and can only be performed when the policy is not in use.

### Default

no firewall-policy

### Parameters

#### **create**

Mandatory keyword used when creating a firewall policy.

#### ***name***

Specifies the name of the firewall policy, up to 32 characters maximum.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.71 flags-tlv

## flags-tlv

### Syntax

[no] **flags-tlv**

### Context

[\[Tree\]](#) (config>router>fad>flex-algo flags-tlv)

## Full Context

```
configure router flexible-algorithm-definitions flex-algo flags-tlv
```

## Description

This command advertises the FAD Flags TLV to provide additional context on how the router must run a constrained SPF (cSPF). The IETF definition includes only the M-flag for use in the FAD Flags TLV. When it is set, the M-flag specifies the use of a Flex-Algorithm specific prefix metric. The M-flag is important for inter-area or inter-domain routing support with Flex-Algorithms.

When a router advertises a FAD, it is optional to advertise the FAD Flags TLV. However, when a FAD that includes the FAD Flags TLV is received, then the router must decode the flags before participating in the Flex-Algorithm.

By default, the following considerations apply to the FAD Flags TLV.

- SR OS sets the M-flag and advertises the FAD Flags TLV.
- When a FAD Flags TLV is received, SR OS decodes the flags and modifies the cSPF computation based upon the M-flag status.

The **no** form of this command prevents the advertisement of the FAD Flags TLV within a FAD.

## Syntax

```
flex-algo flex-algo
```

```
no flex-algo
```

## Context

```
[Tree] (config>router>static-route-entry>indirect>tunnel-next-hop flex-algo)
```

## Full Context

```
configure router static-route-entry indirect tunnel-next-hop flex-algo
```

## Description

This command instructs the tunnel towards the indirect static-route next-hop to use the specified flexible algorithm.

It is assumed that the router using this command is participating in the flexible algorithm. This command instructs the router to lookup the indirect next-hop using flexible algorithm tunnels. If flexible algorithm aware tunnel to the indirect next-hop does not exist, then the static-route is not activated.

The expected outcome of this command is that when the router receives an IP payload packet, that it is steered towards the indirect next-hop using a flexible algorithm aware segment-routing tunnel if such tunnel exists. If such tunnel does not exist, then the route is not active, and the received IP packet will be dropped, if no other Longest Prefix Match (LPM) route exists.

If the *flex-algo* parameter is specified, the resolution filter can only use matching flexible algorithm-aware segment routing tunnels created by flexible algorithm-aware routing protocols (for example, SR IS-IS).

The **no** form of this command disables flexible algorithm-aware indirect next-hop resolution.

## Default

no flex-algo

## Parameters

### *flex-algo*

Configures or deconfigures tunnel-next-hop flexible algorithm for resolving indirect static-route-entry.

**Values** 128 to 255

## Platforms

All

## flex-algo

## Syntax

**flex-algo** *fad-name* [**create**]

**no flex-algo** *fad-name*

## Context

[\[Tree\]](#) (config>router>fad flex-algo)

## Full Context

configure router flexible-algorithm-definitions flex-algo

## Description

This command configures the definition context for a Flexible Algorithm Definition (FAD). Parameters, including the FAD priority, metric type, links to construct a flexible algorithm topology graph, and a description of the algorithm. Up to 256 local FADs can be configured on a router.

The FAD configuration parameters are grouped using the *fad-name* as the reference anchor. When an IGP is configured to use and advertise a local configured FAD, the *fad-name* is used as the reference anchor.

The **no** form of this command deletes the configured parameters and removes the defined FAD.

**Default**

no flex-algo

**Parameters*****fad-name***

Specifies the name of the flexible algorithm, up to 32 characters, that is used as reference anchor for the configured parameters.

**create**

Specifies the mandatory keyword to create a router instance.

**Platforms**

All

**flex-algo****Syntax**

[no] flex-algo *flex-algo*

**Context**

**[Tree]** (config>router>isis>flex-algos flex-algo)

**Full Context**

configure router isis flexible-algorithms flex-algo

**Description**

This command enters the configuration context for an IS-IS flexible algorithm.

A maximum of seven unique flexible algorithms can be configured on a router across all configured IS-IS instances. In each IS-IS flexible algorithm configuration context, the IS-IS instance participation can be either enabled or disabled, and it configures the advertising of a locally-configured flexible algorithm definition.

When flexible algorithm is enabled in an IS-IS instance, it is enabled for all levels (Level 1 and Level 2) within the IS-IS instance.

The **no** form of this command removes the IS-IS flexible algorithm configuration context.

**Default**

no flex-algo

**Parameters*****flex-algo***

Specifies the number of the IS-IS flexible algorithm.

**Values** 128 to 255

## Platforms

All

## flex-algo

### Syntax

**[no] flex-algo** *flex-algo-id*

### Context

**[Tree]** (config>router>ospf>flex-algos flex-algo)

### Full Context

configure router ospf flexible-algorithms flex-algo

### Description

This command enters the configuration context for an OSPFv2 flexible algorithm.

A maximum of seven unique flexible algorithms can be configured on a router across all configured OSPFv2 instances. The supported flexible algorithms are in the range of 128 to 255. In each OSPF flexible algorithm configuration context, the OSPFv2 instance participation can be either enabled or disabled, and it configures the advertising of a locally-configured flexible algorithm definition.

When flexible algorithm is enabled in an OSPF instance, it is enabled for all areas within the OSPF instance.

The **no** form of this command removes the OSPF flexible algorithm configuration context.

### Default

no flex-algo

### Parameters

***flex-algo-id***

Specifies the OSPF flexible algorithm number.

**Values** 128 to 255

configure router policy-options policy-statement entry action flex-algo

configure router policy-options policy-statement default-action flex-algo

## Description

This command configures the Flex-Algorithm for use in the BGP next-hop autobind operation in a BGP import policy. A Flex-Algorithm aware autobind of the BGP next-hop is enabled when the route is matched by the policy statement entry.

**Note:**

- Flex-Algorithm aware next-hop lookup is supported for unicast BGP, VPRN, and BGP-LU.
- This command is not supported for multicast address families.

The **no** form of this command removes the Flex-Algorithm aware next-hop lookup.

**Default**

no flex-algo

**Parameters*****flex-algo-id***

Specifies the flexible algorithm forwarding path.

**Values** 128 to 255

***param-name***

Specifies the parameter name, up to 32 characters, that starts and ends with an at-sign (@) symbol.

**Platforms**

|             |                                                                                                                                                                                                                                                                                                                                                                    |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| video       | This attribute specifies streaming or real-time video media traffic transferred between a sender and receiver. It does not differentiate adaptive and nonadaptive video streaming. Assigned to flows based on packet payload inspection (many protocols) or behavioral mechanisms, and may be used together with the RTC attribute to identify video call traffic. |
| abr_service | This attribute is assigned to adaptive bit rate traffic exchanges where the traffic rate or behavior can be automatically adjusted based on changes in network conditions. Assigned by application filter configuration or by behavioral mechanisms.                                                                                                               |
| audio       | This attribute is assigned to streaming or real-time audio media traffic transferred between a sender and                                                                                                                                                                                                                                                          |

|                         |                                                                                                                                                                                                                                                                                            |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                         | receiver. Assigned to flows based on packet payload inspection or behavioral mechanisms, and may be used together with the RTC attribute to identify voice call traffic.                                                                                                                   |
| encrypted               | This attribute is assigned to traffic exchanges where the initial payload or the entirety of the exchange is encrypted. Assigned to sessions based on packet payload inspection or by behavioral mechanisms.                                                                               |
| download                | This attribute is assigned to traffic that has a high likelihood of exchanging data predominantly in the network to subscriber direction over the lifetime of a session. May be assigned to sessions based on behavioral mechanisms.                                                       |
| upload                  | This attribute is assigned to traffic that has a high likelihood of exchanging data predominantly in the subscriber to network direction over the lifetime of the session. The upload and download attributes are mutually exclusive. Assigned to sessions based on behavioral mechanisms. |
| real_time_communication | This attribute is assigned to traffic that provides a low latency or real-time exchange of information between two or more communicating endpoints. Assigned by packet payload inspection of an RTP protocol being used or by behavioral mechanisms.                                       |
| esni                    | This attribute is assigned to traffic that uses an encrypted server name indication (eSNI), as part of the TLS layer negotiation                                                                                                                                                           |

### Full Context

configure application-assurance group policy charging-filter entry match flow-attribute

## Description

This command configured the addition of a flow attribute to the match criteria used by this charging filter entry.

The **no** form of this command removes the flow attribute match criteria.

## Default

no flow-attribute

## Parameters

*flow-attribute-name*

Specifies the name of the flow attribute, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.79 flow-count

flow-count

## Syntax

**flow-count** *flow-count*

**no flow-count**

## Context

[\[Tree\]](#) (config>app-assure>group>tod-override flow-count)

[\[Tree\]](#) (config>app-assure>group>policer flow-count)

## Full Context

configure application-assurance group policer tod-override flow-count

configure application-assurance group policer flow-count

## Description

This command configures the flow count for the flow-count-limit policer. It is recommended to configure flow count subscriber-level policer for AA subscribers to ensure fair usage of flow resources between AA subscribers.

## Default

no flow-count

## Parameters

*flow-count*

Specifies the flow count for the flow-count-limit policer.

**Values** 0 to 100000000, **max**

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.80 flow-count-limit

### flow-count-limit

#### Syntax

**flow-count-limit** *policer-name* [**event-log** *event-log-name*]

**no flow-count-limit**

#### Context

[\[Tree\]](#) (config>app-assure>group>policy>aqp>entry>action flow-count-limit)

#### Full Context

configure application-assurance group policy app-qos-policy entry action flow-count-limit

#### Description

This command assigns an existing flow count limit policer as an action on flows matching this AQP entry.

The match criteria for the AQP entry must specify a uni-directional traffic direction before a policer action can be configured. If a policer is used in one direction in an AQP match entry the same policer name cannot be used by another AQP entry which uses a different traffic direction match criteria.

When multiple policers apply to a single flow, the final action on a packet is the worst case of all policer outcomes (for example, if one of the policers marks packet out of profile, the final marking will reflect that).

The **no** form of this command removes this flow policer from actions on flows matching this AQP entry.

#### Default

no flow-count-limit

#### Parameters

##### *policer-name*

Specifies the name of the existing flow setup rate policer for this application assurance profile. The *policer-name* is configured in the **config>app-assure>group>policer** context.

##### *event-log-name*

Specifies the name of the event log used when event logging is enabled, up to 32 characters, which is used when event logging is enabled.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.81 flow-label

### flow-label

#### Syntax

**flow-label** *flow-label* [*mask*]

**no flow-label**

#### Context

[\[Tree\]](#) (config>filter>ipv6-filter>entry>match flow-label)

#### Full Context

configure filter ipv6-filter entry match flow-label

#### Description

This command configures the flow-label and optional mask match condition.

The **no** form of the command reverts to the default.

#### Default

no flow-label

#### Parameters

##### *flow-label*

Specifies the flow label to be used as a match criterion. Value can be expressed as a decimal integer, as well as in hexadecimal or binary format. The following value shows decimal integer format only.

**Values** 0 to 1048575

##### *mask*

Specifies the flow label mask value for this policy IPv6 Filter entry. Value can be expressed as a decimal integer, as well as in hexadecimal or binary format. The following value shows decimal integer format only.

**Values** 0 to 1048575

## Platforms

All

## flow-rate-limit

### Syntax

**flow-rate-limit** *policer-name* [**event-log** *event-log-name*]

**no flow-rate-limit**

### Context

**[Tree]** (config>app-assure>group>policy>aqp>entry>action flow-rate-limit)

### Full Context

configure application-assurance group policy app-qos-policy entry action flow-rate-limit

### Description

This command assigns an existing flow setup rate limit policer as an action on flows matching this AQP entry.

The match criteria for the AQP entry must specify a uni-directional traffic direction before a policer action can be configured. If a policer is used in one direction in an AQP match entry the same policer name cannot be used by another AQP entry which uses a different traffic direction match criteria.

When multiple policers apply to a single flow, the final action on a packet is the worst case of all policer outcomes (for example, if one of the policers marks packet out of profile, the final marking will reflect that).

The **no** form of this command removes this flow policer from actions on flows matching this AQP entry.

### Default

no flow-rate-limit

### Parameters

#### ***policer-name***

Specifies the policer name up to 32 characters.

#### **event-log *event-log-name***

Specifies the event-log-name up to 32 characters, which will be used when event logging is enabled.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.85 flow-rate2

## flow-rate2

### Syntax

**flow-rate2** *sample-rate*

## no flow-rate2

### Context

[\[Tree\]](#) (config>app-assure>group>cflowd>comp flow-rate2)

[\[Tree\]](#) (config>app-assure>group>cflowd>rtp-perf flow-rate2)

[\[Tree\]](#) (config>app-assure>group>cflowd>tcp-perf flow-rate2)

### Full Context

configure application-assurance group cflowd comprehensive flow-rate2

configure application-assurance group cflowd rtp-performance flow-rate2

configure application-assurance group cflowd tcp-performance flow-rate2

### Description

This command specifies the per-flow second sampling rate for the cflowd export of Application Assurance performance statistics.

The **no** form of this command reverts to the default.

### Default

no flow-rate2

### Parameters

#### *sample-rate*

Specifies the rate at which to sample flows that are eligible for TCP and/or RTP performance measurement.

**Values** 1 to 1000

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.86 flow-setup-direction

### flow-setup-direction

### Syntax

**flow-setup-direction** {**subscriber-to-network** | **network-to-subscriber** | **both**}

### Context

[\[Tree\]](#) (config>app-assure>group>policy>app-filter>entry flow-setup-direction)

## Full Context

configure application-assurance group policy app-filter entry flow-setup-direction

## Description

This command configures the direction of flow setup to which the application filter entry is to be applied.

## Default

flow-setup-direction both

## Parameters

### subscriber-to-network

Specifies that the app-filter entry will be applied to flows initiated by a local subscriber.

### network-to-subscriber

Specifies that the app-filter entry will be applied to flows initiated from a remote destination towards a local subscriber.

### both

Specifies that the app filter entry will be applied for subscriber-to-network and network-to-subscriber traffic.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.87 flow-setup-high-wmark

### flow-setup-high-wmark

## Syntax

**flow-setup-high-wmark** *high-watermark*

## Context

[\[Tree\]](#) (config>app-assure flow-setup-high-wmark)

## Full Context

configure application-assurance flow-setup-high-wmark

## Description

This command configures the system wide high watermark threshold for per-ISA throughput in packets/second when an alarm will be raised by the agent. The value must be larger than or equal to the packet-rate-low-wmark parameter.

**Default**

flow-setup-high-wmark max

**Parameters*****high-watermark***

Specifies the high watermark for flow setup rate alarms. The value must be larger than or equal to the flow-setup-low-wmark value.

**Values** 1 to 800000, **max** flows/sec (disabled)

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.88 flow-setup-low-wmark

### flow-setup-low-wmark

**Syntax**

flow-setup-low-wmark *low-watermark*

no flow-setup-low-wmark

**Context**

[\[Tree\]](#) (config>app-assure flow-setup-low-wmark)

**Full Context**

configure application-assurance flow-setup-low-wmark

**Description**

This command configures the flow setup rate on the ISA-AA when a flow setup alarm will be raised by the agent.

**Default**

flow-setup-low-wmark 0

**Parameters*****low-watermark***

Specifies the low watermark for flow setup rate alarms. The value must be larger than or equal to the flow-setup-high-wmark value.

**Values** 1 to 799999 flows/sec

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.89 flow-spec-dest

### flow-spec-dest

#### Syntax

**flow-spec-dest** *prefix-list-name*

**no flow-spec-dest**

#### Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from flow-spec-dest)

#### Full Context

configure router policy-options policy-statement entry from flow-spec-dest

#### Description

This command is used to match BGP FlowSpec routes on the basis of the destination IP prefix in the flow specification. An IPv4 FlowSpec route is matched by this command if its NLRI contains a type 1 subcomponent encoding a prefix and prefix-length that is covered by an entry in the referenced prefix-list. An IPv6 FlowSpec route is matched by this command if its NLRI contains a type 1 component encoding prefix-offset=0 and a prefix & prefix-length that is covered by an entry in the referenced prefix-list.

The **flow-spec-dest** command has no effect when the policy is not applied as a BGP import or export policy.

#### Default

no flow-spec-dest

#### Parameters

***prefix-list-name***

Specifies the name of a prefix-list containing IPv4 and/or IPv6 prefix entries [up to 64 characters].

#### Platforms

All

## 10.90 flow-spec-source

## flow-spec-source

### Syntax

**flow-spec-source** *prefix-list-name*

**no flow-spec-source**

### Context

**[Tree]** (config>router>policy-options>policy-statement>entry>from flow-spec-source)

### Full Context

configure router policy-options policy-statement entry from flow-spec-source

### Description

This command is used to match BGP FlowSpec routes on the basis of the source IP prefix in the flow specification. An IPv4 FlowSpec route is matched by this command if its NLRI contains a type 2 subcomponent encoding a prefix and prefix-length that is covered by an entry in the referenced prefix-list. An IPv6 FlowSpec route is matched by this command if its NLRI contains a type 2 component encoding prefix-offset=0 and a prefix & prefix-length that is covered by an entry in the referenced prefix-list.

The **flow-spec-source** command has no effect when the policy is not applied as a BGP import or export policy.

### Default

no flow-spec-source

### Parameters

***prefix-list-name***

Specifies the name of a prefix-list containing IPv4 and/or IPv6 prefix entries, up to 64 characters.

### Platforms

All

## 10.91 flow-table-high-wmark

## flow-table-high-wmark

### Syntax

**flow-table-high-wmark** *high-watermark*

**no flow-table-high-wmark**

## Context

[\[Tree\]](#) (config>app-assure flow-table-high-wmark)

## Full Context

configure application-assurance flow-table-high-wmark

## Description

This command configures the system-wide high watermark threshold as a percentage of the flow table size for the per-ISA utilization of the flow records when a full alarm will be raised by the agent.

## Default

flow-table-high-wmark 95

## Parameters

### *high-watermark*

Specifies the high watermark for flow table full alarms, in percent.

**Values** 0 to 100

**Default** 95

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.92 flow-table-low-wmark

### flow-table-low-wmark

## Syntax

**flow-table-low-wmark** *low-watermark*

**no flow-table-low-wmark**

## Context

[\[Tree\]](#) (config>app-assure flow-table-low-wmark)

## Full Context

configure application-assurance flow-table-low-wmark

## Description

This command configures the system-wide low watermark threshold as a percentage of the flow table size for per-ISA. The value must be lower than or equal to the **flow-table-high-wmark** *high-watermark* parameter.

**Default**

flow-table-low-wmark 90

**Parameters*****low-watermark***

Specifies the low watermark for flow table full alarms, in percent.

**Values** 0 to 100

**Default** 90

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.93 flow-timeout-on-switchover

### flow-timeout-on-switchover

**Syntax**

**flow-timeout-on-switchover** *percent*

**Context**

[\[Tree\]](#) (config>isa>nat-group>inter-chassis-redundancy flow-timeout-on-switchover)

**Full Context**

configure isa nat-group inter-chassis-redundancy flow-timeout-on-switchover

**Description**

This command configures an initial flow timeout on the newly activated node for the **nat-group** after a switchover. This timeout stays in effect only if there is no traffic present over this flow; otherwise, the first packet over the flow after the switchover resets the flow timeout to the originally configured value (under the NAT policy configuration).

This command configuration restricts the flow timeout to a portion of the originally configured value.

**Default**

flow-timeout-on-switchover 50

**Parameters*****percent***

Specifies the percentage of the originally configured timeout value for the flow under the **nat-policy**.

**Values** 1 to 50

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.94 flows-active-count

### flows-active-count

#### Syntax

[no] flows-active-count

#### Context

**[Tree]** (config>log>acct-policy>cr>aa>aa-from-sub-cntr flows-active-count)

**[Tree]** (config>log>acct-policy>cr>aa>aa-to-sub-cntr flows-active-count)

#### Full Context

configure log accounting-policy custom-record aa-specific from-aa-sub-counters flows-active-count

configure log accounting-policy custom-record aa-specific to-aa-sub-counters flows-active-count

#### Description

This command includes the active flow count and only applies to the 7750 SR.

The **no** form of this command excludes the active flow count in the AA subscriber's custom record.

#### Default

no flows-active-count

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.95 flows-admitted-count

### flows-admitted-count

#### Syntax

[no] flows-admitted-count

## Context

**[Tree]** (config>log>acct-policy>cr>aa>aa-to-sub-cntr flows-admitted-count)

**[Tree]** (config>log>acct-policy>cr>aa>aa-from-sub-cntr flows-admitted-count)

## Full Context

configure log accounting-policy custom-record aa-specific to-aa-sub-counters flows-admitted-count

configure log accounting-policy custom-record aa-specific from-aa-sub-counters flows-admitted-count

## Description

This command includes the admitted flow count and only applies to the 7750 SR.

The **no** form of this command excludes the flow's admitted count in the AA subscriber's custom record.

## Default

no flows-admitted-count

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.96 flows-denied-count

### flows-denied-count

## Syntax

[no] flows-denied-count

## Context

**[Tree]** (config>log>acct-policy>cr>aa>aa-from-sub-cntr flows-denied-count)

**[Tree]** (config>log>acct-policy>cr>aa>aa-to-sub-cntr flows-denied-count)

## Full Context

configure log accounting-policy custom-record aa-specific from-aa-sub-counters flows-denied-count

configure log accounting-policy custom-record aa-specific to-aa-sub-counters flows-denied-count

## Description

This command includes the flow's denied count in the AA subscriber's custom record and only applies to the 7750 SR.

The **no** form of this command excludes the flow's denied count.

## Default

no flows-denied-count

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.97 flowspec

### flowspec

#### Syntax

[no] flowspec

#### Context

**[Tree]** (config>service>vprn>if>spoke-sdp>ingress flowspec)

**[Tree]** (config>service>vprn>if>sap>ingress flowspec)

**[Tree]** (config>service>ies>if>spoke-sdp>ingress flowspec)

**[Tree]** (config>service>ies>if>sap>ingress flowspec)

#### Full Context

configure service vprn interface spoke-sdp ingress flowspec

configure service vprn interface sap ingress flowspec

configure service ies interface spoke-sdp ingress flowspec

configure service ies interface sap ingress flowspec

#### Description

This command enables IPv4 FlowSpec filtering on an access IP interface associated with a VPRN or IES service. Filtering is based on all of the IPv4 FlowSpec routes that have been received and accepted by the corresponding BGP instance. Ingress IPv4 traffic on an interface can be filtered by both a user-defined IPv4 filter and FlowSpec. Evaluation proceeds in this order:

- user-defined IPv4 filter entries
- FlowSpec derived filter entries
- user-defined IPv4 filter default-action

The **no** form of this command removes IPv4 FlowSpec filtering from an IP interface.

#### Default

no flowspec. No access interfaces have IPv4 FlowSpec enabled.

#### Platforms

All

**[no] flowtable** *of-table-id*

**Context**

[\[Tree\]](#) (config>open-flow>of-switch flowtable)

**Full Context**

configure open-flow of-switch flowtable

## Description

This command configures the flow table parameters for this OpenFlow switch instance. The **no** form of this command restores flow table configuration default settings.

## Default

no flowtable

## Parameters

### *of-table-id*

Specifies an identifier of the open flow table, a string up to 256 characters.

## Platforms

All

## 10.99 flr-threshold

### flr-threshold

## Syntax

**flr-threshold** *percentage*

**no flr-threshold**

## Context

[\[Tree\]](#) (config>oam-pm>session>ethernet>lmm>availability flr-threshold)

[\[Tree\]](#) (config>oam-pm>session>ethernet>slm flr-threshold)

## Full Context

configure oam-pm session ethernet lmm availability flr-threshold

configure oam-pm session ethernet slm flr-threshold

## Description

This command defines the frame loss threshold used to determine whether the delta-t is available or unavailable. An individual delta-t with a frame loss threshold equal to the configured threshold is marked unavailable. An individual delta-t with a frame loss threshold lower than the configured threshold is marked as available.

The **no** form of this command restores the default value of 50%.

## Parameters

### *percentage*

Specifies the percentage of the threshold.

**Values** 0 to 100

**Default** 50

## Platforms

All

## fir-threshold

### Syntax

**fir-threshold** *percentage*

**no fir-threshold**

### Context

**[Tree]** (config>oam-pm>session>ip>twamp-light>loss fir-threshold)

### Full Context

configure oam-pm session ip twamp-light loss fir-threshold

### Description

This command defines the frame loss threshold used to determine whether the delta-t is available or unavailable. An individual delta-t with a frame loss threshold equal to or higher than the configured threshold is marked unavailable. An individual delta-t with a frame loss threshold lower than the configured threshold is marked as available.

The **no** form of this command restores the default value of 50%.

### Default

fir-threshold 50

### Parameters

*percentage*

Specifies the percentage of the threshold.

**Values** 0 to 100

**Default** 50

configure service vprn subscriber-interface group-interface sap eth-cfm mep alarm-notification fng-alarm-time

configure service vpls eth-cfm mep alarm-notification fng-alarm-time

## Description

This command is used to configure the Fault Notification Generation time values for raising the alarm. This timer is used for network management processes and is not tied into delaying the notification to the fault management system on the network element. This timer does not affect fault propagation mechanisms.

## Parameters

### *time*

Specifies the time, in centiseconds (10ms intervals), that a defect condition at or above the **low-priority-defect** must be present before raising alarm.

**Values** 0, 250, 500, 1000

**Default** 0

```

## Description

This command configures the Fault Notification Generation time values to reset the CCM defect alarm. This timer is used for network management processes and is not tied into delaying the notification to the fault management system on the network element. This timer does not affect fault propagation mechanisms.

## Parameters

### *time*

Specifies the time, in centiseconds (10ms intervals), that a defect condition at or above the **low-priority-defect** must be cleared before resetting the alarm.

**Values** 0, 250, 500, 1000

**Default** 0

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure service vprn interface sap eth-cfm mep alarm-notification fng-reset-time
- configure service ipipe sap eth-cfm mep alarm-notification fng-reset-time
- configure service vpls mesh-sdp eth-cfm mep alarm-notification fng-reset-time
- configure service epipe sap eth-cfm mep alarm-notification fng-reset-time

## fng-reset-time

### Syntax

**fng-reset-time** *time*

### Context

[\[Tree\]](#) (config>router>if>eth-cfm>mep fng-reset-time)

### Full Context

configure router interface eth-cfm mep fng-reset-time

### Description

This command configures the FNG reset time.

### Parameters

***time***

The length of time, in centiseconds, that must expire before a defect is reset.

**Values** 0, 250, 500, 1000

**Default** 0

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 10.102 follow

## follow

### Syntax

**follow** *router* *router-instance* **pool** *name*

**no follow**

### Context

**[Tree]** (config>service>vprn>nat>outside>pool>redundancy follow)

**[Tree]** (config>router>nat>outside>pool>redundancy follow)

### Full Context

configure service vprn nat outside pool redundancy follow

configure router nat outside pool redundancy follow

### Description

This command implicitly enables Pool Fate-Sharing Group (PFSG) which is required in case of multiple NAT policies per inside routing context. A NAT pool configured with this command will not advertise or monitor any route in order to change its (activity) state but instead it will directly follow the state of the lead pool in the PFSG. Once the lead pool changes its (activity) state, all the remaining pools following the lead pool will change their state accordingly.

### Default

no follow

### Parameters

**router** *router-instance*

Specifies the routing instance where the lead pool resides.

**Values** <router-name> | <service-id>

router-name - Base

service-id - 1 to 2147483647

**pool** *name*

Specifies the pool whose activity state is being shared up to 32 characters in length.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.103 force-auth

## force-auth

### Syntax

**force-auth** [cid-change] [rid-change]

**force-auth disabled**

**no force-auth**

### Context

**[Tree]** (config>service>vprn>sub-if>grp-if>ipoe-session force-auth)

**[Tree]** (config>service>ies>sub-if>grp-if>ipoe-session force-auth)

### Full Context

configure service vprn subscriber-interface group-interface ipoe-session force-auth

configure service ies subscriber-interface group-interface ipoe-session force-auth

### Description

By default, if the circuit-id/interface-id or remote-id in the IPoE session re-authentication trigger packet (such as a DHCP renewal) is not empty and different from the circuit-id/interface-id or remote-id stored in the IPoE session data, a forced re-authentication is performed, ignoring the configured **min-auth-interval**. This default behavior can be changed with this command.

The **no** form of this command reverts to the default behavior.

### Default

force-auth cid-change rid-change force-auth disabled on wlan-gw group interfaces

### Parameters

#### cid-change

Perform a forced re-authentication upon a circuit-id/interface-id change. An empty circuit-id/interface-id is not considered a change.

#### rid-change

Perform a forced re-authentication upon a remote-id change. an empty remote-id is not considered a change. For DHCPv6, the enterprise number is excluded from the comparison.

#### disabled

Specifies that the **min-auth-interval** never is ignored. The system does not perform a forced re-authentication upon a circuit-id or interface-id or remote-id change.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 10.104 force-ipv6cp

```
force-ipv6cp
```

### Syntax

```
[no] force-ipv6cp
```

### Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp>host force-ipv6cp)

### Full Context

```
configure subscriber-mgmt local-user-db ppp host force-ipv6cp
```

### Description

This command specifies if the IPv6 control protocol should be negotiated after PPP reaches the Network-Layer Protocol phase.

The **no** form of this command reverts to the default.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 10.105 force-l2pt-boundary

```
force-l2pt-boundary
```

### Syntax

```
force-l2pt-boundary [cdp] [dtp] [pagp] [stp] [udld] [vtp]
```

```
no force-l2pt-boundary
```

### Context

[\[Tree\]](#) (config>service>vpls>sap force-l2pt-boundary)

### Full Context

```
configure service vpls sap force-l2pt-boundary
```

### Description

Enabling force-l2pt-boundary will force all SAPs managed by the specified m-vpls instance on the corresponding port to have l2pt-termination enabled. This command is applicable only to SAPs created under m-vpls regardless of the flavor of STP currently active. It is not applicable to spoke-SDPs.

The execution of this command will fail as soon as at least one of the currently managed SAPs (all SAPs falling within the specified managed-vlan-range) does not have I2pt-termination enabled regardless of its admin/operational status.

If force-I2pt-boundary is enabled on a specified m-vpls SAP, all newly created SAPs falling into the specified managed-vlan-range will have I2pt-termination enabled per default.

Extending or adding new range into a managed-vlan-range declaration will fail as soon as there is at least one SAPs falling into the specified vlan-range does not have I2pt-termination enabled.

Disabling I2pt-termination on currently managed SAPs will fail as soon as the force-I2pt-boundary is enabled under corresponding m-vpls SAP.

### Parameters

**cdp**

Specifies the Cisco discovery protocol

**dtp**

Specifies the dynamic trunking protocol

**pagp**

Specifies the port aggregation protocol

**stp**

Specifies all spanning tree protocols: stp, rstp, mstp, pvst (default)

**udld**

Specifies unidirectional link detection

**vtp**

Specifies the virtual trunk protocol

### Platforms

All

## 10.106 force-mcast

### force-mcast

configure service ies subscriber-interface ipv6 router-advertisements force-mcast

configure service vprn subscriber-interface ipv6 router-advertisements force-mcast

### Description

This command configures the protocols with forced multicast, either IP or MAC.

The **no** form of this command returns the command to the default setting.

### Parameters

**ip**

Specifies that IP for multicast is forced.

**mac**

Specifies that MAC for multicast is forced.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 10.107 force-ppp-mtu-gt-1492

force-ppp-mtu-gt-1492

### Syntax

[no] force-ppp-mtu-gt-1492

### Context

**[Tree]** (config>subscr-mgmt>ppp-policy force-ppp-mtu-gt-1492)

### Full Context

configure subscriber-mgmt ppp-policy force-ppp-mtu-gt-1492

## Description

This command enables PPPoE Maximum-Receive-Unit (MRU) negotiations greater than 1492 bytes without the need to receive a "PPP-Max-Payload" tag in PADI/PADR from the client as defined in RFC 4638, *Accommodating a Maximum Transit Unit/Maximum Receive Unit (MTU/MRU) Greater Than 1492 in the Point-to-Point Protocol over Ethernet (PPPoE)*.

The MRU send in the initial LCP Config Request is determined by the **port mtu** and **ppp-policy ppp-mtu** parameters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 10.108 force-qinq-vc-forwarding

### force-qinq-vc-forwarding

#### Syntax

configure service pw-template force-qinq-vc-forwarding

configure service vpls mesh-sdp force-qinq-vc-forwarding

configure service vpls spoke-sdp force-qinq-vc-forwarding

configure service vpls bgp-evpn mpls force-qinq-vc-forwarding

configure service vpls bgp-evpn segment-routing-v6 force-qinq-vc-forwarding

configure service epipe spoke-sdp force-qinq-vc-forwarding

## Description

This command forces the datapath to push two VLAN tags at network egress when sending traffic on SDP bindings or EVPN destinations. The VLAN tag values are derived from the service-delimiting tags at the ingress, depending on the configured parameter. At network ingress this command, configured on EVPN-MPLS or the SDP-binding, pops two VLAN tags at most.

The **no** form of this command disables the datapath from pushing any VLAN tags in SDP bindings or EVPN, or from popping two VLAN tags.

## Default

no force-qinq-vc-forwarding

## Parameters

### c-tag-c-tag

Specifies that the router pushes two tags with the same value derived from the inner service delimiting tag. At network ingress, two VLAN tags are extracted at most and the C-tag and S-tag p/de bits are propagated to the egress SAPs.

### s-tag-c-tag

Specifies that the router pushes two tags that are copied from the QinQ service-delimiting VLAN values and may be different. At network ingress, two VLAN tags are extracted at most and the p/de bits are propagated to the egress SAP service-delimiting S-tag and C-tag respectively.

## Platforms

All

- configure service vpls spoke-sdp force-qinq-vc-forwarding
- configure service pw-template force-qinq-vc-forwarding

- configure service vpls bgp-evpn segment-routing-v6 force-qinq-vc-forwarding

## 10.109 force-qtag-forwarding

### force-qtag-forwarding

## Syntax

[no] force-qtag-forwarding

## Context

[\[Tree\]](#) (config>service>vpls>pbb force-qtag-forwarding)

## Full Context

```
configure service vpls pbb force-qtag-forwarding
```

## Description

This command forces the addition of a IEEE 802.1q tag after the Customer MAC (C-MAC) addresses when the PBB header is built, as it egresses a related BVPLS.

It is used to preserve the dot1q and DE bits from the customer domain when the service delimiting qtags are stripped when the packet is ingressing a PBB Epipe or an IVPLS. The VLAN value of the service delimiting qtag if one exists is used for the corresponding inserted dot1q field. If a service delimiting qtag does not exist, then the value of zero is used for all the inserted qtag bits.

The **no** form of this command sets default behavior.

## Default

```
no force-qtag-forwarding
```

## Platforms

All

## force-qtag-forwarding

## Syntax

```
[no] force-qtag-forwarding
```

## Context

## 10.110 force-reference

### force-reference

#### Syntax

**force-reference** {ref1 | ref2 | bits | bitsa | bitsb | gnss | gnssa | gnssb | ptp | synce | syncea | synceb}  
**no force-reference**

#### Context

[\[Tree\]](#) (debug>sync-if-timing force-reference)

#### Full Context

debug sync-if-timing force-reference

#### Description

This command forces the system synchronous timing output to use a specific reference.

##### Note:

The list of available references may vary depending on the platform; all references are not supported on every platform.

Only use this command to test and debug problems. Network synchronization problems may appear if you leave network elements with this manual override setting. After forcing the system timing reference input, clear it using the **no force-reference** command.

This command also clears the Wait-to-Restore state of the reference so that the reference can be selected.

This command can also force the CPM clock to use a specific input reference.

When the command is executed, the CPM clock on the active CPM immediately switches its input reference to that specified by the command. If the specified input is not available (shutdown), or in a disqualified state, the CPM clock shall use the next qualified input reference based on the selection rules.

This command also affects the BITS output port on the active CPM. If the BITS output port selection is set to line-reference and the reference being forced is not the BITS input port, then the system uses the forced reference to generate the signal out the BITS output port. If the BITS output port selection is set to internal-clock, then the system uses the output of the CPM clock to generate the signal for the BITS output port.

On a CPM activity switch, the force command is cleared and normal reference selection is determined.

Debug configurations are not saved between reboots.

#### Parameters

**ref1**

Specifies that the clock uses the first timing reference.

**ref2**

Specifies that the clock uses the second timing reference.

**bits**

Specifies that the clock uses the external network interface on the active CPM to be the highest priority input.

**bitsa**

Specifies that the clock uses the bitsa timing reference, for redundant systems with a BITS port on each CPM.

**bitsb**

Specifies that the clock uses the bitsb timing reference, for redundant systems with a BITS port on each CPM.

**gnss**

Specifies that the clock uses the GNSS port as a timing reference. This keyword is supported only on 7750 SR single-slot platforms.

**gnssa**

Specifies that the clock uses the GNSS port on the CPM in slot A as a timing reference. This keyword is supported only on 7750 SR-2e platforms.

**gnssb**

Specifies that the clock uses the GNSS port on the CPM in slot B as a timing reference. This keyword is supported only on 7750 SR-2e platforms.

**ptp**

Specifies that the clock uses the PTP timeReceiver as the timing reference. This keyword is supported on 7450 ESS and 7750 SR platforms.

**synce**

Specifies that the clock uses the SyncE/1588 timing reference on non-redundant systems.

**syncea**

Specifies that the clock uses the SyncE/1588 timing reference on CPM A of redundant systems.

**synceb**

Specifies that the clock uses the SyncE/1588 timing reference on CPM B of redundant systems.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 10.111 force-renews

## force-renews

### Syntax

[no] force-renews

### Context

[\[Tree\]](#) (config>router>dhcp>server force-renews)

[\[Tree\]](#) (config>service>vprn>server force-renews)

### Full Context

configure router dhcp local-dhcp-server force-renews

configure service vprn server force-renews

### Description

This command enables the sending of sending FORCERENEW messages for DHCP.

The **no** form of this command disables the sending of FORCERENEW messages.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 10.112 force-switchover

## force-switchover

### Syntax

force-switchover [now] [ignore-status]

### Context

[\[Tree\]](#) (admin>redundancy force-switchover)

### Full Context

admin redundancy force-switchover

### Description

This command forces a switchover to the standby CPM card. The primary CPM reloads its software image and becomes the secondary CPM.

### Parameters

**now**

Forces the switchover to the redundant CPM card immediately.

**ignore-status**

Forces a switchover despite any diagnostics or conditions on the standby. This is true even if the standby cannot reach the extension CPMs on the extension chassis of a 7950 XRS-40 via its local CPM interconnect ports.

This option is supported on 7950 XRS-20 and 7950 XRS-40 platforms only.

**Platforms**

All

## 10.113 force-unique-ip-addresses

### force-unique-ip-addresses

**Syntax**

[no] force-unique-ip-addresses

**Context**

[\[Tree\]](#) (config>router>nat>inside>l2-aware force-unique-ip-addresses)

[\[Tree\]](#) (config>service>vprn>nat>inside>l2-aware force-unique-ip-addresses)

**Full Context**

configure router nat inside l2-aware force-unique-ip-addresses

configure service vprn nat inside l2-aware force-unique-ip-addresses

**Description**

This command enforces the uniqueness of IPv4 addresses of L2-aware subscribers in an inside routing context.

This functionality is required if multicast sourced from the inside routing context is enabled for L2-aware subscribers.

The **no** form of this command allows L2-aware subscribers to have overlapping IPv4 addresses.

**Default**

no force-unique-ip-addresses

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.114 force-vlan-vc-forwarding

## force-vlan-vc-forwarding

### Syntax

[no] force-vlan-vc-forwarding

### Context

**[Tree]** (config>service>epipe>bgp-evpn>srv6 force-vlan-vc-forwarding)

**[Tree]** (config>service>epipe>bgp-evpn>mpls force-vlan-vc-forwarding)

**[Tree]** (config>service>vpls>bgp-evpn>mpls force-vlan-vc-forwarding)

**[Tree]** (config>service>vpls>bgp-evpn>srv6 force-vlan-vc-forwarding)

### Full Context

configure service epipe bgp-evpn segment-routing-v6 force-vlan-vc-forwarding

configure service epipe bgp-evpn mpls force-vlan-vc-forwarding

configure service vpls bgp-evpn mpls force-vlan-vc-forwarding

configure service vpls bgp-evpn segment-routing-v6 force-vlan-vc-forwarding

### Description

This command enables the system to preserve the VLAN ID and 802.1p bits of the service-delimiting qtag in a new tag, which is sent in the customer frame to the EVPN destinations.

If this configuration is used in conjunction with the **sap ingress vlan-translation** command, the configured translated VLAN ID is the VLAN ID sent to the EVPN destinations, instead of the service-delimiting tag VLAN ID. If the ingress SAP or SDP binding is null-encapsulated, the output VLAN ID and p-bits are zero.

The **no** form of this command does not preserve the VLAN ID and 802.1p bits of the service-delimiting qtag.

### Default

no force-vlan-vc-forwarding

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

- configure service epipe bgp-evpn segment-routing-v6 force-vlan-vc-forwarding
- configure service vpls bgp-evpn segment-routing-v6 force-vlan-vc-forwarding

All

- configure service vpls bgp-evpn mpls force-vlan-vc-forwarding
- configure service epipe bgp-evpn mpls force-vlan-vc-forwarding

## force-vlan-vc-forwarding

### Syntax

**[no] force-vlan-vc-forwarding**

### Context

**[Tree]** (config>service>epipe>spoke-sdp force-vlan-vc-forwarding)

**[Tree]** (config>service>vpls>mesh-sdp force-vlan-vc-forwarding)

**[Tree]** (config>service>vpls>spoke-sdp force-vlan-vc-forwarding)

### Full Context

configure service epipe spoke-sdp force-vlan-vc-forwarding

configure service vpls mesh-sdp force-vlan-vc-forwarding

configure service vpls spoke-sdp force-vlan-vc-forwarding

### Description

This command forces vc-vlan-type forwarding in the datapath for spoke and mesh SDPs which have either vc-type. This command is not allowed on vlan-vc-type SDPs.

The **no** version of this command sets default behavior.

### Default

no force-vlan-vc-forwarding

### Platforms

All

## 10.115 foreign-ip

## foreign-ip

### Syntax

**foreign-ip** *ip-address**[mask]*

**no foreign-ip**

### Context

**[Tree]** (config>subscr-mgmt>isa-svc-chain>vas-filter>entry>match foreign-ip)

### Full Context

configure subscriber-mgmt isa-service-chaining vas-filter entry match foreign-ip

## Description

This command configures the foreign IP address or subnet in the match criterion for this entry. The foreign IP or subnet implies a matching destination IP for upstream traffic and a source IP for downstream traffic.

The **no** form of this command removes the IP address or subnet from the match criterion in the entry.

## Parameters

### *ip-address/mask*

Specifies the IPv4 address and mask.

**Values** ip-address a.b.c.d  
mask 0 to 32

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## foreign-ip

## Syntax

[no] foreign-ip

## Context

[\[Tree\]](#) (config>service>nat>syslog>syslog-export-policy>include foreign-ip)

## Full Context

configure service nat syslog syslog-export-policy include foreign-ip

## Description

This command includes the foreign IP address in the flow log. A foreign IP address is the original IP address toward the destination node and in DNAT it is replaced by the destination IP.

If DNAT is not used, the foreign IP address (the IP address of the destination node) is the same on both sides of NAT.

The **no** form of the command disables the feature.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## foreign-ip

## Syntax

foreign-ip *ip-address*

configure service nat nat-classifier entry match foreign-ip

## Description

This command specifies matching on a foreign IP, that is the destination IP address of the NAT inside service before translation.

## Default

no foreign-ip

## Parameters

### *ip-address*

Specifies the foreign IP address.

**Values** a.b.c.d

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.116 foreign-port

foreign-port

## Syntax

**foreign-port** *port*

**no foreign-port**

## Context

[\[Tree\]](#) (config>subscr-mgmt>isa-svc-chain>vas-filter>entry>match foreign-port)

## Full Context

configure subscriber-mgmt isa-service-chaining vas-filter entry match foreign-port

## Description

This command configures the foreign TCP/UDP port to match in this entry of the VAS filter.

The **no** form of this command

## Parameters

### *port*

Specifies the foreign IP port to match.

**Values** 1 to 65535

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## foreign-port

## Syntax

[no] foreign-port

## Context

[\[Tree\]](#) (config>service>nat>syslog>syslog-export-policy>include foreign-port)

## Full Context

configure service nat syslog syslog-export-policy include foreign-port

## Description

This command includes the foreign port address in the flow log. A foreign port is the port towards the destination node and this port is not translated by any form of NAT.

A foreign port (the port towards the destination node) is the same on both sides of NAT.

The **no** form of the command disables the feature.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.117 format

## format

## Syntax

format [*cf*flash-id] [reliable]

## Context

[\[Tree\]](#) (file format)

## Full Context

file format

## Description

This command formats the compact flash. The compact flash must be shut down before starting the format.

## Parameters

### *cflash-id*

Specifies the compact flash type.

**Values** cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

### *reliable*

Enables the reliance file system and disables the default DoS file system. This option is valid only on compact flashes 1 and 2.

## Platforms

## Context

[\[Tree\]](#) (config>subscr-mgmt>isa-svc-chain>vas-filter>entry>action forward)

## Full Context

configure subscriber-mgmt isa-service-chaining vas-filter entry action forward

## Description

This command configures the forward action.

The **no** form of this command removes the parameters from the configuration.

## Parameters

### *ip-address*

Specifies forwarding the SF IPv4 address for the action in a VAS filter entry.

**ipv6-address**

Specifies forwarding the SF IPv6 address for the action in a VAS filter entry.

**service-id**

Specifies the service ID.

**Values** 1 to 2147483647

**esi**

Specifies the ESI for the action in a VAS filter entry.

**Values** 10-byte Ethernet Segment Identifier:  
00-11-22-33-44-55-66-77-88-99 with any of these separators ('-',':',';')

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Context

[\[Tree\]](#) (config>filter>ipv6-filter>entry>action forward)

[\[Tree\]](#) (config>filter>ip-filter>entry>action forward)

## Full Context

configure filter ipv6-filter entry action forward

configure filter ip-filter entry action forward

## Description

This command sets the context for specific forward commands to be performed.

## Parameters

### *connection-id*

Specifies that the packet should be forwarded over the specified connection (specified by the connection ID under the bonding group interface), if that connect is available. Outside of a bonding egress context, the behavior of this filter is undefined.

**Values** 1, 2

### *esi service-id*

Specifies that the packet matching the entry is forwarded to an ESI-identified first appliance in Nuage service chain using EVPN-resolved VXLAN tunnel in the specified VPLS service.

**esi sf-ip vas-interface router**

Specifies that the packet matching the entry is forwarded to ESI/SF-IP identified first appliance in Nuage service chain using EVPN-resolved VXLAN tunnel over the configured VAS interface in the specified VPRN service.

**gre-tunnel-name**

Specifies the GRE tunnel name up to 32 characters.

**lsp**

Specifies that the packet matching the entry is forwarded using the specified lsp.

**mpls-policy**

Specifies the redirection of the traffic to the programmed instance of the MPLS FP specified by its endpoint IPv4 or IPv6 address. The behavior results in a simple forward if no policy exists, if no instance is programmed, and if the policy or instance is administratively down.

**next-hop**

Specifies that the packet matching the entry is forwarded in the routing context of the incoming interface using direct or indirect IPv4 address in the routing lookup.

**next-hop router**

Specifies that the packet matching the entry is forwarded in the configured routing context using direct or indirect IPv4 address in the routing lookup.

**next-hop interface**

Specifies that the packet matching the entry is forwarded using the configured local interface.

**redirect-policy**

Specifies that the packet matching the entry is forwarded using forward next-hop or forward next hop router and the IP address of destination selected by the configured redirect policy. If no destination is selected, packets are subject to action forward.

**router**

Specifies that the packet matching the entry is routed in the configured routing instance and not in the incoming interface routing instance.

**sap**

Specifies that the packet matching the entry is forwarded using the configured SAP.

**sdp**

Specifies that the packet matching the entry is forwarded using the configured SDP.

**srte-policy**

Specifies the redirection of the traffic to the programmed instance of the SR-TE policy specified by its endpoint IPv4 address or IPv6 address and color. The behavior results in a simple forward if no policy exists, if no instance is programmed, and if the policy or instance is administratively down.

**color-id**

Specifies the color identifier of the specified SR-TE policy.

**Values** 0 to 4294967295

### **vprn-target**

Specifies that the packet matching the entry is redirected towards a designated BGP next-hop ( **bgp-nh**). The user may specify an LSP (**isp** *isp-name*) to use towards that next-hop. If no LSP is specified, the system will automatically select one. The user must specify the routing context ( **router** {*router-instance* | **service-name** *service-name*}) in which the system will perform the lookups in order to derive the proper VPRN service label. The user may specify an advertised prefix route ( **adv-prefix** *ip-address/prefix-length*). This is needed in case label per VRF is not the label allocation method configured at the BGP peer.

### **esi**

Specifies a 10-byte Ethernet Segment Identifier.

### **ip-address/mask**

Specifies an IPv4 advertised route in the CIDR notation. The IPv4 address is in dotted decimal notation.

**Values** ip-address a.b.c.d (host bits must be 0)  
mask: 0 to 32

### **ipv6-address/prefix-length**

Specifies an IPv6 advertised route in the CIDR notation.

**Values** ipv6-address:  

- x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d, where "x" is [0..FFFF]H, and "d" is [0..255]

 prefix-length: 0 to 128

### **bgp-nh ip-address**

Specifies the IPv4 address (in dotted decimal notation) of the target BGP next-hop.

**Values** ip-address d.d.d.d

### **ipv6-address**

Specifies the IPv6 address of a direct or indirect next hop to forward matching packets or of the service SID to use with the SRv6 policy.

### **ip-int-name**

Specifies the name of an egress IP interface where matching packets will be forwarded from. This parameter is only valid for unnumbered point-to-point interfaces. If the string contains special characters (such as #, \$, spaces), the entire string must be enclosed within double quotes.

### **interface-name**

Specifies the (maximum 32-character) name of an egress R-VPLS IP interface used to forward the packets using ESI redirect for VPRN/IES service.

### **isp-name**

Specifies an existing RSVP-TE, MPLS-TP, or SR-TE LSP that supports LSP redirect.

***policy-name***

Specifies an IPv4 redirect policy configured in the config>filter>redirect-policy context.

***sap-id***

Specifies an existing VPLS Ethernet SAP.

***sdp-id:vc-id***

Specifies an existing VPLS SDP.

***router-instance***

Specifies "Base" or an existing VPRN service ID. For the **forward vprn-target bgp-nh** command, *router-instance* must specify an existing VPRN service ID.

***service-name***

Specifies an existing VPRN service name.

***vpls-service-id***

Specifies an existing VPLS service ID or service name.

**Platforms**

All

**forward****Syntax**

**forward**

**forward esi** *esi* **service-id** *vpls-service-id*

[\[Tree\]](#) (config>filter>mac-filter>entry>action forward)

**Full Context**

configure filter mac-filter entry action forward

**Description**

This command sets the context for specific forward commands to be performed.

**Parameters*****esi***

Specifies a 10-byte Ethernet Segment Identifier.

***service-id***

Specifies that a packet matching the entry is forwarded to an ESI-identified first appliance in the Nuage service chain using an EVPN-resolved VXLAN tunnel in the specified VPLS service.

***vpls-service-id***

Specifies an existing VPLS service ID or service name.

***sap***

Specifies that the packet matching the entry is forwarded using the configured SAP.

***sap-id***

Specifies an existing VPLS Ethernet SAP.

***sdp***

Specifies that the packet matching the entry is forwarded using the configured SDP.

***sdp-id:vc-id***

Specifies an existing VPLS SDP.

## 10.119 forward-6in4

### forward-6in4

**Syntax**

[no] forward-6in4

**Context**

[\[Tree\]](#) (config>system>ip forward-6in4)

**Full Context**

configure system ip forward-6in4

**Description**

This command enables forwarding of IPv6 traffic encapsulated in an IPv4 transport sent to the system IP address.

The **no** form of this command disables this option and returns the system to the default behavior.

**Default**

no forward-6in4

**Platforms**

All

## 10.120 forward-delay

### forward-delay

#### Syntax

**forward-delay** *forward-delay*

**no forward-delay** [*forward-delay*]

#### Context

**[Tree]** (config>service>vpls>stp forward-delay)

**[Tree]** (config>service>template>vpls-template>stp forward-delay)

#### Full Context

configure service vpls stp forward-delay

configure service template vpls-template stp forward-delay

#### Description

RSTP, as defined in the IEEE 802.1D-2004 standards, will normally transition to the forwarding state via a handshaking mechanism (rapid transition), without any waiting times. If handshaking fails (e.g. on shared links, see below), the system falls back to the timer-based mechanism defined in the original STP (802.1D-1998) standard.

A shared link is a link with more than two nodes (for example, a shared 10/100BaseT segment). The port-type command is used to configure a link as point-to-point or shared.

For timer-based transitions, the 802.1D-2004 standard defines an internal variable forward-delay, which is used in calculating the default number of seconds that a SAP or spoke-SDP spends in the discarding and learning states when transitioning to the forwarding state.

The value of the forward-delay variable depends on the STP operating mode of the VPLS instance:

- in rstp or mstp mode, but only when the SAP or spoke-SDP has not fallen back to legacy STP operation, the value configured by the hello-time command is used;
- in all other situations, the value configured by the forward-delay command is used.

#### Default

forward-delay 15

#### Parameters

##### **seconds**

The forward delay timer for the STP instance in seconds

**Values** 4 to 30

#### Platforms

All

## 10.121 forward-entries

### forward-entries

#### Syntax

**forward-entries**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>http-rdr-plcy forward-entries)

## 10.123 forward-ipv4-multicast-to-ip-int

`forward-ipv4-multicast-to-ip-int`**Syntax**`[no] forward-ipv4-multicast-to-ip-int`**Context**`[Tree] (config>service>vpls>allow-ip-int-bind forward-ipv4-multicast-to-ip-int)`**Full Context**`configure service vpls allow-ip-int-bind forward-ipv4-multicast-to-ip-int`**Description**

This command enables support for forwarding IPv4 multicast traffic from sources connected to the VPLS service of a routed VPLS to the IP interface of the routed VPLS service. It can only be enabled after the routed VPLS service has been bound to an IP interface.

**Default**`no forward-ipv4-multicast-to-ip-int`**Platforms**

All

## 10.124 forward-ipv4-packets

`forward-ipv4-packets`**Syntax**`[no] forward-ipv4-packets`**Context**`[Tree] (config>service>vprn>if>ipv6 forward-ipv4-packets)`**Full Context**`configure service vprn interface ipv6 forward-ipv4-packets`

## Description

This command allows an IPv6-only interface (with no configured IPv4 addresses) to be used for forwarding transit and locally originating and terminating IPv4 packets.

The interface will report that its IPv4 oper-state is up if its IPv6 oper-state is up. Be aware that not all protocols will observe the interface as up from an IPv4 perspective. This command is mostly intended to support BGP routing use cases. Refer to RFC 5549, Advertising IPv4 Network Layer Reachability Information with an IPv6 Next Hop, for further information.

The **no** form of this command restores the default behavior and prevents the interface from forwarding IPv4 packets if it has no configured IPv4 subnets.

## Platforms

All

## forward-ipv4-packets

## Syntax

## 10.125 forward-ipv6-multicast-to-ip-int

```
forward-ipv6-multicast-to-ip-int
```

### Syntax

```
[no] forward-ipv6-multicast-to-ip-int
```

### Context

```
[Tree] (config>service>vpls>allow-ip-int-bind forward-ipv6-multicast-to-ip-int)
```

### Full Context

```
configure service vpls allow-ip-int-bind forward-ipv6-multicast-to-ip-int
```

### Description

This command enables support for forwarding IPv6 multicast traffic from sources connected to the VPLS service of a routed VPLS to the IP interface of the routed VPLS service. It can only be enabled after the routed VPLS service has been bound to an IP interface.

### Default

```
no forward-ipv6-multicast-to-ip-int
```

### Platforms

All

## 10.126 forward-path

```
forward-path
```

### Syntax

```
[no] forward-path
```

### Context

```
[Tree] (config>router>mpls>mpls-tp>transit-path forward-path)
```

### Full Context

```
configure router mpls mpls-tp transit-path forward-path
```

### Description

This command enables the forward path of an MPLS-TP transit path to be created or edited. The forward path must be created before the reverse path.

The **no** form of this command removes the forward path. The forward path cannot be removed if a reverse exists.

### Default

no forward-path

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 10.127 forward-when

[\[Tree\]](#) (config>filter>ip-filter>entry>action forward-when)

### Full Context

configure filter ipv6-filter entry action forward-when

configure filter ip-filter entry action forward-when

### Description

This command configures the forward-when action for the traffic that matches this filter entry.

### Parameters

#### **pattern**

Specifies the traffic that can be forwarded based on a pattern found in the packet header or data payload.

#### **expression**

Specifies the hexadecimal pattern to match, up to eight bytes.

**Values** 0x0000000000000000 to 0xffffffffffffff

#### **mask**

Specifies the mask for the pattern expression, up to eight bytes.

**Values** 0x0000000000000000 to 0xffffffffffffff

#### **offset-type**

Specifies the starting point reference for the offset-value of this pattern.

**Values** layer-3, layer-4, data, dns-qtype

#### ***offset-value***

Specifies the offset value for the pattern expression.

**Values** 0 to 255

**[Tree]** (config>service>nat>firewall-policy>port-limits forwarding)

#### **Full Context**

configure service nat nat-policy port-limits forwarding

configure service nat firewall-policy port-limits forwarding

#### **Description**

This command configures the maximum number of port forwarding entries.

#### **Default**

no forwarding

#### **Parameters**

***limit***

Specifies the maximum number of port forwarding entries per subscriber.

**Values** 1 to 64

#### **Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat nat-policy port-limits forwarding  
7750 SR, 7750 SR-e, 7750 SR-s, VSR
- configure service nat firewall-policy port-limits forwarding

## forwarding

### Syntax

**forwarding** {**next-hop** *ip-address* | **interface** *interface-name* | **bypass-routing**}

**no forwarding**

### Context

[\[Tree\]](#) (config>oam-pm>session>ip forwarding)

### Full Context

configure oam-pm session ip forwarding

### Description

This command influences the forwarding decision of the TWAMP Light packet. When this command is used, only one of the forwarding options can be enabled at any time.

The **no** form of this command removes the options and enables the default forwarding logic.

### Parameters

#### *ip-address*

Specifies the IP address of the next hop on the path.

#### Values

|               |                                     |
|---------------|-------------------------------------|
| ipv4-address: | a.b.c.d                             |
| ipv6-address: | x:x:x:x:x:x:x (eight 16-bit pieces) |
|               | x:x:x:x:x:d.d.d.d                   |
| x:            | [0 to FFFF]H                        |
| d:            | [0 to 255]D                         |

#### *interface-name*

Specifies the name, up to 32 characters, to refer to the interface from which the packet is sent. The name must already exist in the **config>router>interface** context or within the appropriate **config>service** context.

#### **bypass-routing**

Specifies to send the packet to a host on a directly attached network, bypassing the routing table.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 10.129 forwarding-bits-set

### forwarding-bits-set

#### Syntax

**forwarding-bits-set** {all | non-fwd}

**no forwarding-bits-set**

#### Context

**[Tree]** (config>service>vprn>bgp>group>neighbor>graceful-restart>long-lived forwarding-bits-set)

**[Tree]** (config>service>vprn>bgp>group>graceful-restart>long-lived forwarding-bits-set)

**[Tree]** (config>service>vprn>bgp>graceful-restart>long-lived forwarding-bits-set)

#### Full Context

configure service vprn bgp group neighbor graceful-restart long-lived forwarding-bits-set

configure service vprn bgp group graceful-restart long-lived forwarding-bits-set

configure service vprn bgp graceful-restart long-lived forwarding-bits-set

#### Description

This command determines the setting of the F bits in the GR and LLGR capabilities advertised by the router. When the F bit is set for an AFI/SAFI, it indicates that the advertising router was able to preserve forwarding state for the routes of that AFI/SAFI across the last restart. If a router restarts and does not set F=1, then when the session with a peer is re-established, the peer immediately deletes all LLGR stale routes it was preserving on behalf of the restarting router for the corresponding AFI/SAFI.

This command allows the F bits for all advertised AFI/SAFI to be set to 1, or only the F bits for non-forwarding AFI/SAFI to be set to 1. Non-forwarding AFI/SAFI are the following configuration-related address families: L2-VPN, route-target, flow-IPv4, and flow-IPv6.

#### Default

no forwarding-bits-set

#### Parameters

##### all

Specifies that the F bit for all AFI/SAFI should be set to 1.

##### non-fwd

Specifies that the F bit for only non-forwarding AFI/SAFI should be set to 1. These AFI/SAFI correspond to the following families: L2-VPN, route-target, flow-IPv4, and flow-IPv6.

#### Platforms

All

## forwarding-bits-set

### Syntax

```
forwarding-bits-set {all | non-fwd}
no forwarding-bits-set
```

### Context

**[Tree]** (config>router>bgp>graceful-restart>long-lived forwarding-bits-set)

**[Tree]** (config>router>bgp>group>graceful-restart>long-lived forwarding-bits-set)

**[Tree]** (config>router>bgp>group>neighbor>graceful-restart>long-lived forwarding-bits-set)

### Full Context

```
configure router bgp graceful-restart long-lived forwarding-bits-set
```

```
configure router bgp group graceful-restart long-lived forwarding-bits-set
```

```
configure router bgp group neighbor graceful-restart long-lived forwarding-bits-set
```

### Description

This command determines the setting of the F bits in the GR and LLGR capabilities advertised by the router. When the F bit is set for an AFI/SAFI, it indicates that the advertising router was able to preserve forwarding state for the routes of that AFI/SAFI across the last restart. If a router restarts and does not set F=1, then when the session with a peer re-establishes the peer immediately deletes all LLGR stale routes it was preserving on behalf of the restarting router for the corresponding AFI/SAFI.

This command allows the F bits for all advertised AFI/SAFI to be set to 1, or only the F bits for non-forwarding AFI/SAFI to be set to 1. Non-forwarding AFI/SAFI are the following configuration-related address families: L2-VPN, route-target, flow-IPv4, and flow-IPv6.

### Default

```
no forwarding-bits-set
```

### Parameters

#### all

Specifies that the F bit for all AFI/SAFI should be set to 1.

#### non-fwd

Specifies that the F bit for only non-forwarding AFI/SAFI should be set to 1. These AFI/SAFI correspond to the following families: L2-VPN, route-target, flow-IPv4, and flow-IPv6.

### Platforms

All

## 10.130 forwarding-class

### forwarding-class

#### Syntax

```
forwarding-class {be | l2 | af | l1 | h2 | ef | h1 | nc}
```

```
no forwarding-class [{be | l2 | af | l1 | h2 | ef | h1 | nc}]
```

#### Context

**[Tree]** (config>service>vprn>static-route-entry>indirect forwarding-class)

**[Tree]** (config>service>vprn>static-route-entry>ipsec-tunnel forwarding-class)

**[Tree]** (config>service>vprn>static-route-entry>next-hop forwarding-class)

#### Full Context

configure service vprn static-route-entry indirect forwarding-class

configure service vprn static-route-entry ipsec-tunnel forwarding-class

configure service vprn static-route-entry next-hop forwarding-class

#### Description

This command specifies the enqueueing forwarding class that should be associated with traffic matching the associate static route. If this parameter is not specified, the packet will use the forwarding-class association based on default classification or other QoS Policy associations.

#### Default

no forwarding-class

#### Parameters

##### *Forwarding class*

The forwarding class must be one of the pre-defined system forwarding classes.

**Values** be, l2, af, l1, h2, ef, h1, nc

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### forwarding-class

#### Syntax

```
forwarding-class {be | l2 | af | l1 | h2 | ef | h1 | nc}
```

```
no forwarding-class [{be | l2 | af | l1 | h2 | ef | h1 | nc}]
```

## Context

[\[Tree\]](#) (config>router>static-route-entry>indirect forwarding-class)

[\[Tree\]](#) (config>router>static-route-entry>next-hop forwarding-class)

## Full Context

configure router static-route-entry indirect forwarding-class

configure router static-route-entry next-hop forwarding-class

## Description

This command specifies the enqueueing forwarding class that should be associated with traffic matching the associate static route. If this parameter is not specified, the packet will use the forwarding-class association based on default classification or other QoS Policy associations.

## Default

no forwarding-class

## Parameters

**be | l2 | af | l1 | h2 | ef | h1 | nc**

Specifies the forwarding class.

**Values** be, l2, af, l1, h2, ef, h1, nc

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## forwarding-class

## Syntax

**[no] forwarding-class**

## Context

[\[Tree\]](#) (config>log>acct-policy>cr>aa>aa-from-sub-cntr forwarding-class)

## Full Context

configure log accounting-policy custom-record aa-specific to-aa-sub-counters forwarding-class

configure log accounting-policy custom-record aa-specific from-aa-sub-counters forwarding-class

## Description

This command enables the collection of a Forwarding Class bitmap information added to the XML aa-sub and router level accounting records, and only applies to the 7750 SR.

**Default**

no forwarding-class

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.131 forwarding-policies

### forwarding-policies

**Syntax**

[no] forwarding-policies

**Context**

[\[Tree\]](#) (config>router>mpls forwarding-policies)

**Full Context**

configure router mpls forwarding-policies

**Description**

Commands in this context configure an MPLS forwarding policy.

The **no** form of this command deletes all policies from the forwarding policy database.

**Platforms**

All

## 10.132 forwarding-policy

### forwarding-policy

**Syntax**

[no] forwarding-policy *name*

**Context**

[\[Tree\]](#) (config>router>mpls>fwd-policies forwarding-policy)

**Full Context**

configure router mpls forwarding-policies forwarding-policy

## Description

This command creates an MPLS forwarding policy.

There are two types of MPLS forwarding policy:

- endpoint policy
- label-binding policy

The endpoint policy allows the user to forward unlabeled packets over a set of user-defined direct (with option to push a label stack) or indirect next hops. Routes are bound to an endpoint policy when their next hop matches the endpoint address of the policy.

The label-binding policy provides the same capability for labeled packets. In this case, labeled packets matching the ILM of the policy binding label are forwarded over the set of next hops of the policy.

The data model of a forwarding policy represents each pair of {primary next hop, backup next hop} as a group and models the ECMP set as the set of Next-Hop Groups (NHGs). Flows of prefixes can be switched on a per-NHG basis from the primary next hop, when it fails, to the backup next hop without disturbing the flows forwarded over the other NHGs of the policy. The same can be performed when reverting back from a backup next hop to the restored primary next hop of the same NHG.

The MPLS forwarding policy supports two types of NHGs on a per policy basis:

- An NHG of resolution type indirect supported with the label-binding policy and in which forwarding over the primary/backup next hop is modeled as a swap operation from the binding label to an implicit-null label over multiple outgoing interfaces (multiple NHLFEs) corresponding to the resolved next hops of the indirect route.

Within a given NHG, the primary next hop is the preferred active path in the absence of any failure of the NHG of resolution type indirect.

The forwarding database tracks the primary or backup next hop in the routing table. A **route delete** of the primary indirect next hop causes CPM to program the backup indirect next hop in the data path.

A **route modify** to the indirect primary or backup next hop causes CPM to update the its resolved next hops and to update the data path if it is the active indirect next hop.

When the primary indirect next hop is restored and is added back into the routing table, CPM waits for an amount of time equal to the user-programmed revert timer before updating the data path. However, if the backup indirect next hop fails while the timer is running, CPM updates the data path immediately.

- An NHG of resolution type direct is modeled as follows:
  - For a label-binding policy, forwarding over the primary or backup next hop is modeled as a swap operation from the binding label to the configured label stack or to an implicit-null label (if the **pushed-labels** command not configured) over a single outgoing interface to the next hop.
  - For an endpoint policy, forwarding over the primary or backup next hop is modeled as a push operation from the binding label to the configured label stack or to an implicit-null label (if the **pushed-labels** command not configured) over a single outgoing interface to the next hop.
  - The labels configured by the **pushed-labels** command are not validated.

Within a given NHG, the primary next hop is the preferred active path in the absence of any failure of the NHG of resolution type direct.

The NHG supports uniform failover. The forwarding policy database assigns a Protect-Group ID (PG-ID) to each of the primary next hop and the backup next hop and programs both of them in data path. A failure of the active path switches traffic to the other path following the uniform failover procedures.

The forwarding database tracks the primary or backup next hop in the routing table. A **route delete** of the primary/backup direct next hop causes CPM to send the corresponding PG-ID switch to the data path.

A **route modify** to the direct primary or backup next hop causes CPM to update the MPLS forwarding database and to update the data path since both next hops are programmed.

When the primary direct next hop is restored and is added back into the routing table, CPM waits for an amount of time equal to the user programmed revert timer before activating it and updating the data path. However, if the backup direct next hop fails while the timer is running, CPM activates it and updates the data path immediately. The latter failover to the restored primary next hop is performed using the uniform failover procedure.

The forwarding policy database activates the best endpoint policy among the named policies sharing the same value of the endpoint parameter by selecting the lowest preference value policy. This policy is then programmed into the TTM and into the tunnel table in data path. If this policy goes down, then the forwarding policy database performs a re-evaluation and activates the named policy with the next lowest preference value for the same endpoint value. If a more preferred policy comes back up, the forwarding policy database reverts to it and activates it.

The forwarding policy database similarly activates the best label-binding policy among the named policies sharing the same binding label by selecting the lowest preference value policy. This policy is then programmed into the label FIB table in data path. If this policy goes down, then the forwarding policy database performs a re-evaluation and activates the names policy with the next lowest preference value for the same binding label value. If a more preferred policy comes back up, the forwarding policy database reverts to it and activates it.

Ingress statistics can be enabled as is associated with binding label, that is the ILM of the forwarding policy, and provides aggregate packet and byte counters for packets matching the binding label.

The **no** form of the command deletes the named MPLS forwarding policy.

## Parameters

### *name*

Specifies the name of the MPLS forwarding policy, up to 64 characters.

## Platforms

All

## 10.133 forwarding-set

### forwarding-set

## Syntax

**forwarding-set policy** *policy-name* **set** *set-id*

**no forwarding-set**

**Context**

**[Tree]** (config>router>mpls>lsp-template>class-forwarding forwarding-set)

**[Tree]** (config>router>mpls>lsp>class-forwarding forwarding-set)

**Full Context**

configure router mpls lsp-template class-forwarding forwarding-set

configure router mpls lsp class-forwarding forwarding-set

**Description**

This command configures the mapping of a class-forwarding policy and forwarding set ID to an LSP (RSVP-TE or SR-TE) or an LSP template.

An MPLS LSP can only map to one single class forwarding policy and forwarding set. Multiple LSPs can map to the same policy and set. If the LSPs form part of an ECMP set of next-hops for an IPv4 or IPv6 prefix resolved to IGP shortcuts, the prefix packets with a matching FC are mapped to this set and are sprayed over these LSPs. This behavior is based on a modulo operation of the output of the hash routine on the packet's headers and the number of LSPs in the set.

**Parameters*****policy-name***

Specifies the name of the class forwarding policy, to a maximum of 32 characters.

***set-id***

Specifies the class forwarding set.

**Values** 1 to 4 (in system profile None/A)

1 to 6 (in system profile B)

**Platforms**

All

**10.134 forwarding-tree-topology****forwarding-tree-topology****Syntax**

**forwarding-tree-topology unicast [st | spf]**

**Context**

**[Tree]** (config>service>vpls>spb>level forwarding-tree-topology)

**Full Context**

configure service vpls spb level forwarding-tree-topology

## Description

This command sets the unicast forwarding to follow the shortest path tree defined by the ECT algorithm shortest path forwarding (spf) or to follow a single tree. (st). Shortest path trees make use of more link resources.

Multicast traffic is defaulted to follow the single tree topology. A single tree unicast would make Multicast and unicast follow the same path.

## Default

forwarding-tree-topology unicast spf

## Parameters

### spf

Follows the shortest path tree.

### st

Follows a single tree.

## Platforms

All

## 10.135 fp

fp

## Syntax

fp [*fp-number*]

## Context

[\[Tree\]](#) (config>card fp)

## Full Context

configure card fp

## Description

This command enables access to the configuration of the forwarding planes on a card.

The default forwarding plane is 1. When entering the FP node, if the forwarding plane number is omitted, the system will assume forwarding plane number 1.

Commands can only be configured under **card>fp** if the hardware that the FP resides on (either a card or an XMA) is provisioned. Conversely, all commands under **card>fp** of the corresponding FPs are automatically removed when that hardware is unprovisioned.

## Parameters

### *fp-number*

Specifies that the FP number parameter is optional following the **fp** command.

**Values** 1 to 8

**Default** fp 1

## Platforms

All

## 10.136 fp-redirect-group

### fp-redirect-group

## Syntax

**fp-redirect-group** *policer-type* *policer-id*

**no fp-redirect-group** *policer-type*

## Context

[\[Tree\]](#) (config>qos>network>ingress>fc fp-redirect-group)

## Full Context

```
configure qos network ingress fc fp-redirect-group
```

## Description

This command is used to redirect the FC of a broadcast packet received in a VPLS service over a PW or network IP interface to an ingress forwarding plane queue-group.

It defines the mapping of an FC to a *policer-id* and redirects the lookup of the policer of the same ID in some ingress forwarding plane queue-group instance. However, the queue-group name and instance are explicitly provided only at the time the network QoS policy is applied to the ingress context of a spoke or mesh SDP or a network IP interface.

The broadcast-policer statement is ignored when the network QoS policy is applied to any object other than a VPLS spoke or mesh SDP or a network IP interface.

The **no** form of this command removes the redirection of the FC.

## Parameters

### *policer-type*

The policer type to be used. The *policer-type* is ignored when the network QoS policy is applied to any object other than a VPLS spoke or mesh SDP or a network IP interface.

**Values** broadcast-policer | mcast-policer | policer | unknown-policer

***policer-id***

The specified *policer-id* must exist within the queue-group template applied to the ingress context of the forwarding plane.

**Values** 1 to 32

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## 10.137 fp-resource-policy

### fp-resource-policy

**Syntax**

**fp-resource-policy** *name*

**no fp-resource-policy**

**Context**

[\[Tree\]](#) (config>card>fp fp-resource-policy)

**Full Context**

configure card fp fp-resource-policy

**Description**

This command configures the FP resource policy for the specified FP.

If the allocation configured within the FP resources policy is not achievable with the current ingress or egress queue consumption, the command fails. The configuration within the newly applied FP resource policy takes effect on the FP on which the FP resources policy is applied, and that includes removing an applied user created FP resource policy to return to the default policy, and causes the router to immediately reset the associated cards, XIOMs, and MDAs, except on the 7750 SR-1 where the configuration must be saved, and the router rebooted, immediately after committing the configuration transaction.

The **no** form of this command reverts to the default value by applying the default **fp-resource-policy** to the FP.

**Default**

no fp-resource-policy

**Parameters**

***name***

Specifies the FP resource policy name, up to 64 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## fp-resource-policy

### Syntax

**fp-resource-policy** *policy-name* [**create**]

**no fp-resource-policy** *policy-name*

### Context

[\[Tree\]](#) (config>qos fp-resource-policy)

### Full Context

configure qos fp-resource-policy

### Description

This command configures an FP resource policy that is used to manage resources on an FP4 forwarding plane.

A default policy is created by the system and applied to all FP4 FPs by default. If an FP resource policy is removed from an FP, the system automatically applies the default policy to that FP. The system prevents the modification or deletion of the default policy, and the deletion of any user created policy that is applied to an FP. The system supports a maximum of 15 FP resource policies.

The **no** form of this command deletes the FP resources policy from the system.

### Parameters

#### *policy-name*

Specifies the FP resource policy, up to 64 characters.

#### **create**

Creates the FP resource policy entry.

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

configure service ies subscriber-interface group-interface gtp-parameters fpe

configure service vprn subscriber-interface group-interface gtp-parameters fpe

## Description

This command configures the FPE to be used by a group interface for extended ESM functionality such as GTP termination or bonding.

The FPE must be configured in mode sub-mgmt-extension and must be provisioned before the extended functionality becomes active.

The **no** form of this command disables the FPE for GTP functionality under this group interface.

fpe

## Syntax

**fpe** *fpe-id* [**create**]

**no fpe** *fpe-id*

## Context

[\[Tree\]](#) (config>fwd-path-ext fpe)

## Full Context

configure fwd-path-ext fpe

## Description

This command configures an FPE object which associates the application with a PXC (paired set of PXC sub-ports or a paired set of PXC based LAGs).

The **no** form of this command disables the FPE object association.

## Parameters

### *fpe-id*

Specifies the FPE ID.

**Values** 1 to 64

### **create**

Keyword used to associate the queue group. The create keyword requirement can be enabled or disabled in the **environment>create** context.

**no fragment**

### Context

**[Tree]** (config>filter>ip-filter>entry>match fragment)

**[Tree]** (config>filter>ipv6-filter>entry>match fragment)

### Full Context

configure filter ip-filter entry match fragment

configure filter ipv6-filter entry match fragment

### Description

This command specifies match criterion for fragmented packets.

Matches can be based on the presence of a fragmented packet (or otherwise) on the ingress or egress interface.

Matches can also be based on the presence of the first fragment of a packet, or on the presence of a fragment that is not the first fragment on the ingress interface.

The **no** form of the command removes the match criterion.

### Default

no fragment

### Parameters

#### **true**

Specifies to match on all fragmented packets.

#### **false**

Specifies to match on all non-fragmented packets.

#### **first-only**

Matches if a packet is an initial fragment of a fragmented packet.

#### **non-first-only**

Matches if a packet is a non-initial fragment of a fragmented packet.

## Platforms

All

## fragment

### Syntax

**fragment** {true | false}

**no fragment**

### Context

**[Tree]** (cfg>sys>sec>cpm>ip-filter>entry>match fragment)

**[Tree]** (cfg>sys>sec>cpm>ipv6-filter>entry>match fragment)

### Full Context

configure system security cpm-filter ip-filter entry match fragment

configure system security cpm-filter ipv6-filter entry match fragment

### Description

This command specifies fragmented or non-fragmented IP packets as an IP filter match criterion.

#### Note:

An entry containing Layer 4 match criteria will not match non-initial (2nd, 3rd, etc) fragments of a fragmented packet since only the first fragment contains the Layer 4 information.

This command enables match on existence of IPv6 Fragmentation Extension Header in the IPv6 filter policy. To match first fragment of an IP fragmented packet, specify additional Layer 4 matching criteria in a filter policy entry. The **no** version of this command ignores IPv6 Fragmentation Extension Header presence/absence in a packet when evaluating match criteria of a given filter policy entry.

The **no** form of this command removes the match criterion.

This command enables match on existence of IPv6 Fragmentation Extension Header in the IPv6 filter policy. To match first fragment of an IP fragmented packet, specify additional Layer 4 matching criteria in a filter policy entry. The **no** version of this command ignores IPv6 Fragmentation Extension Header presence/absence in a packet when evaluating match criteria of a given filter policy entry.

### Parameters

#### true

Specifies to match on all fragmented IP packets. A match will occur for all packets that have either the MF (more fragment) bit set or have the Fragment Offset field of the IP header set to a non-zero value. For IPv6, packet matches if it contains IPv6 Fragmentation Extension Header.

#### false

Specifies to match on all non-fragmented IP packets. Non-fragmented IP packets are packets that have the MF bit set to zero and have the Fragment Offset field also set

to zero. For IPv6, packet matches if it does not contain IPv6 Fragmentation Extension Header.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 10.142 fragment-drop

### fragment-drop

#### Syntax

**fragment-drop** {**all** | **out-of-order**} [**event-log** *event-log-name*]

**no fragment-drop**

#### Context

[\[Tree\]](#) (config>app-assure>group>policy>aqp>entry>action fragment-drop)

#### Full Context

configure application-assurance group policy app-qos-policy entry action fragment-drop

#### Description

This command specifies the action to apply to fragments.

#### Default

no fragment-drop

#### Parameters

##### **all**

All the fragments will be dropped.

##### **out-of-order**

All out of order fragments will be dropped.

##### **event-log-name**

Specifies if the dropping of fragments should be logged to the specified event log name.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.143 fragment-drop-all

### fragment-drop-all

#### Syntax

**fragment-drop-all** *direction* [**create**]

**no fragment-drop-all** *direction*

#### Context

[\[Tree\]](#) (config>app-assure>group>statistics>tca fragment-drop-all)

#### Full Context

configure application-assurance group statistics threshold-crossing-alert fragment-drop-all

#### Description

This command configures a TCA for the counter capturing drops due to the fragment-drop- all AQP command. A fragment-drop-all TCA can be created for traffic generated from the subscriber side of AA ( **from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a fragment-drop-all TCA.

#### Parameters

##### **direction**

Specifies the traffic direction.

**Values** from-sub, to-sub

##### **create**

Keyword used to create the TCA.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.144 fragment-drop-out-of-order

### fragment-drop-out-of-order

#### Syntax

**fragment-drop-out-of-order** *direction* [**create**]

**no fragment-drop-out-of-order** *direction*

## Context

[\[Tree\]](#) (config>app-assure>group>statistics>tca fragment-drop-out-of-order)

## Full Context

configure application-assurance group statistics threshold-crossing-alert fragment-drop-out-of-order

## Description

This command configures a TCA for the counter capturing drops due to the fragment-drop-out-of-order AQP command. A fragment-drop-out-of-order TCA can be created for traffic generated from the subscriber side of AA ( **from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a fragment-drop-out-of-order TCA.

## Parameters

### *direction*

Specifies the traffic direction.

**Values** from-sub, to-sub

### **create**

Keyword used to create the TCA.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.145 frame-based-accounting

### frame-based-accounting

## Syntax

**[no] frame-based-accounting**

## Context

[\[Tree\]](#) (config>qos>scheduler-policy frame-based-accounting)

## Full Context

configure qos scheduler-policy frame-based-accounting

## Description

The frame-based-accounting command is used to enable frame-based accounting for both the children queues parented to the scheduling policy and for the schedulers within the scheduler policy.

When frame-based accounting is enabled on the policy, all queues associated with the scheduler (through the parent command on each queue) will have their rate and CIR values interpreted as frame-based values. When shaping, the queues will include the 12-byte Inter-Frame Gap (IFG) and 8 byte preamble

for each packet scheduled out the queue. The profiling CIR threshold will also include the 20-byte frame encapsulation overhead. Statistics associated with the queue do not include the frame encapsulation overhead.

The scheduler policy's scheduler rate and CIR values will be interpreted as frame-based values.

The configuration of **parent-location** and **frame-based-accounting** in a scheduler policy is mutually exclusive to ensure consistency between the different scheduling levels. Packet byte offset settings are not included in the applied rate when frame-based accounting is configured; however, the offsets are applied to the statistics.

The **no** form of this command is used to return all schedulers within the policy and queues associated with the policy to the default packet-based accounting mode. If **frame-based-accounting** is not currently enabled for the scheduling policy, the **no frame-based-accounting** command has no effect.

## Platforms

All

## 10.146 frame-counters

### frame-counters

#### Syntax

[no] frame-counters

#### Context

[\[Tree\]](#) (config>aaa>isa-radius-plcy>acct-include-attributes frame-counters)

#### Full Context

```
configure aaa isa-radius-policy acct-include-attributes frame-counters
```

#### Description

This command includes the frame-counters attribute.

The **no** form of the command excludes frame-counters attribute.

#### Default

no frame-counters

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.147 frame-mix

### frame-mix

#### Syntax

**frame-mix**

#### Context

[\[Tree\]](#) (config>test-oam>sath>svc-test>svc-stream frame-mix)

#### Full Context

configure test-oam service-activation-testhead service-test service-stream frame-mix

#### Description

Commands in this context configure frame mixing for the specified service stream by referencing the **frame-size-template**.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 10.148 frame-payload

### frame-payload

#### Syntax

**frame-payload**

#### Context

[\[Tree\]](#) (config>test-oam>service-activation-testhead>service-test>service-stream frame-payload)

#### Full Context

configure test-oam service-activation-testhead service-test service-stream frame-payload

#### Description

Commands in this context configure packet header information used in frames generated by the testhead function.

Only the specified header information is included in the frame. At a minimum, the user must configure the Ethernet destination MAC address and ETH-CFM information to include in the frame payload configuration.

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 10.149 frame-size-template

### frame-size-template

#### Syntax

**frame-size-template** *frame-size-tmpl-name* [**create**]

**no frame-size-template** *frame-size-tmpl-name*

#### Context

[\[Tree\]](#) (config>test-oam>sath frame-size-template)

#### Full Context

configure test-oam service-activation-testhead frame-size-template

#### Description

This command creates a template to configure frames of different sizes for use with a test stream configured under the **config>test-oam>service-activation- testhead>service-test** context. The ITU-T Y.1564 methodology designates the letters "a" to "h" for a default frame size. The default frame size can be overwritten.

The **no** form of this command deletes the configured frame size template.

#### Default

frame-size-template default

#### Parameters

***frame-size-tmpl-name***

Specifies the template name, up to 64 characters, for a test flow with a specific frame mix.

**create**

Mandatory keyword to create the frame size template.

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

### frame-size-template

#### Syntax

**frame-size-template** *frame-size-tmpl-name*

## Context

[\[Tree\]](#) (config>test-oam>sath>svc-test>svc-stream>frm-mix frame-size-template)

## Full Context

configure test-oam service-activation-testhead service-test service-stream frame-mix frame-size-template

## Description

This command configures the frame size template for the specified service stream.

The user can assign the default *frame-size-tmpl-name* "default" to remove the existing template in a service stream.

## Default

frame-size-template default

## Parameters

### *frame-size-tmpl-name*

Specifies the name, up to 64 characters, for the frame size template.

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 10.150 framed-interface-id

framed-interface-id

## Syntax

[no] framed-interface-id

## Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>include-radius-attribute framed-interface-id)

## Full Context

configure subscriber-mgmt radius-accounting-policy include-radius-attribute framed-interface-id

## Description

This command enables the generation of the **framed-interface-id** RADIUS attribute.

The **no** form of this command reverts to the default.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 10.151 framed-ip-addr

framed-ip-addr

### Syntax

[no] framed-ip-addr

### Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>include-radius-attribute framed-ip-addr)

### Full Context

configure subscriber-mgmt radius-accounting-policy include-radius-attribute framed-ip-addr

### Description

This command enables the inclusion of the **framed-ip-addr** attribute.

The **no** form of this command reverts to the default.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

framed-ip-addr

### Syntax

[no] framed-ip-addr

### Context

[\[Tree\]](#) (config>ipsec>rad-acct-plcy>include framed-ip-addr)

### Full Context

configure ipsec radius-accounting-policy include-radius-attribute framed-ip-addr

### Description

This command enables the inclusion of the **framed-ip-addr** attribute.

### Default

no framed-ip-addr

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## framed-ip-addr

### Syntax

[no] framed-ip-addr

### Context

[\[Tree\]](#) (config>aaa>isa-radius-plcy>acct-include-attributes framed-ip-addr)

[\[Tree\]](#) (config>aaa>isa-radius-plcy>auth-include-attributes framed-ip-addr)

### Full Context

configure aaa isa-radius-policy acct-include-attributes framed-ip-addr

configure aaa isa-radius-policy auth-include-attributes framed-ip-addr

### Description

This command enables the inclusion of the framed-ip-addr attribute.

The **no** form of the command excludes called framed-ip-addr attributes.

### Default

no framed-ip-addr

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.152 framed-ip-netmask

## framed-ip-netmask

### Syntax

[no] framed-ip-netmask

### Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>include-radius-attribute framed-ip-netmask)

### Full Context

configure subscriber-mgmt radius-accounting-policy include-radius-attribute framed-ip-netmask

### Description

This command enables the inclusion of the **framed-ip-netmask** attribute.

The **no** form of this command reverts to the default.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## framed-ip-netmask

### Syntax

[no] framed-ip-netmask

### Context

[\[Tree\]](#) (config>aaa>isa-radius-plcy>acct-include-attributes framed-ip-netmask)

### Full Context

configure aaa isa-radius-policy acct-include-attributes framed-ip-netmask

### Description

This command enables the inclusion of the framed-ip-netmask attribute.

The **no** form of the command disables the inclusion.

### Default

no framed-ip-netmask

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.153 framed-ipv6-prefix

## framed-ipv6-prefix

### Syntax

[no] framed-ipv6-prefix

### Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>include-radius-attribute framed-ipv6-prefix)

### Full Context

configure subscriber-mgmt radius-accounting-policy include-radius-attribute framed-ipv6-prefix

### Description

This command enables the generation of the **framed-ipv6-prefix** RADIUS attribute.

The **no** form of this command disables the generation of the **framed-ipv6-prefix** RADIUS attribute.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## framed-ipv6-prefix

### Syntax

[no] framed-ipv6-prefix

### Context

[\[Tree\]](#) (config>ipsec>rad-acct-plcy>include framed-ipv6-prefix)

### Full Context

configure ipsec radius-accounting-policy include-radius-attribute framed-ipv6-prefix

### Description

This command enables the inclusion of the **framed-ipv6-prefix** attribute.

### Default

no framed-ipv6-prefix

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## framed-ipv6-prefix

### Syntax

[no] framed-ipv6-prefix

### Context

[\[Tree\]](#) (config>aaa>isa-radius-plcy>acct-include-attributes framed-ipv6-prefix)

### Full Context

configure aaa isa-radius-policy acct-include-attributes framed-ipv6-prefix

### Description

If an active SLAAC lease exists, this attribute defines if the SLAAC prefix of the UE is present in accounting.

### Default

no framed-ipv6-prefix

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 10.154 framed-ipv6-route

framed-ipv6-route

**Syntax**

[no] framed-ipv6-route

**Context**

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>include-radius-attribute framed-ipv6-route)

**Full Context**

configure subscriber-mgmt radius-accounting-policy include-radius-attribute framed-ipv6-route

**Description**

When enabled, all valid [99] Framed-IPv6-Route attributes as received in the RADIUS authentication phase and associated with an instantiated IPv6 wan host is included in the RADIUS accounting request messages. The state of the Framed-IPv6-Route (installed, shadowed, hostInactive, and so on) is not considered for reporting in the accounting request messages.

The **no** form of this command reverts to the default.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 10.155 framed-route

framed-route

**Syntax**

[no] framed-route

**Context**

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>include-radius-attribute framed-route)

**Full Context**

configure subscriber-mgmt radius-accounting-policy include-radius-attribute framed-route

## Description

When enabled, all valid [22] Framed-Route attributes as received in the RADIUS authentication phase and associated with an instantiated IPv4 host is included in the RADIUS accounting request messages. The state of the Framed-Route (installed, shadowed, hostInactive, and so on) is not considered for reporting in the accounting request messages.

The **no** form of this command reverts to the default.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 10.156 framing

### framing

#### Syntax

```
framing {sonet | sdh}
```

#### Context

[\[Tree\]](#) (config>port>sonet-sdh framing)

#### Full Context

```
configure port sonet-sdh framing
```

#### Description

This command specifies SONET/SDH framing to be either SONET or SDH.

This command is supported by TDM satellite.

#### Default

```
framing sonet
```

#### Parameters

**sonet**

Configures the port for SONET framing.

**sdh**

Configures the port for SDH framing.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## framing

### Syntax

**framing** {**esf** | **sf** | **unframed-ds1**}

### Context

[\[Tree\]](#) (config>port>tdm>ds1 framing)

### Full Context

configure port tdm ds1 framing

### Description

This command specifies the DS-1 framing to be used with the associated channel.

### Default

framing esf

### Parameters

#### **esf**

Configures the DS-1 port for extended super frame framing.

#### **sf**

Configures the DS-1 port for super frame framing.

#### **unframed-ds1**
