Specifies ds-1 unframed (G.703) mode for DS-1 interfaces. This parameter allows the configuration of an unstructured DS-1 channel on a CES MDA. In G.704, timeslot 0 is used to carry timing information by a service provider, thus, only 31 slots are made available to the end user. In G.703, all 32 time slots are available to the end user. Timing is provided by the end user. When an e1-unframed channel is shutdown, it sends the AIS pattern to the far-end DS-1 which does not react. The operational status remains up and no alarms are generated while the near-end (shutdown) is operationally down. This is normal behavior since the G.703 option does not have framing. G.703 framing is only applicable for FR, PPP, and cHDLC encapsulations.

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## framing

### Syntax

**framing** {**no-crc-g704** | **g704** | **e1-unframed**}

### Context

[\[Tree\]](#) (config>port>tdm>e1 framing)

## Full Context

```
configure port tdm e1 framing
```

## Description

This command specifies the E-1 framing to be used with the associated channel.

## Default

```
framing g704
```

## Parameters

### **g704**

Configures the E-1 port for G.704 framing.

### **no-crc-g70**

Configures the E-1 for G.704 with no CRC4.

### **e1-unframed**

Specifies E-1 unframed (G.703) mode for E-1 interfaces. This parameter also allows the configuration of an unstructured E-1 channel on an ASAP or CES MDA. In G.704, timeslot 0 is used to carry timing information by a service provider, thus, only 31 slots are made available to the end user. In G.703, all 32 time slots are available to the end user. Timing is provided by the end user. When an e1-unframed channel is shutdown, it sends the AIS pattern to the far-end E-1 which does not react. The operational status remains up and no alarms are generated while the near-end (shutdown) is operationally down. This is normal behavior since the G.703 option does not have framing. G.703 framing is only applicable for FR, PPP, and cHDLC and CEM encapsulations.

## framing

## Syntax

```
framing {c-bit | m23 | unframed-ds3}
```

## Context

[\[Tree\]](#) (config>port>tdm>ds3 framing)

## Full Context

```
configure port tdm ds3 framing
```

## Description

This command specifies DS-3 framing for the associated DS-3 port or channel.

## Default

framing c-bit

## Parameters

### c-bit

Configures the DS-3 port/channels for C-Bit framing.

### m23

Configures the DS-3 port/channel for M23 framing.

### unframed-ds3

Specifies ds-3 unframed mode for DS-3 interfaces. This parameter allows the configuration of an unstructured DS-3 channel on a CES MDA.

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## framing

## Syntax

**framing** {**g751** | **g832** | **unframed-e3**}

## Context

[\[Tree\]](#) (config>port>tdm>e3 framing)

## Full Context

configure port tdm e3 framing

## Description

This command specifies E-3 framing for the associated E-3 port or channel.

## Default

for E-3 non-ATM: framing g751 and cannot be changed. for E-3 ATM: framing g832 and cannot be changed.

## Parameters

### g751

Configures the E-3 port/channel for g751 framing.

### g832

Configures the E-3 port/channel for g832 framing.

### unframed-e3

Specifies e-3 unframed mode for E-3 interfaces. This parameter allows the configuration of an unstructured E-3 channel on a CES MDA.

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 10.157 frequency

### frequency

#### Syntax

**frequency** *frequency*

**no frequency**

#### Context

[\[Tree\]](#) (config>port>dwdm frequency)

#### Full Context

configure port dwdm frequency

#### Description

This command configures the center frequency to use for a tunable DWDM optical interface. It replaces the **configure>port>dwdm>channel** command (used prior to Release 22.2.R1). The **frequency** command supports any frequency in the C band, but the actual operating frequency is dependent on the installed optic module.

#### Provisioning rules

The provisioned MDA type must have DWDM tunable optics (for example, p1-100g-tun-b) or the MDA must support the option of tunable DWDM optic modules. The following provisioning rules apply:

- The DWDM frequency must set to a non-zero value before the port is set to **no shutdown**.
- The port must be **shutdown** before changing the DWDM frequency.
- The port must be a physical port to set the DWDM frequency.

#### Default

frequency 0

#### Parameters

**frequency**

Specifies the frequency in MHz.

**Values** 0, 191100000 to 196150000

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 10.158 from

from

### Syntax

**from** [main] [security] [change] [debug-trace]

**no from**

### Context

[\[Tree\]](#) (config>service>vprn>log>log-id from)

### Full Context

```
configure service vprn log log-id from
```

### Description

This command selects the source stream to be sent to a log destination.

One or more source streams must be specified. The source of the data stream must be identified using the **from** command before you can configure the destination using the **to** command. The **from** command can identify multiple source streams in a single statement (for example: **from main change debug-trace**).

Only one **from** command may be entered for a single *log-id*. If multiple **from** commands are configured, then the last command entered overwrites the previous **from** command.

The **no** form of this command removes all previously configured source streams.

### Default

No source stream is configured.

### Parameters

#### main

Instructs all events in the main event stream to be sent to the destination defined in the **to** command for this destination *log-id*. The main event stream contains the events that are not explicitly directed to any other event stream. To limit the events forwarded to the destination, configure filters using the **filter** command.

#### security

Instructs all events in the security event stream to be sent to the destination defined in the **to** command for this destination *log-id*. The security event stream contains all events that pertain to attempts to breach system security. To limit the events forwarded to the destination, configure filters using the **filter** command.

#### change

Instructs all events in the user activity stream to be sent to the destination configured in the **to** command for this destination *log-id*. The change event stream contains all events that directly affect the configuration or operation of this node. To limit the events forwarded to the change stream destination, configure filters using the filter command.

## debug-trace

Instructs all events in the debug-trace event stream to be sent to the destination defined in the **to** command for this destination *log-id*. The debug-trace event stream contains all events that pertain to trace or other debugging information. To limit the events forwarded to the destination, configure filters using the **filter** command.

## Platforms

All

## from

## Syntax

**from** *ip-address*

## Context

[\[Tree\]](#) (config>router>mpls>lsp-template from)

[\[Tree\]](#) (config>router>mpls>lsp from)

## Full Context

configure router mpls lsp-template from

configure router mpls lsp from

## Description

This optional command specifies the IP address of the ingress router for the LSP. When this command is not specified, the system IP address is used. IP addresses that are not defined in the system are allowed. If an invalid IP address is entered, LSP bring-up fails and an error is logged.

If an interface IP address is specified as the **from** address, and the egress interface of the LSP nexthop IP address is a different interface, the LSP is not signaled. As the egress interface changes due to changes in the routing topology, it is recommended to set the **from** IP address to the system IP address or to the address of a loopback interface to ensure the LSP recovers.

Only one **from** address can be configured.

## Default

The system IP address

## Parameters

### *ip-address*

Specifies the IP address of the ingress router. This can be either the interface, the system or a loopback interface IP address. If the IP address is local, the LSP must egress through that local interface which ensures local strictness. When the LSP type is **sr-te**, then an IPv6 address can be used.

**Values**    ipv4-address — a.b.c.d  
              ipv6-address — x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d  
x — 0 to FFFF (hexadecimal)  
d — 0 to 255 (decimal)

## Platforms

All

from

## Syntax

from li

no from

## Context

[\[Tree\]](#) (config>li>log>log-id from)

## Full Context

configure li log log-id from

## Description

This command configures a bit mask that specifies the log event source stream(s) to be forwarded to the destination specified in the log destination (memory, session, SNMP). Events from more than one source can be forwarded to the log destination.

## Parameters

li

Specifies the **li** event stream that contains all events configured for Lawful Intercept activities.

If the requester does not have access to the **li** context, the event stream will fail.

## Platforms

from

## Syntax

from *ipv4-address*

no from

## Context

[\[Tree\]](#) (config>oam-pm>session>mpls>lsp>rsvp-auto from)

## Full Context

configure oam-pm session mpls lsp rsvp-auto from

## Description

One of three mandatory configuration statements that are required to identify automatically create RSVP LSPs, created using **config>router>mpls>lsp-template**. The **config>router>mpls>auto-lsp lsp-template** links three distinct functions. The **config>router>policy-options>prefix-list**, **config>router>policy-options>policy-statement>entry>from** and **config>router>mpls>lsp-template**. The from address under the test context is the same as the **config>router>mpls>lsp-template>from** address.

The three required identifiers are from, lsp-template and to, all under this container.

The **no** form of this command deletes the IP address from the configuration.

## Parameters

### *ipv4-address*

Specifies the IPv4 address.

**Values** a.b.c.d.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

from

## Syntax

**from** {[main] [security] [change] [debug-trace]}

**no from**

## Context

[\[Tree\]](#) (config>log>log-id from)

## Full Context

configure log log-id from

## Description

This command selects the source stream to be sent to a log destination.

One or more source streams must be specified. The source of the data stream must be identified using the **from** command before you can configure the destination using the **to** command. The **from** command can identify multiple source streams in a single statement (for example: **from main change debug-trace**).

Only one **from** command may be entered for a single *log-id*. If multiple **from** commands are configured, then the last command entered overwrites the previous **from** command.

The **no** form of this command removes all previously configured source streams.

## Parameters

### *main*

Instructs all events in the main event stream to be sent to the destination defined in the **to** command for this destination *log-id*. The main event stream contains the events that are not explicitly directed to any other event stream. To limit the events forwarded to the destination, configure filters using the **filter** command.

### *security*

Instructs all events in the security event stream to be sent to the destination defined in the **to** command for this destination *log-id*. The security stream contains all events that affect attempts to breach system security such as failed login attempts, attempts to access MIB tables to which the user is not granted access or attempts to enter a branch of the CLI to which access has not been granted. To limit the events forwarded to the destination, configure filters using the **filter** command.

### *change*

Instructs all events in the user activity stream to be sent to the destination configured in the **to** command for this destination *log-id*. The change event stream contains all events that directly affect the configuration or operation of this node. To limit the events forwarded to the change stream destination, configure filters using the **filter** command.

### *debug-trace*

Instructs all debug-trace messages in the debug stream to be sent to the destination configured in the **to** command for this destination *log-id*. Filters applied to debug messages are limited to application and subject.

## Platforms

All

from

## Syntax

[no] from

## Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry from)

## Full Context

configure router policy-options policy-statement entry from

## Description

This command creates the context to configure policy match criteria based on a route's source or the protocol from which the route is received.

If no condition is specified, all route sources are considered to match.

The **no** form of this command deletes the source match criteria for the route policy statement entry.

configure service epipe segment-routing-v6 locator function

configure router segment-routing segment-routing-v6 base-routing-instance micro-segment-locator function  
configure service epipe segment-routing-v6 micro-segment-locator function

### Description

Commands in this context configure SRv6 and micro-segment SID function values and parameters for the locator.

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 10.169 function-length

### function-length

#### Syntax

**function-length** *function-length*

**no function-length**

#### Context

[\[Tree\]](#) (config>router>segment-routing>srv6>locator function-length)

#### Full Context

configure router segment-routing segment-routing-v6 locator function-length

#### Description

This command configures the length of the function field of an SRv6 locator.

The sum of the function length and the locator prefix length must not exceed 128 bits. This is enforced by CLI validation. Configuring a function length of 16 requires the configuration of the locator level **label-block**.

The **no** form of this command reverts to the default value.

#### Default

function-length 20

#### Parameters

***function-length***

Specifies the function length, in bits.

**Values** 16, 20 to 96

**Platforms**

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

# 11 g Commands

## 11.1 garp-flood-evpn

### garp-flood-evpn

#### Syntax

[no] **garp-flood-evpn**

#### Context

**[Tree]** (config>service>vpls>proxy-arp **garp-flood-evpn**)

#### Full Context

configure service vpls proxy-arp **garp-flood-evpn**

#### Description

This command controls whether the system floods GARP-requests and GARP-replies to the EVPN. The GARPs impacted by this command are identified by the sender's IP being equal to the target's IP and the MAC DA being broadcast.

The **no** form of the command only floods to local SAPs or binds but not to EVPN destinations.

Disabling this command is only recommended in networks where CEs are routers that are directly connected to the PEs. Networks using aggregation switches between the host/routers and the PEs should flood GARP messages in the EVPN to ensure that the remote caches are updated and the BGP does not miss the advertisement of these entries.

#### Default

**garp-flood-evpn**

#### Platforms

All

## 11.2 gateway

## gateway

### Syntax

**gateway name name tunnel ip-address[:port] [nat-ip nat-ip[:port]] [detail] [no-dpd-debug] [display-keys]**

**no gateway name name tunnel ip-address[:port] [nat-ip nat-ip[:port]]**

**no gateway name name tunnel-subnet ip-prefix/ip-prefix-length**

### Context

[\[Tree\]](#) (debug>ipsec gateway)

### Full Context

debug ipsec gateway

### Description

This command enables debugging for dynamic IPsec tunnels that terminate on the specified IPsec gateway.

The tunnel to be debugged can be specified by either its source address or source subnet. If a subnet is specified, the system will enable debugging for all tunnels with source addresses in the specified subnet.

### Parameters

#### **name**

Specifies the name of the IPsec gateway up to 32 characters.

#### **ip-address:port**

Specifies the tunnel IP address of the remote peer and, optionally, the remote UDP port of IKE.

#### **nat-ip:port**

Specifies the inside IP address of the NAT tunnel and, optionally, the port.

#### **detail**

Specifies to display detailed debug information.

#### **no-dpd-debug**

Specifies to stop logging IKEv1 and IKEv2 DPD events during debug in order to produce less noise.

#### **ip-prefix/ip-prefix-length**

Specifies the subnet of the peer's tunnel address.

#### **display-keys**

Specifies the IKE-SA and CHILD-SA keys for inclusion in the debug output.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## gateway

### Syntax

**gateway** [create]

**no gateway**

### Context

**[Tree]** (config>mirror>mirror-dest>encap>layer-3-encap gateway)

### Full Context

configure mirror mirror-dest encap layer-3-encap gateway

### Description

This command configures the parameters to send the mirrored packets to a remote destination gateway. Once a gateway is created, no changes to the **layer-3-encap** type, router or direction-bit are allowed.

### Platforms

All

## 11.3 gen-keypair

## gen-keypair

### Syntax

**gen-keypair** *url-string* **curve** {**secp256r1** | **secp384r1** | **secp521r1**}

**gen-keypair** *url-string* [**size** *key-size*] [**type** {**rsa** | **dsa**}]

### Context

**[Tree]** (admin>certificate gen-keypair)

### Full Context

admin certificate gen-keypair

### Description

This command generates RSA, DSA, or ECDSA private key or public key pairs at the specified location.

### Parameters

***url-string***

Specifies the path of the key file.

|               |            |                                   |
|---------------|------------|-----------------------------------|
| <b>Values</b> | url-string | <local-url> [up to 99 characters] |
|               | local-url  | <cf1ash-id>/<file-path>           |
|               | cf1ash-id  | cf1:   cf2:   cf3:                |

**curve**

Generates an ECDSA key with a specified curve.

**Values** secp256r1, secp384r1, secp521r1

**key-size**

Specifies the key size in bits.

The minimum key-size is 1024 when running in FIPS-140-2 mode.

**Values** 512 to 8192

**Default** 2048

**type**

Specifies the type of key.

**Values** rsa, dsa

**Default** rsa

**Platforms**

All

## 11.4 gen-local-cert-req

### gen-local-cert-req

**Syntax**

**gen-local-cert-req** **keypair** *url-string* **subject-dn** *subject-dn* [**domain-name** *name*] [**ip-addr** *ip-address*]  
**file** *cert-req-file-url* [**hash-alg** *hash-algorithm*]

**Context**

**[Tree]** (admin>certificate gen-local-cert-req)

**Full Context**

admin certificate gen-local-cert-req

## Description

This command generates a PKCS#10 formatted certificate request by using a local existing key pair file.

## Parameters

### *url-string*

Specifies the name of the keyfile in cf3:\system-pki\key that is used to generate a certificate request.

| Values | url-string | <local-url> [up to 99 characters] |
|--------|------------|-----------------------------------|
|        | local-url  | <cflash-id>/<file-path>           |
|        | cflash-id  | cf1:   cf2:   cf3:                |

### *subject-dn*

Specifies the distinguish name that is used as the subject in a certificate request, including:

- C-Country
- ST-State
- O-Organization name
- OU-Organization Unit name
- CN-common name

This parameter is formatted as a text string including any of the above attributes. The attribute and its value is linked by using "=", and "," is used to separate different attributes.

For example: C=US,ST=CA,O=ALU,CN=SR12

| Values | attr1=val1,attr2=val2... where: attrN={C  ST  O  OU  CN}, 256 chars max |
|--------|-------------------------------------------------------------------------|
|--------|-------------------------------------------------------------------------|

### *domain-name*

Specifies a domain name string can be specified and included as the dNSName in the Subject Alternative Name extension of the certificate request.

### *ip-address*

Specifies an IPv4 address string can be specified and included as the ipAddress in the Subject Alternative Name extension of the certificate request.

### *cert-req-file-url*

Specifies the certificate URL. This URL could be either a local CF card path and filename to save the certificate request; or an FTP URL to upload the certificate request.

### *hash-algorithm*

Specifies the hash algorithm to be used in a certificate request.

| Values | sha1, sha224, sha256, sha384, sha512 |
|--------|--------------------------------------|
|--------|--------------------------------------|

## Platforms

All

## 11.5 general-port

### general-port

#### Syntax

**general-port** *port-number*

**no general-port**

#### Context

[\[Tree\]](#) (config>system>snmp general-port)

#### Full Context

configure system snmp general-port

#### Description

This command configures the port number used to receive SNMP request messages and send replies.

For the port used for SNMP notifications, configure the **configure log snmp-trap-group trap-target port** command.

The **no** form of the command reverts to the default value.

#### Default

general-port 161

#### Parameters

*port-number*

Specifies the port number used to send SNMP traffic other than traps.

**Values** 1 to 65535

#### Platforms

All

## 11.6 generate-basic-fec-only

### generate-basic-fec-only

#### Syntax

**[no] generate-basic-fec-only**

**Context**

[\[Tree\]](#) (config>router>ldp generate-basic-fec-only)

**Full Context**

configure router ldp generate-basic-fec-only

**Description**

This command enables mLDP to generate a basic FEC despite the actual root node being resolved using BGP. This functionality is useful if a connected router does not support the mLDP recursive FEC type.

This command only operates with recursive opaque type 7 FECs and non-recursive type 1 FECs.

The **no** form of the command causes mLDP to generate a recursive FEC if the actual root node is resolved using BGP.

**Default**

no generate-basic-fec-only

**Platforms**

All

## 11.7 generate-icmp

### generate-icmp

**Syntax**

[no] generate-icmp

**Context**

[\[Tree\]](#) (config>service>vprn>static-route-entry>black-hole generate-icmp)

**Full Context**

configure service vprn static-route-entry black-hole generate-icmp

**Description**

This optional command causes the ICMP unreachable messages to be sent when received packets match the associated static route. By default, the ICMP unreachable messages for those types of static routes are not generated.

This command can only be associated with a static route that has a black-hole next-hop

The **no** form of this command removes the black-hole next-hop from static route configuration.

**Default**

no generate-icmp

**Platforms**

All

**generate-icmp****Syntax**`[no] generate-icmp`**Context**`[Tree] (config>router>static-route-entry>black-hole generate-icmp)`**Full Context**

configure router static-route-entry black-hole generate-icmp

**Description**

This optional command causes the ICMP unreachable messages to be sent when received packets match the associated static route. By default, the ICMP unreachable messages for those types of static routes are not generated.

This command can only be associated with a static route that has a blackhole next-hop

The **no** form of this command removes the black-hole nexthop from the static route configuration.

**Default**

no generate-icmp

**Platforms**

All

## 11.8 generate-traps

**generate-traps****Syntax**`[no] generate-traps`**Context**`[Tree] (config>system>network-element-discovery generate-traps)`**Full Context**

configure system network-element-discovery generate-traps

## Description

This command configures whether traps are generated every time a node is updated, added, or removed from the OSPF opaque database (using LSA type 10 opaque update).

The **no** form of causes traps to not be generated for database changes.

## Platforms

All

## 11.9 get

```
get
```

### Syntax

```
[no] get
```

### Context

[\[Tree\]](#) (config>service>nat>pcp-server-policy>opcode get)

### Full Context

```
configure service nat pcp-server-policy opcode get
```

### Description

This command enables/disables support for the **get** opcode.

### Default

```
no get
```

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

```
get
```

### Syntax

```
[no] get
```

### Context

[\[Tree\]](#) (configure>system>security>profile>netconf>base-op-authorization get)

### Full Context

```
configure system security profile netconf base-op-authorization get
```

## Description

This command enables the NETCONF get operation.  
The **no** form of this command disables the operation.

## Default

no get

### Note:

The operation is enabled by default in the built-in system-generated administrative profile.

## Platforms

All

## 11.10 get-config

```
get-config
```

## Syntax

```
[no] get-config
```

## Context

**[Tree]** (configure>system>security>profile>netconf>base-op-authorization get-config)

## Full Context

```
configure system security profile netconf base-op-authorization get-config
```

## Description

This command enables the NETCONF get-config operation.  
The **no** form of this command disables the operation.

## Default

no get-config

### Note:

The operation is enabled by default in the built-in system-generated administrative profile.

## Platforms

All

## 11.11 get-data

```
get-data
```

### Syntax

```
[no] get-data
```

### Context

```
[Tree] (configure>system>security>profile>netconf>base-op-authorization get-data)
```

### Full Context

```
configure system security profile netconf base-op-authorization get-data
```

### Description

This command enables the NETCONF get-data operation.

The **no** form of this command disables the operation.

### Default

```
no get-data
```

#### Note:

The operation is enabled by default in the built-in system-generated administrative profile.

### Platforms

```
All
```

## 11.12 get-schema

```
get-schema
```

### Syntax

```
[no] get-schema
```

### Context

```
[Tree] (configure>system>security>profile>netconf>base-op-authorization get-schema)
```

### Full Context

```
configure system security profile netconf base-op-authorization get-schema
```

## Description

This command enables the NETCONF get-schema operation.

The **no** form of this command disables the operation.

## Default

no get-schema

### Note:

The operation is enabled by default in the built-in system-generated administrative profile.

## Platforms

All

## 11.13 ggsn

```
ggsn
```

## Syntax

```
ggsn
```

## Context

[\[Tree\]](#) (config>subscr-mgmt>gtp>peer-profile ggsn)

## Full Context

```
configure subscriber-mgmt gtp peer-profile ggsn
```

## Description

Commands in this context configure communication with a GGSN Mobile Gateway.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 11.14 ggsn-address

```
ggsn-address
```

## Syntax

```
ggsn-address {ipv4 | ipv6}
```

```
no ggsn-address
```

## Context

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>gy>avp ggsn-address)

## Full Context

configure subscriber-mgmt diameter-application-policy gy include-avp ggsn-address

## Description

The command includes the GGSN-Address AVP value in all Diameter DCCA CCR messages. The value is either the local IPv4 address or local IPv6 address used to set up the diameter peer.

The **no** form of this command removes the GGSN-Address AVP from the Diameter DCCA CCR messages.

## Parameters

*ipv4* | *ipv6*

Specifies to include either the IPv4 or IPv6 address.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 11.15 gi-address

### gi-address

## Syntax

**gi-address** *ip-address*

**no gi-address**

## Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe>host gi-address)

## Full Context

configure subscriber-mgmt local-user-db ipoe host gi-address

## Description

This command allows selection of GI addresses based on the host entry in LUDB.

The gi-address must be a valid address (associated with an interface) within the routing context that received the DHCP message on the access side.

The **no** form of this command reverts to the default.

## Parameters

*ip-address*

Specifies the IPv4 gi-address.

**Values** a.b.c.d

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## gi-address

### Syntax

**gi-address** *ip-address* [**src-ip-address**]

**no gi-address**

### Context

**[Tree]** (config>service>ies>if>dhcp gi-address)

**[Tree]** (config>service>ies>sub-if>grp-if>dhcp gi-address)

**[Tree]** (config>service>ies>sub-if>dhcp gi-address)

**[Tree]** (config>service>vprn>if>dhcp gi-address)

**[Tree]** (config>service>vprn>sub-if>dhcp gi-address)

### Full Context

configure service ies interface dhcp gi-address

configure service ies subscriber-interface group-interface dhcp gi-address

configure service ies subscriber-interface dhcp gi-address

configure service vprn interface dhcp gi-address

configure service vprn subscriber-interface dhcp gi-address

### Description

This command configures the gateway interface address for the DHCP relay. A subscriber interface can include multiple group interfaces with multiple SAPs. The GI address is needed, when the router functions as a DHCP relay, to distinguish between the different subscriber interfaces and potentially between the group interfaces defined.

By default, the GI address used in the relayed DHCP packet is the primary IP address of a normal IES interface. Specifying the GI address allows the user to choose a secondary address. For group interfaces a GI address must be specified under the group interface DHCP context or subscriber-interface DHCP context in order for DHCP to function.

The **no** form of this command reverts to the default.

### Parameters

***ip-address***

Specifies the host IP address to be used for DHCP relay packets.

**Values** a.b.c.d

**src-ip-address**

Specifies that this GI address is to be the source IP address for DHCP relay packets. This parameter is not applicable for PPPoE DHCP client messages (**dhcp client-applications ppp**).

**Platforms**

All

- configure service ies interface dhcp gi-address
- configure service vprn interface dhcp gi-address

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn subscriber-interface dhcp gi-address
- configure service ies subscriber-interface dhcp gi-address
- configure service ies subscriber-interface group-interface dhcp gi-address

**gi-address****Syntax**

**gi-address** *ip-address*

**no gi-address**

**Context**

**[Tree]** (config>service>ies>if>sap>ipsec-gw>dhcp gi-address)

**[Tree]** (config>service>vprn>if>sap>ipsec-gw>dhcp gi-address)

**Full Context**

configure service ies interface sap ipsec-gw dhcp gi-address

configure service vprn interface sap ipsec-gw dhcp gi-address

**Description**

This command specifies the gateway IP address of the DHCPv4 packets sent by the system. IPsec DHCP Relay uses only the **gi-address** configuration found under the IPsec gateway and does not take into account **gi-address** with **src-ip-addr** configuration below other interfaces.

**Default**

no gi-address

**Parameters**

***ip-address***

Specifies the host IP address to be used for DHCP relay packets.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## gi-address

### Syntax

**gi-address** *ip-address* [**src-ip-addr**]

**no gi-address**

### Context

[\[Tree\]](#) (config>router>if>dhcp gi-address)

### Full Context

configure router interface dhcp gi-address

### Description

This command configures the gateway interface address for the DHCP relay. The GI address is needed, when the router functions as a DHCP relay, to distinguish between the different subscriber interfaces and potentially between the group interfaces defined.

### Default

no gi-address

### Parameters

#### *ip-address*

Specifies the host IP address to be used for DHCP relay packets.

#### **src-ip-addr**

Uses the GI address as the source IP.

### Platforms

All

## 11.16 global

## global

### Syntax

**global** *file-url*

**no global**

## Context

[\[Tree\]](#) (config>system>login-control>login-scripts global)

## Full Context

configure system login-control login-scripts global

## Description

This command enables an operator to define a common CLI script that executes when any user logs into a CLI session. This login exec script is executed when any user (authenticated by any means including local user database, TACACS+, or RADIUS) opens a CLI session. This allows a user, for example, to define a common set of CLI aliases that are made available on the router for all users. This global login exec script is executed before any user-specific login exec files that may be configured.

This CLI script executes in the context of the user who opens the CLI session. Any commands in the script that the user is not authorized to execute will fail.

The **no** form of this command disables the execution of a global login-script.

## Default

no global

## Parameters

*file-url*

The path or directory name.

## Platforms

All

## 11.17 global-id

global-id

## Syntax

**global-id** *global-id*

**no global-id**

## Context

[\[Tree\]](#) (config>router>mpls>mpls-tp global-id)

## Full Context

configure router mpls mpls-tp global-id

## Description

This command configures the MPLS-TP Global ID for the node. This is used as the 'from' Global ID used by MPLS-TP LSPs originating at this node. If a value is not entered, the Global ID is taken to be Zero. This is used if the global-id is not configured. If an operator expects that inter-domain LSPs will be configured, then it is recommended that the global ID should be set to the local ASN of the node, as configured under **config>system**. If two-byte ASNs are used, then the most significant two bytes of the global-id are padded with zeros.

In order to change the value of the **global-id**, **config>router>mpls>mpls-tp** must be in the shutdown state. This will bring down all of the MPLS-TP LSPs on the node. New values are propagated to the system when a no shutdown is performed.

## Default

no global-id

## Parameters

### *global-id*

Specifies the global ID for the node.

**Values** 0 to 4294967295

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 11.18 global-sampling-rate

### global-sampling-rate

## Syntax

**global-sampling-rate** *sampling-rate*

**no global-sampling-rate**

## Context

[\[Tree\]](#) (config>mirror global-sampling-rate)

## Full Context

configure mirror global-sampling-rate

## Description

This command configures the global sampling rate. The global sampling rate provides a higher sampling rate than the sampling rate specified on the mirror destination. The global sampling rate, when set, applies to all mirror destination services with the **use-global-sampling-rate** command configured.

The global sampling rate takes precedence over the sampling rate specified on a mirror destination. This means that when both the **global-sampling-rate** command and **configure mirror mirror-dest sampling-rate** command are configured under the same mirror destination, the system automatically samples using higher rate configured with the **global-sampling-rate** command and ignores the lower rate configured with the **sampling-rate** command.

The **no** form of this command removes all mirror destinations associated with the global sampling rate and causes all mirror destinations to mirror at the full rate, which means every packet is mirrored unless a mirror destination rate is specified. You must first remove the **use-global-sampling-rate** configuration, before you remove the **global-sampling-rate** configuration.

### Default

no global-sampling-rate

### Parameters

*sampling-rate*

Specifies the global sampling rate. The highest global sampling rate is 1 out of 2 packets and the lowest rate is 1 out of 255. For example, when 2 is the configured rate, the mirror destination samples 1 out of every 2 packets, or equivalent to sampling 50% of packets.

**Values**                    2 to 255

### Platforms

All

## 11.19 global-sid-entries

### global-sid-entries

#### Syntax

**global-sid-entries** *global-sid-entries*

#### Context

[\[Tree\]](#) (conf>router>sr>srv6>micro-segment global-sid-entries)

#### Full Context

configure router segment-routing segment-routing-v6 micro-segment global-sid-entries

#### Description

This command configures the maximum number of unique micro-segment locators that can be configured network wide. The value is expressed as the number of multiples of 1024 and must be the same on every platform network wide.

**Default**

global-sid-entries 16

**Parameters**

*global-sid-entries*

Specifies the maximum number of unique micro-segment locators.

**Values** 4 to 60 (in steps of 4)

**Platforms**

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 11.20 global-timeouts

global-timeouts

**Syntax**

global-timeouts

**Context**

[\[Tree\]](#) (config>system>management-interface>ops global-timeouts)

**Full Context**

configure system management-interface operations global-timeouts

**Description**

Commands in this context configure system timeout parameters for operational commands.

Timeout parameters provide default system-level control for various types of operational commands in model-driven interfaces. The timeout values are used when specific execution and retention timeouts are not requested for a specific operation.

**Platforms**

All

## 11.21 global-variables

## global-variables

### Syntax

**global-variables**  
**no global-variables**

### Context

[\[Tree\]](#) (config>router>policy-options global-variables)

### Full Context

configure router policy-options global-variables

### Description

This command enables the **global-variables** configuration context.  
The **no** form of this command removes all global variables.

### Platforms

All

## 11.22 gnmi

## gnmi

### Syntax

**gnmi**

### Context

[\[Tree\]](#) (config>system>grpc gnmi)

### Full Context

configure system grpc gnmi

### Description

Commands in this context configure a gNMI service on gRPC.

### Platforms

All

## 11.23 gnmi-capabilities

### gnmi-capabilities

#### Syntax

**gnmi-capabilities** {**permit** | **deny**}

#### Context

[\[Tree\]](#) (config>system>security>profile>grpc>rpc-authorization gnmi-capabilities)

#### Full Context

configure system security profile grpc rpc-authorization gnmi-capabilities

#### Description

This command permits the use of Capability RPC for a user associated with the given format. The **no** form of this command reverts to the default value.

#### Default

gnmi-capabilities permit

#### Parameters

##### **permit**

Specifies that the use of the Capability RPC is permitted.

##### **deny**

Specifies that the use of the Capability RPC is denied.

#### Platforms

All

## 11.24 gnmi-get

### gnmi-get

#### Syntax

**gnmi-get** {**permit** | **deny**}

#### Context

[\[Tree\]](#) (config>system>security>profile>grpc>rpc-authorization gnmi-get)

**Full Context**

configure system security profile grpc rpc-authorization gnmi-get

**Description**

This command permits the use of Get RPC.

The **no** form of this command reverts to the default value.

**Default**

gnmi-get permit

**Parameters****permit**

Specifies that the use of the Get RPC is permitted.

**deny**

Specifies that the use of the Get RPC is denied.

**Platforms**

All

## 11.25 gnmi-set

gnmi-set

**Syntax**

gnmi-set {permit | deny}

**Context**

[\[Tree\]](#) (config>system>security>profile>grpc>rpc-authorization gnmi-set)

**Full Context**

configure system security profile grpc rpc-authorization gnmi-set

**Description**

This command permits the use of Set RPC.

The **no** form of this command reverts to the default value.

**Default**

gnmi-set permit

**Parameters****permit**

Specifies that the use of the Set RPC is permitted.

**deny**

Specifies that the use of the Set RPC is denied.

**Platforms**

All

## 11.26 gnmi-subscribe

### gnmi-subscribe

**Syntax**

**gnmi-subscribe** {**permit** | **deny**}

**Context**

[\[Tree\]](#) (config>system>security>profile>grpc>rpc-authorization gnmi-subscribe)

**Full Context**

configure system security profile grpc rpc-authorization gnmi-subscribe

**Description**

This command permits the use of Subscribe RPC.

The **no** form of this command reverts to the default value.

**Default**

gnmi-subscribe permit

**Parameters****permit**

Specifies that the use of the Subscribe RPC is permitted.

**deny**

Specifies that the use of the Subscribe RPC is denied.

**Platforms**

All

## 11.27 gnoi-cert-mgmt-cangenerate

### gnoi-cert-mgmt-cangenerate

#### Syntax

**gnoi-cert-mgmt-cangenerate** {**permit** | **deny**}

#### Context

[\[Tree\]](#) (config>system>security>profile>grpc>rpc-authorization gnoi-cert-mgmt-cangenerate)

#### Full Context

configure system security profile grpc rpc-authorization gnoi-cert-mgmt-cangenerate

#### Description

This command permits the use of gNOI CanGenerateCSR RPCs for the user profile.  
The **no** form of this command reverts to the default value.

#### Default

gnoi-cert-mgmt-cangenerate deny

#### Parameters

##### **permit**

Specifies that the use of the gNOI CanGenerateCSR RPCs for the user profile is permitted.

##### **deny**

Specifies that the use of the gNOI CanGenerateCSR RPCs for the user profile is denied.

#### Platforms

All

## 11.28 gnoi-cert-mgmt-getcert

### gnoi-cert-mgmt-getcert

#### Syntax

**gnoi-cert-mgmt-getcert** {**permit** | **deny**}

#### Context

[\[Tree\]](#) (config>system>security>profile>grpc>rpc-authorization gnoi-cert-mgmt-getcert)

**Full Context**

configure system security profile grpc rpc-authorization gnoi-cert-mgmt-getcert

**Description**

This command permits the use of gNOI GetCertificate RPCs for the user profile.

The **no** form of this command reverts to the default value.

**Default**

gnoi-cert-mgmt-getcert deny

**Parameters****permit**

Specifies that the use of the gNOI GetCertificate RPCs for the user profile is permitted.

**deny**

Specifies that the use of the gNOI GetCertificate RPCs for the user profile is denied.

**Platforms**

All

## 11.29 gnoi-cert-mgmt-install

```
gnoi-cert-mgmt-install
```

**Syntax**

```
gnoi-cert-mgmt-install {permit | deny}
```

**Context**

[\[Tree\]](#) (config>system>security>profile>grpc>rpc-authorization gnoi-cert-mgmt-install)

**Full Context**

configure system security profile grpc rpc-authorization gnoi-cert-mgmt-install

**Description**

This command permits the use of gNOI Install RPCs for the user profile.

The **no** form of this command reverts to the default value.

**Default**

gnoi-cert-mgmt-install deny

**Parameters****permit**

Specifies that the use of the gNOI Install RPCs for the user profile is permitted.

**deny**

Specifies that the use of the gNOI Install RPCs for the user profile is denied.

**Platforms**

All

## 11.30 gnoi-cert-mgmt-revoke

### gnoi-cert-mgmt-revoke

**Syntax**

**gnoi-cert-mgmt-revoke** {**permit** | **deny**}

**Context**

[\[Tree\]](#) (config>system>security>profile>grpc>rpc-authorization gnoi-cert-mgmt-revoke)

**Full Context**

configure system security profile grpc rpc-authorization gnoi-cert-mgmt-revoke

**Description**

This command permits or denies the use of gNOI RevokeCertificates RPCs for the user profile.

The **no** form of this command reverts to the default value.

**Default**

gnoi-cert-mgmt-revoke deny

**Parameters****permit**

Specifies that the use of gNOI RevokeCertificates RPCs for the user profile is permitted.

**deny**

Specifies that the use of gNOI RevokeCertificates RPCs for the user profile is denied.

**Platforms**

All

## 11.31 gnoi-cert-mgmt-rotate

### gnoi-cert-mgmt-rotate

#### Syntax

**gnoi-cert-mgmt-rotate** {**permit** | **deny**}

#### Context

[\[Tree\]](#) (config>system>security>profile>grpc>rpc-authorization gnoi-cert-mgmt-rotate)

#### Full Context

configure system security profile grpc rpc-authorization gnoi-cert-mgmt-rotate

#### Description

This command permits the use of gNOI Rotate RPCs for the user profile.

#### Default

gnoi-cert-mgmt-rotate deny

#### Parameters

##### **permit**

Specifies that the use of the gNOI Rotate RPCs for the user profile is permitted.

##### **deny**

Specifies that the use of the gNOI Rotate RPCs for the user profile is denied.

#### Platforms

All

## 11.32 gnoi-file-get

### gnoi-file-get

#### Syntax

**gnoi-file-get** {**permit** | **deny**}

#### Context

[\[Tree\]](#) (config>system>security>profile>grpc>rpc-authorization gnoi-file-get)

#### Full Context

configure system security profile grpc rpc-authorization gnoi-file-get

**Description**

This command permits the use of gNOI File Get RPC for a file from a target location.

**Default**

gnoi-file-get permit

**Parameters****permit**

Specifies that the use of the gNOI File Get RPC is permitted.

**deny**

Specifies that the use of the gNOI File Get RPC is denied.

**Platforms**

All

## 11.33 gnoi-file-put

### gnoi-file-put

**Syntax**

**gnoi-file-put** {**permit** | **deny**}

**Context**

[\[Tree\]](#) (config>system>security>profile>grpc>rpc-authorization gnoi-file-put)

**Full Context**

configure system security profile grpc rpc-authorization gnoi-file-put

**Description**

This command permits the use of gNOI File Put RPC to write to a file on a target location.

**Default**

gnoi-file-put permit

**Parameters****permit**

Specifies that the use of the gNOI File Put RPC is permitted.

**deny**

Specifies that the use of the gNOI File Put RPC is denied.

## Platforms

All

## 11.34 gnoi-file-remove

### gnoi-file-remove

#### Syntax

```
gnoi-file-remove {permit | deny}
```

#### Context

[\[Tree\]](#) (config>system>security>profile>grpc>rpc-authorization gnoi-file-remove)

#### Full Context

```
configure system security profile grpc rpc-authorization gnoi-file-remove
```

#### Description

This command permits the use of gNOI File Remove RPC to remove a file from the specified target location.

#### Default

```
gnoi-file-remove permit
```

#### Parameters

##### permit

Specifies that the use of the gNOI File Remove RPC is permitted.

##### deny

Specifies that the use of the gNOI File Remove RPC is denied.

## Platforms

All

## 11.35 gnoi-file-stat

### gnoi-file-stat

#### Syntax

```
gnoi-file-stat {permit | deny}
```

**Context**

[\[Tree\]](#) (config>system>security>profile>grpc>rpc-authorization gnoi-file-stat)

**Full Context**

configure system security profile grpc rpc-authorization gnoi-file-stat

**Description**

This command permits the use of gNOI File Stat RPC to retrieve metadata for a file from the specified target location.

**Default**

gnoi-file-stat permit

**Parameters****permit**

Specifies that the use of the gNOI File Stat RPC is permitted.

**deny**

Specifies that the use of the gNOI File Stat RPC is denied.

**Platforms**

All

## 11.36 gnoi-file-transfertoremote

### gnoi-file-transfertoremote

**Syntax**

**gnoi-file-transfertoremote** {**permit** | **deny**}

**Context**

[\[Tree\]](#) (config>system>security>profile>grpc>rpc-authorization gnoi-file-transfertoremote)

**Full Context**

configure system security profile grpc rpc-authorization gnoi-file-transfertoremote

**Description**

This command permits the use of the gNOI File TransferToRemote RPC to transfer the file from the target node to a specified remote location.

**Default**

gnoi-file-transfertoremote permit

**Parameters****permit**

Specifies that the use of the gNOI File TransferToRemote RPC is permitted.

**deny**

Specifies that the use of the gNOI File TransferToRemote RPC is denied.

**Platforms**

All

## 11.37 gnoi-system-cancelreboot

```
gnoi-system-cancelreboot
```

**Syntax**

```
gnoi-system-cancelreboot {permit | deny}
```

**Context**

[\[Tree\]](#) (config>system>security>profile>grpc>rpc-authorization gnoi-system-cancelreboot)

**Full Context**

```
configure system security profile grpc rpc-authorization gnoi-system-cancelreboot
```

**Description**

This command permits the use of gNOI System CancelReboot RPC for a user-given profile.

**Default**

```
gnoi-system-cancelreboot deny
```

**Parameters****permit**

Specifies that the use of gNOI System CancelReboot RPC is permitted.

**deny**

Specifies that the use of gNOI System CancelReboot RPC is denied.

**Platforms**

All

## 11.38 gnoi-system-ping

### gnoi-system-ping

#### Syntax

**gnoi-system-ping** {**permit** | **deny**}

#### Context

[\[Tree\]](#) (config>system>security>profile>grpc>rpc-authorization gnoi-system-ping)

#### Full Context

configure system security profile grpc rpc-authorization gnoi-system-ping

#### Description

This command permits the use of the gNOI Ping RPC to execute the ping command on the target node and stream back the results.

#### Default

gnoi-system-ping permit

#### Parameters

##### **permit**

Specifies that the use of the gNOI Ping RPC is permitted.

##### **deny**

Specifies that the use of the gNOI Ping RPC is denied.

#### Platforms

All

## 11.39 gnoi-system-reboot

### gnoi-system-reboot

#### Syntax

**gnoi-system-reboot** {**permit** | **deny**}

#### Context

[\[Tree\]](#) (config>system>security>profile>grpc>rpc-authorization gnoi-system-reboot)

**Full Context**

configure system security profile grpc rpc-authorization gnoi-system-reboot

**Description**

This command permits the use of gNOI System Reboot RPC for a user-given profile.

The **no** form of this command reverts to the default value.

**Default**

gnoi-system-reboot deny

**Parameters****permit**

Specifies that the use of gNOI System Reboot RPC is permitted.

**deny**

Specifies that the use of gNOI System Reboot RPC is denied.

**Platforms**

All

## 11.40 gnoi-system-rebootstatus

gnoi-system-rebootstatus

**Syntax**

gnoi-system-rebootstatus {permit | deny}

**Context**

[\[Tree\]](#) (config>system>security>profile>grpc>rpc-authorization gnoi-system-rebootstatus)

**Full Context**

configure system security profile grpc rpc-authorization gnoi-system-rebootstatus

**Description**

This command permits the use of gNOI System RebootStatus RPC for a user-given profile.

The **no** form of this command reverts to the default value.

**Default**

gnoi-system-rebootstatus deny

**Parameters****permit**

Specifies that the use of gNOI System RebootStatus RPC is permitted for a user-given profile.

**deny**

Specifies that the use of gNOI System RebootStatus RPC is denied.

**Platforms**

All

## 11.41 gnoi-system-setpackage

### gnoi-system-setpackage

**Syntax**

**gnoi-system-setpackage** {**permit** | **deny**}

**Context**

[\[Tree\]](#) (config>system>security>profile>grpc>rpc-authorization gnoi-system-setpackage)

**Full Context**

configure system security profile grpc rpc-authorization gnoi-system-setpackage

**Description**

This command permits the use of gNOI System SetPackage RPC for a user-given profile. The **no** form of this command reverts to the default value.

**Default**

gnoi-system-setpackage deny

**Parameters****deny**

Specifies that the use of gNOI System SetPackage RPC is denied.

**permit**

Specifies that the use of gNOI System SetPackage RPC is permitted.

**Platforms**

All

## 11.42 gnoi-system-switchcontrolprocessor

### gnoi-system-switchcontrolprocessor

#### Syntax

**gnoi-system-switchcontrolprocessor** {**permit** | **deny**}

#### Context

[\[Tree\]](#) (config>system>security>profile>grpc>rpc-authorization gnoi-system-switchcontrolprocessor)

#### Full Context

configure system security profile grpc rpc-authorization gnoi-system-switchcontrolprocessor

#### Description

This command permits the use of gNOI System SwitchControlProcessor RPC for a user-given profile. The **no** form of this command reverts to the default value.

#### Default

gnoi-system-switchcontrolprocessor deny

#### Parameters

##### **deny**

Specifies that the use of gNOI System SwitchControlProcessor RPC is denied.

##### **permit**

Specifies that the use of gNOI System SwitchControlProcessor RPC is permitted.

#### Platforms

All

## 11.43 gnoi-system-time

### gnoi-system-time

#### Syntax

**gnoi-system-time** {**permit** | **deny**}

#### Context

[\[Tree\]](#) (config>system>security>profile>grpc>rpc-authorization gnoi-system-time)

**Full Context**

configure system security profile grpc rpc-authorization gnoi-system-time

**Description**

This command permits the use of the gNOI Time RPC to return the current time on the target node.

**Default**

gnoi-system-time permit

**Parameters****permit**

Specifies that the use of the gNOI Time RPC is permitted.

**deny**

Specifies that the use of the gNOI Time RPC is denied.

**Platforms**

All

## 11.44 gnoi-system-traceroute

### gnoi-system-traceroute

**Syntax**

**gnoi-system-traceroute** {**permit** | **deny**}

**Context**

[\[Tree\]](#) (config>system>security>profile>grpc>rpc-authorization gnoi-system-traceroute)

**Full Context**

configure system security profile grpc rpc-authorization gnoi-system-traceroute

**Description**

This command permits the use of the gNOI Traceroute RPC to execute the traceroute command on the target node and stream back the results.

**Default**

gnoi-system-traceroute permit

**Parameters****permit**

Specifies that the use of the gNOI Traceroute RPC is permitted.

**deny**

Specifies that the use of the gNOI Traceroute RPC is denied.

**Platforms**

All

## 11.45 gnss

**gnss****Syntax**

gnss

**Context**

[\[Tree\]](#) (config>port gnss)

**Full Context**

configure port gnss

**Description**

Commands in this context configure global navigation satellite systems (GNSS) port attributes for platforms that support one or more embedded GNSS receivers. This command is supported for use with the following ports:

- A/gnss (7750 SR FP5 single-slot platforms and slot A of 7750 SR-2e platforms)
- B/gnss (slot B of 7750 SR-2e platforms)

**Platforms**

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se, 7750 SR-2se

**gnss****Syntax**

gnss

**Context**

[\[Tree\]](#) (config>system>sync-if-timing gnss)

**Full Context**

configure system sync-if-timing gnss

**Description**

Commands in this context configure parameters for system timing using global navigation satellite systems (GNSS) on platforms that support one or more embedded GNSS receivers.

**Platforms**

7750 SR-1-24D, 7750 SR-1-46S, 7750 SR-1-48D, 7750 SR-1-92S, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-1se, 7750 SR-2se

**11.46 goto**

goto

**Syntax**

goto *line*

**Context**

[\[Tree\]](#) (candidate goto)

**Full Context**

candidate goto

**Description**

This command changes the edit point of the candidate configuration. The edit point is the point after which new commands are inserted into the candidate configuration as an operator navigates the CLI and issues commands in edit-cfg mode.

**Parameters**

**line**

Indicates which line to change starting at the point indicated by the following options.

**Values**

line, offset, **first**, **edit-point**, **last**

|                   |                                                                      |
|-------------------|----------------------------------------------------------------------|
| line              | absolute line number                                                 |
| offset            | relative line number to current edit point. Prefixed with '+' or '-' |
| <b>first</b>      | keyword - first line                                                 |
| <b>edit-point</b> | keyword - current edit point                                         |
| <b>last</b>       | keyword - last line that is not 'exit'                               |

**Platforms**

## 11.47 gprs-negotiated-qos-profile

### gprs-negotiated-qos-profile

**Syntax**`[no] gprs-negotiated-qos-profile`**Context**[\[Tree\]](#) (config subscr-mgmt auth-plcy include-radius-attribute gprs-negotiated-qos-profile)**Full Context**

configure subscriber-mgmt authentication-policy include-radius-attribute gprs-negotiated-qos-profile

**Description**

This command enables the inclusion of the 3GPP QoS specification in AAA protocols as signaled in the incoming GTP setup message.

The **no** form of this command disables the inclusion of the attribute.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 11.48 gr-helper

### gr-helper

**Syntax**`gr-helper [enable | disable]`**Context**[\[Tree\]](#) (config>router>rsvp>if gr-helper)**Full Context**

configure router rsvp interface gr-helper

**Description**

This command enables the RSVP Graceful Restart Helper feature.

The RSVP-TE Graceful Restart helper mode allows the SR OS based system (the helper node) to provide another router that has requested it (the restarting node) a grace period, during which the system will continue to use RSVP sessions to neighbors requesting the grace period. This is typically used when another router is rebooting its control plane but its forwarding plane is expected to continue to forward traffic based on the previously available Path and Resv states.

The user can enable Graceful Restart helper on each RSVP interface separately. When the GR helper feature is enabled on an RSVP interface, the node starts inserting a new Restart\_Cap Object in the Hello packets to its neighbor. The restarting node does the same and indicates to the helper node the desired Restart Time and Recovery Time.

The GR Restart helper consists of a couple of phases. Once it loses Hello communication with its neighbor, the helper node enters the Restart phase. During this phase, it preserves the state of all RSVP sessions to its neighbor and waits for a new Hello message.

Once the Hello message is received indicating the restarting node preserved state, the helper node enters the recovery phase in which it starts refreshing all the sessions that were preserved. The restarting node will activate all the stale sessions that are refreshed by the helper node. Any Path state which did not get a Resv message from the restarting node once the Recovery Phase time is over is considered to have expired and is deleted by the helper node causing the proper Path Tear generation downstream.

The duration of the restart phase (recovery phase) is equal to the minimum of the neighbor's advertised Restart Time (Recovery Time) in its last Hello message and the locally configured value of the max-restart (max-recovery) parameter.

When GR helper is enabled on an RSVP interface, its procedures apply to the state of both P2P and P2MP RSVP LSP to a neighbor over this interface.

### Default

disable

### Platforms

All

## 11.49 gr-helper-time

### gr-helper-time

#### Syntax

**gr-helper-time max-recovery *recovery-interval* max-restart *restart-interval***

**no gr-helper-time**

#### Context

**[Tree]** (config>router>rsvp gr-helper-time)

#### Full Context

configure router rsvp gr-helper-time

## Description

This command configures the local values for the max-recovery and the max-restart intervals used in the RSVP Graceful Restart Helper feature.

The values are configured globally in RSVP but separate instances of the timers are applied to each RSVP interface that has the RSVP Graceful Restart Helper enabled.

The **no** version of this command re-instates the default value for the delay timer.

## Default

gr-helper-time max-recovery 300 max-restart 120

## Parameters

### *recovery-interval*

Specifies the max recovery interval value in seconds.

**Values** 1 to 1800

### *restart-interval*

Specifies the max restart interval value in seconds.

**Values** 1 to 300

## 11.51 grace-tx-enable

### grace-tx-enable

#### Syntax

[no] **grace-tx-enable**

#### Context

**[Tree]** (config>system>ethernet>efm-oam grace-tx-enable)

**[Tree]** (config>port>ethernet>efm-oam grace-tx-enable)

#### Full Context

configure system ethernet efm-oam grace-tx-enable

configure port ethernet efm-oam grace-tx-enable

#### Description

Enables the sending of grace for all the enabled EFM-OAM sessions on the node. Disabled by default at the system level and enabled by default at the port level. The combination of the system level and port level configuration will determine if the grace function is enabled on the individual ports. Both the system level and the port level must be enabled in order to support grace on a specific port. If either level is disabled, grace is not enabled on those ports. Enabling grace during an active ISSU or soft reset does not invoke the grace function for the active event.

When both **grace-tx-enable** and **config>system>ethernet>efm-oam dying-gasp-tx-on-reset**, **config>port>ethernet>efm-oam dying-gasp-tx-on-reset** are active on the same port, **grace-tx-enable** takes precedence when a soft reset is invoked if the Peer Vendor OUI being received is 00:16:4d (ALU) or the configured **config>port>ethernet>efm-oam grace-vendor-oui** value. The **grace-tx-enable** command should not be configured if the Nokia Vendor Specific Grace TLV is not supported on the remote peer.

The **no** form of this command disables the sending of the Nokia Vendor Specific Grace TLV.

#### Default

config>system>ethernet>efm-oam>no grace-tx-enable

config>port>ethernet>efm-oam>grace-tx-enable

#### Platforms

All

## grace-tx-enable

### Syntax

**[no] grace-tx-enable**

### Context

**[Tree]** (config>eth-cfm>system grace-tx-enable)

### Full Context

configure eth-cfm system grace-tx-enable

### Description

This command enables ETH-CFM grace transmission at the system level when a soft reset message is received and processed by the ETH-CFM module. Individual MEP configuration determines which of the two supported grace functions, ETH-VSM or ETH-ED, is used to announce grace.

This command controls the overall capability to transmit grace and does not control which grace announcement to use. This command also has no impact on the reception and processing of grace-style PDUs.

The **no** form of this command disables ETH-CFM grace transmission at the system level.

### Default

grace-tx-enable

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 11.52 grace-vendor-oui

## grace-vendor-oui

### Syntax

**grace-vendor-oui** *oui*

**no grace-vendor-oui**

### Context

**[Tree]** (config>port>ethernet>efm-oam grace-vendor-oui)

### Full Context

configure port ethernet efm-oam grace-vendor-oui

## Description

This optional command configures an additional peer vendor OUI which indicates support for the Vendor Specific EFM-OAM Grace functionality, allowing grace to be preferred over dying gasp when both are configured. This is in addition to the Nokia Vendor OUI 00:16:4d.

When both **grace-tx-enable** (**config>system>ethernet>efm-oam grace-tx-enable**, **config>port>ethernet>efm-oam grace-tx-enable**) and **dying-gasp-tx-on-reset** (**config>system>ethernet>efm-oam dying-gasp-tx-on-reset**, **config>port>ethernet>efm-oam dying-gasp-tx-on-reset**) are active on the same port, **grace-tx-enable** takes precedence when a soft reset is invoked if the Peer Vendor OUI being received is 00:16:4d (ALU) or the configured **grace-vendor-oui** value. The **grace-tx-enable** command should not be configured if the Nokia Vendor Specific Grace TLV is not supported on the remote peer, including Nokia 7750 SR equipment prior to release 11.0 R4.

The **no** form of this command removes the additional Vendor OUI but does not remove the Nokia 00:16:4d value.

## Default

no grace-vendor-oui

## Parameters

*oui*

Hex value in the range 00:00:00 to FF:FF:FF.

## Platforms

All

## 11.53 graceful-restart

[\[Tree\]](#) (config>service>vprn>bgp>group graceful-restart)

## Full Context

configure service vprn bgp group neighbor graceful-restart

configure service vprn bgp graceful-restart

configure service vprn bgp group graceful-restart

## Description

This command enables BGP graceful restart helper procedures (the "receiving router" role defined in the standard) for address families included in the GR capabilities of both peers. In a VPRN, SR OS can support GR helper functionality for IPv4, IPv6, label-ipv4, flow-ipv4 (IPv4 FlowSpec) and flow-ipv6 (IPv6 FlowSpec) routes.

When a neighbor covered by the GR helper mode restarts its control plane, forwarding can continue uninterrupted while the session is re-established and routes are re-learned.

The **no** form of this command disables graceful restart.

## Platforms

All

## graceful-restart

## Syntax

[no] graceful-restart

## Context

[\[Tree\]](#) (config>service>vprn>isis graceful-restart)

## Full Context

configure service vprn isis graceful-restart

## Description

This command enables IS-IS graceful restart (GR) to minimize service interruption. When the control plane of a GR-capable router fails or restarts, the neighboring routers (GR helpers) temporarily preserve IS-IS forwarding information. Traffic continues to be forwarded to the restarting router using the last known forwarding tables. If the control plane of the restarting router becomes operationally and administratively up within the grace period, the restarting router resumes normal IS-IS operation. If the grace period expires, then the restarting router is presumed inactive and the IS-IS topology is recalculated to route traffic around the failure.

The **no** form of this command disables graceful restart and removes the graceful restart configuration from the IS-IS instance.

## 11.54 graceful-shutdown

### graceful-shutdown

## Syntax

[no] graceful-shutdown

## Context

[\[Tree\]](#) (config>router>rsvp graceful-shutdown)

[\[Tree\]](#) (config>router>rsvp>interface graceful-shutdown)

## Full Context

configure router rsvp graceful-shutdown

configure router rsvp interface graceful-shutdown

## Description

This command initiates a graceful shutdown of the specified RSVP interface or all RSVP interfaces on the node if applied at the RSVP level. These are referred to as maintenance interface and maintenance node, respectively.

To initiate a graceful shutdown the maintenance node generates a PathErr message with a specific error sub-code of Local Maintenance on TE Link required for each LSP that is exiting the maintenance interface.

The node performs a single make-before-break attempt for all adaptive CSPF LSPs it originates and LSP paths using the maintenance interfaces. If an alternative path for an affected LSP is not found, then the LSP is maintained on its current path. The maintenance node also tears down and re-signals any detour LSP path using listed maintenance interfaces as soon as they are not active.

The maintenance node floods an IGP TE LSA/LSP containing Link TLV for the links under graceful shutdown with TE metric set to 0xffffffff and Unreserved Bandwidth parameter set to zero (0).

A head-end LER node, upon receipt of the PathErr message performs a single make-before-break attempt on the affected adaptive CSPF LSP. If an alternative path is not found, then the LSP is maintained on its current path.

A node does not take any action on the paths of the following originating LSPs after receiving the PathErr message:

a. An adaptive CSPF LSP for which the PathErr indicates a node address in the address list and the node corresponds to the destination of the LSP. In this case, there are no alternative paths which can be found.

- b. An adaptive CSPF LSP whose path has explicit hops defined using the listed maintenance interface(s)/node(s).
- c. A CSPF LSP with the adaptive option disabled and which current path is over the listed maintenance interfaces in the PathErr message. These are not subject to make-before-break.
- d. A non CSPF LSP which current path is over the listed maintenance interfaces in the PathErr message.

The head-end LER node upon receipt of the updates IPG TE LSA/LSP for the maintenance interfaces updates the TE database. This information will be used at the next scheduled CSPF computation for any LSP which path may traverse any of the maintenance interfaces.

The **no** form of this command disables the graceful shutdown operation at the RSVP interface level or at the RSVP level. The configured TE parameters of the maintenance links are restored and the maintenance node floods the links.

## 11.56 granularity

### granularity

**Syntax**

**granularity** {*percent percent-of-admin-pir* | **rate** *rate-in-kilobits-per-second*}

**no granularity**

**Context**

**[Tree]** (config>qos>adv-config-policy>child-control>bandwidth-distribution granularity)

**Full Context**

configure qos adv-config-policy child-control bandwidth-distribution granularity

**Description**

This command is used to create a step-like behavior where the operational PIR will round up to the nearest increment of the specified granularity before being applied to the child. The only exception is when the distributed bandwidth is less than 1% above a lower step value, in which case the lower step value is used.

This step-like behavior may be useful when the bandwidth used by an active child is well known. While the **above-offered-cap** command automatically adds a specified amount to the operational PIR of a child, the **granularity** command only increments the operational PIR to the next step value. While not expected to be used in conjunction, the **above-offered-cap** and **granularity** commands may be used simultaneously, in which case the above-offered-cap increase will be applied first, followed by the granularity rounding to the next step value.

If the **granularity** command is used with a percent-based value, the rounding up function of the configured PIR value on the policer or queue is based on the child's administrative PIR. In this case, care should be taken that the child is either configured with an explicit PIR rate (other than max) or the child's administrative PIR is defined using the percent-rate command with the local parameter enabled if an explicit value is not desired. When a maximum PIR is in use on the child, the system attempts to interpret the maximum child forwarding rate. This rate could be very large if the child is associated with multiple ingress or egress ports.

If the child's administrative PIR is modified while a percent-based granularity is in effect, the system automatically uses the new relative rounding value the next time the child's operational PIR is determined.

When this command is not specified or removed, the system makes no attempt to round up the child's determined operational PIR.

The **no** form of this command is used to remove the operational PIR rounding behavior from all child policers and queues associated with the policy.

## Parameters

### *percent-of-admin-pir*

When the percent qualifier is used, the following percent-of-admin-pir parameter specifies the percentage of the child's administrative PIR that should be used as the rounding step value. If a value of 0 or 0.00 is used, the system will interpret this equivalent to no granularity.

**Values** 0.00 to 100.00

### *rate-in-kilobits-per-second*

When the rate qualifier is used, the following rate-in-kilobits-per-second parameter specifies an explicit rate, in kb/s, that should be used as the child's rounding step value. If a rate step of 0 is specified, the system interprets this equivalent to no granularity.

**Values** 0 to 100,000,000

## Platforms

All

## granularity

## Syntax

**granularity** {**percent** *percent-of-admin-pir* | **rate** *rate-in-kilobits-per-second*}

**no granularity**

## Context

[\[Tree\]](#) (config>qos>adv-config-policy>child-control>offered-measurement granularity)

## Full Context

configure qos adv-config-policy child-control offered-measurement granularity

## Description

This command is used to adjust the sensitivity of the virtual scheduler to changes in the child offered rate. As the child offered rate is determined, it is compared to the previous offered rate. If the delta does not exceed the sensitivity threshold determined for the current offered rate, the change in offered rate is ignored for that iteration.

While it is assumed that changing the offered rate change sensitivity will be a rare occurrence, it may be prudent to react to smaller changes in the offered rate of a particular child policer or queue. Another possible reason for changing the sensitivity is that it may be desired to lower the impact of changes in offered rate on the virtual scheduler for a particular child by raising the granularity.

A side effect of higher sensitivity (lower granularity) is that the virtual scheduler may need to adjust the distributed bandwidth between all children more often, resulting in the possibility of lowering resources available to other virtual scheduler instances on the slot.

A side effect of lower sensitivity (higher granularity) is that the parent virtual scheduler may distribute insufficient bandwidth to the child resulting in dropped packets.

If the `granularity` command is used with a percent-based value, the sensitivity is a function of the configured PIR value on the policer or queue. In this case, care should be taken that the child is either configured with an explicit PIR rate (other than max) or the child's administrative PIR is defined using the `percent-rate` command with the `local` parameter enabled if an explicit value is not desired. When a maximum PIR is in use on the child, the system attempts to interpret the maximum child forwarding rate. This rate could be very large if the child is associated with multiple ingress or egress ports.

Except for the overall cap on the offered input into the virtual scheduler, the child's administrative PIR has no effect on the calculated sensitivity if an explicit rate is specified.

If the child's administrative PIR is modified while a percent-based granularity is in effect, the system automatically uses the new relative sensitivity value the next time the child's offered rate is determined.

The `no` form of this command is used to restore the default offered rate sensitivity behavior to all child policers and queues associated with the policy.

## Parameters

### *percent-of-admin-pir*

When the percent qualifier is used, this parameter specifies the percentage of the child's administrative PIR that are used as the threshold sensitivity to offered rate change. If a value of 0 or 0.00 is used, the system will interpret this equivalent to no granularity.

**Values** 1.00 to 100.00

### *rate-in-kilobits-per-second*

When the rate qualifier is used, this parameter specifies an explicit rate, in kb/s, that are used as the child's offered rate change sensitivity value. If a rate sensitivity of 0 is specified, the system interprets this equivalent to no granularity.

**Values** 0 to 100,000,000

## 11.57 gratuitous-arp

### gratuitous-arp

#### Syntax

**gratuitous-arp** {`one-per-sap`| `one-per-outer-tag`}

## Context

[\[Tree\]](#) (config>subscr-mgmt>up-resiliency>fsg-template gratuitous-arp)

## Full Context

configure subscriber-mgmt up-resiliency fate-sharing-group-template gratuitous-arp

## Description

This command configures the granularity with which Gratuitous ARP packets are sent upon switchover events.

## Parameters

### one-per-sap

Specifies to send a single GARP per SAP. The Sender Protocol Address is any subnet associated with the SAP. If no subnet is available, the system IP is used.

### one-per-outer-tag

Specifies to send a single GARP for all q-in-q SAPs sharing the same outer tag. For dot1q SAPs this behaves the same as **one-per-sap**. The Sender Protocol Address is any subnet associated with the SAP. If no subnet is available, the system IP is used.

**no gre-key**

## Context

[\[Tree\]](#) (config>filter>gre-tun-tmp>ipv4 gre-key)

## Full Context

```
configure filter gre-tunnel-template ipv4 gre-key
```

## Description

This command enables the population of the GRE key field in the GRE header sent with the encapsulated IP packet.

The **no** form of this command disables the population of the optional GRE key field when the matching IP packet is sent encapsulated in a GRE tunnel.

## Parameters

### if-index

Causes the GRE key field to be populated with the ifIndex of the ingress interface on which the matching IP packet was received.

## Platforms

All

## 11.63 gre-termination

### gre-termination

## Syntax

```
[no] gre-termination
```

## Context

[\[Tree\]](#) (config>router>if gre-termination)

## Full Context

```
configure router interface gre-termination
```

## Description

This command enables the termination of MPLS-over-GRE and IP-over-GRE packets on destination IP addresses from a user-defined subnet. The user defines a subnet for the termination of GRE packets by applying the **gre-termination** command to a numbered network IP interface, including a loopback interface.

For more information, refer to "IP-over-GRE and MPLS-over-GRE Termination on a User-Configured Subnet" in the 7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide.

The **no** form of this command disables the termination of MPLS-over-GRE and IP-over-GRE packets on the subnet of the interface. Packets are dropped.

## Platforms

## Syntax

[no] group *ip-address*

## Context

[\[Tree\]](#) (config>subscr-mgmt>igmp-policy>static group)

## Full Context

configure subscriber-mgmt igmp-policy static group

## Description

This command adds or removes a static multicast group.  
The **no** form of this command reverts to the default value.

## Parameters

*ip-address*

Specifies the multicast group IP address.

**Values** a.b.c.d

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

group

## Syntax

[no] group *grp-ipv6-address*

## Context

[\[Tree\]](#) (config>subscr-mgmt>mld-policy>static group)

## Full Context

configure subscriber-mgmt mld-policy static group

## Description

This command configures a static multicast group.  
The **no** form of this command reverts to the default.

## Parameters

### ***grp-ipv6-address***

Specifies the IPv6 address.

**Values**    *ipv6-address* - x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:d.d.d.d  
              x - [0 to FFFF]H  
              d - [0 to 255]D  
              - multicast group IPv6 address

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## group

## Syntax

[no] **group** *group-name*

## Context

**[Tree]** (config>service>vprn>rip group)

**[Tree]** (config>service>ies>rip group)

## Full Context

configure service vprn rip group

configure service ies rip group

## Description

This command creates a context for configuring a RIP group of neighbors. RIP groups are a way of logically associating RIP neighbor interfaces to facilitate a common configuration for RIP interfaces.

The **no** form of this command deletes the RIP neighbor interface group. Deleting the group also removes the RIP configuration of all the neighbor interfaces currently assigned to this group.

## Default

no group

## Parameters

### ***group-name***

The RIP group name. Allowed values are any string, up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

## Platforms

All

## group

### Syntax

**group** *group-id* **rate** *rate*

**no group** *group-id*

### Context

[\[Tree\]](#) (config>port>ethernet>egress>hs-sched-ovr group)

### Full Context

configure port ethernet egress hs-scheduler-overrides group

### Description

This command overrides a group rate configured in the HS scheduler policy applied to the port egress.

The **no** form of this command removes the rate override from the port egress configuration.

### Parameters

#### *group-id*

Specifies the group ID.

**Values** 1

#### *rate*

Specifies the maximum rate in megabits per second. When the **max** keyword follows the **rate** keyword, the bandwidth limitation is removed from the group. The **max** keyword is mutually exclusive to the **rate** parameter. Either the **max** keyword or a rate value must follow the **rate** keyword.

**Values** 1 to 100000, max

### Platforms

7750 SR-7/12/12e

## group

### Syntax

**group** *sonet-sdh-index* **payload** {**tu3** | **vt2** | **vt15**}

### Context

[\[Tree\]](#) (config>port>sonet-sdh group)

## Full Context

configure port sonet-sdh group

## Description

This command configures payload of the SONET/SDH group.

This command is supported by TDM satellite, however the **tu3** parameter is not.

For example:

```
config>port>sonet-sdh#
```

```
group tug3-1.1 payload tu3 group tug3-1.2 payload vt2 group tug3-1.3 payload vt2 group tug3-2.1 payload vt15 group tug3-2.2 payload vt15 group tug3-2.3 payload tu3 group tug3-3.1 payload tu3 group tug3-3.2 payload tu3 group tug3-3.3 payload tu3
```

## Parameters

### ***sonet-sdh-index***

Specifies the components making up the specified SONET/SDH path. Depending on the type of SONET/SDH port the *sonet-sdh-index* must specify more path indexes to specify the payload location of the path.

### **tu3**

Specifies the Tributary Unit Group (TUG3) on a path. Configures the port or channel for transport network use.

### **vt2**

Configures the path as a virtual tributary group of type vt2.

### **vt15**

Configures the path as a virtual tributary group of type vt15.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## group

## Syntax

[no] group *name*

## Context

[\[Tree\]](#) (config>router>bgp group)

## Full Context

configure router bgp group

## Description

Commands in this context configure a BGP peer group.

The **no** form of this command deletes the specified peer group and all configurations associated with the peer group. The group must be shut down before it can be deleted.

### Default

no group

### Parameters

#### *name*

Specifies the peer group name. Allowed values are any string, up to 64 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### Platforms

All

## group

### Syntax

configure service vpls mesh-sdp mld-snooping static group

configure service vpls mesh-sdp igmp-snooping static group

configure service vpls igmp-snooping static group

configure service vpls spoke-sdp igmp-snooping static group

configure service vpls sap mld-snooping static group

configure service vpls spoke-sdp mld-snooping static group

configure service vpls sap igmp-snooping static group

## Description

Commands in this context add a static multicast group as a (\*, G) or as one or more (S,G) records. When a static MLD or IGMP group is added, multicast data for that (\*,G) or (S,G) is forwarded to the specific SAP or SDP without receiving any membership report from a host.

## Parameters

### *grp-ip-address*

Specifies an IGMP multicast group address that receives data on an interface. The IP address must be unique for each static group.

### *grp-ipv6-address*

Specifies an MLD multicast group address that receives data on an interface. The IP address must be unique for each static group.

**Values** ipv6-address:

- x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

## Platforms

All

## group

## Syntax

**group** *name* [**esm-dynamic-peer**]

**no group** *name*

## Context

[\[Tree\]](#) (config>service>vprn>bgp group)

## Full Context

configure service vprn bgp group

## Description

This command creates a context to configure a BGP peer group.

The **no** form of this command deletes the specified peer group and all configurations associated with the peer group. The group must be shut down before it can be deleted.

## Parameters

*name*

Specifies the peer group name. Allowed values is a string up to 64 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed between double quotes.

#### **esm-dynamic-peer**

Specifies that the given BGP group is used by BGP peers created dynamically based on subscriber-hosts pointing to corresponding BGP peering policy. There can be only one BGP group with this flag set in any given VPRN. No BGP neighbors can be manually configured in a BGP group with this flag set.

**Default** disabled

### **Platforms**

All

## **group**

### **Syntax**

[no] **group** *grp-ip-address*

[no] **group start** *grp-ip-address* **end** *grp-ip-address* [**step** *ip-address*]

### **Context**

[\[Tree\]](#) (config>service>vprn>igmp>if>static group)

### **Full Context**

configure service vprn igmp interface static group

### **Description**

This command adds a static multicast group either as a (\*,G) or one or more (S,G) records. Use IGMP static group memberships to test multicast forwarding without a receiver host. When IGMP static groups are enabled, data is forwarded to an interface without receiving membership reports from host members.

When static IGMP group entries on point-to-point links that connect routers to a rendezvous point (RP) are configured, the static IGMP group entries do not generate join messages toward the RP.

### **Parameters**

#### ***grp-ip-address***

Specifies an IGMP multicast group address that receives data on an interface. The IP address must be unique for each static group. The address must be in dotted decimal notation.

#### ***start grp-ip-address***

Specifies the start multicast group address.

#### ***end grp-ip-address***

Specifies the end multicast group address.

#### ***step ip-address***

Specifies the step increment.

## Platforms

All

## group

## Syntax

**[no] group** *grp-ipv6-address*

**[no] group start** *grp-ipv6-address* **end** *grp-ipv6-address* [**step** *ipv6-address*]

## Context

[\[Tree\]](#) (config>service>vprn>mld>if>static group)

## Full Context

configure service vprn mld interface static group

## Description

Commands in this context add a static multicast group either as a (\*,G) or one or more (S,G) records. Use MLD static group memberships to test multicast forwarding without a receiver host. When MLD static groups are enabled, data is forwarded to an interface without receiving membership reports from host members.

When static MLD group entries on point-to-point links that connect routers to a rendezvous point (RP) are configured, the static MLD group entries do not generate join messages toward the RP.

The **no** form of this command removes the IPv6 address from the configuration.

## Parameters

### *grp-ipv6-address*

Specifies an MLD multicast group address that receives data on an interface. The IP address must be unique for each static group.

- Values** ipv6-address:
- x:x:x:x:x:x (eight 16-bit pieces)
  - x:x:x:x:x:d.d.d.d
  - x: [0 to FFFF]H
  - d: [0 to 255]D

### **start** *grp-ipv6-address*

Specifies the start multicast group address.

- Values** ipv6-address:
- x:x:x:x:x:x (eight 16-bit pieces)
  - x:x:x:x:x:d.d.d.d

- x: [0 to FFFF]H
- d: [0 to 255]D

**end grp-ipv6-address**

Specifies the end multicast group address.

**Values** ipv6-address:

- x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

**step ipv6-address**

Specifies the step increment.

**Platforms**

All

**group****Syntax**

[no] **group** *group-name*

**Context**

[\[Tree\]](#) (config>service>vprn>msdp group)

**Full Context**

configure service vprn msdp group

**Description**

This command enables access to the context to create or modify a Multicast Source Discovery Protocol (MSDP) group. To configure multiple MSDP groups, include multiple group statements.

By default, the group's options are inherited from the global MSDP options. To override these global options, group-specific options within the group statement can be configured.

If the group name provided is already configured then this command only provides the context to configure the options pertaining to this group.

If the group name provided is not already configured, then the group name must be created and the context to configure the parameters pertaining to the group should be provided. In this case, the \$ prompt to indicate that a new entity (group) is being created should be used.

For a group to be of use, at least one peer must be configured.

**Default**

no group

**Parameters*****group-name***

Specifies a unique name for the MSDP group.

**Platforms**

All

**group****Syntax**

[no] group *ip-address* [/mask]

**Context**

[\[Tree\]](#) (config>service>vprn>mvpn>pt>selective>multistream-spmsi group)

**Full Context**

configure service vprn mvpn provider-tunnel selective multistream-spmsi group

**Description**

This command creates group prefixes that map to the multicast stream. At least one source must be specified for the policy to be active.

**Parameters*****ip-address/mask***

Specifies the IP address.

**Values**

|                |                                     |
|----------------|-------------------------------------|
| ipv4-prefix    | a.b.c.d                             |
| ipv4-prefix-le | [0..32]                             |
| ipv6-prefix    | x:x:x:x:x:x:x (eight 16-bit pieces) |
|                | x:x:x:x:x:d.d.d.d                   |
| x              | [0..FFFF]H                          |
| d              | [0..255]D                           |

## group

### Syntax

**[no] group** *grp-ip-address*

### Context

**[Tree]** (config>router>igmp>tunnel-interface>static group)

## Full Context

configure router igmp tunnel-interface static group

## Description

Commands in this context add a static multicast group either as a (\*,G) or one or more (S,G) records.

The user can assign static multicast group joins to a tunnel interface associated with an RSVP P2MP LSP.

A given (\*,G) or (S,G) can only be associated with a single tunnel interface.

A multicast packet which is received on an interface and which succeeds the RPF check for the source address will be replicated and forwarded to all OIFs which correspond to the branches of the P2MP LSP.

The packet is sent on each OIF with the label stack indicated in the NHLFE of this OIF. The packets will also be replicated and forwarded natively on all OIFs which have received IGMP or PIM joins for this (S,G).

The multicast packet can be received over a PIM or IGMP interface which can be an IES interface, a spoke SDP terminated IES interface, or a network interface.

## Parameters

### *grp-ip-address*

Specifies a multicast group address that receives data on a tunnel interface. The IP address must be unique for each static group.

## Platforms

All

## group

## Syntax

[no] group *grp-ipv6-address*

[no] group start *grp-ipv6-address* end *grp-ipv6-address* [step *ipv6-address*]

## Context

[\[Tree\]](#) (config>router>mld>if>static group)

## Full Context

configure router mld interface static group

## Description

Commands in this context add a static multicast group either as a (\*,G) or one or more (S,G) records.

Use MLD static group memberships to test multicast forwarding without a receiver host. When MLD static groups are enabled, data is forwarded to an interface without receiving membership reports from host members.

When static MLD group entries on point-to-point links that connect routers to a rendezvous point (RP) are configured, the static MLD group entries do not generate join messages toward the RP.

The **no** form of this command removes the IPv6 address from the configuration.

## Parameters

### ***grp-ipv6-address***

Specifies an MLD multicast group address that receives data on an interface. The IP address must be unique for each static group.

- Values** ipv6-address:
- x:x:x:x:x:x:x (eight 16-bit pieces)
  - x:x:x:x:x:d.d.d.d
  - x: [0 to FFFF]H
  - d: [0 to 255]D

### ***start grp-ipv6-address***

Specifies the start multicast group address.

- Values** ipv6-address:
- x:x:x:x:x:x:x (eight 16-bit pieces)
  - x:x:x:x:x:d.d.d.d
  - x: [0 to FFFF]H
  - d: [0 to 255]D

### ***end grp-ipv6-address***

Specifies the end multicast group address.

- Values** ipv6-address:
- x:x:x:x:x:x:x (eight 16-bit pieces)
  - x:x:x:x:x:d.d.d.d
  - x: [0 to FFFF]H
  - d: [0 to 255]D

### ***step ipv6-address***

Specifies the step increment.

## Platforms

All

group

## Syntax

[no] group *group-name*

## Context

[\[Tree\]](#) (config>router>msdp group)

## Full Context

```
configure router msdp group
```

## Description

This command enables access to the context to create or modify a Multicast Source Discovery Protocol (MSDP) group. To configure multiple MSDP groups, include multiple group statements.

By default, the group's options are inherited from the global MSDP options. To override these global options, group-specific options within the group statement can be configured.

If the group name provided is already configured then this command only provides the context to configure the options pertaining to this group.

If the group name provided is not already configured, then the group name must be created and the context to configure the parameters pertaining to the group should be provided. In this case, the \$ prompt to indicate that a new entity (group) is being created should be used.

For a group to be of use, at least one peer must be configured.

The **no** form of this command removes the *group-name* from the MSDP configuration.

## Default

```
no group
```

## Parameters

### *group-name*

Species a MSDP group name, up to 32 characters.

## Platforms

All

## group

## Syntax

```
group group-id rate rate
```

```
no group group-id
```

## Context

[\[Tree\]](#) (config>qos>hs-scheduler-policy group)

## Full Context

```
configure qos hs-scheduler-policy group
```

## Description

This command defines the maximum rate allowed for the scheduling classes mapped to the specified *group-id*. A group is a scheduling component used to combine up to six consecutive scheduling classes into a single strict priority level. Each scheduling class within the group has an associated weight. When the scheduler is servicing the strict level associated with the group, the ratio of bandwidth allocated to each

scheduling class within the group during congestion is relative to the ratio of the weight of each active member.

The **no** form of the command reverts to the default.

## Default

group 1 rate max

## Parameters

### *group-id*

Specifies the group ID. The group always exists and does not need to be created prior to defining group membership.

**Values** 1

### *rate*

Specifies the maximum rate in megabits per second. When the **max** keyword follows the *rate* keyword, the bandwidth limitation is removed from the group. The **max** keyword and the *rate* parameter are mutually exclusive. Either **max** or a rate value must follow the **rate** keyword.

**Values** 1 to 100000, max

## Platforms

7750 SR-7/12/12e

## group

## Syntax

**group** *name* [**create**]

**no group** *name*

## Context

[\[Tree\]](#) (config>qos>port-scheduler-policy group)

## Full Context

configure qos port-scheduler-policy group

## Description

This command defines a weighted scheduler group within a port scheduler policy.

The port scheduler policy defines a set of eight priority levels. The weighted scheduler group allows for the application of a scheduling weight to groups of child queues competing at the same priority level of the port scheduler policy applied to a Vport defined in the context of the egress of an Ethernet port or applied to the egress of an Ethernet port.

Up to eight groups can be defined within each port scheduler policy. One or more levels can map to the same group. A group has a rate and, optionally, a cir-rate, and inherits the highest scheduling priority of its member levels. A group receives bandwidth from the port or from the Vport and distributes it within the member levels of the group according to the weight of each level within the group.

Each priority level will compete for bandwidth within the group based on its weight under a congestion situation. If there is no congestion, a priority level can achieve up to its rate (cir-rate) worth of bandwidth.

CLI will enforce that mapping of levels to a group are contiguous. A user would not be able to add a priority level to a group unless the resulting set of priority levels is contiguous.

The **no** form of this command removes the group from the port scheduler policy.

## Parameters

### *name*

Specifies the name of the weighted scheduler group and can be up to 32 ASCII characters.

### **create**

This keyword is mandatory when creating the specified group.

## Platforms

All

## group

## Syntax

```
group aa-group-id
```

## Description

Commands in this context perform a group-specific upgrade.

## Parameters

### *aa-group-id*

Specifies an AA ISA group ID.

**Values** 1 to 255

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## group

### Syntax

**group** *group-name*

**no group**

### Context

[\[Tree\]](#) (config>system>security>user>snmp group)

### Full Context

configure system security user snmp group

### Description

This command associates (or links) a user to a group name. The group name must be configured with the **config>system>security>user >snmp>group** command. The **config>system>security>user access** command links the group with one or more views, security model (s), security level (s), and read, write, and notify permissions.

### Parameters

***group-name***

Enter the group name (between 1 and 32 alphanumeric characters) that is associated with this user. A user can be associated with one group-name per security model.

### Platforms

All

## group

### Syntax

**[no] group** *group-name*

### Context

[\[Tree\]](#) (config>router>rip group)

[\[Tree\]](#) (config>router>ripng group)

### Full Context

configure router rip group

configure router ripng group

### Description

This command creates a context for configuring a RIP group of neighbor interfaces.

RIP groups are a way of logically associating RIP neighbor interfaces to facilitate a common configuration for RIP interfaces.

The **no** form of the command deletes the RIP neighbor interface group. Deleting the group will also remove the RIP configuration of all the neighbor interfaces currently assigned to this group.

## Default

no group

## Parameters

### *group-name*

Specifies the RIP group name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

## Platforms

All

## group

## Syntax

[no] group *ip-address* [/mask]

## Context

[\[Tree\]](#) (config>service>vprn>mvpn>pt>selective>umh-rm group)

## Full Context

configure service vprn mvpn provider-tunnel selective umh-rate-monitoring group

## Description

This command configures UMH bandwidth monitoring for the specified <S,G>.

The **no** form of the command removes UMH bandwidth monitoring from the specified <S,G>.

## Parameters

### *ip-address/mask*

Specifies the IP address.

### Values

|             |                                     |

## group

## Syntax

**group down** *time* | **no group down**

**group up** *time* | **no group up**

## Context

[\[Tree\]](#) (config>service>oper-group>hold-time group)

## Full Context

configure service oper-group hold-time group

## Description

The **group down** form of the command configures the number of seconds to wait before notifying clients monitoring this group when its operational status transitions from up to down.

The **group up** form of the command configures the number of seconds to wait before notifying clients monitoring this group when its operational status transitions from down to up. A value of zero indicates that transitions are reported immediately to monitoring clients. The up time option is a must to achieve fast convergence: when the group comes up, the monitoring MH site that tracks the group status may wait without impacting the overall convergence; there is usually a pair MH site that is already handling the traffic.

The **no** form of the command sets the values back to the default.

## Default

group down 0

group up 4

## Parameters

*time*

Specifies the group up or group down time value.

**Values** 0 to 3600

## Platforms

All

## 11.66 group-address

### group-address

#### Syntax

**group-address** *prefix-list-name*

**no group-address**

#### Context

**[Tree]** (config>router>policy-options>policy-statement>entry>from group-address)

#### Full Context

configure router policy-options policy-statement entry from group-address

#### Description

This command specifies the multicast group-address prefix list containing multicast group-addresses that are embedded in the join or prune packet as a filter criterion. The prefix list must be configured prior to entering this command. Prefix lists are configured in the **config>router>policy-options>prefix-list** context.

The **no** form of this command removes the criterion from the configuration.

#### Default

no group-address

#### Parameters

##### *prefix-list-name*

Specifies the prefix-list name. Allowed values are any string up to 64 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

The *prefix-list-name* is defined in the **config>router>policy-options>prefix-list** context.

## 11.67 group-encryption

## group-encryption

### Syntax

**group-encryption**

### Context

**[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw group-encryption)

**[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw group-encryption)

### Full Context

configure service vprn subscriber-interface group-interface wlan-gw group-encryption

configure service ies subscriber-interface group-interface wlan-gw group-encryption

### Description

This command configures group encryption for the WLAN-GW group interface.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## group-encryption

### Syntax

**[no] group-encryption**

### Context

**[Tree]** (config>router>interface group-encryption)

### Full Context

configure router interface group-encryption

### Description

This command enables NGE on the router interface. When NGE is enabled on the interface, all received Layer 3 packets that have the protocol ID configured as ESP are considered to be NGE packets and must be encrypted using a valid set of keys from any preconfigured key group on the system.

The **no** form of this command disables NGE on the interface. NGE cannot be disabled unless all key groups and IP exception filters are removed.

### Default

no group-encryption

### Platforms

VSR

## group-encryption

### Syntax

**group-encryption**

### Context

[\[Tree\]](#) (config group-encryption)

### Full Context

configure group-encryption

### Description

Commands in this context configure group encryption parameters.

### Platforms

## 11.68 group-encryption-label

### group-encryption-label

### Syntax

**group-encryption-label** *encryption-label*

**no group-encryption-label**

### Context

[\[Tree\]](#) (config>grp-encryp group-encryption-label)

### Full Context

configure group-encryption group-encryption-label

### Description

This command configures the group encryption label used to identify when an MPLS payload is encrypted. This label must be unique network-wide and must be configured consistently on all nodes participating in a network group encryption domain. The label cannot be changed or deleted when there are any key groups configured on the node.

The **no** form of the command reverts to the default setting.

### Parameters

*encryption-label*

The network-wide, unique reserved MPLS label for group encryption.

**Values** 32 to 2047

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 11.69 group-inserted-entries

#### Full Context

configure filter ip-filter group-inserted-entries

configure filter ipv6-filter group-inserted-entries

#### Description

This command groups automatically-inserted entries.

#### Parameters

##### *application*

Specifies the application for which the group entries are inserted.

**Values** radius, credit-control

##### *location*

Specifies the location in the entry list in which the group entries are inserted.

**Values** top, bottom

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 11.70 group-interface

### group-interface

#### Syntax

**group-interface** *ip-int-name* [**prefix** {*port-id*}] [**suffix** {*port-id*}]

**no group-interface**

#### Full Context

configure subscriber-mgmt local-user-db ipoe host msap-defaults group-interface

configure subscriber-mgmt local-user-db ppp host msap-defaults group-interface

#### Description

This command configures the group interface.

The **no** form of this command removes the group interface parameters from the configuration.

#### Parameters

##### *ip-int-name*

Specifies the IP interface name, up to 32 characters.

##### **prefix** *port-id*

Specifies the port ID as the prefix to the specified IP interface name.

##### **suffix** *port-id*

Specifies the port ID as the suffix to the specified IP interface name.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### group-interface

#### Syntax

**group-interface** *ip-int-name* [**create**] [**type**]

**no group-interface** *ip-int-name*

#### Context

**[Tree]** (config>service>ies>sub-if group-interface)

**[Tree]** (config>service>vprn>sub-if group-interface)

**Full Context**

configure service ies subscriber-interface group-interface  
 configure service vprn subscriber-interface group-interface

**Description**

This command creates a group interface. This interface is designed for triple play services where multiple SAPs are part of the same subnet. A group interface may contain one or more SAPs.

The **no** form of this command removes the group interface from the subscriber interface.

**Default**

no group-interface

**Parameters*****ip-int-name***

Specifies the interface name of a group interface. If the string contains special characters (#, \$, spaces, and so on.), the entire string must be enclosed within double quotes.

***type***

Specifies the interface type.

**Values**    bonding — Specifies to use connection bonding.  
               gtp — Specifies to use GTP.  
               lms — Specifies to use LMS.  
               wlangw — Specifies to use WLANGW.

***create***

Keyword used to create the group interface.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**group-interface****Syntax**

**group-interface** *interface-name* **svc-id** *service-id*  
**no group-interface**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>gtp>apn-policy>apn>defaults group-interface)

**Full Context**

configure subscriber-mgmt gtp apn-policy apn defaults group-interface

## Description

This command configures the default group interface where the hosts of the GTP connection is enabled. The group interface must be of type **gtp**.

The **no** form of this command removes the default group interface. In this case, a group interface must be specified using authentication.

## Default

no group-interface

## Parameters

### *interface-name*

Specifies the name of the group interface, up to 32 characters.

### *service-id*

Specifies the ID of the service where the group interface resides.

### Values

*service-id*: 1 to 2147483647

*svc-name*: up to 64 characters

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## group-interface

## Syntax

[no] group-interface *ip-int-name*

[no] group-interface fwd-service *service-id ip-int-name*

## Context

[\[Tree\]](#) (config>service>vprn>igmp group-interface)

## Full Context

configure service vprn igmp group-interface

## Description

This command configures IGMP group interfaces.

The **no** form of this command reverts to the default.

## Parameters

### *ip-int-name*

Specifies the name of the IP interface. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed between double quotes.

**fwd-service *service-id***

Specifies the service ID. This is only configured in the retailer VRF. This construct references the wholesaler service under which the group-interface (and the subscriber) is actually defined.

**Values** 1 to 2147483650, svc-name up to 64 characters

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**group-interface****Syntax**

[no] group-interface [fwd-service *service-id*] [*ip-int-name*]

**Context**

[\[Tree\]](#) (debug>router>igmp group-interface)

**Full Context**

debug router igmp group-interface

**Description**

This command enables debugging for IGMP group-interface.  
The **no** form of the command disables debugging.

**Parameters*****service-id***

Debugs information associated with the service ID.

**Values** service-id: 1 to 2148278386  
svc-name: up to 64 characters.

***ip-int-name***

Debugs information associated with the specified IP interface name.

**Values** IP interface address

**Platforms**

All

## group-interface

### Syntax

[no] **group-interface** *ip-int-name*

### Context

**[Tree]** (config>router>igmp group-interface)

**[Tree]** (config>router>igmp>if group-interface)

### Full Context

configure router igmp group-interface

configure router igmp interface group-interface

### Description

This command enables IGMP on a group-interface in a VRF context. Activating IGMP under the group-interface is a prerequisite for subscriber replication. The group-interface is also needed so that MCAC can be applied and various IGMP parameters defined.

This command can be used in a regular, wholesaler or retailer type of VRF. The retailer VRF does not have the concept of group-interfaces under the subscriber-interface hierarchy. In the case that this command is applied to a retailer VRF instance, the optional **fwd-service** command must be configured. The **fwd-service** command is referencing the wholesaler VRF in which the traffic is ultimately replicated. Redirection in the retailer VRF is supported.

This command enables IGMP on a group-interface in the Global Routing Table (GRT). The group-interface in GRT is defined under the IES service. Activating IGMP under the group-interface is a prerequisite for subscriber replication. The group-interface is also needed so that MCAC can be applied and various IGMP parameters defined.

### Parameters

*ip-int-name*

Specifies the name of the group interface.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## group-interface

### Syntax

[no] **group-interface** *ip-int-name*

## Context

[\[Tree\]](#) (config>router>mld group-interface)

## Full Context

configure router mld group-interface

## Description

This command creates and enables the context to configure MLD group interface parameters.

The **no** form of this command removes the interface name from the MLD configuration.

## Parameters

### *ip-int-name*

Specifies the IP group interface name. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

## 11.72 group-interface-template

### group-interface-template

#### Syntax

**group-interface-template** *name* [**create**]

**no group-interface-template** *name*

#### Context

[\[Tree\]](#) (config>subscr-mgmt group-interface-template)

#### Full Context

configure subscriber-mgmt group-interface-template

#### Description

This command creates a template for specifying parameters for automatically generated group interfaces, for example, the creation of CUPS sessions. When no specific name is specified, a template named "default" is used, if it has been manually provisioned.

#### Parameters

##### *name*

Specifies the name of the group interface, up to 32 characters.

##### **create**

Keyword used to create the group interface template.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 11.73 group-list

### group-list

#### Syntax

**group-list** *name*

**no group-list**

#### Context

[\[Tree\]](#) (config>system>security>tls>client-tls-profile group-list)

## Full Context

```
configure system security tls client-tls-profile group-list
```

## Description

This command assigns an existing TLS 1.3 group list to the TLS client profile.

The **no** form of this command removes the group list from the client profile.

## Default

```
no group-list
```

## Parameters

*name*

Specifies the name of the group list, up to 32 characters.

## Platforms

All

## group-list

## Syntax

```
group-list name
```

## Description

This command assigns an existing TLS 1.3 group list to the TLS server profile.

The **no** form of this command removes the group list from the server profile.

## Default

```
no group-list
```

## Parameters

*name*

Specifies the name of the group list, up to 32 characters.

## Platforms

All

## 11.74 group-name

group-name

### Syntax

**group-name** *group-name* **value** *group-value*

**no group-name** *group-name*

### Context

**[Tree]** (config>service>sdp-group group-name)

### Full Context

configure service sdp-group group-name

### Description

This command defines SDP administrative groups, referred to as SDP admin groups.

SDP admin groups provide a way for services using a pseudowire template to automatically include or exclude specific provisioned SDPs. SDPs sharing a specific characteristic or attribute can be made members of the same admin group. When users configure a pseudowire template, they can include and/or exclude one or more admin groups. When the service is bound to the pseudowire template, the SDP selection rules will enforce the admin group constraints specified in the **sdp-include** and **sdp-exclude** commands.

A maximum of 32 admin groups can be created. The group value ranges from zero (0) to 31. It is uniquely associated with the group name at creation time. If the user attempts to configure another group name for a group value that is already assigned to an existing group name, the SDP admin group creation is failed. The same happens if the user attempts to configure an SDP admin group with a new name but associates it to a group value already assigned to an existing group name.

The **no** option of this command deletes the SDP admin group but is only allowed if the group-name is not referenced in a PW template or SDP.

### Parameters

#### **group-name**

Specifies the name of the SDP admin group. A maximum of 32 characters can be entered.

#### **group-value**

Specifies the group value associated with this SDP admin group. This value is unique within the system.

**Values** 0 to 31

#### Full Context

configure service vpls mld-snooping mvr group-policy

configure service vpls igmp-snooping mvr group-policy

configure service vpls pim-snooping group-policy

configure service vpls sap igmp-snooping mvr group-policy

#### Description

This command identifies filter policy of multicast groups to be applied to this VPLS entity. The sources of the multicast traffic must be a member of the VPLS.

The **no** form of this command removes the policy association from the VPLS configuration.

#### Default

no group-policy

#### Parameters

##### *policy-name*

Specifies the group policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. Routing policies are configured in the config>router>policy-options context. The router policy must be defined before it can be imported.

#### Platforms

All

## 11.76 group-prefix

### group-prefix

#### Syntax

**group-prefix** *ip-address/mask* [*ip-address/mask*] [**starg**]

**no group-prefix** *ip-address/mask*

#### Context

[\[Tree\]](#) (config>service>vprn>mvpn>rpf-select>core-mvpn group-prefix)

#### Full Context

configure service vprn mvpn rpf-select core-mvpn group-prefix

#### Description

This command configures multicast group IPv4 prefixes for the MVPN with per-group mapping extranet functionality. Multiple lines are allowed. Duplicate prefixes are ignored.

When the **starg** option is specified, extranet functionality is enabled for PIM ASM as for the specified group. When the option is not specified (not recommended with PIM ASM), the PIM ASM join will be mapped and data plane will be established, but the control plane will not be updated on SPT switchover, unless the switchover is driven by a CPE router on a receiver side.

The **no** form of this command deletes specified prefix from the list, or removes mapping of all prefixes if **group-prefix any** was specified.

#### Parameters

##### *ip-address/mask*

Specifies the IPv4 multicast address prefix with mask. Up to 8 addresses can be specified in a single statement.

#### Platforms

All

### group-prefix

#### Syntax

**group-prefix** *ip-address/mask* [*ip-address/mask...(up to 8 max)*] [**starg**]

**group-prefix any**

**no group-prefix** *ip-address/mask*

**no group-prefix any**

## Context

[\[Tree\]](#) (config>service>vprn>pim>rpf-select>grt-extranet group-prefix)

## Full Context

configure service vprn pim rpf-select grt-extranet group-prefix

## Description

This command configures multicast group IPv4 prefixes for the multicast GRT/VRF with per group mapping extranet functionality. Multiple lines are allowed. Duplicate prefixes are ignored. Operator can either configure specific groups for extranet or specify all groups by using key-word any. The two options are mutually exclusive in configuration.

When the starg option is specified, extranet functionality is enabled for PIM ASM as for the specified group. When the option is not specified (not recommended with PIM ASM), the PIM ASM join will be mapped and data plane will be established, but the control plane will not be updated on SPT switchover, unless the switchover is driven by a CPE router on a receiver side.

The **no** form of this command deletes specified prefix from the list, or removes mapping of all prefixes if group-prefix any was specified.

## Parameters

### *ip-address/mask*

Specifies the IPv4 multicast address prefix with mask.

## group-prefix

## Syntax

[no] group-prefix grp-ipv6-address/prefix-length

## Context

[\[Tree\]](#) (config>service>vprn>pim>rp>ipv6>static group-prefix)

## Full Context

configure service vprn pim rp ipv6 static group-prefix

## Description

The group-prefix for a static-rp defines a range of multicast-ip-addresses for which this static RP is applicable.

The **no** form of this command removes the criterion.

## Parameters

### *grp-ipv6-address*

Specifies the multicast IPv6 address.

### *prefix-length*

Specifies the address prefix length.

## group-prefix

### Syntax

[no] **group-prefix** *grp-ipv6-address*/*prefix-length*

### Context

**[Tree]** (config>router>pim>rp>ipv6>static>address group-prefix)

**[Tree]** (config>router>pim>rp>static>address group-prefix)

### Full Context

configure router pim rp ipv6 static address group-prefix

configure router pim rp static address group-prefix

### Description

This command specifies the range of multicast group addresses which should be used by the router as the Rendezvous Point (RP). The **config>router>pim>rp>static> address** *a.b.c.d* implicitly defaults to deny all for all multicast groups (224.0.0.0/4). A group-prefix must be specified for that static address. This command does not apply to the whole group range.

The **no** form of this command removes the group-prefix from the configuration.

### Parameters

#### *grp-ipv6-address*

Specifies the multicast group IPv6 address expressed in dotted decimal notation.

**Values**    *grp-ipv6-address* x:x:x:x:x:x:x (eight 16-bit pieces)  
                   x:x:x:x:x:d.d.d.d  
                   x [0..FFFF]H  
                   d [0..255]D

#### *prefix-length*

Specifies the prefix length of the IPv6 address.

**Values**    8 to 128

configure service vprn pim ssm-groups group-range

**Description**

This command configures the group address or range of group addresses for which this router can be the rendezvous point (RP).

Use the **no** form of this command to remove the group address or range of group addresses for which this router can be the RP from the configuration.

**Parameters*****ip-prefix***

Specifies the addresses or address ranges that this router can be an RP.

**Values**    ipv4-prefix - a.b.c.d ipv4-prefix-le - [0 to 32] ipv6-prefix - x:x:x:x:x:x:x  
(eight 16-bit pieces) x:x:x:x:x:d.d.d.d x - [0 to FFFF]H d - [0 to 255]D  
ipv6-prefix-le - [0 to 128]

***mask***

Specifies the address mask with the address to define a range of addresses.

***netmask***

Specifies the subnet mask in dotted decimal notation.

**Values**    :a.b.c.d (network bits all 1 and host bits all 0)

**Platforms**

All

**group-range****Syntax**

**[no] group-range** *ipv6-address/prefix-length*

**Context**

**[Tree]** (config>router>pim>rp>ipv6>rp-candidate group-range)

**[Tree]** (config>router>pim>rp>ipv6>embedded-rp group-range)

**Full Context**

configure router pim rp ipv6 rp-candidate group-range

configure router pim rp ipv6 embedded-rp group-range

### Description

This command defines which multicast groups can embed RP address information besides FF70::/12. Embedded RP information is only used when the multicast group is in FF70::/12 or the configured group range.

The **no** form of this command removes the parameter from the

### Parameters

#### *ipv6-address/prefix-length*

Specifies the group range for embedded RP.

- Values**    ipv6-address:
- x:x:x:x:x:x:x (eight 16-bit pieces)
  - x:x:x:x:x:d.d.d.d
  - x: [0 to FFFF]H
  - d: [0 to 255]D
- prefix-length: 16 to 128

### Platforms

All

## group-range

### Syntax

[no] group-range {grp-ip-address/mask | grp-ip-address netmask}

### Context

[\[Tree\]](#) (config>router>pim>rp>rp-candidate group-range)

### Full Context

configure router pim rp rp-candidate group-range

### Description

This command configures the address ranges of the multicast groups for which this router can be an RP.

The **no** form of this commands removes the parameter from the configuration.

### Parameters

#### *grp-ip-address*

Specifies the multicast group IP address expressed in dotted decimal notation.

- Values**    224.0.0.0 to 239.255.255.255

**mask**

Specifies the mask associated with the IP prefix expressed as a mask length or in dotted decimal notation; for example, /16 for a sixteen-bit mask. The mask can also be entered in dotted decimal notation (255.255.0.0).

**Values** 4 to 32

**netmask**

Specifies the subnet mask in dotted decimal notation.

**Values** 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

**Platforms**

All

**group-range****Syntax**

[no] group-range {ip-prefix/mask | ip-prefix netmask}

**Context**

[\[Tree\]](#) (config>router>pim>ssm-groups group-range)

**Full Context**

configure router pim ssm-groups group-range

**Description**

This command configures the address ranges of the multicast groups for this router. When there are parameters present, the command configures the SSM group ranges for IPv6 addresses and netmasks.

The **no** form of this command removes the parameter from the configuration.

**Parameters****ip-prefix/mask**

Specifies the IP prefix in dotted decimal notation for the range used by the ABR to advertise that summarizes the area into another area ipv6-prefix.

**Values**

- ipv4-prefix:
  - a.b.c.d
- ipv4-prefix-le: 0 to 32
- ipv6-address:
  - x:x:x:x:x:x:x (eight 16-bit pieces)
  - x:x:x:x:x:d.d.d.d
  - x: [0 to FFFF]H

- d: [0 to 255]D  
ipv6-prefix-len: 0 to 128

**Values** 0 to 32 (mask length), 0.0.0.0 to 255.255.255.255 (dotted decimal)

#### ***netmask***

Specifies the subnet mask in dotted decimal notation.

**Values** 0.0.0.0 to 255.255.255.255 (network bits all 1 and host bits all 0)

### **Platforms**

All

## 11.78 group-session-limit

### group-session-limit

#### **Syntax**

**group-session-limit** *session-limit*

**group-session-limit** **unlimited**

**no group-session-limit**

#### **Context**

[\[Tree\]](#) (config>service>vprn>l2tp group-session-limit)

[\[Tree\]](#) (config>router>l2tp group-session-limit)

#### **Full Context**

configure service vprn l2tp group-session-limit

configure router l2tp group-session-limit

#### **Description**

This command configures the session limit. The value controls how many L2TP session will be allowed within a given context (system, group, tunnel).

The **no** form of this command removes the session limit value from the configuration.

#### **Default**

no group-session-limit

#### **Parameters**

##### ***session-limit***

Specifies the allowed number of sessions within the given context.

**Values** 1 to 250000

**unlimited**

Specifies to use the maximum number of sessions available.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 11.79 grp-if-query-src-ip

### grp-if-query-src-ip

**Syntax**

**grp-if-query-src-ip** *ip-address*

**no grp-if-query-src-ip**

**Context**

[\[Tree\]](#) (config>service>vprn>igmp grp-if-query-src-ip)

**Full Context**

configure service vprn igmp grp-if-query-src-ip

**Description**

This command configures the query source IP address for all group interfaces.

The **no** form of this command removes the IP address.

**Platforms**

All

### grp-if-query-src-ip

**Syntax**

**grp-if-query-src-ip** *ip-address*

**no grp-if-query-src-ip**

**Context**

[\[Tree\]](#) (config>router>igmp grp-if-query-src-ip)

**Full Context**

configure router igmp grp-if-query-src-ip

## Description

This command configures the query source IP address for all group interfaces.

The **no** form of the command removes the IP address.

## Parameters

### *ip-address*

Sets the query source IP address.

## Platforms

All

## grp-if-query-src-ip

## Syntax

**grp-if-query-src-ip** *ipv6-address*

**no grp-if-query-src-ip**

## Context

[\[Tree\]](#) (config>router>mld grp-if-query-src-ip)

## Full Context

configure router mld grp-if-query-src-ip

## Description

This command configures the query source IPv6 address for all group interfaces.

The **no** form of this command removes the IP address.

## Parameters

### *ipv6-address*

Sets the source IPv6 address for all group interfaces. The address can be up to 64 characters. The source address should be link local.

## Platforms

All

## 11.80 grp-range

## grp-range

### Syntax

[no] **grp-range** *start end*

### Context

[\[Tree\]](#) (config>service>vprn>igmp>ssm-translate grp-range)

### Full Context

configure service vprn igmp ssm-translate grp-range

### Description

This command is used to configure group ranges which are translated to SSM (S,G) entries.

### Parameters

#### *start*

An IP address that specifies the start of the group range.

#### *end*

An IP address that specifies the end of the group range. This value should always be greater than or equal to the value of the *start* value.

### Platforms

All

## grp-range

### Syntax

[no] **grp-range** *start end*

### Context

[\[Tree\]](#) (config>service>vprn>mld>ssm-translate grp-range)

### Full Context

configure service vprn mld ssm-translate grp-range

### Description

This command is used to configure group ranges which are translated to SSM (S,G) entries.

### Parameters

#### *start*

An IP address that specifies the start of the group range.

#### *end*

An IP address that specifies the end of the group range. This value should always be greater than or equal to the value of the *start* value.

## Platforms

All

## grp-range

## Syntax

[no] **grp-range** *start end*

## Context

[\[Tree\]](#) (config>router>igmp>if>ssm-translate grp-range)

## Full Context

configure router igmp ssm-translate grp-range

configure router igmp interface ssm-translate grp-range

## Description

This command is used to configure group ranges which are translated to SSM (S,G) entries.

## Parameters

### *start*

An IP address that specifies the start of the group range.

### *end*

An IP address that specifies the end of the group range. This value should always be greater than or equal to the value of the *start* value.

## Platforms

All

## grp-range

## Syntax

[no] **grp-range** *start end*

## Context

[\[Tree\]](#) (config>router>mld>ssm-translate grp-range)

[\[Tree\]](#) (config>router>mld>if>ssm-translate grp-range)

**Full Context**

```
configure router mld ssm-translate grp-range
configure router mld interface ssm-translate grp-range
```

**Description**

This command is used to configure group ranges which are translated to SSM (S,G) entries. The **no** form of this command removes the start and end ranges from the configuration.

**Parameters*****start***

Specifies an IP address for the start of the group range.

***end***

Specifies an IP address for the end of the group range. This value should always be greater than or equal to the value of the *start* value.

**Platforms**

All

## gtp

### Syntax

gtp

### Context

[\[Tree\]](#) (config>app-assure>group gtp)

### Full Context

configure application-assurance group gtp

### Description

Commands in this context configure GTP parameters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## gtp

### Syntax

[no] gtp

### Context

[\[Tree\]](#) (config>sys>security>cpu-protection>ip>included-protocols gtp)

### Full Context

configure system security cpu-protection ip-src-monitoring included-protocols gtp

### Description

This command includes the extracted IPV4 GTP packets for ip-src-monitoring. IPv4 GTP packets will be subject to the per-source-rate of CPU protection policies.

### Default

no gtp

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## 11.89 gtp-authorized

### gtp-authorized

#### Syntax

[no] gtp-authorized

#### Context

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>ue-query>state gtp-authorized)

#### Full Context

configure subscriber-mgmt wlan-gw ue-query state gtp-authorized

#### Description

This command enables matching on UEs in a GTP-authorized state.

The **no** form of this command disables matching on UEs in a GTP-authorized state, unless all state matching is disabled.

#### Default

no gtp-authorized

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 11.90 gtp-change

### gtp-change

#### Syntax

gtp-change

#### Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>triggered-updates gtp-change)

#### Full Context

configure subscriber-mgmt radius-accounting-policy triggered-updates gtp-change

#### Description

Commands in this context configure which GTP-related changes trigger an interim accounting update.

This command is mutually exclusive with the legacy **gtp-mobility** command, which triggers interim accounting updates for all changes.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 11.91 gtp-filter

### gtp-filter

#### Syntax

**gtp-filter** *gtp-filter-name*

**no gtp-filter**

#### Context

[\[Tree\]](#) (config>app-assure>group>policy>aqp>entry>action gtp-filter)

#### Full Context

configure application-assurance group policy app-qos-policy entry action gtp-filter

#### Description

This command assigns an existing GTP filter as an action on flows matching this AQP entry.

The **no** form of this command removes this GTP filter from actions on flows matching this AQP entry.

#### Default

no gtp-filter

#### Parameters

##### *gtp-filter-name*

Specifies the name of an existing GTP filter for this application assurance profile. The *gtp-filter-name* is configured in the **config>app-assure>group[:partition]>gtp>gtp-filter** context.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### gtp-filter

#### Syntax

**gtp-filter** *filter-name*

## Context

[\[Tree\]](#) (config>app-assure>group>statistics>tca gtp-filter)

## Full Context

configure application-assurance group statistics threshold-crossing-alert gtp-filter

## Description

This command configures TCA generation for a GTP filter.

## Parameters

### *filter-name*

Specifies the name of the GTP filter, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## gtp-filter

## Syntax

**gtp-filter** *gtp-filter-name* [create]

**no gtp-filter** *gtp-filter-name*

## Context

[\[Tree\]](#) (config>app-assure>group>gtp gtp-filter)

## Full Context

configure application-assurance group gtp gtp-filter

## Description

This command allows AA to treat traffic on UDP port number 2152 as GTP-u. Without further specifying any other parameters within this GTP context, AA performs basic GTP-u header sanity checks and discards packets that are malformed. This GTP context allows the operator to configure various GTP filters (maximum of 128 GTP filters).

## Parameters

### *gtp-filter-name*

Specifies a GTP filter name, up to 32 characters.

### **create**

Keyword used to create the GTP filter name and parameters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 11.92 gtp-filter-stats

### gtp-filter-stats

#### Syntax

[no] gtp-filter-stats

#### Context

[\[Tree\]](#) (config>app-assure>group>statistics>aa-admit-deny gtp-filter-stats)

#### Full Context

configure application-assurance group statistics aa-admit-deny gtp-filter-stats

#### Description

This command configures whether to include or exclude GTP filter admit-deny statistics in accounting records.

#### Default

no gtp-filter-stats

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 11.93 gtp-in-gtp

### gtp-in-gtp

#### Syntax

gtp-in-gtp direction *direction* [create]

no gtp-in-gtp direction *direction*

#### Context

[\[Tree\]](#) (config>app-assure>group>statistics>tca>gtp-filter gtp-in-gtp)

#### Full Context

configure application-assurance group statistics threshold-crossing-alert gtp-filter gtp-in-gtp

## Description

This command configures a TCA for the counter capturing drops due to the GTP filter GTP-in-GTP packet check. A gtp-in-gtp drop TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a gtp-in-gtp TCA.

## Parameters

### *direction*

Specifies the traffic direction.

**Values** from-sub, to-sub

### **create**

Keyword used to create the TCA.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## gtp-in-gtp

## Syntax

**gtp-in-gtp**

## Context

[\[Tree\]](#) (config>app-assure>group>gtp>gtp-fltr gtp-in-gtp)

## Full Context

configure application-assurance group gtp gtp-filter gtp-in-gtp

## Description

This command configures GTP-in-GTP packet filtering.

## Default

gtp-in gtp permit

## Parameters

### **permit | deny**

Specifies the action to take for GTP packets that are encapsulated in GTP (GTP-in-GTP).

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 11.94 gtp-local-breakout

### gtp-local-breakout

#### Syntax

**gtp-local-breakout**

#### Context

[\[Tree\]](#) (config>filter>ip-filter>entry>action gtp-local-breakout)

#### Full Context

configure filter ip-filter entry action gtp-local-breakout

#### Description

This command specifies the filter entry action to gtp-local-breakout.

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 11.95 gtp-parameters

### gtp-parameters

#### Syntax

**gtp-parameters**

#### Context

[\[Tree\]](#) (config>service>vpn>sub-if>grp-if gtp-parameters)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if gtp-parameters)

#### Full Context

configure service vpn subscriber-interface group-interface gtp-parameters

configure service ies subscriber-interface group-interface gtp-parameters

#### Description

Commands in this context configure GTP parameters. The configuration of parameters under this context is only allowed when the group interface is created with the GTP parameter specified.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 11.96 gtp-peer-clear-timeout

```
gtp-peer-clear-timeout
```

### Syntax

```
gtp-peer-clear-timeout seconds
no gtp-peer-clear-timeout
```

### Context

[\[Tree\]](#) (config>service>vprn>wlan-gw>dsm gtp-peer-clear-timeout)

### Full Context

```
configure service vprn wlan-gw dsm gtp-peer-clear-timeout
```

### Description

This command configures a GTP peer cleanup timeout to terminate a handover wait state.

### Parameters

***seconds***

Specifies a GTP peer cleanup timeout, in seconds, to terminate a handover wait state.

**Values** 0 to 3600

## 11.97 gtp-ping

```
gtp-ping
```

### Syntax

```
gtp-ping gtp-interface [router router-instance] [source ip-address] destination ip-address udp-port port-number [retry-count count] [time-out timeout]
```

### Context

[\[Tree\]](#) (oam gtp-ping)

### Full Context

```
oam gtp-ping
```

## Description

This command verifies whether a GTPv2 peer is reachable and correctly responds to GTPv2-C Echo Request messages. This command can be executed if no peering exists for the specified peer.

## Parameters

### *gtp-interface*

Specifies the GTP interface where the echo is sent.

**Values** s11, s1u, gnc, gnu, s2bc, s2bu, s2ac, s2au

### *router-instance*

Specifies the router or VRF in which the GTP echo is sent.

**Values** *router-name* — Base, management  
*vprn-svc-id* — 1 to 2147483647

**Default** Base

### *source ip-address*

Specifies the source IP address to be used in the GTP ping.

**Values** a.b.c.d

### *destination ip-address*

Specifies the destination IP address to be used in the GTP ping.

**Values** a.b.c.d

### *port-number*

Specifies the port number to be used. Suggested port numbers are 2123 (GTP-C) or 2152 (GTP-U).

**Values** 1 to 65535

### *count*

Specifies the number of echo message requests before the peer is considered unreachable.

**Values** 1 to 100

**Default** 1

### *timeout*

Specifies the timeout, in seconds, of a single echo message.

**Values** 1 to 10

**Default** 5

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 11.98 gtp-sanity-drop

### gtp-sanity-drop

#### Syntax

**gtp-sanity-drop direction** *direction* [**create**]

**no gtp-sanity-drop direction** *direction*

#### Context

[\[Tree\]](#) (config>app-assure>group>statistics>tca gtp-sanity-drop)

#### Full Context

configure application-assurance group statistics threshold-crossing-alert gtp-sanity-drop

#### Description

This command configures a TCA for the counter capturing drops due to basic GTP header sanity checks, such as validating that the GTP-U version is 1 and that the protocol bit is set to 1 for UDP traffic destined to port 2152. A GTP sanity drop TCA can be created for traffic generated from the subscriber side of AA (**from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a default action TCA.

#### Parameters

##### *direction*

Specifies the traffic direction.

**Values** from-sub, to-sub

##### **create**

Keyword used to create the TCA.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 11.99 gtp-traffic

## gtp-traffic

### Syntax

[no] gtp-traffic

### Context

[\[Tree\]](#) (config>app-assure>group>policer gtp-traffic)

### Full Context

configure application-assurance group policer gtp-traffic

### Description

This command provides a mechanism to configure a policer to function at the GTP tunnel level. GTP tunnels are defined by a TEID and destination IP address as oppose to normal flows that are defined by IP 5 tuple values. By setting this value, the policer then can be used to limit GTP traffic (SeGW GTP firewall application).

The **no** form of this command resets policer behavior to act at the normal 5 tuple flow level and not at the GTP tunnel level.

### Default

no gtp-traffic

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 11.100 gtp-tunnel-database

## gtp-tunnel-database

### Syntax

gtp-tunnel-database

### Context

[\[Tree\]](#) (config>app-assure>group>gtp>gtp-fltr gtp-tunnel-database)

### Full Context

configure application-assurance group gtp gtp-filter gtp-tunnel-database

### Description

Commands in this context configure GTP advanced firewall functions (such as validating GTP tunnels, sequence numbers, source IP addresses).

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## gtp-tunnel-database

### Syntax

**gtp-tunnel-database** *size*

### Context

**[Tree]** (config>isa>aa-grp>shr-res-pool gtp-tunnel-database)

### Full Context

configure isa application-assurance-group shared-resources gtp-tunnel-database

### Description

This command configures the allocation of memory resources required for stateful GTP firewall deployment on 3GPP S5/S8/Gn/Gp interfaces.

### Default

gtp-tunnel-database 0

### Parameters

#### *size*

Specifies the percentage of allocated memory resources.

**Values** 0 to 100

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 11.101 gtp-user

## gtp-user

### Syntax

**gtp-user**

### Context

**[Tree]** (debug>oam>build-packet>packet>field-override>header gtp-user)

**[Tree]** (config>test-oam>build-packet>header gtp-user)

### Full Context

```
debug oam build-packet packet field-override header gtp-user
configure test-oam build-packet header gtp-user
```

### Description

This command causes the associated header to be defined as a GTP user header template and enables the context to define the GTP parameters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 11.102 gtp-user-name

```
gtp-user-name
```

### Syntax

```
gtp-user-name {imsi | imsi-apn | msisdn | msisdn-apn}
no gtp-user-name
```

### Context

[\[Tree\]](#) (config>subscr-mgmt>auth-plcy gtp-user-name)

### Full Context

```
configure subscriber-mgmt authentication-policy gtp-user-name
```

### Description

This command configures the username used to authenticate an FWA session. If a PAP message is present in the PCO IE of the Create Session request, the system uses that for authentication instead of the format specified for this command. If you specify a format that includes APN, the separator is an @ character; for example, msisdn@apn.

The **no** form of this command reverts to the default.

### Default

```
gtp-user-name imsi
```

### Parameters

#### *imsi*

Specifies to use IMSI as the username.

#### *imsi-apn*

Specifies to use IMSI and APN as the username; for example, imsi@apn.

#### *msisdn*

Specifies to use MSISDN as the username.

***msisdn-apn***

Specifies to use MSISDN and APN as the username; for example, `msisdn@apn`.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 11.103 gtpc-inspection

### gtpc-inspection

**Syntax**

`[no] gtpc-inspection`

**Context**

[\[Tree\]](#) (config>app-assure>group>gtp gtpc-inspection)

**Full Context**

configure application-assurance group gtp gtpc-inspection

**Description**

This command configures the inspection of GTP-C packets. This is relevant only when AA GTP FW is deployed on S8/S5/Gp/Gn interfaces. The **gtpc-inspection** command must be enabled before configuring related features, such as APN filtering, GTP tunnel validation, message-type-v2 filtering, sequence number validation, SRC IP validation.

The **no** form of this command disables GTP-C packet inspection.

**Default**

no gtpc-inspection

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 11.104 gtpv1-c

### gtpv1-c

**Syntax**

`gtpv1-c type direction {ingress | egress} script [script]`

**no gtpv1-c** *type* **direction** {**ingress** | **egress**}

### Context

[\[Tree\]](#) (config>python>py-policy gtpv1-c)

### Full Context

configure python python-policy gtpv1-c

### Description

This command configures a Python script for the specified GTPv1-C message type in the specified direction.

The **no** form of this command reverts to the default.

### Parameters

#### *type*

Specifies the message type.

**Values** echo-request, echo-response, version-not-supported, create-pdp-context-request, create-pdp-context-response, delete-pdp-context-request, delete-pdp-context-response, error-indication

#### **direction** {**ingress** | **egress**}

Specifies if the message is incoming or outgoing.

#### *script*

Specifies the name of the Python script, up to 32 characters, that is used to handle the specified message.

### Platforms

All

## 11.105 gtpv2-c

**gtpv2-c**

### Syntax

**gtpv2-c** *type* **direction** {**ingress** | **egress**} **script** [*script*]

**no gtpv2-c** *type* **direction** {**ingress** | **egress**}

### Context

[\[Tree\]](#) (config>python>py-policy gtpv2-c)

## Full Context

```
configure python python-policy gtpv2-c
```

## Description

This command configures a Python script for the specified GTPv2-C message type in the specified direction.

The **no** form of this command reverts to the default.

## Parameters

### *type*

Specifies the message type

**Values** echo-request, echo-response, version-not-supported, create-session-request, create-session-response, delete-session-request, delete-session-response, delete-bearer-request, delete-bearer-response, modify-bearer-request, modify-bearer-response, release-access-bearers-request, release-access-bearers-response, downlink-data-notification, downlink-data-notification-ack, change-notification-request, change-notification-response, stop-paging-indication

### **direction {ingress | egress}**

Specifies if the message is incoming or outgoing.

### *script*

Specifies the name of the Python script, up to 32 characters, that is used to handle the specified message.

## Platforms

## 11.106 guard-time

```
guard-time
```

## Syntax

```
guard-time time
```

```
no guard-time
```

## Context

[\[Tree\]](#) (config>eth-ring guard-time)

## Full Context

```
configure eth-ring guard-time
```

## Description

This command configures the guard time for an Eth-Ring. The guard timer is standard and is configurable from "x" ms to 2 seconds.

The **no** form of this command restores the default guard-time.

## Default

no guard-time

## Parameters

### *value*

Specifies the guard-time, in deciseconds.

**Values** 1 to 20

**Default** 5

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 11.107 gw-address-range

### gw-address-range

## Syntax

**gw-address-range** **start** *start* **end** *end*

**no gw-address-range**

## Context

[\[Tree\]](#) (config>subscr-mgmt>isa-svc-chain>evpn>export gw-address-range)

## Full Context

configure subscriber-mgmt isa-service-chaining evpn export gw-address-range

## Description

This command specifies the address range to be used for the gateway IP address field in EVPN type-5 routes that are advertised for configured NAT pools, to the peer for service-chaining. The system allocates one address for each ISA in the NAT group out of the specified range.

The **no** form of this command removes the values from the configuration.

## Parameters

### *start*

Specifies the starting gateway address range (V4) for this EVPN service.

**Values** ipv4-address: a.b.c.d

**end**

Specifies the ending gateway address range (V4) for this EVPN service.

**Values** ipv4-address: a.b.c.d

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 11.108 gw-addresses

### gw-addresses

#### Syntax

**gw-addresses**

#### Context

#### Full Context

configure service ies subscriber-interface group-interface wlan-gw gw-addresses

configure service vprn subscriber-interface group-interface wlan-gw gw-addresses

#### Description

This command specifies gateway endpoint address for the wlan-gw tunnel.

The **no** form of this command removes the gateway ipv4 or IPv6 endpoint address for the wlan-gw tunnel.

#### Parameters

**ip-address**

Specifies the IP address of the wlan-gw tunnels on this group interface.

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 11.109 gw-mac

## gw-mac

### Syntax

**gw-mac** *mac-address*

**no gw-mac**

### Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>srrp gw-mac)

### Full Context

```
configure service vprn subscriber-interface group-interface srrp gw-mac
```

### Description

This command overrides the default SRRP gateway MAC address used by the SRRP instance. Unless specified, the system uses the same base MAC address for all SRRP instances with the last octet overridden by the lower 8 bits of the SRRP instance ID. The same SRRP gateway MAC address should be in-use by both the local and remote routers participating in the same SRRP context.

One reason to change the default SRRP gateway MAC address is if two SRRP instances sharing the same broadcast domain are using the same SRRP gateway MAC. The system will use the SRRP instance ID to separate the SRRP messages (by ignoring the messages that does not match the local instance ID), but a unique SRRP gateway MAC is essential to separate the routed packets for each gateway IP address.

The **no** form of this command removes the explicit SRRP gateway MAC address from the SRRP instance. The SRRP gateway MAC address can only be changed or removed when the SRRP instance is shutdown.

### Parameters

#### *mac-address*

Specifies a MAC address that is used to override the default SRRP base MAC address.

**Values** Any MAC address except all zeros, broadcast or multicast addresses. The offset is expressed in normal Ethernet MAC address notation. The defined gw-mac cannot be 00:00:00:00:00:00, ff:ff:ff:ff:ff:ff or any multicast address.

If not specified, the system uses the default SRRP gateway MAC address with the last octet set to the 8 least significant bits of the SRRP instance ID.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 11.111 gx-session-level-usage

### gx-session-level-usage

**Syntax**

[no] **gx-session-level-usage**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>cat-map gx-session-level-usage)

**Full Context**

configure subscriber-mgmt category-map gx-session-level-usage

**Description**

This command controls the instantiation of an internal category required for Diameter Gx session level Usage Monitoring (per IP-CAN session).

When configured, Gx session level Usage Monitoring can be enabled for sessions associated with this category map.

The internal category for Gx session level Usage Monitoring is counted against the maximum of sixteen categories that can be configured.

When not configured (default), then no internal category is instantiated and Gx session level Usage Monitoring cannot be enabled for sessions associated with this category map.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

# 12 h Commands

## 12.1 half-life

### half-life

#### Syntax

**half-life** *half-life* **max-suppress-time** *max-time*

#### Context

**[Tree]** (config>port>ethernet>dampening half-life)

#### Full Context

configure port ethernet dampening half-life

#### Description

This command configures the half-life decay time and the maximum period of time for which the port up state can be suppressed.

The *half-life* and *max-time* values must be set at the same time; the ratio of *max-time*/*half-life* must be less than or equal to 49 and greater than or equal to 1.

#### Parameters

##### *half-life*

Specifies the required elapsed time, in seconds, before penalties decay to one-half the initial amount.

**Values** 1 to 2000

**Default** 5

##### *max-time*

Specifies the maximum suppression time, in seconds, which is the time it can take after the physical link comes up before the worst case accumulated penalties have decayed to the reuse threshold. The maximum penalty is derived from the maximum suppression time, half-life, and reuse threshold, using the following equation:

maximum penalty = (reuse threshold) X 2 expo:(max-time/half-life)

**Values** 1 to 43200

**Default** 20

## Platforms

All

## half-life

### Syntax

**half-life** *minutes*

**no half-life**

### Context

[\[Tree\]](#) (config>router>policy-options>damping half-life)

### Full Context

configure router policy-options damping half-life

### Description

This command configures the **half-life** parameter for the route damping profile.

The half-life value is the time, expressed in minutes, required for a route to remain stable in order for the Figure of Merit (FoM) value to be reduced by one half; for example, if the half-life value is 6 (minutes) and the route remains stable for 6 minutes, then the new FoM value is 3 (minutes). After another 3 minutes pass and the route remains stable, the new FoM value is 1.5 (minutes).

When the FoM value falls below the **config>router>policy-options>damping reuse** threshold, the route is once again considered valid and can be reused or included in route advertisements.

The **no** form of this command removes the half life parameter from the damping profile.

### Default

no half-life

### Parameters

*minutes*

Specifies the half-life in minutes expressed as a decimal integer.

**Values** 1 to 45

## Platforms

All

## 12.2 handler

## handler

### Syntax

[no] **handler** *event-handler-name*

### Context

[\[Tree\]](#) (config>log>event-handling handler)

### Full Context

configure log event-handling handler

### Description

This command configures an EHS handler.

The **no** form of this command removes the specified EHS handler.

### Parameters

*event-handler-name*

Specifies the name of the EHS handler, up to 32 characters maximum.

### Platforms

All

## handler

### Syntax

**handler** *name* [create]

**no handler** *name*

### Context

[\[Tree\]](#) (config>system>grpc-tunnel>tunnel handler)

### Full Context

configure system grpc-tunnel tunnel handler

### Description

Commands in this context configure tunnel handler parameters. There can be multiple handlers created for any tunnel.

The **no** form of this command removes the specified tunnel handler.

### Parameters

*name*

Specifies the handler name, up to 32 characters.

**create**

Keyword used to create a tunnel.

**Platforms**

All

## 12.3 hardware-timestamp

### hardware-timestamp

**Syntax**

[no] hardware-timestamp

**Context**

[\[Tree\]](#) (config>aaa>isa-radius-plcy>acct-include-attributes hardware-timestamp)

**Full Context**

configure aaa isa-radius-policy acct-include-attributes hardware-timestamp

**Description**

This command enables the inclusion of the hardware timestamp attributes. The **no** form of the command excludes the hardware timestamp attributes.

**Default**

no hardware-timestamp

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 12.4 hash-algorithm

### hash-algorithm

**Syntax**

hash-algorithm {hash | hash2 | custom| cleartext}

no hash-algorithm

## Context

[\[Tree\]](#) (config>system>security>management-interface>grpc hash-algorithm)

[\[Tree\]](#) (config>system>security>management-interface>netconf hash-algorithm)

[\[Tree\]](#) (config>system>security>management-interface>md-cli hash-algorithm)

## Full Context

configure system security management-interface grpc hash-algorithm

configure system security management-interface netconf hash-algorithm

configure system security management-interface md-cli hash-algorithm

## Description

This command specifies the format of the input and output for encrypted configuration secrets.

The **no** form of this command reverts to the default value.

## Default

hash-algorithm hash2

## Parameters

### hash

Specifies hash. Use this option to transport a phrase between modules and nodes.

### hash2

Specifies hash2 which is module-specific.

### custom

Specifies the custom encryption to management interface.

### cleartext

Specifies that the phrase is displayed as cleartext everywhere.

## Platforms

All

## hash-algorithm

## Syntax

**hash-algorithm** *algorithm*

## Context

[\[Tree\]](#) (config>system>security>pki>cert-upd-prof hash-algorithm)

## Full Context

hash-label [signal-capability]

no hash-label

## Context

[\[Tree\]](#) (config>service>epipe>spoke-sdp hash-label)

[\[Tree\]](#) (config>service>pw-template hash-label)

[\[Tree\]](#) (config>service>ipipe>spoke-sdp hash-label)

## Full Context

configure service epipe spoke-sdp hash-label

configure service pw-template hash-label

configure service ipipe spoke-sdp hash-label

## Description

This command enables the use of the hash label on a VLL, VPRN or VPLS service bound to any MPLS type encapsulated SDP, as well as to a VPRN service that is using the **auto-bind-tunnel** with the **resolution-filter** set to any MPLS tunnel type. This feature is not supported on a service bound to a GRE SDP or for a VPRN service using the autobind mode with the gre option. This feature is also not supported on multicast packets forwarded using RSVP P2MP LSP or mLDP LSP in both the base router instance and

in the multicast VPN (mVPN) instance. It is, however, supported when forwarding multicast packets using an IES/VPRN spoke-interface.

When this feature is enabled, the ingress data path is modified such that the result of the hash on the packet header is communicated to the egress data path for use as the value of the label field of the hash label. The egress data path appends the hash label at the bottom of the stack (BoS) and sets the S-bit to one (1).

To allow applications where the egress LER infers the presence of the hash label implicitly from the value of the label, the Most Significant Bit (MSB) of the result of the hash is set before copying into the Hash Label. This means that the value of the hash label will always be in the range [524,288 - 1,048,575] and will not overlap with the signaled/static LSP and signaled/static service label ranges. This also guarantees that the hash label will not match a value in the reserved label range.

The (unmodified) result of the hash continues to be used for the purpose of ECMP and LAG spraying of packets locally on the ingress LER. Note, however, that for VLL services, the result of the hash is overwritten and the ECMP and LAG spraying will be based on service-id when ingress SAP shared queuing is not enabled. However, the hash label will still reflect the result of the hash such that an LSR can use it to perform fine grained load balancing of VLL pseudowire packets.

Packets generated in CPM and that are forwarded labeled within the context of a service (for example, OAM packets) must also include a Hash Label at the BoS and set the S-bit accordingly.

The TTL of the hash label is set to a value of 0.

The user enables the signaling of the hash-label capability under a VLL spoke-sdp, a VPLS spoke-sdp or mesh SDP, or an IES/VPRN spoke interface by adding the **signal-capability** option. In this case, the decision whether to insert the hash label on the user and control plane packets by the local PE is solely determined by the outcome of the signaling process and can override the local PE configuration. The following are the procedures:

- The local PE will insert the flow label interface parameters sub-TLV with F=1 in the PW ID FEC element in the label mapping message for that spoke SDP or mesh SDP.
- If the remote PE includes this sub-TLV with F=1 or F=0, then local PE must insert the hash label in the user and control plane packets.
- If remote PE does not include this sub-TLV (for example, it does not support it, or it is supported but the user did not enable the **hash-label** option or the **signal-capability** option), then the local PE establishes the PW but must not insert the hash label in the user and control packets over that spoke SDP or mesh SDP. If the remote PE does not support the **signal-capability** option, then there are a couple of possible outcomes:
  - If the **hash-label** option was enabled on the local configuration of the spoke SDP or mesh SDP at the remote PE, the PW packets received by the local PE will have the hash label included. These packets must be dropped. The only way to solve this is to disable the signaling capability option on the local node which will result in the insertion of the hash label by both PE nodes.
  - If the **hash-label** option is not supported or was not enabled on the local configuration of the spoke SDP or mesh SDP at the remote PE, the PW received by the local PE will not have the hash label included.
- The user can enable or disable the signal-capability option in CLI as needed. When doing so, the 7450 ESS or 7750 SR must withdraw the label it sent to its peer and send a new label mapping message with the new value of the F bit in the flow label interface parameters sub-TLV of the PW ID FEC element.

The **no** form of this command disables the use of the hash label.

## Default

no hash-label

## Parameters

### signal-capability

Enables the signaling and negotiation of the use of the hash label between the local and remote PE nodes. The **signal-capability** option is not supported on a VPRN spoke-sdp.

## Platforms

All

## hash-label

## Syntax

**hash-label signal-capability**

**hash-label**

**no hash-label**

## Context

[\[Tree\]](#) (config>service>vpls>mesh-sdp hash-label)

[\[Tree\]](#) (config>service>vpls>spoke-sdp hash-label)

## Full Context

configure service vpls mesh-sdp hash-label

configure service vpls spoke-sdp hash-label

## Description

This command enables the use of the hash label on a VLL, VPRN, or VPLS service bound to any MPLS type encapsulated SDP, as well as to a VPRN service using the **auto-bind-tunnel** with the **resolution-filter** set to any MPLS tunnel type. This feature is not supported on a service bound to a GRE SDP or for a VPRN service using the autobind mode with the gre option. This feature is also not supported on multicast packets forwarded using RSVP P2MP LSP or mLDP LSP in both the base router instance and in the multicast VPN (mVPN) instance. It is, however, supported when forwarding multicast packets using an IES/VPRN spoke-interface.

When this feature is enabled, the ingress data path is modified such that the result of the hash on the packet header is communicated to the egress data path for use as the value of the label field of the hash label. The egress data path appends the hash label at the bottom of the stack (BoS) and sets the S-bit to one (1).

To allow applications where the egress LER infers the presence of the hash label implicitly from the value of the label, the Most Significant Bit (MSB) of the result of the hash is set before copying into the Hash Label. This means that the value of the hash label will always be in the range [524,288 - 1,048,575] and will not overlap with the signaled/static LSP and signaled/static service label ranges. This also guarantees that the hash label will not match a value in the reserved label range.

The (unmodified) result of the hash continues to be used for the purpose of ECMP and LAG spraying of packets locally on the ingress LER. Note, however, that for VLL services, the result of the hash is overwritten and the ECMP and LAG spraying will be based on service-id when ingress SAP shared queuing is not enabled. However, the hash label will still reflect the result of the hash such that an LSR can use it to perform fine grained load balancing of VLL pseudowire packets.

Packets generated in CPM and that are forwarded labeled within the context of a service (for example, OAM packets) must also include a Hash Label at the BoS and set the S-bit accordingly.

The TTL of the hash label is set to a value of 0.

The user enables the signaling of the hash-label capability under a VLL spoke-sdp, a VPLS spoke-sdp or mesh-sdp, or an IES/VP RN spoke interface by adding the **signal-capability** option. In this case, the decision whether to insert the hash label on the user and control plane packets by the local PE is solely determined by the outcome of the signaling process and can override the local PE configuration. The following are the procedures:

- The 7450 ESS, 7750 SR, and 7950 XRS local PE will insert the flow label interface parameters sub-TLV with F=1 in the pseudowire ID FEC element in the label mapping message for that spoke-sdp or mesh-sdp.
- If the remote PE includes this sub-TLV with F=1 or F=0, then local PE must insert the hash label in the user and control plane packets.
- If remote PE does not include this sub-TLV (for example, it does not support it, or it is supported but the user did not enable the **hash-label** option or the **signal-capability** option), then the local PE establishes the pseudowire but must not insert the hash label in the user and control packets over that spoke-sdp or mesh-sdp. If the remote PE does not support the **signal-capability** option, then there are a couple of possible outcomes:
  - If the **hash-label** option was enabled on the local configuration of the spoke-sdp or mesh-sdp at the remote PE, the pseudowire packets received by the local PE will have the hash label included. These packets must be dropped. The only way to solve this is to disable the signaling capability option on the local node which will result in the insertion of the hash label by both PE nodes.
  - If the **hash-label** option is not supported or was not enabled on the local configuration of the spoke-sdp or mesh-sdp at the remote PE, the pseudowire received by the local PE will not have the hash label included.
- The user can enable or disable the signal-capability option in CLI as needed. When doing so, the 7450 ESS, 7750 SR, and 7950 XRS must withdraw the label it sent to its peer and send a new label mapping message with the new value of the F bit in the flow label interface parameters sub-TLV of the pseudowire ID FEC element.

The **no** form of this command disables the use of the hash label.

## Default

no hash-label

## Parameters

### signal-capability

Enables the signaling and negotiation of the use of the hash label between the local and remote PE nodes. The **signal-capability** option is not supported on a VPRN spoke-sdp.

## Platforms

All

## hash-label

### Syntax

**hash-label** [**signal-capability**]

**no hash-label**

### Context

[\[Tree\]](#) (config>service>ies>if>spoke-sdp hash-label)

### Full Context

configure service ies interface spoke-sdp hash-label

### Description

This command enables the use of the hash label on a VLL, VPLS, or VPRN service bound to any MPLS-type encapsulated SDP, as well as to a VPRN service using **auto-bind-tunnel** with the **resolution-filter** configured as any MPLS tunnel type. This feature is not supported on a service bound to a GRE SDP or for a VPRN service using the autobind mode with the gre option.

When this feature is enabled, the ingress data path is modified such that the result of the hash on the packet header is communicated to the egress data path for use as the value of the label field of the hash label. The egress data path appends the hash label at the bottom of the stack (BoS) and sets the S-bit to 1 to indicate that.

In order to allow for applications whereby the egress LER infers the presence of the hash label implicitly from the value of the label, the Most Significant Bit (MSB) of the result of the hash is set before copying into the hash label. This means that the value of the hash label will always be in the range [524,288 to 1,048,575] and will not overlap with the signaled/static LSP and signaled/static service label ranges. This also guarantees that the hash label will not match a value in the reserved label range.

The (unmodified) result of the hash continues to be used for the purpose of ECMP and LAG spraying of packets locally on the ingress LER. For VLL services, the result of the hash is overwritten and the ECMP and LAG spraying will be based on service-id when ingress SAP shared queuing is not enabled. However, the hash label will still reflect the result of the hash such that an LSR can use it to perform fine grained load balancing of VLL pseudowire packets.

Packets that are generated in CPM and forwarded labeled within the context of a service (for example, OAM packets) must also include a hash label at the BoS and set the S-bit accordingly.

The TTL of the hash label is set to a value of 0.

The user enables the signaling of the hash-label capability under a VLL spoke-sdp, a VPLS spoke-sdp or mesh-sdp, or an IES/VPRN spoke interface by adding the **signal-capability** option. In this case, the decision whether to insert the hash label on the user and control plane packets by the local PE is solely determined by the outcome of the signaling process and can override the local PE configuration. The following are the procedures:

- The local PE will insert the flow label interface parameters sub-TLV with F=1 in the PW ID FEC element in the label mapping message for that spoke-sdp or mesh-sdp.

- If the remote PE includes this sub-TLV with F=1 or F=0, then local PE must insert the hash label in the user and control plane packets.
- If remote PE does not include this sub-TLV (for example, it does not support it, or it is supported but the user did not enable the **hash-label** option or the **signal-capability** option), then the local PE establishes the PW but must not insert the hash label in the user and control packets over that spoke-sdp or mesh-sdp. If the remote PE does not support the **signal-capability** option, then there are a couple of possible outcomes:
  - If the **hash-label** option was enabled on the local configuration of the spoke-sdp or mesh-sdp at the remote PE, the PW packets received by the local PE will have the hash label included. These packets must be dropped. The only way to solve this is to disable the signaling capability option on the local node which will result in the insertion of the hash label by both PE nodes.
  - If the **hash-label** option is not supported or was not enabled on the local configuration of the spoke-sdp or mesh-sdp at the remote PE, the PW received by the local PE will not have the hash label included.
- The user can enable or disable the signal-capability option in CLI as needed. When doing so, the router must withdraw the label it sent to its peer and send a new label mapping message with the new value of the F bit in the flow label interface parameters sub-TLV of the PW ID FEC element.

The **no** form of this command disables the use of the hash label.

### Default

no hash-label

### Parameters

configure service vprn hash-label
```

## Description

This command enables the use of the hash label on a VLL, VPLS, or VPRN service bound to any MPLS-type encapsulated SDP as well as to a VPRN service using **auto-bind-tunnel** with the **resolution-filter** configured as any MPLS tunnel type. This feature is not supported on a service bound to a GRE SDP or for a VPRN service using the autobind mode with the gre option.

When this feature is enabled, the ingress data path is modified such that the result of the hash on the packet header is communicated to the egress data path for use as the value of the label field of the hash label. The egress data path appends the hash label at the bottom of the stack (BoS) and sets the S-bit to 1 to indicate that.

In order to allow for applications whereby the egress LER infers the presence of the Hash Label implicitly from the value of the label, the Most Significant Bit (MSB) of the result of the hash is set before copying into the Hash Label. This means that the value of the hash label will always be in the range [524,288 - 1,048,575] and will not overlap with the signaled/static LSP and signaled/static service label ranges. This also guarantees that the hash label will not match a value in the reserved label range.

The (unmodified) result of the hash continues to be used for the purpose of ECMP and LAG spraying of packets locally on the ingress LER. For VLL services, the result of the hash is overwritten and the ECMP and LAG spraying will be based on service-id when ingress SAP shared queuing is not enabled. However, the hash label will still reflect the result of the hash such that an LSR can use it to perform fine grained load balancing of VLL pseudowire packets.

Packets that are generated in CPM and forwarded labeled within the context of a service (for example, OAM packets) must also include a Hash Label at the BoS and set the S-bit accordingly.

The TTL of the hash label is set to a value of 0.

The **no** form of this command disables the use of the hash label.

## Default

```
no hash-label
```

## Parameters

### signal-capability

Specifies whether the service should send the Stack Capability and check whether the capability is received from the peer via LDP interface parameters.

## Platforms

All

## hash-label

### Syntax

**[no] hash-label**

### Context

**[Tree]** (config>service>vpls>bgp-evpn>mpls hash-label)

### Full Context

configure service vpls bgp-evpn mpls hash-label

### Description

This command pushes the hash label based on the following:

- If the **no incl-mcast-l2-attributes-advertisement** command is configured, the hash label is pushed to a unicast EVPN destination.
- If the **incl-mcast-l2-attributes-advertisement** command is configured, the F bit is set to 1 in the Layer 2 Attributes Extended Community of the EVPN IMET route for the service. The hash label is pushed only if the remote PE signaled support for hash label (received F bit is set to 1).

The hash label is never used for BUM packets.

The **no** form of this command disables the push of the hash label.

### Default

no hash-label

**12.7 hash-weight-threshold**

## hash-weight-threshold

### Syntax

**hash-weight-threshold** *weight* [**action** *action*] [**cost** *static-cost*]

**no hash-weight-threshold**

### Context

**[Tree]** (config>lag hash-weight-threshold)

### Full Context

configure lag hash-weight-threshold

### Description

This command controls the operational status of the LAG or the IGP cost based on the sum of the **hash-weight** values for the active links in the LAG.

The **no** form of this command disables the hash weight threshold.

### Parameters

#### *weight*

Specifies the value for the sum of all the active LAG ports **hash-weight** at or below which the configured action is invoked. If the sum of **hash-weight** for operational LAG links exceeds the **hash-weight-threshold** value, then no action is taken.

**Values** 1 to 6400000

#### *action*

Specifies the action to take if the sum of the **hash-weight** for active links in the LAG is equal or below the threshold value.

**Values** **down** — Specifies that the LAG is operationally DOWN. The LAG is only considered as UP once the number of **hash-weight** for the active links exceeds the configured threshold value.

**dynamic-cost** — Specifies that dynamic cost is activated. The LAG remains operationally UP with a link cost relative to the number of operational links. The link is only considered as operationally DOWN when all links in the LAG are down.

**static-cost** — Specifies that static cost is activated. The LAG remains operationally UP with the configured cost, regardless of the number of operational links. The link is only considered as operationally DOWN when all links in the LAG are down. If this parameter is used with an IGP, its **reference-bandwidth** must also be configured.

#### *static-cost*

Specifies the decimal integer static cost of the LAG.

**Values** 1 to 16777215

## 12.10 head-end

```
head-end
```

### Syntax

```
head-end local
```

```
head-end ipv4-address
```

```
no head-end
```

### Context

[\[Tree\]](#) (conf>router>segment-routing>sr-policies>policy head-end)

### Full Context

```
configure router segment-routing sr-policies static-policy head-end
```

### Description

This command associates a head-end location with a statically-defined segment-routing policy. The head-end identifies the router that is the target to install the policy. This is a mandatory parameter and configuration command for enabling the segment-routing policy; if the head-end parameter value is not configured, the execution of the **no shutdown** command on the static segment routing policy fails.

To associate a static policy with the local router as head-end, the keyword **local** must be specified. The static policy is associated with another (non-local) router, if the head-end parameter is set to any IPv4 address. When a non-local, static segment routing policy that originates as a BGP route is imported into

BGP, the configured head-end address is converted to an IPv4-address specific route-target extended community that is automatically added to the route.

The **no** form of this command removes the head-end association.

### Default

no head-end

### Parameters

#### *local*

Keyword indicating that the policy is intended to be used by the local router and not advertised to other BGP routers.

#### *ipv4-address*

Specifies the IP address of the target head-end router.

| Values | ipv4-address: | a.b.c.d |
|--------|---------------|---------|
|--------|---------------|---------|

## health-check

## Syntax

[no] health-check [interval *interval*]

## Context

[\[Tree\]](#) (config>system>security>password health-check)

## Full Context

configure system security password health-check

## Description

This command enables health check monitoring of the RADIUS, TACACS+, and LDAP servers by sending authentication requests for an unknown user at regular intervals. If a response is not received, the operational status of the server is changed to down. The operational status is changed to up when responses are received.

When RADIUS over TLS is configured, Status-Server packets are sent at 30-second intervals as specified in *RFC 3539*, regardless of whether health checks are enabled.

The **no** form of this command disables health monitoring of RADIUS, TACACS+, and LDAP servers. In this case, the operational status for the server is up if a response was received for the last user request.

## Default

health-check interval 30

## Parameters

### *interval*

Specifies the polling interval for RADIUS, TACACS+, and LDAP servers.

**Values** 6 to 1500

**Default** 30

configure router ldp interface-parameters interface ipv4 hello

configure router ldp interface-parameters ipv6 hello

configure router ldp interface-parameters interface ipv6 hello

configure router ldp targeted-session ipv6 hello

configure router ldp targeted-session peer hello

configure router ldp targeted-session peer-template hello

configure router ldp interface-parameters ipv4 hello

configure router ldp targeted-session ipv4 hello

### Description

This command configures the time interval to wait before declaring a neighbor down. The **factor** parameter derives the Hello interval.

The **config>router>ldp>if-params>ipv6>hello** and **config>router>ldp>targ-session>ipv6>hello** commands are not supported on the 7450 ESS.

Hold time is local to the system and sent in the Hello messages to the neighbor. Hold time cannot be less than three times the Hello interval. The hold time can be configured globally (applies to all LDP interfaces) or per interface. The most specific value is used.

When LDP session is being set up, the hold down time is negotiated to the lower of the two peers. Once an operational value is agreed upon, the Hello factor is used to derive the value of the Hello interval.

The **no** form of the command at the interface-parameters and targeted-session level sets the **hello timeout** and the **hello factor** to the default values.

The **no** form of the command, at the interface level, sets the **hello timeout** and the **hello factor** to the value defined under the interface-parameters level.

The **no** form of this command, at the peer level, sets the **hello timeout** and the **hello factor** to the value defined under the targeted-session level.

The session must be flapped for the new settings to operate.

### Default

[Table 50: Hello Timeout Factors](#) lists the default values.

*Table 50: Hello Timeout Factors*

| Context                        | Timeout                                            | Factor |
|--------------------------------|----------------------------------------------------|--------|
| config>router>ldp>if-params    | 15                                                 | 3      |

## 12.19 hello-authentication-key

## hello-authentication-key

### Syntax

**hello-authentication-key** {*authentication-key* | *hash-key*} [**hash** | **hash2** | **custom**]

**no hello-authentication-key**

### Context

[\[Tree\]](#) (config>service>vprn>isis>if hello-authentication-key)

[\[Tree\]](#) (config>service>vprn>isis>if>level hello-authentication-key)

## Full Context

```
configure service vprn isis interface hello-authentication-key
configure service vprn isis interface level hello-authentication-key
```

## Description

This command configures the authentication key (password) for Hello PDUs. Neighboring routers use the password to verify the authenticity of Hello PDUs sent from this interface. Both the Hello authentication key and the Hello authentication type on a segment must match. The **hello-authentication-type** must be specified.

To configure the Hello authentication key in the interface context use the **hello-authentication-key** in the **config>router>isis>if** context.

To configure or override the Hello authentication key for a specific level, configure the **hello-authentication-key** in the **config>router>isis>if>level** context.

If both IS-IS and hello-authentication are configured, Hello messages are validated using Hello authentication. If only IS-IS authentication is configured, it will be used to authenticate all IS-IS (including Hello) protocol PDUs.

When the Hello authentication key is configured in the **config>router>isis>if** context, it applies to all levels configured for the interface.

The **no** form of this command removes the authentication-key from the configuration.

## Default

no hello-authentication-key — No Hello authentication key is configured.

## Parameters

### *authentication-key*

The Hello authentication key (password). The key can be any combination of ASCII characters up to 254 characters in length (un-encrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

### *hash-key*

The hash key. The key can be any combination of ASCII characters up to 342 characters in length (encrypted). If spaces are used in the string, enclose the entire string in quotation marks (" ").

This is useful when a user must configure the parameter, but, for security purposes, the actual unencrypted key value is not provided.

### **hash**

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### **hash2**

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be

in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**custom**

Specifies the custom encryption to management interface.

**[Tree]** (config>service>vprn>isis>if>level hello-authentication-type)

**[Tree]** (config>service>vprn>isis>if hello-authentication-type)

**Full Context**

configure service vprn isis interface level hello-authentication-type

configure service vprn isis interface hello-authentication-type

## Description

This command enables Hello authentication at either the interface or level context. Both the Hello authentication key and the Hello authentication type on a segment must match. The hello **authentication-key** statement must also be included.

To configure the Hello authentication type at the interface context, use **hello-authentication-type** in the **config>router>isis>if** context.

To configure or override the Hello authentication setting for a given level, configure the **hello-authentication-type** in the **config>router>isis>if>level** context.

The **no** form of this command disables Hello authentication.

## Default

no hello-authentication-type — Hello authentication is disabled

## Parameters

### password

Specifies simple password (plain text) authentication is required.

### message-digest

Specifies MD5 authentication in accordance with RFC2104 (HMAC: Keyed-Hashing for Message Authentication) is required.

## Platforms

All

## hello-authentication-type

## Syntax

**hello-authentication-type** {password | message-digest}

configure router l2tp group hello-interval

configure router l2tp hello-interval

configure service vprn l2tp group tunnel hello-interval

```
configure service vprn l2tp group hello-interval
```

### Description

This command configures the time interval between two consecutive tunnel Hello messages. The Hello message is an L2TP control message sent by either peer of a LAC-LNS control connection. This control message is used as a keepalive for the tunnel.

The **no** form of this command removes the interval from the configuration.

### Default

```
hello-interval 300
```

### Parameters

#### *hello-interval*

Specifies the time interval, in seconds, between two consecutive tunnel Hello messages.

**Default** no hello-interval

**Values** 10 to 3600

#### **infinite**

Specifies that no Hello interval messages are sent.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## hello-interval

### Syntax

```
hello-interval seconds
```

```
no hello-interval
```

### Full Context

```
configure service vpls sap spb level hello-interval
```

```
configure service vpls spoke-sdp spb level hello-interval
```

### Description

This command configures the interval in seconds between Hello messages issued on this interface at this level. This command is valid only for interfaces on control B-VPLS.

The no form of this command to reverts to the default value.

## Default

hello-interval 3 — Hello interval default for the designated inter-system.

hello-interval 9 — Hello interval default for non-designated inter-systems.

## Parameters

### *seconds*

The Hello interval in seconds expressed as a decimal integer.

**Values** 1 to 20000

## Platforms

All

## hello-interval

## Syntax

**hello-interval** *seconds*

**no hello-interval**

## Context

[\[Tree\]](#) (config>router>isis>if>level hello-interval)

## Full Context

configure service vprn isis interface level hello-interval

configure router isis interface level hello-interval

## Description

This command configures the interval between IS-IS Hello PDUs issued on the interface at this level. The **hello-interval**, along with the **hello-multiplier**, is used to calculate a hold time, which is communicated to a neighbor in a Hello PDU.

### **Note:**

The neighbor hold time is (hello multiplier X hello interval) on non-designated intermediate system broadcast interfaces and point-to-point interfaces and is (hello multiplier X hello interval / 3) on designated intermediate system broadcast interfaces. Hello values can be adjusted for faster convergence, but the hold time should always be > 3 to reduce routing instability.

The **no** form of this command reverts to the default value.

## Default

3 – for designated intermediate system interfaces

9 – for non-designated intermediate system interfaces and point-to-point interfaces

## Parameters

### *seconds*

The Hello interval in seconds expressed as a decimal integer.

**Values** 1 to 20000

## Platforms

All

## hello-interval

## Syntax

**hello-interval** *hello-interval*

**no hello-interval**

## Context

configure service vprn ospf area interface hello-interval

configure service vprn ospf3 area interface hello-interval

configure service vprn ospf3 area virtual-link hello-interval

configure service vprn ospf area sham-link hello-interval

### Description

This command configures the interval between OSPF Hello messages issued on the interface, virtual link, or sham-link.

The Hello interval, in combination with the dead-interval, is used to establish and maintain the adjacency. Use this parameter to edit the frequency that Hello packets are sent.

Reducing the interval, in combination with an appropriate reduction in the associated **dead-interval**, allows for faster detection of link and/or router failures at the cost of higher processing costs.

The **no** form of this command reverts to the default value.

### Default

hello-interval 10 — a 10-second Hello interval

### Parameters

#### *seconds*

The Hello interval in seconds expressed as a decimal integer.

**Values** 1 to 65535

### Platforms

All

## hello-interval

### Description

This command configures the frequency at which PIM Hello messages are transmitted on this interface. The **no** form of this command resets the configuration to the default value.

### Default

hello-interval 30

### Parameters

#### *hello-interval*

Specifies the Hello interval in seconds. A 0 (zero) value disables the sending of Hello messages (the PIM neighbor will never timeout the adjacency).

**Values** 0 to 255 seconds

### Platforms

All

## hello-interval

### Syntax

**hello-interval** *milli-seconds*

**no hello-interval**

### Context

[Tree] (config>router>rsvp>interface hello-interval)

### Full Context

configure router rsvp interface hello-interval

### Description

This command configures the time interval between RSVP Hello messages.

RSVP Hello packets are used to detect loss of RSVP connectivity with the neighboring node. Hello packets detect the loss of neighbor far quicker than it would take for the RSVP session to time out based on the refresh interval. After the loss of the of number keep-multiplier consecutive Hello packets, the neighbor is declared to be in a down state.

The **no** form of this command reverts to the default value of the hello-interval. To disable sending hello messages, set the value to zero.

### Default

hello-interval 3000

### Parameters

#### *milli-seconds*

Specifies the RSVP Hello interval (in ms), in multiples of 1000. A 0 (zero) value disables the sending of RSVP Hello messages.

**Values** 0 to 60000 ms (in multiples of 1000)

### Platforms

configure service vpls spoke-sdp spb level hello-multiplier
```

## Description

This command configures the number of missing Hello PDUs from a neighbor SPB declares the adjacency down. This command is valid only for interfaces on control B-VPLS.

The no form of this command reverts to the default value.

## Default

hello-interval 3 — SPB can miss up to 3 Hello messages before declaring the adjacency down.

## Parameters

### *multiplier*

The multiplier for the Hello interval expressed as a decimal integer.

**Values** 2 to 100

## Platforms

All

## hello-multiplier

## Syntax

```
hello-multiplier multiplier
no hello-multiplier
```

## Context

[\[Tree\]](#) (config>router>isis>if>level>level-number hello-multiplier)

[\[Tree\]](#) (config>service>vprn>isis>if>level hello-multiplier)

## Full Context

```
configure router isis interface level level-number hello-multiplier
configure service vprn isis interface level hello-multiplier
```

## Description

This command configures the number of missing Hello messages from a neighbor before the router declares the adjacency down.

**Note:**

The neighbor hold time is (hello multiplier X hello interval) on point-to-point interfaces, and (hello multiplier X hello interval / 3) on broadcast interfaces. Hello values can be adjusted for faster convergence, but the hold-time should always be > 3 to reduce routing instability.

The **no** form of this command reverts to the default value.

**Default**

hello-multiplier 3

**Parameters*****multiplier***

The multiplier for the Hello interval expressed as a decimal integer.

**Values** 2 to 100

**Platforms**

All

## hello-multiplier

**Syntax**

**hello-multiplier** *deci-units*

**no hello-multiplier**

**Context**

[\[Tree\]](#) (config>service>vprn>mvpn>pt>inclusive>pim hello-multiplier)

**Full Context**

configure service vprn mvpn provider-tunnel inclusive pim hello-multiplier

**Description**

This command configures the multiplier to determine the hold time for a PIM neighbor on this interface. The **hello-multiplier** in conjunction with the **hello-interval** determines the holdtime for a PIM neighbor.

**Parameters*****deci-units***

Specify the value, specified in multiples of 0.1, for the formula used to calculate the holdtime based on the **hello-multiplier**:

**(hello-interval X hello-multiplier) / 10**

This allows the PIMv2 default **hello-multiplier** of 3.5 and the default timeout of 105 seconds to be supported.

**Values** 20 to 100

**Default** 35

## Platforms

All

hello-multiplier

## Syntax

**hello-multiplier** *deci-units*

**no hello-multiplier**

## Context

[\[Tree\]](#) (config>service>vprn>pim>if hello-multiplier)

## Full Context

configure service vprn pim interface hello-multiplier

## Description

This command configures the multiplier to determine the hold time for a PIM neighbor on this interface. The **hello-multiplier** in conjunction with the **hello-interval** determines the holdtime for a PIM neighbor.

## Default

hello-multiplier 35

## Parameters

### *deci-units*

Specify the value, specified in multiples of 0.1, for the formula used to calculate the holdtime based on the **hello-multiplier**:

**(hello-interval X hello-multiplier) / 10**

This allows the PIMv2 default **hello-multiplier** of 3.5 and the default timeout of 105 seconds to be supported.

**Values** 20 to 100

## Platforms

All

hello-multiplier

## Syntax

**hello-multiplier** *deci-units*

## no hello-multiplier

### Context

[\[Tree\]](#) (config>router>pim>interface hello-multiplier)

### Full Context

configure router pim interface hello-multiplier

### Description

This command configures the multiplier to determine the holdtime for a PIM neighbor on this interface. The **hello-multiplier** in conjunction with the **hello-interval** determines the holdtime for a PIM neighbor. The **no** form of this command reverts to the default value.

### Default

hello-multiplier 35

### Parameters

#### *deci-units*

Specifies the value, in multiples of 0.1, for the formula used to calculate the holdtime based on the **hello-multiplier**:

$(\text{hello-interval} \times \text{hello-multiplier}) / 10$

This allows the PIMv2 default **hello-multiplier** of 3.5 and the default timeout of 105 seconds to be supported.

**Values** 20 to 100

**Default** 35

### Platforms

All

## hello-multiplier

### Syntax

**hello-multiplier** *multiplier*

**no hello-multiplier**

### Context

[\[Tree\]](#) (config>router>isis>if>level hello-multiplier)

### Full Context

configure router isis interface level hello-multiplier

## Description

This command configures a Hello multiplier. The **hello-multiplier**, along with the **hello-interval**, is used to calculate a hold time, which is communicated to a neighbor in a Hello PDU.

The hold time is the time in which the neighbor expects to receive the next Hello PDU. If the neighbor receives a Hello within this time, the hold time is reset. If the neighbor does not receive a Hello within the hold time, it brings the adjacency down.

### Note:

The neighbor hold time is (hello multiplier X hello interval) on non-designated intermediate system broadcast interfaces and point-to-point interfaces and is (hello multiplier X hello interval / 3) on designated intermediate system broadcast interfaces. Hello values can be adjusted for faster convergence, but the hold time should always be > 3 to reduce routing instability.

The **no** form of this command reverts to the default value.

## Default

hello-multiplier 3

## Parameters

### *multiplier*

Specifies the multiplier for the Hello interval expressed as a decimal integer.

**Values** 2 to 100

## Platforms

All

## 12.23 hello-padding

hello-padding

## Syntax

**hello-padding** {**none** | **adaptive** | **loose** | **strict**}

**no hello-padding**

## Context

**[Tree]** (config>service>vprn>isis>level hello-padding)

**[Tree]** (config>service>vprn>isis>if>level hello-padding)

**[Tree]** (config>service>vprn>isis hello-padding)

**[Tree]** (config>service>vprn>isis>if hello-padding)

## Full Context

```
configure service vprn isis level hello-padding
configure service vprn isis interface level hello-padding
configure service vprn isis hello-padding
configure service vprn isis interface hello-padding
```

## Description

This command enables the IS-IS Hello (IIH) message padding to ensure that IS-IS LSPs can traverse the link. When this option is enabled, IS-IS Hello messages are padded to the maximum LSP MTU value, which can be set with the **lsp-mtu-size** command. If link MTU is greater than the maximum LSP MTU value, padding to the link MTU is applied.

The **no** form of this command disables IS-IS Hello message padding at this level. However, the router may still perform Hello padding if it was set at a higher level in the configuration. To ensure that Hello message padding is disabled, set all levels of configuration to **no hello-padding**.

## Default

no hello-padding

## Parameters

### adaptive

Specifies the adaptive padding option; this option is able to detect MTU asymmetry from one side of the connection but uses more overhead than loose padding.

- point-to-point interface—Hello PDUs are padded until the sender declares an adjacency on the link to be in the state up. If the implementation supports RFC 3373/5303, *Three-Way Handshake for IS-IS Point-to-Point Adjacencies*, then this is when the three-way state is up. If the implementation uses the "classic" algorithm described in ISO 10589, this is when the adjacency state is up. If the neighbor does not support the adjacency state TLV, then padding continues.
- broadcast interface—Padding starts until at least one adjacency is up on the interface.

### loose

Specifies the loose padding option; the loose padding may not be able to detect certain conditions such as asymmetrical MTUs between the routing devices.

- point-to-point interface—the Hello packet is padded from the initial detection of a new neighbor until the adjacency transitions to the INIT state
- broadcast interface—padding starts until at least one adjacency (broadcast only has up/down) is up on the interface

### none

Specifies that the Hello message padding is not enabled at this level, even if it is configured at one of the parent levels.

### strict

Specifies the strict padding option.

- point-to-point interface—padding is done for all adjacency states, and is continuous. Strict padding has the most overhead but detects MTU issues on both sides of a link

- broadcast interface—padding is done for all adjacency states, and is continuous. Strict padding has the most overhead but detects MTU issues on both sides of a link

## Platforms

**[Tree]** (config>router>isis>interface>level hello-padding)

### Full Context

configure router isis level hello-padding

configure router isis interface hello-padding

configure router isis hello-padding

configure router isis interface level hello-padding

### Description

This command enables IS-IS Hello (IIH) message padding to ensure that IS-IS LSPs can traverse the link. When this option is enabled, IS-IS Hello messages are padded to the maximum LSP MTU value, which can be set with the **lsp-mtu-size** command. If link MTU is greater than the maximum LSP MTU value, padding to the link MTU is applied.

The **no** form of this command disables IS-IS Hello padding at this level. However, the router may still perform Hello padding if it was set at a higher level in the configuration. To ensure that Hello message padding is disabled, set all levels of configuration to **no hello-padding**.

### Default

no hello-padding

### Parameters

#### **none**

Specifies that the Hello message padding is not enabled at this level, even if it is configured at one of the parent levels.

#### **adaptive**

Specifies the adaptive padding option; this option is able to detect LSP MTU asymmetry from one side of the connection but uses more overhead than loose padding.

1. point-to-point interface—Hello PDUs are padded until the sender declares an adjacency on the link to be in state up. If the implementation supports RFC 3373/5303, "Three-Way Handshake for IS-IS Point-to-Point Adjacencies" then this is when the three-way state is Up. If the implementation use the "classic" algorithm described in ISO 10589, this is when adjacency state is Up. If the neighbor does not support the adjacency state TLV, then padding continues.
2. broadcast interface—Padding starts until at least one adjacency is up on the interface.

**loose**

Specifies the loose padding option; the loose padding may not be able to detect certain situations such as asymmetrical LSP MTUs between the routing devices.

1. point-to-point interface—The Hello packet is padded from the initial detection of a new neighbor until the adjacency transitions to the INIT state.
2. broadcast interface—Padding starts until there is at least one adjacency (broadcast only has up/down) is up on the interface.

**strict**

Specifies the strict padding option; this option is the most overhead-intensive but detects LSP MTU issues on both sides of a link.

1. point-to-point interface—Padding is done for all adjacency states, and is continuous.
2. broadcast interface—Padding is done for all adjacency states, and is continuous.

## 12.24 hello-reduction

### hello-reduction

**Syntax**

**hello-reduction** {**enable** *factor* | **disable**}

**no hello-reduction**

**Context**

**[Tree]** (config>router>ldp>targ-session>peer-template hello-reduction)

**[Tree]** (config>router>ldp>targ-session>ipv4 hello-reduction)

**[Tree]** (config>router>ldp>targ-session>peer hello-reduction)

**[Tree]** (config>router>ldp>targ-session>ipv6 hello-reduction)

**Full Context**

configure router ldp targeted-session peer-template hello-reduction

configure router ldp targeted-session ipv4 hello-reduction

```
configure router ldp targeted-session peer hello-reduction
configure router ldp targeted-session ipv6 hello-reduction
```

## Description

This command enables the suppression of periodic targeted Hello messages between LDP peers once the targeted LDP session is brought up.

The **config>router>ldp>targ-session>ipv6>hello-reduction** command is not supported on the 7450 ESS.

When this feature is enabled, the target Hello adjacency is brought up by advertising the Hold-Time value the user configured in the " **hello timeout**" parameter for the targeted session. The LSR node will then start advertising an exponentially increasing Hold-Time value in the Hello message as soon as the targeted LDP session to the peer is up. Each new incremented Hold-Time value is sent in a number of Hello messages equal to the value of the argument *factor*, which represents the dampening factor, before the next exponential value is advertised. This provides time for the two peers to settle on the new value. When the Hold-Time reaches the maximum value of 0xffff (binary 65535), the two peers will send Hello messages at a frequency of every  $[(65535-1)/\text{local helloFactor}]$  seconds for the lifetime of the targeted-LDP session (for example, if the local Hello Factor is three (3), then Hello messages will be sent every 21844 seconds).

The LSR node continues to compute the frequency of sending the Hello messages based on the minimum of its local Hold-time value and the one advertised by its peer as in RFC 5036. Thus for the targeted LDP session to suppress the periodic Hello messages, both peers must bring their advertised Hold-Time to the maximum value. If one of the LDP peers does not, the frequency of the Hello messages sent by both peers will continue to be governed by the smaller of the two Hold-Time values.

When the user enables the Hello reduction option on the LSR node while the targeted LDP session to the peer is operationally up, the change will take effect immediately. In other words, the LSR node will start advertising an exponentially increasing Hold-Time value in the Hello message, starting with the current configured Hold-Time value.

When the user disables the Hello reduction option while the targeted LDP session to the peer is operationally up, the change in the Hold-Time from 0xffff (binary 65535) to the user configured value for this peer will take effect immediately. The local LSR will immediately advertise the value of the user configured Hold-Time value and will not wait until the next scheduled time to send a Hello to make sure the peer adjusts its local hold timeout value immediately.

In general, any configuration change to the parameters of the T-LDP Hello adjacency (modifying the Hello adjacency Hello Timeout or factor, enabling/disabling Hello reduction, or modifying Hello reduction factor) will cause the LSR node to trigger immediately an updated Hello message with the updated Hold Time value without waiting for the next scheduled time to send a Hello.

The **no** form of this command disables the Hello reduction feature.

## Default

no hello-reduction

## Parameters

### *factor*

Specifies the integer that specifies the Hello reduction dampening factor.

**Values** 3 to20

## Platforms

## 12.25 hello-time

### hello-time

#### Syntax

**hello-time** *hello-time*

**no hello-time** [*hello-time*]

#### Context

**[Tree]** (config>service>template>vpls-template>stp hello-time)

**[Tree]** (config>service>vpls>stp hello-time)

#### Full Context

configure service template vpls-template stp hello-time

configure service vpls stp hello-time

#### Description

This command configures the Spanning Tree Protocol (STP) Hello time for the Virtual Private LAN Service (VPLS) STP instance.

The Hello time parameter defines the default timer value that controls the sending interval between BPDU configuration messages by this bridge, on ports where this bridge assumes the designated role.

The active Hello time for the spanning tree is determined by the root bridge (except when the STP is running in RSTP mode, then the Hello time is always taken from the locally configured parameter).

The configured **hello-time** can also be used to calculate the forward delay. See **auto-edge** (**config>service>vpls>sap>stp auto-edge**, **config>service>template>vpls-sap-template>stp auto-edge**, **config>service>vpls>spoke-sdp>stp auto-edge**).

The **no** form of this command returns the Hello time to the default value.

#### Default

hello-time 2

#### Parameters

**hello-time**

The Hello time for the STP instance in seconds.

**Values** 1 to 10

## Platforms

All

## hello-time

### Syntax

[no] **hello-time** *seconds*

### Context

**[Tree]** (config>service>sdp>keep-alive hello-time)

### Full Context

configure service sdp keep-alive hello-time

### Description

This command configures the time period between SDP keepalive messages on the SDP-ID for the SDP connectivity monitoring messages.

The **no** form of this command reverts the **hello-time** *seconds* value to the default setting.

### Default

hello-time 10

### Parameters

#### *seconds*

Specifies the time period in seconds between SDP keepalive messages, expressed as a decimal integer.

**Values** 1 to 3600

```
configure service vprn bgp group neighbor graceful-restart long-lived helper-override-restart-time
configure service vprn bgp group graceful-restart long-lived helper-override-restart-time
```

## Description

This command overrides the restart-time advertised by a peer (in its GR capability) with a locally-configured value. This override applies only to AFI/SAFI that were included in the GR capability of the peer. The restart-time is always zero for AFI/SAFI not included in the GR capability. This command is useful if the local router wants to force LLGR phase to begin after a set time for all protected AFI/SAFI.

By default, the restart time for all AFI/SAFI in the GR capability is the value signaled by the peer.

## Default

no helper-override-restart-time

## Parameters

### *seconds*

The locally-imposed restart time for all AFI/SAFI included in the peer's GR capability.

**Values** 0 to 4095

## 12.30 hi-bw-mcast-src

### hi-bw-mcast-src

### Syntax

```
hi-bw-mcast-src [alarm] [group group-id] [default-paths-only]
no hi-bw-mcast-src
```

### Context

[\[Tree\]](#) (config>card>fp hi-bw-mcast-src)

### Full Context

```
configure card fp hi-bw-mcast-src
```

### Description

This command designates the forwarding plane as a high-bandwidth IP multicast source, expecting the ingress traffic to include high-bandwidth IP multicast traffic. When configured, the system attempts to allocate a dedicated multicast switch fabric plane (MSFP) to the forwarding plane. If a group is specified,

all FPs in the group will share the same MSFP. If the alarm parameter is specified and the system cannot allocate a dedicated MSFP to the new group or FP, the FPs will be brought online and generate an event (SYSTEM: 2052 - tmnxChassisHiBwMulticastAlarm). Similarly, if during normal operation there is a failure or removal of resources, an event will be generated if the system cannot maintain separation of MSFPs for the MDAs.

The **no** form of this command removes the high-bandwidth IP multicast source designation from the forwarding plane.

### Default

no hi-bw-mcast-src

### Parameters

#### alarm

Enables event generation if the MDA is required to share an MSFP with another MDA that is in a different group. MDAs within the same group sharing an MSFP will not cause this alarm.

#### group-id

Specifies the logical MSFP group for the MDA. MDAs configured with the same *group-id* will be placed on the same MSFP.

**Values** 0 to 32 (A value of 0 removes the MDA from the group).

**Default** By default, "none" is used, and the system will attempt to assign a unique MSFP to the MDA.

#### default-paths-only

When this parameter is specified the system will only attempt to allocate the two default paths (one high priority and one low priority) to dedicated MSFPs.

## 12.37 high-prio-only

### high-prio-only

#### Syntax

**high-prio-only** *percent*

**no high-prio-only**

#### Context

**[Tree]** (config>subscr-mgmt>sla-prof>ingress>qos>queue high-prio-only)

**[Tree]** (config>subscr-mgmt>sla-prof>egress>qos>queue high-prio-only)

#### Full Context

configure subscriber-mgmt sla-profile ingress qos queue high-prio-only

configure subscriber-mgmt sla-profile egress qos queue high-prio-only

#### Description

This command configures the value of the percentage of buffer space for the queue, used exclusively by high priority packets. The specified value overrides the default value for the context.

The priority of a packet can only be set in the SAP ingress QoS policy and is only applicable on the ingress queues for a SAP. The **high-prio-only** parameter is used to override the default value derived from the **network-queue** command.

The defined **high-prio-only** value cannot be greater than the MBS size of the queue. Attempting to change the MBS to a value smaller than the high priority reserve will generate an error and fail execution. Attempting to set the **high-prio-only** value larger than the current MBS size will also result in an error and fail execution.

The **no** form of this command returns high-prio-only to the size as configured in the QoS policy.

#### Parameters

##### *percent*

The *percent* parameter is the percentage reserved for high priority traffic on the queue. If a value of 10KBytes is desired, enter the value 10. A value of 0 specifies that none of the MBS of the queue is reserved for high priority traffic. This does not affect RED slope operation for packets attempting to be queued.

**Values** 0 to 100, default

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## high-prio-only

### Syntax

**high-prio-only** *percent-of-mbs*

**no high-prio-only**

### Context

**[Tree]** (config>qos>sap-egress>policer high-prio-only)

**[Tree]** (config>qos>sap-ingress>policer high-prio-only)

### Full Context

configure qos sap-egress policer high-prio-only

configure qos sap-ingress policer high-prio-only

### Description

This command is used to configure the percentage of the policer's PIR leaky bucket's MBS (maximum burst size) that is reserved for high-priority traffic. While the **mbs** value defines the policer's high-priority violate threshold, the percentage value defined is applied to the **mbs** value to derive the bucket's low-priority violate threshold. See the **mbs** command details for information about which types of traffic are associated with each violate threshold.

### Parameters

#### *percent-of-mbs*

The *percent-of-mbs* parameter is required when specifying **high-prio-only** and is expressed as a percentage.

**Values** 0 to 100

**Default** 10

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## high-prio-only

### Syntax

**high-prio-only** *percent-of-mbs*

**no high-prio-only**

### Context

**[Tree]** (config>qos>qgrps>egr>qgrp>policer high-prio-only)

**[Tree]** (config>qos>qgrps>ing>qgrp>policer high-prio-only)

**Full Context**

```
configure qos queue-group-templates egress queue-group policer high-prio-only
configure qos queue-group-templates ingress queue-group policer high-prio-only
```

**Description**

This command is used to configure the percentage of the policer's PIR leaky bucket's MBS (maximum burst size) that is reserved for high-priority traffic. While the **mbs** value defines the policer's high-priority violate threshold, the percentage value defined is applied to the **mbs** value to derive the bucket's low-priority violate threshold. See the **mbs** command details for information on which types of traffic is associated with each violate threshold.

**Parameters*****percent-of-mbs***

The *percent-of-mbs* parameter is required when specifying **high-prio-only** and is expressed as a percentage.

**Values** 0 to 100

**Default** 10

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## 12.38 high-rate-hold-time

### high-rate-hold-time

**Syntax**

```
high-rate-hold-time seconds [active-min-only]
```

```
no high-rate-hold-time
```

**Context**

[\[Tree\]](#) (config>qos>adv-config-policy>child-control>offered-measurement high-rate-hold-time)

**Full Context**

```
configure qos adv-config-policy child-control offered-measurement high-rate-hold-time
```

**Description**

This command sets a time period that the current offered rate should be maintained for a child policer or queue when it is seen that the offered rate is decreasing. The offered measurement that triggers the hold time is used when the hold timer expires, unless a higher offered rate is seen in the interim. When a higher rate is observed, the hold timer is canceled and the higher offered rate is used immediately.

A possible reason to define a hold timer for an offered rate is to allow a child queue is to dampen the effects of a child with a fluctuating rate on the virtual scheduler. This works similar to the max-decrement in that the child holds on to bandwidth from the virtual scheduler in case it may be needed in the near future.

This parameter has no effect on an increase to the child's offered rate. If the rate increase is above the change sensitivity, the new offered rate is immediately used.

When this command is not specified or removed, the virtual scheduler immediately reacts to measured decreases in offered load.

The **no** form of this command is used to remove any currently configured hold time for all child policers and queues associated with the policy. When the hold time is removed, any current hold timers for child policers are automatically canceled.

## Parameters

### *seconds*

The hold time configured must be specified in seconds. A value of 0 is equivalent to no high-rate-hold-time.

**Default** 0

**Values** 0 to 60

### **active-min-only**

When this optional parameter is specified, the **high-rate-hold-time** command will accept the optional **active-min-only** parameter. Attempting to remove the active-min-only parameter from the **add** command, or removing the **add** command itself, will fail while **active-min-only** is enabled on the **high-rate-hold-time** command. When specified, the respective rate or percentage is treated as the minimum offered rate for a queue, only when the queue has an actual non-zero offered rate. This is intended to limit the artificial increase in offered rate to queues that are currently active. When a queue's measured offered rate drops to zero, the system stops enforcing the minimum value.

## Platforms

All

## 12.39 high-slope

### high-slope

#### Syntax

[no] high-slope

#### Context

[\[Tree\]](#) (config>qos>slope-policy high-slope)

## Full Context

```
configure qos slope-policy high-slope
```

## Description

The **high-slope** context contains the commands and parameters for defining the high Random Early Detection (RED) slope graph. Each buffer pool supports a high RED slope for managing access to the shared portion of the buffer pool for in-profile packets.

The **high-slope** parameters can be changed at any time and the affected buffer pool high RED slopes will be adjusted appropriately.

The **no** form of this command restores the high slope configuration commands to the default values. If the commands within **high-slope** are set to the default parameters, the **high-slope** node will not appear in save config and show config output unless the detail parameter is present.

**12.45 hli-event****hli-event****Syntax****hli-event** {forward | backward | aggregate} **threshold** *raise-threshold* [**clear** *clear-threshold*]**no hli-event** {forward | backward | aggregate}**Context**[\[Tree\]](#) (config>oam-pm>session>ethernet>slm>loss-events hli-event)[\[Tree\]](#) (config>oam-pm>session>ip>twamp-light>loss-events hli-event)[\[Tree\]](#) (config>oam-pm>session>ethernet>lmm>loss-events hli-event)**Full Context**

configure oam-pm session ethernet slm loss-events hli-event

configure oam-pm session ip twamp-light loss-events hli-event

configure oam-pm session ethernet lmm loss-events hli-event

**Description**

This command sets the high loss interval (HLI) threshold to be monitored and the associated thresholds using the counter of the specified direction. The aggregate is a function of summing forward and backward. This value is only used as a threshold mechanism and is not part of the stored statistics. If the optional **clear** *clear-threshold* parameter is not specified, the traffic crossing alarm is stateless. Stateless means the state is not carried forward to other measurement intervals. Each measurement interval is analyzed independently and regardless of any previous window. Each unique event can only be raised once within measurement interval. If the optional **clear** *clear-threshold* parameter is specified, the traffic crossing alarm uses stateful behavior. Stateful means each unique previous event state is carried forward to following measurement intervals. If a threshold crossing event is raised another is raised until a measurement interval completes and the clear threshold has not been exceeded. A clear event is raised under that condition.

The **no** form of this command removes the event threshold for frame loss ratio. The direction must be included with the **no** command.

### Default

no hli-event forward  
no hli-event backward  
no hli-event aggregate

### Parameters

#### **forward**

Specifies the threshold is applied to the forward direction count.

#### **backward**

Specifies the threshold is applied to the backward direction count.

#### **aggregate**

Specifies the threshold is applied to the aggregate count (sum of forward and backward).

#### ***raise-threshold***

Specifies the rising threshold that determines when the event is to be generated, when the percentage of loss value is reached.

**Values** 1 to 864000

#### ***clear-threshold***

Specifies an optional value used for stateful behavior that allows the operator to configure a percentage of loss value lower than the rising percentage to indicate when the clear event should be generated.

**Values** 0 to 863999

A value of zero means that the HLI counter must be 0.

configure vrrp policy priority-event mc-ipsec-non-forwarding hold-clear

configure vrrp policy priority-event port-down hold-clear

configure vrrp policy priority-event host-unreachable hold-clear

#### Description

This command configures the hold clear time for the event. The *seconds* parameter specifies the hold-clear time, the amount of time in seconds by which the effect of a cleared event on the associated virtual router instance is delayed.

The hold-clear time is used to prevent black hole conditions when a virtual router instance advertises itself as a master before other conditions associated with the cleared event have had a chance to enter a forwarding state.

#### Default

no hold-clear

## Parameters

### *seconds*

Specifies the amount of time in seconds by which the effect of a cleared event on the associated virtual router instance is delayed.

**Values** 0 to 86400

## Platforms

All

- configure vrrp policy priority-event lag-port-down hold-clear
  - configure vrrp policy priority-event host-unreachable hold-clear
  - configure vrrp policy priority-event port-down hold-clear
  - configure vrrp policy priority-event route-unknown hold-clear
- 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR
- configure vrrp policy priority-event mc-ipsec-non-forwarding hold-clear

## 12.48 hold-count

### hold-count

## Syntax

**hold-count** *BPDU tx hold count*

**no hold-count**

## Context

[\[Tree\]](#) (config>service>template>vpls-template>stp hold-count)

[\[Tree\]](#) (config>service>vpls>stp hold-count)

## Full Context

configure service template vpls-template stp hold-count

configure service vpls stp hold-count

## Description

This command configures the peak number of BPDUs that can be transmitted in a period of one second.

The **no** form of this command returns the hold count to the default value

## Default

hold-count 6

## Parameters

### *BPDU tx hold count*

The hold count for the STP instance in seconds

**Values** 1 to 10

## Platforms

All

## 12.49 hold-down-time

### hold-down-time

## Syntax

**hold-down-time** *seconds*

**no hold-down-time**

## Context

[\[Tree\]](#) (config>subscr-mgmt>auth-plcy>radius-auth-server hold-down-time)

## Full Context

configure subscriber-mgmt authentication-policy radius-authentication-server hold-down-time

## Description

This command determines the interval during which no new communication attempts is made to a RADIUS server that is marked **down** to prevent immediately overloading the server when it is starting up. The only exception is when all servers in the authentication policy are marked **down**; in that case they will all be used again to prevent failures on new client connections.

The **no** form of this command reverts to the default.

## Default

hold-down-time 30

## Parameters

### *seconds*

Specifies the hold time before re-using a RADIUS server that was down.

**Values** 30 to 900

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## hold-down-time

### Syntax

**hold-down-time** [*sec seconds*] [*min minutes*] [*hrs hours*] [*days days*]  
**no hold-down-time**

### Context

[\[Tree\]](#) (config>aaa>radius-srv-plcy>servers hold-down-time)

### Full Context

configure aaa radius-server-policy servers hold-down-time

### Description

This command determines the interval during which no new communication attempts are made to a RADIUS server that is marked down to prevent immediately overloading the server when it is starting up. The only exception is when all servers in the authentication policy are marked down; in that case, they will all be used again to prevent failures on new client connections.

The **no** form of this command reverts to the default.

### Default

hold-down-time sec 30

### Parameters

#### *days*

Specifies the hold time in days before re-using a RADIUS server that was down.

**Values** 1 to 1

#### *hours*

Specifies the hold time in hours before re-using a RADIUS server that was down.

**Values** 1 to 23

#### *minutes*

Specifies the hold time in minutes before re-using a RADIUS server that was down.

**Values** 1 to 59

#### *seconds*

Specifies the hold time in seconds before re-using a RADIUS server that was down.

**Values** 1 to 59

### Platforms

## hold-down-time

### Syntax

**hold-down-time** *seconds*

**no hold-down-time**

### Context

[\[Tree\]](#) (config>service>sdp>keep-alive hold-down-time)

### Full Context

configure service sdp keep-alive hold-down-time

### Description

This command configures the minimum time period the SDP will remain in the operationally down state in response to SDP keepalive monitoring.

This parameter can be used to prevent the SDP operational state from "flapping" by rapidly transitioning between the operationally up and operationally down states based on keepalive messages.

When an SDP keepalive response is received that indicates an error condition or the **max-drop-count** keepalive messages receive no reply, the *sdp-id* will immediately be brought operationally down. If a keepalive response is received that indicates the error has cleared, the *sdp-id* will be eligible to be put into the operationally up state only after the **hold-down-time** interval has expired.

The **no** form of this command reverts the **hold-down-time seconds** *value* to the default setting.

### Default

hold-down-time 10

### Parameters

***seconds***

Specifies time, in seconds, expressed as a decimal integer. The SDP ID will remain in the operationally down state before it is eligible to enter the operationally up state. A value of 0 indicates that no **hold-down-time** will be enforced for SDP ID.

**Values** 0 to 3600

### Platforms

All

## 12.50 hold-down-timer

## hold-down-timer

### Syntax

**hold-down-timer** *hold-down-timer*

**no hold-down-timer**

### Context

[\[Tree\]](#) (config>router>segment-routing>maintenance-policy hold-down-timer)

### Full Context

configure router segment-routing maintenance-policy hold-down-timer

### Description

This command configures the hold down timer for SR policy candidate paths.

This command is intended to prevent bouncing of the SR policy path state if one or more S-BFD sessions associated with segment lists flap and therefore cause the threshold to be repeatedly crossed in a short period of time. It is started when the number of up S-BFD sessions drops below the threshold. The SR policy path is not considered to be up again until the hold down timer has expired and the number of up S-BFD sessions equals or exceeds the threshold and the internal hold timer is not running.

#### Note:

If the revert timer is also configured, the revert timer is not started until after the number of S-BFD sessions that are up  $\geq$  threshold and the hold down timer for the primary candidate path has expired.

The **no** form of this command reverts to the default.

### Default

hold-down-timer 0

### Parameters

#### ***hold-down-timer***

Specifies the hold-down timer, in deciseconds, in 10ms steps.

**Values** 0 to 5000

## 12.52 hold-on-neighbor-failure

## hold-on-neighbor-failure

### Syntax

**hold-on-neighbor-failure** *multiplier*

**no hold-on-neighbor-failure**

### Context

[\[Tree\]](#) (config>redundancy>multi-chassis>peer>mc-lag hold-on-neighbor-failure)

### Full Context

configure redundancy multi-chassis peer mc-lag hold-on-neighbor-failure

### Description

This command specifies the interval that the standby node will wait for packets from the active node before assuming a redundant-neighbor node failure. This delay in switch-over operation is required to accommodate different factors influencing node failure detection rate, such as IGP convergence, or HA switch-over times and to prevent the standby node to act prematurely.

The **no** form of this command reverts to the default.

### Default

hold-on-neighbor-failure 3

### Parameters

#### *multiplier*

Specifies the time interval that the standby node waits for packets from the active node before assuming a redundant-neighbor node failure.

**Values** 2 to 25

### Platforms

All

## hold-on-neighbor-failure

### Syntax

**hold-on-neighbor-failure** *multiplier*

## 12.53 hold-set

### hold-set

#### Syntax

**hold-set** *seconds*

**no hold-set**

#### Context

**[Tree]** (config>vrrp>policy>priority-event>mc-ipsec-non-forwarding hold-set)

**[Tree]** (config>vrrp>policy>priority-event>route-unknown hold-set)

**[Tree]** (config>vrrp>policy>priority-event>host-unreachable hold-set)

**[Tree]** (config>vrrp>policy>priority-event>port-down hold-set)

**[Tree]** (config>vrrp>policy>priority-event>lag-port-down hold-set)

#### Full Context

configure vrrp policy priority-event mc-ipsec-non-forwarding hold-set

configure vrrp policy priority-event route-unknown hold-set

configure vrrp policy priority-event host-unreachable hold-set

configure vrrp policy priority-event port-down hold-set

configure vrrp policy priority-event lag-port-down hold-set

#### Description

This command specifies the amount of time that must pass before the set state for a VRRP priority control event can transition to the cleared state to dampen flapping events. A flapping event continually transitions between clear and set.

The **hold-set** command is used to dampen the effect of a flapping event. The **hold-set** value is loaded into a hold-set timer that prevents a set event from transitioning to the cleared state until it expires.

Each time an event transitions between cleared and set, the timer is loaded and begins a countdown to zero. When the timer reaches zero, the event is allowed to enter the cleared state. Entering the cleared state is dependent on the object controlling the event, conforming to the requirements defined in the event itself. It is possible, on some event types, to have another set action reload the hold-set timer. This extends the amount of time that must expire before entering the cleared state.

Once the hold-set timer expires and the event meets the cleared state requirements or is set to a lower threshold, the current set effect on the virtual router instances in-use priority can be removed. As with **lag-port-down** events, this may be a decrease in the set effect if the *clearing* amounts to a lower set threshold.

The **hold-set** command can be executed at any time. If the hold-set timer value is configured larger than the new *seconds* setting, the timer is loaded with the new **hold-set** value.

The **no** form of the command disables the hold timer so that event transitions are processed immediately.

### Default

no hold-set

### Parameters

#### *seconds*

The number of seconds that the hold-set timer waits after an event enters a set state or enters a higher threshold set state, depending on the event type.

The value of 0 disables the hold-set timer, preventing any delay in processing lower set thresholds or cleared events.

**Values** 0 to 86400

### Platforms

## 12.54 hold-time

### hold-time

#### Syntax

**hold-time** *seconds*

**no hold-time**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>bgp-prng-plcy hold-time)

#### Full Context

configure subscriber-mgmt bgp-peering-policy hold-time

## Description

This command configures the BGP hold time, expressed in seconds.

The BGP hold time specifies the maximum time BGP waits between successive messages (either keepalive or update) from its peer, before closing the connection.

Even though the router OS implementation allows setting the keepalive time separately, the configured keepalive timer is overridden by the hold-time value under the following circumstances:

If the specified hold-time is less than the configured keepalive time, then the operational keepalive time is set to a third of the hold-time; the configured keepalive time is not changed.

If the hold-time is set to zero, then the operational value of the keepalive time is set to zero; the configured keepalive time is not changed. This means that the connection with the peer is up permanently and no keepalive packets are sent to the peer.

The **no** form of this command reverts to the default.

## Parameters

### *seconds*

Specifies the hold-time, in seconds, expressed as a decimal integer. A value of 0 indicates the connection to the peer is up permanently.

**Values** 0, 3 to 65535

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Full Context

configure subscriber-mgmt vrgw brg brg-profile hold-time

## Description

This command holds the BRG object for the specified time. This applies when the connectivity verification fails or when the last host is removed and **no connectivity-verification** is enabled. Hold time does not apply to an explicit removal via the **radius** or **clear** commands.

The **no** form of this command disables the hold time.

## Parameters

### *seconds*

Specifies the time, in seconds, to hold on to a BRG after the system considered it down.

**Values** 30 to 2592000

### *days*

Specifies the hold-time in days.

**Values** 1 to 30

### *hrs*

Specifies the hold-time in hours.

**Values** 1 to 23

### *min*

Specifies the hold-time in minutes.

**Values** 1 to 59

### *sec*

Specifies the hold-time in seconds.

**Values** 1 to 59

**[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw>mobility hold-time)

## Full Context

configure service vprn subscriber-interface group-interface wlan-gw mobility hold-time

configure service ies subscriber-interface group-interface wlan-gw mobility hold-time

## Description

This command configures the minimum time that a UE is held associated with its current Access Point (AP) before being associated with a new AP.

The hold time is used to prevent overwhelming the system with mobility triggers, by limiting the rate at which a UE can move from one AP to another while the system is very busy already.

## Default

hold-time 5

## Parameters

### *time*

Specifies a hold-down time, in seconds, for handling of successive mobility triggers for a UE. It is the minimal time a UE stays associated with an AP.

**Values** 0 to 255

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## hold-time

### Syntax

**hold-time infinite**  
**hold-time** *seconds*  
**no hold-time**

### Context

[\[Tree\]](#) (config>subscr-mgmt>sap-template hold-time)

### Full Context

configure subscriber-mgmt sap-template hold-time

### Description

This command configures the time for which an SAP is retained after the last session has been removed. Such SAPs can be forcefully removed using the **idle-saps** option in the **clear>subscriber-mgmt>sap-template** context.

The **no** form of this command reverts to the default.

### Default

hold-time 30

### Parameters

#### *infinite*

Keyword specifying to never automatically remove the SAP.

#### *seconds*

Specifies the time, in seconds, that the SAP is retained.

**Values** 30 to 2592000

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## hold-time

### Syntax

**hold-time** *hold-time*  
**no hold-time**

### Context

[\[Tree\]](#) (config>port>aps hold-time)

## Full Context

configure port aps hold-time

## Description

This command specifies how much time can pass, in 100s of milliseconds, without receiving an advertise packet from the neighbor before the multi-chassis signaling link is considered not operational.

The **hold-time** is usually 3 times the value of the **advertise-interval**. The value of the **advertise-interval** is valid only for a multi-chassis APS as indicated by the value of neighbor IP address if it is not set to 0.0.0.0.

## Parameters

### **hold-time**

Specifies how long to wait for an APS advertisement packet before the peer in a Multi-Chassis APS group is considered operationally down.

**Values** 10 to 650

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## hold-time

## Syntax

**hold-time** *time-value*

**no hold-time**

## Context

[\[Tree\]](#) (config>port>ethernet>efm-oam hold-time)

## Full Context

configure port ethernet efm-oam hold-time

## Description

This command configures efm-oam operational transition dampening timers which reduce the number of efm-oam state transitions reported to upper layers.

## Default

no hold-time

## Parameters

### **time-value**

Indicates the number of seconds that the efm-oam protocol will wait before going back to the operational state after leaving the operational state. Note that the hold-time does not apply if efm-oam moved from operational to link-fault.

A hold-time value of zero indicates that there should be no delay in transitioning to the operational state. A non-zero value will cause the efm-oam protocol to attempt to negotiate with a peer if possible, but it will remain in the send-local-remote-ok state until the hold time has expired if negotiation is successful.

If efm-oam is administratively shutdown while it was in the operational state and then re-enabled when a non-zero hold time is configured, efm-oam will attempt transition to the operational state immediately.

The **no** form of this command reverts the value to the default.

**Values** 0 to 50

**Default** 0

## Platforms

All

## hold-time

### Syntax

**hold-time** {[**up** *hold-time-up*] [**down** *hold-time-down*] [**seconds** | **centiseconds**]}

**no hold-time**

### Context

[\[Tree\]](#) (config>port>ethernet hold-time)

### Full Context

configure port ethernet hold-time

### Description

This command configures port link dampening timers which reduce the number of link transitions reported to upper layer protocols. The **hold-time** value dampens interface transitions.

When an interface transitions from an up state to a down state, it is immediately advertised to the rest of the system if the hold-time down interval is zero, but if the hold-time down interval is greater than zero, interface down transitions are not advertised to upper layers until the hold-time down interval has expired. Likewise, an interface is immediately advertised as up to the rest of the system if the hold-time up interval is zero, but if the hold-time up interval is greater than zero, up transitions are not advertised until the hold-time up interval has expired.

For ESM SRRP setup, MCS synchronizes subscriber information between the two chassis. After a chassis recovers from a power reset/down, MCS immediately synchronizes all subscriber information at once. The longer the host list, the longer it will take to synchronize the chassis. In a fully populated chassis, it is recommended to allow at least 45 minutes for MCS synchronization. It is also recommended to hold the port down, facing the subscriber, on the recovering chassis for 45 minutes before it is allowed to forward traffic again.

The **no** form of this command reverts to the default values.

## Default

down 0 seconds — No port link down dampening is enabled; link down transitions are immediately reported to upper layer protocols.

up 0 seconds — No port link up dampening is enabled; link up transitions are immediately reported to upper layer protocols.

## Parameters

### *hold-time-up*

The delay, in seconds or centiseconds, after which to notify the upper layers when an interface transitions from a down state to an up state.

**Values** 0 to 36000 seconds, 0 or 10 to 3600000 centiseconds in 5 centisecond increments

The minimum non-zero *hold-time-up* interval on 10G or higher ports is 10 centiseconds with a granularity of 5 centiseconds. The granularity on 1G ports is 1 second. Centiseconds are not supported on 1G ports.

### *hold-time-down*

The delay, in seconds or centiseconds, after which to notify the upper layers when an interface transitions from an up state to a down state.

**Values** 0 to 36000 seconds, 0 or 10 to 3600000 centiseconds in 5 centisecond increments

The minimum non-zero *hold-time-down* interval on 10G or higher ports is 10 centiseconds with a granularity of 5 centiseconds. The granularity on 1G ports is 1 second. Centiseconds are not supported on 1G ports.

### **seconds | centiseconds**

Specifies the hold time units as **seconds** or **centiseconds**.

## Platforms

## hold-time

## Syntax

**hold-time** {[**up** *hold-time-up*] [**down** *hold-time-down*]}

**no hold-time**

## Context

**[Tree]** (config>port>sonet-sdh hold-time)

## Full Context

configure port sonet-sdh hold-time

## Description

This command configures SONET link dampening timers in 100s of milliseconds. This guards against reporting excessive interface transitions. This is implemented by not advertising subsequent transitions of the interface to upper layer protocols until the configured timer has expired.

### Note:

For APS configurations, the **hold-time down** and **up** default values are 100 ms and 500 ms respectively. If there is a large communication delay (time to exchange K1/K2 bytes) between the APS Controllers of the two endpoints of an APS link, it is highly suggested to increase the default hold-time down timer on the APS group port accordingly with the communication delay. See the **config>port aps** command for more information.

This command is supported by TDM satellite.

## Default

no hold-time

## Parameters

### **up hold-time-up**

Configures the hold-timer for link up event dampening. A value of zero (0) indicates that an up transition is reported immediately.

**Values** 0 to 100

### **down hold-time-down**

The hold-timer for link down event dampening. A value of zero (0) indicates that a down transition is reported immediately.

**Values** 0 to 100

## Platforms

## Description

This command configures link dampening timers in 100s of milliseconds. This guards against reporting excessive interface transitions. This is implemented by not advertising subsequent transitions of the interface to upper layer protocols until the configured timer has expired.

This command is only supported on the m4-chds3-as, m12-chds3-as, and c4-ds3 MDAs.

## Default

no hold-time

## Parameters

### *hold-time-up*

Configures the hold-timer for link up event dampening. A value of zero (0) indicates that an up transition is reported immediately.

**Values** 0 to 100 in 100s of milliseconds (default 0)

### *hold-time-down*

The hold-timer for link down event dampening. A value of zero (0) indicates that a down transition is reported immediately.

**Values** 0 to 100 in 100s of milliseconds (default 5)

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## hold-time

## Syntax

**hold-time down** *hold-down-time*

**no hold-time**

## Context

[\[Tree\]](#) (config>lag hold-time)

## Full Context

configure lag hold-time

## Description

This command specifies the timer, in tenths of seconds, which controls the delay between detecting that a LAG is down (all active ports are down) and reporting it to the higher levels.

A non-zero value can be configured, for example, when active/standby signaling is used in a 1:1 fashion to avoid informing higher levels during the small time interval between detecting that the LAG is down and the time needed to activate the standby link.

**Default**

no hold-time

**Parameters*****hold-down-time***

Specifies the hold-time for event reporting.

**Values** 0 to 2000

**Platforms**

All

**hold-time****Syntax**

**hold-time** *value*

**no hold-time**

**Context**

[\[Tree\]](#) (config>service>vpls>mrp>mvrp hold-time)

**Full Context**

configure service vpls mrp mvrp hold-time

**Description**

This command enables the dampening timer and applies to both types of provisioned SAPs – end-station and UNI. When a value is configured for the timer, it controls the delay between detecting that the last provisioned SAP in VPLS goes down and reporting it to the MVRP module. The CPM will wait for the time specified in the value parameter before reporting it to the MVRP module. If the SAP comes up before the hold-timer expires, the event will not be reported to MVRP module.

The non-zero hold-time does not apply for SAP transition from down to up, This kind of transition is reported immediately to MVRP module without waiting for hold-time expiration. Also this parameter applies only to the provisioned SAPs. It does not apply to the SAPs configured with the **vpls-sap-template** command. Also when end-station QinQ SAPs are present only the "no hold-time" configuration is allowed.

The **no** form of this command disables tracking of the operational status for the last active SAP in the VPLS. MVRP will stop declaring the VLAN only when the last provisioned customer (UNI) SAP associated locally with the service is deleted. Also MVRP will declare the associated VLAN attribute as soon as the first provisioned SAP is created in the associated VPLS instance, regardless of the operational state of the SAP.

**Default**

no hold-time

## Parameters

### *value*

Specifies the hold time in minutes

**Values** 1 to 30

## Platforms

All

## hold-time

## Syntax

**hold-time** *seconds*

**no hold-time**

## Context

[\[Tree\]](#) (config>service>vpls>pim-snooping hold-time)

## Full Context

configure service vpls pim-snooping hold-time

## Description

This command configures the duration that allows the PIM-snooping switch to snoop all the PIM states in the VPLS. During this duration, multicast traffic is flooded in the VPLS. At the end of this duration, multicast traffic is forwarded using the snooped states.

When PIM snooping is enabled in VPLS, there is a period of time when the PIM snooping switch may not have built complete snooping state. The switch cannot build states until the routers connected to the VPLS refresh their PIM messages.

This parameter is applicable only if PIM snooping is enabled.

## Parameters

### *seconds*

Specifies the PIM snooping hold time, in seconds.

**Values** 0 to 300

**Default** 90

## Platforms

All

## hold-time

configure service vprn interface hold-time

configure service vprn network-interface hold-time

configure service vprn redundant-interface hold-time

### Description

This command creates the CLI context to configure interface level hold-up and hold-down timers for the associated IP interface.

The **up** timer controls a delay for the associated IPv4 or IPv6 interface so that the system will delay the deactivation of the associated interface for the specified amount of time.

The **down** timer controls a delay for the associated IPv4 or IPv6 interface so that the system will delay the activation of the associated interface for the specified amount of time

## hold-time

### Syntax

**hold-time** *seconds* [*min seconds2*]

**no hold-time**

### Context

**[Tree]** (config>service>vprn>bgp hold-time)

**[Tree]** (config>service>vprn>bgp>group hold-time)

**[Tree]** (config>service>vprn>bgp>group>neighbor hold-time)

### Full Context

configure service vprn bgp hold-time

configure service vprn bgp group hold-time

configure service vprn bgp group neighbor hold-time

### Description

This command configures the BGP hold time, expressed in seconds.

The BGP hold time specifies the maximum time BGP waits between successive messages (either keepalive or update) from its peer, before closing the connection. This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in group) or neighbor level (only applies to specified peer). The most specific value is used.

Even though the router OS implementation allows setting the **keepalive** (**config>service>vprn>bgp keepalive**, **config>service>vprn>bgp>group keepalive**, **config>service>vprn>bgp>group>neighbor keepalive**) time separately, the configured **keepalive** timer is overridden by the **hold-time** value under the following circumstances:

- If the specified hold-time is less than the configured **keepalive** time, then the operational **keepalive** time is set to a third of the **hold-time**; the configured **keepalive** time is not changed.
- If the **hold-time** is set to zero, then the operational value of the **keepalive** time is set to zero; the configured **keepalive** time is not changed. This means that the connection with the peer is up permanently and no **keepalive** packets are sent to the peer.

The **no** form of this command used at the global level reverts to the default value.

The **no** form of this command used at the group level reverts to the value defined at the global level.  
The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

### Default

hold-time 90

### Parameters

#### *seconds*

Specifies the hold-time, in seconds, expressed as a decimal integer. A value of 0 indicates the connection to the peer is up permanently.

**Values** 0, 3 to 65535

#### *seconds2*

Specifies the minimum hold-time that is accepted for the session. If the peer proposes a hold-time lower than this value the session attempt is rejected.

## Description

This command configures the BGP hold time, expressed in seconds.

The BGP hold time specifies the maximum time BGP waits between successive messages (either keepalive or update) from its peer, before closing the connection. This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in group) or neighbor level (only applies to specified peer). The most specific value is used.

Even though the implementation allows setting the **keepalive** time separately, the configured **keepalive** timer is overridden by the **hold-time** value under the following circumstances:

- If the specified hold-time is less than the configured **keepalive** time, then the operational **keepalive** time is set to a third of the **hold-time**; the configured **keepalive** time is not changed.
- If the **hold-time** is set to zero, then the operational value of the **keepalive** time is set to zero; the configured **keepalive** time is not changed. This means that the connection with the peer is up permanently and no keepalive packets are sent to the peer.

The **no** form of this command used at the global level reverts to the default value.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

## Default

hold-time 90

## Parameters

### *seconds*

Specifies the hold-time, in seconds, expressed as a decimal integer. A value of 0 indicates the connection to the peer is up permanently.

**Values** 0, 3 to 65535

### *min seconds2*

Specifies the minimum hold-time that will be accepted for the session. If the peer proposes a hold-time lower than this value, the session attempt will be rejected.

## 12.55 hold-time-aps

### hold-time-aps

#### Syntax

**hold-time-aps** [**!signal-failure** *sf-time*] [**!signal-degrade** *sd-time*]

**no hold-time-aps**

#### Context

[\[Tree\]](#) (config>port>aps hold-time-aps)

#### Full Context

configure port aps hold-time-aps

#### Description

This command configures hold-down timers to debounce signal failure conditions (lais, b2err-sf) and signal degrade conditions (b2err-sd) for Uni 1+1 Sig+Data APS switching mode (switching mode uni-1plus1).

The **no** version of this command resets the hold-down timer to the default value.

#### Default

0 (disabled)

#### Parameters

##### *sf-time*

Specifies an integer to define the signal failure hold-down time in milliseconds.

**Values** 1 to 100

##### *sd-time*

Specifies an integer to define the signal degrade hold-down time in milliseconds.

**Values** 1 to 100

#### Platforms

## 12.63 hop

hop

## Syntax

**hop** *hop-index* *ip-address* {**strict** | **loose**}

**hop** *hop-index* **sid-label** *sid-value*

**no hop** *hop-index*

## Context

**[Tree]** (config>router>mpls>path hop)

## Full Context

configure router mpls path hop

## Description

This command specifies the hops that the LSP should traverse on its way to the egress router. When specified, the IP address can be the interface IP address, a loopback interface address, or the system IP address. If a loopback interface or the system IP address is specified then the LSP can choose the best available interface.

When an IPv6 hop is specified, the interface IP address must be a global unicast IPv6 address. A link-local address is not allowed and is rejected in the configuration if attempted.

Optionally, the LSP ingress and egress IP address can be included as the first and the last hop. A hop list can include the ingress interface IP address, the system IP address, and the egress IP address of any of the hops being specified.

When the **sid-label** parameter is specified, this command specifies an MPLS label value for a hop in the path of an SR-TE LSP. The label value implied by the SID is only used when the path is used by an SR-TE LSP.

The **no** form of this command deletes hop list entries for the path. All the LSPs currently using this path are affected. Additionally, all services actively using these LSPs are affected. The path must be shutdown first in order to delete the hop from the hop list. The **no hop hop-index** command will not result in any action except a warning message on the console indicating that the path is administratively up.

## Parameters

### *hop-index*

Specifies the hop index is used to order the hops specified. The LSP always traverses from the lowest hop index to the highest. The hop index does not need to be sequential.

**Values** 1 to 1024

### *ip-address*

Specifies a loopback interface, the system or network interface IP address of the transit router. An interface IPv6 address must be a global unicast address.

**Values** ipv4-address — a.b.c.d  
 ipv6-address — x:x:x:x:x:x:x (eight 16-bit pieces)  
 x:x:x:x:x:d.d.d.d  
 x — 0 to FFFF (hexadecimal)  
 d — 0 to 255 (decimal)

### **loose**

This keyword specifies that the route taken by the LSP from the previous hop to this hop can traverse through other routers. Multiple hop entries with the same IP address are flagged as errors. Either the **loose** or **strict** keyword must be specified.

### **strict**

This keyword specifies that the LSP must take a direct path from the previous hop router to this router. No transit routers between the previous router and this router are allowed. If the IP address specified is the interface address, then that is the interface the LSP must use. If there are direct parallel links between the previous router and this router and if system IP address is specified, then any one of the available interfaces can be used by the LSP. The user must ensure that the previous router and this router have a direct link. Multiple hop

entries with the same IP address are flagged as errors. Either the **loose** or **strict** keyword must be specified.

**sid-value**

Specifies the SID value. The *sid-value* can be any valid MPLS/SR label value. It is not restricted by any locally-defined label ranges since these may be different on the remote node or adjacency for which the SID is defined.

**Values** 32 to 1048575

**Platforms**

All

**hop****Syntax**

**hop** *hop-index ip-address*

**no hop** *hop-index*

**Context**

**[Tree]** (config>service>pw-routing>path hop)

**Full Context**

configure service pw-routing path hop

**Description**

This command configures each hop on an explicit path that can be used by one or more dynamic MS-PWs. It specifies the IP addresses of the hops that the MS-PE should traverse. These IP addresses can correspond to the system IP address of each S-PE, or the IP address on which the T-LDP session to a given S-PE terminates.

The **no** form of this command deletes hop list entries for the path. All the MS-PWs currently using this path are unaffected. Additionally, all services actively using these MS-PWs are unaffected. The path must be shutdown first in order to delete the hop from the hop list. The '**no hop hop-index**' command will not result in any action, except for a warning message on the console indicating that the path is administratively up.

**Default**

no hop

**Parameters****hop-index**

Specifies a locally significant numeric identifier for the hop. The hop index is used to order the hops specified. The LSP always traverses from the lowest hop index to the highest. The hop index does not need to be sequential.

**Values** 1 to 1024

***ip-address***

Specifies the system IP address or terminating IP address for the T-LDP session to the S-PE corresponding to this hop. For a given IP address on a hop, the system will choose the appropriate SDP to use.

## 12.65 hop-limit

## hop-limit

### Syntax

**hop-limit** *limit*

**no hop-limit**

### Context

**[Tree]** (config>router>mpls>lsp-template>fast-reroute hop-limit)

[\[Tree\]](#) (config>router>mpls>lsp>fast-reroute hop-limit)

### Full Context

```
configure router mpls lsp-template fast-reroute hop-limit
configure router mpls lsp fast-reroute hop-limit
```

### Description

For fast reroute, how many more routers a detour is allowed to traverse compared to the LSP itself. For example, if an LSP traverses four routers, any detour for the LSP can be no more than ten router hops, including the ingress and egress routers.

The **no** form of this command reverts to the default value.

### Default

hop-limit 16

### Parameters

#### *limit*

Specify the maximum number of hops.

**Values** 0 to 255

### Platforms

All

## hop-limit

### Syntax

```
hop-limit number
no hop-limit
```

### Context

[\[Tree\]](#) (config>router>mpls>lsp>primary-p2mp-instance hop-limit)

[\[Tree\]](#) (config>router>mpls>lsp hop-limit)

### Full Context

```
configure router mpls lsp primary-p2mp-instance hop-limit
configure router mpls lsp hop-limit
```

### Description

This command specifies the maximum number of hops that an LSP can traverse, including the ingress and egress routers. An LSP is not set up if the hop limit is exceeded. This value can be changed dynamically for an LSP that is already set up with the following implications.

If the new value is less than the current number of hops of the established LSP, the LSP is brought down. The software then tries to re-establish the LSP within the new **hop-limit** number. If the new value is equal to or greater than the current number hops of the established LSP, the LSP is not affected.

The **config>router>mpls>lsp>primary-p2mp-instance> hop-limit** command is not supported on the 7450 ESS.

The **no** form of this command returns the parameter to the default value.

## Default

hop-limit 255

## Parameters

### *number*

Specifies the number of hops the LSP can traverse, expressed as an integer.

**Values** 2 to 255

## Platforms

All

## hop-limit

## Syntax

**hop-limit** *number*

**no hop-limit**

## Context

[\[Tree\]](#) (config>router>mpls>lsp>secondary hop-limit)

[\[Tree\]](#) (config>router>mpls>lsp>primary hop-limit)

## Full Context

configure router mpls lsp secondary hop-limit

configure router mpls lsp primary hop-limit

## Description

This optional command overrides the **config>router>mpls>lsp *lsp-name*>hop-limit** command. This command specifies the total number of hops that an LSP traverses, including the ingress and egress routers.

This value can be changed dynamically for an LSP that is already set up with the following implications:

If the new value is less than the current hops of the established LSP, the LSP is brought down. MPLS then tries to re-establish the LSP within the new hop-limit number. If the new value is equal or more than the current hops of the established LSP then the LSP will be unaffected.

The **no** form of this command reverts the values defined under the LSP definition using the **config>router>mpls>lsp *lsp-name*>hop-limit** command.

**Default**

no hop-limit

**Parameters*****number***

Specifies the number of hops the LSP can traverse, expressed as an integer.

**Values** 2 to 255

**Platforms**

All

**hop-limit** {**lt** | **gt** | **eq**} *hop-limit-value*

**hop-limit range** *hop-limit-value* *hop-limit-value*

**no hop-limit**

**Context**

[\[Tree\]](#) (config>filter>ipv6-filter>entry>match hop-limit)

**Full Context**

configure filter ipv6-filter entry match hop-limit

**Description**

This command configures the Time To Live (TTL) match criteria.

The **no** form of this command removes the configuration.

**Default**

no hop-limit

**Parameters****lt**

Specifies "less than". The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.

**gt**

Specifies "greater than". The **gt** parameter cannot be used with the highest possible numerical value for the parameter.

**eq**

Specifies "equal to".

***hop-limit-value***

Specifies the hop limit value for the rate limit action.

**Values** 0 to 255

## 12.66 host

host

### Syntax

**host** *host-name* [**create**]

**no host** *host-name*

### Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp host)

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe host)

### Full Context

configure subscriber-mgmt local-user-db ppp host

configure subscriber-mgmt local-user-db ipoe host

### Description

This command creates an IPoE or PPP host entry in the local user database. A host entry in the local user database is matched based on the specified match-list criteria and an optional mask that is applied to the host-identification parameters.

A default host entry can be created without host-identification parameters which is used when no other host entries match. Note that creating a default host entry also requires a match-list to be specified.

The **no** form of this command removes the host entry from the local user database.

### Parameters

#### *host-name*

Specifies a unique host name, up to 32 characters. The *host-name* **default** creates a special match-all host entry that should not have host-identification parameters and is used when no other host entries match.

#### **create**

Keyword used to create the host name. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## host

## 12.67 host-accounting

## host-accounting

### Syntax

**[no] host-accounting [interim-update]**

### Context

**[Tree]** (config>subscr-mgmt>acct-plcy host-accounting)

### Full Context

configure subscriber-mgmt radius-accounting-policy host-accounting

### Description

This command enables per-host accounting. In host accounting mode, the acct-session-id is generated per host. This acct-session-id is uniformly included in all accounting messages (START/INTERIM-UPDATE/STOP) and it can be included in RADIUS Access-Request message.

Accounting counters are based on the queue counters and as such are aggregated for all host sharing the queues within an sla-profile instance. CoA and LI is supported based on the acct-session-id of the host.

The **no** form of this command reverts to the default.

### Parameters

#### interim-update

Specifies that no interim-update messages are sent for the related subscriber hosts when the session is deleted. Without this keyword, only START and STOP accounting messages are generated when the host is established or terminated. This is equivalent to a time-based accounting where only the duration of the session is required.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 12.68 host-connectivity-verify

## host-connectivity-verify

### Syntax

**host-connectivity-verify source-ip *ip-address* [ source-mac *ieee-address*] [interval *interval*] [ action {remove | alarm}] [timeout *retry-timeout*] [retry-count *count*]**

### Context

**[Tree]** (config>service>vpls host-connectivity-verify)

**[Tree]** (config>service>vpls>sap host-connectivity-verify)

## Full Context

```
configure service vpls host-connectivity-verify
configure service vpls sap host-connectivity-verify
```

## Description

This command enables subscriber host connectivity verification on a given VPLS SAP or within a VPLS service.

This tool will periodically scan all known hosts (from dhcp-state) and perform a UC ARP request. The subscriber host connectivity verification will maintain state (connected vs. not-connected) for all hosts.

The **no** form of this command reverts to the default.

## Parameters

### *ip-address*

Specifies an unused IP address in the same network for generation of subscriber host connectivity verification packets.

### *ieee-address*

Specifies the source MAC address to be used for generation of subscriber host connectivity verification packets.

### *interval*

The interval, in minutes, which specifies the time interval in which all known sources should be verified. The actual rate is then dependent on number of known hosts and interval.

**Values** 1 to 6000 Note that a zero value can be used by the SNMP agent to disable host-connectivity-verify.

### *action {remove | alarm}*

Defines the action taken on a subscriber host connectivity verification failure for a given host. The **remove** keyword raises an alarm and removes the dhcp-state and releases all allocated resources (queues, table entries, and so on). A DHCP release is signaled to corresponding DHCP server. The static host is never removed. The **alarm** keyword raises an alarm indicating that the host is disconnected.

### *retry-timeout*

Specifies the time, in seconds, to wait before a SAP that has been disabled after exceeding the maximum relearn rate is re-enabled.

**Values** 0 to 120

### *count*

Specifies the number of connectivity check retransmissions.

**Values** 10 to 60 seconds

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## host-connectivity-verify

### Syntax

**host-connectivity-verify** [**interval** *interval*] [**action** {**remove** | **alarm**}] [**timeout** *retry-timeout*] [**retry-count** *count*] [**family** *family*]

### Context

**[Tree]** (config>service>vprn>sub-if>grp-if host-connectivity-verify)

**[Tree]** (config>service>ies>sub-if>grp-if host-connectivity-verify)

### Full Context

configure service vprn subscriber-interface group-interface host-connectivity-verify

configure service ies subscriber-interface group-interface host-connectivity-verify

### Description

This command enables subscriber host connectivity verification on a given SAP within a service. This tool periodically scans all known hosts (from dhcp-state) and perform UC ARP requests. The subscriber host connectivity verification maintains state (connected versus. not-connected) for all hosts.

The **no** form of this command reverts to the default.

### Parameters

#### *interval*

Specifies the interval, in minutes, which specifies the time interval which all known sources should be verified. The actual rate is then dependent on the number of known hosts and interval.

**Values** 1 to 6000

A zero value can be used by the SNMP agent to disable host-connectivity-verify.

#### **action** {**remove** | **alarm**}

Defines the action taken on a subscriber host connectivity verification failure for a given host. The **remove** keyword raises an alarm and removes dhcp-state and releases all allocated resources (queues, table entries and so on). DHCP-RELEASE is signaled to corresponding DHCP server. Static hosts is never removed. The **alarm** keyword raises an alarm indicating that the host is disconnected.

#### *retry-timeout*

Specifies the retry timeout.

**Values** 10 to 60 seconds

#### *count*

Specifies the number of retry requests.

**Values** 2 to 29

### **family**

Allows the host connectivity checks to be performed for IPv4 endpoint, IPv6 endpoint or both. With family IPv6 configured, host connectivity checks is performed on the global unicast address (assigned via SLAAC or DHCPv6 IA\_NA) and link-local address of a Layer 3 RG or bridged hosts. In case of SLAAC assignment, host connectivity can only be performed if the /128 is known (via downstream ND). DHCPv6 PD assigned prefixes is removed if link-local address is determined to be unreachable via host connectivity check” Reachability checks for GUA and link-local address is done simultaneously.

**Values**    ipv4, ipv6, both

### **Platforms**

## host-connectivity-verify

### **Syntax**

**host-connectivity-verify** [**source** {**vrrp** | **interface**}] [**interval** *interval*] [**action** { **remove** | **alarm**}] [**timeout** *retry-timeout*] [**retry-count** *retry-count*]

### **Context**

**[Tree]** (config>service>ies>if host-connectivity-verify)

**[Tree]** (config>service>vprn>if host-connectivity-verify)

### **Full Context**

configure service ies interface host-connectivity-verify

configure service vprn interface host-connectivity-verify

### **Description**

This command enables subscriber host connectivity verification for all hosts on this interface. This tool periodically scans all known hosts (from dhcp-state) and perform UC ARP requests. The subscriber host connectivity verification maintains state (connected vs. not-connected) for all hosts.

The **no** form of this command reverts to the default.

### **Parameters**

#### **source {vrrp | interface}**

Specifies the source to be used for generation of subscriber host connectivity verification packets. The **vrrp** keyword specifies that the VRRP state should be used to select proper IP and MAC (active uses VRID, back-up uses interface addresses). The **interface** keyword forces the use of the interface mac and ip addresses.

#### **Note:**

There are up to 256 possible subnets on a given interface, therefore, the subscriber host connectivity verification tool always uses an address of the

subnet to which the given host is pertaining. For group-interfaces, one of the parent subscriber interface subnets (depending on host's address) is used.

**action {remove | alarm}**

Defines the action taken on a subscriber host connectivity verification failure for a given host. The **remove** keyword raises an alarm and removes dhcp-state and releases all allocated resources (queues, table entries, and so on). The **alarm** keyword raises an alarm indicating that the host is disconnected.

**interval**

Specifies the interval, expressed in minutes, which specifies when all known sources should be verified. The actual rate is then dependent on number of known hosts and interval.

**Values** 1 to 6000

**Note:**

A zero value can be used by the SNMP agent to disable host-connectivity-verification.

**retry-timeout**

Specifies the timeout, in seconds, before a connectivity check retransmission.

**Values** 10 to 60

**retry-count**

Specifies the number of connectivity check retransmissions.

**Values** 2 to 29

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**12.70 host-ip****host-ip****Syntax****host-ip** *prefix-list-name***Context**[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from host-ip)**Full Context**

configure router policy-options policy-statement entry from host-ip

## Description

This command specifies a prefix list host IP address as a match criterion for the route policy-statement entry.

## Default

no host-ip

## Parameters

### *prefix-list-name*

Specifies the prefix-list name. Allowed values are any string up to 64 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

The *prefix-list-name* is defined in the **config>router>policy-options>prefix-list** context.

## Platforms

All

## 12.71 host-key

host-key

## Syntax

host-key {mac}

no host-key

## Context

[\[Tree\]](#) (config>subscr-mgmt>host-lockout-plcy host-key)

## Full Context

configure subscriber-mgmt host-lockout-policy host-key

## Description

This command specifies the parameters used in host identification for lockout on a given SAP or capture SAP.

no host-key – include (MAC address, Circuit-Id, Remote-Id)

host-key mac – include MAC address only

"host-key mac" should be used in DHCPv4 scenarios where Circuit-Id and Remote-Id are changed with "dhcp option action replace" configuration: a host lockout context is created with the replaced Circuit-Id/Remote-Id; with the default host-key (including Circuit-Id and Remote-Id), lockout does not kick in on the original trigger packet when it is retransmitted by the client.

Changing the host-key to mac should be used with care: all hosts with the same MAC address on a given SAP or capture SAP are identified as a single host with respect to host-lockout.

This command cannot be changed when the **host-lockout-policy** is referenced (configured under a SAP context).

The **no** form of this command reverts to the default value.

### Parameters

#### mac

Specifies to use the MAC address only for host identification for lockout.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 12.72 host-limit

## 12.73 host-limits

## host-limits

### Syntax

**[no] no host-limits**

### Context

**[Tree]** (config>subscr-mgmt>sub-profile host-limits)

**[Tree]** (config>subscr-mgmt>sla-profile host-limits)

### Full Context

configure subscriber-mgmt sub-profile host-limits

configure subscriber-mgmt sla-profile host-limits

### Description

Commands in this context configure host limits per SLA profile instance or per subscriber.

The **no** form of this command removes the host limit configuration.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 12.74 host-lockout-policy

### host-lockout-policy

### Syntax

**host-lockout-policy** *policy-name*

**no host-lockout-policy**

### Context

**[Tree]** (config>service>vprn>sub-if>grp-if>sap host-lockout-policy)

**[Tree]** (config>service>vpls>sap host-lockout-policy)

**[Tree]** (config>service>ies>if>sap host-lockout-policy)

**[Tree]** (config>service>vprn>if>sap host-lockout-policy)

**[Tree]** (config>service>ies>sub-if>grp-if>sap host-lockout-policy)

### Full Context

configure service vprn subscriber-interface group-interface sap host-lockout-policy

configure service vpls sap host-lockout-policy

configure service ies interface sap host-lockout-policy

```
configure service vprn interface sap host-lockout-policy
configure service ies subscriber-interface group-interface sap host-lockout-policy
```

## Description

This command selects an existing host lockout policy. The **host-lockout-policy** *policy-name* is created in the **config>subscr-mgmt** context.

The **no** form of this command removes the policy name from the SAP configuration.

## Parameters

### *policy-name*

Specifies an existing host lockout policy, up to 32 characters, to associate with the SAP.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## host-lockout-policy

## Syntax

```
host-lockout-policy policy-name [create]
```

```
no host-lockout-policy policy-name
```

## Context

[\[Tree\]](#) (config>subscr-mgmt host-lockout-policy)

## Full Context

```
configure subscriber-mgmt host-lockout-policy
```

## Description

This command creates a host lockout policy. The policy contains set of host lockout configuration parameters. It is applied to SAP or MSAPs (by a MSAP-policy). Any change does not impact existing locked-out hosts, but only new incoming hosts that enter lockout.

The **no** form of this command removes the policy name from the configuration. The policy must not be associated with any entity.

## Parameters

### *policy-name*

Specifies an existing host lockout policy to associate with the SAP.

### **create**

Specifies the keyword required to create the host lockout policy. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 12.75 host-match

### host-match

#### Syntax

**host-match dest** *destination-string* [**create**]

**no host-match dest** *destination-string*

#### Context

[\[Tree\]](#) (config>port>ethernet>access>egr>qgrp host-match)

#### Full Context

configure port ethernet access egress queue-group host-match

#### Description

This command configures host matching for the Ethernet port egress queue-group.

The **no** form of this command removes the destination string from the configuration.

#### Parameters

##### *destination-string*

Specify a host match destination string up to 32 characters.

##### **create**

Keyword used to create the host match. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

#### Platforms

All

### host-match

#### Syntax

**host-match dest** *description-string* [**create**]

**no host-match dest** *destination-string*

#### Context

[\[Tree\]](#) (config>port>ethernet>access>egress>vport host-match)

## Full Context

configure port ethernet access egress vport host-match

## Description

This command specifies the destination and organization strings to be used for matching subscriber hosts with this Vport.

The parent Vport of a subscriber host queue, which has the port-parent option enabled, is determined by matching the destination string **dest** string associated with the subscriber and the organization string org string associated with the subscriber host with the strings defined under a Vport on the port associated with the subscriber.

If a given subscriber host queue does not have the port-parent option enabled, it will be foster-parented to the Vport used by this subscriber and which is based on matching the dest string and org string. If the subscriber could not be matched with a Vport on the egress port, the host queue will not be bandwidth controlled and will compete for bandwidth directly based on its own PIR and CIR parameters.

By default, a subscriber host queue with the port-parent option enabled is scheduled within the context of the port's port scheduler policy.

## Parameters

### *description-string*

The destination character string. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

## Platforms

## 12.78 host-tracking-policy

## host-tracking-policy

### Syntax

**host-tracking-policy** *policy-name* [create]

**no host-tracking-policy** *policy-name*

### Context

[\[Tree\]](#) (config>subscr-mgmt>sub-prof host-tracking-policy)

[\[Tree\]](#) (config>subscr-mgmt host-tracking-policy)

### Full Context

configure subscriber-mgmt sub-profile host-tracking-policy

configure subscriber-mgmt host-tracking-policy

### Description

This command configures a host tracking policy. IGMP host tracking is an option in the subscriber profile that allows the factoring in of a subscriber's (multicast) video traffic by reducing the unicast operational egress aggregate rate or the rate of the scheduler specified in the ANCP policy to account for a subscriber's multicast traffic. If no ANCP policy is defined, the egress aggregate rate configured in the subscriber profile is reduced. If an ANCP policy is defined, the **rate-modify** command in the policy specifies whether the egress aggregate rate or the rate of the egress policer specified in the policy is to be reduced to account for the subscriber's multicast traffic.

The **no** form of this command reverts to the default value.

### Parameters

*policy-name*

Specifies a host tracking policy name up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 12.79 host-unreachable

host-unreachable

### Syntax

[no] **host-unreachable** *ip-address*

[no] **host-unreachable** *ipv6-address*

### Context

[\[Tree\]](#) (config>vrrp>policy>priority-event host-unreachable)

### Full Context

configure vrrp policy priority-event host-unreachable

## Description

This command creates the context to configure a host unreachable priority control event to monitor the ability to receive ICMP echo reply packets from an IP host address.

A host unreachable priority event creates a continuous ICMP echo request (ping) probe to the specified *ip-address*. If a ping fails, the event is considered to be set. If a ping is successful, the event is considered to be cleared.

Multiple unique (different *ip-address*) **host-unreachable** event nodes can be configured within the **priority-event** node to a maximum of 32 events.

The **host-unreachable** command can reference any valid local or remote IP address. The ability to ARP a local IP address or find a remote IP address within a route prefix in the route table is considered part of the monitoring procedure. The **host-unreachable** priority event operational state tracks ARP or route table entries dynamically appearing and disappearing from the system. The operational state of the **host-unreachable** event are listed in [Table 51: Host Unreachable Operational States](#).

Table 51: Host Unreachable Operational States

| Host Unreachable Operational State | Description                                                                                                                          |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| Set – no ARP                       | No ARP address found for <i>ip-addr</i> for <b>drop-count</b> consecutive attempts; only applies when IP address is considered local |
| Set – no route                     | No route exists for <i>ip-addr</i> for <b>drop-count</b> consecutive attempts; only when IP address is considered remote             |
| Set – host unreachable             | ICMP host unreachable message received for <b>drop-count</b> consecutive attempts                                                    |
| Set – no reply                     | ICMP echo request timed out for <b>drop-count</b> consecutive attempts                                                               |
| Set – reply received               | Last ICMP echo request attempt received an echo reply but historically not able to clear the event                                   |
| Cleared – no ARP                   | No ARP address found for <i>ip-addr</i> - not enough failed attempts to set the event                                                |
| Cleared – no route                 | No route exists for <i>ip-addr</i> - not enough failed attempts to set the event                                                     |
| Cleared – host unreachable         | ICMP host unreachable message received - not enough failed attempts to set the event                                                 |
| Cleared – no reply                 | ICMP echo request timed out - not enough failed attempts to set the event                                                            |
| Cleared – reply received           | Event is cleared - last ICMP echo request received an echo reply                                                                     |

Unlike other priority event types, the **host-unreachable** priority event monitors a repetitive task. A historical evaluation is performed on the success rate of receiving ICMP echo reply messages. The operational state takes its cleared and set orientation from the historical success rate. The informational

portion of the operational state is derived from the last attempt's result. It is possible for the previous attempt to fail while the operational state is still cleared due to an insufficient number of failures to cause it to become set. It is also possible for the state to be set while the previous attempt was successful.

When an event transitions from clear to set, the set is processed immediately and must be reflected in the associated virtual router instances in-use priority value. As the event transitions from clear to set, a hold-set timer is loaded with the value configured by the events **hold-set** command. This timer prevents the event from clearing until it expires, damping the effect of event flapping. If the event clears and becomes set again before the hold-set timer expires, the timer is reset to the **hold-set** value, extending the time before another clear can take effect.

The hold-set timer be expired and the historical success rate must be met prior to the event operational state becoming cleared.

The **no** form of the command deletes the specific IP host monitoring event. The event may be deleted at any time. When the event is deleted, the in-use priority of all associated virtual router instances must be reevaluated. The event's **hold-set** timer has no effect on the removal procedure.

## Default

no host-unreachable — No host unreachable priority events are created.

## Parameters

### *ip-address*

The IP address of the host for which the specific event will monitor connectivity. The *ip-addr* can only be monitored by a single event in this policy. The IP address can be monitored by multiple VRRP priority control policies. The IP address can be used in one or multiple **ping** requests. Each VRRP priority control **host-unreachable** and **ping** destined to the same *ip-addr* is uniquely identified on a per message basis. Each session originates a unique identifier value for the ICMP echo request messages it generates. This allows received ICMP echo reply messages to be directed to the appropriate sending application.

**Values** The following values apply to the 7450 ESS:

ipv4-address: a.b.c.d

**Values** The following values apply to the 7750 SR and 7950 XRS:

ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x[-interface]

x: [0..FFFF]H

interface: 32 chars maximum,  
mandatory for link local  
addresses

The link-local IPv6 address must have an interface name specified. The global IPv6 address must not have an interface name specified.

### host-unsolicited-na-flood-evpn

#### Syntax

[no] host-unsolicited-na-flood-evpn

#### Context

[\[Tree\]](#) (config>service>vpls>proxy-nd host-unsolicited-na-flood-evpn)

#### Full Context

configure service vpls proxy-nd host-unsolicited-na-flood-evpn

#### Description

This command controls whether the system floods host unsolicited Neighbor Advertisements to the EVPN. The NA messages impacted by this command are NA messages with the following flags: S=0 and R=0.

The **no** form of the command will only flood to local SAPs/binds but not to the EVPN destinations. This is only recommended in networks where CEs are routers that are directly connected to the PEs. Networks using aggregation switches between the host/routers and the PEs should flood unsolicited NA messages in the EVPN to ensure that the remote caches are updated and the BGP does not miss the advertisement of these entries.

#### Default

no hqos-algorithm
```

#### Context

[\[Tree\]](#) (config>qos>port-scheduler-policy hqos-algorithm)

#### Full Context

```
configure qos port-scheduler-policy hqos-algorithm
```

#### Description

This command configures the port scheduler H-QoS algorithm used to calculate the operational rates for the children connected to the port scheduler. The algorithm can be changed on the fly.

#### Default

default

#### Parameters

##### default

Specifies that the default H-QoS algorithm is used by the port scheduler.

##### above-offered-allowance-control

Enables the control of the amount of bandwidth in excess of the offered rate to be given to a queue or scheduler. This algorithm is supported when only queues and schedulers are parented to the port scheduler on Ethernet Vports or Ethernet physical ports.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 12.85 hqos-mode

### hqos-mode

#### Syntax

```
hqos-mode {port-scheduler | hw-agg-shaping}
```

## Context

[\[Tree\]](#) (config>qos>fp-resource-policy>ports hqos-mode)

## Full Context

configure qos fp-resource-policy ports hqos-mode

## Description

This command configures the default HQoS mode for ports on the specified FP.

## Default

hqos-mode port-scheduler

## Parameters

### port-scheduler

Specifies that the default HQoS mode is port scheduler.

### hw-agg-shaping

Specifies that the default HQoS mode is hardware aggregate shaping.

## Platforms

7750 SR-1, 7750 SR-s

## 12.86 hs-agg-rate-limit

### hs-agg-rate-limit

## Syntax

**hs-agg-rate-limit** *kilobits-per-second*

**no hs-agg-rate-limit**

## Context

[\[Tree\]](#) (config>subscr-mgmt>sla-profile>egress hs-agg-rate-limit)

## Full Context

configure subscriber-mgmt sla-profile egress hs-agg-rate-limit

## Description

This command configures high scale (HS) aggregate rate limit of the SLA profile instance (SPI) associated with the subscriber in expanded SLA mode. The aggregate rate of the subscriber (the primary shaper) is configured in the **config>subscr-mgmt>sub-profile>egress>hs-agg-rate-limit** context.

The **no** form of this command removes the value from the configuration.

## Parameters

### *kilobits-per-second*

Specifies the HS egress aggregate rate limit.

**Values** 1 to 100000000

## Platforms

7750 SR-7/12/12e

## hs-agg-rate-limit

## Syntax

**hs-agg-rate-limit** *kilobits-per-second* [**min-resv-bw** *min-rate*]

**hs-agg-rate-limit** **max** [**min-resv-bw** *min-rate*]

**no** **hs-agg-rate-limit**

## Context

[\[Tree\]](#) (config>subscr-mgmt>sub-profile>egress hs-agg-rate-limit)

## Full Context

configure subscriber-mgmt sub-profile egress hs-agg-rate-limit

## Description

This command configures the HS aggregate rate limit for the subscriber in single SLA mode. In single SLA mode, the **hs-aggregate-rate-limit** command under the **config>subscr-mgmt>sla-profile** context should not be configured.

When both, **sub-profile>egress>hs-agg-rate-limit** and **sla-profile>egress>hs-agg-rate-limit** are configured, the system takes the minimum of the two to program the subscriber's aggregate rate.

The **no** form of this command removes the value from the configuration.

## Parameters

### *kilobits-per-second*

Specifies the HS egress aggregate rate limit.

**Values** 1 to 100000000

### *min-rate*

Specifies the minimum rate of the minimum reserved bandwidth for unicast data traffic. Since minimum rate can oversubscribe subscriber bandwidth to guarantee a minimum bandwidth for unicast traffic, care must be taken in QoS provisioning to prioritize packets accordingly (downstream network elements such as the access node or aggregation nodes) when congestion occurs.

**Values** 0 to 100000000

**max**

Specifies that the egress aggregate rate limit for the subscriber is unlimited. Scheduling for the subscriber queues will only be governed by the individual queue parameters and any congestion on the port relative to each queues scheduling priority.

**Platforms**

7750 SR-7/12/12e

## Full Context

configure qos queue-group-templates egress queue-group queue hs-alt-port-class-pool

## Description

This command specifies that the HSQ queue group queues use the class buffers from the HS alternate port class buffer pools.

The **no** form of the command reverts to the HSQ queue group queues using buffers from HS standard port class pools.

## Platforms

7750 SR-7/12/12e

## 12.88 hs-attachment-policy

## hs-attachment-policy

## Syntax

**hs-attachment-policy** *policy-name* [**create**]

**no hs-attachment-policy** *policy-name*

## Context

**[Tree]** (config>qos hs-attachment-policy)

## Full Context

```
configure qos hs-attachment-policy
```

## Description

This command specifies how the queues within an HSQ queue group associated with the SAP egress policy instance, egress queue group instance, or egress network queue policy instance attaches to the HSQ scheduling classes managed by the port scheduler. On the HSQ IOM, eight queues are allocated per egress SAP or subscriber SLA profile instance (SPI), or per egress (access or network) queue group instance, or per egress network port, numbered 1 through 8. The port scheduler maintains six scheduling classes numbered from 1 through 6 (6 being the highest relative priority and 1 being the lowest). The set of eight queues may also be placed into one of two local Weighted Round Robin (WRR) groups which collapse the member queues into a single scheduling class while providing a weighted fair distribution of scheduling opportunities per member. The attachment policy contains the **attachment** commands that map the queue IDs and WRR groups to the scheduling classes. The attachment policy also defines the mapping of the scheduling classes to the queue's aggregate shapers low and high burst limit thresholds.

The **no** form of the command deletes the HS attachment policy from the system, which is only possible if the policy is not being referenced.

## Parameters

### *policy-name*

Specifies an existing attachment policy, up to 32 characters. Each HS attachment policy must be uniquely named within the system.

### **create**

This keyword is required when first creating the configuration context. After the context is created, it is possible to navigate into the context without the **create** keyword.

## Platforms

7750 SR-7/12/12e

## hs-attachment-policy

## Syntax

```
hs-attachment-policy policy-name
```

```
no hs-attachment-policy
```

## Context

```
[Tree] (config>qos>network-queue hs-attachment-policy)
```

## Full Context

```
configure qos network-queue hs-attachment-policy
```

## Description

This command associates an existing HS attachment policy with the network queue QoS policy. The HS attachment policy controls how the network queues are attached to scheduler classes or WRR groups,

and how WRR groups are attached to the scheduler classes. It also defines the mapping of the scheduling classes to the queues' aggregate shaper's low and high burst limit thresholds.

Only one HS attachment policy can be associated with a network queue policy.

The **no** form of the command removes the policy name from the configuration and reapplies the default HS attachment policy.

## Parameters

### *policy-name*

Specifies an existing attachment policy up, to 32 characters. Each HSQ attachment policy must be uniquely named within the system.

## Platforms

7750 SR-7/12/12e

## hs-attachment-policy

## Syntax

**hs-attachment-policy** *policy-name*

**no hs-attachment-policy**

## Context

[\[Tree\]](#) (config>qos>sap-egress hs-attachment-policy)

## Full Context

```
configure qos sap-egress hs-attachment-policy
```

## Description

This command associates an existing HS attachment policy with the SAP egress QoS policy. The HS attachment policy controls how the SAP egress queues are attached to scheduler classes or WRR groups, and how WRR groups are attached to the scheduler classes. It also defines the mapping of the scheduling classes to the queues' aggregate shaper's low and high burst limit thresholds.

Only one HS attachment policy can be associated with a SAP egress policy.

The **no** form of the command removes the policy name from the configuration and reapplies the default HS attachment policy.

## Parameters

### *policy-name*

Specifies an existing attachment policy up, to 32 characters. Each HSQ attachment policy must be uniquely named within the system.

## Platforms

7750 SR-7/12/12e

## hs-attachment-policy

### Syntax

**hs-attachment-policy** *policy-name*

**no hs-attachment-policy**

### Context

[\[Tree\]](#) (config>qos>qgrps>egr>qgrp hs-attachment-policy)

### Full Context

configure qos queue-group-templates egress queue-group hs-attachment-policy

### Description

This command associates an existing HS attachment policy with the egress queue group template. The HS attachment policy controls how the egress queue group instance queues are attached to scheduler classes or WRR groups, and how WRR groups are attached to the scheduler classes. It also defines the mapping of the scheduling classes to the queues' aggregate shaper's low and high burst limit thresholds.

Only one HS attachment policy can be associated with an egress queue group template.

The **no** form of the command removes the policy name from the configuration and reapplies the default HS attachment policy.

### Parameters

*policy-name*

Specifies an existing attachment policy, up to 32 characters. Each HS attachment policy must be uniquely named within the system.

### Platforms

7750 SR-7/12/12e

## hs-attachment-policy

### Syntax

**hs-attachment-policy** *src-name dst-name* [ **overwrite**]

### Context

[\[Tree\]](#) (config>qos>copy hs-attachment-policy)

### Full Context

configure qos copy hs-attachment-policy

## Description

This command copies existing QoS policy entries for a QoS policy ID to another QoS policy ID.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

## Parameters

### **src-name dst-name**

Indicates that the source policy ID and the destination policy ID are HS policy IDs. Specify the source policy ID that the copy command attempts to copy from and specify the destination policy ID to which the command copies a duplicate of the policy.

### **overwrite**

Specifies to replace the existing destination policy. Everything in the existing destination policy is overwritten with the contents of the source policy. If **overwrite** is not specified, an error occurs if the destination policy ID exists.

### Example:

```
SR>config>qos# copy hs-pool-policy policy1 policy2
- MINOR: CLI Destination "policy2" exists use {overwrite}.
SR>config>qos# copy hs-pool-policy policy1 policy2
overwrite
```

## 12.90 hs-fixed-high-thresh-delta

### hs-fixed-high-thresh-delta

## Syntax

**hs-fixed-high-thresh-delta** *size-in-bytes*

**no hs-fixed-high-thresh-delta**

## Context

[\[Tree\]](#) (config>card>fp>egress hs-fixed-high-thresh-delta)

## Full Context

configure card fp egress hs-fixed-high-thresh-delta

## Description

This command specifies the egress aggregate shaper high burst limit threshold delta for this HSQ IOM FP. An aggregate rate can be applied to each egress HSQ queue group, HS secondary shaper and (for subscribers configured with HS SLA expanded mode) primary shaper which manages the maximum burst limit over a specified shaping rate. Each aggregate shaper supports two thresholds which are used in conjunction with the low burst class setting. The system utilizes the lowest value attainable for each low threshold aggregate burst limit without causing shaper under run conditions. The high burst limit threshold is determined by adding the configured value of this command to the aggregate's low burst limit threshold value. This configured value should be set to at least two times the maximum frame size to prevent lower threshold class forwarding from also affecting the higher threshold classes when forwarding larger packet sizes. An insufficient high threshold delta defeats the intended purpose of mapping classes to the higher threshold.

The configured value for this command can be changed at any time. Modifying the setting causes all aggregate shapers on this FP to reconfigure the low and high burst limit thresholds to reflect the new value.

The **no** form of this command reverts this parameter to the default.

## Default

hs-fixed-high-thresh-delta 4000

## Parameters

### *size-in-bytes*

Specifies high threshold data in bytes.

**Values** 0 to 65536

## Platforms

7750 SR-7/12/12e

## 12.91 hs-low-burst-max-class

hs-low-burst-max-class

## Syntax

**hs-low-burst-max-class** *class*

**no hs-low-burst-max-class**

## Context

[\[Tree\]](#) (config>subscr-mgmt>sub-prof>egress hs-low-burst-max-class)

## Full Context

configure subscriber-mgmt sub-profile egress hs-low-burst-max-class

## Description

This command specifies which scheduling classes map to the low burst limit threshold of an egress HS primary shaper. The HS primary shaper is used to manage aggregate bandwidth of the subscriber with multiple SLA profile instances (expanded SLA mode).

Each HS primary shaper supports two burst thresholds, a low burst limit threshold and a high burst limit threshold. The two thresholds allow separation of burstiness between low and high scheduling classes.

When the low burst threshold of the HS primary shaper is reached, the lower scheduling classes, up to the scheduling class configured by this command, stops being served. Traffic on higher scheduling classes still goes through until the high burst threshold is reached. When the high burst threshold is exceeded, all scheduling classes associated with the HS primary shaper and stops being serve, which effectively shuts off the traffic flow.

Typically, the queues associated with higher scheduling classes are individually rate-limited so that their aggregate allowed throughput is less than the configured rate of the HS primary shaper. Determining the **hs-low-burst-max-class** *class* value involves anticipating the proper dividing line between the low and high scheduling classes by evaluating the forwarding behavior and SLA enforcement of each class.

By default, all scheduling classes are mapped to the low burst limit threshold. When mapping scheduling classes to the high burst limit threshold, an adequate value for the **config>card>fp>egress>hs-fixed-high-thresh-delta** should be specified (by default, it is set to 4000 bytes). This is because the queues associated with the lower scheduling classes may burst over the lower threshold during normal operation due to the scheduler forwarding whole packets. The **hs-fixed-high-thresh-delta** value should be set to at least two times the maximum frame size to prevent lower threshold class forwarding from also affecting the higher threshold classes when forwarding larger packet sizes. An insufficient high threshold delta defeats the intended purpose of mapping classes to the higher threshold.

The system uses the lowest value attainable for each low threshold aggregate burst limit without causing shaper underrun conditions. The high burst limit threshold is determined by adding the **hs-fixed-high-thresh-delta** value to the aggregate low burst limit threshold value.

The **hs-low-burst-max-class** value for HS primary shaper can be changed at any time in the subscriber profile (sub-profile).

The **no** form of this command restores the low burst limit threshold of the scheduling classes to the default value. This causes all scheduling classes associated with the HS primary shaper to be mapped to the low burst limit threshold.

## Default

hs-low-burst-max-class 6

## Parameters

### *class*

Specifies the highest scheduling class that is associated with the low burst limit threshold of the HS primary shaper. Scheduling classes that are higher than the scheduling class ID are associated with the high burst limit threshold.

**Values** 1 to 6

## Platforms

7750 SR-7/12/12e

## 12.92 hs-mbs

### hs-mbs

#### Syntax

**hs-mbs** *percent-of-queue-rate*

**no hs-mbs**

#### Context

[\[Tree\]](#) (config>qos>network-queue>queue hs-mbs)

#### Full Context

configure qos network-queue queue hs-mbs

#### Description

This command configures the queue size of an HSQ queue group network queue. Its value is calculated based on the specified percentage of one second of the queue PIR converted to bytes (the regular **mbs** parameter is ignored in the network queue policy).

The **no** form of the command reverts to the default value.

#### Default

hs-mbs 100

#### Parameters

***percent-of-queue-rate***

Specifies the buffer space for the queue as a percentage of its PIR (in bytes).

**Values** 0.00 to 100.0

#### Platforms

7750 SR-7/12/12e

## 12.93 hs-pool-policy

### hs-pool-policy

#### Syntax

**hs-pool-policy** *name*

**no hs-pool-policy**

## Context

**[Tree]** (config>card>fp>egress hs-pool-policy)

## Full Context

configure card fp egress hs-pool-policy

## Description

This command specifies the HS pool policy for this FP.

An HS pool policy contains the required parameters to create and size root and mid-tier buffer pools on an HSQ IOM, and apply a slope policy to each.

A single HS pool policy is supported per port FP. This command is only applicable to the HSQ IOM (iom4-e-hs) and will fail if configured on all other card types.

The **no** form of this command removes the policy and reapplies the default policy.

## Default

hs-pool-policy default

## Parameters

### *name*

Specifies the HS pool policy name, up to 32 characters.

## Platforms

7750 SR-7/12/12e

## hs-pool-policy

## Syntax

**hs-pool-policy** *policy-name* [**create**]

**no hs-pool-policy** *policy-name*

## Context

**[Tree]** (config>qos hs-pool-policy)

## Full Context

configure qos hs-pool-policy

## Description

Commands in this context create HS pool policy parameters. The policy can be assigned to an egress forwarding plane of an HSQ IOM. The policy contains the required parameters to create and size root and mid-tier buffer pools on an HSQ IOM, and apply a slope policy to each. The HS pool policy can be applied using the **hs-pool-policy** command within the **config>card>fp** *fp-number* **egress** context.

The system supports 63 HS pool policies including the default HS pool policy.

- **HSQ IOM System Reserved Buffers** — The HSQ IOM maintains two types of queues; provisioned queues and system reserved queues. The HSQ IOM ensures that provisioned queues cannot consume buffers that must be available for internal system queues required for correct operating behavior. To prevent buffer starvation between the two types of queues, the system divides the available buffers into two portions. The first portion is given to system root pools and is allocated to HSQ queues reserved for internal functions. The second portion is given to the provisioned or user-defined root pools and is available for egress service queues, network queues, queue-group queues or subscriber queues. By default, 5% of the total buffers available are given to the system root pools leaving 95% for the provisioned root pools.

The default separation between the system and the provisioned root pools can be overridden using the **system-reserve** command.

- **Root Pools** — Root pools are the buffer pools at the bottom of the buffer allocation hierarchy. Two sets of root pools exist: the system root pools and the provisioned root pools. The system root pools cannot be managed by the HS pool policy; only the total number of buffers given to the system root pools can be adjusted by using the **system-reserve** command.

The HS pool policy manages sixteen provisioned root pools defined under the **root-tier** context and specified as root-pool 1 through 16. Each root pool accepts a weight command that defines the relative quantity of buffers that are allocated to each root pool. Root pools are deactivated by defining a weight equal to 0. Root pools with a non-zero weight are sized based on the pool's weight divided by the sum of all root pool weights, multiplied by the available buffer space. In this manner, all buffers not reserved for system use are distributed between the provisioned root pools without oversubscription. The lack of oversubscription prevents buffer starvation between the root pools allowing root pools, to act as protected buffer space between different types of traffic (best-effort, expedited, or real-time). Root pools allocate buffers to the FP-level mid-tier pools.

- **Mid-Tier Pools** — Mid-tier pools are the buffer pools that act as aggregators for port-class pools. Multiple mid-tier pools can be mapped to a single root pool and each mid-tier pool is assigned a percentage of that root pool's buffer space. The sum of the percentages may exceed 100%, allowing for oversubscription of the root pool's buffer space. Due to statistical multiplexing principles, oversubscribing the root pool's buffer allocation may allow more efficient use of the available buffers as not all mid-tier pools are expected to use their fair share simultaneously. Examples of a multiple mid-tier pool application are multiple assured forwarding (AF) or best-effort classes being grouped together in the same root pool. The HS pool policy manages the sixteen mid-tier pools on an HSQ IOM, defined under the **mid-tier** context and specified as mid-pool 1 through 16.
- **Port Class Pools** — The HSQ IOM maintains two sets of scheduler class pools per port: a standard (or default) set and an alternate set. Each set contains six pools, one for each scheduler class serviced by the HSQ IOM port scheduler. Each queue or WRR group is mapped to a scheduling class based on the HS attachment policy defined within the policy or template used to create the queue. Within the SAP egress policy, network queue policy and egress queue group template, an **alt-port-class-pool** command specifies whether the queues created through the policy use the standard or alternate set of port class pools on the physical port. Further, the scheduling class servicing the queue defines which port-class pool (1 through 6) within the set allocate buffers to the queue.

Port-class pools are defined within the **hs-port-pool-policy**, which is applied to each physical port. Further information on HSQ IOM port-class pools is contained in the HS port pool policy section.

- **HSQ Stable Pool Sizing Equivalency** — Stable pool sizing is a feature supported on ingress and on non-HSQ egress forwarding planes. By default, the system tries to make all buffers available to active ports (provisioned and equipped). This leads to a condition where an IOM may have only a single MDA populated and the users on that MDA receive all available buffers. At a later date, the second MDA can be populated, causing the buffer space to be fragmented between the users on each MDA. The users

on the earlier populated MDA may perceive a degradation in service based on the change in available buffers. The stable pool sizing feature mitigates this potential issue by segregating the buffer space per MDA.

The HSQ IOM can be made to operate in this stable buffer allocation mechanism by utilizing per-MDA buffer pools. This is accomplished by performing the following steps:

1. Create two sets of root-pools and two sets of mid-pools in the **hs-pool-policy** applied to the IOM's FP egress CLI context. The first set of mid-pools should be parented to the first set of root-pools. The second set of mid-pools should be parented to the second set of root-pools.
  2. Create two distinct HS port pool policies. One is applied to the ports on the first MDA and has the port-class pools parented to the first set of mid-tier pools from the FP level policy. The second HS port pool policy is applied to the ports on the second MDA (when it is provisioned) and has the port-class pools parented to the second set of mid-tier pools from the FP level policy. This provides deterministic pool sizing independent of MDA equipping events.
  3. Configure further control at the port-class level by utilizing **explicit-percent** based port-class pool sizing, which eliminates the effect of changing port states, including bandwidth changes.
- HSQ Queue Buffer Allocation — As each packet arrives at an HSQ queue, the queue must obtain buffers to admit the packet on the queue. The queue first checks the depth of the queue relative to the packet's congestion priority (based on the in, out, or exceed profile) to determine if the packet should be discarded based on early congestion detection or based on the MBS threshold. If the packet is allowed into the queue, the HSQ IOM continues to determine buffer availability using checks to the queue's port-class pool, the port-class pool's mid-tier pool, and the mid-tier pool's root pool. The same RED slope type used at the queue (high, low, or exceed) is used within each buffer pool. If a buffer is available, the buffer can be allocated, and given to the queue.
  - Default HSQ Pool Policy — An HSQ pool policy with the name **default** always exists on the system and does not need to be created. The default pool policy cannot be changed and is used by all HSQ IOMs within the system unless an explicitly created **hs-pool-policy** is associated with a forwarding plane.

The default policy contains the following parameters:

**system-reserve:** 5%

**root-pool 1**

allocation-weight: 75

slope-policy: \_tmnx\_hs\_default

**root-pool 2**

allocation-weight: 25

slope-policy: \_tmnx\_hs\_default

**root-pool 3 to 16**

allocation-weight: 0

slope-policy: \_tmnx\_hs\_default

**mid-pool 1**

parent-root-pool: 1

allocation-percent: 40%

slope-policy: \_tmnx\_hs\_default

**mid-pool 2**

parent-root-pool: 1  
allocation-percent: 35%

## hs-pool-policy

### Syntax

**hs-pool-policy** *src-name* *dst-name* [**overwrite**]

### Context

[\[Tree\]](#) (config>qos>copy hs-pool-policy)

### Full Context

configure qos copy hs-pool-policy

### Description

This command copies existing QoS policy entries for a QoS policy ID to another QoS policy ID.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

### Parameters

#### **src-name** **dst-name**

Indicates that the source policy ID and the destination policy ID are HS policy IDs. Specify the source policy ID that the copy command attempts to copy from and specify the destination policy ID to which the command copies a duplicate of the policy.

#### **overwrite**

Specifies to replace the existing destination policy. Everything in the existing destination policy is overwritten with the contents of the source policy. If **overwrite** is not specified, an error occurs if the destination policy ID exists.

#### Example:

```
– SR>config>qos# copy hs-pool-policy policy1 policy2
– MINOR: CLI Destination "policy2" exists use {overwrite}.
– SR>config>qos# copy hs-pool-policy policy1 policy2
overwrite
```

## Context

[\[Tree\]](#) (config>port>ethernet>egress hs-port-pool-policy)

## Full Context

configure port ethernet egress hs-port-pool-policy

## Description

This command specifies an HS port pool policy to associate with the port egress.

An HS port buffer pool policy defines and sizes the port-class buffer pools on an HSQ IOM egress port.

A single HS port pool policy is supported per port egress. This command is only applicable to the HSQ IOM (iom4-e-hs) and will fail if configured on all other card types.

The **no** form of this command removes the policy and reapplies the default policy.

## Default

hs-port-pool-policy default

## Parameters

### *policy-name*

Specifies the HS port pool policy up to 32 characters.

## Context

[\[Tree\]](#) (config>qos hs-port-pool-policy)

## Full Context

configure qos hs-port-pool-policy

## Description

This command creates an HS port buffer pool policy. The policy can be assigned to an egress port on an HSQ IOM. The policy contains the required commands to define and size port-class buffer pools on an HSQ IOM. The policy can be applied using the **hs-port-pool-policy** command within the **config>port>ethernet>egress** context.

SR OS supports 2047 HS port pool policies including the default HS port pool policy.

HSQ IOM port buffer pools provide buffer control for queues based on the queue's scheduling class. Two sets of scheduling class pools exist per port: a standard (or default) set and an alternative set. The SAP egress policy, network queue policy, and egress queue group template have a parameter ( **alt-port-class-pool**) that specifies that the queues created by the policy or template uses the alternate port-class pools, as opposed to the default standard port-class pools. Each set has six pools, one for each scheduling class. Based on the **alt-port-class-pool** setting and the queue's scheduling class (based on the HS attachment policy configuration), each queue is mapped to a specific port-class pool.

The HS port pool policy defines how each of these pools are parented (mapped) to an FP level mid-pool and how each pool is sized.

The system allows two separate mechanisms to size each port-class pool:

- dynamic sizing based on port bandwidth, relative to bandwidth of other ports
- explicit sizing based on a percentage of the port-class pool's parent mid-pool

**Dynamic Port-Class Pool Sizing** — Dynamic port-class pool sizing is a mechanism that provides a fair share of a mid-pool's size to each of the port-class pools based on the potential bandwidth represented by each port. To understand port-class pool sizing, consider the following:

- Each port's bandwidth is the minimum of the port's line rate, the port's configured **egress-rate**, and the port's **hs-scheduler-policy max-rate**.
- The port's bandwidth can be further modified by the port's **egr-percentage-of-rate** command, which increases or decreases the port's bandwidth derived by the specified percent. This parameter allows the port to have a higher or lower bandwidth-derived weight based on how the port is actually being used instead of bandwidth alone.
- Because the port-class pools are user mapped to the mid-pools, not every port has a port-class pool associated with a mid-pool, requiring that the system perform the relative bandwidth calculations separately per mid-pool.
- Each port's portion of a specified mid-pool's size is calculated based on:

$$\text{Port\_Portion} = (\text{Port\_Adj\_Bw} / \text{Sigma\_Mid\_Pool\_Ports\_Adj\_Bw}) * \text{Mid\_Pool\_Size}$$

where  $\text{Sigma\_Mid\_Pool\_Ports\_Adj\_Bw}$  is the sum of the adjusted bandwidths for all ports with port-class pools mapped to the mid-pool that are not sized using explicit-percent.

- A port without any port-class pools associated with a given mid-pool has a port portion of zero for that mid-pool.
- Multiple port-class pools on the same port can be mapped to the same mid-pool, requiring a mechanism to distribute the portion of the mid-pool given to the port between multiple port-class pools. Each mid-pool's **port-bw-weight** parameter is used to determine how much of the port's mid-pool portion is given to each port-class pool associated with mid-pool. Port-class pools sized using an **explicit-percent** value instead of port bandwidth are assumed to have a **port-bw-weight** equal to 0, causing those port-class pools to not participate in the port portion distribution. It is expected (but not required) that one of port bandwidth-based sizing or explicit percent-based sizing is used and any concurrent use of both mechanisms is transitory in nature.
- The port bandwidth weighting mechanism allocates 100% of the mid-pool size to the associated port-class pools. To allow the port-class pools to oversubscribe the parent mid-pool, a mid-pool **port-bw-oversub-factor** parameter is supported that allows the port-class pools sized by dynamic port bandwidth to increase in size by the specified oversubscription factor. This oversubscription factor can provide a more efficient use of the mid-pool's available buffers because it is not expected that all port-class pools are utilizing their allotted size simultaneously.

Explicit Port-Class Pool Sizing — The port-class pool's allocation **explicit-percent** *percent-of-parent-pool* command is used to override the dynamic pool sizing mechanism for a given mid-pool. The specified percentage value is applied to the port-class's parent mid-pool's size to derive the port-class pool size.

Explicit and Dynamic Sizing from the Same Mid-Pool Parent — If explicit and dynamic pool sizing are used simultaneously for port-class pools parented to the same mid-pool, unexpected contention or underutilization of the mid-pool's available buffers may result. While this is not a proscribed condition, it is expected most instances of dual-sizing mechanisms are transitory, based on moving between the two mechanisms.

Port-Class Pool Slope Policy Association — The HS port pool policy also provides the ability to specify a slope policy on each port-class pool. The slope policy is used to define the high, low, and exceed slope parameters used to manage contention within the port-class pool.

Default HS Port Pool Policy — An HS port pool policy with the name **default** always exists on the system and does not need to be created. The default port pool policy cannot be changed and is used by all HSQ IOMs within the system unless an explicitly created **hs-port-pool-policy** is associated with an HSQ egress port.

The default policy contains the following parameters:

#### Standard Port-Class Pools

Port-Class-Pool 1

Parent: Mid-Pool 1

Port-Class-Pool 2

Parent: Mid-Pool 2

Port-Class-Pool 3

Parent: Mid-Pool 3

Port-Class-Pool 4

Parent: Mid-Pool 4

Port-Class-Pool 5

Parent: Mid-Pool 5

Port-Class-Pool 6

Parent: Mid-Pool 6

Port-Class-Pool 1 to 6

Port-Bw-Weight: 1

Slope-Policy: *\_tmnx\_hs\_default*

#### Alternate Port-Class Pools

Port-Class-Pool 1 to 6

Parent: None

Port-Bw-Weight: 1

Slope-Policy: *\_tmnx\_hs\_default*

## Parameters

*policy-name*

Specifies an HS port pool policy name up to 32 characters.

### **create**

This keyword is required when first creating the configuration context. After the context is created, it is possible to navigate into the context without the **create** keyword.

## hs-scheduler-policy

## Syntax

**hs-scheduler-policy** *policy-name* [**create**]

**no hs-scheduler-policy** *policy-name*

## Context

[\[Tree\]](#) (config>qos hs-scheduler-policy)

## Full Context

configure qos hs-scheduler-policy

## Description

This command configures an HS scheduler policy. The HS scheduler policies are applied to egress HSQ ports in the **config>port>ethernet>egress** context. The policy contains the required commands to provision the scheduling behavior of the HSQ scheduler classes. When assigned to an HSQ egress port, the policy is used to define the scheduling behavior for all queues associated with the egress port. The values defined in the policy can be overridden on each scheduler instance using the **config>port>ethernet>egress>hs-scheduler-overrides** command.

**HSQ Queue Groups** — A fundamental concept on an HSQ IOM is the queue group. Queue groups are not directly managed by the provisioning. Instead, they are indirectly assigned when creating SAPs or subscribers on an HSQ port. A queue group has eight queue members, numbered from 1 through 8. When creating a SAP or subscriber associated on an HSQ egress port, a queue group is allocated to the object. Within the SAP egress policy, network queue policy and egress queue group template, provisioned queue IDs 1 through 8 correspond directly to queue group queue IDs 1 through 8. Each group also allows each queue to be dynamically placed in a scheduling class or on one of two WRR groups local to the queue group.

Each queue within the group has three RED slopes (managed by associating a slope policy to the queue), an MBS defined in bytes, a packet byte offset parameter used to add or subtract bytes to or from each packet handled by the queue for accounting purposes, and a PIR shaper used to rate limit the queue. An HSQ attachment policy associated with the queue group defines how each queue maps either directly to a scheduling class or one of the WRR groups within the queue group. The attachment policy also defines the scheduling class attachments for the WRR groups.

The queue group supports an aggregate shaper used to manage an aggregate rate limit for all queues within the group. Scheduling for queues within the queue group is stopped and started based on the rate set on the shaper.

**Scheduling Classes and Scheduling Priorities** — HSQ supports six scheduler classes (1 through 6). The scheduler class should not be confused with a QoS policy forwarding class. Forwarding classes within the system are used between the ingress and egress forwarding complexes and help the system to map a packet to per-hop and per-domain behavior. Scheduling classes are slices of scheduling opportunity within a port-scheduling context. Each port scheduler maintains six strict priority levels, where 6 is the highest priority and 1 is the lowest. As a rule, the scheduler services all active queues associated with priority level 6 before moving to queues on priority level 5. This strict behavior continues through priority level 1. Scheduling classes are mapped either to their corresponding scheduling priority level (scheduling class 1 mapped to priority level 1 through scheduling class 6 mapped to priority level 6) or to a single port level WRR group. The WRR group allows collapsing up to 6 of the scheduling classes into a single scheduling priority. The WRR group provides a weighted fair scheduling behavior for its member scheduling classes at that strict priority level.

**Strict Priority Level PIR** — The scheduler supports a strict scheduling level PIR that limits the amount of bandwidth allowed for the level. The rate is defined in increments of megabits per second and can be set to **max** (the default setting) which disables the shaping function. The scheduler includes the full Ethernet frame encapsulation overhead when updating the priority level PIR, including the 12-byte inter-frame gap and the 8-byte preamble.

**Scheduler Maximum Rate** — A maximum scheduling rate can be defined for the scheduler. The rate is specified in megabits per second and the default rate is **max** which allows the scheduler to operate without a set limit. When the HS scheduling policy is applied to an egress port, the maximum scheduling rate can be used to define a rate less than the available line rate of the port. The scheduler includes the full Ethernet frame encapsulation overhead when updating the scheduler level PIR, including the 12-byte inter-frame gap and the 8-byte preamble.

**HS Scheduler Policy Overrides** — After an HS scheduler is applied to an egress port, the various parameters can be overridden, allowing an HS scheduler policy to be adapted to changing needs on a port without requiring a new policy to be created.

**Default HS Scheduling Policy** — An HS scheduling policy with the name **default** always exists on the system and does not need to be created. The default policy cannot be modified or deleted.

The default policy contains the following parameters:

*Table 52: HS Scheduler Policy Parameter Defaults*

| Parameter                    | Sub-Parameter | Default |
|------------------------------|---------------|---------|
| max-rate                     | —             | max     |
| scheduling-class 1 through 6 | rate          | max     |
|                              | group         | —       |
|                              | weight        | —       |
| group 1                      | rate          | max     |

## Default

The **no** form of the command removes an HS scheduler policy from the system. If the HS scheduler policy is currently associated with an egress port, the command fails.

## Parameters

### *policy-name*

Specifies the HS scheduler policy up to 32 characters. Each HS scheduler policy must be uniquely named within the system.

### **create**

This keyword is required when first creating the configuration context. After the context is created, it is possible to navigate into the context without the **create** keyword.

## 12.98 hs-secondary-shaper

### hs-secondary-shaper

#### Syntax

**hs-secondary-shaper** *secondary-shaper-name* [ **create**]

**no hs-secondary-shaper** *secondary-shaper-name*

#### Context

[\[Tree\]](#) (config>port>ethernet>egress hs-secondary-shaper)

#### Full Context

configure port ethernet egress hs-secondary-shaper

#### Description

This command specifies an HS secondary shaper on the port egress. HS secondary shapers are used to apply an aggregate rate and per-scheduling class rates to the set of SAP egress HSQ queue groups which reference them using the SAP egress queue-override **hs-secondary-shaper** command.

By default, the **hs-secondary-shaper** default is applied to each port egress on all HSQ ports and the settings under it can be modified.

Multiple HS secondary shapers are supported per port egress, up to the number supported per-HSQ FP, which is 4096 HS secondary shapers. The number of HS secondary shapers allocated on an HSQ FP can be seen using the **tools dump resource-usage card slot-number fp fp-number** command.

Non-default HS secondary shapers are only configurable on access or hybrid mode ports.

This command is only applicable to the HSQ IOM (iom4-e-hs) and will fail if configured on all other card types.

The **no** form of this command removes the HS secondary shaper from the port egress configuration. An HS scheduler policy cannot be removed when HS scheduler overrides exist on the port egress.

#### Default

hs-secondary-shaper default

#### Parameters

***secondary-shaper-name***

Specifies the secondary shaper name up to 32 characters.

## Platforms

**no hs-wred-queue**

## Context

[\[Tree\]](#) (config>qos>network-queue>queue hs-wred-queue)

## Full Context

configure qos network-queue queue hs-wred-queue

## Description

This command reverts the slope policy applied to the HSQ queue group queue to the default policy. Specifying an existing slope policy applies the named slope policy to the queue.

The **no** form of the command reverts to the default slope policy.

## Default

hs-wred-queue policy "\_tmnx\_hs\_default"

## Parameters

### *slope-policy-name*

Specifies an existing slope policy to apply to this HSQ queue group queue.

## Platforms

7750 SR-7/12/12e

## hs-wred-queue

## Syntax

**hs-wred-queue** [policy *slope-policy-name*]

**no hs-wred-queue**

## Context

[\[Tree\]](#) (config>qos>sap-egress>queue hs-wred-queue)

## Full Context

```
configure qos sap-egress queue hs-wred-queue
```

## Description

This command reverts the slope policy applied to the HSQ queue group queue to the default policy. Specifying an existing slope policy applies the named slope policy to the queue.

The **no** form of the command reverts to the default slope policy.

## Default

```
hs-wred-queue policy "_tmnx_hs_default"
```

## Parameters

### *slope-policy-name*

Specifies an existing slope policy to apply to this HSQ queue group queue.

## Platforms

7750 SR-7/12/12e

## hs-wred-queue

## Syntax

```
hs-wred-queue [policy slope-policy-name]
```

```
no hs-wred-queue
```

## Context

[\[Tree\]](#) (config>qos>qgrps>egr>qgrp>queue hs-wred-queue)

## Full Context

```
configure qos queue-group-templates egress queue-group queue hs-wred-queue
```

## Description

This command reverts the slope policy applied to the HSQ queue group queue to the default policy. Specifying an existing slope policy applies the named slope policy to the queue.

The **no** form of the command reverts to the default slope policy.

## Default

```
hs-wred-queue policy "_tmnx_hs_default"
```

**Parameters*****slope-policy-name***

Specifies an existing slope policy name to apply to this HSQ queue group queue.

**Platforms**

7750 SR-7/12/12e

## 12.102 hs-wred-queue-policy

### hs-wred-queue-policy

**Syntax**

**hs-wred-queue-policy** *name*

**no hs-wred-queue-policy**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>sla-prof>egress>qos>queue hs-wred-queue-policy)

**Full Context**

configure subscriber-mgmt sla-profile egress qos queue hs-wred-queue-policy

**Description**

This command specifies the name of the slope-policy override to be applied for the HS queue of this SLA profile instance.

The **no** form of this command removes the policy name from the configuration.

**Parameters*****name***

Specifies the policy name up to 32 characters.

**Platforms**

7750 SR-7/12/12e

## 12.103 hs-wrr-group

## hs-wrr-group

### Syntax

**[no] hs-wrr-group** *group-id*

### Context

**[Tree]** (config>subscr-mgmt>sla-prof>egress>qos hs-wrr-group)

### Full Context

configure subscriber-mgmt sla-profile egress qos hs-wrr-group

### Description

This command configures the egress HS WRR group override parameters.  
The **no** form of this command removes the group ID from the configuration.

### Parameters

**group-id**

Specifies the HS WRR group ID to override in the QoS policy table.

**Values** 1, 2

### Platforms

7750 SR-7/12/12e

## hs-wrr-group

### Syntax

**hs-wrr-group** *group-id* [**create**]

**no hs-wrr-group** *group-id*

### Context

**[Tree]** (config>service>epipe>sap>egress>queue-override hs-wrr-group)

**[Tree]** (config>service>ipipe>sap>egress>queue-override hs-wrr-group)

### Full Context

configure service epipe sap egress queue-override hs-wrr-group

configure service ipipe sap egress queue-override hs-wrr-group

### Description

This command configures the egress HS WRR group override parameters.  
The **no** form of this command removes the group ID from the configuration.

## Parameters

### *group-id*

Specifies the HS WRR group ID to override.

**Values** 1, 2

### **create**

Keyword used to create an HSS WRR group. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

## Platforms

7750 SR-7/12/12e

## hs-wrr-group

## Syntax

**hs-wrr-group** *group-id* [**create**]

**no hs-wrr-group** *group-id*

## Context

[\[Tree\]](#) (config>service>vpls>sap>egress>queue-override hs-wrr-group)

## Full Context

configure service vpls sap egress queue-override hs-wrr-group

## Description

This command configures the egress HS WRR group override parameters.

The **no** form of this command removes the group ID from the configuration.

## Parameters

### *group-id*

Specifies the HS WRR group ID to override.

**Values** 1, 2

### **create**

Keyword used to create an HSS WRR group. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

## Platforms

7750 SR-7/12/12e

## hs-wrr-group

### Syntax

**hs-wrr-group** *group-id* [**create**]

**hs-wrr-group** *group-id*

### Context

[\[Tree\]](#) (config>service>ies>if>sap>egress>queue-override hs-wrr-group)

### Full Context

configure service ies interface sap egress queue-override hs-wrr-group

### Description

This command configures the egress HS WRR group override parameters. The **no** form of this command removes the group ID from the configuration.

### Parameters

***group-id***

Specifies the HS WRR group ID to override.

**Values** 1, 2

### Platforms

7750 SR-7/12/12e

## hs-wrr-group

### Syntax

**hs-wrr-group** *group-id* [**create**]

**no hs-wrr-group** *group-id*

### Context

[\[Tree\]](#) (config>service>vprn>if>sap>egress>queue-override hs-wrr-group)

### Full Context

configure service vprn interface sap egress queue-override hs-wrr-group

### Description

This command configures the egress HS WRR group override parameters. The **no** form of this command removes the group ID from the configuration.

## Parameters

### *group-id*

Specifies the HS WRR group ID to override.

**Values** 1, 2

### **create**

Keyword used to create the HS WRR group override instance.

## Platforms

7750 SR-7/12/12e

## hs-wrr-group

## Syntax

[no] **hs-wrr-group** *group-id*

## Context

[\[Tree\]](#) (config>qos>network-queue hs-wrr-group)

## Full Context

configure qos network-queue hs-wrr-group

## Description

Commands in this context configure HS WRR group information in the network queue policy. This command provisions the rate and class weight of each of the two WRR scheduling groups that can be utilized by the egress queue-group instance HSQ queues.

The **no** form of the command reverts the HS WRR group parameters to their default values.

## Parameters

### *group-id*

Specifies the HS WRR group identifier. WRR group ID 1 or 2 must be specified when executing the **hs-wrr-group** command. The specified group ID identifies which WRR group context is entered for editing.

**Values** 1, 2

## Platforms

7750 SR-7/12/12e

## hs-wrr-group

### Syntax

**hs-wrr-group** *group-id*

**no hs-wrr-group**

### Context

**[Tree]** (config>qos>sap-egress hs-wrr-group)

### Full Context

configure qos sap-egress hs-wrr-group

### Description

Commands in this context configure HS WRR group information in the SAP egress QoS policy. The **hs-wrr-group** command is used to provision the rate and class weight of each of the two WRR scheduling groups that can be utilized by the SAP egress HSQ queues.

The **no** form of the command resets the HS WRR group parameters to their default values.

### Parameters

#### *group-id*

Specifies the HS WRR group identifier. WRR group ID 1 or 2 must be specified when executing the **hs-wrr-group** command. The specified group ID identifies which WRR group context is entered for editing.

**Values** 1, 2

### Platforms

7750 SR-7/12/12e

## hs-wrr-group

### Syntax

**[no] hs-wrr-group** *group-id*

### Context

**[Tree]** (config>qos>qgrps>egr>qgrp hs-wrr-group)

### Full Context

configure qos queue-group-templates egress queue-group hs-wrr-group

## Description

Commands in this context configure HS WRR group information in the egress queue group template. The **hs-wrr-group** command is used to provision the rate and class weight of each of the two WRR scheduling groups that can be utilized by the egress queue group instance HSQ queues.

The **no** form of the command resets the HS WRR group parameters to their default values.

## Parameters

### *group-id*

Specifies the HS WRR group identifier. WRR group ID 1 or 2 must be specified when executing the **hs-wrr-group** command. The specified group ID identifies which WRR group context is entered for editing.

**Values** 1, 2

## Platforms

7750 SR-7/12/12e

## 12.104 hs-wrr-weight

### hs-wrr-weight

## Syntax

**hs-wrr-weight** *weight*

**no hs-wrr-weight**

## Context

[\[Tree\]](#) (config>subscr-mgmt>sla-prof>egress>qos>queue hs-wrr-weight)

## Full Context

configure subscriber-mgmt sla-profile egress qos queue hs-wrr-weight

## Description

This command configures the SLA profile instance WRR weight override for the HS queue. When a weight value is not specified, there is no override, meaning, the WRR weight is taken from the sap-egress policy.

The **no** form of this command removes the weight value from the configuration.

## Parameters

### *weight*

Specifies the class-weight override for expanded egress HS queues.

**Values** 1 to 127

## Platforms

7750 SR-7/12/12e

## hs-wrr-weight

### Syntax

**hs-wrr-weight** *weight*

**no hs-wrr-weight**

### Context

**[Tree]** (config>service>epipe>sap>egress>queue-override>queue hs-wrr-weight)

**[Tree]** (config>service>ipipe>sap>egress>queue-override>queue hs-wrr-weight)

### Full Context

configure service epipe sap egress queue-override queue hs-wrr-weight

configure service ipipe sap egress queue-override queue hs-wrr-weight

### Description

This command overrides the WRR relative weight as defined within the associated HS attachment policy.

The **no** form of this command removes the WRR weight override value from the configuration.

### Parameters

**weight**

Specifies the HS WRR group queue weight.

**Values** 1 to 127

## Platforms

7750 SR-7/12/12e

## hs-wrr-weight

### Syntax

**hs-wrr-weight** *weight*

**no hs-wrr-weight**

### Context

**[Tree]** (config>service>vpls>sap>egress>queue-override>queue hs-wrr-weight)

### Full Context

configure service vpls sap egress queue-override queue hs-wrr-weight

## Description

This command overrides the WRR relative weight with which this queue should parent into an HSQ WRR group defined within the associated HS attachment policy.

The **no** form of this command removes the WRR weight override value from the configuration.

## Parameters

### *weight*

Specifies the HS WRR group queue weight.

**Values** 1 to 127

## Platforms

7750 SR-7/12/12e

## hs-wrr-weight

## Syntax

**hs-wrr-weight** *weight*

**no hs-wrr-weight**

## Context

[\[Tree\]](#) (config>service>ies>if>sap>egress>queue-override>queue hs-wrr-weight)

## Full Context

configure service ies interface sap egress queue-override queue hs-wrr-weight

## Description

This command overrides the Weighted Round Robin (WRR) relative weight with which this queue should parent into an HSQ WRR group defined within the associated HS attachment policy.

The **no** form of this command removes the WRR weight override value from the configuration.

## Parameters

### *weight*

Specifies the HS WRR group queue weight.

**Values** 1 to 127

## Platforms

7750 SR-7/12/12e

## hs-wrr-weight

### Syntax

**hs-wrr-weight** *weight*

**no hs-wrr-weight**

### Context

**[Tree]** (config>service>vprn>if>sap>egress>queue-override>queue hs-wrr-weight)

### Full Context

configure service vprn interface sap egress queue-override queue hs-wrr-weight

### Description

This command overrides the WRR relative weight with which this queue should parent into an HSQ Weighted Round Robin (WRR) group defined within the associated HS attachment policy.

The **no** form of this command removes the WRR weight override value from the configuration.

### Parameters

**weight**

Specifies the HS WRR group queue weight.

**Values** 1 to 127

### Platforms

7750 SR-7/12/12e

## hs-wrr-weight

### Syntax

**hs-wrr-weight** *weight*

**no hs-wrr-weight**

### Context

**[Tree]** (config>qos>network-queue>queue hs-wrr-weight)

### Full Context

configure qos network-queue queue hs-wrr-weight

### Description

This command specifies the WRR relative weight, with which this queue should parent into an HSQ WRR group defined within the associated HS attachment policy. The weight of each queue determines how much bandwidth that queue gets out of the total rate for the HSQ WRR group.

The **no** form of the command reverts to the default value.

### Default

hs-wrr-weight 1

### Parameters

#### *weight*

Specifies the HS WRR group queue weight.

**Values** 1 to 127

### Platforms

7750 SR-7/12/12e

## hs-wrr-weight

### Syntax

hs-wrr-weight *weight*

no hs-wrr-weight

### Context

[\[Tree\]](#) (config>qos>sap-egress>queue hs-wrr-weight)

### Full Context

configure qos sap-egress queue hs-wrr-weight

### Description

This command specifies the WRR relative weight, with which this queue should parent into an HSQ WRR group defined within the associated HS attachment policy. The weight of each queue determines how much bandwidth that queue gets out of the total rate for the HSQ WRR group.

The **no** form of the command reverts to the default value.

### Default

hs-wrr-weight 1

### Parameters

#### *weight*

Specifies the HS WRR group queue weight.

**Values** 1 to 127

### Platforms

7750 SR-7/12/12e

## hs-wrr-weight

### Syntax

**hs-wrr-weight** *weight*

**no hs-wrr-weight**

### Context

[\[Tree\]](#) (config>qos>qgrps>egr>qgrp>queue hs-wrr-weight)

### Full Context

configure qos queue-group-templates egress queue-group queue hs-wrr-weight

### Description

This command specifies the WRR relative weight, with which this queue should parent into an HSQ WRR group defined within the associated HS attachment policy. The weight of each queue determines how much bandwidth that queue gets out of the total rate for the HSQ WRR group.

The **no** form of the command reverts to the default value.

### Default

hs-wrr-weight 1

### Parameters

***weight***

Specifies HS WRR group queue weight.

**Values** 1 to 127

### Platforms

7750 SR-7/12/12e

## 12.105 http-auth

## http-auth

### Syntax

**http-auth password** *password* [**hash** | **hash2**]

**http-auth username** *user-name*

**http-auth username** *user-name* **password** *password* [**hash** | **hash2**]

**no http-auth**

## Context

[\[Tree\]](#) (config>system>security>pki>est-profile http-auth)

## Full Context

configure system security pki est-profile http-auth

## Description

This command configures HTTP authentication parameters. HTTP authentication is used by a client when requested by the server. When disabled, there is no HTTP-level client authentication.

The **no** form of the command reverts to the default value.

## Default

no http-auth

## Parameters

### *password*

Specifies a text string containing the password. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### *user-name*

Specifies the name of the user to authenticate, up to 32 characters.

### *hash*

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### *hash2*

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

## 12.106 http-connections

## http-connections

### Syntax

**http-connections** [*ip-address/prefix-length*]

**http-connections any**

**http-connections** [*ipv6-address/prefix-length*]

**no http-connections**

### Context

[\[Tree\]](#) (debug>system http-connections)

### Full Context

debug system http-connections

### Description

This command displays HTTP connections debug information.

### Parameters

#### *ip-address/prefix-length*

Displays information for the specified host IP address and prefix length.

**Values** ip-address: a.b.c.d  
prefix-length: 0 to 32

#### **any**

Specifies that any address can be used.

#### *ipv6-address/prefix-length*

Displays information for the specified host IPv6 address and prefix length.

**Values** ipv6-address:

- x:x:x:x:x:x:x:x: (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x [0 to FFFFF] H
- d [0 to 255] D

prefix-length: 0 to 128

## 12.107 http-enrich

### http-enrich

#### Syntax

**http-enrich** *http-enrich-name* [**create**]

**no http-enrich** *http-enrich-name*

#### Context

[\[Tree\]](#) (config>app-assure>group http-enrich)

#### Full Context

configure application-assurance group http-enrich

#### Description

This command configures an HTTP enrichment policy.

The **no** form of this command removes the http enrichment policy from the configuration.

#### Parameters

##### *http-enrich-name*

Specifies the name of the http enrichment policy up to 32 characters.

##### **create**

Mandatory keyword used when creating an application profile. The create keyword requirement can be enabled and disabled in the **environment>create** context.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### http-enrich

#### Syntax

**http-enrich** *http-enrich-name*

**no http-enrich**

#### Context

[\[Tree\]](#) (config>app-assure>group>policy>aqp>entry>action http-enrich)

#### Full Context

configure application-assurance group policy app-qos-policy entry action http-enrich

## Description

This command configures the HTTP header enrichment template name that will be applied as defined in the `tmnxBsxHttpEnrichTable`. An empty value specifies no HTTP header enrichment template.

## Default

no http-enrich

## Parameters

### *http-enrich-name*

Specifies the HTTP header enrichment template name up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 12.108 http-enrich-max-pkt

### http-enrich-max-pkt

## Syntax

[no] `http-enrich-max-pkt size`

## Context

[\[Tree\]](#) (config>isa>aa-grp http-enrich-max-pkt)

## Full Context

configure isa application-assurance-group http-enrich-max-pkt

## Description

This command configures the maximum HTTP enriched packet size.

## Parameters

### *size*

Specifies the maximum HTTP enriched packet size in octets.

**Values** 576 to 9212

**Default** 1500

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 12.109 http-error-redirect

### http-error-redirect

#### Syntax

**http-error-redirect** *redirect-name* [**create**]

**no http-error-redirect** *redirect-name*

#### Context

[\[Tree\]](#) (config>app-assure>group http-error-redirect)

#### Full Context

configure application-assurance group http-error-redirect

#### Description

This command configures an HTTP error redirect policy. The policy contains important information relevant to the redirect server.

The **no** form of this command removes the redirect name from the group configuration.

#### Parameters

##### *redirect-name*

Specifies a string, up to 32 characters, that identifies the HTTP error redirect policy.

##### **create**

Keyword to create the HTTP error redirect policy.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### http-error-redirect

#### Syntax

**http-error-redirect** *redirect-name*

**no http-error-redirect**

#### Context

[\[Tree\]](#) (config>app-assure>group>policy>aqp>entry>action http-error-redirect)

#### Full Context

configure application-assurance group policy app-qos-policy entry action http-error-redirect

## Description

This command specifies the HTTP error redirect that will be applied as defined in the redirect table. An empty value specifies no HTTP error redirect.

## Default

no http-error-redirect

## Parameters

### *redirect-name*

Specifies an http-error redirect action, up to 32 characters, for flows matching this entry.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 12.110 http-host

### http-host

## Syntax

**http-host** *http-host*

**no http-host**

## Context

[\[Tree\]](#) (config>app-assure>group>http-error-redirect http-host)

## Full Context

configure application-assurance group http-error-redirect http-host

## Description

This command refers to the http host name of the landing server (Barefruit or Xerocole). It is used in the HTTP GET operation from the client (which is being redirected) to the redirect search landing server. It must contain a valid IP address or HTTP host name / URI for the HTTP GET from the client to the landing server to work.

The **no** form of this command removes the HTTP host string from the configuration.

## Default

no http-host

## Parameters

### *http-host*

Specifies a string of 255 chars max length, that refers to the HTTP host name of the landing server (barefruit or xerocole).

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 12.111 http-host-recorder

```
http-host-recorder
```

**Syntax**

```
[no] http-host-recorder
```

**Context**

```
[Tree] (debug>app-assure>group http-host-recorder)
```

**Full Context**

```
debug application-assurance group http-host-recorder
```

**Description**

This command enables the http-host-recorder feature on a particular group:partition.

The **no** form of the command disables the http-host-recorder feature.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 12.112 http-listening-port

```
http-listening-port
```

**Syntax**

```
http-listening-port http-listening-port
```

```
no http-listening-port
```

**Context**

```
[Tree] (config>service>upnp>upnp-policy http-listening-port)
```

**Full Context**

```
configure service upnp upnp-policy http-listening-port
```

## Description

This command specifies the listening port of UPnP server.

The **no** form of the command reverts to the default.

## Default

http-listening-port 5000

## Parameters

### *http-listening-port*

Specifies the HTTP TCP port this UPnP IGD listens to.

**Values** 1 to 65535

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 12.113 http-match-all-requests

### http-match-all-requests

## Syntax

[no] http-match-all-requests

## Context

[\[Tree\]](#) (config>app-assure>group>policy>app-filter>entry http-match-all-requests)

[\[Tree\]](#) (config>app-assure>group http-match-all-requests)

## Full Context

configure application-assurance group policy app-filter entry http-match-all-requests

configure application-assurance group http-match-all-requests

## Description

This command enables HTTP matching for all requests for a given HTTP expression.

The **no** form of this command restores the default (removes http-match-all-request for this particular expression) by this app-filter entry.

## Default

no http-match-all-requests

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 12.114 http-notification

### http-notification

#### Syntax

**http-notification** *http-notification-name* [ **create**]

**no http-notification** *http-notification-name*

#### Context

**[Tree]** (config>app-assure>group http-notification)

#### Full Context

configure application-assurance group http-notification

#### Description

This command configures an http-notification object for subscriber in browser notification.

The **no** form of this command removes the http notification policy from the configuration.

#### Parameters

##### *http-notification-name*

Specifies the name of the HTTP Notification policy.

##### **create**

Specifies the mandatory keyword to create the policy.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### http-notification

#### Syntax

**http-notification** *http-notification*

**no http-notification**

#### Context

**[Tree]** (config>app-assure>group>policy>aqp>entry>action http-notification)

#### Full Context

configure application-assurance group policy app-qos-policy entry action http-notification

## Description

This command configures an HTTP notification action for flows matching this entry.

## Default

no http-notification

## Parameters

### *http-notification*

specifies the Application-Assurance HTTP Notification that will be applied as defined in the `tmnxBsxHttpNotifTable`. If no string is configured then no HTTP notification will occur.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 12.115 http-port

### http-port

## Syntax

`http-port {eq | neq} port-num`

`http-port {eq | neq} port-list port-list-name`

`no http-port`

## Context

[\[Tree\]](#) (config>app-assure>group>policy>app-filter>entry http-port)

## Full Context

configure application-assurance group policy app-filter entry http-port

## Description

This command specifies an HTTP server TCP or UDP port number or port list to use in the application definition.

The **no** form of this command restores the default by removing the HTTP port or port list from the application criteria defined by this app-filter entry.

## Default

no http-port

## Parameters

### **eq**

Specifies that the value configured and the value in the flow are equal.

**neq**

Specifies that the value configured differs from the value in the flow.

***port-list-name***

Specifies the name of the port list containing a set or range of ports, up to 32 characters.

***port-num***

Specifies a valid server port number.

**Values** 0 to 65535

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 12.116 http-redirect

### http-redirect

**Syntax**

**http-redirect** *redirect-name* [**create**]

**no http-redirect** *redirect-name*

**Context**

**[Tree]** (config>app-assure>group http-redirect)

**Full Context**

configure application-assurance group http-redirect

**Description**

This command configures an HTTP redirect.

The **no** form of this command removes the HTTP redirect policy from the configuration.

**Parameters*****redirect-name***

Specifies the HTTP redirect that will be applied. If no redirect name is specified, then HTTP redirect is not enabled.

**create**

Keyword to create the HTTP redirect policy.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## http-redirect

### Syntax

**http-redirect** *http-redirect-name* **flow-type** *flow-type*

**no http-redirect**

### Context

**[Tree]** (config>app-assure>group>policy>aqp>entry>action http-redirect)

### Full Context

configure application-assurance group policy app-qos-policy entry action http-redirect

### Description

This command assigns an existing http redirect policy as an action on flows matching this AQP entry.

The redirect only takes effect if the matching flows are HTTP and the condition specified after the **http-redirect** command, admitted flows or dropped-flows, is met. The condition specified by "dropped-flows" means the flow is dropped due to an AQP actions such as "flow rate/count policers" or "drop" actions. HTTP Policy Redirect on admitted-flows allows the operator to redirect HTTP traffic to a web portal while allowing non-HTTP matching the same AQP rule to be forwarded.

No HTTP redirect will take place if HTTP redirect action and a "drop/flow-police" action are part of the default AQP policy, because in this case, any flow drop actions will take place before identification of the application/application-group.

The **no** form of this command removes http redirect from actions on flows matching this AQP entry.

### Default

no http-redirect

### Parameters

#### *http-redirect-name*

Specifies the name of the existing http policy redirect for this application assurance profile. The HTTP redirect name is configured in the **config>app-assure>group>http-redirect** context.

#### *flow-type*

Specifies the flow type.

**Values** **admitted-flows** — Redirect HTTP flows matching the AQP criteria.

**dropped-flows** — Redirects those HTTP flows that are dropped due to an AQP action.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## http-redirect

### Syntax

**http-redirect** *http-redirect-name*

### Context

[\[Tree\]](#) (config>app-assure>group>sess-fltr>entry>action http-redirect)

### Full Context

configure application-assurance group session-filter entry action http-redirect

### Description

This command configures a session filter entry action to HTTP redirect the subscriber flows. The HTTP redirect policy referenced within this session filter entry is configured for captive redirect with the appropriate VLAN id assigned.

### Parameters

***http-redirect-name***

Specifies the name of the http-redirect-policy.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## http-redirect

### Syntax

**http-redirect** *http-redirect-name*

**no http-redirect**

### Context

[\[Tree\]](#) (config>app-assure>group>url-filter http-redirect)

### Full Context

configure application-assurance group url-filter http-redirect

### Description

This command specifies the HTTP redirect that will be applied when the URL filter blocks an HTTP request.

### Default

no http-redirect

## Parameters

### *http-redirect-name*

Specifies the HTTP redirect name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## http-redirect

## Syntax

**http-redirect** *http-redirect-name*

**no http-redirect**

## Context

[\[Tree\]](#) (config>app-assure>group>url-filter>web-service http-redirect)

[\[Tree\]](#) (config>app-assure>group>url-filter>local-filtering>deny-list http-redirect)

[\[Tree\]](#) (config>app-assure>group>url-filter>icap http-redirect)

## Full Context

configure application-assurance group url-filter web-service http-redirect

configure application-assurance group url-filter local-filtering deny-list http-redirect

configure application-assurance group url-filter icap http-redirect

## Description

This command creates or modifies an HTTP redirect policy.

## Default

no http-redirect

The **no** form of this command removes the HTTP redirect policy from the configuration.

## Parameters

### *http-redirect-name*

Specifies the name of the HTTP redirect policy, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## http-redirect

### Syntax

**http-redirect** *rdr-url-string* [**allow-radius-override**]

**http-redirect** **url-from-cpf**

### Context

**[Tree]** (config>filter>ip-filter>entry>action http-redirect)

**[Tree]** (config>filter>ipv6-filter>entry>action http-redirect)

### Full Context

configure filter ip-filter entry action http-redirect

configure filter ipv6-filter entry action http-redirect

### Description

This command sets the filter entry action to **http-redirect** and specifies the redirect URL.

### Parameters

#### *rdr-url-string*

Specifies the HTTP redirect URL, up to 255 characters. This option can be used for any session.

**Values** The following macro substitutions may be used:

- \$URL** — request-URI in the HTTP GET request received
- \$MAC** — a string that represents the MAC address of the subscriber host
- \$IP** — a string that represents the IP address of the subscriber host
- \$SUB** — a string that represents the subscriber ID
- \$SAP** — a string that represents a SAP ID
- \$SAPDESC** — description string configured on the SAP
- \$CID** — a string that represents the circuit ID or interface ID of the subscriber host (hexadecimal format)
- \$RID** — a string that represents the remote ID of the subscriber host (hexadecimal format)

#### **allow-radius-override**

Specifies that the HTTP redirect URL configured by *rdr-url-string* can be optionally overridden by a URL returned by the RADIUS server; this does not apply for the **url-from-cpf** option.

#### **url-from-cpf**

Specifies that the HTTP redirect URL is from the BNG CUPS CPF. This option can be used for BNG CUPS ESM sessions only.

## Platforms

All

## http-redirect

### Syntax

**http-redirect** *url*

### Context

[\[Tree\]](#) (config>filter>mac-filter>entry>action http-redirect)

### Full Context

configure filter mac-filter entry action http-redirect

### Description

This command sets the MAC filter entry action to HTTP redirect.

### Parameters

*url*

Specifies the URL, up to 255 characters.

## Platforms

All

## 12.117 http-redirect-policy

## http-redirect-policy

### Syntax

**http-redirect-policy** *policy-name*

**no http-redirect-policy**

### Context

[\[Tree\]](#) (config>subscr-mgmt http-redirect-policy)

### Full Context

configure subscriber-mgmt http-redirect-policy

## Description

This command configures the redirect policy to constrain forwarding of an unauthenticated "migrant" WIFI user.

## Parameters

### *policy-name*

Specifies the HTTP redirect policy name up to 32 characters.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## http-redirect-policy

## Syntax

**http-redirect-policy** *policy-name*

**no http-redirect-policy**

## Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range http-redirect-policy)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range http-redirect-policy)

## Full Context

```
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range http-redirect-policy
```

```
configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range http-redirect-policy
```

## Description

This command specifies http redirect policy on ISA to redirect http traffic to the URL specified in the policy. The **no** form of this command reverts to the default.

## Parameters

### *policy-name*

Specifies the name of the http redirect policy under subscriber-management context.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 12.118 http-request-filtering

## http-request-filtering

### Syntax

**http-request-filtering** {all | first}

### Context

**[Tree]** (config>app-assure>group>url-filter http-request-filtering)

### Full Context

configure application-assurance group url-filter http-request-filtering

### Description

HTTP Filtering can either be enabled for all HTTP request within a flow or limited to the first HTTP request in a flow.

### Default

http-request-filtering all

### Parameters

#### all

Specifies all HTTP Request within a flow.

#### first

Specifies the first HTTP Request within a flow.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 12.119 http-response-timeout

## http-response-timeout

### Syntax

**http-response-timeout** *timeout*

**no http-response-timeout**

### Context

**[Tree]** (config>system>security>pki>ca-profile>cmpv2 http-response-timeout)

### Full Context

configure system security pki ca-profile cmpv2 http-response-timeout

## Description

This command specifies the timeout value for HTTP response that is used by CMPv2.  
The **no** form of this command reverts to the default.

## Default

http-response-timeout 30

## Parameters

### *timeout*

Specifies the HTTP response timeout, in seconds.

**Values** 1 to 3600

## Platforms

All

## http-response-timeout

## Syntax

http-response-timeout *timeout*

no http-response-timeout

## Context

[\[Tree\]](#) (config>system>security>pki>ca-profile>cmp2 http-response-timeout)

## Full Context

configure system security pki ca-profile cmp2 http-response-timeout

## Description

This command specifies the timeout value for HTTP response that is used by CMPv2.  
The **no** form of this command reverts to the default.

## Default

http-response-timeout 30

## Parameters

### *timeout*

Specifies the HTTP response timeout in seconds.

**Values** 1 to 3600

## 12.120 http-version

http-version

### Syntax

**http-version** [1.0 | 1.1]

### Context

[\[Tree\]](#) (config>system>security>pki>ca-profile>cmpv2 http-version)

### Full Context

configure system security pki ca-profile cmpv2 http-version

### Description

This command configures the HTTP version for CMPv2 messages.

### Default

http-version 1.1

### Platforms

All

## 12.121 http-x-online-host

http-x-online-host

### Syntax

[no] **http-x-online-host**

### Context

[\[Tree\]](#) (config>app-assure>group http-x-online-host)

### Full Context

configure application-assurance group http-x-online-host

### Description

This command specifies whether X-Online-Host header field is used as a replacement for the HTTP Host header field.

The **no** form of this command disables the use of X-Online-Host header field used as a replacement.

**Default**

no http-x-online-host

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 12.122 hw-agg-shaper-queues

### hw-agg-shaper-queues

**Syntax**

[no] hw-agg-shaper-queues {*queue-set-size* *queue-set-size* | **non-shaper-queues**}

**Context**

[\[Tree\]](#) (config>qos>sap-egress hw-agg-shaper-queues)

**Full Context**

configure qos sap-egress hw-agg-shaper-queues

**Description**

This command configures from which pools of queue-set size or non-shaper-queues pool the objects using this SAP egress policy should draw their queues.

**Default**

no hw-agg-shaper-queues

**Parameters*****queue-set-size***

Specifies the queue-set size to use for a specific SAP egress policy.

**Values** 2 to 8

***non-shaper-queues***

Keyword to specify whether to use non-shaper-queues for a specific SAP egress policy.

**Platforms**

7750 SR-1, 7750 SR-s

## 12.123 hw-agg-shaper-scheduler-policy

## hw-agg-shaper-scheduler-policy

### Syntax

**hw-agg-shaper-scheduler-policy** *policy-name*

**no hw-agg-shaper-scheduler-policy**

### Context

**[Tree]** (config>port>ethernet>access>egress>vport hw-agg-shaper-scheduler-policy)

**[Tree]** (config>port>ethernet>egress hw-agg-shaper-scheduler-policy)

### Full Context

configure port ethernet access egress vport hw-agg-shaper-scheduler-policy

configure port ethernet egress hw-agg-shaper-scheduler-policy

### Description

This command assigns a hardware aggregate shaper scheduler policy to the specified vport.

The **no** form removes the policy from the vport.

### Parameters

***policy-name***

Specifies the policy name.

### Platforms

7750 SR-1, 7750 SR-s

## hw-agg-shaper-scheduler-policy

### Syntax

**hw-agg-shaper-scheduler-policy** *policy-name* **[create]**

**no hw-agg-shaper-scheduler-policy**

### Context

**[Tree]** (config>qos hw-agg-shaper-scheduler-policy)

### Full Context

configure qos hw-agg-shaper-scheduler-policy

### Description

This command configures the name of the hardware aggregate shaper scheduler policy.

The **no** form removes the policy.

**Parameters*****policy-name***

Specifies the policy name, up to 64 characters.

**create**

Creates a new policy.

**Platforms**

7750 SR-1, 7750 SR-s

## 12.124 hw-agg-shapers

### hw-agg-shapers

**Syntax**

**hw-agg-shapers [subscribers] [saps]**

**no hw-agg-shapers**

**Context**

[\[Tree\]](#) (config>qos>fp-resource-policy>aggregate-shapers hw-agg-shapers)

**Full Context**

configure qos fp-resource-policy aggregate-shapers hw-agg-shapers

**Description**

This command enables the use of hardware aggregate shapers for subscribers, SAPs, or queue groups on the specified FP.

The **no** form disables the use of hardware aggregate shapers on a the specified FP.

**Parameters****subscribers**

Enables hardware aggregate shapers for subscribers.

**saps**

Enables hardware aggregate shapers for SAPs. This functionality is not currently supported.

**Platforms**

7750 SR-1, 7750 SR-s

## 12.125 hybrid-buffer-allocation

### hybrid-buffer-allocation

#### Syntax

**hybrid-buffer-allocation**

#### Context

[\[Tree\]](#) (config>port hybrid-buffer-allocation)

#### Full Context

configure port hybrid-buffer-allocation

#### Description

Commands in this context configure hybrid port buffer allocation parameters.

#### Platforms

All

## 13 i Commands

### 13.1 i-counters

#### i-counters

##### Syntax

**i-counters** [all]

**no i-counters**

##### Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>cr>queue i-counters)

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>cr>ref-queue i-counters)

##### Full Context

configure subscriber-mgmt radius-accounting-policy custom-record queue i-counters

configure subscriber-mgmt radius-accounting-policy custom-record ref-queue i-counters

##### Description

This command configures ingress counter parameters for this custom record.

The **no** form of this command reverts to the default.

##### Parameters

**all**

Includes all counters.

##### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

#### i-counters

##### Syntax

**i-counters** [all]

**no i-counters**

## Context

**[Tree]** (config>log>acct-policy>cr>policer i-counters)

**[Tree]** (config>log>acct-policy>cr>ref-policer i-counters)

**[Tree]** (config>log>acct-policy>cr>ref-queue i-counters)

**[Tree]** (config>log>acct-policy>cr>queue i-counters)

## Full Context

configure log accounting-policy custom-record policer i-counters

configure log accounting-policy custom-record ref-policer i-counters

configure log accounting-policy custom-record ref-queue i-counters

configure log accounting-policy custom-record queue i-counters

## Description

This command configures ingress counter parameters for this custom record.

The **no** form of this command reverts all ingress counters to their default value.

## Default

i-counters

## Parameters

**all**

Specifies that all ingress counters should be included.

## Platforms

All

## 13.2 i-sid

i-sid

## Syntax

**i-sid** *i-sid*

**no i-sid**

## Context

**[Tree]** (config>test-oam>build-packet>header>pbb i-sid)

**[Tree]** (debug>oam>build-packet>packet>field-override>header>pbb i-sid)

### Full Context

```
configure test-oam build-packet header pbb i-sid
debug oam build-packet packet field-override header pbb i-sid
```

### Description

This command defines the iSID value to be used in the test PBB header.  
The **no** form of this command reverts to the default value.

### Default

i-sid 0

### Parameters

*i-sid*

Specifies the iSID value to be used in the test PBB header.

**Values** 0 to 16777215

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 13.3 ia-na

```
ia-na
```

### Syntax

```
ia-na
```

### Context

[\[Tree\]](#) (config>service>vprn>sub-if>wlan-gw>pool-manager>dhcp6-client ia-na)

[\[Tree\]](#) (config>service>ies>sub-if>wlan-gw>pool-manager>dhcp6-client ia-na)

### Full Context

```
configure service vprn subscriber-interface wlan-gw pool-manager dhcpv6-client ia-na
configure service ies subscriber-interface wlan-gw pool-manager dhcpv6-client ia-na
```

### Description

This command configures the IA-NA for the DHCPv6 client.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.4 ibgp-multipath

### ibgp-multipath

#### Syntax

**[no] ibgp-multipath**

#### Context

**[Tree]** (config>service>vprn>bgp ibgp-multipath)

#### Full Context

configure service vprn bgp ibgp-multipath

#### Description

This command defines the type of IBGP multipath to use when adding BGP routes to the route table if the route resolving the BGP nexthop offers multiple next-hops.

The **no** form of this command disables the IBGP multipath load balancing feature.

#### Platforms

All

### ibgp-multipath

#### Syntax

**[no] ibgp-multipath**

#### Context

**[Tree]** (config>router>bgp ibgp-multipath)

#### Full Context

configure router bgp ibgp-multipath

#### Description

This command enables IBGP multipath load balancing when adding BGP routes to the route table if the route resolving the BGP nexthop offers multiple next-hops.

The **no** form of this command disables the IBGP multipath load balancing feature.

#### Default

no ibgp-multipath

## 13.5 icmp

icmp

### Syntax

icmp

### Context

[\[Tree\]](#) (config>service>ies>sub-if>grp-if icmp)

[\[Tree\]](#) (config>service>ies>if icmp)

[\[Tree\]](#) (config>service>vprn>nw-if icmp)

[\[Tree\]](#) (config>service>vprn>if icmp)

### Full Context

configure service ies subscriber-interface group-interface icmp

configure service ies interface icmp

configure service vprn network-interface icmp

configure service vprn interface icmp

### Description

Commands in this context configure Internet Control Message Protocol (ICMP) parameters on a service.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface icmp

All

- configure service ies interface icmp
- configure service vprn interface icmp
- configure service vprn network-interface icmp

icmp

### Syntax

icmp

**Context**

[\[Tree\]](#) (config>subscr-mgmt>git>ipv4 icmp)

**Full Context**

configure subscriber-mgmt group-interface-template ipv4 icmp

**Description**

Commands in this context configure IPv4 Internet Control Message Protocol (ICMP) parameters.

**Default**

icmp

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

icmp

**Syntax**

icmp

**Context**

[\[Tree\]](#) (config>router>if icmp)

**Full Context**

configure router interface icmp

**Description**

This command enables access to the context to configure Internet Control Message Protocol (ICMP) parameters on a network IP interface. ICMP is a message control and error reporting protocol that also provides information relevant to IP packet processing.

**Platforms**

All

icmp

**Syntax**

[no] icmp

**Context**

[\[Tree\]](#) (debug>router>ip icmp)

**Full Context**

```
debug router ip icmp
```

**Description**

This command enables ICMP debugging.

**Platforms**

All

```
icmp
```

**Syntax**

```
[no] icmp
```

**Context**

[\[Tree\]](#) (config>sys>security>cpu-protection>ip>included-protocols icmp)

**Full Context**

```
configure system security cpu-protection ip-src-monitoring included-protocols icmp
```

**Description**

This command includes the extracted IPv4 ICMP packets for ip-src-monitoring. IPv4 ICMP packets will be subject to the per-source-rate of CPU protection policies.

**Default**

```
no icmp
```

**Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

```
icmp
```

**Syntax**

```
icmp
```

**Context**

[\[Tree\]](#) (config>test-oam icmp)

**Full Context**

```
configure test-oam icmp
```

## Description

Commands in this context configure test ICMP OAM parameters.

## Platforms

All

## 13.6 icmp-code

### icmp-code

#### Syntax

**icmp-code** *icmp-code*

**no icmp-code**

#### Context

**[Tree]** (config>filter>ipv6-filter>entry>match icmp-code)

**[Tree]** (config>filter>ipv6-exception>entry>match icmp-code)

**[Tree]** (config>filter>ip-exception>entry>match icmp-code)

**[Tree]** (config>filter>ip-filter>entry>match icmp-code)

#### Full Context

configure filter ipv6-filter entry match icmp-code

configure filter ipv6-exception entry match icmp-code

configure filter ip-exception entry match icmp-code

configure filter ip-filter entry match icmp-code

#### Description

Configures matching on /ICMPv6 code field in the /ICMPv6 header of an IPv4 or IPv6 packet as a filter match criterion or configures matching on the ICMP code field in the ICMP header of an IPv4 packet as an exception filter match criterion. An entry containing Layer 4 non-zero match criteria will not match non-initial (for example, 2nd, 3rd) fragments of a fragmented packet because only the first fragment contains the Layer 4 information. Similarly an entry containing " **icmp-code 0**" match criterion, may match non-initial fragments when the Layer 4 header is not present in a packet fragment and other match criteria are also met.

The **no** form of the command removes the criterion from the match entry.

#### Default

no icmp-code

## Parameters

### *icmp-code*

Specifies the /ICMPv6 code value that must be present to match. Value can be expressed as a decimal integer, as well as in hexadecimal or binary format, or even using keywords. The following value shows decimal integer only.

**Values** 0 to 255

## Platforms

All

- configure filter ipv6-filter entry match icmp-code
- configure filter ip-filter entry match icmp-code

VSR

- configure filter ipv6-exception entry match icmp-code
- configure filter ip-exception entry match icmp-code

## icmp-code

## Syntax

**icmp-code** *icmp-code*

**no icmp-code**

## Context

**[Tree]** (config>subscr-mgmt>cat-map>category>exh-lvl>ingr-ip>entry>match icmp-code)

**[Tree]** (config>subscr-mgmt>cat-map>category>exh-lvl>egr-ipv6>entry>match icmp-code)

**[Tree]** (config>subscr-mgmt>cat-map>category>exh-lvl>ingr-ipv6>entry>match icmp-code)

**[Tree]** (config>subscr-mgmt>cat-map>category>exh-lvl>egr-ip>entry>match icmp-code)

## Full Context

configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ip-filter-entries  
entry match icmp-code

configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ipv6-filter-entries  
entry match icmp-code

configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ipv6-filter-entries  
entry match icmp-code

configure subscriber-mgmt category-map category exhausted-credit-service-level egress-ip-filter-entries  
entry match icmp-code

## Description

This command configures the ICMP code match condition.

The **no** form of this command reverts to the default.

## Parameters

### *icmp-code*

Specifies the ICMP code numbers accepted in DHB.

**Values** [0 to 255]D, [0X0..0XFF]H, [0b0..0b11111111]B

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## icmp-code

## Syntax

**icmp-code** *icmp-code*

**no icmp-code**

## Context

[\[Tree\]](#) (cfg>sys>sec>cpm>ip-filter>entry>match icmp-code)

[\[Tree\]](#) (cfg>sys>sec>cpm>ipv6-filter>entry>match icmp-code)

## Full Context

configure system security cpm-filter ip-filter entry match icmp-code

configure system security cpm-filter ipv6-filter entry match icmp-code

## Description

This command configures matching on ICMP code field in the ICMP header of an IP packet as an IP filter match criterion.

### Note:

An entry containing Layer 4 match criteria will not match non-initial (2nd, 3rd, and so on) fragments of a fragmented packet because only the first fragment contains the Layer 4 information.

The behavior of the **icmp-code** value is dependent on the configured **icmp-type** value, therefore, a configuration with only an **icmp-code** value specified will have no effect. To match on the **icmp-code**, an associated **icmp-type** must also be specified.

The **no** form of this command removes the criterion from the match entry.

## Default

no icmp-code

## Parameters

### *icmp-code*

Specifies the ICMP code values that must be present to match.

**Values** 0 to 255

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 13.7 icmp-echo-reply

### icmp-echo-reply

#### Syntax

[no] icmp-echo-reply

#### Context

[\[Tree\]](#) (config>service>vprn>nat>outside>pool icmp-echo-reply)

[\[Tree\]](#) (config>router>nat>outside>pool icmp-echo-reply)

#### Full Context

configure service vprn nat outside pool icmp-echo-reply

configure router nat outside pool icmp-echo-reply

#### Description

IPv4 addresses in a NAT pool can be configured to respond to ICMP Echo Requests (PINGs). The configuration can be toggled online while the pool is in use.

In L2-aware NAT when **port-block-extensions** is disabled, the reply from an outside IP address is generated only when this IP address has at least one host (binding) behind it.

In L2-aware NAT when **port-block-extensions** is enabled, the reply from an outside IP address is generated regardless if a binding is present.

In LSN, the reply from an outside IP address is generated regardless if a binding is present.

The **no** form of the command disables ICMP echo replies.

#### Default

no icmp-echo-reply

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.8 icmp-generation

## 13.9 icmp-ping

### icmp-ping

### Syntax

**icmp-ping** {*ip-address* | *dns-name*} [{**bypass-routing** | {**interface** *interface-name*} | {**next-hop** *ip-address*}}] [**count** *requests*] [**do-not-fragment**] [**fc** *fc-name*] [**interval** { *centisecs* | *secs*}] [**pattern**

*pattern*] [**rapid**] [{ **router** *router-or-service* | **router-instance** *router-instance* | **service-name** *service-name*}] [**size** *bytes*] [**source** *ip-address*] [ **timeout** *timeout*] [ **tos** *type-of-service*] [**ttl** *time-to-live*]

## Context

[Tree] (config>saa>test>type icmp-ping)

## Full Context

configure saa test type icmp-ping

## Description

This command configures an ICMP traceroute test.

## Parameters

### *ip-address* | *dns-name*

Specifies the far-end IP address or DNS name to which to send the **svc-ping** request message in dotted-decimal notation.

| Values        |                      |                                                                  |
|---------------|----------------------|------------------------------------------------------------------|
| ipv4-address: | a.b.c.d              |                                                                  |
| ipv6-address: | x:x:x:x:x:x:x        |                                                                  |
|               | x:x:x:x:x:d.d.d.d    |                                                                  |
|               | x:                   | [0 to FFFF]H                                                     |
|               | d:                   | [0 to 255]D                                                      |
|               | interface            | up to 32 characters. This is mandatory for link local addresses. |
| dns-name      | up to 128 characters |                                                                  |

### **bypass-routing**

Specifies whether to send the ping request to a host on a directly attached network bypassing the routing table.

### *interface-name*

Specifies the name used to refer to the interface, up to 32 characters. The name must already exist in the **config>router>interface** context.

### **next-hop ip-address**

Displays only static routes with the specified next-hop IP address.

| Values        |                                     |              |
|---------------|-------------------------------------|--------------|
| ipv4-address: | a.b.c.d (host bits must be 0)       |              |
| ipv6-address: | x:x:x:x:x:x:x (eight 16-bit pieces) |              |
|               | x:x:x:x:x:d.d.d.d                   |              |
|               | x:                                  | [0 to FFFF]H |

d: [0 to 255]D

### **requests**

Specifies the number of times to perform an OAM ping probe operation. Each OAM echo message request must either time out or receive a reply before the next message request is sent.

**Values** 1 to 100000

**Default** 5

### **do-not-fragment**

Sets the DF (Do Not Fragment) bit in the ICMP ping packet (does not apply to ICMPv6).

### **fc-name**

Specifies the forwarding class of the SAA.

**Values** be, l2, af, l1, h2, ef, h1, nc

**Default** nc

### **interval {centisecs | secs}**

Specifies the minimum amount of time, in seconds, that must expire before the next message request is sent. If the **rapid** parameter is configured, this value is measured in centiseconds (hundredths of a second) instead of seconds.

**Values** 1 to 10000

**Default** 1

### **pattern**

Specifies the date portion in a ping packet is filled with the pattern value specified. If not specified, a system-generated sequential pattern is used.

**Values** 0 to 65535

### **rapid**

Configures the *interval* parameter to use centiseconds (hundredths of a second) instead of seconds.

### **router-or-service**

Specifies the numerical reference to the router instance or service. Well known router names "Base", "management", "vpm-vr-name", and "vpls-management" are allowed for convenience, but are mapped numerically.

**Values** {*router-name* | *vprn-svc-id*}

*router-name*: Base, management, cmp-vr-name, vpls-management

*vprn-svc-id*: 1 to 2147483647

*cpm-vr-name*: Up to 32 characters

The parameter *router-instance* is preferred for specifying the router or service.

**Default** Base

### ***router-instance***

Specifies the preferred method for entering a service name. Stored as the service name. Only the service linking function is allowed for both mixed-mode and model-driven configuration modes.

**Values** *router-name*, *vprn-svc-name*

*router-name*: Base, management, vpls-management, *cpm-vr-name*

*vprn-svc-name*: up to 64 characters

*cpm-vr-name*: up to 32 characters

### ***service-name***

Specifies the alias function that allows the service name to be used, converted and stored as a service ID, up to 64 characters.

The *router-instance* parameter is preferred for specifying the router or service.

### ***bytes***

Specifies the request packet size in bytes, expressed as a decimal integer.

**Values** 0 to 16384

**Default** 56

### ***source ip-address***

Specifies the IP address to be used.

|               |               |                   |
|---------------|---------------|-------------------|
| <b>Values</b> | ipv4-address: | a.b.c.d           |
|               | ipv6-address: | x:x:x:x:x:x:x     |
|               |               | x:x:x:x:x:d.d.d.d |
|               | x:            | [0 to FFFF]H      |
|               | d:            | [0 to 255]D       |

### ***timeout***

Specifies the override time that the router waits for a message reply after sending the last probe for a specific test. Upon the expiration of the time out, the test is marked complete and no more packets are processed for any of those request probes.

**Values** 1 to 10

**Default** 5

### ***type-of-service***

Specifies the service type.

**Values** 0 to 255

**Default** 0

#### *time-to-live*

Specifies the TTL value for the MPLS label, expressed as a decimal integer.

**Values** 1 to 128

**Default** 64

### Platforms

All

## 13.10 icmp-query

### icmp-query

#### Syntax

**icmp-query** [**min** *minutes*] [**sec** *seconds*]

**no icmp-query**

#### Context

[\[Tree\]](#) (config>service>nat>nat-policy>timeouts icmp-query)

[\[Tree\]](#) (config>service>nat>up-nat-policy>timeouts icmp-query)

#### Full Context

configure service nat nat-policy timeouts icmp-query

configure service nat up-nat-policy timeouts icmp-query

#### Description

This command configures the timeout applied to an ICMP query session.

#### Default

icmp-query min 1

#### Parameters

**min** *minutes*

Specifies the timeout, in minutes, applied to an ICMP query session.

**Values** 1 to 4

**Default** 1

**sec seconds**

Specifies the timeout, in seconds, applied to an ICMP query session.

**Values** 1 to 59

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.11 icmp-trace

### icmp-trace

**Syntax**

**icmp-trace** [*ip-address* | *dns-name*] [**router** *router-or-service* | **router-instance** *router-instance* | **service-name** *service-name*] [**source** *ip-address*] [**tos** *type-of-service*] [**ttl** *ttl*] [**wait** *milliseconds*]

**Context**

[\[Tree\]](#) (config>saa>test>type icmp-trace)

**Full Context**

configure saa test type icmp-trace

**Description**

This command configures an ICMP traceroute test.

**Parameters**

***ip-address***

Specifies the far-end IP address to which to send the **svc-ping** request message in dotted-decimal notation.

| <b>Values</b> |                     |              |
|---------------|---------------------|--------------|
| ipv4-address: | a.b.c.d             |              |
| ipv6-address: | x:x:x:x:x:x:x       |              |
|               | x:x:x:x:x:d.d.d.d   |              |
|               | x:                  | [0 to FFFF]H |
|               | d:                  | [0 to 255]D  |
| dns-name      | up to 63 characters |              |

***dns-name***

Specifies the DNS name of the far-end device to which to send the **svc-ping** request message, up to 63 characters.

#### ***router-instance***

Specifies the preferred method for entering a service name. Stored as the service name. Only the service linking function is allowed for both mixed-mode and model-driven configuration modes.

**Values** {*router-name* | *vprn-svc-name*}

*router-name*: Base, management, vpls-management, *cpm-vr-name*  
*vprn-svc-name*: up to 64 characters  
*cpm-vr-name*: up to 32 characters

**Default** Base

#### ***router-or-service***

Specifies the numerical reference to the router instance or service. Well known router names "Base", "management" and " vpls-management" are allowed for convenience, but are mapped numerically.

**Values** {*router-name* | *vprn-svc-id*}

*router-name*: Base, management, vpls-management  
*vprn-svc-id*: 1 to 2147483647

The parameter *router-instance* is preferred for specifying the router or service.

**Default** Base

#### ***service-name***

Specifies the alias function that allows the service name to be used, converted and stored as service ID, up to 64 characters.

The parameter *router-instance* is preferred for specifying the router or service.

#### ***source ip-address***

Specifies the IP address to be used.

**Values**

ipv4-address: a.b.c.d  
 ipv6-address: x:x:x:x:x:x:x  
 x:x:x:x:x:d.d.d.d  
 x: [0 to FFFF]H  
 d: [0 to 255]D

#### ***type-of-service***

Specifies the service type.

**Values** 0 to 255

**Default** 0

### ***ttl***

Specifies the TTL value for the MPLS label, expressed as a decimal integer.

**Values** 1 to 255

**Default** 30

### ***milliseconds***

Specifies the time, in milliseconds, to wait for a response to a probe, expressed as a decimal integer.

**Values** 10 to 60000

**Default** 5000

## **Platforms**

## **13.12 icmp-tunneling**

### **icmp-tunneling**

#### **Syntax**

**[no] icmp-tunneling**

#### **Context**

[\[Tree\]](#) (config>router icmp-tunneling)

#### **Full Context**

configure router icmp-tunneling

#### **Description**

This command enables the tunneling of ICMP reply packets over MPLS LSP at a LSR node as per RFC 3032.

The LSR part of this feature consists of crafting the reply ICMP packet of type=11- 'time exceeded', with a source address set to a local address of the LSR node, and appending the IP header and leading payload octets of the original datagram. The system skips the lookup of the source address of the sender of the label TTL expiry packet, which becomes the destination address of the ICMP reply packet. Instead, CPM injects the ICMP reply packet in the forward direction of the MPLS LSP the label TTL expiry packet was received from. The TTL of pushed labels should be set to 255.

The source address of the ICMP reply packet is determined as follows. The LSR uses the address of the outgoing interface for the MPLS LSP. With LDP LSP or BGP LSP multiple ECMP next-hops can exist and in such a case the first outgoing interface is selected. If that interface does not have an address of the same family (IPv4 or IPv6) as the ICMP packet, then the system address of the same family is selected. If one is not configured, the packet is dropped.

When the packet is received by the egress LER, it performs a regular user packet lookup in the data path in the GRT context for BGP shortcut, 6PE, and BGP label route prefixes, or in VPRN context for VPRN and 6VPE prefixes. It then forwards it to the destination, which is the sender of the original packet which TTL expired at the LSR.

If the egress LER does not have a route to the destination of the ICMP packet, it drops the packets.

The rate of the tunneled ICMP replies at the LSR can be directly or indirectly controlled by the existing IOM level and CPM levels mechanisms. Specifically, the rate of the incoming UDP traceroute packets received with a label stack can be controlled at ingress IOM using the distributed CPU protection feature. The rate of the ICMP replies by CPM can also be directly controlled by configuring a system wide rate limit for packets ICMP replies to MPLS expired packets which are successfully forwarded to CPM using the command 'configure system security vprn-network-exceptions'. While this command's name refers to VPRN service, this feature rate limits ICMP replies for packets received with any label stack, including VPRN and shortcuts.

The 7450 ESS, 7750 SR, and 7950 XRS implementation supports appending to the ICMP reply of type Time Exceeded the MPLS label stack object defined in RFC 4950. It does not include it in the ICMP reply type of Destination unreachable.

The new MPLS Label Stack object permits an LSR to include label stack information including label value, EXP, and TTL field values, from the encapsulation header of the packet that expired at the LSR node. The ICMP message continues to include the IP header and leading payload octets of the original datagram.

In order to include the MPLS Label Stack object, SR OS implementation adds support of RFC 4884 which defines extensions for a multi-part ICMPv4/v6 message of type Time Exceeded.

The **no** form of command disables the tunneling of ICMP reply packets over MPLS LSP at a LSR node.

### Default

no icmp-tunneling

### Platforms

## Full Context

configure filter ipv6-exception entry match icmp-type

configure filter ipv6-filter entry match icmp-type

configure filter ip-filter entry match icmp-type

configure filter ip-exception entry match icmp-type

## Description

This command configures matching on the /ICMPv6 type field in the /ICMPv6 header of an IPv4 or IPv6 packet as a filter match criterion or configures matching on the ICMP type field in the ICMP header of an IPv4 packet as an exception filter match criterion. An entry containing Layer 4 non-zero match criteria will not match non-initial (2nd, 3rd, etc.) fragments of a fragmented packet because only the first fragment contains the Layer 4 information. Similarly an entry containing " **icmp-type 0**" match criterion, may match non-initial fragments when the Layer 4 header is not present in a packet fragment and other match criteria are also met.

The **no** form of the command removes the criterion from the match entry.

## Default

no icmp-type

## Parameters

### *icmp-type*

Specifies the /ICMPv6 type value that must be present to match. Value can be expressed as a decimal integer, as well as in hexadecimal or binary format, or even using keywords. The following value shows decimal integer only.

**Values** 0 to 255

## Platforms

VSR

- configure filter ip-exception entry match icmp-type
- configure filter ipv6-exception entry match icmp-type

All

- configure filter ipv6-filter entry match icmp-type
- configure filter ip-filter entry match icmp-type

**icmp6-query** [*min minutes*] [*sec seconds*]

**no icmp6-query**

#### Context

[\[Tree\]](#) (config>service>nat>firewall-policy>timeouts icmp6-query)

#### Full Context

configure service nat firewall-policy timeouts icmp6-query

#### Description

This command configures the timeout interval for ICMPv6 query mappings.

The **no** form of the command reverts the timeout interval to the default of 1 minute.

#### Default

icmp6-query min 1

#### Parameters

##### *minutes*

Specifies the number of minutes in the ICMP query mapping timeout interval.

**Values** 1 to 4

##### *seconds*

Specifies the number of seconds in the ICMP query mapping timeout interval.

**Values** 0 to 59

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.17 id

id

### Syntax

[no] id *service-id*

### Context

[\[Tree\]](#) (debug>service id)

### Full Context

debug service id

### Description

This command enables debugging for the specified service ID.

The **no** form of this command disables the debugging.

### Parameters

*service-id*

The ID that uniquely identifies a service.

**Values** service-id: 1 to 214748364  
svc-name: A string up to 64 characters in length

### Platforms

All

## 13.18 id-permission

id-permission

### Syntax

id-permission {chassis}  
no id-permission

### Context

[\[Tree\]](#) (cfg>eth-cfm>domain>assoc>bridge id-permission)

## Full Context

configure eth-cfm domain association bridge-identifier id-permission

## Description

This command allows the operator to include the sender-id TLV information that was specified under the **config>eth>system>sender-id** configuration for service MEPs and MIPs. When this option is present under the maintenance association, the specific MPs in the association includes the **sender-id** TLV information in ETH-CFM PDUs. MEPs include the **sender-id** TLV for CCM (not sub second CCM enabled MEPs), LBM/LBR, and LTM/LTR. MIPs includes this value in the LBR and LTR PDUs.

### Note:

LBR functions reflect all TLVs received in the LBM unchanged including the SenderID TLV. Transmission of the Management Domain and Management Address fields are not supported in this TLV.

## Parameters

### chassis

Sends the configured chassis information defined under in the **eth-cfm>system>sender-id** context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## id-permission

## Syntax

**id-permission** {chassis | defer}

**no id-permission**

## Context

**[Tree]** (config>eth-cfm>default-domain>bridge-identifier id-permission)

## Full Context

configure eth-cfm default-domain bridge-identifier id-permission

## Description

This command enables the inclusion of the Sender ID TLV information specified under the **config>eth>system>sender-id** command for installed MEPs and MIPs. The inclusion of the Sender ID TLV is based on the configured value. The Sender ID TLV is supported for ETH-CC, ETH-LB, and ETH-LB PDUs.

Note: LBR functions reflect back all TLVs received in the LBM, unchanged, including the Sender ID TLV. Transmission of the Management Domain and Management Address fields are not supported in this TLV.

The **no** form of this command disables the inclusion of the Sender ID TLV.

## Default

id-permission defer (config>eth-cfm>default-domain>bridge-identifier)

no id-permission (config>eth-cfm>domain>association>bridge)

## Parameters

### chassis

Keyword to include the Sender ID TLV with a value equal to the *sender-id* configured under the eth-cfm>system context.

### defer

Keyword to specify that **id-permission** will inherit the value from the global read-only system values.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

# 13.19 identification-strings

## identification-strings

### Syntax

**identification-strings** *option-number* [**create**]

**no identification-strings**

### Context

**[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host identification-strings)

**[Tree]** (config>subscr-mgmt>loc-user-db>ppp>host identification-strings)

### Full Context

configure subscriber-mgmt local-user-db ipoe host identification-strings

configure subscriber-mgmt local-user-db ppp host identification-strings

### Description

This command specifies identification strings for the subscriber. This is useful when the server is centralized with Enhanced Subscriber Management (ESM) in a lower level in the network. These strings are parsed by a downstream Python script or they can be used literally if the **strings-from-option** option in the **config>subscr-mgmt>sub-ident-policy** context is set to this option number. In this case, the option number may be set to any allowed number (between 224 and 254 is suggested, as these are not dedicated to specific purposes). If the option number is not given, a default value of 254 is used. For PPPoE only, if the local user database is attached to the PPPoE node under the group interface and not to a local DHCP server, the strings are used internally so the option number is not used.

The **no** form of this command returns to the default.

## Parameters

### *option-number*

Specifies identification strings for the subscriber.

**Values** 1 to 254

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.20 identifier

### identifier

## Syntax

**identifier** *identifier*

**no identifier**

## Context

[\[Tree\]](#) (config>system>bluetooth>module identifier)

## Full Context

configure system bluetooth module identifier

## Description

This command configures an identifier string used to advertise the Bluetooth module during pairing operations.

If no identifier is specified by the user, the default is derived from the platform type, the CPM slot, and the serial number of the chassis.

For example, a device with a platform field of 7750, SR-12 chassis, and a CPM serial number of NS23456 would have a Bluetooth identifier of "7750-SR-12-CPM-A-NS23456." for the CPM in slot A.

The **no** form of this command resets the identifier back to the default.

## Parameters

### *identifier*

Specifies string, up to 32 characters, using the values in the range 0-9, a-z, or A-Z.

## Platforms

7750 SR-1, 7750 SR-s, 7950 XRS-20e

## 13.21 idi

idi

### Syntax

**idi any**

**idi ipv4-prefix** {**any** | *ipv4-prefix/ipv4-prefix-length*}

**idi ipv6-prefix** {**any** | *ipv6-prefix/ipv6-prefix-length*}

**idi string-type** *string-type* **string-value** *string-value*

**no idi**

### Context

**[Tree]** (config>ipsec>client-db>client>client-id idi)

### Full Context

configure ipsec client-db client client-identification idi

### Description

This command specifies a match criteria that uses the peer's identification initiator (IDi) as the input, only one IDi criteria can be configured for a given client entry. This command supports the following matching methods:

- **idi any**: Matches any type of IDi with any value.
- **idi ipv4-prefix**: Matches an IDi with the type ID\_IPV4\_ADDR. If the **any** parameter is specified, then it will match any IPv4 address. If an IPv4 prefix is specified, then it will match an IPv4 address that is within the specified prefix.
- **idi ipv6-prefix**: Matches an IDi with the type ID\_IPV6\_ADDR. If the **any** parameter is specified, then it will match any IPv6 address. If an IPv6 prefix is specified, then it will match an IPv6 address that is within the specified prefix.
- **idi string-type**: Supports following type of IDi:
  - FQDN: Either a full match or a suffix match
  - RFC822: Either a full match or a suffix match

The **no** form of this command reverts to the default.

### Default

no idi

### Parameters

**any**

Matches any type of IDi with any value.

**ipv4-prefix/ipv4-prefix-length**

Matches any IPv4 address and prefix.

***ipv6-prefix/ipv6-prefix-length***

Matches any IPv6 address and prefix.

***string-type***

Matches the type of IDi value for this IPsec client entry.

**Values** fqdn, fqdn-suffix, rfc822, rfc822-suffix

***string-value***

Matches the IDi value within the client ID for this IPsec client entry up to 256 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**idi****Syntax**

[no] idi

**Context**

[\[Tree\]](#) (config>ipsec>client-db>match-list idi)

**Full Context**

configure ipsec client-db match-list idi

**Description**

This command enables the Identification Initiator (IDI) type in the IPsec client matching process.

The **no** form of this command disables the IDi matching process.

**Default**

no idi

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.22 idle-cycle-flag

**idle-cycle-flag****Syntax**

**idle-cycle-flag** {flags | ones}

**no idle-cycle-flag**

## Context

[\[Tree\]](#) (config>port>tdm>ds3 idle-cycle-flag)

[\[Tree\]](#) (config>port>tdm>e3 idle-cycle-flag)

## Full Context

configure port tdm ds3 idle-cycle-flag

configure port tdm e3 idle-cycle-flag

## Description

This command configures the value that the HDLC TDM DS-0, E-3, or DS-3 interface transmits during idle cycles. For ATM ports/channels/channel-groups, the configuration does not apply and only the no form is accepted.

The **no** form of this command reverts the idle cycle flag to the default value.

## Default

flags (0x7E)

no flags (ATM)

## Parameters

### flags

Specifies that 0x7E is used as the idle cycle flag.

### ones

Specifies that 0xFF is used as the idle cycle flag.

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 13.23 idle-filter

### idle-filter

## Syntax

[no] idle-filter

## Context

[\[Tree\]](#) (config>service>vpls>gsmp>group idle-filter)

[\[Tree\]](#) (config>service>vprn>gsmp>group idle-filter)

## Full Context

configure service vpls gsmp group idle-filter

```
configure service vprn gsmp group idle-filter
```

### Description

This command when applied will filter out new incoming ANCP messages while the subscriber DSL-line-state is idle. The command takes effect at the time that it is applied. Existing subscribers already in idle state are not purged from the database.

The **no** form of this command reverts to the default.

### Platforms

All

## idle-filter

### Syntax

```
[no] idle-filter
```

### Context

[\[Tree\]](#) (config>service>vpls>gsmp idle-filter)

### Full Context

```
configure service vpls gsmp idle-filter
```

### Description

This command when applied will filter out new subscriber's ANCP messages from subscriber with "DSL-line-state" IDLE.

### Default

```
no idle-filter
```

### Platforms

All

## idle-filter

### Syntax

```
idle-filter
```

```
no idle-filter
```

### Context

[\[Tree\]](#) (config>service>vprn>gsmp idle-filter)

**Full Context**

```
configure service vprn gsmpr idle-filter
```

**Description**

This command when applied will filter out new subscriber's ANCP messages from subscriber with "DSL-line-state" IDLE.

**Default**

```
no idle-filter
```

**Platforms**

All

## 13.24 idle-payload-fill

### idle-payload-fill

**Syntax**

```
idle-payload-fill {all-ones}
```

```
idle-payload-fill pattern pattern
```

```
no idle-payload-fill
```

**Context**

[\[Tree\]](#) (config>port>tdm>e1>channel-group idle-payload-fill)

[\[Tree\]](#) (config>port>tdm>ds1>channel-group idle-payload-fill)

**Full Context**

```
configure port tdm e1 channel-group idle-payload-fill
```

```
configure port tdm ds1 channel-group idle-payload-fill
```

**Description**

This command defines the data pattern to be transmitted when the circuit emulation service is not operational or temporarily experiences under-run conditions. This command is only valid for cesopsn and cesopsn-cas circuit emulation services. It is blocked with a warning for unstructured (satop) circuit emulation services.

**Default**

```
idle-payload-fill all-ones
```

**Parameters**

**all-ones**

Defines the 8 bit value to be transmitted as 11111111.

***pattern***

Transmits a user-defined pattern.

**Values** 0 to 255, accepted in decimal, hex or binary

**Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 13.25 idle-signal-fill

### idle-signal-fill

**Syntax**

**idle-signal-fill** {all-ones}

**idle-signal-fill** *pattern* *pattern*

**no idle-signal-fill**

**Context**

[\[Tree\]](#) (config>port>tdm>e1>channel-group idle-signal-fill)

[\[Tree\]](#) (config>port>tdm>ds1>channel-group idle-signal-fill)

**Full Context**

configure port tdm e1 channel-group idle-signal-fill

configure port tdm ds1 channel-group idle-signal-fill

**Description**

This command defines the signaling pattern to be transmitted when the circuit emulation service is not operational or temporarily experiences under-run conditions. This command is only valid for cesopns-cas circuit emulation services. It is blocked with a warning for unstructured (satop) and basic cesopns circuit emulation services.

**Default**

idle-signal-fill all-ones

**Parameters**

**all-ones**

Defines the 8 bit value to be transmitted as 11111111.

***pattern***

Transmits a user-defined pattern.

**Values** 0 to 15, accepted in decimal, hex or binary

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 13.26 idle-time

### idle-time

#### Syntax

**idle-time** *idle*

**no idle-time**

#### Context

**[Tree]** (config>system>telemetry>destination-group>tcp-keepalive idle-time)

**[Tree]** (config>system>grpc>tcp-keepalive idle-time)

**[Tree]** (config>system>grpc-tunnel>destination-group>tcp-keepalive idle-time)

#### Full Context

configure system telemetry destination-group tcp-keepalive idle-time

configure system grpc tcp-keepalive idle-time

configure system grpc-tunnel destination-group tcp-keepalive idle-time

#### Description

This command configures the amount of time, in seconds, that the connection must remain idle before TCP keepalive probes are sent.

The **no** form of this command reverts to the default value.

#### Default

idle-time 600

#### Parameters

*idle*

Specifies the number of seconds before the first TCP keepalive probe is sent.

**Values** 1 to 100000

**Default** 600

## Platforms

All

## 13.27 idle-timeout

### idle-timeout

#### Syntax

**idle-timeout** *idle-timeout*

**idle-timeout infinite**

**no idle-timeout**

#### Context

**[Tree]** (config>service>vprn>l2tp>group idle-timeout)

**[Tree]** (config>service>vprn>l2tp idle-timeout)

**[Tree]** (config>router>l2tp>group idle-timeout)

**[Tree]** (config>router>l2tp>group>tunnel idle-timeout)

**[Tree]** (config>service>vprn>l2tp>group>tunnel idle-timeout)

#### Full Context

configure service vprn l2tp group idle-timeout

configure service vprn l2tp idle-timeout

configure router l2tp group idle-timeout

configure router l2tp group tunnel idle-timeout

configure service vprn l2tp group tunnel idle-timeout

#### Description

This command configures the period of time that an established tunnel with no active sessions persists before being disconnected.

Enter the **no** form of this command to maintain a persistent tunnel.

The **no** form of this command removes the idle timeout from the configuration.

#### Default

no idle-timeout

#### Parameters

***idle-timeout***

Specifies the idle timeout value, in seconds until the group is removed.

**Default** no idle-timeout

**Values** 0 to 3600

**infinite**

Specifies that the tunnel is not closed when idle.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## idle-timeout

**Syntax**

**idle-timeout** *timeout*

**no idle-timeout**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>sla-prof>cat-map>category idle-timeout)

**Full Context**

configure subscriber-mgmt sla-profile category-map category idle-timeout

**Description**

This command defines the idle-timeout value.

The **no** form of this command reverts to the default.

**Parameters**

*timeout*

Specifies the idle-timeout, in seconds.

**Values** 60 to 15552000

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## idle-timeout

**Syntax**

**idle-timeout action** *idle-timeout-action*

**no idle-timeout**

**Context**

**[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range idle-timeout)

**[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range idle-timeout)

**Full Context**

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range idle-timeout

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range idle-timeout

**Description**

This command specifies idle-timeout behavior for DSM UEs and UEs undergoing (ISA-based) portal authentication. This knob only specifies the desired action, idle-timeout is activated by RADIUS on a per-UE basis.

The **no** form of this command resets the idle-timeout to its default.

**Default**

idle-timeout action remove

**Parameters*****action***

Specifies which action to perform when the idle-timeout timer goes off.

**Values** remove, shcv

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

**idle-timeout****Syntax**

**idle-timeout** {*minutes* | **disable**}

**no idle-timeout**

**Context**

**[Tree]** (config>system>login-control idle-timeout)

**Full Context**

configure system login-control idle-timeout

**Description**

This command configures the idle timeout for console, Telnet, SSH, and FTP sessions before the session is terminated by the system.

By default, each idle console, Telnet, SSH, or FTP session times out after 30 minutes of inactivity.

The **no** form of this command reverts to the default value.

### Default

idle-timeout 30

### Parameters

#### *minutes*

Specifies the idle timeout in minutes. Allowed values are 1 to 1440.

**Values** 1 to 1440

#### **disable**

When the **disable** option is specified, a session will never timeout. To re-enable idle timeout, enter the command without the disable option.

### Platforms

All

## 13.28 idle-timeout-action

### idle-timeout-action

### Syntax

idle-timeout-action {shcv-check | terminate}

no idle-timeout-action

### Context

[\[Tree\]](#) (config>subscr-mgmt>sla-prof>cat-map>category idle-timeout-action)

### Full Context

configure subscriber-mgmt sla-profile category-map category idle-timeout-action

### Description

This command defines the action to be executed when the idle-timeout is reached. The action is performed for all hosts associated with the sla-profile instance.

The **no** form of this command reverts to the default.

### Default

idle-timeout-action terminate

### Parameters

**shcv-check**

Performs a subscriber host connectivity verification check (IPoE hosts only).

**Note:**

Host connectivity verification must be enabled on the group-interface where the host is connected.

If the check is successful, the hosts are not disconnected and the idle-timeout timer is reset.

If the check fails, the hosts are deleted, similar as for **idle-timeout-action terminate**.

**terminate**

Deletes the subscriber host from the system: for PPP hosts, a terminate request is send; for IPoE hosts a DHCP release is send to the DHCP server.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.29 ies

### ies

**Syntax**

**ies** *service-id* [**customer** *customer-id*] [**create**] [ **vpn** *vpn-id*] [**name** *name*]

**no ies** *service-id*

**Context**

[\[Tree\]](#) (config>service ies)

**Full Context**

configure service ies

**Description**

This command creates or edits an IES service instance.

The **ies** command creates or maintains an Internet Ethernet Service (IES). If the *service-id* does not exist, a context for the service is created. If the *service-id* exists, the context for editing the service is entered.

IES services allow the creation of customer facing IP interfaces in the same routing instance used for service network core routing connectivity. IES services require that the IP addressing scheme used by the subscriber must be unique between it and other addressing schemes used by the provider and potentially the entire Internet.

IP interfaces defined within the context of an IES service ID must have a SAP created as the access point to the subscriber network. This allows a combination of bridging and IP routing for redundancy purposes.

When a service is created, the **customer** keyword and *customer-id* must be specified and associates the service with a customer. The *customer-id* must already exist having been created using the **customer**

command in the service context. Once a service has been created with a customer association, it is not possible to edit the customer association. The service must be deleted and recreated with a new customer association.

Once a service is created, the use of the **customer** *customer-id* is optional for navigating into the service configuration context. Attempting to edit a service with the incorrect *customer-id* specified results in an error.

Multiple IES services are created to separate customer owned IP interfaces. More than one IES service may be created for a single customer ID. More than one IP interface may be created within a single IES service ID. All IP interfaces created within an IES service ID belongs to the same customer.

By default, no IES service instances exist until they are explicitly created.

The **no** form of this command deletes the IES service instance with the specified *service-id*. The service cannot be deleted until all the IP interfaces defined within the service ID have been shut down and deleted.

## Parameters

### *service-id*

Specifies the unique service identification number identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every router on which this service is defined.

**Values** *service-id*: 1 to 214748364  
*svc-name*: A string up to 64 characters

### *customer-id*

Specifies the customer ID number to be associated with the service. This parameter is required on service creation and optional for service editing or deleting.

**Values** 1 to 2147483647

### *vpn-id*

Specifies the VPN ID number used to identify virtual private networks (VPNs) by a VPN identification number.

**Values** 1 to 2147483647

**Default** null (0)

### **create**

Keyword used to create the service ID. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

### *name name*

This parameter configures an optional service name, up to 64 characters, which adds a name identifier to a given service to then use that service name in configuration references as well as display and use service names in show commands throughout the system. This helps the service provider or administrator to identify and manage services within the SR OS platforms.

All services are required to assign a service ID to initially create a service. However, either the service ID or the service name can be used to identify and reference a given service once it is initially created.

If a name is not specified at creation time, then SR OS assigns a string version of the service-id as the name.

Service names may not begin with an integer (0 to 9).

**Values** *name*: up to 64 characters

## Platforms

All

## ies

## Syntax

**ies** *service-id* **interface** *ip-int-name* [**direction** {**ingress** | **egress** | **both**}]

**no ies** *service-id* **interface** *ip-int-name*

**ies** *service-id* **subscriber-interface** *ip-int-name* **group-interface** *ip-int-name* [**direction** {**ingress** | **egress** | **both**}]

**no ies** *service-id* **subscriber-interface** *ip-int-name*

## Context

[\[Tree\]](#) (config>cflowd>collector>exp-filter>if-list>svc ies)

## Full Context

configure cflowd collector export-filter interface-list service ies

## Description

This command configures the IES service interface flow data sent to this collector.

The **no** form of this command removes the values from the configuration.

## Parameters

### *service-id*

Specifies the unique service ID number or string identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number for every SR OS on which this service is defined.

**Values** *service-id*: 1 to 2147483647  
*svc-name*: 64 characters maximum

### **interface** *ip-int-name*

Specifies the name of the IP interface. Interface names must be unique within the group of defined IP interfaces for **configure router interface** and **configure service ies interface**

commands. An interface name cannot be in the form of an IP address. Interface names can be from 1 to 32 alphanumeric characters and must start with a letter. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

**subscriber-interface *ip-int-name***

Specifies the interface name of a subscriber interface. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes and must start with a letter.

**group-interface *ip-int-name***

Specifies the interface name of a group interface. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes and must start with a letter.

**ingress**

Keyword to specify that ingress flows are sent to the associated Cflowd Collector.

**Default** both

**egress**

Keyword to specify that egress flows are sent to the associated Cflowd Collector.

**Default** both

**both**

Keyword to specify that both ingress and egress flows are sent to the associated Cflowd Collector.

**Default** both

**Platforms**

All

## 13.30 ies-vprn-only-sap-parameters

## 13.33 if-num-validation

### if-num-validation

### Syntax

**if-num-validation** {enable | disable}

**no if-num-validation**

### Context

**[Tree]** (config>router>mpls>if>mpls-tp-mep if-num-validation)

### Full Context

configure router mpls interface mpls-tp-mep if-num-validation

## Description

The `if-num-validation` command is used to enable or disable validation of the `if-num` in LSP Trace packet against the locally configured `if-num` for the interface over which the LSP Trace packet was received at the egress LER. This is because some third-party implementations may not perform interface validation for unnumbered MPLS-TP interfaces and instead set the `if-num` in the DSMAP TLV to 0. If the value is **enable**, the node performs the validation of the ingress and egress `if-nums` received in the LSP echo request messages that ingress on this MPLS-interface. It validates that the message arrives on the interface as identified by the ingress `if-num`, and is forwarded on the interface as identified by the egress `if-num`.

If the value is **disable**, no validation is performed for the ingress and egress `if-nums` received in the LSP echo request messages that ingress on this MPLS-interface.

## Default

`if-num-validation enable`

## Parameters

### **enable**

Enables interface number validation.

### **disable**

Disables interface number validation.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 13.34 if-policy

### if-policy

## Syntax

`if-policy mcac-if-policy-name`

`no if-policy`

## Context

### Context

[\[Tree\]](#) (config>oam-pm>streaming>delay-template ifdv-avg)

## Full Context

```
configure oam-pm streaming delay-template ifdv-avg
```

## Description

This command specifies the sending of average inter-frame delay variation for a specified direction.

The **no** form of this command deletes the specified average direction.

### Note:

All directions can be specified if all directions are important for reporting. However, only enable those directions that are required.

## Parameters

### forward

Specifies the measurement in the forward direction.

### backward

Specifies the measurement in the backward direction.

### round-trip

Specifies the measurement for the round trip.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 13.36 iff-attribute-uniform-propagation

### iff-attribute-uniform-propagation

## Syntax

```
[no] iff-attribute-uniform-propagation
```

## Context

[\[Tree\]](#) (config>service>system>bgp-evpn>ip-prefix-routes iff-attribute-uniform-propagation)

## Full Context

```
configure service system bgp-evpn ip-prefix-routes iff-attribute-uniform-propagation
```

## Description

This command enables the uniform propagation of BGP attributes for EVPN Interface-ful (EVPN-IFF) routes. EVPN-IFF is used in R-VPLS services with **bgp-evpn>ip-route-advertisement**. When enabled, the received EVPN-IFF routes for the R-VPLS can be propagated with the original BGP path attributes into EVPN-IFL, IPVPN, EVPN-IFF (in other R-VPLS services), or BGP IP routes advertised for the attached VPRN. This command also enables the attribute propagation in the opposite direction; for example, from EVPN-IFL, IPVPN, IP, or EVPN-IFF routes into EVPN-IFF routes.

The propagation is in accordance with the uniform mode defined in *draft-ietf-bess-evpn-ipvpn-interworking*.  
The **no** form of this command re-originates the BGP path attributes when propagating EVPN-IFF routes into other inter-subnet forwarding families.

**Default**

no iff-attribute-uniform-propagation

**Platforms**

All

## 13.37 iff-bgp-path-selection

### iff-bgp-path-selection

**Syntax**

**iff-bgp-path-selection** [**d-path-length-ignore**]

**no iff-bgp-path-selection**

**Context**

[\[Tree\]](#) (config>service>system>bgp-evpn>ip-prefix-routes iff-bgp-path-selection)

**Full Context**

configure service system bgp-evpn ip-prefix-routes iff-bgp-path-selection

**Description**

This command enables BGP path selection for EVPN-IFF (Interface-ful) routes.

Once the command is enabled, the EVPN-IFF routes are ordered and selected in a similar manner as IPVPN or EVPN-IFL routes, that is, based on the regular BGP path selection process.

The **no** form of this command causes the system to order EVPN-IFF routes based on their {R-VPLS Iindex, RD, Ethernet Tag}. For example, if two EVPN-IFF routes with different Route Distinguishers (RDs) are received for the same prefix on the same R-VPLS, the route with the lowest RD is selected.

**Default**

no iff-bgp-path-selection

**Parameters****d-path-length-ignore**

Keyword used to make EVPN ignore the D-PATH length when **iff-bgp-path-selection** is enabled.

## Default

no igmp

## Platforms

All

## igmp

## Syntax

[no] igmp

## Context

[\[Tree\]](#) (config>router igmp)

## Full Context

configure router igmp

## Description

This command enables the Internet Group Management Protocol (IGMP) context. When the context is created, the IGMP protocol is enabled.

The Internet Group Management Protocol (IGMP) is used by IPv4 systems (hosts and routers) to report their IP multicast group memberships to neighboring multicast routers. An IP multicast router can be a member of one or more multicast groups, in which case it performs both the "multicast router part" of the protocol which collects the membership information needed by its multicast routing protocol, and the

"group member part" of the protocol which informs itself and other neighboring multicast routers of its memberships.

The **no** form of the command disables the IGMP instance. To start or suspend execution of IGMP without affecting the configuration, use the **no shutdown** command.

#### Description

This command configures an IGMP policy.

The **no** form of this command reverts to the default value.

#### Parameters

##### *policy-name*

Specifies the policy name up to 32 characters.

##### **create**

Keyword used to create the IGMP policy. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### igmp-policy

#### Syntax

**igmp-policy** *policy-name*

**no igmp-policy**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>sub-prof igmp-policy)

#### Full Context

configure subscriber-mgmt sub-profile igmp-policy

## Description

This command will enable IGMP processing per subscriber host. Without this command IGMP states will not be maintained per subscriber hosts. The referenced policy is defined under the **configure>subscriber-mgmt** context and can be only applied via the sub-profile.

The referenced policy contains entries such as:

- description statement
- import statement — IGMP filters
- egress-rate-modify statement—HQoS Adjustment
- mcast-redirect statement—redirection to alternate interface
- static statement—definition of static IGMP groups
- version statement —IGMP version
- fast-leave statement
- max-num-groups statement—the maximum number of multicast groups allowed

The **no** form of this command reverts to the default.

## Parameters

### *policy-name*

Specifies the name of the IGMP policy for the subscriber. The policy itself is defined under the **configure>sub-mgmt** context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
configure service vprn l2tp ignore-avps
```

### Description

This command specifies the L2TP AVPs that should be ignored in L2TP session control.

The **no** form of this command reverts to the default.

### Parameters

#### sequencing-required

Ignores the [39] Sequencing Required AVP on LNS when present in the L2TP ICCN message received from LAC. By default, the session at LNS would be disconnected, in this case with the Call Disconnect Notify (CDN) error code unknownMandatoryReceive(8). Note that when configured, to ignore the Sequencing Required AVP there is no Sequence Numbers inserted into the data channel.

### Platforms

configure service ies subscriber-interface group-interface ignore-df-bit

## Description

This command enables the **ignore-df-bit** flag that ignores the **do-not-fragment** (DF) bit for frames egressing the WLAN-GW group interface and fragments the frame according to the applicable egress MTU. The DF bit is reset for the frames that are fragmented.

The **no** form of this command causes the router to fragment a packet larger than the MTU if the DF bit is set to 0 and drops the packet if the DF bit is set to 1.

## Default

no ignore-df-bit

## Platforms

configure service vprn dhcp local-dhcp-server pool failover ignore-mclt-on-takeover

### Description

With this flag enabled, the remote IP address or prefix can be taken over immediately upon entering the PARTNER-DOWN state of the intercommunication link, without having to wait for the Maximum Client Lead Time (MCLT) to expire. By setting this flag, the lease times of the existing DHCP clients, while the intercommunication link is in the PARTNER-DOWN state, will still be reduced to the MCLT over time and all new lease times are set to MCLT. This behavior remains the same as originally intended for MCLT.

Some deployments require that the remote IP address/prefix range starts delegating new IP addresses and prefixes upon the failure of the intercommunication link, without waiting for the intercommunication link to transition from the COMM-INT state into the PARTNER-DOWN state and the MCLT to expire while in PARTNER-DOWN state.

This can be achieved by enabling the **ignore-mclt-on-takeover** flag and by configuring the **partner-down-delay** to 0.

Enabling this functionality must be exercised with caution. One needs to keep in mind that the partner-down-delay and MCLT timers were originally introduced to prevent IP address duplication in cases where DHCP redundant nodes transition out-of-sync due to the failure of intercommunication link. These timers (**partner-down-delay** and MCLT) would ensure that during their duration, the new IP addresses and

prefixes are delegated only from one node, the one with local IP address-range/prefix. This causes the new IP address delegation to be delayed and the service is impacted.

If it can be assured that the intercommunication link is always available, then the DHCP nodes would stay in sync and the two timers would not be needed. Therefore, it is important that in this mode of operation, the intercommunication link is well protected by providing multiple paths between the two DHCP nodes. The only event that should cause intercommunication link to fail is the entire nodal failure. This failure is acceptable since in this case only one DHCP node is available to provide new IP addresses and prefixes.

The **no** form of this command reverts to the default.

[Tree] (config>router>mpls>lsp igp-shortcut)

#### Full Context

configure router mpls lsp-template igp-shortcut

configure router mpls lsp igp-shortcut

#### Description

This command enables the use of a specific RSVP LSP by IS-IS and OSPF routing protocols as a shortcut or as a forwarding adjacency for resolving IGP routes.

When the **igp-shortcut** or the **advertise-tunnel-link** option is enabled at the IGP instance level, all RSVP LSPs originating on this node are eligible by default as long as the destination address of the LSP, as configured in **config>router>mpls>lsp>to**, corresponds to a router-id of a remote node.

The **lfa-protect** option allows an LSP to be included in both the main SPF and the Loop-Free Alternate (LFA) SPF. For a given prefix, the LSP can be used either as a primary next-hop or as an LFA next-hop, but not both. If the main SPF computation selected a tunneled primary next-hop for a prefix, the LFA SPF will not select an LFA next-hop for this prefix and the protection of this prefix will rely on the RSVP LSP FRR protection. If the main SPF computation selected a direct primary next-hop, then the LFA SPF will select an LFA next-hop for this prefix but will prefer a direct LFA next-hop over a tunneled LFA next-hop.

The **lfa-only** option allows an LSP to be included in the LFA SPF only such that the introduction of IGP shortcuts does not impact the main SPF decision. For a given prefix, the main SPF always selects a direct primary next-hop. The LFA SPF selects an LFA next-hop for this prefix but will prefer a direct LFA next-hop over a tunneled LFA next-hop.

When the **relative-metric** option is enabled, IGP will apply the shortest IGP cost between the endpoints of the LSP plus the value of the offset (instead of the LSP operational metric) when computing the cost of a prefix which is resolved to the LSP. The offset value is optional and it defaults to zero. The minimum net cost for a prefix is one (1) after applying the offset. The TTM continues to show the LSP operational metric as provided by MPLS. In other words, applications such as LDP-over-RSVP (when IGP shortcut is disabled) and BGP and static route shortcuts will continue to use the LSP operational metric.

The **relative-metric** option is mutually exclusive with the **lfa-protect** or the **lfa-only** options. In other words, an LSP with the **relative-metric** option enabled cannot be included in the LFA SPF, and vice-versa, when the **igp-shortcut** option is enabled in the IGP.

Finally, the **relative-metric** option is ignored when forwarding adjacency is enabled in IS-IS or OSPF. In this case, IGP advertises the LSP as a point-to-point unnumbered link along with the LSP operational metric as returned by MPLS and capped to maximum link metric allowed in that IGP. Both the main SPF and the LFA SPFs will use the local IGP database to resolve the routes.

When the router performs local SPF, the SR-TE LSP is used as an eligible IGP shortcut for SRv4 or SRv6 only if the LSP is explicitly allowed using the **allow-sr-over-srte** option when the top SID in the SR-TE LSP is an adjacency SID.

The **no** form of this command disables the use of a specific RSVP LSP by IS-IS and OSPF routing protocols as a shortcut or a forwarding adjacency for resolving IGP routes.

## Default

igp-shortcut. All RSVP LSPs originating on this node are eligible by default as long as the destination address of the LSP corresponds to a router-id of a remote node.

## Parameters

### ifa-protect

Specifies an LSP is included in both the main SPF and the LFA SPF.

### ifa-only

Specifies an LSP is included in the LFA SPF only.

### relative-metric [*offset*]

Specifies the shortest IGP cost between the endpoints of the LSP plus the configured offset, instead of the LSP operational metric returned by MPLS, is used when calculating the cost of prefix resolved to this LSP. The offset parameter is an integer and is optional. An offset value of zero is used when the relative-metric option is enabled without specifying the offset parameter value.

**Values** [-10, +10]

### allow-sr-over-srte

Specifies that the LSP or LSP template is eligible as an IGP shortcut.

## Platforms

All

## igp-shortcut

## Syntax

igp-shortcut

## Context

**[Tree]** (config>router>isis igp-shortcut)

## Full Context

configure router isis igp-shortcut

## Description

This command enables the use of an RSVP-TE or SR-TE shortcut for resolving IGP routes by OSPF or IS-IS routing protocols.

This command instructs IGP to include RSVP LSPs and SR-TE LSPs originating on this node and terminating on the router ID of a remote node as direct links with a metric equal to the metric provided by MPLS.

During the IP reach calculation to determine the reachability of nodes and prefixes, LSPs are overlaid and the LSP metric is used to determine the subset of paths that are equal lowest cost to reach a node or a prefix. If the user enabled the **relative-metric** option for this LSP, IGP will apply the shortest IGP cost between the endpoints of the LSP plus the value of the offset, instead of the LSP operational metric, when computing the cost of a prefix that is resolved to the LSP.

When a prefix is resolved to a tunnel next-hop, the packet is sent labeled with the label stack corresponding to the NHLFE of the RSVP-TE or SR-TE LSP, as well as the explicit-null IPv6 label at the bottom of the stack in the case of an IPv6 prefix. Any network event causing one or more IGP shortcuts to go down will trigger a full SPF computation, which may result in installing a new route over an updated set of tunnel next-hops and IP next-hops.

When **igp-shortcut** is enabled at the IGP instance level, all RSVP-TE and SR-TE LSPs originating on this node are eligible by default as long as the destination address of the LSP, as configured in **config>router>mpls>lsp>to**, corresponds to a router ID of a remote node. LSPs with a destination corresponding to an interface address or any other loopback interface address of a remote node are automatically not considered by IGP. The user can, however, exclude a specific RSVP-TE or SR-TE LSP from being used as a shortcut for resolving IGP routes by entering the **config>router>mpls>lsp>no igp-shortcut** command.

The SPF in IGP only uses RSVP LSPs as forwarding adjacencies, IGP shortcuts, or as endpoints for LDP-over-RSVP. These applications of RSVP LSPs are mutually exclusive at the IGP instance level. If two or more options are enabled in the same IGP instance, then forwarding adjacency takes precedence over the shortcut application, which takes precedence over the LDP-over-RSVP application.

The SPF in IGP uses SR-TE LSPs as IGP shortcuts only.

When ECMP is enabled on the system and multiple equal-cost paths exist for a prefix, the following selection criteria are used to pick up the set of tunnel and IP next-hops to program in the data path.

- Where a destination is a tunnel-endpoint (including external prefixes with tunnel-endpoint as the next-hop), the tunnel with lowest tunnel-index is selected (the IP next-hop is never used in this case).
- Where a destination is not a tunnel-endpoint:
  - LSPs with metric higher than underlying IGP cost between the endpoint of the LSP are excluded
  - Tunnel next-hops are preferred over IP next-hops
  - Within tunnel next-hops, the following priority applies to selection:
    1. The lowest endpoint-to-destination cost is selected
    2. If the endpoint-to-destination costs are the same, the lowest endpoint node router ID is selected
    3. If the router IDs are the same, the lowest tunnel index is selected
  - Within IP next-hops, the following priority applies to selection:
    1. The lowest downstream router ID is selected
    2. If the downstream router IDs are the same, the lowest interface-index is selected

**Note:**

Although ECMP is not performed across both the IP and tunnel next-hops, the tunnel endpoint may lie in one of the shortest IGP paths for that prefix. In that case, the tunnel next-hop is always selected as long as the prefix cost using the tunnel is equal to or lower than the IGP cost.

When both RSVP-TE and SR-TE IGP shortcuts are available, the IP reach calculation, in the unicast routing table, will first follow the above ECMP tunnel and IP next-hop selection rules when resolving a prefix over IGP shortcuts. After the set of ECMP tunnel and IP next-hops have been selected, the preference of tunnel type is then applied based on the user setting for prefix family resolution. If the user enabled resolution of the prefix family to both RSVP-TE and SR-TE tunnel types, the TTM tunnel preference value is used to select one type for the prefix. In other words, an RSVP-TE LSP type is preferred to an SR-TE LSP type on a per-prefix basis.

The ingress IOM sprays the packets for this prefix over the set of tunnel next-hops and IP next-hops based on the hashing routine currently supported for IPv4 packets.

This feature provides IGP with the capability to populate the multicast RTM with the prefix IP next-hop when both the **igp-shortcut** and the **multicast-import** options are enabled in IGP. The unicast RTM can still use the tunnel next-hop for the same prefix. The SPF keeps track of both the direct first hop and the tunneled first hop of a node, which is added to the Dijkstra tree.

## igp-shortcut

**Syntax**

**igp-shortcut**

**Context**

[\[Tree\]](#) (config>router>ospf3 igp-shortcut)

[\[Tree\]](#) (config>router>ospf igp-shortcut)

**Full Context**

configure router ospf3 igp-shortcut

configure router ospf igp-shortcut

**Description**

This command enables the use of an RSVP-TE or SR-TE shortcut for resolving IGP routes by OSPF or IS-IS routing protocols.

This command instructs IGP to include RSVP LSPs and SR-TE LSPs originating on this node and terminating on the router ID of a remote node as direct links with a metric equal to the metric provided by MPLS.

During the IP reach calculation to determine the reachability of nodes and prefixes, LSPs are overlaid and the LSP metric is used to determine the subset of paths that are equal lowest cost to reach a node or a prefix. If the user enabled the **relative-metric** option for this LSP, IGP will apply the shortest IGP cost

between the endpoints of the LSP plus the value of the offset, instead of the LSP operational metric, when computing the cost of a prefix that is resolved to the LSP.

When a prefix is resolved to a tunnel next hop, the packet is sent labeled with the label stack corresponding to the NHLFE of the RSVP-TE or SR-TE LSP, as well as the explicit-null IPv6 label at the bottom of the stack in the case of an IPv6 prefix. Any network event causing one or more IGP shortcuts to go down will trigger a full SPF computation, which may result in installing a new route over an updated set of tunnel next-hops and IP next-hops.

When **igp-shortcut** is enabled at the IGP instance level, all RSVP-TE and SR-TE LSPs originating on this node are eligible by default as long as the destination address of the LSP, as configured in **config>router>mpls>isp>to**, corresponds to a router ID of a remote node. LSPs with a destination corresponding to an interface address or any other loopback interface address of a remote node are automatically not considered by IGP. The user can, however, exclude a specific RSVP-TE or SR-TE LSP from being used as a shortcut for resolving IGP routes by entering the **config>router>mpls>isp>no igp-shortcut** command.

The SPF in IGP only uses RSVP LSPs as forwarding adjacencies, IGP shortcuts, or as endpoints for LDP-over-RSVP. These applications of RSVP LSPs are mutually exclusive at the IGP instance level. If two or more options are enabled in the same IGP instance, then forwarding adjacency takes precedence over the shortcut application, which takes precedence over the LDP-over-RSVP application.

The SPF in IGP uses SR-TE LSPs as IGP shortcuts only.

When ECMP is enabled on the system and multiple equal-cost paths exist for a prefix, the following selection criteria are used to pick up the set of tunnel and IP next-hops to program in the data path.

- Where a destination is a tunnel-endpoint (including external prefixes with tunnel-endpoint as the next hop), the tunnel with lowest tunnel-index is selected (the IP next hop is never used in this case).
- Where a destination is not a tunnel-endpoint:
  - LSPs with metric higher than underlying IGP cost between the endpoint of the LSP are excluded
  - Tunnel next-hops are preferred over IP next-hops
  - Within tunnel next-hops:
    1. The lowest endpoint-to-destination cost is selected
    2. If the endpoint-to-destination costs are the same, the lowest endpoint node router ID is selected
    3. If the router IDs are the same, the lowest tunnel index is selected
  - Within IP next-hops:
    1. The lowest downstream router ID is selected
    2. If the downstream router IDs are the same, the lowest interface-index is selected

**Note:**

Although ECMP is not performed across both the IP and tunnel next-hops, the tunnel endpoint may lie in one of the shortest IGP paths for that prefix. In that case, the tunnel next hop is always selected as long as the prefix cost using the tunnel is equal or lower than the IGP cost.

When both RSVP-TE and SR-TE IGP shortcuts are available, the IP reach calculation, in the unicast routing table, will first follow the above ECMP tunnel and IP next hop selection rules when resolving a prefix over IGP shortcuts. After the set of ECMP tunnel and IP next-hops have been selected, the preference of tunnel type is then applied based on the user setting of the resolution of the family of the prefix. If the user enabled resolution of the prefix family to both RSVP-TE and SR-TE tunnel types, the

TTM tunnel preference value is used to select one type for the prefix. In other words, the RSVP-TE LSP type is preferred to an SR-TE LSP type on a per-prefix basis.

The ingress IOM sprays the packets for this prefix over the set of tunnel next-hops and IP next-hops based on the hashing routine currently supported for IPv4 packets.

This feature provides IGP with the capability to populate the multicast RTM with the prefix IP next hop when both the **igp-shortcut** and the **multicast-import** options are enabled in IGP. The unicast RTM can still make use of the tunnel next hop for the same prefix. This change is made possible with the enhancement by which SPF keeps track of both the direct first hop and the tunneled first hop of a node which is added to the Dijkstra tree.

## 13.65 iid-tlv-enable

### iid-tlv-enable

#### Syntax

[no] iid-tlv-enable

#### Context

[\[Tree\]](#) (config>service>vprn>isis iid-tlv-enable)

#### Full Context

```
configure service vprn isis iid-tlv-enable
```

#### Description

This command enables IS-IS multi-instance (MI) as described in draft-ietf-isis-mi-02. Multiple instances allow instance-specific adjacencies to be formed that support multiple network topologies on the same physical interfaces. Each instance has an LSDB, and each PDU contains a TLV identifying the instance and the topology to which the PDU belongs.

The **iid-tlv-enable** (based on draft-ietf-isis-mi-02) and **standard-multi-instance** (based on draft-ginsberg-isis-mi-bis-01) commands cannot be configured in the same instance, because the MAC addresses and PDUs in each standard are incompatible.

#### Default

no iid-tlv-enable

## Platforms

All

## iid-tlv-enable

### Syntax

**[no] iid-tlv-enable**

### Context

**[Tree]** (config>router>isis iid-tlv-enable)

### Full Context

configure router isis iid-tlv-enable

### Description

This command enables IS-IS multi-instance (MI) as described in *draft-ietf-isis-mi-02*. Multiple instances allows the formation of instance-specific adjacencies that support multiple network topologies on the same physical interfaces. Each instance has an LSDB, and each PDU contains a TLV that identifies the instance and the topology to which the PDU belongs.

The **iid-tlv-enable** (based on *draft-ietf-isis-mi-02*) and **standard-multi-instance** (based on *draft-ginsberg-isis-mi-bis-01*) commands cannot be configured in the same instance, because the MAC addresses and PDUs in each standard are incompatible.

The **no** form of this command disables IS-IS MI.

## 13.66 ike-auth-algorithm

### ike-auth-algorithm

### Syntax

**ike-auth-algorithm {md5 | sha1 | sha256 | sha384 | sha512 | aes-xcbc | auth-encryption}**

### Context

**[Tree]** (config>ipsec>ike-transform ike-auth-algorithm)

### Full Context

configure ipsec ike-transform ike-auth-algorithm

### Description

This command specifies the IKE authentication algorithm for the IKE transform

**Default**

ike-auth-algorithm sha1

**Parameters*****auth-algorithm***

Specifies the values used to identify the hashing algorithm

- Values**
- md5** — Configures the use of the hmac-md5 algorithm for authentication
  - sha1** — Configures the use of the hmac-sha1 algorithm for authentication
  - sha256** — Configures the use of the hmac-sha256 algorithm for authentication.
  - sha384** — Configures the use of the hmac-sha384 algorithm for authentication
  - sha512** — Configures the use of the hmac-sha512 algorithm for authentication.
  - aes-xcbc** — Configures the use of aes-xcbc (RFC 3566, *The AES-XCBC-MAC-96 Algorithm and Its Use With IPsec*) algorithm for authentication.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.67 ike-encryption-algorithm

### ike-encryption-algorithm

**Syntax**

```
ike-encryption-algorithm {des | 3des | aes128 | aes192 | aes256 | aes128-gcm8 | aes128-gcm16 |
aes256-gcm8 | aes256-gcm16}
```

**Context**

[\[Tree\]](#) (config>ipsec>ike-transform ike-encryption-algorithm)

**Full Context**

```
configure ipsec ike-transform ike-encryption-algorithm
```

**Description**

This command specifies the IKE encryption algorithm to be used in the IKE transform instance.

## Default

ike-encryption-algorithm aes128

## Parameters

### *encryption-algorithm*

Specifies the IKE encryption algorithm.

- Values**
- des** — Configures the 56-bit des algorithm for encryption. This is an older algorithm with relatively weak security. While better than nothing, it should only be used where a strong algorithm is not available on both ends at an acceptable performance level.
  - 3des** — Configures the 3-des algorithm for encryption. This is a modified application of the des algorithm which uses multiple des operations to make information more secure.
  - aes128** — Configures the aes algorithm with a block size of 128 bits. This is a mandatory implementation size for aes. This is a very strong algorithm choice.
  - aes192** — Configures the aes algorithm with a block size of 192 bits. This is a stronger version of aes.
  - aes256** — Configures the aes algorithm with a block size of 256 bits. This is the strongest available version of aes.
  - aes128-gcm8** - Configures ESP to use aes-gcm with a 128-bit key size and an 8-byte ICV for encryption and authentication.
  - aes128-gcm16** - Configures ESP to use aes-gcm with a 128-bit key size and a 16-byte ICV for encryption and authentication.
  - aes256-gcm8** - Configures ESP to use aes-gcm with a 256-bit key size and an 8-byte ICV for encryption and authentication.
  - aes256-gcm16** - This parameter configures ESP to use aes-gcm with a 256-bit key size and a 16-byte ICV for encryption and authentication.

## 13.68 ike-mode

ike-mode

### Syntax

ike-mode {main | aggressive}

no ike-mode

## Context

[\[Tree\]](#) (config>ipsec>ike-policy ike-mode)

## Full Context

configure ipsec ike-policy ike-mode

## Description

This command specifies one of either two modes of operation. IKE version 1 can support main mode and aggressive mode. The difference lies in the number of messages used to establish the session.

The **no** form of this command reverts to the default.

## Default

no ike-mode

## Parameters

### main

Specifies identity protection for the hosts initiating the IPsec session. This mode takes slightly longer to complete.

### aggressive

Specifies that the aggressive mode provides no identity protection but is faster.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.69 ike-policy

- configure service ies interface ipsec ipsec-tunnel dynamic-keying ike-policy

## 13.70 ike-prf-algorithm

### ike-prf-algorithm

#### Syntax

```
ike-prf-algorithm {md5 | sha1 | sha256 | sha384 | sha512 | aes-xcbc | same-as-auth}
```

#### Context

[\[Tree\]](#) (config>ipsec>ike-transform ike-prf-algorithm)

#### Full Context

```
configure ipsec ike-transform ike-prf-algorithm
```

#### Description

This command specifies the PRF algorithm to use for IKE security association.

#### Note:

If an authenticated encryption algorithm like AES-GCM is used for IKE encryption algorithm, **same-as-auth** cannot be used for **ike-prf-algorithm**.

#### Default

```
ike-prf-algorithm same-as-auth
```

#### Parameters

##### md5

This parameter configures IKE to use the **hmac-md5** algorithm for PRF.

##### sha1

This parameter configures IKE to use the **hmac-sha1** algorithm for PRF.

##### sha256

This parameter configures IKE to use the **hmac-sha256** algorithm for PRF.

**sha384**

This parameter configures IKE to use the **hmac-sha384** algorithm for PRF.

**sha512**

This parameter configures IKE to use the **hmac-sha512** algorithm for PRF.

**aes-xcbc**

This parameter configures IKE to use the **aes128-xcbc** algorithm for PRF.

**same-as-auth**

This parameter configures the same algorithm as IKE authentication algorithm.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.71 ike-transform

### ike-transform

**Syntax**

**ike-transform** *ike-transform-id* [*ike-transform-id* ...(up to 4 max)]

**no ike-transform**

**Context**

[\[Tree\]](#) (config>ipsec>ike-policy ike-transform)

**Full Context**

configure ipsec ike-policy ike-transform

**Description**

This command specifies the IKE transform to be used in the IKE policy. Up to four IKE transforms can be specified. If multiple IDs are specified, the system selects an IKE transform based on the peer's proposal. If the system is a tunnel initiator, it uses the configured IKE transform to generate the SA payload.

**Default**

no ike-transform

**Parameters*****ike-transform-id***

Specifies up to four existing IKE transform instances to be associated with this IKE policy.

**Values** 1 to 4096

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## ike-transform

### Syntax

**ike-transform** *ike-transform-id* [**create**]

**no ike-transform** *ike-transform-id*

### Context

[\[Tree\]](#) (config>ipsec ike-transform)

### Full Context

configure ipsec ike-transform

### Description

This commands creates a new or enters an existing IKE transform instance. The IKE transform include following configuration for IKE SA:

- DH Group
- IKE authentication algorithm
- IKE encryption algorithm
- IKE SA lifetime

The *ike-transform-id* is referenced in the **ike-policy** configuration.

### Parameters

#### *ike-transform*

Specifies a number used to uniquely identify an IKE transform instance.

**Values** 1 to 4096

#### **create**

Keyword used to create the ike-transform instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.72 ike-version

## ike-version

### Syntax

**ike-version** {1 | 2}

### Context

[\[Tree\]](#) (config>ipsec>ike-policy ike-version)

### Full Context

configure ipsec ike-policy ike-version

### Description

This command sets the IKE version (1 or 2) that the ike-policy will use.

### Default

ike-version 1

### Parameters

1 | 2

Specifies the version of IKE protocol.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.73 ikev1-ph1-responder-delete-notify

## ikev1-ph1-responder-delete-notify

### Syntax

**[no] ikev1-ph1-responder-delete-notify**

### Context

[\[Tree\]](#) (config>ipsec>ike-policy ikev1-ph1-responder-delete-notify)

### Full Context

configure ipsec ike-policy ikev1-ph1-responder-delete-notify

### Description

This command specifies the system, when deleting an IKEv1 phase 1 SA for which it was the responder, to send a delete notification to the peer. This command only applies when the configured ike-version 1. This command is ignored with IKE version 2.

The **no** form of this command reverts to the default.

**Default**

ikev1-ph1-responder-delete-notify

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.74 ikev2-fragment

### ikev2-fragment

**Syntax**

**ikev2-fragment** *mtu octets reassembly-timeout seconds*

**no ikev2-fragment**

**Context**

[\[Tree\]](#) (config>ipsec>ike-policy ikev2-fragment)

**Full Context**

configure ipsec ike-policy ikev2-fragment

**Description**

This command enables IKEv2 protocol level fragmentation (RFC 7383). The specified MTU is the maximum size of IKEv2 packet.

**Default**

no ikev2-fragment

**Parameters*****octets***

Specifies the MTU for IKEv2 messages.

**Values** 512 to 9000

***seconds***

Specifies the timeout for reassembly.

**Values** 1 to 5

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.75 imei

imei

### Syntax

[no] imei

### Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>include-radius-attribute imei)

### Full Context

configure subscriber-mgmt radius-accounting-policy include-radius-attribute imei

configure subscriber-mgmt authentication-policy include-radius-attribute imei

### Description

This command enables the inclusion of the IMEI in AA protocols as signaled in the incoming GTP setup message.

The **no** form of this command disables the inclusion of the attribute.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

imei

### Syntax

[no] imei

### Context

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>nasreq>include-avp imei)

### Full Context

configure subscriber-mgmt diameter-application-policy nasreq include-avp imei

### Description

This command enables the inclusion of the IMEI AVP, as signaled in the incoming GTP setup message.

The **no** form of this command disables the inclusion of the AVP.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.76 implicit-generation

### implicit-generation

#### Syntax

[no] implicit-generation

#### Context

[\[Tree\]](#) (config>subscr-mgmt>auto-sub-id-key implicit-generation)

#### Full Context

configure subscriber-mgmt auto-sub-id-key implicit-generation

#### Description

By default, the system automatically generates a subscriber identifier, using the characters A to Z and 0 to 9, that is used when a subscriber ID is not provided during the authentication of a subscriber host or session and when no explicit default **def-sub-id** is configured at the SAP or in the MSAP policy.

A subscriber ID obtained from authentication sources can conflict with the format of an implicit, automatically generated subscriber ID. When this happens, the subscriber host or session setup fails and generates the following message: "Non auto-generated sub-id 4574233754 with an auto sub-id format not allowed". Therefore, when implicit subscriber ID generation is enabled (the default behavior), a 10-character string containing characters A to Z and 0 to 9 should not be returned from authentication sources.

The **no** form of this command disables the implicit automatic generation of subscriber IDs. When a subscriber ID is not provided in authentication and no explicit **def-sub-id** is configured, then the host or session setup fails and generates the following message: "Missing subscriber id". A 10-character (A to Z and 0 to 9) subscriber ID format can be returned from authentication sources without the risk of conflicts.

Disabling the implicit automatic generation of subscriber IDs fail when there are active subscribers with an implicit automatically generated subscriber ID.

Enabling the implicit automatic generation of subscriber IDs fails when there are active subscribers.

#### Default

implicit-generation

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.77 implicit-null-label

## implicit-null-label

### Syntax

**[no] implicit-null-label**

### Context

**[Tree]** (config>router>ldp implicit-null-label)

### Full Context

configure router ldp implicit-null-label

### Description

This command enables the use of the implicit null label. Use this command to signal the implicit null option for all LDP FECs for which this node is the egress LER.

The **no** form of this command disables the signaling of the implicit null label.

### Default

no implicit-null-label

### Platforms

All

## implicit-null-label

### Syntax

**[no] implicit-null-label**

### Context

**[Tree]** (config>router>rsvp implicit-null-label)

### Full Context

configure router rsvp implicit-null-label

### Description

This command enables the use of the implicit null label.

Signaling the IMPLICIT NULL label value for all RSVP LSPs can be enabled for which this node is the egress LER. RSVP must be shut down before being able to change this configuration option.

The egress LER does not signal the implicit null label value on P2MP RSVP LSPs. However, the Penultimate Hop Popping (PHP) node can honor a Resv message with the label value set to the implicit null.

The **no** form of this command disables the signaling of the implicit null label.

**Default**

no implicit-null-label

**Platforms**

All

**implicit-null-label****Syntax**

**implicit-null-label** [**enable** | **disable**]

**no implicit-null-label**

**Context**

[\[Tree\]](#) (config>router>rsvp>interface implicit-null-label)

**Full Context**

configure router rsvp interface implicit-null-label

**Description**

This command enables the use of the implicit null label over a specific RSVP interface.

All LSPs for which this node is the egress LER and for which the path message is received from the previous hop node over this RSVP interface will signal the implicit null label. This means that if the egress LER is also the merge-point (MP) node, then the incoming interface for the path refresh message over the bypass dictates if the packet will use the implicit null label or not. The same for a 1-to-1 detour LSP.

The user must shut down the RSVP interface before being able to change the implicit null configuration option.

The **no** form of this command returns the RSVP interface to use the RSVP level configuration value.

**Default**

no implicit-null-label

**Parameters*****enable***

Enables the implicit null label.

***disable***

Disables the implicit null label.

**Platforms**

All

## 13.78 import

```
import
```

### Syntax

```
import policy-name
```

```
no import
```

### Context

```
[Tree] (config>subscr-mgmt>loc-user-db>ppp>host>mld-parameters import)
```

```
[Tree] (config>subscr-mgmt>loc-user-db>ipoe>host>mld-parameters import)
```

### Full Context

```
configure subscriber-mgmt local-user-db ppp host mld-parameters import
```

```
configure subscriber-mgmt local-user-db ipoe host mld-parameters import
```

### Description

This command configures an MLD import policy.

The LUDB allows a list of up to 14 MLD import policies per host. The MLD policy also allows the configuration of an additional import policy, providing a total of 15 MLD import policies per host. The import policy inside the MLD policy is always applied last, which determines if the list is a black list or a white list. To configure an MLD white list, the import policies in the LUDB should all be allowed or forward entries and the import policy in the MLD policy should have a default action to deny all. To configure a black list, the import policies inside the LUDB should drop entries and the MLD policy import policy default action should be to forward all. The 15 import policies can be configured to be a mixed white and black list. Since it is difficult to control the order of the import policies within the LUDB, it is recommended to provision the import policy inside the MLD policy first for deterministic behavior.

The **no** form of this command removes the specified import policy.

### Parameters

***policy-name***

Specifies the MLD import policy, up to 32 characters, used to control the multicast group accessible for the subscriber host.

### Platforms

configure service vpls mesh-sdp igmp-snooping import

configure service vpls sap mld-snooping import

### Description

This command specifies the import routing policy to be used for IGMP packets to be used on this SAP or SDP. Only a single policy can be imported on a SAP at any time.

The **no** form of this command removes the policy association from the SAP or SDP.

### Default

no import

### Parameters

#### *policy-name*

Specifies the routing policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. Routing policies are configured in the **config>router>policy-options** context. The router policy must be defined before it can be imported.

### Platforms

All

## import

### Syntax

**import** *policy* [*policy*]

## no import

### Context

[\[Tree\]](#) (config>subscr-mgmt>bgp-prng-plcy import)

### Full Context

configure subscriber-mgmt bgp-peering-policy import

### Description

This command specifies the import policies to be used to control routes advertised to BGP neighbors. Route policies are configured in the **config>router>policy-options** context. When multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied.

The **no** form of this command removes all route policy names from the import list.

### Default

no import — BGP accepts all routes from configured BGP neighbors. Import policies can be used to limit or modify the routes accepted and their corresponding parameters and metrics.

### Parameters

#### *policy*

Specifies route policy statement name, up to 32 characters. Up to five policies can be specified.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**[Tree]** (config>service>vprn>bgp import)

### Full Context

configure service vprn bgp group neighbor import

configure service vprn bgp group import

configure service vprn bgp import

### Description

This command is used to specify route policies that control the handling of inbound routes received from certain peers. Route policies are configured in the **config>router>policy-options** context.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in a peer-group) or neighbor level (only applies to the specified peer). The most specific level is used.

The **import** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine the modifications of each route and the final action to accept or reject the route.

Only one of the 15 objects referenced by the **import** command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters while the remaining 14 objects have a maximum length of 64 characters each.

When multiple **import** commands are issued, the last command entered overrides the previous command.

When an import policy is not specified, BGP routes are accepted by default.

The **no** form of this command removes the policy association.

### Default

no import

### Parameters

***plcy-or-long-expr***

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters).

***plcy-or-expr***

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters).

## Platforms

### Description

This command associates an import policy to filter IGMP packets.

The **no** form of this command removes the values from the configuration.

### Default

no import

### Parameters

*policy-name*

Specifies the import policy name.

## import

### Syntax

**import** *policy-name* [*policy-name* ... (up to 5 max)]

**no import**

### Context

[\[Tree\]](#) (config>service>vprn>isis import)

### Full Context

configure service vprn isis import

### Description

This command applies one or more (up to five) route policies as IS-IS import policies.

When a prefix received in an IS-IS LSP is accepted by an entry in an IS-IS import policy, it is installed in the routing table, if it is the most preferred route to the destination.

When a prefix received in an IS-IS LSP is rejected by an entry in an IS-IS import policy, it is not installed in the routing table, even if it has the lowest preference value among all the routes to that destination.

The flooding of LSPs is unaffected by IS-IS import policy actions.

The **no** form of this command removes all policies from the configuration.

### Default

no import

### Parameters

#### *policy-name*

Identifies the export route policy name. Allowed values are any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed between double quotes. The specified name(s) must already be defined.

### Platforms

## import

### Syntax

**import** *policy-name*

**no import**

### Context

[\[Tree\]](#) (config>service>vprn>mld>if import)

### Full Context

configure service vprn mld interface import

### Description

This command specifies the import route policy to be used for determining which membership reports are accepted by the router. Route policies are configured in the **config>router>policy-options** context.

When an import policy is not specified, all the MLD reports are accepted.

The **no** form of this command removes the policy association from the MLD instance.

### Default

no import

### Parameters

#### *policy-name*

Specifies the route policy name. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed between double quotes. Route policies are configured in the **config>router>policy-options** context.

### Full Context

configure service vprn msdp import

configure service vprn msdp group import

configure service vprn msdp peer import

configure service vprn msdp group peer import

### Description

This command specifies the policies to import source active state from Multicast Source Discovery Protocol (MSDP) into source active list.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple import commands are issued, the last command entered will override the previous command. A maximum of five policy names can be specified.

If you configure an import policy at the global level, each individual peer inherits the global policy.

If you configure an import policy at the group level, each individual peer in a group inherits the group's policy.

If you configure an import policy at the peer level, then policy only applies to the peer where it is configured.

The **no** form of this command removes all policies from the configuration.

### Default

no import

### Parameters

***policy-name***

Specifies the import policy name. Up to five policy-name arguments can be specified.

## Platforms

All

## import

### Syntax

```
import {unicast | ext-community}
```

### Context

[\[Tree\]](#) (config>service>vprn>mvpn>vrf-target import)

### Full Context

```
configure service vprn mvpn vrf-target import
```

### Description

This command specifies communities to be accepted from peers.

### Parameters

#### unicast

Specifies to use unicast vrf-target ext-community for the multicast VPN.

#### ext-comm

An extended BGP community in the **type:x:y** format. The value **x** can be an integer or IP address. The **type** can be the target or origin. **x** and **y** are 16-bit integers.

#### Values

```
target:{ip-address:comm-val | 2byte-asnumber:ext-comm-val |
4byte-asnumber:comm-val}
```

|                        |                 |
|------------------------|-----------------|
| <i>ip-address:</i>     | a.b.c.d         |
| <i>comm-val:</i>       | 0 to 65535      |
| <i>2byte-asnumber:</i> | 1 to 65535      |

```

## Description

This command applies one or more (up to five) route policies as OSPF import policies. When a prefix received in an OSPF LSA is accepted by an entry in an OSPF import policy it is installed in the routing table if it is the most preferred route to the destination. When a prefix received in an OSPF LSA is rejected by an entry in an OSPF import policy it is not installed in the routing table, even if it has the lowest preference value among all the routes to that destination. The flooding of LSAs is unaffected by OSPF import policy actions. This command only applies to the 7750 SR.

## Default

If an OSPF route has the lowest preference value among all routes to a destination it is installed in the routing table.

## Parameters

### *policy-name*

Specifies the import route policy name. A maximum of five policy names can be specified. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed between double quotes.

The specified policy name(s) must be predefined and already exist in the system.

## Platforms

```

```
no import {join-policy | register-policy}
```

## Context

[\[Tree\]](#) (config>service>vprn>pim import)

## Full Context

```
configure service vprn pim import
```

## Description

This command specifies the import route policy to be used for determining which routes are accepted from peers. Route policies are configured in the **config>router>policy-options** context. When an import policy is not specified, BGP routes are accepted by default.

The **no** form of this command removes the policy association from the IGMP instance.

## Default

```
no import join-policy
```

no import register-policy

## Parameters

### join-policy

Use this command to filter PIM join messages which prevents unwanted multicast streams from traversing the network.

### register-policy

This keyword filters register messages. PIM register filters prevent register messages from being processed by the RP. This filter can only be defined on an RP. When a match is found, the RP immediately sends back a register-stop message.

### policy-name

Specifies the route policy name. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed between double quotes. Route policies are configured in the **config>router>policy-options** context.

[\[Tree\]](#) (config>router>igmp>if import)

[\[Tree\]](#) (config>router>igmp>group-interface import)

### Full Context

configure router igmp interface import

configure router igmp group-interface import

### Description

This command applies the referenced IGMP policy (filter) to an interface subscriber or a group-interface. An IGMP filter is also known as a black/white list and it is defined under the **config>router>policy-options**.

When redirection is applied, only the import policy from the subscriber will be in effect. The import policy under the group interface is applicable only for IGMP states received directly on the SAP (AN in IGMP proxy mode).

The **no** form of the command removes the policy association from the IGMP instance.

### Default

no import

## Parameters

### *policy-name*

The route policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. Route policies are configured in the **config>router>policy-options** context.

**no import**

### Context

**[Tree]** (config>service>pw-template>igmp-snooping import)

### Full Context

configure service pw-template igmp-snooping import

### Description

This command specifies the import routing policy to be used for IGMP packets. Only a single policy can be imported at a time.

The **no** form of the command removes the policy association.

### Default

no import

### Parameters

#### *policy-name*

Specifies the import policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. Routing policies are configured in the config>router>policy-options context. The router policy must be defined before it can be imported.

## Platforms

All

## import

### Syntax

**import type** {cert | key | crl} **input** *url-string* **output** *filename* **format** *input-format* [**password** [32 chars max]]

### Context

**[Tree]** (admin>certificate import)

## Full Context

admin certificate import

## Description

This command converts an input file (key/certificate/CRL) to a system format file. The following list summarizes the formats supported by this command:

- Certificate
  - PKCS #12
  - PKCS #7 PEM encoded
  - PKCS #7 DER encoded
  - PEM
  - DER
- Key
  - PKCS #12
  - PEM
  - DER
- CRL
  - PKCS #7 PEM encoded
  - PKCS #7 DER encoded
  - PEM
  - DER

### Note:

If there are multiple objects with the same type in the input file, only the first object is extracted and converted.

## Parameters

### **input *url-string***

Specifies the URL for the input file. This URL could be either a local CF card URL file or a FP URL to download the input file.

| Values      |  |                                 |
|-------------|--|---------------------------------|
| url-string  |  | <local-uri> up to 99 characters |
| local-uri   |  | <cf-flash-id>/<file-path>       |
| cf-flash-id |  | cf1:  cf2:  cf3:                |

### **output *filename***

Specifies the name of output file up to 95 characters. The output directory depends on the file type like following:

- Key: cf3:\system-pki\key
- Cert: cf3:\system-pki\cert

- CRL: cf3:\system-pki\CRL

**type**

The type of input file.

**Values** cert, key, crl

**format**

Specifies the format of input file.

**Values** pkcs12, pkcs7-der, pkcs7-pem, pem, der

**password**

Specifies the password to decrypt the input file in case that it is an encrypted PKCS#12 file.

[\[Tree\]](#) (config>router>bgp>group import)

**Full Context**

configure router bgp import

configure router bgp group neighbor import

configure router bgp group import

**Description**

This command specifies route policies that control the handling of inbound routes received from certain peers. Route policies are configured in the **config>router>policy-options** context.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific level is used.

The **import** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine the modifications of each route and the final action to accept or reject the route.

Only one of the 15 objects referenced by the **import** command is allowed to be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters; the remaining 14 objects have a maximum length of 64 characters each.

When multiple **import** commands are issued, the last command entered overrides the previous command.

When an import policy is not specified, BGP routes are accepted by default.

The **no** form of this command removes the policy association.

## Default

no import

## Parameters

### *plcy-or-long-expr*

Specifies the route policy name (up to 64 characters long) or a policy logical expression (up to 255 characters long). Allowed values are any string up to 255 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### *plcy-or-expr*

Specifies the route policy name (up to 64 characters long) or a policy logical expression (up to 64 characters long). Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

## Syntax

```
import policy-name [policy-name]
```

```
no import
```

## Context

[\[Tree\]](#) (config>router>isis import)

## Full Context

```
configure router isis import
```

## Description

This command specifies up to five route policies as IS-IS import policies.

When a prefix received in an IS-IS LSP is accepted by an entry in an IS-IS import policy, it is installed in the routing table, if it is the most preferred route to the destination.

When a prefix received in an IS-IS LSP is rejected by an entry in an IS-IS import policy, it is not installed in the routing table, even if it has the lowest preference value among all the routes to that destination.

The flooding of LSPs is unaffected by IS-IS import policy actions.

The **no** form of this command removes all policies from the configuration.

## Default

no import

## Parameters

### *policy-name*

Specifies the import route policy name. Allowed values are any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. The specified names must already be defined.

[\[Tree\]](#) (config>router>ospf3 import)

## Full Context

configure router ospf import

configure router ospf3 import

## Description

This command applies one or more (up to 5) route policies as OSPF import policies. When a prefix received in an OSPF LSA is accepted by an entry in an OSPF import policy, it is installed in the routing table if it is the most preferred route to the destination. When a prefix received in an OSPF LSA is rejected by an entry in an OSPF import policy, it is not installed in the routing table, even if it has the lowest preference value among all the routes to that destination. The flooding of LSAs is unaffected by OSPF import policy actions. The **no** form of this command removes all policies from the configuration.

## Default

no import

## Parameters

### *policy-name*

Specifies up to 5 export route policy names. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. The specified names must already be defined.

## Platforms

[\[Tree\]](#) (config>router>ospf3>area import)

## Full Context

```
configure router ospf area import
```

```
configure router ospf3 area import
```

## Description

This command configures ABR import policies to filter OSPFv2 Type 3 Summary-LSAs or OSPFv3 Inter-Area-Prefix-LSA between areas, in order to only permit the specified routes from being imported into an area.

This command cannot be used in OSPF area 0.

The **no** form of this command reverts to the default value.

## Default

```
no import
```

## Parameters

### *policy-name*

Specifies up to five import route policy names. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. The specified names must already be defined.

**[Tree]** (config>router>rip import)

### Full Context

configure router ripng group neighbor import

configure router rip group neighbor import

configure router rip group import

configure router ripng import

configure router ripng group import

configure router rip import

### Description

This command configures import route policies to determine which routes are accepted from RIP neighbors. If no import policy is specified, RIP accepts all routes from configured RIP neighbors. Import policies can be used to limit or modify the routes accepted and their corresponding parameters and metrics.

If multiple policy names are specified, the policies are evaluated in the order they are specified. The first policy that matches is applied. If multiple import commands are issued, the last command entered will override the previous command. A maximum of five policy names can be specified.

The **no** form of the command removes all policies from the configuration.

### Default

no import

### Parameters

#### *policy-name*

Specifies up to five import route policy names. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

The specified names must already be defined.

## Platforms

All

## import

## Syntax

```
import {ignore | accept | drop}
```

## Context

[\[Tree\]](#) (config>service>vprn>bgp-ipvpn>attribute-set import)

## Full Context

```
configure service vprn bgp-ipvpn attribute-set import
```

## Description

This command configures the reception behavior for ATTR\_SETs in received VPN-IP routes.

## Default

```
import ignore
```

## Parameters

### accept

Keyword to configure BGP to accept and process ATTR\_SETs in received unicast VPN-IP routes (MPLS or SRv6) when they are imported into the VPRN. The path attributes contained inside the ATTR\_SET are used for best-path selection within the VPRN, instead of the outer-path attributes attached to the imported VPN-IP route. The path attributes inside the ATTR\_SET determine the path attributes of BGP routes advertised to PE-CE peers of the VPRN. However, the ATTR\_SET is removed at the time of advertisement. VPRN BGP routes with attributes derived from **accept** processing are only advertised to EBGP peers and IBGP route reflector client peers. VPRN BGP routes are not advertised to BGP confederation peers. If the origin AS in the ATTR\_SET attribute does not match the configured ASN, VPRN BGP routes with attributes derived from **accept** processing are advertised to IBGP peers that are not covered by a cluster configuration.

### drop

Keyword to configure BGP to ignore and silently discard ATTR\_SETs in received VPN-IP routes when they are imported into the VPRN. The path attributes contained inside the ATTR\_SET are not used for best path selection within the VPRN. If a VPRN is not involved in an independent domain Layer 3 VPN service, Nokia recommends configuring the **import** command to **drop**.

### ignore

Keyword to configure BGP to ignore ATTR\_SETs in received VPN-IP routes when they are imported into the VPRN. The path attributes contained inside the ATTR\_SET are not used for best-path selection within the VPRN. With the **ignore** parameter, the ATTR\_SET

attribute is transmitted unchanged to the CE. Nokia does not recommend configuring the **import** command to **ignore** in most deployments.

## Platforms

All

## 13.79 import-grt

### import-grt

#### Syntax

**import-grt** *plcy-or-long-expr* [*plcy-or-expr*]

**no import-grt**

#### Context

[\[Tree\]](#) (config>service>vprn>grt import-grt)

#### Full Context

configure service vprn grt-lookup import-grt

#### Description

This command associates policies to control the leaking of GRT routes into the associated VPRN.

The GRT route must have first been leaked by a **leak-export** policy defined under the **config>router** context. Then the route must match a route entry in the specified **import-grt** policy with an accept action. Refer to the *IP Router Configuration Command Reference* section in the *7750 SR Extensible Routing System Virtualized Service Router*.

The **no** form of this command removes route leaking policy associations and disables the leaking of GRT routes into the local VPRN.

#### Parameters

##### *plcy-or-long-expr*

Specifies route policy names, up to 64 characters, or a policy logical expression, up to 255 characters.

**Values** *plcy-or-long-expr*: *policy-name* | *long-expr*

*policy-name*: up to 64 characters

*long-expr*: up to 255 characters

##### *plcy-or-expr*

Specifies up to four route policy names, up to 64 characters, or a policy logical expression, up to 64 characters.

**Values** *plcy-or-expr*: *policy-name* | *expr*

*policy-name*: up to 64 characters

*expr*: up to 64 characters

## Platforms

## 13.80 import-mcast-policy

### import-mcast-policy

#### Syntax

**import-mcast-policy** *policy-name* [*policy-name*]

**no import-mcast-policy**

#### Context

[\[Tree\]](#) (config>router>ldp import-mcast-policy)

#### Full Context

configure router ldp import-mcast-policy

#### Description

This command configures an import policy for mLDP FECs arriving on the node. This command does not work for self-generated mLDP FECs. The action of the policy will accept or reject the FEC. If the FEC is rejected, it will be kept but is not resolved.

The **no** form of this command removes all policies from the configuration.

#### Default

no import-mcast-policy

#### Parameters

***policy-name***

Specifies up to five import route policy names, up to 32 characters, to be assigned to mLDP. The specified name(s) must already be defined.

## Platforms

All

## 13.81 import-pmsi-routes

### import-pmsi-routes

#### Syntax

**import-pmsi-routes**

#### Context

[\[Tree\]](#) (config>router>ldp import-pmsi-routes)

#### Full Context

configure router ldp import-pmsi-routes

#### Description

Commands in this context configure import-pmsi-routes.

For option B, the leafs or ABR/ASBR that are not directly connected to the root have no visibility of the root. As such, for LDP to build the recursive FEC it needs to cache the MVPN PMSI AD routes, this command gives the user the ability to manually enable caching of MVPN PMSI AD routes internally in LDP for EVPN or MVPN inter-as or **mvpn\_no\_export\_community** intra-as.

#### Platforms

All

## 13.82 import-prefixes

### import-prefixes

#### Syntax

**[no] import-prefixes** *policy-name*

#### Context

[\[Tree\]](#) (config>router>ldp>session-params>peer import-prefixes)

#### Full Context

configure router ldp session-parameters peer import-prefixes

#### Description

This command configures the import FEC prefix policy to determine which prefixes received from this LDP peer are imported and installed by LDP on this node. If resolved these FEC prefixes are then re-distributed to other LDP and T-LDP peers. A FEC prefix that is filtered out (deny) will not be imported. A FEC prefix that is filtered in (accept) will be imported.

If no import policy is specified, the node will import all prefixes received from this LDP/T-LDP peer. This policy is applied in addition to the global LDP policy and targeted session policy.

Policies are configured in the **config>router>policy-options** context. A maximum of five policy names can be specified. Peer address has to be the peer LSR-ID address.

The **no** form of the command removes the policy from the configuration.

## Default

no import-prefixes - no import route policy is specified

## Parameters

### *policy-name*

Specifies up to five import-prefix route policy names. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains spaces, use double quotes to delimit the start and end of the string. The specified name(s) must already be defined.

## Platforms

All

# import-prefixes

## Syntax

**import-prefixes** *policy-name* [*policy-name*]

**no import-prefixes**

## Context

[\[Tree\]](#) (config>router>ldp>targeted-session import-prefixes)

## Full Context

configure router ldp targeted-session import-prefixes

## Description

This command configures the import route policy to determine which FEC prefix label bindings are accepted from targeted LDP neighbors into this node. A label binding that is filtered out (deny) will not be imported. A route that is filtered in (accept) will be imported.

If no import policy is specified, this node session will accept all bindings from configured targeted LDP neighbors. This policy is applied in addition to the global LDP policy.

Policies are configured in the **config>router>policy-options** context. A maximum of five policy names can be specified.

The **no** form of this command removes the policy from the configuration.

## Parameters

### *policy-name*

Specifies up to five import policy names. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### Platforms

All

## 13.83 import-tunnel-table

### import-tunnel-table

#### Syntax

**import-tunnel-table** *policy-name* [*policy-name*]

**no import-tunnel-table**

#### Context

[\[Tree\]](#) (config>router>ldp import-tunnel-table)

#### Full Context

configure router ldp import-tunnel-table

#### Description

This command controls the import, in the tunnel table, of LDP tunnels to non-host prefixes. This command is only intended for importing tunnels; it cannot be used for preventing the import of any specific prefix and only non-host prefixes will be considered when evaluating this policy in this context. The LDP tunnels to these non-host prefixes must be created before they can be imported.

This command does not affect the automatic import of LDP tunnels to host prefixes.

The **no** version of this command removes all of the import policies and, by consequence, any tunnels to non-host prefixes from the tunnel table. If a non-host prefix tunnel is currently being used for forwarding, disabling this command may be service-impacting.

#### Default

no import-tunnel-table

#### Parameters

##### *policy-name*

Specifies up to five import route policy names. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

The specified policy names must already be defined.

## 13.85 improved-assert

### improved-assert

#### Syntax

**[no] improved-assert**

## Context

**[Tree]** (config>service>vprn>mvpn>pt>inclusive>pim improved-assert)

## Full Context

configure service vprn mvpn provider-tunnel inclusive pim improved-assert

## Description

This command enables improved assert procedure on the PIM inclusive provider tunnel.

The **no** form of this command disables improved assert procedure.

## Default

enabled

## Platforms

All

## improved-assert

## Syntax

[no] improved-assert

## Context

**[Tree]** (config>service>vprn>pim>if improved-assert)

## Full Context

configure service vprn pim interface improved-assert

## Description

This command enables improved assert processing on this interface. The PIM assert process establishes a forwarder for a LAN and requires interaction between the control and forwarding planes.

The assert process is started when data is received on an outgoing interface. This could impact performance if data is continuously received on an outgoing interface.

When enabled, the PIM assert process is done entirely on the control-plane with no interaction between the control and forwarding plane.

## Default

improved-assert

## Platforms

All

## improved-assert

### Syntax

[no] improved-assert

### Context

[\[Tree\]](#) (config>router>pim>interface improved-assert)

### Full Context

configure router pim interface improved-assert

### Description

This command enables improved assert processing. The PIM assert process establishes a forwarder for a LAN and requires interaction between the control and forwarding planes. The assert process is started when data is received on an outgoing interface meaning that duplicate traffic is forwarded to the LAN until the forwarder is negotiated among the routers.

When the **improved-assert** command is enabled, the PIM assert process is done entirely in the control plane. The advantages are that it eliminates duplicate traffic forwarding to the LAN. It also improves performance since it removes the required interaction between the control and data planes.

#### Note:

**improved-assert** is still fully interoperable with the RFC 4601, *Protocol Independent Multicast - Sparse Mode (PIM-SM): Protocol Specification (Revised)* and RFC 2362, *Protocol Independent Multicast-Sparse Mode (PIM-SM)*, implementations. However, there may be conformance tests that may fail if the tests expect control-data plane interaction in determining the assert winner. Disabling the **improved-assert** command when performing conformance tests is recommended.

### Default

improved-assert

**no in-label**

#### Context

**[Tree]** (config>router>mpls>mpls-tp>transit-path>forward-path in-label)

**[Tree]** (config>router>mpls>mpls-tp>transit-path>reverse-path in-label)

#### Full Context

configure router mpls mpls-tp transit-path forward-path in-label

configure router mpls mpls-tp transit-path reverse-path in-label

## Description

This command configures the label mapping associated with a forward path or reverse path of an MPLS-TP transit path to be configured.

The incoming label, outgoing label and outgoing interface must be configured, using the **in-label**, **out-label** and **out-link** parameters. If the out-link refers to a numbered IP interface, the user may optionally configure the **next-hop** parameter and the system will determine the interface to use to reach the configured next-hop, but will check that the user-entered value for the *out-link* corresponds to the link returned by the system. If they do not correspond, then the path will not come up.

## Default

no in-label

## Parameters

### *in-label*

Specifies the in label.

**Values** 32 to 16415

### *out-label*

Specifies the out label.

**Values** 32 to 16415

### *if-name*

Specifies the name of the outgoing interface use for the path.

### *next-hop*

Specifies the next-hop.

**Values** a.b.c.d

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## in-label

## Syntax

## 13.102 in-remark

### in-remark

**Syntax**

in-remark {dscp *dscp-name* | prec *ip-prec-value*}

no in-remark

## Context

[\[Tree\]](#) (config>qos>sap-ingress>fc in-remark)

## Full Context

```
configure qos sap-ingress fc in-remark
```

## Description

This command is used in a SAP ingress QoS policy to define an explicit in-profile remark action for a forwarding class or subclass. While the SAP ingress QoS policy may be applied to any SAP, the remarking functions are only enforced when the SAP is associated with an IP or subscriber interface (in an IES or VPRN). When the policy is applied to a Layer 2 SAP (i.e., Epipe or VPLS), the remarking definitions are silently ignored.

In the case where the policy is applied to a Layer 3 SAP, the in-profile remarking definition will be applied to packets that have been classified to the forwarding class or subclass. It is possible for a packet to match a classification command that maps the packet to a particular forwarding class or subclass, only to have a more explicit (higher priority match) override the association. Only the highest priority match forwarding class or subclass association will drive the in-profile marking.

The in-remark command is only applicable to ingress IP routed packets that are considered in-profile. The profile of a SAP ingress packet is affected by either the explicit in-profile/out-of-profile definitions or the ingress policing function applied to the packet. [Table 53: Effect of In-Remark Command on Received SAP Ingress Packets](#) shows the effect of the in-remark command on received SAP ingress packets. Within the in-profile IP packet's ToS field, either the six DSCP bits or the three precedence bits are remarked.

*Table 53: Effect of In-Remark Command on Received SAP Ingress Packets*

| SAP Ingress Packet State            | in-remark Command Effect                       |
|-------------------------------------|------------------------------------------------|
| Non-Routed, Policed In-Profile      | No Effect (non-routed packet)                  |
| Non-Routed, Policed Out-of-Profile  | No Effect (non-routed packet)                  |
| Non-Routed, Explicit In-Profile     | No Effect (non-routed packet)                  |
| Non-Routed, Explicit Out-of-Profile | No Effect (non-routed packet)                  |
| IP Routed, Policed In-Profile       | in-remark value applied to IP header ToS field |
| IP Routed, Policed Out-of-Profile   | No Effect (out-of-profile packet)              |
| IP Routed, Explicit In-Profile      | in-remark value applied to IP header ToS field |
| IP Routed, Explicit Out-of-Profile  | No Effect (out-of-profile packet)              |

The **no** form of this command disables ingress remarking of in-profile packets classified to the forwarding class or subclass.

## Parameters

**dscp** *dscp-name*

Specifies that the matching packet's DSCP bits should be overridden with the value represented by *dscp-name*.

The *dscp-name* parameter is a 6-bit value. It must be one of the predefined DSCP names defined on the system.

**Values** be, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cs1, cp9, af11, cp11, af12, cp13, af13, cp15, cs2, cp17, af21, cp19, af22, cp21, af23, cp23, cs3, cp25, af31, cp27, af32, cp29, af33, cp31, cs4, cp33, af41, c p35, af42, cp37, af43, cp39, cs5, cp41, cp42, cp43, cp44, cp45, ef, cp47, nc1, cp49, cp50, cp51, cp52, cp53, cp54, cp55, nc2, cp57, cp58, cp59, cp60, cp61, cp62, cp63

#### **prec ip-prec-value**

Specifies that the matching packet's precedence bits should be overridden with the value represented by *ip-prec-value*.

**Values** 0 to 7

#### **Platforms**

All

## 13.103 inactive-flow-timeout

### inactive-flow-timeout

#### **Syntax**

**inactive-flow-timeout** *seconds*

**no inactive-flow-timeout**

#### **Context**

[\[Tree\]](#) (config>cflowd inactive-flow-timeout)

#### **Full Context**

configure cflowd inactive-flow-timeout

#### **Description**

This command specifies the length of time, in seconds, that must elapse without a packet matching a flow before the flow is considered inactive.

The **no** form of this command resets the inactive flow timeout back to the default of 15 seconds.

Existing flows do not inherit the new **inactive-flow-timeout** value if this parameter is changed while **cflowd** is active. The **inactive-flow-timeout** value for a flow is set when the flow is first created in the active cache table and does not change dynamically.

**Default**

inactive-flow-timeout 15

**Parameters****seconds**

Specifies the length of time, in seconds, without a packet matching a flow before the flow is considered inactive.

**Values** 10 to 600

**Platforms**

All

## 13.104 inactivity-mon

inactivity-mon

**Syntax**

[no] inactivity-mon

**Context**

[\[Tree\]](#) (config>app-assure>group>transit-ip-policy>transit-auto-create inactivity-mon)

**Full Context**

configure application-assurance group transit-ip-policy transit-auto-create inactivity-mon

**Description**

This command enables auto removal of inactive transit subscribers. Periodically AA removes any inactive auto-created subscriber where an inactive sub is defined as having no active flows in the last period.

The **no** form of this command disables the auto removal of inactive transit subscribers.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.105 inactivity-timeout

## inactivity-timeout

### Syntax

**inactivity-timeout** *seconds*

**no inactivity-timeout**

### Context

[\[Tree\]](#) (config>test-oam>twamp>server inactivity-timeout)

### Full Context

configure test-oam twamp server inactivity-timeout

### Description

This command configures the inactivity time out for all TWAMP-control connections. If no TWAMP control message is exchanged over the TCP connection for this duration of time the connection is closed and all in-progress tests are terminated.

The **no** form of this command returns the value to the default.

### Default

inactivity-timeout 900

### Parameters

**seconds**

Specifies the duration of the inactivity time out.

**Values** 60 to 3600

**Default** 900

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## inactivity-timeout

### Syntax

**inactivity-timeout** *seconds*

**no inactivity-timeout**

### Context

[\[Tree\]](#) (config>test-oam>twamp>twamp-light inactivity-timeout)

### Full Context

configure test-oam twamp twamp-light inactivity-timeout

## Description

This command configures the length of time to maintain stale state on the session reflector. Stale state is test data that has not been refreshed or updated by newly arriving probes for that specific test in a predetermined length of time. Any single reflector can maintain up state for a maximum of 12000 tests. If the maximum value is exceeded, the session reflector lacks memory to allocate to new tests.

The **no** form of this command returns the value to the default.

## Default

inactivity-timeout 100

## Parameters

### *seconds*

Specifies the value in seconds for maintaining stale state.

**Values** 10 to 100

**Default** 100

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 13.106 inactivity-timer

### inactivity-timer

## Syntax

**inactivity-timer** [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]

**no inactivity-timer**

## Context

**[Tree]** (config>service>ies>sub-if>ipv6>rtr-sol inactivity-timer)

**[Tree]** (config>service>ies>sub-if>grp-if>ipv6>rtr-sol inactivity-timer)

**[Tree]** (config>service>vprn>sub-if>ipv6>rtr-sol inactivity-timer)

## Full Context

configure service ies subscriber-interface ipv6 router-solicit inactivity-timer

configure service ies subscriber-interface group-interface ipv6 router-solicit inactivity-timer

configure service vprn subscriber-interface ipv6 router-solicit inactivity-timer

## Description

This command specifies the time before an inactive host is removed.

The **no** form of this command reverts to the default.

### Parameters

#### **infinite**

Specifies that the idle host is never removed.

#### **days**

Specifies that the idle host is removed if idle within the number of specified days.

#### **hours**

Specifies that the idle host is removed if idle within the number of specified hours.

#### **minutes**

Specifies that the idle host is removed if idle within the number of specified minutes.

#### **seconds**

Specifies that the idle host is removed if idle within the number of specified seconds.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## inactivity-timer

### Syntax

**inactivity-timer** *timer*

**no inactivity-timer**

### Context

[\[Tree\]](#) (config>eth-cfm>slm inactivity-timer)

### Full Context

configure eth-cfm slm inactivity-timer

### Description

The time the responder keeps a test active. Should the time between packets exceed this values within a test the responder will mark the previous test as complete. It will treat any new packets from a peer with the same test-id, source-mac and MEP-ID as a new test responding with the sequence number one.

The **no** form of the command reverts the timeout to the default value.

### Default

inactivity-timer 100

### Parameters

#### **timer**

Specifies the amount of time in seconds.

**Values** 10 100

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 13.107 inband

inband

### Syntax

inband *service-id*

no inband

### Context

[\[Tree\]](#) (config>system>security>vprn-aaa-server inband)

### Full Context

configure system security vprn-aaa-server inband

### Description

This command configures TACACS+ or RADIUS servers in a VPRN to be used for AAA by that VPRN and by sessions in the Base routing instance.

The **no** form of this command disables the use of servers for in-band management.

### Default

no inband

### Parameters

***service-id***

Specifies the VPRN server for AAA to use for in-band sessions.

**Values** *service-id*: 1 to 2147483648  
*svc-name*: 64 characters maximum

### Platforms

All

## 13.108 inband-collector-export-only

### inband-collector-export-only

#### Syntax

**[no] inband-collector-export-only**

#### Context

[\[Tree\]](#) (config>cflowd inband-collector-export-only)

#### Full Context

configure cflowd inband-collector-export-only

#### Description

This command, when the **inband-collector-export-only** command is enabled, allows only collectors that are reachable through inband interfaces and enables a higher flow export rate.

The **no** form of this command, the default, re-enables the use of the out-of-band management Ethernet port.

#### Platforms

All

## 13.109 inbound-max-sessions

### inbound-max-sessions

#### Syntax

**inbound-max-sessions** *number-of-sessions*

**no inbound-max-sessions**

#### Context

[\[Tree\]](#) (config>system>login-control>ftp inbound-max-sessions)

#### Full Context

configure system login-control ftp inbound-max-sessions

#### Description

This command configures the maximum number of concurrent inbound FTP sessions.

This value is the combined total of inbound and outbound sessions.

The **no** form of this command reverts to the default value.

### Default

inbound-max-sessions 3

### Parameters

#### *value*

Specifies the maximum number of concurrent FTP sessions on the node.

**Values** 0 to 5

### Platforms

All

## inbound-max-sessions

### Syntax

**inbound-max-sessions** *number-of-sessions*

**no inbound-max-sessions**

### Context

[\[Tree\]](#) (config>system>login-control>ssh inbound-max-sessions)

[\[Tree\]](#) (config>system>login-control>telnet inbound-max-sessions)

### Full Context

configure system login-control ssh inbound-max-sessions

configure system login-control telnet inbound-max-sessions

### Description

This parameter limits the number of inbound Telnet and SSH sessions. A maximum of 30 telnet and ssh connections can be established to the router. The local serial port cannot be disabled.

Telnet and SSH maximum sessions can also use the combined total of both inbound sessions (SSH +Telnet). While it is acceptable to continue to internally limit the combined total of SSH and Telnet sessions to N, either SSH or Telnet sessions can use the inbound maximum sessions, if so required by the Operator.

The **no** form of this command reverts to the default value.

### Default

inbound-max-sessions 5

### Parameters

#### *number-of-sessions*

The maximum number of concurrent inbound Telnet sessions, expressed as an integer.

**Values** 0 to 50 (default = 5) or 0 to N where N is the new total number of SSH +Telnet sessions if they are scaled

### Platforms

All

## 13.110 incl-mcast-l2-attributes-advertisement

### incl-mcast-l2-attributes-advertisement

#### Syntax

[no] incl-mcast-l2-attributes-advertisement

#### Context

[\[Tree\]](#) (config>service>vpls>bgp-evpn incl-mcast-l2-attributes-advertisement)

#### Full Context

configure service vpls bgp-evpn incl-mcast-l2-attributes-advertisement

#### Description

This command triggers the advertisement of the Layer 2 attributes extended community including:

- the service MTU in the Layer 2 MTU field
- the F bit, which is set to 1 if the **hash-label** command is set to true (in the **configure service vpls bgp-evpn mpls** context); otherwise, the F bit is set to 0
- the C bit, which is set to 1 if the **control-word** command is set to true (in the **configure service vpls bgp-evpn mpls** context); otherwise, the C bit is set to 0

The router compares the received Layer 2 MTU from a peer with the local service MTU. If there is a mismatch, the operation state of the EVPN destination is set to down, except if the **configure service vpls bgp-evpn ignore-mtu-mismatch** command is enabled.

A mismatch between the received C bit and the local **control-word** setting (in the **configure service vpls bgp-evpn mpls** context) results in the operational state of the EVPN destination being set to down.

A mismatch between the received F bit and the local F bit (via the hash label configuration) results in the operational state of the EVPN destination being set to down.

The **no** form of this command prevents the router from advertising the Layer 2 attributes extended community along with the IMET route for the service.

#### Default

no incl-mcast-l2-attributes-advertisement

### Platforms

## 13.111 incl-mcast-orig-ip

```
incl-mcast-orig-ip
```

### Syntax

```
incl-mcast-orig-ip ip-address
```

```
no incl-mcast-orig-ip
```

### Context

```
[Tree] (config>service>vpls>bgp-evpn incl-mcast-orig-ip)
```

### Full Context

```
configure service vpls bgp-evpn incl-mcast-orig-ip
```

### Description

The IP address configured by the user in the **incl-mcast-orig-ip** command is encoded in the **originating-ip** field of EVPN Inclusive Multicast Routes with tunnel type Ingress Replication (value 6), mLDP (2), and Composite IR and mLDP (130).

The configured address does not need to be reachable in the base router or have an interface in the base router. The originating-ip address is used solely for BGP route-key selection.

The originating-ip is never changed for Inclusive Multicast Routes with tunnel type AR (Assisted Replication, value 10).

The **no** version of the command withdraws the affected Inclusive Multicast Routes and re-advertises it with the default system-ip address in the originating-ip field.

### Default

```
incl-mcast-orig-ip 1
```

### Parameters

***ip-address***

Specifies the IPv4 address value.

**Values** a.b.c.d

### Platforms

All

## 13.112 include

## include

### Syntax

**include** *group-name* [*group-name*]

**no include** [*group-name* [*group-name*]]

### Context

**[Tree]** (config>router>mpls>lsp>secondary include)

**[Tree]** (config>router>mpls>lsp>primary include)

**[Tree]** (config>router>mpls>lsp include)

### Full Context

configure router mpls lsp-template include

configure router mpls lsp primary-p2mp-instance include

configure router mpls lsp secondary include

configure router mpls lsp primary include

configure router mpls lsp include

### Description

This command specifies the admin groups to be included when an LSP is set up. Up to five groups per operation can be specified, up to 32 maximum. The **include** statement instructs the CSPF algorithm to pick TE links among the links which belong to one or more of the specified admin groups. A link that does not belong to at least one of the specified admin groups is excluded and thus pruned from the TE database before the CSPF computation. However, a link can still be selected if it belongs to one of the groups in a **include** statement but also belongs to other groups which are not part of any **include** statement in the LSP or primary/secondary path configuration. In other words, the **include** statements implements the "include-any" behavior.

The **config>router>mpls>lsp>primary-p2mp-instance> include** command is not supported on the 7450 ESS.

The **no** form of this command deletes the specified groups in the specified context.

### Default

no include

### Parameters

***group-name***

Specifies admin groups to be included when an LSP is set up.

### Platforms

All

## include

### Syntax

[no] include

### Context

## 13.117 include-group

### include-group

#### Syntax

**include-group** *ip-admin-group-name* [**pref** *preference*]

**no include-group** *ip-admin-group-name*

#### Context

[Tree] (config>router>route-next-hop-policy>template include-group)

#### Full Context

configure router route-next-hop-policy template include-group

#### Description

This command configures the admin group constraint into the route next-hop policy template.

Each group is entered individually. The **include-group** statement instructs the LFA SPF selection algorithm to pick up a subset of LFA next-hops among the links which belong to one or more of the specified admin groups. A link which does not belong to at least one of the admin-groups is excluded. However, a link can still be selected if it belongs to one of the groups in a include-group statement but also belongs to other groups which are not part of any include-group statement in the route next-hop policy.

The **pref** option is used to provide a relative preference for the admin group to select. A lower preference value means that LFA SPF will first attempt to select a LFA backup next-hop which is a member of the corresponding admin group. If none is found, then the admin group with the next higher preference value is evaluated. If no preference is configured for a given admin group name, then it is supposed to be the least preferred, that is, numerically the highest preference value.

When evaluating multiple **include-group** statements within the same preference, any link which belongs to one or more of the included admin groups can be selected as an LFA next-hop. There is no relative preference based on how many of those included admin groups the link is a member of.

The **exclude-group** statement simply prunes all links belonging to the specified admin group before making the LFA backup next-hop selection for a prefix.

If the same group name is part of both include and exclude statements, the exclude statement will win. In other words, the exclude statement can be viewed as having an implicit preference value of 0.

The admin-group criteria are applied before running the LFA next-hop selection algorithm.

The **no** form deletes the admin group constraint from the route next-hop policy template.

#### Parameters

##### ***ip-admin-group-name***

Specifies the name of the group, up to 32 characters.

##### ***preference***

An integer specifying the relative preference of a group.

**Values** 1 to 255

**Default** 255

## 13.121 inclusive

inclusive

**Syntax**

inclusive

## Context

**[Tree]** (config>service>vpls>provider-tunnel inclusive)

## Full Context

configure service vpls provider-tunnel inclusive

## Description

Commands in this context configure the use of a P2MP LSP as the default tree for forwarding Broadcast, Unknown unicast, and Multicast (BUM) packets of a VPLS or B-VPLS instance. The P2MP LSP is referred to, in this case, as the Inclusive Provider Multicast Service Interface (I-PMSI).

When enabled, this feature relies on BGP Auto-Discovery (BGP-AD), BGP-VPLS or BGP-EVPN to discover the PE nodes participating in a specified VPLS/B-VPLS instance. In the case of BGP-AD or BGP-VPLS, the BGP route contains the information required to signal both point-to-point (P2P) PWs used to forward unicast known Ethernet frames, and the RSVP or mLDP P2MP LSP used to forward the BUM frames. In the case of BGP-EVPN, the EVPN IMET route contains the information to set up the mLDP P2MP LSP and may also contain the information that enables the remote leaf-only nodes to setup an EVPN destination to the sending PE.

### Note:

The provider-tunnel for a specified service must be configured with an owner protocol (BGP-AD, BGP-VPLS or BGP-EVPN); only one owner must be configured. Use the **owner {bgp-ad|bgp-vpls|bgp-evpn-mpls}** command to configure an owner.

With an mLDP I-PMSI, each leaf node will initiate the signaling of the mLDP P2MP LSP upstream using the P2MP FEC information in the I-PMSI tunnel information discovered through the BGP.

If IGMP or PIM snooping are configured on the VPLS/B-VPLS instance, multicast packets matching an L2 multicast Forwarding Information Base (FIB) record will also be forwarded over the P2MP LSP.

Use the **ml dp** command to enable the use of an LDP P2MP LSP as the I-PMSI for forwarding Ethernet BUM and IP multicast packets in a VPLS instance:

```
config>service>vpls [b-vpls]>provider-tunnel>inclusive>ml dp
```

When a **no shutdown** is performed under the context of the inclusive node and the expiration of a delay timer, BUM packets will be forwarded over an automatically signaled mLDP P2MP LSP.

Use the **root-and-leaf** command to configure the node to operate as both root and leaf in the VPLS instance:

```
config>service>vpls [b-vpls]>provider-tunnel>inclusive>root-and-leaf
```

The node behaves as a leaf-only node by default. For the I-PMSI of type mLDP, the leaf-only node will join I-PMSI rooted at other nodes it discovered but will not include a PMSI Tunnel Attribute in BGP route update messages. This way a leaf-only node will forward packets to other nodes in the VPLS/B-VPLS using the point-to-point spoke-SDPs in the case of BGP-AD or BGP-VPLS, or using EVPN destinations in the case of BGP-EVPN.

### Note:

Either BGP-AD/VPLS or BGP-EVPN must be enabled in the VPLS/B-VPLS instance otherwise the execution of the **no shutdown** command under the context of the inclusive node will fail and the I-PMSI will not come up.

If the P2MP LSP instance goes down, the VPLS/B-VPLS immediately reverts the forwarding of BUM packets to the P2P PWs or EVPN destinations (in the case of BGP-EVPN). Performing a shutdown under the context of the inclusive node will allow the user to restore BUM packet forwarding over the P2P PWs or EVPN destinations.

This feature is supported with VPLS and B-VPLS; it is not supported with I-VPLS. Although Routed VPLS is supported, routed traffic cannot be sent over the I-PMSI tree.

## Description

Commands in this context configure inclusive provider tunnels parameters.

**Platforms**

All

**13.122 incoming-sid****incoming-sid****Syntax****incoming-sid** *static label***no incoming-sid****Context****[Tree]** (config>router>p2mp-sr-tree>replication-segment incoming-sid)**Full Context**

configure router p2mp-sr-tree replication-segment incoming-sid

**Description**

This command configures the incoming replication SID for this P2MP SR tree replication segment entry. The **no** form of this command removes the incoming replication SID.

**Parameters*****static label***

Specifies the incoming replication SID label.

**Values** 0 to 4294967295**Platforms**

All

**13.123 incremental-spf-wait****incremental-spf-wait****Syntax****incremental-spf-wait** *incremental-spf-wait***no incremental-spf-wait**

## Context

[\[Tree\]](#) (config>router>ospf>timers incremental-spf-wait)

[\[Tree\]](#) (config>router>ospf3>timers incremental-spf-wait)

## Full Context

configure router ospf timers incremental-spf-wait

configure router ospf3 timers incremental-spf-wait

## Description

This command sets the delay before an incremental SPF calculation is performed when LSA types 3, 4, 5, or 7 are received. This allows multiple updates to be processed in the same SPF calculation. Type 1 or type 2 LSAs are considered a topology change and will always trigger a full SPF calculation.

The **no** form of this command resets the timer value back to the default value.

### Note:

The timer granularity is 10 ms if the value is less than 500 ms, and 100 ms if the value is  $\geq 500$  ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

## Default

incremental-spf-wait 1000

## Parameters

### *incremental-spf-wait*

Specifies the OSPF incremental SPF calculation delay, in milliseconds.

**Values** 0 to 1000

## Platforms

All

## 13.124 index

### index

## Syntax

**index** *index* [create]

**no index** *index*

## Context

[\[Tree\]](#) (config>service>dynsvc>ladb>user index)

## Full Context

configure service dynamic-services local-auth-db user-name index

## Description

This command creates an index entry containing authentication data for a dynamic service SAP. Up to 32 indexes can be created per user name entry, representing up to 32 dynamic service SAPs that can be instantiated with a single dynamic service data trigger. One of the dynamic service SAPs must be the data trigger SAP.

The **no** form of this command removes the index entry from the user name entry in the local authentication database configuration.

## Parameters

### *index*

Specifies the index entry identifier.

**Values** 1 to 32

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.125 indirect

### indirect

## Syntax

[no] indirect *ip-address*

## Context

[\[Tree\]](#) (config>service>vprn>static-route-entry indirect)

## Full Context

configure service vprn static-route-entry indirect

## Description

This command specifies that the route is indirect and specifies the next hop IP address used to reach the destination.

The configured *ip-address* is not directly connected to a network configured on this node. The destination can be reached via multiple paths. The indirect address can only be resolved from dynamic routing protocol. Another static route cannot be used to resolve the indirect address.

The *ip-address* configured here can be either on the network side or the access side and is typically at least one hop away from this node.

**Default**

no indirect

**Parameters*****ip-address***

The IP address of the IP interface.

**Values**

|              |                           |
|--------------|---------------------------|
| ipv4-address | a.b.c.d                   |

## Full Context

info

## Description

This command displays the running configuration for the configuration context where it is entered and all branches below that context level. It can be used in any branch under **configure**, but not with **configure** itself.

By default, the command only enters the configuration parameters that vary from the default values.

The **detail** keyword causes all configuration parameters to be displayed. The **include-dynamic** objective keyword includes configuration parameters from dynamic sources such as dynamic data services Python scripts. These dynamic configuration parameters are not saved in the configuration file.

The **operational** keyword is available in edit-cfg mode only, in which case the keyword is mandatory when using the **info** command.

Example:

```

## Parameters

### detail

Displays all configuration parameters including parameters at their default values.

### objective

Provides an output objective that controls the configuration parameters to be displayed.

**Values** **include-dynamic**: includes configuration parameters from dynamic sources such as dynamic data services Python scripts.

## Platforms

All

## 13.128 info-notification

### info-notification

## Syntax

**info-notification**

## Context

[\[Tree\]](#) (config>port>ethernet>efm-oam>link-mon>local-sf-action info-notification)

## Full Context

configure port ethernet efm-oam link-monitoring local-sf-action info-notification

## Description

The context allows the operator to set different flags in the Information OAM PDU. The flags can be used to notify the peer that a local signal failure threshold has been exceeded within the configured window. This is useful when the local node supports the link monitoring function, but the remote peer does not support this capability. Information OAM PDUs are sent on the interval where the Event Notification OAM PDU is typically only sent on the initial sf-threshold crossing event. It is strongly suggested one of the Information OAM PDU Flag fields used to continually communicate current monitor state to the peer.

Interactions: The signal failure threshold will trigger these actions.

## 13.129 ing-percentage-of-rate

### ing-percentage-of-rate

#### Syntax

**ing-percentage-of-rate** *ing-rate-percentage*

**no ing-percentage-of-rate**

#### Context

[\[Tree\]](#) (config>port>modify-buffer-allocation-rate ing-percentage-of-rate)

#### Full Context

configure port modify-buffer-allocation-rate ing-percentage-of-rate

#### Description

This command increases or decreases the active bandwidth associated with the ingress port that affects the amount of ingress buffer space managed by the port. Changing a port's active bandwidth using the **ing-percentage-of-rate** command is an effective means of artificially lowering the buffers managed by one ingress port and giving them to other ingress ports on the same MDA.

The **ing-percentage-of-rate** command accepts a percentage value that increases or decreases the active bandwidth based on the defined percentage. A value of 50% causes the active bandwidth to be reduced by 50%. A value of 150% causes the active bandwidth to be increased by 50%. Values from 1 to 1000 percent are supported.

A value of 100 (the default value) is equivalent to executing the **no ing-percentage-of-rate** command and restores the ingress active rate to the normal value.

The **no** form of this command removes any artificial increase or decrease of the ingress active bandwidth used for ingress buffer space allocation to the port. The **no ing-percentage-of-rate** command sets the ingress rate percentage to 100%.

#### Parameters

##### *ing-rate-percentage*

The *ing-rate-percentage* parameter is required and specifies the percentage value used to modify the current ingress active bandwidth of the port. This does not actually change the bandwidth available on the port in any way. The defined *ing-rate-percentage* parameter is multiplied by the ingress active bandwidth of the port. A value of 150 results in an increase of 50% (1.5 x Rate).

**Values** 1 to 1000

**Default** 100 (no change to active rate)

## Platforms

## 13.130 ing-weight

### ing-weight

#### Syntax

**ing-weight access** *access-weight* **network** *network-weight*

**no ing-weight**

#### Context

[\[Tree\]](#) (config>port>hybrid-buffer-allocation ing-weight)

#### Full Context

configure port hybrid-buffer-allocation ing-weight

#### Description

This command configures the sharing of the ingress buffers allocated to a hybrid port among the access and network contexts. By default, it is split equally between network and access.

The **no** form of this command reverts to the default values for the ingress access and network weights.

#### Parameters

##### *access-weight*

Specifies the access weight as an integer.

**Values** 0 to 100

**Default** 50

##### *network-weight*

Specifies the network weight as an integer.

**Values** 0 to 100

**Default** 50

**no ingress-buffer-allocation**

#### Context

[\[Tree\]](#) (config>card>fp ingress-buffer-allocation)

#### Full Context

configure card fp ingress-buffer-allocation

#### Description

This command allows the user to configure an ingress buffer allocation percentage per forwarding plane from 20.00% to 80.00%. Ingress buffer allocation applies to user-accessible buffers (total buffers less those reserved for system use).

The ingress buffer allocation percentage determines how much of the user-accessible buffers will be available for ingress purposes. The remaining buffers will be available for egress purposes.

This command is supported on all 50G FP2-based and 100G/200G FP3-based hardware. It is not supported on other FP2 or FP3-based hardware, nor on FP4-based hardware.

The **no** form of this command reverts the ingress buffer allocation to the default value.

#### Default

ingress-buffer-allocation 50.00

#### Parameters

***percentage***

Specifies the buffer allocation percentage.

**Values** 20.00 to 80.00

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e, 7950 XRS

## 13.133 ingress-counter-map

### ingress-counter-map

#### Syntax

**ingress-counter-map policer** *policer-id* **traffic-type** { **unicast** | **multicast** | **broadcast** } [**create**]

**ingress-counter-map queue** *queue-id* **traffic-type** { **unicast** | **multicast** | **broadcast** } [**create**]

**no ingress-counter-map policer** *policer-id*

**no ingress-counter-map queue** *queue-id*

#### Context

[\[Tree\]](#) (config>sflow ingress-counter-map)

#### Full Context

configure sflow ingress-counter-map

#### Description

This command configures the ingress counter map for sFlow. The map must be configured so sFlow agent understands how to interpret data collected against SAP queues and policers. Multiple queues/policers can be mapped to the same **traffic-type** using separate line entries.

The **no** form of this command deletes a SAP policy queue/policer from the map.

#### Parameters

##### *policer-id*

Specifies the policer ID in a SAP ingress QoS policy. If the SAP policy does not have a policer with the specified ID, the map entry will be ignored for this SAP.

**Values** 1 to 32

##### *queue-id*

Specifies the queue ID in a SAP ingress QoS policy. If the SAP policy does not have a queue with the specified ID, the map entry will be ignored for this SAP.

**Values** 1 to 32

#### Platforms

7750 SR, 7750 SR-s, 7950 XRS

## 13.134 ingress-ip-filter-entries

### ingress-ip-filter-entries

#### Syntax

#### Context

[\[Tree\]](#) (config>subscr-mgmt>cat-map>category>exh-lvl ingress-ip-filter-entries)

#### Full Context

configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ip-filter-entries

#### Description

Commands in this context configure the ingress IP filter parameters.

The **no** form of this command reverts to the default.

#### Default

ingress-ip-filter-entries

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.135 ingress-ipv6-filter-entries

### ingress-ipv6-filter-entries

#### Syntax

[no] ingress-ipv6-filter-entries

#### Context

[\[Tree\]](#) (config>subscr-mgmt>cat-map>category>exh-lvl ingress-ipv6-filter-entries)

#### Full Context

configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ipv6-filter-entries

#### Description

Commands in this context configure the ingress IPv6 filter parameters.

The **no** form of this command reverts to the default.

**Default**

ingress-ipv6-filter-entries

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.136 ingress-label

### ingress-label

**Syntax**

**ingress-label** *label* [*label*]

**no ingress-label** [*label*]

**Context**

[\[Tree\]](#) (debug>mirror-source ingress-label)

**Full Context**

debug mirror-source ingress-label

**Description**

This command enables ingress mirroring based on MPLS labels with the following limitations.

- The ingress label provisioned must be a MPLS transport label and can be at any label stack as long as it is known by the system. Transport label distributed by LDP, RSVP, and segment routing are supported. For BGP-specific label distribution mirroring, the following are supported.
  - BGP label-unicast (RFC 8277, *Using BGP to Bind MPLS Labels to Address Prefixes*)
  - VPN service labels distributed by BGP for Carrier Supporting Carrier (CSC) VPNs (RFC 4364, *BGP/MPLS IP Virtual Private Networks (VPNs)*)
  - VPN service labels distributed by BGP in an ASBR (inter-as-option-B)
  - VPN service labels distributed by BGP in a route reflector with next-hop-self (RR + NHS)
- VPN service label mirroring is not supported in a provider edge (PE) router.
- The ingress label can only be mirrored to a single mirror destination. If the same label is defined with multiple mirror destinations, an error is generated and the original mirror destination remains unchanged.

The ingress label mirror source overrides all other mirror source definitions. The MPLS frame is mirrored to the mirror destination as it is received on the ingress network port. The router MPLS label space is global for the system. A specific label is mirrored to a mirror destination regardless of the ingress interface. In addition to mirroring known labels, debug also allows pre-provisioning label values which are yet to be known by the system. Be aware that debug mirroring requires provisioning of static label values while labels distributed by label distribution protocols are dynamic in nature. Therefore, when label values

change due to network changes, labels provisioned in debug mirroring must be changed or deleted manually.

By default, no ingress MPLS frames are mirrored. The **ingress-label** command must be executed to start mirroring on a specific MPLS label.

## Parameters

### *label*

Specifies up to eight transport labels received on ingress to be mirrored. Each label can only be mirrored to a single mirror destination.

If the label does not exist on any ingress network ports, no packets are mirrored for that label. An error will not occur. Once the label exists on a network port, ingress mirroring begins for that label.

**Values** 0 to 1048575

The local MPLS stack may not support portions of this range.

## Platforms

All

## 13.137 ingress-percent-of-total

### ingress-percent-of-total

#### Syntax

**ingress-percent-of-total** *percent-of-total-queues*

**no ingress-percent-of-total**

#### Context

[\[Tree\]](#) (config>qos>fp-resource-policy>queues ingress-percent-of-total)

#### Full Context

configure qos fp-resource-policy queues ingress-percent-of-total

#### Description

This command configures the percentage of the total number of queues on the FP on which the policy is applied that are allocated to ingress, with the remainder allocated to egress. The ingress and egress buffer pool sizes are not affected by the queue allocation.

The allocation is performed in sets of 8192 queues, with a minimum of 8192 queues at ingress and 8192 queues at egress. If the percentage configured results in the queue allocation not being a multiple of 8192, the number of queues at ingress is rounded down to the next 8192 boundary, and consequently the number of queues at egress is rounded up to the next 8192 boundary, both while respecting the minimum at ingress and egress.

If the FP resources policy being applied to any FP and the updated allocation is not achievable with the current ingress or egress queue consumption on any of the related FPs, then the command fails.

The configuration of **ingress-percent-of-total** command, including removing this parameter to return to its default configuration, causes the router to immediately reset the associated cards, XIOMs, and MDAs, except on the 7750 SR-1 where the configuration must be saved, and the router rebooted, immediately after committing the configuration transaction.

The **no** form of this command reverts the percentage of ingress queues, and consequently egress queues, to their default allocation.

## Default

ingress-percent-of-total 50.00

## Parameters

### *percent-of-total-queues*

Specifies the percentage of total ingress queues as two fraction digits.

**Values** 4.00 to 97.00

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 13.138 ingress-policer

### ingress-policer

## Syntax

**ingress-policer** *policer-name*

**no ingress-policer**

## Context

**[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>dsm ingress-policer)

**[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>dsm ingress-policer)

## Full Context

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt ingress-policer

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range distributed-sub-mgmt ingress-policer

## Description

This command specifies the ingress policer applied to all UEs corresponding to default vlan-range (such as group-interface) or the specified vlan-range. The policer can be created in the **config>subscr-mgmt>isa-policer** context. The ingress policer can be overridden per UE from RADIUS via access-accept or COA.

The **no** form of this command reverts to the default.

## Parameters

### *policer-name*

Specifies the identifier of the distributed-sub-mgmt policer for ingress traffic.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.139 ingress-rate

### ingress-rate

## Syntax

**ingress-rate** *sub-rate*

**no ingress-rate**

## Context

[\[Tree\]](#) (config>port>ethernet ingress-rate)

## Full Context

configure port ethernet ingress-rate

## Description

This command configures the maximum amount of ingress bandwidth that this port can receive with the configured sub-rate using packet-based accounting.

The **no** form of this command returns the value to the default.

## Default

no ingress-rate

## Parameters

### *sub-rate*

Specifies the ingress rate, in Mb/s.

**Values** 1 to 400000

## Platforms

All

## 13.140 ingress-repl-inc-mcast-advertisement

### ingress-repl-inc-mcast-advertisement

#### Syntax

[no] ingress-repl-inc-mcast-advertisement

#### Context

[\[Tree\]](#) (config>service>vpls>bgp-evpn ingress-repl-inc-mcast-advertisement)

#### Full Context

configure service vpls bgp-evpn ingress-repl-inc-mcast-advertisement

#### Description

This command enables and disables the advertisement of the Inclusive Multicast Ethernet Tag route (IMET route) with tunnel-type Ingress-Replication in the PMSI Tunnel Attribute, or with the tunnel-type Composite Point-to-Multipoint and Ingress-Replication (P2MP+IR) in the root-and-leaf nodes. The following must be considered:

- When **no ingress-repl-inc-mcast-advertisement** is configured, no IMET routes will be sent for the service unless the **provider-tunnel** is configured with **owner bgp-evpn-mpls** and **root-and-leaf**, in which case, an IMET-P2MP route is sent.
- When **ingress-repl-inc-mcast-advertisement** and **provider-tunnel** are configured for **bgp-evpn-mpls** with **root-and-leaf**, the system will send an IMET-P2MP-IR route, that is, an IMET route with a composite P2MP+IR tunnel type.
- When **no ingress-repl-inc-mcast-advertisement** and **assisted-replication replicator** are configured, the system will send IMET-AR routes, but IMET-IR routes will not be sent.

#### Default

ingress-repl-inc-mcast-advertisement

#### Platforms

All

## 13.141 ingress-replication-bum-label

## ingress-replication-bum-label

### Syntax

[no] **no-ingress-replication-bum-label**

### Context

[\[Tree\]](#) (config>service>vpls>bgp-evpn>mpls ingress-replication-bum-label)

### Full Context

configure service vpls bgp-evpn mpls ingress-replication-bum-label

### Description

This command allows the user to configure the system so that a separate label is sent for BUM (Broadcast, Unknown unicast and Multicast) traffic in a specified service. By default ( **no ingress-replication-bum-label**), the same label is used for unicast and flooded BUM packets when for-warding traffic to remote PEs.

When saving labels, this might cause transient traffic duplication for all-active multi-homing. By enabling **ingress-replication-bum-label**, the system will advertise two labels per EVPN VPLS instance, one for unicast and one for BUM traffic. The ingress PE will use the BUM label for flooded traffic to the advertising egress PE, so that the egress PE can determine if the unicast traffic has been flooded by the ingress PE. Depending on the scale required in the network, the user may choose between saving label space or avoiding transient packet duplication sent to an all-active multi-homed CE for certain macs.

### Default

no ingress-replication-bum-label

## ingress-statistics

### Syntax

**[no] ingress-statistics**

### Context

**[Tree]** (config>router>segment-routing>sr-policies ingress-statistics)

### Full Context

configure router segment-routing sr-policies ingress-statistics

### Description

This command administratively enables the collection of ingress traffic statistics for all segment routing policies. The statistics provide counts for the number of incoming packets and bytes corresponding to each (color, endpoint) combination.

If there are any SR-MPLS interfaces on an FP2 or older line-cards, an attempt to enable this command will fail.

The **no** form of this command disables ingress stats collection for all segment routing policies.

**Default**

no ingress-statistics

**Platforms**

All

## ingress-statistics

**Syntax**

[no] ingress-statistics

**Context**

[\[Tree\]](#) (config>router>policy-options>policy-statement>default-action ingress-statistics)

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>action ingress-statistics)

**Full Context**

configure router policy-options policy-statement default-action ingress-statistics

configure router policy-options policy-statement entry action ingress-statistics

**Description**

This command enables the allocation of statistical indexes to BGP-LU route entries that are programmed on ingress data paths. For effective operation, a prefix must be advertised with a label per prefix for ILM statistics.

The **no** form of this command disables the allocation of statistical indexes to BGP-LU route entries.

**Default**

no ingress-statistics

**Platforms**

## 13.147 init-extract-prio-mode

### init-extract-prio-mode

**Syntax**

```
init-extract-prio-mode {uniform | I3-classify}
```

**Context**

[\[Tree\]](#) (config>card>fp init-extract-prio-mode)

**Full Context**

```
configure card fp init-extract-prio-mode
```

**Description**

This command determines the scheme used to select the initial drop priority of extracted control plane traffic. The initial drop priority of extracted packets can be either low or high priority. The drop priority of the extracted packets can be subsequently altered by mechanisms such as CPU protection. High-priority traffic receives preferential treatment in control plane congestion situations over low-priority traffic.

**Default**

```
init-extract-prio-mode uniform
```

## Parameters

### uniform

Initializes the drop priority of all extracted control traffic as high priority. Drop priority can then be altered (marked low priority) by distributed CPU protection (DCP) or centralized CPU protection rate-limiting functions in order to achieve protocol and interface isolation.

### I3-classify

Initializes the drop priority of Layer 3 extracted control traffic (BGP and OSPF) based on the QoS classification of the packets. This is useful in networks where the DSCP and EXP markings can be trusted as the primary method to distinguish, protect, and isolate good terminating protocol traffic from unknown or potentially harmful protocol traffic instead of using the rate-based DCP and centralized CPU protection traffic marking/coloring mechanisms (for example, **out-profile-rate** and **exceed-action low-priority**).

For network interfaces, the QoS classification profile result selects the drop priority (in = high priority, out = low priority) for extracted control traffic, and the default QoS classification maps different DSCP and EXP values to different in/out profile states.

For access interfaces, the QoS classification priority result typically selects the drop priority for extracted control traffic. The default access QoS classification ( **default-priority**) maps all traffic to **low**. If the queues in the access QoS policy are configured as **profile-mode** queues (rather than the default **priority-mode**) extracted traffic will use the QoS classification profile value configured against the associated FC (rather than the priority result) to select the drop priority.

Layer 2 extracted control traffic (ARP or ETH-CFM) and protocols that cannot always be QoS-classified, such as IS-IS, are initialized as low drop priority in order to protect Layer 2 protocol traffic on uniform interfaces (which would typically be subject to centralized CPU protection). Alternately, DCP can be used (by configuring a non-zero rate with **exceed-action of low-priority** for the **all-unspecified** protocol) to mark some of this traffic as high priority.

## Platforms

## 13.148 init-ss-threshold

### init-ss-threshold

#### Syntax

**init-ss-threshold** *init-ss-threshold*

#### Context

**[Tree]** (config>app-assure>group>tcp-optimizer init-ss-threshold)

#### Full Context

configure application-assurance group tcp-optimizer init-ss-threshold

**Description**

This command configures the initial Slow Start (SS) threshold for a given TCP optimizer policy. Nokia recommends to set the threshold close to the access network Bandwidth Delay Product (BDP).

**Default**

1000000

**Parameters*****init-ss-threshold***

Specifies the initial SS threshold value in kilobytes.

**Values** auto, 0 to 1000000

The auto value instructs the system to use an intelligent mechanism to set the optimum value for the initial SS threshold to dynamically track the BDP of the access network.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**13.149 initial-app-profile****initial-app-profile****Syntax**

**initial-app-profile** *app-profile-name*

**no initial-app-profile**

**[Tree]** (config service ies sub-if grp-if wpp initial-app-profile)

**[Tree]** (config subscr-mgmt loc-user-db ipoe host wpp initial-app-profile)

**[Tree]** (config service vprn sub-if grp-if wpp initial-app-profile)

**Full Context**

configure service ies subscriber-interface group-interface wpp initial-app-profile

configure subscriber-mgmt local-user-db ipoe host wpp initial-app-profile

configure service vprn subscriber-interface group-interface wpp initial-app-profile

**Description**

This command specifies the initial app-profile for the hosts created on the group-interface. This initial app-profile is replaced after hosts pass web portal authentication.

The **no** form of this command reverts to the default.

**Default**

no initial-app-profile

**Parameters*****app-profile-name***

Specifies the initial application profile, up to 32 characters, to be used during the WPP authentication phase of the IPoE hosts.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.150 initial-hold-time

### initial-hold-time

**Syntax**

**initial-hold-time** *seconds*

**initial-hold-time** [**min** *min*] [**sec** *sec*]

**no initial-hold-time**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>vrgw>brg>brg-profile initial-hold-time)

**Full Context**

configure subscriber-mgmt vrgw brg brg-profile initial-hold-time

**Description**

This hold time applies to BRG instances that are created without any hosts; for example, triggered due to proxy authentication. During this initial hold-time the BRG is not deleted and no connectivity-verification is started. When this timer expires, connectivity verification is started. If connectivity verification is disabled and no hosts are associated with the BRG upon expiry, the regular hold time is started and the BRG instance will be removed.

This command allows an operator to have fast BRG removal (no connectivity-verification and **no hold-time**) but still use BRG proxy authentication. Without an initial hold time the BRG would be removed immediately after creation.

This command does not apply to BRG instances that are created through host setup.

The **no** form of this command reverts to the default.

**Default**

initial-hold-time min 5

**Parameters*****seconds***

Specifies the initial time, in seconds, to hold on to a BRG after the system considered it down.

**Values** 0 to 900

***min***

Specifies the initial time in minutes.

**Values** 1 to 15

***sec***

Specifies the initial time in seconds.

**Values** 1 to 59

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range dhcp6 initial-preferred-lifetime

```
configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range slaac initial-preferred-lifetime
```

```
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range slaac initial-preferred-lifetime
```

```
configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range dhcp6 initial-preferred-lifetime
```

## Description

This command specifies the signaled preferred lifetime in DHCPv6 or SLAAC after full authentication (DSM and/or ESM).

The **no** form of this command reverts to the default.

## Default

initial-preferred-lifetime min 5

## Parameters

### *hours*

Specifies the number of initial preferred lifetime hours.

**Values** 1 to 1

### *minutes*

Specifies the number of initial preferred lifetime minutes.

**Values** 5 to 59

### *seconds*

Specifies the number of initial preferred lifetime seconds.

**Values** 1 to 59

**Combined values:** min 5 – hrs 1

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.153 initial-registration

### initial-registration

## Syntax

```
initial-registration ca ca-profile-name key-to-certify key-filename protection-alg {password password
reference ref-number | signature [cert cert-file-name [send-chain [with-ca ca-profile-name]]]
[protection-key key-file-name] [hash-alg {md5 | sha1 | sha224 | sha256 | sha384 | sha512}]}
```

**subject-dn** *dn* [ **domain-name** *domain-names*] [**ip-addr** *ip-address* | *ipv6-address*] **save-as** *save-path-of-result-cert*

## Context

[Tree] (admin>certificate>cmpv2 initial-registration)

## Full Context

admin certificate cmpv2 initial-registration

## Description

This command request initial certificate from CA by using CMPv2 initial registration procedure.

The **ca** parameter specifies a CA-profile which includes CMP server information.

The **key-to-certify** is an imported key file to be certified by the CA.

The protection-key is an imported key file used to for message protection if protection-alg is signature.

The request is authenticated either of following methods:

- A password and a reference number that pre-distributed by CA via out-of-band means.
- The specified password and reference number are not necessarily in the cmp-keylist configured in the corresponding CA-Profile
- A signature signed by the protection-key or key-to-certify, optionally along with the corresponding certificate. If the protection-key is not specified, system will use the key-to-certify for message protection. The hash algorithm used for signature is depends on key type:
- DSA key: SHA1
- RSA key: MD5/SHA1/SHA224 | SHA256 | SHA384 | SHA512, by default is SHA1

Optionally, the system could also send a certificate or a chain of certificates in extraCerts field. Certificate is specified by the "cert" parameter, it must include the public key of the key used for message protection.

Sending a chain is enabled by specify the **send-chain** parameter.

**subject-dn** specifies the subject of the requesting certificate.

**save-as** specifies full path name of saving the result certificate.

In some cases, CA may not return certificate immediately, due to reason like request processing need manual intervention. In such cases, the **admin certificate cmpv2** poll command could be used to poll the status of the request. If key-list is not configured in the corresponding **ca-profile**, then the system will use the existing password to authenticate the CMPv2 packets from server if it is in password protection.

If key-list is configured in the corresponding **ca-profile** and server does not send SenderKID, then the system will use lexicographical first key in the key-list to authenticate the CMPv2 packets from server in case it is in password protection.

## Parameters

### **ca-profile-name**

Specifies a ca-profile name which includes CMP server information up to 32 characters.

### **key-filename**

Specifies the file name of the key to certify up to 95 characters.

### **password**

Specifies an ASCII string up to 64 characters.

***ref-number***

Specifies the reference number for this CA initial authentication key up to 64 characters.

***cert-file-name***

Specifies the certificate file up to 95 characters.

***ca-profile-name***

Specifies to send the chain.

***key-file-name***

Specifies the protection key associated with the action on the CA profile.

***hash-algorithm***

Specifies the hash algorithm for RSA key.

**Values** md5,sha1,sha224,sha256,sha384,sha512

***dn***

Specifies the subject of the requesting certificate up to 256 characters.

**Values** attr1 equals val1  
attr2 equals val2 where: attrN equals {C | ST | O | OU | CN}

***save-path-of-result-cert***

Specifies the save full path name of saving the result certificate up to 200 characters.

**domain-name *domain-names***

Specifies FQDNs for SubjectAltName of the requesting certificate, separated by commas, up to 512 characters.

***ip-address* | *ipv6-address***

Specifies an IPv4 or IPv6 address for SubjectAtName of the requesting certificate.

## 13.154 initial-send-delay-zero

### initial-send-delay-zero

**Syntax**

[no] **initial-send-delay-zero**

**Context**

**[Tree]** (config>service>vprn>bgp>group>neighbor initial-send-delay-zero)

**[Tree]** (config>service>vprn>bgp>group initial-send-delay-zero)

[\[Tree\]](#) (config>service>vprn>bgp initial-send-delay-zero)

### Full Context

```
configure service vprn bgp group neighbor initial-send-delay-zero
configure service vprn bgp group initial-send-delay-zero
configure service vprn bgp initial-send-delay-zero
```

### Description

This command configures BGP to send UPDATE messages announcing reachability information to a peer or set of peers immediately after the sessions come up (become established) with these peers.

The default behavior, provided by the **no** form of this command, is to wait for **min-route-advertisement** time after each session is established before sending the first set of UPDATE messages.

### Platforms

All

## initial-send-delay-zero

### Syntax

**[no] initial-send-delay-zero**

### Context

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range dhcp6 initial-valid-lifetime

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range slaac initial-valid-lifetime

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range dhcp6 initial-valid-lifetime

**Description**

This command specifies the signaled preferred lifetime in DHCPv6 or SLAAC during a migrant phase.

The **no** form of this command reverts to the default.

**Default**

initial-valid-lifetime min 5

**Parameters*****hours***

Specifies the number of initial preferred lifetime hours.

**Values** 1 to 1

***minutes***

Specifies the number of initial preferred lifetime minutes.

**Values** 5 to 59

***seconds***

Specifies the number of initial preferred lifetime seconds.

**Values** 1 to 59

**Combined values:** min 5 – hrs 1

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.158 initiation-message

### initiation-message

**Syntax**

**initiation-message** [*initiation-message*]

**no initiation-message**

**Context**

[\[Tree\]](#) (config>bmp>station initiation-message)

**Full Context**

configure bmp station initiation-message

**Description**

This command configures a free-form initiation message for a type 0 TLV to be sent to the BMP monitoring station. The message is transmitted when a BMP monitoring station establishes a connection to the device. Information can be provided to the BMP station system administrator (for example, a contact phone number). The initiation message includes a type 1 TLV containing the SNMP sysDescr value specified in RFC 1213, *Management Information Base for Network Management of TCP/IP-based internets: MIB-II*,

and a type 2 TLV containing the SNMP sysName value also from RFC 1213. The string in the initiation-message is UTF-8 encoded.

The **no** form of this command removes initiation message from the configuration and causes a free-form message to be included in the type 0 information TLV and the corresponding tlv-length is made 0.

## Parameters

### *initiation-message*

Specifies an initiation message up to 256 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

## Platforms

All

## 13.159 inner-tag

### inner-tag

## Syntax

**inner-tag** *value* [*vid-mask*]

**no inner-tag**

## Context

[\[Tree\]](#) (config>qos>sap-ingress>mac-criteria>entry>match inner-tag)

## Full Context

```
configure qos sap-ingress mac-criteria entry match inner-tag
```

## Description

This command configures the matching of the second tag that is carried transparently through the service. The inner tag on ingress is the second tag on the frame if there are no service delimiting tags. The inner tag is the second tag before any service delimiting tags on egress but is dependent in the ingress configuration and may be set to 0 even in cases where additional tags are on the frame. This allows matching VLAN tags for explicit filtering or QoS setting when using default or null encapsulations.

The inner tag is not applicable in ingress on dot1Q SAPs. The inner tag may be populated on egress depending on the ingress SAP type.

On QinQ SAPs of null and default that do not strip tags, the inner-tag will contain the second tag (which is still the second tag carried transparently through the service.) On ingress SAPs that strip any tags, the inner tag will contain 0 even if there are more than two tags on the frame.

The optional *vid\_mask* is defaulted to 4095 (exact match) but may be specified to allow pattern matching. The masking operation is  $((\text{value and vid-mask}) = (\text{tag and vid-mask}))$ . A value of 6 and a mask of 7 would match all VIDs with the lower 3 bits set to 6.

For QoS, the VID type cannot be specified on the default QoS policy.  
The default vid-mask is set to 4095 for exact match.

## Platforms

### Description

This command sets the input-power-mode of the APEQ for the designated APEQ slot.

### Parameters

*amperage*

Sets the APEQ input power mode.

**Values** 60, 80

**Default** 60

### Platforms

7750 SR-12e, 7950 XRS

## 13.162 insert

insert

### Syntax

insert [*line*]

### Context

[\[Tree\]](#) (candidate insert)

### Full Context

candidate insert

### Description

This command inserts the contents of the temporary buffer (populated by a previous copy or delete command) into the candidate configuration. The contents are inserted by default after the current edit point. Optional parameters allow the insertion after some other point of the candidate. The contents of the temporary buffer are deleted when the operator exits candidate edit mode.

Insertions are context-aware. The temporary buffer always stores the CLI context (such as the current CLI branch) for each line deleted or copied. If the lines to be inserted are supported at the context of the insertion point then the lines are simply inserted into the configuration. If the lines to be inserted are not supported at the context of the insertion point, then the context at the insertion point is first closed using multiple exit statements, the context of the lines to be inserted is built (added) into the candidate at the insertion point, then the lines themselves are added, the context of the inserted lines is closed using exit statements and finally the context from the original insertion point is built again leaving the context at the same point as it was before the insertion.

### Parameters

*line*

Indicates where to insert the line starting at the point indicated by the following options.

#### Values

line, offset, **first**, **edit-point**, **last**

line

absolute line number

|                   |                                                                      |
|-------------------|----------------------------------------------------------------------|
| <b>offset</b>     | relative line number to current edit point. Prefixed with '+' or '-' |
| <b>first</b>      | keyword - first line                                                 |
| <b>edit-point</b> | keyword - current edit point                                         |
| <b>last</b>       | keyword - last line that is not 'exit'                               |

configure aaa isa-radius-policy acct-include-attributes inside-service-id

**Description**

This command enables the inclusion of the NAT inside service ID attributes.

The **no** form of the command excludes NAT inside service ID attributes.

**Default**

no inside-service-id

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.168 install-backup-path

install-backup-path

**Syntax**

install-backup-path

no install-backup-path

**Context**

[\[Tree\]](#) (config>router>policy-options>policy-statement>default-action install-backup-path)

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>action install-backup-path)

## Full Context

```
configure router policy-options policy-statement default-action install-backup-path
configure router policy-options policy-statement entry action install-backup-path
```

## Description

When the best BGP route for an IPv4 or IPv6 prefix is matched by a policy entry or policy default action with this command, BGP attempts to find and install a preprogrammed backup path for the prefix in order to provide BGP fast reroute protection.

The **install-backup-path** command overrides and has no dependency on commands such as the BGP instance **backup-path** command or the VPRN-level **enable-bgp-vpn-backup** command, which enable BGP fast reroute for an entire address family. The **install-backup-path** command provides more precise control over which IP prefixes are supported with preprogrammed backup paths.

In VPRN, if the best path for an IP prefix is provided by a VPRN BGP route, the backup path can be provided by another VPRN BGP route or an imported VPN-IP route. If the best path for an IP prefix is provided by an imported VPN-IP route, the backup path can be provided by another VPN-IP route.

The **install-backup-path** command is supported only in BGP and VRF import policies and has no effect on other types. The **install-backup-path** command applies only to the following types of matched routes: IPv4, IPv6, label-IPv4, label-IPv6, VPN-IPv4, and VPN-IPv6.

The **no** form of this command disables the install-backup-path functionality.

## Default

```
no install-backup-path
```

[no] instant-prune-echo
```

### Context

```
[Tree] (config>service>vprn>pim>if instant-prune-echo)
```

### Full Context

```
configure service vprn pim interface instant-prune-echo
```

### Description

This command enables PIM to send an instant prune echo when the router starts the prune pending timer for a group on the interface. All downstream routers will see the prune message immediately, and can send a join override if they are interested in receiving the group. Configuring instant-prune-echo is recommended on broadcast interfaces with more than one PIM neighbor to optimize multicast convergence.

The **no** form of this command disables instant Prune Echo on the PIM interface.

### Default

```
no instant-prune-echo
```

### Platforms

### Syntax

[no] interactive-authentication

### Context

[\[Tree\]](#) (config>service>vprn>aaa>remote-servers>tacplus interactive-authentication)

### Full Context

configure service vprn aaa remote-servers tacplus interactive-authentication

### Description

This configuration instructs the SR OS to send no username nor password in the TACACS+ start message, and to display the *server\_msg* in the GETUSER and GETPASS response from the TACACS+ server. Interactive authentication can be used to support a One Time Password scheme (such as an S/Key). An example flow (such as with a telnet connection) is as follows:

- The SR OS sends an authentication start request to the TACACS+ server with no username nor password.
- TACACS+ server replies with TAC\_PLUS\_AUTHEN\_STATUS\_GETUSER and a *server\_msg*.
- The SR OS displays the *server\_msg*, and collects the username.
- The SR OS sends a continue message with the username.
- TACACS+ server replies with TAC\_PLUS\_AUTHEN\_STATUS\_GETPASS and a *server\_msg*.
- The SR OS displays the *server\_msg* (which may contain, for example, an S/Key for One Time Password operation), and collects the password.
- The SR OS sends a continue message with the password.
- TACACS+ server replies with PASS or FAIL.

When interactive-authentication is disabled the SR OS will send the username and password in the *tacplus* start message. An example flow (e.g. with a telnet connection) is as follows:

- TAC\_PLUS\_AUTHEN\_TYPE\_ASCII.
  - the login username in the "user" field.
  - the password in the *user\_msg* field (while this is non-standard, it does not cause interoperability problems).
- TACACS+ server ignores the password and replies with TAC\_PLUS\_AUTHEN\_STATUS\_GETPASS.
- The SR OS sends a continue packet with the password in the *user\_msg* field.
- TACACS+ server replies with PASS or FAIL.

When interactive-authentication is enabled, tacplus must be the first method specified in the authentication-order configuration.

## 13.178 intercept-id

### intercept-id

#### Syntax

**intercept-id** *id*

**no intercept-id**

#### Context

**[Tree]** (config>li>li-source>nat>ethernet-header intercept-id)

**[Tree]** (config>li>li-source>nat>l2-aware-sub intercept-id)

**[Tree]** (config>li>li-source>nat>nat64-lsn-sub intercept-id)

[\[Tree\]](#) (config>li>li-source>nat>classic-lsn-sub intercept-id)

[\[Tree\]](#) (config>li>li-source>nat>dslite-lsn-sub intercept-id)

## Full Context

configure li li-source nat ethernet-header intercept-id

configure li li-source nat l2-aware-sub intercept-id

configure li li-source nat nat64-lsn-sub intercept-id

configure li li-source nat classic-lsn-sub intercept-id

configure li li-source nat dslite-lsn-sub intercept-id

## Description

This command configures the intercept-id that is inserted into the packet header for all mirrored packets of the associated **li-source** entry. This **intercept-id** can be used (for example by a downstream LI gateway) to identify the particular LI session to which the packet belongs.

For nat mirroring (a **nat li-source** entry type), when the mirror service is not configured with any routable encap (for example, no ip-udp-shim or ip-gre configured under **config>mirror>mirror-dest>encap**), the presence of a configured intercept-id against an li-source (nat) entry will cause the insertion of the intercept-id after a configurable mac-da, mac-sa and etype (configured under **li-source>nat>ethernet-header**), at the front of each packet mirrored for that particular li-source entry. If there is no **intercept-id** configured (for a **nat** entry using a mirror service without routable encap), then a configurable mac-da and mac-sa are added to the front of the packets (but no intercept-id). In both cases a non-configurable etype is also added immediately before the mirrored customer packet. Note that routable encapsulation configured in the mirror-dest takes precedence over the ethernet-header configuration in the li-source nat entries. If routable encapsulation is configured, then the ethernet-header config is ignored and no mac header is added to the packet (the encap is determined by the mirror-dest in this case).

For all types of **li-source** entries (filter, nat, sap, subscriber), when the mirror service is configured with **ip-udp-shim** routable encap, an intercept-id field (as part of the routable encap) is always present in the mirrored packets. If there is no intercept ID configured for an li-source entry, then the default value will be inserted. When the mirror service is configured with ip-gre routable encap, no intercept-id is inserted and none should be specified against the **li-source** entries.

The **no** form of this command removes the value from the configuration.

## Default

no intercept-id (an id of 0, or no id)

## Parameters

*id*

Specifies the intercept ID value to insert into the header of the mirrored packets.

**Values** 1 to 4294967295 (32b) For nat li-source entries that are using a mirror service that is not configured with routable encap

**Values** 1 to 1,073,741,824 (30b) For all types of li-source entries that are using a mirror service with routable ip-udp-shim encap and no direction-bit.

**Values** 1 to 536,870,912 (29b) For all types of li-source entries that are using a mirror service with routable ip-udp-shim encap and with the direction-bit enabled.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## intercept-id

### Syntax

**intercept-id** [*intercept-id*]

**no intercept-id**

### Context

[\[Tree\]](#) (config>li>li-source>wlan-gw intercept-id)

### Full Context

configure li li-source wlan-gw intercept-id

### Description

This command configures the intercept-id inserted in the packet header for all mirrored packets of the associated li-source. When the mirror service is configured with the **ip-udp-shim** routable encapsulation, the intercept-id field (as part of the routable encap) is always present in the mirrored packets. The intercept ID can be used by the LIG to identify a particular LI session to which the packet belongs.

### Parameters

*intercept-id*

Specifies the intercept ID inserted in the LI header.

### Syntax

**interconnect** {*ring-id ring-index* | **vpls**}

**no interconnect**

## Context

[\[Tree\]](#) (config>eth-ring>sub-ring interconnect)

## Full Context

configure eth-ring sub-ring interconnect

## Description

This command links the G.8032 sub-ring to a ring instance or to a VPLS instance. The ring instance must be a complete ring with two paths but may itself be a sub-ring or a major ring (declared by its configuration on another node).

When the interconnection is to another node, the sub-ring may have a virtual link or a non-virtual-link.

When the sub-ring is configured with a non-virtual link, the sub ring may be alternatively connected to a VPLS service.

This command is only valid on the interconnection node where a single sub-ring port connects to a major ring or terminates on a VPLS service.

The **no** form of this command removes the interconnect node.

## Default

no interconnect

## Parameters

### *ring-id*

Specifies the identifier for the ring instance of the connection ring for this sub-ring on this node.

**Values** 0 to 128

### *vpls*

Specifies that the sub-ring is connected to the VPLS instance that contains the sub-ring SAP.

## Context

[\[Tree\]](#) (config>service>vprn interface)

[\[Tree\]](#) (config>service>ies interface)

## Full Context

configure service vprn interface

configure service ies interface

## Description

This command creates a logical IP routing interface. Once created, attributes like an IP address and service access point (SAP) can be associated with the IP interface.

The **interface** command, under the context of services, is used to create and maintain IP routing interfaces within service IDs. The **interface** command can be executed in the context of a service ID. The IP interface created is associated with the service core network routing instance and default routing table. The typical use for IP interfaces created in this manner is for subscriber Internet access. An IP address cannot be assigned to an IES interface. Multiple SAPs can be assigned to a single group interface.

Interface names are case sensitive and must be unique within the group of defined IP interfaces defined for **config>router>interface**, **config>service>ies>interface** and **config>service>vprn>interface** (that is, the network core router instance). Interface names must not be in the dotted decimal notation of an IP address. For example, the name "1.1.1.1" is not allowed, but "int-1.1.1.1" is allowed. Show commands for router interfaces use either interface names or the IP addresses. Use unique IP address values and IP address names to maintain clarity. It could be unclear to the user if the same IP address and IP address name values are used. Although not recommended, duplicate interface names can exist in different router instances.

When a new name is entered, a new logical router interface is created. When an existing interface name is entered, the user enters the router interface context for editing and configuration.

By default, there are no default IP interface names defined within the system. All IP interfaces must be explicitly defined. Interfaces are created in an enabled state.

The **no** form of this command removes the interface and all the associated configuration. The interface must be administratively shut down before issuing the **no interface** command.

The IP interface must be shut down before the SAP on that interface may be removed. IES and VPRN services do not have the **shutdown** command in the SAP CLI context. The service SAPs rely on the interface status to enable and disable them.

## Parameters

### *ip-int-name*

Specifies the name of the IP interface. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service vprn interface** commands. An interface name cannot be in the form of an IP address. Interface names can be from 1 to 32 alphanumeric characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed between double quotes.

If *ip-int-name* already exists within the service ID, the context will be changed to maintain that IP interface. If *ip-int-name* already exists within another service ID or is an IP interface defined within the **config router** commands, an error will occur and context will not be

changed to that IP interface. If *ip-int-name* does not exist, the interface is created and context is changed to that interface for further command processing.

### tunnel

Specifies that the interface is configured as tunnel interface, which could be used to terminate IPsec or GRE tunnels in the private service.

### create

Creates the IPsec interface instance. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

## Platforms

All

## interface

### Syntax

[no] **interface** *ip-int-name*

### Context

[\[Tree\]](#) (config>router>igmp interface)

### Full Context

configure router igmp interface

### Description

Commands in this context configure an IGMP interface. The interface is a local identifier of the network interface on which reception of the specified multicast address is to be enabled or disabled.

The **no** form of the command deletes the IGMP interface. The **shutdown** command in the **config>router>igmp>interface** context can be used to disable an interface without removing the configuration for the interface.

### Default

no interface

### Parameters

#### *ip-int-name*

The IP interface name. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

If the IP interface name does not exist or does not have an IP address configured an error message will be returned.

If the IP interface exists in a different area it will be moved to this area.

## Platforms

All

## interface

## Syntax

[no] **interface** *ip-int-name*

## Context

[\[Tree\]](#) (config>router>mld interface)

## Full Context

configure router mld interface

## Description

Commands in this context configure an Multicast Listener Discovery (MLD) interface. The interface is a local identifier of the network interface on which reception of the specified multicast address is to be enabled or disabled.

The **no** form of this command deletes the MLD interface. The **shutdown** command in the **config>router>mld>interface** context can be used to disable an interface without removing the configuration for the interface.

## Default

no interface — No interfaces are defined.

## Parameters

### *ip-int-name*

Specifies the IP interface name. Interface names must be unique within the group of defined IP interfaces for **config>router>interface** and **config>service>ies>interface** commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

If the IP interface name does not exist or does not have an IP address configured an error message will be returned.

If the IP interface exists in a different area it will be moved to this area.

## interface

### Syntax

```
[no] interface ip-int-name
```

### Context

[\[Tree\]](#) (config>service>vpls interface)

## Full Context

configure service vpls interface

## Description

This command creates a logical IP routing interface for a VPLS service. Once created, attributes such as IP address and service access points (SAP) can be associated with the IP interface.

The interface command, under the context of services, is used to create and maintain IP routing interfaces within the VPLS service IDs. The IP interface created is associated with the VPLS management routing instance. This instance does not support routing.

Interface names are case-sensitive and must be unique within the group of defined IP interfaces defined for the network core router instance. Interface names in the dotted decimal notation of an IP address are not allowed. For example, the name "1.1.1.1" is not allowed, but "int-1.1.1.1" is allowed. Show commands for router interfaces use either interface names or the IP addresses. Use unique IP address values and IP address names to maintain clarity. Duplicate interface names can exist in different router instances.

Enter a new name to create a logical router interface. When an existing interface name is entered, the user enters the router interface context for editing and configuration.

By default, no default IP interface names are defined within the system. All VPLS IP interfaces must be explicitly defined in an enabled state.

The no form of this command removes the IP interface and the entire associated configuration. The interface must be administratively shut down before issuing the no interface command.

For VPLS services, the IP interface must be shut down before the SAP on that interface is removed.

For VPLS service, ping and traceroute are the only applications supported.

## Parameters

### *ip-int-name*

Specifies the name of the IP interface. Interface names must be unique within the group of defined IP.

An interface name:

- Should not be in the form of an IP address.
- Can be from 1 to 32 alphanumeric characters.
- If the string contains special characters (such as #,\$,spaces), the entire string must be enclosed within double quotes.

If *ip-int-name* already exists within the service ID, the context changes to maintain that IP interface. If *ip-int-name* already exists within another service ID, an error occurs and the context does not change to that IP interface. If *ip-int-name* does not exist, the interface is created and the context is changed to that interface for further command processing.

All

## interface

### Syntax

**[no] interface** [*ip-int-name* | *ip-address*]

### Context

**[Tree]** (debug>router>igmp interface)

### Full Context

debug router igmp interface

### Description

This command enables debugging for IGMP interfaces.

The **no** form of this command disables the IGMP interface debugging for the specifies interface name or IP address.

### Parameters

#### *ip-int-name*

Debugs the information associated with the specified IP interface name.

#### *ip-address*

Debugs the information associated with the specified IP address.

### Platforms

All

## interface

### Syntax

**[no] interface** *ip-int-name*

### Context

**[Tree]** (config>service>vprn>igmp interface)

### Full Context

configure service vprn igmp interface

### Description

Commands in this context configure interface parameters.

### Parameters

#### *ip-int-name*

Specifies the name of the IP interface, up to 32 characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed between double quotes.

## Platforms

All

## interface

## Syntax

**[no] interface** *ip-int-name*

## Context

**[Tree]** (config>service>vprn>isis interface)

## Full Context

configure service vprn isis interface

## Description

This command creates the context to configure an IS-IS interface.

When an area is defined, the interfaces belong to that area. Interfaces cannot belong to separate areas.

When the interface is a POS channel, the OSI Network Layer Control Protocol (OSINLCP) is enabled when the interface is created and removed when the interface is deleted.

The **no** form of this command removes IS-IS from the interface.

The **shutdown** command in the **config>router>isis>if** context administratively disables IS-IS on the interface without affecting the IS-IS configuration.

## Default

no interface — No IS-IS interfaces are defined.

## Parameters

***ip-int-name***

Identify the IP interface name created in the **config>router>if** context. The IP interface name must already exist.

## Platforms

All

## interface

## Syntax

**[no] interface** *ip-int-name*

## Context

[\[Tree\]](#) (config>service>vprn>mld interface)

## Full Context

configure service vprn mld interface

## Description

Commands in this context configure an Multicast Listener Discovery (MLD) interface. The interface is a local identifier of the network interface on which reception of the specified multicast address is to be enabled or disabled.

The **no** form of this command deletes the MLD interface. The **shutdown** command in the **config>router>mld>if** context can be used to disable an interface without removing the configuration for the interface.

## Default

no interface

## Parameters

### *ip-int-name*

Specifies the IP interface name. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed between double quotes.

If the IP interface name does not exist or does not have an IP address configured an error message will be returned.

If the IP interface exists in a different area it will be moved to this area.

## Platforms

**no interface** *ip-int-name*

## Context

[\[Tree\]](#) (config>service>vprn>ospf>area interface)

[\[Tree\]](#) (config>service>vprn>ospf3>area interface)

## Full Context

configure service vprn ospf area interface  
configure service vprn ospf3 area interface

## Description

This command creates a context to configure an OSPF interface.

By default interfaces are not activated in any interior gateway protocol, such as OSPF, unless explicitly configured.

The **no** form of this command deletes the OSPF interface configuration for this interface. The **shutdown** command in the **config>router>ospf>if** context can be used to disable an interface without removing the configuration for the interface.

## Default

no interface

## Parameters

### *ip-int-name*

Specifies the IP interface name. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service vprn interface** commands. An interface name cannot be in the form of an IP address. Interface names can be any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed between double quotes.

If the IP interface name does not exist or does not have an IP address configured an error message will be returned.

If the IP interface exists in a different area it will be moved to this area.

### *secondary*

Keyword used to allow multiple secondary adjacencies, in addition to the primary adjacency, to be established over a single IP interface. This keyword can also be applied to the system interface and to loopback interfaces to allow them to participate in multiple areas, although no adjacencies are formed over these types of interfaces.

## Platforms

All

## interface

## Syntax

[no] interface *ip-int-name*

## Context

[\[Tree\]](#) (config>service>vprn>pim interface)

## Full Context

```
configure service vprn pim interface
```

## Description

This command enables PIM on an interface and enables the context to configure interface-specific parameters. By default interfaces are activated in PIM based on the **apply-to** command, and do not have to be configured on an individual basis unless the default values must be changed.

The **no** form of this command deletes the PIM interface configuration for this interface. If the **apply-to** command parameter is configured, then the **no interface** form must be saved in the configuration to avoid automatic (re)creation after the next **apply-to** is executed as part of a reboot.

The **shutdown** command can be used to disable an interface without removing the configuration for the interface.

## Default

Interfaces are activated in PIM based on the apply-to command.

## Parameters

### *ip-int-name*

Specifies the interface name. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed between double quotes.

## Platforms

## interface

## Syntax

```
[no] interface ip-int-name [dual-stack]
```

## Context

[\[Tree\]](#) (config>router>ldp>interface-parameters interface)

## Full Context

```
configure router ldp interface-parameters interface
```

## Description

This command enables LDP on the specified IP interface.

The **no** form of the command deletes the LDP interface and all configuration information associated with the LDP interface.

The LDP interface must be disabled using the **shutdown** command before it can be deleted.

The user can configure different parameters for IPv4 and IPv6 LDP interfaces by entering **ipv4** or **ipv6** as the next command.

## Parameters

### *ip-int-name*

Specifies the name of an existing interface. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### *dual-stack*

This optional keyword allows the user to explicitly indicate if this interface should create the IPv4 context automatically or not. With the introduction of LDP IPv6, the creation of the interface does not automatically mean it is to be used for IPv4 like with legacy IPv4 only LDP interface. Thus the dual-stack keyword is an indication to the system that user will manually enable the IPv4, IPv6, or the dual-stack IPv4/IPv6 contexts manually.

The following are some of the key points for this keyword:

- If the keyword is provided, then IPv4 interface context will not be created automatically. If it is not provided, the IPv4 interface context will be created like in the legacy single stack LDP IPv4 interface behavior.
- This new keyword will always show in a configuration.

- When entering an already configured interface, there is no need to provide the keyword, but it will be ignored if provided.
- When deleting a configured interface, the keyword will not be accepted in the **no** version of the **interface** command.

## Full Context

```
configure router mpls srlg-database router-id interface
```

## Description

This command allows the operator to manually enter the SRLG membership information for any link in the network, including links on this node, into the user SRLG database.

An interface can be associated with up to five SRLG groups for each execution of this command. The operator can associate an interface with up to 64 SRLG groups by executing the command multiple times.

CSPF will not use entered SRLG membership if an interface is not validated as part of a router ID in the routing table.

The **no** form of this command deletes a specific interface entry in this user SRLG database. The *group-name* must already exist in the config>router>if-attribute>srlg-group context.

## Parameters

### *ip-address*

Specifies the IPv4 address in a.b.c.d

### *srlg-group group-name*

Specifies the SRLG group name. Up to 1024 group names can be defined in the config>router>if-attribute context. The SRLG group names must be identical across all routers in a single domain.

## Platforms

### Context

[\[Tree\]](#) (config>router>pim interface)

## Full Context

configure router pim interface

## Description

This command creates a PIM interface.

Interface names are case-sensitive and must be unique within the group of defined IP interfaces defined for **config>router>interface**, **config>service>ies>interface**, and **config>service>ies>subscriber-interface>group-interface**. Interface names must not be in the dotted decimal notation of an IP address. For example, the name "1.1.1.1" is not allowed, but "int-1.1.1.1" is allowed. Show commands for router interfaces use either the interface names or the IP addresses. Ambiguity can exist if an IP address is used as an IP address and an interface name. Duplicate interface names can exist in different router instances, although this is not recommended because it may be confusing.

By default, no interfaces or names are defined within PIM.

The **no** form of this command removes the IP interface and all the associated configurations.

## Parameters

### *ip-int-name*

Specifies the name of the IP interface, up to 32 characters. Interface names must be unique within the group of defined IP interfaces for **config router interface**, **config service ies interface**, and **config service ies subscriber-interface group-interface** commands. An interface name cannot be in the form of an IP address. If the string contains special characters (#, \$, spaces, and so on.), the entire string must be enclosed within double quotes.

If the *ip-int-name* already exists, the context is changed to maintain that IP interface. If *ip-int-name* does not exist, the interface is created and the context is changed to that interface for further command processing.

## Platforms

**no interface** *interface-name*

## Context

[\[Tree\]](#) (config>router interface)

## Full Context

configure router interface

## Description

This command creates a logical IP routing or unnumbered MPLS-TP interface. Once created, attributes like IP address, port, or system can be associated with the IP interface.

Interface names are case-sensitive and must be unique within the group of IP interfaces defined for **config router interface** and **config service ies interface**. Interface names must not be in the dotted decimal notation of an IP address.; for example, the name "1.1.1.1" is not allowed, but "int-1.1.1.1" is allowed. Show commands for router interfaces use either the interface names or the IP addresses. Ambiguity can exist if an IP address is used as an IP address and an interface name. Duplicate interface names can exist in different router instances, although this is not recommended because it is confusing. Nokia recommends that names are meaningful and unique to remove ambiguity when displaying the state associated with IP interfaces through show commands.

When a new name is entered, a new logical router interface is created. When an existing interface name is entered, the user enters the router interface context for editing and configuration.

Although not a keyword, the ip-int-name "**system**" is associated with the network entity (such as a specific router), not a specific interface. The system interface is also referred to as the loopback address.

An unnumbered MPLS-TP interface is a special type of interface that is only intended for MPLS-TP LSPs. IP routing protocols are blocked on interfaces of this type. If an interface is configured as unnumbered-mpls-tp, then it can only be associated with an Ethernet port or VLAN, using the port command, then either a unicast, multicast, or broadcast remote MAC address may be configured. Only static ARP is supported.

The control-tunnel parameter creates a loopback interface representing a GRE tunnel. One IP tunnel can be created in this interface.

Only the primary IPv4 interface address and only one IP tunnel per interface are allowed. Multiple tunnels can be configured using up to four controlTunnel loopback interfaces. A static route can take the new controlTunnel interface as a next hop.

The **no** form of this command removes the IP interface and all the associated configurations. The interface must be administratively shut down before issuing the **no interface** command.

## Parameters

### *interface-name*

Specifies the name of the IP interface. Interface names must be unique within the group of defined IP interfaces for **config router interface** and **config service ies interface** commands. An interface name cannot be in the form of an IP address. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

**Values** 1 to 32 alphanumeric characters

If the *ip-int-name* already exists, the context is changed to maintain that IP interface. If *ip-int-name* already exists within another service ID or is an IP interface defined within the **config router** commands, an error will occur and the context will not be changed to that IP interface. If *ip-int-name* does not exist, the interface is created and the context is changed to that interface for further command processing.

### **unnumbered-mpls-tp**

Specifies that an interface is an unnumbered MPLS-TP. An unnumbered MPLS-TP interface is a special type of interface that is only intended for MPLS-TP LSPs. IP routing protocols are blocked on interfaces of this type. If an interface is configured as

**unnumbered-mpls-tp**, then it can only be associated with an Ethernet port or VLAN, using the **port** command. A unicast, multicast, or broadcast remote MAC address can be configured using the **static-arp** command. Only static ARP is supported.

**pdn**

Specifies that the interface is a PDN.

configure router ospf area interface

configure router ospf3 area interface

## Description

This command configures an OSPF interface.

Unless they are explicitly configured, interfaces are not activated, by default, in any interior gateway protocol, such as OSPF.

The **no** form of this command deletes the OSPF interface configuration for this interface. Use the **shutdown** command in the **config>router>ospf>interface** context to disable an interface without removing the configuration for the interface.

## Default

no interface

## Parameters

### *ip-int-name*

Specifies the IP interface name. Interface names must be unique within the group of defined IP interfaces for the **configure router interface** and **configure service ies interface** commands. An interface name cannot be in the form of an IP address. Interface names can be any string, up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

If the IP interface name does not exist or does not have an IP address configured, an error message is returned.

If the IP interface exists in a different area it is moved to this area.

### **secondary**

Keyword used to allow multiple secondary adjacencies, in addition to the primary adjacency, to be established over a single IP interface. This keyword can also be applied to the system interface and to loopback interfaces to allow them to participate in multiple areas, although no adjacencies are formed over these types of interfaces.

## interface

## Syntax

[no] interface *ip-int-name*

## Context

[\[Tree\]](#) (config>router>bgp>group>dynamic-neighbor interface)

## Full Context

configure router bgp group dynamic-neighbor interface

## Description

Commands in this context configure an unnumbered base router network interface for dynamic neighbors.

If this interface connects to a network with other BGP routers, sessions with the other routers can be set up automatically without explicitly configuring them as BGP neighbors. The interface must be IPv6 enabled, but because the interface is considered unnumbered, it does not require an IPv4 address or a global-unicast IPv6 address. The sessions are set up using IPv6 link-local addresses.

The BGP unnumbered feature supports all address families that allow IPv6 link-local BGP next-hop addresses. This includes IPv4 with the use of RFC 8950 extensions.

When an interface is added to the list of dynamic-neighbor interfaces, an outgoing connection attempt is initiated toward any directly connected router on the interface that announces itself using an ICMPv6 router advertisement message. The session attempt is unsuccessful if the peer type is not EBGP, the reported AS number of the peer does not match one of the allowed values, or the maximum session limit of the interface would be exceeded.

The **no** form of this command removes the interface from the list of dynamic-neighbor interfaces.

## Parameters

*ip-int-name*

Specifies the name of a base router IP interface, up to 32 characters.

## Platforms

All

## interface

## Syntax

[no] interface *ip-int-name*

## Context

## Description

Commands in this context configure an unnumbered VPRN access IP interface for dynamic neighbors.

If this interface connects to a network with other BGP routers, sessions with the other routers can be set up automatically without explicitly configuring them as BGP neighbors. The interface must be IPv6 enabled, but because the interface is considered unnumbered, it does not require an IPv4 address or a global-unicast IPv6 address. The sessions are set up using IPv6 link-local addresses.

The BGP unnumbered feature supports all address families that allow IPv6 link-local BGP next-hop addresses. This includes IPv4 with the use of RFC 8950 extensions.

When an interface is added to the list of dynamic-neighbor interfaces, an outgoing connection attempt is initiated toward any directly connected router on the interface that announces itself using an ICMPv6 router advertisement message. The session attempt is unsuccessful if the peer type is not EBGP, the reported AS number of the peer does not match one of the allowed values, or the maximum session limit of the interface would be exceeded.

The **no** form of this command removes the interface from the list of dynamic-neighbor interfaces.

## Parameters

*ip-int-name*

Specifies the name of a VPRN access IP interface, up to 32 characters.

## Platforms

All

## 13.181 interface-a

### interface-a

#### Syntax

**interface-a**

#### Context

[\[Tree\]](#) (config>fwd-path-ext>fpe>pw-port-ext interface-a)

#### Full Context

configure fwd-path-ext fpe pw-port-extension interface-a

#### Description

Commands in this context configure the parameters of network interface A of the PW port extension FPE.

#### Platforms

All

### interface-a

#### Syntax

**interface-a**

#### Context

[\[Tree\]](#) (config>fwd-path-ext>fpe>srv6 interface-a)

#### Full Context

configure fwd-path-ext fpe srv6 interface-a

#### Description

This command enables the context to configure the parameters of the network interface-a of the SRv6 FPE.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 13.182 interface-b

## interface-b

### Syntax

**interface-b**

### Context

[\[Tree\]](#) (config>fwd-path-ext>fpe>pw-port-ext interface-b)

### Full Context

configure fwd-path-ext fpe pw-port-extension interface-b

### Description

Commands in this context configure the parameters of network interface B of the PW port extension FPE.

### Platforms

All

## interface-b

### Syntax

**interface-b**

### Context

[\[Tree\]](#) (config>fwd-path-ext>fpe>srv6 interface-b)

### Full Context

configure fwd-path-ext fpe srv6 interface-b

### Description

This command enables the context to configure the parameters of the network interface-b of the SRv6 FPE.

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 13.183 interface-disable-sample

## interface-disable-sample

### Syntax

**[no] interface-disable-sample**

### Context

**[Tree]** (config>filter>ipv6-filter>entry interface-disable-sample)

**[Tree]** (config>filter>ip-filter>entry interface-disable-sample)

### Full Context

configure filter ipv6-filter entry interface-disable-sample

configure filter ip-filter entry interface-disable-sample

### Description

This command disables cflowd sampling for packets matching this filter entry, for the IP interface set to **cflowd interface** mode. This allows the option to not sample specific types of traffic when interface sampling is enabled.

If the cflowd is either not enabled or set to **cflowd acl** mode, this command is ignored.

The **no** form of this command enables sampling.

### Default

no interface-disable-sample

### Platforms

All

## 13.184 interface-id

### interface-id

### Syntax

**interface-id [ascii-tuple]**

**interface-id ifindex**

**interface-id sap-id**

**interface-id string** *string*

**no interface-id**

### Context

**[Tree]** (config>service>vprn>if>ipv6>dhcp6>option interface-id)

[\[Tree\]](#) (config>service>ies>if>ipv6>dhcp6>option interface-id)

### Full Context

configure service vprn interface ipv6 dhcp6-relay option interface-id

configure service ies interface ipv6 dhcp6-relay option interface-id

### Description

This command enables the sending of interface ID options in the DHCPv6 relay packet.

The **no** form of this command disables the sending of interface ID options in the DHCPv6 relay packet.

### Parameters

#### ascii-tuple

Specifies that the ASCII-encoded concatenated tuple is used which consists of the access-node-identifier, service-id, and interface-name, separated by "|".

#### ifindex

Specifies that the interface index is used. The If Index of a router interface can be displayed using the **show>router>interface>detail** command.

#### sap-id

Specifies that the SAP identifier is used.

#### string

Specifies that a string is used.

#### string

Specifies a string of up to 80 characters long, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### Platforms

All

**interface-id**

### Syntax

**interface-id** [ascii-tuple]

**interface-id** ifindex

**interface-id** sap-id

**interface-id** string *string*

**no interface-id**

### Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>ipv6>dhcp6>option interface-id)

## Full Context

```
configure service vprn subscriber-interface group-interface ipv6 dhcp6 option interface-id
```

## Description

This command enables the sending of interface ID options in the DHCPv6 relay packet.

The **no** form of this command disables the sending of interface ID options in the DHCPv6 relay packet.

## Parameters

### **ascii-tuple**

Specifies that the ASCII-encoded concatenated tuple is used which consists of the access-node-identifier, service-id, and interface-name, separated by "|".

### **ifindex**

Specifies that the interface index is used (the If Index of a router interface can be displayed using the command **show>router>if>detail**).

### **sap-id**

Specifies that the SAP identifier is used.

### **string**

Specifies a string, up to 32 characters long, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed between double quotes.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## interface-id

## Syntax

```
interface-id [ascii-tuple]
```

```
interface-id [vlan-ascii-tuple]
```

```
no interface-id
```

## Context

[\[Tree\]](#) (config>service>vpls>sap>dhcp6>ldra>options interface-id)

## Full Context

```
configure service vpls sap dhcp6 ldra options interface-id
```

## Description

This command enables the sending of interface ID options in the DHCPv6 LDRA.

The **no** form of this command disables the sending of interface ID options in the DHCPv6 LDRA.

## Parameters

### ascii-tuple

Specifies the use of the ASCII-encoded concatenated tuple, which consists of the *system name*, *service-id*, and *sap-id* separated by "|".

### vlan-ascii-tuple

Specifies the use of the ASCII-encoded concatenated tuple enhanced with VLAN ID and dot1p bits, consisting of the *system name*, *service-id*, *sap-id*, *dot1p-inner-vlan*, and *inner-vplan-id*, separated by "|".

## Platforms

All

## 13.185 interface-id-mapping

### interface-id-mapping

## Syntax

[no] interface-id-mapping

## Context

[\[Tree\]](#) (config>service>vprn>dhcp6>server interface-id-mapping)

[\[Tree\]](#) (config>router>dhcp6>server interface-id-mapping)

## Full Context

```
configure service vprn dhcp6 local-dhcp-server interface-id-mapping
```

```
configure router dhcp6 local-dhcp-server interface-id-mapping
```

## Description

This command enables the behavior where unique /64 prefix is allocated per interface-id, and all clients having the same interface-id get an address allocated out of this /64 prefix for DHCP6. This is relevant for bridged clients behind the same local-loop (and same SAP), where sharing the same prefix allows communication between bridged clients behind the same local-loop to stay local. For SLAAC based assignment, downstream neighbor-discovery is automatically enabled to resolve the assigned address.

The **no** form of this command reverts to the default.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.186 interface-list

### interface-list

#### Syntax

**interface-list**

#### Context

**[Tree]** (config>cflowd>collector>exp-filter interface-list)

#### Full Context

configure cflowd collector export-filter interface-list

#### Description

Commands in this context allow the administrator to specify which interface's flow data should be exported to the associated collector.

[Table 54: Cflowd Export Filter Precedence](#) describes the cflowd export filter precedence.

*Table 54: Cflowd Export Filter Precedence*

| Family Filter | Router Filter | Interface Filter | Export to Collector                         |
|---------------|---------------|------------------|---------------------------------------------|
| 0             | 0             | 0                | export all                                  |
| 0             | 0             | 1                | export if matched interface only            |
| 0             | 1             | 0                | export if matched router only               |
| 0             | 1             | 1                | export if router match *OR* interface match |
| 1             | 0             | 0                | not exported due to family exclusion filter |
| 1             | 0             | 1                | not exported due to family exclusion filter |
| 1             | 1             | 0                | not exported due to family exclusion filter |
| 1             | 1             | 1                | not exported due to family exclusion filter |

## interface-parameters

### Syntax

**interface-parameters**

### Context

[\[Tree\]](#) (config>router>ldp interface-parameters)

### Full Context

configure router ldp interface-parameters

### Description

Commands in this context configure LDP interfaces and parameters applied to LDP interfaces. The user can configure different default parameters for IPv4 and IPv6 LDP interfaces by entering **ipv4** or **ipv6** as the next command.

### Platforms

All

## 13.188 interface-subnets

## interface-subnets

### Syntax

**interface-subnets** [**service** *service-id*] *interface-name*

**no interface-subnets**

### Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from interface-subnets)

### Full Context

configure router policy-options policy-statement entry from interface-subnets

### Description

This command configures the applied router instance and interfaces that are used as matching condition within each policy-statement entry. A maximum of 10 *interface-name* entries is supported, and all entries must belong to the same routing context (either **base** or **service**). The interface subnet policy-statement match criterion is applied to the following unicast use case contexts:

- **export**, when used with OSPFv2, OSPFv3, IS-IS, RIP, RIPng, and BGP
- **route-table-import**, when used with BGP
- **vrf-export**, when used with MP-BGP

The **no** form of this command removes all policies from the configuration.

### Default

no interface-subnets

### Parameters

#### **service**

Specifies the context in which the configured interface exists. By default, the base routing instance is assumed. However, the configured service context is used only when the service is configured.

#### **service-id**

Specifies the service ID of the service to match.

**Values**    *service-id* — 1 to 2147483647  
              *svc-name* — 64 characters maximum

#### **interface-name**

Specifies the interface name, up to 32 characters, to match when exporting the IP address of the associated interface to a routing protocol.

configure service vpls spoke-sdp eth-cfm mep ais-enable interface-support-enable

configure service vpls sap eth-cfm mep ais-enable interface-support-enable

configure service epipe sap eth-cfm mep ais-enable interface-support-enable

configure service vpls mesh-sdp eth-cfm mep ais-enable interface-support-enable

### Description

This command enables the AIS function to consider the operational state of the entity on which it is configured. With this command, ETH-AIS on DOWN MEPs are triggered and cleared based on the operational status of the entity on which it is configured. If CCM is also enabled, then transmission of the AIS PDU is based on either the non-operational state of the entity or on any CCM defect condition. AIS generation ceases if both the operational state is UP and the CCM has no defect conditions. If the MEP is not CCM-enabled then the operational state of the entity is the only consideration, assuming this command is present for the MEP. By default, AIS is not generated or stopped based on the state of the entity on which the DOWN MEP is configured.

The **no** form of this command disables the AIS function to consider the operational state of the entity on which it is configured.

### Default

no interface-support-enabled

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### interface-type

#### Syntax

**interface-type** {gn | s2a | s2b | s11}

**no interface-type**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>gtp>peer-profile interface-type)

#### Full Context

configure subscriber-mgmt gtp peer-profile interface-type

#### Description

This command specifies the interface applicable for communications to the peer. If the interface type does not match the given context in an uplink context, the peer setup will fail.

The **no** form of this command reverts to the default value.

#### Default

interface-type s2a

#### Parameters

**gn**

Signaling interface with the peer is Gn as specified in 3GPP TS 29.060.

**s2a**

Signaling interface with the peer is s2a as specified in 3GPP TS 29.274.

**s2b**

Signaling interface with the peer is s2b as specified in 3GPP TS 29.274.

**s11**

Signaling interface with the peer is s11 as specified in 3GPP TS 29.274.

## Platforms

## interface-type

### Syntax

**interface-type** {**broadcast** | **point-to-point**}

**no interface-type**

### Context

[\[Tree\]](#) (config>service>vprn>isis>if interface-type)

### Full Context

configure service vprn isis interface interface-type

### Description

This command configures the IS-IS interface type as either broadcast or point-to-point.

Use this command to set the interface type of an Ethernet link to point-to-point to avoid having to carry the designated IS-IS overhead if the link is used as a point-to-point.

If the interface type is not known at the time the interface is added to IS-IS and subsequently the IP interface is bound (or moved) to a different interface type, then this command must be entered manually.

The **no** form of this command reverts to the default value.

### Default

point-to-point — For IP interfaces on SONET channels.

broadcast — For IP interfaces on Ethernet or unknown type physical interfaces.

### Parameters

#### **broadcast**

Configures the interface to maintain this link as a broadcast network.

#### **point-to-point**

Configures the interface to maintain this link as a point-to-point link.

### Platforms

All

## interface-type

### Syntax

**interface-type** {**broadcast** | **point-to-point** | **non-broadcast** | **p2mp-nbma**}

**no interface-type**

### Context

**[Tree]** (config>service>vprn>ospf>area>if interface-type)

**[Tree]** (config>service>vprn>ospf3>area>if interface-type)

### Full Context

configure service vprn ospf area interface interface-type

configure service vprn ospf3 area interface interface-type

### Description

This command configures the interface type to:

- broadcast
- non-broadcast
- point-to-point
- point-to-multipoint on a link without broadcast or multicast support

Use this command to set the interface type of an Ethernet link to point-to-point to avoid having to carry the broadcast adjacency maintenance overhead if the Ethernet link provided the link is used as a point-to-point.

For subscriber interfaces, configure the adjacent interface (CPE) with interface type point-to-point. For subscriber interfaces, when the interface is configured as P2MP-NBMA, the subscriber interface becomes an active OSPF interface, allowing it to both send and receive OSPF LSAs. For all other interface types, subscriber interfaces remain as passive OSPF interfaces by default.

The **no** form of this command reverts to the default value.

### Default

point-to-point — If the physical interface is SONET.

broadcast — If the physical interface is Ethernet or unknown.

### Parameters

#### **broadcast**

Specifies the interface as a broadcast network. To significantly improve adjacency forming and network convergence, configure the network as point-to-point if only two routers are connected, even if the network is a broadcast media such as Ethernet.

#### **point-to-point**

Specifies the interface as a point-to-point link. Set the interface type of an Ethernet link to point-to-point to avoid having to carry the broadcast adjacency maintenance overhead if the Ethernet link provided is used as a point-to-point.

**non-broadcast**

Specifies the interface as a non-broadcast network.

**p2mp-nbma**

Specifies the interface as a point-to-multipoint on a link without broadcast or multicast support. No designated router or backup designated router is elected on this type of interface and all OSPF neighbors connect through individual point-to-point links. Only VPRN and IES services interfaces support this interface type.

**Platforms**

**Full Context**

```
configure system sync-if-timing bits interface-type
```

**Description**

This command configures the Building Integrated Timing Source (BITS) timing reference.

The **no** form of the command reverts to the default configuration.

**Default**

```
interface-type ds1 esf
```

**Parameters****ds1 esf**

Specifies Extended Super Frame (ESF). This is a framing type used on DS1 circuits that consists of 24 192-bit frames, The 193rd bit provides timing and other functions.

**ds1 sf**

Specifies Super Frame (SF), also called D4 framing. This is a common framing type used on DS1 circuits. SF consists of 12 192-bit frames. The 193rd bit provides error checking and other functions. ESF supersedes SF.

**e1 pcm30crc**

Specifies the pulse code modulation (PCM) type. PCM30CRC uses PCM to separate the signal into 30 user channels with CRC protection.

**e1 pcm31crc**

Specifies the pulse code modulation (PCM) type. PCM31CRC uses PCM to separate the signal into 31 user channels with CRC protection.

### Full Context

configure router ospf area interface interface-type

configure router ospf3 area interface interface-type

### Description

This command configures the interface type to:

- broadcast
- non-broadcast
- point-to-point
- point-to-multipoint on a link without broadcast or multicast support

Use this command to set the interface type of an Ethernet link to point-to-point to avoid having to carry the broadcast adjacency maintenance overhead of the Ethernet link provided the link is used as point-to-point.

For subscriber interfaces, configure the adjacent interface (CPE) with interface type point-to-point. For subscriber interfaces, when the interface is configured as P2MP-NBMA, the subscriber interface becomes an active OSPF interface, allowing it to both send and receive OSPF LSAs. For all other interface types, subscriber interfaces remain as passive OSPF interfaces by default.

The **no** form of this command returns the setting to the default value.

### Default

interface-type point-to-point (if the physical interface is SONET)

interface-type broadcast (if the physical interface is Ethernet or unknown)

### Parameters

#### **broadcast**

Specifies the interface as a broadcast network. To significantly improve adjacency forming and network convergence, configure a network as point-to-point if only two routers are connected, even if the network is a broadcast media such as Ethernet.

#### **point-to-point**

Specifies the interface as a point-to-point link. Set the interface type of an Ethernet link to point-to-point to avoid having to carry the broadcast adjacency maintenance overhead if the Ethernet link provided is used as a point-to-point.

#### **non-broadcast**

Specifies the interface as a non-broadcast network.

### **p2mp-nbma**

Specifies the interface as a point-to-multipoint on a link without broadcast or multicast support. No designated router or backup designated router is elected on this type of interface and all OSPF neighbors connect through individual point-to-point links. Only VPRN and IES services interfaces support this interface type.

## **Context**

[\[Tree\]](#) (config>service>vpls>sap>dhcp6>ldra interface-type)

## **Full Context**

configure service vpls sap dhcp6 ldra interface-type

## **Description**

This command configures LDRA interface type as either client or network facing.

The **no** form of this command reverts to the default value.

## **Default**

no interface-type

## **Parameters**

### **client-facing**

Configures the SAP as an untrusted client-facing interface. Only DHCPv6 client messages are accepted and encapsulated in a Relay-Forward message. It is mandatory to configure an interface ID for client-facing SAPs. Relay-Forward, Relay-Reply, and DHCPv6 server messages are silently dropped when received on a client-facing SAP

### **network-facing**

Configures the SAP as a network-facing interface. Only Relay-Reply messages are accepted: the server message is extracted from the Relay-Reply message and forwarded in the VPLS. All other DHCPv6 message types are silently dropped when received on a network-facing SAP.

configure subscriber-mgmt diameter-application-policy gy extended-failure-handling interim-credit

#### Description

Commands in this context configure interim credit parameters for Extended Failure Handling (EFH).

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.192 interim-update

### interim-update

#### Syntax

**interim-update**

**interim-update include-counters** [**hold-down** *seconds*]

**no interim-update**

#### Context

[\[Tree\]](#) (config>service>vprn>wlan-gw>mobility-triggered-acct interim-update)

[\[Tree\]](#) (config>router>wlan-gw>mobility-triggered-acct interim-update)

#### Full Context

configure service vprn wlan-gw mobility-triggered-acct interim-update

configure router wlan-gw mobility-triggered-acct interim-update

## Description

This command enables the inclusion of counters with a **hold-down** time option in mobility-triggered interim updates. When enabled, to disable the inclusion of counters, interim updates must be disabled and then re-enabled without the **include-counters** keyword. By default, the **hold-down** time is not imposed.

The **no** form of this command disables generation of flash interim accounting updates to RADIUS when change in location of the UE is detected.

## Default

no interim-update

## Parameters

### **include-counters**

Specifies the inclusion of counters in mobility-triggered interim updates.

### **seconds**

Specifies the time, in seconds, that must elapse after a mobility-triggered interim with counters sent for the next mobility-triggered interim with counters to be sent.

**Values** 60 to 864000

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.193 interim-update-interval

interim-update-interval

## Syntax

**interim-update-interval** *minutes*

**no interim-update-interval**

## Context

[\[Tree\]](#) (config>app-assure>rad-acct-plcy interim-update-interval)

## Full Context

configure application-assurance radius-accounting-policy interim-update-interval

## Description

This command configures the interim update interval.

The **no** form of this command reverts to the default.

**Default**

no interim-update-interval

**Parameters*****minutes***

Specifies the interval at which subscriber accounting data will be updated. If set no value is specified then no interim updates will be sent.

**Values** 5 to 1080

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.194 interleave

interleave

**Syntax**

[no] interleave

**Context**

**[Tree]** (config>router>l2tp>group>mlppp interleave)

**[Tree]** (config>service>vprn>l2tp>group>mlppp interleave)

**Full Context**

configure router l2tp group mlppp interleave

configure service vprn l2tp group mlppp interleave

**Description**

This command is applicable only to LNS. Interleaving is supported only on MLPPPoX bundles that contain a single member link. If more than one link is present in the MLPPPoX bundle, interleaving is automatically disabled and a TRAP/log (tmnxMlpppBundleIndicatorsChange) is generated.

The minimum supported rate of the link on which interleaving is performed is 1 kb/s.

If configured at this level, interleaving is enabled on all tunnels within the group, unless it is explicitly disabled per tunnel.

The **no** form of this command reverts to the default.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

## interleave

### Syntax

**interleave** {**always** | **never**}

**no interleave**

### Context

**[Tree]** (config>service>vprn>l2tp>group>tunnel>mlppp interleave)

**[Tree]** (config>router>l2tp>group>tunnel>mlppp interleave)

### Full Context

configure service vprn l2tp group tunnel mlppp interleave

configure router l2tp group tunnel mlppp interleave

### Description

This command configures the user of link fragmentation and interleaving and is applicable only to LNS. Interleaving is supported only on MLPPPoX bundles that contain a single member link. If more than one link is present in the MLPPPoX bundle, interleaving is automatically disabled and a TRAP/log (tmnxMlpppBundleIndicatorsChange) is generated.

The minimum supported rate of the link on which interleaving is performed is 1 kb/s.

Interleaving configured on this level overwrites the configuration option under the group hierarchy. If the **no** form of this command is configured for interleaving at this level, the interleaving configuration inherits the configuration option configured under the L2TP group.

The **no** form of this command reverts to the default.

### Parameters

#### **always**

Always perform interleaving on single linked MLPPPoX sessions within this tunnel, regardless of the configuration option for interleaving under the group level.

#### **never**

Never perform interleaving on single linked MLPPPoX sessions within this tunnel, regardless of the configuration option for interleaving under the group level.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

## interleave

### Syntax

**[no] interleave**

## Context

[\[Tree\]](#) (config>service>vprn>if>sap>frame-relay>frf.12 interleave)

## Full Context

```
configure service vprn interface sap frame-relay frf.12 interleave
```

## Description

This command enables interleaving of high priority frames and low-priority frame fragments within a FR SAP using FRF.12 end-to-end fragmentation.

When this option is enabled, only frames of the FR SAP non expedited forwarding class queues are subject to fragmentation. The frames of the FR SAP expedited queues are interleaved, with no fragmentation header, among the fragmented frames. In effect, this provides a behavior like in MLPPP Link Fragment Interleaving (LFI).

When this option is disabled, frames of all the FR SAP forwarding class queues are subject to fragmentation. The fragmentation header is however not included when the frame size is smaller than the user configured fragmentation size. In this mode, the SAP transmits all fragments of a frame before sending the next full or fragmented frame.

The receive direction of the FR SAP supports both modes of operation concurrently, with and without fragment interleaving.

The **no** form of this command restores the default mode of operation.

## Default

no interleave

## 13.195 internal-ip4-address

```
internal-ip4-address
```

## Syntax

```
[no] internal-ip4-address
```

## Context

[\[Tree\]](#) (config>ipsec>ike-policy>relay-unsol-attr internal-ip4-address)

## Full Context

```
configure ipsec ike-policy relay-unsolicited-cfg-attribute internal-ip4-address
```

## Description

This command will return IPv4 address from source (such as a RADIUS server) to IKEv2 remote-access tunnel client regardless if the client has requested it in the CFG\_REQUEST payload.

**Default**

no internal-ip4-address

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.196 internal-ip4-dns

internal-ip4-dns

**Syntax**

[no] internal-ip4-dns

**Context**

[\[Tree\]](#) (config>ipsec>ike-policy>relay-unsol-attr internal-ip4-dns)

**Full Context**

configure ipsec ike-policy relay-unsolicited-cfg-attribute internal-ip4-dns

**Description**

This command will return IPv4 DNS server address from source (such as a RADIUS server) to IKEv2 remote-access tunnel client regardless if the client has requested it in the CFG\_REQUEST payload.

**Default**

no internal-ip4-dns

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.197 internal-ip4-netmask

internal-ip4-netmask

**Syntax**

[no] internal-ip4-netmask

**Context**

[\[Tree\]](#) (config>ipsec>ike-policy>relay-unsol-attr internal-ip4-netmask)

**Full Context**

```
configure ipsec ike-policy relay-unsolicited-cfg-attribute internal-ip4-netmask
```

**Description**

This command will return IPv4 netmask from source (such as a RADIUS server) to IKEv2 remote-access tunnel client regardless if the client has requested it in the CFG\_REQUEST payload.

**Default**

```
no internal-ip4-netmask
```

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.198 internal-ip6-address

```
internal-ip6-address
```

**Syntax**

```
[no] internal-ip6-address
```

**Context**

[\[Tree\]](#) (config>ipsec>ike-policy>relay-unsol-attr internal-ip6-address)

**Full Context**

```
configure ipsec ike-policy relay-unsolicited-cfg-attribute internal-ip6-address
```

**Description**

This command will return IPv6 address from source (such as a RADIUS server) to IKEv2 remote-access tunnel client regardless if the client has requested it in the CFG\_REQUEST payload.

**Default**

```
no internal-ip6-address
```

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.199 internal-ip6-dns

## internal-ip6-dns

### Syntax

[no] internal-ip6-dns

### Context

[\[Tree\]](#) (config>ipsec>ike-policy>relay-unsol-attr internal-ip6-dns)

### Full Context

configure ipsec ike-policy relay-unsolicited-cfg-attribute internal-ip6-dns

### Description

This command will return IPv6 DNS server address from source (RADIUS server) to IKEv2 remote-access tunnel client regardless if the client has requested it in the CFG\_REQUEST payload.

### Default

no internal-ip6-dns

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.200 internal-lease-ipsec

## internal-lease-ipsec

### Syntax

[no] internal-lease-ipsec

### Context

[\[Tree\]](#) (config>service>vprn>dhcp6>server>lease-hold-time-for internal-lease-ipsec)

[\[Tree\]](#) (config>router>dhcp>server>lease-hold-time-for internal-lease-ipsec)

[\[Tree\]](#) (config>router>dhcp6>server>lease-hold-time-for internal-lease-ipsec)

[\[Tree\]](#) (config>service>vprn>dhcp>server>lease-hold-time-for internal-lease-ipsec)

### Full Context

configure service vprn dhcp6 local-dhcp-server lease-hold-time-for internal-lease-ipsec

configure router dhcp local-dhcp-server lease-hold-time-for internal-lease-ipsec

configure router dhcp6 local-dhcp-server lease-hold-time-for internal-lease-ipsec

configure service vprn dhcp local-dhcp-server lease-hold-time-for internal-lease-ipsec

## Description

This command enables the server to hold up the lease of local IPsec clients.

The **no** form of this command disables the ability of the server to hold up the lease of local IPsec clients.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.201 internal-scheduler-weight-mode

### internal-scheduler-weight-mode

#### Syntax

**internal-scheduler-weight-mode** {**default** | **force-equal** | **offered-load** | **capped-offered-load**}

**no internal-scheduler-weight-mode**

#### Context

[\[Tree\]](#) (config>card>virt-sched-adj internal-scheduler-weight-mode)

#### Full Context

configure card virtual-scheduler-adjustment internal-scheduler-weight-mode

#### Description

This command specifies the internal scheduler (tier 0) weight mode for all ingress queues on a LAG on the card on which it is applied.

#### Default

internal-scheduler-weight-mode default

#### Parameters

##### default

Specifies that ingress queues are weighted based on port speed or, if configured, the hash weight.

##### force-equal

Specifies that the ingress queues are always equally weighted.

##### offered-load

Specifies that the ingress queues are weighted based on observed offered load.

##### capped-offered-load

Specifies that the ingress queues are weighted based on observed offered load capped by PIR.

## Platforms

All

## internal-scheduler-weight-mode

### Syntax

**internal-scheduler-weight-mode** {**default** | **force-equal** | **offered-load** | **capped-offered-load**}

**no internal-scheduler-weight-mode**

### Context

**[Tree]** (config>qos>adv-config-policy>child-control>bandwidth-distribution internal-scheduler-weight-mode)

### Full Context

configure qos adv-config-policy child-control bandwidth-distribution internal-scheduler-weight-mode

### Description

This command specifies the internal scheduler (tier 0) weight mode for the queues on a LAG on which the advanced configuration policy is applied.

### Default

internal-scheduler-weight-mode default

### Parameters

#### default

Specifies that queues are weighted based on the port speed or, if configured, the hash weight.

#### force-equal

Specifies that the queues are always equally weighted.

#### offered-load

Specifies that the queues are weighted based on the observed offered load.

#### capped-offered-load

Specifies that the queues are weighted based on the observed offered load capped by PIR.

## 13.202 intersite-shared

## intersite-shared

### Syntax

**intersite-shared** [**persistent-type5-adv**] [**kat-type5-adv-withdraw**]

**no intersite-shared**

### Context

**[Tree]** (config>service>vprn>mvpn intersite-shared)

### Full Context

configure service vprn mvpn intersite-shared

### Description

This command specifies whether to use inter-site shared C-trees or not. Optional parameters allow enabling additional inter-site shared functionality. Not specifying an optional parameter when executing the command disables that parameter.

### Default

n/a

### Parameters

#### **persistent-type5-adv**

When specified for inter-site shared trees enabled, this parameter ensures that Type 5 SA routes are generated for the multicast source even if no joins are present for that source. When the parameter is not specified, the Type 5 SA routes are withdrawn where the prune from the last receiver is received for the multicast source.

#### **kat-type5-adv-withdraw**

When specified for inter-site shared trees, this parameter allows operators to enable KeepAlive Timers (KAT) on source PEs for ng-MVPN inter-site shared deployments. On a multicast source failure, a KAT expiry on source PEs will trigger a withdrawal of Type-5 Source-Active (S-A) route and switch from (C-S,C-G) to (C-\*,C-G). When receiver PEs process reflected Type-5 S-A route withdrawals, they will withdraw their Type-7 ng-MVPN routes to the failed multicast source. The following conditions apply:

- KAT must only be enabled on source PEs.
- Functionality is supported with mLDP and RSVP-TE in the P-instance.
- Local receiver per (C-S, C-G) must be configured on source PEs running KAT.

## 13.203 interval

## interval

### Syntax

**interval** *seconds*

**no interval**

### Context

**[Tree]** (config>subscr-mgmt>diam-appl-plcy>gy>ccrt-replay interval)

**[Tree]** (config>subscr-mgmt>diam-appl-plcy>gx>ccrt-replay interval)

### Full Context

configure subscriber-mgmt diameter-application-policy gy ccrt-replay interval

configure subscriber-mgmt diameter-application-policy gx ccrt-replay interval

### Description

This command specifies the interval at which CCR-T messages for Diameter Gx or Gy sessions that belong to the Diameter application policy are replayed, until a valid CCA-t response is received or until the configured **max-lifetime** period expires.

The **no** form of this command resets the interval to the default setting.

### Default

interval 3600

### Parameters

#### *seconds*

Specifies the interval at which the CCR-T messages are replayed for a gx session. The messages are replayed until a valid CCA-t response is received or until a 24 hour period expires, whichever comes first.

**Values** 60 to 86400

**Default** 3600

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service vprn static-route-entry next-hop cpe-check interval

### Description

This optional parameter specifies the interval between ICMP pings to the target IP address.

### Default

interval 1

## Parameters

### *seconds*

An integer interval value.

**Values** 1 to 255

## Platforms

All

## interval

## Syntax

`interval seconds`

`no interval`

## Context

[\[Tree\]](#) (config>router>mpls>lsp-self-ping interval)

## Full Context

configure router mpls lsp-self-ping interval

## Description

This command configures the interval at which LSP Self Ping packets are periodically sent on a candidate path of an RSVP LSP. This value is used for all LSPs that have LSP Self Ping enabled.

The **no** form of this command reverts to the default value.

## Default

interval 1

## Parameters

### *seconds*

Specifies the value, in seconds, used as the fast retry timer for a secondary path.

**Values** 1 to 10

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## interval

## Syntax

`interval {one-time | minimum-interval}`

## Context

[\[Tree\]](#) (config>app-assure>group>http-notif interval)

## Full Context

configure application-assurance group http-notification interval

## Description

This command configures the minimum interval in between notification messages. It can be set to **one-time** or a value in minutes from 1 to 1440.

The **no** form of this command removes the interval from the http-notification policy.

## Default

interval one-time

## Parameters

### *minimum-interval*

Represents the minimum interval value in minutes in between two http notifications.

**Values** 1 to 1440

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## interval

## Syntax

**interval** *minutes*

**no interval**

## Context

[\[Tree\]](#) (config>test-oam>ldp-treetrace>path-discovery interval)

## Full Context

configure test-oam ldp-treetrace path-discovery interval

## Description

This command configures the frequency of the LDP ECMP OAM path discovery. Every interval, the node sends LSP trace messages to attempt to discover the entire ECMP path tree for a given destination FEC.

The **no** form of this command removes the value from the configuration.

## Default

no interval

## Parameters

### *minutes*

Specifies the number of minutes to wait before repeating the LDP tree auto discovery process.

**Values** 60 to 1440

## Platforms

All

## interval

### Syntax

**interval** *seconds*

**no interval**

### Context

[\[Tree\]](#) (config>test-oam>icmp>ping-template interval)

### Full Context

configure test-oam icmp ping-template interval

### Description

This command configures the packet transmit interval used when the interface is operational and possibly transitioning from up to down, but not down to up, because of the ping-template function.

The **no** form of this command reverts to the default value.

### Default

interval 60

### Parameters

*seconds*

Sets the packet transmit interval, in seconds, when the interface is operational.

**Values** 1 to 60

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## interval

### Syntax

**interval** *minutes*

**no interval**

### Context

[\[Tree\]](#) (config>test-oam>ldp-treetrace>path-probing interval)

## Full Context

configure test-oam ldp-treetrace path-probing interval

## Description

This command configures the frequency of the LSP Ping messages used in the path probing phase to probe the paths of all LDP FECs discovered by the LDP tree trace path discovery.

The **no** form of this command resets the interval to its default value.

## Default

no interval

## Parameters

### *minutes*

Specifies the number of minutes to probe all active ECMP paths for each LDP FEC.

**Values** 1 to 60

## Platforms

All

## interval

## Syntax

**interval** *interval*

**no interval**

## Context

**[Tree]** (config>saa>test>type-multi-line>lsp-ping>sr-policy interval)

configure saa test type-multi-line lsp-ping sr-policy interval

configure saa test type-multi-line lsp-trace sr-policy interval

configure saa test type-multi-line lsp-ping interval

## Description

This command configures the number of seconds to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

The **no** form of this command reverts to the default value.

**Default**

interval 1

**Parameters*****interval***

Specifies the number of seconds to wait before the next message request is sent.

**Values** 1 to 10

**Default** 1

**Platforms**

All

**interval****Syntax**

**interval** *milliseconds*

**no interval**

**Context**

[\[Tree\]](#) (config>oam-pm>session>ethernet>lmm interval)

[\[Tree\]](#) (config>oam-pm>session>ethernet>dmm interval)

**Full Context**

configure oam-pm session ethernet lmm interval

configure oam-pm session ethernet dmm interval

**Description**

This command defines the message period or probe spacing for the transmission of the DMM or LMM frame.

The **no** form of this command sets the interval to the default. If an LMM test is in **no shutdown** state, it always has timing parameters, whether default or operator configured.

**Parameters*****milliseconds***

Specifies the number of milliseconds between the transmission of the DMM or LMM frames. The default value for the DMM or LMM interval is different than the default interval for SLM. This is intentional.

**Values** 50, 100, 200, 300, 400, 500, 600, 700, 800, 900, 1000, 10000

**Default** 1000

## Platforms

**no interval**

### Context

[\[Tree\]](#) (config>oam-pm>session>ip>twamp-light interval)

### Full Context

configure oam-pm session ip twamp-light interval

### Description

This command defines the message period, or probe spacing, for transmitting a TWAMP Light frame.

The **no** form of this command sets the interval to the default value.

### Default

interval 1000

### Parameters

#### *milliseconds*

Specifies the number of milliseconds between TWAMP Light frame transmission.

**Values** 50, 100, 200, 300, 400, 500, 600, 700, 800, 900, 1000, 10000

**Default** 1000

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### Description

This command configures the interval between ICMP pings to the target CPE IP address.

### Default

interval 1

### Parameters

#### *seconds*

Specifies the interval value, in seconds.

**Values** 1 to 255

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.204 intervals-stored

### intervals-stored

### Syntax

```
intervals-stored intervals
```

```
no intervals-stored
```

### Context

[\[Tree\]](#) (config>oam-pm>session>meas-interval intervals-stored)

### Full Context

```
configure oam-pm session meas-interval intervals-stored
```

### Description

This command defines the number of completed measurement intervals per session to be stored in volatile system memory. The entire block of memory is allocated for the measurement interval when the test is active ( **no shutdown**) to ensure memory is available. The numbers are increasing from 1 to the configured value + 1. The active pm data is stored in the interval number 1 and older runs are stored, in order, to the upper most number with the oldest rolling off when the number of completed measurement intervals exceeds the configured value+1. As new test measurement intervals complete for the session,

the stored intervals are renumbered to maintain the described order. Use caution when setting this value. There must be a balance between completed runs stored in volatile memory and the use of the write-to-flash function of the accounting policy.

The **5-mins** and **15-mins** measurement intervals share the same (1 to 96) retention pool. In the event that both intervals are required, the sum total of both intervals cannot exceed 96. The **1-hour** and **1-day** measurement intervals utilize their own ranges.

If this command is omitted when configuring the measurement interval, the default value is used.

The **no** form of the command reverts to the default.

## Default

intervals-stored 1

## Parameters

### *intervals*

Specifies the number of measurement intervals.

|                |                         |
|----------------|-------------------------|
| <b>Values</b>  | <b>5-mins:</b> 1 to 96  |
|                | <b>15-mins:</b> 1 to 96 |
|                | <b>1-hour:</b> 1 to 24  |
|                | <b>1-day:</b> 1         |
| <b>Default</b> | <b>5-mins:</b> 32       |
|                | <b>15-mins:</b> 32      |
|                | <b>1-hour:</b> 8        |

invert-data

## Syntax

[no] invert-data

## Context

[\[Tree\]](#) (config>port>tdm>ds1 invert-data)

[\[Tree\]](#) (config>port>tdm>e1 invert-data)

**Full Context**

```
configure port tdm ds1 invert-data
configure port tdm e1 invert-data
```

**Description**

This command causes all data bits to be inverted, to guarantee ones density. Typically used with AMI line encoding.

**Default**

```
no invert-data
```

**Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 13.206 invert-match

```
invert-match
```

**Syntax**

```
[no] invert-match
```

**Context**

[\[Tree\]](#) (config>app-assure>group>tether-detect>sngl-dev invert-match)

**Full Context**

```
configure application-assurance group tethering-detection single-device invert-match
```

**Description**

This command configures AA to classify flows with expected TTL values as coming from connected devices (tethered).

The **no** form of this command configures AA to classify flows with expected TTL values as coming from the host device (untethered).

**Default**

```
no invert-match
```

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.207 iom

iom

### Syntax

**iom** *slot-number* **type** {[ **load-balancer**] [**ue-anchor**]}

**no iom** *slot-number*

### Context

[\[Tree\]](#) (config>isa>wlan-gw-group iom)

### Full Context

configure isa wlan-gw-group iom

### Description

This command designates the specified IOM as a WLAN-GW IOM. Each WLAN-GW IOM must be provisioned with two ISA-BB modules on a hardware chassis and with an ISA-BB module in the first MDA slot in the VSR.

The **no** form of this command removes the IOM from the configuration.

### Parameters

#### **slot-number**

Indicates the IOM slot to be used in the WLAN-GW group.

**Values** 1 to 10

#### **type** {[**load-balancer**] [**ue-anchor**]}

This parameter is supported on the VSR only. It determines if an IOM slot is used for load-balancing or UE anchoring and processing, or both. When the **wlan-gw-group** has only a single IOM, it is required to put this IOM in both modes at the same time.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

iom

### Syntax

**iom** [**detail**]

**no iom**

### Context

[\[Tree\]](#) (debug>router>mpls>event iom)

**Full Context**

debug router mpls event iom

**Description**

This command reports MPLS debug events originating from the XMA.

The **no** form of the command disables the debugging.

**Parameters****detail**

Displays detailed information about MPLS events originating from the XMA.

**Platforms**

All

## 13.208 ip

ip

**Syntax**

*ip address*

**no ip**

**Context**

[\[Tree\]](#) (config>service>vpls>mcr-default-gtw ip)

**Full Context**

configure service vpls mcr-default-gtw ip

**Description**

This command relates to a system configured for Dual Homing in L2-TPSDA. It defines the IP address used when the system sends out a gratuitous ARP on an active SAP after a ring heals or fails in order to attract traffic from subscribers on the ring with connectivity to that SAP.

The **no** form of this command reverts to the default.

**Default**

no ip

**Parameters****address**

Specifies the IP address in a.b.c.d. format.

## Platforms

All

ip

## Syntax

ip *ip-filter-id*

no ip

## Context

## Full Context

configure filter ip-filter entry match ip

## Description

This command configures a destination or source IP address to be used as an IP match criterion.

## Parameters

### *ip-address/mask*

Specifies the IPv4 address and mask.

| Values     |         |
|------------|---------|
| ip-address | a.b.c.d |

### *netmask*

Specifies the name of the IP prefix list, up to 256 characters.

### *ip-prefix-list-name*

Specifies the name of an IP prefix list, up to 32 characters.

## Platforms

All

ip

## Syntax

**ip** *ipv6-address ipv6-address-mask*

**ip** *ipv6-address/mask*

**ip** **ipv6-prefix-list** *prefix-list-name*

**no ip**

## Context

[\[Tree\]](#) (config>filter>ipv6-filter>entry>match ip)

## Full Context

configure filter ipv6-filter entry match ip

## Description

This command configures a destination or source IP address to be used as an IP match criterion.

## Parameters

### *ipv6-address/mask*

Specifies the IPv6 address and mask.

|               |                                                                                                             |

## 13.209 ip-addr-backup

### ip-addr-backup

**Syntax**

**ip-addr-backup** *ip-address[:port]*

**no ip-addr-backup**

**Context**

[\[Tree\]](#) (config>sflow>receiver ip-addr-backup)

**Full Context**

configure sflow receiver ip-addr-backup

**Description**

This command configures back-up IPv4 or IPv6 destination address for the sFlow agent to send sFlow datagrams to. Optionally a destination port can also be configured (by default port 6343 is used).

The **no** form of this command deletes backup sFlow receiver destination.

**Parameters*****ip-address***

Specifies the IPv4 or IPv6 address to send the sFlow datagrams to.

|               |               |        |
|---------------|---------------|--------|
| <b>Values</b> | a.b.c.d       | (IPv4) |
|               | x:x:x:x:x:x   | (IPv6) |
|               | [x:x:x:x:x:x] | (IPv6) |

x - [0 to FFFF]H

**port**

Specifies the UDP destination port to send the sFlow datagrams to.

**Values** 1 to 65535

**Platforms**

7750 SR, 7750 SR-s, 7950 XRS

## 13.210 ip-addr-primary

### ip-addr-primary

**Syntax**

**ip-addr-primary** *ip-address[:port]*

**no ip-addr-primary**

**Context**

[\[Tree\]](#) (config>sflow>receiver ip-addr-primary)

**Full Context**

configure sflow receiver ip-addr-primary

**Description**

This command configures primary IPv4 or IPv6 destination address for the sFlow agent to send sFlow datagrams to. Optionally a destination port can also be configured (by default port 6343 is used).

The **no** form of this command deletes primary sFlow receiver destination.

**Parameters**

***ip-address***

Specifies the IPv4 or IPv6 address to send the sFlow datagrams.

**Values**

a.b.c.d (IPv4)

x:x:x:x:x:x:x (IPv6)

[x:x:x:x:x:x:x] (IPv6)

x - [0..FFFF]H

**port**

Specifies the UDP destination port to send the sFlow datagrams.

**Values** 1 to 65535

### Platforms

7750 SR, 7750 SR-s, 7950 XRS

## 13.211 ip-addr1

### ip-addr1

#### Syntax

**ip-addr1** {**eq** | **neq**} *ip-address*

**no ip-addr1**

#### Context

[\[Tree\]](#) (debug>app-assure>group>traffic-capture>match ip-addr1)

#### Full Context

debug application-assurance group traffic-capture match ip-addr1

#### Description

This command configures debugging on IP address 1.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.212 ip-addr2

### ip-addr2

#### Syntax

**ip-addr2** {**eq** | **neq**} *ip-address*

**no ip-addr2**

#### Context

[\[Tree\]](#) (debug>app-assure>group>traffic-capture>match ip-addr2)

**Full Context**

```
debug application-assurance group traffic-capture match ip-addr2
```

**Description**

This command configures debugging on IP address 2.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**13.213 ip-address****ip-address****Syntax**

```
ip-address ipv6-address
```

```
no ip-address
```

**Context**

[\[Tree\]](#) (conf>router>segment-routing>sr-policies>policy>srv6>binding-sid ip-address)

**Full Context**

```
configure router segment-routing sr-policies static-policy segment-routing-v6 binding-sid ip-address
```

**Description**

This command configures an SRv6 binding SID for a remote SRv6 policy. It cannot be used with a local head-end location (defined with the **head-end local** command in the **conf>router>segment-routing>sr-policies>policy**).

This command and the **locator** or **micro-segment-locator** command in the **conf>router>segment-routing>sr-policies>policy>srv6>binding-sid** context are mutually exclusive.

If the remote head-end is an SR OS system, the binding SID can either be regular or uSID and, in the latter case, must be configured with the node ID in the following format: <block><uN><uB6>::.

The **no** form of this command removes the configuration.

**Parameters*****ipv6-address***

Specifies the SRv6 binding SID as a 128 bit IPv6 address.

**Values**    x:x:x:x:x:x (16 eight-bit pieces) or x:x:x:x:d:d:d

          x — [0 to FFFF]H

          d — [0 to 255]D

**Platforms**

**13.214 ip-advertise-routes**

## ip-advertise-routes

### Syntax

**ip-advertise-routes**

### Context

[\[Tree\]](#) (config>subscr-mgmt>isa-svc-chain>evpn>export ip-advertise-routes)

### Full Context

configure subscriber-mgmt isa-service-chaining evpn export ip-advertise-routes

### Description

Commands in this context configure EVPN routes to be advertised to a BGP EVPN peer participating in service chaining.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.215 ip-assigned

## ip-assigned

### Syntax

**[no] ip-assigned**

### Context

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>ue-query>state ip-assigned)

### Full Context

configure subscriber-mgmt wlan-gw ue-query state ip-assigned

### Description

This command enables matching on UEs in an IP-assigned state, meaning that the UE already has an IP assigned but it is not yet authorized. This usually only applies when **auth-on-dhcp** is not configured.

The **no** form of this command disables matching on UEs in an IP-assigned state, unless all state matching is disabled.

### Default

no ip-assigned

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.216 ip-assigned-authorized

ip-assigned-authorized

### Syntax

[no] ip-assigned-authorized

### Context

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>ue-query>state ip-assigned-authorized)

### Full Context

configure subscriber-mgmt wlan-gw ue-query state ip-assigned-authorized

### Description

This command enables matching on UEs in an IP-assigned and authorized state, meaning that the UE already has an IP assigned and is authorized, but is not yet promoted to a final state such as ESM or DSM. This applies to UEs authenticated by distributed RADIUS proxy without **auth-on-dhcp** configured. UEs move to this state upon DHCP completion and continue to a more final state (such as DSM, ESM, or portal) upon receiving the first data packet.

The **no** form of this command disables matching on UEs in an IP-assigned and authorized state, unless all state matching is disabled.

### Default

no ip-assigned-authorized

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.217 ip-cache

ip-cache

### Syntax

ip-cache

**Context**

[\[Tree\]](#) (config>app-assure>group>dns-ip-cache ip-cache)

**Full Context**

configure application-assurance group dns-ip-cache ip-cache

**Description**

This command configures the dns-ip-cache cache parameters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.218 ip-can-type

### ip-can-type

**Syntax**

[no] ip-can-type

**Context**

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>gx>include-avp ip-can-type)

**Full Context**

configure subscriber-mgmt diameter-application-policy gx include-avp ip-can-type

**Description**

This command includes the ip-can-type.

The **no** form of this command reverts to the default.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.219 ip-criteria

### ip-criteria

**Syntax**

[no] ip-criteria

## Context

[\[Tree\]](#) (config>qos>sap-egress ip-criteria)

[\[Tree\]](#) (config>qos>sap-ingress ip-criteria)

## Full Context

configure qos sap-egress ip-criteria

configure qos sap-ingress ip-criteria

## Description

IP criteria-based SAP ingress or egress policies are used to select the appropriate ingress or egress queue or policer and corresponding forwarding class and packet profile for matched traffic.

This command is used to enter the context to create or edit policy entries that specify IP criteria such as IP quintuple lookup or DiffServ code point.

The software implementation will exit on the first match found and execute the actions in accordance with the accompanying action command. For this reason, entries must be sequenced correctly from most to least explicit.

The **no** form of this command deletes all the entries specified under this node. When IP criteria entries are removed from a SAP ingress or egress policy, the IP criteria is removed from all services where that policy is applied.

## Platforms

All

## ip-criteria

## Syntax

**[no] ip-criteria**

## Context

[\[Tree\]](#) (config>qos>network>ingress ip-criteria)

[\[Tree\]](#) (config>qos>network>egress ip-criteria)

## Full Context

configure qos network ingress ip-criteria

configure qos network egress ip-criteria

## Description

IP criteria-based network ingress and egress policies are used to select the appropriate ingress or egress queue or policer, and the corresponding forwarding class and packet profile for matched traffic. This command is used to enter the context to create or edit policy entries that specify IP criteria such as IP quintuple lookup or DSCP.

The 7750 SR OS implementation will exit on the first match found and execute the actions in accordance with the accompanying action command. Entries must be sequenced correctly from most to least explicit.

The ingress classification only applies to the outer IP header of non-tunneled traffic. The only exception is for traffic received on a Draft Rosen tunnel, for which only classification on the outer IP header is supported.

Attempting to apply a network QoS policy containing an **ip-criteria** statement to any object except a network IP interface will result in an error.

The **no** form of this command deletes all entries specified under this node. When IP criteria entries are removed from a network policy, the IP criteria are removed from all network interfaces to which that policy is applied.

## Platforms

All

## ip-criteria

## Syntax

## 13.220 ip-exception

### ip-exception

#### Syntax

**ip-exception** *filter-id*

**no ip-exception**

#### Context

**[Tree]** (config>service>ies>if>ipsec ip-exception)

**[Tree]** (config>router>if>ipsec ip-exception)

**[Tree]** (config>service>vprn>if>ipsec ip-exception)

#### Full Context

configure service ies interface ipsec ip-exception

configure router interface ipsec ip-exception

configure service vprn interface ipsec ip-exception

#### Description

This command configures the IP exception filter for the secured interface. All ingress traffic matching by the specified filter bypasses IPsec processing.

The **no** form of this command removes the policy from the configuration.

#### Default

no ip-exception

#### Parameters

***filter-id***

Specifies IP filter policy that will be used to bypass encryption.

#### Platforms

VSR

### ip-exception

#### Syntax

**ip-exception** *filter-id* [**create**]

**no ip-exception** *filter-id*

## Context

[\[Tree\]](#) (config>filter ip-exception)

## Full Context

configure filter ip-exception

## Description

Commands in this context configure the specified IPv4 exception filter.

The **no** form of the command deletes the IPv4 exception filter.

## Parameters

### *filter-id*

Specifies the IPv4 filter policy ID expressed as a decimal integer.

**Values** 1 to 65535

### **create**

This keyword is required to create the configuration context. Once it is created, the context can be enabled with or without the **create** keyword.

## Platforms

VSR

## ip-exception

## Syntax

**ip-exception** *filter-id* **direction** {**inbound** | **outbound**}

**no ip-exception** **direction** {**inbound** | **outbound**}

## Context

[\[Tree\]](#) (config>router>if>group-encryption ip-exception)

## Full Context

configure router interface group-encryption ip-exception

## Description

This command associates an IP exception filter policy with an NGE-enabled router interface to allow packets matching the exception criteria to transit the NGE domain as clear text.

When an exception filter is added for inbound traffic, packets matching the criteria in the IP exception filter policy are allowed to be received in clear text even if an inbound key group is configured. If no inbound key group is configured, then associated inbound IP exception filter policies will be ignored.

When an exception filter is added for outbound traffic, packets matching the criteria in the IP exception filter policy are not encrypted when sent out of the router interface even if an outbound key group is

configured. If no outbound key group is configured, then associated outbound IP exception filter policies will be ignored.

The **no** form of this command removes the IP exception filter policy from the specified direction.

### Default

no ip-exception direction inbound

no ip-exception direction outbound

### Parameters

#### *filter-id*

Specifies the IP exception filter policy. The IP exception ID or exception name must have already been created.

**Values** 1 to 6553, *filter-name* (64 characters maximum)

#### **inbound**

Binds the exception filter policy in the inbound direction.

#### **outbound**

Binds the exception filter policy in the outbound direction.

### Platforms

VSR

## 13.221 ip-fast-reroute

### ip-fast-reroute

#### Syntax

[no] ip-fast-reroute

#### Context

[\[Tree\]](#) (config>router ip-fast-reroute)

#### Full Context

configure router ip-fast-reroute

#### Description

This command enables IP Fast-Reroute (FRR) feature on the system.

This feature provides for the use of a Loop-Free Alternate (LFA) backup next-hop for forwarding in-transit and CPM generated IP packets when the primary next-hop is not available. IP FRR is supported on IPv4 and IPv6 OSPF/IS-IS prefixes forwarded in the base router instance to a network IP interface or to an IES

SAP interface or spoke interface. It is also supported for VPRN VPN-IPv4 OSPF prefixes and VPN-IPv6 OSPF prefixes forwarded to a VPRN SAP interface or spoke interface.

IP FRR also provides a LFA backup next-hop for the destination prefix of a GRE tunnel used in an SDP or in VPRN auto-bind.

When any of the following events occurs, IGP instructs in the fast path on the XMAs to enable the LFA backup next-hop:

- OSPF/IS-IS interface goes operationally down: physical or local admin shutdown.
- Timeout of a BFD session to a next-hop when BFD is enabled on the OSPF/IS-IS interface

When the SPF computation determines there is more than one primary next-hop for a prefix, it will not program any LFA next-hop in RTM. Therefore, the IP prefix will resolve to the multiple equal-cost primary next-hops that provide the required protection.

The **no** form of this command disables the IP FRR feature on the system

### Default

no ip-fast-reroute

## 13.222 ip-filter

### ip-filter

#### Syntax

**ip-filter** *filter-id*

**no ip-filter** [**force**]

#### Context

[\[Tree\]](#) (config>subscr-mgmt>sla-profile>egress ip-filter)

[\[Tree\]](#) (config>subscr-mgmt>sla-profile>ingress ip-filter)

#### Full Context

configure subscriber-mgmt sla-profile egress ip-filter

configure subscriber-mgmt sla-profile ingress ip-filter

#### Description

This command configures an egress or ingress IP filter.

The **no** form of this command reverts to the default.

## Parameters

### *filter-id*

Specifies an existing IP filter policy ID.

**Values** 1 to 65535, or name, up to 64 characters

### **force**

Forces the exclusion of the IP filter.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## ip-filter

## Syntax

**ip-filter** *ip-filter-id* **entry** *entry-id* [*entry-id*]

**no ip-filter** *ip-filter-id* [**entry** *entry-id*]

## Context

[\[Tree\]](#) (config>mirror>mirror-source ip-filter)

## Full Context

configure mirror mirror-source ip-filter

## Description

This command enables mirroring of packets that match specific entries in an existing IP filter.

The **ip-filter** command directs packets which match the defined list of entry IDs to be mirrored to the mirror destination referenced by the *mirror-dest-service-id* of the **mirror-source**.

The IP filter must already exist in order for the command to execute. Filters are configured in the **config>filter** context. If the IP filter does not exist, an error will occur. If the filter exists but has not been associated with a SAP or IP interface, an error is not generated but mirroring will not be enabled (there are no packets to mirror). Once the IP filter is defined to a SAP or IP interface, mirroring is enabled.

If the IP filter is defined as ingress, only ingress packets are mirrored. Ingress mirrored packets are mirrored to the mirror destination prior to any ingress packet modifications.

If the IP filter is defined as egress, only egress packets are mirrored. Egress mirrored packets are mirrored to the mirror destination after all egress packet modifications.

An *entry-id* within an IP filter can only be mirrored to a single mirror destination. If the same *entry-id* is defined multiple times, an error occurs and only the first **mirror-source** definition is in effect.

By default, no packets matching any IP filters are mirrored. Mirroring of IP filter entries must be explicitly defined.

The **no ip-filter** command, without the **entry** keyword, removes mirroring on all *entry-id*'s within the *ip-filter-id*.

When the **no** command is executed with the **entry** keyword and one or more *entry-id*'s, mirroring of that list of *entry-id*'s is terminated within the *ip-filter-id*. If an *entry-id* is listed that does not exist, an error will occur and the command will not execute. If an *entry-id* is listed that is not currently being mirrored, no error will occur for that *entry-id* and the command will execute normally.

## Parameters

### *ip-filter-id*

Specifies the IP filter ID whose entries are mirrored. If the *ip-filter-id* does not exist, an error will occur and the command will not execute. Mirroring of packets will commence once the *ip-filter-id* is defined on a SAP or IP interface.

**Values** 1 to 65535  
name, up to 64 characters

### *entry-id*

Specifies the IP filter entries to use as match criteria for packet mirroring. The **entry** keyword begins a list of *entry-id*'s for mirroring. Multiple *entry-id* entries may be specified with a single command. Each *entry-id* must be separated by a space.

If an *entry-id* does not exist within the IP filter, an error occurs and the command will not execute.

If the filter's *entry-id* is renumbered within the IP filter definition, the old *entry-id* is removed but the new *entry-id* must be manually added to the configuration to include the new (renumbered) entry's criteria.

**Values** 1 to 2097151

## Platforms

All

## ip-filter

## Syntax

[no] **ip-filter** *ip-filter-id*

## Context

**[Tree]** (config>li>li-filter-block-reservation>li-reserved-block ip-filter)

## Full Context

configure li li-filter-block-reservation li-reserved-block ip-filter

## Description

This command configures to which normal IPv4 address filters the entry reservation is applied.

This command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**).

The **no** form of this command removes the IPv4 filter ID from the configuration.

## Parameters

### *ip-filter-id*

Specifies the filter identification identifies the normal IPv4 address filters.

|                      |                                                                                                                                                                    |

### Context

[\[Tree\]](#) (config>li>li-source ip-filter)

### Full Context

configure li li-source ip-filter

### Description

This command enables lawful interception (LI) of packets that match specific entries in an existing IP filter.

The **ip-filter** command directs packets which match the defined list of entry IDs to be intercepted to the destination referenced by the *mirror-dest-service-id* of the **mirror-source**.

The IP filter must already exist in order for the command to execute. Filters are configured in the **config>filter** context. If the IP filter does not exist, an error occurs. If the filter exists but has not been associated with a SAP or IP interface, an error is not generated but mirroring will not be enabled (there are no packets to mirror). Once the IP filter is defined to a SAP, IP interface or subscriber, mirroring is enabled.

If the IP filter is defined as ingress, only ingress packets are intercepted. Ingress packets are sent to the destination prior to any ingress packet modifications.

If the IP filter is defined as egress, only egress packets are intercepted. Egress packets are sent to the destination after all egress packet modifications.

An *entry-id* within an IP filter can only be intercepted to a single destination. If the same *entry-id* is defined multiple times, an error occurs and only the first definition is in effect.

By default, no packets matching any IP filters are intercepted. Interception of IP filter entries must be explicitly defined.

When the **no** command is executed with the **entry** keyword and one or more *entry-id*'s, interception of that list of *entry-id*'s is terminated within the *ip-filter-id*. If an *entry-id* is listed that does not exist, an error will occur and the command will not execute. If an *entry-id* is listed that is not currently being intercepted, no error will occur for that *entry-id* and the command will execute normally.

### Parameters

#### *ip-filter-id*

Specifies the IP filter ID whose entries are to be intercepted. If the *ip-filter-id* does not exist, an error will occur and the command will not execute. Intercepting packets will commence when the *ip-filter-id* is defined on a SAP or IP interface.

#### *entry-id*

Specifies the IP filter entries to use as match criteria for lawful intercept (LI). The **entry** keyword begins a list of *entry-id*'s for interception. Multiple *entry-id* entries can be specified

with a single command. Each *entry-id* must be separated by a space. Up to <N><n> 8 entry IDs may be specified in a single command.

If an *entry-id* does not exist within the IP filter, an error occurs and the command will not execute.

If the filter's *entry-id* is renumbered within the IP filter definition, the old *entry-id* is removed but the new *entry-id* must be manually added to the configuration to include the new (renumbered) entry's criteria.

### ***intercept-id***

Specifies the intercept ID that is inserted into the packet header for all mirrored packets of the associated **li-source** entry. This intercept ID can be used (for example by a downstream LI gateway) to identify the particular LI session to which the packet belongs. For all types of **li-source** entries (filter, nat, sap, subscriber), when the mirror service is configured with **ip-udp-shim** routable encap, an *intercept-id* field (as part of the routable encap) is always present in the mirrored packets. If there is no *intercept-id* configured for an **li-source** entry, then the default value is inserted. When the mirror service is configured with **ip-gre** routable encapsulation, no *intercept-id* is inserted and none should be specified against the **li-source** entries.

**Values** 1 to 4294967295 (32b) for **nat li-source** entries that are using a mirror service that is not configured with routable encap

1 to 1073741824 (30b) for all types of **li-source** entries that are using a mirror service with routable ip-udp-shim encap and no direction-bit.

1 to 536870912 (29b) for all types of **li-source** entries that are using a mirror service with routable **ip-udp-shim** encapsulation and with the **direction-bit** enabled.

### ***session-id***

Specifies the *session-id* that is inserted into the packet header for all mirrored packets of the associated **li-source** entry. This *session-id* can be used (for example by a downstream LI Gateway) to identify the particular LI session to which the packet belongs. The *session-id* is only valid and used for mirror services that are configured with **ip-udp-shim** routable encap ( **config>mirror>mirror-dest>encap>ip-udp-shim**). For all types of **li-source** entries (filter, nat, sap, subscriber), when the mirror service is configured with **ip-udp-shim** routable encap, a *session-id* field (as part of the routable encap) is always present in the mirrored packets. If there is no *session-id* configured for an **li-source** entry, then the default value is inserted. When a mirror service is configured with **ip-gre** routable encap, no *session-id* is inserted and none should be specified against the **li-source** entries.

**Values** 1 to 4,294,967,295 (32b)

**no ip-filter** *ip-filter-id* [**entry** *entry-id*]

## Context

[Tree] (debug>mirror-source ip-filter)

## Full Context

debug mirror-source ip-filter

## Description

This command enables mirroring of packets that match specific entries in an existing IP filter.

The **ip-filter** command directs packets which match the defined list of entry IDs to be mirrored to the mirror destination referenced by the *mirror-dest-service-id* of the **mirror-source**.

The IP filter must already exist in order for the command to execute. Filters are configured in the **config>filter** context. If the IP filter does not exist, an error will occur. If the filter exists but has not been associated with a SAP or IP interface, an error is not generated but mirroring will not be enabled (there are no packets to mirror). Once the IP filter is defined to a SAP or IP interface, mirroring is enabled.

If the IP filter is defined as ingress, only ingress packets are mirrored. Ingress mirrored packets are mirrored to the mirror destination prior to any ingress packet modifications.

If the IP filter is defined as egress, only egress packets are mirrored. Egress mirrored packets are mirrored to the mirror destination after all egress packet modifications.

An *entry-id* within an IP filter can only be mirrored to a single mirror destination. If the same *entry-id* is defined multiple times, an error occurs and only the first **mirror-source** definition is in effect.

By default, no packets matching any IP filters are mirrored. Mirroring of IP filter entries must be explicitly defined.

The **no ip-filter** command, without the **entry** keyword, removes mirroring on all *entry-id*'s within the *ip-filter-id*.

When the **no** command is executed with the **entry** keyword and one or more *entry-id*'s, mirroring of that list of *entry-id*'s is terminated within the *ip-filter-id*. If an *entry-id* is listed that does not exist, an error will occur and the command will not execute. If an *entry-id* is listed that is not currently being mirrored, no error will occur for that *entry-id* and the command will execute normally.

## Parameters

### *ip-filter-id*

The IP filter ID whose entries are mirrored. If the *ip-filter-id* does not exist, an error will occur and the command will not execute. Mirroring of packets will commence once the *ip-filter-id* is defined on a SAP or IP interface.

### *entry-id*

The IP filter entries to use as match criteria for packet mirroring. The **entry** keyword begins a list of *entry-id*'s for mirroring. A maximum of eight *entry-id* entries may be specified with a single command. Each *entry-id* must be separated by a space.

If an *entry-id* does not exist within the IP filter, an error occurs and the command will not execute.

If the filter's *entry-id* is renumbered within the IP filter definition, the old *entry-id* is removed but the new *entry-id* must be manually added to the configuration to include the new (renumbered) entry's criteria.

## Platforms

## ip-filter

## Syntax

**ip-filter** *filter-id* [**name**] [**create**]

**no ip-filter** {*filter-id* | *filter-name*}

## Context

[\[Tree\]](#) (config>filter ip-filter)

## Full Context

configure filter ip-filter

## Description

Commands in this context configure the specified IPv4 filter policy.

The **no** form of the command deletes the IPv4 filter policy. A filter policy cannot be deleted until it is removed from all objects where it is applied.

## Parameters

### *filter-id*

Specifies the IPv4 filter policy ID expressed as a decimal integer.

**Values** 1 to 65535

### *name*

Configures an optional filter name, up to 64 characters in length, to a given filter. This filter name can then be used in configuration references, display, and show commands throughout the system. A defined filter name can help the service provider or administrator to identify and manage filters within the SR OS platforms.

To create a filter, you must assign a filter ID, however, after it is created, either the filter ID or filter name can be used to identify and reference a filter.

If a name is not specified at creation time, then SR OS assigns a string version of the *filter-id* as the name.

Filter names may not begin with an integer (0 to 9).

### *filter-name*

Specifies a string, up to 64 characters, uniquely identifying this IPv4 filter policy.

### **create**

This keyword is required to create the configuration context. Once it is created, the context can be enabled with or without the **create** keyword.

## ip-filter

### Syntax

**ip-filter** *src-filter-id* [**src-entry** *src-entry-id*] **to** *dst-filter-id* [ **dst-entry** *dst-entry-id*] [**overwrite**]

### Context

[\[Tree\]](#) (config>filter>copy ip-filter)

### Full Context

configure filter copy ip-filter

### Description

This command copies an existing filter entry for a specific filter ID to another filter ID. The command is a configuration level maintenance tool used to create new entries using an existing filter policy. If **overwrite** is not specified, an error will occur if the destination filter entry exists.

### Parameters

#### **src-filter-id**

Identifies the source filter policy from which the copy command will attempt to copy. The filter policy must exist within the context of the preceding keyword ( **ip-filter**).

#### **dst-filter-id**

Identifies the destination filter policy to which the copy command will attempt to copy. If the **overwrite** keyword is not specified, the filter entry ID cannot already exist in the destination filter policy. If the **overwrite** keyword is present, the destination entry ID may or may not exist.

#### **overwrite**

Specifies that the destination filter entry may exist. If it does, everything in the existing destination filter entry will be completely overwritten with the contents of the source filter entry. If the destination filter entry exists, either **overwrite** must be specified or an error message will be returned. If **overwrite** is specified, the function of copying from source to destination occurs in a "break before make" manner and therefore should be handled with care.

## 13.223 ip-filter-max-size

### ip-filter-max-size

### Syntax

**ip-filter-max-size** {*value* | **default**}

## Context

[\[Tree\]](#) (config>service>vprn>flowspec ip-filter-max-size)

## Full Context

configure service vprn flowspec ip-filter-max-size

## Description

This command configures the maximum number of FlowSpec routes or rules that can be embedded into an ingress IP filter policy for a specified routing instance. FlowSpec filter entries embedded in a filter policy in this routing instance will use filter entries from the range between the embedding offset and "offset + ip-filter-max-size - 1".

The sum of the **ip-filter-max-size** *value* parameter and the highest offset in any IPv4 filter that embeds IPv4 FlowSpec rules from this routing instance (excluding filters that embed at offset 262143) must not exceed 262143.

The **ip-filter-max-size** configuration can be adjusted up or down at any time. If the number of IPv4 FlowSpec rules that are currently installed is *M*, and the new limit is *N*, where  $N < M$ , then the last set of rules from *N* to *M* (by FlowSpec order) are immediately removed, but are retained in the BGP RIB. If the limit is increased, new rules are programmed only as they are received again in new BGP updates.

## Default

ip-filter-max-size default

## Parameters

### *value*

The maximum number of FlowSpec routes or rules that can be embedded into an ingress IP filter policy.

**Values** 0 to 262143

### default

Configures the maximum size as 512.

## Platforms

All

## ip-filter-max-size

## Syntax

**ip-filter-max-size** {*value* | **default**}

## Context

[\[Tree\]](#) (config>router>flowspec ip-filter-max-size)

## Full Context

configure router flowspec ip-filter-max-size

## Description

This command configures the maximum number of FlowSpec routes or rules that can be embedded into the auto-created embedded filter (fSpec- X). FlowSpec filter entries embedded in a filter policy in this routing instance will use filter entries from the range between "embedding offset + 1" and "embedding offset + ip-filter-max-size".

The sum of the **ip-filter-max-size** *value* parameter and the highest offset in any IPv4 filter that embeds IPv4 FlowSpec rules from this routing instance (excluding filters that embed at offset 262143) must not exceed 262143.

The **ip-filter-max-size** configuration can be adjusted up or down at any time. If the number of IPv4 FlowSpec rules that are currently installed is *M*, and the new limit is *N*, where  $N < M$ , then the last set of rules from *N* to *M* (by FlowSpec order) are immediately removed, but are retained in the BGP RIB. If the limit is increased, new rules are programmed only as they are received again in new BGP updates.

## Default

ip-filter-max-size 512

## Parameters

### *value*

Specifies the maximum number of FlowSpec routes or rules that can be embedded into an ingress IP filter policy.

**Values** 0 to 262143

### default

Keyword to configure the maximum size as 512.

configure router nat inside dual-stack-lite address ip-fragmentation

configure router nat inside nat64 ip-fragmentation

configure service vprn nat inside dslite addressip-fragmentation ip-fragmentation

configure service vprn nat inside nat64 ip-fragmentation

## Description

This command configures downstream IPv6 fragmentation behavior in DS-Lite and NAT64. IPv6 fragmentation is performed in the ISA. IPv4 fragmentation is not affected by this command. If desired, downstream IPv4 packet can be fragmented in the carrier IOM before the packet reaches ISA (and the NAT function). The IPv4 fragmentation in the downstream direction can be set by the **config>router/vprn>nat>outside>mtu** command.

### DS-Lite IPv6 Fragmentation in Downstream Direction (IPv4 to IPv6)

In case that the length of the received IPv4 packet is larger than the configured tunnel-mtu value while fragmentation is allowed, the resulting IPv6 packet will be fragmented (IPv4 is tunneled within IPv6). The maximum size of the of the fragmented IPv6 packet will be 48bytes larger than the configured tunnel-mtu value. This is due to the size of the tunneling IPv6 header: 40bytes basic IPv6 header + 8 bytes of extended fragmentation IPv6 header.

In case that fragmentation is not allowed while the IPv4 packet size is larger than configured tunnel-mtu size, the IPv4 packet will be dropped and an ICMPv4 Datagram Too Big message will be generated towards the source. The advertised mtu size in that ICMP message will be set to configured tunnel-mtu value.

### NAT64 IPv6 Fragmentation in Downstream Direction (IPv4to IPv6)

In contrast to DS-Lite, NAT64 transport is not based on tunneling. Instead, IP headers are translated between IPv4 and IPv6. Consequently, NAT64 fragmentation operates based on the ipv6-mtu, as opposed to tunnel-mtu in DS-Lite which represents the size of the tunnel payload (IPv4 packet).

In case that the length of the translated IPv6 packet exceeds the size of the configured ipv6-mtu value while fragmentation is allowed, the resulting IPv6 packet will be fragmented. The maximum size of the of the fragmented IPv6 packet will be the configured ipv6-mtu value.

In case that fragmentation is not allowed while the translated IPv6 packet size is larger than configured ipv6-mtu size, the IPv4 packet (that is supposed to be translated into IPv6) will be dropped and an ICMPv4 Datagram Too Big message will be generated towards the source. The advertised mtu size in that ICMP message will be set to the ipv6-mtu value minus 28bytes. The 28bytes comes from the size of the IPv6 overhead of the translated packet (20bytes difference between the IP header sizes 40bytes in IPv6 vs 20bytes in IPv4; 8 bytes for extended IPv6 fragmentation header).

## Default

disabled

## Parameters

### **disabled**

IPv6 Fragmentation is disabled. In case that the packet size is larger than what is set by the mtu value (tunnel-mtu or ipv6-mtu) the IPv4 packet will be dropped and ICPMv4 Datagram Too Big messages will be sent back to the source.

### **fragment-ipv6**

IPv6 fragmentation will be performed in all cases, regardless of the DF bit setting in the tunneled/translated IPv4 packet.

### **fragment-ipv6-unless-ipv4-df-set**

IPv6 Fragmentation will be performed only in cases when DF bit in tunneled/translated IPv4 packet is cleared.

configure service vprn interface sap ipsec-tunnel ip-mtu
configure router interface ipsec ipsec-tunnel ip-mtu
configure service vprn interface ipsec ipsec-tunnel ip-mtu
```

## Description

This command configures the IP maximum transmit unit (packet) for this interface.

Because this connects a Layer 2 to a Layer 3 service, this parameter can be adjusted under the IES interface.

The MTU that is advertised from the IES size is:

MINIMUM((SdpOperPathMtu - EtherHeaderSize), (Configured ip-mtu))

By default (for the Ethernet network interface), if no ip-mtu is configured it is (1568 - 14) equals 1554.

The **ip-mtu** command instructs the MS-ISA to perform IP packet fragmentation, prior to IPsec encryption and encapsulation, based on the configured MTU value. In particular:

If the length of a payload IP packet (including its header) exceeds the configured MTU value and the DF flag is clear (due to the presence of the clear-df-bit command or because the original DF value was 0) then the MS-ISA fragments the payload packet as efficiently as possible (i.e. it creates the minimum number of fragments each less than or equal to the configured MTU size); in each created fragment the DF bit shall be 0.

If the length of a payload IP packet (including its header) exceeds the configured MTU value and the DF flag is set (because the original DF value was 1 and the tunnel has no clear-df-bit in its configuration) then the MS-ISA discards the payload packet without sending an ICMP type 3/code 4 message back to the packet's source address.

The effective MTU for packets entering a tunnel is the minimum of the private tunnel SAP interface IP MTU value (used by the IOM) and the tunnel IP MTU value (configured using the above command and used by the MS-ISA). To fragment IP packets larger than X bytes with DF set, rather than discarding them, the tunnel IP MTU should be set to X and the private tunnel SAP interface IP MTU should be set to a value larger than X.

The **no ip-mtu** command, corresponding to the default behavior, disables fragmentation of IP packets by the MS-ISA; all IP packets, regardless of size or DF bit setting, are allowed into the tunnel.

## Default

```
no ip-mtu
```

## Parameters

### *bytes*

Specifies the IP maximum transmit unit (packet) for this interface.

**Values** 512 to 9000

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn interface sap ip-tunnel ip-mtu
- configure service vprn interface sap ipsec-tunnel ip-mtu

VSR

- configure service ies interface ipsec ipsec-tunnel ip-mtu
- configure service vprn interface ipsec ipsec-tunnel ip-mtu
- configure router interface ipsec ipsec-tunnel ip-mtu

## ip-mtu

## Syntax

**ip-mtu** *octets*

### Description

This command configures the IP-MTU size that is used to transport flow synchronization records between the ISAs. Multiple flow synchronization events can be packed into a single frame up to the IP-MTU size.

### Default

ip-mtu 1500

### Parameters

*bytes*

Specifies the IP-MTU size in bytes.

**Values** 512 to 9000

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## ip-mtu

### Syntax

**ip-mtu** *octets*

**no ip-mtu**

### Context

[\[Tree\]](#) (config>router>if ip-mtu)

## Full Context

configure router interface ip-mtu

## Description

This command configures the IP maximum transmit unit (packet) for the associated router IP interface.

The operational IP MTU that is used for the interface is determined based on both the configured IP MTU and the port MTU of the port bound to this interface.

The MTU that is used is:

MINIMUM((Port\_MTU - EthernetHeaderSize), (configured ip-mtu))

The **no** form of this command returns the associated IP interfaces MTU to its default value, which is calculated based on the port MTU setting. (For Ethernet ports the default IP MTU is 1500 octets.)

## Default

no ip-mtu

## Parameters

### octets

Specifies the IP MTU value associated with the IP interface, specified in octets. If the interface supports IPv6 packets, the IP-MTU must be set to a value greater than or equal to ( $\geq$ ) 1280 in accordance with RFC 2460 *Internet Protocol, Version 6 (IPv6) Specification*.

**Values** 512 to 9786

## Platforms

All

## ip-mtu

## Syntax

**ip-mtu** *octets*

**no ip-mtu**

## Context

[\[Tree\]](#) (bof ip-mtu)

## Full Context

bof ip-mtu

## Description

This command configures the IP maximum transmit unit (packet) for the management router instance.

The operational IP MTU that is used for the interface is determined based on both the configured IP MTU and the port MTU of the port bound to this interface.

The MTU that is used is:

$\text{MINIMUM}((\text{Port\_MTU} - \text{EthernetHeaderSize}), (\text{configured ip-mtu}))$

For the management port, the port MTU is fixed at 1514 and the EthernetHeaderSize is 14 so the first element of the equation above is 1500 octets.

The **no** form of this command returns the associated IP interfaces MTU to its default value, which is calculated based on the port MTU setting. (For the management port the default IP MTU is 1500 octets.)

### Default

ip-mtu 1500

### Parameters

#### octets

Specifies the IP MTU value associated with the IP interface, specified in octets. If the interface supports IPv6 packets, the IP-MTU must be set to a value greater than or equal to ( $\geq$ ) 1280 in accordance with RFC 2460 *Internet Protocol, Version 6 (IPv6) Specification*.

**Values** 512 to 9786

entry match ip-option

configure subscriber-mgmt category-map category exhausted-credit-service-level ingress-ip-filter-entries  
entry match ip-option

### Description

This command configures the IP option match condition.

The **no** form of this command reverts to the default.

### Parameters

#### *ip-option-value*

Specifies the IP option value as a decimal hex or binary.

**Values** 0 to 255

#### *ip-option-mask*

Specifies the IP option mask as a decimal hex or binary.

**Values** 0 to 255

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## ip-option

### Syntax

**ip-option** *ip-option-value* [*ip-option-mask*]

**no ip-option**

### Context

[\[Tree\]](#) (config>filter>ip-filter>entry>match ip-option)

### Full Context

configure filter ip-filter entry match ip-option

### Description

This command configures matching packets with a specific IP option or a range of IP options in the first option of the IP header as an IP filter match criterion.

The option-type octet contains 3 fields:

- 1 bit copied flag (copy options in all fragments)
- 2 bits option class
- 5 bits option number

The **no** form of the command removes the match criterion.

### Default

no ip-option

### Parameters

#### *ip-option-value*

Specifies the 8 bit option-type as a decimal integer, binary, or hexadecimal format. The mask is applied as an AND to the option byte, the result is compared with the option-value.

The decimal value entered for the match should be a combined value of the eight bit option type field and not just the option number. Therefore, to match on IP packets that contain the Router Alert option (option number = 20), enter the option type of 148 (10010100).

**Values** 0 to 255

### ***ip-option-mask***

Specifies an optional parameter that can be used when specifying a range of option numbers to use as the match criteria.

This 8 bit mask can be configured using the following formats:

Table 55: *ip-option-mask* Formats

| Format Style | Format Syntax | Example   |
|--------------|---------------|-----------|
| Decimal      | DDD           | 20        |
| Hexadecimal  | 0xHH          | 0x14      |
| Binary       | 0bBBBBBBBB    | 0b0010100 |

**Default** 255 (decimal) (exact match)

**Values** 1 to 255 (decimal)

## **Platforms**

All

## **ip-option**

### **Syntax**

**ip-option** *ip-option-value ip-option-mask*

**no ip-option**

### **Context**

[\[Tree\]](#) (cfg>sys>sec>cpm>ip-filter>entry>match ip-option)

### **Full Context**

configure system security cpm-filter ip-filter entry match ip-option

### **Description**

This command configures matching packets with a specific IP option or a range of IP options in the IP header as an IP filter match criterion.

The option-type octet contains 3 fields:

- 1 bit copied flag (copy options in all fragments)
- 2 bits option class
- 5 bits option number

The **no** form of this command removes the match criterion.

## Default

no ip-option

## Parameters

### *ip-option-value*

Enter the 8 bit option-type as a decimal integer. The mask is applied as an AND to the option byte, the result is compared with the option-value.

The decimal value entered for the match should be a combined value of the eight bit option type field and not just the option number. Thus to match on IP packets that contain the Router Alert option (option number =20), enter the option type of 148 (10010100).

**Values** 0 to 255

### *ip-option-mask*

Specifies a range of option numbers to use as the match criteria.

This 8 bit mask can be configured using the formats described in [Table 56: ip-option-mask Formats](#):

Table 56: *ip-option-mask* Formats

| Format Style | Format Syntax | Example   |
|--------------|---------------|-----------|
| Decimal      | DDD           | 20        |
| Hexadecimal  | 0xHH          | 0x14      |
| Binary       | 0BBBBBBBB     | 0b0010100 |

**Default** 255 (decimal) (exact match)

**Values** 1 to 255 (decimal)

## ip-prefix

### Syntax

**ip-prefix** *ip-prefix/ip-prefix-length*

**no ip-prefix**

### Context

**[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident ip-prefix)

### Full Context

configure subscriber-mgmt local-user-db ipoe host host-identification ip-prefix

### Description

This command specifies the source IPv4/IPv6 address/prefix of the data trigger packet as the host identification.

#### Note:

This command is only used when **ip** is configured as one of the **match-list** parameters.

The **no** form of this command removes the IP prefix from the configuration.

### Parameters

#### *ip-prefix/ip-prefix-length*

Specifies the IPv4 address, IPv6 address, or IPv6 prefix.

| Values             |                                     |
|--------------------|-------------------------------------|
| ipv4-prefix        | a.b.c.d                             |
| ipv4-prefix-length | 0 to 32                             |
| ipv6-prefix        | x:x:x:x:x:x:x (eight 16-bit pieces) |
|                    | x:x:x:x:x:d.d.d.d                   |
|                    | x to [0 to FFFF]H                   |
|                    | d to [0 to 255]D                    |
| ipv6-prefix-length | 0 to 128                            |

### Full Context

configure application-assurance group policy app-qos-policy entry match ip-protocol-num

configure application-assurance group policy app-filter entry ip-protocol-num

### Description

This command configures the IP protocol to use in the application definition.

The **no** form of this command restores the default (removes IP protocol number from application criteria defined by this app-filter entry).

### Default

no ip-protocol-num

### Parameters

**eq**

Specifies that the value configured and the value in the flow must be equal.

**neq**

Specifies that the value configured differs from the value in the flow.

***protocol-id***

Specifies the decimal value representing the IP protocol to be used as an IP filter match criterion. Well known protocol numbers include ICMP (1), TCP (6), UDP (17).

The **no** form the command removes the protocol from the match criteria.

**Values** 1 to 255 (Decimal, Hexadecimal, or Binary representation).

Supported IANA IP protocol names:

none, crtp, crudp, egg, eigrp, encap, ether-ip, gre, icmp, idrp, igmp, igp, ip, ipv6, ipv6-frag, ipv6-icmp, ipv6-no-nxt, ipv6-opts, ipv6-route, isis, iso-ip, l2tp, ospf-igp, pim, pnni, ptp, rdp, rsvp, sctp, stp, tcp, udp, vrrp

\* - udp/tcp wildcard

### Platforms

### Description

This command configures the IP protocol to use in the application definition.

The **no** form of this command restores the default (removes IP protocol number from application criteria defined by this app-filter entry).

### Default

no ip-protocol-num

### Parameters

#### *ip-protocol-number*

Specifies the decimal value representing the IP protocol to be used as an IP filter match criterion. Well known protocol numbers include ICMP (1), TCP (6), UDP (17).

The **no** form the command removes the protocol from the match criteria.

**Values** *protocol-number*: 0 to 255 (decimal, hexadecimal, or binary representation)

*protocol-name*: Supported IANA IP protocol names:

none, crtp, crudp, egp, eigrp, encap, ether-ip, gre, icmp, idrp, igmp, igp, ip, ipv6, ipv6-frag, ipv6-icmp, ipv6-no-nxt, ipv6-opts, ipv6-route, isis, iso-ip, l2tp, ospf-igp, pim, pnni, ptp, rdp, rsvp, sctp, stp, tcp, udp, vrrp

\* - udp/tcp wildcard

## ip-protocol-num

### Syntax

**ip-protocol-num** {*eq* | *neq*} *protocol-id*

**no ip-protocol-num**

**Context**

[\[Tree\]](#) (debug>app-assure>group>traffic-capture>match ip-protocol-num)

**Full Context**

debug application-assurance group traffic-capture match ip-protocol-num

**Description**

This command configures debugging on an IP protocol number.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.237 ip-route-advertisement

### ip-route-advertisement

**Syntax**

**ip-route-advertisement** [**incl-host**] [**domain-id** *global-field:local-field*]  
**no ip-route-advertisement**

**Context**

[\[Tree\]](#) (config>service>vpls>bgp-evpn ip-route-advertisement)

**Full Context**

configure service vpls bgp-evpn ip-route-advertisement

**Description**

This command enables and disables the advertisement of IP prefixes in EVPN. If enabled, any active route in the R-VPLS VPRN route table are advertised in EVPN using the VPLS BGP configuration. The interface host addresses are not advertised in EVPN unless the **ip-route-advertisement incl-host** command is enabled.

The **no** form of this command disables IP prefixes advertisement in EVPN.

**Default**

no ip-route-advertisement

**Parameters****incl-host**

Specifies to advertise the interface host addresses in EVPN.

***global-field:local-field***

Specifies the domain ID.

**Values***4byte-GlobalAdminValue:2byte-LocalAdminValue**4byte-GlobalAdminValue:* 0 to 4294967295*2byte-LocalAdminValue* 0 to 65535**Platforms**

All

## 13.238 ip-route-link-bandwidth

`ip-route-link-bandwidth`**Syntax**`ip-route-link-bandwidth`**Context**[\[Tree\]](#) (config>service>vpls>bgp-evpn ip-route-link-bandwidth)**Full Context**

configure service vpls bgp-evpn ip-route-link-bandwidth

**Description**

Commands in this context configure the IP route link bandwidth.

**Platforms**

All

## 13.239 ip-src

`ip-src`**Syntax**`ip-src ip-address``no ip-src`**Context**[\[Tree\]](#) (config>li>mirror-dest-template>layer-3-encap ip-src)

## Full Context

configure li mirror-dest-template layer-3-encap ip-src

## Description

This command configures the source IPv4 address to use in the IPv4 header part of the routable LI encapsulation.

## Parameters

### *ip-address*

Specifies the source IPv4 address.

**Values** a.b.c.d

## Platforms

All

## 13.240 ip-ttl

ip-ttl

## Syntax

*ip-ttl hops*

*no ip-ttl*

## Context

[\[Tree\]](#) (config>subscr-mgmt>gtp>peer-profile ip-ttl)

## Full Context

configure subscriber-mgmt gtp peer-profile ip-ttl

## Description

This command configures the value to put in the IP header's TTL field for GTP control messages. The **no** form of this command reverts to the default value.

## Default

ip-ttl 255

## Parameters

### *hops*

Specifies the IP TTL.

**Values** 1 to 255

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.241 ip-tunnel

### ip-tunnel

#### Syntax

**ip-tunnel** *name* [**create**]

**no ip-tunnel** *name*

#### Context

**[Tree]** (config>service>vprn>if>sap ip-tunnel)

**[Tree]** (config>service>ies>if>sap ip-tunnel)

#### Full Context

configure service vprn interface sap ip-tunnel

configure service ies interface sap ip-tunnel

#### Description

This command is used to configure an IP-GRE or IP-IP tunnel and associate it with a private tunnel SAP within an IES or VPRN service.

The **no** form of this command deletes the specified IP/GRE or IP-IP tunnel from the configuration. The tunnel must be administratively shutdown before issuing the **no ip-tunnel** command.

#### Default

no-ip tunnel *name*

#### Parameters

***name***

Specifies the name of the IP tunnel. Tunnel names can be from 1 to 32 alphanumeric characters. If the string contains special characters (for example, #, \$, spaces), the entire string must be enclosed within double quotes.

#### Platforms

All

## 13.242 ipcp-subnet-negotiation

### ipcp-subnet-negotiation

#### Syntax

**no ipcp-subnet-negotiation**

#### Context

**[Tree]** (config>router>l2tp>group>ppp ipcp-subnet-negotiation)

**[Tree]** (config>service>vprn>l2tp>group>ppp ipcp-subnet-negotiation)

**[Tree]** (config>service>vprn>l2tp>group>tunnel>ppp ipcp-subnet-negotiation)

**[Tree]** (config>router>l2tp>group>tunnel>ppp ipcp-subnet-negotiation)

#### Full Context

configure router l2tp group ppp ipcp-subnet-negotiation

configure service vprn l2tp group ppp ipcp-subnet-negotiation

configure service vprn l2tp group tunnel ppp ipcp-subnet-negotiation

configure router l2tp group tunnel ppp ipcp-subnet-negotiation

#### Description

This command configures the IPCP subnet negotiation using PPP IPCP Subnet-Mask option (0x90) if requested by the client. The subnet can be obtained from RADIUS (Framed-IP-Netmask attribute) or local user database. The subnet is installed as a managed route of the PPP session. This requires the anti-spoof type on the SAP to be configured to nh-mac.

By default, an IPCP Config Request with IPCP Subnet-Mask option (0x90) is rejected.

The **no** form of this command reverts to the default value.

#### Default

no ipcp-subnet-negotiation

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### ipcp-subnet-negotiation

#### Syntax

**[no] ipcp-subnet-negotiation**

#### Context

**[Tree]** (config>subscr-mgmt>ppp-policy ipcp-subnet-negotiation)

**Full Context**

configure subscriber-mgmt ppp-policy ipcp-subnet-negotiation

**Description**

This command enables subnet negotiation using PPP IPCP Subnet-Mask option (0x90) if requested by the client. The subnet can be obtained from RADIUS (Framed-IP-Netmask attribute) or local user database. The subnet is installed as a managed route of the PPP session. This requires the anti-spoof type on the SAP to be configured to nh-mac.

By default, an IPCP Config Request with IPCP Subnet-Mask option (0x90) is rejected.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.243 ipfix

ipfix

**Syntax**

ipfix

**Context**

[\[Tree\]](#) (config>service ipfix)

**Full Context**

configure service ipfix

**Description**

Commands in this context configure IPFIX parameters.

**Platforms**

All

## 13.244 ipfix-export-policy

ipfix-export-policy

**Syntax**

**ipfix-export-policy** *policy-name*

**no ipfix-export-policy**

## Context

[\[Tree\]](#) (config>service>nat>nat-policy ipfix-export-policy)

[\[Tree\]](#) (config>service>nat>up-nat-policy ipfix-export-policy)

## Full Context

configure service nat nat-policy ipfix-export-policy

configure service nat up-nat-policy ipfix-export-policy

## Description

This command configures the IP flow information export policy.

The **no** form of the command removes the IP flow information export policy.

## Default

no ipfix-export-policy

## Parameters

### *policy-name*

Specifies the name of the policy, up to 32 characters. The specified policy must be created in the **config>service>ipfix ipfix-export-policy** context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## ipfix-export-policy

## Syntax

**ipfix-export-policy** *policy-name* [create]

**no ipfix-export-policy** *policy-name*

## Context

[\[Tree\]](#) (config>service>ipfix ipfix-export-policy)

## Full Context

configure service ipfix ipfix-export-policy

## Description

This command creates an IPFIX export policy with a set of transport parameters that will be used to transmit IPFIX records generated by an application within 7750 SR node to an external collector node. This policy name can be referenced from each application within 7750 SR that requires flow logging.

## Parameters

### *policy-name*

Specifies the name of the policy that can be referenced within an application in 7750 SR node that requires flow logging.

**create**

Keyword used to create the policy.

**Platforms**

All

## 13.245 ipipe

### ipipe

**Syntax**

**ipipe** *service-id* [**customer** *customer-id*] [**create**] [**vpn** *vpn-id*] [**vc-switching**] [**name** *name*]  
**no ipipe** *service-id*

**Context**

[\[Tree\]](#) (config>service ipipe)

**Full Context**

configure service ipipe

**Description**

This command configures an IP-Pipe service.

**Parameters*****service-id***

The unique service identification number or string identifying the service in the service domain. This ID must be unique to this service and may not be used for any other service of any type. The *service-id* must be the same number used for every 7450 ESS or 7750 SR on which this service is defined.

**Values**    *service-id*: 1 to 2147483647  
              *svc-name*: up to 64 characters

***customer-id***

Specifies the customer ID number to be associated with the service. This parameter is required on service creation and optional for service editing or deleting.

**Values**    1 to 2147483647

***vpn vpn-id***

Specifies the VPN ID number which allows you to identify virtual private networks (VPNs) by a VPN identification number.

**Values** 1 to 2147483647

**Default** null (0)

### vc-switching

Specifies if the pseudowire switching signaling is used for the spoke SDPs configured in this service.

### create

Keyword used to create the Ipipe service instance. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

### name name

Configures an optional service name identifier, up to 64 characters, to a given service. This service name can then be used in configuration references, display, and show commands throughout the system. A defined service name can help the service provider or administrator to identify and manage services within the SR OS platforms.

To create a service, you must assign a service ID; however, after it is created, either the service ID or the service name can be used to identify and reference a service.

If a name is not specified at creation time, then SR OS assigns a string version of the *service-id* as the name.

**Values** *name*: up to 64 characters

## Platforms

All

## 13.246 ipoe

ipoe

### Syntax

ipoe

### Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db ipoe)

### Full Context

configure subscriber-mgmt local-user-db ipoe

### Description

Commands in this context configure IPoE host parameters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipoe

## Syntax

ipoe

## Context

[\[Tree\]](#) (debug>call-trace ipoe)

## Full Context

debug call-trace ipoe

## Description

Commands in this context set up call trace debugging for IP over Ethernet (IPoE) sessions.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ipoe

## Syntax

ipoe *origin*

## Context

[\[Tree\]](#) (config>li>x-interfaces>correlation-id ipoe)

## Full Context

configure li x-interfaces correlation-id ipoe

## Description

This command specifies the type of RADIUS accounting session ID to use for IPoE subscriber correlation.

## Default

host

## Parameters

*origin*

Specifies the correlation identifier origin type for IPoE.

**Values** host, queue, session

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## ipoe

### Syntax

**ipoe** *max-nr-of-sessions*

**no ipoe**

### Context

[\[Tree\]](#) (config>subscr-mgmt>sub-profile>session-limits ipoe)

[\[Tree\]](#) (config>subscr-mgmt>sla-profile>session-limits ipoe)

### Full Context

configure subscriber-mgmt sub-profile session-limits ipoe

configure subscriber-mgmt sla-profile session-limits ipoe

### Description

This command configures the maximum number of IPoE sessions per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of IPoE sessions limit.

### Parameters

#### *max-nr-of-sessions*

Specifies the maximum number of IPoE sessions.

**Values** 0 to 131071

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.247 ipoe-bridged-mode

## ipoe-bridged-mode

### Syntax

**[no] ipoe-bridged-mode**

### Context

**[Tree]** (config>service>ies>sub-if>grp-if ipoe-session)

**[Tree]** (config>service>ies>sub-if ipoe-session)

**[Tree]** (config>service>vprn>sub-if>grp-if ipoe-session)

#### Full Context

configure service vprn subscriber-interface ipoe-session

configure service vpls sap ipoe-session

configure service ies subscriber-interface group-interface ipoe-session

configure service ies subscriber-interface ipoe-session

configure service vprn subscriber-interface group-interface ipoe-session

#### Description

Commands in this context configure IPoE session parameters.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.250 ipoe-session-policy

### ipoe-session-policy

#### Syntax

**ipoe-session-policy** *policy-name* **[create]**

**no ipoe-session-policy** *policy-name*

## Context

[\[Tree\]](#) (config>subscr-mgmt ipoe-session-policy)

## Full Context

configure subscriber-mgmt ipoe-session-policy

## Description

This command configures an IPoE session policy. The policies are referenced from subscriber interfaces, group interfaces and capture SAPs. Multiple IPoE session policies can be configured.

The **no** form of this command removes the policy name from the configuration.

## Parameters

### *policy-name*

Specifies the IPoE policy name up to 32 characters.

### **create**

Keyword required to create the configuration context

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## ipoe-session-policy

## Syntax

**ipoe-session-policy** *policy-name*

**no ipoe-session-policy**

## Context

[\[Tree\]](#) (config>service>vpls>sap>ipoe-session ipoe-session-policy)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>ipoe-session ipoe-session-policy)

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>ipoe-session ipoe-session-policy)

## Full Context

configure service vpls sap ipoe-session ipoe-session-policy

configure service ies subscriber-interface group-interface ipoe-session ipoe-session-policy

configure service vprn subscriber-interface group-interface ipoe-session ipoe-session-policy

## Description

This command specifies the IPoE session policy applicable for this group interface or capture SAP.

On WLAN GW group interfaces, it is not possible to change this value.

The **no** form of this command reverts to the default.

## Default

no ipoe-session-policy ipoe-session-policy default on WLAN GW group interfaces

## Parameters

### *policy-name*

Specifies the IPoE session policy name up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.251 ipoe-sub-id-key

### ipoe-sub-id-key

## Syntax

**ipoe-sub-id-key** *sub-id-key* [*sub-id-key*]

**no ipoe-sub-id-key**

## Context

[\[Tree\]](#) (config>subscr-mgmt>auto-sub-id-key ipoe-sub-id-key)

## Full Context

configure subscriber-mgmt auto-sub-id-key ipoe-sub-id-key

## Description

This command enables certain fields to become the base for auto-generation of the default sub-id name. The sub-id name is auto generated if there is not a more specific method available. Such more specific methods would be a default sub-id name as a sap-id, a preconfigured static string or explicit mappings based on RADIUS/LUDB returned strings.

In case that a more specific sub-id name generation method is not available and the auto-id keyword is defined under the def-sub-id hierarchy, the sub-id name is generated by concatenating fields defined in this command separated by a "|" character.

The maximum length of the auto-generated sub-id name is 64 characters while the concatenation of subscriber identification fields can exceed 64 characters. Subscriber host instantiation fails if the sub-id name is based on subscriber identification fields whose concatenated length exceeds 64 characters. Failing the host creation rather than truncating the sub-id name on a 64 character boundary prevents collision of sub-ids (subscriber name duplication).

If the more specific sub-id name generation method is not available and the **auto-id** keyword is not defined under the **def-sub-id** hierarchy, the sub-id name is a random 10 character encoded string based on the fields defined under this command.

There is only one set of identification fields allowed per host type (IPoE or PPP) per chassis.

The **no** form of this command reverts to the default.

## Default

ipoe-sub-id-key mac sap-id

## Parameters

### *sub-id-key*

Specifies the auto-generated sub-id keys for IPoE hosts.

**Values** **mac** — Specifies that the MAC address can be combined with other subscriber host identification fields (circuit-id, remote-id, session-id, sap-id, or service-name) to form a sub-id name in a user readable format or as a random 10 character encoded value.

In case that the mac address is used as a concatenation field in the sub-id name, then its format becomes a string xx:xx:xx:xx:xx:xx with the length 17B.

The MAC address as the subscriber host identification field is not applicable to static hosts.

**circuit-id** — Specifies that the circuit-id can be combined with other subscriber host identification fields (mac, remote-id, session-id, sap-id, or service-name) to form a sub-id name in a user readable format or as a random 10 character encoded value.

In case that the circuit-id is used as a concatenation field in the sub-id name, then its format becomes access-node-id eth slot/port:[vlan-id] or access-node-id atm slot/port:vpi.vci with a variable length.

**Note:**

If circuit-id contains any non-printable ASCII characters, the entire circuit-id string is formatted in hex in the sub-id name output. Otherwise all characters in circuit-id is converted to ASCII. ASCII printable characters contain bytes in range 0x20 to 0x7E.

The circuit-id as the subscriber identification field is not applicable to ARP hosts or static hosts.

**remote-id** — Specifies that the remote-id can be combined with other subscriber host identification fields (mac, circuit-id, session-id, sap-id, or service-name) to form a sub-id name in a user readable format or as a random 10 character encoded value.

In case that the remote-id is used as a concatenation field in the sub-id name, then its format becomes a remote-id string with a variable length.

**Note:**

If remote-id contains any non-printable ASCII characters, the entire remote-id string is formatted in hex in the sub-id name output. Otherwise all characters in remote-id is converted to ASCII. ASCII printable characters contain bytes in range 0x20 to 0x7E.

The remote-id as the subscriber identification field is not applicable to ARP hosts or static hosts.

**sap-id** — Specifies that the sap-id can be combined with other subscriber host identification fields (mac, circuit-id, remote-id, session-id, or service-name) to form a sub-id name in a user readable format or as a random 10 character encoded value.

If a circuit-id is used as a concatenation field in the sub-id name, then its format becomes: slot/mda:[outer-vlan].[inner-vlan] with a variable length.

The sap-id as the subscriber identification field is applicable to all hosts types with exception of static hosts.

**dual-stack-remote-id** — Specifies that the dual stack remote ID is used as the base for the auto-generated subscriber identification

**service-name** — Specifies that the service name that terminates the subscriber is used as the base for auto-generated subscriber identification.

#### Syntax

**ipsec-domain** *ipsec-domain-id* [**create**]

**no ipsec-domain** *ipsec-domain-id*

#### Context

[\[Tree\]](#) (config>redundancy>multi-chassis ipsec-domain)

#### Full Context

configure redundancy multi-chassis ipsec-domain

## Description

Commands in this context configure parameters for the multi-chassis IPsec domain configured on this system.

The **no** form of this command removes the ID from the configuration.

## Parameters

### *ipsec-domain-id*

Specifies IPsec domain ID.

**Values** 1 to 255

### **create**

Keyword used to create the command instance.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

no ipsec-gw
```

## Context

[\[Tree\]](#) (config>service>ies>if>sap ipsec-gw)

[\[Tree\]](#) (config>service>vprn>if>sap ipsec-gw)

## Full Context

```
configure service ies interface sap ipsec-gw
```

```
configure service vprn interface sap ipsec-gw
```

## Description

This command configures an IPsec gateway.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.256 ipsec-lifetime

### ipsec-lifetime

#### Syntax

**ipsec-lifetime** *ipsec-lifetime*

**no ipsec-lifetime**

#### Context

[\[Tree\]](#) (config>ipsec>ike-policy ipsec-lifetime)

#### Full Context

configure ipsec ike-policy ipsec-lifetime

#### Description

This command specifies the lifetime of the Phase 2 IKE key.

The **no** form of this command reverts to the default, which is 3600 seconds.

#### Default

no ipsec-lifetime

#### Parameters

***ipsec-lifetime***

Specifies the Phase 2 lifetime for this IKE policy in seconds.

**Values** 1200 to 31536000

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### ipsec-lifetime

#### Syntax

**ipsec-lifetime** *seconds*

**ipsec-lifetime inherit**

#### Context

[\[Tree\]](#) (config>ipsec>ipsec-transform ipsec-lifetime)

#### Full Context

configure ipsec ipsec-transform ipsec-lifetime

## Description

This command specifies the CHILD\_SA. If the **inherit** parameter is specified, then the system uses the IPsec lifetime configuration in the corresponding IKE policy configured in the same IPsec gateway or IPsec tunnel.

## Default

ipsec-lifetime inherit

## Parameters

### **seconds**

Specifies the lifetime of the Phase 2 IKE key in seconds.

**Values** 1200 to 31536000

### **inherit**

Specifies that the system uses the **ipsec-lifetime** configuration in the corresponding IKE policy that is configured for the same IPsec gateway or IPsec tunnel.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.257 ipsec-responder-only

### ipsec-responder-only

## Syntax

[no] ipsec-responder-only

## Context

[\[Tree\]](#) (config>isa>tunnel-group ipsec-responder-only)

## Full Context

configure isa tunnel-group ipsec-responder-only

## Description

With this command configured, system will only act as IKE responder except for the automatic CHILD\_SA re-key upon MC-IPsec switchover.

## Default

no ipsec-responder-only

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.258 ipsec-transform

### ipsec-transform

#### Syntax

**ipsec-transform** *transform-id* [**create**]

**no ipsec-transform** *transform-id*

#### Context

[\[Tree\]](#) (config>ipsec ipsec-transform)

#### Full Context

configure ipsec ipsec-transform

#### Description

Commands in this context create an **ipsec-transform** policy. IPsec transform policies can be shared. A change to the ipsec-transform is allowed at any time. The change will not impact tunnels that have been established until they are renegotiated. If the change is required immediately the tunnel must be cleared (reset) for force renegotiation.

IPsec transform policy assignments to a tunnel require the tunnel to be shutdown.

The **no** form of this command removes the ID from the configuration.

#### Parameters

##### *transform-id*

Specifies a policy ID value to identify the IPsec transform policy.

**Values** 1 to 2048

##### **create**

This keyword is mandatory when creating an ipsec-transform policy. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.259 ipsec-transport-mode-profile

## ipsec-transport-mode-profile

### Syntax

**ipsec-transport-mode-profile** *name* [**create**]

**no ipsec-transport-mode-profile** *name*

### Context

[\[Tree\]](#) (config ipsec ipsec-transport-mode-profile)

### Full Context

configure ipsec ipsec-transport-mode-profile

### Description

Commands in this context configure an IPsec transport mode profile.

The **no** form of this command removes the name from the configuration.

### Parameters

***name***

Specifies the name of the IPsec transport mode profile, up to 32 characters.

**create**

Keyword used to create the IPsec transport mode profile instance.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## ipsec-transport-mode-profile

### Syntax

**ipsec-transport-mode-profile** *name*

**no ipsec-transport-mode-profile**

### Context

[\[Tree\]](#) (config service ies if sap ip-tunnel ipsec-transport-mode-profile)

[\[Tree\]](#) (config service vprn if sap ip-tunnel ipsec-transport-mode-profile)

### Full Context

configure service ies interface sap ip-tunnel ipsec-transport-mode-profile

configure service vprn interface sap ip-tunnel ipsec-transport-mode-profile

### Description

This command specifies an IPsec transport mode profile name to the SAP.

The **no** form of this command removes the profile name from the service configuration.

### Parameters

#### *name*

Specifies the name of an existing IPsec transport mode profile, up to 32 characters

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.260 ipsec-tunnel

### ipsec-tunnel

### Syntax

**ipsec-tunnel** *ipsec-tunnel-name*

**no ipsec-tunnel** [*ipsec-tunnel-name*]

### Context

[\[Tree\]](#) (config>service>vprn>static-route-entry ipsec-tunnel)

### Full Context

configure service vprn static-route-entry ipsec-tunnel

### Description

This command creates a static route in a VPRN service context that points to the global routing context (base router). This is primarily used to allow traffic that ingress through a VPRN service to be routed out of the global routing context.

This **next-hop** type cannot be used in conjunction with any other next-hop types.

### Default

no ipsec-tunnel

### Parameters

#### *ipsec-tunnel-name*

IPsec tunnel name; maximum length up to 32 characters.

### Platforms

All

## ipsec-tunnel

### Syntax

**ipsec-tunnel** *name* [ **private-sap** [ *0..4094*]] [**private-service-name** *private-service-name*] [**create**]  
**no ipsec-tunnel** *ipsec-tunnel-name*

### Context

**[Tree]** (config>service>ies>if>ipsec ipsec-tunnel)

**[Tree]** (config>service>vprn>if>sap ipsec-tunnel)

**[Tree]** (config>router>if>ipsec ipsec-tunnel)

### Full Context

configure service ies interface ipsec ipsec-tunnel

configure service vprn interface sap ipsec-tunnel

configure router interface ipsec ipsec-tunnel

### Description

This command configures a secured interface IPsec tunnel. If the **private-service-name** is not specified, the private service is the secured interface service.

The **no** form of this command removes the IPsec tunnel from the configuration.

### Parameters

#### **name**

Specifies the name of the IPsec tunnel.

#### **private-sap**

Specifies the private SAP ID.

**Values** 0 to 4094

#### **private-service-name**

Specifies the private service name.

#### **create**

Keyword used to create the IPsec tunnel instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

### Platforms

VSR

- configure service ies interface ipsec ipsec-tunnel
- configure router interface ipsec ipsec-tunnel

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn interface sap ipsec-tunnel

configure subscriber-mgmt local-user-db ipoe host to-client-options ipv4

### Description

Commands in this context configure DHCPv4 options.

### Default

ipv4

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## ipv4

### Syntax

```
ipv4 max-paths [ebgp ebgp-max-paths] [ibgp ibgp-max-paths] [restrict { same-neighbor-as | exact-as-path}] [unequal-cost]
```

```
no ipv4
```

### Context

**[Tree]** (config>service>vprn>bgp>multi-path ipv4)

### Full Context

```
configure service vprn bgp multi-path ipv4
```

### Description

This command sets ECMP multipath parameters that apply only to the (unlabeled) IPv4 unicast address family. These settings override the values set by the **maximum-paths** command.

When multipath is enabled, traffic to the destination is load-shared across a set of paths (BGP routes) that the BGP decision process considers equal to the best path. The actual distribution of traffic over the multiple paths may be equal or unequal (that is, based on weights derived from the Link Bandwidth Extended Community).

To qualify as a multipath, a non-best route must meet the following criteria (some criteria are controlled by this command):

- The multi-path route must be the same type of route as the best path (same AFI/SAFI and, in some cases, same next-hop resolution method).
- The multi-path route must be tied with the best path for all criteria of greater significance than next-hop cost, except for criteria that are configured to be ignored.
- If the best path selection reaches the next-hop cost comparison, the multi-path route must have the same next-hop cost as the best route unless the **unequal-cost** option is configured.
- The multi-path route must not have the same BGP next-hop as the best path or any other multi-path route.
- The multi-path route must not cause the ECMP limit of the routing instance to be exceeded (configured using the **ecmp** command with a value in the range 1 to 64).
- The multi-path route must not cause the applicable *max-paths* limit to be exceeded. If the best path is an EBGp learned route and the **ebgp** option is used, the *ebgp-max-paths* limit overrides the *max-paths* limit. If the best path is an IBGP-learned route and the **ibgp** option is used, the *ibgp-max-paths* limit overrides the *max-paths* limit. All path limits are configurable up to a maximum of 64. Multi-path is effectively disabled if a value is set to 1.
- The multi-path route must have the same neighbor AS in its AS path as the best path if the **restrict same-neighbor-as** option is configured. By default, any path with the same AS path length as the best path (regardless of neighbor AS) is eligible for multi-path.

- The route must have the same AS path as the best path if the **restrict exact-as-path** option is configured. By default, any path with the same AS path length as the best path (regardless of the actual AS numbers) is eligible for multi-path.

The **no** form of this command removes IPv4-specific overrides.

## Default

no ipv4

## Parameters

### *max-paths*

Specifies the maximum number of multipaths per prefix/NLRI if *ebgp-max-paths* or *ibgp-max-paths* does not apply.

**Values** 1 to 64

### *egp-max-paths*

Specifies the maximum number of multipaths per prefix or NLRI when the best path is an EBGp learned route.

**Values** 1 to 64

### *ibgp-max-paths*

Specifies the maximum number of multipaths per prefix or NLRI when the best path is an IBGP learned route.

**Values** 1 to 64

### **restrict same-neighbor-as**

Specifies that the non-best path must have the same neighbor AS in its AS path as the best path.

### **restrict exact-as-path-as**

Specifies that the non-best path must have the same AS path as the best path.

### **unequal-cost**

Instructs BGP to ignore differences in the next-hop cost only when determining eligible multipaths.

### Syntax

ipv4 *ip-address*

ipv4 auto-generate [*vendor-id-value vendor-id-value*]

no ipv4

### Context

[\[Tree\]](#) (config>system>ned>prof>neip ipv4)

### Full Context

configure system network-element-discovery profile neip ipv4

### Description

This command configures the IPv4 NEIP for this profile. The NEIP can be configured manually or set to be automatically generated using the NEID. If the NEID option is set, the first most significant byte of the IPv4 NEIP is set to 140 and the remaining 3 bytes are set to the NEID value. The NEID can be configured with a vendor ID value, in which case the first most significant byte of the IPv4 NEIP is set to this vendor ID value.

The **no** form of this command removes the IPv4 address association for this profile.

### Default

no ipv4

### Parameters

*ip-address*

Specifies the IPv4 address of the NEIP.

**auto-generate**

Specifies that the NEIP is automatically generated using the NEID.

**vendor-id-value**

Specifies the vendor ID value.

**Values** 1 to 255

**Platforms**

**ipv4****Syntax**

**ipv4 send** *send-limit* **receive** [**none**]

**ipv4 send** *send-limit*

**no ipv4**

**Context**

**[Tree]** (config>router>bgp>add-paths ipv4)

**[Tree]** (config>router>bgp>group>neighbor>add-paths ipv4)

**[Tree]** (config>router>bgp>group>add-paths ipv4)

**Full Context**

configure router bgp add-paths ipv4

configure router bgp group neighbor add-paths ipv4

configure router bgp group add-paths ipv4

**Description**

This command configures the add-paths capability for unlabeled IPv4 unicast routes. By default, add-paths is not enabled for unlabeled IPv4 unicast routes.

The maximum number of unlabeled unicast paths per IPv4 prefix to send is the configured send limit, which is a mandatory parameter. The capability to receive multiple unlabeled IPv4 unicast paths per prefix from a peer is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command the receive capability is enabled by default.

The **no** form of this command disables add-paths support for unlabeled IPv4 unicast routes, causing sessions established using add-paths for unlabeled IPv4 unicast to go down and come back up without the add-paths capability.

**Default**

no ipv4

## Parameters

### *send-limit*

Specifies the maximum number of paths per unlabeled IPv4 unicast prefix that are allowed to be advertised to add-paths peers, the actual number of advertised routes may be less. If the value is **none**, the router does not negotiate the send capability with respect to IPv4 AFI/SAFI. If the value is **multipaths**, then BGP advertises all of the used BGP multipaths for each IPv4 NLRI if the peer has signaled support to receive multiple add-paths.

**Values** 1 to 16, none, multipaths

### **receive**

Specifies that the router negotiates to receive multiple unlabeled unicast routes per IPv4 prefix.

### **none**

Specifies that the router does not negotiate to receive multiple unlabeled unicast routes per IPv4 prefix.

## Platforms

All

## ipv4

## Syntax

**ipv4** *max-paths* [**ebgp** *ebgp-max-paths*] [**ibgp** *ibgp-max-paths*] [**restrict** { **same-neighbor-as** | **exact-as-path**}] [**unequal-cost**]

**no ipv4**

## Context

[\[Tree\]](#) (config>router>bgp>multi-path ipv4)

## Full Context

configure router bgp multi-path ipv4

## Description

This command sets ECMP multipath parameters that apply only to the (unlabeled) IPv4 unicast address family. These settings override the values set by the **maximum-paths** command.

When multipath is enabled, traffic to the destination is load-shared across a set of paths (BGP routes) that the BGP decision process considers equal to the best path. The actual distribution of traffic over the multiple paths may be equal or unequal (that is, based on weights derived from the Link Bandwidth Extended Community).

The **no** form of this command removes IPv4-specific overrides.

## Default

no ipv4

## Parameters

### ***max-paths***

Specifies the maximum number of multipaths per prefix/NLRI if *ebgp-max-paths* or *ibgp-max-paths* does not apply.

**Values** 1 to 64

### ***ebgp-max-paths***

Specifies the maximum number of multipaths per prefix or NLRI when the best path is an EBGp learned route.

**Values** 1 to 64

### ***ibgp-max-paths***

Specifies the maximum number of multipaths per prefix or NLRI when the best path is an IBGP learned route.

**Values** 1 to 64

### **restrict same-neighbor-as**

Specifies that the non-best path must have the same neighbor AS in its AS path as the best path.

### **restrict exact-as-path**

Specifies that the non-best path must have the same AS path as the best path.

### **unequal-cost**

Instructs BGP to ignore differences in the next-hop cost only when determining eligible multipaths.

configure subscriber-mgmt sla-profile host-limits ipv4-dhcp
```

```
configure subscriber-mgmt sub-profile host-limits ipv4-dhcp
```

### Description

This command limits the number of IPv4 DHCP hosts per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of IPv4 DHCP hosts limit.

## Parameters

### *max-nr-of-hosts*

Specifies the maximum number of IPv4 DHCP hosts.

#### **Note:**

The operational maximum value may be smaller due to equipped hardware dependencies.

**Values** 0 to 131071

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.266 ipv4-mtu

### ipv4-mtu

#### Syntax

*ipv4-mtu bytes*

*no ipv4-mtu*

#### Context

[\[Tree\]](#) (config>subscr-mgmt>gtp>peer-profile ipv4-mtu)

#### Full Context

configure subscriber-mgmt gtp peer-profile ipv4-mtu

#### Description

This command configures the value of the IPv4-MTU PCO sent in S11 GTP messages. This is the MTU a device should honor when sending data toward the SGW/PGW. For IPv6, this value is signaled in the RA message and which can be configured in the **grp-if> ipv6>rtr-adv>mtu** context.

The **no** form of this command resets the signaled IPv4 MTU to the default.

#### Default

ipv4-mtu 1400

#### Parameters

##### *bytes*

Specifies the MTU value in bytes.

**Values** 512 to 9000

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.267 ipv4-multicast

### ipv4-multicast

**Syntax**

[no] ipv4-multicast

**Context**

[\[Tree\]](#) (config>service>vprn>isis>multi-topology ipv4-multicast)

**Full Context**

configure service vprn isis multi-topology ipv4-multicast

**Description**

This command enables support for the IPv4 topology (MT3) within the associate IS-IS instance.

The **no** form of this command disables support for the IPv4 topology (MT3) within the associated IS-IS instance.

**Default**

no ipv4-multicast

**Platforms**

All

### ipv4-multicast

**Syntax**

[no] ipv4-multicast

**Context**

[\[Tree\]](#) (config>router>isis>multi-topology ipv4-multicast)

**Full Context**

configure router isis multi-topology ipv4-multicast

**Description**

This command enables support for the IPv4 topology (MT3) within the associate IS-IS instance.

The **no** form of this command disables support for the IPv4 topology (MT3) within the associated IS-IS instance.

**Default**

no ipv4-multicast

**Platforms**

All

## 13.268 ipv4-multicast-disable

ipv4-multicast-disable

**Syntax**

[no] ipv4-multicast-disable

**Context**

[\[Tree\]](#) (config>service>vpls>pim-snooping ipv4-multicast-disable)

**Full Context**

configure service vpls pim-snooping ipv4-multicast-disable

**Description**

This command disables PIM snooping for IPv4 multicast traffic within a VPLS service.

The **no** form of this command enables PIM snooping for IPv4 multicast traffic within a VPLS service. To fully remove PIM snooping from a VPLS service it is necessary to issue the no pim-snooping command.

**Default**

no ipv4-multicast-disable

**Platforms**

All

ipv4-multicast-disable

**Syntax**

[no] ipv4-multicast-disable

**Context**

[\[Tree\]](#) (config>service>vprn>isis>if ipv4-multicast-disable)

### Full Context

```
configure service vprn isis interface ipv4-multicast-disable
```

### Description

This command administratively disables/enables ISIS operation for IPv4.

### Default

```
no ipv4-multicast-disable
```

### Platforms

All

## ipv4-multicast-disable

### Syntax

```
[no] ipv4-multicast-disable
```

### Context

[\[Tree\]](#) (config>service>vprn>pim ipv4-multicast-disable)

[\[Tree\]](#) (config>service>vprn>pim>if ipv4-multicast-disable)

### Full Context

```
configure service vprn pim ipv4-multicast-disable
```

```
configure service vprn pim interface ipv4-multicast-disable
```

### Description

This command administratively disables/enables PIM operation for IPv4.

### Default

```
no ipv4-multicast-disable
```

### Platforms

All

## ipv4-multicast-disable

### Syntax

```
[no] ipv4-multicast-disable
```

### Context

[\[Tree\]](#) (config>router>pim>interface ipv4-multicast-disable)

[\[Tree\]](#) (config>router>pim ipv4-multicast-disable)

### Full Context

```
configure router pim interface ipv4-multicast-disable
configure router pim ipv4-multicast-disable
```

### Description

This command administratively enables PIM operation for IPv4.

IPv4 multicast must be enabled to enable MLDP in-band signaling for IPv4 PIM joins; see **config>router>pim>interface p2mp-ldp-tree-join**.

The **no** form of this command disables the PIM operation for IPv4.

### Default

```
no ipv4-multicast-disable
```

### Platforms

All

## ipv4-multicast-disable

### Syntax

```
[no] ipv4-multicast-disable
```

### Context

[\[Tree\]](#) (config>router>isis>interface ipv4-multicast-disable)

### Full Context

```
configure router isis interface ipv4-multicast-disable
```

### Description

This command disables IS-IS IPv4 multicast routing for the interface.

The **no** form of this command enables IS-IS IPv4 multicast routing for the interface.

### Platforms

All

## 13.269 ipv4-multicast-metric

## ipv4-multicast-metric

### Syntax

**ipv4-multicast-metric** *metric*

**no ipv4-multicast-metric**

### Context

[\[Tree\]](#) (config>service>vprn>isis>if>level ipv4-multicast-metric)

### Full Context

configure service vprn isis interface level ipv4-multicast-metric

### Description

This command configures IS-IS interface metric for IPv4 multicast for the VPRN instance.

The **no** form of this command removes the metric from the configuration.

### Parameters

***metric***

Specifies the IS-IS interface metric for IPv4 multicast.

**Values** 1 to 16777215

### Platforms

All

## ipv4-multicast-metric

### Syntax

**ipv4-multicast-metric** *metric*

**no ipv4-multicast-metric**

### Context

[\[Tree\]](#) (config>router>isis>if>level ipv4-multicast-metric)

### Full Context

configure router isis interface level ipv4-multicast-metric

### Description

This command configures the IS-IS interface metric for IPv4 multicast.

The **no** form of this command removes the metric from the configuration.

**Parameters*****metric***

Specifies the IS-IS interface metric for IPv4 multicast.

**Values** 1 to 16777215

**Platforms**

All

## 13.270 ipv4-multicast-metric-offset

### ipv4-multicast-metric-offset

**Syntax**

**ipv4-multicast-metric-offset** *offset-value*

**no ipv4-multicast-metric-offset**

**Context**

[\[Tree\]](#) (config>service>vprn>isis>link-group>level ipv4-multicast-metric-offset)

**Full Context**

configure service vprn isis link-group level ipv4-multicast-metric-offset

**Description**

This command sets the offset value for the IPv4 multicast address family. If the number of operational links drops below the oper-members threshold, the configured offset is applied to the interface metric for the IPv4 multicast topology

The **no** form of this command reverts the offset value to 0.

**Default**

no ipv4-multicast-metric-offset

**Parameters*****offset-value***

Specifies the amount the interface metric for the associated address family is to be increased if the number of operational members in the associated link-group drops below the oper-members threshold.

**Values** 0 to 6777215

**Platforms**

All

## ipv4-multicast-metric-offset

### Syntax

**ipv4-multicast-metric-offset** *offset-value*  
**no ipv4-multicast-metric-offset**

### Context

**[Tree]** (config>router>isis>link-group>level ipv4-multicast-metric-offset)

### Full Context

configure router isis link-group level ipv4-multicast-metric-offset

### Description

This command sets the offset value for the IPv4 multicast address family. If the number of operational links drops below the oper-members threshold, the configured offset is applied to the interface metric for the IPv4 multicast topology.

The **no** form of this command reverts the offset value to 0.

### Default

no ipv4-multicast-metric-offset

### Parameters

#### *offset-value*

Specifies the amount the interface metric for the associated address family is to be increased if the number of operational members in the associated link-group drops below the oper-members threshold

**Values** 0 to 6777215

### Platforms

## 13.271 ipv4-multicast-routing

## ipv4-multicast-routing

### Syntax

**ipv4-multicast-routing** {native | mt}  
**[no] ipv4-multicast-routing**

## Context

[\[Tree\]](#) (config>service>vprn>isis ipv4-multicast-routing)

## Full Context

```
configure service vprn isis ipv4-multicast-routing
```

## Description

The multicast RTM is used for Reverse Path Forwarding checks. This command controls which IS-IS topology is used to populate the IPv4 multicast RTM.

The **no** ipv4-multicast-routing form of this command results in none of the IS-IS routes being populated in the IPv4 multicast RTM and would be used if multicast is configured to use the unicast RTM for the RPF check.

## Default

```
ipv4-multicast-routing native
```

## Parameters

### native

Causes IPv4 routes from the MT0 topology to be added to the multicast RTM for RPF checks.

### mt

Causes IPv4 routes from the MT3 topology to be added to the multicast RTM for RPF checks.

## Platforms

All

## ipv4-multicast-routing

## Syntax

```
ipv4-multicast-routing {native | mt}
```

```
[no] ipv4-multicast-routing
```

## Context

[\[Tree\]](#) (config>router>isis ipv4-multicast-routing)

## Full Context

```
configure router isis ipv4-multicast-routing
```

## Description

The multicast RTM is used for Reverse Path Forwarding checks. This command controls which IS-IS topology is used to populate the IPv4 multicast RTM.

The **no** form of this command results in none of the IS-IS routes being populated in the IPv4 multicast RTM and would be used if multicast is configured to use the unicast RTM for the RPF check.

### Default

ipv4-multicast-routing native

### Parameters

#### native

Causes IPv4 routes from the MT0 topology to be added to the multicast RTM for RPF checks.

#### mt

Causes IPv4 routes from the MT3 topology to be added to the multicast RTM for RPF checks.

### Platforms

All

## 13.272 ipv4-node-sid

### ipv4-node-sid

### Syntax

**ipv4-node-sid index** *index-value* [**clear-n-flag**]

**ipv4-node-sid label** *label-value* [**clear-n-flag**]

**no ipv4-node-sid**

### Context

[\[Tree\]](#) (config>router>isis>interface ipv4-node-sid)

### Full Context

configure router isis interface ipv4-node-sid

### Description

This command assigns a node SID index or label value to the prefix representing the primary address of an IPv4 network interface of **type loopback**. Only a single node SID can be assigned to an interface. The secondary address of an IPv4 interface cannot be assigned a node SID index and does not inherit the SID of the primary IPv4 address.

The command fails if the network interface is not of **type loopback** or if the interface is defined in an IES or a VPRN context. Also, assigning the same SID index or label value to the same interface in two different IGP instances is not allowed within the same node.

The value of the label or index SID is taken from the range configured for this IGP instance. When using the global mode of operation, a new segment routing module checks that the same index or label value

cannot be assigned to more than one loopback interface address. When using the per-instance mode of operation, this check is not required since the index and thus label ranges of the various IGP instance are not allowed to overlap.

The **clear-n-flag** option allows the user to clear the N-flag (node-sid flag) in an IS-IS prefix SID sub-TLV originated for the IPv4 prefix of a loopback interface on the system.

By default, the prefix SID sub-TLV for the prefix of a loopback interface is tagged as a node SID, meaning that it belongs to this node only. However, when the user wants to configure and advertise an anycast SID using the same loopback interface prefix on multiple nodes, you must clear the N-flag to assure interoperability with third party implementations, which may perform a strict check on the receiving end and drop duplicate prefix SID sub-TLVs when the N-flag is set.

The SR OS implementation is relaxed on the receiving end and accepts duplicate prefix SIDs with the N-flag set or cleared. SR OS will resolve to the closest owner, or owners if ECMP is configured, of the prefix SID according to its cost.

### Default

no ipv4-node-sid

### Parameters

#### ***index index-value***

Specifies the index value.

**Values** 0 to 4294967295

#### ***label label-value***

Specifies the label value.

**Values** 0 to 4294967295

#### **clear-n-flag**

Clears the node SID flag.

**Default** no clear-n-flag

### Platforms

## 13.273 ipv4-overall

ipv4-overall

### Syntax

**ipv4-overall** *max-nr-of-hosts*

**no ipv4-overall**

## Context

[\[Tree\]](#) (config>subscr-mgmt>sub-profile>host-limits ipv4-overall)

[\[Tree\]](#) (config>subscr-mgmt>sla-profile>host-limits ipv4-overall)

## Full Context

configure subscriber-mgmt sub-profile host-limits ipv4-overall

configure subscriber-mgmt sla-profile host-limits ipv4-overall

## Description

This command configures the maximum number of IPv4 hosts per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of IPv4 hosts limit.

## Parameters

### *max-nr-of-hosts*

Specifies the maximum number of IPv4 hosts.

### Note:

The operational maximum value may be smaller due to equipped hardware dependencies.

**Values** 0 to 131071

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.274 ipv4-ppp

### ipv4-ppp

## ipv4-routing

### Syntax

[no] ipv4-routing

### Context

[\[Tree\]](#) (config>service>vprn>isis ipv4-routing)

### Full Context

configure service vprn isis ipv4-routing

### Description

This command specifies whether this IS-IS instance supports IPv4.

The **no** form of this command disables IPv4 on the IS-IS instance.

### Default

ipv4-routing

## Platforms

All

## ipv4-routing

## Syntax

[no] **ipv4-routing**

## Context

[\[Tree\]](#) (config>router>isis ipv4-routing)

## Full Context

configure router isis ipv4-routing

## Description

This command specifies whether this IS-IS instance supports IPv4.

The **no** form of this command disables IPv4 on the IS-IS instance.

## Default

ipv4-routing

## Platforms

All

## 13.277 ipv4-sid

## ipv4-sid

## Syntax

**ipv4-sid index** *index-id*

**ipv4-sid label** *label-id*

**no ipv4-sid**

## Context

[\[Tree\]](#) (config>router>segment-routing>sr-mpls>prefix-sids ipv4-sid)

## Full Context

configure router segment-routing sr-mpls prefix-sids ipv4-sid

## Description

This command is used to configure the IPv4 segment routing SID associated with the primary IPv4 address of the loopback or system interface.

The **no** form of this command removes the configuration of the IPv4 segment routing SID associated with the primary IPv4 interface address.

## Default

no ipv4-sid

## Parameters

### **index** *index-id*

Specifies the node SID index for this interface.

**Values** 0 to 4294967295

### **label** *label-id*

Specifies the label value for the node SID.

**Values** 32 to 1048575

## Platforms

All

## 13.278 ipv4-source-address

### ipv4-source-address

## Syntax

**ipv4-source-address** *ipv4-address*

**no ipv4-source-address**

## Context

[\[Tree\]](#) (config>service>vprn>dns ipv4-source-address)

## Full Context

configure service vprn dns ipv4-source-address

## Description

This command configures the IPv4 address of the default secondary DNS server for the subscribers using this interface. Subscribers that cannot obtain an IPv4 DNS server address by other means, can use this for DNS name resolution.

The `ipv4-address` value can only be set to a nonzero value if the value of VPRN type is set to **subscriber-split-horizon**.

The **no** form of this command reverts to the default.

### Parameters

#### *ipv4-address*

Specifies the IPv4 address of the default secondary DNS server.

**Values** `ipv4-address - a.b.c.d`

### Platforms

All

## ipv4-source-address

### Syntax

`ipv4-source-address ip-address`

`no ipv4-source-address`

### Context

[\[Tree\]](#) (config>system>file-trans-prof ipv4-source-address)

### Full Context

configure system file-transmission-profile ipv4-source-address

### Description

This command specifies the IPv4 source address used for transport protocol.

The **no** form of this command uses the default source address which typically is the address of the egress interface.

### Default

`no ipv4-source-address`

### Parameters

#### *ip-address*

Specifies a unicast v4 address. This should be a local interface address.

### Platforms

All

## ipv4-source-address

### Syntax

**ipv4-source-address** *ip-address*

**no ipv4-source-address**

### Context

**[Tree]** (config>service>nat>syslog>syslog-export-policy>collector ipv4-source-address)

### Full Context

configure service nat syslog syslog-export-policy collector ipv4-source-address

### Description

This command configures the IPv4 source address from which the UDP streams containing syslog flow records are sourced.

The **no** form of the command removes the IPv4 address from the configuration.

### Parameters

***ip-address***

Specifies the source IPv4 address from which UDP streams are sent.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.279 ipv4-unicast-metric-offset

## ipv4-unicast-metric-offset

### Syntax

**ipv4-unicast-metric-offset** *offset-value*

**no ipv4-unicast-metric-offset**

### Context

**[Tree]** (config>service>vprn>isis>link-group>level ipv4-unicast-metric-offset)

### Full Context

configure service vprn isis link-group level ipv4-unicast-metric-offset

### Description

This command sets the offset value for the IPv4 unicast address family. If the number of operational links drops below the oper-members threshold, the configured offset is applied to the interface metric.

The **no** form of this command reverts the offset value to 0.

### Default

no ipv4-unicast-metric-offset

### Parameters

#### *offset-value*

Specifies the amount the interface metric for the associated address family is to be increased if the number of operational members in the associated link-group drops below the oper-members threshold.

**Values** 0 to 6777215

### Platforms

All

## ipv4-unicast-metric-offset

### Syntax

**ipv4-unicast-metric-offset** *offset-value*

**no ipv4-unicast-metric-offset**

### Context

## ipv6

### Syntax

[no] ipv6

### Context

[\[Tree\]](#) (config>subscr-mgmt>bgp-prng-plcy>family ipv6)

### Full Context

configure subscriber-mgmt bgp-peering-policy family ipv6

### Description

This command configures Multiprotocol Border Gateway Protocol (MPBGP) support for the IPv6 address family.

The **no** form of this command removes the IPv6 configuration.

### Default

no ipv6

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## ipv6

### Syntax

ipv6 *ipv6-filter-id*

no ipv6

### Context

[\[Tree\]](#) (config>service>template>epipe-sap-template>egress>filter ipv6)

[\[Tree\]](#) (config>service>template>epipe-sap-template>ingress>filter ipv6)

## Full Context

configure service template epipe-sap-template egress filter ipv6  
configure service template epipe-sap-template ingress filter ipv6

## Description

This command associates an existing IPv6 filter policy with the template.

This command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**).

## Parameters

### *ipv6-filter-id*

Specifies the IPv6 filter policy. The filter ID must already exist within the created IPv6 filters.

**Values** 1 to 65535

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## ipv6

## Syntax

**ipv6** *name*  
**no ipv6**

## Context

configure service template vpls-sap-template ingress filter-name ipv6

configure service template vpls-sap-template egress filter-name ipv6

### Description

This command associates an existing IP filter policy with the template.

### Parameters

*name*

Specifies the IPv6 filter policy name, up to 64 characters.

### Platforms

All

## ipv6

### Syntax

**ipv6 max-paths** [**ebgp** *ebgp-max-paths*] [**ibgp** *ibgp-max-paths*] [**restrict** { **same-neighbor-as** | **exact-as-path**}] [**unequal-cost**]

**no ipv6**

### Context

**[Tree]** (config>service>vprn>bgp>multi-path ipv6)

### Full Context

configure service vprn bgp multi-path ipv6

### Description

This command sets ECMP multipath parameters that apply only to the (unlabeled) IPv6 unicast address family. These settings override the values set by the **maximum-paths** command.

When multipath is enabled, traffic to the destination is load-shared across a set of paths (BGP routes) that the BGP decision process considers equal to the best path. The actual distribution of traffic over the multiple paths may be equal or unequal (that is, based on weights derived from the Link Bandwidth Extended Community).

To qualify as a multipath, a non-best route must meet the following criteria (some criteria are controlled by this command):

- The multi-path route must be the same type of route as the best path (same AFI/SAFI and, in some cases, same next-hop resolution method).
- The multi-path route must be tied with the best path for all criteria of greater significance than next-hop cost, except for criteria that are configured to be ignored.
- If the best path selection reaches the next-hop cost comparison, the multi-path route must have the same next-hop cost as the best route unless the **unequal-cost** option is configured.
- The multi-path route must not have the same BGP next-hop as the best path or any other multi-path route.
- The multi-path route must not cause the ECMP limit of the routing instance to be exceeded (configured using the **ecmp** command with a value in the range 1 to 64)
- The multi-path route must not cause the applicable *max-paths* limit to be exceeded. If the best path is an EBGp learned route and the **ebgp** option is used, the *ebgp-max-paths* limit overrides the *max-paths* limit. If the best path is an IBGP-learned route and the **ibgp** option is used, the *ibgp-max-paths* limit overrides the *max-paths* limit. All path limits are configurable up to a maximum of 64. Multi-path is effectively disabled if a value is set to 1.
- The multi-path route must have the same neighbor AS in its AS path as the best path if the **restrict same-neighbor-as** option is configured. By default, any path with the same AS path length as the best path (regardless of neighbor AS) is eligible for multi-path.
- The route must have the same AS path as the best path if the **restrict exact-as-path** option is configured. By default, any path with the same AS path length as the best path (regardless of the actual AS numbers) is eligible for multi-path.

The **no** form of this command removes IPv6-specific overrides.

## Default

no ipv6

## Parameters

### *max-paths*

Specifies the maximum number of multipaths per prefix/NLRI if *ebgp-max-paths* or *ibgp-max-paths* does not apply.

**Values** 1 to 64

### *ebgp-max-paths*

Specifies the maximum number of multipaths per prefix or NLRI when the best path is an EBGp learned route.

**Values** 1 to 64

### *ibgp-max-paths*

Specifies the maximum number of multipaths per prefix or NLRI when the best path is an IBGP learned route.

**Values** 1 to 64

#### **restrict same-neighbor-as**

Specifies that the non-best path must have the same neighbor AS in its AS path as the best path.

#### **restrict exact-as-path-as**

Specifies that the non-best path must have the same AS path as the best path.

#### **unequal-cost**

Instructs BGP to ignore differences in the next-hop cost only when determining eligible multipaths.

When enabled, the Alc-App-Prof-Str VSA is ignored in a radius Accept that enables portal redirection using this redirect policy. AA functionality will be disabled during portal authentication.

The **no** version of this command allows an Alc-App-Prof-Str to be present and will enable Application Assurance during portal authentication. In this case redirection rules defined in this policy are bypassed and it is assumed the AA function is configured for portal redirection.

**Full Context**

configure subscriber-mgmt isa-filter ipv6

**Description**

Commands in this context configure IPv6 parameters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**ipv6****Syntax**

ipv6

**Context**

[\[Tree\]](#) (config>service>vprn>mvpn>red-source-list ipv6)

**Full Context**

configure service vprn mvpn red-source-list ipv6

**Description**

This command enables context to configure list of redundant IPv6 source prefixes for preferred source selection.

**Platforms**

All

## ipv6

### Syntax

ipv6

### Context

[\[Tree\]](#) (config>service>vprn>pim>rp ipv6)

### Full Context

configure service vprn pim rp ipv6

### Description

This command enables access to the context to configure the rendezvous point (RP) of a PIM IPv6 protocol instance.

A Nokia IPv6 PIM router acting as an RP must respond to an IPv6 PIM register message specifying an SSM multicast group address by sending to the first hop router stop register message(s). It does not build an (S, G) shortest path tree toward the first hop router. An SSM multicast group address can be either from the SSM default range or from a multicast group address range that was explicitly configured for SSM.

### Default

ipv6 RP enabled when IPv6 PIM is enabled.

### Platforms

All

## ipv6

### Syntax

[no] ipv6

### Context

[\[Tree\]](#) (config>router>ldp>if-params>if ipv6)

[no] ipv6
```

## Context

[\[Tree\]](#) (config>cflowd>collector>export-filter>family ipv6)

## Full Context

```
configure cflowd collector export-filter family ipv6
```

## Description

This command filters IPv6 flow data from being sent to the associated collector.

The **no** form of this command removes the filter, allowing IPv6 flow data to be sent to the associated collector.

## Default

```
no ipv6
```

## Platforms

All

```
ipv6
```

## Syntax

```
[no] ipv6 ipv6-filter-id
```

## Context

[\[Tree\]](#) (config>filter>system-filter ipv6)

## Full Context

```
configure filter system-filter ipv6
```

## Description

This command activates an IPv6 system filter policy. Once activated, all IPv6 ACL filter policies that chain to the system filter ( **config>filter>ipv6-filter>chain-to-system-filter**) will automatically execute system filter policy rules first.

The **no** form of the command deactivates the system filter policy.

## Parameters

### *ipv6-filter-id*

Specifies the existing IPv6 filter policy with scope **system**. This parameter can either be expressed as a decimal integer, or as an ASCII string of up to 64 characters in length.

**Values** 1 to 65535 or the filter policy name

## ipv6

### Syntax

**ipv6** *ipv6-address*

**ipv6 auto-generate** [**vendor-id-value** *vendor-id*]

**no ipv6**

### Context

[\[Tree\]](#) (config>system>ned>prof>neip ipv6)

### Full Context

configure system network-element-discovery profile neip ipv6

### Description

This command configures the IPv6 NEIP for this profile. The NEIP can be configured manually or set to be automatically generated. If the NEIP is set to be automatically generated, the NEID is used for the subnet and host portion of the IPv6 address and the vendor ID value is set to 140 by default. The vendor ID value can be configured.

The **no** form of this command removes the IPv6 address association for this profile.

### Default

no ipv6

### Parameters

#### *ipv6-address*

Specifies the IPv6 address of the NEIP.

| Values | <i>ipv6-address</i> |                                     |
|--------|---------------------|-------------------------------------|
|        |                     | x:x:x:x:x:x:x (eight 16-bit pieces) |
|        |                     | x:x:x:x:x:d.d.d.d                   |
|        |                     | x: [0..FFFF]H                       |
|        |                     | d: [0..255]D                        |

#### **auto-generate**

Specifies that the NEIP is automatically generated using the NEID.

#### *vendor-id-value*

Specifies the vendor ID value.

| Values |          |
|--------|----------|
|        | 1 to 255 |

### Platforms

All

## ipv6

### Syntax

**ipv6 send** *send-limit* **receive** [ **none**]

**ipv6 send** *send-limit*

**no ipv6**

### Context

[\[Tree\]](#) (config>router>bgp>group>neighbor>add-paths ipv6)

[\[Tree\]](#) (config>router>bgp>add-paths ipv6)

[\[Tree\]](#) (config>router>bgp>group>add-paths ipv6)

### Full Context

configure router bgp group neighbor add-paths ipv6

configure router bgp add-paths ipv6

configure router bgp group add-paths ipv6

### Description

This command configures the add-paths capability for unlabeled IPv6 unicast routes. By default, add-paths is not enabled for unlabeled IPv6 unicast routes.

The maximum number of unlabeled unicast paths per IPv6 prefix to send is the configured send limit, which is a mandatory parameter. The capability to receive multiple unlabeled IPv6 unicast paths per prefix from a peer is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command the receive capability is enabled by default.

The **no** form of this command disables add-paths support for unlabeled IPv6 unicast routes, causing sessions established using add-paths for unlabeled IPv6 unicast to go down and come back up without the add-paths capability.

### Default

no ipv6

### Parameters

#### **send** *send-limit*

Specifies the maximum number of paths per unlabeled IPv6 unicast prefix that are allowed to be advertised to add-paths peers. (The actual number of advertised routes may be less.) If the value is **none**, the router does not negotiate the send capability with respect to IPv6 AFI/SAFI. If the value is **multipaths**, then BGP advertises all the used BGP multipaths for each IPv6 NLRI if the peer has signaled support to receive multiple add-paths.

**Values** 1 to 16, none, multipaths

#### **receive**

Specifies the router negotiates to receive multiple unlabeled unicast routes per IPv6 prefix.

**none**

Specifies the router does not negotiate to receive multiple unlabeled unicast routes per IPv6 prefix.

**Platforms**

All

**ipv6****Syntax**

**ipv6** *max-paths* [**ebgp** *ebgp-max-paths*] [**ibgp** *ibgp-max-paths*] [**restrict** { **same-neighbor-as** | **exact-as-path**}] [**unequal-cost**]

**no ipv6**

**Context**

[\[Tree\]](#) (config>router>bgp>multi-path ipv6)

**Full Context**

configure router bgp multi-path ipv6

**Description**

This command sets ECMP multipath parameters that apply only to the (unlabeled) IPv6 unicast address family. These settings override the values set by the **maximum-paths** command.

When multipath is enabled, traffic to the destination is load-shared across a set of paths (BGP routes) that the BGP decision process considers equal to the best path. The actual distribution of traffic over the multiple paths may be equal or unequal (that is, based on weights derived from the Link Bandwidth Extended Community).

The **no** form of this command removes IPv6-specific overrides.

**Default**

no ipv6

**Parameters*****max-paths***

Specifies the maximum number of multipaths per prefix/NLRI if *ebgp-max-paths* or *ibgp-max-paths* does not apply.

**Values** 1 to 64

***ebgp-max-paths***

Specifies the maximum number of multipaths per prefix or NLRI when the best path is an EBGp learned route.

**Values** 1 to 64

***ibgp-max-paths***

Specifies the maximum number of multipaths per prefix or NLRI when the best path is an IBGP learned route.

**Values** 1 to 64

**restrict same-neighbor-as**

Specifies that the non-best path must have the same neighbor AS in its AS path as the best path.

**restrict exact-as-path**

Specifies that the non-best path must have the same AS path as the best path.

**unequal-cost**

Instructs BGP to ignore differences in the next-hop cost only when determining eligible multipaths.

**Platforms**

All

**ipv6****Syntax**

[no] ipv6

**Context**

[\[Tree\]](#) (config>router>isis>traffic-engineering-options ipv6)

**Full Context**

configure router isis traffic-engineering-options ipv6

**Description**

This command enables the advertisement of IPv6 TE in the IS-IS instance. When this command is enabled, traffic engineering behavior with IPv6 TE links is enabled. This IS-IS instance automatically begins advertising the new RFC 6119 IPv6 and TE TLVs and sub-TLVs.

The **no** form of this command disables IPv6 TE in this ISIS instance.

**Default**

no ipv6

**Platforms**

All

configure application-assurance group transit-ip-policy ipv6-address-prefix-length

#### Description

This command configures a transit IP policy IPv6 address prefix length.

#### Default

no ipv6-address-prefix-length

#### Parameters

##### ***IPv6-prefix-length***

Specifies the prefix length of IPv6 addresses in this policy for both static and dynamic transits.

**Values** 32 to 64

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.283 ipv6-adjacency-sid

ipv6-adjacency-sid

**Syntax**

**ipv6-adjacency-sid** *label value*

**no ipv6-adjacency-sid**

**Context**

[\[Tree\]](#) (config>router>isis>interface ipv6-adjacency-sid)

**Full Context**

configure router isis interface ipv6-adjacency-sid

**Description**

This command allows a static value to be assigned to an IPv6 adjacency SID in IS-IS segment routing.

The **label** option specifies that the value is assigned to an MPLS label.

The **no** form of this command removes the adjacency SID.

**Parameters**

*value*

Specifies the adjacency SID label.

**Values** 18432 to 5248, 1048575 (FP4 or FP5 only)

**Platforms**

All

## 13.284 ipv6-criteria

ipv6-criteria

**Syntax**

**[no] ipv6-criteria**

## Context

[\[Tree\]](#) (config>qos>sap-ingress ipv6-criteria)

[\[Tree\]](#) (config>qos>sap-egress ipv6-criteria)

## Full Context

configure qos sap-ingress ipv6-criteria

configure qos sap-egress ipv6-criteria

## Description

IPv6 criteria-based SAP egress or ingress policies are used to select the appropriate ingress or egress queue or policer and corresponding forwarding class and packet profile for matched traffic.

This command is used to enter the node to create or edit policy entries that specify IPv6 criteria such as IP quintuple lookup or DiffServ code point.

The OS implementation will exit on the first match found and execute the actions in accordance with the accompanying action command. For this reason, entries must be sequenced correctly from most to least explicit.

The **no** form of this command deletes all the entries specified under this node. When ipv6-criteria entries are removed from a SAP ingress policy, the ipv6-criteria is removed from all services where that policy is applied.

## Platforms

All

## ipv6-criteria

## Syntax

**[no] ipv6-criteria**

## Context

[\[Tree\]](#) (config>qos>network>ingress ipv6-criteria)

[\[Tree\]](#) (config>qos>network>egress ipv6-criteria)

## Full Context

configure qos network ingress ipv6-criteria

configure qos network egress ipv6-criteria

## Description

IPv6 criteria-based network ingress and egress policies are used to select the appropriate ingress or egress queue or policer, and the corresponding forwarding class and packet profile for matched traffic. This command is used to enter the context to create or edit policy entries that specify IPv6 criteria such as IP quintuple lookup or DSCP.

The 7750 SR OS implementation will exit on the first match found and execute the actions in accordance with the accompanying action command. Entries must be sequenced correctly from most to least explicit.

The ingress classification only applies to the outer IPv6 header of non-tunneled traffic.

Attempting to apply a network QoS policy containing an **ipv6-criteria** statement to any object except a network IP interface will result in an error.

The **no** form of this command deletes all entries specified under this node. When IP criteria entries are removed from a network policy, the IPv6 criteria are removed from all network interfaces to which that policy is applied.

## Platforms

## 13.286 ipv6-delegated-prefix-length

## ipv6-delegated-prefix-length

### Syntax

**ipv6-delegated-prefix-length** *bits*

**no ipv6-delegated-prefix-length**

### Context

**[Tree]** (config>subscr-mgmt>loc-user-db>ppp>host ipv6-delegated-prefix-length)

**[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host ipv6-delegated-prefix-length)

### Full Context

configure subscriber-mgmt local-user-db ppp host ipv6-delegated-prefix-length

configure subscriber-mgmt local-user-db ipoe host ipv6-delegated-prefix-length

### Description

This command allows configuration of delegated prefix length via local user database.

The **no** form of this command reverts to the default.

### Parameters

*bits*

Specifies the delegated prefix length, in bits.

**Values** 48 to 64

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.287 ipv6-delegated-prefix-pool

## ipv6-delegated-prefix-pool

### Syntax

**ipv6-delegated-prefix-pool** *pool-name*

**no ipv6-delegated-prefix-pool**

### Context

**[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host ipv6-delegated-prefix-pool)

**[Tree]** (config>subscr-mgmt>loc-user-db>ppp>host ipv6-delegated-prefix-pool)

**Full Context**

```
configure subscriber-mgmt local-user-db ipoe host ipv6-delegated-prefix-pool
configure subscriber-mgmt local-user-db ppp host ipv6-delegated-prefix-pool
```

**Description**

This command configures the pool name that is used in DHCPv6 server for DHCPv6 IA-PD prefix selection.

The **no** form of this command removes the pool name from the configuration.

**Parameters*****pool-name***

Specifies the pool name, up to 32 characters, to be assigned to the delegated prefix pool.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
configure test-oam link-measurement measurement-template twamp-light ipv6-destination-discovery
```

**Description**

Commands in this context configure IPv6 discovery of a directly-connected IPv6 peer address.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 13.289 ipv6-eh

## ipv6-eh

### Syntax

**ipv6-eh** {**max** | **limited**}

**no ipv6-eh**

### Context

[\[Tree\]](#) (config>system>ip ipv6-eh)

### Full Context

configure system ip ipv6-eh

### Description

This command defines the maximum number of IPv6 extension headers parsed in the line cards. The system parses up to six extension headers when **ipv6-eh max** is configured.

When the **ipv6-eh limited** command is configured, the system does not parse IPv6 extension headers and provides consistent ipv6-filter matches for the next-header value found in the IPv6 packet header. LAG and ECMP hashing of IPv6 packets with extension headers is limited to Layer 3 IP addresses. Layer 4 ports, TEID, and SPI values are not available for hashing. MLD snooping on Layer 2 services is also not supported in this mode.

The **no** form of this command reverts to the default value.

### Default

ipv6-eh max

### Parameters

#### **max**

Specifies that the maximum number of IPv6 extension headers is parsed in the line cards.

#### **limited**

Specifies that the system does not parse IPv6 extension headers and provides consistent ipv6-filter matches for the next-header value found in the IPv6 packet header.

## 13.291 ipv6-exception

### ipv6-exception

**Syntax**

**ipv6-exception** *exception*

**no ipv6-exception**

**Context**

[\[Tree\]](#) (config>router>if>ipsec ipv6-exception)

[\[Tree\]](#) (config>service>vprn>if>ipsec ipv6-exception)

[\[Tree\]](#) (config>service>ies>if>ipsec ipv6-exception)

**Full Context**

configure router interface ipsec ipv6-exception

configure service vprn interface ipsec ipv6-exception

configure service ies interface ipsec ipv6-exception

**Description**

This command configures the IPv6 filter exception for an IPsec-secured IPv6 interface. When an IPv6 filter exception is added, clear text packets that match the exception criteria in the IPv6 filter exception policy can ingress the interface, even when IPsec is enabled on that interface.

The **no** form of this command removes the IPv6 filter exception.

**Default**

no ipv6-exception

## Parameters

### *exception*

Specifies the IPv6 filter exception that is used to bypass encryption.

**Values**    *exception-id*: 1 to 65535  
*exception-name*: An existing IPv6 filter exception name up to 64 characters.

## Platforms

VSR

## ipv6-exception

## Syntax

```
ipv6-exception exception-id [name exception-name] [create]
no ipv6-exception {exception-id | exception-name}
```

## Context

[\[Tree\]](#) (config>filter ipv6-exception)

## Full Context

configure filter ipv6-exception

## Description

Commands in this context configure the specified IPv6 exception filter.

The **no** form of the command deletes the IPv6 exception filter.

## Parameters

### *exception-id*

Specifies the IPv6 filter exception ID expressed as a decimal integer.

**Values**    1 to 65535

### **name** *exception-name*

Specifies the IPv6 filter exception as a name, up to 64 characters.

### **create**

This keyword is required to create the configuration context. Once it is created, the context can be enabled with or without the **create** keyword.

## Platforms

VSR

## 13.292 ipv6-filter

### ipv6-filter

#### Syntax

**ipv6-filter** *ipv6-filter-id*

**no ipv6-filter** [**force**]

#### Context

[\[Tree\]](#) (config>subscr-mgmt>sla-profile>egress ipv6-filter)

[\[Tree\]](#) (config>subscr-mgmt>sla-profile>ingress ipv6-filter)

#### Full Context

configure subscriber-mgmt sla-profile egress ipv6-filter

configure subscriber-mgmt sla-profile ingress ipv6-filter

#### Description

This command configures an egress or ingress IPv6 filter.

The **no** form of this command reverts to the default.

#### Parameters

##### *ipv6-filter-id*

Specifies an existing IPv6 filter policy ID.

**Values** 1 to 65535, or name, up to 64 characters

##### **force**

Forces the exclusion of the IPv6 filter.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### ipv6-filter

#### Syntax

**ipv6-filter** *ipv6-filter-id* **entry** *entry-id* [*entry-id*]

**no ipv6-filter** *ipv6-filter-id* [**entry** *entry-id*]

#### Context

[\[Tree\]](#) (config>mirror>mirror-source ipv6-filter)

## Full Context

```
configure mirror mirror-source ipv6-filter
```

## Description

This command enables mirroring of packets that match specific entries in an existing IPv6 filter.

The **ipv6-filter** command directs packets which match the defined list of entry IDs to be mirrored to the mirror destination referenced by the *mirror-dest-service-id* of the **mirror-source**.

The IPv6 filter must already exist in order for the command to execute. Filters are configured in the **config>filter** context. If the IPv6 filter does not exist, an error will occur. If the filter exists but has not been associated with a SAP or IPv6 interface, an error is not generated but mirroring will not be enabled (there are no packets to mirror). Once the IPv6 filter is defined to a SAP or IPv6 interface, mirroring is enabled.

If the IPv6 filter is defined as ingress, only ingress packets are mirrored. Ingress mirrored packets are mirrored to the mirror destination prior to any ingress packet modifications.

If the IPv6 filter is defined as egress, only egress packets are mirrored. Egress mirrored packets are mirrored to the mirror destination after all egress packet modifications.

An *entry-id* within an IPv6 filter can only be mirrored to a single mirror destination. If the same *entry-id* is defined multiple times, an error occurs and only the first **mirror-source** definition is in effect.

By default, no packets matching any IPv6 filters are mirrored. Mirroring of IPv6 filter entries must be explicitly defined.

The **no ipv6-filter** command, without the **entry** keyword, removes mirroring on all *entry-id*'s within the *ip-filter-id*.

When the **no** form of this command is executed with the **entry** keyword and one or more *entry-id*'s, mirroring that *entry-id* list is terminated within the *ip-filter-id*. If an *entry-id* is listed that does not exist, an error will occur and the command will not execute. If an *entry-id* is listed that is not currently being mirrored, no error will occur for that *entry-id* and the command will execute normally.

## Parameters

### *ipv6-filter-id*

Specifies the IPv6 filter ID whose entries are mirrored. If the *ipv6-filter-id* does not exist, an error will occur and the command will not execute. Mirroring of packets will commence once the *ipv6-filter-id* is defined on a SAP or IPv6 interface.

### *entry-id*

Specifies the IP filter entries to use as match criteria for packet mirroring. The **entry** keyword begins a list of *entry-id*'s for mirroring. Multiple *entry-id* entries may be specified with a single command. Each *entry-id* must be separated by a space.

If an *entry-id* does not exist within the IP filter, an error occurs and the command will not execute.

If the filter's *entry-id* is renumbered within the IP filter definition, the old *entry-id* is removed but the new *entry-id* must be manually added to the configuration to include the new (renumbered) entry's criteria.

## Platforms

All

## ipv6-filter

### Syntax

[no] **ipv6-filter** *ipv6-filter-id*

### Context

**[Tree]** (config>li>li-filter-block-reservation>li-reserved-block ipv6-filter)

### Full Context

configure li li-filter-block-reservation li-reserved-block ipv6-filter

### Description

This command configures to which normal IPv6 address filters the entry reservation is applied.

This command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**).

The **no** form of this command removes the IPv6 filter ID from the configuration.

### Parameters

#### *ipv6-filter-id*

Specifies the filter identification identifies the normal IPv6 address filters.

| Values               | { <i>filter-id</i>   <i>filter-name</i> }                                                                                                                          |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>filter-id</i> :   | 1 to 65535                                                                                                                                                         |
| <i>filter-name</i> : | up to 64 characters ( <i>filter-name</i> is an alias for input only. The <i>filter-name</i> gets replaced with an id automatically by SR OS in the configuration). |

### Platforms

```

## Context

[\[Tree\]](#) (config>li>li-source ipv6-filter)

## Full Context

```
configure li li-source ipv6-filter
```

## Description

This command enables lawful interception (LI) of packets that match specific entries in an existing IPv6 filter.

The **ipv6-filter** command directs packets which match the defined list of entry IDs to be intercepted to the destination referenced by the *mirror-dest-service-id* of the **mirror-source**.

The IPv6 filter must already exist in order for the command to execute. Filters are configured in the **config>filter** context. If the IPv6 filter does not exist, an error will occur. If the filter exists but has not been associated with a SAP or IPv6 interface, an error is not generated but mirroring will not be enabled (there are no packets to mirror). Once the IPv6 filter is defined to a SAP, IPv6 interface or subscriber, mirroring is enabled (subscriber mirroring applies only to the 7750 SR).

If the IPv6 filter is defined as ingress, only ingress packets are intercepted. Ingress packets are sent to the destination prior to any ingress packet modifications.

If the IPv6 filter is defined as egress, only egress packets are intercepted. Egress packets are sent to the destination after all egress packet modifications.

An *entry-id* within an IPv6 filter can only be intercepted to a single destination. If the same *entry-id* is defined multiple times, an error occurs and only the first definition is in effect.

By default, no packets matching any IPv6 filters are intercepted. Interception of IPv6 filter entries must be explicitly defined.

When the **no** command is executed with the **entry** keyword and one or more *entry-id*'s, interception of that list of *entry-id*'s is terminated within the *ipv6-filter-id*. If an *entry-id* is listed that does not exist, an error will occur and the command will not execute. If an *entry-id* is listed that is not currently being intercepted, no error will occur for that *entry-id* and the command will execute normally.

## Parameters

### *ipv6-filter-id*

Specifies the IPv6 filter ID whose entries are to be intercepted. If the *ipv6-filter-id* does not exist, an error will occur and the command will not execute. Intercepting packets will commence when the *ipv6-filter-id* is defined on a SAP or IPv6 interface.

### *entry-id*

Specifies the IPv6 filter entries to use as match criteria for lawful intercept (LI). The **entry** keyword begins a list of *entry-id*'s for interception. Multiple *entry-id* entries can be specified with a single command. Each *entry-id* must be separated by a space. Up to <N><n> 8 entry IDs may be specified in a single command.

If an *entry-id* does not exist within the IPv6 filter, an error occurs and the command will not execute.

If the filter's *entry-id* is renumbered within the IPv6 filter definition, the old *entry-id* is removed but the new *entry-id* must be manually added to the configuration to include the new (renumbered) entry's criteria.

### *intercept-id*

Specifies the intercept ID that is inserted into the packet header for all mirrored packets of the associated **li-source** entry. This intercept ID can be used (for example by a downstream LI Gateway) to identify the particular LI session to which the packet belongs. For all types of **li-source** entries (**filter**, **nat**, **sap**, **subscriber**), when the mirror service is configured with **ip-udp-shim** routable encap, an *intercept-id* field (as part of the routable encap) is always present in the mirrored packets. If there is no intercept ID configured for an **li-source** entry, then the default value will be inserted. When the mirror service is configured with **ip-gre** routable encapsulation, no *intercept-id* is inserted and none should be specified against the **li-source** entries.

**Values** 1 to 4294967295 (32b) For nat li-source entries that are using a mirror service that is not configured with routable encap

**Values** 1 to 1,073,741,824 (30b) For all types of li-source entries that are using a mirror service with routable ip-udp-shim encap and no direction-bit.

**Values** 1 to 536,870,912 (29b) For all types of li-source entries that are using a mirror service with routable ip-udp-shim encap and with the direction-bit enabled.

### **session-id**

Specifies the *session-id* that is inserted into the packet header for all mirrored packets of the associated **li-source** entry. This *session-id* can be used (for example by a downstream LI Gateway) to identify the particular LI session to which the packet belongs. The *session-id* is only valid and used for mirror services that are configured with **ip-udp-shim** routable encap ( **config>mirror>mirror-dest>encap>ip-udp-shim**). For all types of **li-source** entries (filter, nat, sap, subscriber), when the mirror service is configured with **ip-udp-shim** routable encapsulation, a *session-id* field (as part of the routable encapsulation) is always present in the mirrored packets. If there is no *session-id* configured for an **li-source** entry, then the default value will be inserted. When a mirror service is configured with **ip-gre** routable encap, no *session-id* is inserted and none should be specified against the **li-source** entries.

**Values** 1 to 4,294,967,295 (32b)

All

## ipv6-filter

### **Syntax**

**ipv6-filter** *filter-id* [**name** *filter-name*] [**create**]

**no ipv6-filter** {*filter-id* | *filter-name*}

### **Context**

[\[Tree\]](#) (config>filter ipv6-filter)

### **Full Context**

configure filter ipv6-filter

### **Description**

Commands in this context configure the specified IPv6 filter policy.

The **no** form of the command deletes the IPv6 filter policy. A filter policy cannot be deleted until it is removed from all objects where it is applied.

### **Parameters**

#### **filter-id**

Specifies the IPv6 filter policy ID expressed as a decimal integer.

**Values** 1 to 65535

#### **name**

Configures an optional filter name, up to 64 characters in length, to a given filter. This filter name can then be used in configuration references, display, and show commands throughout the system. A defined filter name can help the service provider or administrator to identify and manage filters within the SR OS platforms.

To create a filter, you must assign a filter ID, however, after it is created, either the filter ID or filter name can be used to identify and reference a filter.

If a name is not specified at creation time, then SR OS assigns a string version of the *filter-id* as the name.

Filter names may not begin with an integer (0 to 9).

**Values** *name*: 64 characters maximum

#### ***filter-name***

Specifies a string of up to 64 characters uniquely identifying this IPv6 filter policy.

#### **create**

This keyword is required to create the configuration context. Once it is created, the context can be enabled with or without the **create** keyword.

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## ipv6-filter

## Syntax

**ipv6-filter** *src-filter-id* [**src-entry** *src-entry-id*] **to** *dst-filter-id* [**dst-entry** *dst-entry-id*] [**overwrite**]

## Context

[\[Tree\]](#) (config>filter>copy ipv6-filter)

## Full Context

configure filter copy ipv6-filter

## Description

This command copies an existing filter entry for a specific filter ID to another filter ID. The command is a configuration level maintenance tool used to create new entries using an existing filter policy. If **overwrite** is not specified, an error will occur if the destination filter entry exists.

## Parameters

### **src-filter-id**

Identifies the source filter policy from which the copy command will attempt to copy. The filter policy must exist within the context of the preceding keyword ( **ipv6-filter**).

### **dst-filter-id**

Identifies the destination filter policy to which the copy command will attempt to copy. If the **overwrite** keyword is not specified, the filter entry ID cannot already exist in the destination filter policy. If the **overwrite** keyword is present, the destination entry ID may or may not exist.

### **overwrite**

Specifies that the destination filter entry may exist. If it does, everything in the existing destination filter entry will be completely overwritten with the contents of the source filter entry. If the destination filter entry exists, either **overwrite** must be specified or an error message will be returned. If **overwrite** is specified, the function of copying from source to

destination occurs in a "break before make" manner and therefore should be handled with care.

## 13.293 ipv6-filter-max-size

### ipv6-filter-max-size

#### Syntax

**ipv6-filter-max-size** {*value* | **default**}

#### Context

[\[Tree\]](#) (config>service>vprn>flowspec ipv6-filter-max-size)

#### Full Context

configure service vprn flowspec ipv6-filter-max-size

#### Description

This command configures the maximum number of IPv6 FlowSpec routes or rules that can be embedded into an ingress IPv6 filter policy for a specified routing instance. Flowspec filter entries embedded in a filter policy in this routing instance will use filter entries from the range between the embedding offset and "offset + ip-filter-max-size – 1".

The sum of the **ip-filter-max-size** *value* parameter and the highest offset in any IPv6 filter that embeds IPv6 FlowSpec rules from this routing instance (excluding filters that embed at offset 262143) must not exceed 262143.

The **ip-filter-max-size** configuration can be adjusted up or down at any time. If the number of IPv6 FlowSpec rules that are currently installed is *M*, and the new limit is *N*, where  $N < M$ , then the last set of rules from *N* to *M* (by FlowSpec order) are immediately removed, but are retained in the BGP RIB. If the limit is increased, new rules are programmed only as they are received again in new BGP updates.

#### Default

ipv6-filter-max-size default

#### Parameters

##### *value*

The maximum number of FlowSpec routes or rules that can be embedded into an ingress IP filter policy.

**Values** 0 to 262143

##### default

Configures the maximum size as 512.

## Platforms

All

## ipv6-filter-max-size

**ipv6-filter-max-size** {*value* | **default**}

## Context

[\[Tree\]](#) (config>router>flowspec ipv6-filter-max-size)

## Full Context

configure router flowspec ipv6-filter-max-size

## Description

This command configures the maximum number of IPv6 FlowSpec routes or rules that can be embedded into the auto-created embedded filter (fSpec- *X*). FlowSpec filter entries embedded in a filter policy in this routing instance will use filter entries from the range between "embedding offset + 1" and "embedding offset + ip-filter-max-size".

The sum of the **ipv6-filter-max-size** *value* parameter and the highest offset in any IPv6 filter that embeds IPv6 FlowSpec rules from this routing instance (excluding filters that embed at offset 262143) must not exceed 262143.

The **ipv6-filter-max-size** configuration can be adjusted up or down at any time. If the number of IPv6 FlowSpec rules that are currently installed is *M*, and the new limit is *N*, where  $N < M$ , then the last set of rules from *N* to *M* (by FlowSpec order) are immediately removed, but are retained in the BGP RIB. If the limit is increased, new rules are programmed only as they are received again in new BGP updates.

## Default

ipv6-filter-max-size 512

## Parameters

### *value*

Specifies the maximum number of FlowSpec routes or rules that can be embedded into an ingress IP filter policy.

**Values** 0 to 262143

### **default**

Keyword to configure the maximum size as 512.

## Description

This command administratively disables/enables PIM operation for IPv6.

## Default

`ipv6-multicast-disable` (config>service>vprn>pim)

`no ipv6-multicast-disable` (config>service>vprn>pim>if)

## Platforms

All

## ipv6-multicast-disable

## Syntax

**[no] ipv6-multicast-disable**

## Context

[\[Tree\]](#) (config>router>pim ipv6-multicast-disable)

**[Tree]** (config>router>pim>interface ipv6-multicast-disable)

### Full Context

```
configure router pim ipv6-multicast-disable
configure router pim interface ipv6-multicast-disable
```

### Description

This command administratively enables PIM operation for IPv6.

IPv6 multicast must be enabled to enable MLDP in-band signaling for IPv6 PIM joins; see **config>router>pim>interface p2mp-ldp-tree-join**.

The **no** form of this command disables the PIM operation for IPv6.

### Default

ipv6-multicast-disable

### Platforms

All

## ipv6-multicast-disable

### Syntax

[no] ipv6-multicast-disable

### Context

**[Tree]** (config>router>isis>interface ipv6-multicast-disable)

### Full Context

```
configure router isis interface ipv6-multicast-disable
```

### Description

This command disables IS-IS IPv6 multicast routing for the interface.

The **no** form of this command enables IS-IS IPv6 multicast routing for the interface.

### Platforms

All

## 13.300 ipv6-multicast-metric

## ipv6-multicast-metric

### Syntax

**ipv6-multicast-metric** *metric*

**no ipv6-multicast-metric**

### Context

[\[Tree\]](#) (config>router>isis>if>level ipv6-multicast-metric)

### Full Context

configure router isis interface level ipv6-multicast-metric

### Description

This command configures the IS-IS interface metric for IPv6 multicast.

The **no** form of this command removes the metric from the configuration.

### Default

no ipv6-multicast-metric

### Parameters

*metric*

Specifies the IS-IS interface metric for IPv6 multicast.

**Values** 1 to 16777215

### Platforms

All

## 13.301 ipv6-multicast-metric-offset

## ipv6-multicast-metric-offset

### Syntax

**ipv6-multicast-metric-offset** *offset-value*

**no ipv6-multicast-metric-offset**

### Context

[\[Tree\]](#) (config>router>isis>link-group>level ipv6-multicast-metric-offset)

### Full Context

configure router isis link-group level ipv6-multicast-metric-offset

## Description

This command sets the offset value for the IPv6 multicast address family. If the number of operational links drops below the oper-members threshold, the configured offset is applied to the interface metric for the IPv6 multicast topology.

The **no** form of this command reverts the offset value to 0.

## Default

no ipv6-multicast-metric-offset

## Parameters

### *offset-value*

Specifies the amount the interface metric for the associated address family is to be increased if the number of operational members in the associated link-group drops below the oper-members threshold

**Values** 0 to 6777215

## Platforms

All

## 13.302 ipv6-multicast-routing

### ipv6-multicast-routing

## Syntax

**ipv6-multicast-routing** {native | mt}

[no] **ipv6-multicast-routing**

## Context

[\[Tree\]](#) (config>router>isis ipv6-multicast-routing)

## Full Context

configure router isis ipv6-multicast-routing

## Description

The multicast RTM is used for Reverse Path Forwarding checks. This command controls which IS-IS topology is used to populate the IPv6 multicast RTM.

The **no** form of this command results in none of the IS-IS routes being populated in the IPv4 multicast RTM and would be used if multicast is configured to use the unicast RTM for the RPF check.

## Default

ipv6-multicast-routing native

## Parameters

### native

Causes IPv6 routes from the MT0 topology to be added to the multicast RTM for RPF checks.

### mt

Causes IPv6 routes from the MT3 topology to be added to the multicast RTM for RPF checks.

## Platforms

All

## 13.303 ipv6-node-sid

### ipv6-node-sid

## Syntax

**ipv6-node-sid index** *index-value* [**clear-n-flag**]

**ipv6-node-sid label** *label-value* [**clear-n-flag**]

**no ipv6-node-sid**

## Context

[\[Tree\]](#) (config>router>isis>interface ipv6-node-sid)

## Full Context

configure router isis interface ipv6-node-sid

## Description

This command assigns a node SID index or label value to the prefix representing the primary address of an IPv6 network interface of type loopback. Only a single node SID can be assigned to an IPv6 interface. When an IPv6 interface has multiple global addresses, the primary address is always the first one in the list, as displayed by the **interface info** command.

The command fails if the network interface is not of loopback type or if the interface is defined in an IES or a VPRN context. Assigning the same SID index/label value to the same interface in two different IGP instances is not allowed within the same node.

The value of the label or index SID is taken from the range configured for this IGP instance. When using the global mode of operation, a new segment routing module checks that the same index or label value cannot be assigned to more than one loopback interface address. When using the per-instance mode of operation, this check is not required since the index and thus label ranges of the various IGP instance are not allowed to overlap.

The **clear-n-flag** option allows the user to clear the N-flag (node-sid flag) in an IS-IS prefix SID sub-TLV originated for the IPv6 prefix of a loopback interface on the system.

By default, the prefix SID sub-TLV for the prefix of a loopback interface is tagged as a node SID, meaning that it belongs to this node only. However, when the user wants to configure and advertise an anycast SID using the same loopback interface prefix on multiple nodes, you must clear the N-flag to assure interoperability with third-party implementations, which may perform a strict check on the receiving end and drop duplicate prefix SID sub-TLVs when the N-flag is set.

The SR OS implementation is relaxed on the receiving end and accepts duplicate prefix SIDs with the N-flag set or cleared. SR OS will resolve to the closest owner, or owners if ECMP is configured, of the prefix SID according to its cost.

### Default

no ipv6-node-sid

### Parameters

#### *index-value*

Specifies the index value.

**Values** 0 to 4294967295

#### *label-value*

Specifies the label value.

**Values** 0 to 4294967295

#### *clear-n-flag*

Clears the node SID flag.

**Default** no clear-n-flag

configure subscriber-mgmt sla-profile host-limits ipv6-pd-ppp-dhcp

configure subscriber-mgmt sub-profile host-limits ipv6-pd-ppp-dhcp

## Description

This command configures the maximum number of IPv6 PPPoE DHCP Prefix Delegation hosts (IA-PD) per SLA profile instance or per subscriber.

#### Note:

Prefix delegation hosts that are modeled as a managed route do not count against this limit.

The **no** form of this command removes the maximum number of IPv6 PPPoE DHCP Prefix Delegation hosts (IA-PD) limit.

## Parameters

### *max-nr-of-hosts*

Specifies the maximum number of IPv6 PPPoE DHCP Prefix Delegation hosts.

**Note:**

The operational maximum value may be smaller due to equipped hardware dependencies.

**Values** 0 to 131071

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.308 ipv6-prefix

ipv6-prefix

**Syntax**

[no] ipv6-prefix

**Context**

[\[Tree\]](#) (debug>router>rpki-session>packet ipv6-prefix)

**Full Context**

debug router rpki-session packet ipv6-prefix

**Description**

This command enables debugging for IPv6 prefix RPKI packets.

The **no** form of this command disables debugging for IPv6 prefix RPKI packets.

**Platforms**

All

## 13.309 ipv6-prefix-list

ipv6-prefix-list

**Syntax**

ipv6-prefix-list *ipv6-prefix-list-name* [create]

no ipv6-prefix-list *ipv6-prefix-list-name*

**Context**

[\[Tree\]](#) (config>qos>match-list ipv6-prefix-list)

## Full Context

```
configure qos match-list ipv6-prefix-list
```

## Description

This command creates a list of IPv6 prefixes for match criteria in QoS policies. An `ipv6-prefix-list` must contain only IPv6 address prefixes created using the **prefix** command and cannot be deleted if it is referenced by a QoS policy.

The **no** form of this command deletes the specified list.

## Parameters

### *ipv6-prefix-list-name*

A string of up to 32 characters of printable ASCII characters. If special characters are used (#, \$, spaces, and so on), the string must be enclosed within double quotes. The name **default** (case insensitive) is reserved by the system.

### **create**

Creates IPv6 prefixes for match criteria in QoS policies.

## Platforms

All

## ipv6-prefix-list

## Syntax

```
ipv6-prefix-list ipv6-prefix-list-name [create]
```

```
no ipv6-prefix-list ipv6-prefix-list-name
```

## Context

[\[Tree\]](#) (config>filter>match-list ipv6-prefix-list)

## Full Context

```
configure filter match-list ipv6-prefix-list
```

## Description

This command creates a list of IPv6 prefixes for match criteria in ACL and CPM IPv6 filter policies.

The **no** form of this command deletes the specified list.

### **Operational Notes:**

An IPv6 prefix list must contain only IPv6 address prefixes.

An IPv6 prefix list cannot be deleted if it is referenced by a filter policy.

See general description related to match-list usage in filter policies.

## Parameters

### *ipv6-prefix-list-name*

Specifies a string of up to 32 printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

#### Syntax

[no] ipv6-routing {native | mt}

#### Context

[\[Tree\]](#) (config>service>vprn>isis ipv6-routing)

#### Full Context

configure service vprn isis ipv6-routing

#### Description

This command enables IPv6 routing.

The **no** form of this command disables support for IS-IS IPv6 TLVs for IPv6 routing.

#### Default

no ipv6-routing

#### Parameters

##### native

Enables IS-IS IPv6 TLVs for IPv6 routing and enables support for native IPv6 TLVs.

##### mt

Enables IS-IS multi-topology TLVs for IPv6 routing. When this parameter is specified, the support for native IPv6 TLVs is disabled.

### Platforms

All

### ipv6-routing

#### Syntax

[no] ipv6-routing {native | mt}

**Context**

[\[Tree\]](#) (config>router>isis ipv6-routing)

**Full Context**

configure router isis ipv6-routing

**Description**

This command enables IPv6 routing.

The **no** form of this command disables support for IS-IS IPv6 TLVs for IPv6 routing.

**Default**

no ipv6-routing

**Parameters****native**

Enables IS-IS IPv6 TLVs for IPv6 routing and enables support for native IPv6 TLVs.

**mt**

Enables IS-IS multi-topology TLVs for IPv6 routing. When this parameter is specified, the support for native IPv6 TLVs is disabled.

**Platforms**

## 13.311 ipv6-sid

ipv6-sid

**Syntax**

**ipv6-sid index** *index-id*

**ipv6-sid label** *label-id*

**no ipv6-sid**

**Context**

[\[Tree\]](#) (config>router>segment-routing>sr-mpls>prefix-sids ipv6-sid)

**Full Context**

configure router segment-routing sr-mpls prefix-sids ipv6-sid

**Description**

This command is used to configure the IPv6 segment routing SID associated with the primary IPv6 address of the loopback or system interface.

The **no** form of this command removes the configuration of the IPv6 segment routing SID associated with the primary IPv6 interface address.

**Default**

no ipv6-sid

**Parameters****index** *index-id*

Specifies the node SID index for this interface.

**Values** 0 to 4294967295

**label** *label-id*

Specifies the label value for the node SID.

**Values** 32 to 1048575

**Platforms**

All

## 13.312 ipv6-slaac-prefix

### ipv6-slaac-prefix

**Syntax**

**ipv6-slaac-prefix** *ipv6-prefix/prefix-length*

**no ipv6-slaac-prefix**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp>host ipv6-slaac-prefix)

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe>host ipv6-slaac-prefix)

**Full Context**

configure subscriber-mgmt local-user-db ppp host ipv6-slaac-prefix

configure subscriber-mgmt local-user-db ipoe host ipv6-slaac-prefix

**Description**

This command configures static IPv6 SLAAC prefix (PIO) for the host. The host will assign an IPv6 address to itself based on this prefix. The prefix length is 64 bits.

The **no** form of this command removes the static IPv6 SLAAC prefix (PIO) for the host from the configuration.

**Default**

no ipv6-slaac-prefix

**Parameters*****ipv6-prefix/prefix-length***

Specifies the IPv6 address and prefix length.

**Values**

|                           |                                                   |
|---------------------------|---------------------------------------------------|
| ipv6-prefix/prefix-length | : ipv6-prefix x:x:x:x:x:x:x (eight 16-bit pieces) |
|                           | x:x:x:x:x:d.d.d.d                                 |
|                           | x [0 to FFFF]H                                    |
|                           | d [0 to 255]D                                     |
| prefix-length             | 64                                                |

**Full Context**

configure subscriber-mgmt local-user-db ipoe host ipv6-slaac-prefix-pool

configure subscriber-mgmt local-user-db ppp host ipv6-slaac-prefix-pool

**Description**

This command configures the IPv6 SLAAC prefix pool of this host.

The **no** form of this command reverts to the default.

**Parameters**

***pool***

Specifies the pool name, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.314 ipv6-source-address

### ipv6-source-address

#### Syntax

**ipv6-source-address** *ipv6-address* [**allow-connections**]

**no ipv6-source-address**

#### Context

[\[Tree\]](#) (config>aaa>diam>node ipv6-source-address)

#### Full Context

configure aaa diameter node ipv6-source-address

#### Description

This command configures IPv6 source address that the SR OS node will use for its peering connection. The **no** form of this command removes the IPv6 source address from the configuration.

#### Parameters

##### *ipv6-address*

Specifies the source IPv6 address to use for outgoing diameter messages to an IPv6-reachable peer.

##### Values

*ipv6-address*: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

##### **allow-connections**

Specifies to accept peering connections on the configured source IPv6 address. The peer initiating the connection can only be an inter-chassis peer.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## ipv6-source-address

### Syntax

**ipv6-source-address** *ipv6-address*

**no ipv6-source-address**

### Context

[\[Tree\]](#) (config>aaa>radius-srv-plcy>servers ipv6-source-address)

### Full Context

configure aaa radius-server-policy servers ipv6-source-address

### Description

This command configures the source address of an IPv6 RADIUS packet.

When no `ipv6-source-address` is configured, the system IPv6 address (inband RADIUS server connection) or Boot Option File (BOF) IPv6 address (outband RADIUS server connection) must be configured in order for the RADIUS client to work with an IPv6 RADIUS server.

This address is also used in the NAS-IPv6-Address attribute.

The **no** form of this command reverts to the default value.

### Parameters

***ipv6-address***

Specifies the source address of an IPv6 RADIUS packet.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## ipv6-source-address

### Syntax

**ipv6-source-address** *ipv6-address*

**no ipv6-source-address**

### Context

[\[Tree\]](#) (config>service>vprn>dns ipv6-source-address)

### Full Context

configure service vprn dns ipv6-source-address

## Description

This command configures the IPv6 address of the default secondary DNS server for the subscribers using this interface. Subscribers that cannot obtain an IPv6 DNS server address by other means, can use this for DNS name resolution.

The `ipv6-address` value can only be set to a nonzero value if the value of VPRN type is set to **subscriber-split-horizon**.

The **no** form of this command reverts to the default.

## Parameters

### *ipv6-address*

Specifies the IPv6 address of the default secondary DNS server.

**Values** `ipv6-address - a.b.c.d`

## Platforms

All

## ipv6-source-address

## Syntax

`ipv6-source-address ipv6-address`

`no ipv6-source-address`

## Context

[\[Tree\]](#) (config>system>file-trans-prof ipv6-source-address)

## Full Context

configure system file-transmission-profile ipv6-source-address

## Description

This command specifies the IPv6 source address used for transport protocol.

The **no** form of this command uses the default source address which typically is the address of egress interface.

## Default

`no ipv6-source-address`

## Parameters

### *ipv6-address*

Specifies a unicast v6 address. This should be a local interface address.

## Platforms

All

## 13.315 ipv6-tcp-mss-adjust

```
ipv6-tcp-mss-adjust
```

### Syntax

```
ipv6-tcp-mss-adjust segment-size
```

```
no ipv6-tcp-mss-adjust
```

### Context

```
[Tree] (config>service>vprn>wlan-gw>dsm ipv6-tcp-mss-adjust)
```

```
[Tree] (config>router>wlan-gw>dsm ipv6-tcp-mss-adjust)
```

### Full Context

```
configure service vprn wlan-gw distributed-sub-mgmt ipv6-tcp-mss-adjust
```

```
configure router wlan-gw distributed-sub-mgmt ipv6-tcp-mss-adjust
```

### Description

This command specifies the value used for TCP-MSS-adjust in the IPv6 upstream direction for DSM. The downstream direction for both IPv4 and IPv6 are both configured under the group-interface. The upstream direction for IPv4 NAT hosts is configured under the NAT policy.

The defined segment size is inserted in a TCP SYN message if there is no existing MSS option or the value in the MSS option is bigger than the configured value.

The **no** form of this command disables upstream TCP MSS adjust for IPv6 DSM.

### Default

```
no ipv6-tcp-mss-adjust
```

### Parameters

***segment-size***

Specifies the segment size to be inserted.

**Values** 160 to 10240

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.316 ipv6-te-router-id

## ipv6-te-router-id

### Syntax

```
ipv6-te-router-id interface interface-name
no ipv6-te-router-id
```

### Context

[\[Tree\]](#) (config>router ipv6-te-router-id)

### Full Context

```
configure router ipv6-te-router-id
```

### Description

This command configures the IPv6 TE Router ID. The IPv6 TE Router ID, when configured, uniquely identifies the router as being IPv6 TE capable to other routers in an IGP TE domain.

IS-IS advertises this information using the IPv6 TE Router ID TLV.

If this command is not configured, the IPv6 TE Router ID will use the global unicast address of the system interface by default. The user can specify the system interface using this command to achieve the same result. If a different interface is specified, the preferred primary global unicast address of that interface is used instead.

The **no** form of this command reverts the IPv6 TE Router ID to the default value.

### Parameters

***interface interface-name***

Specifies the name of the interface to be added or removed. Only system and loopback interfaces are accepted.

### Platforms

All

## 13.317 ipv6-unicast

## ipv6-unicast

### Syntax

```
[no] ipv6-unicast
```

### Context

[\[Tree\]](#) (config>service>vprn>isis>multi-topology ipv6-unicast)

configure service vprn isis interface level ipv6-unicast-metric

### Description

This command configures IS-IS interface metric for IPv6 unicast.

The **no** form of this command removes the metric from the configuration.

### Parameters

*metric*

Specifies the IS-IS interface metric for IPv6 unicast.

**Values** 1 to 16777215

### Platforms

All

## ipv6-unicast-metric

### Syntax

**ipv6-unicast-metric** *metric*

**no ipv6-unicast-metric**

### Context

[\[Tree\]](#) (config>router>isis>if>level ipv6-unicast-metric)

### Full Context

configure router isis interface level ipv6-unicast-metric

### Description

This command configures the IS-IS interface metric for IPv6 unicast.

The **no** form of this command removes the metric from the configuration.

### Default

no ipv6-unicast-metric

### Parameters

*metric*

Specifies the IS-IS interface metric for IPv6 unicast.

**Values** 1 to 16777215

### Platforms

All

## 13.320 ipv6-unicast-metric-offset

## ipv6-unicast-metric-offset

### Syntax

**ipv6-unicast-metric-offset** *offset-value*

**no ipv6-unicast-metric-offset**

### Context

[\[Tree\]](#) (config>service>vprn>isis>link-group>level ipv6-unicast-metric-offset)

## Full Context

```
configure service vprn isis link-group level ipv6-unicast-metric-offset
```

## Description

This command sets the offset value for the IPv6 unicast address family. If the number of operational links drops below the **oper-members** threshold, the configured offset is applied to the interface metric for the IPv6 topology.

The **no** form of this command reverts the offset value to 0.

## Default

```
no ipv6-unicast-metric-offset
```

## Parameters

### *offset-value*

Specifies the amount the interface metric for the associated address family is to be increased if the number of operational members in the associated link-group drops below the oper-members threshold.

**Values** 0 to 6777215

## Platforms

All

## ipv6-unicast-metric-offset

## Syntax

```
ipv6-unicast-metric-offset offset-value
```

```
no ipv6-unicast-metric-offset
```

## Context

[\[Tree\]](#) (config>router>isis>link-group>level ipv6-unicast-metric-offset)

## Full Context

```
configure router isis link-group level ipv6-unicast-metric-offset
```

## Description

This command sets the offset value for the IPv6 unicast address family. If the number of operational links drops below the **oper-members** threshold, the configured offset is applied to the interface metric for the IPv6 topology.

The **no** form of this command reverts the offset value to 0.

## Default

```
no ipv6-unicast-metric-offset
```

## Parameters

### *offset-value*

Specifies the amount the interface metric for the associated address family is to be increased if the number of operational members in the associated link-group drops below the oper-members threshold.

**Values** 0 to 6777215

## Platforms

All

## 13.321 ipv6-wan-address-pool

### ipv6-wan-address-pool

## Syntax

**ipv6-wan-address-pool** *pool-name*

**no ipv6-wan-address-pool**

## Context

**[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host ipv6-wan-address-pool)

**[Tree]** (config>subscr-mgmt>loc-user-db>ppp>host ipv6-wan-address-pool)

## Full Context

configure subscriber-mgmt local-user-db ipoe host ipv6-wan-address-pool

configure subscriber-mgmt local-user-db ppp host ipv6-wan-address-pool

## Description

This command configures the pool name that is used in the DHCPv6 server for DHCPv6 IA-PA address selection.

The **no** form of this command removes the pool name from the configuration.

## Parameters

### *pool-name*

Specifies the WAN address pool, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.322 ipv6-wan-ipoe-dhcp

ipv6-wan-ipoe-dhcp

### Syntax

**ipv6-wan-ipoe-dhcp** *max-nr-of-hosts*

**no ipv6-wan-ipoe-dhcp**

### Context

[\[Tree\]](#) (config>subscr-mgmt>sub-profile>host-limits ipv6-wan-ipoe-dhcp)

[\[Tree\]](#) (config>subscr-mgmt>sla-profile>host-limits ipv6-wan-ipoe-dhcp)

### Full Context

configure subscriber-mgmt sub-profile host-limits ipv6-wan-ipoe-dhcp

configure subscriber-mgmt sla-profile host-limits ipv6-wan-ipoe-dhcp

### Description

This command configures the maximum number of IPv6 IPoE DHCP WAN hosts (IA-NA) per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of IPv6 IPoE DHCP WAN hosts (IA-NA) limit.

### Parameters

#### *max-nr-of-hosts*

Specifies the maximum number of IPv6 IPoE DHCP WAN hosts.

#### **Note:**

The operational maximum value may be smaller due to equipped hardware dependencies.

**Values** 0 to 131071

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**no ipv6-wan-ppp-slaac**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>sla-profile>host-limits ipv6-wan-ppp-slaac)

[\[Tree\]](#) (config>subscr-mgmt>sub-profile>host-limits ipv6-wan-ppp-slaac)

#### Full Context

configure subscriber-mgmt sla-profile host-limits ipv6-wan-ppp-slaac

configure subscriber-mgmt sub-profile host-limits ipv6-wan-ppp-slaac

#### Description

This command configures the maximum number of IPv6 PPPoE SLAAC WAN hosts per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of IPv6 PPPoE SLAAC WAN hosts limit.

### Parameters

#### *max-nr-of-hosts*

Specifies the maximum number of IPv6 PPPoE SLAAC WAN hosts.

**Note:**

The operational maximum value may be smaller due to equipped hardware dependencies

**Values** 0 to 131071

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.327 isa

```
isa
```

**Syntax**

```
isa
```

**Context**

[\[Tree\]](#) (config isa)

**Full Context**

configure isa

**Description**

Commands in this context configure Integrated Services Adapter (ISA) parameters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.328 isa-aa-group

```
isa-aa-group
```

**Syntax**

```
isa-aa-group aa-group-id
```

```
no isa-aa-group
```

**Context**

[\[Tree\]](#) (config>isa>wlan-gw-group>distributed-sub-mgmt isa-aa-group)

## Full Context

```
configure isa wlan-gw-group distributed-sub-mgmt isa-aa-group
```

## Description

This command configures an ISA application assurance group for WLAN gateway DSM subscribers.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## isa-aa-group

## Syntax

```
isa-aa-group isa-aa-group-id {all | unknown}
```

```
no isa-aa-group isa-aa-group-id
```

## Context

[\[Tree\]](#) (debug>mirror-source isa-aa-group)

## Full Context

```
debug mirror-source isa-aa-group
```

## Description

This command configures AA ISA group as a mirror source for this mirror service. Traffic is mirrored after AA processing takes place on AA ISAs of the group, therefore, any packets dropped as part of that AA processing are not mirrored.

## Parameters

### ***isa-aa-group-id***

Specifies the ISA ISA-AA group ID.

**Values** 1 to 255

### **all**

Specifies that all traffic after AA processing will be mirrored.

### **unknown**

Specifies that all traffic during the identification phase (may match policy entry or entries that have mirror action configured) and traffic that had been identified as `unknown_tcp` or `unknown_udp` after AA processing will be mirrored.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.329 isa-aa-oversubscription-factor

isa-aa-oversubscription-factor

### Syntax

**isa-aa-oversubscription-factor** *factor*

**no isa-aa-oversubscription-factor**

### Context

[\[Tree\]](#) (config>isa>wlan-gw-group>distributed-sub-mgmt isa-aa-oversubscription-factor)

### Full Context

configure isa wlan-gw-group distributed-sub-mgmt isa-aa-oversubscription-factor

### Description

This command specifies by how much an AA ISA is oversubscribed when linked to a WLAN-GW group. A factor of 1 indicates that each AA ISA is linked to a single WLAN-GW ISA, while a factor of 10 indicates that each AA ISA is linked to up to 10 WLAN-GW ISAs. The factor must be an integer but poses an oversubscription limit, not an exact ratio. For example, for 2 AA ISAs and 5 WLAN-GW ISAs, a factor of 3 or higher is valid. Additional standby ISAs can be added until the oversubscription limit is reached.

The **no** form of this command resets the configuration to the default value.

### Default

isa-aa-oversubscription-factor 1

### Parameters

**factor**

The number of WLAN GW ISAs that can be served by a single AA ISA.

**Values** 1 to 10

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s

## 13.330 isa-capacity-cost-high-threshold

isa-capacity-cost-high-threshold

### Syntax

**isa-capacity-cost-high-threshold** *threshold*

## no isa-capacity-cost-high-threshold

### Context

[\[Tree\]](#) (config>isa>aa-grp isa-capacity-cost-high-threshold)

### Full Context

configure isa application-assurance-group isa-capacity-cost-high-threshold

### Description

This command configures the ISA-AA capacity cost high threshold.

The **no** form of this command reverts the threshold to the default value.

### Default

isa-capacity-cost-high-threshold 4294967295

### Parameters

#### *threshold*

Specifies the capacity cost high threshold for the ISA-AA group.

**Values** 0 to 4294967295

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.331 isa-capacity-cost-low-threshold

### isa-capacity-cost-low-threshold

### Syntax

**isa-capacity-cost-low-threshold** *threshold*

**no isa-capacity-cost-low-threshold**

### Context

[\[Tree\]](#) (config>isa>aa-grp isa-capacity-cost-low-threshold)

### Full Context

configure isa application-assurance-group isa-capacity-cost-low-threshold

### Description

This command configures the ISA-AA capacity cost low threshold.

The **no** form of this command reverts the threshold to the default value.

**Default**

isa-capacity-cost-low-threshold 0

**Parameters*****threshold***

Specifies the capacity cost low threshold for the ISA-AA group.

**Values** 0 to 4294967295

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.332 isa-dp-cpu-usage

isa-dp-cpu-usage

**Syntax**

[no] isa-dp-cpu-usage

**Context**

[\[Tree\]](#) (config>isa>tunnel-grp>stats-collection isa-dp-cpu-usage)

**Full Context**

configure isa tunnel-group stats-collection isa-dp-cpu-usage

**Description**

This command enables the system to collect statistics used to derive ISA CPU data plane usage. When enabled, this command impacts the ISA performance.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.333 isa-filter

isa-filter

**Syntax**

isa-filter *name* [type {dsm}] [ create]

no isa-filter *name*

## Context

[\[Tree\]](#) (config>subscr-mgmt isa-filter)

## Full Context

configure subscriber-mgmt isa-filter

## Description

Commands in this context configure ISA filter parameters.

## Parameters

### *name*

Specifies the name of the filter.

### *type dsm*

Selects DSM as the type.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.334 isa-overload-cut-through

### isa-overload-cut-through

## Syntax

[no] isa-overload-cut-through

## Context

[\[Tree\]](#) (config>isa>aa-grp isa-overload-cut-through)

## Full Context

configure isa application-assurance-group isa-overload-cut-through

## Description

This command configures the ISA group to enable cut-through of traffic if an overload event occurs, triggered when the IOM weighted average queues depth exceeds the **wa-shared-high-wmark**. In this ISA state, packets are cut-through from application analysis but retain subscriber context with default subscriber policy applied.

The **no** form of this command disables cut-through processing on overload.

## Default

no isa-overload-cut-through

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.335 isa-policer

### isa-policer

#### Syntax

**isa-policer** *policer-name* [**type** *policer-type*] [ **create**]

**no isa-policer** *policer-name*

#### Context

[\[Tree\]](#) (config>subscr-mgmt isa-policer)

#### Full Context

configure subscriber-mgmt isa-policer

#### Description

This command creates the context to configure an ISA policer. When creating a policer for the first time, both the **create** and **type** parameters are required.

The **no** form of this command reverts to the default.

#### Parameters

##### *policer-name*

Specifies the name by which this policer is referenced up to 32 characters.

##### *policer-type*

Specifies the policer type. The dual-bucket-bandwidth policer applies both a CIR and PIR.

**Values** single-bucket-bandwidth, dual-bucket-bandwidth

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 13.336 isa-radius-policy

## isa-radius-policy

### Syntax

**isa-radius-policy** *name* [**create**]

**no isa-radius-policy** *name*

### Context

[\[Tree\]](#) (config>aaa isa-radius-policy)

### Full Context

configure aaa isa-radius-policy

### Description

This command creates a policy template related to transport of accounting messages from the BB-ISA card to the accounting server. It also defines accounting attributes that will be included in accounting messages. The policy template will be instantiated once it is applied to the BB-ISA cards in the nat-group.

The **no** form of the command removes the policy name from the configuration.

### Parameters

#### *name*

Specifies the name of the ISA RADIUS policy that can be referenced by a NAT application.

#### **create**

Keyword used to create the policy.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.337 isa-service-chaining

## isa-service-chaining

### Syntax

[**no**] **isa-service-chaining**

### Context

[\[Tree\]](#) (config>router isa-service-chaining)

### Full Context

configure router isa-service-chaining

**Description**

Commands in this context configure ISA service chaining parameters.  
The **no** form of this command disables ISA service chaining parameters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**isa-service-chaining****Syntax**

**isa-service-chaining**

**Context**

[\[Tree\]](#) (config>subscr-mgmt isa-service-chaining)

**Full Context**

configure subscriber-mgmt isa-service-chaining

**Description**

Commands in this context configure ISA-based service chaining for subscribers with L2-Aware NAT.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.338 isakmp-lifetime

**isakmp-lifetime****Syntax**

**isakmp-lifetime** *seconds*

**Context**

[\[Tree\]](#) (config>ipsec>ike-transform isakmp-lifetime)

**Full Context**

configure ipsec ike-transform isakmp-lifetime

**Description**

This command specifies the lifetime of the IKE SA.

**Default**

isakmp-lifetime 86400

**Parameters****seconds**

Specifies the Phase 1 life time for this IKE transform.

**Values** 1200 to 31536000

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 13.339 isid

isid

**Syntax**

**isid start** [to to]

**no isid start**

**Context**

**[Tree]** (config>service>system>bgp-evpn>eth-seg>service-carving>manual isid)

**Full Context**

configure service system bgp-evpn ethernet-segment service-carving manual isid

**Description**

This command configures the ISID ranges for which the PE is primary, or uses the lowest preference algorithm.

**Note:**

Multiple individual ISID values and ranges are allowed.

The following service-carving manual algorithms are supported for DF election:

- Manual non-preference

A **preference** command is not configured for this algorithm. The primary PE for the configured ISIDs is determined by the ISID range. The manual non-preference algorithm only supports two PEs in the Ethernet Segment

- Manual preference-based

If a **preference** command is configured, the algorithm uses the configured value to determine the DF election. For ISIDs not defined in the range, the highest-preference algorithm is used. For configured ISIDs, the lowest-preference algorithm is used.

## Parameters

### **start**

Specifies the initial **isid** value of the range.

**Values** 1 to 16777215

### **to**

Specifies the end **isid** value of the range. If not configured, only the individual start value is considered.

**Values** 1 to 16777215

## Platforms

All

## isid

## Syntax

**isid** *value* [**to** *higher-value*]

**no isid**

## Context

[\[Tree\]](#) (config>filter>mac-filter>entry>match isid)

## Full Context

configure filter mac-filter entry match isid

## Description

This command configures an ISID value or a range of ISID values to be matched by the mac-filter parent. The pbb-etype value for the related SAP (inherited from the ethernet port configuration) or for the related SDP binding (inherited from SDP configuration) will be used to identify the ISID tag.

The **no** form of this command removes the ISID match criterion.

## Default

no isid

## Parameters

### **value**

Specifies the ISID value, 24 bits as a decimal integer. When just one present identifies a specific ISID to be used for matching.

**Values** 0 to 16777215

### **higher-value**

Identifies a range of ISIDs to be used as matching criteria.

## Platforms

All

## isid

## Syntax

**isid** *value* [*to higher-value*]

**no isid**

**no isid** *value* [*to higher-value*]

## Context

[\[Tree\]](#) (config>serv>mrp>mrp-policy>entry>match isid)

## Full Context

configure service mrp mrp-policy entry match isid

## Description

This command configures an ISID value or a range of ISID values to be matched by the mrp-policy parent when looking at the related MMRP attributes (Group B-MACs). The pbb-etype value for the related SAP (inherited from the ethernet port configuration) or for the related SDP binding (inherited from SDP configuration) will be used to identify the ISID tag.

Multiple ISID statements are allowed under a match node. The following rules govern the usage of multiple ISID statements:

- Overlapping values are allowed:
  - isid from 1 to 10
  - isid from 5 to 15
  - isid 16
- The minimum and maximum values from overlapping ranges are considered and displayed. The above entries will be equivalent with the "isid from 1 to 16" statement.
- There is no consistency check with the content of ISID statements from other entries. The entries are evaluated in the order of their IDs and the first match causes the implementation to execute the associated action for that entry and then to exit the mrp-policy.
- If there are no ISID statements under a match criteria but the **mac-filter** type is **isid** the following behaviors apply for different actions:
  - For **end-station**, it treats any ISID value as no match and goes to next entry or default action which must be "block" in this case
  - For **allow**, it treats any ISID value as a match and allows it
  - For **block**, it treats any ISID value as a match and blocks it

The **no** form of the command can be used in two ways:

**no isid** removes all the previous statements under one match node.

**no isid** *value* | **from** *value* **to** *higher-value* removes a specific ISID value or range. It must match a previously used positive statement: for example if the command **isid 16 to 100** was used using **no isid 16 to 50** will not work but **no isid 16 to 100** will be successful.

### Default

no isid

### Parameters

#### **value or higher-value**

Specifies the ISID value in 24 bits. When just one value is present, it identifies a particular ISID to be used for matching.

**Values** 0 to 16777215

#### **from value to higher-value**

Identifies a range of ISIDs to be used as matching criteria.

### Platforms

All

## 13.340 isid-policy

### isid-policy

### Syntax

**isid-policy**

### Context

[\[Tree\]](#) (config>service>vpls isid-policy)

### Full Context

configure service vpls isid-policy

### Description

This command configures ISID policies for individual ISIDs or ISID ranges in a B-VPLS using SPBM. The ISIDs may belong to I-VPLS services or may be static-isids defined on this node. Multiple entry statements are allowed under a **isid-policy**. ISIDs that are declared as static do not require and **isid-policy** unless the ISIDs are not to be advertised.

**isid-policy** allows finer control of ISID multicast but is not typically required for SPBM operation. Use of ISID policies can cause additional flooding of multicast traffic.

### Platforms

All

## 13.341 isid-range

### isid-range

#### Syntax

**isid-range** *from* [**to** *to*] {**auto-rt** | **route-target** *rt*}

**no isid-range** *from*

#### Context

**[Tree]** (config>service>vpls>bgp-evpn>isid-route-target isid-range)

#### Full Context

configure service vpls bgp-evpn isid-route-target isid-range

#### Description

This command creates a range of ISIDs associated with a specified route-target that is advertised with BMAC-ISID and IMET-ISID routes for the ISID. The route-target can be explicitly configured or automatically assigned by the system if the **auto-rt** option is configured. Auto routes assignment is based on RFC 7623 as follows:

<2-byte-as-number>:<4-byte-value>, where 4-byte-value = 0x30+ISID

The **no** form of the command deletes the **isid-range** and its association with the **route-target**.

The **no** form is the default action, which advertises the BMAC-ISID and IMET-ISID routes with the B-VPLS configured route-target.

#### Default

no isid-range

#### Parameters

##### *from*

Specifies the start of the ISID range.

**Values** 1 to 16777215

##### *to*

Specifies the end of the ISID range. If it is not configured, the range is comprised of (only) the ISID specified in the *to* option.

**Values** 1 to 16777215

##### **auto-rt**

Automatically generates an ISID-derived **route-target** in the format: AS\_number:0x30+ISID.

##### **route-target**

Specifies an explicit route target.

**Values** `rt - target:{<ip-addr:comm-val>| <2byte-as-number:extcomm-val>| <4byte-asnumber:comm-val>}`  
*ip-addr*: a.b.c.d  
*comm-val*: [0 to 65535]

## 13.342 isid-route-target

### isid-route-target

#### Syntax

`isid-route-target`

#### Context

[\[Tree\]](#) (config>service>vpls>bgp-evpn isid-route-target)

#### Full Context

configure service vpls bgp-evpn isid-route-target

#### Description

Commands in this context configure the isid-range to route-target associations.

#### Platforms

All

## 13.343 isis

### isis

#### Syntax

`[no] isis isis-instance`

## Context

[\[Tree\]](#) (config>service>vprn isis)

## Full Context

configure service vprn isis

## Description

Commands in this context configure the Intermediate-System-to-Intermediate-System (IS-IS) protocol instance in the VPRN.

The IS-IS protocol instance is enabled with the **no shutdown** command in the **config>service>vprn>isis** context. Alternatively, the IS-IS protocol instance is disabled with the **shutdown** command in the **config>service>vprn>isis** context.

IS-IS instances are **shutdown** when created, so that all parameters can be configured prior to the instance being enabled.

The **no** form of this command disables the ISIS protocol instance from the given VPRN service.

## Default

0

## Parameters

### *isis-instance*

Specifies the instance ID for an IS-IS instance.

**Values** 0 to 127

## Platforms

All

## isis

## Syntax

[no] isis [*isis-instance*]

## Context

[\[Tree\]](#) (config>router isis)

## Full Context

configure router isis

## Description

Commands in this context configure the Intermediate-System-to-Intermediate-System (IS-IS) protocol instance.

The IS-IS protocol instance is enabled with the **no shutdown** command in the **config>router>isis** context. Alternatively, the IS-IS protocol instance is disabled with the **shutdown** command in the **config>router>isis** context.

IS-IS instances are shutdown when created, so that all parameters can be configured prior to the instance being enabled.

The **no** form of this command deletes the IS-IS protocol instance. Deleting the protocol instance removes all configuration parameters for this IS-IS instance.

## Parameters

### *isis-instance*

Specifies the instance ID for an IS-IS instance.

**Values** 0 to 127

## Platforms

All

## isis

## Syntax

**isis** [*isis-instance*]

## Context

[\[Tree\]](#) (debug>router isis)

## Full Context

debug router isis

## Description

Commands in this context debug IS-IS protocol entities.

## Parameters

### *isis-instance*

Specifies the IS-IS instance.

**Values** 0 to 127

## Platforms

All

## Output

The following output is an example of the debugging information.

**Output Example**

## 14 j Commands

### 14.1 jitter-event

#### jitter-event

##### Syntax

**jitter-event** **rising-threshold** *threshold* [**falling-threshold** *threshold*] [*direction*]

**no jitter-event**

##### Context

[\[Tree\]](#) (config>saa>test jitter-event)

##### Full Context

configure saa test jitter-event

##### Description

This command specifies that at the termination of an SAA test probe, the calculated jitter value is evaluated against the configured rising and falling jitter thresholds. SAA threshold events are generated as required.

Once the threshold (rising/falling) is crossed, it is disabled from generating additional events until the opposite threshold is crossed. If a **falling-threshold** is not supplied, the **rising-threshold** is re-enabled when it falls below the threshold after the initial crossing that generated the event.

The configuration of jitter event thresholds is optional.

The **no** form of the command disables the jitter event.

##### Parameters

###### **rising-threshold** *threshold*

Specifies a rising threshold jitter value, in milliseconds. When the test run is completed, the calculated jitter value is compared to the configured jitter rising threshold. If the test run jitter value is greater than the configured rising threshold value then an SAA threshold event is generated. The SAA threshold event is tmnxOamSaaThreshold, logger application OAM, event #2101.

**Values** 0 to 2147483

**Default** 0

###### **falling-threshold** *threshold*

Specifies a falling threshold jitter value, in milliseconds. When the test run is completed, the calculated jitter value is compared to the configured jitter falling threshold. If the test

run jitter value is greater than the configured falling threshold value then an SAA threshold event is generated. The SAA threshold event is tmnxOamSaaThreshold, logger application OAM, event #2101.

**Values** 0 to 2147483

**Default** 0

### **direction**

Specifies the direction for OAM ping responses received for an OAM ping test run.

**Values** **inbound** — Monitor the value of jitter calculated for the inbound, one-way, OAM ping responses received for an OAM ping test run.

**outbound** — Monitor the value of jitter calculated for the outbound, one-way, OAM ping requests sent for an OAM ping test run.

**roundtrip** — Monitor the value of jitter calculated for the round trip, two-way, OAM ping requests and replies for an OAM ping test run.

**Default** roundtrip

# 15 k Commands

## 15.1 kb-memory-use-alarm

### kb-memory-use-alarm

#### Syntax

**kb-memory-use-alarm** **rising-threshold** *threshold* [**falling-threshold** *threshold*] **interval** *seconds* [*rmon-event-type*] [**startup-alarm** *alarm-type*]  
**no kb-memory-use-warn**

#### Context

[\[Tree\]](#) (config>system>thresholds kb-memory-use-alarm)

#### Full Context

configure system thresholds kb-memory-use-alarm

#### Description

This command configures memory use, in kilobytes, alarm thresholds.

The **no** form of the command removes the parameters from the configuration.

#### Parameters

##### **rising-threshold** *threshold*

Specifies a threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is greater than or equal to this threshold and the associated startup-alarm is equal to rising or either.

After a rising threshold crossing event is generated, another such event will not be generated until the sampled value falls below this threshold and reaches less than or equal the falling-threshold value.

The threshold value represents units of kilobytes.

**Values** -2147483648 to 2147483647

**Default** 0

##### **falling-threshold** *threshold*

Specifies a threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater

than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is less than or equal to this threshold and the associated startup-alarm is equal to falling or either.

After a falling threshold crossing event is generated, another such event will not be generated until the sampled value rises above this threshold and reaches greater than or equal the rising-threshold value.

The threshold value represents units of kilobytes.

**Values** -2147483648 to 2147483647

**Default** 0

### **seconds**

Specifies the polling period over which the data is sampled and compared with the rising and falling thresholds.

**Values** 1 to 2147483647

### **rmon-event-type**

Specifies the type of notification action to be taken when this event occurs.

**Values** log — In the case of log, an entry is made in the RMON-MIB log table for each event occurrence. This does not create an SR OS logger entry. The RMON-MIB log table entries can be viewed using the **show>system>thresholds** CLI command.

trap — An SR OS logger event is generated. The SR OS logger utility then distributes the notification of this event to its configured log destinations which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.

both — Both an entry in the RMON-MIB logTable and an SR OS logger event are generated.

none — No action is taken.

**Default** both

### **startup-alarm alarm-type**

Specifies the alarm that may be sent when this alarm is first created. If the first sample is greater than or equal to the rising threshold value and startup-alarm is equal to rising or either, then a single rising threshold crossing event is generated. If the first sample is less than or equal to the falling threshold value and startup-alarm is equal to falling or either, a single falling threshold crossing event is generated.

**Values** rising, falling, either

**Default** either

## **Platforms**

All

## 15.2 kb-memory-use-warn

### kb-memory-use-warn

#### Syntax

**kb-memory-use-warn** **rising-threshold** *threshold* [**falling-threshold** *threshold*] **interval** *seconds* [*rmon-event-type*] [**startup-alarm** *alarm-type*]

**no kb-memory-use-warn**

#### Context

[\[Tree\]](#) (config>system>thresholds kb-memory-use-warn)

#### Full Context

configure system thresholds kb-memory-use-warn

#### Description

This command configures memory usage, in kilobytes, for warning thresholds

#### Parameters

##### **rising-threshold** *threshold*

Specifies a threshold for the sampled statistic. When the current sampled value is greater than or equal to this threshold, and the value at the last sampling interval was less than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is greater than or equal to this threshold and the associated startup-alarm is equal to rising or either.

After a rising threshold crossing event is generated, another such event will not be generated until the sampled value falls below this threshold and reaches less than or equal the falling-threshold value.

The threshold value represents units of kilobytes.

**Values** -2147483648 to 2147483647

**Default** 0

##### **falling-threshold** *threshold*

Specifies a threshold for the sampled statistic. When the current sampled value is less than or equal to this threshold, and the value at the last sampling interval was greater than this threshold, a single threshold crossing event will be generated. A single threshold crossing event will also be generated if the first sample taken is less than or equal to this threshold and the associated startup-alarm is equal to falling or either.

After a falling threshold crossing event is generated, another such event will not be generated until the sampled value rises above this threshold and reaches greater than or equal the rising-threshold value.

The threshold value represents units of kilobytes.

**Values** -2147483648 to 2147483647

**Default** 0

### ***seconds***

Specifies the polling period over which the data is sampled and compared with the rising and falling thresholds.

**Values** 1 to 2147483647

### ***rmon-event-type***

Specifies the type of notification action to be taken when this event occurs.

**Values** log — An entry is made in the RMON-MIB log table for each event occurrence. This does not create an SR OS logger entry. The RMON-MIB log table entries can be viewed using the show>system>thresholds CLI command.

trap — An SR OSS logger event is generated. The SR OS logger utility then distributes the notification of this event to its configured log destinations which may be CONSOLE, telnet session, memory log, cflash file, syslog, or SNMP trap destinations logs.

both — Both an entry in the RMON-MIB logTable and an SR OS logger event are generated.

none — No action is taken.

**Default** both

### ***alarm-type***

Specifies the alarm that may be sent when this alarm is first created. If the first sample is greater than or equal to the rising threshold value and startup-alarm is equal to rising or either, then a single rising threshold crossing event is generated. If the first sample is less than or equal to the falling threshold value and startup-alarm is equal to falling or either, a single falling threshold crossing event is generated.

**Values** rising, falling, either

**Default** either

All

## **15.3 keep-alive**

## keep-alive

### Syntax

**keep-alive** [*interval seconds*] [**retry-count** *value*] [**timeout** *retry-seconds*]

**no keep-alive**

### Context

[\[Tree\]](#) (config>subscr-mgmt>gtp>peer-profile keep-alive)

### Full Context

configure subscriber-mgmt gtp peer-profile keep-alive

### Description

This command configures Echo-Request messages.

The **no** form of this command reverts to the default values.

### Default

keep-alive interval 60 retry-count 4 timeout 5

### Parameters

#### *seconds*

Specifies, in seconds, the interval between keep-alive Echo-Request messages towards the same peer.

**Values** 0, 60 to 180

**Default** 60

#### *value*

Specifies, in seconds, the interval between keep-alive Echo-Request messages towards the same peer.

**Values** 1 to 15

**Default** 4

#### *retry-seconds*

Specifies the retry timeout, in seconds.

**Values** 1 to 20

**Default** 5

### Platforms

**no keep-alive**

### Context

[\[Tree\]](#) (config>port>ethernet>dw1 keep-alive)

### Full Context

configure port ethernet down-when-looped keep-alive

### Description

This command configures the time interval between keep-alive PDUs.

### Default

no keep-alive

### Parameters

*timer*

Specifies the time interval, in seconds, between keep-alive PDUs.

**Values** 1 to 120

### Platforms

All

## keep-alive

### Syntax

**keep-alive** *seconds*

### Context

[\[Tree\]](#) (config>li>x-interfaces>x2>timeouts keep-alive)

[\[Tree\]](#) (config>li>x-interfaces>x3>timeouts keep-alive)

### Full Context

configure li x-interfaces x2 timeouts keep-alive

configure li x-interfaces x3 timeouts keep-alive

## Description

This command configures the X2 and X3 keep-alive timeout.

## Parameters

### *seconds*

Specifies the maximum time to wait for a LIC reply to a keep alive request. The system retries up to three more times, and if no reply is received, the system declares a connection fault and logs the failure event.

**Values** 300 to 600

**Default** 300

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## keep-alive

## Syntax

**keep-alive**

## Context

[\[Tree\]](#) (config>service>sdp keep-alive)

## Full Context

configure service sdp keep-alive

## Description

This command enables the context to configure SDP connectivity monitoring keepalive messages for the SDP ID.

SDP ID keepalive messages use SDP Echo Request and Reply messages to monitor SDP connectivity. The operating state of the SDP is affected by the keepalive state on the SDP ID. SDP Echo Request messages are only sent when the SDP ID is completely configured and administratively up. If the SDP ID is administratively down, keepalives for that SDP ID are disabled. SDP Echo Requests (when sent for keepalive messages) are always sent with the *originator-sdp-id*. All SDP ID keepalive SDP Echo Replies are sent using generic IP/GRE OAM encapsulation.

When a keepalive response is received that indicates an error condition, the SDP ID will immediately be brought operationally down. Once a response is received that indicates the error has cleared and the **hold-down-time** interval has expired, the SDP ID will be eligible to be put into the operationally up state. If no other condition prevents the operational change, the SDP ID will enter the operational state.

A set of event counters track the number of keepalive requests sent, the size of the message sent, non-error replies received and error replies received. A keepalive state value is kept indicating the last response event. A keepalive state timestamp value is kept indicating the time of the last event. With each keepalive event change, a log message is generated indicating the event type and the timestamp value.

[Table 57: Keepalive Interpretation and Effect of SDP Echo Reply](#) describes the keepalive interpretation of SDP echo reply response conditions and the effect on the SDP ID operational status.

Table 57: *Keepalive Interpretation and Effect of SDP Echo Reply*

| Result of Request                                                                                      | Stored Response State          | Operational State                      |
|--------------------------------------------------------------------------------------------------------|--------------------------------|----------------------------------------|

## 15.4 keep-alive-interval

### keep-alive-interval

#### Syntax

**keep-alive-interval** *interval*

**no keep-alive-interval**

#### Context

[\[Tree\]](#) (config>redundancy>multi-chassis>peer>mc-lag keep-alive-interval)

#### Full Context

configure redundancy multi-chassis peer mc-lag keep-alive-interval

#### Description

This command sets the interval at which keep-alive messages are exchanged between two systems participating in MC-LAG. These keep-alive messages are used to determine remote-node failure and the interval is set in deciseconds.

The **no** form of this command sets the interval to default value.

### Default

keep-alive-interval 10

### Parameters

#### *interval*

The time interval expressed in tenths of a second.

**Values** 5 to 500

### Platforms

All

## keep-alive-interval

### Syntax

**keep-alive-interval** *interval*

**no keep-alive-interval**

### Context

**[Tree]** (config>service>ies>sub-if>grp-if>srrp keep-alive-interval)

**[Tree]** (config>service>vprn>sub-if>grp-if>srrp keep-alive-interval)

### Full Context

configure service ies subscriber-interface group-interface srrp keep-alive-interval

configure service vprn subscriber-interface group-interface srrp keep-alive-interval

### Description

This command defines the interval between SRRP advertisement messages sent when operating in the master state. The interval is also the basis for setting the master-down timer used to determine when the master is no longer sending. The system uses three times the keep-alive interval to set the timer. Every time an SRRP advertisement is seen that is better than the local priority, the timer is reset. If the timer expires, the SRRP instance assumes that a master does not exist and initiates the attempt to become master.

When in backup state, the SRRP instance takes the keep-alive interval of the master as represented in the masters SRRP advertisement message. Once in master state, the SRRP instance uses its own configured keep-alive interval.

The keep-alive-interval may be changed at any time, but will have no effect until the SRRP instance is in the master state.

The **no** form of this command restores the default interval.

## Default

keep-alive-interval 10

## Parameters

### *interval*

Specifies the interval, in deciseconds, between SRRP advertisement messages sent when operating in the master state.

**Values** 1 to 100

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**Full Context**

```
configure bmp station connection tcp-keepalive keep-count
```

**Description**

This command configures the number of missed keepalives before the TCP connection is declared down. The **no** form of this command reverts to the default.

**Default**

```
keep-count 4
```

**Parameters**

*count*

Specifies the number of missed keepalives before the TCP connection is declared down.

**Values** 3 to 100

**Platforms**

All

## 15.6 keep-idle

```
keep-idle
```

**Syntax**

```
keep-idle idle
```

```
no keep-idle
```

**Context**

[\[Tree\]](#) (config>bmp>station>connection>tcp-keepalive keep-idle)

**Full Context**

```
configure bmp station connection tcp-keepalive keep-idle
```

**Description**

This command configures the time until the first TCP keepalive probe is sent. The **no** form of this command reverts to the default.

**Default**

```
keep-idle 600
```

**Parameters***idle*

Specifies the time, in seconds, until the first TCP keepalive probe is sent.

**Values** 1 to 100000

**Platforms**

All

## 15.7 keep-interval

### keep-interval

**Syntax**

**keep-interval** *interval*

**no keep-interval**

**Context**

[\[Tree\]](#) (config>bmp>station>connection>tcp-keepalive keep-interval)

**Full Context**

configure bmp station connection tcp-keepalive keep-interval

**Description**

This command configures the time between two TCP keepalives probes.

The **no** form of this command reverts to the default.

**Default**

keep-interval 15

**Parameters***interval*

Specifies the time, in seconds, between two TCP keepalives probes.

**Values** 1 to 100000

**Platforms**

All

## 15.8 keep-multiplier

### keep-multiplier

#### Syntax

**[no] keep-multiplier** *number*

**no keep-multiplier**

#### Context

**[Tree]** (config>router>rsvp keep-multiplier)

#### Full Context

configure router rsvp keep-multiplier

#### Description

The **keep-multiplier** *number* is an integer used by RSVP to declare that a reservation is down or the neighbor is down.

The **no** form of this command reverts to the default value.

#### Default

keep-multiplier 3

#### Parameters

***number***

Specifies the **keep-multiplier** value.

**Values** 1 to 255

#### Platforms

All

## 15.9 keepalive

### keepalive

#### Syntax

**keepalive** *seconds* [**hold-up-multiplier** *multiplier*]

**no keepalive**

## Context

**[Tree]** (config>service>vprn>l2tp>group>ppp keepalive)

**[Tree]** (config>service>vprn>l2tp>group>tunnel>ppp keepalive)

**[Tree]** (config>router>l2tp>group>ppp keepalive)

**[Tree]** (config>router>l2tp>group>tunnel>ppp keepalive)

## Full Context

configure service vprn l2tp group ppp keepalive

configure service vprn l2tp group tunnel ppp keepalive

configure router l2tp group ppp keepalive

configure router l2tp group tunnel ppp keepalive

## Description

This command configures the PPP keepalive interval and multiplier.

## Default

keepalive 30 hold-up-multiplier 3

## Parameters

### *seconds*

Specifies in seconds the interval.

**Values** 10 to 300

### *multiplier*

Specifies the multiplier.

**Values** 1 to 5

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## keepalive

## Syntax

**keepalive** *seconds* [**hold-up-multiplier** *multiplier*]

**no keepalive**

## Context

**[Tree]** (config>subscr-mgmt>ppp-policy keepalive)

## Full Context

```
configure subscriber-mgmt ppp-policy keepalive
```

## Description

This command defines the keepalive interval and the number of keepalives that can be missed before the session is declared down for this PPP policy.

The **no** form of this command reverts to the default value.

## Default

```
keepalive 30 hold-up-multiplier 3
```

## Parameters

### *seconds*

Specifies the keepalive interval in seconds.

**Values** 4 to 300

### *hold-up-multiplier multiplier*

Specifies the number of keepalives that can be missed.

**Values** 1 to 5

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## keepalive

## Syntax

```
keepalive seconds [hold-up-multiplier multiplier]
```

```
no keepalive
```

## Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp>host>plcy-parms keepalive)

## Full Context

```
configure subscriber-mgmt local-user-db ppp host ppp-policy-parameters keepalive
```

## Description

This command configures the keepalive time interval in seconds at which LCP echo requests are transmitted for the PPP session and the number of LCP echo replies that can be missed before the PPP session is brought down. Overrides the values configured in **subscriber-mgmt ppp-policy** for PPPoE PTA sessions or in the Base router or VPRN service **l2tp group** context for L2TP LNS sessions.

The **no** form of this command removes the LCP keepalive parameter overrides.

## Default

no keepalive

## Parameters

### *seconds*

Specifies the keepalive interval in seconds.

**Values** 4 to 300

### *hold-up-multiplier multiplier*

Specifies the number of keepalives that can be missed.

**Values** 1 to 5

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## keepalive

## Syntax

**keepalive** *seconds*

**no keepalive**

## Context

[\[Tree\]](#) (config>subscr-mgmt>bgp-prng-plcy keepalive)

## Full Context

configure subscriber-mgmt bgp-peering-policy keepalive

## Description

This command configures the BGP keepalive timer. A keepalive message is sent every time this timer expires.

The keepalive value is generally one-third of the hold-time interval. Even though the OS implementation allows the keepalive value and the hold-time interval to be independently set, under the following circumstances, the configured keepalive value is overridden by the hold-time value:

If the specified keepalive value is greater than the configured hold-time, then the specified value is ignored, and the keepalive is set to one third of the current hold-time value.

If the specified hold-time interval is less than the configured keepalive value, then the keepalive value is reset to one third of the specified hold-time interval.

If the hold-time interval is set to zero, then the configured value of the keepalive value is ignored. This means that the connection with the peer is up permanently and no keepalive packets are sent to the peer.

The **no** form of this command used at the global level reverts to the default value.

## Default

keepalive 30

## Parameters

**seconds**

Specifies the keepalive timer in seconds, expressed as a decimal integer.

**Values** 0 to 21845

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## keepalive

## Syntax

**keepalive** *seconds*

**no keepalive**

[Tree] (config>service>vprn>bgp keepalive)

## Full Context

configure service vprn bgp group neighbor keepalive

configure service vprn bgp group keepalive

configure service vprn bgp keepalive

## Description

This command configures the BGP keepalive timer. A keepalive message is sent every time this timer expires. The **seconds** parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific value is used.

The **keepalive** value is generally one-third of the **hold-time** interval. Even though the OS implementation allows the **keepalive** value and the **hold-time** interval to be independently set, under the following circumstances, the configured **keepalive** value is overridden by the **hold-time** value:

If the specified **keepalive** value is greater than the configured **hold-time**, then the specified value is ignored, and the **keepalive** is set to one third of the current **hold-time** value.

If the specified **hold-time** interval is less than the configured **hold-time** value, then the **keepalive** value is reset to one third of the specified **hold-time** interval.

If the **hold-time** interval is set to zero, then the configured value of the **keepalive** value is ignored. This means that the connection with the peer is up permanently and no **keepalive** packets are sent to the peer.

The **no** form of this command used at the global level reverts to the default value.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

## Default

keepalive 30

## Parameters

### *seconds*

The keepalive timer in seconds, expressed as a decimal integer.

**Values** 0 to 21845

## Platforms

All

## keepalive

## Syntax

**keepalive** *timeout factor*

## no keepalive

### Context

- [Tree] (config>router>ldp>if-params>ipv4 keepalive)

- [Tree] (config>router>ldp>targ-session>peer-template keepalive)
- [Tree] (config>router>ldp>if-params>if>ipv6 keepalive)

### Full Context

```
configure router ldp interface-parameters ipv4 keepalive
configure router ldp targeted-session ipv4 keepalive
configure router ldp interface-parameters ipv6 keepalive
configure router ldp targeted-session peer keepalive
configure router ldp interface-parameters interface ipv4 keepalive
configure router ldp targeted-session ipv6 keepalive
configure router ldp targeted-session peer-template keepalive
configure router ldp interface-parameters interface ipv6 keepalive
```

### Description

This command configures the time interval (in s), that LDP waits before tearing down the session. The **factor** parameter derives the keepalive interval.

The **config>router>ldp>if-params>ipv6>keepalive** and **config>router>ldp>targ-session>ipv6>keepalive** commands are not supported on the 7450 ESS.

If no LDP messages are exchanged for the configured time interval, the LDP session is torn down. Keepalive timeout is usually three times the keepalive interval. To maintain the session permanently, regardless of the activity, set the value to zero.

When LDP session is being set up, the keepalive timeout is negotiated to the lower of the two peers. Once an operational value is agreed upon, the keepalive factor is used to derive the value of the keepalive interval.

The **no** form of the command at the interface-parameters and targeted-session levels sets the **keepalive timeout** and the **keepalive factor** to the default value.

The **no** form of this command, at the interface level, sets the **keepalive timeout** and the **keepalive factor** to the value defined under the **interface-parameters** level.

The **no** form of this command, at the peer level, sets the **keepalive timeout** and the **keepalive factor** to the value defined under the **targeted-session** level.

The session must be flapped for the new settings to operate.

## Default

[Table 58: Timeout Factor Defaults](#) lists the default values.

*Table 58: Timeout Factor Defaults*

| Context                             | Timeout                                            | Factor |
|-------------------------------------|----------------------------------------------------|--------|
| config>router>ldp>if-params         | 30                                                 | 3      |
| config>router>ldp>targ-session      | 40                                                 | 4      |
| config>router>ldp>if-params>if      | Inherits values from interface-parameters context. |        |
| config>router>ldp>targ-session>peer | Inherits values from targeted-session context.     |        |

## Parameters

### *timeout*

Configures the time interval, in seconds, that LDP waits before tearing down the session.

**Values** 1 to 65535

### *factor*

Specifies the number of keepalive messages, expressed as a decimal integer, that should be sent on an idle LDP session in the keepalive timeout interval.

**Values** 1 to 255

## Platforms

All

## keepalive

## Syntax

[no] keepalive

## Context

[\[Tree\]](#) (debug>router>ldp>peer>packet keepalive)

## Full Context

debug router ldp peer packet keepalive

## Description

This command enables debugging for LDP Keepalive packets.

The **no** form of the command disables the debugging output.

## Platforms

All

## keepalive

### Syntax

**keepalive** *seconds*

**no keepalive**

### Context

**[Tree]** (config>router>pcep>pcc keepalive)

**[Tree]** (config>router>pcep>pce keepalive)

### Full Context

configure router pcep pcc keepalive

configure router pcep pce keepalive

### Description

This command configures the PCEP session keep-alive value. A PCEP speaker (PCC or PCE) must send a keep-alive message if no other PCEP message is sent to the peer at the expiry of this timer. This timer is restarted every time a PCEP message or keep-alive message is sent.

The keep-alive mechanism is asymmetric, meaning that each peer can use a different keep-alive timer value at its end.

The **no** form of the command returns the keep-alive timer to the default value.

### Default

keepalive 30

### Parameters

**seconds**

the keep-alive value, in seconds

**Values** 1 to 255

### Platforms

All

- configure router pcep pcc keepalive

VSR-NRC

- configure router pcep pce keepalive

## keepalive

### Syntax

**keepalive** *deciseconds* **dropcount** *count*

### Context

[\[Tree\]](#) (config>isa>nat-group>inter-chassis-redundancy keepalive)

### Full Context

configure isa nat-group inter-chassis-redundancy keepalive

### Description

This command configures keepalives between the CPMs residing on different chassis. The keepalives are used to detect the presence of the peering node. If the redundant peer connectivity is lost beyond the limit defined by keepalives, then each node in the redundant pair transitions into a standalone mode. Keepalives use UDP transport.

### Default

keepalive 30 dropcount 2

### Parameters

#### *deciseconds*

Specifies the number of keepalives that are transported periodically at intervals defined by this parameter.

**Values** 2 to 250

#### *count*

Specifies the drop count. If the number of consecutive keepalives defined by this parameter is lost, then the peer is considered unreachable and the node transitions into a standalone mode of operation.

**Values** 2 to 20

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## keepalive

### Syntax

**[Tree]** (config>router>bgp keepalive)

## Full Context

configure router bgp group neighbor keepalive

configure router bgp group keepalive

configure router bgp keepalive

## Description

This command configures the BGP keepalive timer. A keepalive message is sent every time this timer expires.

The **keepalive** parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific value is used.

The **keepalive** value is generally one-third of the **hold-time** interval. Even though the implementation allows the **keepalive** value and the **hold-time** interval to be independently set, under the following circumstances, the configured **keepalive** value is overridden by the **hold-time** value:

- If the specified **keepalive** value is greater than the configured **hold-time**, then the specified value is ignored and the **keepalive** is set to one third of the current **hold-time** value.
- If the specified **hold-time** interval is less than the configured **keepalive** value, then the **keepalive** value is reset to one third of the specified **hold-time** interval.
- If the **hold-time** interval is set to zero, then the configured value of the **keepalive** value is ignored. This means that the connection with the peer is up permanently and no **keepalive** packets are sent to the peer.

The **no** form of this command used at the global level reverts to the default value.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

## Default

keepalive 30

## Parameters

### *seconds*

Specifies the keepalive timer, in seconds, expressed as a decimal integer.

**Values** 0 to 21845

## Platforms

All

## keepalive

### Syntax

**keepalive** [**neighbor** *ip-addr* | **group** *name*]

**no keepalive**

### Context

**[Tree]** (debug>router>bgp keepalive)

### Full Context

debug router bgp keepalive

### Description

This command decodes and logs all sent and received keepalive messages in the debug log.

The **no** form of this command disables the debugging.

### Parameters

#### **neighbor** *ip-address*

Debugs only events affecting the specified BGP neighbor.

- Values**
- ipv4-address:
    - a.b.c.d (host bits must be 0)
  - ipv6-address:
    - x:x:x:x:x:x [-interface] (eight 16-bit pieces)
    - x:x:x:x:x:d.d.d.d [-interface]
    - x: [0 to FFFF]H
    - d: [0 to 255]D
    - interface: up to 32 characters for link local addresses

#### **group** *name*

Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

### Platforms

All

## 15.10 keepalive-override

## keepalive-override

### Syntax

**keepalive-override** *keepalive-timer*

**no keepalive-override**

### Context

**[Tree]** (config>mcast-mgmt>multicast-info-policy>bundle>channel>source-override keepalive-override)

**[Tree]** (config>mcast-mgmt>multicast-info-policy>bundle>channel keepalive-override)

**[Tree]** (config>mcast-mgmt>multicast-info-policy>bundle keepalive-override)

### Full Context

configure mcast-management multicast-info-policy bundle channel source-override keepalive-override

configure mcast-management multicast-info-policy bundle channel keepalive-override

configure mcast-management multicast-info-policy bundle keepalive-override

### Description

This command configures the keepalive timer override. The PIM (S,G) Keepalive Timer (KAT) is used to maintain the (S,G) state when (S,G) join is not received. Expiry of the KAT causes the (S,G) entry to be removed.

The KAT override configuration is performed with a multicast information policy, which must be applied to the related PIM routing instance. When a KAT override is configured under a channel (a group or a group range), it applies to all (S,G) entries that fall under it, except when the source-override is configured and a KAT override is also configured under the source-override. In this scenario, the specific KAT override must be used for the (S,G) entries that fall under the source-override, while other (S,G) entries under the bundle use the KAT override configured under the channel.

### Parameters

***keepalive-timer***

Specifies the keepalive timer override, in seconds.

**Values** 10 to 86000

### Platforms

All

## 15.11 kernel

## kernel

### Syntax

**kernel password** *password*

**no kernel**

### Context

[\[Tree\]](#) (config>system>security>ssh>client-kex-list kex)

### Full Context

configure system security ssh server-kex-list kex

configure system security ssh client-kex-list kex

## Description

This command allows the user to configure phase 1 SSH v2 KEX algorithms for SR OS as an SSH server or an SSH client. By default, the client and server lists are empty. If the user configures this list, SSH uses the hard-coded list with the first-listed algorithm having the highest priority and so on. An empty server or client list is the default list and contains the following algorithms:

```
diffie-hellman-group16-sha512
diffie-hellman-group14-sha256
diffie-hellman-group14-sha1
diffie-hellman-group14-sha1
diffie-hellman-group1-sha1
```

The **no** form of this command removes the specified KEX index. If all KEX indexes are removed, the default list is used again.

## Parameters

### *index*

Specifies the index of the algorithm in the list. The lowest index in the list is negotiated first on the SSH negotiation list, while the highest index is at the bottom of the SSH negotiation list.

**Values** 1 to 255

### *kex-name*

Specifies the KEX algorithm for computing the shared secret key.

**Values** diffie-hellman-group16-sha512, diffie-hellman-group14-sha256, diffie-hellman-group14-sha1, diffie-hellman-group-exchange-sha1, diffie-hellman-group1-sha1

### Context

[\[Tree\]](#) (config>system>security>pki>ca-profile>cmpv2>key-list key)

## Full Context

configure system security pki ca-profile cmpv2 key-list key

## Description

This command specifies a pre-shared key used for CMPv2 initial registration. Multiples of key commands are allowed to be configured under this context.

The password and reference-number is distributed by the CA via out-of-band means.

The configured password is stored in configuration file in an encrypted form by using SR OS hash2 algorithm.

The **no** form of this command removes the parameters from the configuration.

## Parameters

### ***password***

Specifies a printable ASCII string, up to 64 characters.

### **hash**

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified

### **hash2**

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### **custom**

Specifies the custom encryption to management interface.

### **reference *reference-number***

Specifies a printable ASCII string, up to 64 characters in length.

key-generation same-as-existing-key

## Parameters

*bits*

Specifies the size in bits..

**Values** 512 to 8192

**Default** 2048

*curve*

Specifies the elliptic curve for key generation.

**Values** secp256r1, secp384r1, secp521r1

**Default** secp256r1

**same-as-existing-key**

Specifies to use the same algorithm and key or size curve as the existing key.

## Platforms

All

## 15.15 key-list

### key-list

#### Syntax

key-list

#### Context

[\[Tree\]](#) (config>system>security>pki>ca-profile>cmpv2 key-list)

#### Full Context

configure system security pki ca-profile cmpv2 key-list

#### Description

This command enables the context to configure pre-shared key list parameters.

#### Platforms

## 15.16 key-re-exchange

### key-re-exchange

#### Syntax

**key-re-exchange**

#### Context

[\[Tree\]](#) (config>system>security>ssh key-re-exchange)

#### Full Context

configure system security ssh key-re-exchange

#### Description

This command enables the key re-exchange context.

#### Platforms

All

## 15.17 key-rollover-interval

### key-rollover-interval

#### Syntax

**key-rollover-interval** *key-rollover-interval*

#### Context

[\[Tree\]](#) (config>service>vpn>ospf3>area key-rollover-interval)

#### Full Context

configure service vpn ospf3 area key-rollover-interval

#### Description

This command configures the key rollover interval.

The **no** form of this command reverts to the default.

#### Default

key-rollover-interval 10

## Parameters

### *key-rollover-interval*

Specifies the time, in seconds, after which a key rollover will start.

**Values** 10 to 300

## Platforms

All

## key-rollover-interval

## Syntax

**key-rollover-interval** *seconds*

## Context

## Description

This command configures the key rollover interval.

## Default

key-rollover-interval 10

## Parameters

### *seconds*

Specifies the time, in seconds, after which a key rollover will start.

**Values** 10 to 300

## Platforms

All

## 15.18 key-update

## key-update

### Syntax

**key-update** *ca* *ca-profile-name* **newkey** *key-filename* **oldkey** *key-filename* **oldcert** *cert-filename* [**hash-  
alg** *hash-algorithm*] **save-as** *save-path-of-result-cert*

### Context

[\[Tree\]](#) (admin>certificate>cmpv2 key-update)

### Full Context

admin certificate cmpv2 key-update

### Description

This command requests a new certificate from the CA to update an existing certificate due to reasons such as **key refresh** or **replacing compromised key**.

In some cases, the CA may not return certificate immediately, due to reasons such as request processing need manual intervention. In such cases, the admin certificate cmpv2 poll command can be used to poll the status of the request.

### Parameters

#### ***ca-profile-name***

Specifies a ca-profile name which includes CMP server information, up to 32 characters.

#### ***newkey key-filename***

Specifies the key file of the requesting certificate, up to 95 characters.

#### ***oldkey key-filename***

Specifies the key to be replaced, up to 95 characters.

#### ***cert-filename***

Specifies the file name of an imported certificate to be replaced, up to 95 characters.

#### ***hash-algorithm***

Specifies the hash algorithm for RSA key.

**Values** md5,sha1,sha224,sha256,sha384,sha512

#### ***save-path-of-result-cert***

Specifies the save full path name of saving the result certificate, up to 200 characters.

### Platforms

All

## 15.19 key-value

## key-value

### Syntax

**key-value** *public-key-value*

**no key-value**

### Context

**[Tree]** (config>system>security>user>public-keys>ecdsa>ecdsa-key key-value)

**[Tree]** (config>system>security>user>public-keys>rsa>rsa-key key-value)

### Full Context

configure system security user public-keys ecdsa ecdsa-key key-value

configure system security user public-keys rsa rsa-key key-value

### Description

This command configures a value for the RSA or ECDSA public key. The public key must be enclosed in quotation marks. For RSA, the key is between 768 and 4096 bits. For ECDSA, the key is between 1 and 1024 bits.

### Default

no key-value

### Parameters

***public-key-value***

Specifies the public key value, up to 800 characters for RSA and up to 255 characters for ECDSA.

### Platforms

All

## 15.20 keychain

## keychain

### Syntax

**[no] keychain** *keychain-name*

### Context

**[Tree]** (config>system>security keychain)

## Full Context

configure system security keychain

## Description

This command enables the context to configure keychain parameters. A keychain must be configured on the system before it can be applied to a session.

The **no** form of this command removes the keychain nodal context and everything under it from the configuration. If the keychain to be removed is in use when the no keychain command is entered, the command will not be accepted and an error indicating that the keychain is in use will be printed.

## Parameters

### *keychain-name*

Specifies a keychain name which identifies this particular keychain entry.

**Values** An ASCII string up to 32 characters.

## Platforms

All

## 15.21 keygroup-name

keygroup-name

## Syntax

**keygroup-name** *keygroup-name*

**no keygroup-name**

## Context

[\[Tree\]](#) (config>grp-encryp>encryp-keygrp keygroup-name)

## Full Context

configure group-encryption encryption-keygroup keygroup-name

## Description

This command is used to name the key group. The key group name can be used to reference a key group when configuring services or displaying information.

The **no** form of the command reverts to the default value.

## Parameters

### *keygroup-name*

The name of the key group, up to 64 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 15.22 kill-session

### kill-session

**Syntax**

[no] kill-session

**Context**

[\[Tree\]](#) (configure>system>security>profile>netconf>base-op-authorization kill-session)

**Full Context**

configure system security profile netconf base-op-authorization kill-session

**Description**

This command authorizes a user associated with the profile to send a NETCONF <kill-session> operation. This kill session operation allows a NETCONF client to kill another NETCONF session, but not the session in which the operation is requested.

The **no** form of the command denies the user from requesting a kill-session.

**Default**

no kill-session

**Platforms**

All

## 16 I Commands

### 16.1 I2

I2

#### Syntax

[no] I2

#### Context

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>tunnel-query>type I2)

#### Full Context

configure subscriber-mgmt wlan-gw tunnel-query type I2

#### Description

This command enables matching on Layer 2 tunnels.

The **no** form of this command disables matching on Layer 2 access points, unless no other tunnel type specifier is configured.

#### Default

no I2

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

I2

#### Syntax

[no] I2

#### Context

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>ue-query>state I2)

#### Full Context

configure subscriber-mgmt wlan-gw ue-query state I2

## Description

This command enables matching on UEs in a Layer 2 wholesale state.

The **no** form of this command disables matching on UEs in a Layer 2 wholesale state, unless all state matching is disabled.

## Default

no I2

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.2 I2-access-id-alias

### I2-access-id-alias

## Syntax

**I2-access-id-alias** *string*

**no I2-access-id-alias**

## Context

**[Tree]** (config>service>vpls>sap>pfcp I2-access-id-alias)

## Full Context

configure service vpls sap pfcp I2-access-id-alias

## Description

This command defines a Layer 2 access ID alias for the capture SAP. It replaces the default underlying port-based or LAG-based Layer 2 access ID. Different capture SAPs on the same underlying port or LAG can have different Layer 2 access ID aliases.

The **no** form of the command removes the configuration.

## Parameters

*string*

Specifies the Layer 2 access ID alias, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 16.3 I2-access-points

### I2-access-points

#### Syntax

**I2-access-points**

#### Context

**[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw I2-access-points)

**[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw I2-access-points)

#### Full Context

configure service ies subscriber-interface group-interface wlan-gw I2-access-points

configure service vprn subscriber-interface group-interface wlan-gw I2-access-points

#### Description

Commands in this context configure Layer 2 access points in WLAN gateway group interfaces.

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.4 I2-ap

### I2-ap

#### Syntax

**I2-ap** *sap-id* [**create**]

**no I2-ap** *sap-id*

#### Context

**[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw>I2-access-points I2-ap)

**[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw>I2-access-points I2-ap)

#### Full Context

configure service vprn subscriber-interface group-interface wlan-gw I2-access-points I2-ap

configure service ies subscriber-interface group-interface wlan-gw I2-access-points I2-ap

## Description

This command adds a specific SAP where Layer 2 WLAN gateway aggregation is performed. The following SAPs are supported:

- Ethernet
- LAG
- MPLS pseudowire SDPs

This command can be repeated multiple times to create multiple Layer 2 access points.

The **no** form of this command removes the Layer 2 access point. This is only allowed if the Layer 2 access point SAP is shutdown.

## Parameters

### *sap-id*

Specifies SAP to be created.

### **create**

Keyword used to create the Layer 2 WLAN gateway aggregation instance. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.5 l2-ap-auto-sub-id-fmt

### l2-ap-auto-sub-id-fmt

## Syntax

**l2-ap-auto-sub-id-fmt** {**include-ap-tags** | **sap-only**}

## Context

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>wlan-gw l2-ap-auto-sub-id-fmt)

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>wlan-gw l2-ap-auto-sub-id-fmt)

## Full Context

configure service ies subscriber-interface group-interface wlan-gw l2-ap-auto-sub-id-fmt

configure service vprn subscriber-interface group-interface wlan-gw l2-ap-auto-sub-id-fmt

## Description

This command configures the contents of the auto-generated subscriber ID when the **ipoe-sub-id-key** command is set to include **sap-id** and the **def-sub-id** command is configured with **use-auto-id**. The VLANs must be configured so that the subscriber ID length is not exceeded.

This command can include either the SAP or the SAP + AP delimiting tags.

The **no** form of this command reverts to the default configuration.

### Default

`l2-ap-auto-sub-id-fmt include-ap-tags`

### Parameters

#### **include-ap-tags**

Specifies that the SAP + AP delimiting tags is used.

#### **sap-only**

Specifies that the SAP only is used.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.6 l2-ap-encap-type

### l2-ap-encap-type

#### Syntax

`l2-ap-encap-type {null | dot1q | qinq}`

#### Context

**[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw l2-ap-encap-type)

**[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw l2-ap-encap-type)

#### Full Context

configure service ies subscriber-interface group-interface wlan-gw l2-ap-encap-type

configure service vprn subscriber-interface group-interface wlan-gw l2-ap-encap-type

#### Description

This parameter specifies the number of AP identifying VLAN tags for an AP. This is the default value that can be overridden per SAP. This value must be at least equal to the number of VLANs configured in the SAP or enabling a SAP will fail.

A SAP VLAN is explicitly configured, for example **l2-ap 1/1/1:25**. Other VLANs on the same port can still be used in other contexts.

The number of VLAN tags Epipe to the WLAN gateway IOM equals the **l2-ap-encap-type** minus the encaps of the SAP. Upon receipt of a packet, these VLANs are stored as a Layer 2 tunnel identifier, and are only used in context of WLAN gateway.

The **no** form of this command sets the default value.

**Default**

I2-ap-encap-type null

**Parameters****null**

Both the SAP and the AP are not VLAN-tagged.

**dot1q**

Either the AP or the SAP uses one VLAN tag.

**qinq**

Up to two VLAN tags are used by the AP or SAP.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.7 I2-aware

### I2-aware

**Syntax**

I2-aware

**Context**

[\[Tree\]](#) (config>service>vprn>nat>inside I2-aware)

**Full Context**

configure service vprn nat inside I2-aware

**Description**

Commands in this context configure parameters specific to Layer2-Aware NAT.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### I2-aware

**Syntax**

I2-aware

**Context**

[\[Tree\]](#) (config>router>nat>inside I2-aware)

## Full Context

```
configure router nat inside l2-aware
```

## Description

Commands in this context configure Layer2-Aware NAT.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## l2-aware

## Syntax

```
l2-aware subscriber sub-ident-string ip ip-address protocol {tcp | udp} [port port] [outside-ip ip-address]
 [outside-port port] [nat-policy policy-name] [member member-id] [port-range-start port]
no l2-aware subscriber sub-ident-string ip ip-address protocol {tcp | udp port port}
```

## Context

[\[Tree\]](#) (config>service>nat>fwd l2-aware)

## Full Context

```
configure service nat port-forwarding l2-aware
```

## Description

This command creates NAT static port forwards for Layer2-Aware subscribers. The ESM subscriber must be present in the system before this command is executed. The **no** form of the command deletes NAT static port forwards for Layer2-Aware subscribers.

## Parameters

### **subscriber** *sub-ident-string*

This mandatory parameter specifies the ESM subscriber for which the SPF is to be created; ESM subscriber must be present in the system before the SPF can be created.

### **ip** *ip-address*

This mandatory parameter specifies the source IPv4/IPv6 address for which SPF will be created.

### **protocol** {**tcp** | **udp**}

This mandatory parameter specifies the protocol to use, either TCP or UDP.

### **port** *port*

This optional parameter specifies a source port.

**Values** 1 to 65535

### **outside-ip** *ipv4-address*

This mandatory parameter specifies the outside IPv4 address. If the outside IPv4 address is specified, then all other optional parameters become mandatory.

**outside-port *port***

This optional parameter specifies the outside port.

**nat-policy *policy-name***

If multiple NAT policies are used inside the routing context, then the NAT policy should be specified in the SPF request so the SPF is created in the correct NAT pool. Otherwise, the default NAT policy from the inside routing context will be used.

**member *member-id***

This optional parameter should not be used by the operator. It is used only if the command is replayed via the **exec** command or at **boot-config**. The member ID indicates the identifier of the NAT ISA group member associated with this NAT subscriber.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.8 I2-aware-ip-address

### I2-aware-ip-address

**Syntax**

**I2-aware-ip-address** *ip-address*

**I2-aware-ip-address from-pool**

**no I2-aware-ip-address**

**Context**

**[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>dhcp I2-aware-ip-address)

**[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>dhcp I2-aware-ip-address)

**Full Context**

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range dhcp I2-aware-ip-address

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range dhcp I2-aware-ip-address

**Description**

This command configures the Layer2-Aware NAT inside IP address to be assigned via DHCP on the WLAN-GW ISA.

If the **from-pool** parameter is specified instead of an IPv4 address, a unique address is allocated to each UE. The pool used is managed by the dhcpv4-nat pool manager, configured under the same subscriber interface. This option is only available when **auth-on-dhcp** is also configured.

The **no** form of this command reverts to the default.

### Parameters

#### ***ip-address***

Specifies the Layer2-Aware NAT inside IP address.

#### **from-pool**

Specifies that the Layer2-Aware IP address is allocated from a pool.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.9 l2-aware-nat-bypass

### l2-aware-nat-bypass

### Syntax

**[no] l2-aware-nat-bypass**

### Context

[\[Tree\]](#) (config>filter>ip-filter>entry>action l2-aware-nat-bypass)

### Full Context

configure filter ip-filter entry action l2-aware-nat-bypass

### Description

This command enables bypassing NAT for packets pertaining to L2-Aware hosts and matching this entry. This action is only applicable to L2-Aware NAT subscribers and it must be configured together with **action forward**. Traffic identified in the match condition bypasses L2-Aware NAT. A common use case is to bypass NAT for on-net destinations (within the customer network).

Traffic that is not classified for bypass is automatically diverted to L2-Aware NAT, unless it is explicitly configured in the IP filter to be dropped.

For selective NAT bypass to take effect, in addition to the IP filter configuration, the L2-Aware NAT subscriber must be specifically enabled for selective bypass via the **nat-allow-bypass** configuration option in the NAT CLI node in the SLA profile.

The **no** form of this command automatically diverts traffic to L2-Aware NAT, unless it is explicitly configured in the IP filter to be dropped.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.10 I2-aware-sub

### I2-aware-sub

#### Syntax

**[no] I2-aware-sub** *sub-ident-string*

#### Context

**[Tree]** (config>li>li-source>nat I2-aware-sub)

#### Full Context

configure li li-source nat I2-aware-sub

#### Description

This command configures a Layer-2-Aware subscriber source.

The **no** form of this command removes the values from the configuration.

#### Parameters

***sub-ident-string***

Specifies a source name.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.11 I2-inner-vlan

### I2-inner-vlan

#### Syntax

**I2-inner-vlan** *q-tag*

**no I2-inner-vlan**

#### Context

**[Tree]** (config>subscr-mgmt>wlan-gw>tunnel-query I2-inner-vlan)

#### Full Context

configure subscriber-mgmt wlan-gw tunnel-query I2-inner-vlan

## Description

This command enables matching on a Layer 2 access point with a specified C-VLAN.

The **no** form of this command disables matching on a C-VLAN.

## Default

no l2-inner-vlan

## Parameters

### *q-tag*

Specifies the *q-tag* for the C-VLAN.

**Values** 0 to 4095

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.12 l2-ip

### l2-ip

## Syntax

[no] l2-ip

## Context

[\[Tree\]](#) (config>cflowd>collector>export-filter>family l2-ip)

## Full Context

```
configure cflowd collector export-filter family l2-ip
```

## Description

This command filters Layer 2 IP flow data from being sent to the associated collector.

The **no** form of this command removes the filter, allowing Layer 2 IP flow data to be sent to the associated collector.

## Default

no l2-ip

## Platforms

All

## 16.13 I2-outer-vlan

### I2-outer-vlan

#### Syntax

**I2-outer-vlan** *q-tag*

**no I2-outer-vlan**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>tunnel-query I2-outer-vlan)

#### Full Context

configure subscriber-mgmt wlan-gw tunnel-query I2-outer-vlan

#### Description

This command enables matching on a Layer 2 access point with a specified S-VLAN.

The **no** form of this command disables matching on an S-VLAN.

#### Default

no I2-outer-vlan

#### Parameters

***q-tag***

Specifies the *q-tag* for the S-VLAN.

**Values** 0 to 4095

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.14 I2-outside

### I2-outside

#### Syntax

**I2-outside**

**no I2-outside**

## Context

[\[Tree\]](#) (config>service>nat>firewall-policy l2-outside)

[\[Tree\]](#) (config>service>nat>nat-policy l2-outside)

## Full Context

configure service nat firewall-policy l2-outside

configure service nat nat-policy l2-outside

## Description

This command configures a NAT policy to be used with a Layer 2 outside service instead of a Layer 3 outside service. This command and the **pool** command are mutually exclusive.

## Default

no l2-outside

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat firewall-policy l2-outside

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat nat-policy l2-outside

## 16.15 l2-sap

### l2-sap

## Syntax

**l2-sap** *sap-id*

**no l2-sap**

## Context

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>tunnel-query l2-sap)

## Full Context

configure subscriber-mgmt wlan-gw tunnel-query l2-sap

## Description

This command enables matching on Layer 2 access points active on the specified SAP.

The **no** form of this command disables matching on the SAP.

**Default**

no l2-sap

**Parameters*****sap-id***

Specifies the SAP ID. For details on SAP ID parameter values, refer to section *Monitor CLI Commands* in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Basic System Configuration Guide*.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.16 l2-service

### l2-service

**Syntax**

**l2-service** *service-id*

**no l2-service**

**Context**

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range l2-service)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range l2-service)

**Full Context**

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range l2-service

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range l2-service

**Description**

This command specifies the VPLS service used for L2 wholesale. When such a service is configured no other configuration is allowed under the vlan-range.

The **no** form of this command removes the L2 wholesale service, this is only allowed if the l2-service node is shut down.

**Parameters*****service-id***

Specifies the VPLS service ID to use for Layer 2 wholesale.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.17 I2pt-termination

### I2pt-termination

#### Syntax

**I2pt-termination** [cdp] [dtp] [pagp] [stp] [udld] [vtp]

**no I2pt-termination**

#### Context

**[Tree]** (config>service>vpls>sap I2pt-termination)

**[Tree]** (config>service>template>vpls-sap-template I2pt-termination)

**[Tree]** (config>service>vpls>spoke-sdp I2pt-termination)

#### Full Context

configure service vpls sap I2pt-termination

configure service template vpls-sap-template I2pt-termination

configure service vpls spoke-sdp I2pt-termination

#### Description

This command enables Layer 2 Protocol Tunneling (L2PT) termination on a specified SAP or spoke-SDP. L2PT termination is supported only for STP BPDUs. PDUs of other protocols are discarded.

This feature can be enabled only if STP is disabled in the context of the specified VPLS service.

The **no** form of this command reverts to the default.

#### Default

no I2pt-termination

#### Parameters

##### cdp

Specifies the Cisco discovery protocol

##### dtp

Specifies the dynamic trunking protocol

##### pagp

Specifies the port aggregation protocol

##### stp

Specifies all spanning tree protocols: stp, rstp, mstp, pvst (default)

##### udld

Specifies unidirectional link detection

##### vtp

Specifies the virtual trunk protocol

## Platforms

All

## I2pt-termination

### Syntax

**I2pt-termination** [**cdp**] [**dtp**] [**pagp**] [**stp**] [**udld**] [**vtp**]

**no I2pt-termination**

### Context

[\[Tree\]](#) (config>service>pw-template I2pt-termination)

### Full Context

configure service pw-template I2pt-termination

### Description

This command enables Layer 2 Protocol Tunneling (L2PT) termination on a given SAP or spoke SDP. L2PT termination will be supported only for STP BPDUs. PDUs of other protocols will be discarded.

This feature can be enabled only if STP is disabled in the context of the given VPLS service.

### Default

no I2pt-termination

### Parameters

#### **cdp**

Specifies the Cisco discovery protocol.

#### **dtp**

Specifies the dynamic trunking protocol.

#### **pagp**

Specifies the port aggregation protocol.

#### **stp**

Specifies all spanning tree protocols: stp, rstp, mstp, pvst (default).

#### **udld**

Specifies unidirectional link detection.

#### **vtp**

Specifies the virtual trunk protocol.

l2tp

### Context

[\[Tree\]](#) (config>router l2tp)

### Full Context

configure router l2tp

### Description

Commands in this context configure L2TP parameters. L2TP extends the PPP model by allowing Layer 2 and PPP endpoints to reside on different devices interconnected by a packet-switched network.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## I2tp

### Syntax

[no] I2tp

### Context

**[Tree]** (debug>router>I2tp>group>packet I2tp)

**[Tree]** (debug>router I2tp)

**[Tree]** (debug>router>I2tp>assignment-id>packet I2tp)

**[Tree]** (debug>router>I2tp>packet I2tp)

**[Tree]** (debug>router>I2tp>peer>packet I2tp)

### Full Context

debug router I2tp group packet I2tp

debug router I2tp

debug router I2tp assignment-id packet I2tp

debug router I2tp packet I2tp

debug router I2tp peer packet I2tp

### Description

This command sets debugging for L2TP packets.

The **no** form of this command removes the settings of debugging for L2TP packet.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## I2tp

### Syntax

[no] I2tp

### Context

**[Tree]** (config>redundancy>multi-chassis>peer>sync I2tp)

### Full Context

configure redundancy multi-chassis peer sync I2tp

### Description

This command enables L2TP.

The **no** form of this command disables L2TP.

## Platforms

All

## l2tp

## Syntax

**l2tp** [**terminate-only**]

**no l2tp**

## Context

**[Tree]** (debug>service>id>ppp>event l2tp)

## Full Context

debug service id ppp event l2tp

## Description

This command enables PPP L2TP event debug.

## Parameters

**terminate-only**

Enables debug for local terminated PPP session.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## l2tp

## Syntax

**[no] l2tp**

## Context

**[Tree]** (config>subscr-mgmt>wlan-gw>tunnel-query>type l2tp)

## Full Context

configure subscriber-mgmt wlan-gw tunnel-query type l2tp

## Description

This command enables matching on L2TP tunnels.

The **no** form of this command disables matching on L2TP tunnels, unless no other tunnel type specifier is configured.

**Default**

no l2tp

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

**l2tp****Syntax**

[no] l2tp

**Context**

[\[Tree\]](#) (config>service>vprn l2tp)

**Full Context**

configure service vprn l2tp

**Description**

Commands in this context configure L2TP parameters. L2TP extends the PPP model by allowing Layer 2 and PPP endpoints to reside on different devices interconnected by a packet-switched network.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**l2tp****Syntax**

l2tp

**Context**

[\[Tree\]](#) (debug>oam>build-packet>packet>field-override>header l2tp)

[\[Tree\]](#) (config>test-oam>build-packet>header l2tp)

**Full Context**

debug oam build-packet packet field-override header l2tp

configure test-oam build-packet header l2tp

**Description**

This command causes the associated header to be defined as an L2TP header template and enables the context to define the L2TP parameters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 16.19 l2tp-accounting-policy

### l2tp-accounting-policy

#### Syntax

**l2tp-accounting-policy** *policy-name* [**create**]

**no l2tp-accounting-policy** *policy-name*

#### Context

[\[Tree\]](#) (config>aaa l2tp-accounting-policy)

#### Full Context

configure aaa l2tp-accounting-policy

#### Description

This command configures an L2TP accounting policy.

The **no** form of this command removes the *policy-name* from the configuration.

#### Parameters

##### *policy-name*

Specifies a policy name.

##### **create**

This keyword is required when first creating the configuration context. Once the context is created, it is possible to navigate into the context without the **create** keyword.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 16.20 l2tp-lns

### l2tp-lns

#### Syntax

**l2tp-lns** *max-nr-of-sessions*

**no l2tp-lns**

## Context

[\[Tree\]](#) (config>subscr-mgmt>sla-profile>session-limits l2tp-lns)

[\[Tree\]](#) (config>subscr-mgmt>sub-profile>session-limits l2tp-lns)

## Full Context

configure subscriber-mgmt sla-profile session-limits l2tp-lns

configure subscriber-mgmt sub-profile session-limits l2tp-lns

## Description

This command configures the maximum number of L2TP LNS sessions per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of L2TP LNS sessions limit.

## Parameters

### *max-nr-of-sessions*

Specifies the maximum number of L2TP LNS sessions.

**Values** 0 to 131071

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 16.21 l2tp-load-balancing

### l2tp-load-balancing

## Syntax

[no] l2tp-load-balancing

## Context

[\[Tree\]](#) (config>system>load-balancing l2tp-load-balancing)

## Full Context

configure system load-balancing l2tp-load-balancing

## Description

This command enables the inclusion of the L2TPv2 session ID into the load-balancing hash algorithm to induce more variation and better load distribution over available links and next-hops.

The **no** form of this command disables the inclusion of the session-id.

## Platforms

All

## 16.22 l2tp-lts

### l2tp-lts

#### Syntax

**l2tp-lts** *max-nr-of-sessions*

**no l2tp-lts**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>sub-profile>session-limits l2tp-lts)

[\[Tree\]](#) (config>subscr-mgmt>sla-profile>session-limits l2tp-lts)

#### Full Context

configure subscriber-mgmt sub-profile session-limits l2tp-lts

configure subscriber-mgmt sla-profile session-limits l2tp-lts

#### Description

This command configures the maximum number of L2TP LTS sessions per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of L2TP LTS sessions limit.

#### Parameters

***max-nr-of-sessions***

Specifies the maximum number of L2TP LTS sessions.

**Values** 0 to 131071

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 16.23 l2tp-overall

## I2tp-overall

### Syntax

**I2tp-overall** *max-nr-of-sessions*

**no I2tp-overall**

### Context

[\[Tree\]](#) (config>subscr-mgmt>sub-profile>session-limits I2tp-overall)

[\[Tree\]](#) (config>subscr-mgmt>sla-profile>session-limits I2tp-overall)

### Full Context

configure subscriber-mgmt sub-profile session-limits I2tp-overall

configure subscriber-mgmt sla-profile session-limits I2tp-overall

### Description

This command configures the maximum number of L2TP sessions per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of L2TP sessions limit.

### Parameters

#### *max-nr-of-sessions*

Specifies the maximum number of L2TP sessions.

**Values** 0 to 131071

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 16.24 I2tp-tunnel-id-range

## I2tp-tunnel-id-range

### Syntax

**I2tp-tunnel-id-range** *start I2tp-tunnel-id end I2tp-tunnel-id*

**no I2tp-tunnel-id-range**

### Context

[\[Tree\]](#) (config>redundancy>multi-chassis>peer>sync>track-srrp-instances>track-srrp I2tp-tunnel-id-range)

**Full Context**

configure redundancy multi-chassis peer sync track-srrp-instances track-srrp l2tp-tunnel-id-range

**Description**

This command sets the tunnel-id range that is used to allocate a new tunnel-id for a tunnel for which multi-chassis redundancy is configured to this MCS peer.

The **no** form of this command reverts to the default.

**Parameters****start l2tp-tunnel-id**

Specifies the start of the range of L2TP tunnel identifiers that can be allocated by L2TP on this system, to be synchronized with Multi Chassis Redundancy Synchronization (MCS).

**Values** 1 to 16383

**end l2tp-tunnel-id**

Specifies the end of the range of L2TP tunnel identifiers that can be allocated by L2TP on this system, to be synchronized with Multi Chassis Redundancy Synchronization (MCS).

**Values** 1 to 16383

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**16.25 l2tpv3****l2tpv3****Syntax**

**l2tpv3**

**Context**

**[Tree]** (config>router>l2tp l2tpv3)

**[Tree]** (config>router>l2tp>group l2tpv3)

**[Tree]** (config>service>vprn>l2tp l2tpv3)

**Full Context**

configure router l2tp l2tpv3

```
configure service vprn l2tp group tunnel l2tpv3
configure router l2tp group tunnel l2tpv3
configure service vprn l2tp group l2tpv3
configure router l2tp group l2tpv3
configure service vprn l2tp l2tpv3
```

### Description

Commands in this context configure L2TPv3 parameters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## l2tpv3

### Syntax

l2tpv3

### Context

[\[Tree\]](#) (config>service>epipe>spoke-sdp>ingress l2tpv3)

[\[Tree\]](#) (config>service>epipe>spoke-sdp>egress l2tpv3)

### Full Context

```
configure service epipe spoke-sdp ingress l2tpv3
```

```
configure service epipe spoke-sdp egress l2tpv3
```

### Description

Commands in this context configure L2TPv3 spoke SDPs for Epipe services.

### Platforms

All

## l2tpv3

### Syntax

l2tpv3

### Context

[\[Tree\]](#) (config>mirror>mirror-dest>spoke-sdp>ingress l2tpv3)

[\[Tree\]](#) (config>mirror>mirror-dest>spoke-sdp>egress l2tpv3)

[\[Tree\]](#) (config>mirror>mirror-dest>remote-src>spoke-sdp>ingress l2tpv3)

### Full Context

```
configure mirror mirror-dest spoke-sdp ingress l2tpv3
configure mirror mirror-dest spoke-sdp egress l2tpv3
configure mirror mirror-dest remote-source spoke-sdp ingress l2tpv3
```

### Description

Commands in this context configure an RX/TX cookie for L2TPv3 egress spoke SDP or for the remote-source ingress spoke SDP.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure mirror mirror-dest spoke-sdp ingress l2tpv3

All

- configure mirror mirror-dest spoke-sdp egress l2tpv3
- configure mirror mirror-dest remote-source spoke-sdp ingress l2tpv3

## 16.26 l2tpv3-session

### l2tpv3-session

#### Syntax

```
l2tpv3-session [create]
no l2tpv3-session
```

#### Context

**[Tree]** (config>service>vpls>sap l2tpv3-session)  
**[Tree]** (config>service>epipe>sap l2tpv3-session)

#### Full Context

```
configure service vpls sap l2tpv3-session
configure service epipe sap l2tpv3-session
```

#### Description

This command creates the configuration context to define the L2TPv3 tunnel parameters.  
The **no** form of this command deletes the L2TPv3 configuration context.

#### Parameters

##### create

This keyword is mandatory while creating a L2TPv3 session.

## Platforms

All

## 16.27 l2w

### l2w

#### Syntax

[no] l2w

#### Context

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>tunnel-query>ue-state l2w)

#### Full Context

configure subscriber-mgmt wlan-gw tunnel-query ue-state l2w

#### Description

This command enables matching on tunnels with L2W UEs.

The **no** form of this command disables matching on L2W UEs, unless UE state matching is disabled altogether.

#### Default

no l2w

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.28 l3-ring

### l3-ring

#### Syntax

l3-ring *name* [create]

no l3-ring *name*

#### Context

[\[Tree\]](#) (config>redundancy>mc>peer>mcr l3-ring)

**Full Context**

configure redundancy multi-chassis peer mc-ring l3-ring

**Description**

This command configures a Layer 3 multi-chassis ring.

The **no** form of this command reverts to the default.

**Platforms**

All

## 16.29 I4-load-balancing

### I4-load-balancing

**Syntax**

[no] I4-load-balancing

**Context**

[\[Tree\]](#) (config>system>load-balancing I4-load-balancing)

**Full Context**

configure system load-balancing I4-load-balancing

**Description**

This command configures system-wide Layer 4 load balancing. The configuration at the system level can enable or disable load balancing based on Layer 4 fields. If enabled, the Layer 4 source and destination port fields will be included in hashing calculation for TCP/UDP packets.

The hashing algorithm addresses finer spraying granularity where many hosts are connected to the network.

To address more efficient traffic distribution between network links (forming a LAG group), a hashing algorithm extension takes into account L4 information (that is, src/dst L4-protocol port).

The hashing index can be calculated according to the following algorithm:

**Example:**

```
- If [(TCP or UDP traffic) & enabled]
 - hash (TCP/UDP ports, IP addresses)
- else if (IP traffic)
 - hash (IP addresses)
- else
 - hash (MAC addresses)
- endif
```

This algorithm will be used in all cases where IP information in per-packet hashing is included (refer to "Traffic Load Balancing Options" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Interface Configuration Guide*). However, the Layer 4 information (TCP/UDP ports) will not be used for fragmented packets.

**Default**

no l4-load-balancing

**Platforms**

All

## 16.30 l4-src-port

### l4-src-port

**Syntax**

**l4-src-port** *port* [*mask*]

**no l4-src-port**

**Context**

[\[Tree\]](#) (config>system>security>mgmt-access-filter>ip-filter>entry l4-src-port)

[\[Tree\]](#) (config>system>security>mgmt-access-filter>ipv6-filter>entry l4-src-port)

**Full Context**

configure system security management-access-filter ip-filter entry l4-src-port

configure system security management-access-filter ipv6-filter entry l4-src-port

**Description**

This command configures a destination TCP or UDP port number or port range for a management access filter match criterion.

The **no** form of this command reverts to the default values.

**Default**

no l4-src-port

**Parameters**

*port*

Specifies the destination TCP or UDP port number as a match criterion.

**Values** 1 to 65535

**Default** 6 (exact match)

**mask**

Specifies the mask used to select a range of source port numbers. [Table 59: Format Styles to Configure Mask](#) lists the format styles to configure the 16-bit mask.

Table 59: Format Styles to Configure Mask

| Format Style | Format Syntax      | Example            |
|--------------|--------------------|--------------------|
| Decimal      | DDDDD              | 63488              |
| Hexadecimal  | 0xHHHH             | 0xF800             |
| Binary       | 0bBBBBBBBBBBBBBBBB | 0b1111100000000000 |

To select a range from 1024 up to 2047, specify 1024 and 0xFC00 for port and mask respectively.

**Values** 1 to 65535 (decimal)

**Default** 65535 (exact match)

**Platforms**

All

**16.31 label****label****Syntax**

label [detail]

no label

**Context**

[\[Tree\]](#) (debug>router>ldp>peer>packet label)

**Full Context**

debug router ldp peer packet label

**Description**

This command enables debugging for LDP Label packets.

The **no** form of the command disables the debugging output.

**Parameters**

*detail*

Displays detailed information.

## Platforms

All

label

## Syntax

**label** *label*

**no label**

## Context

[\[Tree\]](#) (config>test-oam>build-packet>header>mpls label)

[\[Tree\]](#) (debug>oam>build-packet>packet>field-override>header>mpls label)

## Full Context

configure test-oam build-packet header mpls label

debug oam build-packet packet field-override header mpls label

## Description

This command defines the MPLS value to be used in the MPLS header.

The **no** form of this command removes the label value.

## Default

label 0

## Parameters

*label*

Specifies the MPLS label to be used in the MPLS header.

**Values** 0 to 1048575

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

label

## Syntax

**[no]** **label** *label*

**Context**

[\[Tree\]](#) (debug>router>rib-api label)

**Full Context**

debug router rib-api label

**Description**

This command enables debugging for the specified RIB-API label.

**Parameters*****label***

Specifies the label of the specified RIB-API entry.

**Values** 32 to 1048575

**Platforms**

All

## 16.32 label-allocation

label-allocation

**Syntax**

label-allocation

**Context**

[\[Tree\]](#) (config>router>bgp label-allocation)

**Full Context**

configure router bgp label-allocation

**Description**

This commands enables the context to configure the allocation of MPLS labels to specific BGP routes.

**Platforms**

All

## 16.33 label-block

## label-block

### Syntax

**label-block** *name*

**no label-block**

### Context

[\[Tree\]](#) (conf>router>segment-routing>srv6>loc>static-function label-block)

### Full Context

configure router segment-routing segment-routing-v6 locator static-function label-block

### Description

This command configures a reserved label block name to be used in the termination of services on the SRv6 FPE.

Static values of the service SID function are mapped to label values drawn from this reserved label block. A static function value of 1 maps to the first label in this label block and so on.

Dynamic values of service SID function are mapped to label values drawn from the dynamic label range.

An End or End.X function does not map to a label value.

The **no** form of this command removes the label block name from the configuration.

### Default

no label-block

### Parameters

*name*

Specifies a reserved label block name, up to 64 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## label-block

### Syntax

**label-block** *name*

**no label-block**

### Context

[\[Tree\]](#) (config>router>segment-routing>srv6>locator label-block)

### Full Context

configure router segment-routing segment-routing-v6 locator label-block

## Description

This command configures a reserved label block name for the termination of services on the SRv6 FPE.

When an operator configures this block, the router maps both static and dynamic values of the service SID functions to label values drawn from the reserved label block. This reserved block and the block defined under **static-function** are mutually exclusive. The configuration of this block does not constrain the configuration of a particular function length.

An End or End.X function does not map to a label value.

The **no** form of this command removes the label block name from the configuration.

## Default

no label-block

## Parameters

*name*

Specifies a reserved label block name, up to 64 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## label-block

## Syntax

**label-block** *name*

**no label-block**

## Context

[\[Tree\]](#) (conf>router>sr>srv6>ms>block label-block)

## Full Context

configure router segment-routing segment-routing-v6 micro-segment block label-block

## Description

This command associates a pre-configured reserved label block with the micro-SID block.

The **no** form of this command disassociates the reserved label block.

## Default

no label-block

## Parameters

*name*

Specifies a reserved label block name, up to 64 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 16.34 label-ipv4

### label-ipv4

#### Syntax

**label-ipv4** *max-paths* [**ebgp** *ebgp-max-paths*] [**ibgp** *ibgp-max-paths*] [**restrict** {**same-neighbor-as** | **exact-as-path**}] [**unequal-cost**]

**no** label-ipv4

#### Context

[\[Tree\]](#) (config>service>vprn>bgp>multi-path label-ipv4)

#### Full Context

configure service vprn bgp multi-path label-ipv4

#### Description

This command sets ECMP multipath parameters that apply only to the label unicast IPv4 address family.

When multipath is enabled, traffic to the destination is load-shared across a set of paths (BGP routes) that the BGP decision process considers equal to the best path. The distribution of traffic over the multiple paths may or may not be equal. The distribution is based on weights derived from the Link Bandwidth Extended Community.

For more information about the criteria a non-best route must meet to qualify as a multipath, see "BGP route installation in the route table" in the *7450 ESS 7750 SR 7950 XRS VSR Unicast Routing Protocols User Guide*.

The **no** form of this command removes label-IPv4-specific overrides.

#### Default

no label-ipv4

#### Parameters

##### *max-paths*

Specifies the maximum number of multipaths per prefix or NLRI. Setting this value to 1 disables multipath. This limit only applies if neither the *ebgp-max-paths* limit nor the *ibgp-max-paths* limit apply.

**Values** 1 to 64

##### *ebgp-max-paths*

Specifies the maximum number of multipaths per prefix or NLRI when the best path is an EBGp learned route. If the **ebgp** option is configured, this value overrides the *max-*

*paths* limit. If the best path is an EBGP learned route and this value is set to 1, multipath is disabled.

**Values** 1 to 64

### ***ibgp-max-paths***

Specifies the maximum number of multipaths per prefix or NLRI when the best path is an IBGP learned route. If the **ibgp** option is configured, this value overrides the *max-paths* limit. If the best path is an IBGP learned route and this value is set to 1, multipath is disabled.

**Values** 1 to 64

### **restrict same-neighbor-as**

Specifies that the non-best path must have the same neighbor AS in its AS path as the best path.

### **restrict exact-as-path-as**

Specifies that the non-best path must have the same AS path as the best path.

### **unequal-cost**

Instructs BGP to ignore differences in the next-hop cost only when determining eligible multipaths.

## **Platforms**

All

## **label-ipv4**

## **Syntax**

**label-ipv4 send** *send-limit*

**label-ipv4 send** *send-limit* **receive** [none]

**no label-ipv4**

## **Context**

**[Tree]** (config>router>bgp>group>neighbor>add-paths label-ipv4)

**[Tree]** (config>router>bgp>group>add-paths label-ipv4)

**[Tree]** (config>router>bgp>add-paths label-ipv4)

## **Full Context**

configure router bgp group neighbor add-paths label-ipv4

configure router bgp group add-paths label-ipv4

configure router bgp add-paths label-ipv4

## Description

This command configures the add-paths capability for labeled-unicast IPv4 routes. By default, add-paths is not enabled for labeled-unicast IPv4 routes.

The maximum number of labeled-unicast paths per IPv4 prefix to send is the configured *send-limit*, which is a mandatory parameter. The capability to receive multiple labeled-unicast paths per prefix from a peer is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command, receive capability is enabled by default.

The **no** form of this command disables add-paths support for labeled-unicast IPv4 routes, causing sessions established using add-paths for labeled-unicast IPv4 to go down and come back up without the add-paths capability.

## Default

no label-ipv4

## Parameters

### *send-limit*

Specifies the maximum number of paths per labeled-unicast IPv4 prefix that are allowed to be advertised to add-paths peers. (The actual number of advertised routes may be less.) If the value is none, the router does not negotiate the send capability with respect to label-IPv4 AFI/SAFI. If the value is **multipaths**, then BGP advertises all the used BGP multipaths for each IPv4 NLRI if the peer has signaled support to receive multiple add paths.

**Values** 1 to 16, none, multipaths

### **receive**

Specifies the router negotiates to receive multiple labeled-unicast routes per IPv4 prefix.

### **none**

Specifies that the router does not negotiate to receive multiple labeled-unicast routes per IPv4 prefix.

## Platforms

All

## label-ipv4

## Syntax

**label-ipv4** *max-paths* [**ebgp** *ebgp-max-paths*] [**ibgp** *ibgp-max-paths*] [**restrict** {**same-neighbor-as** | **exact-as-path**}] [**unequal-cost**]

**no label-ipv4**

## Context

**[Tree]** (config>router>bgp>multi-path label-ipv4)

## Full Context

```
configure router bgp multi-path label-ipv4
```

## Description

This command sets ECMP multipath parameters that apply only to the label IPv4 unicast address family. These settings override the values set by the **maximum-paths** command.

When multipath is enabled, traffic to the destination is load-shared across a set of paths (BGP routes) that the BGP decision process considers equal to the best path. The actual distribution of traffic over the multiple paths may be equal or unequal (that is, based on weights derived from the Link Bandwidth Extended Community).

The **no** form of this command removes label-IPv4-specific overrides.

## Default

```
no label-ipv4
```

## Parameters

### *max-paths*

Specifies the maximum number of multipaths per prefix/NLRI if *ebgp-max-paths* or *ibgp-max-paths* does not apply.

**Values** 1 to 64

### *ebgp-max-paths*

Specifies the maximum number of multipaths per prefix or NLRI when the best path is an EBGp learned route.

**Values** 1 to 64

### *ibgp-max-paths*

Specifies the maximum number of multipaths per prefix or NLRI when the best path is an IBGP learned route.

**Values** 1 to 64

### **restrict same-neighbor-as**

Specifies that the non-best path must have the same neighbor AS in its AS path as the best path.

### **restrict exact-as-path**

Specifies that the non-best path must have the same AS path as the best path.

### **unequal-cost**

Instructs BGP to ignore differences in the next-hop cost only when determining eligible multipaths.

## Platforms

All

## 16.35 label-ipv6

### label-ipv6

#### Syntax

**label-ipv6** *max-paths* [**ebgp** *ebgp-max-paths*] [**ibgp** *ibgp-max-paths*] [**restrict** {**same-neighbor-as** | **exact-as-path**}] [**unequal-cost**]

**no label-ipv6**

#### Context

[\[Tree\]](#) (config>service>vprn>bgp>multi-path label-ipv6)

#### Full Context

configure service vprn bgp multi-path label-ipv6

#### Description

This command sets ECMP multipath parameters that apply only to the label unicast IPv6 address family.

When multipath is enabled, traffic to the destination is load-shared across a set of paths (BGP routes) that the BGP decision process considers equal to the best path. The distribution of traffic over the multiple paths may or may not be equal. The distribution is based on weights derived from the Link Bandwidth Extended Community.

For more information about the criteria a non-best route must meet to qualify as a multipath, see "BGP route installation in the route table" in the *7450 ESS 7750 SR 7950 XRS VSR Unicast Routing Protocols User Guide*.

The **no** form of this command removes label-IPv6-specific overrides.

#### Default

no label-ipv6

#### Parameters

##### *max-paths*

Specifies the maximum number of multipaths per prefix or NLRI. Setting this value to 1 disables multipath. This limit only applies if neither the *ebgp-max-paths* limit nor the *ibgp-max-paths* limit apply.

**Values** 1 to 64

##### *ebgp-max-paths*

Specifies the maximum number of multipaths per prefix or NLRI when the best path is an EBGp learned route. If the **ebgp** option is configured, this value overrides the *max-paths* limit. If the best path is an EBGp learned route and this value is set to 1, multipath is disabled.

**Values** 1 to 64

***ibgp-max-paths***

Specifies the maximum number of multipaths per prefix or NLRI when the best path is an IBGP learned route. If the **ibgp** option is configured, this value overrides the *max-paths* limit. If the best path is an IBGP learned route and this value is set to 1, multipath is disabled.

**Values** 1 to 64

**restrict same-neighbor-as**

Specifies that the non-best path must have the same neighbor AS in its AS path as the best path.

**restrict exact-as-path-as**

Specifies that the non-best path must have the same AS path as the best path.

**unequal-cost**

Instructs BGP to ignore differences in the next-hop cost only when determining eligible multipaths.

**Platforms**

All

**label-ipv6****Syntax**

**label-ipv6 send** *send-limit*

**label-ipv6 send** *send-limit receive* [none]

**no label-ipv6**

**[Tree]** (config>router>bgp>group>add-paths label-ipv6)

**[Tree]** (config>router>bgp>add-paths label-ipv6)

**Full Context**

configure router bgp group neighbor add-paths label-ipv6

configure router bgp group add-paths label-ipv6

configure router bgp add-paths label-ipv6

**Description**

This command configures the add-paths capability for labeled-unicast IPv6 routes. By default, add-paths is not enabled for labeled-unicast IPv6 routes.

The maximum number of labeled-unicast paths per IPv6 prefix to send is the configured *send-limit*, which is a mandatory parameter. The capability to receive multiple labeled-unicast paths per prefix from a peer

is configurable using the **receive** keyword, which is optional. If the **receive** keyword is not included in the command, receive capability is enabled by default.

The **no** form of this command disables add-paths support for labeled-unicast IPv6 routes, causing sessions established using add-paths for labeled-unicast IPv6 to go down and come back up without the add-paths capability.

## Default

no label-ipv6

## Parameters

### *send-limit*

Specifies the maximum number of paths per labeled-unicast IPv6 prefix that are allowed to be advertised to add-paths peers. (The actual number of advertised routes may be less.) If the value is none, the router does not negotiate the send capability with respect to label-IPv6 AFI/SAFI. If the value is **multipaths**, then BGP advertises all the used BGP multipaths for each IPv6 NLRI if the peer has signaled support to receive multiple add paths.

**Values** 1 to 16, none, multipaths

### **receive**

Specifies that the router negotiates to receive multiple labeled-unicast routes per IPv6 prefix.

### **none**

Specifies that the router does not negotiate to receive multiple labeled-unicast routes per IPv6 prefix.

## Platforms

All

## label-ipv6

## Syntax

**label-ipv6** *max-paths* [**ebgp** *ebgp-max-paths*] [**ibgp** *ibgp-max-paths*] [**restrict** {**same-neighbor-as** | **exact-as-path**}] [**unequal-cost**]

**no label-ipv6**

## Context

[\[Tree\]](#) (config>router>bgp>multi-path label-ipv6)

## Full Context

configure router bgp multi-path label-ipv6

## Description

This command sets ECMP multipath parameters that apply only to the label unicast IPv6 address family. These settings override the values set by the **maximum-paths** command.

When multipath is enabled, traffic to the destination is load-shared across a set of paths (BGP routes) that the BGP decision process considers equal to the best path. The actual distribution of traffic over the multiple paths may be equal or unequal (that is, based on weights derived from the Link Bandwidth Extended Community).

The **no** form of this command removes label-IPv6-specific overrides.

## Default

no label-ipv6

## Parameters

### *max-paths*

Specifies the maximum number of multipaths per prefix/NLRI if *ebgp-max-paths* or *ibgp-max-paths* does not apply.

**Values** 1 to 64

### *ebgp-max-paths*

Specifies the maximum number of multipaths per prefix or NLRI when the best path is an EBGp learned route.

**Values** 1 to 64

### *ibgp-max-paths*

Specifies the maximum number of multipaths per prefix or NLRI when the best path is an IBGP learned route.

**Values** 1 to 64

### **restrict same-neighbor-as**

Specifies that the non-best path must have the same neighbor AS in its AS path as the best path.

### **restrict exact-as-path**

Specifies that the non-best path must have the same AS path as the best path.

### **unequal-cost**

Instructs BGP to ignore differences in the next-hop cost only when determining eligible multipaths.

## 16.36 label-ipv6-explicit-null

## label-ipv6-explicit-null

### Syntax

**[no] label-ipv6-explicit-null**

## Context

[\[Tree\]](#) (config>router>bgp>next-hop-res>lbl-routes>use-bgp-routes label-ipv6-explicit-null)

## Full Context

configure router bgp next-hop-resolution labeled-routes use-bgp-routes label-ipv6-explicit-null

## Description

This command allows a labelled IPv6 route with the explicit-null label to be resolved by other labelled IPv6 routes with the explicit-null label, and also by unlabeled IPv4 routes and unlabeled IPv6 routes that are resolved by static routes, interface routes, or tunnels. Up to four levels of recursive resolution are supported when the top route is a labelled IPv6 route with an explicit-null label.

Regardless of setting, a labelled IPv6 route with a regular label (other than explicit-null) is never resolved by other labelled IPv6 routes.

The **no** form of this command disables the label-ipv6-explicit-null functionality. When disabled, a labeled IPv6 route cannot be resolved by other labeled IPv6 routes.

## Default

no label-ipv6-explicit-null

## Platforms

All

## 16.37 label-map

### label-map

## Syntax

**[no]** label-map *in-label*

## Context

[\[Tree\]](#) (config>router>mpls>interface label-map)

## Full Context

configure router mpls interface label-map

## Description

This command is used on transit routers when a static LSP is defined. The static LSP on the ingress router is initiated using the **config router mpls static-lsp** *lsp-name* command. An *in-label* can be associated with either a **pop** or a **swap** action, but not both. If both actions are specified, the last action specified takes effect.

The **no** form of this command deletes the static LSP configuration associated with the *in-label*.

**Parameters*****in-label***

Specifies the incoming MPLS label on which to match.

**Values** 32 to 1023

**Platforms**

All

## 16.38 label-mode

### label-mode

**Syntax**

**label-mode** {vrf | next-hop}

**no label-mode**

**Context**

[\[Tree\]](#) (config>service>vprn label-mode)

**Full Context**

configure service vprn label-mode

**Description**

This command controls the method by which service labels are allocated to routes exported by the VPRN as BGP-VPN routes. The **vrf** option selects service label per VRF mode while the **next-hop** option selects service label per next-hop mode.

The **no** form of this command sets the mode to the default mode of service label per VRF.

**Default**

no label-mode

**Parameters****vrf**

Selects service label per VRF mode.

**next-hop**

Selects service label per next-hop mode.

**Platforms**

All

### label-preference

#### Syntax

**label-preference** *value*

**no label-preference**

#### Context

**[Tree]** (config>service>vprn>bgp>group label-preference)

**[Tree]** (config>service>vprn>bgp>group>neighbor label-preference)

**[Tree]** (config>service>vprn>bgp label-preference)

#### Full Context

configure service vprn bgp group label-preference

configure service vprn bgp group neighbor label-preference

configure service vprn bgp label-preference

#### Description

This command configures the route preference for routes learned from labeled-unicast peers.

This command can be configured at three levels:

- Global level — applies to all peers
- Group level — applies to all peers in the peer-group
- Neighbor level — applies only to the specified peer

The most specific value is used.

The lower the preference, the higher the chance of the route being the active route.

The **no** form of this command used at the global level reverts to the default *value* of 170.

The **no** form of this command used at the group level reverts to the *value* defined at the global level.

The **no** form of this command used at the neighbor level reverts to the *value* defined at the group level.

#### Default

no label-preference

#### Parameters

*value*

Specifies the route preference value.

**Values** 1 to 255

## Platforms

All

## label-preference

configure router bgp group label-preference

### Description

This command configures the route preference for routes learned from labeled-unicast peers.

This command can be configured at three levels:

- Global level — applies to all peers
- Group level — applies to all peers in the peer-group
- Neighbor level — applies only to the specified peer

The most specific value is used.

The lower the preference, the higher the chance of the route being the active route.

The **no** form of this command used at the global level reverts to the default *value* of 170.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

### Default

no label-preference

### Parameters

***value***

Specifies the route preference value.

**Values** 1 to 255

## Platforms

All

## 16.40 label-route-local

### label-route-local

#### Syntax

```
label-route-local [{none | all}]
```

#### Context

[\[Tree\]](#) (config>router>ttd-propagate label-route-local)

#### Full Context

```
configure router ttl-propagate label-route-local
```

#### Description

This command configures the TTL propagation for locally generated packets which are forwarded over a BGP label route in the Global Routing Table (GRT) context.

For IPv4 and IPv6 packets forwarded using an RFC 8277 label route in the global routing instance, including 6PE, the all value of the command enables TTL propagation from the IP header into all labels in the transport label stack. The none value reverts to the default mode which disables TTL propagation from the IP header to the labels in the transport label stack. This command does not have a no version.

The TTL of the IP packet is always propagated into the RFC 8277 label itself, and this command only controls the propagation into the transport labels, for example, labels of the RSVP or LDP LSP to which the BGP label route resolves and which are pushed on top of the BGP label.

If the BGP peer advertised the implicit-null label value for the BGP label route, the TTL propagation will not follow the configuration described, but will follow the configuration to which the BGP label route resolves:

RSVP LSP shortcut:

- configure router mpls shortcut-local-ttl-propagate

LDP LSP shortcut:

- configure router ldp shortcut-local-ttl-propagate

This feature does not impact packets forwarded over BGP shortcuts. The ingress LER operates in uniform mode by default and can be changed into pipe mode using the configuration of TTL propagation for RSVP or LDP LSP shortcut listed.

#### Default

label-route-local none

#### Parameters

none

Specifies that the TTL of the IP packet is not propagated into the transport label stack.

**all**

Specifies that the TTL of the IP packet is propagated into all labels of the transport label stack.

**Platforms**

All

## 16.41 label-route-transit

### label-route-transit

**Syntax**

**label-route-transit** [{none | all}]

**Context**

[\[Tree\]](#) (config>router>tll-propagate label-route-transit)

**Full Context**

```
configure router tll-propagate label-route-transit
```

**Description**

This command configures the TTL propagation for transit packets which are forwarded over a BGP label route in the Global Routing Table (GRT) context.

For IPv4 and IPv6 packets forwarded using a RFC 8277 label route in the global routing instance, including 6PE, the all value of the command enables TTL propagation from the IP header into all labels in the transport label stack. The none value reverts to the default mode which disables TTL propagation from the IP header to the labels in the transport label stack. This command does not have a no version.

The TTL of the IP packet is always propagated into the RFC 8277 label itself, and this command only controls the propagation into the transport labels, for example, labels of the RSVP or LDP LSP to which the BGP label route resolves and which are pushed on top of the BGP label.

If the BGP peer advertised the implicit-null label value for the BGP label route, the TTL propagation will not follow the configuration described, but will follow the configuration to which the BGP label route resolves.

RSVP LSP shortcut:

- configure router mpls shortcut-transit-ttl-propagate

LDP LSP shortcut:

- configure router ldp shortcut-transit-ttl-propagate

This feature does not impact packets forwarded over BGP shortcuts. The ingress LER operates in uniform mode by default and can be changed into pipe mode using the configuration of TTL propagation for the listed RSVP or LDP LSP shortcut.

**Default**

label-route-transit none

**Parameters****none**

Specifies that the TTL of the IP packet is not propagated into the transport label stack.

**all**

Specifies that the TTL of the IP packet is propagated into all labels of the transport label stack.

**Platforms**

All

## 16.42 label-stack-reduction

### label-stack-reduction

**Syntax**

[no] label-stack-reduction

**Context**

[\[Tree\]](#) (config>router>mpls>lsp label-stack-reduction)

[\[Tree\]](#) (config>router>mpls>lsp-template label-stack-reduction)

**Full Context**

configure router mpls lsp label-stack-reduction

configure router mpls lsp-template label-stack-reduction

**Description**

This command enables the label stack size reduction for a SR-TE LSP or SR-TE LSP template.

At a high level, the label stack reduction algorithm attempts to replace a segment of a computed SR-TE LSP path with the farthest node SID on that path that results in using ECMP paths with links which still comply to the TE constraints of the LSP path.

The **no** form of this command returns the command to its default value.

**Default**

no label-stack-reduction

**Platforms**

All

## 16.43 label-stack-statistics-count

### label-stack-statistics-count

#### Syntax

**label-stack-statistics-count** *label-stack-statistics-count*

**no label-stack-statistics-count**

#### Context

**[Tree]** (config>system>ip>mpls label-stack-statistics-count)

#### Full Context

configure system ip mpls label-stack-statistics-count

#### Description

This command enables the system to collect traffic statistics on the specified number of labels of the MPLS label stack.

The **no** form of this command disables the collecting of traffic statistics.

#### Default

label-stack-statistics-count 1

#### Parameters

***label-stack-statistics-count***

Specifies the number of labels on which the system can collect statistics.

**Values** 1, 2

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 16.44 label-withdrawal-delay

### label-withdrawal-delay

#### Syntax

**label-withdrawal-delay** *seconds*

**no label-withdrawal-delay**

## Context

[\[Tree\]](#) (config>router>ldp label-withdrawal-delay)

## Full Context

configure router ldp label-withdrawal-delay

## Description

This command specifies configures the time interval (in s), LDP will delay for the withdrawal of FEC-label binding it distributed to its neighbors when FEC is de-activated. When the timer expires, LDP then sends a label withdrawal for the FEC to all its neighbors. This is applicable only to LDP IPv4 prefix FECs and is not applicable to pseudowires (service FECs).

When there is an upper layer (user of LDP) which depends of LDP control plane for failover detection then label withdrawal delay and tunnel-down-damp-time options must be set to 0.

An example is PW redundancy where the primary PW doesn't have its own fast failover detection mechanism and the node depends on LDP tunnel down event to activate the standby PW.

## Default

no label-withdrawal-delay

## Parameters

### *seconds*

Specifies the time that LDP delays the withdrawal of FEC-label binding it distributed to its neighbors when FEC is de-activated.

**Values** 3 to 120

## Platforms

All

## 16.45 labeled-routes

### labeled-routes

## Syntax

labeled-routes

configure subscriber-mgmt sla-profile host-limits lac-overall

## Description

This command configures the maximum number of L2TP LAC hosts per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of L2TP LAC hosts limit.

## Parameters

### *max-nr-of-hosts*

Specifies the maximum number of L2TP LAC hosts.

### Note:

The operational maximum value may be smaller due to equipped hardware dependencies.

**Values** 0 to 131071

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 16.47 lacp

lacp

### Syntax

**lacp** [**mode**] [**administrative-key** *admin-key*] [**system-id** *system-id*] [**system-priority** *priority*]

**no lacp**

### Context

[\[Tree\]](#) (config>lag lacp)

### Full Context

configure lag lacp

### Description

This command enables the LACP protocol. Per the IEEE 802.1ax standard, the Link Aggregation Control Protocol (LACP) provides a standardized means for exchanging information between Partner Systems on a link to allow their Link Aggregation Control instances to reach agreement on the identity of the Link Aggregation Group to which the link belongs, move the link to that Link Aggregation Group, and enable its transmission and reception functions in an orderly manner.

If any of the parameters are omitted, the existing configuration is preserved. The default parameter values are used if a parameter is never explicitly configured.

### Default

no lacp

### Parameters

#### mode

Specifies the mode in which LACP will operate.

**Values** **passive** — Starts transmitting LACP packets only after receiving packets.

**active** — Initiates the transmission of LACP packets.

#### admin-key

Specifies an administrative key value to identify the channel group on each port configured to use LACP. A random key is assigned by default if a value is not specified when using classic CLI only.

**Values** 1 to 65535

#### system-id

Specifies the 48-bit system ID in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff, where aa, bb, cc, dd, ee and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

**Values** 1 to 65535

**Default** 32768

***priority***

Specifies the system priority.

**Values** 0 to 65535

**Default** 32768

**Platforms**

All

[\[Tree\]](#) (config>lag lacp-mux-control)

**Full Context**

configure lag lacp-mux-control

**Description**

This command configures the type of multiplexing machine control to be used in a LAG with LACP in active/passive modes.

The **no** form of this command disables multiplexing machine control.

**Default**

lacp-mux-control coupled

**Parameters**

**coupled**

Specifies that TX and RX activate together.

**independent**

Specifies that RX activates independent of TX.

**Platforms**

All

**16.49 lacp-system-priority****lacp-system-priority****Syntax****lacp-system-priority** *lacp-system-priority***no lacp-system-priority****Context**[\[Tree\]](#) (config>system lacp-system-priority)**Full Context**

configure system lacp-system-priority

**Description**

This command configures the Link Aggregation Control Protocol (LACP) system priority on aggregated Ethernet interfaces. LACP allows the operator to aggregate multiple physical interfaces to form one logical interface.

**Default**

lacp-system-priority 32768

**Parameters*****lacp-system-priority***

Specifies the LACP system priority.

**Values** 1 to 65535**Platforms**

All

**16.50 lacp-tunnel**

## lacp-tunnel

### Syntax

[no] lacp-tunnel

### Context

[\[Tree\]](#) (config>port>ethernet lacp-tunnel)

### Full Context

configure port ethernet lacp-tunnel

### Description

This command enables LACP packet tunneling for the Ethernet port. When tunneling is enabled, the port does not process any LACP packets but tunnels them instead. The port cannot be added as a member to a LAG group.

In this context, the **lacp-tunnel** command is supported for Epipe and VPLS services only.

The **no** form of this command disables LACP packet tunneling for the Ethernet port.

### Default

no lacp-tunnel

### Platforms

All

## 16.51 lacp-xmit-interval

## lacp-xmit-interval

### Syntax

lacp-xmit-interval {slow | fast}

no lacp-xmit-interval

### Context

[\[Tree\]](#) (config>lag lacp-xmit-interval)

### Full Context

configure lag lacp-xmit-interval

### Description

This command specifies the interval signaled to the peer and tells the peer at which rate it should transmit.

**Default**

lacp-xmit-interval fast

**Parameters****slow**

Transmits packets every 30 seconds.

**fast**

Transmits packets every second.

**Platforms**

All

## 16.52 lacp-xmit-stdby

lacp-xmit-stdby

**Syntax**

[no] lacp-xmit-stdby

**Context**

[\[Tree\]](#) (config>lag lacp-xmit-stdby)

**Full Context**

configure lag lacp-xmit-stdby

**Description**

This command enables LACP message transmission on standby links.

The **no** form of this command disables LACP message transmission. This command should be disabled for compatibility when using active/standby groups. This forces a timeout of the standby links by the peer. Use the **no** form if the peer does not implement the correct behavior regarding the lacp sync bit.

**Default**

lacp-xmit-stdby

**Platforms**

All

## 16.53 lag

## lag

### Syntax

**lag** *lag-id* **lACP-key** *admin-key* **system-id** *system-id* [**remote-lag** *remote-lag-id*] **system-priority** *system-priority* **source-bmac-lsb** **use-lACP-key**

**lag** *lag-id* **lACP-key** *admin-key* **system-id** *system-id* [**remote-lag** *remote-lag-id*] **system-priority** *system-priority* **source-bmac-lsb** *MAC-Lsb*

**lag** *lag-id* **lACP-key** *admin-key* **system-id** *system-id* [**remote-lag** *remote-lag-id*] **system-priority** *system-priority*

**lag** *lag-id* [**remote-lag** *remote-lag-id*]

**no lag** *lag-id*

### Context

[\[Tree\]](#) (config>redundancy>multi-chassis>peer>mc-lag lag)

### Full Context

configure redundancy multi-chassis peer mc-lag lag

### Description

This command defines a LAG which is forming a redundant-pair for MC-LAG with a LAG configured on the given peer. The same LAG group can be defined only in the scope of 1 peer. In order MC-LAG to become operational, all parameters (**lACP-key**, **system-id**, **system-priority**) must be configured the same on both nodes of the same redundant pair.

The partner system (the system connected to all links forming MC-LAG) will consider all ports using the same **lACP-key**, **system-id**, **system-priority** as the part of the same LAG. In order to achieve this in MC operation, both redundant-pair nodes have to be configured with the same values. In case of the mismatch, MC-LAG is kept in oper-down status.

Note that the correct CLI command to enable MC LAG for a LAG in **standby-signaling power-off mode** is **lag** *lag-id* [**remote-lag** *remote-lag-id*]. In the CLI help output, the first three forms are used to enable MC LAG for a LAG in LACP mode. MC LAG is disabled (regardless of the mode) for a given LAG with **no lag** *lag-id*.

### Parameters

#### *lag-id*

The LAG identifier, expressed as an integer. Specifying the *lag-id* allows the mismatch between lag-id on redundant-pair. If no **lag-id** is specified it is assumed that neighbor system uses the same *lag-id* as a part of the specific MC-LAG. If no matching MC-LAG group can be found between neighbor systems, the individual LAGs operates as usual (no MC-LAG operation is established).

**Values** 1 to 800

#### *admin-key*

Specifies a 16 bit key that needs to be configured in the same manner on both sides of the MC-LAG in order for the MC-LAG to come up.

**Values** 1 to 65535

***system-id***

Specifies a 6 byte value expressed in the same notation as MAC address.

**Values** xx:xx:xx:xx:xx:xx - xx [00 to FF]

***remote-lag-id***

Specifies the LAG ID on the remote system.

**Values** 1 to 800

***system-priority***

Specifies the system priority to be used in the context of the MC-LAG. The partner system will consider all ports using the same **lacp-key**, **system-id**, and **system-priority** as part of the same LAG.

**Values** 1 to 65535

***MAC-Lsb***

Configures the last 16 bit of the MAC address to be used for all traffic ingressing the MC-LAG link(s) or if use-lacp-key option is used, it will only copy the value of lacp-key (redundancy multi-chassis mc-lag lag lacp-key admin-key). The command will fail if the *value* is the same with any of the following configured attributes:

- Source-bmac-lsb assigned to other MC-LAG ports.
- Isb 16 bits value for the source-bmac configured at chassis or BVPLS level

The first 32 bits will be copied from the source B-MAC of the BVPLS associated with the IVPLS for a specific IVPLS SAP mapped to the MC-LAG. The BVPLS source B-MAC can be provisioned for each BVPLS or can be inherited from the chassis PBB configuration.

**Values** 1 to 65535 or xx-xx or xx:xx

**Platforms**

lag

**Syntax**

**lag** *lag-id* [**name** *lag-name*]

**no lag** *lag-id*

**Context**

[\[Tree\]](#) (config lag)

## Full Context

configure lag

## Description

Commands in this context configure Link Aggregation Group (LAG) attributes.

A LAG is used to group multiple ports into one logical link. The aggregation of multiple physical links allows for load sharing and offers seamless redundancy. If one link fails, traffic is redistributed over the remaining links.

### Note:

For all ports in a LAG group, autonegotiation must be set to "limited" or "off".

There are three possible settings for autonegotiation, as follows:

- "on" or enabled with full port capabilities advertised
- "off" or disabled where there is no autonegotiation advertisements
- "limited" where a single speed/duplex is advertised.

When autonegotiation is enabled on a port, the link attempts to automatically negotiate the link speed and duplex parameters; the configured duplex and speed parameters are ignored.

When autonegotiation is disabled on a port, the port does not attempt to autonegotiate and will only operate at the **speed** and **duplex** settings configured for the port.

### Note:

Disabling autonegotiation on gigabit ports is not allowed. This is in accordance with the IEEE 802.3 specification for gigabit Ethernet, which requires gigabyte to be enabled for far end fault indication.

If the **config>port>ethernet autonegotiate limited** keyword option is specified, the port will autonegotiate but only advertise the **speed** and **duplex** settings configured for the port. Use the **limited** mode on multi-speed gigabit ports to force gigabit operation while keeping autonegotiation is enabled for compliance with IEEE 801.3.

The system requires autonegotiation to be disabled or limited for ports in a LAG to guarantee a specific port speed.

The **no** form of this command deletes the LAG from the configuration. A LAG can only be deleted while the LAG is administratively shut down. Any dependencies, such as IP-Interface configurations, must be removed from the configuration before the **no lag** command is issued.

## Parameters

### *lag-id*

Specifies the LAG identifier, expressed as an integer.

The LAG ID ranging from 1 to 64 supports up to 64 LAG members and LAG ID above 64 supports 32 LAG members.

**Values** 1 to 800

### *lag-name*

Specifies an optional LAG name, up to 27 characters.

In model-driven interfaces, the LAG name is used for configuration references and **show** commands. A service provider or administrator can use the defined LAG name to identify and manage LAGs within the SR OS platforms.

In the classic CLI interface, the user must assign a LAG ID to create the LAG. The LAG name is optional and, if specified, must always start with "lag-". If a name is not specified, SR OS automatically assigns a string version of the LAG ID as "lag-<lag-id>".

**Values** lag-<23 chars max>

## 16.57 lag-port-down

### lag-port-down

#### Syntax

**lag-port-down** *lag-id* **number-down** *number-lag-port-down* **level** *level-id*

**no lag-port-down** *lag-id* **number-down** *number-lag-port-down*

#### Context

[\[Tree\]](#) (config>router>mcac>policy>bundle>mc-constraints lag-port-down)

#### Full Context

configure router mcac policy bundle mc-constraints lag-port-down

#### Description

This command configures the bandwidth available both at the interface and bundle level when a specific number of ports in a LAG group fail.

The **no** form of this command removes the values from the configuration.

#### Parameters

##### *lag-id*

Specifies the LAG ID. When the number of ports available in the LAG link is reduced by the number of ports configured in this context then the *level-id* specified here must be applied.

##### *number-lag-port-down*

If the number of ports available in the LAG is reduced by the number of ports configured in this command here then bandwidth allowed for bundle and/or interface will be as per the levels configured in this context.

**Values** 1 to 64 (for 64-link LAG) 1 to 32 (for other LAGs)

##### *level-id*

Specifies the amount of bandwidth available within a given bundle for MC traffic for a specified level.

**Values** 1 to 8

#### Platforms

All

## lag-port-down

### Syntax

[no] **lag-port-down** *lag-id*

### Context

**[Tree]** (config>vrrp>policy>priority-event lag-port-down)

### Full Context

configure vrrp policy priority-event lag-port-down

### Description

This command creates the context to configure Link Aggregation Group (LAG) priority control events that monitor the operational state of the links in the LAG.

The **lag-port-down** command configures a priority control event. The event monitors the operational state of each port in the specified LAG. When one or more of the ports enter the operational down state, the event is considered to be set. When all the ports enter the operational up state, the event is considered to be clear. As ports enter the operational up state, any previous set threshold that represents more down ports is considered cleared, while the event is considered to be set.

Multiple unique **lag-port-down** event nodes can be configured within the **priority-event** node up to the maximum of 32 events.

The **lag-port-down** command can reference an arbitrary LAG. The *lag-id* does have to already exist within the system. The operational state of the **lag-port-down** event will indicate:

- Set – non-existent
- Set – one port down
- Set – two ports down
- Set – three ports down
- Set – four ports down
- Set – five ports down
- Set – six ports down
- Set – seven ports down
- Set – eight ports down
- Cleared – all ports up

When the *lag-id* is created, or a port in *lag-id* becomes operationally up or down, the event operational state must be updated appropriately.

When one or more of the LAG composite ports enters the operationally down state or the *lag-id* is deleted or does not exist, the event is considered to be set. When an event transitions from clear to set, the set is processed immediately and must be reflected in the associated virtual router instances in-use priority value. As the event transitions from clear to set, a hold-set timer is loaded with the value configured by the events **hold-set** command. This timer prevents the event from clearing until it expires, damping the effect of event flapping. If the event clears and becomes set again before the hold-set timer expires, the timer is reset to the **hold-set** value, extending the time before another clear can take effect.

The **lag-port-down** event is considered to have a tiered event set state. While the priority impact per number of ports down is totally configurable, as more ports go down, the effect on the associated virtual router instances in-use priority is expected to increase (lowering the priority). When each configured threshold is crossed, any higher thresholds are considered further event sets and are processed immediately with the hold-set timer reset to the configured value of the **hold-set** command. As the thresholds are crossed in the opposite direction (fewer ports down than previously), the priority effect of the event is not processed until the hold-set timer expires. If the number of ports down threshold again increases before the hold-set timer expires, the timer is only reset to the **hold-set** value if the number of ports down is equal to or greater than the threshold that set the timer.

The event contains **number-down** nodes that define the priority delta or explicit value to be used based on the number of LAG composite ports that are in the operationally down state. These nodes represent the event set thresholds. Not all port down thresholds must be configured. As the number of down ports increase, the **number-down** *ports-down* node that expresses a value equal to or less than the number of down ports describes the delta or explicit priority value to be applied.

The **no** form of the command deletes the specific LAG monitoring event. The event can be removed at anytime. When the event is removed, the in-use priority of all associated virtual router instances must be reevaluated. The events **hold-set** timer has no effect on the removal procedure.

### Default

no lag-port-down — No LAG priority control events are created.

### Parameters

#### *lag-id*

The LAG ID that the specific event is to monitor expressed as a decimal integer. The *lag-id* can only be monitored by a single event in this policy. The LAG may be monitored by multiple VRRP priority control policies. A port within the LAG and the LAG ID itself are considered to be separate entities. A composite port may be monitored with the **port-down** event while the *lag-id* the port is in is monitored by a **lag-port-down** event in the same policy.

**Values** 1 to 800 (apply to the 7750 SR and 7950 XRS)  
1 to 200 (apply to the 7450 ESS)

### Platforms

All

## 16.58 lag-usage-optimization

### lag-usage-optimization

#### Syntax

[no] lag-usage-optimization

## Context

[\[Tree\]](#) (config>router>pim lag-usage-optimization)

## Full Context

configure router pim lag-usage-optimization

## Description

This command enables the router's usage of the LAG so traffic for a given multicast stream destined to an IP interface using the LAG is sent only to the forwarding complex that owns the LAG link on which it will actually be forwarded.

Changing the value causes the PIM protocol to be restarted.

If this optimization is disabled, the traffic is sent to all forwarding complexes that own at least one link in the LAG.

The **no** form of this command causes the traffic to be sent to all the forwarding complexes that own at least one link in the LAG.

### Note:

Changes made for multicast hashing cause Layer 4 multicast traffic to not be hashed. This is independent of if **lag-usage-optimization** is enabled or disabled.

Using this command and the **mc-ecmp-hashing-enabled** command on mixed port speed LAGs is not recommended, because some groups may be forwarded incorrectly.

## Default

no lag-usage-optimization

## 16.62 lanext-route-distinguisher

lanext-route-distinguisher

### Syntax

[no] lanext-route-distinguisher

### Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>include lanext-route-distinguisher)

### Full Context

configure subscriber-mgmt radius-accounting-policy include-radius-attribute lanext-route-distinguisher

### Description

This command enables the system to include the HLE service's EVPN route distinguisher (Alc-RD) in RADIUS accounting packets.

The **no** form of this command excludes the HLE service's EVPN route distinguisher (Alc-RD) from RADIUS accounting packets.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.63 lanext-route-target

lanext-route-target

### Syntax

[no] lanext-route-target

## Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>include lanext-route-target)

## Full Context

configure subscriber-mgmt radius-accounting-policy include-radius-attribute lanext-route-target

## Description

This command enables the system to include the HLE service's EVPN route target (Alc-RT) in RADIUS accounting packets.

The **no** form of this command excludes the HLE service's EVPN route target (Alc-RT) from RADIUS accounting packets.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.64 lanext-vni

### lanext-vni

## Syntax

[no] lanext-vni

## Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>include lanext-vni)

## Full Context

configure subscriber-mgmt radius-accounting-policy include-radius-attribute lanext-vni

## Description

This command enables the system to include the HLE service's EVPN VXLAN VNI (Alc-Vxlan-VNI) in RADIUS accounting packets.

The **no** form of this command excludes the HLE service's EVPN VXLAN VNI (Alc-Vxlan-VNI) from RADIUS accounting packets.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.65 last-member-query-interval

## last-member-query-interval

### Syntax

**last-member-query-interval** *tenths-of-seconds*

**no last-member-query-interval**

### Context

configure service vpls mesh-sdp igmp-snooping last-member-query-interval

configure service vpls sap igmp-snooping last-member-query-interval

configure service vpls spoke-sdp igmp-snooping last-member-query-interval

configure service vpls sap mld-snooping last-member-query-interval

configure service vpls spoke-sdp mld-snooping last-member-query-interval

### Description

This command configures the maximum response time used in group-specific queries sent in response to 'leave' messages, and is also the amount of time between two consecutive group-specific queries. This value may be tuned to modify the leave latency of the network. A reduced value results in reduced time to detect the loss of the last member of a group.

The configured **last-member-query-interval** is ignored when fast leave is enabled on the SAP or SDP.

The **no** form of this command reverts to the default value.

### Default

last-member-query-interval 10

### Parameters

***tenths-of-seconds***

Specifies the frequency, in tenths of a second, at which query messages are sent.

**Values** 1 to 50

### Platforms

All

## last-member-query-interval

### Syntax

**last-member-query-interval** *tenths-of-seconds*

**no last-member-query-interval**

### Context

## 16.66 last-reported-delay-hold

```
last-reported-delay-hold
```

## Syntax

```
last-reported-delay-hold seconds
```

```
no last-reported-delay-hold
```

## Context

[\[Tree\]](#) (config>test-oam>link-meas>template last-reported-delay-hold)

## Full Context

```
configure test-oam link-measurement measurement-template last-reported-delay-hold
```

## Description

This command configures the timer that specifies the wait time before the last reported delay measurement is flushed after a link measurement test enters the operationally down state. The aging timer delays the flushing of the last reported delay metric to the routing engine.

This timer starts a countdown to zero when an administrative function causes the operational state of the test on that specific interface to transition from up to down. If the timer expires before the operational state

transitions to up, the previously reported value is flushed. The Delay Measurement Last Reported indicates "Cleared". The timestamp indicates the time of the clear event. The Triggered By indicates "Expired". If the administrative state recovers to operationally up before the expiration of the timer, the previous reported value is not flushed.

The aging timer does not apply to failure conditions that do not affect the administrative state of the interface, for example interface failure or routing changes.

The **no** form of this command reverts to the default value.

## Default

last-reported-delay-hold 86400

## Parameters

### *seconds*

Specifies the delay measurement retention time, in seconds, after the interface on which it was collected is administratively disabled. If the configured value is reached, the last reported measurement is cleared.

A configured value of 0 indicates that the previous reported value is cleared without additional wait time.

**Values** 0 to 86400

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 16.67 latency-event

### latency-event

#### Syntax

**latency-event rising-threshold *threshold* [falling-threshold *threshold*] [*direction*]**

**no latency-event**

#### Context

[\[Tree\]](#) (config>saa>test latency-event)

#### Full Context

configure saa test latency-event

#### Description

Specifies that at the termination of an SAA test probe, the calculated latency event value is evaluated against the configured rising and falling latency event thresholds. SAA threshold events are generated as required.

Once the threshold (rising/falling) is crossed, it is disabled from generating additional events until the opposite threshold is crossed. If a **falling-threshold** is not supplied, the **rising-threshold** is re-enabled when it falls below the threshold after the initial crossing that generated the event.

The configuration of latency event thresholds is optional.

The **no** form of this command disables the latency event.

## Parameters

### **rising-threshold** *threshold*

Specifies a rising threshold latency value, in milliseconds. When the test run is completed, the calculated latency value is compared to the configured latency rising threshold. If the test run latency value is greater than the configured rising threshold value then an SAA threshold event is generated. The SAA threshold event is `tmnxOamSaaThreshold`, logger application OAM, event #2101.

**Values** 0 to 2147483

**Default** 0

### **falling-threshold** *threshold*

Specifies a falling threshold latency value, in milliseconds. When the test run is completed, the calculated latency value is compared to the configured latency falling threshold. If the test run latency value is greater than the configured falling threshold value then an SAA threshold event is generated. The SAA threshold event is `tmnxOamSaaThreshold`, logger application OAM, event #2101.

**Values** 0 to 2147483

**Default** 0

### **direction**

Specifies the direction for OAM ping responses received for an OAM ping test run.

**Values** **inbound** — Monitor the value of jitter calculated for the inbound, one-way, OAM ping responses received for an OAM ping test run.

**outbound** — Monitor the value of jitter calculated for the outbound, one-way, OAM ping requests sent for an OAM ping test run.

**roundtrip** — Monitor the value of jitter calculated for the round trip, two-way, OAM ping requests and replies for an OAM ping test run.

**Default** roundtrip

## 16.69 layer-3-encap

### layer-3-encap

#### Syntax

**layer-3-encap** [{ip-udp-shim | ip-gre | ip-udp-shim-sampled}] [create]

**no layer-3-encap**

#### Context

[\[Tree\]](#) (config>mirror>mirror-dest>encap layer-3-encap)

#### Full Context

configure mirror mirror-dest encap layer-3-encap

#### Description

This command specifies the format of the routable encapsulation to add to each copied packet. Layer 3 encapsulation takes precedence over Ethernet encapsulation configuration in an LI source. No changes are allowed to the Layer 3 encapsulation once a gateway is configured.

The **no** form of this command removes the routable encapsulation.

## Default

no layer-3-encap

## Parameters

### ip-udp-shim

Specifies that the type of Layer 3 encapsulation is an IPv4 header, UDP header, and LI shim header added to the mirrored packets.

### ip-gre

Specifies that the type of Layer 3 encapsulation is an IPv4 header and GRE header added to the mirrored packets. This encapsulation type is only supported with *mirror-type ip-only*.

### ip-udp-shim-sampled

Specifies that the type of Layer 3 encapsulation is an IPv4 header, UDP header, and a mirror shim header added to the mirrored packets providing direction, mirror type, filter action, interface type, and interface value.

### create

Creates a Layer 3 encapsulation.

## Platforms

All

## layer-3-encap

## Syntax

**layer-3-encap** [ip-udp-shim | ip-gre]

**no layer-3-encap**

## Context

[\[Tree\]](#) (config>li>mirror-dest-template layer-3-encap)

## Full Context

configure li mirror-dest-template layer-3-encap

## Description

This command specifies the format of the routable encapsulation to add to each copied packet. Layer 3 encapsulation takes precedence over Ethernet encapsulation configuration in an LI source. No changes are allowed to the Layer 3 encapsulation after a gateway is configured.

The **no** form of this command disables Layer 3 encapsulation.

## Parameters

### ip-udp-shim

Specifies that the type of Layer 3 encapsulation is an IPv4 header, UDP header, and LI-Shim.

**ip-gre**

Specifies that the type of Layer 3 encapsulation is an IPv4 GRE.

**Platforms**

All

## 16.70 lbl-eth-or-ip-l4-teid

### lbl-eth-or-ip-l4-teid

**Syntax**

**Full Context**

configure service vpls load-balancing lbl-eth-or-ip-l4-teid

configure service epipe load-balancing lbl-eth-or-ip-l4-teid

**Description**

This command enables hashing of MPLS Ethernet and MPLS IP packets received on the Epipe and VPLS service SAP using the MPLS labels, the inner IP addresses, the port numbers, and the GTP TEID field, if read by the system. This capability is supported on FP4- and FP5-based line cards.

The **no** form of this command disables hashing.

**Default**

no lbl-eth-or-ip-l4-teid

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 16.71 lbm-svc-act-responder

## lbm-svc-act-responder

### Syntax

**[no] lbm-svc-act-responder**

### Context

**[Tree]** (config>service>epipe>spoke-sdp>eth-cfm>mep lbm-svc-act-responder)

**[Tree]** (config>service>epipe>sap>eth-cfm>mep lbm-svc-act-responder)

### Full Context

configure service epipe spoke-sdp eth-cfm mep lbm-svc-act-responder

configure service epipe sap eth-cfm mep lbm-svc-act-responder

### Description

This command enables the MEP to process service activation streams encapsulated in ETH-CFM LBM frames that are directed to the MEP. The MEP will be allocated additional resources to rapidly respond to a high-speed stream of LBM messages.

A MEP created with this option will not validate any TLVs, will not validate the ETH-LBM MAC Address, and will not increment or compute any loopback statistics. Statistical computation and reporting is the responsibility of the test head-end. The ETH-CFM level of the high speed ETH-LBM stream must match the level of a MEP configured with this command. The high-speed stream must not target an ETH-CFM level that is not explicitly configured with this option. MEPs act as boundaries for lower levels, below the configured MEP level values. Those boundary levels do not inherit this function.

When the service activation test is complete, the MEP may be returned to standard processing by removing this command. If there is available bandwidth, the MEP will respond to other ETH-CFM PDUs, such as ETH-DMM marker packets, using standard processing.

The interaction between this command and the **tools perform service id *service-id* loopback eth** command must be carefully considered. It is recommended that either the **lbm-svc-act-responder** or the **tools perform service id *service-id* loopback eth** command be used at any given time within a service. If both commands must be configured, and the target reflection point is the MAC Swap Loopback function, the inbound stream of data must not include ETH-CFM traffic that is equal to or lower than the domain level of any configured MEP which would otherwise extract and process the ETH-CFM message. If the reflection target is a MEP configured with the **lbm-svc-act-responder** option, the mode (ingress or egress) of the SAP or SDP specified with this tools command and the MEP **direction** (up or down) must match when the functions are enabled on the same reflection point, and the domain level of the inbound ETH-LBM must be the same as that of the MEP configured with the **lbm-svc-act-responder** option. At no time should the two functions be conflicting with each other along the path of the stream. This conflict would lead to unpredictable and possibly destabilizing situations.

The **no** form of this command reverts to MEP LBM standard processing.

### Default

no lbm-svc-act-responder

## 16.72 lbo

lbo

### Syntax

**lbo** [0dB | -7.5dB | -15.0dB | -22.5dB]

### Context

[\[Tree\]](#) (config>port>tdm lbo)

### Full Context

configure port tdm lbo

### Description

This command applies only to a DS-1 port configured with a 'long' buildout (see the **buildout** command). Specify the number of decibels the transmission signal decreases over the line.

For 'short' buildout the following values are valid:

lboNotApplicable — Not applicable

For 'long' buildout the following values are valid:

|              |              |
|--------------|--------------|
| lbo0dB       | For 0 dB     |
| lboNeg7p5dB  | For -7.5 dB  |
| lboNeg15p0dB | For -15.0 dB |
| lboNeg22p5dB | For -22.5 dB |

The default for 'short' build out is 'NotApplicable' while the default for 'long' buildout is 'lbo0dB'.

## 16.73 lcp-force-ack-accm

lcp-force-ack-accm

### Syntax

**lcp-force-ack-accm** {always | never}

**no lcp-force-ack-accm**

## Context

**[Tree]** (config>service>vprn>l2tp>group>ppp lcp-force-ack-accm)

**[Tree]** (config>router>l2tp>group>ppp lcp-force-ack-accm)

**[Tree]** (config>router>l2tp>group>tunnel>ppp lcp-force-ack-accm)

**[Tree]** (config>service>vprn>l2tp>group>tunnel>ppp lcp-force-ack-accm)

## Full Context

configure service vprn l2tp group ppp lcp-force-ack-accm

configure router l2tp group ppp lcp-force-ack-accm

configure router l2tp group tunnel ppp lcp-force-ack-accm

configure service vprn l2tp group tunnel ppp lcp-force-ack-accm

## Description

This command enables the LCP Asynchronous Control Character Map (ACCM) configuration option. When enabled, the LCP ACCM configuration option is acknowledged during LCP negotiation between the LNS and the PPP client. The option is then ignored and no ACCM mapping is done.

By default, an L2TP tunnel inherits the configuration from the L2TP group CLI context.

The **no** form of this command disables the LCP ACCM configuration option.

## Parameters

### **always**

Specifies to acknowledge the LCP ACCM configuration option, but not to perform ACCM mapping. This option overrides the group level configuration.

### **never**

Specifies to reject the LCP ACCM configuration option. This option overrides the group level configuration.

## Platforms

### Syntax

[no] ldp

### Context

[\[Tree\]](#) (config>service>sdp ldp)

### Full Context

configure service sdp ldp

### Description

This command enables LDP-signaled LSPs on MPLS-encapsulated SDPs.

In MPLS SDP configurations *either* one or more LSP names can be specified *or* LDP can be enabled. The SDP **ldp** and **lsp** commands are mutually exclusive except if the `mixed-lsp-mode` option is also enabled. If an LSP is specified on an MPLS SDP, then LDP cannot be enabled on the SDP. To enable LDP on the SDP when an LSP is already specified, the LSP must be removed from the configuration using the **no lsp lsp-name** command or the `mixed-lsp-mode` option is also enabled.

Alternatively, if LDP is already enabled on an MPLS SDP, then an LSP cannot be specified on the SDP. To specify an LSP on the SDP, the LDP must be disabled. The LSP must have already been created in the **config>router>mpls** context with a valid far-end IP address. The above rules are relaxed when the **mixed-lsp** option is enabled on the SDP.

## Full Context

configure router mpls lsp ldp-over-rsvp

configure router mpls lsp-template ldp-over-rsvp

## Description

This command configures an LSP so that it can be used by the IGP to calculate its SPF tree.

When the **ldp-over-rsvp** option is also enabled in ISIS or OSPF, the IGP provides LDP with all ECMP IP next-hops and tunnel endpoints that it considers to be the lowest cost path to its destination.

IGP provides only the endpoints which are the closest to the destination in terms of IGP cost for each IP next-hop of a prefix. If this results in more endpoints than the ECMP value configured on the router, it will further prune the endpoints based on the lowest router-id and for the same router-id, it will select lowest interface-index first.

LDP then looks up the tunnel table to select the actual tunnels to the endpoint provided by IGP and further limits the endpoint selection to the ones which are the closest to destination across all the IP next-hops provided by IGP for a prefix. For each remaining endpoint, LDP selects a tunnel in a round-robin fashion until the router ECMP value is reached. For each endpoint, only tunnels with the same lowest metric are candidates. If more than one tunnel qualifies, the selection begins with the lowest tunnel-id.

## ldp-shortcut

### Syntax

[no] ldp-shortcut

### Context

[\[Tree\]](#) (config>router ldp-shortcut)

### Full Context

configure router ldp-shortcut

### Description

This command enables the resolution of IGP routes using LDP LSP across all network interfaces participating in the IS-IS and OSPF routing protocol in the system.

When LDP shortcut is enabled, LDP populates the routing table with next-hop entries corresponding to all prefixes for which it activated an LDP FEC. For a given prefix, two route entries are populated in the system routing table. One corresponds to the LDP shortcut next-hop and has an owner of LDP. The other one is the regular IP next-hop. The LDP shortcut next-hop always has preference over the regular IP next-hop for forwarding user packets and specified control packets over a given outgoing interface to the route next-hop.

All user and specified control packets for which the longest prefix match in RTM yields the FEC prefix will be forwarded over the LDP LSP.

When an IPv4 packet is received on an ingress network interface, a subscriber IES interface, or a regular IES interface, the lookup of the packet by the ingress forwarding engine will result in the packet being sent labeled with the label stack corresponding to the NHLFE of the LDP LSP when the preferred RTM entry corresponds to an LDP shortcut.

If the preferred RTM entry corresponds to an IP next-hop, the IPv4 packet is forwarded without a label.

When ECMP is enabled and multiple equal-cost next-hops exit for the IGP route, the ingress forwarding engine will spray the packets for this route based on hashing routine currently supported for IPv4 packets. When the preferred RTM entry corresponds to an LDP shortcut route, spraying will be performed across the multiple next-hops for the LDP FEC. The FEC next-hops can either be direct link LDP neighbors or T-LDP neighbors reachable over RSVP LSPs in the case of LDP-over-RSVP but not both.

When the preferred RTM entry corresponds to a regular IP route, spraying will be performed across regular IP next-hops for the prefix.

The **no** form of this command disables the resolution of IGP routes using LDP shortcuts.

## 16.81 ldp-sync

### ldp-sync

### Syntax

[no] ldp-sync

### Context

[\[Tree\]](#) (config>service>vprn>static-route-entry>indirect ldp-sync)

### Full Context

configure service vprn static-route-entry indirect ldp-sync

### Description

This command extends the LDP synchronization feature to a static route. When an interface comes back up, it is possible that a preferred static route using the interface as next-hop for a given prefix is enabled before the LDP adjacency to the peer LSR comes up on this interface. In this case, traffic on an SDP that uses the static route for the far-end address would be black-holed until the LDP session comes up and the FECs exchanged.

This option when enabled delays the activation of the static route until the LDP session comes up over the interface and the `ldp-sync-timer` configured on that interface has expired

**Default**

no `ldp-sync`

### ldp-sync-timer

**Syntax**

`ldp-sync-timer seconds [end-of-lib]`

## no ldp-sync-timer

### Context

[Tree] (config>router>if ldp-sync-timer)

### Full Context

configure router interface ldp-sync-timer

### Description

This command enables synchronization of an IGP and LDP. When a link is restored after a failure, the IGP sets the link cost to infinity and advertises it. The actual value advertised in OSPF is 0xFFFF (65535). The actual value advertised in IS-IS regular metric is 0x3F (63) and in IS-IS wide-metric is 0xFFFFFE (16777214). This feature is not supported on RIP interfaces.

If an interface belongs to both IS-IS and OSPF, a physical failure will cause both IGPs to advertise an infinite metric and to follow the IGP-LDP synchronization procedures. If only one IGP bounces on this interface or on the system, then only the affected IGP advertises the infinite metric and follows the IGP-LDP synchronization procedures.

Next, an LDP Hello adjacency is brought up with the neighbor. The LDP synchronization timer is started by the IGP when the LDP session to the neighbor is up over the interface. This is to allow time for the label-FEC bindings to be exchanged.

When the LDP synchronization timer expires, the link cost is restored and is readvertised. The IGP will announce a new best next hop and LDP will use it if the label binding for the neighbor's FEC is available.

If the user changes the cost of an interface, the new value is advertised at the next flooding of link attributes by the IGP. However, if the LDP synchronization timer is still running, the new cost value will only be advertised after the timer expires. The new cost value will also be advertised after the user executes any of the following commands:

- **tools>perform>router>isis>ldp-sync-exit**
- **tools>perform>router>ospf>ldp-sync-exit**
- **config>router>if>no ldp-sync-timer**
- **config>router>ospf>disable-ldp-sync**
- **router>isis>disable-ldp-sync**

If the user changes the value of the LDP synchronization timer parameter, the new value will take effect at the next synchronization event. If the timer is still running, it will continue to use the previous value.

If parallel links exist to the same neighbor, then the bindings and services should remain up as long as there is one interface that is up. However, the user-configured LDP synchronization timer still applies on the interface that failed and was restored. In this case, the router will only consider this interface for forwarding after the IGP re-advertises its actual cost value.

The LDP Sync Timer State is not always synchronized across to the standby CPM. Therefore, after an activity switch, the timer state might not be same as it was on the previously active CPM.

If the **end-of-lib** option is configured, then the system will start the LDP synchronization timer as usual. If the LDP End of LIB Typed Wildcard FEC messages are received for every FEC type negotiated for a given session to an LDP peer for that IGP interface, the **ldp-sync-timer** is terminated early and the IGP link cost is restored. If the **ldp-sync-timer** expires before the LDP End of LIB messages are received for

every negotiated FEC type, then the system will restore the IGP link cost. The **end-of-lib** option is disabled by default.

The **no** form of this command disables IGP-LDP synchronization and deletes the configuration.

### Default

no ldp-sync-timer

### Parameters

#### **seconds**

Specifies the time interval for the IGP-LDP synchronization timer.

**Values** 1 to 1800

#### **end-of-lib**

Specifies that the system should terminate the **ldp-sync-timer** early if the LDP End of LIB Typed Wildcard FEC messages are received for every FEC type negotiated for a given session to an LDP peer for that IGP interface.

## 16.83 ldp-treetrace

### ldp-treetrace

### Syntax

```
ldp-treetrace {prefix ip-prefix/mask} [downstream-map-tlv {dsmap | ddmap}] [fc fc-name [profile {in | out}]] [max-path max-paths] [max-ttl tvl-value] [retry-count retry-count] [timeout timeout]
```

### Context

[\[Tree\]](#) (oam ldp-treetrace)

### Full Context

oam ldp-treetrace

### Description

This command allows the user to perform a single run of the LDP ECMP OAM tree trace to discover all ECMP paths of an LDP FEC.

### Parameters

#### **ip-prefix/mask**

Specifies the address prefix and subnet mask of the target BGP IPv4 label route.

**Values** ip-prefix: a.b.c.dmask, the value must be 32

**downstream-map-tlv {dsmap | ddmmap}**

Specifies which format of the downstream mapping TLV to use in the LSP trace packet. The DSMAP TLV is the original format in RFC 4379 (obsoleted by RFC 8029). The DDMAP is the new enhanced format specified in RFC 6424 and RFC 8029.

**Default** Inherited from global configuration of downstream mapping TLV in option **mpls-echo-request-downstream-map {dsmap | ddmmap}**.

**fc-name**

Specifies the FC and profile parameters are used to indicate the forwarding class and profile of the MPLS echo request packet.

When an MPLS echo request packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the specified FC and profile parameter values. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface.

When the MPLS echo request packet is received on the responding node, The FC and profile parameter values are dictated by the LSP-EXP mappings of the incoming interface.

When an MPLS echo reply packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the FC and profile parameter values determined by the classification of the echo request packet, which is being replied to, at the incoming interface. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface. The ToS byte is not modified. [Table 60: Idp-treetrace Request Packet and Behavior](#) summarizes this behavior.

*Table 60: Idp-treetrace Request Packet and Behavior*

|                                     |                                                                                                                                                                                                                                                                                                                  |

**Values** be, l2, af, l1, h2, ef, h1, nc

**Default** be

#### **profile {in | out}**

Specifies the profile state of the MPLS echo request packet.

**Values** in, out

**Default** out

#### **max-paths**

Specifies the maximum number of paths for a ldp-tree-trace test, expressed as a decimal integer.

**Values** 1 to 255

**Default** 128

#### **ttl-value**

Specifies the maximum TTL value in the MPLS label for the LSP trace test, expressed as a decimal integer.

**Values** 1 to 255

**Default** 30

#### **retry-count**

Specifies the maximum number of consecutive MPLS echo requests, expressed as a decimal integer that do not receive a reply before the trace operation fails for a given TTL.

**Values** 1 to 255

**Default** 5

### ***timeout***

Specifies the time, in seconds, used to override the default time out value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response is not received. Any response received after the request times out is silently discarded.

**Values** 1 to 60

**Default** 3

**no leak**

### Context

**[Tree]** (debug>router>ospf leak)

**[Tree]** (debug>router>ospf3 leak)

### Full Context

debug router ospf leak

debug router ospf3 leak

### Description

This command enables debugging for OSPF leaks.

### Parameters

***ip-address***

Specifies the IPv4 or IPv6 address to debug OSPF leaks.

**Values** ipv4-address:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

## 16.86 leak-export

## leak-export

### Syntax

**leak-export** *plcy-or-long-expr* [*plcy-or-expr* [*plcy-or-expr*]]

**no leak-export**

## Context

[\[Tree\]](#) (config>router leak-export)

## Full Context

configure router leak-export

## Description

This command associates up to four policies to control the leaking of GRT routes into the associated VPRN.

If a route is evaluated and the action is accepted, that route is subject leaking into an associated VPRN instance, assuming the route is fully resolved and active.

This process creates the pool of routes that can be leaked. Within each VPRN, a corresponding **import-grt** policy must be configured to import select routes into that specific VPRN instance.

The **no** form of this command removes all route leaking policy associations and effectively disables the leaking of GRT routes into associated VPRNs.

## Parameters

### *plcy-or-long-expr*

Specifies the route policy name, up to 64 characters or a policy logical expression, up to 255 characters.

**Values** *plcy-or-long-expr*: *policy-name* | *long-expr*

*policy-name*: up to 64 characters

*long-expr*: up to 255 characters

### *plcy-or-expr*

Specifies the route policy name, up to 64 characters or a policy logical expression, up to 64 characters long. A maximum of four policy names or policy logical expressions can be specified in a single statement.

**Values** *plcy-or-expr*: *policy-name* | *expr*

*policy-name*: up to 64 characters

*expr*: up to 64 characters

## Full Context

```
configure service vprn bgp rib-management label-ipv6 leak-import
```

```
configure service vprn bgp rib-management ipv4 leak-import
```

```
configure service vprn bgp rib-management label-ipv4 leak-import
```

```
configure service vprn bgp rib-management ipv6 leak-import
```

## Description

This command configures route policies that control the importation of leak-eligible routes from the BGP RIB of another routing instance into the unlabeled-IPv4, unlabeled-IPv6, labeled-IPv4, or labeled-IPv6 RIB of the VPRN instance. To leak a route from one routing instance to another, the origin and destination RIB types must be the same; for example, it is not possible to leak a route from an unlabeled-IPv4 RIB of a VPRN into the labeled-IPv4 RIB of the base router.

The **leak-import** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine the final action to accept or reject the route.

Only one of the 15 objects referenced by the **leak-import** command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters while the remaining 14 objects have a maximum length of 64 characters each.

When a **leak-import** policy is not specified, no BGP routes from other routing instances are leaked into the VPRN BGP RIB.

The **no** form of this command removes the policy association.

## Default

```
no leak-import
```

## Parameters

### *plcy-or-long-expr*

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters). Allowed values are any string of characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### *plcy-or-expr*

Specifies the route policy name (up to 64 characters) or a policy logical expression (up to 255 characters). Allowed values are any string of characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### Full Context

configure router bgp rib-management ipv6 leak-import

configure router bgp rib-management label-ipv4 leak-import

configure router bgp rib-management ipv4 leak-import

### Description

This command configures the router to specify route policies that control the importation of leak-eligible routes from the BGP RIB of another routing instance into the unlabeled-IPv4, unlabeled-IPv6, or labeled-IPv4 RIB of the base router. To leak a route from one routing instance to another, the origin and destination RIB types must be the same; for example, it is not possible to leak a route from an unlabeled-IPv4 RIB of a VPRN into the labeled-IPv4 RIB of the base router.

The **leak-import** command can reference up to 15 objects, where each object is either a policy logical expression or the name of a single policy. The objects are evaluated in the specified order to determine final action to accept or reject the route.

Only one of the 15 objects referenced by the **leak-import** command can be a policy logical expression consisting of policy names (enclosed in square brackets) and logical operators (AND, OR, NOT). The first of the 15 objects has a maximum length of 255 characters while the remaining 14 objects have a maximum length of 64 characters each.

When a **leak-import** policy is not specified, no BGP routes from other routing instances are leaked into the base router BGP RIB.

The **no** form of this command removes the policy association.

### Default

no leak-import

### Parameters

#### *plcy-or-long-expr*

Specifies up to 14 route policy names (up to 64 characters long) or a policy logical expression (up to 255 characters long). Allowed values are any string of characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

#### *plcy-or-expr*

The route policy name (up to 64 characters long) or a policy logical expression (up to 64 characters long). Allowed values are any string of characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

## 16.89 learn-ap-mac

### learn-ap-mac

#### Syntax

**learn-ap-mac** [**delay-auth**]

**no learn-ap-mac**

#### Context

**[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw learn-ap-mac)

**[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw learn-ap-mac)

#### Full Context

configure service ies subscriber-interface group-interface wlan-gw learn-ap-mac

configure service vprn subscriber-interface group-interface wlan-gw learn-ap-mac

#### Description

This command enables the sending of ARP or ND packets on the WLAN-GW GRE tunnel for certain events. The target IP address in the ARP/ND packet is the endpoint IP address of the AP. The ARP/ND response from the AP should contain the AP MAC, which subsequently can be reported in a called-station-id message. When enabled, a message will be sent for following events:

- CPM: Mobility to an AP for which the AP-MAC is not yet known
- CPM: RS-triggered authentication on an AP for which the AP-MAC is not yet known
- ISA: Any mobility event
- ISA: Any authentication where the AP-MAC is not yet known (for example, from a RADIUS proxy cache or a DHCP circuit-id). If the optional keyword **delay-auth** is configured, then the authentication will be delayed until the ARP/ND is answered or timed out, after which the AP-MAC can be included in the authentication.

This configuration is ignored for L2-AP and L2TPv3 access.

#### Parameters

**delay-auth**

Specifies that authentication will be delayed until the ARP/ND is answered or timed out, after which the AP-MAC can be included in the authentication.

#### Full Context

configure service vprn interface vpls evpn arp learn-dynamic

configure service ies interface vpls evpn nd learn-dynamic

configure service vprn interface vpls evpn nd learn-dynamic

configure service ies interface vpls evpn arp learn-dynamic

#### Description

This command controls whether the ARP or ND frames received on EVPN binds are used to learn dynamic ARP and ND entries in the ARP/ND table.

The **no** form of the command reverts to the default.

#### Default

learn-dynamic

#### Platforms

All

## 16.91 learn-l2tp-cookie

## learn-l2tp-cookie

### Syntax

**learn-l2tp-cookie** {**if-match** | **never** | **always**} [**cookie** *hex string*]

**no learn-l2tp-cookie**

### Context

**[Tree]** (config>service>ies>sub-if>grp-if>wlan-gw learn-l2tp-cookie)

**[Tree]** (config>service>vprn>sub-if>grp-if>wlan-gw learn-l2tp-cookie)

### Full Context

configure service ies subscriber-interface group-interface wlan-gw learn-l2tp-cookie

configure service vprn subscriber-interface group-interface wlan-gw learn-l2tp-cookie

### Description

This command specifies when this system will learn the cookie from L2TP tunnels terminating on this interface. Learning the cookie means that the value of the octets 3-8 of the cookie is interpreted as an access point's MAC address, and used as such, for example in the Called-Station-Id attribute of RADIUS Interim-Update messages.

### Parameters

#### **if-match**

Specifies that the cookie is interpreted only if the value of the first two octets of the cookie is equal to the value of the object `tmnxWlanGwSoftGrelfL2tpCookie`.

#### **cookie** *hex string*

Specifies the value used to compare the first two bytes of the cookie. This parameter is only valid if **if-match** is configured.

**Values** 0x0000 to 0xFFFF...(4 hex nibbles)

#### **never**

Specifies that the cookie value will always be ignored.

#### **always**

Always learn the AP-MAC from the cookie, regardless of the value of the first two bytes.

configure router dhcp local-dhcp-server lease-hold-time

configure router dhcp6 local-dhcp-server lease-hold-time

configure service vprn dhcp6 local-dhcp-server lease-hold-time

### Description

This command configures the time to remember this lease and is applicable for unsolicited release conditions such as lease timeout if the **lease-hold-time-for** command is set to the default value **no solicited-release** and is additionally applicable for normal solicited releases from DHCP clients if the **lease-hold-time-for** command is set to **solicited-release**.

The **no** form of this command reverts to the default.

### Default

lease-hold-time sec 0

### Parameters

#### *lease-hold-time*

Specifies the amount of time to remember the lease.

| Values |                |           |
|--------|----------------|-----------|
|        | <i>days</i>    | 0 to 7305 |
|        | <i>hours</i>   | 0 to 23   |
|        | <i>minutes</i> | 0 to 59   |
|        | <i>seconds</i> | 0 to 59   |

configure service ies subscriber-interface group-interface dhcp lease-populate

configure service vprn interface dhcp lease-populate

configure service vpls sap dhcp lease-populate

configure service vprn subscriber-interface dhcp lease-populate

configure service ies interface dhcp lease-populate

## Description

Commands in this context configure IPoE host parameters.

For VPLS, DHCP snooping must be explicitly enabled (using the **snoop** command) at all points where DHCP messages requiring snooping enter the VPLS instance (both from the DHCP server and from the subscribers). Lease state information is extracted from snooped DHCP ACK messages to populate lease state table entries for the SAP.

The optional *nbr-of-leases* parameter defines the number lease state table entries allowed.

- for this SAP in case of a VPLS service
- for this interface in case of an IES or VPRN interface
- for each SAP in case of an IES or VPRN group-interface
- for this interface in case of an IES or VPRN retail subscriber-interface

If the *nbr-of-leases* parameter is omitted, only a single entry is allowed. Once the maximum number of entries has been reached, subsequent lease state entries are not allowed and subsequent DHCP ACK messages are discarded.

The retained lease state information representing dynamic hosts may be used to:

- Populate a SAP based anti-spoof filter table to provide dynamic anti-spoof filtering. If the system is unable to populate the dynamic host information in the anti-spoof filter table on the SAP, the DHCP ACK message must be discarded without adding new lease state entry or updating an existing lease state entry.
- Populate the system's ARP cache based on the arp-populate configuration. Applicable to IES and VPRN interfaces or group-interfaces.

- Populate managed entries into a VPLS forwarding database. VPLS forwarding database population is an implicit feature that automatically places the dynamic host's MAC address into the VPLS FDB. When a dynamic host's MAC address is placed in the lease state table, it will automatically be populated into the VPLS forwarding database associated with the SAP on which the host is learned. The dynamic host MAC address will override any static MAC entries using the same MAC and prevent dynamic learning of the MAC on another interface. Existing static MAC entries with the same MAC address as the dynamic host are marked as inactive but not deleted. If all entries in the lease state table associated with the MAC address are removed, the static MAC may be populated. New static MAC definitions for the VPLS instance may be created while a dynamic host exists associated with the static MAC address.
  - Generate dynamic ARP replies if **arp-reply-agent** is enabled. Applicable to VPLS service SAPs
- The **no** form of this command reverts to the default.

## Parameters

### *nbr-of-leases*

Specifies the number of DHCPv4 leases allowed.

### **l2-header**

Indicates a mode of operation where anti-spoof entry associated with the given DHCP state is created based on the *src-mac* address from the Layer 2 header of the DHCP request message. The Layer 2 header flag is not set by default. This parameter is only applicable for group interfaces.

### **mac**

Specifies that the provisioned *ieee-address* is used in the anti-spoofing entries for this SAP. The parameter may be changed mid-session. Existing sessions will not be re-programmed unless a **tools>perform>subscriber-mgmt>remap-lease-state** command is issued for the lease. This parameter is only applicable for group interfaces.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- `configure service vprn subscriber-interface group-interface dhcp lease-populate`
- `configure service ies subscriber-interface group-interface dhcp lease-populate`
- `configure subscriber-mgmt msap-policy vpls-only-sap-parameters dhcp lease-populate`
- `configure service vprn subscriber-interface dhcp lease-populate`

All

- `configure service ies interface dhcp lease-populate`
- `configure service vpls sap dhcp lease-populate`
- `configure service vprn interface dhcp lease-populate`

## lease-populate

## Syntax

**lease-populate** [*nbr-of-leases*]

**lease-populate** [*nbr-of-leases*] **route-populate** [**pd**] **na** [**ta**]

**lease-populate** [*nbr-of-leases*] **route-populate** **pd** [**na**] [**ta**] [**exclude**]  
**lease-populate** [*nbr-of-leases*] **route-populate** [**pd**] [**na**] **ta**  
**no lease-populate**

## Context

**[Tree]** (config>service>ies>if>ipv6>dhcp6-relay lease-populate)

## Full Context

configure service ies interface ipv6 dhcp6-relay lease-populate

## Description

This command specifies the maximum number of DHCPv6 lease states allocated by the DHCPv6 relay function, allowed on this interface.

Optionally, by specifying **route-populate** parameter, system could:

- Create routes based on the IA\_PD/IA\_NA/IA\_TA prefix option in relay-reply message.
- Create black hole routes based on OPTION\_PD\_EXCLUDE in IA\_PD in relay-reply message.

These routes could be redistributed into IGP/BGP by using route-policy, following protocol types that could be used in "from protocol":

- dhcpv6-pd
- dhcpv6-na
- dhcpv6-ta
- dhcpv6-pd-excl

## Parameters

### *nbr-of-leases*

Defines the number lease state table entries allowed for this interface. If this parameter is omitted, only a single entry is allowed. Once the maximum number of entries has been reached, subsequent lease state entries are not allowed and subsequent DHCPv6 REPLY messages are discarded.

**Values** 1 to 8000

### **route-populate**

Specifies the route populate parameter.

**Values** pd/na/ta — Create route based on specified option.

exclude — Create blackhole route based on OPTION\_PD\_EXCLUDE.

## Platforms

All

## lease-populate

### Syntax

```
lease-populate [nbr-of-leases]
lease-populate [nbr-of-leases] route-populate [pd] na [ta]
lease-populate [nbr-of-leases] route-populate pd [na] [ta] [exclude]
lease-populate [nbr-of-leases] route-populate [pd] [na] ta
no lease-populate
```

### Context

[\[Tree\]](#) (config>service>ies>if>ipv6>dhcp-relay lease-populate)

### Full Context

```
configure service ies interface ipv6 dhcp-relay lease-populate
```

### Description

This command specifies the maximum number of DHCPv6 lease states allocated by the DHCPv6 relay function, allowed on this interface.

Optionally, by specifying "route-populate" parameter, system could:

- Create routes based on the IA\_PD/IA\_NA/IA\_TA prefix option in relay-reply message.
- Create black hole routes based on OPTION\_PD\_EXCLUDE in IA\_PD in relay-reply message.

These routes could be redistributed into IGP/BGP by using route-policy, following protocol types that could be used in "from protocol":

- dhcpv6-pd
- dhcpv6-na
- dhcpv6-ta
- dhcpv6-pd-excl

### Parameters

#### *nbr-of-entries*

Defines the number lease state table entries allowed for this interface. If this parameter is omitted, only a single entry is allowed. Once the maximum number of entries has been reached, subsequent lease state entries are not allowed and subsequent DHCPv6 ACK messages are discarded.

**Values** 1 to 8000

#### *route-populate*

Specifies the route populate parameter.

**Values** pd/na/ta — Create route based on specified option.

exclude — Create blackhole route based on OPTION\_PD\_EXCLUDE.

## 16.95 lease-query

### lease-query

#### Syntax

**lease-query** [**max-retry** *Max nbr of retries*]

**no lease-query**

#### Context

**[Tree]** (config>service>ies>sub-if>wlan-gw>pool-manager>dhcp6-client lease-query)

**[Tree]** (config>service>vprn>sub-if>wlan-gw>pool-manager>dhcp6-client lease-query)

#### Full Context

configure service ies subscriber-interface wlan-gw pool-manager dhcpv6-client lease-query

configure service vprn subscriber-interface wlan-gw pool-manager dhcpv6-client lease-query

#### Description

This command enables lease-query. If this is specified the dhcp6-client will retrieve any existing addresses when becoming active. The lease-query is performed for all of the configured servers

The **no** form of this command disables lease-query.

#### Parameters

##### **Max nbr of retries**

Specifies the maximum number of retries before the lease query assumes no existing subnets were allocated.

**Values** 0 to 10

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.96 lease-rebind-time

 configure router dhcp local-dhcp-server pool options lease-time

## Description

This command configures the amount of time that the DHCP server grants to the DHCP client permission to use a specific IP address.

The **no** form of this command removes the lease time parameters from the configuration.

## Parameters

### *days*

Specifies the number of days that the given IP address is valid.

**Values** 0 to 3650

### *hours*

Specifies the number of hours that the given IP address is valid.

**Values** 0 to 23

### *minutes*

Specifies the number of minutes that the given IP address is valid.

**Values** 0 to 59

### *seconds*

Specifies the number of seconds that the given IP address is valid.

**Values** 0 to 59

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## lease-time

## Syntax

**lease-time** [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*] [**override**]

**no lease-time**

## Context

**[Tree]** (config>service>ies>if>dhcp>proxy-server lease-time)

**[Tree]** (config>service>ies>sub-if>grp-if>dhcp>proxy-server lease-time)

**[Tree]** (config>service>vprn>if>dhcp>proxy lease-time)

**[Tree]** (config>service>vprn>sub-if>grp-if>dhcp>proxy-server lease-time)

**[Tree]** (config>subscr-mgmt>msap-policy>vpls-only>dhcp>proxy lease-time)

[\[Tree\]](#) (config>service>vpls>sap>dhcp>proxy-server lease-time)

### Full Context

```
configure service ies interface dhcp proxy-server lease-time
configure service ies subscriber-interface group-interface dhcp proxy-server lease-time
configure service vprn interface dhcp proxy-server lease-time
configure service vprn subscriber-interface group-interface dhcp proxy-server lease-time
configure subscriber-mgmt msap-policy vpls-only-sap-parameters dhcp proxy-server lease-time
configure service vpls sap dhcp proxy-server lease-time
```

### Description

This command defines the length of lease-time that is provided to DHCP clients. By default, the local-proxy-server always makes use of the lease time information provide by either a RADIUS or DHCP server.

The **no** form of this command disables the use of the lease-time command. The local-proxy-server will use the lease-time offered by either a RADIUS or DHCP server.

### Default

```
lease-time days 7
```

### Parameters

#### **override**

Specifies that the local-proxy-server will use the configured lease-time information to provide DHCP clients

#### **days**

Specifies the number of days that the given IP address is valid.

**Values** 0 to 3650

#### **hours**

Specifies the number of hours that the given IP address is valid.

**Values** 0 to 23

#### **minutes**

Specifies the number of minutes that the given IP address is valid.

**Values** 0 to 59

#### **seconds**

Specifies the number of seconds that the given IP address is valid.

**Values** 0 to 59

### Platforms

All

### Full Context

configure service ies subscriber-interface group-interface wpp lease-time

configure service vprn subscriber-interface group-interface wpp lease-time

### Description

This command configures the amount of time that the DHCP server grants to the DHCP client permission to use a particular IP address.

The **no** form of this command removes the lease time parameters from the configuration.

### Parameters

#### *lease-time*

Specifies the lease time.

| Values                    |  |           |
|---------------------------|--|-----------|
| <b>days</b> <i>days</i>   |  | 0 to 3650 |
| <b>hrs</b> <i>hours</i>   |  | 0 to 23   |
| <b>min</b> <i>minutes</i> |  | 0 to 59   |
| <b>sec</b> <i>seconds</i> |  | 0 to 59   |

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## lease-time

### Syntax

**lease-time** *seconds*

**lease-time** [**days** <*days*>] [**hrs** <*hrs*>] [**min** <*min*>] [**sec** <*sec*>]

**no lease-time**

### Context

**[Tree]** (config>subscr-mgmt>vrgw>brg>brg-profile>dhcp-pool lease-time)

### Full Context

configure subscriber-mgmt vrgw brg brg-profile dhcp-pool lease-time

### Description

This command configures the lease time, in seconds, to be used when allocating addresses from the pool. This time value should always be longer than the renew/rebind time.

The **no** form of this command reverts to the default.

### Default

lease-time hrs 6

### Parameters

#### *seconds*

Specifies the lease time in seconds.

**Values** 300 to 315446399

#### *days*

Specifies the lease time in days.

**Values** 1 to 3650

#### *hrs*

Specifies the lease time in hours.

**Values** 1 to 23

#### *min*

Specifies the lease time in minutes.

**Values** 1 to 59

#### *sec*

Specifies the lease time in seconds.

**Values** 1 to 59

## 16.99 least-fill

### least-fill

#### Syntax

[no] least-fill

#### Context

**[Tree]** (config>router>mpls>lsp-template least-fill)

**[Tree]** (config>router>mpls>lsp least-fill)

#### Full Context

configure router mpls lsp-template least-fill

configure router mpls lsp least-fill

#### Description

This command enables the use of the least-fill path selection method for the computation of the path of this LSP.

When MPLS requests the computation of a path for this LSP, CSPF will find all equal cost shortest paths which satisfy the constraints of this path. Then, CSPF identifies the single link in each of these paths which has the least available bandwidth as a percentage of its maximum reservable bandwidth. It then selects the path which has the largest value of this percentage least available bandwidth figure. CSPF identifies the least available bandwidth link in each equal cost path after it has accounted for the bandwidth of the new requested path of this LSP.

CSPF applies the least-fill path selection method to all requests for a path, primary and secondary, of an LSP for which this option is enabled. The bandwidth of the path can be any value, including zero.

CSPF applies the least-fill criterion separately to each preemption priority in the base TE. A higher setup priority path can preemptively lower holding priority paths.

CSPF also applies the least-fill criterion separately to each Diff-Serv TE class if Diff-Serv TE is enabled on this node. A higher setup priority path can preemptively lower holding priority paths within a Class Type.

MPLS will re-signal and move the LSP to the new path in the following cases:

- Initial LSP path signaling.
- Re-try of an LSP path after failure.
- Make-before-break (MBB) due to pending soft preemption of the LSP path.
- MBB due to LSP path configuration change, that is, a user change to bandwidth parameter of primary or secondary path, or a user enabling of fast-reroute option for the LSP.
- MBB of secondary path due to an update to primary path SRLG.

- MBB due to FRR Global Revertive procedures on the primary path.
- Manual re-signaling of an LSP path or of all LSP paths by the user.

During a manual re-signaling of an LSP path, MPLS will always re-signal the path regardless of whether the new path is exactly the same or different than the current path and regardless of whether the metric of the new path is different or not from that of the current path.

During a timer-based re-signaling of an LSP path which has the least-fill option enabled, MPLS will only re-signal the path if the metric of the new path is different than the one of the current path.

The **no** form of this command deletes a specific node entry in this database.

### Default

no least-fill. The path of an LSP is randomly chosen among a set of equal cost paths.

### Platforms

All

## 16.100 least-fill-min-thd

### least-fill-min-thd

#### Syntax

**least-fill-min-thd** *percent*

**no least-fill-min-thd**

#### Context

[\[Tree\]](#) (config>router>mpls least-fill-min-thd)

#### Full Context

configure router mpls least-fill-min-thd

#### Description

This parameter is used in the least-fill path selection process. When comparing the percentage of least available link bandwidth across the sorted paths, whenever two percentages differ by less than the value configured as the least-fill-min-thresh, CSPF will consider them equal and will apply a random number generator to select the path among these paths

The **no** form of this command resets this parameter to its default value.

#### Default

least-fill-min-thd 5

#### Parameters

*percentage*

Specifies the least fill minimum threshold value as a percentage.

**Values** 1 to 100%

### Platforms

All

## 16.101 least-fill-reoptim-thd

### least-fill-reoptim-thd

#### Syntax

**least-fill-reoptim-thd** *percent*

**no least-fill-reoptim-thd**

#### Context

[\[Tree\]](#) (config>router>mpls least-fill-reoptim-thd)

#### Full Context

configure router mpls least-fill-reoptim-thd

#### Description

This parameter is used in the least-fill path selection method. During a timer-based re-signaling of an LSP path which has the least-fill option enabled, CSPF will first update the least-available bandwidth figure for the current path of this LSP. It then applies the least-fill path selection method to select a new path for this LSP. If the new computed path has the same cost as the current path, it will compare the least-available bandwidth figures of the two paths and if the difference exceeds the user configured optimization threshold, MPLS will generate a trap to indicate that a better least-fill path is available for this LSP. This trap can be used by an external SNMP based device to trigger a manual re-signaling of the LSP path since the timer-based re-signaling will not re-signal the path in this case. MPLS will generate a path update trap at the first MBB event which results in the re-signaling of the LSP path. This should clear the eligibility status of the path at the SNMP device.

The **no** form of this command resets this parameter to its default value.

#### Default

least-fill-reoptim-thd 10

#### Parameters

*percentage*

Specifies the least fill reoptimization threshold value as a percentage.

**Values** 1 to 100%

configure service vpls sap mrp leave-all-time
```

### Description

This command controls the frequency with which the LeaveAll state machine generates LeaveAll PDUs. The timer is required on a per-Port, per-MRP Participant basis. The Leave All Period Timer is set to a random value, T, in the range  $\text{LeaveAllTime} < T < 1.5 * \text{leave-all-time}$  when it is started. Refer to IEEE 802.1ak-2007 section 10.7.4.3.

### Default

```
leave-all-time 100
```

### Parameters

#### *value*

The frequency with which the LeaveAll state machine generates LeaveAll PDUs, in tenths of a second.

**Values** 60 to 300

configure service vpls spoke-sdp mrp leave-time
```

## Description

This command controls the period of time that the Registrar state machine will wait in the leave state before transitioning to the MT (Empty) state when it is removed. An instance of the timer is required for each state machine that is in the leave state. The leave period timer is set to the value specified for **leave-time** when it is started.

A registration is normally in an "in" state where there is an MFIB entry and traffic is being forwarded. When a "leave all" is performed (periodically around every 10-15 seconds per SAP/SDP binding - see leave-all-time-below), a node sends a message to its peer indicating a leave all is occurring and puts all of its registrations in leave state.

The peer refreshes its registrations based on the leave all PDU it receives and sends a PDU back to the originating node with the state of all its declarations.

Refer to IEEE 802.1ak-2007 section 10.7.4.2.

## Default

leave-time 30

## Parameters

### *value*

The period of time that the Registrar state machine waits in the leave state before transitioning to the MT state, in tenths of a second.

**Values** 30 to 60

[no] legacy-dns-nbns

**Context**

[\[Tree\]](#) (config>subscr-mgmt>sys-bhv legacy-dns-nbns)

**Full Context**

configure subscriber-mgmt system-behavior legacy-dns-nbns

**Description**

This command enables legacy DNS NBNS behavior, which restricts the supported default extended authentication origins for DNS and NBNS name servers. The main differences include:

- only support DHCP server as origin for DHCP relay: IPoE DHCPv4/DHCPv6 and PPPoE DHCPv6
- Local Address Assignment (LAA) is highest priority origin: IPoE and PPPoE SLAAC DNSv6 and PPPoE DNSv4
- no default DNS for IPoE DHCPv4 proxy

The **no** form of this command reverts to the recommended default extended DNS and NBNS name server origin priorities.

**Default**

no legacy-dns-nbns

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 16.107 legacy-ipv4-lsr-interop

### legacy-ipv4-lsr-interop

#### Syntax

**[no] legacy-ipv4-lsr-interop**

#### Context

[\[Tree\]](#) (config>router>ldp legacy-ipv4-lsr-interop)

#### Full Context

configure router ldp legacy-ipv4-lsr-interop

#### Description

This command provides for a global LDP knob to allow interoperability with legacy IPv4 LSR implementations which do not comply with the processing of Hello TLVs with the U-bit set. Specifically, this feature disables the following Hello TLVs:

- The Nokia proprietary Interface Info TLV (0x3E05) in the Hello message sent to the peer. This also results in the non-generation of the Nokia proprietary Hello Adjacency Status TLV (0x3E06) since the Interface Info TLV is not sent.

This is performed in SR OS releases 12 and higher.

- The RFC 7552 standard dual-stack capability TLV (0x701) and the Nokia proprietary Adjacency capability TLV (0x3E07) in SR OS releases 13 and higher.

#### Platforms

## 16.108 length

### length

#### Syntax

**length {133 | 266 | 399 | 533 | 655}**

#### Context

[\[Tree\]](#) (config>port>tdm length)

#### Full Context

configure port tdm length

## Description

This command applies only to a DS-1 port configured with a 'short' buildout. The **length** command configures the length of the line (in feet). For line lengths longer than 655 feet, configure the DS-1 port buildout as 'long'.

For 'long' buildout the following values are valid:

NotApplicable — Not applicable

For 'short' buildout the following values are valid:

- 0 to 133 For line length from 0 to 133 feet
- 134 to 266 For line length from 134 to 266 feet
- 267 to 399 For line length from 267 to 399 feet
- 400 to 533 For line length from 400 to 533 feet
- 534 to 655 For line length from 534 to 655 feet

The default for 'long' buildout is 'NotApplicable' while the default for 'short' buildout is '0 to 133'.

## 16.110 ler-use-dscp

### ler-use-dscp

## Syntax

```
[no] ler-use-dscp
```

## Context

```
[Tree] (config>qos>network>ingress ler-use-dscp)
```

## Full Context

```
configure qos network ingress ler-use-dscp
```

## Description

This command is used to enable tunnel QoS mapping on all ingress network IP interfaces that the network-qos-policy-id is associated with. The command may be defined at any time after the network QoS policy has been created. Any network IP interfaces currently associated with the policy will immediately start to use the internal IP ToS field of any tunnel terminated IP routed packet received on the interface, ignoring any QoS markings in the tunnel portion of the packet.

This attribute provides the ability to ignore the network ingress QoS mapping of a terminated tunnel containing an IP packet that is to be routed to a base router or VPRN destination. This is advantageous when the mapping for the tunnel QoS marking does not accurately or completely reflect the required QoS handling for the IP routed packet. When the mechanism is enabled on an ingress network IP interface, the IP interface will ignore the tunnel's QoS mapping and derive the internal forwarding class and profile based on the precedence or DiffServ Code Point (DSCP) values within the routed IP header ToS field compared to the Network QoS policy defined on the IP interface.

The default state is not to enforce tunnel termination IP routed QoS override within the network QoS policy.

The **no** form of this command removes tunnel termination IP routed QoS override from the network QoS policy and all ingress network IP interfaces associated with the policy.

**Default**

no ler-use-dscp

**Platforms**

All

## 16.111 less-specific

### less-specific

**Syntax**

**less-specific** [**allow-default**]

**no less-specific**

**Context**

[\[Tree\]](#) (config>vrrp>policy>priority-event>route-unknown less-specific)

**Full Context**

configure vrrp policy priority-event route-unknown less-specific

**Description**

This command allows a CIDR shortest match hit on a route prefix that contains the IP route prefix associated with the route unknown priority event.

The **less-specific** command modifies the search parameters for the IP route prefix specified in the **route-unknown** priority event. Specifying **less-specific** allows a CIDR shortest match hit on a route prefix that contains the IP route prefix.

The **less-specific** command eases the RTM lookup criteria when searching for the *prefix/mask-length*. When the **route-unknown** priority event sends the prefix to the RTM (as if it was a destination lookup), the result route table prefix (if a result is found) is checked to see if it is an exact match or a less specific match. The **less-specific** command enables a less specific route table prefix to match the configured prefix. When **less-specific** is not specified, a less specific route table prefix fails to match the configured prefix. The **allow-default** optional parameter extends the **less-specific** match to include the default route (0.0.0.0).

The **no** form of the command prevents RTM lookup results that are less specific than the route prefix from matching.

**Default**

no less-specific — The route unknown priority events requires an exact prefix/mask match.

## Parameters

### **allow-default**

When the **allow-default** parameter is specified with the **less-specific** command, an RTM return of 0.0.0.0 matches the IP prefix. If **less-specific** is entered without the **allow-default** parameter, a return of 0.0.0.0 will not match the IP prefix. To disable **allow-default**, but continue to allow **less-specific** match operation, only enter the **less-specific** command (without the **allow-default** parameter).

### Full Context

configure port tdm e3 egress-scheduler-override level

configure port tdm ds1 channel-group egress-scheduler-override level

configure port sonet-sdh path egress-scheduler-override level

configure port ethernet egress-scheduler-override level

configure port tdm e1 egress-scheduler-override level

configure port tdm ds3 egress-scheduler-override level

### Description

This command overrides the maximum and CIR rate parameters for a specific priority level on the port or channel's port scheduler instance. When the **level** command is executed for a priority level, the corresponding priority level command in the port-scheduler-policy associated with the port is ignored.

The override level command supports the keyword **max** for the **rate** and **cir** parameter. When executing the level override command, at least the **rate** or **cir** keywords and associated parameters must be specified for the command to succeed.

The **no** form of this command removes the local port priority level rate overrides. Once removed, the port priority level will use the port scheduler policies level command for that priority level.

### Parameters

#### *priority-level*

Identifies which of the eight port priority levels are being overridden.

**Values** 1 to 8

***pir-rate***

Overrides the port scheduler policy's maximum level rate and requires either the **max** keyword or a rate defined in kilobits per second to follow.

**Values** For Ethernet: 1 to 6400000000, **max**  
For SONET-SDH and TDM: 1 to 3200000000, **max**

***cir-rate***

Overrides the port scheduler policy's within-cir level rate and requires either the **max** keyword or a rate defined in kilobits per second to follow.

**Values** For Ethernet: 1 to 6400000000, **max**  
For SONET-SDH and TDM: 1 to 3200000000, **max**

***pir-percent***

Specifies the PIR as a percentage.

**Values** 0.01 to 100.00

***cir-percent***

Specifies the CIR as a percentage.

**Values** 0.00 to 100.00

**max**

removes any existing rate limit imposed by the port scheduler policy for the priority level allowing it to use as much total bandwidth as possible.

**Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

- configure port tdm ds1 channel-group egress-scheduler-override level

configure service vprn isis link-group level
```

### Description

This command creates the context to configure IS-IS Level 1 or Level 2 area attributes.

A router can be configured as a Level 1, Level 2, or Level 1/2 system. A Level 1 adjacency can be established if there is at least one area address shared by this router and a neighbor. A Level 2 adjacency cannot be established over this interface.

Level 1/2 adjacency is created if the neighbor is also configured as Level 1/2 router and has at least one area address in common. A Level 2 adjacency is established if there are no common area IDs.

A Level 2 adjacency is established if another router is configured as Level 2 or a Level 1/2 router with interfaces configured as Level 1/2 or Level 2. Level 1 adjacencies are not established over this interface.

To reset global and/or interface level parameters to the default, the following commands must be entered independently:

- **level>no hello-authentication-key**
- **level>no hello-authentication-type**
- **level>no hello-interval**
- **level>no hello-multiplier**
- **level>no metric**
- **level>no passive**
- **level>no priority**

### Default

level 1 or level 2

### Parameters

#### *level-number*

The IS-IS level number.

**Values** 1, 2

### Platforms

All

## level

### Syntax

**level** *syslog-level*

### Context

[\[Tree\]](#) (config>service>vprn>log>syslog level)

### Full Context

configure service vprn log syslog level

## Description

This command configures the syslog message severity level threshold. All messages with severity level equal to or higher than the threshold are sent to the syslog target host.

Only a single threshold level can be specified. If multiple levels are entered, the last **level** entered will overwrite the previously entered commands.

## Default

level info

## Parameters

### *syslog-level*

The threshold severity level name.

**Values** emergency, alert, critical, error, warning, notice, info, debug

| Router severity level     | Numerical Severity (highest to lowest) | Configured Severity | Definition                       |

## Full Context

configure router igmp interface mcac mc-constraints level

configure router mld interface mcac mc-constraints level

configure router pim interface mcac mc-constraints level

configure router mcac policy bundle mc-constraints level

## Description

This command configures the amount of bandwidth available within a given bundle for MC traffic for a specified level. The amount of allowable BW for the specified level is expressed in kb/s and this can be defined for up to eight different levels.

If no bandwidth is defined for a given level then no limit is applied.

The **no** form of this command removes the level from the configuration.

## Parameters

### *level*

Specifies the bandwidth for a given level. Level 1 has the highest priority. Level 8 has the lowest priority.

**Values** 1 to 8

### *bw bandwidth*

Specifies the bandwidth, in kb/s, for the level.

**Values** 1 to 2147483647 kb/s

**Default** 1

**no level** *priority-level*

## Context

[Tree] (config>qos>port-scheduler-policy level)

## Full Context

configure qos port-scheduler-policy level

## Description

This command configures an explicit within-CIR bandwidth limit and a total bandwidth limit for each port scheduler's priority level. To understand how to set the level rate and CIR parameters, a basic understanding of the port-level scheduler bandwidth allocation mechanism is required. The port scheduler takes all available bandwidth for the port or channel (after the max-rate and any port egress-rate limits have been accounted for) and offers it to each of the eight priority levels twice.

The first pass is called the within-CIR pass and consists of providing the available port bandwidth to each of the 8 priority levels, starting with level 8 and moving down to level 1. Each level takes the offered load and distributes it to all child members that have a port-parent cir-level equal to the current priority level. (Any child with a cir-weight equal to 0 is skipped in this pass.) Each child may consume bandwidth up to the child's frame-based within-CIR offered load. The remaining available port bandwidth is then offered to the next lower priority level until level 1 is reached.

The second pass is called the above-CIR pass and consists of providing the remaining available port bandwidth to each of the eight priority levels a second time. Again, each level takes the offered load and distributes it to all child members that have a port-parent level equal to the current priority level. Each child may consume bandwidth up to the remainder of the child's frame-based offered load (some of the offered load may have been serviced during the within-CIR pass). The remaining available port bandwidth is then offered to the next priority level until level 1 is again reached.

If the port scheduling policy is using the default orphan behavior (orphan-override has not been configured on the policy), the system then takes any remaining port bandwidth and allocates it to the orphan queues and scheduler on priority level 1. In a non-override orphan state, all orphans are attached to priority level 1 using a weight of 0. The zero weight value causes the system to allocate bandwidth equally to all orphans based on each orphan queue or scheduler's ability to use the bandwidth. If the policy has an orphan-override configured, the orphans are handled based on the override commands parameters in a similar fashion to properly parented queues and schedulers.

The port scheduler priority level command **rate** keyword is used to optionally limit the total amount of bandwidth that is allocated to a priority level (total for the within-CIR and above-CIR passes). The **cir** keyword optionally limits the first pass bandwidth allocated to the priority level during the within-CIR pass.

When executing the **level** command, at least one of the optional keywords, **rate** or **cir**, must be specified. If neither keyword is included, the command will fail.

If a previous explicit value for **rate** or **cir** exists when the **level** command is executed, and either **rate** or **cir** is omitted, the previous value for the parameter is overwritten by the default value and the previous value is lost.

The configured priority level rate limits may be overridden at the egress port or channel using the **egress-scheduler-override level priority-level** command. When a scheduler instance has an override defined for a priority level, both the **rate** and **cir** values are overridden even when one of them is not explicitly expressed in the override command. For instance, if the **cir** kilobits per second portion of the override is not

expressed, the scheduler instance defaults to not having a CIR rate limit for the priority level even when the port scheduler policy has an explicit CIR limit defined.

The **no** form of this command returns the level to its default value.

## Default

no level priority-level

## Parameters

### *priority-level*

Specifies to which priority level the level command pertains. Each of the eight levels is represented by an integer value of 1 to 8, with 8 being the highest priority level.

**Values** 1 to 8 (8 is the highest priority)

### *pir-rate*

Specifies the total bandwidth limits allocated to priority-level, in kilobits per second.

**Values** 1 to 6400000000, **max**

### *pir-percent*

Specifies the percent bandwidth limits allocated to priority-level.

**Values** 0.01 to 100.00

### *cir-rate*

The cir specified limits the total bandwidth allocated in the within-CIR distribution pass to priority-level. When cir is not specified, all the available port or channel bandwidth may be allocated to the specified priority level during the within-CIR pass.

**Values** 0 to 6400000000, **max**

The value given for kilobits per second is expressed in kilobits per second on a base 10 scale as is usual for line rate calculations. If a value of 1 is given, the result is 1000 bits per second (as opposed to a base 2 interpretation that would be 1024 bits per second).

### *cir-percent*

Specifies the percent bandwidth limits allocated to priority-level.

**Values** 0.00 to 100.00

### *group name*

specifies the existing group that the weighted scheduler group this level maps to, up to 32 characters.

### *weight*

Specifies the weight of the level within this weighted scheduler group.

**Values** 1 to 100

**Default** 1

### *monitor-threshold percent*

Specifies the percent of the configured rate. If the offered rate exceeds the configured threshold, a counter monitoring the threshold will be increased.

**Values** 0 to 100

[\[Tree\]](#) (config>router>isis>interface level)

## Full Context

configure router isis level

configure router isis interface level

## Description

This command creates the context to configure IS-IS Level 1 or Level 2 area attributes.

A router can be configured as a Level 1, Level 2, or Level 1/2 system. A Level 1 adjacency can be established if there is at least one area address shared by this router and a neighbor. A Level 2 adjacency cannot be established over this interface.

Level 1/2 adjacency is created if the neighbor is also configured as Level 1/2 router and has at least one area address in common. A Level 2 adjacency is established if there are no common area IDs.

A Level 2 adjacency is established if another router is configured as Level 2 or a Level 1/2 router with interfaces configured as Level 1/2 or Level 2. Level 1 adjacencies are not established over this interface.

To reset global and/or interface level parameters to the default, the following commands must be entered independently:

```
- level>no hello-authentication-key
- level>no hello-authentication-type
- level>no hello-interval
- level>no hello-multiplier
- level>no metric
- level>no passive
- level>no priority
```

### Default

level 1 or level 2

### Parameters

**1**

Specifies the IS-IS operational characteristics of the interface at level 1.

**2**

Specifies the IS-IS operational characteristics of the interface at level 2.

## 16.114 lfa-policy-map

### lfa-policy-map

## Syntax

**lfa-policy-map route-nh-template** *template-name*

**no lfa-policy-map**

## Context

[\[Tree\]](#) (config>service>vprn>isis>if lfa-policy-map)

## Full Context

configure service vprn isis interface lfa-policy-map

## Description

This command applies a route next-hop policy template to the IS-IS interface for the VPRN instance.

When a route next-hop policy template is applied to an interface in IS-IS, it is applied in both level 1 and level 2. When a route next-hop policy template is applied to an interface in OSPF, it is applied in all areas.

However, the command in an OSPF interface context can only be executed under the area in which the specified interface is primary and then applied in that area and in all other areas where the interface is secondary. If the user attempts to apply it to an area where the interface is secondary, the command fails.

If the user excluded the interface from LFA using the command **loopfree-alternate-exclude**, the LFA policy, if applied to the interface, has no effect.

Finally, if the user applied a route next-hop policy template to a loopback interface or to the system interface, the command will not be rejected, but it will result in no action being taken.

The **no** form deletes the mapping of a route next-hop policy template to an OSPF or IS-IS interface.

## Parameters

### *template-name*

Specifies the name of the template, up to 32 characters.

**no li-filter-lock-state**

### Context

**[Tree]** (config>li li-filter-lock-state)

### Full Context

configure li li-filter-lock-state

### Description

This command configures the lock state of the filters used by LI. With the configurable filter lock for LI feature an LI user can control the behavior of filters when they are used for LI.

Prior to Release 12.0.R1, when a filter entry was used as a Lawful Intercept (LI) mirror source criteria, all subsequent attempts to modify the filter were then blocked to avoid having the LI session impacted by a non-LI user.

The **no** form of this command reverts to the default.

### Default

li-filter-lock-state locked

### Parameters

#### **locked**

When an li-source criteria is configured that references any entry of filter Y, then filter Y can no longer be changed (until there are no longer any li-source references to entries of filter Y).

#### **unlocked-for-li-users**

Filters can continue to be edited by LI users only even when an li-source references an entry in that filter.

#### **unlocked-for-all-users**

Filters can continue to be edited by all users even when an li-source references an entry in that filter.

## Description

Specifies the **li-ip-filter** that will have its entries inserted into a list of normal IP filters.

The **no** form of this command removes the LI filter name from the configuration.

## Parameters

### *li-filter-name*

Specifies an existing li-ip-filter, up to 32 characters.

## Platforms

All

## li-ip-filter

### Syntax

**li-ip-filter** *li-filter-name* **entry** *li-entry-id* [*li-entry-id*] [**intercept-id** *intercept-id* [*intercept-id*]] [**session-id** *session-id* [*session-id*]]

**no li-ip-filter** *li-filter-name* [**entry** *li-entry-id* [*li-entry-id*]]

### Context

**[Tree]** (config>li>li-source li-ip-filter)

### Full Context

configure li li-source li-ip-filter

### Description

This command enables lawful interception (LI) of packets that match specific entries in an existing LI IP filter that has been associated with a normal IP filter. The specification of an **li-ip-filter** entry as an **li-source** means that packets matching the **li-ip-filter** entry will be intercepted on all interfaces/saps/and so on where the associated normal ip-filter(s) are applied.

### Parameters

#### *li-filter-name*

Specifies the name of the **li-ip-filter**, up to 32 characters.

#### *li-entry-id*

Specifies the entry ID in the **li-ip-filter** that is to be used as an **li-source** criteria.

**Values** 1 to 65535

#### *intercept-id*

Specifies the **intercept-id** that is inserted into the packet header for all mirrored packets of the associated **li-source** entry. This **intercept ID** can be used (for example by a downstream LI gateway) to identify the particular LI session to which the packet belongs. For all types of **li-source** entries (filter, nat, sap, subscriber), when the mirror service is configured with **ip-udp-shim** routable encap, an *intercept-id* field (as part of the routable encap) is always present in the mirrored packets. If there is no *intercept-id* configured for an **li-source** entry, then the default value will be inserted. When the mirror service is configured with **ip-gre** or **ip-udp-shim-sampled** routable encap, no **intercept ID** is inserted and none can be specified against the **li-source** entries.

#### *session-id*

Specifies the **session-id** that is inserted into the packet header for all mirrored packets of the associated **li-source** entry. This *session-id* can be used (for example by a downstream LI Gateway) to identify the particular LI session to which the packet belongs. The *session-id* is only valid and used for mirror services that are configured with **ip-udp-shim** routable encap (**config>mirror>mirror-dest>encap>ip-udp-shim**). For all types of **li-source** entries (filter, nat, sap, or subscriber), when the mirror service is configured with **ip-udp-shim** routable encap, a *session-id* field (as part of the routable encap) is always present in the mirrored packets. If there is no *session-id* configured for an **li-source** entry, then the default value will be inserted. When a mirror service is configured with **ip-gre** or **ip-**

**udp-shim-sampled** routable encap, no session-id is inserted and none can be specified against the li-source entries.

**li-reserved-block** *block-name* [**create**]

**no li-reserved-block** *block-name*

**Context**

[\[Tree\]](#) (config>li>li-filter-block-reservation li-reserved-block)

## Full Context

```
configure li li-filter-block-reservation li-reserved-block
```

## Description

This command creates or edits an LI reserved block. An LI reserved block allows an operator to define where entries from an LI filter should be inserted into a normal filter. The block reserves a configurable number of entries in the normal filter that can only be used for entries inserted from associated LI filters. The LI filter entries that get inserted into the reserved block in each normal filter are not visible to non-LI operators. The block also defines to which normal filters the reservation is applied.

The **no** form of this command removes the block name from the configuration.

## Parameters

### *block-name*

Specifies the name of the MAC filter. Block names cannot start with an underscore character (for example, "\_my-filter") and cannot use the name "default".

### li-separate

## Syntax

```
[no] li-separate
```

## Context

**[Tree]** (bof li-separate)

## Full Context

```
bof li-separate
```

## Description

This command specifies whether or not a non-LI user has access to lawful intercept (LI) information. When this command is enabled, a user who does not have LI access will not be allowed to access CLI or SNMP objects in the li context. Modifying this command will not take effect until the system is rebooted.

When the **no li-separate** command is set (the default mode), those who are allowed access to the **config>system>security>profile** context and user command nodes are allowed to modify the configuration of the LI parameters. In this mode, a user that has a profile allowing access to the **config>li** and/or **show>li** command contexts can enter and use the commands under those nodes.

When the **li-separate** command is configured, only users that have the LI access capabilities set in the **config>system>security>user>access li** context are allowed to access the **config>li** and/or **show>li**

command contexts. A user who does not have LI access is not allowed to enter the **config>li** and **show>li** contexts even though they have a profile that allows access to these nodes. When in the **li-separate** mode, only users with **config>system>security>user>access li** set in their user account have the ability modify the setting LI parameters in either their own or other profiles and user configurations.

**Default**

no li-separate

Commands in this context configure the Network Element to communicate with LI Centers (LICs).

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 16.133 lifetime

### lifetime

**Syntax**

**lifetime** **minimum** *minimum* **maximum** *maximum*

**no lifetime**

**Context**

[\[Tree\]](#) (config>service>nat>pcp-server-policy lifetime)

**Full Context**

configure service nat pcp-server-policy lifetime

**Description**

This command configures the lifetime of explicit mappings made by the PCP servers.

**Default**

lifetime minimum 120 maximum 86400

**Parameters*****minimum***

Specifies the minimum lifetime of explicit mappings made by the PCP servers using this PCP policy, in seconds.

**Values** 60 to 86399

***maximum***

Specifies the maximum lifetime of explicit mappings made by the PCP servers using this PCP policy, in seconds.

**Values** 61 to 86400

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## lifetime

### Syntax

**lifetime** {*seconds* | **forever**}

### Context

**[Tree]** (config>system>script-control>script-policy lifetime)

### Full Context

configure system script-control script-policy lifetime

### Description

This command is used to configure the maximum amount of time that a script may run.

### Default

lifetime 3600

### Parameters

#### **seconds**

Specifies the maximum amount of time that a script may run, in seconds.

**Values** 0 to 21474836

**Default** 3600 (1 hour)

#### **forever**

Specifies to allow a script to run indefinitely.

## Platforms

All

## 16.134 limit

## limit

### Syntax

**limit** {**all-packet-matches** | **first-session-match**}

## Context

[\[Tree\]](#) (debug>app-assure>group>traffic-capture>record limit)

## Full Context

debug application-assurance group traffic-capture record limit

## Description

This command records limit conditions.

## Parameters

### **all-packet-matches**

Records all the packets matching the condition.

### **first-session-match**

Records only the first session matching the condition.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.135 limit-init-exchange

### limit-init-exchange

## Syntax

**limit-init-exchange** [**reduced-max-exchange-timeout** *seconds*]

**no limit-init-exchange**

## Context

[\[Tree\]](#) (config>ipsec>ike-policy limit-init-exchange)

## Full Context

configure ipsec ike-policy limit-init-exchange

## Description

This command limits the number of ongoing IKEv2 initial exchanges per tunnel to 1. When the system receives a new IKEv2 IKE\_SA\_INIT request when there is an ongoing IKEv2 initial exchange from same peer, then system reduces the timeout value of the existing exchange to the specified **reduced-max-exchange-timeout**. If the **reduced-max-exchange-timeout** is **disabled**, then the system does not reduce the timeout value.

The **no** form of this command reverts to the default value.

**Default**

limit-init-exchange reduced-max-exchange-timeout 2

**Parameters****seconds**

Specifies the maximum timeout for the in-progress initial IKE exchange.

**Values** 2 to 60, disabled

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.136 limit-mac-move

### limit-mac-move

**Syntax**

limit-mac-move [blockable | non-blockable]

no limit-mac-move

**Context**

**[Tree]** (config>service>vpls>spoke-sdp limit-mac-move)

**[Tree]** (config>service>vpls>sap limit-mac-move)

**Full Context**

configure service vpls spoke-sdp limit-mac-move

configure service vpls sap limit-mac-move

**Description**

This command indicates whether or not the mac-move agent, when enabled using **config>service>vpls>mac-move** or **config>service>epipe>mac-move**, limits the MAC re-learn (move) rate on this SAP.

**Default**

limit-mac-move blockable

**Parameters****blockable**

Specifies that the agent monitors the MAC re-learn rate on the SAP, and it blocks it when the re-learn rate is exceeded.

**non-blockable**

Specifies that this SAP is not blocked, and another blockable SAP is blocked instead.

### Platforms

All

## limit-mac-move

### Syntax

**limit-mac-move** [**blockable** | **non-blockable**]

**no limit-mac-move**

### Context

[\[Tree\]](#) (config>service>pw-template limit-mac-move)

### Full Context

configure service pw-template limit-mac-move

### Description

This command indicates whether or not the mac-move agent will limit the MAC re-learn (move) rate.

### Default

limit-mac-move blockable

### Parameters

#### **blockable**

The agent will monitor the MAC re-learn rate, and it will block it when the re-learn rate is exceeded.

#### **non-blockable**

When specified, a SAP will not be blocked, and another blockable SAP will be blocked instead.

### Platforms

All

## 16.137 limit-pir-zero-drain

## limit-pir-zero-drain

### Syntax

**[no] limit-pir-zero-drain**

**Context**

**[Tree]** (config>qos>adv-config-policy>child-control>bandwidth-distribution limit-pir-zero-drain)

**Full Context**

configure qos adv-config-policy child-control bandwidth-distribution limit-pir-zero-drain

**Description**

This command is used to configure the system to use the minimum configurable PIR instead of an H-QoS derived zero operational PIR. The default behavior is to allow the operational PIR of the queue to remain the last configured value while setting the queue MBS to zero (preventing queuing of newly arriving packets). Retaining the previous PIR value may cause a momentary burst above an aggregate rate associated with the queue as it drains. Using the **limit-pir-zero-drain** command causes the queue to drain at the lowest rate possible (typically 1 kb/s) that limits overrun situations.

The **no** form of this command reverts to default behavior.

**Platforms**

All

**16.138 limit-unused-bandwidth**

## limit-unused-bandwidth

**Syntax**

**[no] limit-unused-bandwidth**

**Context**

**[Tree]** (config>port>ethernet>access>egr>qgrp>agg-rate limit-unused-bandwidth)

**[Tree]** (config>port>ethernet>access>egress>vport limit-unused-bandwidth)

**[Tree]** (config>service>vprn>sub-if>grp-if>sap>egress limit-unused-bandwidth)

**[Tree]** (config>port>ethernet>network>egr>qgrp>agg-rate limit-unused-bandwidth)

**Full Context**

configure port ethernet access egress queue-group agg-rate limit-unused-bandwidth

configure port ethernet access egress vport limit-unused-bandwidth

configure service vprn subscriber-interface group-interface sap egress limit-unused-bandwidth

configure port ethernet network egress queue-group agg-rate limit-unused-bandwidth

**Description**

This command specifies to limit the unused bandwidth and allow a tighter control in allocation of bandwidth by HQoS. When enabled, HQoS algorithm distributes any unused aggregate bandwidth between queues

operating below their fair share rates. This allows a simplified aggregate rate protection while allocating bandwidth by HQoS.

The **no** form of this command reverts to the default.

## Platforms

All

- configure port ethernet network egress queue-group agg-rate limit-unused-bandwidth
- configure port ethernet access egress vport limit-unused-bandwidth
- configure port ethernet access egress queue-group agg-rate limit-unused-bandwidth

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service customer multi-service-site egress agg-rate limit-unused-bandwidth

### Description

This command is used to enable aggregate rate overrun protection.

The **no** form of the command disables aggregate rate overrun protection.

### Default

no limit-unused-bandwidth

### Platforms

All

## 16.139 line-length

## line-length

### Syntax

**line-length** {110 | 220 | 330 | 440 | 550 | 660}

### Context

[\[Tree\]](#) (config>system>sync-if-timing>bits>output line-length)

### Full Context

configure system sync-if-timing bits output line-length

### Description

This command configures the **line-length** parameter of the BITS output. This is the distance in feet between the network element and the office clock (BITS/SSU). There are two possible BITS-out interfaces, one for each CPM. They are configured together, but they are displayed separately in the show command. This command is only applicable when the interface-type is DS1.

**Default**

line-length 110

**Parameters****110**

Specifies that the distance is from 0 to 110 feet.

**220**

Specifies that the distance is from 110 to 220 feet.

**330**

Specifies that the distance is from 220 to 330 feet.

**440**

Specifies that the distance is from 330 to 440 feet.

**550**

Specifies that the distance is from 440 to 550 feet.

**660**

Specifies that the distance is from 550 to 660 feet.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 16.140 link

### link

**Syntax**

**link** *port-id* {**primary** | **secondary**}

**no link** *port-id*

**Context**

[\[Tree\]](#) (config>lag>link-map-profile link)

**Full Context**

configure lag link-map-profile link

**Description**

This command designates one of the configured ports of the LAG to be used on egress as either a primary or secondary link (based on the option selected) by all SAPs and network interfaces that use this LAG link map profile.

Links are part of a profile. When a link is added or deleted, all SAPs and network interfaces that use this link-map-profile may be re-hashed if required.

The **no** form of this command deletes the link from this LAG link mapping profile. A port must be deleted from all LAG link profiles if it is to be deleted from the LAG.

## Parameters

### *port-id*

Specifies a physical port ID that is an existing member of this LAG.

|                |                                |                                     |         |
|----------------|--------------------------------|-------------------------------------|---------|
| <i>port-id</i> | <i>slot/mda/port[.channel]</i> |                                     |         |
|                | eth-sat-id                     | <i>esat-id/slot/</i><br><i>port</i> |         |
|                |                                | esat                                | keyword |
|                |                                | <i>id</i>                           | 1 to 20 |
|                | pxc-id                         | <i>pxc-id.sub-port</i>              |         |
|                |                                | pxc                                 | keyword |
|                |                                | <i>id</i>                           | 1 to 64 |
|                |                                | <i>sub-port</i>                     | a, b    |

### **primary**

Designates one of the configured ports of the LAG to be used on egress as a primary link by SAPs/network interfaces that use this LAG link map profile.

### **secondary**

Designates one of the configured ports of the LAG to be used on egress as a secondary link by SAPs/network interfaces that use this LAG link map profile.

## Platforms

All

## link

## Syntax

[no] link

## Context

[\[Tree\]](#) (config>test-oam>link-meas>template>ret-path link)

## Full Context

configure test-oam link-measurement measurement-template twamp-light return-path link

## Description

This command includes a return path sub-TLV link. The link sub-tlv instructs a Session-Reflector configured for type **stamp** to use the receiving logical IP interface for the transmission of the response

packet from the reflector to the **session-sender**. The destination of the reflected packet must be installed in the forwarding table and reachable out the IP interface or the packet is dropped by the Session-Reflector. When there are parallel non-equal cost return paths between the Session-Reflector and the Session-Sender the response packet can only be returned on the lowest cost path.

### Default

no link

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure service ies subscriber-interface group-interface ipv6 dhcp6 relay link-address

configure service ies subscriber-interface ipv6 dhcp6 relay link-address

configure service vprn subscriber-interface ipv6 dhcp6 relay link-address

## Description

This command configures the link address used for prefix selection at the DHCP server.

The link-address is a field in DHCP6 Relay-Forward message that is used in DHCP6 server to select the IPv6 address (IA-NA) or IPv6 prefix (IA-PD) from a pool with configured prefix range covering the link-address. The selection scope is the pool or a prefix range within the pool.

The **no** form of this command reverts to the default.

### Default

no link-address

### Parameters

#### *ipv6-address*

Specifies the link-address.

| Values | ipv6-address | x:x:x:x:x:x:x (eight 16-bit pieces) |
|--------|--------------|-------------------------------------|
|        |              | x:x:x:x:x:d.d.d.d                   |
|        |              | x - [0 to FFFF]H                    |
|        |              | d - [0 to 255]D                     |

configure service vprn interface sap ipsec-gw dhcp6 link-address

configure service ies interface sap ipsec-gw dhcp6 link-address

## Description

This command specifies the link address of the relayed DHCPv6 packets sent by the system.

## Default

no link-address

## Parameters

### *ipv6-address*

Specifies a global unicast IPv6 address.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.143 link-bandwidth

### link-bandwidth

## Syntax

link-bandwidth

## Context

[\[Tree\]](#) (config>service>vprn>bgp>group>neighbor link-bandwidth)

[\[Tree\]](#) (config>service>vprn>bgp>group link-bandwidth)

## Full Context

configure service vprn bgp group neighbor link-bandwidth

configure service vprn bgp group link-bandwidth

## Description

This command enables the configuration context for handling the link-bandwidth extended community attached to specific BGP routes.

When all used multipaths of an IP prefix correspond to BGP routes with a link-bandwidth extended community, the datapath is programmed to do weighted ECMP across the BGP next-hops in proportion to the bandwidth values.

## Platforms

All

## link-bandwidth

### Syntax

## 16.144 link-fault

## link-fault

### Syntax

**link-fault local-port-action {log-only | out-of-service}**

### Context

**[Tree]** (config>port>ethernet>efm-oam>peer-rdi-rx link-fault)

### Full Context

configure port ethernet efm-oam peer-rdi-rx link-fault

### Description

This command defines how to react to the reception of a link fault flag set in the informational PDU from a peer.

## Default

link-fault local-port-action out-of-service

## Parameters

### local-port-action

Defines whether or not the local port will be affected when a link fault is received from a peer.

### log-only

Keyword that prevents the port from being affected when the local peer receives a link fault. The dying gasp will be logged but the port will remain operational.

### out-of-service

Keyword that causes the port to enter a non-operation down state with a port state of link up. The error will be logged upon reception of link fault event. The port will not be available to service data but will continue to carry Link OAM traffic to ensure the link is monitored.

## Platforms

configure service ies interface ipv6 link-local-address
configure service vprn subscriber-interface ipv6 link-local-address
configure router interface ipv6 link-local-address
```

## Description

This command configures the IPv6 Link Local address that is used as a virtual SRRP IPv6 address by the Master SRRP node. This address is sent in the Router Advertisements initiated by the Master SRRP node. Clients use this address as IPv6 default-gateway. Both SRRP nodes, Master and Backup, must be configured with the same Link Local address.

Only one link-local-address is allowed per interface.

### Caution:

Removing a manually configured link local address may impact routing protocols or static routes that have a dependency on that address. It is not recommended to remove a link local address when there are active IPv6 subscriber hosts on an IES or VPRN interface.

The **no** form of this command reverts to the default.

## Parameters

### *ipv6-address*

Specifies the IPv6 address in the form:

#### Values

```
ipv6-address: x:x:x:x:x:x:x
 x:x:x:x:x:d.d.d.d
 x - [0..FFFF]H
 d - [0..255]D
```

### *dad-disable*

Disables Duplicate Address Detection (DAD) and sets the address to preferred, even if there is a duplicated address.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface ipv6 link-local-address
- configure service vprn subscriber-interface ipv6 link-local-address

All

- configure service vprn interface ipv6 link-local-address
- configure router interface ipv6 link-local-address
- configure service ies interface ipv6 link-local-address

## 16.147 link-local-modifier

### link-local-modifier

#### Syntax

**link-local-modifier** *modifier*

**no link-local-modifier**

#### Context

**[Tree]** (config>service>ies>if>ipv6>secure-nd link-local-modifier)

#### Full Context

configure service ies interface ipv6 secure-nd link-local-modifier

#### Description

This command configures the Cryptographically Generated Address (CGA) modifier for link-local addresses.

#### Parameters

*modifier*

Specifies the modifier in 32 hexadecimal nibbles.

**Values** 0x0 to 0xFFFFFFFF

#### Platforms

All

### link-local-modifier

#### Syntax

**link-local-modifier** *modifier*

**[no] link-local-modifier**

#### Context

**[Tree]** (config>service>vprn>if>secure-nd link-local-modifier)

#### Full Context

configure service vprn interface secure-nd link-local-modifier

## Description

This command configures the Cryptographically Generated Address (CGA) modifier for link-local addresses.

## Parameters

### *modifier*

Specifies the modifier in 32 hexadecimal nibbles.

**Values** 0x0–0xFFFFFFFF

## link-local-modifier

## Syntax

**link-local-modifier** *modifier*

**no link-local-modifier**

## Context

[\[Tree\]](#) (config>router>if>ipv6>secure-nd link-local-modifier)

## Full Context

configure router interface ipv6 secure-nd link-local-modifier

## Description

This command configures the Cryptographically Generated Address (CGA) modifier for link-local addresses.

## Parameters

### *modifier*

Specifies the modifier in 32 hexadecimal nibbles.

**Values** 0x0 to 0xFFFFFFFF

## Platforms

All

## 16.148 link-map-profile

## link-map-profile

## Syntax

**link-map-profile** *link-map-profile-id* [**create**]

**no link-map-profile** *link-map-profile-id*

### Context

[\[Tree\]](#) (config lag link-map-profile)

### Full Context

configure lag link-map-profile

### Description

This command creates the link map profile that can to control which LAG ports are to be used on egress or enables the configuration context for previously created link map profile. link map profiles are not created by default.

The **no** form of this command, deletes the specified link map profile.

### Parameters

***link-map-profile-id***

An integer from 1 to 64 that defines a unique LAG link map profile on this LAG.

### Platforms

All

## 16.149 link-measurement

### link-measurement

### Syntax

**link-measurement**

### Context

[\[Tree\]](#) (config>test-oam link-measurement)

### Full Context

configure test-oam link-measurement

### Description

Commands in this context configure various link measurement template attributes that are inherited on associated IP interfaces for delay reporting to the routing engine.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 16.150 link-monitoring

### link-monitoring

#### Syntax

[no] link-monitoring

#### Context

[\[Tree\]](#) (config>port>ethernet>efm-oam>discovery>advertise-capabilities link-monitoring)

#### Full Context

configure port ethernet efm-oam discovery advertise-capabilities link-monitoring

#### Description

When the link monitoring function is in a no shutdown state, the Link Monitoring capability (EV) is advertised to the peer through the EFM OAM protocol. This may not be desired if the remote peer does not support the Link Monitoring functionality.

The **no** version of this command suppresses the advertisement of capabilities.

#### Default

link-monitoring

#### Platforms

All

### link-monitoring

#### Syntax

link-monitoring

#### Context

[\[Tree\]](#) (config>port>ethernet>efm-oam link-monitoring)

#### Full Context

configure port ethernet efm-oam link-monitoring

#### Description

This context contains link monitoring specific options defining the various local thresholds, port interaction and peer notification methods. In order to activate Link monitoring function, this context must be configured with the no shutdown option. Shutting down link monitoring will clear all historical link monitoring counters. If the port was removed from service and placed in a non-operational down state and a port state of link up

because a signal failure threshold was crossed and link monitoring is shutdown, the port will be returned to service assuming no underlying conditions prevent this return to service.

When the link monitoring function is in a **no shutdown** state, the Link Monitoring capability (EV) is advertised to the peer through the EFM OAM protocol. This may not be desired if the remote peer does not support the Link Monitoring functionality.

## Platforms

All

## 16.151 link-specific-rate

### link-specific-rate

#### Syntax

**link-specific-rate** *packet-rate-limit*

**no link-specific-rate**

#### Context

[\[Tree\]](#) (config>sys>security>cpu-protection link-specific-rate)

#### Full Context

configure system security cpu-protection link-specific-rate

#### Description

This command configures a link-specific rate for CPU protection. This limit is applied to all ports within the system. The CPU will receive no more than the configured packet rate for all link level protocols such as LACP from any one port. The measurement is cleared each second and is based on the ingress port.

#### Default

link-specific-rate 15000

#### Parameters

***packet-rate-limit***

Specifies a packet arrival rate limit, in packets per second, for link level protocols.

**Values** 1 to 65535, **max** (no limit)

#### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## 16.152 link-state-export-enable

### link-state-export-enable

#### Syntax

[no] link-state-export-enable

#### Context

[\[Tree\]](#) (config>router>bgp link-state-export-enable)

#### Full Context

configure router bgp link-state-export-enable

#### Description

This command enables the export of link-state information from the BGP-LS address family into the local Traffic Engineering Database (TED).

The **no** form of this command disables the export of link state information into the TED.

#### Default

no link-state-export-enable

#### Platforms

All

## 16.153 link-state-import-enable

### link-state-import-enable

#### Syntax

[no] link-state-import-enable

#### Context

[\[Tree\]](#) (config>router>bgp link-state-import-enable)

#### Full Context

configure router bgp link-state-import-enable

#### Description

This command enables the import of link-state information into the BGP-LS address family for advertisement to other BGP neighbors.

The **no** form of this command disables the import of link state information into the BGP-LS address family.

**Default**

no link-state-import-enable

**Platforms**

All

## 16.154 link-type

### link-type

**Syntax**

**link-type** {pt-pt | shared}

**no link-type** [pt-pt | shared]

**Context**

**[Tree]** (config>service>template>vpls-sap-template>stp link-type)

**[Tree]** (config>service>vpls>spoke-sdp>stp link-type)

**[Tree]** (config>service>vpls>sap>stp link-type)

**Full Context**

configure service template vpls-sap-template stp link-type

configure service vpls spoke-sdp stp link-type

configure service vpls sap stp link-type

**Description**

This command instructs STP on the maximum number of bridges behind this SAP or spoke-SDP. If there is only a single bridge, transitioning to forwarding state will be based on handshaking (fast transitions). If more than two bridges are connected via a shared media, their SAP or spoke-SDPs should all be configured as shared, and timer-based transitions are used.

The **no** form of this command returns the link type to the default value.

**Default**

link-type pt-pt

**Platforms**

All

## link-type

### Syntax

**link-type** {pt-pt | shared}

**no link-type**

### Context

**[Tree]** (config>service>pw-template>stp link-type)

### Full Context

configure service pw-template stp link-type

### Description

This command instructs STP on the maximum number of bridges behind this SAP or spoke SDP. If there is only a single bridge, transitioning to forwarding state will be based on handshaking (fast transitions). If more than two bridges are connected via a shared media, their SAP or spoke SDPs should all be configured as shared, and timer-based transitions are used.

The **no** form of this command returns the link type to the default value.

### Default

link-type pt-pt

## 16.155 linktrace

## linktrace

### Syntax

**linktrace** {*mac-address* | **remote-mepid** *mep-id*} **mep** *mep-id* **domain** *md-index* **association** *ma-index* [**t***ttl-value*]

### Context

**[Tree]** (oam>eth-cfm linktrace)

### Full Context

oam eth-cfm linktrace

### Description

The command initiates a linktrace test.

## Parameters

### *mac-address*

Specifies a unicast MAC address destination.

**Values** xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

### *remote-mepid mep-id*

Specifies the remote MEP ID of the peer within the association. The domain and association information are derived from the **source mep** for the session. The Layer 2 IEEE MAC address is resolved from previously-learned remote MAC addressing, derived from the reception and processing of the ETH-CC PDU. The local MEP must be administratively enabled.

**Values** 1 to 8191

### *mep mep-id*

Specifies the local MEP ID.

**Values** 1 to 8191

### *md-index*

Specifies the MD index.

**Values** 1 to 4294967295

### *ma-index*

Specifies the MA index.

**Values** 1 to 4294967295

### *ttl-value*

Specifies the TTL for a returned linktrace.

**Values** 0 to 255

**Default** 64

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 16.156 listening-port

### listening-port

## Syntax

**listening-port** *port*

**no listening-port**

## Context

[\[Tree\]](#) (config>system>grpc listening-port)

## Full Context

configure system grpc listening-port

## Description

This command configures the listening port for the gRPC server.

The **no** form of this command reverts to the default.

## Default

listening-port 57400

## Parameters

### *port*

Specifies the port number.

**Values** 1024 to 49151, 57400

**Default** 57400

## Platforms

All

## 16.157 live-output

### live-output

## Syntax

**live-output** *{ip-address | fqdn}* [**port** *port*] [**router** *{router-instance | service-name service-name}*]

**no live-output**

## Context

[\[Tree\]](#) (config>call-trace>trace-profile live-output)

## Full Context

configure call-trace trace-profile live-output

## Description

This command specifies a live output destination for this trace. When configured, captures will not be stored locally but sent (over UDP) to the server in the specified routing context. The destination can be

specified as either an IP address or a DNS FQDN. The **live-output** and **debug-output** commands are mutually exclusive.

The **no** form of this command disables live output streaming.

### Parameters

#### ***ip-address***

Specifies the IPv4 or IPv6 address of the server to stream to.

#### ***fqdn***

Specifies the FQDN that represents the server in DNS, up to 255 characters.

#### ***port***

Specifies the UDP port on which the server is listening.

**Values** 1 to 65535

**Default** 29770

#### ***router-instance***

Specifies the router instance in which the live output is forwarded.

#### ***service-name***

Specifies the name of the Layer 3 service in which the live output is forwarded.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 16.158 lldp

### lldp

#### Syntax

lldp

#### Context

**Platforms**

All

**16.159 llf**

## llf

### Syntax

[no] llf

### Context

[\[Tree\]](#) (config>service>epipe>sap>ethernet llf)

### Full Context

configure service epipe sap ethernet llf

### Description

This command enables Link Loss Forwarding (LLF) on an Ethernet port. This feature provides an end-to-end OAM fault notification for Ethernet VLL service. It brings down the Ethernet port (Ethernet LLF) or sends a SONET/SDH Path AIS (ATM LLF) toward the attached CE when there is a local fault on the Pseudowire or service, or a remote fault on the SAP or pseudowire, signaled with label withdrawal or T-LDP status bits. It ceases when the fault disappears.

The Ethernet port must be configured for null encapsulation.

This feature is also supported in Epipes with BGP-EVPN enabled. In this case, upon removal of the EVPN destination, the port is brought oper-down with flag LinkLossFwd, however the AD per-EVI route for the SAP is still advertised (the SAP is kept oper-up).

The **no** form of this command disables LLF on an Ethernet port.

### Default

no llf

### Platforms

All

## 16.160 Imm

## Imm

### Syntax

Imm [test-id *test-id*] [create]

no Imm

### Context

[\[Tree\]](#) (config>oam-pm>session>ethernet Imm)

## Full Context

```
configure oam-pm session ethernet lmm
```

## Description

This command configures the LMM test ID to be assigned to the Tx and Rx counter-based loss test and creates the individual test. LMM does not carry this test ID in the PDU; the value is of local significance.

The **no** form of this command removes the LMM test function from the PM Session.

## Parameters

### *test-id*

Specifies the value to be placed in the 4-byte test ID field of an ETH-DMM PDU.

**Values** 0 to 2147483647 | **auto**  
**auto** - automatically assigns a *test-id*

### **create**

Creates the test.

```

```
configure service vprn l2tp group tunnel Ins-group
```

## Description

This command configures the ISA LNS group for the L2TP group.

The **no** form of this command removes the LNS group ID from the configuration.

## Default

no lns-group

## Parameters

### *lns-group-id*

Specifies the LNS group ID.

**Values** 1 to 4

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## lns-group

## Syntax

**lns-group** *lns-group-id* [**create**]

**no lns-group** *lns-group-id*

## Context

[\[Tree\]](#) (config>isa lns-group)

## Full Context

configure isa lns-group

## Description

This command configures an LNS group.

The **no** form of the command removes the LNS group ID from the configuration.

## Parameters

### *lns-group-id*

Specifies the LNS group identifier.

**Values** 1 to 4

### **create**

Mandatory keyword used when creating tunnel group in the ISA context. The create keyword requirement can be enabled/disabled in the **environment>create** context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.162 load

### load

#### Syntax

**load** *file-url* [**overwrite** | **insert** | **append**]

#### Context

[\[Tree\]](#) (candidate load)

#### Full Context

candidate load

#### Description

This command loads a previously saved candidate configuration into the current candidate. The edit point will be set to the end of the loaded configuration lines. The candidate configuration cannot be modified while a load is in progress.

#### Default

If the candidate is empty then a load without any of the optional parameters (such as **overwrite**, and so on) will load the *file-url* into the candidate. If the candidate is not empty then one of the options, such as **overwrite**, **insert**, and so on, must be specified.

#### Parameters

##### ***file-url***

Specifies the directory and filename to load.

##### **overwrite**

Discards the contents of the current candidate and replace it with the contents of the file.

##### **insert**

Inserts the contents of the file at the current edit point.

##### **append**

Inserts the contents of the file at the end of the current candidate.

#### Platforms

All

## 16.163 load-balance-key

### load-balance-key

#### Syntax

**load-balance-key** [**vendor** *vendor-id* [*vendor-id*]] **attribute-type** *attribute-type* [*attribute-type*]

**load-balance-key source-ip-udp**

**no load-balance-key**

#### Context

**[Tree]** (config>service>vprn>radius-proxy>server load-balance-key)

**[Tree]** (config>router>radius-proxy>server load-balance-key)

#### Full Context

configure service vprn radius-proxy server load-balance-key

configure router radius-proxy server load-balance-key

#### Description

This command specifies the key used in calculating a hash to select an external RADIUS server from the pool of configured servers.

The key can be the source IP and source UDP port tuple, or the specified RADIUS attribute in RADIUS packets.

The **no** form of this command removes the parameters from the configuration.

#### Parameters

##### *vendor-id*

Specifies the vendor-id of vendor-specific attribute.

**Values** 0 to 16777215

##### *attribute-type*

Specifies that the key is constructed with the attributes in the RADIUS message.

**Values** 1 to 255

##### **source-ip-udp**

Specifies that the key consists of the source IP address and source UDP port of the RADIUS message.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 16.164 load-balance-method

### load-balance-method

#### Syntax

**load-balance-method** {**per-session** | **per-tunnel**}

**no load-balance-method**

#### Context

**[Tree]** (config>router>l2tp>group load-balance-method)

**[Tree]** (config>service>vprn>l2tp>group>tunnel load-balance-method)

**[Tree]** (config>service>vprn>l2tp>group load-balance-method)

**[Tree]** (config>router>l2tp>group>tunnel load-balance-method)

#### Full Context

configure router l2tp group load-balance-method

configure service vprn l2tp group tunnel load-balance-method

configure service vprn l2tp group load-balance-method

configure router l2tp group tunnel load-balance-method

#### Description

This command is applicable only to LNS. By default traffic load balancing between the BB-ISAs is based on sessions. Each session is individually assigned to an BB-ISA during session establishment phase.

By introducing MLPPPoX, all sessions of a bundle must be terminated on the same LNS BB-ISA. This is necessary for two reasons:

- QoS in the carrier IOM has a uniform view of the subscriber
- a single BB-ISA is responsible for MLPPPoX encapsulation/fragmentation for a given bundle.

Therefore, if fragmentation is enabled, load-balancing per tunnel must be configured. In the per tunnel load-balancing mode, all sessions within the same tunnel are terminated on the same LNS BB-ISA.

In the case that we have MLPPPoX sessions with a single member link, both load-balancing methods are valid.

The **no** form of this command reverts to the default.

#### Default

load-balance-method per-session

#### Parameters

##### **per-session**

Specifies that the traffic load balancing between the LNS BB-ISAs is based on individual PPPoE sessions.

**per-tunnel**

Specifies that the traffic load balancing between the LNS BB-ISAs is based on tunnels.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 16.166 load-balancing-algorithm

### load-balancing-algorithm

#### Syntax

**load-balancing-algorithm** *option*

**no load-balancing-algorithm**

#### Context

**[Tree]** (config>port>tdm>ds1>channel-group load-balancing-algorithm)

**[Tree]** (config>port>tdm>ds3 load-balancing-algorithm)

**[Tree]** (config>port>tdm>e1>channel-group load-balancing-algorithm)

**[Tree]** (config>port>tdm>e3 load-balancing-algorithm)

**[Tree]** (config>port>ethernet load-balancing-algorithm)

**[Tree]** (config>port>sonet-sdh>path load-balancing-algorithm)

#### Full Context

configure port tdm ds1 channel-group load-balancing-algorithm

configure port tdm ds3 load-balancing-algorithm

configure port tdm e1 channel-group load-balancing-algorithm

configure port tdm e3 load-balancing-algorithm

configure port ethernet load-balancing-algorithm

configure port sonet-sdh path load-balancing-algorithm

#### Description

This command specifies the load balancing algorithm to be used on this port.

In the default mode, **no load-balancing-algorithm**, the port inherits the global settings. The value is not applicable for ports that do not pass any traffic.

The configuration of load-balancing-algorithm at logical port level has three possible values:

- **include-l4** — Enables inherits system-wide settings including Layer 4 source and destination port value in hashing algorithm.
- **exclude-l4** — Layer 4 source and destination port value will not be included in hashing.
- **no load-balancing-algorithm** — Inherits system-wide settings.

The hashing algorithm addresses finer spraying granularity where many hosts are connected to the network. To address more efficient traffic distribution between network links (forming a LAG group), a hashing algorithm extension takes into account Layer 4 information (src/dst L4-protocol port). The hashing index can be calculated according to the following algorithm:

If [(TCP or UDP traffic) & enabled]

hash (<TCP/UDP ports>, <IP addresses>)

else if (IP traffic)

hash (<IP addresses>)

else

hash (<MAC addresses>)

endif

This algorithm will be used in all cases where IP information in per-packet hashing is included (refer to "Traffic Load Balancing Options" in the *7450 ESS*, *7750 SR*, *7950 XRS*, and *VSR Interface Configuration Guide*). However the Layer 4 information (TCP/UDP ports) will not be used in the following cases:

- fragmented packets

## Default

no load-balancing-algorithm

## Parameters

### *option*

Specifies the load balancing algorithm to be used on this port.

**Values** **include-l4** — Specifies that the source and destination ports are used in the hashing algorithm. **exclude-l4** — Specifies that the source and destination ports are not used in the hashing algorithm.

## 16.167 load-balancing-weight

### load-balancing-weight

#### Syntax

**load-balancing-weight** *value*  
**no load-balancing-weight** [*value*]

#### Context

**[Tree]** (config>service>vprn>static-route-entry>next-hop load-balancing-weight)

#### Full Context

configure service vprn static-route-entry next-hop load-balancing-weight

#### Description

This command configures a weighted ECMP load-balancing weight for a static route next-hop.

If all of the ECMP next-hops of a static route have a configured load-balancing-weight then packets matching the route are sprayed according to the relative weights. In other words, the next-hop interface with the largest load-balancing weight should receive the most forwarded traffic if weighted ECMP is applicable.

The **no** form of this command disables weighted ECMP for the interface and effectively disables weighted ECMP for the entire static route.

#### Parameters

*value*

Specifies the cost metric value.

**Values** 0 to 4294967295

#### Platforms

All

### load-balancing-weight

#### Syntax

**load-balancing-weight** [*weight*]  
**no load-balancing-weight**

#### Context

**[Tree]** (config>service>vprn>ospf>area>if load-balancing-weight)

[\[Tree\]](#) (config>service>vprn>ospf3>area>if load-balancing-weight)

### Full Context

```
configure service vprn ospf area interface load-balancing-weight
configure service vprn ospf3 area interface load-balancing-weight
```

### Description

This command configures the weighted ECMP load-balancing weight for an IS-IS, OSPF, and OSPF3 interface. If the interface becomes an ECMP next hop for an IPv4 or IPv6 route, and all the other ECMP next hops are interfaces with configured (non-zero) load-balancing weights, then the traffic distribution over the ECMP interfaces is proportional to the weights. This means that the interface with the largest load-balancing weight receives the most forwarded traffic if weighted ECMP is applicable.

The **no** form of this command disables weighted ECMP for the interface which effectively disables weighted ECMP for any IP prefix that has this interface as a next hop.

### Default

```
no load-balancing-weight
```

### Parameters

#### *weight*

Specifies the load balancing weight.

**Values** 1 to 4294967295

### Platforms

All

## load-balancing-weight

### Syntax

```
load-balancing-weight weight
no load-balancing-weight
```

### Context

[\[Tree\]](#) (config>service>vprn>isis>if load-balancing-weight)

### Full Context

```
configure service vprn isis interface load-balancing-weight
```

### Description

This command configures the weighted ECMP load-balancing weight for an IS-IS interface of the VPRN. If the interface becomes an ECMP next-hop for IPv4 or IPv6 route and all the other ECMP next-hops are interfaces with configured (non-zero) load-balancing weights, then the traffic distribution over the ECMP

interfaces is proportional to the weights. In other words, the interface with the largest **load-balancing-weight** should receive the most forwarded traffic if weighted ECMP is applicable.

The **no** form of this command disables weighted ECMP for the interface and, therefore, effectively disables weighted ECMP for any IP prefix that has this interface as a next-hop.

## Default

no load-balancing-weight

## Parameters

### *weight*

Specifies the load balancing weight.

**Values** 0 to 4294967295

## Platforms

All

## load-balancing-weight

## Syntax

**load-balancing-weight** *weight*

**no load-balancing-weight**

## Context

[\[Tree\]](#) (config>router>ldp>if-params>if load-balancing-weight)

## Full Context

configure router ldp interface-parameters interface load-balancing-weight

## Description

This command configures the load balancing weight for the LDP interface. The load balancing weight, normalized to 64, is used for weighted ECMP of LDP labeled packets over direct network IP interfaces.

If the interface becomes an ECMP next hop for an LDP FEC, and all the other ECMP next hops are interfaces with configured (non-zero) load-balancing weights, then the traffic distribution over the ECMP interfaces is proportional to the normalized weight with a granularity of 64.

If one or more of the LDP interfaces in the ECMP set does not have a configured load-balancing weight, then the system falls back to ECMP.

The **no** form of this command removes the load balancing weight for the LDP interface.

## Parameters

### *weight*

Specifies the load balancing weight value.

**Values** 0 to 4294967295

## Platforms

All

## load-balancing-weight

## Syntax

**load-balancing-weight** *weight*

**no load-balancing-weight**

## Context

[\[Tree\]](#) (config>router>mpls>lsp load-balancing-weight)

## Full Context

configure router mpls lsp load-balancing-weight

## Description

This command assigns a weight to an MPLS LSP for use in the weighted load-balancing, or weighted ECMP, over MPLS feature.

## Parameters

***weight***

Specifies a 32-bit integer representing the weight of the LSP.

**Values** 0 to 4294967295

## Platforms

All

## load-balancing-weight

## Syntax

**load-balancing-weight** *weight*

**no load-balancing-weight**

## Context

[\[Tree\]](#) (config>router>mpls>fwd-policies>fwd-policy>nh-grp load-balancing-weight)

## Full Context

configure router mpls forwarding-policies forwarding-policy next-hop-group load-balancing-weight

## Description

This command configures the load balancing weight of an NHG entry in a forwarding policy.

A weight for each NHG of a policy must be assigned to the weighted ECMP forwarding to operate over the set of NHGs of the policy.

The **no** form of this command removes the load balancing weight from an NHG entry in a forwarding policy.

## Parameters

### *weight*

Specifies the load balancing weight value.

**Values** 1 to 4294967295

## Platforms

All

## load-balancing-weight

## Syntax

**load-balancing-weight** *value*

**no load-balancing-weight** [*value*]

## Context

## Context

[\[Tree\]](#) (config>service>vpn>tfl-propagate local)

## Full Context

configure service vpn tfl-propagate local

## Description

This command overrides the global configuration of the TTL propagation for locally generated packets which are forwarded over a MPLS LSPs in a given VPRN service context.

The global configuration is performed under `config>router>ttl-propagate>vprn-local`.

The default behavior for a given VPRN instance is to inherit the global configuration for the same command. The user can explicitly set the default behavior by configuring the inherit value

## Default

local inherit

## Parameters

### *inherit*

Specifies the TTL propagation behavior is inherited from the global configuration under `config>router>ttl-propagate>vprn-local`.

### *none*

Specifies the TTL of the IP packet is not propagated into the VC label or labels in the transport label stack.

### *vc-only*

Specifies the TTL of the IP packet is propagated into the VC label and not into the labels in the transport label stack.

### *all*

Specifies the TTL of the IP packet is propagated into the VC label and all labels in the transport label stack.

**no local-address**

### Context

[\[Tree\]](#) (config>subscr-mgmt>bgp-prng-plcy local-address)

### Full Context

configure subscriber-mgmt bgp-peering-policy local-address

### Description

This command configures the local IP address used by the group or neighbor when communicating with BGP peers.

Outgoing connections use the **local-address** as the source of the TCP connection when initiating connections with a peer.

When a local address is not specified, the 7750 SR OS uses the system IP address when communicating with IBGP peers and uses the interface address for directly connected EBGP peers. This command is used at the neighbor level to revert to the value defined under the group level.

The **no** form of this command removes the configured local-address for BGP.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

### Parameters

#### *ip-address*

Specifies the IPv4 or IPv6 address of the local address.

For IPv4, the local address is expressed in dotted decimal notation. Allowed values are a valid routable IP address on the router, either an interface or system IP address.

For IPv6, the local address is expressed in semi-colon hexadecimal notation. Allowed values is an interface or a system IP address.

#### Values

*ipv4-address:* a.b.c.d

*ipv6-address:* x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

## Platforms

### Syntax

**local-address** *ip-address*

**no local-address**

### Context

**[Tree]** (config>service>vprn>gsmp>group>neighbor local-address)

**[Tree]** (config>service>vpls>gsmp>group>neighbor local-address)

### Full Context

configure service vprn gsmp group neighbor local-address

configure service vpls gsmp group neighbor local-address

### Description

This command configures the source ip-address used in the connection towards the neighbor. The local address is optional. If specified the node will accept connections only for that address in the service running ANCP. The address may be created after the reference but connections will not be accepted until it is created. If the local address is not used, the system accepts connections on any interface within the routing context.

The **no** form of this command reverts to the default.

### Parameters

***ip-address***

Specifies the source IP address to be used in the connection toward the neighbor.

**Values** *ip-address*: a.b.c.d. (unicast address only)

### Platforms

configure service vprn msdp peer local-address

configure service vprn msdp group local-address

configure service vprn msdp group peer local-address

configure service vprn msdp local-address

## Description

This command configures the local end of a Multicast Source Discovery Protocol (MSDP) session. For MSDP to function, at least one peer must be configured. When configuring a peer, you must include this **local-address** command to configure the local end of the MSDP session. This address must be present on the node and is used to validate incoming connections to the peer and to establish connections to the remote peer.

If the user enters this command, then the address provided is validated and will be used as the local address for MSDP peers from that point. If a subsequent **local-address** command is entered, it will replace the existing configuration and existing sessions will be terminated.

Similarly, when the **no** form of this command is entered, the existing local address will be removed from the configuration and the existing sessions will be terminated.

Whenever a session is terminated, all information pertaining to and learned from that peer will be removed.

Whenever a new peering session is created or a peering session is lost, an event message should be generated.

The **no** form of this command removes the local address from the configuration.

## Default

no local-address

## Parameters

***ip-address***

Specifies an existing address on the node.

## Platforms

All

# local-address

## Syntax

**local-address** *ip-address*

**no local-address**

## Context

**[Tree]** (config>router>pcep>pcc local-address)

**[Tree]** (config>router>pcep>pce local-address)

## Full Context

configure router pcep pcc local-address

configure router pcep pce local-address

## Description

This command configures the local IPv4 address of the PCEP speaker.

The PCEP protocol operates over TCP using destination TCP port 4189. The PCE client (PCC) always initiates the connection. After the user configures the PCEP local IPv4 address and the peer IPv4 address on the PCC, the latter initiates a TCP connection to the PCE. If both a local IPv4 and a local IPv6 address are configured, the connection uses the local address that is the same family as the peer address. When the connection is established, the PCC and PCE exchange OPEN messages, which initializes the PCEP session and exchanges the session parameters to be negotiated.

By default, the PCC attempts to reach the remote PCE address out of band using the management port. If it cannot, it attempts to reach the remote PCE address in band. The user can change the configuration of the peer to attempt connecting in band only or out of band only. When the session comes up out of band, the management IP address is used as the local address. The local IPv4 address configured by the user is only used for in-band sessions and is otherwise ignored.

The **no** form of the command removes the configured local address of the PCEP speaker.

## Parameters

### *ip-address*

Specifies the IP address of the PCEP speaker to be used for in-band sessions.

## Platforms

All

- configure router pcep pcc local-address

VSR-NRC

- configure router pcep pce local-address

## Full Context

configure router origin-validation rpki-session local-address

## Description

This command configures the local address to use for setting up the TCP connection used by an RPKI-Router session. The default local-address is the outgoing interface IPv4 or IPv6 address. The local-address cannot be changed without first shutting down the session.

## Default

no local-address

## Parameters

### *ip-address*

Specifies an IPv4 address or an IPv6 address.

## Platforms

All

## local-address

### Syntax

**local-address** [*ip-int-name* | *ip-address* | *ipv6-address*]

**no local-address**

### Context

**[Tree]** (config>router>bgp>group>neighbor local-address)

**[Tree]** (config>router>bgp>group local-address)

### Full Context

configure router bgp group neighbor local-address

configure router bgp group local-address

### Description

This command configures the local IP address used by the group or neighbor when communicating with BGP peers.

Outgoing connections use the **local-address** as the source of the TCP connection when initiating connections with a peer.

When a local address is not specified, the router uses the system IP address when communicating with IBGP peers and uses the interface address for directly connected EBGP peers. This command is used at the neighbor level to revert to the value defined under the group level.

When set to a router interface, the **local-address** inherits the primary IPv4 or IPv6 address of the router interface depending on whether BGP is configured for IPv4 or IPv6. If the corresponding IPv4 or IPv6 address is not configured on the router interface, the BGP sessions that have this interface set as the **local-address** are kept down until an interface address is configured on the router interface.

The **no** form of this command removes the configured local-address for BGP.

The **no** form of this command used at the group level returns the configuration to the value defined at the global level.

The **no** form of this command used at the neighbor level returns the configuration to the value defined at the group level.

### Default

no local-address

### Parameters

#### *ip-address*

Specifies the local address expressed in dotted decimal notation. Allowed value is a valid routable IP address on the router, either an interface or system IP address.

- Values** ipv4-address:
- a.b.c.d (host bits must be 0)

### ***ipv6-address***

Specifies the local address expressed in dotted decimal notation. Allowed value is a valid routable IPv6 address on the router, either an interface or system IPv6 address.

- Values** ipv6-address:
- x:x:x:x:x:x:x (eight 16-bit pieces)
  - x:x:x:x:x:d.d.d.d
  - x: [0 to FFFF]H
  - d: [0 to 255]D

### ***ip-int-name***

Specifies the IP interface name whose address the local address will inherit. The interface can be any network interface configured on the system.

## **Platforms**

All

## **local-address**

## **Syntax**

**local-address** *ip-address* | *ipv6-address*

**no local-address**

## **Context**

[\[Tree\]](#) (config>bmp>station>connection local-address)

## **Full Context**

configure bmp station connection local-address

## **Description**

This command configures the local IP address used by the local router when communicating with the BMP monitoring station. This configuration is optional.

Outgoing connections use the local-address as the source of the TCP connection when initiating connections with a monitoring station.

The BMP session may flap when this parameter is changed. Shut down the BMP session before changing the values.

The **no** form of this command removes the configured local-address for the BMP session. The default is to use the system IP address.

## Default

local-address ip-address (system IP address)

## Parameters

### *ip-address*

Specifies the local address expressed in dotted decimal notation. Allowed value is a valid routable IP address on the router, either an interface or system IP address.

- Values** ipv4-address:
- a.b.c.d (host bits must be 0)

### *ipv6-address*

Specifies the local address expressed in dotted decimal notation. Allowed value is a valid routable IPv6 address on the router, either an interface or system IPv6 address.

- Values** ipv6-address:
- x:x:x:x:x:x:x (eight 16-bit pieces)
  - x:x:x:x:x:d.d.d.d
  - x: [0 to FFFF]H
  - d: [0 to 255]D

## 16.171 local-address-ipv6

### local-address-ipv6

#### Syntax

**local-address-ipv6** *ipv6-address*

**no local-address-ipv6**

#### Context

**[Tree]** (config>router>pcep>pce local-address-ipv6)

**[Tree]** (config>router>pcep>pcc local-address-ipv6)

#### Full Context

configure router pcep pce local-address-ipv6

configure router pcep pcc local-address-ipv6

#### Description

This command configures the local IPv6 address of the PCEP speaker.

The PCEP protocol operates over TCP using destination TCP port 4189. The PCE client (PCC) always initiates the connection. After the user configures the PCEP local IPv6 address and the peer IPv6 address on the PCC, the latter initiates a TCP connection to the PCE. If both a local IPv4 and a local IPv6 address are configured, the connection uses the local address that is the same family as the peer address. When the connection is established, the PCC and PCE exchange OPEN messages, which initializes the PCEP session and exchanges the session parameters to be negotiated.

By default, the PCC attempts to reach the remote PCE address out of band using the management port. If it cannot, it attempts to reach the remote PCE address in-band. The user can change the configuration of the peer to attempt connecting in band only or out of band only. When the session comes up out of band, the management IP address is used as the local address. The local IPv6 address configured by the user is only used for in-band sessions and is otherwise ignored.

The **no** form of the command removes the configured local address of the PCEP speaker.

#### Parameters

***ipv6-address***

Specifies the IP address of the PCEP speaker to be used for in-band sessions.

#### Platforms

VSR-NRC

- configure router pcep pce local-address-ipv6

All

- configure router pcep pcc local-address-ipv6

## 16.172 local-age

### local-age

#### Syntax

**local-age** *aging-timer*

**no local-age** [*aging-timer*]

#### Context

[\[Tree\]](#) (config>service>template>vpls-template local-age)

[\[Tree\]](#) (config>service>vpls local-age)

#### Full Context

configure service template vpls-template local-age

configure service vpls local-age

#### Description

Specifies the aging time for locally learned MAC addresses in the forwarding database (FDB) for the Virtual Private LAN Service (VPLS) instance. In a VPLS service, MAC addresses are associated with a Service Access Point (SAP) or with a Service Distribution Point (SDP). MACs associated with a SAP are classified as local MACs, and MACs associated with an SDP are remote MACs.

Like in a Layer 2 switch, learned MACs can be aged out if no packets are sourced from the MAC address for a period of time (the aging time). In each VPLS service instance, there are independent aging timers for local learned MAC and remote learned MAC entries in the FDB. The **local-age** timer specifies the aging time for local learned MAC addresses.

The **no** form of this command returns the local aging timer to the default value.

#### Default

local age 300 — Local MACs aged after 300 seconds.

#### Parameters

***aging-timer***

Specifies the aging time for local MACs expressed in seconds

**Values** 60 to 86400

#### Platforms

All

## 16.173 local-as

```
local-as
```

### Syntax

```
local-as as-number [private]
```

```
no local-as
```

### Context

**[Tree]** (config>subscr-mgmt>bgp-prng-plcy local-as)

### Full Context

```
configure subscriber-mgmt bgp-peering-policy local-as
```

### Description

This command configures a BGP virtual autonomous system (AS) number.

In addition to the AS number configured for BGP in the config>router>autonomous-system context, a virtual (local) AS number is configured. The virtual AS number is added to the as-path message before the router's AS number makes the virtual AS the second AS in the as-path.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). Thus, by specifying this at each neighbor level, it is possible to have a separate as-number per EBGP session.

When a command is entered multiple times for the same AS, the last command entered is used in the configuration. The **private** attribute can be added or removed dynamically by reissuing the command.

Changing the local AS at the global level in an active BGP instance causes the BGP instance to restart with the new local AS number. Changing the local AS at the global level in an active BGP instance causes BGP to re-establish the peer relationships with all peers in the group with the new local AS number. Changing the local AS at the neighbor level in an active BGP instance causes BGP to re-establish the peer relationship with the new local AS number.

This is an optional command and can be used in the following circumstance:

Provider router P is moved from AS1 to AS2. The customer router that is connected to P, however, is configured to belong to AS1. To avoid reconfiguring the customer router, the **local-as** value on router P can be set to AS1. Thus, router P adds AS1 to the as-path message for routes it advertises to the customer router.

The **no** form of this command used at the global level will remove any virtual AS number configured.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

### Parameters

***as-number***

Specifies the virtual autonomous system number, expressed as a decimal integer.

**Values** 1 to 4294967295

**private**

Specifies that the local-as number is hidden in paths learned from the peering.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## local-as

**Syntax**

**local-as** *as-number* [**private**] [**no-prepend-global-as**]

**no local-as**

**Context**

**[Tree]** (config>service>vprn>bgp>group>neighbor local-as)

**[Tree]** (config>service>vprn>bgp>group local-as)

**[Tree]** (config>service>vprn>bgp local-as)

**Full Context**

configure service vprn bgp group neighbor local-as

configure service vprn bgp group local-as

configure service vprn bgp local-as

**Description**

This command configures a BGP virtual autonomous system (AS) number.

In addition to the global AS number configured for BGP in the config>router>autonomous-system context, a virtual (local) AS number can be configured to support various AS number migration scenarios. The local AS number is added to the beginning of the as-path attribute ahead of the router's AS number.

This configuration parameter can be set at three levels: global level (applies to all EBGP peers), group level (applies to all EBGP peers in peer-group) or neighbor level (only applies to EBGP specified peer). Thus, by specifying this at each neighbor level, it is possible to have a separate local-as per EBGP session. The local-as command is not supported for IBGP sessions. When the optional **private** keyword is specified in the command the local-as number is not added to inbound routes from the EBGP peer that has **local-as** in effect.

When a command is entered multiple times for the same AS, the last command entered is used in the configuration. The **private** attribute can be added or removed dynamically by reissuing the command.

Changing the local AS at the global level in an active BGP instance causes the BGP instance to restart with the new local AS number. Changing the local AS at the global level in an active BGP instance causes BGP to re-establish the peer relationships with all peers in the group with the new local AS number. Changing the local AS at the neighbor level in an active BGP instance causes BGP to re-establish the peer relationship with the new local AS number.

This is an optional command and can be used in the following circumstance:

Provider router P is moved from AS1 to AS2. The customer router that is connected to P, however, is configured to belong to AS1. To avoid reconfiguring the customer router, the **local-as** value on router P can be set to AS1. Thus, router P adds AS1 to the as-path message for routes it advertises to the customer router.

The **no** form of this command used at the global level removes any virtual AS number configured.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

## Default

no local-as

## Parameters

### *as-number*

The virtual autonomous system number, expressed as a decimal integer.

**Values** 1 to 65535

### **private**

Specifies the local-as is hidden in paths learned from the peering.

### **no-prepend-global-as**

Specifies that the global-as is hidden in paths announced to the EBGP peer.

## Platforms

All

## local-as

## Syntax

**local-as** *as-number* [**private**] [no-prepend-global-as]

**no local-as**

## Context

[\[Tree\]](#) (config>router>bgp>group>neighbor local-as)

[\[Tree\]](#) (config>router>bgp local-as)

[\[Tree\]](#) (config>router>bgp>group local-as)

## Full Context

configure router bgp group neighbor local-as

configure router bgp local-as

configure router bgp group local-as

## Description

This command configures a BGP local autonomous system (AS) number. In addition to the global AS number configured for BGP using the `autonomous-system` command, a local AS number can be configured to support various AS number migration scenarios.

When the **local-as** command is applied to a BGP neighbor and the local-as is different from the peer-as, the session comes up as EBGP and by default the global-AS number and then (in that order) the local-as number are prepended to the `AS_PATH` attribute in outbound routes sent to the peer. In received routes from the EBGP peer, the local AS is prepended to the AS path by default, but this can be disabled with the **private** option.

When the **local-as** command is applied to a BGP neighbor and the local-as is the same as the peer-as, the session comes up as IBGP, and by default, the global-AS number is prepended to the `AS_PATH` attribute in outbound routes sent to the peer.

This configuration parameter can be set at three levels: global level (applies to all BGP peers), group level (applies to all BGP peers in group) or neighbor level (only applies to one specific BGP neighbor). By specifying this at the neighbor level, it is possible to have a separate **local-as** for each BGP session.

When the optional **no-prepend-global-as** command is configured, the global-as number is not added in outbound routes sent to an IBGP or EBGP peer.

When a command is entered multiple times for the same AS, the last command entered is used in the configuration. The **private** option can be added or removed dynamically by reissuing the command. Changing the local AS at the global level in an active BGP instance causes the BGP instance to restart with the new local AS number. Changing the local AS at the global level in an active BGP instance causes BGP to re-establish the peer relationships with all peers in the group with the new local AS number. Changing the local AS at the neighbor level in an active BGP instance causes BGP to re-establish the peer relationship with the new local AS number.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

## Default

no local-as

## Parameters

### *as-number*

Specifies the virtual autonomous system number expressed as a decimal integer.

**Values** 1 to 4294967295

### **private**

Specifies the local-as is hidden in paths learned from the peering.

### **no-prepend-global-as**

Specifies that the global-as is hidden in paths announced to the BGP peer.

## 16.174 local-attachment-circuit

### local-attachment-circuit

#### Syntax

**local-attachment-circuit** *ac-name* [**endpoint** *endpoint-name*] [**bgp** *bgp-instance*] [**create**]

**no local-attachment-circuit** *ac-name*

#### Context

[\[Tree\]](#) (config>service>epipe>bgp-evpn local-attachment-circuit)

#### Full Context

configure service epipe bgp-evpn local-attachment-circuit

#### Description

This command configures a local attachment circuit (AC) in which the local Ethernet tag can be configured.

The **no** form of this command disables the context.

#### Default

no local-attachment-circuit

#### Parameters

##### ***ac-name***

Specifies the name of the local attachment circuit, up to 32 characters.

##### ***endpoint-name***

Specifies the name of the endpoint, up to 32 characters.

##### ***bgp-instance***

Specifies the BGP instance ID.

**Values** 1 to 2

**Default** 1

##### **create**

Keyword used to create the local AC.

#### Platforms

All

## 16.175 local-auth-db

### local-auth-db

#### Syntax

**local-auth-db** *name*

**no local-auth-db**

#### Context

[\[Tree\]](#) (config>service>dynsvc>policy>auth local-auth-db)

#### Full Context

configure service dynamic-services dynamic-services-policy authentication local-auth-db

#### Description

This command configures the local authentication database to be used for local authentication of data-triggered dynamic services.

Local authentication and RADIUS authentication are mutually exclusive.

The **no** form of this command removes the local authentication database from the configuration and disables local authentication.

#### Parameters

*name*

local authentication database name, up to 32 characters.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### local-auth-db

#### Syntax

**local-auth-db** *name* [**create**]

**no local-auth-db** *name*

#### Context

[\[Tree\]](#) (config>service>dynsvc local-auth-db)

#### Full Context

configure service dynamic-services local-auth-db

## Description

This command creates a local authentication database that can be used for local authentication of data-triggered dynamic services.

The **no** form of this command removes the local authentication database from the configuration.

## Parameters

### *name*

Specifies a local authentication database name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 16.176 local-dhcp-server

### local-dhcp-server

## Syntax

**local-dhcp-server** *server-name* [**create**]

**no local-dhcp-server** *server-name*

## Context

[\[Tree\]](#) (config>service>vprn>dhcp local-dhcp-server)

[\[Tree\]](#) (config>router>dhcp local-dhcp-server)

## Full Context

configure service vprn dhcp local-dhcp-server

configure router dhcp local-dhcp-server

## Description

This command instantiates a local DHCP server. A local DHCP server can serve multiple interfaces but is limited to the routing context it was which it was created.

The **no** form of this command reverts to the default.

## Parameters

### *server-name*

Specifies the name of local DHCP server, up to 32 characters.

### **create**

Keyword used to create the local DHCP server. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## local-dhcp-server

### Syntax

**local-dhcp-server** *server-name* [**create**] [**auto-provisioned**]

**no local-dhcp-server** *server-name*

### Context

[\[Tree\]](#) (config>router>dhcp6 local-dhcp-server)

### Full Context

configure router dhcp6 local-dhcp-server

### Description

This command instantiates a DHCP6 server. A local DHCP6 server can serve multiple interfaces but is limited to the routing context it was which it was created.

The **no** form of this command reverts to the default.

### Parameters

#### **server-name**

Specifies the name of local DHCP6 server, up to 32 characters.

#### **create**

Keyword used to create the local DHCP or DHCP6 server. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

#### **auto-provisioned**

Specifies the auto provisioning mode. This parameter only applies to DHCP6 creation to configure DHCP6 default values.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## local-dhcp-server

### Syntax

[**no**] **local-dhcp-server** *server-name* [**lease-address** *ip-prefix*[*prefix-length*]]

[**no**] **local-dhcp-server** *server-name* [**mac** *ieee-address*]

**Context**

[\[Tree\]](#) (debug>router local-dhcp-server)

**Full Context**

debug router local-dhcp-server

**Description**

This command enables, disables or configures debugging for a local DHCP server.

**Parameters*****server-name***

Specifies an existing local DHCP server name.

***ip-prefix[/prefix-length]***

Specifies the IP prefix and prefix length of the subnet.

**Values** ip-prefix — a.b.c.d (host bits must be 0)  
length — 0 to 32

***ieee-address***

Specifies that the provisioned MAC address for the local DHCP server.

***ipv6z-address***

Specifies the IPv6z address.

ipv6-address: x:x:x:x:x:x:x [-interface]

x:x:x:x:x:d.d.d.d [-interface]

x: [0 to FFFF]H

d: [0 to 255]D

interface up to 32 characters, mandatory for link local addresses

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## Full Context

configure router interface ipv6 local-dhcp-server

configure router interface local-dhcp-server

## Description

This command instantiates a local DHCP server. A local DHCP server can serve multiple interfaces but is limited to the routing context in which it was created.

The **no** form of this command reverts to the default value.

## Default

no local-dhcp-server

## Parameters

### *local-server-name*

Specifies the name of local DHCP server, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 16.177 local-ecid

local-ecid

## Syntax

**local-ecid** *emulated circuit identifier*

**no local-ecid**

## Context

[\[Tree\]](#) (config>service>epipe>sap>cem local-ecid)

## Full Context

configure service epipe sap cem local-ecid

## Description

This command defines the Emulated Circuit Identifiers (ECID) to be used for the local (source) end of the circuit emulation service.

The **no** form of this command removes the ECID from the configuration.

### Default

local-ecid 65535

### Parameters

#### *emulated circuit identifier*

Specifies the value to be used as the local (source) ECID for the circuit emulation service. On CES packet reception, the ECID in the packet will be compared to the configured local-ecid value. These must match for the packet payload to be used for the TDM circuit. The remote-ecid value is inserted into the MEF-8 CES packet to be transmitted.

**Values** 0 to 1048575

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 16.178 local-end

### local-end

#### Syntax

**local-end** {*ip-address* | *ipv6-address*}

**no local-end**

#### Context

[\[Tree\]](#) (config>service>sdp local-end)

#### Full Context

configure service sdp local-end

#### Description

This command configures the local-end address of the following SDP encapsulation types:

- IPv6 address of the termination point of a SDP of encapsulation **I2tpv3** (L2TP v3 tunnel).
- IPv4/IPv6 source address of a SDP of encapsulation **eth-gre-bridged** (L2oGRE SDP).
- IPv4 source address of a SDP of encapsulation **gre** (GRE SDP).

A change to the value of the local-end parameter requires that the SDP be shut down.

When used as the source address of a SDP of encapsulation **gre** (GRE SDP), the primary IPv4 address of any local network IP interface, loopback or otherwise, may be used.

The address of the following interfaces are not supported:

- unnumbered network IP interface
- IES interface
- VPRN interface
- CSC VPRN interface

The **local-end** parameter value adheres to the following rules:

- A maximum of 15 distinct address values can be configured for all GRE SDPs under the **config>service>sdp>local-end** context, and all L2oGRE SDPs under the **config>service>system>gre-eth-bridged>tunnel-termination** context.
- The same source address cannot be used in both contexts since an address configured for a L2oGRE SDP matches an internally created interface that is not available to other applications.
- The **local-end** address of a GRE SDP, when different from system, need not match the primary address of an interface that has the MPLS-over-GRE termination subnet configured, unless a GRE SDP or tunnel from the far-end router terminates on this address.

The **no** form of the command removes the address from the local-end configuration.

## Parameters

### *ip-address* | *ipv6-address*

Specifies a IPv4 or IPv6 address for local-end of an SDP in dotted decimal notation.

#### Values

|              |                                     |
|--------------|-------------------------------------|
| ip-address   | a.b.c.d                             |
| ipv6-address | x:x:x:x:x:x:x (eight 16-bit pieces) |
|              | x:x:x:x:x:d.d.d.d                   |
|              | x - [0..FFFF]H                      |
|              | d - [0..255]D                       |

## Full Context

configure application-assurance group url-filter local-filtering

## Description

This command configures a URL filter policy for local filtering in order to filter traffic based on a list of URLs located on a file stored in the router compact flash.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.181 local-forward

### local-forward

#### Syntax

**local-forward** *local-forward-id* [**create**]

**no local-forward** *local-forward-id*

#### Context

[\[Tree\]](#) (config>system>satellite local-forward)

#### Full Context

configure system satellite local-forward

#### Description

This command creates a local-forward instance.

A local-forward instance creates a traffic bypass within the Ethernet satellite, which allows traffic to be forwarded between satellite client ports.

The **no** form of this command deletes the specified local-forward instance.

#### Parameters

##### **local-forward-id**

Specifies the ID number for the local-forward instance.

**Values** 1 to 10240

##### **create**

Creates a new local-forward instance.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 16.182 local-gateway-address

### local-gateway-address

#### Syntax

**local-gateway-address** [*ip-address* | *ipv6-address*]

**no local-gateway-address**

#### Context

[\[Tree\]](#) (config>service>ies>if>ipsec>ipsec-tunnel local-gateway-address)

[\[Tree\]](#) (config>router>if>ipsec>ipsec-tunnel local-gateway-address)

#### Full Context

configure service ies interface ipsec ipsec-tunnel local-gateway-address

configure router interface ipsec ipsec-tunnel local-gateway-address

#### Description

This command configures local gateway address of the IPsec gateway.

#### Parameters

##### *ip-address*

Specifies a unicast IPv4 address, up to 64 characters.

##### *ipv6-address*

Specifies a unicast global unicast IPv6 address, up to 64 characters.

#### Platforms

VSR

### local-gateway-address

#### Syntax

**local-gateway-address** *ip-address*

**no local-gateway-address**

#### Context

[\[Tree\]](#) (config>service>vprn>if>sap>ipsec-gw local-gateway-address)

[\[Tree\]](#) (config>service>ies>if>sap>ipsec-gw local-gateway-address)

#### Full Context

configure service vprn interface sap ipsec-gw local-gateway-address

```
configure service ies interface sap ipsec-gw local-gateway-address
```

### Description

This command configures local gateway address of the IPsec gateway.

### Parameters

#### *ip-address*

Specifies a unicast IPv4 address or a global unicast IPv6 address. This address must be within the subnet of the public interface.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## local-gateway-address

### Syntax

```
local-gateway-address ip-address peer ip-address delivery-service service-id
no local-gateway-address
```

### Context

[\[Tree\]](#) (config>service>vprn>if>sap>ipsec-tunnel local-gateway-address)

### Full Context

```
configure service vprn interface sap ipsec-tunnel local-gateway-address
```

### Description

This command specifies the local gateway address used for the tunnel and the address of the remote security gateway at the other end of the tunnel remote peer IP address to use.

### Default

no local-gateway-address

### Parameters

#### *ip-address*

IP address of the local end of the tunnel.

#### **delivery-service** *service-id*

The ID of the IES or VPRN (front-door) delivery service of this tunnel. Use this service-id to find the VPRN used for delivery.

**Values** *service-id*: 1 to 2147483648

*svc-name*: Specifies an existing service name up to 64 characters in length.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.183 local-id

### local-id

#### Syntax

**local-id** *type* [**value** *value*]

**no local-id**

#### Context

**[Tree]** (config>service>vprn>if>ipsec>ipsec-tunnel>dyn local-id)

**[Tree]** (config>service>vprn>if>sap>ipsec-tun>dyn local-id)

**[Tree]** (config>service>vprn>if>sap>ipsec-gw local-id)

**[Tree]** (config>service>ies>if>ipsec>ipsec-tunnel>dyn local-id)

**[Tree]** (config>service>ies>if>sap>ipsec-gw local-id)

**[Tree]** (config>router>if>ipsec>ipsec-tunnel>dyn local-id)

**[Tree]** (config>ipsec>trans-mode-prof>dyn local-id)

#### Full Context

configure service vprn interface ipsec ipsec-tunnel dynamic-keying local-id

configure service vprn interface sap ipsec-tunnel dynamic-keying local-id

configure service vprn interface sap ipsec-gw local-id

configure service ies interface ipsec ipsec-tunnel dynamic-keying local-id

configure service ies interface sap ipsec-gw local-id

configure router interface ipsec ipsec-tunnel dynamic-keying local-id

configure ipsec ipsec-transport-mode-profile dynamic-keying local-id

#### Description

This command specifies the local ID used for IDi or IDr for IKEv2 negotiation.

The default behavior depends on the local-auth-method as follows:

- Psk: local tunnel IP address
- Cert-auth: subject of the local certificate

The **no** form of this command removes the parameters from the configuration.

#### Default

no local-id

## Parameters

### *type*

Specifies the type of local ID payload, which could be IPv4 or IPv6 address or FQDN domain name or distinguish the name of the subject in the X.509 certificate.

**Values**    *ipv4* — Specifies to use IPv4 as the local ID type; the default value is the local tunnel end-point address.

*ipv6* — Specifies to use IPv6 as the local ID type; the default value is the local tunnel end-point address.

*fq1dn* — Specifies to use FQDN as the local ID type. The value must be configured.

### *value*

Specifies the data type as an enumerated integer that describes the local identifier type used for IDi or IDr for IKEv2, up to 255 characters.

## Platforms

### VSR

- configure router interface ipsec ipsec-tunnel dynamic-keying local-id
- configure service vprn interface ipsec ipsec-tunnel dynamic-keying local-id
- configure service ies interface ipsec ipsec-tunnel dynamic-keying local-id

### 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service ies interface sap ipsec-gw local-id
- configure service vprn interface sap ipsec-gw local-id
- configure ipsec ipsec-transport-mode-profile dynamic-keying local-id
- configure service vprn interface sap ipsec-tunnel dynamic-keying local-id

## 16.184 local-ip

### local-ip

### Syntax

**local-ip** {*ip-prefix/prefix-length* | *ip-prefix netmask* | **any**}

### Context

**[Tree]** (config>router>ipsec>sec-plcy>entry local-ip)

**[Tree]** (config>service>vprn>ipsec>sec-plcy>entry local-ip)

### Full Context

configure router ipsec security-policy entry local-ip

configure service vpn ipsec security-policy entry local-ip

### Description

This command configures the local (from the VPN) IP prefix/mask for the policy parameter entry.

Only one entry is necessary to describe a potential flow. The **local-ip** and **remote-ip** commands can be defined only once. The system evaluates:

- the local IP as the source IP when traffic is examined in the direction of the flows from private to public and as the destination IP when traffic flows from public to private
- the remote IP as the source IP when traffic flows public to private and as the destination IP when traffic flows from private to public

### Parameters

#### *ip-prefix*

The destination address of the aggregate route in dotted decimal notation

**Values** a.b.c.d (host bits must be 0)  
prefix-length 1 to 32

#### *netmask*

The subnet mask in dotted decimal notation

#### **any**

keyword to specify that it can be any address

### Platforms

VSR

- configure router ipsec security-policy entry local-ip  
7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR
- configure service vpn ipsec security-policy entry local-ip

## 16.185 local-ip-address

local-ip-address

### Syntax

**local-ip-address** *ip-address*

**no local-ip-address**

### Context

[\[Tree\]](#) (config>lag>bfd>family local-ip-address)

**Full Context**

```
configure lag bfd family local-ip-address
```

**Description**

This command is used to specify the IPv4 or IPv6 address of the BFD source.

The **no** form of this command removes this address from the configuration.

**Default**

```
no local-ip-address
```

**Parameters*****ip-address***

Specifies the IP address.

**Values**

|               |                                     |
|---------------|-------------------------------------|
| ipv4-address: | a.b.c.d                             |
| ipv6-address: | x:x:x:x:x:x:x (eight 16-bit pieces) |
|               | x:x:x:x:x:d.d.d.d                   |
|               | x:[0 to FFFF]H                      |
|               | d: [0 to 255]D                      |

**Platforms**

All

**16.186 local-ip-range-start**

```
local-ip-range-start
```

**Syntax**

```
local-ip-range-start ip-address
```

```
no local-ip-range-start
```

**Context**

[\[Tree\]](#) (config>isa>nat-group>inter-chassis-redundancy local-ip-range-start)

**Full Context**

```
configure isa nat-group inter-chassis-redundancy local-ip-range-start
```

## Description

This command configures the first IP address that is assigned to a first member ISA in the nat-group. The remaining member ISAs in the **nat-group** are automatically assigned the consecutive IP addresses, starting from the first IP address. These IP addresses are used to communicate between the ISAs on redundant nodes for the purpose of flow synchronization. Traffic from the first local IP address (member ISA), is sent to the first IP address from the remote IP range.

The **no** form of this command reverts to the default.

## Default

no local-ip-range-start

## Parameters

### *ip-address*

Specifies the first IP address from the range assigned to the first member ISA in the form of a.b.c.d

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.187 local-lsr-id

### local-lsr-id

## Syntax

**local-lsr-id** {system | interface} [32bit-format]

**local-lsr-id** *interface-name* [32bit-format]

**no local-lsr-id**

## Context

[\[Tree\]](#) (config>router>ldp>if-params>if>ipv6 local-lsr-id)

[\[Tree\]](#) (config>router>ldp>if-params>if>ipv4 local-lsr-id)

## Full Context

configure router ldp interface-parameters interface ipv6 local-lsr-id

configure router ldp interface-parameters interface ipv4 local-lsr-id

## Description

This command enables the use of the address of the local LDP interface, or any other network interface configured on the system, as the LSR-ID to establish link LDP Hello adjacency and LDP session with directly connected LDP peers. The network interface can be a loopback or not.

Link LDP sessions to all peers discovered over a given LDP interface share the same local LSR-ID. However, LDP sessions on different LDP interfaces can use different network interface addresses as their local LSR-ID.

By default, the LDP session to a peer uses the system interface address as the LSR-ID unless explicitly configured using this command. The system interface must always be configured on the router, or the LDP protocol will not come up on the node. There is no requirement to include the system interface in any routing protocol.

At initial configuration, the LDP session to a peer will remain down while the network interface used as LSR-ID is down. LDP will not try to bring it up using the system interface.

If the network IP interface used as LSR-ID goes down, the LDP sessions to all discovered peers using this LSR-ID go down.

When an interface other than the system is used as the LSR-ID, the transport connection (TCP) for the link LDP session will also use the address of that interface as the transport address. If the system or interface value is configured in the **config>router>ldp>if-params>if>ipv4** or **config>router>ldp>if-params>if>ipv6>transport-address** context, it will be overridden with the address of the LSR-ID interface.

When the **local-lsr-id** command is enabled with the **32bit-format** option, an SR OS LSR will be able to establish an LDP IPv6 Hello adjacency and an LDP IPv6 session with an RFC 7552 compliant peer LSR. The LSR uses a 32-bit LSR-ID set to the value of the IPv4 address of the specified local LSR-ID interface and a 128-bit transport address set to the value of the IPv6 address of the specified local LSR-ID interface.

**Note:**

The system interface cannot be used as a local LSR-ID with the **32bit-format** option enabled because the system interface is the default LSR-ID and transport address for all LDP sessions to peers on this LSR. This configuration is blocked in the CLI.

If the user enables the **32bit-format** option in the IPv6 context of a running LDP interface, the already established LDP IPv6 Hello adjacency and LDP IPv6 session will be brought down and re-established with the new 32-bit LSR-ID value.

If the user changes the LSR-ID value between **system**, **interface**, and *interface-name*, or enables the **32bit-format** option while the LDP session is up, LDP will immediately tear down all sessions using this LSR-ID and will attempt to re-establish them using the new LSR-ID.

The **no** form of this command returns to the default behavior, in which case the system interface address is used as the LSR-ID.

**Default**

no local-lsr-id

**Parameters****system**

Specifies the use of the address of the system interface as the value of the LSR-ID of this LDP LSR.

**interface**

Specifies the use of the address of the local LDP interface as the value of the LSR-ID of this LDP LSR.

**interface-name interface-name**

Specifies the name, up to 32 character, of the network IP interface (which address is used as the LSR-ID of this LDP LSP). An interface name cannot be in the form of an IP address. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### **32bit-format**

Specifies the use of the IPv4 address of the local LSR-ID interface as the LSR-ID of this LDP LSR.

## **Platforms**

All

## **local-lsr-id**

## **Syntax**

**local-lsr-id** *interface-name* [**32bit-format**]

**no local-lsr-id**

## **Context**

[\[Tree\]](#) (config>router>ldp>targ-session>peer local-lsr-id)

[\[Tree\]](#) (config>router>ldp>targ-session>peer-template local-lsr-id)

## **Full Context**

configure router ldp targeted-session peer local-lsr-id

configure router ldp targeted-session peer-template local-lsr-id

## **Description**

This command enables the use of the address of any network interface configured on the system, as the LSR-ID to establish a targeted LDP Hello adjacency and a targeted LDP session with an LDP peer. The network interface can be a loopback or not.

By default, the targeted LDP session to a peer uses the system interface address as the LSR-ID and as the transport address, unless explicitly configured using this command. The system interface must always be configured on the router, or the LDP protocol will not come up on the node. There is no requirement to include the system interface in any routing protocol.

When the **local-lsr-id** command is enabled with the **32bit-format** option, an SR OS LSR will be able to establish a targeted LDP IPv6 Hello adjacency and a targeted LDP IPv6 session with an RFC 7552 compliant peer LSR. The LSR uses a 32-bit LSR-ID set to the value of the IPv4 address of the specified local LSR-ID interface and a 128-bit transport address set to the value of the IPv6 address of the specified local LSR-ID interface.

### **Note:**

The system interface cannot be used as a local LSR-ID with the **32bit-format** option enabled because the system interface is the default LSR-ID and transport address for all targeted LDP sessions to peers on this LSR. This configuration is blocked in the CLI.

If the user enables the **32bit-format** option in the IPv6 context of a running targeted LDP peer, the already established targeted LDP IPv6 Hello adjacency and targeted LDP IPv6 session will be brought down and re-established with the new 32-bit LSR-ID value.

If the user changes the local LSR-ID value or enables/disables the **32bit-format** option, while the targeted LDP session is up, LDP will immediately tear down the targeted session using this LSR-ID and will attempt to re-establish it using the new LSR-ID.

The **no** form of this command returns to the default behavior, in which case the system interface address is used as the LSR-ID.

## Default

no local-lsr-id

## Parameters

### *interface-name*

Specifies the name, up to 32 characters, of the network IP interface (which address is used as the LSR-ID of this LDP LSP). An interface name cannot be in the form of an IP address. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### *32bit-format*

Specifies the use of the IPv4 address of the local LSR-ID interface as the LSR-ID of this LDP LSR.

## 16.189 local-monitoring-policer

### local-monitoring-policer

**Syntax**

[no] local-monitoring-policer *policer-name* [create]

**Context**

[\[Tree\]](#) (config>sys>security>dist-cpu-protection>policy local-monitoring-policer)

**Full Context**

configure system security dist-cpu-protection policy local-monitoring-policer

**Description**

This command configures a monitoring policer that is used to monitor the aggregate rate of several protocols arriving on an object (for example, SAP). When the **local-monitoring-policer** is determined to be in a nonconforming state (at the end of a minimum monitoring time of 60 seconds) then the system will attempt to allocate dynamic policers for the particular object for any protocols associated with the local monitor (for example, using the **protocol name enforcement dynamic policer-name** CLI command).

If the system cannot allocate all the dynamic policers within 150 seconds, it will stop attempting to allocate dynamic policers, raise a LocMonExcdAllDynAlloc log event, and go back to using the local monitor. The local monitor may then detect exceeded packets again and make another attempt at allocating dynamic policers.

Once this *policer-name* is referenced by a protocol then this policer will be instantiated for each "object" that is created and references this DDoS policy. If there is no policer free then the object will be blocked from being created.

**Parameters*****policy-name***

Specifies name of the policy, up to 32 characters.

configure router l2tp group local-name

configure router l2tp group tunnel local-name

configure service vprn l2tp group local-name

configure router l2tp local-name

configure service vprn l2tp local-name

#### Description

This command creates the local host name used by this system for the tunnels in this L2TP group during the authentication phase of tunnel establishment. It can be used to distinguish tunnels.

The **no** form of this command removes the host name from the configuration.

#### Default

no local-name

#### Parameters

***host-name***

Specifies the host name, up to 64 characters in length, that the router will use to identify itself during L2TP authentication.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### local-port-action

#### Syntax

**local-port-action** {**log-only** | **out-of-service**}

#### Context

**[Tree]** (config>port>ethernet>efm-oam>link-mon>local-sf-action local-port-action)

#### Full Context

configure port ethernet efm-oam link-monitoring local-sf-action local-port-action

#### Description

This command configures the parameters that define if and how the local port will be affected when the local signal failure threshold (**sf-threshold**) has been reached within the configured window.

Interactions: The signal failure threshold will trigger these actions.

#### Default

local-port-action out-of-service

#### Parameters

##### log-only

Keyword that prevents the port from being affected when the configured signal failure threshold is reached within the window. The event will be logged but the port will remain operational.

##### out-of-service

Keyword that causes the port to enter a non-operation down state with a port state of link up. The error will be logged when the configured signal failure threshold (**sf-threshold**) is reached within the window. The port will not be available to service data but will continue to carry Link OAM traffic to ensure the link is monitored.

## 16.192 local-preference

### local-preference

#### Syntax

**local-preference** *local-preference*

**no local-preference**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>bgp-prng-plcy local-preference)

#### Full Context

configure subscriber-mgmt bgp-peering-policy local-preference

#### Description

This command enables setting the BGP local-preference attribute in incoming routes if not specified and configures the default value for the attribute. This value is used if the BGP route arrives from a BGP peer without the **local-preference** integer set.

The specified value can be overridden by any value set via a route policy.

The **no** form of this command at the global level specifies that incoming routes with local-preference set are not overridden and routes arriving without local-preference set are interpreted as if the route had local-preference value of 100.

#### Parameters

##### **local-preference**

The local preference value to be used as the override value, expressed as a decimal integer.

**Values** 0 to 4294967295

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### Full Context

configure service vprn bgp group local-preference

configure service vprn bgp group neighbor local-preference

configure service vprn bgp local-preference

### Description

This command enables setting the BGP local-preference attribute in incoming routes if not specified and configures the default value for the attribute. This value is used if the BGP route arrives from a BGP peer without the **local-preference** integer set.

The specified value can be overridden by any value set via a route policy. This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific value is used.

The **no** form of this command at the global level specifies that incoming routes with local-preference set are not overridden and routes arriving without local-preference set are interpreted as if the route had local-preference value of 100.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

### Default

no local-preference - Does not override the local-preference value set in arriving routes and analyze routes without local preference with value of 100.

### Parameters

#### **local-preference**

The local preference value to be used as the override value, expressed as a decimal integer.

**Values** 0 to 4294967295

### Platforms

## Full Context

configure router bgp group neighbor local-preference

configure router bgp group local-preference

configure router bgp local-preference

## Description

This command enables setting the BGP local-preference attribute in incoming routes if not specified and configures the default value for the attribute.

This value is used if the BGP route arrives from a BGP peer without the **local-preference** integer set.

The specified value can be overridden by any value set via a route policy. This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to the specified peer). The most specific value is used.

The **no** form of this command at the global level specifies that incoming routes with local-preference set are not overridden and routes arriving without local-preference set are interpreted as if the route had local-preference value of 100.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

## Default

no local-preference

## Parameters

### *local-preference*

Specifies the local preference value to be used as the override value expressed as a decimal integer.

**Values** 0 to 4294967295

## Platforms

All

## local-preference

## Syntax

**local-preference** *preference* [**equal** | **or-higher** | **or-lower**]

**no local-preference**

## Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from local-preference)

## Full Context

configure router policy-options policy-statement entry from local-preference

## Description

This command matches BGP routes based on local preference (the value in the LOCAL\_PREF attribute).

If no comparison qualifiers are present (**equal**, **or-higher**, **or-lower**), then **equal** is the implied default.

A non-BGP route does not match a policy entry if it contains the **local-preference** command.

## Default

no local-preference

## Parameters

### *preference*

Specifies the local preference value.

**Values** 0 to 4294967295, or a parameter name delimited by starting and ending at-sign (@) characters

### **equal**

Specifies that matched routes should have the same local preference as the value specified.

### **or-higher**

Specifies that matched routes should have the same or a greater local preference as the value specified.

### **or-lower**

Specifies that matched routes should have the same or a lower local preference as the value specified.

## Platforms

All

## local-preference

## Syntax

[\[Tree\]](#) (config>router>policy-options>policy-statement>default-action local-preference)

## Full Context

configure router policy-options policy-statement entry local-preference

configure router policy-options policy-statement default-action local-preference

### Description

This command assigns a BGP local preference to routes matching a route policy statement entry.

If no local preference is specified, the BGP configured local preference is used.

The **no** form of this command disables assigning a local preference in the route policy entry.

### Default

no local-preference

### Parameters

#### *preference*

Specifies the local preference expressed as a decimal integer.

**Values** 0 to 4294967295 name — Specifies the local preference parameter variable name. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@".

#### Context

[\[Tree\]](#) (config>service>pw-routing local-prefix)

#### Full Context

configure service pw-routing local-prefix

#### Description

This command configures one or more node prefix values to be used for MS-PW routing. At least one prefix must be configured on each node that is an S-PE or a T-PE.

The **no** form of this command removes a previously configured prefix, and will cause the corresponding route to be withdrawn if it has been advertised in BGP.

### Default

no local-prefix

### Parameters

#### *local-prefix*

Specifies a 32 bit prefix for the All. One or more prefix values, up to a maximum of 16, may be assigned to the 7450 ESS, 7750 SR, or 7950 XRS node. The global ID can contain the 2-octet or 4-octet value of the provider's Autonomous System Number (ASN). The presence of a global ID based on the provider's ASN ensures that the All for spoke-SDPs configured on the node will be globally unique.

| Values | <global-id>:<ip-addr>  <raw-prefix> |                 |
|--------|-------------------------------------|-----------------|
|        | ip-addr                             | a.b.c.d         |
|        | raw-prefix                          | 1 to 4294967295 |
|        | global-id                           | 1 to 4294967295 |

## 16.194 local-priority

### local-priority

#### Syntax

**local-priority** *local-priority*

#### Context

[\[Tree\]](#) (config>service>vprn>ptp>peer local-priority)

#### Full Context

configure service vprn ptp peer local-priority

#### Description

This command configures the local priority used to choose between PTP TimeTransmitters in the best TimeTransmitter clock algorithm (BTCA).

The value 1 is the highest priority and 255 is the lowest priority.

If the PTP profile is **ieee1588-2008**, the priority of a peer cannot be configured.

If the PTP profile is **g8265dot1-2010**, this parameter configures the priority used to choose between TimeTransmitter clocks with the same quality. Refer to the G.8265.1 standard for more information

If the PTP profile is **g8275dot1-2014** or **g8275dot2-2016**, this parameter sets the value of the **localPriority** associated with the Announce messages received from the external clocks (**ptp>peer** or **ptp>port**), or the local clock (PTP). Refer to the ITU-T G.8275.1/G.8275.2 standard for detailed information

## Default

local-priority 128

## Parameters

### *local-priority*

Specifies the value of the local priority.

**Values** 1 to 255

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 16.195 local-proxy-arp

### local-proxy-arp

### Syntax

[no] **local-proxy-arp**

### Context

**[Tree]** (config>service>ies>sub-if>grp-if local-proxy-arp)

**[Tree]** (config>service>vprn>if local-proxy-arp)

**[Tree]** (config>service>vprn>sub-if>grp-if local-proxy-arp)

**[Tree]** (config>service>ies>if local-proxy-arp)

### Full Context

configure service ies subscriber-interface group-interface local-proxy-arp

configure service vprn interface local-proxy-arp

configure service vprn subscriber-interface group-interface local-proxy-arp

configure service ies interface local-proxy-arp

### Description

This command enables local proxy ARP. When local proxy ARP is enabled on an IP interface, the system responds to all ARP requests for IP addresses belonging to the subnet with its own MAC address, and thus becomes the forwarding point for all traffic between hosts in that subnet.

When **local-proxy-arp** is enabled, ICMP redirects on the ports associated with the service are automatically blocked.

The **no** form of this command reverts to the default.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn subscriber-interface group-interface local-proxy-arp
- configure service ies subscriber-interface group-interface local-proxy-arp

All

- configure service vprn interface local-proxy-arp
- configure service ies interface local-proxy-arp

## local-proxy-arp

### Syntax

[no] local-proxy-arp

### Context

[\[Tree\]](#) (config>router>if local-proxy-arp)

### Full Context

configure router interface local-proxy-arp

### Description

This command enables local proxy ARP on the interface.

### Default

no local-proxy-arp

### Platforms

All

## 16.196 local-proxy-nd

## local-proxy-nd

### Syntax

[no] local-proxy-nd

### Context

[\[Tree\]](#) (config>service>ies>if>ipv6 local-proxy-nd)

[\[Tree\]](#) (config>service>vprn>if>ipv6 local-proxy-nd)

### Full Context

```
configure service ies interface ipv6 local-proxy-nd
configure service vprn interface ipv6 local-proxy-nd
```

### Description

This command enables local proxy neighbor discovery on the interface.

When this command is enabled, the interface replies to neighbor solicitation requests when both the hosts are on the same subnet. In this case, ICMP redirects are disabled. When this command is disabled, the interface does not reply to neighbor solicitation requests if both the hosts are on the same subnet.

The **no** form of this command reverts to the default.

### Platforms

All

## local-proxy-nd

## 16.197 local-routes-domain-id

## local-routes-domain-id

### Syntax

```
local-routes-domain-id [global-field:local-field]
```

**no local-routes-domain-id****Context**

[\[Tree\]](#) (config>service>vprn local-routes-domain-id)

**Full Context**

configure service vprn local-routes-domain-id

**Description**

This command specifies the domain ID that is used in the D-PATH attribute for local routes before those routes are exported to a BGP neighbor using BGP-IPVPN, EVPN-IFF, EVPN-IFL or PE-CE BGP. A local route is a non-BGP route installed in the VPRN route table and learned using static route or an IGP.

The domain IDs are used in the D-PATH attribute, in accordance with *draft-ietf-bess-evpn-ipvpn-interworking*. The D-PATH attribute is modified by gateway routers, where a gateway is defined as a PE where a VPRN is instantiated, and that VPRN advertises or receives routes from multiple BGP owners (for example, EVPN-IFL and BGP-IPVPN).

The D-PATH attribute is used on gateways to detect loops (for received routes where the D-PATH contains a local domain ID) and to make BGP best path selection decisions based on the D-PATH length (shorter D-PATH is preferred).

The **no** form of this command removes the domain ID for local routes.

**Default**

no local-routes-domain-id

**Parameters*****global-field:local-field***

Specifies the domain ID for local routes.

**Values**

*4byte-GlobalAdminValue:2byte-LocalAdminValue*

*4byte-GlobalAdminValue:* 0 to 4294967295

*2byte-LocalAdminValue* 0 to 65535

configure mcast-management multicast-info-policy bundle channel video local-rt-port

configure mcast-management multicast-info-policy bundle video local-rt-port

configure mcast-management multicast-info-policy bundle channel source-override video local-rt-port

### Description

This command configures the local port on which retransmission (RET) requests are received. The value of this object can only be set for the default bundle and will be used by all channels.

The **local-rt-port** *port* value is the only configuration parameter in the bundle "default" context.

The **no** form of the command removes the port from the video configuration.

### Parameters

*port*

Specifies a local port for RT requests.

**Values** 1024 to 5999, 6251 to 65535

### Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

### Context

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>channel>video local-rt-server)

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>channel>source-override>video local-rt-server)

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>video local-rt-server)

### Full Context

configure mcast-management multicast-info-policy bundle channel video local-rt-server

configure mcast-management multicast-info-policy bundle channel source-override video local-rt-server

configure mcast-management multicast-info-policy bundle video local-rt-server

### Description

This command enables the local retransmission server capability on the ISA video group.

RET server parameters can be configured in a multicast information policy or a service, but the parameters will have no effect if the RET server is disabled or if the video group is administratively disabled (shutdown).

The **no** form of the command returns the parameter to the default value where the RET server is disabled on the video group.

### Default

no local-rt-server

### Parameters

**disable**

Specifies to disable the RET server.

### Platforms

7450 ESS, 7750 SR, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 16.202 local-sr-protection

### local-sr-protection

#### Syntax

**local-sr-protection** *local-sr-protection*

**no local-sr-protection**

#### Context

**[Tree]** (config>router>mpls>lsp-template local-sr-protection)

**[Tree]** (config>router>mpls>lsp local-sr-protection)

#### Full Context

configure router mpls lsp-template local-sr-protection

configure router mpls lsp local-sr-protection

#### Description

This command configures the SR LFA protection needed for the adjacencies used in the path computation of an SR-TE LSP by the local CSPF.

The default value of the command is **preferred**. The local CSPF will prefer a protected adjacency over an unprotected adjacency whenever both exist for a TE link. However, the entire computed path can combine both types of adjacencies.

When the user enables the **mandatory** value, CSPF uses it as an additional path constraint and selects protected adjacencies exclusively in computing the path of the SR-TE LSP. CSPF will return no path if all candidate paths that otherwise satisfy all other LSP path constraints do not have an unprotected SID for each of their TE links.

Similarly, if the user enables the value **none**, CSPF uses it as an additional path constraint and selects unprotected adjacencies exclusively in computing the path of the SR-TE LSP. CSPF will return no path if all candidate paths that otherwise satisfy all other LSP path constraints do not have a protected SID for each of their TE links.

The **no** form of this command returns the command to its default value.

#### Default

no local-sr-protection

#### Parameters

***local-sr-protection***

Specifies the local-sr-protection for LSPs.

**Values** none — Selects unprotected adjacencies only in the SR-TE LSP path computation.

preferred — Prefers protected adjacencies in the SR-TE LSP path computation.

mandatory — Selects protected adjacencies only in the SR-TE LSP path computation.

#### Syntax

**local-switching-service-state** {**pbb-tunnel** | **sap**}

#### Context

[\[Tree\]](#) (config>service>epipe>pbb local-switching-service-state)

#### Full Context

configure service epipe pbb local-switching-service-state

#### Description

In a PBB Epipe with two SAPs and a PBB tunnel, this command controls whether the operational status of the PBB-Epipe service depends on the status of the PBB tunnel only.

#### Default

local-switching-service-state sap

#### Parameters

##### **pbb-tunnel**

Specifies that the operational state of the PBB-Epipe service is up if the PBB tunnel is operationally up, irrespective of the operational state of the two SAPs.

##### **sap**

Specifies that the operational state of the PBB-Epipe service is up, if two of the three endpoints (PBB tunnel and two SAPs) are up. This option implies that at least one of the SAPs must be up for the PBB-Epipe service to be operationally up.

**16.207 location****location****Syntax**

**location** *cflash-id*

**no location**

**Context**

**[Tree]** (config>system>persistence>subscriber-mgmt location)

**[Tree]** (config>system>persistence>ancp location)

**[Tree]** (config>system>persistence>dhcp-server location)

**[Tree]** (config>system>persistence>python location)

**[Tree]** (config>system>persistence>nat-fwd location)

**Full Context**

configure system persistence subscriber-mgmt location

configure system persistence ancp location

configure system persistence dhcp-server location  
configure system persistence python-policy-cache location  
configure system persistence nat-port-forwarding location

## Description

This command instructs the system where to write the persistency files for the corresponding application. Each application creates two files on the flash card, one with suffix `.i<version>`, referencing an index file, and the other with suffix `.0<version>`, where `<version>` is a 2-digit number reflecting the file version. These versions are not related to the SR OS release running on the node. The `<version>` can remain the same over two major releases, for example, when no format change is made to the persistency file. On boot, the system scans the file systems looking for the corresponding persistency files, and the load begins.

For example, in the subscriber management context, the location specifies the flash device on a CPM card where the data for handling subscriber management persistency is stored.

The **no** form of this command returns the system to the default. If there is a change in file location while persistence is running, a new file will be written on the new flash, and then the old file will be removed.

## Default

no location

## Parameters

### *cf*flash-id

Specifies the compact flash device name.

**Values** cf1:, cf2:, cf3:

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure system persistence subscriber-mgmt location
- configure system persistence dhcp-server location

- configure system persistence ancp location
- configure system persistence python-policy-cache location

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure system persistence nat-port-forwarding location

## location

## Syntax

**location** {cf1 | cf2}

## Context

[\[Tree\]](#) (config>call-trace location)

## Full Context

configure call-trace location

## Description

This command specifies the compact flash (CF) configuration to store call trace files.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## location

## Syntax

**location** *cflash-id*

**no location**

## Context

[\[Tree\]](#) (config>system>persistence>application-assurance location)

## Full Context

configure system persistence application-assurance location

## Description

This command instructs the system where to write the file. The name of the file is: appassure.db. On boot the system scans the file systems looking for appassure.db, if it finds it, it starts to load it.

The **no** form of this command returns the system to the default. If there is a change in file location while persistence is running, a new file will be written on the new flash, and then the old file will be removed.

## Default

no location

## Parameters

***cflash-id***

Specifies the compact flash type.

**Values** cf1:, cf2:, cf3:

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## location

### Syntax

**location** *remote-url*

**no location**

### Context

[\[Tree\]](#) (config>service>nat>deterministic-script location)

### Full Context

configure service nat deterministic-script location

### Description

This command configures the remote location where the Python script will be exported. The Python script is then used off-line to perform reverse query. If this command is configured, the Python script generation is triggered by any modification of the deterministic NAT configuration. The new script reflects the change in mappings caused by configuration change. However, the script must be manually exported to the outside location with the **admin nat save-deterministic-nat** command. The script cannot be stored locally on the system.

The script allows two forms of queries:

- Forward – input is NAT inside parameters, output is NAT outside parameters.
- Backward – input is NAT outside parameters, output is NAT inside parameters.

Forward Query:

```
user@external-server:/home/ftp/pub/det-nat-script$./det-nat.py -f -s 10 -a 10.0.5.10
```

output:

```
subscriber has public ip address 198.51.100.1 from service 0 and is using ports [1324 - 1353]
```

Reverse Query:

```
user@external-server:/home/ftp/pub/det-nat-script$./det-nat.py -b -s 0 -a 198.51.100.1 -p 3020
```

output:

```
subscriber has private ip address 10.0.5.66 from service 10
```

### Default

no location

### Parameters

***remote-url***

A remote location where the script is stored:

`[[ftp:// | tftp://]<login>:<pswd>@<remote-locn>][<file-path>]`

Maximum length is 180 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## location

### Syntax

**location** *location*

**no location**

### Context

[\[Tree\]](#) (config>system location)

### Full Context

configure system location

### Description

This command creates a text string that identifies the system location for the device.

Only one location can be configured. If multiple locations are configured, the last one entered overwrites the previous entry.

The **no** form of the command reverts to the default value.

### Parameters

#### *location*

Specifies the location as a character string. The string may be up to 80 characters. Any printable, seven-bit ASCII characters can be used within the string. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### Platforms

## location

### Syntax

**location** *file-url*

**no location**

### Context

[\[Tree\]](#) (config>system>script-control>script location)

## Full Context

configure system script-control script location

## Description

This command is used to identify the location of a script to be scheduled.

The **no** form of the command removes the location.

## Default

no location

## Parameters

### *file-url*

Specifies the location to search for scripts.

**Values** *local-url* | *remote-url*

*local-url* — [*cflash-id*] [*file-path*] 200 chars max, including *cflash-id* directory length 99 characters max each

*remote url* — [{ftp:// | tftp://}login:password@remote-location/][file-path]  
255 characters max directory length 99 characters max each

*remote-location* — [hostname | ipv4-address | ipv6-address]

*ipv4-address* — a.b.c.d

*ipv6-address* — x:x:x:x:x:x:x[-interface]

x:x:x:x:x:d.d.d.d[-interface]

x — [0 to FFFF]H

d — [0 to 255]D

interface — 32 characters max, for link local addresses

*cflash-id* — cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

## Platforms

All

## location

## Syntax

**location** *cflash-id* [*backup-cflash-id*]

**no location**

## Context

**[Tree]** (config>log>file>file-id location)

## Full Context

configure log file file-id location

## Description

This command specifies the primary and optional backup location where the log or billing file will be created.

The **location** command is optional. If the location command not explicitly configured, log files will be created on cf1: and accounting files will be created on cf2: without overflow onto other devices. Generally, cf3: is reserved for system files (configurations, images, and so on).

When multiple location commands are entered in a single file ID context, the last command overwrites the previous command.

When the location of a file ID that is associated with an active log ID is changed, the log events are not immediately written to the new location. The new location does not take effect until the log is rolled over either because the rollover period has expired or a **clear log log-id** command is entered to manually rollover the log file.

When creating files, the primary location is used as long as there is available space. If no space is available, an attempt is made to delete unnecessary files that are past their retention date.

If sufficient space is not available an attempt is made to remove the oldest to newest closed log or accounting files. After each file is deleted, the system attempts to create the new file.

A medium severity trap is issued to indicate that a compact flash is either not available or that no space is available on the specified flash and that the backup location is being used.

A high priority alarm condition is raised if none of the configured compact flash devices for this file ID are present or if there is insufficient space available. If space does becomes available, then the alarm condition will be cleared.

Log files are created on cf1: and accounting files are created on cf2.

Use the **no** form of this command to revert to default settings.

## Default

no location

## Parameters

### ***cflash-id***

Specify the primary location.

**Values** cflash-id: cf1:, cf2:, cf3:

### ***backup-cflash-id***

Specify the secondary location.

**Values** cflash-id: cf1:, cf2:, cf3:

## location

### Syntax

**location** *location-id* [**primary-ip-address** *ipv4-address*] [**secondary-ip-address** *ipv4-address*] [**tertiary-ip-address** *ipv4-address*]

### Context

[\[Tree\]](#) (config>router>bgp>optimal-route-reflection location)

### Full Context

configure router bgp optimal-route-reflection location

### Description

This command configures the location ID for the for the route reflector. A BGP neighbor can be associated with a location if it is a route-reflector client.

### Parameters

#### *location-id*

Specifies an optimal-route-reflection location.

**Values** 1 to 255

#### *ipv4-address*

Specifies the primary, secondary, or tertiary IP address.

**Values** primary ipv4-address, secondary ipv4-address, tertiary ipv4-address

### Platforms

All

## 16.208 locator

## locator

### Syntax

**locator** *name* **function end-b6-encaps-red** [**function-value** *function-value*]

**no locator**

### Context

[\[Tree\]](#) (conf>router>segment-routing>sr-policies>policy>srv6>binding-sid locator)

## Full Context

configure router segment-routing sr-policies static-policy segment-routing-v6 binding-sid locator

## Description

This command configures binding SID locator parameters for a local SRv6 policy. This command and the **ip-address** command in the **conf>router>segment-routing>sr-policies>policy>srv6>binding-sid** context for a remote SRv6 policy are mutually exclusive.

The **no** form of the command removes the configuration.

## Parameters

### *name*

Specifies the name of the locator, up to 64 characters. A corresponding locator name must exist in the **config>router>segment-routing>srv6** context.

### **end-b6-encaps-red**

Keyword to configure End.B6.Encaps.Red as the End.B6 function that must be implemented by the datapath.

### *function-value*

Specifies the optional function value. If a function value is configured, the router checks whether this function value is available for the named locator. If no function value is configured, the router dynamically allocates a value.

**Values** 1 to 1048575

**Default** no function value

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## locator

## Syntax

[no] locator *locator-name*

## Context

[\[Tree\]](#) (config>router>segment-routing>srv6 locator)

## Full Context

configure router segment-routing segment-routing-v6 locator

## Description

This command configures the name of an SRv6 locator to be used by the routing protocols and services. This also creates the context to configure the locator block, locator node, function and argument lengths.

A limit of 16 locators per system is enforced.

The **no** form of this command removes the specified locator name.

### Parameters

#### *locator-name*

Specifies a locator name, up to 64 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## locator

### Syntax

[no] **locator** *locator-name*

### Context

[\[Tree\]](#) (config>router>segment-routing>srv6>inst locator)

### Full Context

configure router segment-routing segment-routing-v6 base-routing-instance locator

### Description

This command refers to a locator name defined under the **config>router>segment-routing>srv6** context. This command assigns a locator to BGP for use with base router routes.

The **no** form of this command removes the reference to a locator name locator.

### Parameters

#### *locator-name*

Specifies a locator name, up to 64 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## locator

### Syntax

[no] **locator** *locator-name*

### Context

[\[Tree\]](#) (config>router>isis>srv6 locator)

### Full Context

configure router isis segment-routing-v6 locator

## Description

This command refers to a locator name defined under the **config>router>segment-routing>srv6** context.

This command assigns a locator to each algorithm in an IS-IS instance. The same locator of a specific algorithm number can be shared with other IGP instances and BGP instances in IP-VPN or EVPN.

The locator block, locator node, function and argument lengths are defined under the **config>router>segment-routing>srv6** context.

The **no** form of this command removes the reference to a locator name.

## Parameters

### *locator-name*

Specifies a locator name, up to 64 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

**16.209 lock**

lock

**Syntax**

[no] lock

**Context**

[\[Tree\]](#) (configure>system>security>profile>netconf>base-op-authorization lock)

**Full Context**

configure system security profile netconf base-op-authorization lock

**Description**

This command authorizes a user associated with the profile to send a NETCONF <lock> operation. This lock operation allows a NETCONF client to lock a configuration datastore.

The **no** form of the command denies the user from requesting a lock.

**Default**

no lock

**Platforms**

All

**16.210 lock-override**

lock-override

**Syntax**

[no] lock-override

**Context**

[\[Tree\]](#) (config>system>script-control>script-policy lock-override)

**Full Context**

configure system script-control script-policy lock-override

## Description

This command allows a triggered EHS/CRON script to execute while there is a datastore lock, started by an MD interface, in place.

A triggered EHS/CRON script queues until an **ongoing commit** (or **confirmed-commit**) is done. When an EHS/CRON script is triggered while the **lock-override** CLI knob is on, SR OS behaves as follows.

When an exclusive session is in place:

- Keep if it is an MD-CLI session. Disconnect if it is a NETCONF session
- Lose the exclusive lock
- Lose any uncommitted configuration changes

When a global session is in place:

- Keep the MD-CLI or NETCONF session
- Keep the uncommitted configuration changes
- An update may be required after committing the EHS/CRON script configuration changes

The **no** form of this command does not allow the script to execute while there is a datastore lock in place.

## Default

lock-override

## Platforms

All

## 16.211 lockout

### lockout

## Syntax

**lockout failed-attempts** *count* **duration** *duration-minutes* **block** *block-minutes* [**max-port-per-ip** *number-of-ports*]

**no lockout**

## Context

[\[Tree\]](#) (config>ipsec>ike-policy lockout)

## Full Context

configure ipsec ike-policy lockout

## Description

This command enables the lockout mechanism for the IPsec tunnel. The system will lock out an IPsec client for the configured time interval if the number of failed authentications exceeds the configured value within the specified duration. This command only applies when the system acts as a tunnel responder.

A client is defined as the tunnel IP address plus the port.

Optionally, the **max-port-per-ip** parameter can be configured as the maximum number of ports allowed behind the same IP address. If this threshold is exceeded, then all ports behind the IP address are blocked.

The **no** form of this command disables the lockout mechanism.

## Default

no lockout

## Parameters

### *count*

Specifies the maximum number of failed authentications allowed during the *duration-minutes* interval.

**Values** 1 to 64

**Default** 3

### *duration-minutes*

Specifies the interval of time, in minutes, during which the configured failed authentication count must be exceeded in order to trigger a lockout.

**Values** 1 to 60

**Default** 5

### *block-minutes*

Specifies the number of minutes that the client is blocked if the configured failed authentication count is exceeded.

**Values** 1 to 1440, infinite

**Default** 10

### *number-of-ports*

Specifies the maximum number of ports allowed behind the same IP address.

**Values** 1 to 32000

**Default** 16

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## lockout

### Syntax

**clear lockout** {**user** *user-name* | **all**}

### Context

**[Tree]** (admin>clear lockout)

### Full Context

admin clear lockout

### Description

This command is used to clear any lockouts for a specific user, or for all users.

### Parameters

#### ***user-name***

Clears the locked username.

#### **all**

Clears all locked usernames.

## 16.214 log

log

**Syntax**

log

**Context**

[\[Tree\]](#) (config log)

**Full Context**

configure log

**Description**

Commands in this context are used to configure both event logs and accounting logs. Event logs control the generation, dissemination and recording of system events for monitoring status and troubleshooting faults within the system. Event logging configuration includes syslog, snmp notifications (traps), NETCONF notifications and other types of event log outputs. Accounting logs collect comprehensive accounting statistics and write them to XML files on the compact flash in order to support a variety of billing models.

[\[Tree\]](#) (config>filter>ip-filter>entry log)

### Full Context

configure filter mac-filter entry log

configure filter ipv6-filter entry log

configure filter ip-filter entry log

### Description

This command associates a filter log to the current filter policy entry and therefore enables logging for that filter entry.

The filter log must exist before a filter entry can be enabled to use the filter log.

The **no** form of the command disables logging for the filter entry.

### Default

no log

### Parameters

***log-id***

Specifies the filter log ID expressed as a decimal integer.

**Values** 101 to 199

### Platforms

All

## log

### Syntax

**log** *log-id* [**create**]

**no log** *log-id*

## Context

[\[Tree\]](#) (config>filter log)

## Full Context

configure filter log

## Description

This command, creates a configuration context for the specified filter log if it does not exist, and enables the context to configure the specified filter log.

The **no** form of the command deletes the filter log. The log cannot be deleted if there are filter entries configured to write to the log. All filter entry logging associations need to be removed before the log can be deleted.

## Default

log 101

## Parameters

### *log-id*

Specifies the filter log ID expressed as a decimal integer.

**Values** 101 to 199

### **create**

This keyword is required to create the configuration context. After it is created, the context can be enabled with or without the **create** keyword.

configure system security cpm-filter mac-filter entry log

configure system security cpm-filter ipv6-filter entry log

## Description

This command specifies the log in which packets matching this entry should be entered. The value zero indicates that logging is disabled.

The **no** form of this command deletes the log ID.

## Parameters

***log-id***

Specifies the log ID where packets matching this entry should be entered.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

# 16.215 log-anno-interval

log-anno-interval

## Syntax

**log-anno-interval** *log-interval*

**no log-anno-interval**

## Context

**[Tree]** (config>system>ptp log-anno-interval)

## Full Context

configure system ptp log-anno-interval

## Description

This command configures the announce message interval used for both unicast and multicast messages.

For unicast messages, it defines the announce message interval that is requested during unicast negotiation to any peer. This controls the announce message rate sent from remote peers to the local

node. It does not affect the announce message rate that may be sent from the local node to remote peers. Remote peers may request an announce message rate anywhere within the acceptable grant range.

For multicast messages, used on PTP Ethernet ports, this configures the message interval used for Announce messages transmitted by the local node.

This value also defines the interval between executions of the BTCA within the node.

The announce-interval cannot be changed unless the PTP is shut down.

**Note:**

In order to minimize BTCA driven reconfigurations, the IEEE recommends that the announce-interval should be consistent across the entire 1588 network.

The **no** form of this command reverts the configuration to the default value. The default value varies depending on the configuration of the **profile** command.

**Default**

log-anno-interval 1 (1 packet every 2 seconds) for **ieee1588-2008**

log-anno-interval 1 (1 packet every 2 seconds) for **g8265dot1-2010**

log-anno-interval -3 (8 packets per second) for **g8275dot1-2014**

log-anno-interval 1 (1 packet every 2 seconds) for **g8275dot2-2016**

**Parameters*****log-interval***

Specifies the announce packet interval, in log form.

**Values**    -3 to 4

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## log-anno-interval

**Syntax**

**log-anno-interval** *log-interval*

**no log-anno-interval**

**Context**

**[Tree]** (config>system>ptp>alternate-profile log-anno-interval)

**Full Context**

configure system ptp alternate-profile log-anno-interval

## Description

This command configures the announce message interval used for multicast messages within the alternate profile.

For multicast messages used on PTP Ethernet ports, this command configures the message interval used for announce messages transmitted by the local node

This value has no impact on the interval used for the BTCA, which is controlled by the value defined for the primary profile.

This value can only be changed when the alternate profile is shut down.

The **no** form of this command reverts to the default value.

## Default

log-anno-interval -3 (eight packets per second)

## Parameters

### *log-interval*

Specifies the announce packet interval, in log form.

**Values** -3 to 4

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 16.216 log-delay-interval

### log-delay-interval

## Syntax

**log-delay-interval** *log-interval*

**no log-delay-interval**

## Context

[\[Tree\]](#) (config>system>ptp>port log-delay-interval)

## Full Context

configure system ptp port log-delay-interval

## Description

This command configures the minimum interval used for multicast Delay\_Req messages. This parameter is applied on a per-port basis. For ports in a timeReceiver state, it shall be the interval used, unless the parent port indicates a longer interval. For a port in timeTransmitter state, it shall be the interval advertised

to external timeReceiver ports as the minimum acceptable interval for Delay\_Req messages from those timeReceiver ports.

It is a requirement of the 1588 standard that a port in timeReceiver state shall check the logMessageInterval field of received multicast Delay\_Resp messages. If the value of the logMessageInterval field of those messages is greater than the value programmed locally for the generation of Delay\_Req messages, then the timeReceiver must change to use the greater value (i.e. longer interval) for the generation of Delay\_Req messages. This requirement is supported in the router.

The parameter is only applicable to ports and not to peers.

The **no** form of this command reverts the configuration to the default value. The default value varies depending on the configuration of the **profile** command.

### Default

log-delay-interval -6 (64 packets per second) for **ieee1588-2008**

log-delay-interval -6 (64 packets per second) for **g8265dot1-2010**

log-delay-interval -4 (16 packets per second) for **g8275dot1-2014**

log-delay-interval -6 (64 packets per second) for **g8275dot2-2016**

### Parameters

#### *log-interval*

Specifies the Delay\_Req message interval, in log form.

**Values** -6 to 0

**Default** -6

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 16.217 log-events

### log-events

#### Syntax

**log-events** [**verbose**]

### Parameters

#### **verbose**

Sends the same events as just "log-events" plus Hold Down Start and Down End events. The optional "verbose" includes some events that are more likely used during debug/tuning/investigations.

### Platforms

All

## 16.218 log-files-total-size

## log-files-total-size

### Syntax

**log-files-total-size** *megabytes*

**no log-files-total-size**

### Context

[\[Tree\]](#) (config>log>storage log-files-total-size)

### Full Context

configure log file-storage-control log-files-total-size

## Description

This command configures the limit for the total space that all log files can occupy on each storage device on the active CPM.

When this threshold is reached, log events are no longer written to the files in the \log directory until SR OS removes older log files and the occupancy is below the limit.

When unconfigured, there is no specific limit for the total size of all log files.

Only log files in the \log directory with system generated names (including no file extension) are applicable toward the total size limit.

If a user manually adds or deletes log files from the \log directory, the size of the files is not taken into account for up to 1 hour.

The configured total size limit is not validated against the actual size of the installed storage devices. If the configured limit is larger than the installed CF device, the limit is never reached.

## Default

no log-files-total-size

## Parameters

*megabytes*

Specifies the total size limit for log files, in MB.

**Values** 50 to 4,194,304 MB (4 TBytes,  $2^{22}$  MB)

**Default** 0

## Platforms

All

## 16.219 log-filter

log-filter

### Syntax

**log-filter** *filter-id*

**no log-filter**

### Context

**[Tree]** (config>log>event-trigger>event>trigger-entry log-filter)

### Full Context

configure log event-trigger event trigger-entry log-filter

## Description

This command configures the log filter to be used for this trigger entry. The log filter defines the matching criteria that must be met in order for the log event to trigger the handler execution. The log filter is applied to the log event and, if the filtering decision results in a forward action, then the handler is triggered.

It is typically unnecessary to configure match criteria for the application or number in the log filter used for EHS since the particular filter is only applied for a specific log event application and number, as configured under the **config>log>event-trigger** context.

The **no** form of this command removes the log filter configuration.

## Parameters

### *filter-id*

Specifies the identifier of the filter.

**Values** 1 to 1500

## Platforms

All

## 16.220 log-id

log-id

## Syntax

**log-id** *log-id* [**name** *log-name*]

**no log-id** *log-id*

## Context

[\[Tree\]](#) (config>service>vprn>log log-id)

## Full Context

configure service vprn log log-id

## Description

This command creates a context to configure destinations for event streams.

The **log-id** context is used to direct events, alarms or traps, and debug information to respective destinations.

A maximum of 30 logs can be configured.

Before an event can be associated with this log-id, the **from** command identifying the source of the event must be configured.

Only one destination can be specified for a *log-id*. The destination of an event stream can be an in-memory buffer, console, session, snmp-trap-group, Syslog, or file.

Use the **event-control** command to suppress the generation of events, alarms, and traps for all log destinations.

An event filter policy can be applied in the log-id context to limit which events, alarms, and traps are sent to the specified log-id.

By default, the log events in a VPRN log are a subset of the complete set of possible log events in SR OS. See the **config>log>services-all-events** command for more details.

The **no** form of this command deletes the log destination ID from the configuration.

## Default

No log destinations are defined.

## Parameters

### *log-id*

Specifies the log ID number, expressed as a decimal integer.

**Values** 1 to 100

### *name log-name*

Configures an optional log name, up to 64 characters, that can be used to refer to the log destination after it is created.

## Platforms

All

## log-id

## Syntax

**log-id** *log-id* [**name** *li-log-name*]

**no log-id** *log-id*

## Context

[\[Tree\]](#) (config>li>log log-id)

## Full Context

configure li log log-id

## Description

This command configures an LI event log destination. The *log-id* is used to direct events, alarms or traps, and debug information for specific destinations.

## Parameters

### *log-id*

Specifies the log ID, expressed as a decimal number.

**Values** 1 to 100

***name li-log-name***

Configures an optional log name, up to 64 characters, that can be used to refer to the log destination after it is created.

All

**log-id**

**Syntax**

**log-id** *log-id* [**name** *log-name*]

**no log-id** *log-id*

**Context**

[\[Tree\]](#) (config>log log-id)

**Full Context**

configure log log-id

**Description**

This command creates a context to configure destinations for event streams.

The **log-id** context is used to direct events, alarms or traps, and debug information for specific destinations.

A maximum of 30 logs can be configured.

Before an event can be associated with this log ID, the **from** command identifying the source of the event must be configured.

Only one destination can be specified for a *log-id*. The destination of an event stream can be an in-memory buffer, console, session, snmp-trap-group, syslog, or file.

Use the **event-control** command to suppress the generation of events, alarms, and traps for all log destinations.

An event filter policy can be applied in the log-id context to limit which events, alarms, and traps are sent to the specified log-id.

Log-IDs 99 and 100 are created by the agent. Log-ID 99 captures all log messages. Log-ID 100 captures log messages with a severity level of major and above.

**Note:**

Log-ID 99 provides valuable information for the admin-tech file. Removing or changing the log configuration may hinder debugging capabilities. It is strongly recommended not to alter the configuration for Log-ID 99.

The **no** form of this command deletes the log destination ID from the configuration.

## Parameters

### *log-id*

Specifies the log ID, expressed as a decimal integer.

**Values** 1 to 101

### *name log-name*

Configures an optional log name, up to 64 characters, that can be used to refer to the log destination after it is created.

## Platforms

All

## 16.221 log-prefix

### log-prefix

## Syntax

**log-prefix** *log-prefix-string*

**no log-prefix**

## Context

[\[Tree\]](#) (config>service>vprn>log>syslog log-prefix)

## Full Context

configure service vprn log syslog log-prefix

## Description

This command adds the string prepended to every syslog message sent to the syslog host.

RFC3164, *The BSD syslog Protocol*, allows an alphanumeric string (tag) to be prepended to the content of every log message sent to the syslog host. This alphanumeric string can, for example, be used to identify the node that generates the log entry. The software appends a colon (:) and a space to the string and it is inserted in the syslog message after the date stamp and before the syslog message content.

Only one string can be entered. If multiple strings are entered, the last string overwrites the previous string. The alphanumeric string can contain lowercase (a-z), uppercase (A-Z) and numeric (0-9) characters.

The **no** form of this command removes the log prefix string.

## Default

log-prefix "TMNX".

## Parameters

### *log-prefix-string*

Specifies the alphanumeric string of up to 32 characters. Spaces and colons ( : ) cannot be used in the string.

## Platforms

All

## log-prefix

## Syntax

**log-prefix** *prefix-text*

## Context

[\[Tree\]](#) (config>service>nat>syslog>syslog-export-policy log-prefix)

## Full Context

configure service nat syslog syslog-export-policy log-prefix

## Description

This command configures the syslog log prefix. For more information, refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide*. The **config>log>syslog>level** hierarchy also applies to this context.

## Default

log-prefix "TMNX"

## Parameters

### *prefix-text*

Specifies an alphanumeric string, up to 32 characters. Spaces and colons ( : ) cannot be used in the string.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## log-prefix

## Syntax

**log-prefix** *log-prefix-string*

**no log-prefix**

## Context

[\[Tree\]](#) (config>log>syslog log-prefix)

## Full Context

```
configure log syslog log-prefix
```

## Description

This command adds the string prepended to every syslog message sent to the syslog host.

RFC 3164, allows an alphanumeric string (tag) to be prepended to the content of every log message sent to the syslog host. This alphanumeric string can, for example, be used to identify the node that generates the log entry. The software appends a colon (:) and a space to the string and it is inserted in the syslog message after the date stamp and before the syslog message content.

Only one string can be entered. If multiple strings are entered, the last string overwrites the previous string. The alphanumeric string can contain lowercase (a-z), uppercase (A-Z) and numeric (0 to 9) characters.

The **no** form of this command removes the log prefix string.

## Default

```
no log-prefix
```

## Parameters

### *log-prefix-string*

Specifies an alphanumeric string up to 32 characters in length. Spaces and colons ( : ) cannot be used in the string.

## 16.222 log-sync-interval

### log-sync-interval

## Syntax

```
log-sync-interval log-interval
```

```
no log-sync-interval
```

## Context

```
\[Tree\] (config>service>vprn>ptp>peer log-sync-interval)
```

## Full Context

```
configure service vprn ptp peer log-sync-interval
```

## Description

This command configures the message interval used for unicast event messages. It defines the message interval for both Sync and Delay\_Resp messages that are requested during unicast negotiation to the

specific peer. This controls the Sync and Delay\_Resp message rate sent from remote peers to the local node. It does not affect the Sync or Delay\_Resp packet rate that may be sent from the local node to remote peers. Remote peers may request a Sync or Delay\_Resp packet rate anywhere within the acceptable grant range.

The **log-sync-interval** cannot be changed unless the peer is shutdown.

This command only applies to the 7450 ESS and 7750 SR.

The **no** form of this command reverts the value to the profile default.

### Default

log-sync-interval -6 (64 packets per second) for **ieee1588-2008**

log-sync-interval -6 (64 packets per second) for **g8265dot1-2010**

log-sync-interval -4 (16 packets per second) for **g8275dot1-2014**

log-sync-interval -6 (64 packets per second) for **g8275dot2-2016**

### Parameters

#### *log-interval*

Specifies the sync message interval, in log form.

**Values** -6 to 0

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## log-sync-interval

**log-sync-interval** *log-interval*

**no log-sync-interval**

### Context

**[Tree]** (config>system>ptp>peer log-sync-interval)

### Full Context

configure system ptp peer log-sync-interval

### Description

This command configures the message interval used for unicast event messages. It defines the message interval for both Sync and Delay\_Resp messages that are requested during unicast negotiation to the specific peer. This controls the Sync and Delay\_Resp message rate sent from remote peers to the local node. It does not affect the Sync or Delay\_Resp packet rate that may be sent from the local node to remote peers. Remote peers may request a Sync or Delay\_Resp packet rate anywhere within the acceptable grant range.

The **log-sync-interval** cannot be changed unless the peer is shutdown.

The **no** form of this command reverts the value to the profile default.

### Default

log-sync-interval -6 (64 packets per second) for **ieee1588-2008**

log-sync-interval -6 (64 packets per second) for **g8265dot1-2010**

log-sync-interval -4 (16 packets per second) for **g8275dot1-2014**

log-sync-interval -6 (64 packets per second) for **g8275dot2-2016**

### Parameters

#### *log-interval*

Specifies the sync message interval, in log form.

**Values** -6 to 0

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## log-sync-interval

### Syntax

**log-sync-interval** *log-interval*

**no log-sync-interval**

### Context

[\[Tree\]](#) (config>system>ptp>port log-sync-interval)

### Full Context

configure system ptp port log-sync-interval

### Description

This command configures the message interval used for transmission of multicast Sync messages.

For multicast messages used on PTP Ethernet ports, this configures the message interval used for Sync messages transmitted by the local node when the port is in Master state.

The **no** form of this command reverts the value to the profile default.

### Default

log-sync-interval -6 (64 packets per second) for **ieee1588-2008**

log-sync-interval -6 (64 packets per second) for **g8265dot1-2010**

log-sync-interval -4 (16 packets per second) for **g8275dot1-2014**

log-sync-interval -6 (64 packets per second) for **g8275dot2-2016**

## Parameters

### *log-interval*

Specifies the message interval, in log form.

**Values** -6 to 0 (This corresponds to a maximum rate of 64 packets per second, and a minimum rate of 1 packet per second.)

**Default** -6

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 16.223 logger-event-bundling

### logger-event-bundling

#### Syntax

[no] **logger-event-bundling**

#### Context

[\[Tree\]](#) (config>router>mpls logger-event-bundling)

#### Full Context

configure router mpls logger-event-bundling

#### Description

This feature merges two of the most commonly generated MPLS traps, vRtrMplsXCCreate and vRtrMplsXCDelete, which can be generated at both LER and LSR into a new specific trap vRtrMplsSessionsModified. In addition, this feature perform bundling of traps of multiple RSVP sessions, that is LSPs, into this new specific trap.

The intent is to provide a tool for the user to minimize trap generation in an MPLS network. Note that the MPLS trap throttling will not be applied to this new trap.

The **no** version of this command disables the merging and bundling of the above MPLS traps.

## 16.225 logical-port-status

### logical-port-status

### Syntax

logical-port-status {rsvp-te | mpls-tp | sr-te}

no logical-port-status [{rsvp-te | mpls-tp | sr-te}]

### Context

[\[Tree\]](#) (config>open-flow>of-switch logical-port-status)

### Full Context

configure open-flow of-switch logical-port-status

### Description

This command enables status change reporting to the OpenFlow controller for the specified logical port type. To report on multiple logical port types, the command needs to be executed multiple times with different logical port specified as required.

The **no** form of this command disables status reporting for specified or all (no argument) logical ports.

### Default

no logical-port-status

## Parameters

### **rsvp-te**

Enables reporting on RSVP-TE LSP logical ports.

### **mpls-te**

Enables reporting on MPLS-TE logical ports.

### **sr-te**

Enables reporting on SR-TE logical ports.

## Platforms

All

## 16.226 login-banner

### login-banner

## Syntax

[no] login-banner

## Context

[\[Tree\]](#) (config>system>login-control login-banner)

## Full Context

configure system login-control login-banner

## Description

This command enables or disables the display of a login banner. The login banner contains the SR OS copyright and build date information for a console login attempt.

The **no** form of this command causes only the configured pre-login-message and a generic login prompt to display.

## Platforms

All

## 16.227 login-control

## login-control

### Syntax

**login-control**

### Context

### Full Context

configure system login-control

### Description

This command creates the context to configure the session control for console, Telnet, SSH, and FTP sessions.

### Platforms

All

## 16.228 login-exec

## login-exec

### Syntax

**login-exec** *url-prefix: source-url*

**no login-exec**

### Context

[\[Tree\]](#) (config>system>security>user>console login-exec)

[\[Tree\]](#) (config>system>security>user-template>console login-exec)

### Full Context

configure system security user console login-exec

configure system security user-template console login-exec

### Description

This command configures a user's login exec file which executes whenever the user successfully logs in to a console session.

Only one exec file can be configured. If multiple **login-exec** commands are entered for the same user, each subsequent entry overwrites the previous entry.

The **no** form of this command disables the login exec file for the user.

**Default**

no login-exec

**Parameters*****url-prefix: source-url***

Specifies either a local or remote URL, up to 200 characters, that identifies the exec file that is executed after the user successfully logs in.

**Platforms**

All

## 16.229 login-scripts

### login-scripts

**Syntax**

login-scripts

**Context**

[\[Tree\]](#) (config>system>login-control login-scripts)

**Full Context**

configure system login-control login-scripts

**Description**

Commands in this context configure CLI scripts that execute when a user (authenticated via any method including local user database, TACACS+, or RADIUS) first logs into a CLI session.

**Platforms**

All

## 16.230 logout

### logout

**Syntax**

logout

**Context**

**[Tree]** (logout)

**Full Context**

logout

**Description**

This command logs out of the router session.

When the **logout** command is issued from the console, the login prompt is displayed, and any log IDs directed to the console are discarded. When the console session resumes (regardless of the user), the log output to the console resumes.

When a Telnet session is terminated from a **logout** command, all log IDs directed to the session are removed. When a user logs back in, the log IDs must be re-created.

**Context**

**[Tree]** (config>log>acct-policy>cr>aa>aa-sub-cntr long-duration-flow-count)

**Full Context**

configure log accounting-policy custom-record aa-specific aa-sub-counters long-duration-flow-count

**Description**

This command includes the long duration flow count. This command only applies to the 7750 SR.

The **no** form of this command excludes the long duration flow count in the AA subscriber's custom record.

**Default**

no long-duration-flow-count

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.232 long-lived

### long-lived

#### Syntax

[no] long-lived

#### Context

**[Tree]** (config>service>vprn>bgp>graceful-restart long-lived)

**[Tree]** (config>service>vprn>bgp>group>neighbor>graceful-restart long-lived)

**[Tree]** (config>service>vprn>bgp>group>graceful-restart long-lived)

#### Full Context

configure service vprn bgp graceful-restart long-lived

configure service vprn bgp group neighbor graceful-restart long-lived

configure service vprn bgp group graceful-restart long-lived

#### Description

Commands in this context configure BGP Long-Lived Graceful-Restart (LLGR) procedures.

LLGR, known informally as BGP persistence, is an extension of BGP graceful restart that allows a session to stay down for a longer period of time. During this time, learned routes are marked and re-advertised as stale but they can continue to be used as routes of last resort.

The LLGR handling of a session failure can be invoked immediately or it can be delayed until the end of the traditional GR restart window.

```
loop-detect {drop-peer | discard-route | ignore-loop | off}
no loop-detect
```

## Context

[\[Tree\]](#) (config>subscr-mgmt>bgp-prng-plcy loop-detect)

## Full Context

```
configure subscriber-mgmt bgp-peering-policy loop-detect
```

## Description

This command configures how the BGP peer session handles loop detection in the AS path.

### Note:

Dynamic configuration changes of **loop-detect** are not recognized.

The **no** form of this command used at the global level reverts to default, which is **loop-detect ignore-loop**.

## Parameters

### drop-peer

Sends a notification to the remote peer and drops the session.

### discard-route

Discards routes received with loops in the AS path.

### ignore-loop

Ignores routes with loops in the AS path but maintains peering.

### off

Disables loop detection.

## Full Context

configure service vprn bgp loop-detect

configure service vprn bgp group neighbor loop-detect

configure service vprn bgp group loop-detect

## Description

This command configures how the BGP peer session handles loop detection in the AS path.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific value is used.

Dynamic configuration changes of **loop-detect** are not recognized.

The **no** form of this command used at the global level reverts to default, which is **loop-detect ignore-loop**.

The **no** form of this command used at the group level reverts to the value defined at the global level.

The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

## Default

loop-detect ignore-loop

## Parameters

### drop-peer

Sends a notification to the remote peer and drops the session.

### discard-route

Discards routes received with loops in the AS path.

### ignore-loop

ignores routes with loops in the AS path but maintains peering.

### off

Disables loop detection.

## Platforms

[\[Tree\]](#) (config>router>bgp>group loop-detect)

[\[Tree\]](#) (config>router>bgp>group>neighbor loop-detect)

## Full Context

configure router bgp loop-detect

configure router bgp group loop-detect

configure router bgp group neighbor loop-detect

## Description

This command configures how the BGP peer session handles loop detection in the AS path.

This configuration parameter can be set at three levels: global level (applies to all peers), group level (applies to all peers in peer-group) or neighbor level (only applies to specified peer). The most specific value is used.

### Note:

Dynamic configuration changes of **loop-detect** are not recognized.

The **no** form of this command used at the global level reverts to default, which is **loop-detect ignore-loop**.

The **no** form of this command used at the group level reverts to the value defined at the global level.  
The **no** form of this command used at the neighbor level reverts to the value defined at the group level.

## Default

loop-detect ignore-loop

## Parameters

### drop-peer

Sends a notification to the remote peer and drops the session.

### discard-route

Discards routes received from a peer with the same AS number as the router itself. This option prevents routes looped back to the router from being added to the routing information base and consuming memory. When this option is changed, the change will not be active for an established peer until the connection is re-established for the peer.

### ignore-loop

Ignores routes with loops in the AS path but maintains peering.

### off

Disables loop detection.

## Platforms

**[Tree]** (config>service>vprn>bgp>group>neighbor loop-detect-threshold)

**[Tree]** (config>service>vprn>bgp>group loop-detect-threshold)

## Full Context

configure service vprn bgp loop-detect-threshold

configure service vprn bgp group neighbor loop-detect-threshold

configure service vprn bgp group loop-detect-threshold

## Description

This command provides additional control over the behavior enabled by the **loop-detect** command. If this command specifies a threshold value of  $n$ , then a route received by the local BGP speaker with an AS path that contains up to  $n$  occurrences of the local speaker's AS number is considered valid and not treated as an AS path loop. An AS loop is considered to occur only when the received AS path has more than  $n$  occurrences of the local speaker's AS number.

The **no** form of this command removes the configuration and sets the value to 0. One or more occurrence of the local speaker's AS number in the received AS path triggers the **loop-detect** behavior.

## Default

no loop-detect-threshold

## Parameters

### *loop-detect-threshold*

The maximum number of occurrences of the local speaker's AS number in the received AS path before the AS path is considered to be a loop.

**Values** 0 to 15

**Default** 0

## Platforms

All

configure router bgp group loop-detect-threshold

## Description

This command provides additional control over the behavior enabled by the **loop-detect** command. If this command specifies a threshold value of  $n$ , then a route received by the local BGP speaker with an AS path

that contains up to  $n$  occurrences of the local speaker's AS number is considered valid and not treated as an AS path loop. An AS loop is considered to occur only when the received AS path has more than  $n$  occurrences of the local speaker's AS number.

The **no** form of this command removes the configuration and sets the value to 0. One or more occurrence of the local speaker's AS number in the received AS path triggers the **loop-detect** behavior.

### Default

no loop-detect-threshold

### Parameters

#### *loop-detect-threshold*

The maximum number of occurrences of the local speaker's AS number in the received AS path before the AS path is considered to be a loop.

**Values** 0 to 15

**Default** 0

### Platforms

## 16.235 loopback

### loopback

#### Syntax

[no] loopback

#### Context

[\[Tree\]](#) (config>service>vprn>if loopback)

[\[Tree\]](#) (config>service>ies>if loopback)

#### Full Context

configure service vprn interface loopback

configure service ies interface loopback

#### Description

This command specifies that the associated interface is a loopback interface that has no associated physical interface. As a result, the associated IES/VP RN interface cannot be bound to a SAP.

**Note:**

Configure an IES interface as a loopback interface by issuing the **loopback** command instead of the **sap sap-id** command. The loopback flag cannot be set on an interface where a SAP is already defined and a SAP cannot be defined on a loopback interface.

The **no** form of this command reverts to the default.

**Platforms**

All

**loopback****Syntax**

[no] loopback

**Context**

[\[Tree\]](#) (config>service>vprn>nw-if loopback)

**Full Context**

configure service vprn network-interface loopback

**Description**

This command specifies that the associated interface is a loopback interface that has no associated physical interface. As a result, the associated interface cannot be bound to a SAP.

When using mtrace/mstat in a Layer 3 VPN context then the configuration for the VPRN should have a loopback address configured which has the same address as the core instance's system address (BGP next-hop).

**Default**

no loopback

**Platforms**

All

**loopback****Syntax**

loopback {line | internal}

no loopback

**Context**

[\[Tree\]](#) (config>port>sonet-sdh loopback)

## Full Context

```
configure port sonet-sdh loopback
```

## Description

This command activates a loopback on the SONET/SDH port.

The SONET port must be in a shut down state to activate any type of loopback. The loopback setting is never saved to the generated/saved configuration file.

Note that loopback mode changes on a SONET/SDH port can affect traffic on the remaining ports.

This command is supported by TDM satellite.

## Default

```
no loopback
```

## Parameters

### line

Set the port into line loopback state.

### internal

Set the port into internal loopback state.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## loopback

## Syntax

```
loopback {line | internal | fdl-ansi | fdl-bellcore | payload-ansi | inband-ansi | inband-bellcore}
no loopback
```

## Context

[\[Tree\]](#) (config>port>tdm>ds1 loopback)

## Full Context

```
configure port tdm ds1 loopback
```

## Description

This command puts the specified port or channel into a loopback mode.

The corresponding port or channel must be in a shutdown state in order for the loopback mode to be enabled. The upper level port or channel or parallel channels should not be affected by the loopback mode.

Note that this command is not saved in the router configuration between boots.

The **no** form of this command disables the specified type of loopback.

## Default

no loopback

## Parameters

### line

Places the associated port or channel into a line loopback mode. A line loopback loops frames received on the corresponding port or channels back to the remote router.

### internal

Places the associated port or channel into an internal loopback mode. An internal loopback loops the frames from the local router back at the framer.

### fdl-ansi

Requests FDL line loopback according to ANSI T1.403.

### fdl-bellcore

Requests FDL line loopback according to Bellcore TR-TSY-000312.

### payload-ansi

Requests payload loopback using ANSI signaling.

### inband-ansi

Requests inband line loopback according to ANSI T1.403.

### inband-bellcore

Requests inband line loopback according to Bellcore signaling.

## Platforms

```

## Context

[\[Tree\]](#) (oam>eth-cfm loopback)

## Full Context

oam eth-cfm loopback

## Description

The command initiates a loopback test.

## Parameters

### *mac-address*

Specifies a unicast MAC address or multicast MAC address. The last nibble of the multicast address must match the level of the local MEP, or the command fails and the test is not instantiated.

**Values** xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx or multicast

### **multicast**

Builds the class one destination multicast address based on the level of the local MEP. The last nibble of the multicast address must match the level of the local MEP or the command fails and the test is not instantiated.

### **remote-mepid** *mep-id*

Specifies the remote MEP ID of the peer within the association. The domain and association information are derived from the **source mep** for the session. The Layer 2 IEEE MAC address is resolved from previously-learned remote MAC addressing, derived from the reception and processing of the ETH-CC PDU. The local MEP must be administratively enabled.

**Values** 1 to 8191

**mep mep-id**

Specifies the local MEP ID.

**Values** 1 to 8191

**md-index**

Specifies the MD index.

**Values** 1 to 4294967295

**ma-index**

Specifies the MA index.

**Values** 1 to 4294967295

**send-count**

Specifies the number of messages to send, expressed as a decimal integer. Loopback messages are sent back-to-back, with no delay between the transmissions.

**Values** 1 to 1024

**Default** 1

**data-size**

Specifies the size of the variable data pattern only of the data TLV. This value does not include the 1 Byte Type, 2 Byte Length. This means that the total size of the data TLV is the configured value plus the 3 addition bytes to accommodate the type and length fields. If 0 is specified, no data TLV is added to the packet. This parameter and **lbm-padding** are mutually exclusive.

**Values** 0 to 1500

**Default** 0

**priority**

Specifies a 3-bit value to be used in the VLAN tag, if present, in the transmitted frame.

**Values** 0 to 7

**Default** The CCM and LTM priority of the MEP

**padding-size**

Specifies the complete size of the data TLV, which includes the 1 Byte Type, 2 Byte Length, and the variable data pad. If 0 is specified, no data TLV is added to the packet. MSDU is not processed when **lbm-padding** is in use. This parameter and **size** are mutually exclusive.

**Values** 0, 3 to 9000

**Default** 0

***timeout-time***

Specifies the time, in seconds, used to override the default *timeout-time* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of message time out, the requesting router assumes that the message response is not received. Any response received after the request times out is silently discarded.

**Values** 1 to 10

**Default** 5

***interval-time***

Specifies the time, in deciseconds (100 ms), to configure the spacing between probes within the test run. A value of 0 means probes are sent with no enforced delay. This value is only applicable to tests where the **send-count** is 5 or less.

**Values** 0 to 600

**Default** 0 or 10 depending on the **send-count**

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**[Tree]** (config>router>ospf loopfree-alternate-exclude)

### Full Context

configure router ospf3 loopfree-alternate-exclude

configure router ospf loopfree-alternate-exclude

## Description

This command excludes from the LFA SPF calculation those prefixes that match a prefix entry or a tag entry in a prefix policy. If a prefix is excluded from LFA, it is not included in LFA calculations regardless of its priority. The prefix tag will, however, be used in the main SPF.

The implementation also allows the user to exclude a specific interface in IS-IS or OSPF, a or all interfaces in an OSPF area or IS-IS level from the LFA SPF.

### Note:

Prefix tags are defined for the IS-IS protocol but not for the OSPF protocol.

The default action of the **loopfree-alternate-exclude** command, when not explicitly specified by the user in the prefix policy, is "reject". Therefore, regardless of whether the user explicitly added the statement "default-action reject" to the prefix policy, a prefix that does not match any entry in the policy will be accepted into LFA SPF.

The **no** form of this command deletes the exclude prefix policy.

## Default

no loopfree-alternate-exclude

## Parameters

### *prefix-policy*

Specifies up to five policy prefix names. The specified policy name must already be defined. Prefix policies are created with the command **config>router>policy-options>prefix-list**; for information on prefix lists, refer to "Route Policies" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Unicast Routing Protocols Guide*.

## Description

This command enables Loop-Free Alternate (LFA) computation by SPF for the IS-IS routing protocol.

When this command is enabled, it instructs the IGP SPF to attempt to pre-compute both a primary next-hop and an LFA next-hop for every learned prefix. When found, the LFA next-hop is populated into the routing table along with the primary next-hop for the prefix.

The user enables the remote LFA next-hop calculation by the IGP LFA SPF by appending the `remote-lfa` option. When this option is enabled in an IGP instance, SPF performs the remote LFA additional computation following the regular LFA next-hop calculation when the latter resulted in no protection for one or more prefixes which are resolved to a given interface.

Remote LFA extends the protection coverage of LFA-FRR to any topology by automatically computing and establishing/tearing-down shortcut tunnels, also referred to as repair tunnels, to a remote LFA node which puts the packets back into the shortest without looping them back to the node which forwarded them over the repair tunnel. The remote LFA node is referred to as PQ node. A repair tunnel can in theory be an

RSVP LSP, a LDP-in-LDP tunnel, or a SR tunnel. In this feature, it is restricted to use SR repair tunnel to the remote LFA node.

The remote LFA algorithm is a per-link LFA SPF calculation and not a per-prefix like the regular LFA one. So, it provides protection for all destination prefixes which share the protected link by using the neighbor on the other side of the protected link as a proxy for all these destinations.

The Topology-Independent LFA (TI-LFA) further improves the protection coverage of a network topology by computing and automatically instantiating a repair tunnel to a Q node which is not in shortest path from the computing node. The repair tunnel uses shortest path to the P node and a source routed path from the P node to the Q node.

In addition, the TI-LFA algorithm selects the backup path which matches the post-convergence path. This helps the capacity planning in the network since traffic will always flow on the same path when transitioning to the FRR next-hop and then onto the new primary next-hop.

At a high level, the TI-LFA protection algorithm is searching for a candidate P-Q set separated with a number of hops such that the label stack size does not exceed the value of **ti-lfa max-sr-frr-labels**, on each of the post-convergence paths to each destination node or prefix D.

When the **ti-lfa** option is enabled in IS-IS, it provides TI-LFA node-protect or link-protect backup path in IS-IS MT=0 for an SR-ISIS IPV4/IPv6 tunnel (node SID and adjacency SID), for an IPv4 SR-TE LSP, and for LDP IPv4 FEC when the LDP **fast-reroute backup-sr-tunnel** option is enabled.

The **max-sr-frr-labels** parameter is used to limit the search for the TI-LFA backup next-hop:

1. 0 — The IGP LFA SPF restricts the search to TI-LFA backup next-hop which does not require a repair tunnel, meaning that P node and Q node are the same and match a neighbor. This is also the case when both P and Q node match the advertising router for a prefix.
2. 1 to 3 — The IGP LFA SPF will widen the search to include a repair tunnel to a P node which itself is connected to the Q nodes with a 0-to-2 hops for a total of maximum of three labels: one node SID to P node and two adjacency SIDs from P node to the Q node. If the P node is a neighbor of the computing node, its node SID is compressed and meaning that up to three adjacency SIDs can separate the P and Q nodes.
3. 2 (default) — Corresponds to a repair tunnel to a non-adjacent P which is adjacent to the Q node. If the P node is a neighbor of the computing node, then the node SID of the P node is compressed and the default value of two labels corresponds to two adjacency SIDs between the P and Q nodes.

When the **node-protect** command is enabled, the router will prefer a node-protect over a link-protect repair tunnel for a given prefix if both are found in the Remote LFA or TI-LFA SPF computations. The SPF computations may only find a link-protect repair tunnel for prefixes owned by the protected node. This node-protect backup protects against the failure of a downstream node in the path of the prefix of a node SID except for the node owner of the node SID.

The parameter **max-pq-nodes** in Remote LFA controls the maximum number of PQ nodes found in the LFA SPFs for which the node protection check is performed. The node-protect condition means the router must run the original Remote LFA algorithm plus one extra forward SPF on behalf of each PQ node found, potentially after applying the **max-pq-cost** parameter, to check if the path from the PQ node to the destination does not traverse the protected node. Setting this parameter to a lower value means the LFA SPFs will use less computation time and resources but may result in not finding a node-protect repair tunnel.

The **no** form of this command disables the LFA computation by IGP SPF.

### Description

This command enables Loop-Free Alternate (LFA) computation by SPF under the OSPF or OSPFv3 routing protocol instance.

When this command is enabled, it instructs the IGP SPF to attempt to precalculate both a primary next hop and an LFA next hop for every learned prefix. When found, the LFA next hop is populated into the routing table along with the primary next hop for the prefix.

The user enables the remote LFA next hop calculation by the IGP LFA SPF by appending the **remote-lfa** option. When this option is enabled in an IGP instance, SPF performs the remote LFA additional computation following the regular LFA next hop calculation when the latter resulted in no protection for one or more prefixes which are resolved to a particular interface.

Remote LFA extends the protection coverage of LFA-FRR to any topology by automatically computing and establishing or tearing down shortcut tunnels, also referred to as repair tunnels, to a remote LFA node that puts the packets back into the shortest path without looping them back to the node that forwarded them over the repair tunnel. The remote LFA node is referred to as a PQ node. A repair tunnel can, in theory, be an RSVP-TE LSP, an LDP-in-LDP tunnel, or a segment routing (SR) tunnel. In this command, **remote-lfa** is restricted to using an SR repair tunnel to the remote LFA node.

The remote LFA algorithm is a per-link LFA SPF calculation and not a per-prefix calculation like the regular LFA algorithm. The remote LFA algorithm provides protection for all destination prefixes that share the protected link by using the neighbor on the other side of the protected link as a proxy for all the destinations.

The Topology-Independent LFA (TI-LFA) further improves the protection coverage of a network topology by computing and automatically instantiating a repair tunnel to a Q node which is not in shortest path from the computing node. The repair tunnel uses shortest path to the P node and a source routed path from the P node to the Q node.

In addition, the TI-LFA algorithm selects the backup path which matches the post-convergence path. This helps the capacity planning in the network since traffic will always flow on the same path when transitioning to the FRR next hop and then onto the new primary next hop.

At a high level, the TI-LFA protection algorithm is searching for a candidate P-Q set separated with a number of hops such that the label stack size does not exceed the value of **ti-lfa max-sr-frr-labels**, on each of the post-convergence paths to each destination node or prefix D.

When the **ti-lfa** option is enabled in OSPF, it provides TI-LFA node-protect or link-protect backup path for a SR-OSPF IPv4 tunnel (node SID and adjacency SID), and for a IPv4 SR-TE LSP.

The **max-sr-frr-labels** parameter is used to limit the search for the TI-LFA backup next hop:

1. 0 — The IGP LFA SPF restricts the search to TI-LFA backup next hop which does not require a repair tunnel, meaning that P node and Q node are the same and match a neighbor. This is also the case when both P and Q node match the advertising router for a prefix.
2. 1 to 3 — The IGP LFA SPF will widen the search to include a repair tunnel to a P node which itself is connected to the Q nodes with a 0-to-2 hops for a total of maximum of three labels: one node SID to P node and two adjacency SIDs from P node to the Q node. If the P node is a neighbor of the computing node, its node SID is compressed and meaning that up to three adjacency SIDs can separate the P and Q nodes.
3. 2 (default) — Corresponds to a repair tunnel to a non-adjacent P which is adjacent to the Q node. If the P node is a neighbor of the computing node, then the node SID of the P node is compressed and the default value of two labels corresponds to two adjacency SIDs between the P and Q nodes.

The TI-LFA repair tunnel can have a maximum of three labels pushed in addition to the label of the destination node or prefix. The user can set a lower maximum value for the additional FRR labels by configuring the CLI option **max-sr-frr-labels labels**. The default value is 2.

When the **node-protect** command is enabled, the router will prefer a node-protect over a link-protect repair tunnel for a given prefix if both are found in the Remote LFA or TI-LFA SPF computations. The SPF computations may only find a link-protect repair tunnel for prefixes owned by the protected node. This node-protect backup protects against the failure of a downstream node in the path of the prefix of a node SID except for the node owner of the node SID.

The parameter **max-pq-nodes** in Remote LFA controls the maximum number of PQ nodes found in the LFA SPFs for which the node protection check is performed. The node-protect condition means the router must run the original Remote LFA algorithm plus one extra forward SPF on behalf of each PQ node found, potentially after applying the **max-pq-cost** parameter, to check if the path from the PQ node to the destination does not traverse the protected node. Setting this parameter to a lower value means the LFA SPFs will use less computation time and resources but may result in not finding a node-protect repair tunnel.

The **no** form of this command disables the LFA computation by the IGP SPF.

## loss-event

### Syntax

**loss-event rising-threshold *threshold* [falling-threshold *threshold*] [*direction*]**

**no loss-event**

### Context

[\[Tree\]](#) (config>saa>test loss-event)

### Full Context

configure saa test loss-event

### Description

Specifies that at the termination of an SAA test run, the calculated loss event value is evaluated against the configured rising and falling loss event thresholds. SAA threshold events are generated as required.

The configuration of loss event thresholds is optional.

The **no** form of this command disables the loss-event test run.

### Parameters

#### **rising-threshold *threshold***

Specifies a rising threshold loss event value, in packets. When the test run is completed, the calculated loss event value is compared to the configured loss event rising threshold.

If the test run loss event value is greater than the configured rising threshold value then an SAA threshold event is generated. The SAA threshold event is `tmnxOamSaaThreshold`, logger application OAM, event #2101.

**Values** 0 to 2147483647

**Default** 0

#### **falling-threshold *threshold***

Specifies a falling threshold loss event value, in packets. When the test run is completed, the calculated loss event value is compared to the configured loss event falling threshold. If the test run loss event value is greater than the configured falling threshold value then an SAA threshold event is generated. The SAA threshold event is `tmnxOamSaaThreshold`, logger application OAM, event #2101.

**Values** 0 to 2147483647

**Default** 0

#### ***direction***

Specifies the direction for OAM ping responses received for an OAM ping test run.

**Values** **inbound** — Monitor the value of jitter calculated for the inbound, one-way, OAM ping responses received for an OAM ping test run.

**outbound** — Monitor the value of jitter calculated for the outbound, one-way, OAM ping requests sent for an OAM ping test run.

**roundtrip** — Monitor the value of jitter calculated for the round trip, two-way, OAM ping requests and replies for an OAM ping test run.

**Default** roundtrip

#### **Context**

**[Tree]** (config>oam-pm>session>measurement-interval>event-mon loss-events)

## Full Context

```
configure oam-pm session measurement-interval event-mon loss-events
```

## Description

This enables the monitoring of all configured loss events. Adding this functionality starts the monitoring of the configured loss events at the start of the next measurement interval. If the function is removed using the **no** command, all monitoring of configured loss events, logging, and recording of new events for that session are suspended. Any existing events at the time of the shut down are maintained until the active measurement window in which the removal was performed has completed. The state of this monitoring function can be changed without having to shut down all the tests in the session.

The **no** form of this command disables the monitoring of all configured loss events.

## 16.241 loss-threshold

## loss-threshold

### Syntax

**loss-threshold** *percent*

**no loss-threshold**

### Context

**[Tree]** (config>test-oam>sath>accept-crit-tmpl loss-threshold)

### Full Context

configure test-oam service-activation-testhead acceptance-criteria-template loss-threshold

### Description

This command configures a frame loss ratio (FLR) value that is compared to the measured FLR at the end of the test to determine the test result. If the measured value is greater than the configured value, the test fails; otherwise, it passes. Thresholds must be explicitly configured to use them for the comparison.

The FLR is computed as a ratio of the difference of the number of received frames to the number of injected or sent frames divided by the number of sent frames.

The **no** form of this command disables the comparison of the parameter with the measured value so that the threshold value is ignored for declaring the test result.

### Default

no loss-threshold

### Parameters

*percent*

Specifies the loss percentage threshold value for comparison with the measured value.

**Values** 0.0000 to 100.0000

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 16.244 low-burst-max-class

low-burst-max-class

## Syntax

**low-burst-max-class** *class*

**no low-burst-max-class**

## Context

[\[Tree\]](#) (config>port>ethernet>egress>hs-sec-shaper>agg low-burst-max-class)

## Full Context

configure port ethernet egress hs-secondary-shaper aggregate low-burst-max-class

## Description

This command specifies which scheduling classes map to the low burst-limit threshold of an egress HS secondary shaper. Egress SAPs can be configured to use an HS secondary shaper that manages their maximum burst limit over a specified aggregate shaping rate. Each HS secondary shaper supports two thresholds, a low burst limit threshold and a high burst limit threshold.

By default, all scheduling classes are mapped to the low burst limit threshold. It is important to note that when mapping scheduling classes to the high burst limit threshold an adequate value for the **card>fp>egress>hs-fixed-high-thresh-delta** must be specified. This is due to the fact that the queues associated with the lower classes may burst over the lower threshold in normal operation due to the scheduler forwarding whole packets. The **hs-fixed-high-thresh-delta** value should be set to at least two times the maximum frame size to prevent lower threshold class forwarding from also affecting the higher threshold classes when forwarding larger packet sizes. An insufficient high threshold delta defeats the intended purpose of mapping classes to the higher threshold.

The system utilizes the lowest value attainable for each low threshold aggregate burst limit without causing shaper underrun conditions. The high burst limit threshold is determined by adding the **hs-fixed-high-thresh-delta** value configured in the **config>card>fp>egress** context to the aggregate's low burst limit threshold value.

The low-burst-max-class value can be changed at any time for an HS secondary shaper.

The **no** form of this command restores the HS secondary shaper's aggregate low burst limit threshold maximum scheduling class mapping to the default value. This causes all sets of queues associated with the hs-secondary-shaper secondary-shaper-name to have all scheduling classes mapped to the low burst limit threshold.

## Default

low-burst-max-class 6

## Parameters

### *class*

Specifies the low burst maximum class. This parameter is required when executing the **low-burst-max-class** command. The parameter reflects the highest scheduling class that will be associated with the low burst limit threshold associated with the HS secondary aggregate shaper. Scheduling classes higher than scheduling class ID will be associated with the high burst limit threshold.

**Values** 1 to 6

## Platforms

7750 SR-7/12/12e

## low-burst-max-class

## Syntax

**low-burst-max-class** *class*

**no low-burst-max-class**

## Context

[\[Tree\]](#) (config>qos>hs-attachment-policy low-burst-max-class)

## Full Context

```
configure qos hs-attachment-policy low-burst-max-class
```

## Description

This command specifies which scheduling classes map to the low burst-limit threshold of the queue-level aggregate shaper. Each egress SAP or subscriber SLA profile instance (SPI), per port set of network interface queues and egress queue group template instance has an aggregate shaper that manages the maximum burst limit over a specified shaping rate. Each aggregate shaper supports two thresholds. As the scheduling rate for the set of queues increases, eventually the aggregate rate exceeds the rate limit and the aggregate burst limit starts to be consumed. If this continues, the low burst limit threshold is exceeded and the queues mapped to the scheduling classes associated with low threshold are removed from the scheduler. If the remaining aggregate rate (from the higher scheduling classes) continues to exceed the shaping rate, then the burst limit continues to be consumed and eventually the high burst limit threshold is exceeded. This causes the queues for all scheduling classes to be removed from the scheduler.

The second (high) threshold exists to allow the higher priority classes to continue to forward, thereby mitigating the effects of low priority bursts beyond the aggregate shaping rate. Typically, the higher scheduling class queues are either individually rate-limited so their aggregate allowed throughput is less than the aggregate rate or the expected aggregate unshaped traffic from the individual higher scheduling classes does not exceed the aggregate shaping rate. Determining the value of **low-burst-max-class** class involves anticipating the proper dividing line between the low and high scheduling classes by evaluating the forwarding behavior and SLA enforcement of each class.

By default, all scheduling classes are mapped to the low burst limit threshold. When mapping scheduling classes to the high burst limit threshold, an adequate value for the **card>fp>egress>hs-fixed-high-thresh-delta** must be specified. This is due to the fact that the queues associated with the lower classes may burst over the lower threshold in normal operation due to the scheduler forwarding whole packets. Set the **hs-fixed-highthresh- delta** value to at least two times the maximum frame size to prevent lower threshold class forwarding from also affecting the higher threshold classes when forwarding larger packet sizes. An insufficient high threshold delta defeats the intended purpose of mapping classes to the higher threshold.

The system utilizes the lowest value attainable for each low threshold aggregate burst limit without causing shaper underrun conditions. The high burst limit threshold is determined by adding the **hs-fixed-high-thresh-delta** value configured in the **config>card>fp>egress** CLI context to the aggregate's low burst limit threshold value.

The **low-burst-max-class** value can be changed at any time in the HS attachment policy. Modifying the setting causes all queue aggregate shapers to reconfigure the scheduling class mappings to the low and high burst limit thresholds to reflect the new value for scheduling class ID.

**Scheduling Classes** — As described in the **queue** and **wrr-group** attachment commands, each queue is either directly or indirectly (through a WRR group) mapped to a scheduling class. Each scheduling class has an inherent priority at the port scheduler. The inherent descending priority is as follows:

- Scheduling Class 6 (Highest)
- Scheduling Class 5
- Scheduling Class 4
- Scheduling Class 3

- Scheduling Class 2
- Scheduling Class 1 (lowest)

Placing scheduling classes into the port level WRR group causes those classes to compete for scheduling opportunities based on their associated weights instead of inherent priority. If higher weights are given to higher scheduling class IDs, then the relative proportional scheduling priority may continue to exhibit the priority level indicated by the class ID.

Setting Low and High Burst Limit Threshold Association — [Table 64: Low and High Burst Limit Threshold Association](#) demonstrates the effect of the **low-burst-max-class** command parameters on scheduling class mappings to the low and high burst limit thresholds.

Table 64: Low and High Burst Limit Threshold Association

| <b>low-burst-max-class<br/>sched-class</b> | <b>Scheduling Classes on<br/>Low Threshold</b> | <b>Scheduling Classes on<br/>High Threshold</b> |
|--------------------------------------------|------------------------------------------------|-------------------------------------------------|
| 1                                          | 1                                              | 2, 3, 4, 5, and 6                               |
| 2                                          | 1 and 2                                        | 3, 4, 5, and 6                                  |
| 3                                          | 1, 2, and 3                                    | 4, 5, and 6                                     |
| 4                                          | 1, 2, 3, and 4                                 | 5 and 6                                         |
| 5                                          | 1, 2, 3, 4, and 5                              | 6                                               |
| 6                                          | 1, 2, 3, 4, 5, and 6                           | —                                               |

The **no** form of the command restores the queue aggregate low burst limit threshold maximum scheduling class mapping to the default value. This causes all sets of queues associated with the specified **hs-attachment-policy** *policy-name* to have all scheduling classes mapped to the low burst limit threshold.

## Default

low-burst-max-class 6

## Parameters

### *class*

Specifies the low burst maximum class. This parameter is required when executing the **low-burst max-class** command. The parameter reflects the highest scheduling class that is associated with the low burst limit threshold associated with the queue aggregate shaper. Scheduling classes higher than the scheduling class ID are associated with the high burst limit threshold.

**Values** 1 to 6

```

## Description

This command specifies the lowest priority defect that generates a fault alarm. This setting is also used to determine the fault state of the MEP which, when enabled to do so, causes a network reaction.

## Default

low-priority-defect macRemErrXcon

## Parameters

### *low-priority-defect*

Specifies the lowest priority defect.

**Values** allDef, macRemErrXcon, remErrXcon, errXcon, xcon, noXcon

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 16.250 low-slope

### low-slope

## Syntax

[no] low-slope

## Context

[\[Tree\]](#) (config>qos>slope-policy low-slope)

## Full Context

configure qos slope-policy low-slope

## Description

The **low-slope** context contains the commands and parameters for defining the low Random Early Detection (RED) slope graph. Each buffer pool supports a low RED slope for managing access to the shared portion of the buffer pool for low out-of-profile packets.

The **low-slope** parameters can be changed at any time and the affected buffer pool low RED slopes must be adjusted appropriately.

The **no** form of this command restores the low slope configuration commands to the default values. If the leaf commands within **low-slope** are set to the default parameters, the **low-slope** node will not appear in save config and show config output unless the detail parameter is present.

## 16.251 low-wmark

### low-wmark

#### Syntax

**low-wmark** *percent*

#### Context

[\[Tree\]](#) (config>app-assure>group>dns-ip-cache>ip-cache low-wmark)

#### Full Context

configure application-assurance group dns-ip-cache ip-cache low-wmark

#### Description

This command configures the low watermark value for the dns-ip-cache. If the dns-ip-cache has previously crossed the high-watermark value, the system will clear the trap in case the number of IP addresses stored in the cache crosses below the low watermark value.

#### Default

low-wmark 80

#### Parameters

***percent***

Specifies the low watermark value, in percent.

**Values** 0 to 100

**Default** 80

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 16.252 lower-bound

### lower-bound

#### Syntax

**lower-bound** *microseconds*

**no lower-bound**

**Context**

**[Tree]** (config>oam-pm>bin-group>bin-type>bin lower-bound)

**Full Context**

configure oam-pm bin-group bin-type bin lower-bound

**Description**

This command allows the operator specify the individual floors thresholds for the bins. The operator does not have to specific a lower threshold for every bin that was previously defined by the bin-count for the specific type. By default, each bin is the bin-number times 5000 microseconds. Lower thresholds in the previous adjacent bin must be lower than the threshold of the next higher bin threshold. A separate line per bin is required to configure an operator-specific threshold. An error prevents the bin from entering the active state if this is not maintained, at the time the **no shutdown** is issued. Bin 0 is the result of the difference between 0 and the configured lower-threshold of bin 1. The highest bin in the bin-count captures every result above the threshold. Any negative delay metric result is treated as zero and placed in bin 0.

The **no** form of this command removes the user configured threshold value and applies the default for the bin.

**Parameters*****microseconds***

Specifies the threshold that defines the floor of the bin. The bin range is the difference between its configured threshold and the threshold of the next higher bin in microsecond threshold value.

**Values** 1 to 4294967295

**Default** bin-number \* 5000

**Platforms**

All

**16.253 Isa-accumulate****Isa-accumulate****Syntax**

**Isa-accumulate** *Isa-accumulate*

**no Isa-accumulate**

**Context**

**[Tree]** (config>router>ospf3>timers Isa-accumulate)

**[Tree]** (config>router>ospf>timers Isa-accumulate)

## Full Context

```
configure router ospf3 timers lsa-accumulate
```

```
configure router ospf timers lsa-accumulate
```

## Description

This command sets the internal OSPF delay to allow for the accumulation of multiple LSA so OSPF messages can be sent as efficiently as possible. The **lsa-accumulate** timer applies to all LSAs except Type 1 and Type 2 LSAs, which are sent immediately. LSAs are accumulated and then sent when:

- its size reaches the MTU size of the interface
- a new LSA is received on the interface
- the **lsa-accumulate** timer expires

Shorting this delay can speed up the advertisement of LSAs to OSPF neighbors but may increase the number of OSPF messages sent.

The **no** form of this command reverts to the default value.

### Note:

The timer granularity is 10 ms if the value is less than 500 ms, and 100 ms if the value is greater than or equal to 500 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

## Default

```
lsa-accumulate 1000
```

## Parameters

### *lsa-accumulate*

Specifies the LSA accumulation delay in milliseconds.

**Values** 0 to 1000

```

## Description

This parameter defines the minimum delay that must pass between receipt of the same Link State Advertisements (LSAs) arriving from neighbors.

It is recommended that the neighbor's configured **lsa-generate** *lsa-second-wait* interval is equal to or greater than the **lsa-arrival** timer configured here.

Use the **no** form of this command to return to the default.

### Note:

The timer granularity is 10 ms if the value is less than 500 ms, and 100 ms if the value is  $\geq 500$  ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

## Default

```
lsa-arrival 1000
```

## Parameters

### *lsa-arrival-time*

Specifies the timer in milliseconds.

**Values** 0 to 600000

configure router ospf3 area interface lsa-filter-out
```

## Description

This command enables filtering of outgoing OSPF LSAs on the selected OSPFv2 or OSPFv3 interface. Three filtering options are provided:

- Do not flood any LSAs out the interface. This option is suitable if the neighbor is simply-connected and has a statically configured default route with the address of this interface as next-hop.
- Flood the router's own router-LSA out the interface and suppress all other flooded LSAs. This option is suitable if the neighbor is simply-connected and has a statically configured default route with a loopback or system interface address (contained in the router-LSA) as next-hop.
- Flood the router's own router-LSA and all self-generated type-3, type-5 and type-7 LSAs advertising a default route (0/0) out the interface; suppress all other flooded LSAs. This option is suitable if the neighbor is simply-connected and does not have a statically configured default route.

The **no** form of this command disables OSPF LSA filtering (normal operation).

```

## Full Context

```
configure service vprn ospf3 timers lsa-generate
configure service vprn ospf timers lsa-generate
```

## Description

This parameter customizes the throttling of OSPF LSA-generation. Timers that determine when to generate the first, second, and subsequent LSAs can be controlled with this command. Subsequent LSAs are generated at increasing intervals of the *lsa-second-wait* timer until a maximum value is reached.

Configuring the **lsa-arrival** interval to equal or less than the *lsa-second-wait* interval configured in the **lsa-generate** command is recommended.

The **no** form of this command reverts to the default.

### Note:

The timer granularity is 10 ms if the value is less than 500 ms, and 100 ms if the value is  $\geq 500$  ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

## Parameters

### *max-lsa-wait*

Specifies the maximum interval, in milliseconds, between two consecutive occurrences of an LSA being generated.

**Values** 10 to 600000

**Default** 5000

### *lsa-initial-wait*

Specifies the first waiting period between link-state advertisements (LSA) originate(s), in milliseconds. When the LSA exceeds the **lsa-initial-wait** timer value and the topology changes, there is no wait period and the LSA is immediately generated.

When an LSA is generated, the initial wait period commences. If, within the specified **lsa-initial-wait** period and another topology change occurs, then the **lsa-initial-wait** timer applies.

**Values** 10 to 600000

**Default** 5000

### *lsa-second-wait*

Specifies the hold time in milliseconds between the first and second LSA generation. The next topology change is subject to this second wait period. With each subsequent topology change, the wait time doubles (this is 2x the previous wait time). This assumes that each failure occurs within the relevant wait period.

**Values** 10 to 600000

**Default** 5000

debug router ospf lsdb

**Description**

This command enables debugging for an OSPF link-state database (LSDB).

**Parameters*****type***

Specifies the OSPF link-state database (LSDB) type.

**Values** in the **ospf** context — router, network, summary, asbr, extern, nssa, area-opaque, as-opaque, link-opaque  
in the **ospf3** context — router, network, inter-area-pfx, inter-area-rtr, external, nssa, intra-area-pfx, rtr-info-link, rtr-info-area, rtr-info-as

***ls-id***

Specifies an LSA type specific field containing either a router ID or an IP address. It identifies the piece of the routing domain being described by the advertisement.

***adv-rtr-id***

Specifies the router identifier of the router advertising the LSA.

***area area-id***

Specifies a 32-bit integer uniquely identifying an area.

**Values** ip-address — a.b.c.d  
area — 0 to 4294967295

### Context

[\[Tree\]](#) (config>service>nat>fwd Isn)

### Full Context

configure service nat port-forwarding Isn

### Description

This command creates NAT static port forwards for LSN44, Ds-Lite and NAT64. Static port forwards (SPF) are static mappings created so that certain applications on the inside (private side) can be reached from

host that are on the outside of the NAT. SPF statically map the subscriber (inside IP address in LSN44, CPE IPv6 address/prefix in DS-Lite and IPv6 prefix in NAT64), inside port and protocol to an outside IPv4 address, port and the same protocol.

If only the inside router, the inside IPv4/v6 address/prefix and the protocol are configured as parameters in the SPF request, the remaining fields in the mapping (outside port and outside IPv4 address) will be selected automatically by the node and reported in CLI once the command execution is completed.

Specifying the outside IPv4 address in the SPF request, mandates that all other, otherwise optional, parameters be also specified in the request (inside port and outside port). This creates a fully specified SPF request. Fully specified SPF request can be used in multi-chassis NAT redundancy deployments where the SPF is manually replicated between the SR OS nodes. In single chassis NAT deployments, fully specified SPF request is guaranteed to work only in the system with a single MS-ISA in it. Otherwise (multiple MS-ISAs in the system) a conflict may arise where two distinct inside IP addresses that may reside on separate MS-ISAs are requested to be mapped to the same outside IPv4 address. This will not be possible since the outside IPv4 address cannot be split across the MS-ISAs (each IP address, inside or outside, is tied to a single MS-ISA).

In non-fully specified SPF requests (missing the inside port and/or outside port and the outside IPv4 address within the SPF request), the outside IPv4 address selection will depend on the configuration of the outside port in the SPF request:

- If the outside port is not specified or is specified from the configured **port-forwarding-range** [1024..port-forwarding-range], then the outside IPv4 address will be the same as the outside IPv4 address in an existing dynamic mapping for the same subscriber. If the subscriber does not exist (no dynamic mappings exist at the time of SPF creation request), then the subscriber will be automatically created and an outside IPv4 address will be assigned. In case that the outside ports are not available from the outside IPv4 address of the corresponding dynamic mapping, then the SPF request will fail. In other words, the dynamic and static mappings (created in this manner) for the same subscriber must use the same outside IPv4 address.
- If the outside port from the well-known port range [0 to 1023] is requested, then the outside IPv4 address does not have to match the outside IPv4 address of an existing dynamic mapping for the same subscriber, but can instead be any outside IPv4 address.

If multiple NAT policies per inside routing context are used, then the NAT policy must be specified in the SPF creation request. This is needed so the SPF be created in the correct pool.

SPFs are disabled by default and they must be explicitly enabled by the **port-limits forwarding** command within the NAT policy.

Configured SPFs, unlike SPFs created with the **tools** commands, are preserved across reboots without having to configure persistency (**config>system>persistence>nat-port-forwarding**) since they are part of the configuration. When the pool is shutdown the SPFs are deactivated. When the pool is enabled (no shutdown), the SPFs (as created by the **tools** command or by configuration) are activated.

To avoid possible persistency related conflicts, SPFs can only be created using one method on a given node: either as configuration (the CLI **configure** branch) or using the **tools** command. For example: if a first SPF entry is created via CLI **tools** commands, the node prevents SPF creation via configuration (the CLI **configure** branch) and vice versa.

The **no** form of the command deletes NAT static port forwards for LSN44, Ds-Lite and NAT64.

## Parameters

### **router** *router-instance*

This mandatory parameter specifies the inside routing instance; router name or service-id.

**Values** router-name, service-id

**b4 ipv6-address**

This optional parameter specifies the IPv6 address of the B4 element in DS-Lite.

**Values** <ipv6-address> : ipv6-address - x:x:x:x:x:x:x (eight 16-bit pieces)  
 x:x:x:x:x:d.d.d.d  
 x - [0..FFFF]H  
 d - [0..255]D

**aftr ipv6-address**

This optional parameter specifies IPv6 address of the AFTR element in DS-Lite.

**Values** <ip-address> : ipv4-address - a.b.c.d  
 ipv6-address - x:x:x:x:x:x:x (eight 16-bit pieces)  
 x:x:x:x:x:d.d.d.d  
 x - [0..FFFF]H  
 d - [0..255]D

**protocol {tcp | udp}**

This mandatory parameter specifies the protocol to use, either TCP or UDP.

**port port**

This optional parameter specifies a source port.

**Values** 1 to 65535

**outside-ip ipv4-address**

This mandatory parameter specifies the outside IPv4 address. If the outside IPv4 address is specified, then all other optional parameters become mandatory.

**outside-port port**

This optional parameter specifies the outside port.

**nat-policy policy-name**

If multiple NAT policies are used inside the routing context, then the NAT policy should be specified in the SPF request so the SPF is created in the correct NAT pool. Otherwise, the default NAT policy from the inside routing context will be used.

**force**

Force allocation of static port forwards.

This command is only applicable to a LSN44 pool with flexible port allocations. Such pools allow interleaving of static port forwards with other dynamically allocated ports triggered by traffic flow.

If the requested outside port in the static port forward command is already occupied by a dynamically allocated port, using the force keyword preempts the dynamically allocated port and reassigns it as a port forwarding port.

During preemption, all the flows associated with the dynamically allocated port are terminated.

When the requested port forward is occupied by another static port and not a dynamic port, the command fails even if the force keyword is configured.

When a static port forwarding command requests an arbitrary outside port that is not specified in the command, the force keyword has an effect if the entire port space is already occupied. In this case, one of the dynamic ports is preempted.

**Values** Keyword

## 16.259 lsp

```
lsp
```

### Syntax

[no] **lsp** *lsp-name*

### Context

[\[Tree\]](#) (config>router>ldp>targ-session>peer>tunneling lsp)

### Full Context

configure router ldp targeted-session peer tunneling lsp

### Description

This command configures a specific LSP destined to this peer and to be used for tunneling of LDP FEC over RSVP. A maximum of 4 RSVP LSPs can be explicitly used for tunneling LDP FECs to the T-LDP peer.

It is not necessary to specify any RSVP LSP in this context unless there is a need to restrict the tunneling to selected LSPs. All RSVP LSPs with a to address matching that of the T-LDP peer are eligible by default. The user can also exclude specific LSP names by using the `ldp-over-rsvp exclude` command in the **config>router>mpls>lsp** context.

## Full Context

configure router ldp targeted-session peer mcast-tunneling lsp

## Description

This command configures a specific LSP destined to this peer and to be used for tunneling of multicast LDP FEC over RSVP.

## Parameters

### *lsp-name*

Specifies the LSP name, up to 64 characters in length.

## Platforms

All

lsp

## Syntax

[no] lsp *lsp-name* sender *sender-address*

## Context

[\[Tree\]](#) (config>router>mpls>ingress-statistics lsp)

## Full Context

configure router mpls ingress-statistics lsp

## Description

This command configures statistics in the ingress data path of a terminating RSVP LSP at an egress LER. The LSP name must correspond to the name configured by the operator at the ingress LER. It must not contain the special character ":" which is used as a field separator by the ingress LER for encoding the LSP and path names into the RSVP session name field in the session\_attribute object. The operator must execute the **no shutdown** for this command to effectively enable statistics.

The same set of counters is updated for packets received over any path of this LSP and over the lifetime of the LSP. In steady-state, the counters are updated for packets received over the active path of the LSP. The active path can be the primary path, one of the secondary paths, the FRR detour path, or the FRR bypass path when the tail-end node is also the MP.

When a hierarchy of LSPs is in use, statistics collection on the outermost label corresponding to the tunneling LSP and on the inner labels, corresponding to the tunneled LSPs are mutually exclusive. A consequence of this is that when the operator enables statistics collection on an RSVP LSP which is also used for tunneling LDP FECs with the LDP over RSVP feature, then statistics will be collected on the RSVP LSP only. There will be no statistics collected for an LDP FEC tunneled over this RSVP LSP and also egressing on the same node regardless if the operator enabled statistics collection on this FEC.

When, the operator disables statistics collection on the RSVP LSP, then statistics collection, if enabled, will be performed on a tunneled LDP FEC.

The operator can enable statistics collection on a manual bypass terminating on the egress LER. However all LSPs which primary path is protected by the manual bypass will not collect statistics when they activate forwarding over the manual bypass. When, the operator disables statistics collection on the manual bypass LSP, then statistics collection on the protected LSP, if enabled, will continue when the bypass LSP is activated.

The **no** form of this command disables statistics for this RSVP LSP in the ingress data path and removes the accounting policy association from the LSP.

## Parameters

### **sender-address** *ip-address*

Specifies a string of 15 characters representing the IP address of the ingress LER for the LSP.

### **lsp-name**

Specifies the LSP name, up to 64 characters in length, as configured at the ingress LER.

## Platforms

All

lsp

## Syntax

```
[no] lsp lsp-name [bypass-only | p2mp-lsp | mpls-tp src-tunnel-num | sr-te]
```

## Context

**[Tree]** (config>router>mpls lsp)

## Full Context

```
configure router mpls lsp
```

## Description

This command creates an LSP that is either signaled dynamically by the router, or a statically provisioned MPLS-TP LSP.

When the LSP is created, the egress router must be specified using the **to** command and at least one **primary** or **secondary** path must be specified for signaled LSPs, or at least one working path for MPLS-TP LSPs. All other statements under the LSP hierarchy are optional.

LSPs are created in the administratively down (**shutdown**) state.

The **no** form of this command deletes the LSP. All configuration information associated with this LSP is lost. The LSP must be administratively shutdown before it can be deleted. The LSP must also be unbound from all SDPs before it can be deleted.

## Parameters

### *lsp-name*

Specifies the name that identifies the LSP. The LSP name can be up to 64 characters long and must be unique.

### *bypass-only*

Defines an LSP as a manual bypass LSP exclusively. When a path message for a new LSP requests bypass protection, the PLR first checks if a manual bypass tunnel satisfying the path constraints exists. If one is found, the router selects it. If no manual bypass tunnel is found, the router dynamically signals a bypass LSP in the default behavior. The CLI for this feature includes a knob that provides the user with the option to disable dynamic bypass creation on a per node basis.

### *p2mp-lsp*

Defines an LSP as a point-to-multipoint LSP. The following parameters can be used with a P2MP LSP: *adaptive*, *adspec*, *cspf*, *exclude*, *fast-reroute*, *from*, *hop-limit*, *include*, *metric*, *retry-limit*, *retry-timer*, *resignal-timer*. The following parameters cannot be used with a P2MP LSP: *primary*, *secondary*, *to*, *dest-global-id*, *dest-tunnel-number*, *working-tp-path*, *protect-tp-path*.

This option is not supported on the 7450 ESS.

### *mpls-tp src-tunnel-num*

Defines an LSP as an MPLS-TP LSP. The *src-tunnel-num* is a mandatory create time parameter for mpls-tp LSPs, and has to be assigned by the user based on the configured range of tunnel IDs. The following parameters can only be used with an MPLS-TP LSP: *to*, *dest-global-id*, *dest-tunnel-number*, *working-tp-path*, *protect-tp-path*. Other parameters defined for the above LSP types cannot be used.

### *sr-te*

Defines an LSP of type Segment Routing Traffic Engineering (SR-TE) LSP. The user can associate an empty path or a path with strict or loose explicit hops with the primary path of the SR-TE LSP. A hop which corresponds to an adjacency SID must be identified with its far-end host IP address (*next-hop*) on the subnet. If the local end host IP address is provided, this hop is ignored since this router can have multiple adjacencies (*next-hops*) on the same subnet. A hop which corresponds to a node SID is identified by the prefix address. The user is only allowed to configure a primary path for the SR-TE LSP.

configure router static-route-entry indirect tunnel-next-hop resolution-filter rsvp-te lsp

## Description

This command restricts the search for a resolving LSP to a specific set of named LSPs. Only those LSPs named in the associated name list will be searched for a match to resolve the associated static route.

## Parameters

### *lsp-name*

Specifies the name of the LSP to be searched for a valid resolving tunnel for the static route's next-hop.

## Platforms

All

## lsp

## Syntax

[no] **lsp** *lsp-name*

## Context

[\[Tree\]](#) (config>service>sdp lsp)

## Full Context

configure service sdp lsp

## Description

This command creates associations between one or more label switched paths (LSPs) and an Multi-Protocol Label Switching (MPLS) Service Distribution Point (SDP). This command is implemented *only* on MPLS-type encapsulated SDPs.

In MPLS SDP configurations *either* one or more LSP names can be specified *or* LDP can be enabled. The SDP **ldp** and **lsp** commands are mutually exclusive except if the mixed-lsp-mode option is also enabled. If an LSP is specified on an MPLS SDP, then LDP cannot be enabled on the SDP. To enable LDP on the SDP when an LSP is already specified, the LSP must be removed from the configuration using the **no lsp lsp-name** command.

Alternatively, if LDP is already enabled on an MPLS SDP, then an LSP cannot be specified on the SDP. To specify an LSP on the SDP, the LDP must be disabled or the mixed-lsp-mode option is also enabled. The

LSP must have already been created in the **config>router>mpls** context, with a valid far-end IP address. RSVP must be enabled.

If no LSP is associated with an MPLS SDP, the SDP cannot enter the operationally up state. The SDP can be administratively enabled (**no shutdown**) with no LSP associations. The *lsp-name* may be shutdown, causing the association with the SDP to be operationally down (the LSP will not be used by the SDP).

Up to 16 LSP names can be entered on a single command line.

The **no** form of this command deletes one or more LSP associations from an SDP. If the *lsp-name* does not exist as an association or as a configured LSP, no error is returned. An *lsp-name* must be removed from all SDP associations before the *lsp-name* can be deleted from the system. The SDP must be administratively disabled (**shutdown**) before the last *lsp-name* association with the SDP is deleted.

## Parameters

### *lsp-name*

Specifies the name of the LSP to associate with the SDP. An LSP name is case sensitive and is limited to 32 ASCII 7-bit printable characters with no spaces. If an exact match of *lsp-name* does not already exist as a defined LSP, an error message is generated. If the *lsp-name* does exist and the LSP **to** IP address matches the SDP **far-end** IP address, the association is created.

## Platforms

## lsp

## Syntax

**lsp** *lsp-name*

**[no]** **lsp**

## Context

[\[Tree\]](#) (config>oam-pm>session>ip>tunnel>mpls>rsvp-te lsp)

## Full Context

configure oam-pm session ip tunnel mpls rsvp-te lsp

## Description

This command configures the name of the RSVP-TE LSP to transport the test packets.

The **no** form of this command removes the *lsp-name* from the configuration.

## Parameters

### *lsp-name*

Specifies the LSP name, up to 64 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## lsp

### Syntax

**no lsp**

### Context

[\[Tree\]](#) (config>oam-pm>session>ip>tunnel>mpls>sr-te lsp)

### Full Context

configure oam-pm session ip tunnel mpls sr-te lsp

### Description

This command configures specification of SR-TE specific tunnel information that is used to transport the test packets. Entering this context removes all other tunnel type options configured under the **configure oam-pm session ip tunnel mpls** context. Only a single **mpls** type can be configured for an OAM-PM session.

The **no** form of this command removes the SR-TE LSP name from the configuration.

### Default

### Parameters

*lsp-name*

Specifies the SR-TE LSP name, up to 64 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 16.260 lsp-bfd

## lsp-bfd

### Syntax

**lsp-bfd** *prefix-list-name*

**no lsp-bfd** *prefix-list-name*

### Context

[\[Tree\]](#) (config>router>ldp lsp-bfd)

## Full Context

```
configure router ldp lsp-bfd
```

## Description

Commands in this context configure LSP BFD for a set of LDP LSPs with FECs matching those defined in the specified prefix list.

Up to 16 LSP BFD instances can be configured for LDP.

If a prefix corresponding to an LDP FEC appears in more than one prefix list, then the system will apply the LSP BFD configuration to the LSP only once. A prefix list may contain a longest match corresponding to one or more LDP FECs, in which case the BFD configuration is applied to all of those LDP LSPs.

The **no** form of the command removes LSP BFD. Specifying a prefix list name will remove LSP BFD for all LDP FECs that match the specified prefix list, except those LDP FECs that also match another LSP BFD prefix list.

## Default

```
no lsp-bfd
```

## Parameters

### *prefix-list-name*

Specifies the name of the prefix list configured using the **configure router policy-options prefix-list name** command, up to 32 characters maximum. The prefix list name can be specified by the **lsp-bfd** command prior to the prefix list being defined in the **config>router>policy-options** context.

## 16.261 lsp-bsid-block

`lsp-bsid-block`

### Syntax

`lsp-bsid-block` *name*

`no lsp-bsid-block`

### Context

[\[Tree\]](#) (config>router>mpls lsp-bsid-block)

### Full Context

configure router mpls lsp-bsid-block

### Description

This command configures a reference to a pre-existing reserved label block for statically configured binding SIDs.

The **no** form of this command removes the use of the label block as a pool of binding SIDs.

### Parameters

*name*

Specifies an existing reserved label block name, up to 64 characters.

### Platforms

All

## 16.262 lsp-exp

`lsp-exp`

### Syntax

`lsp-exp` *lsp-exp-value* [**fc** *fc-name*] [**priority** {**low** | **high**}]

`no lsp-exp` *lsp-exp-value*

### Context

[\[Tree\]](#) (config>qos>sap-ingress lsp-exp)

## Full Context

```
configure qos sap-ingress lsp-exp
```

## Description

This command explicitly sets the forwarding class or subclass enqueueing priority when a packet is marked with a MPLS EXP bits specified. Adding a `lsp-exp` rule on the policy forces packets that match the MPLS LSP EXP specified to override the forwarding class and enqueueing priority based on the parameters included in the `lsp-exp` rule. When the forwarding class is not specified in the rule, a matching packet preserves (or inherits) the existing forwarding class derived from earlier matches in the classification hierarchy. When the enqueueing priority is not specified in the rule, a matching packet preserves (or inherits) the existing enqueueing priority derived from earlier matches in the classification hierarchy.

The *lsp-exp-value* is derived from the MPLS LSP EXP bits of the top label.

Multiple commands can be entered to define the association of some or all eight LSP EX bit values to the forwarding class.

The **no** form of this command removes the explicit `lsp-exp` classification rule from the SAP ingress policy. Removing the rule on the policy immediately removes the rule on all ingress SAPs using the policy.

This command applies to Ethernet Layer 2 SAPs only.

## Parameters

### *lsp-exp-value*

This value is a required parameter that specifies the unique MPLS LSP EXP value that will match the `lsp-exp` rule. If the command is executed multiple times with the same *lsp-exp-value*, the previous forwarding class and enqueueing priority is completely overridden by the new parameters or defined to be inherited when a forwarding class or enqueueing priority parameter is missing.

A maximum of eight `lsp-exp` rules are allowed on a single policy.

**Values** 0 to 7

### **fc** *fc-name*

The value given for the *fc-name* parameter must be one of the predefined forwarding classes in the system. Specifying the *fc-name* is optional. When a packet matches the rule, the forwarding class is only overridden when the *fc-name* parameter is defined on the rule. If the packet matches and the forwarding class is not explicitly defined in the rule, the forwarding class is inherited based on previous rule matches.

The *subclass-name* parameter is optional and used with the *fc-name* parameter to define a pre-existing subclass. The *fc-name* and *subclass-name* parameters must be separated by a period (dot). If *subclass-name* does not exist in the context of *fc-name*, an error will occur.

**Values** *class*[.*subclass*]  
*class*: be, l2, af, l1, h2, ef, h1, nc  
*subclass*: 29 characters max

### **priority**

The **priority** parameter is used to override the default enqueueing priority for all packets received on an ingress SAP using this policy that match this rule. Specifying the priority

is optional. When a packet matches the rule, the enqueueing priority is only overridden when the **priority** parameter is defined on the rule. If the packet matches and priority is not explicitly defined in the rule, the enqueueing priority is inherited based on previous rule matches.

### high

The **high** parameter is used in conjunction with the **priority** parameter. Setting the enqueueing parameter to **high** for a packet increases the likelihood of enqueueing the packet when the ingress queue is congested. Ingress enqueueing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueueing priority is lost.

### low

The **low** parameter is used in conjunction with the **priority** parameter. Setting the enqueueing parameter to **low** for a packet decreases the likelihood of enqueueing the packet when the ingress queue is congested. Ingress enqueueing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueueing priority is lost.

**Default** no override

## Platforms

All

## lsp-exp

### Syntax

**lsp-exp** *lsp-exp-value* **fc** *fc-name* **profile** {**in** | **out**}

**no** **lsp-exp**

### Context

[\[Tree\]](#) (config>qos>network>ingress lsp-exp)

### Full Context

configure qos network ingress lsp-exp

### Description

This command creates a mapping between the LSP EXP bits of the network ingress traffic and the forwarding class.

Ingress traffic that matches the specified LSP EXP bits will be assigned to the corresponding forwarding class. Multiple commands can be entered to define the association of some or all eight LSP EXP bit values to the forwarding class. For undefined values, packets are assigned to the forwarding class specified under the **default-action** command.

The **no** form of this command removes the association of the LSP EXP bit value to the forwarding class. The **default-action** then applies to that LSP EXP bit pattern.

**Default**

no lsp-exp

**Parameters*****lsp-exp-value***

Specify the LSP EXP values to be associated with the forwarding class.

**Values** 0 to 8 (Decimal representation of three EXP bit field)

**fc *fc-name***

Enter this required parameter to specify the fc-name that the EXP bit pattern will be associated with.

**Values** be, l2, af, l1, h2, ef, h1, nc

**profile {in | out}**

Enter this required parameter to indicate whether the LSP EXP value is the in-profile or out-of-profile value.

**Values** in, out

**Platforms**

All

## 16.263 lsp-exp-in-profile

### lsp-exp-in-profile

**Syntax**

**lsp-exp-in-profile** *lsp-exp-value*

**no lsp-exp-in-profile**

**Context**

[\[Tree\]](#) (config qos network egress fc lsp-exp-in-profile)

**Full Context**

configure qos network egress fc lsp-exp-in-profile

**Description**

This command specifies the in-profile LSP EXP value for the forwarding class. The EXP value will be used for all LSP labeled packets requiring marking that require marking at egress on this forwarding class queue, and that are in-profile. The in-profile traffic is marked with the same value as in-profile traffic.

When multiple EXP values are associated with the forwarding class at network egress, the last name entered will overwrite the previous value.

The **no** form of this command resets the configuration to the factory default in-profile EXP setting.

### Default

Policy-id 1:                Factory setting  
 Policy-id 2 to 65535:    Policy-id setting

### Parameters

#### *lsp-exp-value*

Specifies the 3-bit LSP EXP bit value, expressed as a decimal integer.

**Values**    0 to 7

### Platforms

All

## 16.264 lsp-exp-out-profile

### lsp-exp-out-profile

### Syntax

**lsp-exp-out-profile** *lsp-exp-value*  
**no lsp-exp-out-profile**

### Context

[\[Tree\]](#) (config qos network egress fc lsp-exp-out-profile)

### Full Context

configure qos network egress fc lsp-exp-out-profile

### Description

This command specifies the out-of-profile LSP EXP value for the forwarding class. The EXP value will be used for all LSP labeled packets that require marking at egress on this forwarding class queue, and that are out-of-profile. The exceed-profile traffic is marked with the same value as out-of-profile traffic.

When multiple EXP values are associated with the forwarding class at network egress, the last name entered will overwrite the previous value.

The **no** form of this command resets the configuration to the factory default out-of-profile EXP setting.

### Default

Policy-id 1:                Factory setting

Policy-id 2 to 65535: Policy-id setting

### Parameters

#### *mpls-exp-value*

Specifies the 3-bit MPLS EXP bit value, expressed as a decimal integer.

**Values** 0 to 7

### Platforms

All

## 16.265 lsp-history

### lsp-history

#### Syntax

[no] lsp-history

#### Context

[\[Tree\]](#) (config>router>mpls lsp-history)

#### Full Context

configure router mpls lsp-history

#### Description

This command allocates memory which may be used to store up to the last 100 significant events for each point-to-point RSVP-TE LSP.

The **no** version of this command deallocates any memory for storing LSP history events and any event history is deleted.

#### Platforms

All

## 16.266 lsp-init-retry-timeout

### lsp-init-retry-timeout

#### Syntax

**lsp-init-retry-timeout** *seconds*

## no lsp-init-retry-timeout

### Context

[\[Tree\]](#) (config>router>mpls lsp-init-retry-timeout)

### Full Context

configure router mpls lsp-init-retry-timeout

### Description

This command configures the initial LSP path retry-timer.

The new LSP path initial retry-timer is used instead of the retry-timer to abort the retry cycle when no RESV is received. The retry-timer exclusively governs the time between two retry cycles and to handle retrying of an LSP path in a failure case with PATH errors or RESVTear.

The intent is that the user can now control how many refreshes of the pending PATH state can be performed before starting a new retry-cycle with a new LSP ID. This is all done without affecting the ability to react faster to failures of the LSP path, which will continue to be governed by the retry-timer.

The **no** form of this command returns the timer to the default value.

### Default

lsp-init-retry-timeout 30

### Parameters

#### *seconds*

Specifies the value (in s), used as the fast retry timer for a secondary path.

**Values** 10 to 600

**Default** 30

### Platforms

All

## 16.267 lsp-lifetime

### lsp-lifetime

### Syntax

**lsp-lifetime** *seconds*

**no lsp-lifetime**

### Context

[\[Tree\]](#) (config>service>vpls>spb lsp-lifetime)

## Full Context

```
configure service vpls spb lsp-lifetime
```

## Description

This command sets the time, in seconds, SPB wants the LSPs it originates to be considered valid by other routers in the domain. This is a control B-VPLS command.

Each LSP received is maintained in an LSP database until the `lsp-lifetime` expires unless the originating router refreshes the LSP. By default, each router refreshes its LSPs every 20 minutes (1200 seconds) so other routers will not age out the LSP.

The LSP refresh timer is derived from this formula:  $\text{lsp-lifetime}/2$ .

LSPs originated by SPB should be valid for 1200 seconds (20 minutes).

The **no** form of this command reverts to the default value.

## Default

```
lsp-lifetime 1200
```

## Parameters

### *seconds*

The time, in seconds, that SPB wants the LSPs it originates to be considered valid by other routers in the domain.

**Values** 350 to 65535

## 16.268 lsp-minimum-remaining-lifetime

### lsp-minimum-remaining-lifetime

**Syntax**

**lsp-minimum-remaining-lifetime** *seconds*

**no lsp-minimum-remaining-lifetime**

**Context**

[\[Tree\]](#) (config>service>vprn>isis lsp-minimum-remaining-lifetime)

**Full Context**

configure service vprn isis lsp-minimum-remaining-lifetime

**Description**

This command configures the minimum value to which the remaining lifetime of the LSP is set. The value is a counter that decrements, in seconds, starting from the value in the received LSP (if not self-originated) or from **lsp-lifetime seconds** (if self-originated). When the remaining lifetime becomes zero, the contents of the LSP is purged. The remaining lifetime of an LSP is not changed when there is no **lsp-minimum-remaining-lifetime** value configured.

The configured value must be greater than or equal to the **lsp-lifetime** value.

The **no** form of this command removes the *seconds* value from the configuration.

**Default**

no lsp-minimum-remaining-lifetime

**Parameters****seconds**

Specifies the decrementing counter, in seconds. The configured value must be greater than or equal to the locally configured value of `lsp-lifetime` (MaxAge).

**Values** 350 to 65535

## Platforms

All

## lsp-minimum-remaining-lifetime

### Syntax

`lsp-minimum-remaining-lifetime` *seconds*

`no lsp-minimum-remaining-lifetime`

### Context

[\[Tree\]](#) (config>router>isis lsp-minimum-remaining-lifetime)

### Full Context

configure router isis lsp-minimum-remaining-lifetime

### Description

This command configures the minimum value to which the remaining lifetime of the LSP is set. The value is a counter that decrements, in seconds, starting from the value in the received LSP (if not self-originated) or from `lsp-lifetime` *seconds* (if self-originated). When the remaining lifetime becomes zero, the contents of the LSP is purged. The remaining lifetime of an LSP is not changed when there is no `lsp-minimum-remaining-lifetime` value configured.

The configured value must be greater than or equal to the `lsp-lifetime` value.

The `no` form of this command removes the *seconds* value from the configuration.

### Parameters

*seconds*

Specifies the decrementing counter, in seconds. The configured value must be greater than or equal to the locally configured value of `lsp-lifetime` (MaxAge).

**Values** 350 to 65535

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 16.271 lsp-pacing-interval

### lsp-pacing-interval

**Syntax**

```
lsp-pacing-interval milli-seconds
no lsp-pacing-interval
```

**Context**

```
[Tree] (config>service>vpls>spoke-sdp>spb lsp-pacing-interval)
[Tree] (config>service>vpls>sap>spb lsp-pacing-interval)
```

**Full Context**

```
configure service vpls spoke-sdp spb lsp-pacing-interval
configure service vpls sap spb lsp-pacing-interval
```

**Description**

This command configures the interval during which LSPs are sent from the interface.

To avoid overwhelming neighbors that have less CPU processing power with LSPs, the pacing interval can be configured to limit how many LSPs are sent during an interval. LSPs may be sent in bursts during the interval up to the configured limit. If a value of 0 is configured, no LSPs are sent from the interface.

If configured to the default LSP pacing interval of 100, LSPs are sent in 100 millisecond intervals.

The **no** form of this command reverts to the default value.

**Note:**

The IS-IS timer granularity is 100 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

**Default**

lsp-pacing-interval 100

**Parameters*****milli-seconds***

The interval in milliseconds during which IS-IS LSPs are sent from the interface, expressed as a decimal integer.

0 to 65535

**Platforms**

All

## lsp-pacing-interval

**Syntax**

**lsp-pacing-interval** *milliseconds*

**no lsp-pacing-interval**

**Context**

[\[Tree\]](#) (config>service>vprn>isis>if lsp-pacing-interval)

**Full Context**

configure service vprn isis interface lsp-pacing-interval

**Description**

This command configures the interval at which LSPs are sent from the interface.

To avoid overwhelming neighbors that have less CPU processing power with LSPs, the pacing interval can be configured to limit how many LSPs are sent at the interval. LSPs are sent in bursts at the interval up to the configured limit. If a value of 0 is configured, no LSPs are sent from the interface.

If configured to the default LSP pacing interval of 100, LSPs are sent in 100 millisecond intervals.

The **no** form of this command reverts to the default value.

**Note:**

The IS-IS LSP pacing interval is 100 milliseconds for values < 100 milliseconds, and 1 second for values ≥ 100 milliseconds. For example, a pacing interval of 2 milliseconds means that a

maximum of 50 LSPs are sent in a burst at 100 millisecond intervals. The default pacing interval of 100 milliseconds means that a maximum of 10 LSPs are sent in a burst at 1 second intervals.

## Default

lsp-pacing-interval 100

## Parameters

### *milliseconds*

Specifies the pacing interval in milliseconds at which IS-IS LSPs are sent from the interface at each interval expressed as a decimal integer.

**Values** 0 to 65535

## Platforms

All

## lsp-pacing-interval

## Syntax

**lsp-pacing-interval** *milliseconds*

**no lsp-pacing-interval**

## Context

[\[Tree\]](#) (config>router>isis>interface lsp-pacing-interval)

## Full Context

configure router isis interface lsp-pacing-interval

## Description

This command configures the interval at which LSPs are sent from the interface.

To avoid overwhelming neighbors that have less CPU processing power with LSPs, the pacing interval can be configured to limit how many LSPs are sent at the interval. LSPs are sent in bursts at the interval up to the configured limit. If a value of 0 is configured, no LSPs are sent from the interface. The interval applies to all LSPs: LSPs generated by the router, and LSPs received from other routers.

If configured to the default LSP pacing interval of 100, LSPs are sent in 100 millisecond intervals.

The **no** form of this command reverts to the default value.

### **Note:**

The IS-IS LSP pacing interval is 100 milliseconds for values < 100 milliseconds, and 1 second for values ≥ 100 milliseconds. For example, a pacing interval of 2 milliseconds means that a maximum of 50 LSPs are sent in a burst at 100 millisecond intervals. The default pacing interval of 100 milliseconds means that a maximum of 10 LSPs are sent in a burst at 1 second intervals.

**Default**

lsp-pacing-interval 100

**Parameters****milli-seconds**

Specifies the interval in milliseconds during which IS-IS LSPs are sent from the interface expressed as a decimal integer.

**Values** 0 to 65535

**Platforms**

## Full Context

configure saa test type lsp-ping

oam lsp-ping

## Description

This command performs in-band LSP connectivity tests.

This command performs an LSP ping using the protocol and data structures defined in the RFC 8029, *Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures*.

The LSP ping operation is modeled after the IP ping utility which uses ICMP echo request and reply packets to determine IP connectivity.

In an LSP ping, the originating device creates an MPLS echo request packet for the LSP and path to be tested. The MPLS echo request packet is sent through the data plane and awaits an MPLS echo reply packet from the device terminating the LSP. The status of the LSP is displayed when the MPLS echo reply packet is received.

This command, when used with the **static** option, performs in-band on-demand LSP connectivity verification tests for static MPLS-TP LSPs. For other LSP types, the **static** option should be excluded and these are described elsewhere in this user guide.

The **lsp-ping static** command performs an LSP ping using the protocol and data structures defined in the RFC 8029, *Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures*, as extended by RFC 6426, *MPLS On-Demand Connectivity Verification and Route Tracing*.

In MPLS-TP, the echo request and echo reply messages are always sent in-band over the LSP, either in a G-ACh channel or encapsulated as an IP packet below the LSP label.

The timestamp format to be sent, and to be expected when received in a PDU, is as configured by the **config>test-oam>mpls-time-stamp-format** command. If RFC 4379 (obsoleted by RFC 8029) is selected, then the timestamp is in seconds and microseconds since 1900, otherwise it is in seconds and microseconds since 1970.

## Default

The active LSP path

Values: Any path name associated with the LSP

## Parameters

### ***lsp-name***

Specifies the name of the target RSVP-TE LSP, up to 64 characters.

**rsvp-te lsp-name**

Specifies the name of the target RSVP-TE LSP, up to 64 characters.

**Note:**

The **rsvp-te** explicit target FEC type is not supported under the SAA context.

**path-name**

Specifies the LSP path name, up to 32 characters, to which to send the LSP ping request.

**Values** Any path name associated with the LSP.

**Default** The active LSP path.

**bgp-label prefix ip-prefix/prefix-length**

Specifies the address prefix and subnet mask of the target BGP IPv4 /32 label route or the target BGP IPv6 /128 label route.

|               |                                      |                                     |
|---------------|--------------------------------------|-------------------------------------|
| <b>Values</b> | <ipv4-prefix>/32   <ipv6-prefix>/128 |                                     |
|               | ipv4-prefix                          | a.b.c.d                             |
|               | ipv6-prefix                          | x:x:x:x:x:x:x (eight 16-bit pieces) |
|               |                                      | x:x:x:x:x:d.d.d.d                   |
|               | x:                                   | [0 to FFFF]H                        |
|               | d:                                   | [0 to 255]D                         |

**path-destination ip-address**

Specifies the IP address of the path destination from the range 127/8. When the LDP FEC prefix is IPv6, the user must enter a 127/8 IPv4 mapped IPv6 address, that is, in the range ::ffff:127/104.

ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

**flex-algo flex-algo-num**

Specifies the Segment Routing Flexible Algorithm for the test.

**Values** 128 to 255

**interface if-name**

Specifies the name of an IP interface, up to 32 characters, to send the MPLS echo request message to. The name must already exist in the **config>router>interface** context.

**next-hop *ip-address***

Specifies the next-hop address to send the MPLS echo request message to.

|               |               |                                                          |
|---------------|---------------|----------------------------------------------------------|
| <b>Values</b> | ipv4-address: | a.b.c.d                                                  |
|               | ipv6-address: | x:x:x:x:x:x:x (eight 16-bit pieces)<br>x:x:x:x:x:d.d.d.d |
|               | x:            | [0 to FFFF]H                                             |
|               | d:            | [0 to 255]D                                              |

**prefix *ip-prefix/prefix-length***

Specifies the address prefix and subnet mask of the target LDP FEC.

|               |                                      |                                                          |
|---------------|--------------------------------------|----------------------------------------------------------|
| <b>Values</b> | <ipv4-prefix>/32   <ipv6-prefix>/128 |                                                          |
|               | ipv4-prefix                          | a.b.c.d                                                  |
|               | ipv6-prefix                          | x:x:x:x:x:x:x (eight 16-bit pieces)<br>x:x:x:x:x:d.d.d.d |
|               | x:                                   | [0 to FFFF]H                                             |
|               | d:                                   | [0 to 255]D                                              |

**ldp prefix *ip-prefix/prefix-length***

Specifies the address prefix and subnet mask of the target LDP FEC.

|               |                                      |                                                          |
|---------------|--------------------------------------|----------------------------------------------------------|
| <b>Values</b> | <ipv4-prefix>/32   <ipv6-prefix>/128 |                                                          |
|               | ipv4-prefix                          | a.b.c.d                                                  |
|               | ipv6-prefix                          | x:x:x:x:x:x:x (eight 16-bit pieces)<br>x:x:x:x:x:d.d.d.d |
|               | x:                                   | [0 to FFFF]H                                             |
|               | d:                                   | [0 to 255]D                                              |

**sr-isis prefix *ip-prefix/prefix-length***

Specifies the address prefix and subnet mask of the target node SID of the SR-IS-IS tunnel.

|               |                                      |                                     |
|---------------|--------------------------------------|-------------------------------------|
| <b>Values</b> | <ipv4-prefix>/32   <ipv6-prefix>/128 |                                     |
|               | ipv4-prefix                          | a.b.c.d                             |
|               | ipv6-prefix                          | x:x:x:x:x:x:x (eight 16-bit pieces) |

x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

### **igp-instance**

Specifies the IGP instance of the node SID prefix.

**Values** isis-inst: 0 to 127  
ospf3-inst: 0 to 31, 64 to 95  
ospf-inst: 0 to 31

### **sr-ospf prefix ip-prefix/prefix-length**

Specifies the address prefix and subnet mask of the target node SID of the SR-OSPF tunnel.

**Values** <ipv4-prefix>/32 | <ipv6-prefix>/128

ipv4-prefix - a.b.c.d

ipv6-prefix - x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

### **sr-ospf3 prefix ip-prefix/prefix-length**

Specifies the address prefix and subnet mask of the target node SID of the SR-OSPF3 tunnel. Note that only IPv6 prefixes in OSPFv3 instance ID 0-31 are supported.

**Values** ipv6-prefix - x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

### **sr-policy color color-id endpoint ip-address segment-list segment-list-id**

Specifies the name of the target IPv4 or IPv6 SR policy.

**Note:**

The **sr-policy** target FEC type is supported under the OAM context and under **type-multi-line node** in the SAA context.

**color color-id** — Specifies the color ID.

**Values** 0 to 4294967295

**endpoint** *ip-address* — Specifies the endpoint address.

**Values**

ipv4-address: a.b.c.d  
 ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)  
 x:x:x:x:x:d.d.d.d  
 x: [0 to FFFF]H  
 d: [0 to 255]D

**segment-list** *segment-list-id* — Specifies the segment list ID.

**Values** 1 to 32

**detail**

Displays detailed information.

**sr-te** *lsp-name*

Specifies the name of the target SR-TE LSP, up to 64 characters.

**static**

Specifies the target FEC stack sub-type "Static LSP".

**assoc-channel** {*ipv4* | *non-ip* | *none*}

Specifies the launched echo request's usage of the Associated Channel (ACH) mechanism, when testing an MPLS-TP LSP.

**Values** **ipv4** — Use an Associated Channel with IP encapsulation, as described in RFC 6426, Section 3.2.  
**non-ip** — Do not use an Associated Channel, as described in RFC 6426, Section 3.1.  
**none** — Use the Associated Channel mechanism described in RFC 6426, Section 3.3.

**Default** non-ip

**global-id**

Specifies the MPLS-TP global ID for the far end node of the LSP under test. If this is not entered, then the dest-global-id is taken from the LSP context.

**Values** 0 to 4294967295

**Default** 0

**node-id**

Specifies the MPLS-TP global ID for the far end node of the LSP under test. If this is not entered, then the dest-global-id is taken from the LSP context.

**Values** a.b.c.d, 1 to 4294967295

**Default** 0

**force**

Allows LSP ping to test a path that is operationally down, including cases where MPLS-TP BFD CC/V is enabled and has taken a path down. This parameter is only allowed in the OAM context; it is not allowed for a test configured as a part of an SAA.

**Default** disabled

**path-type {active | working | protect}**

The LSP path to test.

**Values** **active** — The currently active path. If MPLS-TP linear protection is configured on the LSP, then this is the path that is selected by the MPLS-TP PSC protocol for sending user plane traffic. If MPLS-TP linear protection is not configured, then this is the working path.

**working** — The working path of the MPLS-TP LSP.

**protect** — The protect path of the MPLS-TP LSP.

**Default** active

**fc-name**

Specifies the FC and profile parameters that are used to indicate the forwarding class and profile of the MPLS echo request packet.

When an MPLS echo request packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the specified fc and profile parameter values. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface.

When the MPLS echo request packet is received on the responding node, The FC and profile parameter values are dictated by the LSP-EXP mappings of the incoming interface.

When an MPLS echo reply packet is generated in CPM and is forwarded to the outgoing interface, the packet is queued in the egress network queue corresponding to the FC and profile parameter values determined by the classification of the echo request packet, which is being replied to, at the incoming interface. The marking of the packet's EXP is dictated by the LSP-EXP mappings on the outgoing interface. The ToS byte is not modified. [Table 65: lsp-ping Request Packet and Behavior](#) summarizes this behavior.

*Table 65: lsp-ping Request Packet and Behavior*

|                                  |                                                                                                                                                                                                                                                                                                            |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CPM (sender node)                | Echo request packet: <ul style="list-style-type: none"> <li>packet {tos=1, fc1, profile1}</li> <li>fc1 and profile1 are as entered by user in OAM command or default values</li> <li>tos1 as per mapping of {fc1, profile1} to IP precedence in network egress QoS policy of outgoing interface</li> </ul> |
| Outgoing interface (sender node) | Echo request packet:                                                                                                                                                                                                                                                                                       |

| Incoming interface (sender node)    | <p>Echo reply packet:</p> <ul style="list-style-type: none"> <li>packet {tos1, exp2}</li> <li>exp2 mapped to {fc1, profile1} as per classification in network QoS policy of incoming interface</li> </ul>                                                                                                                    |

The LSP-EXP mappings on the receive network interface controls the mapping of the message reply at the originating router.

**Values** be, l2, af, l1, h2, ef, h1, nc

**Default** be

#### **profile {in | out}**

Specifies the profile state of the MPLS echo request packet.

**Default** out

#### **flex-algo flex-algo-num**

Specifies the Segment Routing Flexible Algorithm for the test. This option is only supported for **oam lsp-ping sr-isis** and **oam lsp-ping sr-ospf**. This option is not supported for SAA. If this option is not set, then the system looks up the prefix without flex-algo awareness.

**Values** 128 to 255

**Default** none

#### **interval**

Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

**Values** 1 to 10

**Default** 1

### **send-count**

Specifies the number of messages to send, expressed as a decimal integer. The **send-count** parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message **interval** value must be expired before the next message request is sent.

**Values** 1 to 100

**Default** 1

### **octets**

Specifies the MPLS echo request packet size in octets, expressed as a decimal integer. The request payload is padded with zeros to the specified size.

**Values** 1 to 9786

**Default** 1

### **src-ip-address ip-address**

Specifies the source IP address. This option is used when an OAM packet must be generated from a different address than the node's system interface address. An example is when the OAM packet is sent over an LDP LSP and the LDP LSR-ID of the corresponding LDP session to the next-hop is set to an address other than the system interface address.

|               |               |                                     |
|---------------|---------------|-------------------------------------|
| <b>Values</b> | ipv4-address: | a.b.c.d                             |
|               | ipv6-address: | x:x:x:x:x:x:x (eight 16-bit pieces) |
|               |               | x:x:x:x:x:d.d.d.d                   |
|               | x:            | [0 to FFFF]H                        |
|               | d:            | [0 to 255]D                         |

### **timeout**

Specifies number, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the last probe for a specific test. Upon the expiration of the time out, the test is marked complete and no more packets are processed for any of those request probes.

**Values** 1 to 10

**Default** 5

***label-ttl***

Specifies the TTL value for the MPLS label, expressed as a decimal integer.

**Values** 1 to 255

**Default** 255

**Platforms**

All

**Output**

**Output Example**

The following output is an example of LDP IPv4 and IPv6 prefix FECs.

```

## 16.273 Isp-ping-interval

### Isp-ping-interval

### Syntax

**Isp-ping-interval** *seconds*

**no Isp-ping-interval**

### Context

[\[Tree\]](#) (config>router>ldp>Isp-bfd Isp-ping-interval)

### Full Context

configure router ldp Isp-bfd Isp-ping-interval

## Description

This command configures the interval between periodic LSP ping messages for LSPs on which **bfd-enable** is configured. The LSP ping messages are used to bootstrap and maintain the LSP BFD session.

Configuring an interval of 0 seconds disables periodic LSP ping. An LSP ping message containing a bootstrap TLV will only be sent when the BFD session is first initialized.

In scaled environments, LSP BFD sessions should use longer intervals to reduce congestion and common resource loading. Unless required, the interval should not be set lower than 300 s.

The **no** form of this command restores the default interval.

## Default

lsp-ping-interval 60

## Parameters

### *seconds*

Specifies the interval between periodic LSP ping messages, in seconds.

**Values** 0, 60 to 300

## Platforms

All

## lsp-ping-interval

## Syntax

**lsp-ping-interval** *seconds*

**no lsp-ping-interval**

## Full Context

configure router mpls lsp primary bfd lsp-ping-interval

configure router mpls lsp-template bfd lsp-ping-interval

configure router mpls lsp bfd lsp-ping-interval

configure router mpls lsp secondary bfd lsp-ping-interval

## Description

This command configures the interval for the periodic LSP ping for RSVP LSPs on which **bfd-enable** has been configured. This interval is used to bootstrap and maintain the LSP BFD session. A value of 0 disables periodic LSP Ping, such that an LSP Ping containing a bootstrap TLV is only sent when the BFD session is first initialized.

In scaled environments, LSP BFD sessions should use longer timers to reduce the chance of congestion and loading of common resources. Unless required, the **lsp-ping-interval** should not be set lower than 300 seconds.

The **no** form of this command reverts to the default value.

## Default

no lsp-ping-interval

## Parameters

### *seconds*

Sets the periodic LSP Ping interval in seconds.

**Values** 0, 60 to 300

**Default** 60

## Platforms

All

## 16.275 Isp-refresh-interval

Isp-refresh-interval

### Syntax

**Isp-refresh-interval** [*seconds*] [**half-lifetime** [**enable** | **disable**]]

**no Isp-refresh-interval**

### Context

[\[Tree\]](#) (config>service>vpls>spb Isp-refresh-interval)

### Full Context

configure service vpls spb Isp-refresh-interval

### Description

This command configures the LSP refresh timer interval. When configuring the LSP refresh interval, the value that is specified for **Isp-lifetime** must also be considered. The LSP refresh interval cannot be greater than 90% of the LSP lifetime.

The no form of this command reverts to the default (600 seconds), unless this value is greater than 90% of the LSP lifetime. For example, if the LSP lifetime is 400, then the **no Isp-refresh-interval** command will be rejected.

### Default

Isp-refresh-interval 600 half-lifetime enable

### Parameters

**seconds**

Specifies the refresh interval.

**Values** 150 to 65535

**half-lifetime**

Sets the refresh interval to always be half the **lsp-lifetime** value. When this parameter is set to **enable**, the configured refresh interval is ignored.

**Values** enable, disable

## Platforms

All

## lsp-refresh-interval

### Syntax

**lsp-refresh-interval** [*seconds*] [*half-lifetime* {**enable** | **disable**}]

**no lsp-refresh-interval**

### Context

[\[Tree\]](#) (config>service>vprn>isis lsp-refresh-interval)

### Full Context

configure service vprn isis lsp-refresh-interval

### Description

This command configures the IS-IS LSP refresh timer interval for the VPRN instance. When configuring the LSP refresh interval, the value that is specified for **lsp-lifetime** must also be considered. The LSP refresh interval cannot be greater than 90% of the LSP lifetime.

The **no** form of this command reverts to the default (600 seconds), unless this value is greater than 90% of the LSP lifetime. For example, if the LSP lifetime is 400, then the no lsp-refresh-interval command will be rejected.

### Default

lsp-refresh-interval 600 half-lifetime enable

### Parameters

#### **seconds**

Specifies the refresh interval.

**Values** 150 to 65535

#### **half-lifetime**

Sets the refresh interval to always be half the **lsp-lifetime** value. When this parameter is set to **enable**, the configured refresh interval is ignored.

**Values** enable, disable

## Platforms

All

## lsp-refresh-interval

### Syntax

```
lsp-refresh-interval [seconds] [half-lifetime {enable | disable}]
no lsp-refresh-interval
```

### Context

[\[Tree\]](#) (config>router>isis lsp-refresh-interval)

### Full Context

```
configure router isis lsp-refresh-interval
```

### Description

This command configures the IS-IS LSP refresh timer interval. When configuring the LSP refresh interval, the value that is specified for **lsp-lifetime** must also be considered. The LSP refresh interval cannot be greater than 90% of the LSP lifetime.

The **no** form of this command reverts to the default (600 seconds), unless this value is greater than 90% of the LSP lifetime. For example, if the LSP lifetime is 400, then the no lsp-refresh-interval command will be rejected.

### Default

```
lsp-refresh-interval 600 half-lifetime enable
```

### Parameters

#### *seconds*

Specifies the refresh interval.

**Values** 150 to 65535

#### *half-lifetime*

Sets the refresh interval to always be half the **lsp-lifetime** value. When this parameter is set to **enable**, the configured refresh interval is ignored.

**Values** enable, disable

### Platforms

All

## 16.276 lsp-self-ping

## lsp-self-ping

### Syntax

**[no] lsp-self-ping**

### Context

**[Tree]** (config>router>mpls lsp-self-ping)

### Full Context

configure router mpls lsp-self-ping

### Description

Commands in this context configure LSP self-ping parameters.

LSP Self-ping checks that the datapath of an RSVP LSP has been programmed by all LSRs along its path before switching the traffic to it. If enabled, LSP Self-ping packets are sent periodically at a configurable interval following the receipt of the RESV message for an RSVP LSP path following an MBB or other event where the active path changes while the previous active path stayed up. The router will not switch traffic to the new path until an LSP Self-ping reply is received from the far-end LER.

When configured under the MPLS context, LSP Self-ping is enabled for all RSVP LSPs, unless it is explicitly disabled for a given LSP.

The **no** form of this command disables the system check for LSP Self-ping.

### Default

no lsp-self-ping

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## lsp-self-ping

### Syntax

**lsp-self-ping {enable | disable | inherit}**

**no lsp-self-ping**

### Context

**[Tree]** (config>router>mpls>lsp-template lsp-self-ping)

**[Tree]** (config>router>mpls>lsp lsp-self-ping)

### Full Context

configure router mpls lsp-template lsp-self-ping

configure router mpls lsp lsp-self-ping

## Description

This command enables LSP Self-ping on a given RSVP-TE LSP or LSP template. If set to **disable**, then LSP Self-ping is disabled irrespective of the setting of **lsp-self-ping>rsvp-te** under the **mpls** context. By default, each LSP and LSP template inherits this value.

The **no** form of this command reverts to the default.

## Default

lsp-self-ping inherit

## Parameters

### enable

Enables LSP Self-ping on this RSVP LSP or RSVP LSPs (one-hop-p2p or mesh-p2p) using this LSP template.

### disable

Disables LSP Self-ping on this RSVP LSP or RSVP LSPs using this LSP template.

### inherit

Inherits the value configured under **config>router>mpls>lsp-self-ping>rsvp-te**.

## Platforms

All

- configure router mpls lsp-template lsp-self-ping  
7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS
- configure router mpls lsp lsp-self-ping

## 16.277 lsp-setup

### lsp-setup

## Syntax

## Full Context

debug router mpls event lsp-setup

## Description

This command debugs LSP setup events.

The **no** form of the command disables the debugging.

### Parameters

#### detail

Displays detailed information about LSP setup events.

### Platforms

All

## 16.278 lsp-template

### lsp-template

### Syntax

**lsp-template** *p2mp-lsp-template-name*

**no lsp-template**

### Context

[\[Tree\]](#) (config>service>vpls>provider-tunnel>inclusive>rsvp lsp-template)

### Full Context

configure service vpls provider-tunnel inclusive rsvp lsp-template

### Description

This command specifies the template name of the RSVP P2MP LSP instance to be used by the leaf node or the root-and-leaf node that participates in BGP-AD VPLS. The P2MP LSP is referred to as the Inclusive Provider Multicast Service Interface (I-PMSI).

After the user performs a **no shutdown** under the context of the inclusive node and the delay timer expires, BUM packets will be forwarded over an automatically signaled instance of the RSVP P2MP LSP specified in the LSP template.

The **no** version of this command removes the P2MP LSP template from the I-PMSI configuration.

### Parameters

#### *p2mp-lsp-template-name*

Specifies the name of the P2MP LSP template up to 32 characters in length.

### Platforms

All

## Isp-template

### Syntax

**Isp-template**

**[Tree]** (config>service>vprn>mvpn>pt>selective>multistream-spmsi Isp-template)

### Full Context

configure service vprn mvpn provider-tunnel selective multistream-spmsi Isp-template

### Description

This command creates a RSVP-TE LSP template for S-PMSI. Multi-stream S-PMSIs can share a single template or can each use their own template.

### Parameters

*name*

Specifies the LSP template name, up to 32 characters.

## Platforms

All

## Isp-template

### Syntax

**Isp-template** *Isp-template*

**no Isp-template**

### Context

**[Tree]** (config>service>vprn>mvpn>pt>selective>rsvp Isp-template)

**[Tree]** (config>service>vprn>mvpn>pt>inclusive Isp-template)

### Full Context

configure service vprn mvpn provider-tunnel selective rsvp Isp-template

configure service vprn mvpn pt inclusive Isp-template

### Description

This command specifies the use of automatically created P2MP LSP as the inclusive or selective provider tunnel. The P2MP LSP will be signaled using the parameters specified in the template, such as bandwidth constraints, and so on.

### Default

no Isp-template

### Parameters

***Isp-template***

Specifies the LSP template name, up to 32 characters.

## Platforms

All

## Isp-template

### Syntax

**Isp-template** *template-name* [**mesh-p2p** | **mesh-p2p-srte** | **one-hop-p2p** | **on-demand-p2p-srte** | **one-hop-p2p-srte** | **p2mp** | **pce-init-p2p-srte** **template-id** {**default** | *template-id*}]

**no Isp-template** *template-name*

### Context

**[Tree]** (config>router>mpls Isp-template)

## Full Context

```
configure router mpls lsp-template
```

## Description

This command creates a template that can be referenced by a client application where dynamic LSP creation is required. The LSP template type (**p2mp**, **one-hop-p2p**, **mesh-p2p**, **one-hop-p2p-srte**, **mesh-p2p-srte**, **pce-init-p2p-srte**, or **on-demand-p2p-srte**) is mandatory.

The **no** form of this command deletes the LSP template. An LSP template cannot be deleted if a client application is using it.

## Parameters

### *template-name*

Specifies the name of the LSP template, up to 32 characters. An LSP template name and LSP name must not be the same.

### **mesh-p2p** | **mesh-p2p-srte** | **one-hop-p2p** | **one-hop-p2p-srte** | **p2mp** | **pce-init-p2p-srte** | **on-demand-p2p-srte**

Identifies the type of LSP this template will signal.

The **p2mp** option is supported on the 7750 SR, 7950 XRS, and with VPLS only on the 7450 ESS.

### *default*

Sets the template to be the default LSP template for PCE-initiated SR-TE LSPs.

### *template-id*

Specifies the value that is signaled in the PCE to identify the LSP template.

## Platforms

All

```

## Full Context

```
configure router gtm provider-tunnel inclusive rsvp isp-template
```

```
configure router gtm provider-tunnel selective rsvp isp-template
```

## Description

This command specifies the use of automatically created P2MP LSP as the provider tunnel. The P2MP LSP will be signaled using the parameters specified in the template, such as bandwidth constraints.

The **no** form of this command removes the `lsp-template` name from this configuration.

## Default

`no lsp-template`

## Parameters

### *lsp-template*

Specifies the name of the LSP template, up to 32 characters.

## Platforms

All

## lsp-template

## Syntax

**lsp-template** *template-name*

**no lsp-template**

## Context

[\[Tree\]](#) (`config>oam-pm>session>mpls>lsp>rsvp-auto lsp-template`)

## Full Context

`configure oam-pm session mpls lsp rsvp-auto lsp-template`

## Description

This command specifies the LSP template used to identify the LSP for testing.

One of three mandatory configuration statements that are required to identify automatically created RSVP LSPs, created using **config>router>mpls>lsp-template**. The **config>router>mpls>auto-lsp>lsp-template** links three distinct functions.

The **lsp-template** *template-name* must match the name of **config>router>mpls>lsp-template** used to dynamically create the RSVP LSP. This is a loose reference and does not impede the manipulation of the **config>router>mpls>lsp-template**. The required identifiers are **from**, **lsp-template** and **to**, all under this node.

The **no** form of this command deletes the *template-name* reference from the configuration.

## Parameters

### *template-name*

Specifies the name of the LSP template, up to 32 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**lsp-template****Syntax**

**lsp-template** *template-name*

**no lsp-template**

**Context**

**[Tree]** (config>oam-pm>session>ip>tunnel>mpls>rsvp-te-auto lsp-template)

**Full Context**

configure oam-pm session ip tunnel mpls rsvp-te-auto lsp-template

**Description**

This command configures the name of the LSP template used to identify the unique LSP. Configure the following three commands to identify an RSVP-TE Auto LSP: **from**, **to**, and **lsp-template**. When all three of these values are configured, the specific RSVP LSP can be identified and the test packets can be carried across the tunnel

The **no** form of this command removes the LSP template name from the configuration.

**Parameters**

***template-name***

Specifies the LSP template name, up to 32 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Context

**[Tree]** (oam lsp-trace)

**[Tree]** (config>saa>test>type lsp-trace)

## Full Context

oam lsp-trace

configure saa test type lsp-trace

## Description

This command performs an LSP traceroute using the protocol and data structures defined in IETF RFC 8029.

The LSP trace operation is modeled after the IP traceroute utility, which uses ICMP echo request and reply packets with increasing TTL values to determine the hop-by-hop route to a destination IP.

In an LSP trace, the originating device creates an MPLS echo request packet for the LSP to be tested with increasing values of the TTL in the outermost label. The MPLS echo request packet is sent through the data plane and awaits a TTL exceeded response or the MPLS echo reply packet from the device terminating the LSP. The devices that reply to the MPLS echo request packets with the TTL exceeded and the MPLS echo reply are displayed.

The downstream mapping TLV is used in **lsp-trace** to provide a mechanism for the sender and responder nodes to exchange and validate interface and label stack information for each downstream hop in the path of the LDP FEC an RSVP LSP, or a BGP IPv4 label route.

Two downstream mapping TLVs are supported. The original Downstream Mapping (DSMAP) TLV defined in RFC 4379 (obsoleted by RFC 8029) and the new Downstream Detailed Mapping (DDMAP) TLV defined in RFC 6424 AND RFC 8029. More details are provided in the DDMAP TLV sub-section below.

In addition, when the responder node has multiple equal cost next hops for an LDP FEC, a BGP label IPv4 prefix, an SR-ISIS node SID, an SR-OSPF node SID, or an SR-TE LSP, it replies in the Downstream Mapping TLV with the downstream information for each outgoing interface which is part of the ECMP next-

hop set for the prefix. The downstream mapping TLV can further be used to exercise a specific path of the ECMP set using the **path-destination** option.

This command, when used with the **static** option, performs in-band on-demand LSP traceroute tests for static MPLS-TP LSPs. For other LSP types, the **static** option should be excluded and these are described elsewhere in this user guide.

The **lsp-trace static** command performs an LSP trace using the protocol and data structures defined in the RFC 8029, Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures, as extended by RFC 6426, MPLS On-Demand Connectivity Verification and Route Tracing.

In MPLS-TP, the echo request and echo reply messages are always sent in-band over the LSP, either in a G-ACh channel or encapsulated as an IP packet below the LSP label.

The timestamp format to be sent, and to be expected when received in a PDU, is as configured by the **configure test-oam mpls-time-stamp-format** command. If RFC 4379 (obsoleted by RFC 8029) is selected, the timestamp is in seconds and microseconds since 1900, otherwise it is in seconds and microseconds since 1970.

## Parameters

### ***lsp-name***

Specifies the name of the target RSVP-TE LSP, up to 64 characters.

### ***rsvp-te lsp-name***

Specifies the name of the target RSVP-TE LSP, up to 64 characters.

#### **Note:**

The **rsvp-te** explicit target FEC type is not supported under the SAA context.

### ***path-name***

Specifies the LSP path name along which to send the LSP trace request.

**Values** Any path name associated with the LSP.

**Default** The active LSP path.

### **bgp-label prefix *ip-prefix/prefix-length***

Specifies the address prefix and subnet mask of the target BGP IPv4 /32 label route or the target IPv6 /128 label route.

| <b>Values</b> | <ipv4-prefix>/32   <ipv6-prefix>/128 |
|---------------|--------------------------------------|
| ipv4-prefix   | a.b.c.d                              |
| ipv6-prefix   | x:x:x:x:x:x:x (eight 16-bit pieces)  |
|               | x:x:x:x:x:d.d.d.d                    |
| x:            | [0 to FFFF]H                         |
| d:            | [0 to 255]D                          |

### **path-destination *ip-address***

Specifies the IP address of the path destination from the range 127/8. When the LDP FEC prefix is IPv6, the user must enter a 127/8 IPv4 mapped IPv6 address, that is, in the range ::ffff:127/104.

**if-name**

Specifies the name of an IP interface, up 32 characters, to send the MPLS echo request to. The name must already exist in the **config>router>interface** context.

**next-hop ip-address**

Specifies the next hop to send the MPLS echo request message to.

|               |                                                   |
|---------------|---------------------------------------------------|
| <b>Values</b> | ipv4-address: a.b.c.d                             |
|               | ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces) |
|               | x:x:x:x:x:d.d.d.d                                 |
|               | x: [0 to FFFF]H                                   |
|               | d: [0 to 255]D                                    |

**prefix ip-prefix/prefix-length**

Specifies the address prefix and subnet mask of the target LDP FEC.

|               |                                      |                                       |
|---------------|--------------------------------------|---------------------------------------|
| <b>Values</b> | <ipv4-prefix>/32   <ipv6-prefix>/128 |                                       |
|               | ipv4-prefix                          | - a.b.c.d                             |
|               | ipv6-prefix                          | - x:x:x:x:x:x:x (eight 16-bit pieces) |
|               |                                      | x:x:x:x:x:d.d.d.d                     |
|               | x -                                  | [0 to FFFF]H                          |
|               | d -                                  | [0 to 255]D                           |

**ldp prefix ip-prefix/prefix-length**

Specifies the address prefix and subnet mask of the target LDP FEC.

|               |                                      |                                     |
|---------------|--------------------------------------|-------------------------------------|
| <b>Values</b> | <ipv4-prefix>/32   <ipv6-prefix>/128 |                                     |
|               | ipv4-prefix                          | a.b.c.d                             |
|               | ipv6-prefix                          | x:x:x:x:x:x:x (eight 16-bit pieces) |
|               |                                      | x:x:x:x:x:d.d.d.d                   |
|               | x:                                   | [0 to FFFF]H                        |
|               | d:                                   | [0 to 255]D                         |

**sr-isis prefix ip-prefix/prefix-length**

Specifies the address prefix and subnet mask of the target node SID of the SR-ISIS tunnel.

|               |                                      |                                                          |
|---------------|--------------------------------------|----------------------------------------------------------|
| <b>Values</b> | <ipv4-prefix>/32   <ipv6-prefix>/128 |                                                          |
|               | ipv4-prefix                          | a.b.c.d                                                  |
|               | ipv6-prefix                          | x:x:x:x:x:x:x (eight 16-bit pieces)<br>x:x:x:x:x:d.d.d.d |
|               | x:                                   | [0 to FFFF]H                                             |
|               | d:                                   | [0 to 255]D                                              |

**igp-instance**

Specifies the IGP instance of the node SID prefix.

|               |                               |
|---------------|-------------------------------|
| <b>Values</b> | isis-inst: 0 to 127           |
|               | ospf3-inst: 0 to 31, 64 to 95 |
|               | ospf-inst: 0 to 31            |

**sr-ospf prefix ip-prefix/prefix-length**

Specifies the address prefix and subnet mask of the target node SID of the SR-OSPF tunnel.

|               |                                      |                                                            |
|---------------|--------------------------------------|------------------------------------------------------------|
| <b>Values</b> | <ipv4-prefix>/32   <ipv6-prefix>/128 |                                                            |
|               | ipv4-prefix                          | - a.b.c.d                                                  |
|               | ipv6-prefix                          | - x:x:x:x:x:x:x (eight 16-bit pieces)<br>x:x:x:x:x:d.d.d.d |
|               | x -                                  | [0 to FFFF]H                                               |
|               | d -                                  | [0 to 255]D                                                |

**sr-ospf3 prefix ip-prefix/prefix-length**

Specifies the address prefix and subnet mask of the target node SID of the SR-OSPF3 tunnel. Only IPv6 prefixes in OSPFv3 instance ID 0-31 are supported.

|               |             |                                                            |
|---------------|-------------|------------------------------------------------------------|
| <b>Values</b> | ipv6-prefix | - x:x:x:x:x:x:x (eight 16-bit pieces)<br>x:x:x:x:x:d.d.d.d |
|               | x -         | [0 to FFFF]H                                               |
|               | d -         | [0 to 255]D                                                |

**sr-policy color color-id endpoint ip-address segment-list segment-list-id**

Specifies the name of the target IPv4 or IPv6 SR policy.

**Note:**

The **sr-policy** target FEC type is supported under the OAM context and under **type-multi-line node** in the SAA context.

**color** *color-id* — Specifies the color ID.

**Values** 0 to 4294967295

**endpoint** *ip-address* — Specifies the endpoint address.

**Values**

|               |                                     |
|---------------|-------------------------------------|
| ipv4-address: | a.b.c.d                             |
| ipv6-address: | x:x:x:x:x:x:x (eight 16-bit pieces) |
|               | x:x:x:x:x:d.d.d.d                   |
| x:            | [0 to FFFF]H                        |
| d:            | [0 to 255]D                         |

**segment-list** *segment-list-id* — Specifies the segment list ID.

**Values** 1 to 32

**detail**

Displays detailed information and allows the user to display hop 0 (that is, ingress) information. When this parameter is applied to static LSPs, the next hop 0 information is not displayed. This information is also not displayed if the **min-ttl** *min-label-ttl* value is greater than 1.

**sr-te** *lsp-name*

Specifies the name of the target SR-TE LSP, up to 64 characters.

**static**

Specifies the selection of the target FEC Stack sub-type "Static LSP".

**assoc-channel** {*ipv4* | *non-ip* | *none*}

Specifies the launched echo request's usage of the Associated Channel (ACH) mechanism, when testing an MPLS-TP LSP.

**Values**

- ipv4** — Use the Associated Channel mechanism with IP encapsulation, as described in RFC 6426, Section 3.2.
- non-ip** — Do not use an Associated Channel, as described in RFC 6426, Section 3.1.
- none** — Use the Associated Channel mechanism described in RFC 6426, Section 3.3.

**path-type** {*active* | *working* | *protect*}

Specifies the LSP path to test.

**Values**

- active** — Specifies the currently active path. If MPLS-TP linear protection is configured on the LSP, then this is the path that is selected by the MPLS-TP PSC protocol for sending user plane traffic. If MPLS-TP linear protection is not configured, then this is the working path.

- working** — Specifies the working path of the MPLS-TP LSP.
- protect** — Specifies the protect path of the MPLS-TP LSP.

**Default** active

**downstream-map-tlv**
