Description	<p>This command configures an override for the TCP maximum segment size to use with a specific peer or set of peers (depending on the scope of the command).</p> <p>The configured value controls two properties of the TCP connection as follows:</p> <p>TCP MSS option - The router advertises the TCP MSS option value in the TCP SYN packet it sends as part of the 3-way handshake. The advertised value may be lower than the configured value, depending on the IP MTU of the first hop IP interface. The peers must abide by this value when sending TCP segments to the local router.</p> <p>TCP maximum segment size - The actual transmitted size may be lower than the configured value, depending on the TCP MSS option value signaled by the peers, the effect of path MTU discovery, or other factors.</p>

Synopsis	Default route tag
Context	<b>configure</b> <a href="#">service vprn string</a> <a href="#">bgp-evpn mpls number</a> <a href="#">default-route-tag string</a>
Tree	<a href="#">default-route-tag</a>
Description	This command configures a route tag that is used when sending a route to the BGP application (for the corresponding service and BGP instance). If the corresponding BGP instance is enabled, the command cannot be changed. When used for BGP EVPN contexts, only one route tag can be passed to BGP for matching on export policies. In case of a conflict with other route tags pushed by EVPN, the default route tag has the least priority. The following are examples of the conflict priority handling: <ul style="list-style-type: none"> <li>• If a service is configured with both <b>default-route-tag X</b> and <b>proxy-arp evpn-route-tag Y</b>, the EVPN uses route tag Y when sending EVPN proxy-arp routes to the BGP RIB for advertisement.</li> </ul>

- If a given IP-prefix route is tagged in the route-table with tag *A* and the R-VPLS, in which the route is advertised, uses *B* as the **default-route-tag**, then EVPN keeps tag *A* when sending the route to the BGP RIB.

The **default-route-tag** configuration is only supported on EVPN and IP-VPN service routes. The route tag for ES and AD per-ES routes is always zero.

## domain-id *string*

### WARNING:

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Domain ID of received BGP route before readvertisement
Context	<b>configure service vpn</b> <i>string</i> <b>bgp-evpn mpls</b> <i>number</i> <b>domain-id</b> <i>string</i>
Tree	<b>domain-id</b>
Description	<p>This command specifies the domain ID. The domain ID identifies the network from which the BGP route was received before the RTM advertises it to a different neighbor. The domain ID is part of a domain, represented as domain-id:isf_safi_type in the D-PATH attribute, as described in <i>draft-ietf-bess-evpn-ipvpn-interworking</i>. Gateway routers modify the D-PATH attribute. A gateway is a PE where a VPRN is instantiated. The VPRN in this case advertises or receives routes from multiple BGP owners (for example, EVPN-IFL and BGP-IPVPN) or multiple instances of the same owner (for example, VPRN with two BGP-IPVPN instances).</p> <p>Gateways use the D-PATH attribute to detect loops (for received routes where the D-PATH contains a local domain ID) and to make BGP best-path selection decisions based on the D-PATH length (shorter D-PATH is preferred).</p> <p>In the following example, suppose a gateway receives prefix P in an EVPN-IFL instance with the following D-PATH from neighbor N:</p> <pre>Seg Len=1 / 65000:1:128</pre> <p>If the router imports the route in VPRN-1, BGP-EVPN SRv6 instance with domain 65000:2, it readvertises it to its BGP-IPVPN MPLS instance as follows:</p> <pre>Seg Len=2 / 65000:2:70 / 65000:1:128</pre> <p>That is, the gateway prepends the local domain ID and family to the D-PATH before readvertising the route into a different instance.</p>

Synopsis	Enables dynamic egress label limit
Context	<b>configure service vprn string bgp-evpn mpls number dynamic-egress-label-limit boolean</b>
Tree	<a href="#">dynamic-egress-label-limit</a>
Description	<p>When configured to <b>true</b>, this command relaxes the egress MPLS label limit check when resolving BGP next hops in the tunnel table.</p> <p>For VPRN services, the OAM label is never computed and, therefore, one more egress label is allowed.</p> <p>For EVPN (Epipe and VPLS) services, the system only computes the control word and ESI label if they are used. For the control word, the system reduces the egress label limit by one label if the control word is configured in the service. When configured, the ESI label is not counted for Epipes or VPLS services without an ES.</p> <p>When configured to <b>false</b> this command, for EVPN, Epipe, and VPLS services, always accounts for the ESI label and control word.</p>

Description	<p>This command configures a route tag that is used when sending a route to the BGP application (for the corresponding service and BGP instance). If the corresponding BGP instance is enabled, the command cannot be changed.</p> <p>When used for BGP EVPN contexts, only one route tag can be passed to BGP for matching on export policies. In case of a conflict with other route tags pushed by EVPN, the default route tag has the least priority.</p> <p>The following are examples of the conflict priority handling:</p> <ul style="list-style-type: none"> <li>• If a service is configured with both <b>default-route-tag</b> <i>X</i> and <b>proxy-arp evpn-route-tag</b> <i>Y</i>, the EVPN uses route tag <i>Y</i> when sending EVPN proxy-arp routes to the BGP RIB for advertisement.</li> <li>• If a given IP-prefix route is tagged in the route-table with tag <i>A</i> and the R-VPLS, in which the route is advertised, uses <i>B</i> as the <b>default-route-tag</b>, then EVPN keeps tag <i>A</i> when sending the route to the BGP RIB.</li> </ul> <p>The <b>default-route-tag</b> configuration is only supported on EVPN and IP-VPN service routes. The route tag for ES and AD per-ES routes is always zero.</p>

## domain-id string

**WARNING:**

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Domain ID of received BGP route before readvertisement
Context	<b>configure service vprn string bgp-evpn segment-routing-v6 number domain-id string</b>
Tree	<b>domain-id</b>
Description	<p>This command specifies the domain ID. The domain ID identifies the network from which the BGP route was received before the RTM advertises it to a different neighbor. The domain ID is part of a domain, represented as domain-id:isf_safi_type in the D-PATH attribute, as described in <i>draft-ietf-bess-evpn-ipvpn-interworking</i>. Gateway routers modify the D-PATH attribute. A gateway is a PE where a VPRN is instantiated. The VPRN in this case advertises or receives routes from multiple BGP owners (for example, EVPN-IFL and BGP-IPVPN) or multiple instances of the same owner (for example, VPRN with two BGP-IPVPN instances).</p> <p>Gateways use the D-PATH attribute to detect loops (for received routes where the D-PATH contains a local domain ID) and to make BGP best-path selection decisions based on the D-PATH length (shorter D-PATH is preferred).</p> <p>In the following example, suppose a gateway receives prefix P in an EVPN-IFL instance with the following D-PATH from neighbor N:</p> <pre>Seg Len=1 / 65000:1:128</pre> <p>If the router imports the route in VPRN-1, BGP-EVPN SRv6 instance with domain 65000:2, it readvertises it to its BGP-IPVPN MPLS instance as follows:</p> <pre>Seg Len=2 / 65000:2:70 / 65000:1:128</pre> <p>That is, the gateway prepends the local domain ID and family to the D-PATH before readvertising the route into a different instance.</p>

### **weighted-ecmp** *boolean*

Synopsis Enable weighted ECMP

Context **configure service vprn** *string* **bgp-evpn segment-routing-v6** *number* **evpn-link-bandwidth weighted-ecmp** *boolean*

Tree **weighted-ecmp**

Description When configured to **true**, the router supports the processing of the EVPN link bandwidth extended community when installing an ECMP set for an EVPN IP-Prefix route in the VPRN route table.

Flows to an IP Prefix received with a weight and a zero ESI value are sprayed according to the weight. If the EVPN IP-Prefix route received with the weight has a non-zero ESI, the weight is divided into the number of PEs attached to the Ethernet Segment (and rounded up if the result is not an integer).

The command also enables the weighted ECMP functionality for BGP CEs that are configured with an **evpn-link-bandwidth add-to-received-bgp** weight.

When configured to **false**, the router disables the processing of the EVPN link bandwidth extended community.

Synopsis	Source IPv6 address
Context	<b>configure</b> <b>service vpn</b> <i>string</i> <b>bgp-evpn</b> <b>segment-routing-v6</b> <i>number</i> <b>source-address</b> <i>string</i>
Tree	<b>source-address</b>
Description	When configured, this command specifies the source IPv6 address used in the SA field of the outer IPv6 header of the SRv6 encapsulated packet.  When not configured, the source IPv6 address is inherited from the configuration of the global default address in the <b>router "base" segment-routing segment-routing-v6 source-address</b> context.

A source IPv6 address must be configured in this context or in the base router context.  
The system does not check if the address entered is a valid local address.

**export** *boolean*

Synopsis	Add ATTR_SET path attribute to exported VPN-IP routes
----------	---

Context	<b>configure service vprn string bgp-ipvpn attribute-set export boolean</b>
Tree	<b>export</b>
Description	<p>When configured to <b>true</b>, the router adds an ATTR_SET path attribute to all VPN-IP routes that come from the VRF export of BGP routes advertised by PE-CE peers of the VPRN. This attribute contains an exact copy of all BGP path attributes (post-import policy) of the PE-CE BGP route, excluding the NEXT_HOP, MP_REACH, and MP_UNREACH attributes, as well as the AS4_PATH or AS4_AGGREGATOR attributes. The origin AS in the ATTR_SET encodes the ASN (or confederation ID, if configured) of the exporting VPRN service. Neither the VRF export policy nor a regular BGP export policy is allowed to modify the contents of the ATTR_SET.</p> <p>When configured to <b>false</b>, the router does not add an ATTR_SET path attribute to VPN-IP routes exported by the VPRN. Nokia recommends configuring this command to <b>false</b>, unless there is a requirement for the VPRN to deliver an independent domain L3 VPN service.</p>
Default	false

### import keyword

Synopsis	Reception behavior of ATTR_SET
Context	<b>configure service vprn string bgp-ipvpn attribute-set import keyword</b>
Tree	<b>import</b>
Description	<p>This command configures the reception behavior for ATTR_SETs in received VPN-IP routes.</p> <ul style="list-style-type: none"> <li>• <b>accept</b> — BGP accepts and processes ATTR_SETs in received unicast VPN-IP routes (MPLS or SRv6) when they are imported into the VPRN. The path attributes contained inside the ATTR_SET are used for best path selection within the VPRN, instead of the outer path attributes attached to the imported VPN-IP route. The path attributes inside the ATTR_SET determine the path attributes of BGP routes advertised to PE-CE peers of the VPRN. However, the ATTR_SET is removed at the time of advertisement. VPRN BGP routes with attributes derived from <b>accept</b> processing can only be advertised to EBGp peers and IBGP route reflector client peers. VPRN BGP routes cannot be advertised to BGP confederation peers. If the origin AS in the ATTR_SET attribute does not match the configured ASN, VPRN BGP routes with attributes derived from <b>accept</b> processing are advertised to IBGP peers that are not covered by a cluster configuration.</li> <li>• <b>drop</b> — BGP ignores and silently discards ATTR_SETs in received VPN-IP routes when they are imported into the VPRN. The path attributes contained inside the ATTR_SET are not used for best path selection within the VPRN. If a VPRN is not involved in an independent domain L3 VPN service, Nokia recommends configuring this command to use the <b>drop</b> option.</li> <li>• <b>ignore</b> — BGP ignores ATTR_SETs in received VPN-IP routes when they are imported into the VPRN. The path attributes contained inside the ATTR_SET are not</li> </ul>

used for best path selection within the VPRN. With the **ignore** option, the ATTR\_SET attribute is transmitted unchanged to the CE. Nokia recommends not to configure this command to use the **ignore** option in most deployments.

### **rsvp** *boolean*

Synopsis	Use RSVP tunneling for next-hop resolution
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">bgp-ipvpn</a> <a href="#">mpls auto-bind-tunnel</a> <a href="#">resolution-filter</a> <a href="#">rsvp</a> <i>boolean</i>
Tree	<a href="#">rsvp</a>
Description	When configured to <b>true</b> , BGP searches the best metric RSVP LSP to determine the address of the BGP next hop. This address can correspond to the system interface or to another loopback interface used by the BGP instance on the remote node. The LSP metric is provided by MPLS in the tunnel table. In the case of multiple RSVP LSPs with the same lowest metric, BGP selects the LSP with the lowest tunnel ID.  When configured to <b>false</b> , the RSVP LSP is not used for next-hop resolution.

Context	<b>configure</b> <a href="#">service vprn string</a> <a href="#">bgp-ipvpn mpls auto-bind-tunnel</a> <a href="#">weighted-ecmp boolean</a>
Tree	<a href="#">weighted-ecmp</a>
Description	When configured to <b>true</b> , this command enables weighted ECMP for packets using tunnels that a VPRN automatically binds to. Packets are sprayed across LSPs in the ECMP according to the outcome of the hash algorithm and the configured load balancing weight of each LSP. When configured to <b>false</b> , this command disables weighted ECMP for next-hop tunnel selection.

**domain-id string**

Synopsis	Domain ID of received BGP route before readvertisement
Context	<b>configure</b> <a href="#">service vprn string</a> <a href="#">bgp-ipvpn mpls domain-id</a> <a href="#">string</a>
Tree	<a href="#">domain-id</a>
Description	This command specifies the domain ID. The domain ID identifies the network from which the BGP route was received before the RTM advertises it to a different neighbor. The domain ID is part of a domain, represented as domain-id:isf_safi_type in the D-PATH attribute, as described in <i>draft-ietf-bess-evpn-ipvpn-interworking</i> . Gateway routers modify the D-PATH attribute. A gateway is a PE where a VPRN is instantiated. The

VPRN in this case advertises or receives routes from multiple BGP owners (for example, EVPN-IFL and BGP-IPVPN) or multiple instances of the same owner (for example, VPRN with two BGP-IPVPN instances).

Gateways use the D-PATH attribute to detect loops (for received routes where the D-PATH contains a local domain ID) and to make BGP best-path selection decisions based on the D-PATH length (shorter D-PATH is preferred).

In the following example, suppose a gateway receives prefix P in an EVPN-IFL instance with the following D-PATH from neighbor N:

Seg Len=1 / 65000:1:128

If the router imports the route in VPRN-1, BGP-EVPN SRv6 instance with domain 65000:2, it readvertises it to its BGP-IPVPN MPLS instance as follows:

Seg Len=2 / 65000:2:70 / 65000:1:128

That is, the gateway prepends the local domain ID and family to the D-PATH before readvertising the route into a different instance.

### **dynamic-egress-label-limit** *boolean*

Synopsis Enables dynamic egress label limit

Context **configure** *service vprn string bgp-ipvpn mpls dynamic-egress-label-limit boolean*

Tree [dynamic-egress-label-limit](#)

Description When configured to **true**, this command relaxes the egress MPLS label limit check when resolving BGP next hops in the tunnel table.

For VPRN services, the OAM label is never computed and, therefore, one more egress label is allowed.

For EVPN (Epipe and VPLS) services, the system only computes the control word and ESI label if they are used. For the control word, the system reduces the egress label limit by one label if the control word is configured in the service. When configured, the ESI label is not counted for Epipes or VPLS services without an ES.

When configured to **false** this command, for EVPN, Epipe, and VPLS services, always accounts for the ESI label and control word.

Default false

Description	<p>This command configures a route tag that is used when sending a route to the BGP application (for the corresponding service and BGP instance). If the corresponding BGP instance is enabled, the command cannot be changed.</p> <p>When used for BGP EVPN contexts, only one route tag can be passed to BGP for matching on export policies. In case of a conflict with other route tags pushed by EVPN, the default route tag has the least priority.</p> <p>The following are examples of the conflict priority handling:</p> <ul style="list-style-type: none"> <li>• If a service is configured with both <b>default-route-tag</b> X and <b>proxy-arp evpn-route-tag</b> Y, the EVPN uses route tag Y when sending EVPN proxy-arp routes to the BGP RIB for advertisement.</li> </ul>

- If a given IP-prefix route is tagged in the route-table with tag *A* and the R-VPLS, in which the route is advertised, uses *B* as the **default-route-tag**, then EVPN keeps tag *A* when sending the route to the BGP RIB.

The **default-route-tag** configuration is only supported on EVPN and IP-VPN service routes. The route tag for ES and AD per-ES routes is always zero.

Synopsis Maximum time that DHCP server can extend client's lease

Context **configure** *service vprn string dhcp-server dhcpv4 string failover maximum-client-lead-time number*

Tree [maximum-client-lead-time](#)

Description	This command configures the maximum client lead time (MCLT), which is the maximum time that a DHCP server can extend the client's lease time beyond the lease time currently known by the DHCP partner node. In dual-homed environments, the initial lease time for all DHCP clients is restricted to the MCLT by default. Consecutive DHCP renewals can extend the lease time beyond the MCLT.

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**minimum-free**

Synopsis	Enter the <b>minimum-free</b> context
Context	<b>configure service vprn string dhcp-server dhcpv4 string pool string minimum-free</b>
Tree	<b>minimum-free</b>
Description	Commands in this context specify the minimum number of free addresses in this pool.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**absolute number**

Synopsis	Minimum number of free addresses in this pool or subnet
Context	<b>configure service vprn string dhcp-server dhcpv4 string pool string minimum-free absolute number</b>
Tree	<b>absolute</b>
Range	0 to 255
Default	1
Notes	The following elements are part of a choice: <b>absolute</b> or <b>percent</b> .
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**event-when-depleted boolean**

Synopsis	Generate notification when addresses are depleted
Context	<b>configure service vprn string dhcp-server dhcpv4 string pool string minimum-free event-when-depleted boolean</b>
Tree	<b>event-when-depleted</b>
Description	When configured to <b>true</b> , a system-generated event is generated when all available addresses in the pool or subnet of a local DHCP server are depleted.  When configured to <b>false</b> , no action is taken when all available addresses in the pool or subnet of a local DHCP server are depleted.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**percent** *number*

Synopsis	Minimum free addresses as a percentage

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**nak-non-matching-subnet** *boolean*

Synopsis	Send NAK if no match for request address pool range
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">dhcp-server dhcpv4</a> <i>string</i> <a href="#">pool</a> <i>string</i> <a href="#">nak-non-matching-subnet</a> <i>boolean</i>
Tree	<a href="#">nak-non-matching-subnet</a>
Description	When configured to <b>true</b> , a NAK response when the local DHCPv4 server receives a DHCP request with option 50 (the client is trying to request a previously allocated message). If the address-allocation algorithm uses a pool that does not contain the requested address, the system returns the DHCP NAK.  When configured to <b>false</b> or unconfigured, the system drops the DHCP packet.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**offer-time** *number*

Synopsis	Time interval during which a DHCP offer remains valid
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">dhcp-server dhcpv4</a> <i>string</i> <a href="#">pool</a> <i>string</i> <a href="#">offer-time</a> <i>number</i>

### **use-gi-address**

Synopsis Enable the **use-gi-address** context

Context **configure service vprn** *string dhcp-server dhcpv4 string pool-selection use-gi-address*

Tree [use-gi-address](#)

Description Commands in this context configure gateway interface (GI) address matching. When configured, the pool can be used for address matching even if a subnet is not found. If the local user database name is not used, addresses are provided only by GI. If a user must be blocked from getting an address, the server maps to a local user database and configures the user with no address.

A pool can include multiple subnets. Since the GI is shared by multiple subnets in a subscriber interface, the pool can provide IP addresses from any of the subnets included when the GI is matched to one of its subnets. This allows a pool to be created that represents a sub-net.

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Tree	<a href="#">preferred-lifetime</a>
Description	This command configures the preferred lifetime of the IPv6 lease address or prefix. When the preferred lifetime expires, any derived addresses are deprecated. The preferred lifetime must be less than or equal to the valid lifetime.  Each address or prefix assigned to the client has associated preferred and valid lifetimes specified by the address assignment authority (such as the DHCP server, RADIUS, or ESM). To request an extension of the lifetimes assigned to an address, the client sends a renew message to the addressing authority. The authority sends a reply message to the client with the new lifetimes, allowing the client to continue

to use the address/prefix without interruption. The lifetimes are transmitted from the addressing authority to the client in the identity association (IA) option at the top level of the message (not the address or prefix level).

Range	300 to 315446399
Units	seconds
Default	3600
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Context	<b>configure</b> <b>service</b> <b>vprn</b> <i>string</i> <b>dhcp-server</b> <b>dhcpv6</b> <i>string</i> <b>defaults</b> <b>rebind-time</b> <i>number</i>
Tree	<b>rebind-time</b>
Description	<p>This command configures the rebind time, known as T2, at which the client contacts the addressing authority to extend the lifetimes of its leases.</p> <p>The IP addressing authority (such as the DHCP server, RADIUS, or ESM) controls the time for extending lifetimes on assigned addresses/prefixes through the T1 and T2 parameters assigned to an identity association (IA). At renew time, T1, the client initiates a renew or reply message exchange to extend the lifetimes of any addresses in the IA. The client includes an IA option with all addresses or prefixes currently assigned to the IA in its renew message.</p> <p>Recommended values for T1 and T2 are 0.5 and 0.8 times the shortest preferred lifetime of the addresses or prefixes in the IA that the addressing authority is willing to extend, respectively. The configured rebind timer value should always be less than or equal to the rebind timer. The T1 and T2 values are carried in the IPV6 address option in the IA.</p>
Range	0 to 1209600
Units	seconds
Default	2880
Introduced	16.0.R4
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Context	<b>configure</b> <b>service</b> <b>vprn</b> <i>string</i> <b>dhcp-server</b> <b>dhcpv6</b> <i>string</i> <b>defaults</b> <b>valid-lifetime</b> <i>number</i>
Tree	<b>valid-lifetime</b>
Description	<p>This command configures a valid lifetime for a DHCPv6 lease address or prefix. The valid lifetime is the length of time an address and prefix remains in the valid state. The valid lifetime must be greater than or equal to the preferred lifetime. When the valid lifetime expires, the address and prefix becomes invalid and must not be used in communications. RFC 2461 recommends a default value of 30 days.</p> <p>Each address and prefix assigned to the client has associated preferred and valid lifetimes specified by the address assignment authority (such as the DHCP server, RADIUS, or ESM). Synopsis	Maximum time that DHCP server can extend client's lease
Context	<b>configure service vpn string dhcp-server dhcpv6 string failover maximum-client-lead-time number</b>
Tree	<a href="#">maximum-client-lead-time</a>
Description	This command configures the maximum client lead time (MCLT), which is the maximum time that a DHCP server can extend the client's lease time beyond the lease time currently known by the DHCP partner node. In dual-homed environments, the initial lease time for all DHCP clients is restricted to the MCLT by default. Consecutive DHCP renewals can extend the lease time beyond the MCLT.

Synopsis	Delay to prevent lease duplication during link failure
Context	<b>configure service vpn string dhcp-server dhcpv6 string failover partner-down-delay number</b>

Tree	<a href="#">partner-down-delay</a>
Description	This command configures the interval before a failed intercommunication link transitions from the COMM-INT state to the PARTNER-DOWN state. This delay prevents IP lease duplication during link failure by not allowing new IP addresses to be assigned from the remote IP address range. This timer is intended to provide the operator with enough time to remedy the failed situation and avoid duplication of IP addresses and prefixes during the failure.

Tree	<a href="#">interface-id-mapping</a>
Description	When configured to <b>true</b> , this command specifies an interface-mapping method that uses a combination of unique /64 prefixes and interface IDs. A /64 prefix is allocated to each interface ID, and all clients with the same interface ID are assigned an address from the prefix. This method is used for bridging clients in the same local loop and SAP, so that sharing the prefix allows communication to stay local. For SLAAC-based assignment, downstream neighbor discovery is automatically enabled to resolve the assigned address.

Tree	<a href="#">ignore-mclt-on-takeover</a>
Description	When configured to <b>true</b> , the remote IP address range can be taken over immediately when the intercommunication link enters the PARTNER-DOWN state, without having to wait for the MCLT to expire.  When configured to <b>false</b> , the DHCP lease time for new clients is restricted to the MCLT during a failure. For existing clients, the lease time is gradually reduced over time to the MCLT by consecutive DHCP renewals.
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**maximum-client-lead-time** *number***WARNING:**

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Maximum time that DHCP server can extend client's lease
Context	<b>configure</b> <a href="#">service</a> <a href="#">vprn</a> <i>string</i> <a href="#">dhcp-server</a> <a href="#">dhcpv6</a> <i>string</i> <a href="#">pool</a> <i>string</i> <a href="#">failover</a> <b>maximum-client-lead-time</b> <i>number</i>
Tree	<a href="#">maximum-client-lead-time</a>
Description	This command configures the maximum client lead time (MCLT), which is the maximum time that a DHCP server can extend the client's lease time beyond the lease time

currently known by the DHCP partner node. In dual-homed environments, the initial lease time for all DHCP clients is restricted to the MCLT by default. Consecutive DHCP renewals can extend the lease time beyond the MCLT.

Range	600 to 86399
Units	seconds
Default	600
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### **partner-down-delay** *number*

#### **WARNING:**

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Delay to prevent lease duplication during link failure
Context	<b>configure</b> <b>service</b> <b>vprn</b> <i>string</i> <b>dhcp-server</b> <b>dhcpv6</b> <i>string</i> <b>pool</b> <i>string</i> <b>failover</b> <b>partner-down-delay</b> <i>number</i>
Tree	<b>partner-down-delay</b>
Description	This command configures the interval before a failed intercommunication link transitions from the COMM-INT state to the PARTNER-DOWN state. This delay prevents IP lease duplication during link failure by not allowing new IP addresses to be assigned from the remote IP address range. This timer is intended to provide the operator with enough time to remedy the failed situation and avoid duplication of IP addresses and prefixes during the failure.
Range	0 to 86399
Units	seconds
Default	86399
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### startup-wait-time *number*

#### WARNING:

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Time between initialization and assuming active role
----------	--

Context	<b>configure service vprn</b> <i>string dhcp-server dhcpv6 string pool string failover startup-wait-time number</i>
Tree	<a href="#">startup-wait-time</a>
Description	This command configures a delay that avoids transient issues during the initialization process. During startup wait time, each failover peer waits after the initialization process before assuming the active role for the prefix designated as local or remote.
Range	60 to 3600
Units	seconds
Default	120
Introduced	16.0.R1

### **preferred-lifetime** *number*

Synopsis	Time this lease remains preferred
Context	<b>configure</b> <b>service</b> <b>vprn</b> <i>string</i> <b>dhcp-server</b> <b>dhcpv6</b> <i>string</i> <b>pool</b> <i>string</i> <b>prefix</b> <i>string</i> <b>preferred-lifetime</b> <i>number</i>
Tree	<b>preferred-lifetime</b>
Description	This command configures the preferred lifetime of the IPv6 lease address or prefix. When the preferred lifetime expires, any derived addresses are deprecated. The preferred lifetime must be less than or equal to the valid lifetime.  Each address or prefix assigned to the client has associated preferred and valid lifetimes specified by the address assignment authority (such as the DHCP server, RADIUS, or ESM). To request an extension of the lifetimes assigned to an address, the client sends a renew message to the addressing authority. The authority sends a reply message to the client with the new lifetimes, allowing the client to continue to use the address/prefix without interruption. The lifetimes are transmitted from the addressing authority to the client in the identity association (IA) option at the top level of the message (not the address or prefix level).

Description	<p>When configured to <b>true</b>, this command enables the use of entropy labels.</p> <p>The entropy label and indicator (EL/ELI) are inserted on relevant packets. Applicable packets are those for which at least one LSP in the stack at the far end has advertised the entropy-label capability. These LSPs are in LDP or RSVP tunnels used by an IGP or BGP shortcut. If the tunnel is of type RSVP, the entropy-label capability must also be enabled under the <b>configure router mpls</b> or <b>configure router mpls lsp</b> context.</p> <p>This command also results in other traffic that is forwarded over an LDP or RSVP LSP for which this router is the LER, and for which there is no explicit service endpoint on this router, to have the EL/ELI enabled, subject to the LSP far-end advertising entropy-label-capability. An example of such traffic includes packets arriving on a stitched LDP LSP forwarded over an RSVP LSP.</p> <p>The entropy label and the hash label features are mutually exclusive. Synopsis	Export preferred BGP route even if inactive
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">export-inactive-bgp</a> <i>boolean</i>
Tree	<a href="#">export-inactive-bgp</a>
Description	When configured to <b>true</b> , the preferred BGP route learned by a VPRN is exported as the VPN-IP route even if it is inactive in the route table because a preferred BGP VPRN route from another PE is present. This overrides the default state in which the

VPRN cannot export an inactive BGP route. For the BGP route to be exported, the VRF export policy must accept it. This command applies to both MPLS VPN and SRv6 VPN routes. In SRv6 VPN routes the advertised instruction is an End.DT, while in MPLS VPN routes the advertised label is a per-next-hop label. This “best-external” type of route advertisement is useful in active/standby multi-homing scenarios because it ensures that all PEs know about the backup path provided by the standby PE.

When configured to **false**, the preferred BGP route is not exported if it is inactive.

Default	false
Introduced	16.0.R1
Platforms	All

Synopsis	Export best BGP route when better non-BGP route present
Context	<b>configure service vpn</b> <i>string</i> <b>export-inactive-bgp-enhanced</b> <i>boolean</i>

Description	<p>When configured to <b>true</b>, the router allows a BGP route that is inactive (because a better non-BGP route for the same prefix is present) to be exportable as a VPN-IP route.</p> <p>A BGP route learned from a VPRN BGP peer is exportable as a VPN-IP route, only if it is the best route for the prefix and is installed in the route table of the VPRN. If the <b>export-inactive-bgp</b> command is <b>true</b> in the VPRN configuration, this rule is relaxed, and the best inactive VPRN BGP route is exportable as a VPN-IP route, provided that the active installed route for the prefix is an imported VPN-IP route.</p> <p>The rule described in the preceding paragraph can be relaxed even further by configuring this command to <b>true</b>. When this command is <b>true</b>, the best inactive VPRN BGP route (best amongst all routes received from all CEs) is exportable as a VPN-IP route, regardless of the route type of the active installed route.</p> <p>The configuration of this command overrides the <b>export-inactive-bgp</b> command. If this command is <b>true</b>, the <b>export-inactive-bgp</b> command does not need to be <b>true</b>.</p> <p>When configured to <b>false</b>, the router disables allowing an inactive BGP route in the presence of a better non-BGP route to be exportable as a VPN-IP route.</p>

### **ip-filter-max-size** *number*

Synopsis Maximum number of flowspec rule entries in IPv4 filter

Context **configure** [service](#) [vprn](#) *string* [flowspec](#) [ip-filter-max-size](#) *number*

Tree [ip-filter-max-size](#)

Description This command configures the maximum number of IPv4 flowspec routes, or rules, that can be entered in the auto-created embedded filter, fSpec-X. Flowspec filter entries embedded in a filter policy in this routing instance will use filter entries from the range between the embedding offset and (offset + ip-filter-max-size – 1).

The sum of the maximum-size value and the highest offset in any IPv4 filter that embeds IPv4 flowspec rules from this routing instance (excluding filters that embed at offset 262143) must not exceed 262143.

The maximum size can be adjusted up or down at any time. If the current number of IPv4 flowspec rules is greater than the new maximum, the extra rules are removed immediately but retained in the BGP RIB. If the limit is increased, new rules are programmed only as they are received in new BGP updates.

Range 0 to 262143

Default 512

Introduced 16.0.R1

Platforms All

Tree	<a href="#">policy</a>
Description	This command configures the name of the global channel bandwidth definition policy that is used for (H)MCAC and HQoS adjustment.

Within the scope of HQoS adjustment, the channel definition policy under the group interface is used if redirection is unconfigured. In this case, the HQoS adjustment can be applied to IPoE subscribers in per-SAP replication mode.

If redirection is configured, the channel bandwidth definition policy applied under the Layer 3 redirected interface is in effect.

Hierarchical MCAC (HMCAC) is supported on two levels simultaneously:

- subscriber level and redirected interface when redirection is configured
- subscriber level and group-interface level when redirection is unconfigured

In HMCAC, the subscriber is checked against its bandwidth limits first, then against the bandwidth limits of the redirected or group interface. If redirection is configured but the policy is referenced only under the group interface, no admission control is executed (HMCAC or MCAC).

Synopsis Maximum number of group sources for this interface

Context **configure** [service vpn](#) *string* [igmp interface](#) *string* **maximum-number-group-sources** *number*

Tree [maximum-number-group-sources](#)

Description This command configures the maximum number of group sources for which IGMP or MLD can have local receiver information based on received IGMP or MLD reports on this interface. When this configuration is changed dynamically to a lower value than the currently accepted number of group sources, the group sources that are already accepted are not deleted. Only new group sources are not allowed.

Range 1 to 32000

Introduced 16.0.R1

Synopsis	Redundant next-hop address for the dynamic IPsec tunnel
Context	<b>configure service vpn string interface string dynamic-tunnel-redundant-nexthop string</b>
Tree	<a href="#">dynamic-tunnel-redundant-nexthop</a>

Description	This command specifies the redundant next-hop address on a public or private IPsec interface (with public or private tunnel SAP) for a dynamic IPsec tunnel. The next-hop address is used by a standby node to shunt traffic to a master if it receives the address. The next-hop address is resolved in the routing table of a corresponding service.
Notes	The following elements are part of a choice: <b>multi-chassis-shunting-profile</b> or <b>(dynamic-tunnel-redundant-nexthop</b> and <b>static-tunnel-redundant-nexthop)</b> .
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## strict-match *boolean*

### WARNING:

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable strict match of the security policy entry
Context	<b>configure</b> <a href="#">service vprn string</a> <a href="#">interface string</a> <a href="#">ipsec ipsec-tunnel string</a> <a href="#">security-policy strict-match boolean</a>
Tree	<a href="#">strict-match</a>
Description	When configured to <b>true</b> , this command enables strict match of the security policy entry.

When a CREATE\_CHILD exchange request is received for a static IPsec tunnel, and this request is not a rekey request, ISA matches the received TSi and TSr with the configured security policy. This can be a match only when a received TS (in TSi or TSr) address range matches exactly with the subnet in a security policy entry.

If there is no match, the setup fails, and TS\_UNACCEPTABLE is sent.

If there is a match, but there is an existing CHILD\_SA for the matched security policy, the setup fails, and NO\_PROPOSAL\_CHOSEN is sent.

If there is a match, and there is not a CHILD\_SA for the matched entry, the subnet is sent in the matched security policy entry as TSi and TSr, and the CHILD\_SA is created.

Default	false

Tree	<a href="#">multiplier</a>
Description	This command configures the number of missed messages before the BFD session state is changed to down and the upper-level protocol is notified of the fault. A multiplier of less than 3 should not be used in production environments.

Range	1 to 20
Default	3
Introduced	16.0.R1
Platforms	All

**receive number**

Synopsis	BFD receive interval over this interface
Context	<b>configure service vprn string interface string ipv4 bfd receive number</b>
Tree	<a href="#">receive</a>
Description	This command specifies the receive interval for the BFD session. On the 7750 SR, this command can only be configured to a value less than 100 when the <b>type</b> command is configured to <b>cpm-np</b> .
Range	10 to 100000
Units	milliseconds
Default	100
Introduced	16.0.R1
Platforms	All

**transmit-interval number**

Synopsis	BFD transmit interval over this interface
Context	<b>configure service vprn string interface string ipv4 bfd transmit-interval number</b>
Tree	<a href="#">transmit-interval</a>

**type keyword**

Synopsis	Local termination point for the BFD session
Context	<b>configure service vprn string interface string ipv4 bfd type keyword</b>
Tree	<b>type</b>
Description	This command sets the local termination point for the BFD session to allow for fast timers down to 10 ms granularity. The options to specify where the BFD session runs are: <ul style="list-style-type: none"> <li>• <b>auto</b> (default) – the system chooses and uses the line card CPU only for single-hop BFD sessions with timer intervals equal to or greater than 100ms. All others are placed on the <b>cpm-np</b>.</li> <li>• <b>cpm-np</b> – BFD session runs on the FP complex associated with the CPM. This is either the FP on the CPM or the one elected on smaller systems.</li> <li>• <b>fp</b> – BFD session runs on the line card CPU. This option can only be used for single-hop BFD sessions with timers equal to or greater than 100ms.</li> </ul>
Options	cpm-np, auto, fp
Default	auto
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### **proactive-refresh** *boolean*

Synopsis	Send a single refresh message before entry timeout
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">interface</a> <i>string</i> <a href="#">ipv4 neighbor-discovery</a> <a href="#">proactive-refresh</a> <i>boolean</i>
Tree	<a href="#">proactive-refresh</a>
Description	When configured to <b>true</b> , the router always sends a refresh message 30 seconds before the timeout of the entry (a single refresh message with no retries). When configured to <b>false</b> , the router marks an entry as stale 30 seconds before age-out, and the router only sends an ARP request to refresh the entry if the IOM receives traffic that uses it. Then, the IOM asks the ARP application to send a refresh message. With ARP proactive refresh enabled, the ARP module sends a refresh message regardless of the IOM receiving traffic.
Default	false

----------	--

Context	<b>configure service vprn</b> <i>string</i> <b>interface</b> <i>string</i> <b>ipv4 qos-route-lookup</b> <i>keyword</i>
Tree	<a href="#">qos-route-lookup</a>
Description	This command specifies the IP address type used for QPPB enabled per-packet QoS handling (in terms of FC and priority). When using QPPB, routes are associated with a QoS treatment (FC and optionally priority) through either explicit configuration or the route policy. If an IPv4 or IPv6 packet arrives on an interface where the configuration of this command applies to the packet, the QoS treatment of the packet is based on the route that matched the destination IP address or the route that matched the source IP address.  See "Enabling QPPB on an IP interface" in the <i>7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide</i> for more information about QPPB.

Tree	<a href="#">admin-state</a>
Description	<p>The command determines the administrative state of non-owner virtual router instances.</p> <p>Non-owner virtual router instances can be administratively disabled. This allows the termination of VRRP participation in the virtual router and stops all routing and other access capabilities with regards to the virtual router IP addresses. Disabling the virtual router instance provides a mechanism to maintain the virtual routers without causing false backup or master state changes.</p> <p>When <b>disabled</b>, no VRRP advertisement messages are generated and all received VRRP advertisement messages are silently discarded with no processing.</p> <p>Whenever the administrative or operational state of a virtual router instance transitions, a log message is generated.</p> <p>An owner virtual router context does not use this command. To administratively disable an owner virtual router instance, use the <b>admin-state</b> command within the parent IP interface node which administratively disables the IP interface.</p>

### **backup string**

Synopsis	Virtual router IP addresses for the interface
Context	<b>configure</b> <a href="#">service vprn</a> <a href="#">string interface</a> <a href="#">string ipv4 vrrp number backup</a> <a href="#">string</a>
Tree	<a href="#">backup</a>
Description	This command associates virtual router IP addresses with those of the parental IP interface.  This command has two different functions based on whether it is being executed on an owner or non-owner virtual router instance.  Non-owner virtual router instances create a routable IP interface address that is operationally dependent on the virtual router instance mode (master or backup). This command, when executed on an owner virtual router instance, does not create a routable IP interface address; it simply defines the existing IP addresses of the parental IP interface that are advertised by the virtual router instance.  For owner virtual router instances, this command defines the IP addresses that are advertised within VRRP advertisement messages. This communicates the IP addresses that the master is advertising to backup virtual routers receiving the messages. The specified <i>unicast-ipv4-address</i> must be equal to one of the existing IP addresses in the parental IP interface (primary or secondary) or this command fails.  See "Owner and non-owner VRRP" in the <i>7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide</i> for more information about owner and non-owner virtual router instances.

**mac** *string*

Synopsis	Virtual MAC address to use in ARP responses
Context	<b>configure</b> <i>service vprn string interface string ipv4 vrrp number mac string</i>
Tree	<i>mac</i>
Description	<p>This command sets an explicit MAC address for the virtual router instance that overrides the VRRP default derived from the VRID.</p> <p>Changing the default MAC address is useful when an existing HSRP or other non-VRRP default MAC is in use by the IP hosts that use the virtual router IP address. Many hosts do not monitor unessential ARPs and continue to use the cached non-VRRP MAC address after the virtual router becomes master of the host's gateway address.</p> <p>Additionally, this command sets the MAC address used in ARP responses when the virtual router instance is master. Routing of IP packets with <i>unicast-mac-address</i> as the destination MAC is also enabled. The MAC must be the same for all virtual routers participating as a virtual router or indeterminate connectivity by the attached IP hosts</p>

results. All VRRP advertisement messages are transmitted with *unicast-mac-address* as the source MAC.

An operator can execute this command at any time and it takes effect immediately. When the virtual router MAC on a master virtual router instance changes, a gratuitous ARP is immediately sent with a VRRP advertisement message. If the virtual router instance is disabled or operating as a backup, the gratuitous ARP and VRRP advertisement messages are not sent.

Introduced	16.0.R1

### **master-int-inherit** *boolean*

Synopsis	Allow master instance to dictate the master down timer
Context	<b>configure</b> <i>service vprn string interface string ipv4 vrrp number master-int-inherit boolean</i>
Tree	<a href="#">master-int-inherit</a>
Description	When configured to <b>true</b> , the virtual router instance inherits the advertisement interval timer of the master VRRP router, which backup routers use to calculate the master down timer.  When configured to <b>false</b> , the locally configured message interval must match the master's VRRP advertisement message advertisement interval field value or the message is discarded.
Introduced	16.0.R1
Platforms	All

### **message-interval** *number*

Synopsis	Interval for sending VRRP advertisement messages
Context	<b>configure</b> <i>service vprn string interface string ipv4 vrrp number message-interval number</i>
Tree	<a href="#">message-interval</a>
Description	This command configures the administrative advertisement message timer used by the master virtual router instance to send VRRP advertisement messages. The backup master down timer is derived from the value configured using this command.  The usage of this command varies for non-owner virtual router instances, depending on the state of the virtual router (master or backup) and the state of the <b>master-int-inherit</b> command: <ul style="list-style-type: none"> <li>When a non-owner is operating as master for the virtual router, the system uses the configured value of this command as the operational advertisement timer, similar to an owner virtual router instance. The <b>master-int-inherit</b> command has no effect when operating as master.</li> </ul>

- When a non-owner is in the backup state with **master-int-inherit** disabled, the system uses the configured value of this command to match the incoming advertisement interval field of the VRRP advertisement message. If the locally configured message interval does not match the advertisement interval field, the system discards the VRRP advertisement.
- When a non-owner is in the backup state with **master-int-inherit** enabled, the configured value of this command is ignored. The master down timer is indirectly derived from the advertisement interval field value of the incoming VRRP advertisement message.

### **owner** *boolean*

#### **WARNING:**

Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Designate the virtual router instance as owner
Context	<b>configure</b> <b>service</b> <b>vprn</b> <i>string</i> <b>interface</b> <i>string</i> <b>ipv4</b> <b>vrrp</b> <i>number</i> <b>owner</b> <i>boolean</i>
Tree	<b>owner</b>
Description	When configured to <b>true</b> , the router designates this virtual router instance as the owner of the virtual router IP addresses. Therefore, this virtual router becomes responsible for forwarding packets sent to the virtual router IP addresses. The owner also assumes the role of master virtual router. When configured to <b>false</b> , this virtual router instance is designated as a non-owner.
Default	false
Introduced	16.0.R1
Platforms	All

**passive** *boolean***WARNING:**

Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Suppress the processing of VRRP advertisement messages
Context	<b>configure</b> <b>service</b> <b>vprn</b> <i>string</i> <b>interface</b> <i>string</i> <b>ipv4</b> <b>vrrp</b> <i>number</i> <b>passive</b> <i>boolean</i>
Tree	<b>passive</b>
Description	<p>When configured to <b>true</b>, the router identifies this virtual router instance as passive; and therefore the owner of the virtual router IP addresses. A passive virtual router instance does not transmit or receive VRRP advertisement messages and is always in either the master state (if the interface is operationally up) or the init state (if the interface is operationally down).</p> <p>When configured to <b>false</b>, this virtual router instance is not identified as passive, meaning that it transmits and receives VRRP advertisement messages.</p>
Default	false
Introduced	16.0.R1

Context	<b>configure</b> <b>service</b> <b>vprn</b> <i>string</i> <b>interface</b> <i>string</i> <b>ipv4</b> <b>vrrp</b> <i>number</i> <b>ping-reply</b> <i>boolean</i>
Tree	<b>ping-reply</b>
Description	<p>When configured to <b>true</b>, the router allows the non-owner master to reply to ICMP echo requests directed at the IP addresses of the virtual router instance. Any routed interface can receive the ping request. Ping must not have been disabled at the management security level (either on the parental IP interface or on the Ping source host address).</p> <p>When configured to <b>false</b>, ICMP echo requests sent to non-owner master virtual IP addresses are silently discarded.</p> <p>Non-owner backup virtual routers never respond to ICMP echo requests, regardless of the configuration of this command.</p>

**primary-preference** *number*

Synopsis	Index assigned to the IPv6 address of the interface
Context	<b>configure</b> <i>service vprn string interface string ipv6 address string primary-preference number</i>
Tree	<i>primary-preference</i>
Description	This command assigns a primary preference index to an IPv6 address of the interface to enforce the order in which the address is used by control plane protocols and applications that require a fixed address of the interface, such as LDP and Segment Routing. In cases where a fixed address is required when originating packets from the interface, the IPv6 address with the lowest primary preference index is selected. If the selected address is removed, the next IPv6 address with the next lowest primary preference index is selected.

If this index is not specified for the IPv6 address, the system assigns the next available index value to the address. The address index space is unique across all addresses of a given interface.

### **qos-route-lookup** *keyword*

Synopsis IP address for QoS route lookup for ingress IP packets

Context **configure** *service vpn* *string interface string ipv6 qos-route-lookup keyword*

Tree [qos-route-lookup](#)

Description This command specifies the IP address type used for QPPB enabled per-packet QoS handling (in terms of FC and priority). When using QPPB, routes are associated with a QoS treatment (FC and optionally priority) through either explicit configuration or the route policy. If an IPv4 or IPv6 packet arrives on an interface where the configuration of this command applies to the packet, the QoS treatment of the packet is based on the route that matched the destination IP address or the route that matched the source IP address.

See "Enabling QPPB on an IP interface" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for more information about QPPB.

Tree	<a href="#">admin-state</a>
Description	<p>The command determines the administrative state of non-owner virtual router instances.</p> <p>Non-owner virtual router instances can be administratively disabled. This allows the termination of VRRP participation in the virtual router and stops all routing and other access capabilities with regards to the virtual router IP addresses. Disabling the virtual router instance provides a mechanism to maintain the virtual routers without causing false backup or master state changes.</p> <p>When <b>disabled</b>, no VRRP advertisement messages are generated and all received VRRP advertisement messages are silently discarded with no processing.</p> <p>Whenever the administrative or operational state of a virtual router instance transitions, a log message is generated.</p> <p>An owner virtual router context does not use this command. To administratively disable an owner virtual router instance, use the <b>admin-state</b> command within the parent IP interface node which administratively disables the IP interface.</p>

Tree	<a href="#">backup</a>
Description	<p>This command associates router IPv6 virtual router IP addresses with those of the parental IP interface.</p> <p>This command has two different functions based on whether it is being executed on an owner or non-owner virtual router instance.</p> <p>Non-owner virtual router instance create a routable IP interface address that is operationally dependent on the virtual router instance mode (master or backup). This command, when executed on an owner virtual router instance, does not create a routable IP interface address; it simply defines the existing IP addresses of the parental IP interface that are advertised by the virtual router instance.</p>

For owner virtual router instances, this command defines the IP addresses that are advertised within VRRP advertisement messages. This communicates the IP addresses that the master is representing to backup virtual routers receiving the messages. The specified IPv6 address must be equal to one of the existing parental IP addresses in the parental IP interface (primary or secondary) or this command fails.

See "Owner and non-owner VRRP" in the *7450 ESS, 7750 SR, 7950 XRS, and VSR Router Configuration Guide* for more information about owner and non-owner virtual router instances.

Context	<b>configure</b> <a href="#">service vprn string</a> <a href="#">interface string</a> <a href="#">ipv6 vrrp number</a> <a href="#">mac string</a>
Tree	<a href="#">mac</a>
Description	<p>This command sets an explicit MAC address for the virtual router instance that overrides the VRRP default derived from the VRID.</p> <p>Changing the default MAC address is useful when an existing HSRP or other non-VRRP default MAC is in use by the IP hosts that use the virtual router IP address. Many hosts do not monitor unessential ARPs and continue to use the cached non-VRRP MAC address after the virtual router becomes master of the host's gateway address.</p> <p>Additionally, this command sets the MAC address used in ARP responses when the virtual router instance is master. Routing of IP packets with <i>unicast-mac-address</i> as the destination MAC is also enabled. The MAC must be the same for all virtual routers participating as a virtual router or indeterminate connectivity by the attached IP hosts results. All VRRP advertisement messages are transmitted with <i>unicast-mac-address</i> as the source MAC.</p> <p>An operator can execute this command at any time and it takes effect immediately. When the virtual router MAC on a master virtual router instance changes, a gratuitous ARP is immediately sent with a VRRP advertisement message. If the virtual router instance is disabled or operating as a backup, the gratuitous ARP and VRRP advertisement messages are not sent.</p>

Context	<b>configure service vprn</b> <i>string</i> <b>interface</b> <i>string</i> <b>multi-chassis-shunting-profile</b> <i>reference</i>
Tree	<a href="#">multi-chassis-shunting-profile</a>
Description	This command configures the name of a multi-chassis shunting profile to use on public or private tunnel interfaces.
Reference	<b>configure service vprn</b> <i>string</i> <b>ipsec multi-chassis-shunting-profile</b> <i>string</i>
Notes	The following elements are part of a choice: <b>multi-chassis-shunting-profile</b> or ( <b>dynamic-tunnel-redundant-nexthop</b> and <b>static-tunnel-redundant-nexthop</b> ).
Introduced	22.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### **ping-template**

Synopsis	Enable the <b>ping-template</b> context
Context	<b>configure service vprn</b> <i>string</i> <b>interface</b> <i>string</i> <b>ping-template</b>
Tree	<a href="#">ping-template</a>
Description	Commands in this context map a ping template to the service IP interface. The template is created in the <code>configure test-oam icmp ping-template</code> context.

Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### **admin-state** *keyword*

### **destination-address** *string*

#### **WARNING:**

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Ping template destination address
Context	<b>configure</b> <a href="#">service</a> <a href="#">vprn</a> <i>string</i> <a href="#">interface</a> <i>string</i> <a href="#">ping-template</a> <a href="#">destination-address</a> <i>string</i>
Tree	<a href="#">destination-address</a>
Description	This command configures the address to where the ICMP echo requests are directed to test connectivity. The source of the ICMP echo request is the primary IPv4 address of the interface under which the ping-template is configured. The destination address must be on the same subnet as the source IP address.  Unnumbered interfaces and loopback addresses are not supported.
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### **name** *reference*

#### **WARNING:**

Modifying this element recreates the parent element automatically for the new value to take effect.

Tree	<a href="#">scheduler</a>

**Description** This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (**#**, **\$**, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can be reused in multiple scheduler policies. If the scheduler name already exists within the policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands.

If the scheduler name exists within the policy on a different tier, an error occurs and the current context does not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name.

If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context is not change.

Synopsis Enter the **collect-lmm-fc-stats** context

Context **configure service vpn** *string* **interface** *string* **sap** *string* **eth-cfm collect-lmm-fc-stats**

Tree **collect-lmm-fc-stats**

Description Commands in this context configure per forwarding class (FC) LMM information collection.

The commands **fc-in-profile** and **fc** in this context are mutually exclusive. The commands apply to either profile-aware or profile-unaware FCs respectively.

This command and the **collect-lmm-stats** command are mutually exclusive when there is entity resource contention.

## fc keyword

Synopsis Forwarding class name for profile-unaware counter

Context **configure service vpn** *string* **interface** *string* **sap** *string* **eth-cfm collect-lmm-fc-stats fc** *keyword*

Tree **fc**

Description This command configures individual counters for the specified FCs without regard for profile. The system includes all countable packets that match a configured FC, regardless of profile, in this counter.

An FC specified as part of this command and for this specific context cannot be specified as a profile-aware FC using the **fc-in-profile** command under the **collect-lmm-fc-stats** context.

When this command is reentered, a differential is performed. Omitted FCs stop counting, newly added FCs start counting, and unchanged FCs continue to count.

Options be, l2, af, l1, h2, ef, h1, nc

Tree	<a href="#">tx-eth-vsm-grace</a>
Description	<p>When configured to <b>true</b>, the router can transmit the Nokia ETH-CFM Grace PDU from the MEP when a system soft reset notification is received for one or more cards.</p> <p>The Nokia Grace function is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect.</p> <p>The operator must configure the <b>configure system eth-cfm grace</b> command to instruct the system that the node is capable of transmitting expected-defect windows to peers. The system can only transmit one form of ETH-CFM grace (Nokia ETH-CFM Grace or ITU-T Y.1731 ETH-ED).</p> <p>When configured to <b>false</b>, the router disables the transmission of the Nokia ETH-CFM Grace PDU from the MEP.</p>
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Tree	<a href="#">squelch-ingress-levels</a>
Description	<p>This command defines the levels of the ETH-CFM packets that are silently discarded on ingress into the SAP or SDP binding from the wire that matches the service delineation of the SAP or SDP binding. All ETH-CFM packets inbound to the SAP or SDP binding that match the configured levels are dropped without regard for any other ETH-CFM criteria. No statistical information or drop count is available for any ETH-CFM packet that is silently discarded by this option.</p> <p>The list of levels must be a complete contiguous list from 0 up to the highest level that will be dropped.</p>
Range	0 to 7
Max. Instances	8
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Tree	<a href="#">scheduler</a>
Description	<p>This command specifies the scheduler name which is composed of printable 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. Each scheduler must have a unique name within the context of the scheduler policy. However, the same name can be reused in multiple scheduler policies. If the scheduler name already exists within the policy tier level, the context changes to that scheduler name for the purpose of editing the scheduler commands.</p> <p>If the scheduler name exists within the policy on a different tier, an error occurs and the current context does not change. If the scheduler name does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name.</p> <p>If the provided scheduler name is invalid, a name syntax error occurs, the command does not execute, and the context is not change.</p>

### **pmtu-discovery-aging** *number*

**WARNING:**

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Aging out time of the learned path MTU
Context	<b>configure</b> <b>service</b> <b>vprn</b> <i>string</i> <b>interface</b> <i>string</i> <b>sap</b> <i>string</i> <b>ipsec-tunnel</b> <i>string</i> <b>pmtu-discovery-aging</b> <i>number</i>
Tree	<b>pmtu-discovery-aging</b>
Description	This command configures the temporary public and private MTU expiration time. The temporary MTU is used for MTU propagation.
Range	900 to 3600
Units	seconds
Default	900
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### **private-tcp-mss-adjust** *number*

**WARNING:**

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	TCP maximum segment size (MSS) adjustment
Context	<b>configure</b> <b>service</b> <b>vprn</b> <i>string</i> <b>interface</b> <i>string</i> <b>sap</b> <i>string</i> <b>ipsec-tunnel</b> <i>string</i> <b>private-tcp-mss-adjust</b> <i>number</i>
Tree	<b>private-tcp-mss-adjust</b>
Description	This command specifies the TCP MSS to adjust for the tunnel on the private side. When configured, the system may use the value to update the MSS option in the received TCP SYN packet on the private side.
Range	512 to 9000
Units	bytes
Introduced	19.7.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### **propagate-pmtu-v4** *boolean*

**WARNING:**

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable propagation of the path MTU to IPv4 hosts
Context	<b>configure</b> <i>service vpn</i> <i>string</i> <i>interface</i> <i>string</i> <i>sap</i> <i>string</i> <i>ipsec-tunnel</i> <i>string</i> <b>propagate-pmtu-v4</b> <i>boolean</i>
Tree	<a href="#">propagate-pmtu-v4</a>
Description	When configured to <b>true</b> , the system propagates the path MTU learned from the public side to the private side (IPv4 hosts).
Default	true
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### **propagate-pmtu-v6** *boolean*

**WARNING:**

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable propagation of the path MTU to IPv6 hosts
Context	<b>configure</b> <i>service vpn</i> <i>string</i> <i>interface</i> <i>string</i> <i>sap</i> <i>string</i> <i>ipsec-tunnel</i> <i>string</i> <b>propagate-pmtu-v6</b> <i>boolean</i>
Tree	<a href="#">propagate-pmtu-v6</a>
Description	When configured to <b>true</b> , the system propagates the path MTU learned from the public side to the private side (IPv6 hosts).
Default	true
Introduced	21.5.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**public-tcp-mss-adjust** (*number | keyword*)**WARNING:**

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	TCP maximum segment size (MSS) on the public network
Context	<b>configure</b> <b>service vprn</b> <i>string</i> <b>interface</b> <i>string</i> <b>sap</b> <i>string</i> <b>ipsec-tunnel</b> <i>string</i> <b>public-tcp-mss-adjust</b> ( <i>number   keyword</i> )
Tree	<b>public-tcp-mss-adjust</b>
Description	This command configures the MSS for the TCP traffic in an IPsec tunnel that is sent from the public network to the private network. The system may use this value to adjust or insert the MSS option in the TCP SYN packet.
Range	512 to 9000
Units	bytes
Options	auto
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**replay-window** *number***WARNING:**

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Anti-replay window size
Context	<b>configure</b> <b>service vprn</b> <i>string</i> <b>interface</b> <i>string</i> <b>sap</b> <i>string</i> <b>ipsec-tunnel</b> <i>string</i> <b>replay-window</b> <i>number</i>
Tree	<b>replay-window</b>
Description	This command specifies the size of an IPsec anti-replay window. If unconfigured, IPsec anti-replay is disabled.
Range	32   64   128   256   512
Units	packets
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## strict-match *boolean*

### WARNING:

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable strict match of the security policy entry
Context	<b>configure service vpn</b> <i>string</i> <b>interface</b> <i>string</i> <b>sap</b> <i>string</i> <b>ipsec-tunnel</b> <i>string</i> <b>security-policy strict-match</b> <i>boolean</i>
Tree	<b>strict-match</b>
Description	When configured to <b>true</b> , this command enables strict match of the security policy entry. When a CREATE_CHILD exchange request is received for a static IPsec tunnel, and this request is not a rekey request, ISA matches the received TSi and TSr with the

configured security policy. This can be a match only when a received TS (in TSi or TSr) address range matches exactly with the subnet in a security policy entry.

If there is no match, the setup fails, and TS\_UNACCEPTABLE is sent.

If there is a match, but there is an existing CHILD\_SA for the matched security policy, the setup fails, and NO\_PROPOSAL\_CHOSEN is sent.

If there is a match, and there is not a CHILD\_SA for the matched entry, the subnet is sent in the matched security policy entry as TSi and TSr, and the CHILD\_SA is created.

Default	false
Introduced	19.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Tree	<a href="#">link-map-profile</a>
Description	This command assigns a preconfigured LAG link map profile to a SAP or network interface configured on a LAG or a PW port that exists on a LAG. After an operator assigns a LAG link map profile, the system rehashes the SAP or network interface egress traffic over the LAG as required by the new configuration.  If the LAG link map profile for a SAP or network interface is deleted, the system reverts back to per-flow hashing.

### **wait-for-up-timer** *number*

Synopsis	Time waited for BFD up status
Context	<b>configure service vprn</b> <i>string</i> <b>interface</b> <i>string</i> <b>spoke-sdp</b> <i>string</i> <b>bfd wait-for-up-timer</b> <i>number</i>
Tree	<b>wait-for-up-timer</b>
Description	This command configures the time interval that is used to wait for a BFD session to come up.  This command is triggered when a spoke-SDP is first administratively enabled and a VCCV BFD session transitions from up to down. The command is required to allow time for BFD sessions to come up, and for BFD to settle before selecting the active spoke-SDP for use in a redundant set. In the case where a VCCV BFD session is bouncing, the timer prevents excessive flapping of the operational state of a spoke-SDP.

## tx-eth-vsm-grace *boolean*

Synopsis Transmit ETH-ED PDUs from the MEP

Context **configure** [service vprn](#) [string interface](#) [string spoke-sdp](#) [string eth-cfm mep md-admin-name](#) [reference ma-admin-name](#) [reference mep-id](#) [number grace eth-vsm-grace tx-eth-vsm-grace](#) *boolean*

Tree [tx-eth-vsm-grace](#)

Description When configured to **true**, the router can transmit the Nokia ETH-CFM Grace PDU from the MEP when a system soft reset notification is received for one or more cards.

The Nokia Grace function is a vendor-specific PDU that informs MEP peers that the local node may be entering a period of expected defect.

The operator must configure the **configure system eth-cfm grace** command to instruct the system that the node is capable of transmitting expected-defect windows to peers. The system can only transmit one form of ETH-CFM grace (Nokia ETH-CFM Grace or ITU-T Y.1731 ETH-ED).

When configured to **false**, the router disables the transmission of the Nokia ETH-CFM Grace PDU from the MEP.

Default	true

Synopsis	Default router preference for Router Advertisements
Context	<b>configure service vprn</b> <i>string</i> <b>ipv6 router-advertisement interface</b> <i>reference</i> <b>nd-router-preference</b> <i>keyword</i>
Tree	<b>nd-router-preference</b>
Description	<p>This command configures the default router preference for Router Advertisements (RAs) and allows IPv6 hosts to discover and select a default gateway address by listening to RAs.</p> <p>This feature provides basic traffic engineering functionality for host devices. When this command is applied, the router advertises the respective router preference to the connected host to assist in its selection of the most appropriate default gateway on a link.</p> <p>This extension is backward compatible, both for routers (setting the router preference bits) and hosts (interpreting the router preference bits). These bits are ignored by hosts that do not implement the RFC 4191 functionality by configuring this command. Similarly, hosts that do not implement the RFC 4191 functionality interpret the values sent by devices that do not implement the RFC 4191 extension as a medium preference.</p>
Options	medium, high, low
Default	medium

### **overload-fib-error-notify-only**

Synopsis	Enable the <b>overload-fib-error-notify-only</b> context
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">isis</a> <i>number</i> <b>overload-fib-error-notify-only</b>
Tree	<a href="#">overload-fib-error-notify-only</a>
Description	<p>Commands in this context configure the IS-IS router to send a notification when an overload condition occurs while programming the FIB, instead of advertising the overload condition of the router in the IS-IS LSP.</p> <p><b>Note:</b> Nokia recommends being careful using this command. When you configure the router not to advertise the IS-IS overload state in the IS-IS LSP, other routers are not instructed to take the overloaded router out of the IS-IS forwarding topology and this will cause suboptimal forwarding and non-deterministic behavior on the overloaded router. To avoid changing the default IS-IS overflow behavior, leave this command disabled.</p> <p>When this command is configured, the IS-IS router enters a suboptimal state where it sends only a notification trap; transit traffic can still use the router in this state.</p>

The IS-IS router tracks the segment routing prefix SIDs where FIB programming failed. With the **retry** command configured, the router retries programming the segment routing prefix SIDs in the FIB using this tracked information.

When this command is not configured, during normal operation, the system may force the router to enter an overload state because of a lack of FIB resources. In this state, the router is used to terminate traffic and is not used to transit traffic.

Introduced	23.7.R1
Platforms	All

### **retry** *number*

Synopsis	Time to retry programming failed entries in the FIB
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">isis</a> <i>number</i> <a href="#">overload-fib-error-notify-only</a> <b>retry</b> <i>number</i>
Tree	<a href="#">retry</a>
Description	This command configures the time the router uses to retry programming the failed entries in the FIB.  The <b>overload-fib-error-notify-only</b> command must be configured to use the retry timer. The removal of the <b>overload-fib-error-notify-only</b> configuration causes the system to program the failed entries in the FIB by triggering an immediate SPF.

Notes	The following elements are part of a choice: <b>ip</b> or <b>mac</b> .
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

**interleave** *boolean*

Synopsis	Enable link fragmentation and interleaving
Context	<b>configure</b> <a href="#">service</a> <a href="#">vpn</a> <i>string</i> <a href="#">l2tp</a> <a href="#">group</a> <i>string</i> <a href="#">lns</a> <a href="#">mlppp</a> <a href="#">interleave</a> <i>boolean</i>
Tree	<a href="#">interleave</a>
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

**max-fragment-delay** (*number* | *keyword*)

Synopsis	Maximum fragment delay caused by transmission on a link
Context	<b>configure</b> <a href="#">service</a> <a href="#">vpn</a> <i>string</i> <a href="#">l2tp</a> <a href="#">group</a> <i>string</i> <a href="#">lns</a> <a href="#">mlppp</a> <a href="#">max-fragment-delay</a> ( <i>number</i>   <i>keyword</i> )

Tree	<a href="#">max-fragment-delay</a>
Range	5 to 1000
Units	milliseconds
Options	no-fragmentation
Default	no-fragmentation
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

### **max-links** *number*

Synopsis	Maximum MLPPP links
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">l2tp group</a> <i>string</i> <a href="#">lns mlppp max-links</a> <i>number</i>
Tree	<a href="#">max-links</a>
Range	1 to 8
Default	1
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

### **reassemble-timeout** *number*

Synopsis	Reassembly timeout
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">l2tp group</a> <i>string</i> <a href="#">lns mlppp reassemble-timeout</a> <i>number</i>
Tree	<a href="#">reassemble-timeout</a>
Range	100   1000
Units	milliseconds
Default	1000
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

### **short-sequence-numbers** *boolean*

Synopsis	Request a peer to send short sequence numbers
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">l2tp group</a> <i>string</i> <a href="#">lns mlppp short-sequence-numbers</a> <i>boolean</i>
Tree	<a href="#">short-sequence-numbers</a>

Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

## ppp

Synopsis	Enter the <b>ppp</b> context
Context	<b>configure</b> <a href="#">service vprn string l2tp group string lns ppp</a>
Tree	<a href="#">ppp</a>
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## authentication *keyword*

Synopsis	PPP authentication protocol to negotiate
Context	<b>configure</b> <a href="#">service vprn string l2tp group string lns ppp authentication keyword</a>
Tree	<a href="#">authentication</a>
Options	pap, chap, pref-chap, pref-pap
Default	pref-chap
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## authentication-policy *string*

Synopsis	Authentication policy when a DHCP message is received
Context	<b>configure</b> <a href="#">service vprn string l2tp group string lns ppp authentication-policy string</a>
Tree	<a href="#">authentication-policy</a>
String Length	1 to 32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## chap-challenge-length

Synopsis	Enter the <b>chap-challenge-length</b> context
Context	<b>configure</b> <a href="#">service vprn string l2tp group string lns ppp chap-challenge-length</a>

Tree	<a href="#">chap-challenge-length</a>
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**end number**

Synopsis	Upper bound of the PPP CHAP challenge length
Context	<b>configure</b> <a href="#">service vprn string l2tp group string lns ppp chap-challenge-length end number</a>
Tree	<a href="#">end</a>
Range	8 to 64
Units	octets
Default	64
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**start number**

Synopsis	Lower bound of the PPP CHAP challenge length
Context	<b>configure</b> <a href="#">service vprn string l2tp group string lns ppp chap-challenge-length start number</a>
Tree	<a href="#">start</a>
Range	8 to 64
Units	octets
Default	32
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**default-group-interface**

Synopsis	Enter the <b>default-group-interface</b> context
Context	<b>configure</b> <a href="#">service vprn string l2tp group string lns ppp default-group-interface</a>
Tree	<a href="#">default-group-interface</a>
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**interface** *string*

Synopsis	Group interface
Context	<b>configure</b> <a href="#">service</a> <a href="#">vprn</a> <a href="#">string</a> <a href="#">l2tp</a> <a href="#">group</a> <a href="#">string</a> <a href="#">lns</a> <a href="#">ppp</a> <a href="#">default-group-interface</a> <a href="#">interface</a> <a href="#">string</a>

### local-routes-domain-id *string*

Synopsis	Local routes domain ID
Context	<b>configure service vprn</b> <i>string local-routes-domain-id string</i>
Tree	<a href="#">local-routes-domain-id</a>
Description	<p>This command specifies the domain ID that is used in the D-PATH attribute for local routes before those routes are exported to a BGP neighbor using BGP-IPVPN, EVPN-IFF, EVPN-IFL, or PE-CE BGP. A local route is a non-BGP route installed in the VPRN route table and learned using static route or an IGP.</p> <p>The domain IDs are used in the D-PATH attribute, in accordance with draft-ietf-bess-evpn-ipvpn-interworking. Gateway routers modify the D-PATH attribute. A gateway is a PE where a VPRN is instantiated. The VPRN in this case advertises or receives routes from multiple BGP owners (for example, EVPN IFL and BGP IPVPN).</p> <p>Gateways use the D-PATH attribute to detect loops (for received routes where the D-PATH contains a local domain ID) and to make BGP best-path selection decisions based on the D-PATH length (shorter D-PATH is preferred).</p>

Synopsis TLS client profile used to encrypt syslog communication  
 Context **configure service vprn string log syslog string tls-client-profile reference**  
 Tree [tls-client-profile](#)  
 Description This command specifies the Transport Layer Security (TLS) client profile used to encrypt syslog communications. When configured, syslog messages are sent using TLS.  
 Any change to this command results in a brief interruption of the event log, which may cause the loss of a few syslog messages.  
 When this command is unconfigured, the syslog messages are sent over UDP.

## **bfd-leaf** *boolean*

Synopsis	Enable unidirectional multipoint BFD on the leaf PE
Context	<b>configure service vpn</b> <i>string</i> <b>mvpn provider-tunnel inclusive p2mp-sr bfd-leaf</b> <i>boolean</i>
Tree	<b>bfd-leaf</b>
Description	When configured to <b>true</b> , this command enables unidirectional multipoint BFD sessions on a receiver (leaf) PE node for upstream fast failure detection over P2MP SR tree LSP.
Default	false
Introduced	21.10.R1
Platforms	All

## bfd-root

Synopsis	Enable the <b>bfd-root</b> context
Context	<b>configure service vprn string mvpn provider-tunnel inclusive p2mp-sr bfd-root</b>
Tree	<b>bfd-root</b>
Introduced	21.10.R1
Platforms	All

## multiplier *number*

Synopsis	Multiplier for the transmit interval of the BFD session
Context	<b>configure service vprn string mvpn provider-tunnel inclusive p2mp-sr bfd-root multiplier <i>number</i></b>
Tree	<b>multiplier</b>
Description	This command configures the multiplier for the transmit interval. The interval and the multiplier are used to calculate the detection time, which is the period of time without receiving BFD packets after which the session failure is determined.
Range	1 to 20
Default	3
Introduced	21.10.R1
Platforms	All

## transmit-interval *number*

Synopsis	Transmit interval of the BFD session
Context	<b>configure service vprn string mvpn provider-tunnel inclusive p2mp-sr bfd-root transmit-interval <i>number</i></b>
Tree	<b>transmit-interval</b>
Description	This command configures the transmit interval. The interval and the multiplier are used to calculate the detection time, which is the period of time without receiving BFD packets after which the session failure is determined.
Range	10 to 100000
Notes	This element is mandatory.
Introduced	21.10.R1
Platforms	All

**p2mp-policy** *boolean*

Synopsis	Use P2MP policy for inclusive MVPN provider tunnel

Context	<b>configure service vprn</b> <i>string nat inside large-scale dual-stack-lite endpoint string min-first-fragment-size-rx number</i>
Tree	<a href="#">min-first-fragment-size-rx</a>
Description	This command configures the minimum MTU size for the first fragment in the upstream direction. This command can be used to enable processing of first IPv6 fragments smaller than 1280 bytes. RFC 8200 recommends the minimum MTU in IPv6 be 1280 bytes which allows fragmentation only for packets that are larger than 1280 bytes. If

a first fragment is smaller than 1280 bytes, DS-lite implementation in the SR OS, by default, drops the first fragment.

Description	<p>This command references an import policy to determine the routes that should be installed in the routing table as NAT routes, which are used to steer traffic to NAT.</p> <p>A dynamic route obtained by BGP-VPN can be imported into an inside (private side) routing context in NAT environment. This route is associated with a NAT policy that maps traffic destined into a NAT pool and outside routing context. If the NAT policy is not explicitly configured in the import route-policy, the imported NAT route is, by default, associated with the default NAT policy defined in the NAT inside routing context.</p>

All BGP-VPN routes that are destined to be imported into NAT inside routing context must be configured with action-type accept in the route policy.

Tree	<a href="#">address-pooling</a>
Description	<p>This command configures address pooling which defines a relationship between the NAT subscriber and its outside IP address(es).</p> <p>The behavior in NAT, as defined in RFC 7857, strongly recommends that the NAT subscribers be mapped to a single outside IP address. If this outside IP address runs out of ports, no new ports for the subscriber are allocated. This behavior is called paired address pooling.</p> <p>The alternative behavior is arbitrary address pooling, where a NAT subscriber is mapped to multiple IP addresses when the current outside IP address runs out of ports. This way, the subscriber becomes associated with multiple outside IP addresses. While this results in better resource utilization in NAT, it may negatively affect the behavior of some applications.</p>

**default-host**

Synopsis	Enable the <b>default-host</b> context
Context	<b>configure</b> <a href="#">service vprn string nat outside pool string I2-aware default-host</a>
Tree	<a href="#">default-host</a>
Description	<p>Commands in this context configure the default DMZ host options. A default DMZ host is a node on the inside to which all unknown traffic is redirected by changing the destination IPv4 address in the traffic header. During this operation, the checksums in the Layer 3 and Layer 4 header (UDP and TCP) are recalculated.</p> <p>Unknown traffic in NAT represent all unmatched traffic arriving from the outside (where there is no pinhole or a matching flow record created by traffic initiated from the inside). The purpose of the default DMZ host is to capture and analyze the unknown traffic as part of threat analysis.</p>

The rate of redirected unknown traffic can be restricted by configuration.

## default-host

Synopsis	Enable the <b>default-host</b> context
Context	<b>configure service vpn</b> <i>string</i> <b>nat outside pool</b> <i>string</i> <b>large-scale default-host</b>
Tree	<b>default-host</b>
Description	<p>Commands in this context configure the default DMZ host options. A default DMZ host is a node on the inside to which all unknown traffic is redirected by changing the destination IPv4 address in the traffic header. During this operation, the checksums in the Layer 3 and Layer 4 header (UDP and TCP) are recalculated.</p> <p>Unknown traffic in NAT represent all unmatched traffic arriving from the outside (where there is no pinhole or a matching flow record created by traffic initiated from the inside). The purpose of the default DMZ host is to capture and analyze the unknown traffic as part of threat analysis.</p> <p>The rate of redirected unknown traffic can be restricted by configuration.</p>

## lag

Synopsis	Enter the <b>lag</b> context
Context	<b>configure service vprn string network-interface string lag</b>
Tree	<a href="#">lag</a>
Introduced	16.0.R1
Platforms	All

**link-map-profile** *number*

Synopsis	LAG link map profile for a SAP or network interface
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">network-interface</a> <i>string</i> <a href="#">lag link-map-profile</a> <i>number</i>
Tree	<a href="#">link-map-profile</a>
Description	This command assigns a preconfigured LAG link map profile to a SAP or network interface configured on a LAG or a PW port that exists on a LAG. After an operator assigns a LAG link map profile, the system rehashes the SAP or network interface egress traffic over the LAG as required by the new configuration.  If the LAG link map profile for a SAP or network interface is deleted, the system reverts back to per-flow hashing.
Range	1 to 64
Introduced	16.0.R1
Platforms	All

**per-link-hash**

Synopsis	Enter the <b>per-link-hash</b> context
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">network-interface</a> <i>string</i> <a href="#">lag per-link-hash</a>

## flow-label-load-balancing *boolean*

Synopsis	Enable flow label load balancing
Context	<b>configure</b> <a href="#">service vprn string</a> <a href="#">network-interface string</a> <a href="#">load-balancing flow-label-load-balancing boolean</a>
Tree	<a href="#">flow-label-load-balancing</a>
Description	When configured to <b>true</b> , the router enables load balancing in ECMP and LAG based on the output of a hash performed on the triplet (SA, DA, flow label) in the header of an IPv6 packet received on an IES, VPRN, R-VPLS, CSC, or network interface.  When configured to <b>false</b> , the router disables load balancing in ECMP and LAG.
Default	false
Introduced	21.5.R1
Platforms	All

## ip-load-balancing *keyword*

Synopsis	IP load-balancing algorithm
Context	<b>configure</b> <a href="#">service vprn string</a> <a href="#">network-interface string</a> <a href="#">load-balancing ip-load-balancing keyword</a>
Tree	<a href="#">ip-load-balancing</a>
Description	This command specifies whether to include the source address, destination address, or both in LAG or ECMP hash on IP interfaces. Additionally, when the <b>l4-load-balancing</b>

command is enabled, this command also includes the source or destination port in the hash inputs.

Options	both, destination, source, inner-ip
Default	both
Introduced	16.0.R3
Platforms	All

### **lsr-load-balancing** *keyword*

Synopsis	LSR load-balancing algorithm
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">network-interface</a> <i>string</i> <a href="#">load-balancing</a> <a href="#">lsr-load-balancing</a> <i>keyword</i>
Tree	<a href="#">lsr-load-balancing</a>
Description	This command specifies whether the IP header is used in the LAG and ECMP LSR hashing algorithm. This is the per-interface setting.
Options	lbl-only, lbl-ip, ip-only, eth-encap-ip, lbl-ip-l4-teid
Introduced	16.0.R1
Platforms	All

### **spi-load-balancing** *boolean*

Synopsis	Enable SPI use in hashing
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">network-interface</a> <i>string</i> <a href="#">load-balancing</a> <a href="#">spi-load-balancing</a> <i>boolean</i>
Tree	<a href="#">spi-load-balancing</a>
Description	When configured to <b>true</b> , the router uses the Security Parameter Index (SPI) in hashing for ESP and AH encrypted IPv4 and IPv6 traffic. This is a per-interface setting.
Default	false
Introduced	16.0.R1
Platforms	All

### **teid-load-balancing** *boolean*

Synopsis	Enable use of TEID in hashing
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">network-interface</a> <i>string</i> <a href="#">load-balancing</a> <a href="#">teid-load-balancing</a> <i>boolean</i>

Synopsis	Port egress queue group instance for this interface
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">network-interface</a> <i>string</i> <a href="#">qos</a> <a href="#">egress-instance</a> <i>number</i>
Tree	<a href="#">egress-instance</a>
Description	This command specifies which instance to associate with this specific network IP interface since multiple instances of the same egress queue-group can be applied to the same port.
Range	1 to 65535
Introduced	16.0.R1
Platforms	All

### **egress-port-redirect-group** *reference*

Synopsis	QoS queue group name
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">network-interface</a> <i>string</i> <a href="#">qos</a> <a href="#">egress-port-redirect-group</a> <i>reference</i>
Tree	<a href="#">egress-port-redirect-group</a>
Description	This command configures the egress queue group used for all egress forwarding-class redirections specified within the network QoS policy ID. The specified queue group name must exist as an egress queue group applied to the egress context of the port associated with the IP interface.
Reference	<b>configure</b> <a href="#">qos</a> <a href="#">queue-group-templates</a> <a href="#">egress</a> <a href="#">queue-group</a> <i>string</i>

### **authentication-keychain** *reference*

Synopsis	Keychain used to authenticate broadcast messages
Context	<b>configure service vprn string ntp broadcast reference authentication-keychain reference</b>
Tree	<a href="#">authentication-keychain</a>
Description	<p>This command configures the keychain used to authenticate messages sent by this node.</p> <p>The keychain infrastructure is queried using this keychain name to get the youngest key used for generating the authentication value for the message. When an NTP packet is received by this node, the keychain infrastructure is queried using the keychain name and the key ID extracted from the received message to get the key used to perform the authentication check. If authentication does not pass, the packet is rejected. Keychain entries also have a direction. The key ID and authentication keychain are mutually exclusive. When neither one is set, for example, the key ID has a value of '0' and the value of this command is empty, no authentication is performed.</p>

### **strict** *boolean*

Synopsis	Enable BFD strict mode
Context	<b>configure service vprn</b> <i>string</i> <b>ospf number area</b> <i>string</i> <b>interface</b> <i>string</i> <b>bfd-liveness strict</b> <i>boolean</i>
Tree	<b>strict</b>
Description	<p>When configured to <b>true</b>, the system uses BFD strict-mode. BFD strict-mode mandates that an active BFD session must exist between the OSPF neighbors before establishing a full adjacency. When configured to <b>true</b>, the router uses Link-Local Signaling (LLS) with the B-flag set to instruct the OSPF neighbors that BFD must be enabled on the link. BFD strict-mode requires both sides to have the B-flag set.</p> <p>During OSPFv3 BFD strict-mode operations, the router advertises the local interface IPv4 address TLV using LLS, but the SR OS router continues to use IPv6-based BFD sessions for both the IPv4 and IPv6 address families.</p>
Default	false
Introduced	23.3.R1
Platforms	All

### **strict-mode-holddown** *number*

Synopsis	Adjacency up time delay after BFD session establishment
Context	<b>configure service vprn</b> <i>string</i> <b>ospf number area</b> <i>string</i> <b>interface</b> <i>string</i> <b>bfd-liveness strict-mode-holddown</b> <i>number</i>
Tree	<b>strict-mode-holddown</b>
Description	This command configures a delay timer before bringing up the OSPF adjacency after the BFD session establishment. Holddown helps mitigate potential routing churn when BFD sessions are unstable. The holddown timer is reset when a BFD session operationally toggles.

### **interface-type** *keyword*

**WARNING:**

Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis Interface type

Context **configure service vprn** *string ospf number area string interface string interface-type keyword*

Tree [interface-type](#)

Description This command specifies the interface type.  
**broadcast** - Broadcast network

To significantly improve adjacency forming and network convergence, configure a network as point-to-point if only two routers are connected, even if the network is a broadcast media such as Ethernet.

**non-broadcast** - Non-broadcast network

**point-to-point** - Point-to-point link

Set the interface type of an Ethernet link to **point-to-point** to avoid having to carry the broadcast adjacency maintenance overhead if the Ethernet link provided is used as a point-to-point.

**p2mp-nbma** - Point-to-multipoint on a link without broadcast or multicast support

No designated router or backup designated router is elected on this type of interface and all OSPF neighbors connect through individual point-to-point links. Only VPRN and IES services interfaces support this interface type.

**secondary** - Multiple secondary adjacencies allowed

A **secondary** interface allows multiple secondary adjacencies, in addition to the primary adjacency, to be established over a single IP interface. This interface type can also be applied to the system interface and to loopback interfaces to allow them to participate in multiple areas, although no adjacencies are formed over these types of interfaces.

**strict** *boolean*

Synopsis	Enable BFD strict mode
Context	<b>configure service vprn</b> <i>string ospf3 number area string interface string</i> <b>bfd-liveness strict</b> <i>boolean</i>
Tree	<b>strict</b>
Description	<p>When configured to <b>true</b>, the system uses BFD strict-mode. BFD strict-mode mandates that an active BFD session must exist between the OSPF neighbors before establishing a full adjacency. When configured to <b>true</b>, the router uses Link-Local Signaling (LLS) with the B-flag set to instruct the OSPF neighbors that BFD must be enabled on the link. BFD strict-mode requires both sides to have the B-flag set.</p> <p>During OSPFv3 BFD strict-mode operations, the router advertises the local interface IPv4 address TLV using LLS, but the SR OS router continues to use IPv6-based BFD sessions for both the IPv4 and IPv6 address families.</p>
Default	false
Introduced	23.3.R1

Description	<p>This command specifies the interface type.</p> <p><b>broadcast</b> - Broadcast network</p> <p>To significantly improve adjacency forming and network convergence, configure a network as point-to-point if only two routers are connected, even if the network is a broadcast media such as Ethernet.</p> <p><b>non-broadcast</b> - Non-broadcast network</p> <p><b>point-to-point</b> - Point-to-point link</p> <p>Set the interface type of an Ethernet link to <b>point-to-point</b> to avoid having to carry the broadcast adjacency maintenance overhead if the Ethernet link provided is used as a point-to-point.</p> <p><b>p2mp-nbma</b> - Point-to-multipoint on a link without broadcast or multicast support</p> <p>No designated router or backup designated router is elected on this type of interface and all OSPF neighbors connect through individual point-to-point links. Only VPRN and IES services interfaces support this interface type.</p> <p><b>secondary</b> - Multiple secondary adjacencies allowed</p> <p>A <b>secondary</b> interface allows multiple secondary adjacencies, in addition to the primary adjacency, to be established over a single IP interface. This interface type can also be applied to the system interface and to loopback interfaces to allow them to participate in multiple areas, although no adjacencies are formed over these types of interfaces.</p>

### **policy reference**

Synopsis Multicast CAC policy name

Context **configure service vprn string pim interface string mcac policy reference**

Tree [policy](#)

Description This command configures the name of the global channel bandwidth definition policy that is used for (H)MCAC and HQoS adjustment.

Within the scope of HQoS adjustment, the channel definition policy under the group interface is used if redirection is unconfigured. In this case, the HQoS adjustment can be applied to IPoE subscribers in per-SAP replication mode.

If redirection is configured, the channel bandwidth definition policy applied under the Layer 3 redirected interface is in effect.

Hierarchical MCAC (HMCAC) is supported on two levels simultaneously:

- subscriber level and redirected interface when redirection is configured
- subscriber level and group-interface level when redirection is unconfigured

In HMCAC, the subscriber is checked against its bandwidth limits first, then against the bandwidth limits of the redirected or group interface. If redirection is configured but the policy is referenced only under the group interface, no admission control is executed (HMCAC or MCAC).

## **authentication-key** *string*

Synopsis	Authentication password passed between RIP neighbors
Context	<b>configure service vprn</b> <i>string</i> <b>rip authentication-key</b> <i>string</i>
Tree	<b>authentication-key</b>
Description	<p>This command sets the authentication password to be passed between RIP neighbors. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.</p> <p>The authentication type and authentication key must match exactly for the RIP message to be considered authentic and processed.</p> <p>When unconfigured, this command removes the authentication password from the configuration and disables authentication.</p>

String Length	1 to 51
Introduced	16.0.R4
Platforms	All

### **authentication-type** *keyword*

Synopsis	Authentication type used between RIP neighbors
Context	<b>configure</b> <b>service vprn</b> <i>string rip authentication-type keyword</i>
Tree	<a href="#">authentication-type</a>
Description	This command sets the type of authentication to be used between RIP neighbors. The authentication type and authentication key must match exactly for the RIP message to be considered authentic and processed. When unconfigured, this command removes the authentication type from the configuration and effectively disables authentication.
Options	none, password, md5, md20

Synopsis Enable split horizon and poison reverse  
Context **configure** [service vprn](#) *string* [ripng group](#) *string* [neighbor reference](#) [split-horizon boolean](#)  
Tree [split-horizon](#)

Description	<p>When configured to <b>true</b>, this command enables the use of split horizon with poison reverse. Split-horizon with poison reverse means that routes learned from a neighbor through a given interface are advertised in updates out of the same interface but with a metric of 16 (infinity).</p> <p>When configured to <b>false</b>, this command enables split horizon without poison reverse. This allows the routes to be re-advertised on interfaces other than the interface that learned the route, with the advertised metric equaling an increment of the metric-in value.</p>

Synopsis Micro-segment SRv6 locator name

Context **configure service vprn** *string* [segment-routing-v6](#) *number* [micro-segment-locator reference](#)

Tree [micro-segment-locator](#)

Description This command associates a pre-defined micro-segment SRv6 locator (defined in the **configure router segment-routing segment-routing-v6** context) with the SRv6 instance in the service. The same micro-segment locator can be referenced in multiple BGP instances used by IPVPN or EVPN.

Reference **configure router** *string* [segment-routing](#) [segment-routing-v6](#) [micro-segment-locator string](#)

Notes This element is part of a list key.

Introduced 22.10.R1

Description	Commands in this context configure DSCP remarking for self-generated application traffic.

All packets generated by the configured application instance use the value configured for the DSCP name or value. The instance can be Base, router, VPRN, or management.

The system uses the DSCP value configured in this instance to:

- set the DSCP bits in the IP packet
- signal from the CPM to the egress FC QoS policy to set the Ethernet 802.1p and MPLS EXP bits including, PPPoE, and IS-IS packets that do not carry DSCP bits

- configure the DSCP value in the egress IP header (which the egress QoS policy does not overwrite)

Synopsis	Enter the <b>community</b> list instance
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">snmp community</a> <i>string</i>
Tree	<a href="#">community</a>
Description	<p>Commands in this context set the SNMP community names to be used with the associated VPRN instance. These VPRN community names are used to associate SNMP v1/v2c requests with a particular VPRN context and to return a reply that contains VPRN-specific data or limit SNMP access to data in a specific VPRN instance.</p> <p>VPRN SNMP communities configured with an access permission of 'r' are automatically associated with the default access group "snmp-vprn-ro" and the "vprn-view" view (read only). VPRN SNMP communities configured with an access permission of 'rw' are automatically associated with the default access group "snmp-vprn" and the "vprn-view" view (read/write).</p> <p>The community in an SNMP v1/v2 request determines the SNMP context (that is, the VPRN number for accessing SNMP tables) and not the VPRN of the incoming interface on which the request was received. For example, when an SNMP request arrives on VPRN 5 interface "ringo" with a destination IP address equal to the "ringo" interface, but the community in the SNMP request is the community configured against VPRN 101, the SNMP request is processed using the VPRN 101 context. (the response contains information about VPRN 101). Nokia recommends avoiding the use of a simple series of VPRN SNMP community values that are similar to each other (for example, avoid my-vprncomm-1, my-vprn-comm-2, and so on).</p>

Tree	<a href="#">cpe-check</a>
Description	<p>When configured, this command enables the Customer Premises Equipment (CPE) check feature and specifies the IP address of the target CPE device.</p> <p>This option initiates a background ICMP ping test to the configured target IP address. The IP address can either be an IPv4 address for IPv4 static routes or an IPv6 address for IPv6 static routes. To avoid possible circular references, the target IP address cannot exist in the same subnet as the static route subnet. This command is mutually exclusive with BFD support on a specific static route.</p> <p><b>Note:</b> A node that is sourcing CPE-check packets waits an additional full interval before taking action, which gives the CPE time to respond. For example, with a drop-count of 3 and an interval of 1s, three CPE-check packets are sent out and the node waits for the duration of another interval before acting on the loss. Failure declaration may take extra time depending on the load, interval, and other factors. In line with multitasking, multi-priority operating principles of the node, and the relative priority of <b>cpe-ping</b>, the node paces these minor events.</p>

Tree	<b>address</b>
Description	<p>This command specifies the backup IP forwarding address that is used for static route Fast ReRoute (FRR). The configured address, if reachable, acts as pre-installed backup forwarding information that can be used when the primary IP next-hop suddenly fails.</p> <p>The configured backup next-hop IP address can be directly or indirectly connected (using an IGP or tunnel) to the node. The backup next-hop forwarding information or the Next-hop Label Forwarding Entry (NHLFE) tunnel forwarding information from the IP Routing Table Manager (RTM) is used to preconfigure an IP fast-reroute backup path.</p> <p>One backup next-hop address can protect a single primary static route entry next-hop address without ECMP and it is only activated when the primary next-hop has no active ECMP.</p> <p>The configured IP address can be either on the network or the access side.</p>
Introduced	21.2.R1
Platforms	All

Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**echo-receive** *number*

Synopsis	Minimum echo interval over this interface
Context	<b>configure service vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>ipv4 bfd</b> <b>echo-receive</b> <i>number</i>
Tree	<b>echo-receive</b>
Range	100 to 100000
Units	milliseconds
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**multiplier** *number*

Synopsis	Number of consecutive BFD messages missed from the peer
----------	---

Context	<b>configure service vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>ipv4 bfd multiplier</b> <i>number</i>
Tree	<b>multiplier</b>
Description	This command configures the number of missed messages before the BFD session state is changed to down and the upper-level protocol is notified of the fault. A multiplier of less than 3 should not be used in production environments.
Range	1 to 20
Default	3
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### **receive number**

Synopsis	BFD receive interval over this interface
Context	<b>configure service vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>ipv4 bfd receive number</b>
Tree	<b>receive</b>
Description	This command specifies the receive interval for the BFD session. On the 7750 SR, this command can only be configured to a value less than 100 when the <b>type</b> command is configured to <b>cpm-np</b> .
Range	10 to 100000
Units	milliseconds
Default	100
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### **transmit-interval number**

Synopsis	BFD transmit interval over this interface
Context	<b>configure service vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>ipv4 bfd transmit-interval number</b>
Tree	<b>transmit-interval</b>
Description	This command configures the transmit intervals. On the 7750 SR, this command can only be configured to a value less than 100 when the <b>type</b> command is configured to <b>cpm-np</b> .
Range	10 to 100000
Units	milliseconds

Default	100
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### **type** *keyword*

Synopsis	Local termination point for the BFD session
Context	<b>configure</b> <b>service</b> <b>vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>ipv4</b> <b>bfd</b> <b>type</b> <i>keyword</i>
Tree	<b>type</b>
Description	This command sets the local termination point for the BFD session to allow for fast timers down to 10 ms granularity. The options to specify where the BFD session runs are: <ul style="list-style-type: none"> <li>• <b>auto</b> (default) – the system chooses and uses the line card CPU only for single-hop BFD sessions with timer intervals equal to or greater than 100ms. All others are placed on the <b>cpm-np</b>.</li> <li>• <b>cpm-np</b> – BFD session runs on the FP complex associated with the CPM. This is either the FP on the CPM or the one elected on smaller systems.</li> <li>• <b>fp</b> – BFD session runs on the line card CPU. This option can only be used for single-hop BFD sessions with timers equal to or greater than 100ms.</li> </ul>
Options	cpm-np, auto, fp
Default	auto
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

### **dhcp**

Synopsis	Enter the <b>dhcp</b> context
Context	<b>configure</b> <b>service</b> <b>vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>ipv4</b> <b>dhcp</b>
Tree	<b>dhcp</b>
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### **admin-state** *keyword*

Synopsis	Administrative state of DHCP
----------	------------------------------

Context	<b>configure service vprn</b> <i>string subscriber-interface string group-interface string ipv4 dhcp admin-state keyword</i>
Tree	<a href="#">admin-state</a>
Options	enable, disable
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## client-applications

Synopsis	Enter the <b>client-applications</b> context
Context	<b>configure service vprn</b> <i>string subscriber-interface string group-interface string ipv4 dhcp client-applications</i>
Tree	<a href="#">client-applications</a>
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## dhcp boolean

Synopsis	Enable IPoE clients to use DHCP relay or proxy server
Context	<b>configure service vprn</b> <i>string subscriber-interface string group-interface string ipv4 dhcp client-applications dhcp boolean</i>
Tree	<a href="#">dhcp</a>
Default	true
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## ppp boolean

Synopsis	Enable PPPoE clients to use DHCP relay or proxy server
Context	<b>configure service vprn</b> <i>string subscriber-interface string group-interface string ipv4 dhcp client-applications ppp boolean</i>
Tree	<a href="#">ppp</a>
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**description string**

Synopsis	Text description
Context	<b>configure service vpn string subscriber-interface string group-interface string ipv4 dhcp description string</b>
Tree	<b>description</b>
String Length	1 to 80
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**filter reference**

Synopsis	DHCP filter ID for the group interface
Context	<b>configure service vpn string subscriber-interface string group-interface string ipv4 dhcp filter reference</b>
Tree	<b>filter</b>
Reference	<b>configure filter dhcp-filter number</b>
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**gi-address string**

Synopsis	GI address for the DHCP relay
Context	<b>configure service vpn string subscriber-interface string group-interface string ipv4 dhcp gi-address string</b>
Tree	<b>gi-address</b>
Description	<p>This command configures the GI address to distinguish between the different subscriber interfaces (and potentially group interfaces) defined when the router functions as a DHCP relay.</p> <p>By default, the GI address used in the relayed DHCP packet is the primary IP address of a normal IES interface. Specifying the GI address allows the user to choose a secondary address. For group interfaces, a GI address must be specified under the group interface DHCP context or subscriber interface DHCP context for DHCP to function.</p>
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## lease-populate

Synopsis	Enter the <b>lease-populate</b> context
Context	<b>configure service vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>ipv4 dhcp lease-populate</b>
Tree	<b>lease-populate</b>
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## I2-header

Synopsis	Enable the <b>I2-header</b> context
Context	<b>configure service vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>ipv4 dhcp lease-populate I2-header</b>
Tree	<b>I2-header</b>
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## mac *string*

Synopsis	IEEE address used in anti-spoofing entries for the SAP
Context	<b>configure service vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>ipv4 dhcp lease-populate I2-header mac</b> <i>string</i>
Tree	<b>mac</b>
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## max-leases *number*

Synopsis	Maximum number of DHCPv4 leases
Context	<b>configure service vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>ipv4 dhcp lease-populate max-leases</b> <i>number</i>
Tree	<b>max-leases</b>
Range	1 to 511999
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**match-circuit-id** *boolean*

Synopsis	Enable Option 82 circuit ID on relayed DHCP packets
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">subscriber-interface</a> <i>string</i> <a href="#">group-interface</a> <i>string</i> <a href="#">ipv4 dhcp</a> <a href="#">match-circuit-id</a> <i>boolean</i>

**discover-delay** *number*

Synopsis	Delay before sending DHCP Discover messages
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">subscriber-interface</a> <i>string</i> <a href="#">group-interface</a> <i>string</i> <a href="#">ipv4 dhcp</a> <a href="#">offer-selection</a> <a href="#">client-mac</a> <a href="#">discover-delay</a> <i>number</i>
Tree	<a href="#">discover-delay</a>
Description	This command configures the time to delay sending DHCP Discover messages from the specified MAC addresses.

Range	1 to 100
Units	deciseconds
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### **mac-address** *keyword*

Synopsis	Designated client MAC addresses for Offer selection
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">subscriber-interface</a> <i>string</i> <a href="#">group-interface</a> <i>string</i> <a href="#">ipv4 dhcp offer-selection</a> <a href="#">client-mac</a> <a href="#">mac-address</a> <i>keyword</i>
Tree	<a href="#">mac-address</a>
Description	This command specifies the client MAC addresses for which the Discover delay applies.
Options	odd, even
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### **discover-delay** *number*

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### **discover-delay** *number*

Synopsis	Delay before sending DHCP Discover messages
Context	<b>configure service vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>ipv4 dhcp offer-selection server</b> <i>string</i> <b>discover-delay</b> <i>number</i>
Tree	<a href="#">discover-delay</a>
Description	This command configures the time to delay DHCP Discover messages sent to the server.
Range	1 to 100
Units	deciseconds
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### **option-82**

Synopsis	Enter the <b>option-82</b> context
Context	<b>configure service vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>ipv4 dhcp option-82</b>
Tree	<a href="#">option-82</a>

Description	Commands in this context configure the processing required when the router receives a DHCP request that already has an Option 82 field in the packet.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### **action** *keyword*

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## vlan-ascii-tuple

Synopsis	Include the VLAN ID and dot1p bits in the ASCII tuple
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">subscriber-interface</a> <i>string</i> <a href="#">group-interface</a> <i>string</i> <a href="#">ipv4 dhcp option-82 circuit-id</a> <a href="#">vlan-ascii-tuple</a>

Tree	<a href="#">vlan-ascii-tuple</a>
Description	When configured, the router includes the VLAN ID and dot1p bits with the ASCII-tuple information. This only occurs on dot1q and QinQ-encapsulated ports. When the Option 82 bits are stripped, dot1p bits are copied to the Ethernet header of the outgoing packet. When unconfigured, the router leaves the circuit ID sub-option of the DHCP packet empty.
Notes	The following elements are part of a choice: <b>ascii-tuple</b> , <b>ifindex</b> , <b>none</b> , <b>sap-id</b> , or <b>vlan-ascii-tuple</b> .
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## remote-id

Synopsis	Enter the <b>remote-id</b> context
Context	<b>configure service vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>ipv4 dhcp option-82 remote-id</b>
Tree	<a href="#">remote-id</a>
Description	Commands in this context configure the remote IP sub-option of the DHCP packet with the identity of the remote host end (typically the DHCP client).
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## ascii-string *string*

Synopsis	User-defined ASCII string for the remote ID
Context	<b>configure service vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>ipv4 dhcp option-82 remote-id ascii-string</b> <i>string</i>
Tree	<a href="#">ascii-string</a>
String Length	1 to 32
Notes	The following elements are part of a choice: <b>ascii-string</b> , <b>mac</b> , or <b>none</b> .
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## mac

Synopsis	Use the MAC address for the remote ID
----------	---------------------------------------

Context	<b>configure service vprn</b> <i>string</i> <i>subscriber-interface string</i> <i>group-interface string</i> <i>ipv4 dhcp option-82 remote-id mac</i>
Tree	<a href="#">mac</a>
Notes	The following elements are part of a choice: <b>ascii-string</b> , <b>mac</b> , or <b>none</b> .
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### none

Synopsis	Do not include the remote ID
Context	<b>configure service vprn</b> <i>string</i> <i>subscriber-interface string</i> <i>group-interface string</i> <i>ipv4 dhcp option-82 remote-id none</i>
Tree	<a href="#">none</a>
Notes	The following elements are part of a choice: <b>ascii-string</b> , <b>mac</b> , or <b>none</b> .
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### vendor-specific-option

Synopsis	Enter the <b>vendor-specific-option</b> context
Context	<b>configure service vprn</b> <i>string</i> <i>subscriber-interface string</i> <i>group-interface string</i> <i>ipv4 dhcp option-82 vendor-specific-option</i>
Tree	<a href="#">vendor-specific-option</a>
Description	Commands in this context configure the Nokia Vendor-Specific Option (VSO) of the DHCP packet.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### client-mac-address *boolean*

Synopsis	Send the MAC address in the VSO
Context	<b>configure service vprn</b> <i>string</i> <i>subscriber-interface string</i> <i>group-interface string</i> <i>ipv4 dhcp option-82 vendor-specific-option client-mac-address boolean</i>
Tree	<a href="#">client-mac-address</a>

Introduced	21.7.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### **server** *string*

Synopsis	IP addresses for DHCP server requests
Context	<b>configure service vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>ipv4 dhcp server</b> <i>string</i>
Tree	<b>server</b>
Description	This command configures a list of servers that this interface forwards requests to. The operator can enter the list of servers as either IP addresses or fully qualified domain names. The operator must specify at least one server specified for DHCP relay to work. If there are multiple servers, the system forwards the request to all the servers in the list.
Max. Instances	8
Notes	This element is ordered by the user.
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### **src-ip-addr** *keyword*

Synopsis	Type of source address to use for DHCP relay
Context	<b>configure service vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>ipv4 dhcp src-ip-addr</b> <i>keyword</i>

Tree	<a href="#">src-ip-addr</a>
Options	auto, gi-address
Default	auto
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### trusted *boolean*

Synopsis	Relay untrusted packets
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">subscriber-interface</a> <i>string</i> <a href="#">group-interface</a> <i>string</i> <a href="#">ipv4 dhcp</a> <a href="#">trusted</a> <i>boolean</i>
Tree	<a href="#">trusted</a>
Description	<p>When configured to <b>true</b>, the router enables the trusted mode on the interface. When enabled, the relay agent changes the existing GI address (of the request) to the ingress interface, and forwards the request.</p> <p>A DHCP request that contains a GI address of 0.0.0.0 and an Option 82 field in the packet is discarded unless it arrives on a trusted circuit.</p> <p>This behavior only applies if the Relay Agent Information Option action is to keep the existing information. When the Option 82 field is replaced by the relay agent, the original Option 82 information is lost, and there is no reason to enable the trusted option.</p>
Default	false
Introduced	16.0.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### user-db *reference*

Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### **multiplier number**

Synopsis	Number of consecutive BFD messages missed from the peer
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">subscriber-interface</a> <i>string</i> <a href="#">group-interface</a> <i>string</i> <a href="#">ipv6 bfd multiplier number</a>
Tree	<a href="#">multiplier</a>
Description	This command configures the number of missed messages before the BFD session state is changed to down and the upper-level protocol is notified of the fault. A multiplier of less than 3 should not be used in production environments.
Range	1 to 20
Default	3
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### **receive number**

Synopsis	BFD receive interval over this interface
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">subscriber-interface</a> <i>string</i> <a href="#">group-interface</a> <i>string</i> <a href="#">ipv6 bfd receive number</a>
Tree	<a href="#">receive</a>
Description	This command specifies the receive interval for the BFD session. On the 7750 SR, this command can only be configured to a value less than 100 when the <b>type</b> command is configured to <b>cpm-np</b> .
Range	10 to 100000
Units	milliseconds
Default	100
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**transmit-interval** *number*

Synopsis	BFD transmit interval over this interface
Context	<b>configure</b> <b>service</b> <b>vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>ipv6</b> <b>bfd</b> <b>transmit-interval</b> <i>number</i>
Tree	<b>transmit-interval</b>
Description	This command configures the transmit intervals. On the 7750 SR, this command can only be configured to a value less than 100 when the <b>type</b> command is configured to <b>cpm-np</b> .
Range	10 to 100000
Units	milliseconds
Default	100
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**type** *keyword*

Synopsis	Local termination point for the BFD session
Context	<b>configure</b> <b>service</b> <b>vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>ipv6</b> <b>bfd</b> <b>type</b> <i>keyword</i>
Tree	<b>type</b>
Description	This command sets the local termination point for the BFD session to allow for fast timers down to 10 ms granularity. The options to specify where the BFD session runs are: <ul style="list-style-type: none"> <li>• <b>auto</b> (default) – the system chooses and uses the line card CPU only for single-hop BFD sessions with timer intervals equal to or greater than 100ms. All others are placed on the <b>cpm-np</b>.</li> <li>• <b>cpm-np</b> – BFD session runs on the FP complex associated with the CPM. This is either the FP on the CPM or the one elected on smaller systems.</li> <li>• <b>fp</b> – BFD session runs on the line card CPU. This option can only be used for single-hop BFD sessions with timers equal to or greater than 100ms.</li> </ul>
Options	cpm-np, auto, fp
Default	auto
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

## dhcp6

Synopsis Enter the **collect-lmm-fc-stats** context

Context **configure service vprn** *string* **subscriber-interface** *string* **group-interface** *string* **sap** *string* **eth-cfm collect-lmm-fc-stats**

Tree **collect-lmm-fc-stats**

Description Commands in this context configure per forwarding class (FC) LMM information collection.

The commands **fc-in-profile** and **fc** in this context are mutually exclusive. The commands apply to either profile-aware or profile-unaware FCs respectively.

This command and the **collect-lmm-stats** command are mutually exclusive when there is entity resource contention.

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

### fc keyword

Synopsis Forwarding class name for profile-unaware counter

Context **configure service vprn** *string* **subscriber-interface** *string* **group-interface** *string* **sap** *string* **eth-cfm collect-lmm-fc-stats fc** *keyword*

Tree **fc**

Description This command configures individual counters for the specified FCs without regard for profile. The system includes all countable packets that match a configured FC, regardless of profile, in this counter.

An FC specified as part of this command and for this specific context cannot be specified as a profile-aware FC using the **fc-in-profile** command under the **collect-lmm-fc-stats** context.

When this command is reentered, a differential is performed. Omitted FCs stop counting, newly added FCs start counting, and unchanged FCs continue to count.

Options be, l2, af, l1, h2, ef, h1, nc

Max. Instances 8

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

Tree	<a href="#">squelch-ingress-levels</a>
Description	<p>This command defines the levels of the ETH-CFM packets that are silently discarded on ingress into the SAP or SDP binding from the wire that matches the service delineation of the SAP or SDP binding. All ETH-CFM packets inbound to the SAP or SDP binding that match the configured levels are dropped without regard for any other ETH-CFM criteria. No statistical information or drop count is available for any ETH-CFM packet that is silently discarded by this option.</p> <p>The list of levels must be a complete contiguous list from 0 up to the highest level that will be dropped.</p>

Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

## delay-auth *boolean*

Synopsis	Delay AP-MAC until after ARP/ND authentication response
Context	<b>configure service vprn string subscriber-interface string group-interface string wlan-gw learn-ap-mac delay-auth boolean</b>
Tree	<a href="#">delay-auth</a>
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

## mcs-peer

Synopsis	Enable the <b>mcs-peer</b> context
Context	<b>configure service vprn string subscriber-interface string group-interface string wlan-gw mcs-peer</b>
Tree	<a href="#">mcs-peer</a>
Description	Commands in this context configure a multi-chassis synchronization peer.
Introduced	23.10.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

## address *reference*

**WARNING:**

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

**WARNING:**

Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	IP address of the MCS peer
Context	<b>configure</b> <b>service</b> <b>vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>wlan-gw</b> <b>mcs-peer</b> <b>address</b> <i>reference</i>
Tree	<b>address</b>
Description	This command configures the IPv4 address or the global IPv6 unicast address for a multi-chassis synchronization peer.
Reference	<b>configure</b> <b>redundancy</b> <b>multi-chassis</b> <b>peer</b> ( <i>ipv4-address-no-zone   ipv6-address-no-zone</i> )
Notes	This element is mandatory.
Introduced	23.10.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

**sync-tag** *string***WARNING:**

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

**WARNING:**

Modifying this element recreates the parent element automatically for the new value to take effect.

Synopsis	Synchronization tag shared by MCS peers
Context	<b>configure</b> <b>service</b> <b>vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>wlan-gw</b> <b>mcs-peer</b> <b>sync-tag</b> <i>string</i>
Tree	<b>sync-tag</b>
Description	This command configures the synchronization tag for synchronization of ESM and the tunnel state for ESM over soft-GRE with an MCS peer.
String Length	1 to 32
Notes	This element is mandatory.
Introduced	23.10.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

## mobility

Synopsis	Enter the <b>mobility</b> context

Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

## inter-tunnel-type *boolean*

**WARNING:**

Modifying this element toggles the **admin-state** of the parent element automatically for the new value to take effect.

Synopsis	Enable mobility between terminating tunnel types
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">subscriber-interface</a> <i>string</i> <a href="#">group-interface</a> <i>string</i> <a href="#">wlan-gw</a> <a href="#">mobility inter-tunnel-type</a> <i>boolean</i>
Tree	<a href="#">inter-tunnel-type</a>
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

## inter-vlan *boolean*

Synopsis	Allow mobility within different VLANs of the same range
----------	---

Context	<b>configure service vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>wlan-gw</b> <b>mobility inter-vlan</b> <i>boolean</i>
Tree	<b>inter-vlan</b>
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

## trigger

Synopsis	Enter the <b>trigger</b> context
Context	<b>configure service vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>wlan-gw</b> <b>mobility trigger</b>
Tree	<b>trigger</b>
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

## control *boolean*

Synopsis	Use control traffic as a mobility trigger
Context	<b>configure service vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>wlan-gw</b> <b>mobility trigger control</b> <i>boolean</i>
Tree	<b>control</b>
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

## data *boolean*

Synopsis	Use data traffic as mobility trigger
Context	<b>configure service vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>group-interface</b> <i>string</i> <b>wlan-gw</b> <b>mobility trigger data</b> <i>boolean</i>
Tree	<b>data</b>
Default	false
Introduced	16.0.R1
Platforms	7750 SR, 7750 SR-e, 7750 SR-s, VSR

**iapp** *boolean*

Synopsis	Use IAPP messages as a mobility trigger
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">subscriber-interface</a> <i>string</i> <a href="#">group-interface</a> <i>string</i> <a href="#">wlan-gw</a> <a href="#">mobility trigger iapp</a> <i>boolean</i>

Tree [soft-quota-exhausted-filter](#)

Description This command applies a filter when a soft volume quota is reached. The filter replaces the currently applied filter (which can be preconfigured using the **ip-filter** command in the **configure service vprn subscriber-interface group-interface wlan-gw vlan-range dsm ingress ip-filter** context or be set using a RADIUS CoA message) for the UE upon quota exhaustion. If the quota is extended using a RADIUS CoA message, the filter is automatically reverted. Configuration changes apply only to new DSM UEs and not to existing UEs.

Reference **configure subscriber-mgmt isa-filter** *string*

Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### **type** *keyword*

Synopsis	Local termination point for the BFD session
Context	<b>configure service vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>ipv4 bfd type</b> <i>keyword</i>
Tree	<b>type</b>
Description	This command sets the local termination point for the BFD session to allow for fast timers down to 10 ms granularity. The options to specify where the BFD session runs are: <ul style="list-style-type: none"> <li>• <b>auto</b> (default) – the system chooses and uses the line card CPU only for single-hop BFD sessions with timer intervals equal to or greater than 100ms. All others are placed on the <b>cpm-np</b>.</li> </ul>

- **cpm-np** – BFD session runs on the FP complex associated with the CPM. This is either the FP on the CPM or the one elected on smaller systems.
- **fp** – BFD session runs on the line card CPU. This option can only be used for single-hop BFD sessions with timers equal to or greater than 100ms.

Options	cpm-np, auto, fp
Default	auto
Introduced	21.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

### **default-dns** *string*

## discover-delay *number*

Synopsis	Delay before sending DHCP Discover messages
Context	<b>configure service vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>ipv4 dhcp offer-selection</b> <b>client-mac</b> <b>discover-delay</b> <i>number</i>
Tree	<a href="#">discover-delay</a>
Description	This command configures the time to delay sending DHCP Discover messages from the specified MAC addresses.
Range	1 to 100
Units	deciseconds
Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## mac-address *keyword*

Synopsis	Designated client MAC addresses for Offer selection
Context	<b>configure service vprn</b> <i>string</i> <b>subscriber-interface</b> <i>string</i> <b>ipv4 dhcp offer-selection</b> <b>client-mac</b> <b>mac-address</b> <i>keyword</i>
Tree	<a href="#">mac-address</a>
Description	This command specifies the client MAC addresses for which the Discover delay applies.
Options	odd, even

Introduced	20.10.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### **discover-delay** *number*

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### **discover-delay** *number*

Synopsis Delay before sending DHCP Discover messages

Context **configure** [service vprn](#) *string* [subscriber-interface](#) *string* [ipv4 dhcp offer-selection server](#) *string* **discover-delay** *number*

Tree [discover-delay](#)

Description This command configures the time to delay DHCP Discover messages sent to the server.

Range 1 to 100

Units deciseconds

Introduced 20.10.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### **option-82**

Synopsis Enter the **option-82** context

Context **configure** [service vprn](#) *string* [subscriber-interface](#) *string* [ipv4 dhcp option-82](#)

Tree [option-82](#)

Description Commands in this context configure the processing required when the router receives a DHCP request that already has an Option 82 field in the packet.

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### **vendor-specific-option**

Synopsis Enter the **vendor-specific-option** context

Context **configure** [service vprn](#) *string* [subscriber-interface](#) *string* [ipv4 dhcp option-82 vendor-specific-option](#)

Tree [vendor-specific-option](#)

Description Commands in this context configure the Nokia Vendor-Specific Option (VSO) of the DHCP packet.

Introduced 16.0.R1

Platforms 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**client-mac-address** *boolean*

Synopsis	Send the MAC address in the VSO
Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">subscriber-interface</a> <i>string</i> <a href="#">ipv4 dhcp option-82 vendor-specific-option</a> <a href="#">client-mac-address</a> <i>boolean</i>

Context	<b>configure</b> <a href="#">service vprn</a> <i>string</i> <a href="#">subscriber-mgmt multi-chassis-shunt-id</a> <i>number</i>
Tree	<a href="#">multi-chassis-shunt-id</a>
Description	<p>This command configures the shunt ID that is used to shunt downstream traffic from a standby node to an active node. Because this ID identifies the traffic service on the standby node, the same ID must be configured per service on each node.</p> <p>This configuration is required for inter-BNG-UP resiliency shunting, but not for non-BNG-UP shunting. However, when configured, it is also used for shunting non-BNG-UP sessions in the same service.</p>
Range	1 to 8191
Introduced	22.2.R1
Platforms	7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Context	<b>configure service vprn</b> <i>string</i> <a href="#">subscriber-mgmt up-resiliency monitor-oper-group reference</a>
Tree	<a href="#">monitor-oper-group</a>
Description	Commands in this context define parameters to derive the service health based on monitored operational groups. The BNG UPF sends the health value to the BNG CPF. The BNG CPF uses the value to determine the need for a BNG UPF status change (active or standby).  <b>Note:</b> The following is only applicable for the <b>configure service vpls capture-sap</b> context. If the configured groups are not the same for all capture SAPs sharing the same underlying port or LAG, the configuration of a Layer 2 access ID alias is required, or else the system chooses arbitrarily one set of configured groups.

**type keyword**

Synopsis	Processing behavior type for the reflector
Context	<b>configure service vprn string twamp-light reflector type keyword</b>
Tree	<a href="#">type</a>
Description	<p>This command configures the processing behavior of the TWAMP Light reflector. When the value is <b>twamp-light</b> the reflector does not check the received PDU as a traditional base TWAMP Light packet without TLV processing. When the value is <b>stamp</b>, the reflector attempts to find and process supported STAMP TLVs that follow the base STAMP packet.</p> <p>In mixed environments where different types of Session-Senders may be targeting a common TWAMP Light reflector, set the value to <b>stamp</b>. When the reflector is operating in <b>stamp</b> mode, the primary parsing is based on STAMP, checking and processing known TLVs, or determining if the arriving PDU is a TWAMP Light PDU. A Session-Sender launching a TWAMP Light-based packet must use all zeros padding pattern when the pad size is non zero.</p>
Options	stamp, twamp-light
Default	twamp-light
Introduced	22.7.R1
