## Full Context

configure system port-topology port

## Description

This command is used for satellites. It identifies to the SR OS that there is an internal connection between two ports.

Permitted pairings of the two ports are:

First port	Second port
Router port	Satellite uplink port
Satellite uplink port	Router port

For satellites, this command configures the binding between a host port ID and the satellite uplink from the satellite chassis. The port topology can be configured with the host connected to a satellite uplink or the

satellite uplink port connected to the specified host port. Both configurations are supported, as shown in the following examples:

```
*A:Dut-A# configure system port-topology port esat-1/1/u4 to 1/2/2 create
*A:Dut-A# configure system port-topology no port esat-1/1/u4
*A:Dut-A# configure system port-topology port 1/2/2 to esat-1/1/u4 create
*A:Dut-A# configure system port-topology no port 1/2/2
```

The **no** form of the command removes the internal connection.

## Default

no port port-id

## Parameters

### *port-id*

Specifies one port of an internal port connection. These ports can be router ports or Ethernet satellite uplink ports. Acceptable pairings are defined in the command description.

#### Values

(Router port)

*slot/mda/port*

<i>slot</i>	The slot number of the card in the chassis. The maximum slot number is platform dependent. Refer to the hardware installation guides for more information.
<i>mda</i>	[1 to 2]
<i>port</i>	[1 to 160] (depending on the MDA type)

(Ethernet satellite uplink port)

*esat-id/slot/uport*

<b>esat</b>	keyword
<i>id</i>	[1 to 20]
<i>slot</i>	[1]
<b>u</b>	keyword for up-link port
<i>port</i>	[1 to 4]

### **create**

Specifies the keyword required to create the binding between the two ports.

### Syntax

**port** *port-id*

### Context

[\[Tree\]](#) (config>system>satellite>port-template port)

### Full Context

configure system satellite port-template port

### Description

This command specifies the satellite port to be reconfigured.

The **no** form of this command deletes the specified port configuration.

### Parameters

***port-id***

Specifies the satellite physical port ID. This must use the format *slot/mda/port*. Currently, all satellites have a single slot and a single MDA, so these values will always be 1. For example, port 10 would be specified as 1/1/10.

### Platforms

## port

### Syntax

**port** *port-id* [**create**]

**no port** *port-id*

### Context

[\[Tree\]](#) (config>system>ptp port)

### Full Context

configure system ptp port

### Description

This command configures PTP over Ethernet on the physical port. The PTP process shall transmit and receive PTP messages through the port using Ethernet encapsulation (as opposed to UDP/IPv4 encapsulation).

The frames are transmitted with no VLAN tags even if the port is configured for dot1q or qinq modes for encaps-type. In addition, the received frames from the external PTP clock must also be untagged.

There are two reserved multicast addresses allocated for PTP messages (see *Annex F IEEE Std 1588™-2008*). Either address can be configured for the PTP messages sent through this port.

A PTP port may not be created if the PTP profile is set g8265dot1-2010.

If the port specified in the port-id supports 1588 port based timestamping, then a side effect of enabling PTP over Ethernet on the port shall be the enabling of Synchronous Ethernet on that port.

De-provisioning of the card or MDA containing the specified port is not permitted while the port is configured within PTP.

Changing the encapsulation or the port type of the Ethernet port is not permitted when PTP Ethernet Multicast operation is configured on the port.

To allocate an ethernet satellite client port as a PTP port, the ethernet satellite must first be enabled for the transparent clock function. For more information, see the **config>system>satellite>eth-sat ptp-tc** command.

The SyncE/1588 ports of the CPM and CCMs can be specified as a PTP port. These use the 'A/3' and 'B/3' designation and they both must be specified as two PTP ports if both are to be used. The active CPM sends and receives messages on both ports if they are specified and enabled.

## Parameters

### *port-id*

Specifies a specific physical port.

**Values** *slot/mda/port*

### **create**

Creates the PTP port. This keyword is required when first creating the PTP port, if the system is configured to require it (enabled in the environment create command). Once the PTP port is created, it is possible to navigate into the context without the create keyword.

## Context

**[Tree]** (config>log>syslog port)

## Full Context

configure log syslog port

## Description

This command configures the UDP port that will be used to send syslog messages to the syslog target host.

The port configuration is needed if the syslog target host uses a port other than the standard UDP syslog port 514.

Only one port can be configured. If multiple **port** commands are entered, the last entered port overwrites the previously entered ports.

The **no** form of this command removes the value from the configuration.

## Parameters

### *value*

Specifies the value that is the configured UDP port number used when sending syslog messages.

**Values** 1 to 65535

## Platforms

All

port

## Syntax

**port** *port*

**no port**

## Context

[\[Tree\]](#) (config>system>netconf port)

## Full Context

configure system netconf port

## Description

This command specifies the port on which the SR OS NETCONF server listens for new connections. Only one port can be configured for NETCONF management.

The configured port applies to both non-VPRN and VPRN management. New NETCONF connections are able to use the configured port. The SR OS NETCONF server errors if a port, different from the configured port, is used to SSH to the SR OS NETCONF server. For NETCONF connections not using VPRN management, active NETCONF connections are not disconnected if the port used to establish the connections is changed. For NETCONF connections using VPRN management, active NETCONF connections are disconnected if the port used to establish the connections is changed.

The **no** form of this command resets the port on which the SR OS NETCONF server listens to the default port of 830.

## Parameters

### *port*

Specifies the port on which NETCONF listens for new connections.

**Values** 22, 830

**Default** 830

## Platforms

All

## Full Context

configure system security cpm-filter ipv6-filter entry match port

configure system security cpm-filter ip-filter entry match port

## Description

This command configures a TCP/UDP source or destination port match criterion in IPv4 and IPv6 CPM filter policies. A packet matches this criterion if packet's TCP/UDP (as configured by protocol/next-header match) source OR destination port matches either the specified port value or a port in the specified port range or port list.

This command is mutually exclusive with **src-port** and **dst-port** commands.

The **no** form of this command deletes the specified port match criterion.

## Default

no port

## Parameters

### *tcp/udp port-number*

Specifies the source or destination port to be used as a match criterion specified as a decimal integer.

**Values** 0 to 65535

**mask**

Specifies the 16 bit mask to be applied when matching the port.

**Values** [0x0000 to 0xFFFF] | [0 to 65535] | [0b0000000000000000. to 0b1111111111111111]

**range tcp/udp port-number**

Specifies an inclusive range of source or destination port values to be used as match criteria. *start* of the range and *end* of the range are expressed as decimal integers.

**Values** start, end, port-number: 1 to 65535

**port-list port-list-name**

Specifies a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.205 port-bw-oversub-factor

## port-bw-oversub-factor

### Syntax

**port-bw-oversub-factor** *oversubscription-factor*

**no port-bw-oversub-factor**

### Context

[\[Tree\]](#) (config>qos>hs-pool-policy>mid-tier>mid-pool port-bw-oversub-factor)

### Full Context

configure qos hs-pool-policy mid-tier mid-pool port-bw-oversub-factor

### Description

This command modifies the size of the mid-pool when calculating the port-class pool sizes based on port bandwidth ratios. The command does not actually change the size of the mid-pool, only the size reported to the port-class pool sizing function.

Port-class pools can be sized in one of two ways: dynamically (proportionate to the bandwidth of each port) or explicitly (based on a percentage of the parent mid-pool). Explicit percentages require careful determination of the amount to give each pool. The dynamic sizing function attempts to automatically size each pool based on the relative amount of bandwidth each port-class pool is supporting compared to other port's port-class pools. This is accomplished by determining a dynamic weight for each port with port-class pools mapped to a given mid-pool. As true with any weighted behavior, the mid-pool buffer allocation resource is distributed in a non-oversubscribed manner to its child port-class pools. The **port-bw-oversub-factor** *oversubscription-factor* allows this distribution mechanism to become proportionally oversubscribed based on the defined factor. An oversubscription-factor of 1.5 causes the port-class pool dynamic sizes to be 1.5 times bigger, allowing for a potentially more efficient utilization of the buffers represented by mid-pool.

The **port-bw-oversub-factor** *oversubscription-factor* for a mid-pool can be modified at any time, causing the corresponding port-class pool dynamic sizes to be recalculated.

A similar behavior can be obtained by increasing the mid-pool's allocation-percent of its parent root-pool. However, the major difference in using **port-bw-oversub-factor** is that it provides larger port-class pools without allowing the mid-pool to use a higher number of buffers in the root pool.

The **no** form of the command reverts to the default.

## Default

port-bw-oversub-factor 1

## Parameters

### **oversubscription-factor**

Specifies the factor by which the dynamically-sized port-class pools associated with the mid-pool may oversubscribe the mid-pool. This parameter is required when the **port-bw-oversub-factor** command is executed.

**Values** 1 to 10

## Platforms

7750 SR-7/12/12e

## 20.206 port-control

port-control

## Syntax

**port-control** [auto | force-auth | force-unauth]

## Context

**[Tree]** (config>port>ethernet>dot1x port-control)

## Full Context

```
configure port ethernet dot1x port-control
```

## Description

This command configures the 802.1x authentication mode.

The **no** form of this command returns the value to the default.

## Default

```
port-control force-auth
```

## Parameters

### force-auth

Disables 802.1x authentication and causes the port to transition to the authorized state without requiring any authentication exchange. The port transmits and receives normal traffic without requiring 802.1x-based host authentication.

### force-unauth

Causes the port to remain in the unauthorized state, ignoring all attempts by the hosts to authenticate. The switch cannot provide authentication services to the host through the interface.

### auto

Enables 802.1x authentication. The port starts in the unauthorized state, allowing only EAPoL frames to be sent and received through the port. Both the router and the host can initiate an authentication procedure. The port will remain in unauthorized state (no traffic except EAPoL frames is allowed) until the first client is authenticated successfully. After this, traffic is allowed on the port for all connected hosts.

## port-down

## Syntax

[no] **port-down** *port-id*

## Context

[\[Tree\]](#) (config>vrrp>policy>priority-event port-down)

## Full Context

configure vrrp policy priority-event port-down

## Description

This command configures a port down priority control event that monitors the operational state of a port or SONET/SDH channel. When the port or channel enters the operational down state, the event is considered set. When the port or channel enters the operational up state, the event is considered cleared.

Multiple unique **port-down** event nodes can be configured within the **priority-event** context up to the overall limit of 32 events. Up to 32 events can be defined in any combination of types.

The **port-down** command can reference an arbitrary port or channel. The port or channel does not need to be preprovisioned or populated within the system. The operational state of the **port-down** event is set as follows:

- Set – non-provisioned
- Set – not populated
- Set – down
- Cleared – up

When the port or channel is provisioned, populated, or enters the operationally up or down state, the event operational state is updated appropriately.

When the event enters the operationally down, non-provisioned, or non-populated state, the event is considered to be set. When an event transitions from clear to set, the set is processed immediately and must be reflected in the associated virtual router instances in-use priority value. As the event transitions from cleared to set, a hold-set timer is loaded with the value configured by the events **hold-set** command. This timer prevents the event from clearing until it expires, damping the effect of event flapping. If the event clears and becomes set again before the hold-set timer expires, the timer is reset to the **hold-set** value, extending the time before another clear can take effect.

When the event enters the operationally up state, the event is considered to be cleared. Once the events **hold-set** expires, the effects of the events **priority** value are immediately removed from the in-use priority of all associated virtual router instances.

The actual effect on the virtual router instance in-use priority value depends on the defined event priority and its delta or explicit nature.

The **no** form of the command deletes the specific port or channel monitoring event. The event may be removed at anytime. When the event is removed, the in-use priority of all associated virtual router instances will be re-evaluated. The events **hold-set** timer has no effect on the removal procedure.

## Default

no port-down — No port down priority control events are defined.

## Parameters

### *port-id*

The port ID of the port monitored by the VRRP priority control event.

The *port-id* can only be monitored by a single event in this policy. The port can be monitored by multiple VRRP priority control policies. A port and a specific channel on the port are considered to be separate entities. A port and a channel on the port can be monitored by separate events in the same policy.

**Values** The following values apply to the 7750 SR:

	<i>slot/mdal/port[.channel]</i>		
eth-sat-id	<i>esat-id/slot/port</i>		
	<i>esat</i>	keyword	
	<i>id</i>	1 to 20	
pxc-id	<i>pxc-id.sub-port</i>		
	<i>pxc</i>	keyword	
	<i>id</i>	1 to 64	
	<i>sub-port</i>	a, b	
aps-id	<i>aps-group-id[.channel]</i>		
	<i>aps</i>	keyword	
	<i>group-id</i>	1 to 64	
ccag-id	<i>ccag-id.path-id[cc-type]</i>		
	<i>ccag</i>	keyword	
	<i>id</i>	1 to 8	
	<i>path-id</i>	a, b	
	<i>cc-type</i>	.sap-net, .net-sap	

**Values** The following values apply to the 7450 ESS:

port- id	<i>slot/mda/ port[channel]</i>		
	eth-sat-id	<i>esat-id/slot/port</i>	
		esat	keyword
		<i>id</i>	1 to 20
	pxc-id	<i>pxc-id.sub-port</i>	
		pxc	keyword
		<i>id</i>	1 to 64
		<i>sub-port</i>	a, b
	ccag-id	<i>ccag-id. path-id[cc- type]</i>	
		ccag	keyword
		<i>id</i>	1 to 8
		path-id	a, b
		cc-type	.sap-net, .net- sap

The POS channel on the port monitored by the VRRP priority control event. The *port-id. channel-id* can only be monitored by a single event in this policy. The channel can be monitored by multiple VRRP priority control policies. A port and a specific channel on the port are considered to be separate entities. A port and a channel on the port can be monitored by separate events in the same policy.

If the port is provisioned, but the *channel* does not exist or the port has not been populated, the appropriate event operational state is Set – non-populated.

If the port is not provisioned, the event operational state is Set – non-provisioned.

If the POS interface is configured as a clear-channel, the *channel-id* is 1 and the channel bandwidth is the full bandwidth of the port.

## 20.208 port-format

## port-format

### Syntax

**port-format** *formatting*

**no port-format**

### Context

**[Tree]** (config>router>wpp>portals>portal port-format)

**[Tree]** (config>service>vprn>wpp>portals>portal port-format)

### Full Context

configure router wpp portals portal port-format

configure service vprn wpp portals portal port-format

### Description

This command specifies the encoding format of WPP port attribute.

The standard format is as follows:

<0 to 20 character system-name><1 character separator><2-digit slot><1-digit mda><2-digit port><4-digit top><5-digit bottom>

As a general rule, if a value is not present or is too large to fit in the field, is the field set to all zeros. The following rules apply to standard formats.

- With a standard port, when the separator is a "-" character, the slot is the *slot-id*, mda is the *mda-id*, and the port is the *port-id*.
- With an ESAT port, when the separator is a "." character, the slot is the *satellite-id*, MDA is satellite *slot-id*, and the port is satellite *port-id*.
- With a PXC port, when separator is a "#" character, the MDA is the PXC *subport-id*, and the port is the PXC *port-id*.
- With a LAG port, the port is the *lag-id*.
- With a connector port, the slot is the *slot-id*, the MDA is the *mda-id*, and the port is the *connector-id*.

The vendor-specific format is as follows:

With dot1q, append "%u" with the top *vlan-id*.

With qinq, append "%u.%u" with the top *vlan-id* and the bottom *vlan-id*.

As a general rule, there can be no trailing zeros. The string truncates if it becomes too long. 0 to 16 characters are allowed for the system name. The following rules apply to vendor-specific formats.

- With a standard port, append "%s-%u/%u/%u" with the *system-name*, *slot-id*, *mda-id*, and *port-id*.
- With an ESAT port, append "%s-S%u/%u/%u" with the *system-name*, *satellite-id*, *satellite-slot-id*, and *satellite-port-id*.
- With a PXC port, append "%s-P%u%c" with the *system-name*, PXC *port-id*, and PXC *subport-id* ? 'a' : 'b'.
- With a LAG port, append "%s-L%u" with the *system-name* and *lag-id*.

- With a connector port append "%s-%u%uc%u/%u" with the *system-name*, *slot-id*, *mda-id*, *connector-id*, and *connector-port-id*.

The **no** form of this command reverts to the default.

### Default

port-format standard

### Parameters

#### *formatting*

Specifies the encoding format of the WPP port attribute.

**Values** standard, vendor-specific

### Description

This command will enable the reservation of the dynamic port blocks when the first port forward for the subscriber is created. The dynamic port block allocation is logged only if the block is being utilized (mapping are created). In other words, dynamic port block reservation due to the port forward creation but without any dynamic mapping, will not be logged.

The reserved port block will be released only when the last mapping in the block expires and there is not port forward associated with the subscriber. The de-allocation log (syslog or Radius) will be generated when the dynamic port block is completely released.

Dynamic port block reservation can be enabled only if the configured maximum number of subscriber per outside IP address is less or equal then the maximum number of configured port blocks per outside IP address.

### Default

no port-forwarding-dyn-block-reservation

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.211 port-forwarding-range

## port-forwarding-range

### Syntax

**port-forwarding-range** [*range-start*] *range-end*

**no port-forwarding-range**

### Context

**[Tree]** (config>service>vprn>nat>outside>pool port-forwarding-range)

[\[Tree\]](#) (config>router>nat>outside>pool port-forwarding-range)

## Full Context

```
configure service vprn nat outside pool port-forwarding-range
```

```
configure router nat outside pool port-forwarding-range
```

## Description

This command configures the lower and upper limit for port forwards in the ephemeral port space (wildcard port space) of all IP addresses in a NAT pool. A well-known port range (ports 1 to 1023) is always enabled for port forwards, and it cannot be disabled for pools in NAPT mode.

Pools in 1:1 mode do not support configured port forwards. These pools do not perform port translation and they automatically forward traffic initiated on the outside toward the inside.

Port 0 is always excluded from the port forwarding range.

The upper bound of the wildcard port range is reserved for port forwards. If the value for the *range-start* is not provided, the wildcard port range implicitly starts at 1024.

*range-start 0* cannot be configured by an operator because it is reserved for 1:1 pools that do not support configured port forwards.

If you configure *port-forwarding-range 3000*, configures ports 1 to 3000 as port forwards. This implies that the well-known ports and wildcard ports are contiguous. If you configure *port-forwarding-range 2000 3000*, the router implicitly includes ports 1 to 1023, plus enables the wildcard port range 2000 to 3000, which is now disjointed from the well-known ports.

The *range-start* parameter has additional values that are configurable in the CLI. 0 is reserved for pools that do not support configured port forwards (those are 1:1 pools).

*range-start 1* means that well-known ports and wildcard port forwards are contiguous. This is configured by omitting the *range-start* parameter and only configuring the *range-end* parameter.

The **no** form of this command disables the port forwards capability in the wildcard port range of all IP addresses in a NAT pool.

Default ranges in the *range-start* and *range-end* parameters in the MIB for the NAT pools that support port forwarding ranges are set to include only well-known ports, *range-start 1* and *range-end 1023*.

## Parameters

### *range-start*

Specifies the lower boundary of the wildcard port range reserved for port forwards. When configured, the value must be less than the *range-end* value.

**Values** 0, 1, 1025 to 65535

**Default** 1

### *range-end*

Specifies the upper boundary of the wildcard port range reserved for port forwards.

**Values** 0, 1023 to 65535

**Default** 1023

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## port-forwarding-range

### Syntax

**port-forwarding-range** *range-end*

**no port-forwarding-range**

### Context

**[Tree]** (config>service>nat>nat-policy port-forwarding-range)

**[Tree]** (config>service>nat>firewall-policy port-forwarding-range)

### Full Context

configure service nat nat-policy port-forwarding-range

configure service nat firewall-policy port-forwarding-range

### Description

This command configures the end of the port range available for port forwarding. The start of the range is always equal to one.

The number of ports that can be configured is half of the available block =>  $64512 : 2 = 32256$

In combination with port-forwarding-range the formulas are:

"max port-reservation blocks" =  $65535 - \text{"port-forwarding-range"}$

"max port-reservation ports" =  $(65535 - \text{"port-forwarding-range"}) / 2$

with:

the default min value for "port-forwarding-range" = 1023

Also, the same applies for max port-forwarding-range if the port-reservation is already configured:

"max port-forwarding-range" =  $65535 - \text{"port-reservation blocks"}$

"max port-forwarding-range" =  $65535 - (\text{"port-reservation ports"} * 2)$

The **no** form of the command reverts to the default.

### Default

port-forwarding-range 1023

### Parameters

***range-end***

Specifies the end of the port range available for port forwarding.

**Values** 1023 to 65535

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat nat-policy port-forwarding-range

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service nat firewall-policy port-forwarding-range

## 20.213 port-id-subtype

```
port-id-subtype
```

### Syntax

```
port-id-subtype {tx-if-alias | tx-if-name | tx-local}
```

## Context

[\[Tree\]](#) (config>port>ethernet>lldp>dstmac port-id-subtype)

## Full Context

configure port ethernet lldp dest-mac port-id-subtype

## Description

This command specifies how to encode the PortID TLV transmit to the peer. The default setting **tx-local** (ifindex value) is required by some versions of the NSP NSM-P to properly build the Layer 2 topology map using LLDP. Changing this value to transmit the ifname ( **tx-if-name**) or ifAlias (**tx-if-alias**) in place of the ifindex (**tx-local**) may affect the ability of the NSP NFM-P to build the Layer 2 topology map using LLDP.

## Default

port-id-subtype tx-local

## Parameters

### tx-if-alias

Transmits the ifAlias String (subtype 1) that describes the port as stored in the IF-MIB, either user configured or the default entry (i.e. 10/100/Gig Ethernet SFP).

### tx-if-name

Transmits the ifName string (subtype 5) that describes the port as stored in the IF-MIB ifName info.

### tx-local

The interface ifIndex value (subtype 7) as the PortID.

port-list

**Syntax**

**port-list** *port-list-name* [create]

**no port-list** *port-list-name*

**Context**

[\[Tree\]](#) (config>app-assure>group port-list)

**Full Context**

configure application-assurance group port-list

**Description**

This command defines an AA group or partition named port-list, which contains a list of port numbers or port ranges. The port list is then referenced in AA policy app-filters, allowing increased flexibility in the use of server ports or HTTP proxy ports for application definition.

The **no** form of this command removes the list.

**Parameters**

***port-list-name***

Specifies the name of the port list.

**Default** default

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## port-list

### Syntax

**port-list** *port-list-name* [create]

**no port-list** *port-list-name*

### Context

[\[Tree\]](#) (config>filter>match-list port-list)

### Full Context

configure filter match-list port-list

### Description

This command creates a list of TCP/UDP/SCTP port values or ranges for match criteria in IPv4 and IPv6 ACL and CPM filter policies.

The **no** form of this command deletes the specified list.

#### Operational notes:

SCTP port match is supported in ACL filter policies only.

A port-list must contain only TCP/UDP/SCTP port values or ranges.

A TCP/UDP/SCTP port match list cannot be deleted if it is referenced by a filter policy.

See general description related to match-list usage in filter policies.

### Parameters

#### *port-list-name*

Specifies a string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

## Platforms

All

## port-list

### Syntax

**port-list** *port-list-name* [create]

**no port-list** *port-list-name*

**Description**

This command creates a list of port values or ranges for match criteria in QoS policies.

The **no** form of this command deletes the specified list.

**Parameters*****port-list-name***

Specifies a port list name, up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.216 port-map

### port-map

**Syntax**

**port-map** *client-port-id* **primary** *primary-uplink-port-id* [**secondary** *secondary-uplink-port-id*]

**port-map** *client-port-id* **system-default**

**Context**

[\[Tree\]](#) (config>system>satellite>eth-sat port-map)

**Full Context**

configure system satellite eth-sat port-map

**Description**

This command configures the mapping between a satellite client port and its associated uplink. This command allows both a primary and an optional secondary uplink to be configured.

If a secondary uplink is configured, it is used to forward traffic if the primary uplink is down for any reason.

Before an uplink can be used as either a primary or secondary uplink, it must be configured using the **port-topology** configuration command.

To return the uplink association to its default the **port-map** *client-port-id* **system-default** command should be used.

## Parameters

### *client-port-id*

Specifies the satellite client port associated with the port mapping, in the format **esat-id/slot/port**.

### *primary-uplink-port-id*

Specifies the primary satellite uplink to be associated with the associate client port, in the format **esat-id/slot/uport** where *id* is 1 to 20.

### *secondary-uplink-port-id*

Specifies the secondary satellite uplink to be associated with the associate client port, in the format **esat-id/slot/uport** where *id* is 1 to 20.

### **system-default**

Specifies to set the port map to the system default.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.217 port-num

port-num

### Syntax

**port-num** *virtual-port-number*

**no port-num** [*virtual-port-number*]

### Context

[\[Tree\]](#) (config>service>vpls>spoke-sdp>stp port-num)

[\[Tree\]](#) (config>service>vpls>sap>stp port-num)

### Full Context

configure service vpls spoke-sdp stp port-num

configure service vpls sap stp port-num

### Description

This command configures the virtual port number which uniquely identifies a SAP within configuration bridge protocol data units (BPDUs). The internal representation of a SAP is unique to a system and has a reference space much bigger than the 12 bits definable in a configuration BPDU. STP takes the internal representation value of a SAP and identifies it with its own virtual port number that is unique to every other SAP defined on the TLS. The virtual port number is assigned at the time that the SAP is added to the TLS. Since the order that the SAP was added to the TLS is not preserved between reboots of the system, the virtual port number may change between restarts of the STP instance.

The virtual port number cannot be administratively modified.

### Full Context

```
configure system security cpu-protection port-overall-rate
```

### Description

This command configures a per-port overall rate limit for CPU protection.

### Default

```
port-overall-rate max
```

### Parameters

#### *packet-rate-limit*

Specifies an overall per-port packet arrival rate limit in packets per second.

**Values** 1 to 65535, max (indicates no limit)

#### **action-low-priority**

Marks packets that exceed the rate as low-priority (for preferential discard later if there is congestion in the control plane) instead of discarding them immediately.

## 20.219 port-parent

## port-parent

### Syntax

**port-parent** [**weight** *weight*] [**level** *level*] [**cir-weight** *cir-weight*] [**cir-level** *cir-level*]

**no port-parent**

### Context

**[Tree]** (config>qos>sap-egress>policer port-parent)

### Full Context

configure qos sap-egress policer port-parent

### Description

This command specifies whether this SAP egress policer feeds off a port-level scheduler. When configured, the policer is parented by a port-level scheduler. This requires that **policers-hqos-manageable** be configured in the SAP egress QoS policy. This command and the SAP egress policer **scheduler-parent** and the **parent** commands are mutually exclusive.

The **port-parent** command defines a child/parent association between an egress policer and a port-based scheduler or between an intermediate service scheduler and a port-based scheduler. The **port-parent** command allows for a set of within-CIR and above-CIR parameters that define the port priority levels and weights for the policer. If the **port-parent** command is executed without any parameters, the default parameters are used.

In this context, the **port-parent** command and the **scheduler-parent** command (used to create a parent/child association between a queue and an intermediate scheduler) are mutually exclusive. Executing a **port-parent** command when a **scheduler-parent** definition exists causes the current intermediate scheduler association to be removed and replaced by the defined port-parent association. Executing a **scheduler-parent** command when a **port-parent** definition exists causes the port scheduler association to be removed and replaced by the defined intermediate scheduler association.

Changing the parent context on a SAP egress policy policer may cause a SAP or subscriber or a multiservice site context of the policer (policy associated with a SAP or subscriber profile or a multiservice site) to enter an orphaned state. If an instance of a policer is created on a port or channel that does not have a port scheduler enabled, and the SAP egress policy creating the policer has a port parent association, the policer will be allowed to run according to its own rate parameters and will not be controlled by a virtual scheduling context. If an instance of a policer is on a port or channel that has a port scheduler configured and the SAP egress policy defines the policer as having a non-existent intermediate scheduler parent, the policer will be treated as an orphan and will be handled according to the current orphan behavior on the port scheduler.

The **no** form of this command removes a port scheduler parent association for the policer. When removed, if a port scheduler is defined on the port on which the policer instance exists, the policer will be treated as orphaned to the port scheduler.

### Default

no port-parent

### Parameters

**weight** *weight*

Specifies the weight that the policer will use at the above-CIR port priority level (defined by the **level** parameter).

All weight values from all weighted active policers, queues, and schedulers with a common port parent are added together. Then, each individual active weight is divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit.

The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the **weight** parameter is set to a value of 0, the policer receives bandwidth only after other children with a non-zero weight at this level.

**Values** 0 to 100

**Default** 1

#### **level** *level*

Specifies the port priority that the policer uses to receive bandwidth for its above-CIR offered load.

**Values** 1 to 8 (8 is the highest priority)

**Default** 1

#### **cir-weight** *cir-weight*

Specifies the weight that the policer uses at the within-CIR port priority level (defined by the **cir-level** parameter).

All **cir-weight** values from all weighted active policers, queues, and schedulers with a common port parent are added together. Then, each individual active weight is divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit.

The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the **cir-weight** parameter is set to a value of 0, the policer receives bandwidth only after the other children with a non-zero weight at this level.

**Values** 0 to 100

**Default** 0

#### **cir-level** *cir-level*

Specifies the port priority that the policer will use to receive bandwidth for its within-CIR offered load. If the **cir-level** parameter is set to a value of 0 (the default value), the policer does not receive bandwidth during the port schedulers within-CIR pass and the **cir-weight** parameter is ignored. If the **cir-level** parameter is 1 or greater, the **cir-weight** parameter is used.

**Values** 0 to 8 (8 is the highest priority)

**Default** 0

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-1s, 7750 SR-1se, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, VSR

## port-parent

## Syntax

**port-parent** [**weight** *weight*] [**level** *level*] [**cir-weight** *cir-weight*] [**cir-level** *cir-level*]

**no port-parent**

## Context

[\[Tree\]](#) (config>qos>sap-egress>queue port-parent)

## Full Context

configure qos sap-egress queue port-parent

## Description

This command specifies whether this queue feeds off a port-level scheduler. When configured, this SAP egress queue is parented by a port-level scheduler. This object is mutually exclusive with SAP egress queue parent. Only one kind of parent is allowed.

The **port-parent** command defines a child/parent association between an egress queue and a port-based scheduler or between an intermediate service scheduler and a port-based scheduler. The **port-parent** command allows for a set of within-CIR and above-CIR parameters that define the port priority levels and weights for the queue or scheduler. If the **port-parent** command is executed without any parameters, the default parameters are assumed.

In this context, the **port-parent** command is mutually exclusive to the **parent** command (used to create a parent/child association between a queue and an intermediate scheduler). Executing a **port-parent** command when a parent definition is in place causes the current intermediate scheduler association to be removed and replaced by the defined port-parent association. Executing a **parent** command when a port-parent definition exists causes the port scheduler association to be removed and replaced by the defined intermediate scheduler name.

Changing the parent context on a SAP egress policy queue may cause a SAP or subscriber or multiservice site context of the queue (policy associated with a SAP or subscriber profile or multiservice site) to enter an orphaned state. If an instance of a queue is created on a port or channel that does not have a port scheduler enabled and the sap-egress policy creating the queue has a port-parent association, the queue will be allowed to run according to its own rate parameters and will not be controlled by a virtual scheduling context. If an instance of a queue is on a port or channel that has a port scheduler configured and the sap-egress policy defines the queue as having a non-existent intermediate scheduler parent, the queue will be treated as an orphan and will be handled according to the current orphan behavior on the port scheduler.

The **no** form of this command removes a port scheduler parent association for the queue or scheduler. If a port scheduler is defined on the port on which the queue or scheduler instance exists, the queue or scheduler will become orphaned if a port scheduler is configured on the egress port of the queue or scheduler.

## Default

no port-parent

## Parameters

### **weight** *weight*

Specifies the weight the queue or scheduler will use at the above-CIR port priority level (defined by the level parameter).

**Values** 0 to 100

**Default** 1

### **level** *level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its above-CIR offered-load.

**Values** 1 to 8 (8 is the highest priority)

**Default** 1

### **cir-weight** *cir-weight*

Specifies the weight the queue or scheduler will use at the within-CIR port priority level (defined by the cir-level parameter). The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the cir-weight parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port schedulers within-CIR pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

**Values** 0 to 100

**Default** 0

### **cir-level** *cir-level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its within-CIR offered-load. If the cir-weight parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port schedulers within-CIR pass and the cir-level parameter is ignored. If the cir-weight parameter is 1 or greater, the cir-level parameter comes into play.

**Values** 0 to 8 (8 is the highest priority)

**Default** 0

## Platforms

All

## port-parent

### Syntax

**port-parent** [**weight** *weight*] [**level** *level*] [**cir-weight** *cir-weight*] [**cir-level** *cir-level*]

**no port-parent**

### Context

**[Tree]** (config>qos>network-queue>queue port-parent)

### Full Context

configure qos network-queue queue port-parent

### Description

This command specifies whether this queue feeds off a port-level scheduler. For the network-queue policy context, only the port-parent command is supported. When a port scheduler exists on the port, network queues without a port-parent association will be treated as an orphan queue on the port scheduler and treated according to the current orphan behavior on the port scheduler. If the port-parent command is defined for a network queue on a port without a port scheduler defined, the network queue will operate as if a parent association does not exist. When a port scheduler policy is associated with the egress port, the port-parent command will come into effect.

When a network-queue policy is associated with an FP for ingress queue definition, the port-parent association of the queues is ignored.

The **no** form of this command removes a port scheduler parent association for the queue or scheduler. If a port scheduler is defined on the port then the queue or scheduler instance exists, the queue or scheduler will become orphaned.

### Default

no port-parent

### Parameters

#### **weight** *weight*

Specifies the weight the queue or scheduler will use at the above-CIR port priority level (defined by the level parameter).

**Values** 0 to 100

**Default** 1

#### **level** *level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its above-CIR offered-load.

**Values** 1 to 8 (8 is the highest priority)

**Default** 1

#### **cir-weight** *cir-weight*

Specifies the weight the queue or scheduler will use at the within-CIR port priority level (defined by the `cir-level` parameter). The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the `cir-weight` parameter is set to a value of 0, the queue or scheduler does not receive bandwidth during the port scheduler's within-CIR pass and the `cir-level` parameter is ignored. If the `cir-weight` parameter is 1 or greater, the `cir-level` parameter is used.

**Values** 0 to 100

**Default** 0

#### **cir-level** *cir-level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its within-CIR offered-load. If the `cir-weight` parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port scheduler's within-CIR pass and the `cir-level` parameter is ignored. If the `cir-weight` parameter is 1 or greater, the `cir-level` parameter comes into play.

configure qos scheduler-policy tier scheduler port-parent

## Description

The **port-parent** command defines a child/parent association between an egress scheduler and a port-based scheduler, or between an intermediate service scheduler and a port-based scheduler. The **port-parent** command allows for a set of within-CIR and above-CIR parameters that define the port priority levels and weights for the scheduler. If the **port-parent** command is executed without any parameters, the default parameters are assumed.

In this context, the **port-parent** command and the **parent** command (used to create a parent/child association to an intermediate scheduler) are mutually exclusive. Executing a **port-parent** command when a parent definition is in place causes the current intermediate scheduler association to be removed and replaced by the defined port-parent association. Executing a **parent** command when a port-parent definition exists causes the port scheduler association to be removed and replaced by the defined intermediate scheduler name.

Changing the parent context on a SAP egress policy policer or queue may cause a SAP or subscriber context of the policer or queue (policy associated with a SAP or subscriber profile) to enter an orphaned state. If an instance of a policer or queue is created on a port or channel that does not have a port scheduler enabled and the sap-egress policy creating the policer queue has a port-parent association, the policer or queue will be allowed to run according to its own rate parameters and will not be controlled by a virtual scheduling context. If an instance of a policer or queue is on a port or channel that has a port scheduler configured and the sap-egress policy defines the policer or queue as having a non-existent intermediate scheduler parent, the policer or queue will be treated as an orphan and will be handled according to the current orphan behavior on the port scheduler.

The **no** form of this command removes a port scheduler parent association for the scheduler. If a port scheduler is defined on the port that the scheduler instance exists, the scheduler will become orphaned if an port scheduler is configured on the egress port of the queue or scheduler.

## Default

no port-parent

## Parameters

### weight *weight*

Specifies the weight the queue or scheduler will use at the above-CIR port priority level (defined by the **level** parameter).

**Values** 0 to 100

**Default** 1

### level *level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its above-CIR offered-load.

**Values** 1 to 8 (8 is the highest priority)

**Default** 1

#### **cir-weight** *cir-weight*

Specifies the weight the queue or scheduler will use at the within-CIR port priority level (defined by the *cir-level* parameter). The weight is specified as an integer value from 0 to 100 with 100 being the highest weight. When the **cir-weight** parameter is set to a value of 0, the queue or scheduler does not receive bandwidth during the port scheduler's within-CIR pass and the **cir-level** parameter is ignored. If the **cir-weight** parameter is 1 or greater, the **cir-level** parameter comes into play.

**Values** 0 to 100

**Default** 0

#### **cir-level** *cir-level*

Specifies the port priority the queue or scheduler will use to receive bandwidth for its within-CIR offered-load. If the *cir-weight* parameter is set to a value of 0 (the default value), the queue or scheduler does not receive bandwidth during the port scheduler's within-CIR pass and the *cir-level* parameter is ignored. If the *cir-weight* parameter is 1 or greater, the *cir-level* parameter comes into play.

**Values** 0 to 8 (8 is the highest priority)

**Default** 0

### **Platforms**

All

## **20.220 port-policy**

port-policy

### **Syntax**

**port-policy** [*port-policy*]

**no port-policy**

### **Context**

[\[Tree\]](#) (config>isa>wlan-gw-group port-policy)

### **Full Context**

configure isa wlan-gw-group port-policy

## Description

This command configures the port policy of this WLAN Gateway ISA group. If a port policy is associated with a WLAN Gateway ISA group, ports created for this group can take applicable configuration from that port policy. This port policy is applicable to those ports that take part in the per-tunnel QoS processing.

The **no** form of the command removes the **port-policy** name from the configuration.

## Default

no port-policy

## Parameters

### *port-policy*

Specifies the port policy of this WLAN Gateway ISA group, up to 32 characters.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## port-policy

## Syntax

**port-policy** *port-policy-name* [**create**]

**no port-policy** *port-policy-name*

## Context

[\[Tree\]](#) (config port-policy)

## Full Context

configure port-policy

## Description

This command either creates a new port-policy with create parameter or enters the configuration context of an existing port-policy.

The **no** form of this command removes the port policy name from the configuration.

## Parameters

### *port-policy-name*

Specifies the name of *port-policy* up to 32 characters.

### **create**

Creates the port-policy instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## port-policy

### Syntax

**port-policy** *policy-name*

**no port-policy**

### Context

[\[Tree\]](#) (config>isa>Ins-group port-policy)

### Full Context

configure isa Ins-group port-policy

### Description

This command enables policies referenced in the **config>port-policy** context to be created under **ports**. These are the ports that link the carrier IOM to the ISA, and are hidden within the system (they cannot be created through the CLI). They are created automatically. Use the **show port** command to view information.

Currently only the port scheduler policy is supported. Each Ins-esm port in the Ins-group receives an independent port scheduler instance. The port schedulers are instantiated in the carrier IOM on the Ins-esm ports that carry PPPoE traffic in the downstream direction towards the ISA before the PPPoE traffic is L2TP encapsulated.

The **no** form of the command removes the policy name from the configuration.

### Default

no port-policy

### Parameters

***policy-name***

Specifies the port policy of this LNS group, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.221 port-range-block

## port-range-block

### Syntax

**[no] port-range-block**

**Context**

[\[Tree\]](#) (config>aaa>isa-radius-plcy>acct-include-attributes port-range-block)

**Full Context**

configure aaa isa-radius-policy acct-include-attributes port-range-block

**Description**

This command enables the inclusion of the NAT port range block attributes.

The **no** form of the command excludes NAT port range block attributes.

**Default**

no port-range-block

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.222 port-recorder

port-recorder

**Syntax**

[no] port-recorder

**Context**

[\[Tree\]](#) (debug>app-assure>group port-recorder)

**Full Context**

debug application-assurance group port-recorder

**Description**

This commands allows to stop or start the http-host-recorder. To reset the recorded values execute shutdown followed by **no** shutdown.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.223 port-redirect-group

## port-redirect-group

### Syntax

```
port-redirect-group {queue queue-id | policer policer-id [queue queue-id]}
```

```
no port-redirect-group
```

### Context

[\[Tree\]](#) (config>qos>network>egress>fc port-redirect-group)

### Full Context

```
configure qos network egress fc port-redirect-group
```

### Description

This command is used to redirect the FC of a packet of a pseudowire (PW) or network IP interface to an egress port queue group.

It defines the mapping of an FC to a queue ID or a policer ID and a queue ID and redirects the lookup of the queue or policer of the same ID in some egress port queue-group instance. However, the queue-group name and instance are explicitly provided only at the time the network QoS policy is applied to egress context of a spoke-sdp or a network IP interface.

The **no** version of this command removes the redirection of the FC.

### Parameters

#### *queue-id*

This parameter must be specified when executing the **port-redirect-group** command. The specified *queue-id* must exist within the egress port queue group on each IP interface where the network QoS policy is applied.

**Values** 1 to 8

#### *policer id*

The specified policer-id must exist within the queue-group template applied to the ingress context of the forwarding plane.

**Values** 1 to 8

### Platforms

All

## 20.224 port-reservation

## port-reservation

### Syntax

**port-reservation blocks** *num-blocks*

**port-reservation ports** *num-ports*

**no port-reservation**

### Context

**[Tree]** (config>service>vprn>nat>outside>pool port-reservation)

**[Tree]** (config>router>nat>outside>pool port-reservation)

### Full Context

configure service vprn nat outside pool port-reservation

configure router nat outside pool port-reservation

### Description

This command configures the size of the port-block that will be assigned to a host that is served by this pool. The number of ports configured are available to UDP, TCP and ICMP (as identifiers).

### Parameters

#### *num-blocks*

Specifies the number of port-blocks per IP address. Setting this parameter to one (1) for large scale NAT enables 1:1 NAT for IP addresses in this pool.

**Values** 1 to 64512

#### *num-ports*

Specifies the number of ports per block.

**Values** 1 to 32256

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## port-reservation

### Syntax

**port-reservation** *num-ports*

**no port-reservation**

### Context

**[Tree]** (config>service>vprn>nat>outside>pool>deterministic port-reservation)

**[Tree]** (config>router>nat>outside>pool>deterministic port-reservation)

## Full Context

```
configure service vprn nat outside pool deterministic port-reservation
configure router nat outside pool deterministic port-reservation
```

## Description

This command is applicable only to deterministic NAT. It configures the number of deterministic ports per subscriber (for example a subscriber is an inside IP address in LSN44 or IPv6 address or prefix in DS-Lite). Once this command is enabled, the pool will transition into deterministic mode of operation. This means that the subscribers can use dynamic port-blocks in the pool only as a mean to expand the range of originally assigned deterministic ports. A pool with such property is referred to as deterministic pool. However, deterministic NAT and non-deterministic NAT cannot use the same pool simultaneously.

All subscribers in deterministic pool are pre-mapped during the configuration phase to outside IP addresses and deterministic port-blocks. Because of this, the deterministic pool cannot be oversubscribed with subscribers (first-come, first-served).

Once the deterministic pool becomes operational (no shutdown) a log is created. The same applies if the pool is disabled (shutdown). As a result of this one-time logging, there will be no additional logging when a subscriber starts using ports from the pre-assigned deterministic port block. This drastically reduces the logging overhead. However, when a deterministic port block is expanded by a dynamic port block, a log will be created on any allocation/de-allocation of the dynamic port block. The logs are also created for static port forwards (including PCP).

The number of subscribers per outside IP address (subscriber-limit) multiplied by the number of deterministic ports per subscriber (port-reservation) will determine the port range of an outside IP address that will be dedicated to deterministic mappings. The number of subscribers per outside IP address in deterministic NAT must be power of 2 ( $2^n$ ). Once the deterministic ports are allocated, the dynamic ports are carved out of the remaining port space of the same outside IP address according to the existing **port-reservation** command under the same hierarchy,

## Parameters

### *num-ports*

Specifies the number of ports in a deterministic port block that is allocated and dedicated to a single subscribers during the configuration phase.

**Values** 1 to 65536

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## port-reservation

## Syntax

```
[no] port-reservation
```

## Context

[\[Tree\]](#) (config>service>nat>pcp-server-policy>option port-reservation)

**Full Context**

configure service nat pcp-server-policy option port-reservation

**Description**

This command enables/disables support for the **port-reservation** option.

**Default**

no port-reservation

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.225 port-role

```
port-role
```

**Syntax**

[no] port-role

**Context**

[\[Tree\]](#) (debug>service>id>stp port-role)

**Full Context**

debug service id stp port-role

**Description**

This command enables STP debugging for changes in port roles.

**Platforms**

## 20.226 port-scheduler-policy

```
port-scheduler-policy
```

**Syntax**

**port-scheduler-policy** *port-scheduler-policy-name*

**no port-scheduler-policy**

## Context

[Tree] (config>port>ethernet>access>egress>vport port-scheduler-policy)

## Full Context

configure port ethernet access egress vport port-scheduler-policy

## Description

This command specifies the destination and organization strings to be used for matching subscriber hosts with this Vport.

The parent Vport of a subscriber host queue, which has the port-parent option enabled, is determined by matching the destination string dest string associated with the subscriber and the organization string org string associated with the subscriber host with the strings defined under a Vport on the port associated with the subscriber.

If a given subscriber host policers or queue does not have the port-parent option enabled, it is foster-parented to the Vport used by this subscriber and which is based on matching the dest string and org string. If the subscriber could not be matched with a Vport on the egress port, the host policer or queue will not be bandwidth controlled and competes for bandwidth directly based on its own PIR and CIR parameters.

By default, a subscriber host policer or queue with the port-parent option enabled is scheduled within the context of the port's port scheduler policy.

The **agg-rate rate**, **port-scheduler-policy** and **scheduler-policy** commands are mutually exclusive. Changing between the use of a scheduler policy and the use of an **agg-rate** or **port-scheduler-policy** involves removing the existing command and applying the new command. Applying a scheduler policy to a Vport is only applicable to Ethernet interfaces.

The **no** form of this command removes the *port-scheduler-policy-name* from the configuration.

The **agg-rate rate**, **port-scheduler-policy** and **scheduler-policy** commands are mutually exclusive. Changing between the use of a scheduler policy and the use of an **agg-rate/port-scheduler-policy** involves removing the existing command and applying the new command.

The **no** form of this command reverts to the default.

## Parameters

***port-scheduler-policy-name***

Specifies an existing **port-scheduler-policy** configured in the **config>qos** context.

## Platforms

All

## port-scheduler-policy

## Syntax

**port-scheduler-policy** *port-scheduler-policy-name*

**no port-scheduler-policy**

## Context

[\[Tree\]](#) (config>isa>aa-grp>qos>egress>to-subscriber port-scheduler-policy)

[\[Tree\]](#) (config>isa>aa-grp>qos>egress>from-subscriber port-scheduler-policy)

## Full Context

configure isa application-assurance-group qos egress to-subscriber port-scheduler-policy

configure isa application-assurance-group qos egress from-subscriber port-scheduler-policy

## Description

This command assigns an existing port scheduler policy as applicable to the specific application assurance group traffic.

## Default

no port-scheduler-policy

## Parameters

### *port-scheduler-policy-name*

Specifies the name of an existing port scheduler policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## port-scheduler-policy

## Syntax

**port-scheduler-policy** *port-scheduler-name* [ **create**]

**no port-scheduler-policy** *port-scheduler-name*

## Context

[\[Tree\]](#) (config>qos port-scheduler-policy)

## Full Context

configure qos port-scheduler-policy

## Description

When a port scheduler has been associated with an egress port, it is possible to override the following parameters:

- The max-rate allowed for the scheduler
- The maximum rate for each priority level (1 to 8)
- The cir associated with each priority level (1 to 8)

The orphan priority level (level 0) has no configuration parameters and cannot be overridden.

The **no** form of this command removes a port scheduler policy from the system. If the port scheduler policy is associated with an egress port or channel, the command will fail.

### Parameters

#### ***port-scheduler-name***

Specifies an existing port scheduler name. Each port scheduler must be uniquely named within the system and can be up to 32 ASCII characters.

### Platforms

All

## port-scheduler-policy

### Syntax

**port-scheduler-policy** *src-name dst-name* [**overwrite**]

### Context

[\[Tree\]](#) (config>qos>copy port-scheduler-policy)

### Full Context

configure qos copy port-scheduler-policy

### Description

This command copies existing QoS policy entries for a QoS policy to another QoS policy.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

If **overwrite** is not specified, an error will occur if the destination policy exists.

### Parameters

#### ***src-name dst-name***

Indicates that the source policy and the destination policy are port scheduler policy IDs. Specify the source policy that the copy command will attempt to copy from and specify the destination policy name to which the command will copy a duplicate of the policy.

#### **overwrite**

Forces the destination policy name to be copied as specified. When forced, everything in the existing destination policy will be completely overwritten with the contents of the source policy.

### Platforms

All

## 20.227 port-set

```
port-set
```

### Syntax

```
[no] port-set
```

### Context

```
[Tree] (config>service>nat>pcp-server-policy>option port-set)
```

### Full Context

```
configure service nat pcp-server-policy option port-set
```

### Description

This command enables PORT\_SET option support. When this command is disabled, the PCP uses a plain MAP option to allocate a single port at a time. This is default behavior. Instead of asking for each individual port in multiple requests through the MAP option, this **port-set** option allows individual ports to ask the SR OS for a set of ports at once in a single request.

The **no** form of this command disables PORT\_SET option support.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.228 port-state

```
port-state
```

### Syntax

```
[no] port-state
```

### Context

```
[Tree] (debug>service>id>stp port-state)
```

### Full Context

```
debug service id stp port-state
```

### Description

This command enables STP debugging for port states.

The **no** form of the command disables debugging.

## Platforms

All

## 20.229 port-template

### port-template

#### Syntax

**port-template** *template-name* **sat-type** *sat-type* [**create**]

**no port-template** *template-name*

#### Context

[\[Tree\]](#) (config>system>satellite port-template)

#### Full Context

configure system satellite port-template

#### Description

This command creates a new port template context to define the port usage for a specific satellite type. A port template is specific to the specified satellite type. Port templates must be configured separately using different template names for each different satellite chassis type.

The **no** form of this command deletes the specified port template.

#### Parameters

##### **template-name**

Specifies the name for the associated port template. This value must be unique in the network.

##### **sat-type**

Specifies the type of satellite chassis associated with the port-template.

**Values** es24-1gb-sfp, es24-1gb-tx, es24-sass-1gb-sfp, es48-1gb-sfp, es48-1gb-tx, es48-sass-1gb-sfp, es64-10gb-sfpp+4-100gb-cfp4, es24-sasmp-1gb-sfp

##### **create**

Creates a new port template.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.230 port-threshold

### port-threshold

#### Syntax

```
port-threshold value [action { dynamic-cost | static-cost | down}] [ cost static-cost]  
no port-threshold
```

#### Context

[Tree] (config>lag port-threshold)

#### Full Context

configure lag port-threshold

#### Description

This command configures the behavior for the Link Aggregation Group (LAG) if the number of operational links is equal to or below a threshold level.

Nokia recommends that operators use the **weight-threshold** or **hash-weight-threshold** command instead of the **port-threshold** command to control LAG operational status. For example, when 10GE and 100GE ports are mixed in a LAG, each 10GE port will have a weight of 1, while each 100GE port will have a weight of 10.

The **weight-threshold** or **hash-weight-threshold** command can also be used for LAGs with all ports of equal speed to allow a common operational model. For example, each port has a weight of 1 to mimic **port-threshold** and its related configuration.

The **no** form of this command reverts to the default values.

#### Default

```
port-threshold 0 action down
```

#### Parameters

##### **value**

Specifies the decimal integer threshold number of operational links for the LAG at or below which the configured action is invoked. If the number of operational links exceeds the **port-threshold** value, any action taken for being below the threshold value will cease.

**Values** 0 to 63

##### **action**

Specifies the action to take if the number of active links in the LAG is at or below the threshold value.

##### **dynamic-cost**

Specifies that dynamic costing is activated. As a result, the LAG remains operationally up with a cost relative to the number of operational links. The link is only regarded as operationally down when all links in the LAG are down.

**static-cost**

Specifies that static costing is activated. As a result, the LAG remains operationally up with the configured cost, regardless of the number of operational links. The link is only regarded as operationally down when all links in the LAG are down.

**down**

Specifies that LAG is brought operationally down if the number of operational links is equal to or less than the configured threshold value. The LAG is only regarded as up once the number of operational links exceeds the configured threshold value.

**static-cost**

Specifies decimal integer static cost of the LAG.

**Values** 1 to 16777215

**Platforms**

All

## 20.231 port-topology

### port-topology

**Syntax**

**port-topology**

**Context**

[\[Tree\]](#) (config>system port-topology)

**Full Context**

configure system port-topology

**Description**

This parameter creates or edits the context to configure intra-node port connections.

**Default**

disabled

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.232 port-type

```
port-type
```

### Syntax

```
port-type lag-port-type
```

```
no port-type
```

### Context

[\[Tree\]](#) (config>lag port-type)

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe>host>wpp portal)

### Full Context

configure service ies subscriber-interface group-interface wpp portal

configure service vprn subscriber-interface group-interface wpp portal

configure subscriber-mgmt local-user-db ipoe host wpp portal

### Description

This command specifies the web portal server that system talks to for the hosts on the group-interface. This command is mutually exclusive with the **portal-group** command.

The **no** form of this command removes the router instance or portal name from the configuration.

### Parameters

***router-instance***

Specifies the virtual router instance.

Values	router-name:	Base, management
	service-id:	1 to 2147483647
	service-name:	Specifies the service name up to 64 characters

**Default** Base

### ***wpp-portal-name***

Specifies the name of the web portal server up to 32 characters.

### **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## portal

### **Syntax**

[no] **portal router** *router-instance name wpp-portal-name*

### **Context**

[\[Tree\]](#) (config>aaa>wpp>portal-groups>portal-group portal)

### **Full Context**

configure aaa wpp portal-groups portal-group portal

### **Description**

This command configures the portal for this portal group.

### **Parameters**

#### ***router-instance***

Specifies the virtual router instance.

Values	router-name:	Base, management
	service-id:	1 to 2147483647
	service-name:	Specifies the service name up to 64 characters

**Default** Base

### ***wpp-portal-name***

Specifies the name of the web portal server up to 32 characters.

### **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## portal

### Syntax

[no] portal *wpp-portal-name*

### Context

[\[Tree\]](#) (debug>router>wpp portal)

### Full Context

debug router wpp portal

### Description

This command enables WPP debugging for the specified WPP portal.

### Parameters

***wpp-portal-name***

Specifies the WPP portal name.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## portal

### Syntax

[no] portal

### Context

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>ue-query>state portal)

### Full Context

configure subscriber-mgmt wlan-gw ue-query state portal

### Description

This command enables matching on UEs in a portal state.

The **no** form of this command disables matching on UEs in a portal state, unless all state matching is disabled.

### Default

no portal

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.237 portal-group

```
portal-group
```

### Syntax

```
portal-group portal-group-name
```

```
no portal-group
```

### Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe>host>wpp portal-group)

### Full Context

```
configure subscriber-mgmt local-user-db ipoe host wpp portal-group
```

### Description

This command configures the WPP portal group name. This command is mutually exclusive with the **portal** command.

### Parameters

***portal-group-name***

Specifies the WPP portal group name, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
portal-group
```

### Syntax

```
portal-group portal-group-name [create]
```

```
no portal-group portal-group-name
```

### Context

[\[Tree\]](#) (config>aaa>wpp>portal-groups portal-group)

### Full Context

```
configure aaa wpp portal-groups portal-group
```

## Description

This command creates a new portal group or enters the configuration context of an existing port group.

## Parameters

### *portal-group-name*

Specifies the portal group name up to 32 characters.

### **create**

Keyword required to create the configuration context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## portal-group

## Syntax

**portal-group** *portal-group-name*

**no portal-group**

## Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>wpp portal-group)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>wpp portal-group)

## Full Context

configure service vprn subscriber-interface group-interface wpp portal-group

configure service ies subscriber-interface group-interface wpp portal-group

## Description

This command specifies the WPP portal group for the subscriber interface. This command is mutually exclusive with the **portal** command.

The **no** form of this command removes the name from the service configuration.

## Parameters

### *portal-group-name*

Specifies the portal group name up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.238 portal-groups

### portal-groups

#### Syntax

**portal-groups**

#### Context

[\[Tree\]](#) (config>aaa>wpp portal-groups)

#### Full Context

configure aaa wpp portal-groups

#### Description

Commands in this context configure portal group parameters for WPP.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.239 portal-hold-time

### portal-hold-time

#### Syntax

**portal-hold-time** *seconds*

**no portal-hold-time**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>http-rdr-plcy portal-hold-time)

#### Full Context

configure subscriber-mgmt http-redirect-policy portal-hold-time

#### Description

This command configures the time for which the forwarding state applicable during redirect phase is held in the system, after the user has been authenticated on the portal. This allows the HTTP response from the portal to be forwarded back on the existing connection.

#### Parameters

*seconds*

Specifies how long the system holds on to re-direct forwarding resources of a subscriber, after it has left the re-direct portal.

**Values** 1 to 60

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.240 portals

portals

### Syntax

portals

### Context

[\[Tree\]](#) (config>router>wpp portals)

[\[Tree\]](#) (config>service>vprn>wpp portals)

### Full Context

configure router wpp portals

configure service vprn wpp portals

### Description

Commands in this context configure WPP portal server parameters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.241 ports

ports

### Syntax

ports

### Context

[\[Tree\]](#) (config>qos>fp-resource-policy ports)

### Full Context

configure qos fp-resource-policy ports

### Description

This command enters the ports context.

### Platforms

7750 SR-1, 7750 SR-s

ports

### Syntax

**ports** *num-ports*

**no ports**

### Context

[\[Tree\]](#) (config>service>nat>up-nat-policy>port-block-extensions ports)

### Full Context

configure service nat up-nat-policy port-block-extensions ports

### Description

This command configures the number of ports in extended port blocks for the NAT subscriber.

### Parameters

*num-ports*

Specifies the number of ports per extended port block.

**Values** 10 to 5000

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.242 post-policer-mapping

post-policer-mapping

### Syntax

**post-policer-mapping** *mapping-policy-name* [ **create**]

**no post-policer-mapping** *mapping-policy-name*

## Context

[\[Tree\]](#) (config>qos post-policer-mapping)

## Full Context

```
configure qos post-policer-mapping
```

## Description

This command configures a post-policer mapping policy which is used to remap a packet's forwarding class and profile state to another forwarding class and profile state for post-policer traffic.

A post-policer mapping policy is created without any forwarding class or profile remapping statements. If an empty policy is applied to a SAP-egress QoS policy, no remapping occurs.

The **no** form of this command deletes the post-policer mapping policy. A post-policer mapping policy can only be deleted if there are no references to it.

## Parameters

### *mapping-policy-name*

Specifies the name of the post-policer mapping policy, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## post-policer-mapping

## Syntax

```
post-policer-mapping src-name dst-name [ overwrite]
```

## Context

[\[Tree\]](#) (config>qos>copy post-policer-mapping)

## Full Context

```
configure qos copy post-policer-mapping
```

## Description

This command copies an existing post-policer mapping policy to another policy name.

The copy command is used to create new policies using existing policies and also allows bulk modifications to an existing policy with the use of the overwrite keyword.

## Parameters

### *src-name*

Specifies the source policy name that the copy command attempts to copy from.

### *dst-name*

Specifies the destination policy name to which the command copies a duplicate of the policy.

**overwrite**

Specifies that the existing destination policy is to be replaced. Everything in the existing destination policy is overwritten with the contents of the source policy. If **overwrite** is not specified, an error occurs if the destination policy name exists.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## post-policer-mapping

**Syntax**

**post-policer-mapping** *mapping-policy-name*

**no post-policer-mapping**

**Context**

[\[Tree\]](#) (config>qos>sap-egress post-policer-mapping)

**Full Context**

configure qos sap-egress post-policer-mapping

**Description**

This command applies a post-policer mapping policy in a SAP egress QoS policy. The policy contains forwarding class and profile remapping statements, which remap the forwarding class and profile state of an egress policed packet (the profile being the resulting profile after the packet has been processed by the egress policer) to another forwarding class and profile.

The remapping applies to all policers within the SAP egress QoS policy, including regular child policers and policers configured in an IP/IPv6 criteria action statement, except for dynamic policers.

Post-policer mapping is supported on FP3- and higher-based hardware, with the exception of the 7750 SR-a4/a8, which does not support egress policers resulting in the policy being ignored.

The **no** form of this command deletes the post-policer mapping policy from the SAP egress QoS policy.

**Parameters**

***mapping-policy-name***

Specifies the name of the post-policer mapping policy, up to 32 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## 20.243 power

```
power
```

### Syntax

```
power power-state
```

### Context

[\[Tree\]](#) (config>system>bluetooth power)

### Full Context

```
configure system bluetooth power
```

### Description

This command sets the operating mode of the Bluetooth module. This can be powered off or powered on but requires the pairing button to initiate the pairing operation, or powered on and continuously pairing.

The **pairing-button** setting also impacts how pairing operations work.

### Default

```
power off
```

### Parameters

***power-state***

Specifies the power state.

<b>Values</b>	off — Bluetooth radio disabled.
	enabled-manual — Bluetooth is enabled (pairing requires the use of the pairing button).
	enabled-automatic — Bluetooth is enabled and continuously attempts to pair whenever it is not actively paired to a device.

### Platforms

```
7750 SR-1, 7750 SR-s, 7950 XRS-20e
```

## 20.244 power-priority-level

```
power-priority-level
```

### Syntax

```
power-priority-level priority
```

## no power-priority-level

### Context

[\[Tree\]](#) (config>card>mda power-priority-level)

[\[Tree\]](#) (config>card>xiom>mda power-priority-level)

### Full Context

configure card mda power-priority-level

configure card xiom mda power-priority-level

### Description

This command sets the power priority value for an XMA or MDA-s on platforms that support intelligent power management.

### Default

power-priority-level 150

### Parameters

#### *priority*

Specifies the power priority level. An operator must assign a priority value to each XMA or MDA-s using a range of number from 1 to 200. The lowest number has the highest priority. The priority number range from 1 to 100 should be used for modules considered essential for system operation. Lower priority values of 101 to 200 should be used for non-essential modules.

**Values** 1 to 200

### Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

- configure card mda power-priority-level

7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

- configure card xiom mda power-priority-level

## 20.245 power-safety-alert

### power-safety-alert

### Syntax

**power-safety-alert** *wattage*

## Context

[\[Tree\]](#) (config>system>pwr-mgmt power-safety-alert)

## Full Context

configure system power-management power-safety-alert

## Description

This command sets a value in watts for the Power Safety Alert. The Power Safety Alert minor alarm is generated when the system power capacity drops below the Power Safety Level (in watts) plus the Power Safety Alert. This is a critical level, which when breached the system starts shutting down IO cards based on card priority.

## Parameters

### *wattage*

Specifies the number of watts for the power safety alert level.

**Values** 0 to 102600

**Default** 0

## Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## 20.246 power-safety-level

power-safety-level

## Syntax

**power-safety-level** *percent*

## Context

[\[Tree\]](#) (config>system>pwr-mgmt power-safety-level)

## Full Context

configure system power-management power-safety-level

## Description

This command sets the Power Safety Level, which is a percentage of the calculated worst case power draw value. Once a Power Safety Level is configured by the operator, both the Basic and Advanced modes use the Power Safety Level as a reference for calculating the power redundancy using N+1 algorithm during startup and recovery from power depression.

**Default**

power-safety-level 100

**Parameters*****percent***

Specifies the Power Safety Level as a percentage of the calculated worst case power draw value.

**Values** 0 to 100

**Platforms**

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## 20.247 power-save

power-save

**Syntax**

[no] power-save

**Context**

[\[Tree\]](#) (config>card power-save)

**Full Context**

configure card power-save

**Description**

This command enables power-save mode on a specific card when it is not in use. Power-save mode allows a card to be installed and configured in a platform for future use, while having minimal impact on the overall power consumption. The card placed in power-save mode is forced into an idle state to consume minimal power. This command resets the card and then disallows the download of a software image when the card comes back up. To enable power-save mode, the desired card must first be shut down, then placed into power-save mode. In this mode, the card is not counted in the intelligent power management budget. Cards set to power-save mode do not pass traffic.

The **no** form of this command removes the card from power-save mode.

**Default**

no power-save

**Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a8, 7750 SR-2e, 7750 SR-3e, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## 20.248 power-supply

### power-supply

#### Syntax

**power-supply** *power-supply-id* *type*

#### Context

[\[Tree\]](#) (config>system power-supply)

#### Full Context

configure system power-supply

#### Description

This command configures information about the type of power supply used for each power feed connection on the router chassis. The information is used to populate queries made using the **show>chassis detail** and **show>chassis power-supply** commands.

#### Parameters

##### *power-supply-id*

Specifies the power feed connection.

**Values** 1, 2

##### *type*

Specifies the type of power source that is connected to the power feed connection.

**Values** dc — Specifies that a single DC power source is connected to the power feed connector.  
ac single — Specifies that a single AC power source is connected to the power feed connector.  
ac multiple — Specifies that multiple AC power sources are connected to the power feed connector.  
default — Reverts the configured information to the default power source type for the chassis.  
none — Specifies that no power source is connected to the power feed connector.

#### Platforms

7450 ESS, 7750 SR-7/12

## 20.249 ppid

```
ppid
```

### Syntax

```
ppid
```

### Context

[\[Tree\]](#) (config>app-assure>group>statistics>tca>sctp-filter ppid)

### Full Context

```
configure application-assurance group statistics threshold-crossing-alert sctp-filter ppid
```

### Description

This command configures a TCA for the counter capturing PPID hits for the specified SCTP filter.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

```
ppid
```

### Syntax

```
ppid
```

### Context

[\[Tree\]](#) (config>app-assure>group>sctp-filter ppid)

### Full Context

```
configure application-assurance group sctp-filter ppid
```

### Description

Commands in this context configure actions for specific or default Payload Protocol Identifiers (PPIDs).

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.250 ppid-range

## ppid-range

### Syntax

**ppid-range direction** *direction* [**create**]

**no ppid-range direction** *direction*

### Context

[\[Tree\]](#) (config>app-assure>group>statistics>tca>sctp-filter ppid-range)

### Full Context

configure application-assurance group statistics threshold-crossing-alert sctp-filter ppid-range

### Description

This command configures a TCA for the counter capturing hits for the specified SCTP filter PPID range command. An PPIPD range TCA can be created for traffic generated from the subscriber side of AA ( **from-sub**) or for traffic generated from the network toward the AA subscriber (**to-sub**). The **create** keyword is mandatory when creating a TCA.

### Parameters

#### **direction**

Specifies the traffic direction.

**Values** from-sub, to-sub

#### **create**

Keyword used to create the TCA.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## ppid-range

### Syntax

**ppid-range min** *min-ppid* **max** *max-ppid*

**no ppid-range**

### Context

[\[Tree\]](#) (config>app-assure>group>sctp-filter ppid-range)

### Full Context

configure application-assurance group sctp-filter ppid-range

## Description

This command specifies the range of PPID values that are allowed by AA SCTP filter firewall. The **no** form of this command removes this PPID range.

## Default

no ppid-range

## Parameters

### *min-ppid*

Specifies the minimum SCTP Payload Protocol Identifier (PPID) to be permitted by the SCTP filter. The value must be less than or equal to the **max** *max-ppid* value.

**Values** 0 to 4294967295

### *max-ppid*

Specifies the maximum SCTP Payload Protocol Identifier (PPID) to be permitted by the SCTP filter. The value must be greater or equal to the **min** *min-ppid* value.

**Values** 0 to 4294967295

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.251 ppp

ppp

## Syntax

ppp

## Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db ppp)

## Full Context

configure subscriber-mgmt local-user-db ppp

## Description

Commands in this context configure PPP host parameters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ppp

## Syntax

ppp

## Context

## Full Context

debug router l2tp peer packet ppp

debug router l2tp group packet ppp

debug router l2tp assignment-id packet ppp

debug router l2tp packet ppp

## Description

This command selects protocol for PPP packet debugging.

The **no** form of this command disables the protocols selection for PPP packet debugging.

## Parameters

### lcp

Specifies the LCP protocol.

### pap

Specifies the PAP protocol.

### chap

Specifies the CHAP protocol.

### ipcp

Specifies the IPCP protocol.

### ipv6cp

Specifies the IPv6CP protocol.

### other

Specifies any other protocol.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

ppp

## Syntax

[no] ppp

## Context

[\[Tree\]](#) (debug>service>id ppp)

## Full Context

debug service id ppp

## Description

This command enables and configures PPP debugging.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## ppp

### Syntax

**ppp** [terminate-only]

**no ppp**

### Context

**[Tree]** (debug>service>id>ppp>event ppp)

### Full Context

debug service id ppp event ppp

### Description

This command enables debugging for PPP events.

### Parameters

**terminate-only**

Enables debugging for terminate-only PPP events.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## ppp

### Syntax

**ppp** [lcp] [pap] [chap] [ ipcp]

**no ppp**

### Context

**[Tree]** (debug>service>id>ppp>packet ppp)

### Full Context

debug service id ppp packet ppp

### Description

This command enables debugging for specific PPP packets

### Parameters

**lcp**

Enables debugging for LCP packets.

**pap**

Enables debugging for PAP packets.

**chap**

Enables debugging for CHAP packets.

**ipcp**

Enables debugging for IPCP packets.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**ppp****Syntax**

ppp

**Context**

[\[Tree\]](#) (debug>call-trace ppp)

**Full Context**

debug call-trace ppp

**Description**

Commands in this context set up call trace debugging for Point-to-Point Protocol sessions.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**ppp****Syntax**

ppp [**lcp**] [**pap**] [**chap**] [**ipcp**] [**ipv6cp**] [**ipv6**]

**Context**

[\[Tree\]](#) (debug>subscr-mgmt>vrgw>brg>pppoe-client>brg-id ppp)

**Full Context**

debug subscriber-mgmt vrgw brg pppoe-client brg-id ppp

**Description**

This command specifies which messages in PPP setup are tracked by debugging. If no messages are specified, they are all tracked. LCP Echo Request and Echo Response are never shown during debugging.

**Parameters**

**lcp**

---

<b>pap</b>	Tracks lcp messages during debugging.
<b>chap</b>	Tracks pap messages during debugging.
<b>ipcp</b>	Tracks chap messages during debugging.
<b>ipv6cp</b>	Tracks ipcp messages during debugging.
<b>ipv6</b>	Tracks ipv6cp messages during debugging.
	Tracks ipv6 messages during debugging.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.252 ppp-authentication

### ppp-authentication

**Syntax**

**ppp-authentication** {**pap** | **chap** | **pref-chap** | **pref-pap**}

**no ppp-authentication**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>ppp-policy ppp-authentication)

**Full Context**

configure subscriber-mgmt ppp-policy ppp-authentication

**Description**

This command configures the PPP protocol used to authenticate the PPP session.

**Default**

ppp-authentication pref-chap

**Parameters****pap**

Specifies to always use PAP to authenticate the sessions.

**chap**

Specifies to always use CHAP to authenticate the sessions.

**pref-chap**

Specifies to attempt to use CHAP and if it fails, use PAP.

**pref-pap**

Specifies to attempt to use PAP and if it fails, use CHAP.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.253 ppp-chap-challenge-length

### ppp-chap-challenge-length

**Syntax**

**ppp-chap-challenge-length** **min** *minimum-length* **max** *maximum-length*

**no ppp-chap-challenge-length**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>ppp-policy ppp-chap-challenge-length)

**Full Context**

configure subscriber-mgmt ppp-policy ppp-chap-challenge-length

**Description**

This command configures the minimum and maximum length of a PPP Chap Challenge.

When the Chap Challenge is exactly 16 bytes, it is send in the [60] CHAP-Challenge RADIUS attribute and copied in the RADIUS Authenticator field from the RADIUS Access Request.

**Default**

ppp-chap-challenge-length min 32 max 64

**Parameters****min** *minimum-length*

Specifies the minimum PPP CHAP challenge length.

**Values** 8 to 64

**max** *maximum-length*

Specifies the maximum PPP CHAP challenge length.

**Values** 8 to 64

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.254 ppp-initial-delay

```
ppp-initial-delay
```

**Syntax**

**[no] ppp-initial-delay**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>ppp-policy ppp-initial-delay)

**Full Context**

configure subscriber-mgmt ppp-policy ppp-initial-delay

**Description**

This command delays the sending of an LCP-configure request after the discovery phase by 40 – 60 milliseconds.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.255 ppp-mtu

```
ppp-mtu
```

**Syntax**

**ppp-mtu *mtu-bytes***

**no ppp-mtu**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>ppp-policy ppp-mtu)

**Full Context**

configure subscriber-mgmt ppp-policy ppp-mtu

**Description**

This command configures the maximum PPP MTU size.

## Parameters

### *mtu-bytes*

Specifies the maximum PPP MTU size.

**Values** 512 to 9212

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.256 ppp-options

### ppp-options

## Syntax

**ppp-options**

## Context

[\[Tree\]](#) (config>subscr-mgmt>ppp-policy ppp-options)

## Full Context

configure subscriber-mgmt ppp-policy ppp-options

## Description

Commands in this context configure PPP options.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.257 ppp-policy

### ppp-policy

## Syntax

**ppp-policy** *ppp-policy-name* [**create**]

**no ppp-policy** *ppp-policy-name*

## Context

[\[Tree\]](#) (config>subscr-mgmt ppp-policy)

## Full Context

```
configure subscriber-mgmt ppp-policy
```

## Description

This command configures a PPP policy. These policies are referenced from interfaces configured for PPP. Multiple PPP policies may be configured.

The default policy cannot be modified or deleted.

## Default

```
ppp-policy default
```

## Parameters

### *ppp-policy-name*

Specifies the PPP policy name, up to 32 characters.

### **create**

Keyword used to create the entity. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.258 ppp-policy-parameters

### ppp-policy-parameters

## Syntax

```
ppp-policy-parameters
```

## Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp>host ppp-policy-parameters)

## Full Context

```
configure subscriber-mgmt local-user-db ppp host ppp-policy-parameters
```

## Description

This command enables the context to configure PPP policy parameters to override the values from the host associated with the PPP policy.

The PPP host uses the values configured in the PPP policy under the group interface. It is possible to use this command to override the values from the host associated with the PPP policy. Matching a pattern on the subscriber MAC address to limit the number of sessions per MAC address is possible.

When a value is configured, the system overrides that particular PPP policy parameter. The absence of specific parameters means no overriding is performed.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.259 ppp-sub-id-key

### ppp-sub-id-key

#### Syntax

**ppp-sub-id-key** *sub-id-key* [*sub-id-key*]

**no ppp-sub-id-key**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>auto-sub-id-key ppp-sub-id-key)

#### Full Context

configure subscriber-mgmt auto-sub-id-key ppp-sub-id-key

#### Description

This command enables certain fields to become the base for auto-generation of default sub-id name. The sub-id name is auto-generated if there is not a more specific method available. Examples of these specific methods would be a default sub-id name as a sap-id, a preconfigured static string or explicit mappings based on RADIUS/LUDB returned strings.

In case that a more specific sub-id name generation method is not available and the **auto-id** keyword is defined under the def-sub-id hierarchy, the sub-id name is generated by concatenating fields defined in this command separated by a "|" character.

The maximum length of the auto-generated sub-id name is 64 characters while the concatenation of subscriber identification fields can exceed 64 characters. Subscriber host instantiation fails if the sub-id name is based on subscriber identification fields whose concatenated length exceeds 64 characters. Failing the host creation rather than truncating the sub-id name on a 64 character boundary prevents collision of sub-ids (subscriber name duplication).

In case that a more specific sub-id name generation method is not available and the **auto-id** keyword is not defined under the def-sub-id hierarchy, the sub-id name is a random 10 character encoded string based on the fields defined under this command.

There is only one set of identification fields allowed per host type (IPoE or PPP) per chassis.

The **no** form of this command reverts to the default.

#### Default

ppp-sub-id-key mac sap-id session-id

## Parameters

### *sub-id-key*

Specifies the auto-generated sub-id keys for PPP hosts.

**Values** **mac** — Specifies that the MAC address can be combined with other subscriber host identification fields (circuit-id, remote-id, session-id or sap-id) to form a sub-id name in a user readable format or as a random 10 character encoded value.

In case that the mac address is used as a concatenation field in the sub-id name, then its format becomes a string xx:xx:xx:xx:xx:xx with the length 17B.

The MAC address as the subscriber host identification field is not applicable to static hosts.

**circuit-id** — Specifies that the circuit-id can be combined with other subscriber host identification fields (mac, remote-id, session-id or sap-id) to form a sub-id name in a user readable format or as a random 10 character encoded value.

If the circuit-id is used as a concatenation field in the sub-id name, then its format becomes access-node-id eth slot/port:[vlan-id] or access-node-id atm slot/port:vpi.vci with a variable length.

**Note:**

If circuit-id contains any non-printable ASCII characters, the entire circuit-id string is formatted in hex in the sub-id name output. Otherwise all characters in circuit-id is converted to ASCII. ASCII printable characters contain bytes in range 0x20 to 0x7E.

If the circuit-id is used as the subscriber identification field is not applicable to ARP hosts or static hosts.

**remote-id** — Specifies that the remote-id can be combined with other subscriber host identification fields (mac, circuit-id, session-id or sap-id) to form a sub-id name in a user readable format or as a random 10 character encoded value.

If the remote-id is used as a concatenation field in the sub-id name, then its format becomes a remote-id string with a variable length.

**Note:**

If the remote ID contains any non-printable ASCII characters, the entire remote-id string is formatted in hex in the sub-id name output. Otherwise all characters in remote-id is converted to ASCII. ASCII printable characters contain bytes in range 0x20 to 0x7E.

The remote ID as the subscriber identification field is not applicable to ARP hosts or static hosts.

**sap-id** — The SAP ID can be combined with other subscriber host identification fields (mac, circuit-id, remote-id, or session-id) to form a

sub-id name in a user readable format or as a random 10 character encoded value.

In case that the circuit-id is used as a concatenation field in the sub-id name, then its format becomes: slot/mda:[outer-vlan].[inner-vlan] with a variable length.

The SAP ID as the subscriber identification field is applicable to all hosts types with exception of static hosts.

**session-id** — The session ID can be combined with other subscriber host identification fields (mac, circuit-id, remote-id, or sap-id) to form a sub-id name in a user readable format or as a random 10 character encoded value.

In case that the circuit ID is used as a concatenation field in the sub-id name, then its format becomes a decimal number with variable length.

The session ID as the subscriber identification field is applicable only to PPPoE/PPPoEoA type hosts.

## 20.260 ppp-user-db

### ppp-user-db

#### Syntax

**ppp-user-db** *local-user-db-name*

**no ppp-user-db**

#### Context

[\[Tree\]](#) (config>service>vpls ppp-user-db)

#### Full Context

configure service vpls ppp-user-db

#### Description

This command enabled access to LUDB for PPPoE and PPPoEoA v4 and v6 hosts under the capture SAP. The name of this local user database must match the name of local user database configured under the **config>service>vprn/ies>sub-if>grp-if>pppoe** hierarchy.

The **no** form of this command reverts to the default.

#### Parameters

*local-user-db*

Specifies the name of the local-user-database, up to 256 characters.

## Platforms

All

## 20.261 ppp-user-name

### ppp-user-name

#### Syntax

**ppp-user-name append** *domain-name*

**ppp-user-name default-domain** *domain-name*

**ppp-user-name replace** *domain-name*

**ppp-user-name strip**

**no ppp-user-name**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>auth-plcy ppp-user-name)

#### Full Context

configure subscriber-mgmt authentication-policy ppp-user-name

#### Description

This command specifies the domain name manipulation action to perform on the PAP/CHAP user name prior to authentication.

The **no** form of this command reverts to the default.

#### Default

The PAP/CHAP user name is not changed.

#### Parameters

##### **append** *domain-name*

Appends an "@" delimiter followed by the specified *domain-name* to the PAP/CHAP user name, independent if a domain name is already present.

##### **default-domain** *domain-name*

Appends an "@" delimiter followed by the specified *domain-name* to the PAP/CHAP user name only if a domain name is not already present.

##### **replace** *domain-name*

Replaces the string after the "@" delimiter in the PAP/CHAP user name with the specified *domain-name*.

**strip**

Removes the "@" delimiter and all subsequent characters from the PAP/CHAP user name.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.262 pppoe

**pppoe****Syntax**

[no] pppoe

**Context**

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if pppoe)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if pppoe)

**Full Context**

configure service vprn subscriber-interface group-interface pppoe

configure service ies subscriber-interface group-interface pppoe

**Description**

Commands in this context configure PPPoE parameters.

The **no** form of this command reverts all PPPoE parameters from the PPPoE context to their defaults.

**Default**

pppoe

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**pppoe****Syntax**

pppoe *type* direction {ingress | egress} script *name*

no pppoe *type* direction {ingress | egress}

**Context**

[\[Tree\]](#) (config>python>py-policy pppoe)

## Full Context

configure python python-policy pppoe

## Description

This command specifies the python-script for the specified PPPoE message type in the specified direction. Multiple **pppoe** command configuration are allowed in the same Python policy.

The **no** form of this command reverts to the default.

## Parameters

### *type*

Specifies the message type.

**Values** session-lcp, session-pap, session-chap, session-ipcp, session-ip6cp, pado, padi, padr, pads, padt

### *direction {ingress | egress}*

Specifies whether the event is incoming or outgoing. The system only invokes the configured script for the specified packet type in the specified direction.

### *script*

Specifies the name of the Python script, up to 32 characters, that is used to handle the specified message.

## Platforms

All

## pppoe

## Syntax

**pppoe** *service-id*

**no pppoe**

## Context

**[Tree]** (config>service>vprn>if>sap>fwd-wholesale pppoe)

**[Tree]** (config>service>vprn>sub-if>grp-if>sap>fwd-wholesale pppoe)

## Full Context

configure service vprn interface sap fwd-wholesale pppoe

configure service vprn subscriber-interface group-interface sap fwd-wholesale pppoe

## Description

This command specifies that PPPoE packets on ingress on Ethertypes 0x8863 and 0x8864 are redirected to the specified service. The service referred to by *svc-id* must be an Epipe service. Redirection to VC-switching Epipe services is not supported.

The **no** form of this command removes the redirect.

### Parameters

#### *service-id*

Specifies the service ID of the Epipe to which packets are redirected.

**Values** 1 to 2147483647 | *svc-name* up to 64 characters

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service ies interface sap fwd-wholesale pppoe

### Description

This command specifies that PPPoE packets on ingress on Ethertypes 0x8863 and 0x8864 will be redirected to the specified service. The service referred to by *svc-id* must be an Epipe service. Redirection to VC-switching Epipe services is not supported.

The **no** form of this command removes the redirect.

### Parameters

#### *service-id*

Specifies the service ID of the Epipe to which packets are redirected.

**Values** 1 to 2147483647 | *svc-name* up to 64 characters

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## pppoe

### Syntax

**pppoe** *origin*

### Context

[\[Tree\]](#) (config>li>x-interfaces>correlation-id pppoe)

### Full Context

configure li x-interfaces correlation-id pppoe

### Description

This command specifies the type of RADIUS accounting session ID to use for PPPoE subscriber correlation.

### Default

host

### Parameters

*origin*

Specifies the correlation identifiers origin for PPPoE.

**Values** host, queue, session

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.263 pppoe-access-method

## pppoe-access-method

### Syntax

**pppoe-access-method** {none | padi | pap-chap}

**no pppoe-access-method**

### Context

[\[Tree\]](#) (config>subscr-mgmt>auth-plcy pppoe-access-method)

### Full Context

configure subscriber-mgmt authentication-policy pppoe-access-method

## Description

This command indicates the authentication method used towards the RADIUS server in case the policy is used for PPPoE.

The **no** form of this command reverts to the default.

## Parameters

### **none**

Indicates that the client is authenticated by the local user database defined under the group interface and not through RADIUS.

### **padi**

Indicates that the client is authenticated by RADIUS as soon as the PADI packet comes in (there is no PPP authentication done in the session in this case).

### **pap-chap**

Indicates that the RADIUS authentication of the client is delayed until the authentication protocol phase in the PPP session (PAP or CHAP) and authentication is performed with the user name and PAP password / CHAP response supplied by the client.

configure subscriber-mgmt sla-profile session-limits pppoe-overall

configure subscriber-mgmt sub-profile session-limits pppoe-overall

## Description

This command configures the maximum number of PPPoE sessions per SLA profile instance or per subscriber.

The **no** form of this command removes the maximum number of PPPoE sessions limit.

## Parameters

### *max-nr-of-sessions*

Specifies the maximum number of PPPoE sessions.

**Values** 0 to 131071

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.269 pppoe-policy

```
pppoe-policy
```

### Syntax

```
pppoe-policy pppoe-policy-name  
no pppoe-policy
```

### Context

[\[Tree\]](#) (config>service>vpls>sap pppoe-policy)

### Full Context

```
configure service vpls sap pppoe-policy
```

### Description

This command references a pppoe-policy that defines session parameters (ppp-mtu, authentication options, and so on) during the session initiation phase. Normally, the PPPoE policy is referenced under the **group-interface** hierarchy. But with capture SAP is it not known at the session initiation phase to which group-interface the session belongs. This is why, with the capture SAP, the ppp-policy must be referenced directly under the capture SAP. The pppoe-policy referenced under the group-interface must be the same as the pppoe-policy referenced under the capture SAP. Otherwise the session will not come up.

The **no** form of this command reverts to the default.

### Parameters

***pppoe-policy-name***  
Specifies the pppoe-policy name up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.270 pppoe-python-policy

### Context

[[Tree](#)] (debug>call-trace>ppp pppoe-trace)

### Full Context

debug call-trace ppp pppoe-trace

### Description

This command enables tracing locally terminated or LAC PPPoE sessions specified by the configured parameters. At least one filter rule must be provisioned. This command can trace a single session or multiple sessions, and can use wildcard characters.

This command can be executed multiple times to start multiple traces. When rules overlap, such as for a wildcard SAP and a specific SAP, the rule that a specific trace is associated with cannot be guaranteed.

The **no** form of this command prevents new traces from being configured and terminates all trace jobs that were previously started using the **trace** command.

### Parameters

#### **circuit-id**

Specifies a circuit ID, up to 255 characters, that is used to filter sessions to trace.

#### **ieee-address**

Specifies a MAC address that is used to identify a session to trace, in the format "ab:cd:ef:01:23:45". A wildcard character can be used to match all remaining octets; for example, the format "ab:cd:ef:\*" can be used to filter by OUI.

#### **user-name**

Specifies a username, up to 32 characters, that is used to filter sessions to trace. A wildcard character (\*) can be used at the beginning and at the end of the filter.

**num**

Specifies the maximum number of jobs that may be started with this rule.

**Values** 1 to 50

**Default** 1

**remote-id**

Specifies a remote ID, up to 255 characters, that is used to filter sessions to trace.

**sap-id**

Specifies a SAP to trace. The following formats are accepted:

- *port/lag/pw-port:svlan.cvlan*
- *port/lag/pw-port:vlan*
- *port/lag/pw-port*
- *port/lag/pw-port:vlan.\**
- *port/lag/pw-port:\** (also matches \*.\*).

**trace-existing-sessions**

Specifies that existing PPPoE sessions are traced. If this parameter is not included, only new PPPoE sessions are traced.

**trace-name**

Specifies the name, up to 32 characters, by which the trace is referenced.

**trace-profile-name**

Specifies the name of the trace profile to be applied, up to 32 characters. The default parameters are used if a trace profile is not specified.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.273 pppoe-user-db

### pppoe-user-db

**Syntax**

**pppoe-user-db** *local-user-db-name*

**no pppoe-user-db**

**Context**

[\[Tree\]](#) (config>service>vpls pppoe-user-db)

## Full Context

```
configure service vpls pppoe-user-db
```

## Description

This command enabled access to LUDB for PPPoE and PPPoEoA v4 and v6 hosts under the capture SAP. The name of this LUDB must match the name of the LUDB configured under the **config>service>vprn/ies>sub-if>grp-if>pppoe** hierarchy.

The **no** form of this command reverts to the default.

## Parameters

### *local-user-db*

Specifies the name of the local user database, up to 256 characters.

## Platforms

All

```
pppoe-user-db
```

## Syntax

```
pppoe-user-db ludb-name
```

```
no pppoe-user-db
```

## Context

[\[Tree\]](#) (config>service>vpls>sap pppoe-user-db)

## Full Context

```
configure service vpls sap pppoe-user-db
```

## Description

This command enables LUDB authentication on capture SAPs for PPPoE(oA) clients. If this command is configured along with the **authentication-policy** command (RADIUS authentication), then the authentication-policy command takes precedence.

The **no** form of this command reverts to the default.

## Parameters

### *ludb-name*

Specifies the name of the local user database up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.274 pptp

```
pptp
```

### Syntax

```
[no] pptp
```

### Context

```
[Tree] (config>service>nat>up-nat-policy>alg pptp)
```

```
[Tree] (config>service>nat>nat-policy>alg pptp)
```

### Full Context

```
configure service nat up-nat-policy alg pptp
```

```
configure service nat nat-policy alg pptp
```

### Description

This command enables PPTP ALG.

The call-id is captured in the outgoing call management messages and along with the source IP address and the source TCP, is translated by NAT. Once the PPTP call is established, the call-id in the associated GRE packet in the incoming direction (from outside to inside) is correspondingly translated so that it matches the call-id mapping established during the call establishment phase. The call IDs used in the mappings are selected randomly and they try to honor parity (odds/even).

A PPTP session can be initiated only from the inside of NAT.

GRE traffic is allowed through NAT only if the corresponding mapping exists. This mapping is created during the call negotiation phase.

There can be seven calls (GRE tunnels) per control session.

### Default

```
no pptp
```

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.275 pre-auth-policy

```
pre-auth-policy
```

### Syntax

```
pre-auth-policy policy-name
```

## no pre-auth-policy

### Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp>host pre-auth-policy)

### Full Context

configure subscriber-mgmt local-user-db ppp host pre-auth-policy

### Description

This command configures the RADIUS pre-authentication policy to use to authenticate the PPP host.

The **no** form of this command reverts to the default.

### Parameters

*policy-name*

Specifies the pre-authentication policy of the host, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.276 pre-login-message

### pre-login-message

### Syntax

**pre-login-message** *login-text-string* [**name**]

**no pre-login-message**

### Context

[\[Tree\]](#) (config>system>login-control pre-login-message)

### Full Context

configure system login-control pre-login-message

### Description

This command creates a message displayed prior to console login attempts on the console via Telnet.

Only one message can be configured. If multiple **pre-login-messages** are configured, the last message entered overwrites the previous entry.

It is possible to add the name parameter to an existing message without affecting the current **pre-login-message**.

The **no** form of this command removes the message.

## Default

no pre-login-message

## Parameters

### *login-text-string*

Specifies the login text string up to 900 characters. Any printable, 7-bit ASCII characters can be used. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. Some special characters can be used to format the message text. The \n character can be used to create multi-line messages. A \n in the message moves to the beginning of the next line by sending ASCII/UTF-8 chars 0xA (LF) and 0xD (CR) to the client terminal. A \r in the message sends the ASCII/UTF-8 char 0xD (CR) to the client terminal.

### **name**

When this keyword is specified, the configured system name is always displayed first in the login message. To remove the name from the login message, the message must be cleared and a new message entered without the name.

## 20.277 pre-shared-key

### pre-shared-key

## Syntax

**pre-shared-key** *pre-shared-key-index* [**encryption-type** *encryption-type*] [**create**]

**no pre-shared-key** *pre-shared-key-index*

## Context

[\[Tree\]](#) (config>macsec>conn-assoc>static-cak pre-shared-key)

## Full Context

configure macsec connectivity-association static-cak pre-shared-key

## Description

This command specifies the pre-shared key used to enable MACsec using static connectivity association key (CAK) security mode. This command also specifies the encryption algorithm used for encrypting the SAK.

A pre-shared key includes a connectivity association key name (CKN) and a connectivity association key (CAK). The pre-shared key-the CKN and CAK-must match on both ends of a link.

A pre-shared key is configured on both devices at each end of point-to-point link to enable MACsec using static CAK security mode. The MACsec Key Agreement (MKA) protocol is enabled after the successful MKA liveliness negotiation.

The encryption-type is used for encrypting the SAK and authenticating the MKA packet. The symmetric encryption key SAK (Security Association Key) needs to be encrypted (wrapped) via the MKA protocols. The AES key is derived via pre-shared-key.

The **no** form of this command removes the index.

## Parameters

### *pre-shared-key-index*

Specifies the index of this pre-shared-key.

**Values** 1, 2

### *encryption-type*

Specifies the type of encryption.

**Values** aes-128-cmac, aes-256-cmac

### **create**

Mandatory to create an entry.

## Platforms

## pre-shared-key

## Syntax

**pre-shared-key** *key* [**hash** | **hash2** | **custom**]

**no pre-shared-key**

## Context

[\[Tree\]](#) (config>ipsec>client-db>client>credential pre-shared-key)

## Full Context

configure ipsec client-db client credential pre-shared-key

## Description

This command specifies a pre-shared key used to authenticate peers.

The **no** form of this command reverts to the default.

## Default

no pre-shared-key

## Parameters

### **key**

An ASCII string to use as the pre-shared key for dynamic keying. When the **hash** or **hash2** parameters are not used, the key is a clear text key; otherwise, the key text is encrypted.

### **hash**

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### **hash2**

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### **custom**

Specifies the custom encryption to management interface.

## 20.279 prec

```
prec
```

### Syntax

```
prec ip-prec-value [fc fc-name] [priority {high | low}]
```

```
no prec ip-prec-value
```

### Context

[\[Tree\]](#) (config>qos>sap-ingress prec)

### Full Context

```
configure qos sap-ingress prec
```

### Description

This command explicitly sets the forwarding class or enqueueing priority when a packet is marked with an IP precedence value ( *ip-prec-value* ). Adding an IP precedence rule on the policy forces packets that match the specified *ip-prec-value* to override the forwarding class and enqueueing priority based on the parameters included in the IP precedence rule.

When the forwarding class is not specified in the rule, a matching packet preserves (or inherits) the existing forwarding class derived from earlier matches in the classification hierarchy.

When the enqueueing priority is not specified in the rule, a matching packet preserves (or inherits) the existing enqueueing priority derived from earlier matches in the classification hierarchy.

The *ip-prec-value* is derived from the most significant three bits in the IP header ToS byte field (precedence bits). The three precedence bits define eight Class-of-Service (CoS) values commonly used to map packets to per-hop Quality of Service (QoS) behavior. The precedence bits are also part of the DiffServ Code Point (DSCP) method of mapping packets to QoS behavior. The DSCP uses the most significant six bits in the IP header ToS byte and so overlaps with the precedence bits. Both IP precedence and DSCP classification rules are supported. DSCP rules have a higher match priority than IP precedence rules and where a *dscp-name* DSCP value overlaps an *ip-prec-value*, the DSCP rule takes precedence.

The **no** form of this command removes the explicit IP precedence classification rule from the SAP ingress policy. Removing the rule on the policy immediately removes the rule on all ingress SAPs using the policy.

### Parameters

#### *ip-prec-value*

The *ip-prec-value* is a required parameter that specifies the unique IP header ToS byte precedence bits value that will match the IP precedence rule. If the command is executed more than once with the same *ip-prec-value*, the previous forwarding class and enqueueing priority is completely overridden by the new parameters or defined to be inherited when a forwarding class or enqueueing priority parameter is missing.

A maximum of eight IP precedence rules are allowed on a single policy.

The precedence is evaluated from the lowest to highest value.

**Values** 0 to 7

### **fc** *fc-name*

The value given for the *fc-name* parameter must be one of the predefined forwarding classes in the system. Specifying the *fc-name* is optional. When a packet matches the rule, the forwarding class is only overridden when the **fc** *fc-name* parameter is defined on the rule. If the packet matches and the forwarding class is not explicitly defined in the rule, the forwarding class is inherited based on previous rule matches.

The *subclass-name* parameter is optional and used with the *fc-name* parameter to define a pre-existing subclass. The *fc-name* and *subclass-name* parameters must be separated by a period (.). If *subclass-name* does not exist in the context of *fc-name*, an error will occur. If *subclass-name* is removed using the **no fc** *fc-name.subclass-name* **force** command, the **default-fc** command will automatically drop the *subclass-name* and only use *fc-name* (the parent forwarding class for the subclass) as the forwarding class.

#### **Values**

fc: *class[.subclass]*

*class*: be, l2, af, l1, h2, ef, h1, nc

*subclass*: 29 characters max

**Default** Inherit (When **fc** is not defined, the rule preserves the previous forwarding class of the packet.)

### **priority**

The priority parameter overrides the default enqueueing priority for all packets received on an ingress SAP using this policy that match this rule. Specifying the priority is optional. When a packet matches the rule, the enqueueing priority is only overridden when the priority parameter is defined on the rule. If the packet matches and priority is not explicitly defined in the rule, the enqueueing priority is inherited based on previous rule matches.

**Values** high, low

**Default** Inherits the priority defined by the default-priority statement.

### **high**

This parameter is used in conjunction with the **priority** parameter. Setting the enqueueing parameter to **high** for a packet increases the likelihood of enqueueing the packet when the ingress queue is congested. Ingress enqueueing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueueing priority is lost.

### **low**

This parameter is used in conjunction with the **priority** parameter. Setting the enqueueing parameter to **low** for a packet decreases the likelihood of enqueueing the packet when the ingress queue is congested. Ingress enqueueing priority only affects ingress SAP queuing. When the packet is placed in a buffer on the ingress queue, the significance of the enqueueing priority is lost.

## Platforms

## prec

## Syntax

```
prec {ip-prec-value | in-profile ip-prec-value out-profile ip-prec-value [exceed-profile ip-prec-value]}  
no prec
```

## Context

[\[Tree\]](#) (config>qos>sap-egress>fc prec)

## Full Context

```
configure qos sap-egress fc prec
```

## Description

This command defines a value to be used for remarking packets for the specified FC. If the optional in/out/exceed-profile is specified, the command will remark different IP precedence values depending on whether the packet was classified to be in, exceed, or out-of-profile. All inplus-profile traffic is marked with the same value as in-profile traffic.

## Parameters

### *ip-prec-value*

This parameter specifies the IP precedence to be used to remark all traffic.

**Values** 0 to 7

### **exceed-profile** *ip-prec-value*

This optional parameter specifies the IP precedence to be used to remark traffic that is exceed-profile. If not specified, this defaults to the same value configured for the **out-profile** parameter.

**Values** 0 to 7

### **in-profile** *ip-prec-value*

This parameter specifies the IP precedence to be used to remark traffic that is in-profile.

**Values** 0 to 7

### **out-profile** *ip-prec-value*

This parameter specifies the IP precedence to be used to remark traffic that is out-of-profile.

**Values** 0 to 7

## Platforms

## prec

## Syntax

```
prec ip-prec-value [fc fc-name] [profile {in | out | exceed | inplus}]
```

```
no prec ip-prec-value
```

## Context

[\[Tree\]](#) (config>qos>sap-egress prec)

## Full Context

```
configure qos sap-egress prec
```

## Description

This command defines a specific IP precedence value that must be matched to perform the associated reclassification actions. If an egress packet on the SAP matches the specified IP precedence value, the forwarding class, or profile behavior may be overridden. By default, the forwarding class and profile of the packet is derived from ingress classification and profiling functions.

The IP precedence bits used to match against precedence reclassification rules come from the Type of Service (ToS) field within the IPv4 header. If the packet does not have an IPv4 header, precedence-based matching is not performed.

The reclassification actions from a precedence reclassification rule may be overridden by a DSCP or IP flow matching event.

The **fc** keyword is optional. When specified, the egress classification rule will overwrite the forwarding class derived from ingress. The new forwarding class is used for egress remarking and queue mapping decisions. If a DSCP, ipv6-criteria, or ip-criteria match occurs after the IP precedence match, the new forwarding class may be overridden by the higher priority match actions. If the higher priority match actions do not specify a new fc, the fc from the IP precedence match will be used.

The **profile** keyword is optional. When specified, the egress classification rule will overwrite the profile of the packet derived from ingress. The new profile value is used for egress remarking and queue congestion behavior. If a DSCP, IPv6 criteria, or IP criteria match occurs after the IP precedence match, the new profile may be overridden by the higher priority match actions. If the higher priority match actions do not specify a new profile, the profile from the IP precedence match will be used.

The **no** form of this command removes the reclassification rule from the SAP egress QoS policy.

## Parameters

### fc *fc-name*

This keyword is optional. When specified, packets matching the IP precedence value will be explicitly reclassified to the forwarding class specified as *fc-name* regardless of the ingress classification decision. The explicit forwarding class reclassification may be overwritten by a higher priority DSCP, IPv6 criteria, or IP criteria reclassification match. The FC name defined must be one of the eight forwarding classes supported by the system. To

remove the forwarding class reclassification action for the specified precedence value, the **prec** command must be re-executed without the **fc** parameter defined.

**Values** be, l1, af, l2, h1, ef, h2 or nc

### **profile {in | out | exceed | inplus}**

This keyword is optional. When specified, packets matching the IP precedence value will be explicitly reclassified to the specified profile regardless of the ingress profiling decision. The explicit profile reclassification may be overwritten by a higher priority DSCP, IPv6 criteria, or IP criteria reclassification match. To remove the profile reclassification action for the specified precedence value, the **prec** command must be re-executed without the **profile** parameter defined.

#### **in**

Specifies that any packets matching the reclassification rule will be treated as in-profile by the egress forwarding plane.

#### **out**

Specifies that any packets matching the reclassification rule will be treated as out-of-profile by the egress forwarding plane.

#### **exceed**

Specifies that any packets matching the reclassification rule will be treated as exceed-profile by the egress forwarding plane.

#### **inplus**

Specifies that any packets matching the reclassification rule will be treated as inplus-profile by the egress forwarding plane.

## **Platforms**

All

## **prec**

## **Syntax**

**prec** *ip-prec-value* **fc** *fc-name* **profile** {**in** | **out** | **exceed** | **inplus**}

**no prec** *ip-prec-value*

## **Context**

**[Tree]** (config>qos>network>egress prec)

## **Full Context**

configure qos network egress prec

## **Description**

This command defines a specific IP precedence value that must be matched in order to perform the associated reclassification actions. If an egress packet on an IES/VP RN interface spoke SDP, on a CSC

network interface in a VPRN, or network interface that the network QoS policy is applied to, matches the specified IP precedence value, the forwarding class and profile may be overridden.

By default, the forwarding class and profile of the packet is derived from ingress classification and profiling functions.

The IP precedence bits used to match against the reclassification rules come from the Type of Service (ToS) field within the IPv4 header or the Traffic Class field from the IPv6 header. If the packet does not have an IP header, IP precedence-based matching is not performed.

The configuration of egress prec classification and the configuration of an egress IP criteria or IPv6 criteria entry statement within a network QoS policy are mutually exclusive.

The IP precedence-based and DSCP-based reclassification are supported on a network interface, on a CSC network interface in a VPRN, and on a PW used in an IES or VPRN spoke interface.

This command will block the application of a network QoS policy with the egress reclassification commands to a spoke SDP part of a Layer 2 service. Conversely, this command will not allow the user to add the egress reclassification commands to a network QoS policy if it is being used by a Layer 2 spoke SDP.

The egress reclassification commands will only take effect if the redirection of the spoke SDP or CSC interface to use an egress port queue-group succeeds. For example, the following commands will succeed:

```

-
  config>service>vprn>if>
spoke-sdp>egress>qos network-policy-id port-redirect-
group
  queue-group-name instance instance-id
- config>service>ies>if>spoke-
sdp>
egress>qos network-policy-id port-redirect-group queue-group-
name
instance instance-id
- config>service>vprn>nw-if> qos network-policy-id port-redirect-
group
queue-group-name instance instance-id

```

When the redirection command fails in CLI, the PW will use the network QoS policy assigned to the network IP interface; however, any reclassification in the network QoS policy applied to the network interface will be ignored.

The **no** form of this command removes the egress reclassification rule.

## Parameters

### ***ip-prec-value***

0 to 7

### ***fc fc-name***

be, l2, af, l1, h2, ef, h1, nc

### ***profile {in | out | exceed | inplus}***

The profile reclassification action is mandatory. When specified, packets matching the IP precedence value will be explicitly reclassified to the profile specified regardless of the ingress profiling decision. To remove the profile reclassification action for the specified IP precedence value, the **no prec** command must be executed.

This value may be overwritten by an explicit profile action in an DSCP reclassification match.

**in** - Specifies that any packets matching the reclassification rule will be treated as in-profile by the egress forwarding plane.

**out** - Specifies that any packets matching the reclassification rule will be treated as out-of-profile by the egress forwarding plane.

**exceed** - Specifies that any packets matching the reclassification rule will be treated as exceed-profile by the egress forwarding plane.

**inplus** - Specifies that any packets matching the reclassification rule will be treated as inplus-profile by the egress forwarding plane.

**Values** 1 to 4

#### *primary*

Assigns this as the primary spoke-SDP

### Platforms

All

## precedence

### Syntax

**precedence** {*precedence-value* | **primary**}

**no precedence**

### Context

[\[Tree\]](#) (config>mirror>mirror-dest>spoke-sdp precedence)

### Full Context

configure mirror mirror-dest spoke-sdp precedence

### Description

This command indicates that the SDP is of type secondary with a specific precedence value or of type primary.

The mirror or LI service always uses the primary type as the active pseudowire and only switches to a secondary pseudowire when the primary is down. The mirror service switches the path back to the primary pseudowire when it is back up. The user can configure a timer to delay reverting back to primary or to never revert back.

If the active pseudowire goes down, the mirror service switches the path to a secondary sdp with the lowest precedence value. That is, secondary SDPs which are operationally up are considered in the order of their precedence value, 1 being the lowest value and 4 being the highest value. If the precedence value is the same, then the SDP with the lowest SDP ID is selected.

An explicitly named endpoint can have a maximum of one SAP and one ICB. Once a SAP is added to the endpoint, only one more object of type ICB SDP is allowed. An explicitly named endpoint, which does not have a SAP object, can have a maximum of four SDPs, which can include any of the following: a single primary SDP, one or many secondary SDPs with precedence, and a single ICB SDP.

An SDP is created with type secondary and with the lowest precedence value of 4.

## Parameters

### *precedence-value*

Specifies the precedence of the SDP.

**Values** 1 to 4

### *primary*

Specified that a special value of the precedence which assigns the SDP the lowest precedence and enables the revertive behavior.

```
configure service vprn subscriber-interface group-interface srrp preempt
```

```
configure service ies subscriber-interface group-interface srrp preempt
```

## Description

When preempt is enabled, a newly initiated SRRP instance can override an existing Master SRRP instance if its priority value is higher than the priority of the current Master.

If preempt is disabled, an SRRP instance only becomes Master if the master down timer expires before an SRRP advertisement message is received from the adjacent SRRP enabled node.

The **no** form of this command reverts to the default.

**Default**

preempt

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
preempt
```

**Syntax**

[no] preempt

**Context**

[\[Tree\]](#) (config>service>ies>if>ipv6>vrrp preempt)

**Full Context**

configure service ies interface ipv6 vrrp preempt

**Description**

The preempt mode value controls whether a specific backup virtual router preempts a lower priority master.

When preempt is enabled, the virtual router instance overrides any non-owner master with an "in use" message priority value less than the virtual router instance in-use priority value. If preempt is disabled, the virtual router only becomes master if the master down timer expires before a VRRP advertisement message is received from another virtual router.

The IP address owner will always become master when available. Preempt mode cannot be disabled on the owner virtual router.

The **no** form of this command disables preempt mode.

**Default**

preempt

**Platforms**

All

```
preempt
```

**Syntax**

[no] preempt

**Context**

[\[Tree\]](#) (config>service>ies>if>vrrp preempt)

## Full Context

```
configure service ies interface vrrp preempt
```

## Description

The preempt command provides the ability of overriding an existing non-owner master to the virtual router instance. Enabling preempt mode is almost required for proper operation of the base-priority and vrrp-policy-id definitions on the virtual router instance. If the virtual router cannot preempt an existing non-owner master, the effect of the dynamic changing of the in-use priority is greatly diminished.

The preempt command is only available in the non-owner vrrp virtual-router-id nodal context. The owner may not be preempted due to the fact that the priority of non-owners can never be higher than the owner. The owner will always preempt all other virtual routers when it is available.

Non-owner virtual router instances will only preempt when preempt is set and the current master has an in-use message priority value less than the virtual router instances in-use priority.

A master non-owner virtual router will only allow itself to be preempted when the incoming VRRP Advertisement message Priority field value is one of the following:

- Greater than the virtual router in-use priority value
- Equal to the in-use priority value and the source IP address (primary IP address) is greater than the virtual router instance primary IP address

The **no** form of this command prevents a non-owner virtual router instance from preempting another, less desirable virtual router. Use the preempt command to restore the default mode.

## Default

```

```
configure service vprn interface ipv6 vrrp preempt
```

## Description

The preempt mode value controls whether a specific backup virtual router preempts a lower priority master.

When preempt is enabled, the virtual router instance overrides any non-owner master with an "in use" message priority value less than the virtual router instance in-use priority value. If preempt is disabled, the virtual router only becomes master if the master down timer expires before a VRRP advertisement message is received from another virtual router.

The IP address owner will always become master when available. Preempt mode cannot be disabled on the owner virtual router.

The default value for preempt mode is enabled.

## 20.282 preemption-timer

```
preemption-timer
```

### Syntax

```
preemption-timer seconds
```

```
no preemption-timer
```

### Context

```
[Tree] (config>router>rsvp preemption-timer)
```

### Full Context

```
configure router rsvp preemption-timer
```

### Description

This parameter configures the time in seconds a node holds to a reservation for which it triggered the soft preemption procedure.

The preempting node starts a separate preemption timer for each preempted LSP path. While this timer is on, the node should continue to refresh the Path and Resv for the preempted LSP paths. When the preemption timer expires, the node tears down the reservation if the head-end node has not already done so.

A value of zero means the LSP should be preempted immediately; hard preempted.

The **no** form of this command reverts to the default value.

### Default

```
preemption-timer 300
```

### Parameters

***seconds***

Specifies the time (in s), of the preemption timer.

**Values** 0 to 1800 seconds

## prefer-local-time

### Syntax

[no] prefer-local-time

### Context

[\[Tree\]](#) (config>system>time prefer-local-time)

### Full Context

configure system time prefer-local-time

### Description

This command sets the preference to use local or UTC time in the system. This preference is applied to objects such as log file names, created and completed times reported in log files, NETCONF and gRPC date-and-time leafs, and rollback times displayed in **show** routines.

#### Note:

The operator may force the timezone used for **show** outputs during a CLI session using an environment variable in the **environment>time-display {utc | local}** command.

**Note:**

The preference for CLI output is set with the **environment time-display** command.

**Note:**

The format used for the date-time strings may change when the **prefer-local-time** option is enabled. For example, when enabled, all date-time strings include a suffix of three to five characters that indicates the timezone used for the presentation. This suffix may not be present if the option is not enabled.

**Note:**

The time format for timestamps on log events is controlled on a per-log basis using the **config> log>log-id>time-format {utc | local}** CLI command and not via **prefer-local-time**.

The **no** form of this command indicates preference for UTC time.

**Default**

no prefer-local-time

```

### Context

[\[Tree\]](#) (config>router>ldp prefer-tunnel-in-tunnel)

### Full Context

```
configure router ldp prefer-tunnel-in-tunnel
```

## Description

This command specifies to use tunnel-in-tunnel over a simple LDP tunnel. Specifically, the user packets for LDP FECs learned over this targeted LDP session can be sent inside an RSVP LSP which terminates on the same egress router as the destination of the targeted LDP session. The user can specify an explicit list of RSVP LSP tunnels under the Targeted LDP session or LDP will perform a lookup in the Tunnel Table Manager (TTM) for the best RSVP LSP. In the former case, only the specified LSPs will be considered to tunnel LDP user packets. In the latter case, all LSPs available to the TTM and which terminate on the same egress router as this targeted LDP session will be considered. In both cases, the metric specified under the LSP configuration is used to control this selection.

The lookup in the TTM will prefer a LDP tunnel over an LDP-over-RSVP tunnel if both are available. Also, the tunneling operates on the dataplane only. Control packets of this targeted LDP session are sent over the IGP path.

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>channel preference)

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>channel>source-override preference)

### Full Context

configure mcast-management multicast-info-policy bundle preference

configure mcast-management multicast-info-policy bundle channel preference

configure mcast-management multicast-info-policy bundle channel source-override preference

### Description

This command sets the relative preference level for multicast channels. The preference of a channel specifies its relative importance over other multicast channels. Eight levels of preference are supported; 0 through 7. Preference value 7 indicates the highest preference level.

When the multicast ingress path manager is congested on one or more of the switch fabric multicast paths, it uses the preference values associated with each multicast record to determine which records are allowed on the path and which records be placed in a black-hole state.

The preference value is also compared to the bundles **cong-priority-threshold** setting to determine the congestion priority of the channel. The result also dictates the channels multicast CAC class level (high or low). When the channels preference value is less than the congestion priority threshold, it is considered to have a congestion priority and CAC class value equal to low. When the channels preference value is equal to or greater than the threshold, it is considered to have a congestion priority and a CAC class value equal to high.

The preference value is also compared to the bundles **ecmp-opt-threshold** setting to determine whether the channel is eligible for ECMP path dynamic optimization. If the preference value is equal to or less than the threshold, the channel may be optimized. If the preference value is greater than the threshold, the channel will not be dynamically optimized.

The preference command may be executed in three contexts; bundle, channel and source-override. The bundle default preference value is 0. The channel and **source-override** preference settings are considered overrides to the bundle setting and have a default value of null (undefined).

The **no** form of this command restores the default preference value (0 or null depending on the context).

## Parameters

### *preference-level*

The preference-level parameter is required and defines the preference value of the channel.

**Values** 1 to 7

Bundle default:	0
Channel default:	Null (undefined)
Source-override default:	Null (undefined)

Override sequence — The channel setting overrides the bundle setting. The **source-override** setting overrides the channel and bundle settings.

### Syntax

**preference** *preference*

**no preference**

### Context

[\[Tree\]](#) (config>service>vprn>isis>level preference)

### Full Context

configure service vprn isis level preference

### Description

This command configures the preference level of either IS-IS Level 1 or IS-IS Level 2 internal routes. By default, the preferences are listed in the table below.

A route can be learned by the router by different protocols, in which case, the costs are not comparable. When this occurs, the preference is used to decide to which route will be used.

Different protocols should not be configured with the same preference, if this occurs the tiebreaker is per the default preference table as defined in the table below. If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used. If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision what route to use is determined by the configuration of the **ecmp** in the config>router context.

## Default

Default preferences are listed in [Table 90: Default Preferences](#).

Table 90: Default Preferences

Route Type	Preference	Configurable
Direct attached	0	No

[\[Tree\]](#) (config>router>ospf3 preference)

## Full Context

configure router ospf preference

configure router ospf3 preference

## Description

This command configures the preference for OSPF internal routes.

A route can be learned by the router from different protocols, in which case, the costs are not comparable. When this occurs, the preference is used to decide which route will be used.

Different protocols should not be configured with the same preference, if this occurs the tiebreaker is per the default preference table as defined in [Table 94: Route Preference Defaults by Route Type](#) . If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used.

If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision of what route to use is determined by the configuration of the **ecmp** in the **config>router** context.

The **no** form of this command reverts to the default value.

<sup>7</sup> External preferences are changed using the external-preference command in the **config>router>isis>level** *level-number* context.

**Default**

preference 10

**Parameters*****preference***

Specifies the preference for internal routes expressed as a decimal integer. Defaults for different route types are listed in [Table 94: Route Preference Defaults by Route Type](#) .

*Table 94: Route Preference Defaults by Route Type*

Route Type	Preference	Configurable
Direct attached	0	No

### Full Context

configure router isis loopfree-alternates multi-homed-prefix preference  
configure router ospf loopfree-alternates multi-homed-prefix preference

### Description

This command configures the preference for the multihomed prefix LFA backup path. This knob can be enabled at a LFA computing node to force the programming of the multihomed prefix LFA backup path which, in some topologies, can avoid transiting using the best ABR or ASBR.

The **no** form of this command reverts to the default value.

### Default

preference none

### Parameters

#### *none*

Specifies the preference for an LFA, TI-LFA, or RLFA backup path over the multihomed prefix LFA backup path. The multihomed prefix LFA is only programmed in cases where the prefix is not protected by LFA, RLFA, or TI-LFA.

#### *all*

Specifies the forced programming of the multihomed prefix LFA backup path regardless of the outcome of the LFA, TI-LFA, or RLFA backup path computation.

```

## Description

This command configures the preference for RIP routes.

A route can be learned by the router from different protocols in which case the costs are not comparable. When this occurs, the preference is used to decide which route will be used.

Different protocols should not be configured with the same preference, if this occurs the tiebreaker is per the default preference table as defined in [Table 95: Route Preference Defaults by Route Type](#) . If multiple routes are learned with an identical preference using the same protocol, the lowest cost route is used.

If multiple routes are learned with an identical preference using the same protocol and the costs (metrics) are equal, then the decision of what route to use is determined by the configuration of the **ecmp** in the **config>router** context.

The **no** form of the command reverts to the default value.

## Default

```
preference 100
```

## Parameters

### *preference*

Specifies the preference for RIP routes expressed as a decimal integer. Defaults for different route types are listed in [Table 95: Route Preference Defaults by Route Type](#) .

*Table 95: Route Preference Defaults by Route Type*

Route Type	Preference	Configurable
Direct attached	0	—
Static routes	5	Yes
OSPF internal	10	Yes
IS-IS level 1 internal	15	Yes
IS-IS level 2 internal	18	Yes
RIP	100	Yes

IS-IS level 2 external	165	Yes
BGP	170	Yes

**Values** 0 to 255

## Platforms

All

## preference

## Syntax

**preference** *preference*

## Context

**[Tree]** (conf>router>segment-routing>sr-policies>policy preference)

## Full Context

configure router segment-routing sr-policies static-policy preference

## Description

This command associates a preference value with a statically defined-segment routing policy. This is an optional parameter.

When there are multiple policies for the same (color, endpoint) combination that are targeted for local installation, only one is selected as the active path for the (color, endpoint). In this selection process (which considers both static local policies and BGP signaled policies), the policy with the highest preference value is preferred over all policies with a lower preference value.

The **no** form of this command reverts to the default value.

## Default

preference 100

## Parameters

***preference***

Specifies the preference ID.

**Values** 0 to 4294967295

## Platforms

All

## preference

### Syntax

**preference** *preference*

**no preference**

### Context

**[Tree]** (config>router>policy-options>policy-statement>name>default-action preference)

**[Tree]** (config>router>policy-options>policy-statement>entry>action preference)

### Full Context

configure router policy-options policy-statement name default-action preference

configure router policy-options policy-statement entry action preference

### Description

This command assigns a route preference to routes matching the route policy statement entry.

If no preference is specified, the default Route Table Manager (RTM) preference for the protocol is used.

The **no** form of this command disables setting an RTM preference in the route policy entry.

#### Note:

This command is supported with the following protocols: RIP import, BGP import, VPRN VRF import ( **vrf-import**), and VPRN GRT lookup export ( **export-grt**).

### Default

no preference

### Parameters

***preference***

Specifies the route preference expressed as a decimal integer.

**Values** 1 to 255 (0 represents unset - MIB only)

*name* — The preference parameter variable name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must start and end with at-signs (@); for example, "@variable@".

## 20.290 preferred

```
preferred
```

### Syntax

[no] preferred

### Context

[\[Tree\]](#) (config>isa>nat-group>inter-chassis-redundancy preferred)

### Full Context

```
configure isa nat-group inter-chassis-redundancy preferred
```

### Description

This command sets the preference for activity of a **nat-group** in stateful inter-chassis redundancy configuration if both nodes have equal health. An example of where this can be useful is in a load balancing environment where the activity of NAT groups can be distributed between the two redundant nodes.

A **nat-group** with **preferred** command configured on a node that freshly became part of multi-chassis redundancy, takes over activity from an existing and traffic-serving node with equal health that does not have the **preferred** command configured. This causes a switchover and a brief interruption in traffic flow.

By default the preferred status is not set for the node.

The **no** form of this command reverts to the default.

### Default

no preferred

[\[Tree\]](#) (config>service>vprn>dhcp6>server>pool prefix)

### Full Context

configure router dhcp6 local-dhcp-server pool prefix

configure service vprn dhcp6 local-dhcp-server pool prefix

### Description

This command allocates a prefix to a pool from which Prefix Delegation prefixes and or WAN addresses can be assigned for DHCP6.

The **no** form of this command removes the prefix parameters from the configuration.

**Default**

prefix failover local

**Parameters*****prefix ipv6-addr/prefix-length***

Specifies the prefix.

<b>Values</b>		
	ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:d.d.d.d
		x [0 to FFFF]H
		d [0 to 255]D
	prefix-length	1 to 128

**failover {local | remote | access-driven}**

This command designates a prefix as local, remote, or access-driven. This is used when multi-chassis synchronization is enabled.

**Values** **local** — An IPv6 prefix designated as local is used for new lease grants or to renew the existing lease grants. Local prefix designation should be always paired with the remote designation of the same prefix on the peering node.

The IPv6 prefix configured as local on one node can only be configured as remote on the other node. No other combination is allowed between the two nodes for an IPv6 prefix that is configured as local.

The DHCPv6 relay could point to both IPv6 DHCP server addresses — the one hosting the local IPv6 prefix and the one hosting the corresponding remote IPv6 prefix. Under normal circumstances the new lease will always be allocated from the local IPv6 prefix while the leases can be renewed from either IPv6 prefix (local or remote). Under network failure, the remote IPv6 prefix can be taken over according to the intercommunication link state transitions and associated timers.

**remote** — A prefix designated as remote is used only to renew the existing DHCP leases. The new leases are assigned from it only after the **maximum-client-lead-time** and **partner-down-delay** *time* elapses.

To ensure faster takeover, the partner-down-delay can be set to 0 and the MCLT time can be ignored. Extra caution should be exercised when enabling this mode of operation, as described in the configuration guides.

The IPv6 prefix configured as remote on one node can only be configured as local on the other node. No other combination is allowed between the two nodes for an IP address ranges that is configured as remote.

**access-driven** — A prefix designated as access-driven is like local (a new prefix assignment as well as a renewal). However, as the prefix is shared between the redundant server pair, the following additional conditions should be met to avoid duplicate address allocations:

- A dual home access protection mechanism such as SRRP or MC-LAG must ensure a single active path from the DHCP client to the server.
- The DHCP relay should point to the local server only.

### ***pd***

Specifies that this aggregate is used by IPv6 ESM hosts for DHCPv6 prefix-delegation.

### **wan-host**

Specifies that this aggregate is used by IPv6 ESM hosts for local addressing or by a routing gateway's WAN interface.

### **create**

Keyword used to create the prefix configuration. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## **Platforms**

**[Tree]** (config>service>ies>sub-if>ipv6>sub-pfx prefix)

## Full Context

configure service vprn subscriber-interface ipv6 subscriber-prefixes prefix

configure service ies subscriber-interface ipv6 subscriber-prefixes prefix

## Description

This command allows a list of prefixes (using the prefix command multiple times) to be routed to hosts associated with this subscriber interface. Each prefix is represented in the associated FDB with a reference to the subscriber interface. Prefixes are defined as being for prefix delegation (pd) or use on a WAN interface or host (wan-host).

The **no** form of this command reverts to the default.

## Parameters

### *ipv6-address*

Specifies the 128-bit IPv6 address.

**Values** 128-bit hexadecimal IPv6 address in compressed form

### *prefix-length*

Specifies the length of any associated aggregate prefix.

**Values** 32 to 63

### **pd**

Specifies that this aggregate is used by IPv6 ESM hosts for DHCPv6 prefix-delegation.

**wan-host**

Specifies that this aggregate is used by IPv6 ESM hosts for local addressing or by a routing gateway's WAN interface.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service vpls bgp-ad vsi-id prefix

**Description**

This command specifies the low-order 4 bytes used to compose the Virtual Switch Instance Identifier (VSI-ID) to use for NLRI in BGP auto-discovery in this VPLS service.

If no value is set, the system IP address will be used.

**Default**

no prefix

**Parameters*****low-order-vsi-id***

Specifies a unique VSI ID

**Values** 0— 4294967295

**Platforms**

All

**prefix****Syntax**

**[no] prefix** *ip-prefix|prefix-length*

## Context

[\[Tree\]](#) (config>service>vprn>bgp>group>dynamic-neighbor>match prefix)

## Full Context

configure service vprn bgp group dynamic-neighbor match prefix

## Description

This command configures a prefix to accept dynamic BGP sessions (sessions from source IP addresses not matching any configured neighbor addresses). A dynamic session is associated with the group having the longest match prefix entry for the source IP address of the peer. The group association determines local parameters that apply to the session, including the local AS, the local IP address, the MP-BGP families, the import and export policies, and so on.

The **no** form of this command removes a prefix entry.

## Parameters

### *ip-prefix/prefix-length*

Specifies a prefix from which to accept dynamic BGP sessions.

**Values**

- ipv4-prefix* — a.b.c.d (host bits must be 0)
- ipv4-prefix-length* — 0 to 32
- ipv6-prefix* — x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x — [0 to FFFF]H
- d — [0 to 255]D
- ipv6-prefix-length* — 0 to 128

## Platforms

All

## prefix

## Syntax

**[no] prefix** *ipv6-prefix/prefix-length*

## Context

[\[Tree\]](#) (config>service>vprn>router-advert>if prefix)

## Full Context

configure service vprn router-advertisement interface prefix

## Description

This command configures an IPv6 prefix in the router advertisement messages. To support multiple IPv6 prefixes, use multiple prefix statements. No prefix is advertised until explicitly configured using prefix statements.

## Parameters

### *ipv6-prefix*

Specifies the IP prefix for prefix list entry in dotted decimal notation.

Values		
ipv4-prefix	a.b.c.d	(host bits must be 0)
ipv4-prefix-length	0 to 32	
ipv6-prefix	x:x:x:x:x:x:x	(eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d	
	x: [0 to FFFF]H	
	d: [0 to 255]D	
ipv6-prefix-length	0 to 128	

### *prefix-length*

Specifies a route must match the most significant bits and have a prefix length.

**Values** 1 to 128

## Platforms

All

prefix

## Syntax

**prefix** *prefix-string*

**no prefix**

## Context

[\[Tree\]](#) (config>app-assure>group>cflowd>export-override prefix)

## Full Context

configure application-assurance group cflowd export-override prefix

## Description

This command specifies the *prefix-string* associated with the **export-override**.

## Parameters

### *prefix-string*

Specifies a prefix string, up to eight characters. If the eight-character prefix is "ABCDEFG\_" for a particular node, the cflowd export override would generate IPv4 interface names such as ABCDEF\_255.255.255.255 or IPv6 as ABCDEF\_2001:DB8:EF01:2345::/64. By default the prefix will be left blank.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## prefix

## Syntax

**prefix** *ip-prefix/ip-prefix-length* [**name** *prefix-name*]

**no prefix** *ip-prefix/ip-prefix-length*

## Context

[\[Tree\]](#) (config>app-assure>group>ip-prefix-list prefix)

## Full Context

configure application-assurance group ip-prefix-list prefix

## Description

This command configures an IP prefix within the list.

The **no** form of this command removes the IP prefix from the configuration.

## Parameters

### *ip-prefix/ip-prefix-length*

The IP address in dotted decimal notation.

#### Values

<i>ipv4-prefix</i>	<i>a.b.c.d</i> (host bits must be 0)
<i>ipv4-prefix-length</i>	0 to 32
<i>ipv6-prefix</i>	<i>x:x:x:x:x:x:x</i> (eight 16-bit pieces)
	<i>x:x:x:x:x:d.d.d.d</i>
	<i>x:</i> [0 to FFFF]H
	<i>d:</i> [0 to 255]D
<i>prefix-name</i>	up to 32 characters

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## prefix

## Syntax

**prefix** *ipv6-prefix/prefix-length*

**no prefix**

## Context

**[Tree]** (config>service>vprn>nat>inside>nat64 prefix)

**[Tree]** (config>router>nat>inside>nat64 prefix)

## Full Context

configure service vprn nat inside nat64 prefix

configure router nat inside nat64 prefix

## Description

This command configures the IPv6 prefix used to derive the IPv6 address from the IPv4 address, and is same as the prefix used by DNS64 to generate AAAA record returned for IPv4 endpoint resolution. NAT64 node announces this prefix in routing to attract traffic from IPv6 hosts. If the prefix is not configured, then a well-known prefix, 64:FF9B::/96, is used.

The **no** form of the command removes the prefix from the NAT64 configuration.

## Parameters

### *ipv6-prefix/prefix-length*

Specifies the NAT64 destination prefix.

Values	ipv6-prefix:	x::x::x::x::x::x (eight 16-bit pieces)
		x::x::x::x::x::x:d.d.d.d
		x - [0..FFFF]H
		d - [0..255]D
	prefix-length	32, 40, 48, 56, 64, 96

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## prefix

### Syntax

**prefix** *ip-prefix/length* [**nat-policy** *nat-policy-name*]

**no prefix** *ip-prefix/length*

### Context

**[Tree]** (config>service>nat>nat-prefix-list prefix)

### Full Context

configure service nat nat-prefix-list prefix

### Description

This command creates a prefix entry in the nat-prefix-list.

This prefix can be used to identify traffic with specific destination IP that needs to be associated with corresponding nat-policy (and implicitly the NAT pool) for L2-aware subscribers. In this fashion, a single L2-aware subscriber can direct traffic to multiple NAT pools, depending on the traffic destination.

Another use for a prefix is in DNAT-only application (DNAT without SNAPT). In this case the prefix identifies the inside source IP range that will be explicitly configured to ensure proper downstream routing in dNAT-only case.

The nat-prefix-list cannot reference the default nat-policy (the one that is referenced in the subscriber-profile).

The **no** form of the command reverts to the default.

### Parameters

#### *ip-prefix/length*

Specifies the IP prefix for nat prefix list entry in dotted decimal notation.

**Values** *ip-prefix*: a.b.c.d (host bits must be 0) *ipv4-prefix-length*: 0 to 32

#### **nat-policy** *nat-policy-name*

Specifies the NAT policy name. Allowed values are any string up to 32 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes..

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## prefix

### Syntax

**prefix** *prefix/prefix-length* [ **create**]

**no prefix** *prefix/prefix-length*

## Context

**[Tree]** (config>service>vprn>firewall>domain prefix)

**[Tree]** (config>router>firewall>domain prefix)

## Full Context

configure service vprn firewall domain prefix

configure router firewall domain prefix

## Description

This command specifies a prefix for which firewall functionality will apply within the domain. Prefixes cannot be shared or duplicated across multiple domains in the same routing context. A domain can contain multiple prefixes.

The **no** form of the command removes the prefix from the domain.

## Parameters

### create

Mandatory keyword used when creating a prefix entry.

### *prefix/prefix-length*

Specifies the prefix.

**Values** *prefix* — x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x — 0 to FFFF (in hexadecimal)

d — 0 to 255 (in decimal)

*prefix-length* — 1 to 64

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## prefix

## Syntax

**prefix** *ip-address*

**no prefix**

## Context

**[Tree]** (config>router>bier>template>sub-domain prefix)

## Full Context

configure router bier template sub-domain prefix

## Description

This command specifies the prefix used for BFR. The prefix should be an IPv4 /32 address. The prefix can be a loopback interface or system IP address.

The **no** form of this command removes the prefix.

## Parameters

### *ip-address*

Specifies the IP address to be used as the BFR prefix in dotted decimal format.

## Platforms

All

## prefix

## Syntax

**prefix** *ip-prefix/prefix-length* [**create**]

**no prefix** *ip-prefix/prefix-length*

## Context

[\[Tree\]](#) (config>test-oam>twamp>server prefix)

## Full Context

configure test-oam twamp server prefix

## Description

This command configures an IP address prefix containing one or more TWAMP clients. For a TWAMP client to connect to the TWAMP server (and subsequently conduct tests) it must establish the control connection using an IP address that is part of a configured prefix.

## Parameters

### *ip-prefix/prefix-length*

Specifies an IPv4 or IPv6 address prefix.

#### Values

ipv4-prefix:	a.b.c.d (host bits must be 0)
ipv4-prefix-le:	0 to 32
ipv6-prefix:	x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
x:	[0 to FFFF]H
d:	[0 to 255]D

ipv6-prefix-le: 0 to 128

### **prefix length**

Specifies the prefix length.

**Values** 0 to 128

### **create**

Creates a prefix instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## prefix

## **Syntax**

**prefix** *ip-prefix/prefix-length* [**create**]

**no prefix** *ip-prefix/prefix-length*

## **Context**

**[Tree]** (config>router>twamp-light>reflector prefix)

**[Tree]** (config>service>vprn>twamp-light>reflector prefix)

## **Full Context**

configure router twamp-light reflector prefix

configure service vprn twamp-light reflector prefix

## **Description**

This command defines which TWAMP Light packet prefixes the reflector processes.

The **no** form of this command with the specific prefix removes the accepted source.

## **Parameters**

### ***ip-prefix/prefix-length***

Specifies the IPv4 or IPv6 address and length.

#### **Values**

ipv4-prefix: a.b.c.d (host bits must be 0)

ipv4-prefix-le: 0 to 32

ipv6-prefix: x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

ipv6-prefix-le: 0 to 128

### create

Creates a prefix instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## prefix

### Syntax

[no] **prefix** *ip-prefix/prefix-length*

### Context

[\[Tree\]](#) (config>qos>match-list>ip-prefix-list prefix)

### Full Context

```
configure qos match-list ip-prefix-list prefix
```

### Description

This command adds an IPv4 address prefix to an existing IPv4 address prefix match list.

To add a set of unique prefixes, execute the command with all unique prefixes. The prefixes are allowed to overlap IPv4 address space.

An IPv4 prefix addition will be blocked, if resource exhaustion is detected anywhere in the system because of QoS Policies that use this IPv4 address prefix list.

The **no** form of this command deletes the specified prefix from the list.

### Parameters

#### *ip-prefix*

A valid IPv4 address prefix in dotted decimal notation.

**Values** 0.0.0.0 to 255.255.255.255 (host bit must be 0)

#### *prefix-length*

Length of the entered IP prefix

**Values** 1 to 32

### Platforms

All

## prefix

### Syntax

[no] **prefix** *ipv6-prefix/prefix-length*

### Context

**[Tree]** (config>qos>match-list>ipv6-prefix-list prefix)

### Full Context

configure qos match-list ipv6-prefix-list prefix

### Description

This command adds an IPv6 address prefix to an existing IPv6 address prefix match list.

To add set of unique prefixes, execute the command with all unique prefixes. The prefixes are allowed to overlap IPv6 address space.

An IPv6 prefix addition will be blocked if resource exhaustion is detected anywhere in the system because of QoS Policies that use this IPv6 address prefix list.

The **no** form of this command deletes the specified prefix from the list.

### Parameters

#### *ipv6-prefix*

Specifies the IPv6 prefix for the IP match criterion in hex digits.

**Values** ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x: [0 to FFFF]H  
d: [0 to 255]D

#### *prefix-length*

Specifies the IPv6 prefix length for the IPv6 address expressed as a decimal integer.

**Values** 1 to 128

### Platforms

All

## prefix

### Syntax

[no] **prefix** *ip-prefix/prefix-length*

## Context

[\[Tree\]](#) (config>filter>match-list>ip-prefix-list prefix)

## Full Context

configure filter match-list ip-prefix-list prefix

## Description

This command adds an IPv4 address prefix to an existing IPv4 address prefix match list.

The **no** form of this command deletes the specified prefix from the list.

### Operational Notes:

To add set of unique prefixes, execute the command with all unique prefixes. The prefixes are allowed to overlap IPv4 address space.

An IPv4 prefix addition will be blocked, if resource exhaustion is detected anywhere in the system because of filter policies that use this IPv4 address prefix list.

## Parameters

### *ip-prefix*

Specifies a valid IPv4 address prefix in dotted decimal notation.

**Values** 0.0.0.0 to 255.255.255.255 (host bit must be 0)

### *prefix-length*

Specifies the length of the entered IPv4 prefix.

**Values** 0 to 32

## Platforms

All

prefix

## Syntax

[no] prefix *ipv6-prefix/prefix-length*

## Context

[\[Tree\]](#) (config>filter>match-list>ipv6-prefix-list prefix)

## Full Context

configure filter match-list ipv6-prefix-list prefix

## Description

This command adds an IPv6 address prefix to an existing IPv6 address prefix match list.

The **no** form of this command deletes the specified prefix from the list.

**Operational Notes:**

To add set of different prefixes, execute the command with all unique prefixes. The prefixes are allowed to overlap IPv6 address space.

An IPv6 prefix addition will be blocked, if resource exhaustion is detected anywhere in the system because of filter policies that use this IPv6 address prefix list.

**Parameters*****ipv6-prefix/prefix-length***

Specifies an IPv6 address prefix written as hexadecimal numbers separated by colons with host bits set to 0. One string of zeros can be omitted, so 2001:db8::700:0:217A is equivalent to 2001:db8:0:0:0:700:0:217A.

**Values** x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x: [0..FFFF]H  
d: [0..255]D

***prefix-length***

Specifies the length of the entered IPv6 prefix.

**Values** 1 to 128

**Platforms**

All

**prefix****Syntax**

[no] **prefix** *ipv6-prefix|prefix-length*

**Context**

**[Tree]** (config>router>router-advert>if prefix)

**Full Context**

configure router router-advertisement interface prefix

**Description**

This command configures an IPv6 prefix in the router advertisement messages. To support multiple IPv6 prefixes, use multiple prefix statements. No prefix is advertised until explicitly configured using prefix statements.

**Parameters*****ipv6-prefix***

The IP prefix for prefix list entry in dotted decimal notation.

Values			
	ipv6-prefix	x:x:x:x:x:x:x (eight 16-bit pieces)	
		x:x:x:x:x:d.d.d	
		x:	[0 to FFFF]H
		d:	[0 to 255]D
	ipv6-prefix-length	0 to 128	

**prefix-length**

Specifies a route must match the most significant bits and have a prefix length.

**Values** 1 to 128

**Platforms**

All

**prefix****Syntax**

[no] prefix *ip-prefix/ip-prefix-length*

**Context**

[\[Tree\]](#) (config>router>bgp>group>dynamic-neighbor>match prefix)

**Full Context**

configure router bgp group dynamic-neighbor match prefix

**Description**

This command configures a prefix to accept dynamic BGP sessions (sessions from source IP addresses not matching any configured neighbor addresses). A dynamic session is associated with the group having the longest match prefix entry for the source IP address of the peer. The group association determines local parameters that apply to the session, including the local AS, the local IP address, the MP-BGP families, the import and export policies, and so on.

The **no** form of this command removes a prefix entry.

**Parameters*****ip-prefix/ip-prefix-length***

Specifies a prefix from which to accept dynamic BGP sessions.

**Values** *ipv4-prefix* — a.b.c.d (host bits must be 0)  
*ipv4-prefix-length* — 0 to 32  
*ipv6-prefix* — x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d  
 x — [0 to FFFF]H  
 d — [0 to 255]D  
*ipv6-prefix-length* — 0 to 128

## Platforms

All

## prefix

## Syntax

[no] **prefix** *ip-prefix/prefix-length* [**exact** | **longer** | **through** *length* | **prefix-length-range** *length1-length2* | **to** *ip-prefix/prefix-length* | **address-mask** *mask-pattern*]

## Context

[\[Tree\]](#) (config>router>policy-options>prefix-list prefix)

## Full Context

configure router policy-options prefix-list prefix

## Description

This command creates a prefix entry in the route policy prefix list.

The **no** form of this command deletes the prefix entry from the prefix list.

## Parameters

### *ip-prefix/prefix-length*

Specifies the IP prefix and length for the prefix list entry in dotted decimal notation.

**Values**

ipv4-prefix:

- a.b.c.d (host bits must be 0)

ipv4-prefix-length: [0 to 32]

ipv6-prefix:

- x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

ipv6-prefix-length: [0 to 128]

### **exact**

Specifies the prefix list entry only matches the route with the specified *ip-prefix* and prefix *mask* (length) values.

**longer**

Specifies the prefix list entry matches any route that matches the specified *ip-prefix* and prefix *mask* length values equal to or greater than the specified mask.

**through *length***

Specifies the prefix list entry matches any route that matches the specified ip-prefix and has a prefix length between the specified *length* values inclusive.

**Values** 0 to 32

**prefix-length-range *length1* - *length2***

Specifies a route must match the most significant bits and have a prefix length with the given range. The range is inclusive of start and end values.

**Values** 0 to 32, *length2* > *length1*

**to *ip-prefix/prefix-length***

Specifies a second IP prefix and length used in route policy prefix lists. A route matches prefix1 to prefix2 if it matches prefix1 and prefix2 according to their respective prefix lengths and if the route's own prefix length is between the prefix lengths of prefix1 and prefix2. It could take many individual 'exact' match prefix entries to reproduce the same logic.

***mask-pattern***

Specifies the address mask to use for matching entries to this prefix entry. A route matches a prefix and address mask combination if the bitwise logical AND of this prefix and the mask equals the bitwise logical AND of the route's address and the same mask and, additionally, the prefix length of the route matches the prefix length of the prefix entry.

**Values** ipv4-address:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

## prefix-delegation

### Syntax

**[no] prefix-delegation**

### Context

**[Tree]** (config>service>ies>if>ipv6>dhcp6-server prefix-delegation)

### Full Context

configure service ies interface ipv6 dhcp6-server prefix-delegation

### Description

This command enables the prefix delegation options for delegating a long-lived prefix from a delegating router to a requesting router, where the delegating router does not require knowledge about the topology of the links in the network to which the prefixes are assigned.

The **no** form of this command disables prefix-delegation.

### Platforms

All

## 20.295 prefix-exclude

## prefix-exclude

### Syntax

**prefix-exclude** *policy-name* [*policy-name*]

**no prefix-exclude**

### Context

**[Tree]** (config>router>ldp>aggregate-prefix-match prefix-exclude)

### Full Context

configure router ldp aggregate-prefix-match prefix-exclude

### Description

This command specifies the policy name containing the prefixes to be excluded from the aggregate prefix match procedures. In this case, LDP will perform an exact match of a specific FEC element prefix as opposed to a longest match of one or more LDP FEC element prefixes, against this prefix when it receives a FEC-label binding or when a change to this prefix occurs in the routing table.

The **no** form of this command removes all policies from the configuration.

## Default

no prefix-exclude

## Parameters

### *policy-name*

Specifies the route policy name, up to five. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

The specified name(s) must already be defined.

## Platforms

All

## prefix-exclude

## Syntax

## 20.298 prefix-list

### prefix-list

#### Syntax

**prefix-list** *name* [{**all** | **none** | **any**}]

**no prefix-list** [*name*] [{**all** | **none** | **any**}]

#### Context

**[Tree]** (config>service>vprn>static-route-entry>black-hole prefix-list)

**[Tree]** (config>service>vprn>static-route-entry>indirect prefix-list)

**[Tree]** (config>service>vprn>static-route-entry>next-hop prefix-list)

#### Full Context

configure service vprn static-route-entry black-hole prefix-list

configure service vprn static-route-entry indirect prefix-list

configure service vprn static-route-entry next-hop prefix-list

#### Description

This command associates a new constraint to the associated static route such that the static route is only active if **any**, **none**, or **all** of the routes in the prefix list are present and active in the route-table.

#### Default

no prefix-list

#### Parameters

##### *name*

Specifies the name of a currently configured prefix-list.

##### **all**

Specifies that the static route condition is met if all prefixes in the prefix-list must be present in the active static route.

##### **none**

Specifies that the static route condition is met if none of the prefixes in the named prefix-list can be present in the active static route.

##### **any**

Specifies that the static route condition is met if any prefixes in the prefix-list are present in the active static route.

## Platforms

All

## prefix-list

### Syntax

**prefix-list** *prefix-list-name* [{**all** | **none**}]

**no prefix-list** [*prefix-list-name*] [{**all** | **none**}]

### Context

**[Tree]** (config>router>static-route-entry>black-hole prefix-list)

**[Tree]** (config>router>static-route-entry>indirect prefix-list)

**[Tree]** (config>router>static-route-entry>next-hop prefix-list)

### Full Context

configure router static-route-entry black-hole prefix-list

configure router static-route-entry indirect prefix-list

configure router static-route-entry next-hop prefix-list

### Description

This command associates a new constraint to the associated static route such that the static route is only active if **none** or **all** of the routes in the prefix list are present and active in the route-table.

### Default

no prefix-list

### Parameters

#### *prefix-list-name*

Specifies the name of a currently configured prefix-list.

#### **all**

Specifies that the static route condition is met if all prefixes in the prefix-list must be present in the active route-table.

#### **none**

Specifies that the static route condition is met if none of the prefixes in the named prefix-list can be present in the active route-table.

## Platforms

All

## prefix-list

### Syntax

**[no] prefix-list** *name*

### Context

**[Tree]** (config>router>policy-options prefix-list)

### Full Context

configure router policy-options prefix-list

### Description

This command creates a context to configure a prefix list to use in route policy entries.

The **no** form of this command deletes the named prefix list.

### Parameters

#### *name*

Specifies the prefix list name. Allowed values are any string up to 64 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must be enclosed by at-signs (@) and may be midstring; for example, "@variable@", "start@variable@end", "@variable@end", or "start@variable@".

An empty prefix list can be configured for pre-provisioning. This empty prefix list will not find a match when referred to by a policy. When removing member prefixes from a prefix list, the prefix list will not be automatically removed when the last member is removed. If required, an empty prefix list must be explicitly removed using the **no** form of this command.

### Platforms

## prefix-list

### Syntax

**prefix-list** *name* [*name*]

**no prefix-list**

### Context

**[Tree]** (config>router>policy-options>policy-statement>entry>to prefix-list)

**[Tree]** (config>router>policy-options>policy-statement>entry>from prefix-list)

### Full Context

configure router policy-options policy-statement entry to prefix-list

configure router policy-options policy-statement entry from prefix-list

### Description

This command configures a prefix list as a match criterion for a route policy statement entry.

If no prefix list is specified, any network prefix is considered a match.

An empty prefix list will evaluate as if 'no match' was found.

The prefix lists specify the network prefix (this includes the prefix and length) a specific policy entry applies.

A maximum of 28 prefix names can be specified.

The **no** form of this command removes the prefix list match criterion.

### Default

no prefix-list

### Parameters

#### *name*

Specifies the prefix list name. Allowed values are any string up to 64 characters composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. Policy parameters must be enclosed by at-signs (@) and may be midstring; for example, "@variable@," "start@variable@end", "@variable@end", or "start@variable@".

**[Tree]** (config>router>nat>inside>deterministic prefix-map)

### Full Context

configure service vprn nat inside deterministic prefix-map

configure router nat inside deterministic prefix-map

## Description

This command is applicable to deterministic NAT and static 1:1 NAT. It is used to configure source IP prefixes on the inside and their association with outside deterministic NAT pools via the NAT policy. Hosts within the source IP prefix are deterministically mapped to outside IP addresses and port ranges in the associated deterministic NAT pool.

Multiple source IP prefixes within an inside routing instance can be defined and they can reference different NAT policies (and therefore, outside deterministic NAT pools and routing instances). Source IP prefixes from multiple routing instances can share the same deterministic NAT pool.

With this command, multiple NAT policies based on a destination prefix or filter criteria can be used together with deterministic NAT.

Non-deterministic NAT can be used simultaneously with deterministic NAT within the same inside routing instance. However, they cannot share the same NAT pool.

Source IP prefixes can be added or removed as long as the associated deterministic NAT pool is in a **no shutdown** mode.

Removing a prefix or modifying the map statement under it requires that the source IP prefix be in a **shutdown** mode.

## Parameters

### *ip-prefix/length*

Specifies source IP prefix on the inside whose hosts is deterministically mapped to an outside IP address and port block in the corresponding deterministic NAT pool.

#### Values

<ip-prefix/ip-pref*>	<ipv4-prefix>/<ipv4-prefix-length> <ipv6-prefix>/<ipv6-prefix-length>
<ipv4-prefix>	a.b.c.d (host bits must be 0)
<ipv4-prefix-length>	0 to 32
<ipv6-prefix>	x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x - [0 to FFFF]H d - [0 to 255]D
<ipv6-prefix-length>	0 to 128

### *nat-sub-type*

Specifies the subscriber type.

<b>Values</b>	classic-lsn-sub: LSN44 subscriber dslit-lsn-sub: DT-lite subscriber
---------------	--

### *nat-policy-name*

Specifies a NAT policy, up to 32 characters, that points to an outside pool and outside routing instance.

**create**

Keyword used to create the particular prefix instance.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.300 prefix-options

```

## Description

This command excludes from LFA SPF calculation prefixes that match a prefix entry or a tag entry in a prefix policy.

The implementation already allows the user to exclude an interface in IS-IS or OSPF, an OSPF area, or an IS-IS level from the LFA SPF.

If a prefix is excluded from LFA, then it will not be included in LFA calculation regardless of its priority. The prefix tag will, however, be used in the main SPF.

This command specifies the name of the policy for the prefixes to exclude from the LFA SPF calculation in this IS-IS instance.

**Note:**

Prefix tags are defined for the IS-IS protocol but not for the OSPF protocol.

The default action, when not explicitly specified by the user in the prefix policy, is a "reject". Thus, regardless if the user did or did not explicitly add the statement "default-action reject" to the prefix policy, a prefix that did not match any entry in the policy will be accepted into LFA SPF.

The **no** form of this command deletes the exclude prefix policy.

**Default**

no prefix-policy

**Parameters*****prefix-policy prefix-policy***

Specifies the name of the prefix policy, up to 32 characters. Up to five prefix policies can be specified. The specified name must have been already defined.

## 20.302 prefix-sid-range

```
prefix-sid-range
```

**Syntax**

```
prefix-sid-range global
```

```
prefix-sid-range start-label start-label max-index max-index
```

```
no prefix-sid-range
```

**Context**

[\[Tree\]](#) (config>router>bgp>segment-routing prefix-sid-range)

**Full Context**

```
configure router bgp segment-routing prefix-sid-range
```

**Description**

This command configures the label block that BGP segment routing is allowed to use.

The **start-label** and **max-index** parameters specify that BGP should be restricted to a subrange of the SRGB, with the subrange starting at **start-label** and ending at **max-index**.

It is not possible to enable segment routing (perform a **no shutdown**) unless the **prefix-sid-range** is configured using the **global** keyword or using the **start-label** and **max-index** parameters.

The **no** form of the command allocates no labels for BGP segment-routing.

**Default**

no prefix-sid-range

**Parameters****global**

Specifies that BGP is allowed to allocate labels from the entire space of the SRGB, as defined under **config>router>mpls-labels>sr-labels**.

**start-label**

Specifies the first label value that is available to BGP in a contiguous range of labels.

**Values** 0 to 524287

**max-index**

Specifies the last label value that is available to BGP in a contiguous range of labels.

**Values** 1 to 524287

**Platforms**

All

**prefix-sid-range****Syntax**

**prefix-sid-range** {**global** | **start-label** *label-value* **max-index** *index-value*}

**no prefix-sid-range**

**Context**

[\[Tree\]](#) (config>router>isis>segment-routing prefix-sid-range)

**Full Context**

configure router isis segment-routing prefix-sid-range

**Description**

This command configures the prefix SID index range and offset label value for a given IGP instance.

The key parameter is the configuration of the prefix SID index range and the offset label value which this IGP instance will use. Since each prefix SID represents a network global IP address, the SID index for a prefix must be network-wide unique. Thus, all routers in the network are expected to configure and advertise the same prefix SID index range for a given IGP instance. However, the label value used by each router to represent this prefix; that is, the label programmed in the ILM can be local to that router by the use of an offset label, referred to as a start label:

*Local Label (Prefix SID) = start-label + {SID index}*

The label operation in the network becomes thus very similar to LDP when operating in the independent label distribution mode (RFC 5036, *LDP Specification*) with the difference that the label value used to

forward a packet to each downstream router is computed by the upstream router based on advertised prefix SID index using the above formula.

There are two mutually exclusive modes of operation for the prefix SID range on the router. In the **global** mode of operation, the user configures the global value and this IGP instance will assume the start label value is the lowest label value in the SRGB and the prefix SID index range size equal to the range size of the SRGB. Once one IGP instance selected the global option for the prefix SID range, all IGP instances on the system will be restricted to do the same. The user must shutdown the segment routing context and delete the **prefix-sid-range** command in all IGP instances in order to change the SRGB. Once the SRGB is changed, the user must re-enter the **prefix-sid-range** command again. The SRGB range change will be failed if an already allocated SID index/label goes out of range.

In the per-instance mode of operation, the user partitions the SRGB into non-overlapping sub-ranges among the IGP instances. The user thus configures a subset of the SRGB by specifying the start label value and the prefix SID index range size. All resulting net label values (start-label + index) must be within the SRGB or the configuration will be failed. Furthermore, the code checks for overlaps of the resulting net label value range across IGP instances and will strictly enforce that these ranges do not overlap. The user must shutdown the segment routing context of an IGP instance in order to change the SID index/label range of that IGP instance using the **prefix-sid-range** command. In addition, any range change will be failed if an already allocated SID index/label goes out of range. The user can however change the SRGB on the fly as long as it does not reduce the current per IGP instance SID index/label range defined with the **prefix-sid-range**. Otherwise, the user must shutdown the segment routing context of the IGP instance and delete and re-configure the **prefix-sid-range** command.

## Default

no prefix-sid-range

## Parameters

### *label-value*

Specifies the label offset for the SR label range of this IGP instance.

**Values** 0 to 524287

### *index-value*

Specifies the maximum value of the prefix SID index range for this IGP instance.

**Values** 1 to 524287

configure router ospf segment-routing prefix-sid-range

configure router ospf3 segment-routing prefix-sid-range

## Description

This command configures the prefix SID index range and offset label value for an IGP instance.

The key parameter is the configuration of the prefix SID index range and the offset label value that this IGP instance will use. Because each prefix SID represents a network global IP address, the SID index for a prefix must be unique network-wide. Therefore, all routers in the network are expected to configure and advertise the same prefix SID index range for an IGP instance. However, the label value used by each router to represent this prefix, that is, the label programmed in the ILM, can be local to that router by the use of an offset label, referred to as a start label:

*Local Label (Prefix SID) = start-label + {SID index}*

The label operation in the network is very similar to LDP when operating in independent label distribution mode (RFC 5036, *LDP Specification*), with the difference being that the label value used to forward a packet to each downstream router is computed by the upstream router based on the advertised prefix SID index using the above formula.

There are two mutually exclusive modes of operation for the prefix SID range on the router. In the **global** mode of operation, the user configures the global value and this IGP instance will assume the start label value is the lowest label value in the SRGB and the prefix SID index range size equal to the range size of the SRGB. After one IGP instance selected the global option for the prefix SID range, all IGP instances on the system will be restricted to do the same. The user must shutdown the segment routing context and delete the **prefix-sid-range** command in all IGP instances in order to change the SRGB. After the SRGB is changed, the user must re-enter the **prefix-sid-range** command again. The SRGB range change will be failed if an already allocated SID index/label goes out of range.

In per-instance mode, the user partitions the SRGB into non-overlapping sub-ranges among the IGP instances. The user configures a subset of the SRGB by specifying the start label value and the prefix SID index range size. All resulting net label values (start-label + index) must be within the SRGB or the configuration will fail. The 7750 SR checks for overlaps of the resulting net label value range across IGP instances and will strictly enforce no overlapping of these ranges. The user must shut down the segment routing context of an IGP instance in order to change the SID index/label range of that IGP instance using the **prefix-sid-range** command. A range change will fail if an already allocated SID index/label goes out of range. The user can change the SRGB without shutting down the segment routing context as long as it does not reduce the current per-IGP instance SID index/label range defined with the **prefix-sid-range** command. Otherwise, shut down the segment routing context of the IGP instance, and disable and re-enable the **prefix-sid-range** command.

## Default

no prefix-sid-range

## Parameters

*label-value*

Specifies the label offset for the SR label range of this IGP instance.

**Values** 0 to 524287

***index-value***

Specifies the maximum value of the prefix SID index range for this IGP.

**Values** 1 to 524287

primary

## Syntax

primary *path-name*

no primary

## Context

[\[Tree\]](#) (config>router>mpls>lsp primary)

## Full Context

configure router mpls lsp primary

## Description

This command specifies a preferred path for the LSP. This command is optional only if the **secondary** *path-name* is included in the LSP definition. Only one primary path can be defined for an LSP.

Some of the attributes of the LSP such as the bandwidth, and hop-limit can be optionally specified as the attributes of the primary path. The attributes specified in the **primary path** *path-name* command, override the LSP attributes.

The **no** form of this command deletes the association of this *path-name* from the LSP *lsp-name*. All configurations specific to this primary path, such as record, bandwidth, and hop limit, are deleted. The primary path must be shutdown first in order to delete it. The **no primary** command will not result in any action except a warning message on the console indicating that the primary path is administratively up.

## Parameters

### *path-name*

Specifies the case-sensitive alphanumeric name label for the LSP path up to 64 characters in length.

## Platforms

All

## primary

## Syntax

[no] primary [*mda-id* | *esa-vm-id*]

## Context

[\[Tree\]](#) (config>isa>aa-grp primary)

## Full Context

configure isa application-assurance-group primary

## Description

This command assigns an AA ISA or ESA-VM configured in the specified location to this application assurance group. Primary and backup ISAs have equal operational status and when both ISAs are coming up, the one that becomes operational first becomes the active ISA.

On an activity switch from the primary ISA, all configurations are already on the backup ISA but flow state information must be re-learned. Any statistics not yet spooled will be lost. Auto-switching from the backup to primary, once the primary becomes available again, is not supported.

Operator is notified through SNMP events when:

- When AA service goes down (all ISAs in the group are down) or comes back up (an ISA in the group becomes active)
- When AA redundancy fails (one of the ISAs in the group is down) or recovers (the failed MDA comes back up)
- When an AA activity switch occurred.

The **no** form of this command removes the specified ISA from the application assurance group.

## Parameters

### *mda-id*

Specifies the slot/mda or esa/vm, identifying a provisioned AA ISA.

Values	<i>slot/mda</i>
	<i>slot</i> 1 to 10, depending on chassis model
	<i>mda</i> 1 to 2

**esa-vm-id**

Specifies the ESA and VM, identifying a provisioned ESA-VM. The value of the `esa-vm-id` for application assurance is used as the `esa-id` plus 128. For example, an ESA 1 with VM2 would be referred to as `esa-129/2`.

Values	
	<code>esa-id+128/vm-id</code>
<code>esa-id</code>	1 to 16
<code>vm-id</code>	1 to 4

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**primary****Syntax**

`primary mda-id`

`no primary`

**Context**

[\[Tree\]](#) (config>isa>tunnel-grp primary)

**Full Context**

configure isa tunnel-group primary

**Description**

This command assigns an ISA IPsec module configured in the specified slot to this IPsec group. The backup ISA IPsec provides the IPsec group with warm redundancy when the primary ISA IPsec in the group is configured. Primary and backup ISA IPsec have equal operational status and when both MDAs are coming up, the one that becomes operational first becomes the active ISA IPsec.

All configuration information is pushed down to the backup MDA from the CPM once the CPM gets notice that the primary module has gone down. This allows multiple IPsec groups to use the same backup module. Any statistics not yet spooled will be lost. Auto-switching from the backup to primary, once the primary becomes available again, is supported.

The operator is notified through SNMP events when:

- When the ISA IPsec service goes down (all modules in the group are down) or comes back up (a module in the group becomes active).
- When ISA IPsec redundancy fails (one of the modules in the group is down) or recovers (the failed module comes back up).
- When an ISA IPsec activity switch took place.

The **no** form of this command removes the specified primary ID from the group's configuration.

**Default**

no primary

**Parameters*****mda-id***

Specifies the card/slot identifying a provisioned IPsec ISA.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

configure service ies interface ipsec ipsec-tunnel dynamic-keying cert status-verify primary

configure ipsec ipsec-transport-mode-profile dynamic-keying cert primary

**Description**

This command specifies the primary and secondary CVS methods used to verify the revocation status of the peer's certificate.

OCSP or CRL uses the corresponding configuration in the CA profile of the issuer of the certificate in question.

**Default**

primary *crl*

**Parameters*****primary***

Specifies the primary CSV method used to verify the revocation status of the peer's certificate.

**Values** **ocsp** — Specifies that the OCSP protocol should be used. The OCSP server is configured in the corresponding CA profile.

**crl** — Specifies that the local CRL file should be used. The CRL file is configured in the corresponding CA profile.

**Default** *crl*

***secondary***

Specifies the secondary CSV method used to verify the revocation status of the peer's certificate.

**Values** **ocsp** — Specifies that the OCSP protocol should be used. The OCSP server is configured in the corresponding CA profile.

**crl** — Specifies that the local CRL file should be used. The CRL file is configured in the corresponding CA profile.

**none** — Specifies that no secondary method of CSV is used.

**Default** *none*

**Platforms**

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range dhcp primary-dns

#### Description

This command configures the primary DNS address to be returned via DHCP on WLAN-GW ISA.

The **no** form of this command reverts to the default.

#### Parameters

***ip-address***

Specifies the primary DNS address.

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

### primary-dns

#### Syntax

**primary-dns** *ip-address*

**no primary-dns**

**Context**

[\[Tree\]](#) (config>service>vprn>dns primary-dns)

**Full Context**

configure service vprn dns primary-dns

**Description**

This command configures the primary DNS server used for DNS name resolution. DNS name resolution can be used when executing ping, traceroute, and service-ping, and also when defining file URLs. DNS name resolution is not supported when DNS names are embedded in configuration files.

The **no** form of this command removes the primary DNS server from the configuration.

**Default**

no primary-dns — No primary DNS server is configured.

**Parameters*****ip-address***

The IP or IPv6 address of the primary DNS server.

**Values**

ipv4-address -a.b.c.d

ipv6-address: x:x:x:x:x:x:x[-interface]

x:x:x:x:x:d.d.d.d[-interface]

x: [0..FFFF]H

d: [0..255]D

interface - 32 characters max, for link local addresses.

## 20.309 primary-image

primary-image

## Syntax

**primary-image** *file-url*

**no primary image**

## Context

[\[Tree\]](#) (bof primary-image)

## Full Context

bof primary-image

## Description

This command specifies the primary directory location for runtime image file loading.

The system attempts to load all runtime image files configured in the **primary-image** first. If this fails, the system attempts to load the runtime images from the location configured in the **secondary-image**. If the secondary image load fails, the tertiary image specified in **tertiary-image** is used.

All runtime image files (\*.tim files) must be located in the same directory.

The **no** form of this command removes the **primary-image** configuration.

## Parameters

### *file-url*

Specifies the *file-url* can be either local (this CPM) or a remote FTP server.

### Values

<i>file-url</i>	{ <i>local-url</i>   <i>remote-url</i> } (up to 180 characters)
<i>local-url</i>	[ <i>cflash-id</i> ]/[ <i>file-path</i> ]

primary-p2mp-instance
```

### Syntax

```
[no] primary-p2mp-instance instance-name
```

### Context

```
[Tree] (config>router>mpls>lsp primary-p2mp-instance)
```

### Full Context

```
configure router mpls lsp primary-p2mp-instance
```

### Description

This command creates the primary instance of a P2MP LSP. The primary instance of a P2MP LSP is modeled as a set of root-to-leaf (S2L) sub-LSPs. The root, for example a head-end node triggers signaling using one path message per S2L path. The leaf sub-LSP paths are merged at branching points.

This command is not supported on the 7450 ESS.

### Parameters

#### *instance-name*

Specifies a name that identifies the P2MP LSP instance. The instance name can be up to 32 characters long and must be unique.

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>channel>source-override primary-tunnel-interface)

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>channel primary-tunnel-interface)

## Full Context

configure mcast-management multicast-info-policy bundle primary-tunnel-interface

configure mcast-management multicast-info-policy bundle channel source-override primary-tunnel-interface

configure mcast-management multicast-info-policy bundle channel primary-tunnel-interface

## Description

This command allows the user to define a bundle in the multicast-info-policy and specify channels in the bundle that must be received from the primary tunnel interface associated with an RSVP P2MP LSP. The multicast info policy is applied to the base router instance.

The egress LER can accept multicast packets via two different methods. The regular RPF check on unlabeled IP multicast packets, which is based on routing table lookup. The static assignment which specifies the receiving of a multicast group <\*,G> or a specific <S,G> from a primary tunnel-interface associated with an RSVP P2MP LSP.

One or more primary tunnel interfaces in the base router instance can be configured. That is, the user can specify to receive different multicast groups, <\*,G> or specific <S,G>, from different P2MP LSPs. This assumes that there are static joins configured for the same multicast groups at the ingress LER to forward over a tunnel interface associated with the same P2MP LSP.

At any given time, packets of the same multicast group can be accepted from either the primary tunnel interface associated with a P2MP LSP or from a PIM interface. These are mutually exclusive options. As soon as a multicast group is configured against a primary tunnel interface in the multicast info policy, it is blocked from other PIM interfaces.

A multicast packet received on a tunnel interface associated with a P2MP LSP can be forwarded over a PIM or IGMP interface which can be an IES interface, a spoke SDP terminated IES interface, or a network interface.

The **no** form of this command removes the static RPF check.

## Parameters

### *lsp-name*

Species a string of up to 32 characters identifying the LSP name as configured at the ingress LER.

### *ip-address*

Specifies a string of 15 characters representing the IP address of the ingress LER for the LSP.

### *p2mp-id*

Identifier used for signaling mLDP P2MP LSP (applies only to the 7750 SR).

**Values** 1 to 4294967296

## Full Context

configure subscriber-mgmt sub-profile ingress policer-control-policy priority-mbs-thresholds priority

configure subscriber-mgmt sub-profile egress policer-control-policy priority-mbs-thresholds priority

## Description

The **priority** level command contains the **mbs-contribution** configuration command for a given strict priority level. Eight levels are supported numbered 1 through 8 with 8 being the highest strict priority.

Each of the eight priority CLI nodes always exists and do not need to be created. While parameters exist for each priority level, the parameters are only applied when the priority level within a parent policer instance is currently supporting child policers.

## Parameters

### *level*

Specifies the priority level override.

**Values** 1 to 8

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## priority

### Syntax

**priority** *priority* **source** {**python** | **diameter-gx** | **ludb** | **radius** | **diameter-nasreq** | **gtp** | **dhcp** | **local-address-assignment**}

**no priority** *priority*

### Context

[\[Tree\]](#) (config>subscr-mgmt>auth-orig priority)

### Full Context

configure subscriber-mgmt authentication-origin priority

### Description

This command allows the relative order of authentication priorities to be swapped between RADIUS and LUDB by configuring the RADIUS source priority to value 3. By moving RADIUS to the third position, LUDB, and all the origins below LUDB, are pushed down. The active order of priorities can be displayed in the output of the **show subscriber-mgmt authentication-origin** command.

The **no** form of this command deletes the priority value. To restore defaults, the priority configuration must be deleted.

### Parameters

#### **priority**

Specifies the authentication origin priority override.

**Values** 1 to 7

#### **source**

Specifies the source of authentication priority. Only **radius** can be configured. RADIUS as the authentication origin can be assigned priority 3 which places it above LUDB.

**Values** python, diameter-gx, ludb, radius, diameter-nasreq, gtp, dhcp, local-address-assignment

**[Tree]** (config>service>ies>sub-if>grp-if>srrp priority)

## Full Context

configure service vprn subscriber-interface group-interface srrp priority

configure service ies subscriber-interface group-interface srrp priority

## Description

This command overrides the default base priority for the SRRP instance. The SRRP instance priority is advertised by the SRRP instance to its neighbor router and is compared to the priority received from the neighbor router. The router with the best (highest) priority enters the master state while the other router enters the backup state. If the priority of each router is the same, the router with the lowest source IP address in the SRRP advertisement message assumes the master state.

The base priority of an SRRP instance can be managed by VRRP policies. A VRRP policy defines a set of connectivity or verification tests which, when they fail, may lower an SRRP instances base priority (creating an in-use priority for the instance). Every time an SRRP instances in-use priority changes when in master state, it sends an SRRP advertisement message with the new priority. If the dynamic priority drops to zero or receives an SRRP Advertisement message with a better priority, the SRRP instance transitions to the *becoming backup* state.

When the priority command is not specified, or the no priority command is executed, the system uses a default base priority of 100. The priority command may be executed at any time.

The **no** form of this command restores the default base priority to the SRRP instance. If a VRRP policy is associated with the SRRP instance, it will use the default base priority as the basis for any modifications to the SRRP instances in-use priority.

## Default

priority 100

## Parameters

### *priority*

Specifies a base priority for the SRRP instance to override the default.

**Values** 1 to 254

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## priority

## Syntax

**[no] priority level**

## Context

**[Tree]** (config>card>fp>ingress>access>queue-group>policer-control-override>priority-mbs-thresholds priority)

**[Tree]** (config>card>fp>ingress>network>queue-group>policer-control-override>priority-mbs-thresholds priority)

## Full Context

configure card fp ingress access queue-group policer-control-override priority-mbs-thresholds priority  
configure card fp ingress network queue-group policer-control-override priority-mbs-thresholds priority

## Description

The **priority** level command contains the **mbs-contribution** configuration command for a given strict priority level. Eight levels are supported numbered 1 through 8 with 8 being the highest strict priority.

Each of the eight priority CLI nodes always exists and do not need to be created. While parameters exist for each priority level, the parameters are only applied when the priority level within a parent policer instance is currently supporting child policers.

## Parameters

### *level*

Specifies the priority level.

**Values** 1 to 8

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## priority

## Syntax

**priority** *priority-value*

**no priority**

## Context

**[Tree]** (config>lag>eth-cfm>mep>ais-enable priority)

**[Tree]** (config>port>ethernet>eth-cfm>mep>ais-enable priority)

## Full Context

configure lag eth-cfm mep ais-enable priority  
configure port ethernet eth-cfm mep ais-enable priority

## Description

This command specifies the priority of the AIS messages generated by the node.

The **no** form of the command reverts to the default values.

## Parameters

### *priority-value*

Specifies the priority value of the AIS messages originated by the node.

**Values** 0 to 7

**Default** 7

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## priority

## Syntax

**priority** *priority*

**no priority**

## Context

**[Tree]** (config>port>ethernet>eth-cfm>mep>grace>eth-ed priority)

**[Tree]** (config>eth-tunnel>path>eth-cfm>mep>grace>eth-ed priority)

**[Tree]** (config>lag>eth-cfm>mep>grace>eth-ed priority)

**[Tree]** (config>eth-ring>path>eth-cfm>mep>grace>eth-ed priority)

## Full Context

configure port ethernet eth-cfm mep grace eth-ed priority

configure eth-tunnel path eth-cfm mep grace eth-ed priority

configure lag eth-cfm mep grace eth-ed priority

configure eth-ring path eth-cfm mep grace eth-ed priority

## Description

This command sets the priority bits and determines the forwarding class based on the mapping of priority to FC.

The **no** form of this command disables the local priority configuration and sets the priority to the **ccm-ltm-priority** associated with this MEP.

## Default

no priority

## Parameters

### *priority*

Specifies the priority bit.

**Values** 0 to 7

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## priority

## Syntax

**[no] priority** *level*

## Context

configure service vpls stp priority

## Description

The bridge-priority command is used to populate the priority portion of the bridge ID field within outbound BPDUs (the most significant 4 bits of the bridge ID). It is also used as part of the decision process when determining the best BPDU between messages received and sent. All values are truncated to multiples of 4096, conforming with IEEE 802.1t and 802.1D-2004.

The **no** form of this command returns the bridge priority to the default value.

## Default

priority 4096

## Parameters

### *bridge-priority*

Specifies the bridge priority for the STP instance

**Values** Allowed values are integers in the range of 4096 to 65535 with 4096 being the highest priority. The actual bridge priority value stored/used is the number entered with the lowest 12 bits masked off which means the actual range of values is 4096 to 61440 in increments of 4096.

## Platforms

## Full Context

```
configure service vpls spoke-sdp priority
configure service vpls sap stp priority
configure service vpls spoke-sdp stp priority
```

## Description

This command configures the Nokia Spanning Tree Protocol (STP) priority for the SAP or spoke SDP.

STP priority is a configurable parameter associated with a SAP or spoke SDP. When configuration BPDUs are received, the priority is used in some circumstances as a tie breaking mechanism to determine whether the SAP or spoke SDP be designated or blocked.

In traditional STP implementations (802.1D-1998), this field is called the port priority and has a value of 0 to 255. This field is coupled with the port number (0 to 255 also) to create a 16 bit value. In the latest STP standard (802.1D-2004) only the upper 4 bits of the port priority field are used to encode the SAP or spoke SDP priority. The remaining 4 bits are used to extend the port ID field into a 12 bit virtual port number field. The virtual port number uniquely references a SAP or spoke SDP within the STP instance.

STP computes the actual priority by taking the input value and masking out the lower four bits. The result is the value that is stored in the SDP priority parameter. For instance, if a value of 0 is entered, masking out the lower 4 bits results in a parameter value of 0. If a value of 255 is entered, the result is 240.

The **no** form of this command returns the STP priority to the default value.

## Default

priority 128

## Parameters

### *stp-priority*

Specifies the STP priority value for the SAP or spoke SDP. 0 is the highest priority. The actual value used for STP priority (and stored in the configuration) is the result of masking out the lower 4 bits, therefore the actual value range is 0 to 240 in increments of 16.

**Values** 0 to 255

## Platforms

**priority** *base-priority*

**no priority**

### Context

**[Tree]** (config>service>ies>if>ipv6>vrrp priority)

### Full Context

configure service ies interface ipv6 vrrp priority

### Description

This command provides the ability to configure a specific priority value to the virtual router instance. In conjunction with an optional policy command, the base-priority is used to derive the in-use priority of the virtual router instance.

This command is only available in the non-owner vrrp virtual-router-id nodal context. The priority of owner virtual router instances is permanently set to 255 and cannot be changed. For non-owner virtual router instances, if the priority command is not executed, the base-priority will be set to 100.

The **no** form of this command restores the default value of 100 to base-priority.

### Default

**priority** 100

### Parameters

#### *base-priority*

The base-priority parameter configures the base priority used by the virtual router instance. If a VRRP Priority Control policy is not also defined, the base-priority will be the in-use priority for the virtual router instance.

**Values** 1 to 254

**Default** 100

## Full Context

configure service vprn static-route-entry next-hop forwarding-class priority

configure service vprn static-route-entry ipsec-tunnel forwarding-class priority

configure service vprn static-route-entry indirect forwarding-class priority

## Description

This optional command associates an enqueueing priority with the static route. The options are either high or low, with low being the default. This parameter has the ability to affect the likelihood that a packet will be enqueued at SAP ingress in the face of ingress congestion.

Once a packet is enqueued into an ingress buffer, the significance of this parameter is lost.

## Default

priority low

## Parameters

### **low**

Setting the enqueueing parameter for a packet to **low** decreases the likelihood of enqueueing the packet when the ingress queue is congested. Ingress enqueueing priority only affects

ingress SAP queuing. Once the packet is placed in a buffer on the ingress queue, the significance of the enqueueing priority is lost.

### high

Setting the enqueueing parameter for a packet to **high** increases the likelihood of enqueueing the packet when the ingress queue is congested. Ingress enqueueing priority only affects ingress SAP queuing. Once the packet is placed in a buffer on the ingress queue, the significance of the enqueueing priority is lost.

## Full Context

configure service vprn ospf area interface priority

configure service vprn ospf3 area interface priority

## Description

This command configures the priority of the OSPF interface that is used to elect the designated router (DR) on the subnet.

This parameter is only used if the interface is of type **broadcast**. The router with the highest priority interface becomes the DR. A router with priority 0 is not eligible to be the designated router or backup designated router.

The **no** form of this command resets the interface priority to the default value.

## Default

priority 1

## Parameters

### *number*

The interface priority expressed as a decimal integer. A value of 0 indicates the router is not eligible to be the Designated Router or Backup Designated Router on the interface subnet.

**Values** 0 to 255

## Platforms

All

## priority

## Syntax

**priority** *dr-priority*

**no priority**

## Context

[\[Tree\]](#) (config>service>vprn>pim>if priority)

## Full Context

configure service vprn pim interface priority

## Description

This command sets the priority value to become the rendezvous point (RP) that is included in bootstrap messages sent by the router. The RP is sometimes called the bootstrap router. The **priority** command indicates whether the router is eligible to be a bootstrap router.

The **no** form of this command disqualifies the router to participate in the bootstrap election.

## Default

priority 1 (The router is the least likely to become the designated router.)

## Parameters

### *dr-priority*

Specifies the priority to become the designated router. The higher the value, the higher the priority.

**Values** 1 to 4294967295

## Platforms

All

## priority

## Syntax

**priority** *bootstrap-priority*

### Description

This command defines the priority used to become the rendezvous point (RP). The higher the priority value, the more likely that this router will become the RP.

Use the **no** form of this command to revert to the default value.

### Default

priority 192

### Parameters

**priority**

Specifies the priority to become the designated router. The higher the value the more likely the router will become the RP.

**Values** 0 to 255

### Platforms

All

## priority

### Syntax

**priority** *priority-level*

**no priority**

### Context

**[Tree]** (config>router>ldp>lsp-bfd priority)

### Full Context

configure router ldp lsp-bfd priority

## Description

This command configures a priority value that is used to order prefix list processing if multiple prefix lists are configured.

The **no** form of this command restores the default priority value.

## Default

priority 1

## Parameters

### *priority-level*

Specifies the priority value of the prefix list.

**Values** 1 to 16

## Platforms

[\[Tree\]](#) (config>router>mpls>lsp>primary priority)

[\[Tree\]](#) (config>router>mpls>lsp>secondary priority)

[\[Tree\]](#) (config>router>mpls>lsp-template priority)

## Full Context

configure router mpls lsp primary priority

configure router mpls lsp secondary priority

configure router mpls lsp-template priority

## Description

This command enables the soft preemption procedures for this LSP path. The operator enables the soft preemption mechanism on a specific LSP name by explicitly configuring the setup and holding priorities for the primary path at the head-end node. The operator can similarly configure priority values for a secondary path for this LSP name. Different values could be used for the primary and for any of the secondary paths. In the absence of explicit user configuration, the setup priority is internally set to the default value of 7 and the holding priority is set to the default value of 0.

**Note:**

Valid user-entered values for these two parameters require that the holding priority be numerically lower than or equal to the setup priority, otherwise preemption loops can occur.

preemption is effected when a router preempting node processes a new RSVP session reservation and there is not enough available bandwidth on the RSVP interface, or the Class Type (CT) when Diff-Serv is enabled, to satisfy the bandwidth in the FlowSpec object while there exist other session reservations for LSP paths with a strictly lower holding priority (numerically higher holding priority value) than the setup priority of the new LSP reservation. If enough available bandwidth is freed on the link or CT to accommodate the new reservation by preempting one or more lower priority LSP paths, the preempting node allows temporary overbooking of the RSVP interface and honors the new reservation.

The preempting node will immediately set the 'Preemption pending' flag (0x10) in the IPv4 Sub-Object in the RRO object in the Resv refresh for each of the preempted LSP paths. The IPv4 Sub-Object corresponds to the outgoing interface being used by the preempting and preempted LSP paths; however, the bandwidth value in the FlowSpec object is not changed. The Resv flag must also be set if the preempting node is a merge point for the primary LSP path and the backup bypass LSP or detour LSP and the backup LSP is activated.

When evaluating if enough available bandwidth will be freed, the preempting node considers the reservations in order from the lowest holding priority (numerically higher holding priority value) to the holding priority just below the setup priority of the new reservation. A new reservation cannot preempt a reservation which has a value of the holding priority equal to the new reservation setup priority.

When Diff-Serv is enabled on the preempting node and the MAM bandwidth allocation model is used, a new reservation can only preempt a reservation in the same Class Type (CT).

LSP paths which were not flagged at the head-end for soft preemption will be hard preempted. LSP paths with the default holding priority of 0 cannot be preempted. LSP paths with zero bandwidth do not preempt other LSP paths regardless of the values of the path setup priority and the path holding priority. They can also not be preempted.

When evaluating if enough available bandwidth will be freed, the preempting node considers the reservations in order from the lowest holding priority (numerically higher holding priority) to the holding priority just below the setup priority of the new reservation. There is no specific order in which the reservations in the same holding priority are considered.

The preempting node starts a preemption timer for each of the preempted LSP paths. While this timer is on, the node should continue to refresh the Path and Resv for the preempted LSP paths. When the preemption timer expires, the node tears down the reservation if the head-end node has not already done so.

A head-end node upon receipt of the Resv refresh message with the 'Preemption pending' flag must immediately perform a make-before-break on the affected adaptive CSPF LSP. Both IGP metric and TE metric based CSPF LSPs are included. If an alternative path that excludes the flagged interface is not found, then the LSP is put on a retry in a similar way to the Global Revertive procedure at a head-end node. However, the number of retries and the retry timer are governed by the values of the **retry-limit** and **retry-timer** parameters: **config>router>mpls>lsp>retry-limit**; **config>router>mpls>lsp>retry-timer**.

MPLS will keep the address list of flagged interfaces for a maximum of 60 s (not user-configurable) from the time the first Resv message with the 'Preemption pending' flag is received. This actually means that MPLS will request CSPF to find a path that excludes the flagged interfaces in the first few retries until success or until 60 s have elapsed. Subsequent retries after the 60 s will not exclude the flagged interfaces as it is assumed IGP has converged by then and the Unreserved Bandwidth sub-TLV for that priority, or TE Class, in the TE database will show the updated value taking into account the preempting LSP path reservation or a value of zero if overbooked.

If the LSP has a configured secondary standby which is operationally UP, the router will switch the path of the LSP to it and then start the MBB. If no standby path is available and a secondary non-standby is configured, the router will start the MBB and signal the path of the secondary. The LSP path will be switched to either the secondary or the new primary, whichever comes up first.

The **no** form of this command reverts the LSP path priority to the default values and results in setting the setup priority to 7, in setting the hold priority to 0, and in clearing the 'soft preemption desired' flag in the RRO in the Resv refresh message.

## Default

no priority

## Parameters

### *setup-priority*

Specifies the priority of the reservation for this session at setup time.

**Values** 0 to 7 (0 is the highest priority and 7 is the lowest priority.)

**Default** 7 — This session does not preempt any other session.

### *holding-priority*

Specifies the priority of the reservation for this session at preemption action.

**Values** 0 to 7 (0 is the highest priority and 7 is the lowest priority.)

**Default** 0 — This session does not get preempted by any other session.

[\[Tree\]](#) (config>router>static-route-entry>next-hop>forwarding-class priority)

## Full Context

configure router static-route-entry indirect forwarding-class priority

configure router static-route-entry next-hop forwarding-class priority

## Description

This optional command associates an enqueueing priority with the static route. The options are either high or low, with low being the default. This parameter has the ability to affect the likelihood that a packet will be enqueued at SAP ingress in the face of ingress congestion.

Once a packet is enqueued into an ingress buffer, the significance of this parameter is lost.

## Default

priority low

## Parameters

### low

Setting the enqueueing parameter for a packet to **low** decreases the likelihood of enqueueing the packet when the ingress queue is congested. Ingress enqueueing priority only affects ingress SAP queuing. Once the packet is placed in a buffer on the ingress queue, the significance of the enqueueing priority is lost.

### high

Setting the enqueueing parameter for a packet to **high** increases the likelihood of enqueueing the packet when the ingress queue is congested. Ingress enqueueing priority only affects ingress SAP queuing. Once the packet is placed in a buffer on the ingress queue, the significance of the enqueueing priority is lost.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## priority

### Syntax

### Description

This command sets the priority bits and determines the forwarding class based on the mapping of priority to FC.

The **no** form of this command disables the local priority configuration and sets the priority to the **ccm-ltm-priority** associated with this MEP.

### Default

no priority

### Parameters

**priority**

Specifies the priority bit.

**Values** 0 to 7

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## priority

### Syntax

**priority** *priority*

**no priority**

### Context

[\[Tree\]](#) (config>router>fad>flex-algo priority)

## Full Context

configure router flexible-algorithm-definitions flex-algo priority

## Description

This command configures the priority of the FAD. This priority is used as a tie-breaker when the router has received multiple FADs for the same flexible algorithm.

Every router that is configured to participate in a particular flexible algorithm uses the same tie-breaker logic to select the winning FAD. This allows for consistent FAD definition selection in cases where routers advertise different winning definitions for a specific flexible algorithm. The following rules apply to the breaker mechanism.

- From the advertisements of the FAD in the area (including both locally generated advertisements and received advertisements), select the one with the highest priority value.
- If there are multiple advertisements of the FAD with the same highest priority, select the one that is originated from the router with either the highest system ID or router ID.

The **no** form of this command sets the priority to the default value.

## Default

priority 100

## Parameters

### *priority*

Configures the priority of this FAD.

**Values** 0 to 255

**Default** 100

## Platforms

## Full Context

configure router interface vrrp priority

configure router interface ipv6 vrrp priority

## Description

This command configures the base router priority for the virtual router instance used in the master election process.

The priority is the most important parameter set on a non-owner virtual router instance. The priority defines a virtual router's selection order in the master election process. Together, the priority value and the **preempt** mode allow the virtual router with the best priority to become the master virtual router.

The *base-priority* is used to derive the in-use priority of the virtual router instance as modified by any optional VRRP priority control policy. VRRP priority control policies can be used to either override or adjust the base priority value depending on events or conditions within the chassis.

The **priority** command is only available in the non-owner **vrrp** nodal context. The priority of **owner** virtual router instances is permanently set to 255 and cannot be changed.

For non-owner virtual router instances, the default base priority value is 100.

The **no** form of the command reverts to the default value.

## Default

priority 100

## Parameters

### *priority*

The base priority used by the virtual router instance expressed as a decimal integer. If no VRRP priority control policy is defined, the *base-priority* is the in-use priority for the virtual router instance.

**Values** 1 to 254

## Platforms

All

## priority

## Syntax

**priority** *priority-level* [{**delta** | **explicit**}]

configure vrrp policy priority-event lag-port-down weight-down priority
configure vrrp policy priority-event route-unknown priority
configure vrrp policy priority-event port-down priority
```

## Description

This command controls the effect the set event has on the virtual router instance in-use priority.

When the event is set, the *priority-level* is either subtracted from the base priority of each virtual router instance or it defines the explicit in-use priority value of the virtual router instance depending on whether the **delta** or **explicit** keywords are specified.

Multiple set events in the same policy have interaction constraints:

- If any set events have an explicit **priority** value, all the delta **priority** values are ignored.
- The set event with the lowest explicit **priority** value defines the in-use priority that are used by all virtual router instances associated with the policy.
- If no set events have an explicit **priority** value, all the set events delta **priority** values are added and subtracted from the base priority value defined on each virtual router instance associated with the policy.
- If the delta priorities sum exceeds the **delta-in-use-limit** parameter, then the **delta-in-use-limit** parameter is used as the value subtracted from the base priority value defined on each virtual router instance associated with the policy.

If the **priority** command is not configured on the priority event, the *priority-value* defaults to 0 and the qualifier keyword defaults to **delta**, therefore, there is no impact on the in-use priority.

The **no** form of the command configures the set event to subtract 0 from the base priority (no effect).

## Default

no priority

## Parameters

### *priority-level*

The priority level adjustment value expressed as a decimal integer.

**Values** 0 to 254

### **delta**

Configures what effect the *priority-level* will have on the base priority value. The default base priority value is **delta**.

When **delta** is specified, the *priority-level* value is subtracted from the associated virtual router instance's base priority when the event is set and no explicit events are set. The sum of the priority event *priority-level* values on all set delta priority events are subtracted from the virtual router base priority to derive the virtual router instance in-use priority value. If the **delta** priority event is cleared, the *priority-level* is no longer used in the in-use priority calculation.

### explicit

Configures what effect the *priority-level* will have on the base priority value.

When **explicit** is specified, the *priority-level* value is used to override the base priority of the virtual router instance if the priority event is set and no other **explicit** priority event is set with a lower *priority-level*. The set **explicit** priority value with the lowest *priority-level* determines the actual in-use protocol value for all virtual router instances associated with the policy.

### Platforms

All

## priority

### Syntax

**priority** *priority-level* **explicit**

**no** **priority**

### Context

[\[Tree\]](#) (config>vrrp>policy>priority-event>mc-ipsec-non-forwarding priority)

### Full Context

configure vrrp policy priority-event mc-ipsec-non-forwarding priority

### Description

This command controls the effect the set event has on the virtual router instance in-use priority.

When the event is set, the *priority-level* is either subtracted from the base priority of each virtual router instance or it defines the explicit in-use priority value of the virtual router instance depending on whether the **delta** or **explicit** keywords are specified.

Multiple set events in the same policy have interaction constraints:

- If any set events have an explicit **priority** value, all the delta **priority** values are ignored.
- The set event with the lowest explicit **priority** value defines the in-use priority that are used by all virtual router instances associated with the policy.
- If no set events have an explicit **priority** value, all the set events delta **priority** values are added and subtracted from the base priority value defined on each virtual router instance associated with the policy.
- If the delta priorities sum exceeds the **delta-in-use-limit** parameter, then the **delta-in-use-limit** parameter is used as the value subtracted from the base priority value defined on each virtual router instance associated with the policy.

If the **priority** command is not configured on the priority event, the *priority-value* defaults to 0 and the qualifier keyword defaults to **delta**, therefore, there is no impact on the in-use priority.

The **no** form of the command configures the set event to subtract 0 from the base priority (no effect).

## Default

no priority

## Parameters

### *priority-level*

The priority level adjustment value expressed as a decimal integer.

**Values** 0 to 254

### **explicit**

When **explicit** is specified, the *priority-level* value is used to override the base priority of the virtual router instance if the priority event is set and no other **explicit** priority event is set with a lower *priority-level*. The set **explicit** priority value with the lowest *priority-level* determines the actual in-use protocol value for all virtual router instances associated with the policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## priority

## Syntax

**priority** *bridge-priority*

**no priority**

## Context

[\[Tree\]](#) (config>service>pw-template>stp priority)

## Full Context

configure service pw-template stp priority

## Description

The **bridge-priority** command is used to populate the priority portion of the bridge ID field within outbound BPDUs (the most significant 4 bits of the bridge ID). It is also used as part of the decision process when determining the best BPDU between messages received and sent. All values will be truncated to multiples of 4096, conforming with IEEE 802.1t and 802.1D-2004.

The **no** form of this command returns the bridge priority to the default value.

## Default

priority 4096

## Parameters

### *bridge-priority*

Specifies the bridge priority for the STP instance.

**Values** Allowed values are integers in the range of 4096 to 65535 with 4096 being the highest priority. The actual bridge priority value stored/used is the number entered with the lowest 12 bits masked off which means the actual range of values is 4096 to 61440 in increments of 4096.

**[Tree]** (config>card>fp>ingress>access>queue-group>policer-control-override priority-mbs-thresholds)

#### Full Context

configure card fp ingress network queue-group policer-control-override priority-mbs-thresholds

configure card fp ingress access queue-group policer-control-override priority-mbs-thresholds

## Description

This command contains the root arbiter parent policer's **min-thresh-separation** command and each priority level's **mbs-contribution** command that is used to internally derive each priority level's shared-portion and fair-portion values. The system uses each priority level's shared-portion and fair-portion value to calculate each priority level's discard-unfair and discard-all MBS thresholds that enforce priority sensitive rate-based discards within the root arbiter's parent policer.

The **priority-mbs-thresholds** CLI node always exists and does not need to be created.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## 20.326 priority1

## priority1

### Syntax

**priority1** *priority-value*

**no priority1**

### Context

[\[Tree\]](#) (config>system>ptp priority1)

### Full Context

configure system ptp priority1

### Description

This command configures the priority1 value of the local clock. This parameter is only used when the profile is set to ieee1588-2008. This value is used by the Best Master Clock Algorithm to determine which clock should provide timing for the network.

This value is used for the value to advertise in the Announce messages and for the local clock value in data set comparisons.

The **no** form of the command reverts to the default configuration.

### Default

priority1 128

### Parameters

***priority-value***

Specifies the value of the priority1 field.

**Values** 0 to 255

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.327 priority2

## priority2

### Syntax

**priority2** *priority-value*

**no priority2**

## Context

[\[Tree\]](#) (config>system>ptp priority2)

## Full Context

configure system ptp priority2

## Description

This command configures the priority2 value of the local clock. This parameter is only used when the **profile** is set to **ieee1588-2008**, **g8275dot1-2014**, or **g8275dot2-2016**. The parameter is ignored when any other profile is selected.

This value is used by the Best timeTransmitter Clock algorithm to determine which clock should provide timing for the network.

### Note:

This value is used for the value to advertise in the Announce messages and for local clock value in data set comparisons.

The **no** form of the command reverts to the default configuration.

## Default

priority2 128

## Parameters

### *priority-value*

Specifies the value of the priority2 field.

**Values** 0 to 255

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.328 priv-lvl

priv-lvl

## Syntax

```

### Full Context

```
configure li x-interfaces lics lic authentication private-ki
```

### Description

This command configures the private key for the X1 and X2 interfaces.

The **no** form of this command reverts to the default.

### Parameters

*hex-string*

Specifies the password. Must contain exactly 32 hex nibbles.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.332 private-retail-subnets

```
private-retail-subnets
```

### Syntax

```
[no] private-retail-subnets
```

### Context

```
[Tree] (config>service>vprn>sub-if private-retail-subnets)
```

### Full Context

```
configure service vprn subscriber-interface private-retail-subnets
```

## Description

This command controls the export of retail subnets and prefixes to the wholesale forwarding service. When this attribute is configured, subnets and prefixes configured on the retail subscriber interface are no longer exported to the associated wholesale VPRN and remain private to the retail VPRN. This is useful in a IPoE or PPPoE business service context, as it allows retail services to use overlapping IP address spaces even if those services are associated with the same wholesale service. IPoE and PPPoE sessions are actually terminated in the retail service although their traffic transits on a SAP belonging to the wholesale service.

Configuring private retail subnets is not supported for IPv4 static hosts and ARP hosts. If PPPoE sessions need to coexist with IPv4 static hosts or ARP hosts, then this attribute should not be configured on the retail subscriber interface.

This command fails if the subscriber interface is not associated with a wholesale service.

If the retail VPRN is of the type **hub**, this attribute is mandatory. In this case, private retail subnets are enabled by default and cannot be unconfigured.

The **no** form of this command disables overlapping IP addresses between different retailers referring to this interface.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.333 private-service

### private-service

#### Syntax

**private-service** *service-id*

**private-service name** *service-name*

**no private-service**

#### Context

[\[Tree\]](#) (config>ipsec>client-db>client private-service)

#### Full Context

configure ipsec client-db client private-service

#### Description

This command specifies the private service ID that is used for tunnel setup.

The **no** form of this command reverts to the default.

#### Default

no private-service

## Parameters

### *service-id*

Specifies the service ID of the tunnel delivery service.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **private-service name** *service-name* variant can be used in all configuration modes.

**Values** {*id* | *svc-name*}

*id*: 1 to 2147483647

*svc-name*: up to 64 characters (*svc-name* is an alias for input only. The *svc-name* gets replaced with an id automatically by SR OS in the configuration).

### *name service-name*

Identifies the service, up to 64 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.334 private-tcp-mss-adjust

### private-tcp-mss-adjust

#### Syntax

**private-tcp-mss-adjust** *octets*

**private-tcp-mss-adjust** **default**

**no private-tcp-mss-adjust**

#### Context

**[Tree]** (config>router>l2tp>group>l2tpv3 private-tcp-mss-adjust)

**[Tree]** (config>service>vprn>l2tp>l2tpv3 private-tcp-mss-adjust)

**[Tree]** (config>service>vprn>l2tp>group>l2tpv3 private-tcp-mss-adjust)

**[Tree]** (config>router>l2tp>group>tunnel>l2tpv3 private-tcp-mss-adjust)

**[Tree]** (config>service>vprn>l2tp>group>tunnel>l2tpv3 private-tcp-mss-adjust)

#### Full Context

configure router l2tp group l2tpv3 private-tcp-mss-adjust

configure service vprn l2tp l2tpv3 private-tcp-mss-adjust

configure service vprn l2tp group l2tpv3 private-tcp-mss-adjust

```
configure router l2tp group tunnel l2tpv3 private-tcp-mss-adjust
configure service vprn l2tp group tunnel l2tpv3 private-tcp-mss-adjust
```

## Description

This command enables TCP MSS adjust for L2TPv3 tunnels on the private side of the group or tunnel level. When this command is configured, the system updates the TCP MSS option value of the received TCP SYN packet on the private side.

Note that this command can be overridden by the corresponding configuration on the group or tunnel level.

With the **default** parameter, the system uses the upper-level configuration. With the non-default parameter, the system uses this configuration instead of the upper level configuration.

The **no** form of this command disables TCP MSS adjust on the private side.

## Default

```
no private-tcp-mss-adjust
```

## Parameters

### **octets**

Specifies the new TCP MSS value in octets.

**Values** 512 to 9000

### **default**

Specifies to use the upper-level configuration

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## private-tcp-mss-adjust

## Syntax

```
private-tcp-mss-adjust bytes
```

```
private-tcp-mss-adjust octets
```

```
no private-tcp-mss-adjust
```

## Full Context

```

configure service ies interface sap ip-tunnel private-tcp-mss-adjust
configure service vprn interface sap ipsec-tunnel private-tcp-mss-adjust
configure service ies interface ipsec ipsec-tunnel private-tcp-mss-adjust
configure service vprn interface ipsec ipsec-tunnel private-tcp-mss-adjust
configure ipsec tunnel-template private-tcp-mss-adjust
configure router interface ipsec ipsec-tunnel private-tcp-mss-adjust
configure service vprn interface sap ip-tunnel private-tcp-mss-adjust

```

## Description

This command enables TCP MSS to adjust for L2TPv3 tunnels, IPsec, or IP tunnels on the private side. When the command is configured, the system updates the TCP MSS option to the value of the received TCP SYN packet on the private side.

The **no** form of this command disables TCP MSS adjust on the private side.

## Default

```
no private-tcp-mcc-adjust
```

## Parameters

### *bytes*

Specifies the new TCP MSS value in bytes.

**Values** 512 to 9000

### *octets*

Specifies the new TCP MSS value in octets.

**Values** 512 to 9000

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn interface sap ip-tunnel private-tcp-mss-adjust
- configure service ies interface sap ip-tunnel private-tcp-mss-adjust
- configure service vprn interface sap ipsec-tunnel private-tcp-mss-adjust
- configure ipsec tunnel-template private-tcp-mss-adjust

VSR

- configure router interface ipsec ipsec-tunnel private-tcp-mss-adjust
- configure service vprn interface ipsec ipsec-tunnel private-tcp-mss-adjust

## 20.335 probe-count

```
probe-count
```

### Syntax

```
probe-count probes-per-hop
```

```
no probe-count
```

### Context

```
[Tree] (config>saa>test>type-multi-line>lsp-trace>sr-policy probe-count)
```

### Full Context

```
configure saa test type-multi-line lsp-trace sr-policy probe-count
```

### Description

This command configures the number of probes per hop.

The **no** form of this command reverts to the default value.

### Default

```
probe-count 1
```

### Parameters

***probes-per-hop***

Specifies the probes-per-hop count, expressed as number of packets.

**Values** 1 to 10

**Default** 1

### Platforms

All

## 20.336 probe-fail-enable

```
probe-fail-enable
```

### Syntax

```
[no] probe-fail-enable
```

## Context

[\[Tree\]](#) (config>saa>test>trap-gen probe-fail-enable)

## Full Context

configure saa test trap-gen probe-fail-enable

## Description

This command enables the generation of an SNMP trap when the consecutive probe failure threshold (configured using the **probe-fail-threshold** command) is reached during the execution of the SAA ping test. This command is not applicable to SAA trace route tests.

The **no** form of this command disables the generation of an SNMP trap.

## Platforms

All

## 20.337 probe-fail-threshold

probe-fail-threshold

## Syntax

**probe-fail-threshold** *threshold*

**no probe-fail-threshold**

## Context

[\[Tree\]](#) (config>saa>test>trap-gen probe-fail-threshold)

## Full Context

configure saa test trap-gen probe-fail-threshold

## Description

This command configures the threshold for trap generation after ping probe failure.

This command has no effect when **probe-fail-enable** is disabled. This command is not applicable to SAA trace route tests.

The **no** form of this command returns the threshold value to the default.

## Default

probe-fail-threshold 1

## Parameters

***threshold***

Specifies the number of consecutive ping probe failures required to generate a trap.

**Values** 0 to 15

## Platforms

All

## 20.338 probe-history

### probe-history

#### Syntax

```
probe-history {keep | drop | auto}
```

#### Context

[\[Tree\]](#) (config>saa>test probe-history)

#### Full Context

```
configure saa test probe-history
```

#### Description

Specifies history probe behavior. Defaults are associated with various configured parameters within the SAA test. Auto (keep) is used for test with probe counts of 100 or less, and intervals of 1 second and above. Auto (drop) only maintains summary information for tests marked as continuous with file functions, probe counts more than 100 and intervals of less than 1 second. SAA tests that are not continuous with a write to file defaults to Auto (keep). The operator is free to change the default behaviors for each type. Each test that maintains per probe history consumes more system memory. When per probe entries are required, the probe history is available at the completion of the test.

#### Default

```
probe-history auto
```

#### Parameters

##### auto

An auto selector that determines the storage of the history information.

##### drop

Stores summarized min/max/avg data not per probe information for test runs. This may be configured for all tests to conserve memory.

##### keep

Stores per probe information for tests. This consumes significantly more memory than summary information and should only be used if necessary.

## Platforms

All

## 20.339 process-arp-probes

```
process-arp-probes
```

### Syntax

```
[no] process-arp-probes
```

### Context

[\[Tree\]](#) (config>service>vpls>proxy-arp process-arp-probes)

### Full Context

```
configure service vpls proxy-arp process-arp-probes
```

### Description

This command enables router proxy ARP function replies to Duplicate Address Detection (DAD) ARP probes upon a successful proxy ARP table lookup.

The **no** form of this command disables the router from replying to DAD ARP probes.

### Default

```
process-arp-probes
```

## Platforms

All

## 20.340 process-cpm-traffic-on-sap-down

```
process-cpm-traffic-on-sap-down
```

### Syntax

```
[no] process-cpm-traffic-on-sap-down
```

### Context

[\[Tree\]](#) (config>service>vpls>sap process-cpm-traffic-on-sap-down)

### Full Context

```
configure service vpls sap process-cpm-traffic-on-sap-down
```

## Description

This command is applicable to simple SAPs configured on LAGs that are not part of any "endpoint" configurations or complicated resiliency schemes like MC-LAG with inter-chassis-backup (ICB) configurations. When configured, a simple LAG SAP is not removed from the forwarding plane and flooded traffic (unknown unicast, broadcast and multicast) is dropped on egress. This allows applicable control traffic that is extracted at the egress interface to be processed by the CPM. This command will not prevent a VPLS service from entering an operationally down state if it is the last active connection to enter a nonoperational state. By default, without this command, when a SAP on a LAG enters a nonoperational state, it is removed from the forwarding plane and no forwarding occurs to the egress.

The **no** form of this command removes a SAP over a LAG that is not operational from the forwarding process.

## Default

no process-cpm-traffic-on-sap-down

## Platforms

All

## 20.341 process-dad-neighbor-solicitations

## 20.342 profile

```
profile
```

### Syntax

```
profile profile-name [create]
```

```
no profile profile-name
```

### Context

```
[Tree] (config>app-assure>group>url-filter>web-service profile)
```

### Full Context

```
configure application-assurance group url-filter web-service profile
```

### Description

This command configures the category profiles of the web service.

The **no** form of this command removes the category profiles configuration.

### Parameters

***profile-name***

Specifies the name of the category profile, up to 256 characters.

**create**

Keyword that specifies to create a category profile.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

```
profile
```

### Syntax

```
[no] profile user-profile-name
```

### Context

```
[Tree] (config>system>security profile)
```

### Full Context

```
configure system security profile
```

## Description

This command creates a context to create user profiles for command authorization and other functions associated with a user.

Profiles can be used to deny or permit user access to entire command branches or to specific commands.

Once the profiles are created, the **user** command assigns users to one or more profiles. You can define up to 16 user profiles but a maximum of 8 profiles can be assigned to a user.

The **no** form of this command deletes a user profile.

## Parameters

### *user-profile-name*

Specifies the user profile name entered as a character string. The string is case sensitive and limited to 32 ASCII 7-bit printable characters with no spaces.

## Platforms

All

## profile

## Syntax

configure saa test type-multi-line lsp-ping sr-policy profile

## Description

This command configures the profile state of the MPLS echo request packet.

The **no** form of this command reverts to the default value.

## Default

profile out

## Parameters

*in*

Specifies "in" as the profile state of the MPLS echo request packet.

**out**

Specifies "out" as the profile state of the MPLS echo request packet.

**Platforms**

All

**profile****Syntax**

**profile** {in | out}

**no profile**

**Context**

[\[Tree\]](#) (config>oam-pm>session>ip profile)

**Full Context**

configure oam-pm session ip profile

**Description**

This command defines whether the TWAMP Light PDU packet should be treated as in-profile or out-of-profile. The default has been selected because the forwarding class defaults to best effort.

The **no** form of this command restores the default value.

**Default**

profile out

**Parameters****in**

Specifies that the TWAMP Light PDU packet is sent as in-profile.

**out**

Specifies that the TWAMP Light PDU packet is sent as out-of-profile.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## Description

This command defines whether the DM PDU packet should be treated as in profile or out-of-profile. The **no** form of this command reverts the default value.

## Default

profile out

## Parameters

**in**

Marks the PDU in profile.

**out**

Marks the PDU out of profile.

**Default** out

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## profile

## Syntax

**profile** {in | out}

**no profile**

## Context

[\[Tree\]](#) (config>qos>sap-ingress>fc profile)

## Full Context

configure qos sap-ingress fc profile

## Description

This command places a forwarding class or subclass into a color aware profile mode. Normally, packets associated with a class are considered in-profile or out-of-profile solely based on the dynamic rate of the ingress queue relative to its CIR. Explicitly defining a class as in-profile or out-of-profile overrides this function by handling each packet with the defined profile state.

The profile command may only be executed when the forwarding class or the parent forwarding class (for a subclass) is mapped to a queue that has been enabled to support color aware profile packets. The queue may only be configured for profile-mode at the time the queue is created in the SAP ingress QoS policy.

A queue operating in profile-mode may support in-profile, out-of-profile, and non-profiled packets simultaneously. However, the high- and low-priority classification actions are ignored when the queue is in profile-mode.

The **no** form of this command removes an explicit in-profile or out-of-profile configuration on a forwarding class or subclass.

## Default

**no profile** — The default profile state of a forwarding class or subclass is not to treat ingress packets as color aware. An explicit definition for in-profile or out-of-profile must be specified on the forwarding class or subclass.

## Parameters

### in

The **in** keyword is mutually exclusive to the **out** keyword. When the profile in command is executed, all packets associated with the class will be handled as in-profile. Packets explicitly handled as in-profile or out-of-profile still flow through the ingress service queue associated with the class to preserve order within flows. In-profile packets will count against the CIR of the queue, diminishing the amount of CIR available to other classes using the queue that are not configured with an explicit profile.

### out

The **out** keyword is mutually exclusive to the **in** keyword. When the profile out command is executed, all packets associated with the class will be handled as out-of-profile. Packets explicitly handled as in-profile or out-of-profile still flow through the ingress service queue associated with the class to preserve order within flows. Out-of-profile packets will not count against the CIR of the queue, allowing other classes using the queue that are not configured with an explicit profile to be measured against the full CIR.

## Platforms

All

## profile

## Syntax

```
profile {g8265dot1-2010 | ieee1588-2008 | g8275dot1-2014 | g8275dot2-2016}
```

## Context

[\[Tree\]](#) (config>system>ptp profile)

## Full Context

```
configure system ptp profile
```

## Description

This command configures the profile for the internal PTP clock, which defines the Best timeTransmitter Clock Algorithm (BTCA) behavior.

The profile setting for the clock cannot be changed unless PTP is shutdown.

The **clock-type** is restricted based on the PTP profile setting.

- If the profile is **ieee1588-2008**, the **clock-type** is not restricted.
- If the profile is **g8265dot1-2010**, the **clock type** may only be **ordinary slave** or **ordinary master**; boundary clock is not allowed.
- If the profile is **g8275dot1-2014** or **g8275dot2-2016**, the **clock-type** may only be boundary clock or **ordinary slave**; **ordinary master** is not allowed.

When the profile is changed, the domain changes to the default value for the new profile. Any command parameters that are set to default for the original profile are changed to the default for the new profile. This applies to the following:

- **log-anno-interval** set for the clock
- **log-sync-interval** set for a peer or a port
- **log-delay-interval** set for a port

Non-default parameter values for the original profile remain unchanged.

## Default

profile g8265dot1-2010

## Parameters

### **g8265dot1-2010**

Conforms to the ITU-T G.8265.1 specification.

### **ieee1588-2008**

Conforms to the 2008 version of the IEEE1588 standard.

### **g8275dot1-2014**

Conforms to the ITU-T G.8275.1 specification.

### **g8275dot2-2016**

Conforms to the ITU-T G.8275.2 specification.

## Platforms

## 20.343 profile-capped

## profile-capped

### Syntax

[no] profile-capped

### Context

**[Tree]** (config>qos>qgrps>ingress>queue-group profile-capped)

**[Tree]** (config>qos>sap-egress>policer profile-capped)

**[Tree]** (config>qos>sap-ingress>policer profile-capped)

**[Tree]** (config>qos>qgrps>egr>queue-group profile-capped)

### Full Context

configure qos queue-group-templates ingress queue-group profile-capped

configure qos sap-egress policer profile-capped

configure qos sap-ingress policer profile-capped

configure qos queue-group-templates egress queue-group profile-capped

### Description

Profile-capped mode enforces an overall in-profile burst limit to the CIR bucket for ingress undefined, ingress explicit in-profile, egress soft-in-profile, and egress explicit in-profile packets. The default behavior when profile-capped mode is not enabled is to ignore the CIR output state when an explicit in-profile packet is handled by an ingress or egress policer.

The profile-capped mode makes two changes:

- At egress, soft-in-profile packets (packets received from ingress as in-profile) are treated the same as explicit in-profile (unless explicitly reclassified as out-of-profile) and have an initial policer state of in-profile.
- At both ingress and egress, any packet output from the policer with a non-conforming CIR state are treated as out-of-profile (out-of-profile state is ignored for initial in-profile packets when profile-capped mode is not enabled).

### Default

no profile-capped

### Platforms

All

- configure qos queue-group-templates egress queue-group profile-capped
  - configure qos queue-group-templates ingress queue-group profile-capped
- 7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

**[Tree]** (config>service>ies>sub-if>grp-if>sap>sub-sla-mgmt>single-sub profiled-traffic-only)

## Full Context

configure service vpls sap sub-sla-mgmt single-sub-parameters profiled-traffic-only

configure service ies interface sap sub-sla-mgmt single-sub profiled-traffic-only

configure service vprn interface sap sub-sla-mgmt single-sub profiled-traffic-only

configure service vprn subscriber-interface group-interface sap sub-sla-mgmt single-sub-parameters profiled-traffic-only

configure service ies subscriber-interface group-interface sap sub-sla-mgmt single-sub-parameters profiled-traffic-only

## Description

This command specifies whether only profiled traffic is applicable for this SAP. The profiled traffic refers to single subscriber traffic on a dedicated SAP (in the VLAN-per-subscriber model). When enabled, subscriber queues are instantiated through the QOS policy defined in the sla-profile and the associated SAP queues are deleted. This can increase subscriber scaling by reducing the number of queues instantiated per subscriber (in the VLAN-per-subscriber model). In order for this to be achieved, any configured multi-sub-sap limit must be removed (leaving the default of 1).

The **no** form of this command disables the command.

```

### Full Context

```
configure router mpls lsp fast-reroute propagate-admin-group
```

```
configure router mpls lsp-template fast-reroute propagate-admin-group
```

### Description

The command enables the signaling of the primary LSP path admin-group constraints in the FRR object at the ingress.

When this command is executed, the admin-group constraints configured in the context of the P2P LSP primary path, or the ones configured in the context of the LSP and inherited by the primary path, are copied into the FAST\_REROUTE object. The admin-group constraints are copied into the 'include-any' or 'exclude-any' fields.

The ingress LER thus propagates these constraints to the downstream nodes during the signaling of the LSP to allow them to include the admin-group constraints in the selection of the FRR backup LSP for protecting the LSP primary path.

The ingress LER inserts the FAST\_REROUTE object by default in a primary LSP path message. If the user disables the object using the following command, the admin-group constraints will not be propagated: **config>router>mpls>no frr-object.**

Note that the same admin-group constraints can be copied into the Session Attribute object. They are intended for the use of an LSR, typically an ABR, to expand the ERO of an inter-area LSP path. They are also used by any LSR node in the path of a CSPF or non-CSPF LSP to check the admin-group constraints against the ERO regardless if the hop is strict or loose. These are governed strictly by the command:

```
config>router>mpls>lsp>propagate-admin-group
```

In other words, the user may decide to copy the primary path admin-group constraints into the FAST\_REROUTE object only, or into the Session Attribute object only, or into both. Note, however, that the PLR rules for processing the admin-group constraints can make use of either of the two object admin-group constraints.

This feature is supported with the following LSP types and in both intra-area and inter-area TE where applicable:

- Primary path of a RSVP P2P LSP.
- S2L path of an RSVP P2MP LSP instance
- LSP template for an S2L path of an RSVP P2MP LSP instance.

The **no** form of this command disables the signaling of administrative group constraints in the FRR object.

### Default

no propagate-admin-group

### Platforms

All

## propagate-admin-group

### Syntax

[no] propagate-admin-group

### Context

[\[Tree\]](#) (config>router>mpls>lsp propagate-admin-group)

[\[Tree\]](#) (config>router>mpls>lsp-template propagate-admin-group)

### Full Context

configure router mpls lsp propagate-admin-group

configure router mpls lsp-template propagate-admin-group

### Description

This command enables propagation of session attribute object with resource affinity (C-type 1) in PATH message. If an LSR receives a session attribute with resource affinity, then it will check the compatibility of admin-groups received in PATH message against configured admin-groups on the egress interface of LSP.

To support admin-group for inter-area LSP, the ingress node must configure propagating admin-groups within the session attribute object. If a PATH message is received by an LSR node that has the **cspf-on-loose-hop** option enabled and the message includes admin-groups, then the ERO expansion by CSPF to calculate the path to the next loose hop includes the admin-group constraints received from ingress node.

If this option is disabled, then the session attribute object without resource affinity (C-Type 7) is propagated in PATH message and CSPF at the LSR node does not include admin-group constraints.

This admin group propagation is supported with a P2P LSP, a P2MP LSP instance, and an LSP template.

The user can change the value of the **propagate-admin-group** option on the fly. A RSVP P2P LSP performs a Make-Before-Break (MBB) on changing the configuration. A S2L path of an RSVP P2MP LSP performs a Break-Before-Make on changing the configuration.

The **no** form of this command reverts to the default value.

### Default

no propagate-admin-group

## Platforms

## 20.350 propagate-hold-time

```
propagate-hold-time
```

### Syntax

```
propagate-hold-time second
```

```
no propagate-hold-time
```

### Context

[\[Tree\]](#) (config>eth-cfm>redundancy>mc-lag propagate-hold-time)

### Full Context

```
configure eth-cfm redundancy mc-lag propagate-hold-time
```

### Description

This command configures the delay, in seconds, that fault propagation is delayed because of port or MC-LAG state changes. This provides the amount of time for system stabilization during a port state changes that may be protected by MC-LAG. This command requires the standby-mep-shutdown command in order to take effect.

The **no** form of the command reverts to the default.

### Default

```
propagate-hold-time 1
```

### Parameters

**seconds**

Specifies the amount of time in seconds. Zero means no delay.

**Values** 0 to 60

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## propagate-mac-flush

### Syntax

[no] propagate-mac-flush

### Context

[\[Tree\]](#) (config>service>vpls propagate-mac-flush)

### Full Context

configure service vpls propagate-mac-flush

### Description

This command enabled propagation of mac-flush messages received from the specified T-LDP on all spoke and mesh-SDPs within the context of the VPLS service. The propagation will follow split-horizon principles and any data-path blocking in order to avoid looping of these messages.

### Default

no propagate-mac-flush

### Platforms

All

## 20.352 propagate-mac-flush-from-bvpls

## propagate-mac-flush-from-bvpls

### Syntax

[no] propagate-mac-flush-from-bvpls

### Context

[\[Tree\]](#) (config>service>vpls>pbp propagate-mac-flush-from-bvpls)

### Full Context

configure service vpls pbp propagate-mac-flush-from-bvpls

### Description

This command enables the propagation in the local PBB of any regular LDP MAC Flush received in the related B-VPLS. If an LDP MAC flush-all-but-mine is received in the B-VPLS context, the command controls also whether a flush is performed for all the customer MACs in the associated FDB. The command does not have any effect on a PBB MAC Flush (LDP MAC flush with PBB TLV) received in the related B-VPLS context.

The **no** form of this command disables the propagation of LDP MAC Flush i from the related B-VPLS.

**Default**

no propagate-mac-flush-from-bvpls

**Platforms**

All

## 20.353 propagate-metric

```
propagate-metric
```

**Syntax**

[no] propagate-metric

**Context**

[\[Tree\]](#) (config>service>vprn>rip propagate-metric)

**Full Context**

configure service vprn rip propagate-metric

**Description**

This command enables the BGP MED to be used to configure the RIP metric at the BGP to RIP transition on egress routers. BGP always configures the BGP MED to the RIP metric at the ingress router. When **propagate-metric** is configured, the RIP metric at egress routers is configured as the BGP MED attribute added to the optional value configured with the **metric-out** command.

The **no** version of this command sets the RIP metric to the optional value configured with the **metric-out** command plus 1.

**Default**

no propagate-metric

**Platforms**

All

configure router interface ipsec ipsec-tunnel propagate-pmtu-v6

#### Description

This command enables the system to propagate the path MTU learned from public side to private side (IPv6 hosts).

The **no** form of this command prevents the learned path MTU propagation.

#### Default

propagate-pmtu-v6

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service ies interface sap ip-tunnel propagate-pmtu-v6
- configure service vprn interface sap ip-tunnel propagate-pmtu-v6
- configure service vprn interface sap ipsec-tunnel propagate-pmtu-v6
- configure ipsec tunnel-template propagate-pmtu-v6

VSR

- configure service ies interface ipsec ipsec-tunnel propagate-pmtu-v6
- configure router interface ipsec ipsec-tunnel propagate-pmtu-v6
- configure service vprn interface ipsec ipsec-tunnel propagate-pmtu-v6

## 20.356 propagate-topology-change

propagate-topology-change

### Syntax

[no] propagate-topology-change

### Context

**[Tree]** (config>eth-ring>sub-ring>interconnect propagate-topology-change)

### Full Context

configure eth-ring sub-ring interconnect propagate-topology-change

### Description

This command configures the G.8032 sub-ring to propagate topology changes. From the sub-ring to the major ring as specified in the G.8032 interconnection flush logic. This command is only valid on the sub-ring and on the interconnection node. Since this command is only valid on a Sub-ring, a virtual link or non-virtual link must be specified to configure this command. The command is blocked on major rings (when both path a and b are specified on a ring).

The **no** form of this command reverts propagate to the default value.

### Default

no propagate-topology-change

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.357 protect-circuit

protect-circuit

### Syntax

protect-circuit *port-id*

**no protect-circuit****Context**

[Tree] (config>port>aps protect-circuit)

**Full Context**

configure port aps protect-circuit

**Description**

This command configures a physical port that will act as the protection circuit for this APS group. The protect circuit port must contain only the default configuration and cannot belong to another APS group. The protect circuit port must be of the same type as the working circuit for the APS group, for the port to be added to an APS group port. If that's not the case, the command will return an error.

A protection circuit can only be added if the working circuit already exists; the protection circuit must be removed from the configuration before the working circuit is removed.

When a port is a protect-circuit of an APS group, the configuration options available in the **config>port port-id>sonet-sdh** context is not allowed for that port unless it is part of the noted exceptions. The exception list includes these SONET/SDH commands:

- clock-source
- [no] loopback
- [no] report-alarm
- section-trace
- [no] threshold

When is port configured as a protection circuit of an APS group, the configurations described above and all service configurations related to APS port are operationally inherited by the protect circuit. If the protect circuit cannot inherit the configurations (due to resource limitations), the configuration attempt fails and an error is returned to the user.

The protect circuit must be shutdown before it can be removed from the APS group port. The inherited configuration for the circuit and APS operational commands for that circuit are not preserved when the circuit is removed from the APS group.

The **no** form of this command removes the protect-circuit.

**Parameters****port-id**

Specifies the physical port that will act as the protection circuit for this APS group in the following format.

<i>port-id</i>	<i>slot/mda/port</i>		
	<i>eth-sat-id</i>	<i>esat-id/slot/port</i>	
		<i>esat</i>	keyword
		<i>id</i>	1 to 20
	<i>pxc-id</i>	<i>pxc-id.sub-port</i>	

<i>pxc</i>	keyword
<i>id</i>	1 to 64
<i>sub-port</i>	a, b

Refer to "Modifying Hold-Down Timer Values" in the **config>port>aps working-circuit** command description for information about modifying the timer defaults in the event of communication delays between the APS controllers.

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 20.358 protect-tp-path

### protect-tp-path

#### Syntax

[no] protect-tp-path

#### Context

[\[Tree\]](#) (config>router>mpls>lsp protect-tp-path)

#### Full Context

configure router mpls lsp protect-tp-path

#### Description

This command creates or edits the protect path for an MPLS-TP LSP. At least one working path must exist before a protect path can be created for an MPLS-TP LSP. If MPLS-TP linear protection is also configured, then this is the path that is used as the default protect path for the LSP. The protect path must be deleted before the working path. Only one protect path can be created for each MPLS-TP LSP.

The following commands are applicable to the working-tp-path: **lsp-num**, **in-label**, **out-label**, **mep**, **shutdown**.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.359 protecting-next-hop-id

## protecting-nexthop-id

### Syntax

**protecting-nexthop-id** *next-hop-index*  
**no protecting-nexthop-id**

### Context

**[Tree]** (config>router>p2mp-sr-tree>replication-segment>next-hop-id protecting-nexthop-id)

### Full Context

configure router p2mp-sr-tree replication-segment next-hop-id protecting-nexthop-id

### Description

This command provides the ID of the protection next-hop used for FRR.

The protection next-hop outgoing SID is pushed on top of the next-hop SID list.

The **no** form of this command removes the protection next-hop.

### Parameters

***next-hop-index***

Specifies the ID of the protection next-hop.

**Values** 1 to 4096

### Platforms

All

## 20.360 protection

## protection

### Syntax

**protection none**  
**protection hmac-sha256 key** *key* [**hash** | **hash2** | **custom**]  
**no protection**

### Context

**[Tree]** (config>python>py-script protection)

### Full Context

configure python python-script protection

## Description

This command specifies the format of the Python script file(s) in this python-script. Unintentional changing of Python script file could be prevented by using protected format.

The **no** form of this command equals to **protection none**.

## Parameters

### none

Indicates the Python script is stored in plain text, without any mechanism in place to ensure the integrity nor the confidentiality of the content of the Python script.

### hmac-sha256

Indicates the first line of the Python script must consist of the hash value obtained by hashing the rest of the Python script using the **hmac-sha256** hashing algorithm.

### key

The specified key along with original Python script file content are used to compute the hash. The computed hash will be compared to the hash in the Python script file. If there is no match, then system will fail to load the script.

### hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, clear text form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### custom

Specifies the key entered is a customized hashing scheme.

## Platforms

All

## protection

## Syntax

**protection** *protection*

**no protection**

## Context

**[Tree]** (config>router>segment-routing>srv6>inst>loc>func>end-x protection)

**[Tree]** (config>router>segment-routing>srv6>inst>ms-loc>func>ua protection)

### Full Context

```
configure router segment-routing segment-routing-v6 base-routing-instance locator function end-x  
protection
```

```
configure router segment-routing segment-routing-v6 base-routing-instance micro-segment-locator function  
ua protection
```

### Description

This command configures the protection type of the SID.

The **no** form of this command reverts to the default value of **protected**.

### Default

```
protection protected
```

### Parameters

#### *protection*

Specifies whether the adjacency SID is protected.

**Values**   protected, unprotected

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 20.361 protection-template

### protection-template

### Syntax

```
protection-template name
```

```
no protection-template
```

### Context

[\[Tree\]](#) (config>router>mpls>mpls-tp protection-template)

### Full Context

```
configure router mpls mpls-tp protection-template
```

### Description

Protection templates are used to define generally applicable protection parameters for MPLS-TP tunnels.

Only linear protection is supported, and so the application of a named template to an MPLS-TP LSP

implies that linear protection is used. A protection template is applied under the MEP context of the protect-path of an MPLS-TP LSP.

The protection-template command creates or edits a named protection template.

### Default

no protection-template

### Parameters

#### *name*

Specifies the protection template name as a text string of up to 32 characters in printable 7-bit ASCII, enclosed in double quotes.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## protection-template

### Syntax

**protection-template** *name*

**no protection-template**

### Context

[\[Tree\]](#) (config>router>mpls>lsp>protect-tp-path>mep protection-template)

### Full Context

configure router mpls lsp protect-tp-path mep protection-template

### Description

This command applies a protection template name to an MPLS-TP LSP that the protect path is configured under. If the template is applied, then MPLS-TP 1:1 linear protection is enabled on the LSP, using the parameters specified in the named template.

A named protection template can only be applied to the protect path context of an MPLS-TP LSP.

The no form of this command removes the template and thus disables mpls-tp linear protection on the LSP.

### Default

no protection-template

### Parameters

#### *name*

Specifies a text string for the template up to 32 characters in printable 7-bit ASCII, enclosed in double quotes.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.362 protection-type

### protection-type

#### Syntax

```
protection-type {g8031-1to1 | loadsharing}
```

#### Context

```
[Tree] (config>eth-tunnel protection-type)
```

#### Full Context

```
configure eth-tunnel protection-type
```

#### Description

This command configures the model used for determining which members are actively receiving and transmitting data.

When the value is set to "g8031-1to1 (1)", as per the G.8031 specification, only two members are allowed, and only one of them can be active at one point in time.

When the value is set to "loadsharing (2)", multiple members can be active at one point in time.

#### Default

```
protection-type g8031-1to1
```

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### protection-type

#### Syntax

```
protection-type {link | node}  
no protection-type
```

#### Context

```
[Tree] (config>router>route-next-hop-policy>template protection-type)
```

#### Full Context

```
configure router route-next-hop-policy template protection-type
```

#### Description

This command configures the protection type constraint into the route next-hop policy template.

The user can select if link protection or node protection is preferred in the selection of an LFA next-hop for all IP prefixes and LDP FEC prefixes to which a route next-hop policy template is applied. The default in SR OS implementation is node protection. The implementation will fall back to the other type if no LFA next-hop of the preferred type is found.

When the route next-hop policy template is applied to an IP interface, all prefixes using this interface as a primary next-hop will follow the protection type preference specified in the template.

The **no** form deletes the protection type constraint from the route next-hop policy template.

### Default

protection-type node

### Parameters

**{link | node}**

Specifies the two possible values for the protection type.

**Default** node

### Platforms

All

## 20.363 proto-version

proto-version

### Syntax

proto-version {v070 | latest}

### Context

[\[Tree\]](#) (config>system>grpc>gnmi proto-version)

### Full Context

configure system grpc gnmi proto-version

### Description

This command sets the gnmi.proto version that the GRPC server should use for all gNMI RPCs.

### Default

proto-version latest

### Parameters

**v070**

Specifies to use v0.7.0 for gNMI RPCs. Only use this option for backward compatibility with legacy collectors.

**latest**

Specifies to use the latest gnmi.proto version for gNMI RPCs. The latest version is v0.8.0.

**Platforms**

All

## 20.364 protocol

### protocol

**Syntax**

**protocol** *protocol* **profile-name** *profile-name*

**Context**

[\[Tree\]](#) (config>system>security>pki>cert-upd-prof protocol)

**Full Context**

configure system security pki certificate-update-profile protocol

**Description**

This command configures the protocol to update the certificate.

**Default**

protocol cmpv2

**Parameters**

*protocol*

Specifies the protocol type.

**Values** cmpv2, est

*profile-name*

Specifies the name of the CA or EST profile to be used for the certificate update.

**Platforms**

All

## protocol

### Syntax

**protocol** *protocol-id*

**no protocol**

### Context

[\[Tree\]](#) (config>subscr-mgmt>isa-svc-chain>vas-filter>entry>match protocol)

### Full Context

configure subscriber-mgmt isa-service-chaining vas-filter entry match protocol

### Description

This command configures the protocol ID to be matched in this entry of the VAS filter.

The **no** form of this command removes the protocol ID from the match criterium in the entry.

### Parameters

***protocol-id***

Specifies the protocol to match.

**Values** protocol-id: *protocol-number* | *protocol-name*

protocol-number: 1, 6, 17]D

[0x1,0x6,0x11]H [0b1,0b110,0b10001]B

protocol-name: none, icmp, tcp, udp

\* udp/tcp wildcard

## protocol

### Syntax

**protocol** *protocol-name*

### Context

[\[Tree\]](#) (config>app-assure protocol)

### Full Context

configure application-assurance protocol

## Description

This command configures the shutdown of protocols system-wide.

## Parameters

### *protocol-name*

A string of up to 32 characters identifying a predefined protocol.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

```
protocol
```

## Syntax

```
protocol {eq | neq} protocol-name
```

```
no protocol
```

## Context

[\[Tree\]](#) (config>app-assure>group>policy>app-filter>entry protocol)

## Full Context

```
configure application-assurance group policy app-filter entry protocol
```

## Description

This command configures protocol signature in the application definition.

The **no** form of this command restores the default (removes protocol from match application defined by this app-filter entry).

## Default

```
no protocol
```

## Parameters

### **eq**

Specifies that the value configured and the value in the flow are equal.

### **neq**

Specifies that the value configured differs from the value in the flow.

### *protocol-name*

A string of up to 32 characters identifying a predefined protocol.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## Full Context

configure ipsec ts-list local entry protocol

configure ipsec ts-list remote entry protocol

## Description

This command specifies the protocol and port range in the IKEv2 traffic selector.

The SR OS supports OPAQUE ports and port ranges for the following protocols:

- TCP
- UDP
- SCTP
- ICMP
- ICMPv6
- MIPv6

For ICMP and ICMPv6, the *port* value takes the form *icmp-type/icmp-code*. For MIPv6, the *port* value is the mobility header type. For other protocols, only the **port any** configuration can be used.

## Default

no protocol

## Parameters

### *protocol-id*

Specifies the protocol ID. The value can be a number, a protocol name, or **any**.

### *begin-port-id*

Specifies the beginning of the port range.

**Values** For TCP, UDP, and SCTP, the value is the port number.  
For ICMP and ICMPv6, the value takes the form *icmp-type/icmp-code*; for example, 0/0.  
For MIPv6, the value is the mobility header type.

### *end-port-id*

Specifies the end of the port range

**Values** For TCP, UDP, and SCTP, the value is the port number.  
For ICMP and ICMPv6, the value takes the form *icmp-type/icmp-code*; for example, 0/0.  
For MIPv6, the value is the mobility header type.

### *opaque*

Specifies OPAQUE ports.

**any**

Specifies any port.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

protocol

### Syntax

[no] protocol {*number* | **any**}

### Context

[\[Tree\]](#) (config>service>nat>firewall-policy>unknown-protocols protocol)

### Full Context

configure service nat firewall-policy unknown-protocols protocol

### Description

This command configures the protocol numbers that are allowed to create unknown flows.

Protocol or IPv6 extension header values that are explicitly supported by SR OS can be configured but will not be treated as unknown protocols.

The **no** form of the command removes the allowance for the specified protocol to create unknown flows.

### Parameters

**any**

Specifies that unknown flows can be created by any protocol.

**number**

Specifies the IANA number of a protocol that needs to be allowed to create unknown flows.

**Values** 0 to 255

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

protocol

### Syntax

[no] protocol *protocol-id*

## Context

[\[Tree\]](#) (config>filter>match-list>protocol-list protocol)

## Full Context

configure filter match-list protocol-list protocol

## Description

This command adds a protocol to the match protocol list.

The **no** form of this command removes the protocol from the **protocol-list**.

## Parameters

### *protocol-id*

*protocol-number, protocol-name*

### *protocol-number*

Specifies the protocol number value to be added or removed from the protocol list. The value can be expressed as a decimal integer, or in hexadecimal or binary format.

**Values** [0 to 255]D  
[0x0 to 0xFF]H  
[0b0 to 0b11111111]B

### *protocol-name*

Specifies the protocol name to be added or removed from the protocol list.

**Values** icmp, igmp, ip, tcp, egp, igp, udp, rdp, ipv6, ipv6-route, ipv6-frag, idrp, rsvp, gre, ipv6-icmp, ipv6-no-nxt, ipv6-opts, iso-ip, eigrp, ospf-igp, ether-ip, encap, pnni, pim, vrrp, l2tp, stp, ptp, isis, crtp, crudp, sctp.

## Platforms

All

protocol

## Syntax

**protocol** *protocol*

**no protocol** [*protocol*]

## Context

[\[Tree\]](#) (config>vrrp>policy>priority-event>route-unknown protocol)

## Full Context

configure vrrp policy priority-event route-unknown protocol

## Description

This command adds one or more route sources to match the route unknown IP route prefix for a route unknown priority control event.

If the route source does not match one of the defined protocols, the match is considered unsuccessful and the **route-unknown** event transitions to the set state.

The **protocol** command is optional. If the **protocol** command is not executed, the comparison between the RTM prefix return and the **route-unknown** IP route prefix will not include the source of the prefix. The **protocol** command cannot be executed without at least one associated route source parameter. All parameters are reset each time the **protocol** command is executed and only the explicitly defined protocols are allowed to match.

The **no** form of the command removes protocol route source as a match criteria for returned RTM route prefixes.

To remove specific existing route source match criteria, execute the **protocol** command and include only the specific route source criteria. Any unspecified route source criteria is removed.

## Default

no protocol — No route source for the route unknown priority event is defined.

## Parameters

### *protocol*

Explicitly defined protocols

**Values** **bgp** - This parameter defines BGP as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **bgp** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **bgp** parameter, a returned route prefix with a source of BGP will not be considered a match and will cause the event to enter the set state. This parameter only applies to the 7750 SR and 7950 XRS.

**bgp-vpn** - This parameter defines **bgp-vpn** as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **bgp-vpn** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **bgp-vpn** parameter, a returned route prefix with a source of **bgp-vpn** will not be considered a match and will cause the event to enter the set state. This parameter only applies to the 7750 SR and 7950 XRS.

**ospf** - This parameter defines OSPF as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **ospf** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **ospf** parameter, a returned route prefix with a source of OSPF will not be considered a match and will cause the event to enter the set state.

**is-is** - This parameter defines IS-IS as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **is-is** parameter is not exclusive from the

other available **protocol** parameters. If **protocol** is executed without the **is-is** parameter, a returned route prefix with a source of IS-IS will not be considered a match and will cause the event to enter the set state.

**rip** - This parameter defines RIP as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **rip** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **rip** parameter, a returned route prefix with a source of RIP will not be considered a match and will cause the event to enter the set state.

**static** - This parameter defines a static route as an eligible route source for a returned route prefix from the RTM when looking up the **route-unknown** route prefix. The **static** parameter is not exclusive from the other available **protocol** parameters. If **protocol** is executed without the **static** parameter, a returned route prefix with a source of static route will not be considered a match and will cause the event to enter the set state.

## Platforms

All

## protocol

## Syntax

**protocol** *protocol-id*

**no protocol**

## Context

[\[Tree\]](#) (config>system>security>mgmt-access-filter>ip-filter>entry protocol)

## Full Context

configure system security management-access-filter ip-filter entry protocol

## Description

This command configures an IP protocol type to be used as a management access filter match criterion.

The protocol type, such as TCP, UDP, and OSPF, is identified by its respective protocol number. Well-known protocol numbers include ICMP (1), TCP (6), and UDP (17).

The **no** form the command removes the protocol from the match criteria.

## Parameters

***protocol***

Specifies the protocol number for the match criterion.

**Values** 1 to 255 (decimal)

## Platforms

All

## protocol

## Syntax

[no] protocol *name* [create]

## Context

[\[Tree\]](#) (config>sys>security>dist-cpu-protection>policy protocol)

## Full Context

configure system security dist-cpu-protection policy protocol

## Description

This command creates the protocol for control in the policy.

Explanatory notes for some of the protocols:

- bfd-cpm: includes all bfd handled on the CPM including cpm-np type, single hop and multi-hop, and MPLS-TP CC and CV bfd
- dhcp: includes dhcp for IPv4 and IPv6
- eth-cfm: 802.1ag and includes Y.1731. Eth-cfm packets on port and LAG based facility MEPs are not included (but packets on Tunnel MEPs are).
- icmp: includes IPv4 and IPv6 ICMP (including RS/RA/Redirect) except NS/NA Neighbor Discovery packets which are classified as a separate protocol "ndis"
- icmp-ping-check: includes those packets associated with ping-template functions
- isis: includes isis used for SPBM
- ldp: includes ldp and t-ldp
- mpls-ttl: MPLS packets that are extracted due to an expired mpls ttl field
- ndis: IPv6 NS/NA Neighbor Discovery (not including RS/RA/Redirect which are classified as part of the protocol "icmp")
- ospf: includes all OSPFv2 and OSPFv3 packets
- pppoe-pppoa: includes PADx, LCP, PAP/CHAP and NCPs
- vrrp: includes VRRP and SRRP packets
- multi-chassis: includes SR OS Multi-Chassis UDP port 1025 packets
- multi-chassis-sync: includes SR OS Multi-Chassis Sync TCP port 45067 packets
- all-unspecified: a special "protocol". When configured, this treats all extracted control packets that are not explicitly created in the dist-cpu-protection policy as a single aggregate flow (or "virtual protocol"). It lumps together "all the rest of the control traffic" to allow it to be rate limited as one flow. It includes all control traffic of all protocols that are extracted and sent to the CPM (even protocols that cannot be explicitly configured with the distributed CPU protection feature). Control packets that are both forwarded and copied for extraction are not included. If a user later explicitly configures a protocol, that

protocol is suddenly no longer part of the "all-unspecified" flow. The "all-unspecified" protocol must be explicitly configured in order to operate.

"no protocol x" means packets of protocol x are not monitored and not enforced (although they do count in the fp protocol queue) on the objects to which this dist-cpu-protection policy is assigned, although the packets will be treated as part of the all-unspecified protocol if the all-unspecified protocol is created in the policy.

## Parameters

### *names*

Signifies the protocol name.

**Values** arp, dhcp, http-redirect, icmp, icmp-ping-check, igmp, mld, ndis, pppoe-pppoe, all-unspecified, mpls-ttl, multi-chassis, multi-chassis-sync, vrrp, bfd-cpm, bgp, eth-cfm, isis, ldp, ospf, pim, rsvp.

## Platforms

All

## protocol

## Syntax

**protocol** *protocol* [**all** | { **instance** *instance*}]

**protocol** *protocol2* [*protocol2* (up to 5 max)]

**no protocol**

## Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from protocol)

## Full Context

configure router policy-options policy-statement entry from protocol

## Description

This command configures a routing protocol as a match criterion for a route policy statement entry. This command is used for both import and export policies depending how it is used.

### **Note:**

The **instance** command cannot be used if multiple protocol names are specified for the *protocol2* parameter.

The **no** form of this command removes the protocol match criterion.

## Default

no protocol

## Parameters

### *protocol*

Specifies the protocol name for the match criterion.

**Values** direct, static, bgp, isis, ospf, rip, aggregate, bgp-vpn, igmp, pim, ospf3, ldp, sub-mgmt, mld, managed, vpn-leak, nat, periodic, ipsec, dhcpv6-pd, dhcpv6-na, dhcpv6-ta, dhcpv6-pd-excl, ripng, bgp-label, direct-interface, arp-nd, rib-api, evpn-if

### *instance*

Specifies the OSPF, OSPFv3, or IS-IS protocol instance.

**Values** isis-inst — 0 to 127  
ospf-inst — 0 to 31  
ospf3-inst — 0 to 31, 64 to 95

### *protocol2*

Specifies up to five protocol names to match on.

**Values** direct, static, isis, aggregate, bgp, bgp-label, direct-interface

### *all*

Keyword that specifies to match on any OSPF, OSPFv3, or IS-IS protocol instance.

## Platforms

All

## protocol

## Syntax

**protocol** *protocol* [**all** | **instance** *instance*]

**protocol** **bgp** **bgp-label**

**no protocol**

## Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>to protocol)

## Full Context

configure router policy-options policy-statement entry to protocol

## Description

This command configures a routing protocol as a match criterion for a route policy statement entry. This command is used for both import and export policies depending on how it is used.

The **no** form of this command removes the protocol match criterion.

**Default**

no protocol

**Parameters*****protocol***

Specifies the protocol name to match on.

**Values** bgp, isis, ospf, rip, bgp-vpn, ospf3, vpn-leak, ldp, ripng, bgp-label

***instance***

Specifies the OSPF, OSPFv3, or IS-IS instance.

**Values** isis-inst — 0 to 127  
ospf-inst — 0 to 31  
ospf3-inst — 0 to 31, 64 to 95

**all**

Keyword that specifies to match on any OSPF, OSPFv3, or IS-IS protocol instance.

## 20.365 protocol-configuration-options

### protocol-configuration-options

**Syntax**

**protocol-configuration-options** {apco | pco}  
**no protocol-configuration-options**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>gtp>peer-profile protocol-configuration-options)

**Full Context**

configure subscriber-mgmt gtp peer-profile protocol-configuration-options

**Description**

This command configures the Information Element to use for the Protocol Configuration Options.

The **no** form of this command reverts to the default value.

**Default**

protocol-configuration-options pco

## Parameters

### apco

Specifies that the system uses the Protocol Configuration Options Information Element.

### pco

Specifies that the system uses the Additional Protocol Configuration Options Information Element.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 20.366 protocol-list

### protocol-list

## Syntax

**protocol-list** *protocol-list-name* [**create**]

**no protocol-list** *protocol-list-name*

## Context

[\[Tree\]](#) (config>filter>match-list protocol-list)

## Full Context

configure filter match-list protocol-list

## Description

This command creates a list of IP protocols that can be used in line card IP and IPv6 filters.

The **no** form of this command removes the IP protocol list.

## Default

no protocol-list

## Parameters

### *protocol-list-name*

Specifies the name of the protocol list.

### **create**

This keyword is required to create the protocol list. After it is created, the protocol list can be enabled with or without the **create** keyword.

## Platforms

All

## 20.367 protocol-port

```
protocol-port
```

### Syntax

```
[no] protocol-port
```

### Context

[\[Tree\]](#) (config>cflowd>collector>aggregation protocol-port)

### Full Context

```
configure cflowd collector aggregation protocol-port
```

### Description

This command specifies that flows be aggregated based on the IP protocol, source port number, and destination port number.

The **no** form of this command removes this type of aggregation from the collector configuration.

### Platforms

All

## 20.368 protocol-protection

```
protocol-protection
```

### Syntax

```
protocol-protection [allow-sham-links] [block-pim-tunneled]
```

```
no protocol-protection
```

### Context

[\[Tree\]](#) (config>sys>security>cpu-protection protocol-protection)

### Full Context

```
configure system security cpu-protection protocol-protection
```

### Description

This command causes the network processor on the CPM to discard all packets received for protocols that are not configured on the particular interface. This helps mitigate DoS attacks by filtering invalid control

traffic before it hits the CPU. For example, if an interface does not have IS-IS configured, then protocol protection will discard any IS-IS packets received on that interface.

### Default

no protocol-protection

### Parameters

#### allow-sham-links

Allows sham links. As OSPF sham links form an adjacency over the MPLS-VPRN backbone network, when protocol-protection is enabled, the tunneled OSPF packets to be received over the backbone network must be explicitly allowed.

#### block-pim-tunneled

Blocks extraction and processing of PIM packets arriving at the SR OS node inside a tunnel (for example, MPLS or GRE) on a network interface. With protocol-protection enabled and tunneled pim blocked, PIM in an mVPN on the egress DR will not switch traffic from the (\*,G) to the (S,G) tree.

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

## 20.369 protocol-version

### protocol-version

### Syntax

**protocol-version** *TLS version*

**no protocol-version**

### Context

[\[Tree\]](#) (config>system>security>tls>client-tls-profile protocol-version)

### Full Context

configure system security tls client-tls-profile protocol-version

### Description

This command configures the TLS version to be negotiated between the client and server.

When configured, the client adds the specified version as a supported version in its Hello message to the server. If **tls-version-all** is specified, the client adds both TLS 1.2 and TLS 1.3 as supported versions in its Hello message.

The **no** form of this command reverts to the default TLS version.

## Default

protocol-version tls-version12

## Parameters

*TLS version*

Specifies the TLS version to include in the client Hello message.

**Values**                   tls-version12, tls-version13, tls-version-all

## Platforms

All

## protocol-version

## Syntax

**protocol-version** *TLS version*

**no protocol-version**

## Context

[\[Tree\]](#) (config>system>security>tls>server-tls-profile protocol-version)

## Full Context

configure system security tls server-tls-profile protocol-version

## Description

This command configures the TLS version to be negotiated between the server and client.

When configured, the server adds the specified version as a supported version in its Hello message to the client. If **tls-version-all** is specified, the server adds both TLS 1.2 and TLS 1.3 as supported versions in its Hello message.

The **no** form of this command reverts to the default TLS version.

## Default

protocol-version tls-version12

## Parameters

*TLS version*

Specifies the TLS version to include in the server Hello message.

**Values**                   tls-version12, tls-version13, tls-version-all

## Platforms

All

## 20.370 provider-tunnel

```
provider-tunnel
```

### Syntax

```
[no] provider-tunnel
```

### Context

[\[Tree\]](#) (config>service>vpls provider-tunnel)

### Full Context

```
configure service vpls provider-tunnel
```

### Description

Commands in this context configure the use of a P2MP LSP to forward Broadcast, Unknown unicast, and Multicast (BUM) packets of a VPLS or B-VPLS instance. The P2MP LSP is referred to as the Provider Multicast Service Interface (PMSI).

### Platforms

### Full Context

configure service ies subscriber-interface group-interface proxy-arp-policy

configure service vprn subscriber-interface group-interface proxy-arp-policy

configure service vprn interface proxy-arp-policy

configure service ies interface proxy-arp-policy

### Description

This command specifies an existing policy-statement to analyze match and action criteria that controls the flow of routing information to and from a given protocol, set of protocols, or a neighbor.

The **no** form of this command disables the proxy ARP capability.

## Parameters

### *policy-name*

Specifies the export route policy name. Allowed values are any string, up to 32 characters, composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

The specified name must already be defined.

## Platforms

**proxy-arp-policy****Syntax**

**proxy-arp-policy** *policy-name* [*policy-name*]

**no proxy-arp-policy**

**Context**

[\[Tree\]](#) (config>router>if proxy-arp-policy)

**Full Context**

configure router interface proxy-arp-policy

**Description**

This command enables and configure proxy ARP on the interface and specifies an existing policy-statement to analyze match and action criteria that controls the flow of routing information to and from a given protocol, set of protocols, or a specific neighbor. The policy-name is configured in the **config>router>policy-options** context.

Use proxy ARP so the router responds to ARP requests on behalf of another device. Static ARP is used when a router needs to know about a device on an interface that cannot or does not respond to ARP requests. Therefore, the router configuration can state that if it has a packet that has a certain IP address to send it to the corresponding ARP address.

**Default**

no proxy-arp-policy

**Parameters*****policy-name***

Specifies the export route policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes. A maximum of five policy names can be specified in a single statement. The specified policy names must already be defined.

## 20.379 ps-information

### ps-information

## Syntax

[no] ps-information

## Context

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>gy>avp ps-information)

## Full Context

configure subscriber-mgmt diameter-application-policy gy include-avp ps-information

## Description

This command includes the following AVPs in Diameter DCCA CCR messages encapsulated in [3GPP-873] Service-Information or [3GPP-874] PS-Information grouped AVPs:

- [8] Framed-IP-Address
- [30] Called-Station-Id
- [97] Framed-IPv6-Prefix
- [123] Delegated-IPv6-Prefix
- [6527-99] Alc-IPv6-Address
- [10415-1] 3GPP-IMSI
- [10415-2] 3GPP-Charging-Id
- [10415-5] 3GPP-GPRS-Negotiated-QoS-Profile
- [10415-7] 3GPP-GGSN-Address
- [10415-10] GGSN-NSAPI
- [10415-11] 3GPP-Session-Stop-Indicator
- [10415-12] 3GPP-Selection-Mode
- [10415-13] 3GPP-Charging-Characteristics

- [10415-16] 3GPP-GGSN-IPv6-Address
- [10415-21] 3GPP-RAT-Type
- [10415-847] GGSN-Address
- [10415-1004] Charging-Rule-Base-Name
- [10415-1247] PDP-Context-Type

The AVPs are included when configured in the **include-avp** context.

By default, these AVPs are included at the command level.

The **no** form of this command resets to the default setting.

## 20.381 psid-offset

psid-offset

### Syntax

**psid-offset** *psid-offset-length*

## no psid-offset

### Context

[Tree] (config>service>nat>map-domain>mapping-rule psid-offset)

### Full Context

configure service nat map-domain mapping-rule psid-offset

### Description

This command configures the length of the high order bits in the protocol port field whose aggregate value should always be greater than 0. This automatically excludes certain ports (such as well-known ports) from the translation.

It is a function of the CE to make sure that the psid-offset bits are always greater than 0. The VSR does not check whether those bits are 0.

### Default

psid-offset 6

### Parameters

#### *psid-offset-length*

Specifies the length of the psid-offset bits in the protocol port field.

**Values** 0 to 16

### Platforms

VSR

## Description

Commands in this context configure parameters for IEEE 1588-2008, *Precision Time Protocol*.

This command is only available on the control assemblies that support 1588.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

```
ptp
```

## Syntax

```
ptp
```

## Context

[\[Tree\]](#) (config>system>sync-if-timing ptp)

## Full Context

configure system sync-if-timing ptp

## Description

Commands in this context configure parameters for system timing via IEEE 1588-2008, Precision Time Protocol.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.384 ptp-asymmetry

### ptp-asymmetry

## Syntax

**ptp-asymmetry** *nanoseconds*

**no ptp-asymmetry**

## Context

[\[Tree\]](#) (config>port>ethernet ptp-asymmetry)

## Full Context

configure port ethernet ptp-asymmetry

## Description

This command configures the PTP asymmetry delay on an Ethernet port. The command is used to correct for known asymmetry as part of time of day or phase recovery using PTP packets on both local and downstream PTP clocks.

## Default

no ptp-asymmetry

## Parameters

### *nanoseconds*

Specifies the value, in nanoseconds, that the forward path delay varies from the mean path delay; the value can be a negative number.

**Values** -2147483648 to 2147483647

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.385 ptp-hw-assist

```
ptp-hw-assist
```

### Syntax

```
[no] ptp-hw-assist
```

### Context

[\[Tree\]](#) (config>service>ies>if ptp-hw-assist)

### Full Context

```
configure service ies interface ptp-hw-assist
```

### Description

This command configures the 1588 port based timestamping assist function for the interface. This capability is supported on a specific set of hardware. The command may be blocked if not all hardware has the required level of support.

Only one interface per physical port can have ptp-hw-assist enabled.

```
no ptp-hw-assist
```

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

```
ptp-hw-assist
```

### Syntax

```
[no] ptp-hw-assist
```

### Context

[\[Tree\]](#) (config>service>vprn>if ptp-hw-assist)

### Full Context

```
configure service vprn interface ptp-hw-assist
```

### Description

This command configures the 1588 port based timestamping assist function for the interface. This capability is supported on a specific set of hardware. The command may be blocked if not all hardware has the required level of support.

If the SAP configuration of the interface is removed, the ptp-hw-assist configuration will be removed.

If the IPv4 address configuration of the interface is removed, the ptp-hw-assist configuration will be removed.

Only one interface per physical port can have ptp-hw-assist enabled.

**Default**

no ptp-hw-assist

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**ptp-hw-assist****Syntax**

[no] ptp-hw-assist

**Context**

[\[Tree\]](#) (config>router>if ptp-hw-assist)

**Full Context**

configure router interface ptp-hw-assist

**Description**

This command configures the 1588 port based timestamping assist function for the interface. Various checks are performed to ensure that this feature can be enabled. If a check fails:

- The command is blocked/rejected with an appropriate error message.
- If the SAP configuration of the interface is removed, the ptp-hw-assist configuration will be removed.
- If the IPv4 address configuration of the interface is removed, the ptp-hw-assist configuration will be removed.

The port will validate the destination IP address on received 1588 messages. If the 1588 messages are sent to a loopback address within the node rather than the address of the interface, then the loopback address must be configured in the **config>system>security>source-address application ptp** context.

**Default**

no ptp-hw-assist

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.386 ptp-tc

## ptp-tc

### Syntax

[no] ptp-tc

### Context

[\[Tree\]](#) (config>system>satellite>eth-sat ptp-tc)

### Full Context

configure system satellite eth-sat ptp-tc

### Description

This command enables the ethernet satellite IEEE1588 transparent clock function. This function works with the SR OS host router configured as a PTP ordinary clock or boundary clock. This provides increased accuracy on the PTP event messages transiting the satellite. When a IEEE1588 event message transits the ethernet satellite, the correction field of the message is updated with the residence time of that message. This is used in PTP time calculations. All ports of the satellite are enabled for this capability with the one setting. This feature must be enabled to allow the assignment of one of the satellite's client ports as a PTP port under **config>system>ptp>port**. This feature is only valid when using PTP over Ethernet encapsulation; it is not valid for PTP over IP encapsulation.

To enable this command, the satellite must have first been configured to support the feature using the **config>system>satellite>eth-sat>feature transparent-clock-eth** and must have been enabled for synchronous ethernet with **config>system>satellite>eth-sat>sync-e**.

All host ports connecting to this satellite must support 1588 port-based timestamping.

The **no** version of this command disables the specific satellite functionality.

### Default

no ptp-tc

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.387 ptsf

## ptsf

### Syntax

ptsf

### Context

[\[Tree\]](#) (config>system>ptp ptsf)

**Full Context**

configure system ptp ptsf

**Description**

Commands in this context configure PTSF-unusable configuration.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.388 public-key-authentication

public-key-authentication

**Syntax**

[no] public-key-authentication

**Context**

[\[Tree\]](#) (config>system>security>ldap public-key-authentication)

**Full Context**

configure system security ldap public-key-authentication

**Description**

This command enables public key retrieval from the LDAP server. If disabled (**no public-key-authentication**), password authentication is attempted via LDAP.

**Default**

no public-key-authentication

**Platforms**

All

## 20.389 public-key-min-bits

public-key-min-bits

**Syntax**

public-key-min-bits *bits*

no public-key-min-bits

## Context

[\[Tree\]](#) (config>service>ies>if>ipv6>secure-nd public-key-min-bits)

## Full Context

configure service ies interface ipv6 secure-nd public-key-min-bits

## Description

This command configures the minimum acceptable key length for public keys used in the generation of a Cryptographically Generated Address (CGA).

## Parameters

### *bits*

Specifies the number of bits.

**Values** 512 to 1024

## Platforms

All

## public-key-min-bits

## Syntax

**public-key-min-bits** *bits*

**[no] public-key-min-bits**

## Context

[\[Tree\]](#) (config>service>vprn>if>secure-nd public-key-min-bits)

## Full Context

configure service vprn interface secure-nd public-key-min-bits

## Description

This command configures the minimum acceptable key length for public keys used in the generation of a Cryptographically Generated Address (CGA).

## Parameters

### *bits*

Specifies the number of bits.

**Values** 512 to 1024

## public-key-min-bits

### Syntax

**public-key-min-bits** *bits*

**no public-key-min-bits**

### Context

[\[Tree\]](#) (config>router>if>ipv6>secure-nd public-key-min-bits)

### Full Context

configure router interface ipv6 secure-nd public-key-min-bits

### Description

This command configures the minimum acceptable key length for public keys used in the generation of a Cryptographically Generated Address (CGA).

### Parameters

***bits***

Specifies the number of bits.

**Values** 512 to 1024

### Platforms

All

## 20.390 public-keys

## public-keys

### Syntax

**public-keys**

### Context

[\[Tree\]](#) (config>system>security>user public-keys)

### Full Context

configure system security user public-keys

### Description

This command allows the user to enter the context to configure public keys for SSH.

## Platforms

All

## 20.391 public-tcp-mss-adjust

```
public-tcp-mss-adjust
```

### Syntax

```
public-tcp-mss-adjust octets
```

```
public-tcp-mss-adjust default
```

```
no public-tcp-mss-adjust
```

### Context

```
[Tree] (config>service>vprn>l2tp>l2tpv3 public-tcp-mss-adjust)
```

```
[Tree] (config>service>vprn>l2tp>group>l2tpv3 public-tcp-mss-adjust)
```

```
[Tree] (config>router>l2tp>group>l2tpv3 public-tcp-mss-adjust)
```

```
[Tree] (config>service>vprn>l2tp>group>tunnel>l2tpv3 public-tcp-mss-adjust)
```

### Full Context

```
configure service vprn l2tp l2tpv3 public-tcp-mss-adjust
```

```
configure service vprn l2tp group l2tpv3 public-tcp-mss-adjust
```

```
configure router l2tp group l2tpv3 public-tcp-mss-adjust
```

```
configure service vprn l2tp group tunnel l2tpv3 public-tcp-mss-adjust
```

### Description

This command enables TCP MSS adjust for L2TPv3 tunnels on the public side on the group or tunnel level. When the command is configured, the system updates the TCP MSS option value of the received TCP SYN packet on the public side that is encapsulated in the L2TPv3 tunnel.

Note that this command can be overridden by the corresponding configuration on the group or tunnel level.

With the **default** parameter, the system uses the upper level configuration. With the non-default parameter, the system uses this configuration instead of the upper level configuration.

The **no** form of this command disables TCP MSS adjust on the public side.

### Default

```
no public-tcp-mss-adjust
```

### Parameters

**octets**

Specifies the new TCP MSS value in octets

**Values** 512 to 9000

**default**

Specifies to use the upper-level configuration

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## public-tcp-mss-adjust

**Syntax**

**public-tcp-mss-adjust** *bytes*

**public-tcp-mss-adjust** *octets*

**public-tcp-mss-adjust** **auto**

**no public-tcp-mss-adjust**

**Context**

**[Tree]** (config>service>vprn>if>ipsec>ipsec-tunnel public-tcp-mss-adjust)

**[Tree]** (config>service>ies>if>ipsec>ipsec-tunnel public-tcp-mss-adjust)

**[Tree]** (config>service>ies>if>sap>ip-tunnel public-tcp-mss-adjust)

**[Tree]** (config>service>vprn>if>sap>ipsec-tun public-tcp-mss-adjust)

**[Tree]** (config>ipsec>tnl-temp public-tcp-mss-adjust)

**[Tree]** (config>service>vprn>if>ip-tunnel public-tcp-mss-adjust)

**[Tree]** (config>router>if>ipsec>ipsec-tunnel public-tcp-mss-adjust)

**Full Context**

configure service vprn interface ipsec ipsec-tunnel public-tcp-mss-adjust

configure service ies interface ipsec ipsec-tunnel public-tcp-mss-adjust

configure service ies interface sap ip-tunnel public-tcp-mss-adjust

configure service vprn interface sap ipsec-tunnel public-tcp-mss-adjust

configure ipsec tunnel-template public-tcp-mss-adjust

configure service vprn interface ip-tunnel public-tcp-mss-adjust

configure router interface ipsec ipsec-tunnel public-tcp-mss-adjust

**Description**

This command enables the Maximum Segment Size (MSS) for the TCP traffic in an IPsec tunnel which is sent from the public network to the private network. The system may use this value to adjust or insert the MSS option in TCP SYN packet.

If the **auto** parameter is specified, the system derives the new MSS value based on the public MTU and IPsec overhead.

The **no** form of this command disables TCP MSS adjust on the public side.

### Default

no public-tcp-mss-adjust

### Parameters

#### **auto**

Derive the new MSS value based on the public MTU and IPsec overhead.

#### **bytes**

Specifies the new TCP MSS value in bytes.

**Values** 512 to 9000

#### **octets**

Specifies the new TCP MSS value in octets

**Values** 512 to 9000

### Platforms

VSR

- configure service vprn interface ipsec ipsec-tunnel public-tcp-mss-adjust
- configure service ies interface ipsec ipsec-tunnel public-tcp-mss-adjust
- configure router interface ipsec ipsec-tunnel public-tcp-mss-adjust

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service ies interface sap ip-tunnel public-tcp-mss-adjust
- configure service vprn interface sap ipsec-tunnel public-tcp-mss-adjust
- configure ipsec tunnel-template public-tcp-mss-adjust

## 20.392 purge-timeout

purge-timeout

### Syntax

purge-timeout *seconds*

no purge-timeout

### Context

[\[Tree\]](#) (config>system>grpc>rib-api purge-timeout)

## Full Context

```
configure system grpc rib-api purge-timeout
```

## Description

This command configures the purge timeout associated with the RibApi gRPC service.

If a gRPC client used the RibApi gRPC service to program RIB entries into the router, and then the TCP connection drops for any reason, the associated RIB entries are immediately marked as stale and a timer with the **purge-timeout** value is started. Upon timer expiration, all of the stale entries are removed. While the timer is running, the stale entries remain valid and usable for forwarding but are less preferred than any non-stale entry. The **purge-timeout** gives an opportunity for the disconnected client, or some other client, to re-program the necessary RIB entries so that forwarding can continue uninterrupted.

The **no** form of this command resets to the default value of 0. Entries are immediately deleted when the TCP connection drops.

## Default

```
no purge-timeout
```

## Parameters

### *seconds*

Specifies the number of seconds until the stale entries are purged.

**Values** 1 to 100 000

**Default** 0

## Platforms

All

## 20.393 purge-timer

```
purge-timer
```

## Syntax

```
purge-timer minutes
```

```
no purge-timer
```

## Context

[\[Tree\]](#) (config>router>bgp purge-timer)

## Full Context

```
configure router bgp purge-timer
```

## Description

When the system sends a VPN-IP Route-Refresh to a peer it sets all the VPN-IP routes received from that peer (in the RIB-IN) to stale and starts the purge-timer. If the routes are not updated (refreshed) before the purge-timer has expired then the routes are removed.

The BGP purge timer configures the time before stale routes are purged.

The **no** form of this command reverts to the default.

## Default

purge-timer 10

## Parameters

### *minutes*

Specifies the maximum time before stale routes are purged.

**Values** 1 to 60

## Platforms

All

## 20.394 push

```
push
```

## Syntax

```
push {label | implicit-null-label} nexthop ip-address
```

```
no push {out-label | implicit-null-label}
```

## Context

[\[Tree\]](#) (config>router>mpls>static-lsp push)

## Full Context

```
configure router mpls static-lsp push
```

## Description

This command specifies the label to be pushed on the label stack and the next hop IP address for the static LSP.

The **no** form of this command removes the association of the label to push for the static LSP.

## Parameters

### *implicit-null-label*

Specifies the use of the implicit label value for the push operation.

**label**

The label to push on the label stack. Label values 16 through 1,048,575 are defined as follows:

- label values 16 through 31 are reserved
- label values 32 through 1,023 are available for static assignment
- label values 1,024 through 2,047 are reserved for future use
- label values 2,048 through 18,431 are statically assigned for services
- label values 28,672 through 131,071 are dynamically assigned for both MPLS and services
- label values 131,072 through 1,048,575 are reserved for future use

**Values** 16 to 1048575

**nexthop ip-address**

Specifies the IP address of the next hop towards the LSP egress router. If an ARP entry for the next hop exists, then the static LSP is marked operational. If ARP entry does not exist, software sets the operational status of the static LSP to down and continues to ARP for the configured nexthop. Software continuously tries to ARP for the configured nexthop at a fixed interval.

**Platforms**

All

**20.395 pushed-labels****pushed-labels****Syntax**

**pushed-labels** *label* [*label*]

**no pushed-labels**

**Context**

**[Tree]** (config>router>mpls>fwd-policies>fwd-policy>nh-grp>pri pushed-labels)

**[Tree]** (config>router>mpls>fwd-policies>fwd-policy>nh-grp>bkup pushed-labels)

**Full Context**

configure router mpls forwarding-policies forwarding-policy next-hop-group primary-next-hop pushed-labels

configure router mpls forwarding-policies forwarding-policy next-hop-group backup-next-hop pushed-labels

## Description

This command configures the pushed label stack for the primary or backup next hop of a next-hop group of an MPLS forwarding policy.

The **no** form of this command removes the pushed label stack.

## Parameters

### *label*

Specifies the label value; up to a maximum of 10 labels.

**Values** 0 to 1048575

## Platforms

All

## 20.396 pw-cap-list

### pw-cap-list

## Syntax

**pw-cap-list** {**ethernet** | **ethernet-vlan**} [{ **ethernet** | **ethernet-vlan**}]

**no pw-cap-list**

## Context

[\[Tree\]](#) (config>service>vprn>l2tp>group>l2tpv3 pw-cap-list)

## Full Context

configure service vprn l2tp group l2tpv3 pw-cap-list

## Description

This command configures the allowable pseudowire capability list that is advertised to the far end. An empty list results in both pseudowire capabilities being advertised. Up to two capabilities are allowed to be advertised.

The **no** form of this command removes the list and advertises both pseudowire capabilities to the far end.

## Default

no pw-cap-list

## Parameters

### **ethernet**

Specifies that the Ethernet pseudo-wire type is advertised.

### **ethernet-vlan**

Specifies that the Ethernet-VLAN pseudo-wire type is advertised.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 20.397 pw-path-id

```
pw-path-id
```

### Syntax

```
[no] pw-path-id
```

### Context

**[Tree]** (config>service>epipe>spoke-sdp pw-path-id)

**[Tree]** (config>service>vprn>if>spoke-sdp pw-path-id)

**[Tree]** (config>service>vpls>spoke-sdp pw-path-id)

**[Tree]** (config>service>cpipe>spoke-sdp pw-path-id)

**[Tree]** (config>service>ies>if>spoke-sdp pw-path-id)

**[Tree]** (config>service>vprn>red-if>spoke-sdp pw-path-id)

### Full Context

```
configure service epipe spoke-sdp pw-path-id
```

```
configure service vprn interface spoke-sdp pw-path-id
```

```
configure service vpls spoke-sdp pw-path-id
```

```
configure service cpipe spoke-sdp pw-path-id
```

```
configure service ies interface spoke-sdp pw-path-id
```

```
configure service vprn redundant-interface spoke-sdp pw-path-id
```

### Description

Commands in this context configure an MPLS-TP Pseudowire Path Identifier for a spoke-sdp. All elements of the PW path ID must be configured in order to enable a spoke-sdp with a PW path ID.

For an IES or VPRN spoke-sdp, the pw-path-id is only valid for ethernet spoke-sdps.

The **pw-path-id** is only configurable if all of the following is true:

- SDP signaling is off
- control-word is enabled (control-word is disabled by default)
- the service type is Epipe, VPLS, Cpipe, or IES/VPRN interface
- mate SDP signaling is off for vc-switched services

The **no** form of this command deletes the PW path ID.

## Default

no pw-path-id

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure service vprn interface spoke-sdp pw-path-id
- configure service cpipe spoke-sdp pw-path-id
- configure service vpls spoke-sdp pw-path-id
- configure service epipe spoke-sdp pw-path-id
- configure service ies interface spoke-sdp pw-path-id

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

- configure service vprn redundant-interface spoke-sdp pw-path-id

## pw-path-id

## Syntax

[no] pw-path-id

## Context

[\[Tree\]](#) (config>mirror>mirror-dest>remote-src>spoke-sdp pw-path-id)

[\[Tree\]](#) (config>mirror>mirror-dest>spoke-sdp pw-path-id)

## Full Context

configure mirror mirror-dest remote-source spoke-sdp pw-path-id

configure mirror mirror-dest spoke-sdp pw-path-id

## Description

Commands in this context configure an MPLS-TP Pseudowire Path Identifier for a spoke SDP. All elements of the PW path ID must be configured in order to enable a spoke SDP with a PW path ID.

For an IES or VPRN spoke SDP, the *pw-path-id* is only valid for Ethernet spoke SDPs.

The **pw-path-id** is only configurable if all of the following is true:

- SDP signaling is off
- control-word is enabled (control-word is disabled by default)
- the service type is Epipe, Cpipe, Apipe, IES, VPLS, or VPRN interface
- mate SDP signaling is off for VC-switched services

The **no** form of this command deletes the PW path ID.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 20.398 pw-port

```
pw-port
```

### Syntax

```
pw-port pw-port-id [pw-headend]
```

```
no pw-port
```

### Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg pw-port)

### Full Context

```
configure service system bgp-evpn ethernet-segment pw-port
```

### Description

This command configures a PW port associated to the Ethernet Segment. When the Ethernet Segment is configured as **all-active**, only a LAG or a PW port can be associated to the Ethernet Segment. When the Ethernet Segment is configured as **single-active**, then a LAG, port or SDP can be associated to the Ethernet Segment, but not a PW port unless the **pw-headend** parameter is configured. In either case, only one of the four objects can be configured in the Ethernet Segment. A specified PW port can be part of only one Ethernet Segment.

The **no** version of this command removes the PW port from the Ethernet Segment.

### Default

```
no pw-port
```

### Parameters

#### *pw-port-id*

Specifies the PW port identifier.

**Values** 1 to 32767

#### **pw-headend**

Keyword used to specify multihoming procedures are run in the PW port stitching Epipe and the routes advertised in the context of the stitching Epipe contain the ESI of the Ethernet Segment.

### Platforms

All

## pw-port

### Syntax

**pw-port** *id* [**create**]

**no pw-port** *id*

### Context

[\[Tree\]](#) (config pw-port)

### Full Context

configure pw-port

### Description

This command creates a PW port that can be bound to a physical port or associated with an FPE (anchored PW port). A PW port's purpose is to provide, through a PW SAP, access level (or SAP level) capability to customer traffic that is tunneled to the SR OS node through an IP/MPLS network.

The **no** form of this command removes the **pw-port** ID.

### Default

no pw-port

### Parameters

*id*

Specifies the ID of the PW port.

**Values** 1 to 32767

**create**

Keyword required to create the configuration context.

### Platforms

All

## pw-port

### Syntax

**pw-port** *pw-port-id* [**vc-id** *vc-id*] [**create**]

**no pw-port** *pw-port-id*

### Context

[\[Tree\]](#) (config>service>sdp>binding pw-port)

## Full Context

```
configure service sdp binding pw-port
```

## Description

This command creates a pseudowire port.

The **no** form of the command removes the pseudowire port ID from the configuration.

## Parameters

### *pw-port-id*

Specifies a unique identifier of the pseudowire port.

**Values** 1 to 10239

### *vc-id*

Specifies a virtual circuit identifier signaled to the peer.

**Values** 1 to 4294967295

### **create**

This keyword is required when a new pseudowire is being created.

## Platforms

All

## pw-port

## Syntax

```
pw-port pw-port-id [fpe fpe-id] [create]
```

```
no pw-port
```

## Context

[\[Tree\]](#) (config>service>epipe pw-port)

## Full Context

```
configure service epipe pw-port
```

## Description

This command is used to associate the PW-port with the PXC ports or PXC based LAGs referenced in the FPE. That is, the PW-port becomes anchored by the PXC. This enables an external PW that is mapped to the anchored PW-port to be seamlessly rerouted between the I/O ports without interruption of service on the PW-port. This mapping between the external PW (spoke SDP) and the PXC based PXC-port is performed via an Epipe operating in vc-switching mode (creation time parameter).

## Default

```
no pw-port
```

## Parameters

### *pw-port-id*

Specifies the PW-port associated with this service.

**Values** 1 to 10239

### *fpe fpe-id*

Specifies the FPE object which contains the PXC-based ports or PXC-based LAGs.

**Values** 1 to 64

## Platforms

All

## pw-port

## Syntax

**pw-port** *pw-port-id* [**fpe** *fpe-id*] [**create**]

**no pw-port**

## Context

[\[Tree\]](#) (config>service>epipe pw-port)

## Full Context

configure service epipe pw-port

## Description

This command is only applicable for VSR configurations. This command associates a Flex PW port with any of the following constructs:

- an MPLS-based spoke SDP (PW)
- L2oGRE tunnel using IPv4 or IPv6 transport

With this configuration, a PW that is terminated on a Flex PW port can be seamlessly rerouted between I/O ports.

The payload from the PW is extracted from the Flex PW port and processed in accordance with the configured application (a capture SAP in ESM, a PW SAP for business services, and so on). The Epipe that associates the Flex PW port with the spoke SDP or with the tunnel is a regular Epipe service (not of type *vc-switching*).

This command must be configured before a spoke SDP is added to the Epipe.

The **no** form of this command removes the *pw-port-id* from the configuration.

## Parameters

### *pw-port-id*

Specifies the PW port associated with the PW.

**Values** 1 to 32767

**fpe-id**

Specifies the FPE object.

**Values** 1 to 64

**create**

Keyword required to create the configuration context.

**Platforms**

All

## 20.399 pw-port-extension

### pw-port-extension

**Syntax**

[no] pw-port-extension

**Context**

[\[Tree\]](#) (config>fwd-path-ext>fpe pw-port-extension)

**Full Context**

configure fwd-path-ext fpe pw-port-extension

**Description**

Commands in this context configure the type of the cross-connect required to terminate an external tunnel to an anchored PW port. The system automatically builds the internal infrastructure required to perform the tunnel termination on a PW port.

PW ports support the following types of tunnels:

- GRE/MPLS PW with SDP of type MPLS or GRE
- L2oGRE bridged Ethernet over GRE, where GRE protocol number is 0x6558

The **no** form of this command removes the cross-connect type from the configuration.

**Default**

no pw-port-extension

**Platforms**

All

## 20.400 pw-port-list

pw-port-list

### Syntax

pw-port-list

### Context

[\[Tree\]](#) (config>service>system pw-port-list)

### Full Context

configure service system pw-port-list

### Description

Commands in this context configure a port list to bind to Flex PW ports.

### Platforms

VSR

## 20.401 pw-routing

pw-routing

### Syntax

pw-routing

### Context

[\[Tree\]](#) (config>service pw-routing)

### Full Context

configure service pw-routing

### Description

Commands in this context configure dynamic multi-segment pseudowire (MS-PW) routing. Pseudowire routing must be configured on each node that will be a T-PE or an S-PE.

### Platforms

All

## 20.402 pw-sap-secondary-shaper

```
pw-sap-secondary-shaper
```

### Syntax

```
pw-sap-secondary-shaper pw-sap-sec-shaper-name  
no pw-sap-secondary-shaper
```

### Context

[\[Tree\]](#) (config>service>sdp>binding>pw-port>egress>shaper pw-sap-secondary-shaper)

### Full Context

```
configure service sdp binding pw-port egress shaper pw-sap-secondary-shaper
```

### Description

This command configures a default secondary shaper applicable to pw-saps under normal interfaces. The **no** form of the command removes the shaper name from the configuration.

### Platforms

All

## 20.403 pw-status-signaling

```
pw-status-signaling
```

### Syntax

```
[no] pw-status-signaling
```

### Context

[\[Tree\]](#) (config>service>epipe>spoke-sdp pw-status-signaling)

### Full Context

```
configure service epipe spoke-sdp pw-status-signaling
```

### Description

This command enables pseudowire status signaling for this spoke SDP binding. The **no** form of this command disables the status signaling.

**Default**

pw-status-signaling

**Platforms**

All

pw-status-signaling

**Syntax**

[no] pw-status-signaling

**Context**

[\[Tree\]](#) (config>service>vpls>spoke-sdp pw-status-signaling)

**Full Context**

configure service vpls spoke-sdp pw-status-signaling

**Description**

This command specifies the type of signaling used by this multi-segment pseudowire provider-edge for this service.

When no pw-status-signaling is enabled, a 7450 ESS, 7750 SR, and 7950 XRS will not include the pseudowire status TLV in the initial label mapping message of the pseudowire used for a spoke-SDP. This will force both 7450 ESS, 7750 SR, and 7950 XRS PEs to use the pseudowire label withdrawal method for signaling pseudowire status.

If pw-status-signaling is configured, the node will include the use of the pseudowire status TLV in the initial label mapping message for the pseudowire.

**Platforms**

All

## 20.404 pw-template

pw-template

**Syntax**

**pw-template** *policy-id* [use-provisioned-sdp | [prefer-provisioned-sdp] [auto-gre-sdp] ][create] [ name *name*]

**no pw-template** *policy-id*

**Context**

[\[Tree\]](#) (config>service pw-template)

## Full Context

configure service pw-template

## Description

This command configures an SDP template.

## Parameters

### *policy-id*

Specifies a number that uniquely identifies a template for the creation of an SDP.

**Values** *policy-id*: 1 to 2147483647

### **use-provisioned-sdp**

Specifies whether to use an already provisioned SDP. When specified, the tunnel manager is consulted for an existing active SDP (with a matching far-end address), and the SDP with the lowest metric is chosen. If there are multiple SDPs with the same metric, then the highest SDP identifier that is oper-up is chosen. The choice of SDP can be configured by applying **sdp-include/exclude** in the PW template together with an sdp-group in the provisioned SDPs. This option, and the **auto-gre-sdp** option, are mutually exclusive.

### **prefer-provisioned-sdp**

Specifies that if an existing matching SDP that conforms to any restrictions defined in the **pw-template** is found (for example, **sdp-include/exclude group**), then it will be used, following the same logic as for the **use-provisioned-sdp** parameter. Otherwise, the command will automatically create an SDP in the same manner as if the user did not specify any option. This option and the **use-provisioned-sdp** option are mutually exclusive.

### **auto-gre-sdp**

Specifies that an SDP should automatically be created using a GRE tunnel. This option and the **use-provisioned-sdp** option are mutually exclusive. The PW template parameters **hash-label**, **entropy-label** and **sdp-include/exclude** are ignored when an GRE SDP is auto-created.

### **auto-mpls-sdp**

Specifies that an SDP should automatically be created using an MPLS tunnel. This is the default.

### **create**

This keyword is required when first creating the configuration context. Once the context is created, it is possible to navigate into the context without the **create** keyword.

### **name name**

A name of the operator's choice, up to 64 characters. The name is saved as part of the configuration.

If a name is not specified at creation time, then SR OS assigns a string version of the policy-id as the name.

**Values** *name*: 64 characters maximum

## Platforms

All

## 20.405 pw-template-bind

pw-template-bind

### Syntax

**pw-template-bind** *policy-id*

**no pw-template-bind**

### Context

[\[Tree\]](#) (config>service>epipe>spoke-sdp-fec pw-template-bind)

### Full Context

configure service epipe spoke-sdp-fec pw-template-bind

### Description

This command binds includes the parameters included in a specific PW template to a spoke SDP. The **no** form of this command removes the values from the configuration.

### Parameters

*policy-id*

Specifies the existing policy ID.

**Values** 1 to 2147483647

## Platforms

All

## 20.406 pw-template-binding

pw-template-binding

### Syntax

**pw-template-binding** *policy-id* [**import-rt** { *ext-community* [*ext-community*]}] [**endpoint** *endpoint-name*]

**no pw-template-binding** *policy-id*

## Context

[Tree] (config>service>epipe>bgp pw-template-binding)

## Full Context

configure service epipe bgp pw-template-binding

## Description

This command binds the advertisements received with the route targets (RT) that match the configured list (either the generic or the specified import) to a specific pw-template. If the RT list is not present, or if multiple matches are found, the numerically lowest pw-template is used.

The pw-template-binding applies to BGP-VPWS when enabled in the Epipe.

For BGP VPWS, the following additional rules govern the use of pseudowire-template:

- On transmission, the settings for the L2-Info extended community in the BGP updates are derived from the pseudowire template attributes. If multiple pseudowire template bindings (with or without import-rt) are specified for the same VPWS instance the first pw-template entry will be used for the information in the BGP update sent.
- On reception, the values of the parameters in the L2-Info extended community of the BGP updates are compared with the settings from the corresponding pseudowire template bindings. The following steps are used to determine the local pw-template:
  - The RT values are matched to determine the pw-template. The route targets configured for each pw-template-binding are compared to the route targets within the BGP update. The PW template corresponding to **pw-template-binding** with the first matching route target is used to for the SDP. The matching is performed from the lowest PW template binding identifier to the highest.
  - If no pw-template-binding matches are found from the previous step, the first (numerically lowest) configured pw-template entry without any route-target configured will be used.

If the value used for Layer 2 MTU (unless the value zero is received), or control word does not match, the pseudowire is created but with the operationally down state.

If the value used for the S (sequenced delivery) flag is not zero the pseudowire is not created.

The **tools perform** commands can be used to control the application of changes in pw-template for BGP-VPWS.

The **no** form of this command removes the values from the configuration.

## Parameters

### *policy-id*

Specifies an existing policy ID.

**Values** 1 to 2147483647

### *import-rt ext-comm*

Specifies the communities, up to five, allowed to be accepted from remote PE neighbors. An extended BGP community in the type:x:y format. The value x can be an integer or IP address. The type can be the target or origin.

**Values** target:{ip-addr:comm-val | 2byte-asnumber:ext-comm-val| 4byte-snumber:comm-val}

ip-addr	a.b.c.d
comm-val	0 to 65535
2byte-asnumber	0 to 65535
ext-comm-val	0 to 4294967295
4byte-asnumber	0 to 4294967295

**endpoint-name**

Specifies the name of the endpoint the BGP PW template is associated with, up to 32 characters. When the configured endpoint is associated to the **pw-template-binding** of a BGP VPWS service, EVPN MPLS can also be configured and associated to the same endpoint in the same Epipe service. Modifying this element causes the parent element to be recreated automatically in order for the new value to take effect.

**Platforms**

All

**pw-template-binding****Syntax**

**pw-template-binding** *policy-id* [**split-horizon-group** *group-name*] [**import-rt** {*ext-community*}]

**no pw-template-bind** *policy-id*

**Context**

**[Tree]** (config>service>vpls>bgp pw-template-binding)

**[Tree]** (config>service>vpls>bgp-ad pw-template-binding)

**Full Context**

configure service vpls bgp pw-template-binding

configure service vpls bgp-ad pw-template-binding

**Description**

This command binds the advertisements received with the route target (RT) that matches the configured list (either the generic or the specified import) to a specific PW template. If the RT list is not present the pw-template is used for all of them.

The **pw-template-binding** applies to both BGP-AD and BGP-VPLS if these features are enabled in the VPLS.

For BGP VPLS the following additional rules govern the use of pseudowire-template.

- On transmission, the settings for the L2-Info extended community in the BGP update are derived from the pseudowire template attributes. If multiple pseudowire template bindings (with or without import-rt) are specified, the first pw-template entry will be used for the information in the BGP update sent.

- On reception, the values of the parameters in the L2-Info extended community of the BGP update are compared with the settings from the corresponding pw-template. The following steps are used to determine the local pw-template.
  - The RT values are matched to determine the pw-template. The route targets configured for each pw-template-binding are compared to the route targets within the BGP update. The PW template corresponding to pw-template-binding with the first matching route target is used to for the SDP. The matching is performed from the lowest PW template binding identifier to the highest
  - If no pw-templates matches are found from the previous step, the first (numerically lowest) configured pw-template entry without any route-target configured will be used.

If the values used for Layer 2 MTU (unless the value zero is received) or control word flag do not match, the pseudowire is created but with the operationally down state.

If the value used for the S (sequenced delivery) flag is not zero, the pseudowire is not created.

The tools perform commands can be used to control the application of changes in pw-template for both BGP-AD and BGP-VPLS.

The **no** form of this command removes the values from the configuration.

## Parameters

### *policy-id*

Specifies an existing policy ID

**Values** 1 to 2147483647

### *group-name*

The specified group-name overrides the split horizon group template settings

### *import-rt ext-comm*

Specifies communities allowed to be accepted from remote PE neighbors. An extended BGP community in the **type:x:y** format. The value **x** can be an integer or IP address. The **type** can be the target or origin. **x** and **y** are 16-bit integers. A maximum of five *import-rt ext-com* can be specified.

**Values** target:{*ip-addr:comm-val*| *2byte-asnumber:ext-comm-val*| *4byte-asnumber:comm-val*}  
*ip-addr*: a.b.c.d  
*comm-val*: [0 to 65535]  
*2byte-as-number*: [0 to 65535]  
*ext-comm-val*: [0 to 4294967295]  
*4byte-asnumber*: [0 to 4294967295]

## 20.407 pw-template-id-range

### pw-template-id-range

#### Syntax

```
pw-template-id-range start pw-template-id end pw-template-id  
no pw-template-id-range
```

#### Context

[\[Tree\]](#) (config>service>md-auto-id pw-template-id-range)

#### Full Context

```
configure service md-auto-id pw-template-id-range
```

#### Description

This command specifies the range of IDs used by SR OS to automatically assign an ID to PW templates that are created in model-driven interfaces without an ID explicitly specified by the user or client.

A PW template created with an explicitly-specified ID cannot use an ID in this range. In the classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD interfaces, the range can be changed, which causes any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **config>service md-auto-id** command for further details.

#### Default

```
no pw-template-id-range
```

#### Parameters

##### **start** *pw-template-id*

Specifies the lower value of the ID range. The value must be less than or equal to the **end** value.

**Values** 1 to 2147483647

##### **end** *pw-template-id*

Specifies the upper value of the ID range. The value must be greater than or equal to the **start** value.

**Values** 1 to 2147483647

All

## 20.408 pw-type

```
pw-type
```

### Syntax

```
pw-type ethernet-vlan vlan-id
```

```
pw-type ethernet
```

```
no pw-type
```

### Context

[\[Tree\]](#) (config>service>vpls>sap>l2tpv3-session pw-type)

[\[Tree\]](#) (config>service>epipe>sap>l2tpv3-session pw-type)

### Full Context

```
configure service vpls sap l2tpv3-session pw-type
```

```
configure service epipe sap l2tpv3-session pw-type
```

### Description

This command specifies the PW-type for the associated L2TPv3 session.

The support types are either Ethernet or Ethernet-VLAN. If Ethernet-VLAN is configured, a VLAN value must be specified as well.

The **no** form of this command deletes the PW-type configuration.

### Parameters

*vlan-id*

Specifies the VLAN-ID.

### Platforms

All

## 20.409 pwc

```
pwc
```

### Syntax

```
pwc [previous]
```

## Context

[Tree] (pwc)

## Full Context

pwc

## Description

This command displays the present or previous working context of the CLI session. The **pwc** command provides a user who is in the process of dynamically configuring a chassis a way to display the current or previous working context of the CLI session. The **pwc** command displays a list of the CLI nodes that hierarchically define the current context of the CLI instance of the user.

The following example is from a 7750 SR:

```
A:ALA-1>config>router>bgp>group# pwc
-----
Present Working Context :
-----
<root>
  configure
  router Base
  bgp
  group test
  ospf
  area 1
-----
A:ALA-1>config>router>bgp>group#
```

When the **previous** keyword is specified, the previous context displays. This is the context entered by the CLI parser upon execution of the **exit** command. The current context of the CLI is not affected by the **pwc** command.

The following example is from a 7450 ESS:

```
*A:ALA-1>config>router>ospf>area>if# pwc previous
-----
Previous Working Context :
-----
<root>
  configure
  router "Base"
  ospf
  area "0.0.0.0"
-----
*A:ALA-1config>router>ospf>area>if#
```

## Parameters

### previous

Displays the previous present working context.

## Platforms

All

## 20.410 pxc

```
pxc
```

### Syntax

```
pxc pxc-id [create]
```

```
no pxc pxc-id
```

### Context

[\[Tree\]](#) (config>port-xc pxc)

### Full Context

```
configure port-xc pxc
```

### Description

This command creates a port cross-connect (PXC) object. Referencing an Ethernet port within the PXC object will automatically configure this Ethernet port as a loopback port. The node will automatically create two PXC sub-ports under this Ethernet port. The configuration of PXC sub-ports can be accessed through the CLI.

### Parameters

*pxc-id*

Specifies the port cross-connect identifier.

**Values** 1 to 64

### Platforms

All

## 20.411 pxc-pxc-id.sub-port-id

```
pxc-pxc-id.sub-port-id
```

### Syntax

```
pxc-pxc-id.sub-port-id
```

### Context

[\[Tree\]](#) (config>port pxc-pxc-id.sub-port-id)

## Full Context

```
configure port pxc-pxc-id.sub-port-id
```

## Description

This command enables access to PXC sub-port level parameters. The PXC sub-ports are automatically created once the external Ethernet port is configured inside of an PXC object. The PXC sub-ports are by default administratively disabled (shutdown). In order for PXC sub-ports to become operational, both, the underlying external Ethernet port and the PXC object must be operationally up.

## Parameters

### *pxc-id*

Specifies the unique identifier of this PXC.

**Values** 1 to 64

### *sub-port-id*

When this the *pxc-id* is configured, two logical sub-ports are automatically created. These logical sub-ports are used to create two paths within the loop; one upstream path, and one downstream path. These sub-ports are destroyed when either this PXC row is destroyed, this object is de-provisioned.

**Values** a, b

### Description

This command specifies the Python policy for MGW profile packets sent/received on the group interface.

The **no** form of this command removes the policy name from the configuration.

### Default

no python-policy

### Parameters

#### *name*

Specifies an existing Python policy name up to 32 characters.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## python-policy

### Syntax

**python-policy** [*policy-name*]

**no python-policy**

### Context

[\[Tree\]](#) (config>aaa>diam>node python-policy)

### Full Context

configure aaa diameter node python-policy

### Description

This command specified the python-policy for Diameter messages received or transmitted.

The **no** form of this command reverts to the default.

### Parameters

#### *policy-name*

Specifies the name of the Python policy, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## python-policy

### Syntax

**python-policy** *name* [**create**] [**wlan-gw-group** *wlan-gw-group-id*] [**nat-group** *nat-group-id*]

**no python-policy** *name*

### Context

**[Tree]** (config>python python-policy)

### Full Context

configure python python-policy

### Description

This command creates a new Python policy or enables an existing Python policy configuration context.

There are two types of Python policies: centralized and distributed. A centralized Python policy runs on a CPM, while a distributed Python policy runs on an ISA. With the distributed Python policy, a **wlan-gw-group** *wlan-gw-group-id* or a **nat-group** *nat-group-id* command must be specified.

The **no** form of this command removes the Python policy from the configuration.

### Parameters

#### *name*

Specifies the Python policy name up to 32 characters.

#### **create**

This keyword is required when first creating the Python policy. Once the context is created, it is possible to navigate into the context without the **create** keyword.

#### **wlan-gw-group** *wlan-gw-group-id*

Specifies the ID of the WLAN GW group that the distributed python-policy installs.

#### **nat-group** *nat-group-id*

Specifies the ID of the NAT group that the distributed python-policy installs.

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>ipv4>dhcp4 python-policy)

## Full Context

configure service vpn subscriber-interface group-interface ipv4 dhcp4 python-policy

configure service ies subscriber-interface group-interface ipv4 dhcp4 python-policy

## Description

This command specified the Python policy for DHCPv4 packets sent/received on the group interface.

The **no** form of this command removes the policy name from the configuration.

## Parameters

### *name*

Specifies an existing Python policy name, up to 32 characters.

## python-policy

### Syntax

**python-policy** *name*

**no python-policy**

### Context

**[Tree]** (config>service>vprn>sub-if>grp-if>ipv6>dhcp6 python-policy)

**[Tree]** (config>service>ies>sub-if>grp-if>ipv6>dhcp6 python-policy)

### Full Context

configure service vprn subscriber-interface group-interface ipv6 dhcp6 python-policy

configure service ies subscriber-interface group-interface ipv6 dhcp6 python-policy

### Description

This command specified the Python policy for DHCPv6 packets sent/received on the group interface.

The **no** form of this command removes the policy name from the configuration.

### Parameters

*name*

Specifies an existing Python policy name, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## python-policy

### Syntax

**python-policy** *name*

**no python-policy**

### Context

**[Tree]** (config>aaa>radius-srv-plcy python-policy)

### Full Context

configure aaa radius-server-policy python-policy

### Description

This command specifies the Python policy for RADIUS packets to/from the RADIUS servers defined in the specified **radius-server-policy**.

The **no** form of this command removes the policy name from the configuration.

### Parameters

*name*

Specifies the name of the Python policy, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## python-policy

### Syntax

**python-policy** *name*

**no python-policy**

### Context

[\[Tree\]](#) (config>service>vpn>radius-proxy>server python-policy)

[\[Tree\]](#) (config>router>radius-proxy>server python-policy)

### Full Context

configure service vpn radius-proxy server python-policy

configure router radius-proxy server python-policy

### Description

This command specifies the Python policy for RADIUS packets sent/received on the client side of the RADIUS proxy server.

This command supports RADIUS proxy on both CPMs and ISAs.

The **no** form of this command removes the policy name from the configuration.

### Parameters

*name*

Specifies the name of the Python policy, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## python-policy

### Syntax

**python-policy** *name*

**no python-policy**

## Context

[\[Tree\]](#) (config>subscr-mgmt>pppoe-client-policy python-policy)

## Full Context

configure subscriber-mgmt pppoe-client-policy python-policy

## Description

This command applies a Python policy to all messages sent and received by the PPPoE client.

The **no** form of this command removes the associated Python policy from the PPPoE client.

## Parameters

*name*

The name of a preconfigured Python policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## python-policy

## Syntax

**python-policy** *name*

**no python-policy**

## Context

[\[Tree\]](#) (config>service>vprn>if>ipv6 python-policy)

## Full Context

configure service vprn interface ipv6 python-policy

## Description

This command specifies a python policy. Python policies are configured in the **config>python> python-policy** *name* context.

## Parameters

*name*

Specifies the name of an existing python script, up to 32 characters in length.

## Platforms

All

## python-policy

### Syntax

**python-policy** *python-policy-name*

**no python-policy**

### Context

[\[Tree\]](#) (config>router>if>dhcp python-policy)

### Full Context

configure router interface dhcp python-policy

### Description

This command specifies a python policy. Python policies are configured in the **config>python>python-policy** *name* context.

### Default

no python-policy

### Parameters

***python-policy-name***

Specifies the name of an existing python script, up to 32 characters in length.

### Platforms

All

## python-policy

### Syntax

**python-policy** *policy-name*

**no python-policy**

### Context

[\[Tree\]](#) (config>log>log-id python-policy)

### Full Context

configure log log-id python-policy

### Description

This command associates the Python script with the events sent to this log ID. The Python policy can be associated with the log only if the destination in the log ID is set to **syslog**.

For information about Python policy configuration, refer to the Python Script Support for ESM in the *7450 ESS, 7750 SR, and VSR Triple Play Service Delivery Architecture Guide*.

The **no** form of this command disables Python processing of the events in this log ID.

**Default**

no python-policy

**Parameters*****policy-name***

Specifies a Python policy name, up to 32 characters.

**Platforms**

All

## 20.414 python-policy-cache

python-policy-cache

**Syntax**

python-policy-cache

**Context**

[\[Tree\]](#) (config>system>persistence python-policy-cache)

**Full Context**

configure system persistence python-policy-cache

**Description**

This command configures Python policy cache persistency parameters.

**Platforms**

All

## 20.415 python-script

python-script

**Syntax**

python-script *name* [create]

**no python-script** *name*

### Context

[\[Tree\]](#) (config>python python-script)

### Full Context

configure python python-script

### Description

Commands in this context configure Python scripts to modify messages of different protocols.

The **no** form of this command removes the Python script name from the configuration.

### Parameters

#### **name**

Specifies the name of this Python script policy.

#### **create**

This keyword is required when first creating the Python script. Once the context is created, it is possible to navigate into the context without the **create** keyword.

### Platforms

All

## python-script

### Syntax

**python-script** *script-name*

### Context

[\[Tree\]](#) (debug>python python-script)

### Full Context

debug python python-script

### Description

Commands in this context debug the specified Python script.

### Parameters

#### ***policy-name***

Specifies the Python script name, up to 32 characters.

### Platforms

All

## 21 q Commands

### 21.1 q-tag-range

#### q-tag-range

##### Syntax

**q-tag-range** *qtag1* [to *qtag1*]

**no q-tag-range** *qtag1*

##### Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg>dot1q q-tag-range)

##### Full Context

configure service system bgp-evpn ethernet-segment dot1q q-tag-range

##### Description

This command determines the VIDs associated with the virtual Ethernet Segment on a specific dot1q port or LAG based on the following considerations:

- Values \*, 0 to 4094 are allowed.
- Any SAP for which the service-delimiting qtag matches the range is associated with the virtual ES, and only those, for example, SAP 1/1/1:0 will not match port 1/1/1, qtag-range 100.
- Maximum 8 ranges are allowed in the dot1q context.
- A range can be comprised of a single qtag.
- Shutting down the ES is not required prior to changing the q-tag-range.

The **no** form of the command removes the configured range. Only the first *qtag1* value is required to remove the range.

##### Parameters

###### *qtag1*

Specifies the VID. When configuring a range of qtags (and not a single value), the second *qtag1* value must be greater than the first *qtag1*.

**Values** \*, 0 to 4094

##### Platforms

All

## 21.2 qci

```
qci
```

### Syntax

```
qci qci-value
```

```
no qci
```

### Context

```
[Tree] (config>subscr-mgmt>gtp>peer-profile>mme>qos qci)
```

```
[Tree] (config>subscr-mgmt>gtp>peer-profile>pgw>qos qci)
```

### Full Context

```
configure subscriber-mgmt gtp peer-profile mme qos qci
```

```
configure subscriber-mgmt gtp peer-profile pgw qos qci
```

### Description

This command configures the QoS Class Identifier (QCI) to send in the Bearer Level QoS IE in GTPv2 messages.

The **no** form of this command reverts to the default.

### Default

```
qci 8
```

### Parameters

*qci-value*

Specifies the QCI value to send.

**Values** 1 to 9

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 21.3 qinq

## qinq

### Syntax

qinq

### Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg qinq)

### Full Context

configure service system bgp-evpn ethernet-segment qinq

### Description

Commands in this context configure q-tag and s-tag additions to the port or LAG virtual Ethernet Segments.

### Platforms

All

## 21.4 qinq-etype

### qinq-etype

#### Syntax

**qinq-etype** *qinq-etype-value*

**no qinq-etype**

#### Context

[\[Tree\]](#) (config>port>ethernet qinq-etype)

#### Full Context

configure port ethernet qinq-etype

#### Description

This command configures the Ethertype used for Q-in-Q encapsulation.  
The **no** form of this command reverts the qinq-etype value to the default.

#### Default

no qinq-etype

#### Parameters

*qinq-etype-value*

Specifies the qinq-etype to expect in the form of 0x600 to 0xfff.

**Values** 1536 to 65535 in decimal or hex formats

## Platforms

All

## qinq-etype

## Syntax

**qinq-etype** *qinq-etype*

**no qinq-etype**

## Context

[\[Tree\]](#) (config>pw-port qinq-etype)

## Full Context

configure pw-port qinq-etype

## Description

This command configures the QinQ Ethertype on the PW port. The PW port is used to extract a customer's Ethernet traffic that is transported in a tunnel over an IP/MPLS network. The **qinq-etype** represents the first two bytes (TPID) in the outer 801.1Q header of the double-tagged Ethernet frame inside the tunnel.

The **no** form of this command removes the configuration.

## Parameters

### **qinq-etype**

The value for the **qinq-etype** field, in hexadecimal format.

**Values** 0x0600..0xFFFF

**Default** 0x8100

## Platforms

All

## 21.5 qinq-mark-top-only

## qinq-mark-top-only

### Syntax

[no] qinq-mark-top-only

### Context

**[Tree]** (config>service>ies>sub-if>grp-if>sap>egress qinq-mark-top-only)

**[Tree]** (config>service>vprn>sub-if>grp-if>sap>egress qinq-mark-top-only)

**[Tree]** (config>service>vprn>if>sap>egress qinq-mark-top-only)

### Full Context

configure service ies subscriber-interface group-interface sap egress qinq-mark-top-only

configure service vprn subscriber-interface group-interface sap egress qinq-mark-top-only

configure service vprn interface sap egress qinq-mark-top-only

### Description

When the encapsulation type is qinq for the access port for the specified SAP, enabling this command specifies which P-bits or DEI bit to mark during packet egress. Only the P-bits or DEI bit in the top Q tag are marked. When this command is disabled, both sets of P-bits and the DEI bit are marked.

### Default

no qinq-mark-top-only

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn subscriber-interface group-interface sap egress qinq-mark-top-only
- configure service ies subscriber-interface group-interface sap egress qinq-mark-top-only

All

- configure service vprn interface sap egress qinq-mark-top-only

## qinq-mark-top-only

### Syntax

[no] qinq-mark-top-only

### Context

**[Tree]** (config>service>epipe>sap>egress qinq-mark-top-only)

**[Tree]** (config>service>ipipe>sap>egress qinq-mark-top-only)

### Full Context

configure service epipe sap egress qinq-mark-top-only

```
configure service ipipe sap egress qinq-mark-top-only
```

### Description

When enabled (the encapsulation type of the access port where this SAP is defined as qinq), the **qinq-mark-top-only** command specifies which P-bits/DEI bit to mark during packet egress. When disabled, both set of P-bits/DEI bit are marked. When the enabled, only the P-bits/DEI bit in the top Q-tag are marked.

### Default

```
no qinq-mark-top-only
```

### Platforms

All

```
qinq-mark-top-only
```

### Syntax

```
[no] qinq-mark-top-only
```

### Context

[\[Tree\]](#) (config>service>vpls>sap>egress qinq-mark-top-only)

### Full Context

```
configure service vpls sap egress qinq-mark-top-only
```

### Description

When enabled (the encapsulation type of the access port where this SAP is defined as qinq), the **qinq-mark-top-only** command specifies which P-bits/DEI bit to mark during packet egress. When disabled, both set of P-bits/DEI bit are marked. When enabled, only the P-bits/DEI bit in the top Q-tag are marked.

The **no** form of this command disables the command.

### Default

```
no qinq-mark-top-only
```

### Platforms

All

```
qinq-mark-top-only
```

### Syntax

```
[no] qinq-mark-top-only
```

## Context

[\[Tree\]](#) (config>service>ies>if>sap>egress qinq-mark-top-only)

## Full Context

configure service ies interface sap egress qinq-mark-top-only

## Description

When enabled (the encapsulation type of the access port where this SAP is defined as qinq), the **qinq-mark-top-only** command specifies which P-bits/DEI bit to mark during packet egress. When disabled, both set of P-bits/DEI bit are marked. When the enabled, only the P-bits/DEI bit in the top Q-tag are marked.

## Default

no qinq-mark-top-only

## Platforms

## 21.6 qinq-vlan-translation

### qinq-vlan-translation

## Syntax

**qinq-vlan-translation** *s-tag.c-tag*

**no qinq-vlan-translation**

## Context

[\[Tree\]](#) (config>service>epipe>sap>ingress qinq-vlan-translation)

## Full Context

configure service epipe sap ingress qinq-vlan-translation

## Description

This command provides ingress VLAN translation for two service-delimiting VLAN values, as opposed to the **vlan-translation** command that provides translation for only one service-delimiting VLAN value. This command is used with the **force-qinq-vc-forwarding** command so that the VLAN values that are pushed on SDP bindings or EVPN-MPLS can be normalized (translated).

The **no** form of the command disables QinQ VLAN translation.

## Default

no qinq-vlan-translation

## Parameters

### *s-tag.c-tag*

Specifies that the VLAN tag values are pushed on SDP bindings and EVPN-MPLS destinations when **force-qinq-vc-forwarding s-tag-c-tag** is configured. When **force-qinq-vc-forwarding c-tag-c-tag** is configured, only the C-tag value in **qinq-vlan-translation s-tag.c-tag** is pushed. When the asterisk (\*) value is used for the C-tag, no translation is made on the C-tag.

**Values**    *s-tag*: 0 to 4094  
               *c-tag*: 0 to 4094, \*

## Platforms

All

## 21.7 ql-minimum

### ql-minimum

#### Syntax

**ql-minimum** {*prs* | *stu* | *st2* | *tnc* | *st3e* | *st3* | *prc* | *ssua* | *ssub* | *sec* | *eec1* | *eec2*}  
**no ql-minimum**

#### Context

[\[Tree\]](#) (config>system>sync-if-timing>bits>output ql-minimum)

#### Full Context

configure system sync-if-timing bits output ql-minimum

#### Description

This command configures the minimum acceptable QL value that a signal must have in order to be selected for the BITSout port. This ensures that the signal has traceability to a source with at least this quality level so that attached equipment can function properly.

The **no** form of this command disables this check.

#### Default

no ql-minimum

#### Parameters

##### **prs**

Specifies the SONET Primary Reference Source.

##### **stu**

	Specifies the SONET Synchronous Traceability Unknown.
<b>st2</b>	Specifies the SONET Stratum 2.
<b>tnc</b>	Specifies the SONET Transit Node Clock.
<b>st3e</b>	Specifies the SONET Stratum 3E.
<b>st3</b>	Specifies the SONET Stratum 3.
<b>prc</b>	Specifies the SDH Primary Reference Clock.
<b>ssua</b>	Specifies the SDH Primary Level Synchronization Supply Unit.
<b>ssub</b>	Specifies the SDH Second Level Synchronization Supply Unit.
<b>sec</b>	Specifies the SDH Synchronous Equipment Clock.
<b>eec1</b>	Specifies the Ethernet Equipment Clock Option 1 (sdh).
<b>eec2</b>	Specifies the Ethernet Equipment Clock Option 2 (sonet).

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## ql-minimum

### Syntax

**ql-minimum** {prs | stu | **st2** | tnc | st3e | st3 | prc | ssua | ssub | sec | eec1 | eec2}

**no ql-minimum**

### Context

[\[Tree\]](#) (config>system>sync-if-timing ql-minimum)

### Full Context

configure system sync-if-timing ql-minimum

### Description

This command configures the minimum acceptable QL value that a signal must have in order to be considered for selection by the system timing module.

The **no** form of this command disables this check.

### Default

no ql-minimum

### Parameters

**prs**

Specifies the SONET Primary Reference Source.

**stu**

Specifies the SONET Synchronous Traceability Unknown.

**st2**

Specifies the SONET Stratum 2.

**tnc**

Specifies the SONET Transit Node Clock.

**st3e**

Specifies the SONET Stratum 3E.

**st3**

Specifies the SONET Stratum 3.

**prc**

Specifies the SDH Primary Reference Clock.

**ssua**

Specifies the SDH Primary Level Synchronization Supply Unit.

**ssub**

Specifies the SDH Second Level Synchronization Supply Unit.

**sec**

Specifies the SDH Synchronous Equipment Clock.

**eec1**

Specifies the Ethernet Equipment Clock Option 1 (sdh).

**eec2**

Specifies the Ethernet Equipment Clock Option 2 (sonet).

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 21.8 ql-override

## ql-override

### Syntax

**ql-override** {**prs** | **stu** | **st2** | **tnc** | **st3e** | **st3** | **prc** | **ssua** | **ssub** | **sec**}

**no ql-override**

### Context

**[Tree]** (config>system>sync-if-timing>bits ql-override)

**[Tree]** (config>system>sync-if-timing>ptp ql-override)

**[Tree]** (config>system>sync-if-timing>synce ql-override)

**[Tree]** (config>system>sync-if-timing>gnss ql-override)

### Full Context

configure system sync-if-timing bits ql-override

configure system sync-if-timing ptp ql-override

configure system sync-if-timing synce ql-override

configure system sync-if-timing gnss ql-override

### Description

This command configures the QL value to be used for the reference for SETS input selection and BITS output selection. This value overrides any value received by that reference's SSM process.

### Default

no ql-override

### Parameters

#### prs

Specifies the SONET Primary Reference Source Traceable.

#### stu

Specifies the SONET Synchronous Traceability Unknown.

#### st2

Specifies the SONET Stratum 2 Traceable.

#### tnc

Specifies the SONET Transit Node Clock Traceable.

#### st3e

Specifies the SONET Stratum 3E Traceable.

#### st3

Specifies the SONET Stratum 3 Traceable.

#### prc

Specifies the SDH Primary Reference Clock Traceable.

**ssua**

Specifies the SDH Primary Level Synchronization Supply Unit Traceable.

**ssub**

Specifies the SDH Second Level Synchronization Supply Unit Traceable.

**sec**

Specifies the SDH Synchronous Equipment Clock Traceable.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure system sync-if-timing bits ql-override

**[Tree]** (config>subscr-mgmt>msap-policy>ies-vprn>egress qos)

**[Tree]** (config>subscr-mgmt>msap-policy>vpls-only>ingress qos)

### Full Context

configure subscriber-mgmt msap-policy vpls-only-sap-parameters egress qos

configure subscriber-mgmt msap-policy ies-vprn-only-sap-parameters ingress qos

configure subscriber-mgmt msap-policy ies-vprn-only-sap-parameters egress qos

configure subscriber-mgmt msap-policy vpls-only-sap-parameters ingress qos

### Description

This command specifies the ingress or egress Quality of Service (QoS) policy that is associated with a Managed SAP (MSAP). Only QoS policies with scope template can be associated with MSAPs.

The **no** form of this command resets the default value. The system default QoS policy is used in that case.

### Default

qos 1 — For egress parameters.

qos 1 multipoint-shared — For ingress vpls-only-sap-parameters.

qos 1 shared-queuing — For ingress ies-vprn-only-sap-parameters.

### Parameters

#### *policy-id*

Specifies the QoS policy ID or name to associate with the MSAPs. The policy ID or name must already exist.

**Values** id: 1 to 65535  
name: policy name up to 64 characters.

#### **multipoint-shared**

Ingress unicast MSAP queues are mapped one-for-one with hardware queues. Multipoint MSAP queues are not instantiated. Unicast and BUM packets traverse the ingress forwarding plane twice: in the first pass, both unicast and BUM traffic use the unicast MSAP queues, while in the second pass shared unicast and multipoint queues are used towards the egress line card. Multipoint-shared queuing greatly reduces ingress queue consumption. This keyword can only be specified for ingress **vpls-only-sap-parameters**.

#### **shared-queuing**

Ingress unicast MSAP queues are mapped one-for-one with hardware queues. Unicast packets traverse the ingress forwarding plane twice: in the first pass the MSAP queues are used, while in the second pass shared queues are used towards the egress line card.

Shared-queuing greatly reduces ingress queue consumption. This keyword can only be specified for ingress **ies-vprn-only-sap-parameters**.

### service-queuing

Ingress MSAP queues are mapped to multiple hardware queues, per egress line card destination. For scaled environments such as in subscriber management, this could lead to a high number of queue resources being used. Therefore, service-queuing for MSAPs should only be enabled for specific use cases. This keyword can only be specified for ingress parameters.

[\[Tree\]](#) (config>subscr-mgmt>sla-prof>egress qos)

### Full Context

configure subscriber-mgmt sla-profile egress qos

### Description

This command specifies the egress QoS policy applicable to this SLA profile. The policy must already be defined in the **config>qos>sap-egress** context.

The **no** form of this command reverts to the default.

### Default

qos 1 port-scheduler

### Parameters

#### *policy-id*

Specifies the egress policy to be applied to the egress SLA profile.

**Values** 1 to 65535

#### **vport-scheduler** | **port-scheduler**

Specifies if a host queue with the port-parent option enabled should be scheduled within the context of a Vport port scheduler policy or at the port's port scheduler policy.

#### **force**

Forces a policy change

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## qos

### Syntax

**qos** *policy-id* [**shared-queuing** | **multipoint-shared** | **service-queuing**] [**force**]

**no qos**

### Context

[\[Tree\]](#) (config>subscr-mgmt>sla-prof>ingress qos)

### Full Context

configure subscriber-mgmt sla-profile ingress qos

### Description

This command specifies the ingress QoS policy applicable to this SLA profile. The policy must already be defined in the **config>qos>sap-ingress** context.

The **no** form of this command reverts to the default.

### Default

qos 1

### Parameters

#### *policy-id*

Specifies the policy to be applied to the ingress SLA profile.

**Values** 1 to 65535

#### **shared-queuing**

Specifies the policy used by this SAP. When the value of this object is null it means that the SAP will use individual ingress QoS queues, instead of the shared ones.

#### **multipoint-shared**

This keyword is mutually exclusive with the **shared-queuing** and **service-queuing** keywords. When multipoint-shared is specified, the ingress forwarding plane will conserve hardware queues by performing two tier queuing on ingress unicast and multipoint packets through the SAP. Unicast service queues defined in the SAP ingress QoS policy are created for the SAP on the ingress forwarding plane without regard for the switch fabric destinations to which the SAP may need to forward (other destinations in the VPLS context). The multipoint queues defined in the SAP ingress QoS policy are not created for the SAP. Instead, all multipoint traffic is mapped to the unicast queues based on forwarding class in the first pass. In the second pass the unicast packets is mapped to the unicast shared queues while the multipoint traffic is mapped to the multipoint shared queues.

#### **service-queuing**

This keyword is mutually exclusive with the **multipoint-shared** and **shared-queuing** keywords to state that service queuing is needed.

**force**

Forces a policy change.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### Description

This command associates a Quality of Service (QoS) policy with an egress Service Access Point (SAP) or IP interface.

QoS egress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP or IP interface. If the policy ID does not exist, an error is returned.

The **qos** command associates both ingress and egress QoS policies. The **qos** command only allows ingress policies to be associated on SAP or IP interface ingress and egress policies on SAP or IP interface egress. Attempts to associate a QoS policy of the wrong type returns an error.

Only one ingress and one egress QoS policy can be associated with a SAP or IP interface at one time. Attempts to associate a second QoS policy of a given type returns an error.

By default, no specific QoS policy is associated with the SAP or IP interface for ingress or egress, so the default QoS policy is used.

The **no** form of this command removes the QoS policy association from the SAP or IP interface, and the QoS policy reverts to the default.

### Parameters

*policy-id*

The ingress/egress policy ID to associate with SAP or IP interface on ingress/egress. The policy ID must already exist.

**Values** 1 to 65535

#### ***port-redirect-group***

This keyword associates a SAP egress with an instance of a named queue group template on the egress port of a given IOM/IMM/XMA. The queue-group-name and instance instance-id are mandatory parameters when executing the command.

#### ***queue-group-name***

Specifies the name of the egress port queue group of the IOM/IMM/XMA, up to 32 characters in length. The queue-group-name must correspond to a valid egress queue group, created under config>port>ethernet>access>egress.

#### ***instance instance-id***

Specifies the instance of the named egress port queue group on the IOM/IMM/XMA.

**Values** 1 to 40960

**Default** 1

### **Platforms**

### **Full Context**

configure service vpls sap egress qos

### **Description**

This command associates a Quality of Service (QoS) policy with an egress Service Access Point (SAP).

QoS ingress and egress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP. If the policy-id does not exist, an error will be returned.

The qos command is used to associate both ingress and egress QoS policies. The qos command only allows ingress policies to be associated on SAP ingress and egress policies on SAP egress. Attempts to associate a QoS policy of the wrong type returns an error.

Only one ingress and one egress QoS policy can be associated with a SAP at one time. Attempts to associate a second QoS policy of a specified type will return an error.

When an egress QoS policy is associated with an IES IP interface that has been bound to a VPLS, the policy becomes associated with every SAP on the VPLS and augments the egress QoS policy that is defined on each SAP. Packets that are bridged will be processed using the policy defined on the VPLS SAP; packets that are routed will be processed using the policy defined in the IES IP interface- binding context.

By default, if no specific QoS policy is associated with the SAP for ingress or egress, so the default QoS policy is used.

The **no** form of this command removes the QoS policy association from the SAP, and the QoS policy reverts to the default.

## Parameters

### ***port-redirect-group***

Associates a SAP egress with an instance of a named queue group template on the egress port of a specified IOM/IMM/XMA. The queue-group-name and instance instance-id are mandatory parameters when executing the command.

### ***queue-group-name***

Specifies the name of the egress port queue group of the IOM/IMM/XMA, up to 32 characters in length. The queue-group-name must correspond to a valid egress queue group, created under *config>port>ethernet>access>egress*.

### **instance *instance-id***

Specifies the instance of the named egress port queue group on the IOM/IMM/XMA

**Values** 1 to 40960

**Default** 1

## Description

Associates a Quality of Service (QoS) policy with an ingress Service Access Point (SAP) or IP interface.

QoS ingress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP or IP interface. If the *policy-id* does not exist, an error is returned.

This **qos** command is used to associate ingress QoS policies. The **qos** command only allows ingress policies to be associated on SAP or IP interface ingress.

Only one ingress and one egress QoS policy can be associated with a SAP or IP interface at one time. Attempts to associate a second QoS policy of a given type returns an error.

By default, no specific QoS policy is associated with the SAP or IP interface for ingress so the default QoS policy is used.

The normal behavior is for queues to be created per destination. Shared and multipoint shared change this behavior creating either unicast or unicast and mcast shared queues.

The **no** form of this command removes the QoS policy association from the SAP or IP interface, and the QoS policy reverts to the default.

## Parameters

### *policy-id*

The ingress policy ID to associate with SAP or IP interface on ingress. The policy ID must already exist.

**Values** 1 to 65535

### **shared-queuing**

Specifies the ingress shared queue policy a SAP uses. When the value of this object is null, the SAP uses individual ingress QoS queues, instead of the shared ones. This keyword only applies on the SAP ingress.

## Platforms

## Description

This command associates a Quality of Service (QoS) policy with an ingress Service Access Point (SAP).

QoS ingress and egress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP. If the policy ID does not exist, an error is returned.

The **qos** command is used to associate both ingress and egress QoS policies. The qos command only allows ingress policies to be associated on SAP ingress and egress policies on SAP egress. Attempts to associate a QoS policy of the wrong type returns an error.

Only one ingress and one egress QoS policy can be associated with a SAP or IP interface at one time. Attempts to associate a second QoS policy of a given type returns an error.

By default, no specific QoS policy is associated with the SAP for ingress or egress, so the default QoS policy is used.

The **no** form of this command removes the QoS policy association from the SAP, and the QoS policy reverts to the default.

The **no** form of this command removes the QoS policy association from the SAP or IP interface, and the QoS policy reverts to the default.

## Parameters

### *policy-id*

The ingress/egress policy ID to associate with SAP or IP interface on ingress/egress. The policy ID must already exist.

1 to 65535

### **shared-queuing**

Specifies the ingress shared queue policy used by this SAP. When the value of this object is null it means that the SAP uses individual ingress QoS queues instead of the shared ones.

### **multipoint-shared**

Specifies that this queue-id is for multipoint forwarded traffic only. This queue-id can only be explicitly mapped to the forwarding class multicast, broadcast, or unknown unicast ingress traffic. Attempting to map forwarding class unicast traffic to a multipoint queue generates an error; no changes are made to the current unicast traffic queue mapping.

A queue must be created as multipoint. The multipoint designator cannot be defined after the queue is created. If an attempt is made to modify the command to include the multipoint keyword, an error is generated and the command is not executed.

The multipoint keyword can be entered in the command line on a preexisting multipoint queue to edit queue ID parameters.

**Default** Present (the queue is created as non-multipoint).

**Values** **Multipoint** or not present.

### **fp-redirect-group**

Creates an instance of a named queue group template on the ingress forwarding plane of a given IOM/IMM/XMA. The queue-group-name and instance instance-id are mandatory parameters when executing the command. The named queue group template can contain only policers. If it contains queues, then the command fails.

**queue-group-name**

Specifies the name of the queue group template to be instantiated on the forwarding plane of the IOM/IMM/XMA, up to 32 characters. The queue-group-name must correspond to a valid ingress queue group template name, configured in the **config>qos>queue-group-templates** context.

**instance-id**

Specifies the instance of the named queue group to be created on the IOM/IMM/XMA ingress forwarding plane.

**Platforms**

All

```
qos
```

configure service vpls spoke-sdp egress qos

### Description

This command is used to redirect pseudowire (PW) packets to an egress port queue-group for the purpose of shaping.

The egress PW shaping provisioning model allows the mapping of one or more PWs to the same instance of queues, or policers and queues, that are defined in the queue-group template.

Operationally, the provisioning model consists of the following steps:

1. Create an egress queue-group template and configure queues only, or policers and queues for each FC that needs to be redirected.
2. Apply the queue-group template to the network egress context of all ports where there exists a network IP interface that the PW packets can be forwarded on. This creates one instance of the template on the egress of the port. One or more instances of the same template can be created.
3. Configure FC-to-policer or FC-to-queue mappings together with the redirect to a queue-group in the egress context of a network QoS policy. No queue-group name is specified in this step, which means the same network QoS policy can redirect different PWs to different queue-group templates.
4. Apply this network QoS policy to the egress context of a spoke-sdp inside a service, or to the egress context of a PW template and specify the redirect queue-group name.

One or more spoke-sdps can have their FCs redirected to use queues only, or queues and policers in the same queue-group instance.

The following are the constraints and rules of this provisioning model:

1. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name does not exist, the association is failed at the time the user associates the egress context of a spoke-sdp to the named queue-group. In such a case, the PW packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface the PW packet is forwarded on. This queue can be a queue-group queue or the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port. This is the existing implementation and default behavior for a PW packet.

2. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name exists but the policer-id and/or the queue-id is not defined in the queue-group template, the association is failed at the time the user associates the egress context of a spoke-sdp to the named queue-group. In such a case, the PW packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface the PW packet is forwarded on.
3. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name exists and the policer-id or policer-id plus queue-id exist, it is not required to check that an instance of that queue-group exists in all egress network ports that have network IP interfaces. The handling of this is dealt with in the data path as follows:
  - When a PW packet for that FC is forwarded and an instance of the referenced queue-group name exists on that egress port, the packet is processed by the queue-group policer and will then be fed to the queue-group queue.
  - When a PW packet for that FC is forwarded and an instance of the referenced queue-group name does not exist on that egress port, the PW packet will be fed directly to the corresponding egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.
4. If a network QoS policy is applied to the egress context of a PW, any PW FC that is not explicitly redirected in the network QoS policy will have the corresponding packets feed directly the corresponding the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.

When the queue-group name the PW is redirected to exists and the redirection succeeds, the marking of the packet's DEI/dot1p/DSCP and the tunnel's DEI/dot1p/DSCP/EXP is performed according to the relevant mappings of the {FC, profile} in the egress context of the network QoS policy applied to the PW. This is true regardless of whether an instance of the queue-group exists or not on the egress port the PW packet is forwarded to. If the packet's profile value changed due to egress child policer CIR profiling, the new profile value is used to mark the packet's DEI/dot1p and the tunnel's DEI/dot1p/EXP, and the DSCP/prec will be remarked if **enable-dscp-prec-marking** is enabled under the policer.

When the queue-group name the PW is redirected does not exist, the redirection command is failed. In this case, the marking of the packet's DEI/dot1p/DSCP and the tunnel's DEI/dot1p/DSCP/EXP fields is performed according to the relevant commands in the egress context of the network QoS policy applied to the network IP interface to which the PW packet is forwarded.

The **no** version of this command removes the redirection of the PW to the queue-group.

## Parameters

### *network-policy-id*

Specifies the network policy identification. The value uniquely identifies the policy on the system.

**Values** 1 to 65535

### *queue-group-name*

Specifies the name of the queue group template up to 32 characters in length.

### *instance-id*

Specifies the optional identification of a specific instance of the queue-group.

**Values** 1 to 65535

### Description

This command is used to redirect pseudowire packets to an egress port queue-group for the purpose of shaping.

The egress pseudowire shaping provisioning model allows the mapping of one or more pseudowires to the same instance of queues, or policers and queues, which are defined in the queue-group template.

Operationally, the provisioning model consists of the following steps:

1. Create an egress queue-group template and configure queues only or policers and queues for each FC that needs to be redirected.
2. Apply the queue-group template to the network egress context of all ports where there exists a network IP interface on which the pseudowire packets can be forwarded. This creates one instance of the template on the egress of the port. One or more instances of the same template can be created.
3. Configure FC-to-policer or FC-to-queue mappings together with the redirect to a queue-group in the egress context of a network QoS policy. No queue-group name is specified in this step, which means the same network QoS policy can redirect different pseudowires to different queue-group templates.
4. Apply this network QoS policy to the egress context of a spoke-SDP inside a service or to the egress context of a pseudowire template and specify the redirect queue-group name.

One or more spoke-SDPs can have their FCs redirected to use queues only or queues and policers in the same queue-group instance.

The following are the constraints and rules of this provisioning model:

1. When a pseudowire FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name does not exist, the association is failed at the time the user associates the egress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface on which the pseudowire packet is forwarded. This queue can be a queue-group queue, or the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port. This is the existing implementation and default behavior for a pseudowire packet.
2. When a pseudowire FC is redirected to use a queue or a policer, and a queue in a queue-group and the queue-group name exists, but the policer-id and/or the queue-id is not defined in the queue-group template, the association is failed at the time the user associates the egress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface the pseudowire packet is forwarded on.
3. When a pseudowire FC is redirected to use a queue, or a policer and a queue in a queue-group, and the queue-group name exists and the policer-id or policer-id plus queue-id exist, it is not required to check that an instance of that queue-group exists in all egress network ports which have network IP interfaces. The handling of this is dealt with in the data path as follows:
  - a. When a pseudowire packet for that FC is forwarded and an instance of the referenced queue-group name exists on that egress port, the packet is processed by the queue-group policer and will then be fed to the queue-group queue.
  - b. When a pseudowire packet for that FC is forwarded and an instance of the referenced queue-group name does not exist on that egress port, the pseudowire packet will be fed directly to the corresponding egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.
4. If a network QoS policy is applied to the egress context of a pseudowire, any pseudowire FC, which is not explicitly redirected in the network QoS policy, will have the corresponding packets feed directly the corresponding the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.

When the queue-group name the pseudowire is redirected to exists and the redirection succeeds, the marking of the packet DEI/dot1p/DSCP and the tunnel DEI/dot1p/DSCP/EXP is performed; according to the relevant mappings of the (FC, profile) in the egress context of the network QoS policy applied to the pseudowire. This is true regardless, whether an instance of the queue-group exists or not on the egress port to which the pseudowire packet is forwarded. If the packet profile value changed due to egress child policer CIR profiling, the new profile value is used to mark the packet DEI/dot1p and the tunnel DEI/dot1p/EXP, and the DSCP/prec will be remarked if **enable-dscp-prec-marking** is enabled under the policer.

When the queue-group name the pseudowire is redirected does not exist, the redirection command is failed. In this case, the marking of the packet DEI/dot1p/DSCP and the tunnel DEI/dot1p/DSCP/EXP fields is performed according to the relevant commands in the egress context of the network QoS policy applied to the network IP interface to which the pseudowire packet is forwarded.

The **no** version of this command removes the redirection of the pseudowire to the queue-group.

## Parameters

### *network-policy-id*

Specifies the network policy identification. The value uniquely identifies the policy on the system.

**Values** 1 to 65535

### *port-redirect-group queue-group-name*

This optional parameter specifies that the *queue-group-name* will be used for all egress forwarding class redirections within the network QoS policy ID. The specified *queue-group-name* must exist as a port egress queue group on the port associated with the IP interface.

**egress-instance** *instance-id*

Specifies the identification of a specific instance of the queue-group.

**Values** 1 to 16384

## Description

This command is used to redirect pseudowire packets to an ingress forwarding plane queue-group for the purpose of rate-limiting.

The ingress pseudowire rate-limiting feature uses a policer in queue-group provisioning model. This model allows the mapping of one or more pseudowires to the same instance of policers, which are defined in a queue-group template.

Operationally, the provisioning model in the case of the ingress pseudowire shaping feature consists of the following steps:

1. Create an ingress queue-group template and configure policers for each FC that needs to be redirected and optionally, for each traffic type (unicast, broadcast, unknown, or multicast).
2. Apply the queue-group template to the network ingress forwarding plane where there exists a network IP interface to which the pseudowire packets can be received. This creates one instance of the template on the ingress of the FP. One or more instances of the same template can be created.
3. Configure FC-to-policer mappings together with the policer redirect to a queue-group in the ingress context of a network QoS policy. No queue-group name is specified in this step, which means the same network QoS policy can redirect different pseudowires to different queue-group templates.
4. Apply this network QoS policy to the ingress context of a spoke-SDP inside a service, or to the ingress context of a pseudowire template, and specify the redirect queue-group name.

5. One or more spoke-SDPs can have their FCs redirected to use policers in the same policer queue-group instance.

The following are the constraints and rules of this provisioning model when used in the ingress pseudowire rate-limiting feature:

1. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name does not exist, the association is failed at the time the user associates the ingress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
2. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists but the policer-id is not defined in the queue-group template, the association is failed at the time the user associates the ingress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
3. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists and the policer-id is defined in the queue-group template, it is not required to check that an instance of that queue-group exists in all ingress FPs which have network IP interfaces. The handling of this is dealt with in the data path as follows:

When a pseudowire packet for that FC is received and an instance of the referenced queue-group name exists on that FP, the packet is processed by the policer and will then feed the per-FP ingress shared queues referred to as *policer-output-queues*.

When a pseudowire packet for that FC is received and an instance of the referenced queue-group name does not exist on that FP, the pseudowire packets will be fed directly into the corresponding ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.

- If a network QoS policy is applied to the ingress context of a pseudowire, any pseudowire FC which is not explicitly redirected in the network QoS policy will have the corresponding packets feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
- If no network QoS policy is applied to the ingress context of the pseudowire, then all packets of the pseudowire will feed:

the ingress network shared queue for the packet FC defined in the network-queue policy applied to the ingress of the FP. This is the default behavior.

a queue-group policer followed by the per-FP ingress shared queues referred to as *policer-output-queues* if the ingress context of the network IP interface from which the packet is received is redirected to a queue-group (csc-policing). The only exceptions to this behavior are for packets received from a IES/VP RN spoke interface and from an R-VPLS spoke-SDP, which is forwarded to the R-VPLS IP interface. In these two cases, the ingress network shared queue for the packet FC defined in the network-queue policy applied to the ingress of the FP is used.

When a pseudowire is redirected to use a policer queue-group, the classification of the packet for the purpose of FC and profile determination is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the pseudowire. This is true regardless of whether an instance of the named policer queue-group exists on the ingress FP on which the pseudowire packet is received. The user can apply a QoS filter matching the dot1.p in the VLAN tag corresponding to the Ethernet port encapsulation, the EXP in the outer label when the tunnel is an LSP, the DSCP in the IP header if the tunnel encapsulation is GRE, and the DSCP in the payload IP header if the user enabled the **ler-use-dscp** option and the pseudowire terminates in IES or VP RN service (spoke-interface).

When the policer queue-group name the pseudowire is redirected does not exist, the redirection command is failed. In this case, the packet classification is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the network IP interface on which the pseudowire packet is received.

The **no** version of this command removes the redirection of the pseudowire to the queue-group.

## Parameters

### ***network-policy-id***

Specifies the network policy identification. The value uniquely identifies the policy on the system.

**Values** 1 to 65535

### **fp-redirect-group** *queue-group-name*

Specifies the name of the queue group template up to 32 characters in length.

### **ingress-instance** *instance-id*

Specifies the identification of a specific instance of the queue-group.

**Values** 1 to 16384

## Full Context

configure service pw-template egress qos

## Description

This command is used to redirect PW packets to an egress port queue-group for the purpose of shaping.

The egress PW shaping provisioning model allows the mapping of one or more PWs to the same instance of queues, or policers and queues, that are defined in the queue-group template.

Operationally, the provisioning model consists of the following steps:

1. Create an egress queue-group template and configure queues only, or policers and queues for each FC that needs to be redirected.

2. Apply the queue-group template to the network egress context of all ports where there exists a network IP interface that the PW packets can be forwarded on. This creates one instance of the template on the egress of the port. One or more instances of the same template can be created.
3. Configure FC-to-policer or FC-to-queue mappings together with the redirect to a queue-group in the egress context of a network QoS policy. No queue-group name is specified in this step, which means the same network QoS policy can redirect different PWs to different queue-group templates.
4. Apply this network QoS policy to the egress context of a spoke-SDP inside a service, or to the egress context of a PW template and specify the redirect queue-group name.

One or more spoke-SDPs can have their FCs redirected to use queues only, or queues and policers in the same queue-group instance.

The following are the constraints and rules of this provisioning model.

1. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name does not exist, the association is failed at the time the user associates the egress context of a spoke-SDP to the named queue-group. In such a case, the PW packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface the PW packet is forwarded on. This queue can be a queue-group queue or the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port. This is the existing implementation and default behavior for a PW packet.
2. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name exists but the policer-id and/or the queue-id is not defined in the queue-group template, the association is failed at the time the user associates the egress context of a spoke-SDP to the named queue-group. In such a case, the PW packet will be fed directly to the corresponding egress queue for that FC used by the IP network interface the PW packet is forwarded on.
3. When a PW FC is redirected to use a queue or a policer and a queue in a queue-group and the queue-group name exists and the policer-id or policer-id plus queue-id exist, it is not required to check that an instance of that queue-group exists in all egress network ports that have network IP interfaces. The handling of this is dealt with in the data path as follows:
  - When a PW packet for that FC is forwarded and an instance of the referenced queue-group name exists on that egress port, the packet is processed by the queue-group policer and will then be fed to the queue-group queue.
  - When a PW packet for that FC is forwarded and an instance of the referenced queue-group name does not exist on that egress port, the PW packet will be fed directly to the corresponding egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.
4. If a network QoS policy is applied to the egress context of a PW, any PW FC that is not explicitly redirected in the network QoS policy will have the corresponding packets feed directly the corresponding the egress shared queue for that FC defined in the network-queue policy applied to the egress of this port.

When the queue-group name the PW is redirected to exists and the redirection succeeds, the marking of the packet's DEI/dot1p/DSCP and the tunnel's DEI/dot1p/DSCP/EXP is performed according to the relevant mappings of the {FC, profile} in the egress context of the network QoS policy applied to the PW. This is true regardless of whether an instance of the queue-group exists or not on the egress port the PW packet is forwarded to. If the packet's profile value changed due to egress child policer CIR profiling, the new profile value is used to mark the packet's DEI/dot1p and the tunnel's DEI/dot1p/EXP, and the DSCP/prec will be remarked if **enable-dscp-prec-marking** is enabled under the policer.

When the queue-group name the PW is redirected does not exist, the redirection command is failed. In this case, the marking of the packet's DEI/dot1p/DSCP and the tunnel's DEI/ dot1p/DSCP/EXP fields is

performed according to the relevant commands in the egress context of the network QoS policy applied to the network IP interface the PW packet is forwarded to.

The **no** version of this command removes the redirection of the PW to the queue-group.

## Parameters

### *network-policy-id*

Specifies the network policy identification. The value uniquely identifies the policy on the system.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **qos name** *network-policy-name* variant can be used in all configuration modes.

**Values** 1 to 65535

### *queue-group-name*

Specifies the name of the queue group template up to 32 characters in length.

### *instance-id*

Specifies the identification of a specific instance of the queue-group.

**Values** 1 to 65535

### *name network-policy-name*

Specifies the network policy name. The value uniquely identifies the policy on the system, up to 64 characters.

## Description

This command is used to redirect pseudowire packets to an ingress forwarding plane queue-group for the purpose of rate-limiting.

The ingress pseudowire rate-limiting feature uses a policer in queue-group provisioning model. This model allows the mapping of one or more pseudowires to the same instance of policers, which are defined in a queue-group template.

Operationally, the provisioning model in the case of the ingress pseudowire shaping feature consists of the following steps:

1. Create an ingress queue-group template and configure policers for each FC that needs to be redirected and optionally, for each traffic type (unicast or multicast).
2. Apply the queue-group template to the network ingress forwarding plane where there exists a network IP interface to which the pseudowire packets can be received. This creates one instance of the template on the ingress of the FP. One or more instances of the same template can be created.
3. Configure FC-to-policer mappings together with the policer redirect to a queue-group in the ingress context of a network QoS policy. No queue-group name is specified in this step, which means the same network QoS policy can redirect different pseudowires to different queue-group templates.
4. Apply this network QoS policy to the ingress context of a spoke-SDP inside a service, or to the ingress context of a pseudowire template, and specify the redirect queue-group name.
5. One or more spoke-SDPs can have their FCs redirected to use policers in the same policer queue-group instance.

The following are the constraints and rules of this provisioning model when used in the ingress pseudowire rate-limiting feature:

1. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name does not exist, the association is failed at the time the user associates the ingress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
2. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists but the policer-id is not defined in the queue-group template, the association is failed at the time the user associates the ingress context of a spoke-SDP to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
3. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists and the policer-id is defined in the queue-group template, it is not required to check that an instance of that queue-group exists in all ingress FPs which have network IP interfaces. The handling of this is dealt with in the data path as follows:

When a pseudowire packet for that FC is received and an instance of the referenced queue-group name exists on that FP, the packet is processed by the policer and will then feed the per-FP ingress shared queues referred to as *policer-output-queues*.

When a pseudowire packet for that FC is received and an instance of the referenced queue-group name does not exist on that FP, the pseudowire packets will be fed directly into the corresponding ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.

- If a network QoS policy is applied to the ingress context of a pseudowire, any pseudowire FC which is not explicitly redirected in the network QoS policy will have the corresponding packets feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
- If no network QoS policy is applied to the ingress context of the pseudowire, then all packets of the pseudowire will feed:
  - the ingress network shared queue for the packet FC defined in the network-queue policy applied to the ingress of the FP. This is the default behavior.
  - a queue-group policer followed by the per-FP ingress shared queues referred to as *policer-output-queues* if the ingress context of the network IP interface from which the packet is received is redirected to a queue-group. The only exceptions to this behavior are for packets received from a IES/VPRN spoke interface and from an R-VPLS spoke-SDP, which is forwarded to the R-VPLS IP interface. In these two cases, the ingress network shared queue for the packet FC defined in the network-queue policy applied to the ingress of the FP is used.

When a pseudowire is redirected to use a policer queue-group, the classification of the packet for the purpose of FC and profile determination is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the pseudowire. This is true regardless of whether an instance of the named policer queue-group exists on the ingress FP on which the pseudowire packet is received. The user can apply a QoS filter matching the dot1-p in the VLAN tag corresponding to the Ethernet port encapsulation, the EXP in the outer label when the tunnel is an LSP, the DSCP in the IP header if the tunnel encapsulation is GRE, and the DSCP in the payload IP header if the user enabled the **ler-use-dscp** option and the pseudowire terminates in IES or VPRN service (spoke-interface).

When the policer queue-group name the pseudowire is redirected does not exist, the redirection command is failed. In this case, the packet classification is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the network IP interface on which the pseudowire packet is received.

The **no** version of this command removes the redirection of the pseudowire to the queue-group.

## Parameters

### Description

This command is used to redirect pseudowire packets to an ingress forwarding plane queue-group for the purpose of rate-limiting.

The ingress pseudowire rate-limiting feature uses a policer in queue-group provisioning model. This model allows the mapping of one or more pseudowires to the same instance of policers which are defined in a queue-group template.

Operationally, the provisioning model in the case of the ingress pseudowire shaping feature consists of the following steps:

1. Create an ingress queue-group template and configure policers for each FC which needs to be redirected and optionally for each traffic type (unicast or multicast).
2. Apply the queue-group template to the network ingress forwarding plane where there exists a network IP interface which the pseudowire packets can be received on. This creates one instance of the template on the ingress of the FP. One or more instances of the same template can be created.
3. Configure FC-to-policer mappings together with the policer redirect to a queue-group in the ingress context of a network QoS policy. No queue-group name is specified in this step which means the same network QoS policy can redirect different pseudowires to different queue-group templates.
4. Apply this network QoS policy to the ingress context of a spoke-sdp inside a service or to the ingress context of a pseudowire template and specify the redirect queue-group name.

One or more spoke-sdps can have their FCs redirected to use policers in the same policer queue-group instance.

The following are the constraints and rules of this provisioning model when used in the ingress pseudowire rate-limiting feature:

1. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name does not exist, the association is failed at the time the user associates the ingress context of a spoke-sdp to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
2. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists but the policer-id is not defined in the queue-group template, the association is failed at the time the user associates the ingress context of a spoke-sdp to the named queue-group. In such a case, the pseudowire packet will feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
3. When a pseudowire FC is redirected to use a policer in a named policer queue-group and the queue-group name exists and the policer-id is defined in the queue-group template, it is not required to check that an instance of that queue-group exists in all ingress FPs which have network IP interfaces. The handling of this is dealt with in the data path as follows:
  - When a pseudowire packet for that FC is received and an instance of the referenced queue-group name exists on that FP, the packet is processed by the policer and will then feed the per-FP ingress shared queues referred to as "policer-output-queues".
  - When a pseudowire packet for that FC is received and an instance of the referenced queue-group name does not exist on that FP, the pseudowire packets will be fed directly into the corresponding ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
4. If a network QoS policy is applied to the ingress context of a pseudowire, any pseudowire FC which is not explicitly redirected in the network QoS policy will have the corresponding packets feed directly the ingress network shared queue for that FC defined in the network-queue policy applied to the ingress of the FP.
5. If no network QoS policy is applied to the ingress context of the pseudowire, then all packets of the pseudowire will feed:
  - the ingress network shared queue for the packet's FC defined in the network-queue policy applied to the ingress of the FP. This is the default behavior.
  - a queue-group policer followed by the per-FP ingress shared queues referred to as "policer-output-queues" Good received is redirected to a queue-group. The only exceptions to this behavior are for packets received from a IES/VRPN spoke interface and from a R-VPLS spoke-sdp which is forwarded to the R-VPLS IP interface. In these two cases, the ingress network shared queue for the packet's FC defined in the network-queue policy applied to the ingress of the FP is used. When a pseudowire is redirected to use a policer queue-group, the classification of the packet for the purpose of FC and profile determination is performed according to default classification rule or the QoS filters defined in the ingress context of the network QoS policy applied to the pseudowire. This is true regardless if an instance of the named policer queue-group exists on the ingress FP the pseudowire packet is received on. The user can apply a QoS filter matching the dot1p in the VLAN tag corresponding to the Ethernet port encapsulation, the EXP in the outer label when the tunnel is an LSP, the DSCP in the IP header if the tunnel encapsulation is GRE, and the DSCP in the payload's IP header if the user enabled the ler-use-dscp option and the pseudowire terminates in IES or VRPN service (spoke-interface).

When the policer queue-group name the pseudowire is redirected does not exist, the redirection command is failed. In this case, the packet classification is performed according to default classification rule or the

QoS filters defined in the ingress context of the network QoS policy applied to the network IP interface the pseudowire packet is received on.

The `no` version of this command removes the redirection of the pseudowire to the queue-group.

## Parameters

### *network-policy-id*

Specifies the network policy identification. The value uniquely identifies the policy on the system.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The `qos name network-policy-name` variant can be used in all configuration modes.

**Values** 1 to 65535

### *queue-group-name*

Specifies the name of the queue group template up to 32 characters in length.

### *instance-id*

Specifies the identification of a specific instance of the queue-group.

**Values** 1 to 65535

### *name network-policy-name*

Specifies the network policy name. The value uniquely identifies the policy on the system, up to 64 characters.

## Platforms

configure service vpls vxlan network ingress qos

### Description

This command is used to redirect traffic arriving on VXLAN tunnels in an EVPN VXLAN service as a single entity (per forwarding class) to policers in an ingress forwarding plane queue group for the purpose of rate-limiting.

For the policer to be used, the following must be true:

- The configured queue group template name must be applied to the forwarding plane on which the ingress traffic arrives using the instance id specified.
- The policer referenced in the FC-to-policer mappings in the ingress context of a network QoS policy must be present in the specified queue group template.

The command will fail if the queue group template name does not exist or if the policer specified in the network QoS policy does not exist in the queue group template. If the queue group template name with the specified instance is not applied to the forwarding plane on which the VXLAN traffic arrives, then this traffic will use the ingress network queues related to the network interface; however, the ingress classification is still based on the applied network QoS policy.

The unicast traffic can be redirected to a policer under the forwarding class **fp-redirect-group** command in the ingress section of a network QoS policy. Similarly, broadcast, unknown and multicast traffic can be redirected to a **broadcast-policer**, **unknown-policer** or **mcast-policer**, respectively, also under the forwarding class **fp-redirect-group** command in the ingress section of a network QoS policy.

Ingress classification is based on the configuration of the ingress section of the specified network QoS policy, noting that the dot1p and DSCP classification is based on the outer Ethernet header and IP header, and the use of **ler-use-dscp**, **ip-criteria** and **ipv6-criteria** statements are ignored.

When this command is applied, it overrides the QoS applied to the related network interfaces for traffic arriving on VXLAN tunnels in that service but does not affect traffic received on a spoke-SDP in the same service.

The **no** version of this command removes the redirection of VXLAN tunnel traffic from the queue group policers.

## Parameters

### ***network-policy-id***

Specifies the network policy identification. The value uniquely identifies the policy on the system.

**Values** 1 to 65535

### ***queue-group-name***

Specifies the name of the queue group template up to 32 characters in length

### ***instance-id***

Specifies the identification of a specific instance of the queue-group

**Values** 1 to 65535

**no qos** [*policy-id*]

### Context

**[Tree]** (config>service>template>vpls-sap-template>ingress qos)

### Full Context

configure service template vpls-sap-template ingress qos

### Description

This command associates a Quality of Service (QoS) policy with an ingress Service Access Point (SAP) for the Epipe SAP template.

### Parameters

#### *policy-id*

The ingress policy ID to associate with SAP or IP interface on ingress. The policy ID must already exist.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **qos name sap-ingress-policy-name** variant can be used in all configuration modes.

**Values** 1 to 65535

#### **shared-queuing**

This keyword can only be specified on SAP ingress. Specify the ingress shared queue policy used by this SAP. When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

#### **multipoint-shared**

This keyword can only be specified on SAP ingress. Multipoint shared queuing is a superset of shared queuing. When multipoint shared queuing keyword is set, as well as the unicast packets, multipoint packets also used shared queues.

Ingress unicast service queues are mapped one-for-one with hardware queues and unicast packets traverse the ingress forwarding plane twice, similar to the shared-queuing option. In addition, the multipoint queues defined in the ingress SAP QoS policy are not created. Instead, multipoint packets (broadcast, multicast and unknown unicast destined) are treated to the same dual pass ingress forwarding plane processing as unicast packets.

When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

**Values** Multipoint or not present

**Default** Present (the queue is created as non-multipoint)

***sap-ingress-policy-name***

The SAP ingress QoS policy name to associate with the SAP on ingress, up to 64 characters.

**Platforms**

All

**qos**

**Syntax**

**qos** *sap-egress-policy-id*

**qos name** *sap-egress-policy-name*

**no qos**

configure service template vpls-sap-template egress qos

**Description**

This command associates an existing QoS policy with the template.

**Parameters**

***sap-egress-policy-id***

The egress policy ID to associate with SAP or IP interface on egress. The policy ID must already exist.

This variant of the command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **qos name** *sap-egress-policy-name* variant can be used in all configuration modes.

**Values** 1 to 65535

***sap-egress-policy-name***

The SAP egress QoS policy name to associate with the SAP on egress, up to 64 characters.

**Platforms**

All

## qos

### Syntax

**qos** *policy-id* [**shared-queuing** | **multipoint-shared**] [**fp-redirect-group** *queue-group-name* **instance** *instance-id*]

**no qos**

### Context

[\[Tree\]](#) (config>service>vpls>sap>ingress qos)

### Full Context

configure service vpls sap ingress qos

### Description

This command associates a Quality of Service (QoS) policy with an ingress Service Access Point (SAP).

QoS ingress and egress policies are important for the enforcement of SLA agreements. The policy ID must be defined prior to associating the policy with a SAP or IP interface. If the policy-id does not exist, an error will be returned.

The qos command is used to associate both ingress and egress QoS policies. The qos command only allows ingress policies to be associated on SAP ingress and egress policies on SAP egress. Attempts to associate a QoS policy of the wrong type returns an error.

Only one ingress and one egress QoS policy can be associated with a SAP at one time. Attempts to associate a second QoS policy of a specified type will return an error.

When an ingress QoS policy is defined on IES ingress IP interface that is bound to a VPLS, the policy becomes associated with every SAP on the VPLS and augments the QoS policy that is defined on each SAP. Packets that are bridged will be processed using the policy defined on the VPLS SAP; packets that are routed will be processed using the policy defined in the IES IP interface-binding context.

By default, if no specific QoS policy is associated with the SAP for ingress or egress, the default QoS policy is used.

The no form of this command removes the QoS policy association from the SAP, and the QoS policy reverts to the default.

### Parameters

#### *policy-id*

The ingress policy ID to associate with SAP or IP interface on ingress. The policy ID must already exist.

**Values** 1 to 65535

#### **shared-queuing**

This keyword can only be specified on SAP ingress. Specify the ingress shared queue policy used by this SAP. When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

#### **multipoint-shared**

This keyword can only be specified on SAP ingress. Multipoint shared queuing is a superset of shared queuing. When multipoint shared queuing keyword is set, as well as the unicast packets, multipoint packets also used shared queues.

Ingress unicast service queues are mapped one-for-one with hardware queues and unicast packets traverse the ingress forwarding plane twice, similar to the shared-queuing option. In addition, the multipoint queues defined in the ingress SAP QoS policy are not created. Instead, multipoint packets (broadcast, multicast and unknown unicast destined) are treated to the same dual pass ingress forwarding plane processing as unicast packets.

When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

When the value of this object is null, the SAP will use individual ingress QoS queues, instead of the shared ones.

**Values** Multipoint or not present

**Default** Present (the queue is created as non-multipoint)

### **fp-redirect-group**

Creates an instance of a named queue group template on the ingress forwarding plane of a specified IOM/IMM/XMA. The queue-group-name and instance instance-id are mandatory parameters when executing the command. The named queue group template can contain only policers. If it contains queues, then the command will fail.

### **queue-group-name**

Specifies the name of the queue group template to be instantiated on the forwarding plane of the IOM/IMM/XMA, up to 32 characters in length. The queue-group-name must correspond to a valid ingress queue group template name, configured under config>qos>queue- group-templates.

### **instance-id**

Specifies the instance of the named queue group to be created on the IOM/IMM/XMA ingress forwarding plane.

## **Platforms**

All

## **qos**

### **Syntax**

**qos** *network-policy-id*

**qos** *network-policy-id* **egress-port-redirect-group** *queue-group-name* **egress-instance** *instance-id*  
**ingress-fp-redirect-group** *queue-group-name* **ingress-instance** *instance-id*

**qos** *network-policy-id* **egress-port-redirect-group** *queue-group-name* **egress-instance** *instance-id*

**qos** *network-policy-id* **ingress-fp-redirect-group** *queue-group-name* **ingress-instance** *instance-id*

**no qos**

## Context

[\[Tree\]](#) (config>service>vprn>nw-if qos)

## Full Context

configure service vprn network-interface qos

## Description

This command associates a network Quality of Service (QoS) policy with a network IP interface. Only one network QoS policy can be associated with an IP interface at one time. Attempts to associate a second QoS policy return an error.

Associating a network QoS policy with a network interface is useful for the following purposes:

- To apply classification rules for determining the forwarding-class and profile of ingress packets on the interface.
- To associate ingress packets on the interface with a queue-group instance applied to the ingress context of the interface's forwarding plane (FP). (This is only applicable to interfaces on IOM3 and later cards.) The referenced ingress queue-group instance may have policers defined in order to rate limit ingress traffic on a per-forwarding class (and forwarding type: unicast vs. multicast) basis.
- To perform 802.1p, DSCP, IP precedence and/or MPLS EXP re-marking of egress packets on the interface.
- To associate egress packets on the interface with a queue-group instance applied to the egress context of the interface's port. The referenced egress queue-group instance may have policers and/or queues defined in order to rate limit egress traffic on a per-forwarding class basis.

The **no** form of this command removes the network QoS policy association from the network IP interface, and the QoS policy reverts to the default.

## Default

no qos

## Parameters

### *network-policy-id*

An existing network policy ID to associate with the IP interface.

**Values** 1 to 65535

### *port-redirect-group queue-group-name*

This optional parameter specifies the egress queue-group used for all egress forwarding-class redirections specified within the network QoS policy ID. The specified *queue-group-name* must exist as an egress queue group applied to the egress context of the port associated with the IP interface.

### *egress-instance instance-id*

Since multiple instances of the same egress queue-group can be applied to the same port this optional parameter is used to specify which particular instance to associate with this particular network IP interface.

**Values** 1 to 16384

**fp-redirect-group *queue-group-name***

This optional parameter specifies the ingress queue-group used for all ingress forwarding-class redirections specified within the network QoS policy ID. The specified queue-group-name must exist as an ingress queue group applied to the ingress context of the forwarding plane associated with the IP interface.

**ingress-instance *instance-id***

Since multiple instances of the same ingress queue-group can be applied to the same forwarding plane this parameter is required to specify which particular instance to associate with this particular network IP interface.

**Values** 1 to 16384

**Platforms**

All

qos

**Syntax**

**qos** *network-policy-id* **fp-redirect-group** *queue-group-name* *instance* *instance-id*

**no qos**

**Context**

[\[Tree\]](#) (config>service>vprn>network>ingress qos)

**Full Context**

configure service vprn network ingress qos

**Description**

This command is used to redirect unicast packets arriving on an automatically (using the **auto-bind-tunnel** command) or manually configured (using a **spoke-sdp** command, but not the **spoke-sdp** command under the VPRN IP interface) binding in a VPRN to a policer in an ingress forwarding plane queue-group for the purpose of rate-limiting.

For the policer to be used, the following must be true:

1. The configured queue group template name must be applied to the forwarding plane on which the ingress traffic arrives using the instance id specified.
2. The policer referenced in the FC-to-policer mappings in the ingress context of a network QoS policy must be present in the specified queue group template.

The command fails if the queue group template name does not exist or if the policer specified in the network QoS policy does not exist in the queue group template. If the queue group template name with the specified instance is not applied to the forwarding plane on which the VPRN binding unicast traffic arrives then this traffic uses the ingress network queues related to the network interface, however, the ingress classification is still based on the applied network QoS policy.

The unicast traffic can be redirected to a policer under the forwarding class **fp-redirect-group** command in the ingress section of a network QoS policy; any **fp-redirect-group multicast-policer, broadcast-policer**

or **unknown-policer** commands are ignored for this traffic. Multicast traffic would use the ingress network queues or queue group related to the network interface.

Ingress classification is based on the configuration of the ingress section of the specified network QoS policy, noting that the dot1p and exp classification is based on the outer Ethernet header and MPLS label whereas the DSCP applies to the outer IP header if the tunnel encapsulation is GRE, or the DSCP in the first IP header in the payload if **ler-use-dscp** is enabled in the ingress section of the referenced network QoS policy.

When this command is applied, it overrides the QoS applied to the related network interfaces for unicast traffic arriving on bindings in that VPRN.

The **no** version of this command removes the redirection of VPRN binding traffic to the queue-group policers.

## Parameters

### ***network-policy-id***

Specifies the network policy identification. The value uniquely identifies the policy on the system.

**Values** 1 to 65535

### ***fp-redirect-group queue-group-name***

Specifies the name of the queue group template up to 32 characters in length.

### ***instance instance-id***

Specifies the identification of a specific instance of the queue-group.

**Values** 1 to 65535

## 21.11 qos-marking-from-sap

### qos-marking-from-sap

#### Syntax

[no] qos-marking-from-sap

#### Context

[\[Tree\]](#) (config>subscr-mgmt>sla-profile>egress qos-marking-from-sap)

#### Full Context

configure subscriber-mgmt sla-profile egress qos-marking-from-sap

#### Description

This command sets the QoS policy from which the egress QoS marking rules are applied.

**Note:**

If applied to a managed SAP, the default s-egress qos-policy (sap-egress 1) cannot be changed.

The **no** form of this command reverts to the egress QoS marking defined in SAP-egress policy defined at sla-profile level.

#### Default

qos-marking-from-sap

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 21.12 qos-policy-id-range

### qos-policy-id-range

#### Syntax

```
qos-policy-id-range start policy-id end policy-id  
no qos-policy-id-range
```

#### Context

[\[Tree\]](#) (config>qos>md-auto-id qos-policy-id-range)

#### Full Context

```
configure qos md-auto-id qos-policy-id-range
```

#### Description

This command specifies the range of IDs used by SR OS to automatically assign an ID to QoS policies that are created in model-driven interfaces without an ID explicitly specified by the user or client.

A QoS policy created with an explicitly-specified ID cannot use an ID in this range. In classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD interfaces, the range can be changed which will cause any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **config>eth-cfm md-auto-id** command for further details.

#### Default

```
no qos-policy-id-range
```

#### Parameters

##### **start** *policy-id*

Specifies the lower value of the ID range. The value must be less than or equal to the **end** value.

**Values** 1 to 65535

##### **end** *policy-id*

Specifies the upper value of the ID range. The value must be greater than or equal to the **start** value.

**Values** 1 to 65535

#### Platforms

All

configure service ies subscriber-interface group-interface ipv6 qos-route-lookup

configure service vprn subscriber-interface group-interface qos-route-lookup

configure service ies subscriber-interface group-interface qos-route-lookup

#### Description

This command enables QoS classification of the ingress IP packets on an interface based on the QoS information associated with routes in the forwarding table.

If the optional **destination** parameter is specified and the destination address of an incoming IP packet matches a route with QoS information the packet is classified to the fc and priority associated with that route, overriding the fc and priority/profile determined from the sap-ingress or network qos policy associated with the IP interface. If the destination address of the incoming packet matches a route with no QoS information the fc and priority of the packet remain as determined by the sap-ingress or network QoS policy.

If the optional **source** parameter is specified and the source address of an incoming IP packet matches a route with QoS information the packet is classified to the fc and priority associated with that route, overriding the fc and priority/profile determined from the sap-ingress or network qos policy associated with the IP interface. If the source address of the incoming packet matches a route with no QoS information the fc and priority of the packet remain as determined by the sap-ingress or network QoS policy.

If neither the optional **source** or **destination** parameter is present, then the default is **destination** address matching.

The functionality enabled by the qos-route-lookup command can be applied to IPv4 packets or IPv6 packets on an interface, depending on whether it is present at the interface context (applies to IPv4) or the interface>ipv6 context (applies to IPv6). The ability to specify source address based QoS lookup is not supported for IPv6. For the 7740 ESS, subscriber management group interfaces also do not support the source QPPB option.

The **no** form of this command reverts to the default.

### Default

destination

### Parameters

#### source

Enables QoS classification of incoming IP packets based on the source address matching a route with QoS information.

#### destination

Enables QoS classification of incoming IP packets based on the destination address matching a route with QoS information.

configure service ies interface ipv6 qos-route-lookup

### Description

This command enables QoS classification of the ingress IP packets on an interface based on the QoS information associated with routes in the forwarding table.

If the optional **destination** parameter is specified and the destination address of an incoming IP packet matches a route with QoS information the packet is classified to the forwarding class (fc) and priority associated with that route, overriding the fc and priority/profile determined from the sap-ingress or network qos policy associated with the IP interface. If the destination address of the incoming packet matches a route with no QoS information the fc and priority of the packet remain as determined by the sap-ingress or network qos policy.

If the optional **source** parameter is specified and the source address of an incoming IP packet matches a route with QoS information the packet is classified to the fc and priority associated with that route, overriding the fc and priority/profile determined from the sap-ingress or network qos policy associated with

the IP interface. If the source address of the incoming packet matches a route with no QoS information the fc and priority of the packet remain as determined by the sap-ingress or network qos policy.

If neither the optional **source** or **destination** parameter is present, then the default is **destination** address matching.

The functionality enabled by the qos-route-lookup command can be applied to IPv4 packets or IPv6 packets on an interface, depending on whether it is present at the interface context (applies to IPv4) or the interface>ipv6 context (applies to IPv6). Subscriber management group interfaces also do not support the source QPPB option.

The **no** form of this command reverts to the default destination address matching mode.

## Default

no qos-route-lookup

## Parameters

### source

Enables QoS classification of incoming IP packets based on the source address matching a route with QoS information.

### destination

Enables QoS classification of incoming IP packets based on the destination address matching a route with QoS information.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## qos-route-lookup

## Syntax

**qos-route-lookup** [source | destination]

**no qos-route-lookup**

## Context

[\[Tree\]](#) (config>service>vprn>if>ipv6 qos-route-lookup)

[\[Tree\]](#) (config>service>vprn>if qos-route-lookup)

## Full Context

configure service vprn interface ipv6 qos-route-lookup

configure service vprn interface qos-route-lookup

## Description

This command enables QoS classification of the ingress IP packets on an interface based on the QoS information associated with routes in the forwarding table.

If the optional **destination** parameter is specified and the destination address of an incoming IP packet matches a route with QoS information the packet is classified to the fc and priority associated with that route, overriding the fc and priority/profile determined from the sap-ingress or network qos policy associated with the IP interface. If the destination address of the incoming packet matches a route with no QoS information the fc and priority of the packet remain as determined by the sap-ingress or network QoS policy.

If the optional **source** parameter is specified and the source address of an incoming IP packet matches a route with QoS information the packet is classified to the fc and priority associated with that route, overriding the fc and priority/profile determined from the sap-ingress or network qos policy associated with the IP interface. If the source address of the incoming packet matches a route with no QoS information the fc and priority of the packet remain as determined by the sap-ingress or network QoS policy.

If neither the optional **source** nor **destination** parameter is present, then the default is **destination** address matching.

The functionality enabled by the qos-route-lookup command can be applied to IPv4 packets or IPv6 packets on an interface, depending on whether it is present at the interface context (applies to IPv4) or the interface>ipv6 context (applies to IPv6). The ability to specify source address based QoS lookup is not supported for IPv6. Subscriber management group interfaces also do not support the source QPPB option.

The **no** form of this command reverts to the default destination address matching mode.

## Default

no qos-route-lookup

## Parameters

### source

Enables QoS classification of incoming IP packets based on the source address matching a route with QoS information.

### destination

Enables QoS classification of incoming IP packets based on the destination address matching a route with QoS information.

## Platforms

## Description

This command enables QoS classification of the ingress IP packets on an interface based on the QoS information associated with routes in the forwarding table.

If the optional **destination** parameter is specified and the destination address of an incoming IP packet matches a route with QoS information the packet is classified to the fc and priority associated with that route, overriding the fc and priority/profile determined from the sap-ingress or network qos policy associated with the IP interface. If the destination address of the incoming packet matches a route with no QoS information the fc and priority of the packet remain as determined by the sap-ingress or network qos policy.

If the optional **source** parameter is specified and the source address of an incoming IP packet matches a route with QoS information the packet is classified to the fc and priority associated with that route, overriding the fc and priority/profile determined from the sap-ingress or network qos policy associated with the IP interface. If the source address of the incoming packet matches a route with no QoS information the fc and priority of the packet remain as determined by the sap-ingress or network qos policy.

If neither the optional **source** or **destination** parameter is present, then the default is **destination** address matching.

The functionality enabled by the qos-route-lookup command can be applied to IPv4 packets or IPv6 packets on an interface, depending on whether it is present at the interface context (applies to IPv4) or the interface>ipv6 context (applies to IPv6). Subscriber management group interfaces for the 7750 SR and 7450 ESS also do not support the source QPPB option.

The **no** form of this command reverts to the default.

## Default

```
no qos-route-lookup
```

## Parameters

### source

Enables QoS classification of incoming IP packets based on the source address matching a route with QoS information.

### destination

Enables QoS classification of incoming IP packets based on the destination address matching a route with QoS information.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

configure service vpls mesh-sdp mld-snooping query-interval

configure service vpls spoke-sdp mld-snooping query-interval

configure service vpls sap mld-snooping query-interval

### Description

This command configures the IGMP query interval. If the **send-queries** command is enabled, this parameter specifies the interval between two consecutive general queries sent by the system on this SAP or SDP.

The configured query-interval must be greater than the configured query-response-interval.

If send-queries is not enabled on this SAP or SDP, the configured query-interval value is ignored.

### Default

query-interval 125

### Parameters

**seconds**

Specifies the time interval, in seconds, that the router transmits general host-query messages

**Values** 2 to 1024

**Values** **config>service>vpls>igmp-snooping:** 1 - 65535  
**config>service>vpls>sap>igmp-snooping:** 2 - 1024

## Platforms

[\[Tree\]](#) (config>router>mld>group-interface query-interval)

[\[Tree\]](#) (config>router>igmp>group-interface query-interval)

## Full Context

configure service vprn mld group-interface query-interval

configure service vprn igmp group-interface query-interval

configure router mld group-interface query-interval

configure router igmp group-interface query-interval

## Description

This command configures the query interval when the group interface is configured with **no sub-hosts-only**. If nothing is configured, by default, the **query-interval** takes the value defined in the **config>router>igmp** (or **mld**) context or in the **config>service>vprn>igmp** (or **mld**) context.

The **no** form of this command reverts to the default value.

## Default

query-interval 125

## Parameters

**seconds**

Specifies the frequency, in seconds, at which the router transmits general host-query messages.

**Values** 2 to 1024

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## query-interval

**query-interval** *seconds*

**no query-interval**

### Context

**[Tree]** (config>router>mld>if query-interval)

**[Tree]** (config>router>mld query-interval)

### Full Context

configure router mld interface query-interval

configure router mld query-interval

### Description

This command specifies the frequency that the querier router transmits general host-query messages. The host-query messages solicit group membership information and are sent to the all-systems multicast group address, 224.0.0.1.

The **no** form of this command reverts to the default value.

### Default

query-interval 125

### Parameters

***seconds***

The time frequency, in seconds, that the router transmits general host-query messages.

**Values** 2 to 1024

## Platforms

All

## query-interval

### Syntax

**query-interval** *seconds*

**no query-interval**

## Context

[\[Tree\]](#) (config>subscr-mgmt>igmp-policy query-interval)

## Full Context

configure subscriber-mgmt igmp-policy query-interval

## Description

This command specifies the frequency at which the querier router transmits general host-query messages. Host-query messages solicit group membership information and are sent to the all-systems multicast group address, 224.0.0.1. If nothing is configured, by default, the **query-interval** takes the value defined in the **config>router>igmp** context or in the **config>service>vprn>igmp** context. It is highly recommended that all three query intervals be configured together on each IGMP policy.

The **no** form of this command reverts to the default value.

## Parameters

### *seconds*

Specifies the frequency, in seconds, at which the router transmits general host-query messages.

**Values** 2 to 1024

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure service vprn igmp group-interface query-response-interval

configure router mld group-interface query-response-interval

configure service vprn mld group-interface query-response-interval

configure service vprn igmp query-response-interval

## Description

This command configures the query response interval on when the group interface is configured with the **no sub-hosts-only** command. If nothing is configured, by default, the **query-response-interval** takes the value defined in the **config>router>igmp** (or **mld**) context or in the **config>service>vprn>igmp** (or **mld**) context.

The **no** form of this command reverts to the default value.

### Default

query-response-interval 10

### Parameters

#### *seconds*

Specifies the length of time to wait to receive a host-query message response from the host.

**Values** 1 to 1023

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn mld group-interface query-response-interval
- configure service vprn igmp group-interface query-response-interval
- configure router igmp group-interface query-response-interval
- configure router mld group-interface query-response-interval

All

- configure service vprn igmp query-response-interval

## query-response-interval

### Syntax

**query-response-interval** *seconds*

**no query-response-interval**

### Context

[\[Tree\]](#) (config>router>mld>if query-response-interval)

[\[Tree\]](#) (config>router>mld query-response-interval)

### Full Context

configure router mld interface query-response-interval

configure router mld query-response-interval

### Description

This command specifies how long the querier router waits to receive a response to a host-query message from a host.

The **no** form of this command reverts to the default value.

## Default

query-response-interval 10

## Parameters

### *seconds*

Specifies the length of time to wait to receive a response to the host-query message from the host.

**Values** 1 to 1023

## Platforms

All

## query-response-interval

## Syntax

**query-response-interval** *seconds*

configure router igmp query-response-interval

configure router igmp interface query-response-interval

## Description

This command specifies how long the querier router waits to receive a response to a host-query message from a host.

## Default

query-response-interval 10

## Parameters

### *seconds*

Specifies the length of time to wait to receive a response to the host-query message from the host.

**Values** 1 to 1023

## Platforms

All

## query-response-interval

### Syntax

**query-response-interval** *seconds*  
**no query-response-interval**

### Context

[\[Tree\]](#) (config>subscr-mgmt>igmp-policy query-response-interval)

### Full Context

configure subscriber-mgmt igmp-policy query-response-interval

### Description

This command configures the query response interval. If nothing is configured, by default, the **query-response-interval** takes the value defined in the **config>router>igmp** context or in the **config>service>vprn>igmp** context. It is highly recommended that all three query intervals be configured together on each IGMP policy.

The **no** form of this command reverts to the default value.

### Parameters

#### *seconds*

Specifies the length of time, in seconds, that the querier router waits to receive a response to from the host.

**Values** 1 to 1023

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 21.19 queue

## queue

## Syntax

**queue** *queue-id* {**ingress-only** | **egress-only** | **ingress-egress**}

**no queue** *queue-id*

## Context

[\[Tree\]](#) (config>subscr-mgmt>cat-map>category queue)

## Full Context

configure subscriber-mgmt category-map category queue

## Description

This command configures a queue in this category.

The **no** form of this command reverts to the default.

## Parameters

### *queue-id*

Specifies the queue ID for this instances. Each queue nominated in the category map is monitored for activity (over a period of approximately 60 seconds), should the activity fall below the threshold value then a time is started. Whenever this timer exceeds the configured timeout under the idle-timeout the action (currently disconnect) is executed for that subscriber and all hosts under that given SLA-profile-instance.

**Values** 1 to 32

### **ingress-only**

Specifies that ingress queues are defined in this category.

### **egress-only**

Specifies that egress queues are defined in this category.

### **ingress-egress**

Specifies that ingress and egress queues are defined in this category.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## queue

## Syntax

**[Tree]** (config>subscr-mgmt>sla-prof>ingress>qos queue)

## Full Context

configure subscriber-mgmt sla-profile egress qos queue

configure subscriber-mgmt sla-profile ingress qos queue

## Description

Commands in this context configure egress or ingress queue parameters. Parameters defined in the **config>qos>sap-egress** *policy-id* or the **config>qos>sap-ingress** *policy-id* context are overridden by parameters specified in the subscriber management SLA profile context.

The classification and the queue mapping are shared by all the hosts on the same complex that use the same QoS policy (specified in the **sla-profile** SAP egress and SAP ingress policy IDs).

The queues are shared by all the hosts (of the same subscriber) on the same SAP that are using the same SLA profile. Queues are instantiated when, on a given SAP, a host of a subscriber is the first to use a certain SLA profile. This instantiation is referred to as an SLA profile instance.

The **no** form of this command removes the *queue-id* from the SLA profile.

## Parameters

### *queue-id*

Specifies the queue ID for the SAP egress or ingress queue, expressed as a decimal integer. The ID uniquely identifies the queue within the profile.

**Values** 1 to 0

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**no queue** *queue-id*

### Context

**[Tree]** (config>port>ethernet>access>egr>qgrp>qover queue)

**[Tree]** (config>port>eth>network>egr>qgrp>qover queue)

### Full Context

configure port ethernet access egress queue-group queue-overrides queue

configure port ethernet network egress queue-group queue-overrides queue

### Description

This command associates a queue for use in a queue group template. The defined queue-id acts as a repository for the default parameters for the queue. The template queue is created on each queue-group object which is created with the queue group template name. Each queue is identified within the template by a queue-id number. The template ensures that all queue groups created with the template's name will have the same queue-ids providing a uniform structure for the forwarding class redirection commands in the SAP egress QoS policies. The parameters within the template queue will be used as the default settings for each queue in the actual queue group. The queue parameters may be individually changed for each queue in each queue group using per queue overrides.

The **no** form of this command removes the queue-id from the configuration.

### Parameters

#### *queue-id*

Specifies the queue ID.

**Values** 1 to 8

#### **create**

Mandatory when creating an entry.

### Platforms

All

no queue
```

## Context

[\[Tree\]](#) (config>qos>sap-ingress>fc queue)

## Full Context

```
configure qos sap-ingress fc queue
```

## Description

This command overrides the default queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy before the mapping can be made. When the forwarding class mapping is executed, all traffic classified to *fc-name* on a SAP using this policy.

The **no** form of this command sets the *queue-id* back to the default queue for the forwarding class.

## Default

```
queue 1
```

## Parameters

### *queue-id*

Specifies the SAP egress queue-id to be associated with the forwarding class. The queue-id must be an existing queue defined in sap-egress policy-id.

**Values** 1 — 8

**Default** 1

### **group** *queue-group-name*

This optional parameter is used to redirect the forwarding type within the forwarding class to the specified *queue-id* within the *queue-group-name*. When the policy is applied, all packets matching the forwarding class and forwarding type will be redirected to the queue within the specified queue group. The queue-group-name are configured in the **config>qos>queue-group-templates** egress and ingress contexts. This parameter is used when policy-based queue group redirection is desired. That is, the specific queue group to redirect to is named in the QoS policy.

**no queue** *queue-id*

## **Context**

[\[Tree\]](#) (config>qos>sap-ingress queue)

## **Full Context**

configure qos sap-ingress queue

## **Description**

This command creates the context to configure an ingress SAP QoS policy queue.

Explicit definition of an ingress queue's type is supported. A single ingress queue allows support for multiple forwarding classes. The default behavior automatically chooses the expedited or best effort nature of the queue based on the forwarding classes mapped to it. As long as all forwarding classes mapped to the queue are expedited (nc, ef, h1, or h2), the queue is treated as an expedited queue by the hardware schedulers. When any best effort forwarding classes are mapped to the queue (be, af, l1, or l2), the queue is treated as best effort (be) by the hardware schedulers. The queue type must be defined at the time of queue creation within the policy.

The **queue** command allows the creation of multipoint queues. Only multipoint queues can receive ingress packets that need flooding to multiple destinations. By separating the unicast for multipoint traffic at service ingress and handling the traffic on separate multipoint queues, special handling of the multipoint traffic is possible. Each queue acts as an accounting and (optionally) shaping device offering precise control over potentially expensive multicast, broadcast, and unknown unicast traffic. Only the back-end support of multipoint traffic (between the forwarding class and the queue based on forwarding type) needs to be

defined. The individual classification rules used to place traffic into forwarding classes are not affected. Queues must be defined as multipoint at the time of creation within the policy.

The multipoint queues are for multipoint-destined service traffic. Within non-multipoint services, such as Epipe services, all traffic is considered unicast due to the nature of the service type. Multicast and broadcast-destined traffic in an Epipe service will not be mapped to a multipoint service queue.

When an ingress SAP QoS policy with multipoint queues is applied to an Epipe SAP, the multipoint queues are not created. When an ingress SAP QoS policy with multipoint queues is applied to an IES SAP, a multipoint queue will be created when PIM is enabled on the IES interface.

Any billing or statistical queries about a multipoint queue on a non-multipoint service returns zero values. Any queue parameter information requested about a multipoint queue on a non-multipoint service returns the queue parameters in the policy. Buffers will not be allocated for multipoint queues on non-multipoint services. Buffer pool queries return zero values for actual buffers allocated and current buffer utilization.

The **no** form of this command removes the *queue-id* from the SAP ingress QoS policy and from any existing SAPs using the policy. If any forwarding class forwarding types are mapped to the queue, they revert to their default queues. When a queue is removed, any pending accounting information for each SAP queue created due to the definition of the queue in the policy is discarded.

## Parameters

### *queue-id*

The *queue-id* for the queue, expressed as an integer. The *queue-id* uniquely identifies the queue within the policy. This is a required parameter each time the queue command is executed.

**Values** 1 to 32

### *queue-type*

The **expedite**, **best-effort**, and **auto-expedite** queue types are mutually exclusive. Each defines the method that the system uses to service the queue from a hardware perspective. A keyword can be specified at the time the queue is created. If an attempt to change the keyword after the queue is initially defined, an error is generated.

**Values** expedite, best-effort, auto-expedite

**expedite** — This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

**best-effort** — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

**auto-expedite** — This keyword allows the system to auto-define the way the queue is serviced by the hardware. When **auto-expedite** is defined on the queue, the queue is treated in an expedited manner when all forwarding classes mapped to the queue are configured as expedited types nc, ef, h1 or h2. When a single non-expedited forwarding class is mapped to the queue (be, af, l1, and l2), the queue automatically falls back to non-expedited status.

**Default** auto-expedite

**multipoint**

This optional keyword specifies that this *queue-id* is for multipoint forwarded traffic only. This *queue-id* can only be explicitly mapped to the forwarding class multicast, broadcast, or unknown unicast ingress traffic. If forwarding class unicast traffic is mapped to a multipoint queue, an error is generated and no changes are made to the current unicast traffic queue mapping.

A queue must be created as multipoint. The **multipoint** designator cannot be defined after the queue is created. If an attempt is made to modify the command to include the **multipoint** keyword, an error is generated and the command will not execute.

The **multipoint** keyword can be entered in the command line on a preexisting multipoint queue to edit *queue-id* parameters.

**Default** non-multipoint (unicast queue)

**queue-mode**

Specifies the mode in which the queue is operating. This attribute is associated with the queue at the time of creation and cannot be modified thereafter.

**Values** **profile-mode**: When the queue is operating in the profile mode (or the color aware mode), the queue tries to provide the appropriate bandwidth to the packets with different profiles. The profiles are assigned according to the configuration of the forwarding class or the sub-forwarding class.

**priority-mode**: The queue is capable of handling traffic differently with two distinct priorities. These priorities are assigned by the stages preceding the queueing framework in the system. In priority mode, the queue does not have the functionality to support the profiled traffic and in such cases the queue will have a degraded performance. However, the converse is not valid and a queue in-profile mode should be capable of supporting the different priorities of traffic.

**Default** priority-mode

**create**

Keyword creates an ingress SAP QoS policy queue.

**Platforms**

All

**queue****Syntax**

**queue** *queue-id* [{**group** *queue-group-name* [**instance** *instance-id*] | **port-redirect-group-queue**}]

**no queue**

**Context**

[\[Tree\]](#) (config>qos>sap-egress>fc queue)

## Full Context

```
configure qos sap-egress fc queue
```

## Description

This command overrides the default queue mapping for **fc** fc-name. The specified queue ID must exist within the policy before the mapping can be made. When the forwarding class mapping is executed, all traffic is classified to fc-name on a SAP using this policy.

The **no** form of this command sets the queue-id back to the default queue for the forwarding class (queue 1).

## Default

```
no queue
```

## Parameters

### *queue-id*

Specifies the SAP egress queue-id to be associated with the forwarding class. The queue-id must be an existing queue defined in sap-egress policy-id.

**Values** 1 to 8

**Default** 1

### *queue-group-name*

This optional parameter is used to redirect the forwarding type within the forwarding class to the specified *queue-id* within the *queue-group-name*. When the policy is applied, all packets matching the forwarding class and forwarding type will be redirected to the queue within the specified queue group. The queue-group-name are configured in the **config>qos>queue-group-templates** egress and ingress contexts. This parameter is used when policy-based queue group redirection is desired. That is, the specific queue group to redirect to is named in the QoS policy.

### *instance-id*

This parameter is used to specify the specific instance of a queue group with template queue-group-name to which this queue should be redirected. This parameter is only valid for queue groups on egress ports where policy-based redirection is required.

**Values** 1 to 40960

**Default** 1

### **port-redirect-group-queue**

This keyword is used to mark a given forwarding class queue for redirection to an egress queue group queue. This is only used when the specific queue group instance is assigned at the time the QoS policy is applied to the SAP. This redirection model is known as SAP-based redirection.

## queue

### Syntax

**queue** *queue-id* [*queue-type*] [**create**]

**no queue** *queue-id*

### Context

**[Tree]** (config>qos>sap-egress queue)

### Full Context

configure qos sap-egress queue

### Description

This command creates the context to configure an egress service access point (SAP) QoS policy queue.

Explicit definition of an egress queue's type is supported. A single egress queue allows support for multiple forwarding classes. The default behavior automatically chooses the expedited or best effort nature of the queue based on the forwarding classes mapped to it. As long as all forwarding classes mapped to the queue are expedited (nc, ef, h1, or h2), the queue is treated as an expedited queue by the hardware schedulers. When any best effort forwarding classes are mapped to the queue (be, af, l1, or l2), the queue is treated as best effort by the hardware schedulers. The queue type must be defined at the time of queue creation within the policy.

The **no** form of this command removes the *queue-id* from the SAP egress QoS policy and from any existing SAPs using the policy. If any forwarding class forwarding types are mapped to the queue, they revert to their default queues. When a queue is removed, any pending accounting information for each SAP queue created due to the definition of the queue in the policy is discarded.

### Parameters

#### *queue-id*

The ID for the queue, expressed as an integer. The *queue-id* uniquely identifies the queue within the policy. This is a required parameter each time the queue command is executed.

**Values** 1 to 32

#### *queue-type*

Specifies the method that system uses to service the queue from a hardware perspective. A keyword can be specified at the time the queue is created. If an attempt is made to change the keyword after the queue is initially defined, an error is generated.

**Values** **expedite** - Specifies that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

**best-effort** - Specifies that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

**auto-expedite** - Allows the system to auto-define the way the queue is serviced by the hardware. When **auto-expedite** is defined on the queue, the queue is treated in an expedited manner when all

forwarding classes mapped to the queue are configured as expedited types nc, ef, h1, or h2. When a single non-expedited forwarding class is mapped to the queue (be, af, l1, and l2), the queue automatically falls back to non-expedited status.

**Default** auto-expedite

### create

Creates an entry for the queue.

## Platforms

All

## queue

### Syntax

**queue** *queue-id* **sched-class** *class-id*

**queue** *queue-id* **unattached**

**queue** *queue-id* **wrr-group** *wrr-group-id*

**no queue** *queue-id*

### Context

[\[Tree\]](#) (config>qos>hs-attachment-policy queue)

### Full Context

configure qos hs-attachment-policy queue

### Description

This command defines how the specified queue-id is attached to the scheduler. A queue may have one of four attachment states:

- directly attached to a scheduler class
- attached to a WRR group which is attached to a scheduler class
- attached to a WRR group which is unattached
- unattached

The following items are rules for attachment:

- Only one queue or WRR group can be attached to a given scheduling class. If another queue or a WRR group is currently attached to the specified scheduling class, the queue's attachment command fails and the current attachment for the *queue-id* is unchanged.
- Queues must be attached to scheduler classes (directly or indirectly through a WRR group) in an ascending order.

For example, if queue 3 is attached to scheduler class 2, queues 1 and 2 cannot be attached to scheduling classes 3 through 6 (or attached to a WRR group that is attached to scheduling classes 3 through 6).

- Up to six queues can be placed in any WRR group. These queues can all be in one WRR group or be spread between both WRR groups. Attempting to execute the **wrr-group** keyword on a seventh queue within the attachment policy fails.
- Queues must attach to WRR groups in contiguous order.
- WRR group 1 must have lower queue ID members than WRR group 2. Attempting to attach a queue ID to group 1 that is higher than any queue ID currently attached to group 2 fails with no change to the current attachment state for that queue ID. Attempting to attach a queue ID to group 2 that is lower than any queue ID currently attached to group 1 fails with no change to the current attachment state for that queue ID.
- WRR group 1 must have at least one attached member queue before queues can be attached to WRR group 2.
- Queues and WRR groups can be unattached at any time.
  - Unattached queues, or queues attached to an unattached WRR group, discard all received packets. Normal discard accounting is maintained.
  - The unattached state for an in-service queue or WRR group is intended for **hs-attachment-policy** editing purposes and is expected to be an intermediate state in this case.

When an **hs-attachment-policy** is initially created, all queues and both WRR groups default to the unattached state. Each queue and WRR group attachment state must be explicitly configured.

The **no** form of the command reverts to the default unattached attachment state for queue ID. The command fails if the specified *queue-id* is currently in a WRR group and removing the queue from that group causes the queue IDs for that group to become discontinuous.

## Default

queue *queue-id* unattached

## Parameters

### *queue-id*

Specifies the queue identifier for the HS attachment policy queue. This parameter is required when executing the command.

**Values** 1 to 8

### **sched-class**

Specifies a direct attachment between the *queue-id* and one of the six scheduling classes. A value of 1 through 6 must accompany the **sched-class** keyword representing the queue's attached scheduling class. The **sched-class**, **group**, and **unattached** keywords are mutually exclusive. One of the keywords must be specified when the **queue** attachment command is executed.

### *class-id*

Specifies the scheduling class that is associated with this *queue-id*.

**Values** 1 to 6

### **wrr-group**

Specifies the inclusion of the *queue-id* in either WRR group 1 or WRR group 2. A value of 1 or 2 must accompany the **wrr-group** keyword representing the queue's attached WRR group number. Queues placed in a WRR group must have contiguous queue IDs.

The **sched-class**, **group**, and **unattached** keywords are mutually exclusive. One of the keywords must be specified when the **queue** attachment command is executed.

**wrr-group-id**

Specifies the WRR group to which the queue-id is to be attached.

**Values** 1, 2

**unattached**

Indicates that the *queue-id* is not attached to any scheduling class or WRR group. An unattached queue does not forward any packets. The **sched-class**, **group**, and **unattached** keywords are mutually exclusive. One of the keywords must be specified when the **queue** attachment command is executed.

**Platforms**

7750 SR-7/12/12e

**queue****Syntax**

**queue** *queue-id* [**multipoint**] [*queue-type*] [**create**]

**no queue** *queue-id*

**Context**

**[Tree]** (config>qos>network-queue>fc queue)

**Full Context**

configure qos network-queue fc queue

**Description**

Commands in this context configure a QoS network-queue policy queue.

Explicit definition of an ingress queue's type status is supported. A single ingress queue allows support for multiple forwarding classes. The default behavior automatically chooses the expedited or best effort nature of the queue based on the forwarding classes mapped to it. As long as all forwarding classes mapped to the queue are expedited (nc, ef, h1, or h2), the queue is treated as an expedited queue by the hardware schedulers. When any best effort forwarding classes are mapped to the queue (be, af, l1, or l2), the queue is treated as best effort (be) by the hardware schedulers. The queue type must be defined at the time of queue creation within the policy.

The **queue** command allows the creation of multipoint queues. Only multipoint queues can receive ingress packets that need flooding to multiple destinations. By separating the unicast for multipoint traffic at service ingress and handling the traffic on separate multipoint queues, special handling of the multipoint traffic is possible. Each queue acts as an accounting and (optionally) shaping device offering precise control over potentially expensive multicast, broadcast, and unknown unicast traffic. Only the back-end support of multipoint traffic (between the forwarding class and the queue based on forwarding type) needs to be defined. The individual classification rules used to place traffic into forwarding classes are not affected. Queues must be defined as multipoint at the time of creation within the policy.

The multipoint queues are for multipoint traffic.

The multipoint queues are for multipoint-destined service traffic. Within non-multipoint services, such as Epipe services, all traffic is considered unicast due to the nature of the service type. Multicast and broadcast-destined traffic in an Epipe service will not be mapped to a multipoint service queue.

When a QoS policy with multipoint queues is applied to an Epipe or IES SAP, the multipoint queues are not created. Any billing or statistical queries about a multipoint queue on a non-multipoint service returns zero values. Any queue parameter information requested about a multipoint queue on a non-multipoint service returns the queue parameters in the policy. Buffers will not be allocated for multipoint queues on non-multipoint services. Buffer pool queries return zero values for actual buffers allocated and current buffer utilization.

The **no** form of this command removes the *queue-id* from the network-queue policy and from any existing SAPs using the policy. If any forwarding class forwarding types are mapped to the queue, they revert to their default queues. When a queue is removed, any pending accounting information for each SAP queue created due to the definition of the queue in the policy is discarded.

## Parameters

### *queue-id*

The *queue-id* for the queue, expressed as an integer. The *queue-id* uniquely identifies the queue within the policy. This is a required parameter each time the queue command is executed.

**Values** 1 to 32

### **multipoint**

This optional keyword specifies that this *queue-id* is for multipoint forwarded traffic only. This *queue-id* can only be used to forward multicast, broadcast, or unknown unicast ingress traffic.

A queue must be created as multipoint. The **multipoint** designator cannot be defined after the queue is created. If an attempt is made to modify the command to include the **multipoint** keyword, an error is generated, and the command will not execute.

The **multipoint** keyword can be entered in the command line on a preexisting multipoint queue to edit *queue-id* parameters.

**Default** Non-multipoint (unicast queue)

### *queue-type*

The **expedite**, **best-effort**, and **auto-expedite** queue types are mutually exclusive. Each defines the method that the system uses to service the queue from a hardware perspective. While parental virtual schedulers can be defined for the queue, they only enforce how the queue interacts for bandwidth with other queues associated with the same scheduler hierarchy. An internal mechanism that provides access rules when the queue is vying for bandwidth with queues in other virtual schedulers is also needed. A keyword must be specified at the time the queue is created in the network-queue policy. If an attempt is made to change the keyword after the queue is initially defined, an error is generated.

**Values** expedite, best-effort, auto-expedite

**expedite** — This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

**best-effort** — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

**auto-expedite** — This keyword allows the system to auto-define the way the queue is serviced by the hardware. When **auto-expedite** is defined on the queue, the queue is treated in an expedited manner when all forwarding classes mapped to the queue are configured as expedited types nc, ef, h1 or h2. When a single non-expedited forwarding class is mapped to the queue (be, af, l1, and l2), the queue automatically falls back to non-expedited status.

**Default** auto-expedite

## Platforms

**no queue** *queue-id*

## Context

[\[Tree\]](#) (config>qos>qgrps>ing>queue-group queue)

## Full Context

configure qos queue-group-templates ingress queue-group queue

## Description

This command creates a queue for use in a queue group template. When created, the defined queue-id acts as a repository for the default parameters for the queue. The template queue is created on each queue-group object that is created with the queue group template name. Each queue is identified within the template by a queue-id number. The template ensures that all queue groups created with the template name will have the same queue-ids providing a uniform structure for the forwarding class redirection commands in the SAP ingress QoS policies. The parameters within the template queue will be used as the default settings for each queue in the actual queue group. The queue parameters may be individually changed for each queue in each queue group using per queue overrides.

When a queue within a template is mapped by a forwarding class on any object, the queue may be edited, but not deleted.

The **no** form of this command removes a template queue from the queue group template. If the queue is specified as a forwarding class redirection target in any SAP ingress QoS policy, the command will fail.

## Parameters

### *queue-id*

This required parameter identifies the queue that will either be created or edited within the queue group template.

**Values** 1 to 32

### **multipoint**

This optional keyword creates an ingress multipoint queue. Multipoint queues in a queue group may be used by ingress VPLS for forwarding types multicast, broadcast or unknown within a forwarding class. For ingress IES and VPRN access SAPs, only multicast is supported. Multipoint queues are only supported on ingress queue group templates.

**Default** non-multipoint (unicast queue)

### *queue-type*

The queue types are mutually exclusive.

**Values** **expedite** — This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

**best-effort** — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

**Default** best-effort

### *queue-mode*

These keywords are optional and mutually exclusive when creating a new template queue. The keywords specify how the queue manages ingress explicitly profiled packets.

**Values** **profile-mode** — Overrides the default priority mode of the queue and allows the adoption of color aware profiling within the queue. Forwarding classes and subclasses may be explicitly defined as in-profile or out-of-profile. Out-of-profile classified packets bypass the CIR rate associated with the queue, reserving it for the undefined or in-profile classified packets. If the template queue is not defined as profile-mode and the packet redirected to the queue is explicitly out-of-profile based on the classification rules, the queues within-CIR bandwidth may be consumed by the packet.

**priority-mode** — Defines that the SAP ingress QoS policy priority classification result will be honored by the queue. Priority mode is the default mode of the queue. High-priority packets are allowed into the queue up to the MBS defined for the queue. Low-priority packets are discarded at the low-priority MBS threshold that is derived from applying the low drop-tail percentage to the queue's MBS.

### **create**

Keyword used to create the queue ID instance.

## Platforms

All

## queue

### Syntax

**queue** *queue-id*

**no queue**

### Context

[\[Tree\]](#) (config>qos>qgrps>egr>queue-group-template>fc queue)

### Full Context

configure qos queue-group-templates egress queue-group-template fc queue

### Description

This command is used to map the forwarding class to the specified *queue-id*. The specified *queue-id* must exist within the egress queue group template. When a queue is defined in a forwarding class mapping, that queue cannot be deleted unless the forwarding class mapping is moved to another queue within the template. Other criteria may also exist preventing the queue from being deleted from the template such as an applied SAP egress QoS policy mapping to the queue.

### Parameters

*queue-id*

The specified *queue-id* must exist within the egress queue group template.

**Values** 1 to 8

## queue

### Syntax

**queue** *queue-id* [*queue-type*] [**create**]

**no queue** *queue-id*

### Context

[\[Tree\]](#) (cfg>qos>qgrps>egr>queue-group queue)

### Full Context

configure qos queue-group-templates egress queue-group queue

## Description

This command creates a queue for use in a queue group template. When created, the defined *queue-id* acts as a repository for the default parameters for the queue. The template queue is created on each queue group object that is created with the queue group template name. Each queue is identified within the template by a queue ID. The template ensures that all queue groups created with the template name will have the same queue-ids providing a uniform structure for the forwarding class redirection commands in the SAP egress QoS policies. The parameters within the template queue will be used as the default settings for each queue in the actual queue group. The queue parameters may be individually changed for each queue in each queue group using per queue overrides.

## Parameters

### *queue-id*

Specifies the queue ID. The specified *queue-id* must exist within the egress queue group template.

**Values** 1 to 8

### *queue-type*

Specifies the method that the system uses to service the queue from a hardware perspective.

**Values** expedite, best-effort

**expedite** — This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

**best-effort** — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

**Default** best-effort

All

## queue

## Syntax

`queue queue-id`

`no queue`

## Context

[\[Tree\]](#) (config>qos>shared-queue>fc queue)

## Full Context

configure qos shared-queue fc queue

## Description

This command overrides the default unicast forwarding type queue mapping for **fc** *fc-name*. The specified *queue-id* must exist within the policy as a non-multipoint queue before the mapping can be made. When the forwarding class mapping is executed, all unicast traffic (this includes all traffic, even broadcast and multicast for services) on a SAP using this policy is forwarded using the *queue-id*.

The **no** form of this command sets the unicast (point-to-point) *queue-id* back to the default queue for the forwarding class (queue 1).

## Parameters

### *queue-id*

The *queue-id* parameter specified must be an existing non-multipoint queue defined in the **config>qos>sap-ingress** context. For the 7950 XRS, this is not configurable in the policer-output-queues profile.

**Values** Any valid non-multipoint *queue-id* in the policy including 1 and 3 through 32.

**Default** 1

## Platforms

**no queue** *queue-id*

## Context

[\[Tree\]](#) (config>qos>shared-queue queue)

## Full Context

configure qos shared-queue queue

## Description

This command creates the context to configure a shared queue QoS policy queue.

Explicit definition of an ingress queue's type is supported. A single ingress queue allows support for multiple forwarding classes. The default behavior automatically chooses the expedited or best effort nature of the queue based on the forwarding classes mapped to it. As long as all forwarding classes mapped to the queue are expedited (nc, ef, h1, or h2), the queue is treated as an expedited queue by the hardware schedulers. When any best effort forwarding classes are mapped to the queue (be, af, l1, or l2), the queue is treated as best effort by the hardware schedulers. The queue type can be overridden within the policy.

On the 7450 ESS, the expedited hardware schedulers are used to enforce expedited access to internal switch fabric destinations. The hardware status of the queue must be defined at the time of queue creation within the policy.

## Parameters

### *queue-id*

The *queue-id* for the queue, expressed as an integer. The *queue-id* uniquely identifies the queue within the policy. This is a required parameter each time the queue command is executed.

**Values** 1 to 32

### *queue-type*

The **expedite**, **best-effort**, and **auto-expedite** queue types are mutually exclusive. Each defines the method that the system uses to service the queue from a hardware perspective. While parental virtual schedulers can be defined for the queue, they only enforce how the queue interacts for bandwidth with other queues associated with the same scheduler hierarchy. An internal mechanism that provides access rules when the queue is vying for bandwidth with queues in other virtual schedulers is also needed. A keyword must be specified at the time the queue is created in the SAP ingress policy. If an attempt to change the keyword after the queue is initially defined, an error is generated.

**expedite** — This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

**best-effort** — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

**auto-expedite** — This keyword allows the system to auto-define the way the queue is serviced by the hardware. When auto-expedite is defined on the queue, the queue is treated in an expedited manner when all forwarding classes mapped to the queue are configured as expedited types nc, ef, h1, or h2. When a single non-expedited forwarding class is mapped to the queue (be, af, l1, and l2) the queue automatically falls back to non-expedited status.

**Default** auto-expedite

### *multipoint*

This keyword specifies that this *queue-id* is for multipoint forwarded traffic only. This *queue-id* can only be explicitly mapped to the forwarding class multicast, broadcast, or unknown unicast ingress traffic. If forwarding class unicast traffic is mapped to a multipoint queue, an error is generated and no changes are made to the current unicast traffic queue mapping.

A queue must be created as multipoint. The **multipoint** designator cannot be defined after the queue is created. If an attempt is made to modify the command to include the **multipoint** keyword, an error is generated and the command will not execute.

The **multipoint** keyword can be entered in the command line on a preexisting multipoint queue to edit *queue-id* parameters.

configure qos network-queue queue

## Description

This command enters the context to configure a QoS network-queue policy queue.

Explicit definition of an ingress queue's type status is supported. A single ingress queue allows support for multiple forwarding classes. The default behavior automatically chooses the expedited or best effort nature of the queue based on the forwarding classes mapped to it. As long as all forwarding classes mapped to the queue are expedited (nc, ef, h1, or h2), the queue is treated as an expedited queue by the hardware schedulers. When any best effort forwarding classes are mapped to the queue (be, af, l1, or l2), the queue is treated as best effort (be) by the hardware schedulers. The queue type must be defined at the time of queue creation within the policy.

The **queue** command allows the creation of multipoint queues. Only multipoint queues can receive ingress packets that need flooding to multiple destinations. By separating the unicast for multipoint traffic at service ingress and handling the traffic on separate multipoint queues, special handling of the multipoint traffic is possible. Each queue acts as an accounting and (optionally) shaping device offering precise control over potentially expensive multicast, broadcast, and unknown unicast traffic. Only the back-end support of multipoint traffic (between the forwarding class and the queue based on forwarding type) needs to be defined. The individual classification rules used to place traffic into forwarding classes are not affected. Queues must be defined as multipoint at the time of creation within the policy.

The multipoint queues are for multipoint traffic.

The multipoint queues are for multipoint-destined service traffic. Within non-multipoint services, such as Epipe services, all traffic is considered unicast due to the nature of the service type. Multicast and broadcast-destined traffic in an Epipe service will not be mapped to a multipoint service queue.

When a QoS policy with multipoint queues is applied to an Epipe or IES SAP, the multipoint queues are not created. Any billing or statistical queries about a multipoint queue on a non-multipoint service returns zero values. Any queue parameter information requested about a multipoint queue on a non-multipoint service returns the queue parameters in the policy. Buffers will not be allocated for multipoint queues on non-multipoint services. Buffer pool queries return zero values for actual buffers allocated and current buffer utilization.

The **no** form of this command removes the *queue-id* from the network-queue policy and from any existing SAPs using the policy. If any forwarding class forwarding types are mapped to the queue, they revert to their default queues. When a queue is removed, any pending accounting information for each SAP queue created due to the definition of the queue in the policy is discarded.

## Parameters

### *queue-id*

The *queue-id* for the queue, expressed as an integer. The *queue-id* uniquely identifies the queue within the policy. This is a required parameter each time the queue command is executed.

**Values** 1 to 32

### **multipoint**

This optional keyword specifies that this *queue-id* is for multipoint forwarded traffic only. This *queue-id* can only be used to forward multicast, broadcast, or unknown unicast ingress traffic.

A queue must be created as multipoint. The **multipoint** designator cannot be defined after the queue is created. If an attempt is made to modify the command to include the **multipoint** keyword, an error is generated, and the command will not execute.

The **multipoint** keyword can be entered in the command line on a preexisting multipoint queue to edit *queue-id* parameters.

**Default** Non-multipoint (unicast queue)

### **queue-type**

The **expedite**, **best-effort**, and **auto-expedite** queue types are mutually exclusive. Each defines the method that the system uses to service the queue from a hardware perspective. While parental virtual schedulers can be defined for the queue, they only enforce how the queue interacts for bandwidth with other queues associated with the same scheduler hierarchy. An internal mechanism that provides access rules when the queue is vying for bandwidth with queues in other virtual schedulers is also needed. A keyword must be specified at the time the queue is created in the network-queue policy. If an attempt is made to change the keyword after the queue is initially defined, an error is generated.

**Values** expedite, best-effort, auto-expedite

**expedite** — This keyword ensures that the queue is treated in an expedited manner independent of the forwarding classes mapped to the queue.

**best-effort** — This keyword ensures that the queue is treated in a non-expedited manner independent of the forwarding classes mapped to the queue.

**auto-expedite** — This keyword allows the system to auto-define the way the queue is serviced by the hardware. When **auto-expedite** is defined on the queue, the queue is treated in an expedited manner when all forwarding classes mapped to the queue are configured as expedited types nc, ef, h1 or h2. When a single non-expedited forwarding class is mapped to the queue (be, af, l1, and l2), the queue automatically falls back to non-expedited status.

**Default** auto-expedite

### **Platforms**

## **21.20 queue-delay**

queue-delay

### **Syntax**

**queue-delay** *delay*

**no queue-delay**

**Context**

**[Tree]** (config>qos>qgrps>egr>qgrp>queue queue-delay)

**Full Context**

configure qos queue-group-templates egress queue-group queue queue-delay

**Description**

This command configures the target queue delay for packets forwarded through the queue. It is used to determine the related queue parameters based on the administrative PIR of the queue. This command and the **mbs** command are mutually exclusive.

In order to change between the **mbs** and **queue-delay** parameters, the current parameter must be removed before adding the new parameter; that is, changing from **mbs** to **queue-delay** requires a **no mbs** before the **queue-delay** is configured and changing from **queue-delay** to **mbs** requires a **no queue-delay** before the **mbs** is configured.

If **queue-delay** is configured for an egress queue group queue, it is not possible to override the MBS for that queue.

The **no** form of this command disables the determination of the queue parameters based on the queue delay.

**Default**

no queue-delay

**Parameters****delay**

Specifies the target queue delay in ms.

**Values** 0 to 5000 (decimal)

**Platforms**

### Full Context

configure port ethernet access egress queue-group agg-rate queue-frame-based-accounting

configure port ethernet access egress vport agg-rate queue-frame-based-accounting

configure port ethernet network egress queue-group agg-rate queue-frame-based-accounting

## Description

This command enables frame based accounting on all policers and queues associated with the agg-rate context. It is only supported on Ethernet ports. Packet byte offset settings are not included in the applied rate when queue frame-based accounting is configured, regardless of how offsets are applied to the statistics.

The **no** form of this command disables frame based accounting on all policers and queues associated with the agg-rate context.

## 21.22 queue-group

### queue-group

## Syntax

**queue-group** *queue-group-name* **instance** *instance-id* [**create**]

**no queue-group** *queue-group-name* **instance** *instance-id*

## Context

[\[Tree\]](#) (config>card>fp>ingress>access queue-group)

## Full Context

configure card fp ingress access queue-group

## Description

This command creates an instance of a named queue group template on the ingress forwarding plane of a given IOM/IMM. The *queue-group-name* and **instance** *instance-id* are mandatory parameters when executing the command.

The named queue group template can contain only policers. If it contains queues, then the command will fail.

The **no** form of this command deletes a specific instance of a queue group.

## Parameters

### *queue-group-name*

Specifies the name of the queue group template to be instantiated on the forwarding plane of the IOM/IMM, up to 32 characters. The *queue-group-name* must correspond to a

valid ingress queue group template name, configured under **config>qos>queue-group-templates**.

#### ***instance-id***

Specifies the instance of the named queue group to be created on the IOM/IMM ingress forwarding plane.

**Values** 1 to 65535

#### **create**

Keyword used to associate the queue group. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

## queue-group

### **Syntax**

**queue-group** *queue-group-name* **instance** *instance-id* [**create**]

**no queue-group** *queue-group-name* **instance** *instance-id*

### **Context**

[\[Tree\]](#) (config>card>fp>ingress>network queue-group)

### **Full Context**

configure card fp ingress network queue-group

### **Description**

This command creates a queue-group instance in the network ingress context of a forwarding plane.

Only a queue-group containing policers can be instantiated. If the queue-group template contains policers and queues, the queues are not instantiated. If the queue-group contains queues only, the instantiation in the data path is failed.

One or more instances of the same policer queue-group name and/or a different policer queue-group name can be created on the network ingress context of a forwarding plane.

The queue-group-name must be unique within all network ingress and access ingress queue groups in the system. The queue-group instance-id must be unique within the context of the forwarding plane.

The **no** form of this command deletes the queue-group instance from the network ingress context of the forwarding plane.

### **Parameters**

#### ***queue-group-name***

Specifies the name of the queue group template up to 32 characters.

#### ***instance-id***

Specifies the identification of a specific instance of the queue-group.

**Values** 1 to 65535

### **create**

Keyword used to create the queue-group instance.

## **Platforms**

**queue-group** *queue-group-name* **instance** *instance-id*

**no queue-group**

### **Context**

[\[Tree\]](#) (config>port>ethernet>network>egress queue-group)

### **Full Context**

configure port ethernet network egress queue-group

### **Description**

This command configures a queue-group instance in the network egress context of a port.

Queue-groups containing queues only or policers and queues can be instantiated. When a port is a LAG, one instance of the queue-group is instantiated on each member link.

One or more instances of the same queue-group name and/or a different queue-group name can be created in the network egress context of a port.

The queue-group-name must be unique within all network egress and access egress queue groups in the system. The queue-group instance-id must be unique within the context of the port.

The **no** version of this command deletes the queue-group instance from the network egress context of the port.

### **Parameters**

#### ***queue-group-name***

Specifies the name of the queue group template up to 32 characters.

#### ***instance-id***

Specifies the identification of a specific instance of the queue-group.

**Values** 1 to 65535

**[Tree]** (config>port>ethernet>access>egr queue-group)

### Full Context

configure port ethernet access ingress queue-group

configure port ethernet access egress queue-group

### Description

This command creates an ingress or egress queue group on an Ethernet port. A queue group is a collection of queues identified by a group name. Queue groups created on access ports are used as an alternative queue destination for SAPs.

Within a SAP, a forwarding class may be redirected from the local SAP queue to a port queue group queue. The forwarding classes from multiple SAPs may be redirected to the same queue group which can be used to minimize the number of per-SAP queues.

Queue groups may be created on both access and network oriented ports. When the port is in access mode, the queue groups must be created within the port access node.

Within the access node, queue groups are also configured as ingress or egress. Access ingress queue groups can only be used by ingress SAP forwarding classes and only a single ingress queue group per port is supported. Multiple access egress queue groups may be created on a single port and are used by egress SAP forwarding classes. The instance-id parameter identifies different instances of the same queue group template. Creating multiple queue groups with a different instance ID but the same queue group name results in separate queue groups being created on the port. The instance-id parameter is only valid for egress queue groups on access ports.

When the queue group is created in an ingress port context, the group-name must be an existing ingress queue group template. Similarly, queue groups created in an egress port context must have a group-name of an existing egress queue group template. Two ingress queue groups with the same name cannot be created on the same port. Two egress queue groups can only be created on the same port with the same queue group template name if they have different instance-id values.

The queues defined in the template are created on the queue group. The queue parameters within the template are used as the default queue parameters for each queue in the queue group. The default queue parameters for each queue may be overridden on the queue group with specific queue parameters.

Each queue group supports the application of a scheduler-policy for the purpose of managing the queues within the group into an aggregate SLA. The queues defined within the template may be configured with parent scheduler defining the mapping of a queue to one of the schedulers within the scheduler policy. Egress queue groups also support the **agg-rate** parameter and the queues in the egress template support the port-parent command. Each command is used for configuring egress port virtual scheduling behavior.

Each queue group allows the application of an accounting policy and the ability to enable and disable collecting statistics. The statistics are derived from the queue counters on each queue within the queue

group. The accounting policy defines which queue counters are collected and to which accounting file they will be written.

A queue group does not have an administrative shutdown or no shutdown command. A queue group is considered to be always on once created.

When creating a queue group, the system will attempt to allocate queue resources based on the queues defined in the queue group template. If the appropriate queue resources do not currently exist, the queue group will not be created. Ingress port queue groups do not support the shared-queuing or multipoint-shared queuing behavior.

When the queue group is created on a LAG (Link Aggregation Group), it must be created on the primary port member. The primary port member is the port with the lowest port ID based on the slot, MDA position and port number on the MDA. A queue group created on the primary LAG port will be automatically created on all other port members. If a new port is being added to a LAG with an existing queue group, the queue group must first be created on the port prior to adding the port to the LAG. If the LAG queue group has queue overrides, the queue overrides must also be defined on the port queue group prior to adding the port to the LAG.

A port queue group cannot be removed from the port when a forwarding class is currently redirected to the group. All forwarding class redirections must first be removed prior to removing the queue group.

## Parameters

### *queue-group-name*

The group-name parameter is required when executing the port queue-group command. The specified group-name must exist as an ingress or egress queue group template depending on the ingress or egress context of the port queue group. Only a single queue group may be created on an ingress port. Multiple queue groups may be created on an egress port.

### *instance-id*

Specifies the identification of a specific instance of the queue-group.

**Values** 1 to 65535

### **create**

Keyword used to associate the queue group. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

## Platforms

All

## queue-group

## Syntax

**queue-group** *queue-group-name* [**create**]

**no queue-group** *queue-group-name*

## Context

**[Tree]** (config>qos>qgrps>egress queue-group)

[\[Tree\]](#) (config>qos>qgrps>ingress queue-group)

### Full Context

configure qos queue-group-templates egress queue-group

configure qos queue-group-templates ingress queue-group

### Description

This command creates a queue group template. The system does not maintain default queue groups or queue group templates. Each queue group template used in the system must be explicitly created.

The **no** form of this command removes the specified queue group template from the system. If the queue group template is currently in use by an ingress port, the command will fail. If *queue-group-name* does not exist, the command has no effect and does not return an error.

### Parameters

#### *queue-group-name*

Specifies the name of the queue group template up to 32 characters. Each ingress queue group template must be uniquely named within the system. Multiple ingress queue group templates may not share the same name. An ingress and egress queue group template may share the same name.

#### **create**

Keyword used to create the queue group instance. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

### Platforms

All

## 21.23 queue-group-egress

### queue-group-egress

### Syntax

**queue-group-egress** *src-name dst-name* [**overwrite**]

### Context

[\[Tree\]](#) (config>qos>copy queue-group-egress)

### Full Context

configure qos copy queue-group-egress

### Description

This command copies an existing **queue-group-egress** *queue-group-name* to another **queue-group-egress** *queue-group-name*. The **copy** command is a configuration level maintenance tool used to create

new entries using an existing mapping policy name. If **overwrite** is not specified, an error occurs if the destination policy exists.

### Parameters

#### ***src-name***

Specifies the existing source **queue-group-egress** *queue-group-name*, up to 32 characters, from which the **copy** command attempts to copy.

#### ***dst-name***

Specifies the destination **queue-group-ingress** *queue-group-name*, up to 32 characters, to which the copy command attempts to copy.

#### **overwrite**

Use this parameter when the **queue-group-egress** *dst-name* already exists. If it does, everything in the existing destination **queue-group-egress** *dst-name* is completely overwritten with the contents of the **queue-group-egress** *src-name*. The **overwrite** parameter must be specified or else the following error message is returned:

```
MINOR: CLI Destination "qge2" exists - use {overwrite}.
```

If **overwrite** is specified, the function of copying from source to destination occurs in a "break before make" manner and therefore should be handled with care.

### Platforms

All

## 21.24 queue-group-ingress

### queue-group-ingress

#### Syntax

```
queue-group-ingress src-name dst-name [overwrite]
```

#### Context

```
[Tree] (config>qos>copy queue-group-ingress)
```

#### Full Context

```
configure qos copy queue-group-ingress
```

#### Description

This command copies an existing **queue-group-ingress** to another **queue-group-ingress**. The **copy** command is a configuration level maintenance tool used to create new entries using an existing mapping policy name. If **overwrite** is not specified, an error occurs if the destination policy exists.

### Parameters

#### ***src-name***

Specifies the existing source **queue-group-ingress**, up to 32 characters, from which the **copy** command attempts to copy.

**dst-name**

Specifies the destination **queue-group-ingress**, up to 32 characters, to which the copy command attempts to copy.

**overwrite**

Use this parameter when the **queue-group-ingress dst-name** already exists. If it does, everything in the existing destination **queue-group-ingress dst-name** is completely overwritten with the contents of the **queue-group-ingress src-name**. The **overwrite** parameter must be specified or else the following error message is returned:

```
MINOR: CLI Destination "qgitest2" exists - use {overwrite}.
```

If **overwrite** is specified, the function of copying from source to destination occurs in a "break before make" manner and therefore should be handled with care.

### queue-instance-accounting

#### Syntax

```
queue-instance-accounting [interim-update]
no queue-instance-accounting
```

#### Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy queue-instance-accounting)

#### Full Context

```
configure subscriber-mgmt radius-accounting-policy queue-instance-accounting
```

#### Description

This command enables per queue-instance-accounting. A stream of accounting messages (START/INTERIM-UPDATE/STOP) is generated per queuing instance. A queuing instance is equivalent to an sla-profile instance. Accounting session id is generated per queuing instance and this accounting session id cannot be included in RADIUS Access-Request message. Queue instance counters represent volume based aggregation for all hosts sharing the queuing instance.

CoA and LI is supported based on the acct-session-id of the queuing instance.

The **no** form of this command reverts to the default.

#### Default

```
queue-instance-accounting interim-update
```

#### Parameters

##### interim-update

Specifies whether accounting messages are sent for the queue-instance. The queue-instance is the SLA profile instance.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### queue-parameters

**Syntax**

**queue-parameters**

**Context**

**[Tree]** (config>mcast-mgmt>bw-plcy>t2-paths>secondary-path queue-parameters)

**[Tree]** (config>mcast-mgmt>bw-plcy>t2-paths>primary-path queue-parameters)

**Full Context**

configure mcast-management bandwidth-policy t2-paths secondary-path queue-parameters

configure mcast-management bandwidth-policy t2-paths primary-path queue-parameters

**Description**

Commands in this context configure queue parameters. This command defines the individual parameters for the queues through which multicast packets are forwarded into the switch fabric on each path.

The individual path queues may be viewed as shared queues. All multicast packets forwarded through the switch fabric associated with one of the paths bypass the normal queuing behavior. Instead of being forwarded through the normal service or network multicast queue, a single queue associated with the multicast path is used. To retain billing and diagnostic information, the forwarding and discard statistics for the service or network queue the packet would have traversed without ingress multicast management is used to account for each packet's behavior.

**Note:**

Any ingress scheduling policy functions attempting to manage the service or network multicast queues is only able to read the statistics of the multicast queues and not able to manage the queues dynamic rate since the packets are flowing through different, non-managed queues. Since this is the case, multicast queues parented to a scheduling policy should be parented to the root scheduler at the highest priority without any rate limitation. Any ingress rate limiting for multicast traffic is performed by the multicast path bandwidth manger based on each records priority and a possible "black-hole" rate threshold.

All queues created for ingress multicast path management are automatically created by the system out of the system reserved queue space. Each queue is created as an expedited queue.

When forwarding through the queues, each packets forwarding class is ignored. However, the forwarding class is retained for proper egress processing. The packets expressed or implied profile is also ignored within the ingress path queues. A packets congestion priority is derived from the records cong-priority-threshold evaluation result as indicated by the policy or multicast-info-policy. The **cong-priority-threshold** sets the high or low congestion priority of a record based on the records preference value. Within each multicast information policy bundle the **cong-priority-threshold** *preference-level* is set with a value from 0 to 7 and defines the threshold at which all records with a preference equal to or higher than the defined preference is treated as congestion priority high. Multicast records with a preference lower than the defined class threshold is treated as congestion priority low. Low-priority packets use the low drop-tail threshold of the queue, while high-priority packets use the standard MBS value. In the event of path congestion, low-priority packets are discarded first, leaving room for the higher priority packets.

For the primary and secondary paths, a single queue exists for each path and every packet forwarded through the path by the bandwidth manager uses that queue.

**[Tree]** (config>port>tdm>e3>network queue-policy)

**[Tree]** (config>port>sonet-sdh>path>network queue-policy)

**[Tree]** (config>port>ethernet>network queue-policy)

## Full Context

configure port tdm ds1 channel-group network queue-policy

configure port tdm ds3 network queue-policy

configure port tdm e1 channel-group network queue-policy

configure port tdm e3 network queue-policy

configure port sonet-sdh path network queue-policy

configure port ethernet network queue-policy

## Description

This command specifies the existing network queue policy which defines queue parameters such as CBS, high priority only burst size, MBS, CIR and PIR rates, as well as forwarding-class to queue mappings. The network-queue policy is defined in the **config>qos>network-queue** context.

## Default

queue-policy default

## Parameters

### *name*

Specifies an existing network-queue policy name. The name can be up to 32 characters.

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

- configure port tdm ds1 channel-group network queue-policy
- configure port tdm e3 network queue-policy
- configure port tdm e1 channel-group network queue-policy
- configure port tdm ds3 network queue-policy

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure port sonet-sdh path network queue-policy

All

- configure port ethernet network queue-policy

## queue-policy

## Syntax

**queue-policy** *network-queue-policy-name*

**no queue-policy**

## Context

[\[Tree\]](#) (config>isa>aa-grp>qos>egress>to-subscriber queue-policy)

[\[Tree\]](#) (config>isa>aa-grp>qos>egress>from-subscriber queue-policy)

## Full Context

configure isa application-assurance-group qos egress to-subscriber queue-policy

configure isa application-assurance-group qos egress from-subscriber queue-policy

## Description

This command assigns an IOM network queue policy as applicable to specific application assurance group traffic.

## Default

queue-policy "default"

**Parameters**

*network-queue-policy-name*

Specifies the name of the network queue policy defined in the system.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 21.32 queue-sets

### queue-sets

**Syntax**

queue-sets

**Context**

[\[Tree\]](#) (config>qos>fp-resource-policy>aggregate-shapers queue-sets)

**Full Context**

configure qos fp-resource-policy aggregate-shapers queue-sets

**Description**

Commands in this context configure queue sets.

**Platforms**

7750 SR-1, 7750 SR-s

## 21.33 queues

### queues

**Syntax**

queues

**Context**

[\[Tree\]](#) (config>qos>fp-resource-policy queues)

**Full Context**

configure qos fp-resource-policy queues

## Description

Commands in this context modify the FP resource policy information for the queues.

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

## 21.34 queues-hqos-manageable

### queues-hqos-manageable

#### Syntax

[no] queues-hqos-manageable

#### Context

[\[Tree\]](#) (config>qos>qgrps>egr>qgrp queues-hqos-manageable)

#### Full Context

configure qos queue-group-templates egress queue-group queues-hqos-manageable

#### Description

This command specifies that the queues within this egress queue group template are to be managed by the Hierarchical QoS (HQoS) process when the template is applied to an Ethernet access egress or network egress context. It is applicable to all egress queue group templates, including the default **policer-output-queues** template.

The **no queues-hqos-manageable** command must be configured for access egress queue groups that are used for post-policer traffic in order to prevent HQoS from measuring the traffic through a policer managed by HQoS then again through a post-policer access egress queue group queue.

Avoid scenarios that result in traffic being either not being measured or being measured twice by HQoS as they will cause the HQoS result to be inaccurate.

A template configured for **no queues-hqos-manageable** cannot be applied to an Ethernet network egress context. Any egress queue group templates applied to an Ethernet network egress context cannot be configured as **no queues-hqos-manageable**. The configuration of **no queues-hqos-manageable** and the configuration of policers and queue **packet-byte-offset** within the egress queue group template are mutually exclusive.

When a queue group template with **no queues-hqos-manageable** is configured under a port's Ethernet access egress context, the configuration of an aggregate rate or scheduler policy is not permitted under that context, nor are parent overrides for any of the queues in the queue group. If a port scheduler is configured on the port, the queue group queues are not parented to the port scheduler.

The **no** form of this command specifies that queues within this egress queue group are not managed by HQoS.

**Default**

queues-hqos-manageable

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-1s, 7750 SR-1se, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, VSR

## 21.35 quiet-period

quiet-period

**Syntax**

quiet-period *seconds*

**Context**

[\[Tree\]](#) (config>port>ethernet>dot1x quiet-period)

**Full Context**

configure port ethernet dot1x quiet-period

**Description**

This command configures the period between two authentication sessions during which no EAPOL frames are sent by the router.

The **no** form of this command returns the value to the default.

**Default**

quiet-period 60

**Parameters**

***seconds***

Specifies the quiet period in seconds.

**Values** 1 to 3600

**Platforms**

All

## 21.36 quit

## quit

### Syntax

quit

### Context

**[Tree]** (candidate quit)

### Full Context

candidate quit

### Description

This command exits the **edit-cfg** mode. The contents of the current candidate will not be deleted and the operator can continue editing the candidate later.

### Platforms

## 22 r Commands

### 22.1 radius

#### radius

##### Syntax

**radius** *type* **direction** {**ingress** | **egress**} **script** *script*

**no radius** *type* **direction** {**ingress** | **egress**}

##### Context

[\[Tree\]](#) (config>python>py-policy radius)

##### Full Context

configure python python-policy radius

##### Description

This command specifies the Python script for the specified RADIUS packet type in the specified direction.

Multiple **radius** command configurations are allowed in the same Python policy.

The **no** form of this command reverts to the default.

##### Parameters

###### *type*

Specifies the message type of the event.

**Values** access-request, access-accept, access-reject, accounting-request, accounting-response, access-challenge, disconnect-request, change-of-authorization-request

###### **direction** {**ingress** | **egress**}

Specifies whether the event is incoming or outgoing.

###### *script*

Specifies the name of the Python script, up to 32 characters, that is used to handle the specified message.

##### Platforms

All

## radius

### Syntax

[no] radius

### Context

[\[Tree\]](#) (debug>router radius)

### Full Context

debug router radius

### Description

This command enables the debug router RADIUS context.

### Platforms

All

## radius

### Syntax

radius [create]

no radius

### Context

[\[Tree\]](#) (config>service>vprn>aaa>remote-servers radius)

### Full Context

configure service vprn aaa remote-servers radius

### Description

This command creates the context to configure RADIUS authentication on the VPRN.

Implement redundancy by configuring multiple server addresses for each VPRN.

The **no** form of this command removes the RADIUS configuration.

### Parameters

**create**

Keyword used to create the RADIUS context.

### Platforms

All

## radius

### Syntax

radius

### Context

[\[Tree\]](#) (config>app-assure>group>transit-ip-policy radius)

### Full Context

configure application-assurance group transit-ip-policy radius

### Description

This command enables dynamic RADIUS-based management of transit aa-subs for the transit-ip-policy. This is mutually exclusive to other types management of transit subs for a specific transit-ip-policy.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## radius

### Syntax

radius

### Context

[\[Tree\]](#) (config>li radius)

### Full Context

configure li radius

### Description

This command configures RADIUS for Lawful Intercept.

### Platforms

All

## radius

### Syntax

radius [detail] [hex]

no radius

**Context**

[\[Tree\]](#) (debug radius)

**Full Context**

debug radius

**Description**

This command enables debugging for RADIUS connections.

The **no** form of the command disables the debug output.

**Parameters****detail**

Displays detailed output.

**hex**

Displays the packet dump in hex format.

**Platforms**

All

**radius****Syntax**

[no] radius

**Context**

[\[Tree\]](#) (config>system>security radius)

**Full Context**

configure system security radius

**Description**

This command creates the context to configure RADIUS authentication on the router.

Implement redundancy by configuring multiple server addresses for each router.

The **no** form of this command removes the RADIUS configuration.

**Platforms**

All

## 22.2 radius-accounting

### radius-accounting

#### Syntax

**radius-accounting**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>sub-prof radius-accounting)

#### Full Context

configure subscriber-mgmt sub-profile radius-accounting

#### Description

Commands in this context configure RADIUS accounting subscriber profile parameters.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.3 radius-accounting-policy

### radius-accounting-policy

#### Syntax

**radius-accounting-policy** *policy-name*

**no radius-accounting-policy**

#### Context

[\[Tree\]](#) (config>service>vprn>l2tp>group radius-accounting-policy)

[\[Tree\]](#) (config>service>ies>if>sap>ipsec-gw radius-accounting-policy)

[\[Tree\]](#) (config>service>vprn>l2tp radius-accounting-policy)

[\[Tree\]](#) (config>router>l2tp radius-accounting-policy)

[\[Tree\]](#) (config>service>vprn>if>sap>ipsec-gw radius-accounting-policy)

[\[Tree\]](#) (config>router>l2tp>group>tunnel radius-accounting-policy)

[\[Tree\]](#) (config>service>vprn>l2tp>group>tunnel radius-accounting-policy)

[\[Tree\]](#) (config>router>l2tp>group radius-accounting-policy)

## Full Context

```
configure service vprn l2tp group radius-accounting-policy
configure service ies interface sap ipsec-gw radius-accounting-policy
configure service vprn l2tp radius-accounting-policy
configure router l2tp radius-accounting-policy
configure service vprn interface sap ipsec-gw radius-accounting-policy
configure router l2tp group tunnel radius-accounting-policy
configure service vprn l2tp group tunnel radius-accounting-policy
configure router l2tp group radius-accounting-policy
```

## Description

This command configures the RADIUS accounting policy.  
The **no** form of this command reverts to the default value.

## Default

```
no radius-accounting-policy
```

## Parameters

### *policy-name*

Specifies the policy name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn l2tp group radius-accounting-policy
- configure service vprn l2tp radius-accounting-policy
- configure service vprn l2tp group tunnel radius-accounting-policy
- configure router l2tp radius-accounting-policy
- configure router l2tp group tunnel radius-accounting-policy
- configure router l2tp group radius-accounting-policy

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service ies interface sap ipsec-gw radius-accounting-policy
- configure service vprn interface sap ipsec-gw radius-accounting-policy

## radius-accounting-policy

## Syntax

```
radius-accounting-policy name [create]
```

```
no radius-accounting-policy
```

## Context

[\[Tree\]](#) (config>subscr-mgmt radius-accounting-policy)

## Full Context

configure subscriber-mgmt radius-accounting-policy

## Description

This command specifies a subscriber RADIUS based accounting policy.

The **no** form of this command removes the policy name from the configuration.

## Parameters

### *name*

The name of the policy. The string is case-sensitive and limited to 32 ASCII 7-bit printable characters with no spaces.

### **create**

Keyword used to create a RADIUS accounting policy instance. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## radius-accounting-policy

## Syntax

**radius-accounting-policy** *nat-accounting-policy*

**no radius-accounting-policy**

## Context

[\[Tree\]](#) (config>isa>wlan-gw-group>nat radius-accounting-policy)

## Full Context

configure isa wlan-gw-group nat radius-accounting-policy

## Description

This command configures the RADIUS accounting policy to use for each MDA in this ISA group.

The **no** form of this command removes the accounting policy from the configuration.

## Parameters

### *nat-accounting-policy*

Specifies the RADIUS accounting policy up to 32 characters.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## radius-accounting-policy

### Syntax

**radius-accounting-policy** *rad-acct-plcy-name*

**no radius-accounting-policy**

### Context

[\[Tree\]](#) (config>app-assure>group>statistics>aa-sub radius-accounting-policy)

### Full Context

configure application-assurance group statistics aa-sub radius-accounting-policy

### Description

This command specifies an existing subscriber RADIUS based accounting policy to use for AA. RADIUS Accounting policies are configured in the **config>app-assure>radius-accounting-policy** context.

### Default

no radius-accounting-policy

### Parameters

***rad-acct-plcy-name***

Specifies the name of the policy. The string is case sensitive and limited to 32 ASCII 7-bit printable characters with no spaces.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## radius-accounting-policy

### Syntax

**radius-accounting-policy** *rad-acct-plcy-name* [**create**]

**no radius-accounting-policy** *rad-acct-plcy-name*

### Context

[\[Tree\]](#) (config>app-assure radius-accounting-policy)

### Full Context

configure application-assurance radius-accounting-policy

## Description

This command specifies an existing subscriber RADIUS-based accounting policy to use for AA. RADIUS accounting policies are configured in the **config>app-assure>radius-accounting-policy** context.

## Default

no radius-accounting-policy

## Parameters

### *rad-acct-plcy-name*

Specifies the policy name. The string is case sensitive and limited to 32 ASCII 7-bit printable characters with no spaces.

### **create**

Keyword used to create the policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## radius-accounting-policy

## Syntax

**radius-accounting-policy** *name* [**create**]

**no radius-accounting-policy** *name*

## Context

[\[Tree\]](#) (config>ipsec radius-accounting-policy)

## Full Context

configure ipsec radius-accounting-policy

## Description

This command specifies an existing RADIUS accounting policy to use to collect accounting statistics on this subscriber profile by RADIUS. This command is used independently of the **collect-stats** command.

## Parameters

### *name*

Specifies an existing RADIUS based accounting policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## radius-accounting-policy

### Syntax

**radius-accounting-policy** *nat-accounting-policy*

**no radius-accounting-policy**

### Context

**[Tree]** (config>isa>nat-group radius-accounting-policy)

### Full Context

configure isa nat-group radius-accounting-policy

### Description

This command specifies the RADIUS accounting policy to use for each MDA in this ISA group.

The **no** form of the command removes the policy ID from the configuration.

### Default

no radius-accounting-policy

### Parameters

#### *nat-accounting-policy*

Reference to the nat-accounting-policy which defines:

Source IP addresses that are assigned to BB-ISA cards.

Parameters related to RADIUS server itself.

List of RADIUS attributes that are included in accounting messages.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.4 radius-accounting-server

## radius-accounting-server

### Syntax

**radius-accounting-server**

### Context

**[Tree]** (config>aaa>l2tp-acct-plcy>include-radius-attribute radius-accounting-server)

## Full Context

```
configure aaa l2tp-accounting-policy include-radius-attribute radius-accounting-server
```

## Description

Commands in this context configure RADIUS accounting server attributes under a specific session authentication policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## radius-accounting-server

## Syntax

```
radius-accounting-server
```

## Context

[\[Tree\]](#) (config>app-assure>rad-acct-plcy radius-accounting-server)

## Full Context

```
configure aaa l2tp-accounting-policy radius-accounting-server
```

```
configure application-assurance radius-accounting-policy radius-accounting-server
```

## Description

This command creates the context for defining RADIUS accounting server attributes under a specific session authentication policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure aaa l2tp-accounting-policy radius-accounting-server

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure application-assurance radius-accounting-policy radius-accounting-server

## 22.5 radius-attr

## radius-attr

## Syntax

```
radius-attr type attribute-type [extended-type attribute-ext-type] [transaction]
```

**radius-attr type** *attribute-type* [**transaction**] {**address** | **hex** | **integer** | **string**} **value** *attribute-value*

**radius-attr vendor** *vendor-id* **type** *attribute-type* [**extended-type** *attribute-ext-type*] [**transaction**] [**encoding** *encoding-type*]

**radius-attr vendor** *vendor-id* **type** *attribute-type* [**extended-type** *attribute-ext-type*] [**transaction**] [**encoding** *encoding-type*] {**address** | **hex** | **integer** | **string**} **value** *attribute-value*

**no radius-attr type** *attribute-type* [**extended-type** *attribute-ext-type*]

**no radius-attr type** *attribute-type* [**extended-type** *attribute-ext-type*] {**address** | **hex** | **integer** | **string**} **value** *attribute-value*

**no radius-attr vendor** *vendor-id* **type** *attribute-type* [**extended-type** *attribute-ext-type*]

**no radius-attr vendor** *vendor-id* **type** *attribute-type* [**extended-type** *attribute-ext-type*] {**address** | **hex** | **integer** | **string**} [**value**] *attribute-value*

## Context

[Tree] (debug>router>radius radius-attr)

## Full Context

debug router radius radius-attr

## Description

This command specifies the RADIUS attribute filter of command **debug router radius**.

## Parameters

### **attribute-type**

Specifies the RADIUS attribute type.

**Values** 1 to 255

### **attribute-ext-type**

Specifies the RADIUS attribute extended type (RFC 6929).

**Values** 1 to 255

### **address**

Specifies the value is a IPv4 or IPv6 address/prefix/subnet.

### **string**

Specifies the value is a ASCII string.

### **integer**

Specifies the value is a integer.

### **hex**

Specifies the value is a binary string in hex format, such as "\0xAB01FE".

### **attribute-value**

Specifies the value of the RADIUS attribute.

**Values** address <ipv4-address> | <ipv6-address> | <ipv6-prefix/prefix-length>

ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces)
ipv6-prefix	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x - [0 to FFFF]H
	d - [0 to 255]D
ipv6-prefix-length [0 to 128]	
hex	[0x0 to 0xFFFFFFFF (up to 506 hex nibbles)]
integer	[0 to 4294967295]
string	ascii-string (up to 253 characters)

**transaction**

Specifies that the system outputs both request and response packets in the same session even if the response packet does not include the filter attribute.

**vendor-id**

Specifies the vendor ID for the vendor specific attribute.

**Values** 0 to 16777215

**encoding-type**

Specifies the size of the vendor-type and vendor-length in bytes. It is a two digitals string: "xy", x is the size of vendor-type, range from 1 to 4; y is the size of vendor-length, range from 0 to 2; it is "11" by default.

**Values** type-size:1 to 4, length-size: 0 to 2

**Platforms**

All

## 22.6 radius-auth-policy

### radius-auth-policy

**Syntax**

**radius-auth-policy** *radius-authentication-policy-name*

**no radius-auth-policy**

## Context

[\[Tree\]](#) (config>subscr-mgmt>gtp>apn-policy>apn radius-auth-policy)

## Full Context

configure subscriber-mgmt gtp apn-policy apn radius-auth-policy

## Description

This command configures the RADIUS authentication policy with which the GTP connection is authenticated.

The **no** form of this command removes the authentication policy. Only new session setups are affected.

## Default

no radius-auth-policy

## Parameters

### *radius-authentication-policy-name*

Specifies the name of the authentication policy to be used, up to 32 characters.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.7 radius-authentication

### radius-authentication

## Syntax

**radius-authentication**

## Context

[\[Tree\]](#) (config>subscr-mgmt>vrgw>brg>brg-profile radius-authentication)

configure subscriber-mgmt vrgw brg brg-profile radius-authentication

## Description

Commands in this context configure parameters related to RADIUS authentication performed for the BRG.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.8 radius-authentication-policy

### radius-authentication-policy

#### Syntax

**radius-authentication-policy** *name*

**no radius-authentication-policy**

#### Context

[\[Tree\]](#) (config>service>ies>if>sap>ipsec-gw radius-authentication-policy)

[\[Tree\]](#) (config>service>vprn>if>sap>ipsec-gw radius-authentication-policy)

#### Full Context

configure service ies interface sap ipsec-gw radius-authentication-policy

configure service vprn interface sap ipsec-gw radius-authentication-policy

#### Description

This command configures the policy used for the IKEv2 remote-access tunnels terminated on the IPsec gateway. The **radius-authentication-policy** is defined under **config>ipsec** context.

#### Parameters

*name*

Specifies the name of an existing RADIUS authentication policy.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### radius-authentication-policy

#### Syntax

**radius-authentication-policy** *name* [create]

**no radius-authentication-policy** *name*

#### Context

[\[Tree\]](#) (config>ipsec radius-authentication-policy)

#### Full Context

configure ipsec radius-authentication-policy

#### Description

This command specifies the RADIUS authentication policy associated with this IPsec gateway.

## Parameters

### *name*

Specifies an existing RADIUS authentication policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.9 radius-authentication-server

### radius-authentication-server

## Syntax

**radius-authentication-server**

## Context

[\[Tree\]](#) (config>subscr-mgmt>auth-plcy radius-authentication-server)

## Full Context

configure subscriber-mgmt authentication-policy radius-authentication-server

## Description

Commands in this context define RADIUS authentication server attributes under a specific session authentication policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.10 radius-coa-port

### radius-coa-port

## Syntax

**radius-coa-port** *{port-number}*

**no radius-coa-port**

## Context

[\[Tree\]](#) (config>aaa radius-coa-port)

## Full Context

```
configure aaa radius-coa-port
```

## Description

This command configures the system-wide UDP port number that RADIUS is listening on for CoA and Disconnect messages.

The **no** form of this command reverts to the default.

## Default

```
radius-coa-port 3799
```

## Parameters

### *port-number*

Specifies the UDP port number for RADIUS CoA and disconnect messages.

**Values** 1647, 1700, 1812, 3799

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.11 radius-plcy

### radius-plcy

## Syntax

```
radius-plcy name
```

```
no radius-plcy
```

## Context

[\[Tree\]](#) (config>port>ethernet>dot1x radius-plcy)

## Full Context

```
configure port ethernet dot1x radius-plcy
```

## Description

This command references the RADIUS policy to be used for 802.1x authentication. An 802.1x RADIUS policy must be configured (**config>system>security>dot1x**) before it is associated to a port. If the RADIUS policy ID does not exist, an error is returned. Only one 802.1x RADIUS policy can be associated with a port at a time.

The **no** form of this command removes the RADIUS policy association.

## Default

no radius-plcy

## Parameters

### *name*

Specifies an existing 802.1x RADIUS policy name, up to 32 characters.

## Platforms

All

## radius-plcy

## Syntax

**radius-plcy** *name* [**create**]

## Context

[\[Tree\]](#) (config>system>security>dot1x radius-plcy)

## Full Context

configure system security dot1x radius-plcy

## Description

This command creates the context to configure RADIUS server parameters for 802.1x network access control on the router.

### Note:

The RADIUS server configured under the config>system>security>dot1x>radius-plcy context authenticates clients who get access to the data plane of the router as opposed to the RADIUS server configured under the **config>system>radius** context which authenticates CLI login users who get access to the management plane of the router.

The **no** form of this command removes the RADIUS server configuration for 802.1x.

## Platforms

## 22.12 radius-proxy

## radius-proxy

## Syntax

**radius-proxy**

## Context

[\[Tree\]](#) (config>router radius-proxy)

[\[Tree\]](#) (config>service>vprn radius-proxy)

## Full Context

configure router radius-proxy

configure service vprn radius-proxy

## Description

This command context to configure RADIUS proxy parameters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.13 radius-proxy-cache

### radius-proxy-cache

## Syntax

**radius-proxy-cache** *router* *router-instance* **server** *server-name*

**no radius-proxy-cache**

## Context

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>wlan-gw>ranges>range>track-mobility radius-proxy-cache)

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>wlan-gw>ranges>range>track-mobility radius-proxy-cache)

## Full Context

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range track-mobility radius-proxy-cache

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range track-mobility radius-proxy-cache

## Description

This command specifies the RADIUS-proxy server to allow subscribers created via data-triggered authentication to create an entry. This RADIUS proxy cache entry allows efficient handling of UE mobility.

## Parameters

***router-instance***

Specifies the router instance.

Values	router-name	Base
	service-id	1 to 2147483647

**server-name**

Specifies the server name up to 32 characters.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.14 radius-proxy-server

### radius-proxy-server

**Syntax**

[no] **radius-proxy-server** **router** *router-instance* **name** *server-name*

**Context**

[\[Tree\]](#) (config>subscr-mgmt>vrgw>brg>brg-profile radius-proxy-server)

**Full Context**

configure subscriber-mgmt vrgw brg brg-profile radius-proxy-server

**Description**

This command enables BRG processing on the specified RADIUS proxy server. Whenever an Access-Accept message is received with the attribute Alc-BRG-Id present, this triggers the creation of a BRG. The BRG uses the **brg-profile** specified in the Access-Accept message or fall back to this BRG profile. When the specified **radius-proxy-server** has a cache enabled, no cache entries are created for a transaction identified as BRG. A RADIUS proxy server can only be listed in one BRG profile.

This command can be executed multiple times.

The **no** form of this command removes BRG processing for the specified **radius-proxy server**.

**Parameters****router-instance**

Specifies the ID of the VRF where the proxy server is located.

**server-name**

Specifies the name of the RADIUS proxy server.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## radius-proxy-server

### Syntax

```
radius-proxy-server router router-instance name server-name  
no radius-proxy-server
```

### Context

**[Tree]** (config>router>nat>inside>subscriber-identification radius-proxy-server)

**[Tree]** (config>service>vprn>nat>inside>subscriber-identification radius-proxy-server)

### Full Context

configure router nat inside subscriber-identification radius-proxy-server

configure service vprn nat inside subscriber-identification radius-proxy-server

### Description

This command configures RADIUS proxy server parameters. This is a reference to a RADIUS accounting proxy server in Subscriber Aware Large Scale NAT44 application. RADIUS accounting proxy server will cache attributes related to a BNG subscriber as they are received in standard accounting messages (RFC 2866). Radius accounting proxy server can be configured in any routing instance within 7750 SR.

### Parameters

**router** *router-instance*

Specifies the routing instance in which the RADIUS accounting proxy is configured.

**name** *server-name*

Specifies the name reference to the RADIUS accounting proxy server that is instantiated in 7750 SR.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.15 radius-script-policy

### radius-script-policy

### Syntax

```
radius-script-policy policy-name [create]  
no radius-script-policy policy-name
```

## Context

[\[Tree\]](#) (config>aaa radius-script-policy)

## Full Context

configure aaa radius-script-policy

## Description

This command configures a RADIUS script policy.

The **no** form of this command removes the script policy from the configuration.

## Parameters

### *policy-name*

Configures Python scripts to modify RADIUS messages.

### **create**

This keyword is required when first creating the configuration context. Once the context is created, it is possible to navigate into the context without the **create** keyword.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.16 radius-server

### radius-server

## Syntax

**radius-server**

## Context

[\[Tree\]](#) (config>service>vprn radius-server)

[\[Tree\]](#) (config>router radius-server)

## Full Context

configure service vprn radius-server

configure router radius-server

## Description

Commands in this context configure the RADIUS server under router or VPRN service.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.17 radius-server-policy

### radius-server-policy

#### Syntax

**radius-server-policy** *policy-name*

**no radius-server-policy**

#### Context

**[Tree]** (config>aaa>l2tp-acct-plcy radius-server-policy)

#### Full Context

configure aaa l2tp-accounting-policy radius-server-policy

#### Description

This command references an existing **radius-server-policy** (available under the **config>aaa** context) for use in subscriber management authentication and accounting.

When configured in an authentication-policy, following CLI commands are ignored in the policy to avoid conflicts:

- all commands in the radius-authentication-server context
- accept-authorization-change
- coa-script-policy
- accept-script-policy
- request-script-policy

When configured in a radius-accounting-policy, following CLI commands are ignored in the policy to avoid conflicts:

- all commands in the radius-accounting-server context
- acct-request-script-policy

The **no** form of this command removes the radius-server-policy reference from the configuration.

#### Default

no radius-server-policy

#### Parameters

***policy-name***

Specifies the RADIUS server policy.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## radius-server-policy

### Syntax

**radius-server-policy** *policy-name* [**create**]

**no radius-server-policy** *policy-name*

### Context

[\[Tree\]](#) (config>aaa radius-server-policy)

### Full Context

configure aaa radius-server-policy

### Description

This command creates a radius-server-policy.

A RADIUS server policy can be used in

- radius-proxy, for application like EAP authentication for WIFI access
- authentication policy, for Enhanced Subscriber Management authentication
- RADIUS accounting policy, for Enhanced Subscriber Management accounting
- dynamic data service RADIUS accounting
- AAA route downloader

The **no** form of this command removes the policy name from the configuration.

### Parameters

#### *policy-name*

Specifies the name of the radius-server-policy up to 32 characters.

#### **create**

Keyword used to create a radius-server-policy name. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## radius-server-policy

### Syntax

**radius-server-policy** *radius-server-policy-name*

**no radius-server-policy**

## Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy radius-server-policy)

[\[Tree\]](#) (config>subscr-mgmt>auth-plcy radius-server-policy)

## Full Context

configure subscriber-mgmt radius-accounting-policy radius-server-policy

configure subscriber-mgmt authentication-policy radius-server-policy

## Description

This command references an existing radius-server-policy (available under the config>aaa context) for use in subscriber management authentication and accounting.

When configured in an authentication-policy, following CLI commands are ignored in the policy to avoid conflicts:

- all commands in the radius-authentication-server context
- accept-authorization-change
- coa-script-policy
- accept-script-policy
- request-script-policy

When configured in a radius-accounting-policy, following CLI commands are ignored in the policy to avoid conflicts:

- all commands in the radius-accounting-server context
- acct-request-script-policy

The **no** form of this command removes the radius-server-policy reference from the configuration

## Parameters

***radius-server-policy-name***

Specifies the RADIUS server policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

radius-server-policy

## Syntax

**radius-server-policy** *policy-name*

**no radius-server-policy**

## Context

[\[Tree\]](#) (config>aaa>route-downloader radius-server-policy)

## Full Context

```
configure aaa route-downloader radius-server-policy
```

## Description

This command references an existing radius-server-policy (available under the **config>aaa** context). The server (or servers) referenced by the policy is used as the targets for the access-request message.

The **no** form of this command removes the policy name from the route-downloader configuration.

## Parameters

### *policy-name*

Specifies the RADIUS server policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## radius-server-policy

## Syntax

```
radius-server-policy policy-name
```

```
no radius-server-policy
```

## Context

[\[Tree\]](#) (config>subscr-mgmt>vrgw>brg>brg-profile>radius-authentication radius-server-policy)

## Full Context

```
configure subscriber-mgmt vrgw brg brg-profile radius-authentication radius-server-policy
```

## Description

This command is used if the BRG must be authenticated to the controller/PCMP by the vRGW. This is required if the BRG does not perform RADIUS authentication via the proxy server. The vRGW originates a valid Access Request using the BRG ID as the username.

The **no** form of this command removes the **radius-server-policy** from the configuration. Setup of an unauthenticated BRG fails.

## Parameters

### *policy-name*

Specifies the RADIUS server policy, up to 32 characters, to be applied to this subscriber authentication policy.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## radius-server-policy

### Syntax

**radius-server-policy** *radius-server-policy-name*

**no radius-server-policy**

### Context

**[Tree]** (config>ipsec>rad-acct-plcy radius-server-policy)

**[Tree]** (config>ipsec>rad-auth-plcy radius-server-policy)

### Full Context

configure ipsec radius-accounting-policy radius-server-policy

configure ipsec radius-authentication-policy radius-server-policy

### Description

This command references an existing **radius-server-policy** (available under the **config>aaa** context) for use in subscriber management authentication and accounting.

When configured in an authentication-policy, following CLI commands are ignored in the policy to avoid conflicts:

- all commands in the radius-authentication-server context
- accept-authorization-change
- coa-script-policy
- accept-script-policy
- request-script-policy

When configured in a radius-accounting-policy, following CLI commands are ignored in the policy to avoid conflicts:

- all commands in the radius-accounting-server context
- acct-request-script-policy

The **no** form of this command removes the radius-server-policy reference from the configuration.

### Default

no radius-server-policy

### Parameters

***radius-server-policy-name***

Specifies the RADIUS server policy.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## radius-server-policy

### Syntax

**radius-server-policy** *policy-name*

**no radius-server-policy**

### Context

**[Tree]** (config>subscr-mgmt>vrgw>brg>brg-profile radius-server-policy)

### Full Context

configure subscriber-mgmt vrgw brg brg-profile radius-server-policy

### Description

This command allows the vRGW to authenticate on the BRG's behalf. This is required if the BRG does not perform authentication itself using the radius proxy. The vRGW originates a valid Access Request using the BRG ID as a username.

The **no** form of this command removes the RADIUS server policy from the configuration. Setting up of an unauthenticated BRG will now fail.

### Default

no radius-server-policy

### Parameters

***policy-name***

Specifies the RADIUS server policy, up to 32 characters, to apply in this subscriber authentication policy.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## radius-server-policy

### Syntax

**radius-server-policy** *policy-name*

**radius-server-policy auth** *policy-name-auth*

**radius-server-policy acct** *policy-name-acct*

**radius-server-policy auth** *policy-name-auth* **acct** *policy-name-acct*

**no radius-server-policy**

### Context

**[Tree]** (config>port>ethernet>dot1x radius-server-policy)

## Full Context

```
configure port ethernet dot1x radius-server-policy
```

## Description

This command configures the RADIUS policy with IPv4/IPv6 in base routing and VPRN. The current RADIUS policy can be found under the **configure>aaa>radius-server-policy** context.

The RADIUS servers for the policy are configured under **configure>router>radius-server** or **configure>service>vprn>radius-server** context.

The RADIUS policy is assigned under dot1x using the **radius-server-policy** command. When the RADIUS policy is configured, both authorization and accounting are performed via the same server.

The **no** form of this command allows authorization and accounting via different servers.

## Default

```
no radius-server-policy
```

## Parameters

### *policy-name*

Specifies the RADIUS server policy, up to 32 characters.

The policy is configured under **configure>aaa>radius-server-policy**. When the policy name is configured, both authorization and accounting are done via this server.

### *policy-name-auth*

Specifies the AAA RADIUS server policy for dot1x authorization only; up to 32 characters.

The policy is configured under **configure>aaa>radius-server-policy**. The policy name authorization is used if the user needs a different server for authorization.

### *policy-name-acct*

Specifies the AAA RADIUS server policy for dot1x accounting only; up to 32 characters.

The policy is configured under **configure>aaa>radius-server-policy**. The policy name accounting is used if the user needs a different server for accounting.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.18 radius-session-timeout

```
radius-session-timeout
```

## Syntax

```
radius-session-timeout {backwards-compatible | ignore | absolute}
```

```
no radius-session-timeout
```

## Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>ipoe-session radius-session-timeout)

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>ipoe-session radius-session-timeout)

## Full Context

```
configure service vprn subscriber-interface group-interface ipoe-session radius-session-timeout
```

```
configure service ies subscriber-interface group-interface ipoe-session radius-session-timeout
```

## Description

This command specifies how to interpret the session-timeout coming from a RADIUS VSA in an Access-Accept or CoA message.

The value of this command can only be changed on wlan-gw group interfaces.

The **no** form of this command to resets the default behavior.

## Default

radius-session-timeout absolute (backward compatible on wlan-gw group interfaces)

## Parameters

### backwards-compatible

Specifies that the VSA is interpreted as an IPv4 lease time if the Alc-Lease-Time attribute is not present and an absolute timeout otherwise. The VSA is treated the same as for non-ipoe session DHCP hosts.

### ignore

Specifies that the VSA meaning is irrelevant for IPoE session and should be ignored.

### absolute

Specifies that the VSA would be treated as a timeout starting from the moment the IPoE session is set up.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.19 radius-user-name

```
radius-user-name
```

## Syntax

[no] radius-user-name

## Context

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>gy>include-avp radius-user-name)

### Full Context

configure subscriber-mgmt diameter-application-policy gy include-avp radius-user-name

### Description

This command includes the RADIUS user name AVP in the Diameter Gy messages.

The **no** form of this command returns the command to the default setting.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.20 rai

rai

### Syntax

[no] rai

### Context

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>gx>include-avp rai)

### Full Context

configure subscriber-mgmt diameter-application-policy gx include-avp rai

### Description

This command enables the inclusion of the RAI AVP as signaled in the incoming GTP setup message.

The **no** form of this command disables the inclusion of the AVP.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.21 range

range

### Syntax

range *encap-range* **sync-tag** *sync-tag*

**no range** *encap-range*

**Context**

**[Tree]** (config>redundancy>multi-chassis>peer>sync>port range)

**Full Context**

configure redundancy multi-chassis peer sync port range

**Description**

This command configures a range of encapsulation values.

**Parameters*****encap-range***

Specifies a range of encapsulation values on a port to be synchronized with a multi-chassis peer.

Values		
Dot1Q		start-tag-end-tag
start-tag		0 to 4094
end-tag		0 to 4094
QinQ		qtag1.start-qtag2-qtag1.end-qtag2-start-qtag1.*-end-qtag1.*
qtag1		1 to 4094
start-qtag1		1 to 4094
en-qtag1		1 to 4094
start-qtag2		0 to 4094
end-qtag2		0 to 4094

***sync-tag***

Specifies a synchronization tag up to 32 characters to be used while synchronizing this encapsulation value range with the multi-chassis peer.

**Platforms**

All

**range**

**Syntax**

**range** *vc-id-range* [**sync-tag** *sync-tag*]

**no range** *vc-id-range*

## Context

[\[Tree\]](#) (config>redundancy>multi-chassis>peer>sync>sdp range)

## Full Context

configure redundancy multi-chassis peer sync sdp range

## Description

This command specifies a range of VC IDs for manually configured spoke SDPs to be synchronized with the multi-chassis peer and a synchronization tag to be used while synchronizing each range with the multi-chassis peer. The **range** command and the configuration of a synchronization tag on the parent **sdp** command are mutually exclusive.

To synchronize a single spoke SDP, the *start-vc-id* should be the same as the *end-vc-id*. If the configured *end-vc-id* is lower than the *start-vc-id*, the **range** command fails.

The synchronization tag can be changed by entering the same command with a different synchronization tag. Changing the synchronization tag removes all states relating to the previous synchronization tag for the SDP and a new synchronization tag state is created.

Multiple **range** commands can be configured, however, overlapping ranges for the same SDP (*sdp-id*) are not permitted.

The synchronization of PIM snooping is only supported for manually configured spoke SDPs but is not supported for spoke SDPs configured within an endpoint. See PIM Snooping for IPv4 Synchronization for service support.

The synchronization of the PIM snooping state is not supported on any of the following when used with the configured *sdp-id*:

- mesh SDPs
- spoke SDPs in non-VPLS services
- BGP-AD/BGP-VPLS (FEC 129) spoke SDPs
- spoke SDPs configured in endpoints
- pseudowire SAPs
- ESM-over-MPLS pseudowires

Non-existent spoke SDPs may be specified. If these spoke SDPs are created at a later time, then all states on the spoke SDPs are synchronized according to the synchronization tag and the synchronization protocols enabled. The **sync-tag** can be changed by entering the same command with a different **sync-tag** value. If the synchronization tag is changed, then all states for the previous **sync-tag** are removed for the SDP configured in the command and the state is then built for the new synchronization tag.

## Parameters

### **vc-id-range**

Specifies a non-overlapping range of VC IDs for the spoke SDPs of the SDP to be synchronized with the multi-chassis peer.

**Values**    *start-vc-id-end-vc-id*  
               *start-vc-id*: 1 to 4294967295  
               *end-vc-id*: 1 to 4294967295

**sync-tag**

Specifies a synchronization tag, up to 32 characters, to be used when synchronizing with the multi-chassis peer.

**Platforms**

All

**range****Syntax**

[no] range *vlan-range*

**Context**

**[Tree]** (config>redundancy>mc>peer>mcr>ring>path-b range)

**[Tree]** (config>redundancy>mc>peer>mcr>ring>path-excl range)

**Full Context**

configure redundancy multi-chassis peer mc-ring ring path-b range

configure redundancy multi-chassis peer mc-ring ring path-excl range

**Description**

This command configures a Layer 2 MC-Ring path-b or path-excl VLAN range.

By default, all customer VLANs participating in an L2 MC-Ring are on path-a. For load balancing purposes, a range of customer VLANs can be configured to use path-b which is set up in the opposite direction than path-a. The range of VLANs that are not participating in L2 MC-Ring are configured using the **path-excl** command.

**Parameters****vlan-range**

Specifies the VLAN range.

**Values** [0 to 4094] - [0 to 4094]

[0 to 4094] - \*

\* \_ \*

**Platforms**

All

**range****Syntax**

[no] range *vlan-range*

## Context

[\[Tree\]](#) (config>service>vpls>sap>managed-vlan-list range)

## Full Context

configure service vpls sap managed-vlan-list range

## Description

This command configures a range of VLANs on an access port that are to be managed by an existing management VPLS.

This command is only valid when the VPLS in which it is entered was created as a management VPLS, and when the SAP in which it was entered was created on an Ethernet port with encapsulation type of dot1q or qinq, or on a SONET/SDH port with encapsulation type of bcp-dot1q.

To modify the range of VLANs, first the new range should be entered and afterwards the old range removed.

The **no** form of this command removes the VLAN range from this configuration.

## Parameters

### *vlan-range*

Specifies the VLAN start value and VLAN end value. The end-vlan must be greater than start-vlan. The format is <start-vlan>-<end-vlan>.

**Values** start-vlan: 1 to 4094  
end-vlan: 1 to 4094

## Platforms

configure service vprn subscriber-interface group-interface wlan-gw vlan-tag-ranges range

configure service ies subscriber-interface group-interface wlan-gw vlan-tag-ranges range

## Description

This command creates a VLAN range or enters the context of the specified VLAN ranges for configuration applicable to that range of VLANs.

## Parameters

### start

Specifies the start of the VLAN range.

**Values** 0 to 4096

**Default** 200

### end

Specifies the end of VLAN range.

**Values** 0 to 4096

**Default** 400

### default

Specifies to use defaults for the interface.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

**no range**

## Context

[\[Tree\]](#) (config>service>vpls>isid-policy>entry range)

## Full Context

configure service vpls isid-policy entry range

## Description

This command specifies an ISID or a Range of ISIDs in a B-VPLS. One range is allowed per entry.

## Default

no range

## Parameters

*isid*

Specifies the ISID value in 24 bits. When singular, ISID identifies a particular ISID to be used for matching

**Values** 0 to 16777215

#### **to isid**

Identifies upper value in a range of ISIDs to be used as matching criteria

### **Platforms**

All

## **range**

### **Syntax**

**range** *range-id isid isid-value [to isid-value] [create]*

**no range** *range-id*

### **Context**

**[Tree]** (config>service>vpls>spoke-sdp>static-isid range)

**[Tree]** (config>service>vpls>sap>static-isid range)

### **Full Context**

configure service vpls spoke-sdp static-isid range

configure service vpls sap static-isid range

### **Description**

This command identifies a set of ISIDs for I-VPLS services that are external to SPBM. These ISIDs are advertised as supported locally on this node unless an altered by an isid-policy. This allows communication from I-VPLS services external to SPBM through this node. The SAP may be a regular SAP or MC-LAG SAP. The spoke-SDP may be an active/standby spoke. When used with MC-LAG or active/stand-by PWs the conditional static-mac must be configured. ISIDs declared this way become part of the ISID multicast and consume MFIBs. Multiple SPBM static-isid ranges are allowed under a SAP/spoke-SDP.

The static-isids are associated with a remote B-MAC that must be declared as a static-mac for unicast traffic. ISIDs are advertised as if they were attached to the local B-MAC. Only remote I-VPLS ISIDs need to be defined. In the MFIB, the group MACs are then associated with the active SAP or spoke-SDP. An ISID policy may be defined to suppress the advertisement of an ISID if the ISID is primarily used for unicast services. The following rules govern the usage of multiple ISID statements:

- overlapping values are allowed:
  - isid from 301 to 310
  - isid from 305 to 315
  - isid 316
- the minimum and maximum values from overlapping ranges are considered and displayed. The above entries will be equivalent with "ISID from 301 to 316" statement.

- there is no consistency check with the content of ISID statements from other entries. The entries will be evaluated in the order of their IDs and the first match will cause the implementation to execute the associated action for that entry.

The **no** form of this command removes all the previous statements under one interface

**no isid value** | from value to higher-value - removes a specific ISID value or range. Must match a previously used positive statement: for example if the command "isid 316 to 400" was used using "no isid 316 to 350" will not work but "no isid 316 to 400 will be successful.

## Parameters

### *range-id*

Sets context for specified entry ID for the static-isids

**Values** 1— 8191

### *isid-value*

Configures the ISID or the start of an ISID range. Specifies the ISID value in 24 bits. When just one present identifies a particular ISID to be used for matching.

**Values** 0 to 16777215

### *to isid*

Identifies upper value in a range of ISIDs to be used as matching criteria

**Values** 0 to 16777215

### **create**

This keyword is mandatory when creating a range instance.

## Platforms

All

## range

## Syntax

**range start-entry** *policer-id* **count** *count*

**no range**

## Context

**[Tree]** (config>qos>sap-ingress>dyn-policer range)

**[Tree]** (config>qos>sap-egress>dyn-policer range)

## Full Context

configure qos sap-ingress dynamic-policer range

configure qos sap-egress dynamic-policer range

## Description

This command defines the range of ids for dynamic policers that are created using a Gx interface.

The **no** form of this command disables creation of dynamic policers using a Gx interface, resulting in a Gx rule instantiation failure, which is the default.

## Default

no range

## Parameters

### **start-entry** *policer-id*

Specifies the lowest entry in the range.

**Values** 1 to 63

### **count** *count*

Specifies the number of entries in the range.

**Values** 1 to 63

## 22.22 rapid-psc-timer

### rapid-psc-timer

## Syntax

**rapid-psc-timer** *interval*

**no rapid-psc-timer**

## Context

[\[Tree\]](#) (config>router>mpls>mpls-tp>protection-template rapid-psc-timer)

## Full Context

configure router mpls mpls-tp protection-template rapid-psc-timer

## Description

This command configures the rapid timer value to be used for protection switching coordination (PSC) packets for MPLS-TP linear protection (RFC 6378).

## Default

rapid-psc-timer 10

## Parameters

### *interval*

Specifies the rapid timer interval in milliseconds.

**Values** [10, 100, 1000]

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.23 rapid-retransmit-time

### rapid-retransmit-time

## Syntax

**rapid-retransmit-time** *hundred-milliseconds*

**no rapid-retransmit-time**

## Context

[\[Tree\]](#) (config>router>rsvp rapid-retransmit-time)

## Full Context

configure router rsvp rapid-retransmit-time

## Description

This command defines the value of the Rapid Retransmission Interval. It is used in the re-transmission mechanism to handle unacknowledged message\_id objects and is based on an exponential back-off timer.

Re-transmission interval of a RSVP message with the same message\_id = 2 \* rapid-retransmit-time interval of time.

The node stops re-transmission of unacknowledged RSVP messages:

- If the updated back-off interval exceeds the value of the regular refresh interval.
- If the number of re-transmissions reaches the value of the **rapid-retry-limit** parameter, whichever comes first.

The Rapid Retransmission Interval must be smaller than the regular refresh interval configured in **config>router>rsvp>refresh-time**.

The **no** form of this command reverts to the default value.

## Default

rapid-retransmit-time 5

## Parameters

*hundred-milliseconds*

Specifies the rapid retransmission interval, in hundred-milliseconds (for example, enter "6" for a 600 millisecond retransmit time).

**Values** 1 to 100, in units of 100 ms.

All

## 22.24 rapid-retry-limit

### rapid-retry-limit

#### Syntax

**rapid-retry-limit** *number*

**no rapid-retry-limit**

#### Context

[\[Tree\]](#) (config>router>rsvp rapid-retry-limit)

#### Full Context

configure router rsvp rapid-retry-limit

#### Description

This command defines the value of the Rapid Retry Limit. This is used in the retransmission mechanism based on an exponential backoff timer in order to handle unacknowledged message\_id objects. The RSVP message with the same message\_id is retransmitted every 2 \* rapid-retransmit-time interval of time. The node stops retransmission of unacknowledged RSVP messages whenever the updated backoff interval exceeds the value of the regular refresh interval or the number of retransmissions reaches the value of the **rapid-retry-limit** parameter, whichever comes first.

The **no** form of this command reverts to the default value.

#### Default

rapid-retry-limit 3

#### Parameters

***number***

Specifies the value of the Rapid Retry Limit.

**Values** 1 to 6, integer values

#### Platforms

## 22.25 rapid-update

### rapid-update

#### Syntax

```
rapid-update [l2-vpn] [mvpn-ipv4] [mvpn-ipv6] [mdt-safi] [evpn] [label-ipv4] [label-ipv6] [vpn-ipv4]
             [vpn-ipv6] [mcast-vpn-ipv4] [mcast-vpn-ipv6]
no rapid-update
```

#### Context

[\[Tree\]](#) (config>router>bgp rapid-update)

#### Full Context

```
configure router bgp rapid-update
```

#### Description

This command enables and disables BGP rapid update for specified address families.

If rapid update is enabled for a set of address families, and a route belonging to a family in that set is received by the router and chosen for propagation to certain BGP peers, the remaining time on the MRAI timer of these peers is ignored and the route is transmitted immediately, along with all other pending routes for these peers (including routes of address families not specified in the **rapid-update** command).

The **rapid-update** command overrides the peer-level **min-route-advertisement** (**config>router>bgp min-route-advertisement**, **config>router>bgp>group min-route-advertisement**, **config>router>bgp>group>neighbor min-route-advertisement**) time and applies the minimum setting (0 seconds) to routes belonging to specified address families; routes of other address families continue to be advertised according to the session-level MRAI setting.

The **no** form of this command disables rapid update for all address families.

#### Default

```
no rapid-update
```

#### Parameters

##### l2-vpn

Specifies the BGP rapid update for the 12-byte Virtual Switch Instance identifier (VSI-ID) value consisting of the 8-byte route distinguisher (RD) followed by a 4-byte value.

##### mvpn-ipv4

Specifies BGP rapid update for the mvpn-ipv4 address family. The mvpn-ipv4 address is a variable size value consisting of the 1-byte route type, 1-byte length and variable size that is route type specific. Route type defines encoding for the route type specific field. Length indicates the length in octets of the route type specific field.

##### mdt-safi

Specifies BGP rapid update for the mdt-safi address family. The address is a 16-byte value consisting of 12-byte route distinguisher (RD) followed by a 4-byte group address.

**mvpn-ipv6**

Specifies BGP rapid update for the mvpn-ipv6 address family.

**evpn**

Specifies BGP rapid update for the evpn address family by including or removing EVPN routes from the set of routes that can trigger rapid update.

**label-ipv4**

Includes or removes label-ipv4 routes from the set of routes that can trigger rapid update.

**label-ipv6**

Includes or removes label-ipv6 routes from the set of routes that can trigger rapid update.

**vpn-ipv4**

Includes or removes vpn-ipv4 routes from the set of routes that can trigger rapid update.

**vpn-ipv6**

Includes or removes vpn-ipv6 routes from the set of routes that can trigger rapid update.

**mcast-vpn-ipv4**

Includes or removes mcast-vpn-ipv4 routes from the set of routes that can trigger rapid update.

**mcast-vpn-ipv6**

Includes or removes mcast-vpn-ipv6 routes from the set of routes that can trigger rapid update.

### Full Context

configure subscriber-mgmt gtp peer-profile rat-type

### Description

This command configures the default Radio Access Type (RAT) signaled during GTP setup. RAT is the underlying physical connection method for a radio-based communication network. This can be overridden by RADIUS.

The **no** form of this command reverts to the default value.

### Default

rat-type wlan

### Parameters

#### **utran**

Specifies the signaled RAT type is UTRAN (1).

#### **geran**

Specifies the signaled RAT type is GERAN (2).

#### **wlan**

Specifies the signaled RAT type is WLAN (3).

#### **gan**

Specifies the signaled RAT type is GAN (4).

#### **hspa**

Specifies the signaled RAT type is HSPA Evolution (5).

#### **eutran**

Specifies the signaled RAT type is EUTRAN (6).

#### **virtual**

Specifies the signaled RAT type is virtual (7).

#### **id**

Specifies the numeric RAT type value.

**no rate**

### Context

[\[Tree\]](#) (config>subscr-mgmt>sla-prof>egress>qos>queue rate)

## Full Context

configure subscriber-mgmt sla-profile egress qos queue rate

## Description

This command defines the administrative Peak Information Rate (PIR) and the administrative Committed Information Rate (CIR) parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile then out-of-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent command's *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

## Parameters

### *pir-rate*

Defines the administrative PIR rate, in kb/s, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed. Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queues **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 2000000000, max

**Default** max

### *cir-rate*

Defines the administrative CIR rate, kb/s, for the queue. The **cir** parameter overrides the default administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed. Fractional values are not allowed and must be given as a positive integer.

**Values** 0 to 2000000000, max

**Default** 0

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## rate

### Syntax

**rate** *pir-rate* [**cir** *cir-rate*]

**no rate**

### Context

**[Tree]** (config>subscr-mgmt>sla-prof>ingress>qos>queue rate)

### Full Context

configure subscriber-mgmt sla-profile ingress qos queue rate

### Description

This command defines the administrative Peak Information Rate (PIR) and the administrative Committed Information Rate (CIR) parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets through the switch fabric (for SAP ingress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. For SAP ingress, the CIR also defines the rate that packets are considered in-profile by the system. In-profile then out-of-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent command's *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP ingress or SAP egress QoS policy with the *queue-id*.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

### Parameters

#### *pir-rate*

Defines the administrative PIR rate, in kilobits, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queues **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 2000000000, max

**Default** max

***cir-rate***

Specifies the **cir** parameter used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and must be given as a positive integer.

**Values** 0 to 2000000000, max

**Default** 0

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**rate****Syntax**

**rate** {max | *rate*} [cir {max | *rate*}]

**Context**

**[Tree]** (config>subscr-mgmt>sla-prof>ingress>qos>policer rate)

**[Tree]** (config>subscr-mgmt>sla-prof>egress>qos>policer rate)

**Full Context**

configure subscriber-mgmt sla-profile ingress qos policer rate

configure subscriber-mgmt sla-profile egress qos policer rate

**Description**

This command is used to configure the policer's metering and optional profiling rates. The metering rate is used by the system to configure the policer's PIR leaky bucket's decrement rate while the profiling rate configures the policer's CIR leaky bucket's decrement rate. The decrement function empties the bucket while packets applied to the bucket attempt to fill it based on each packets size. If the bucket fills faster than how much is decremented per packet, the bucket's depth eventually reaches its exceed (CIR) or violate (PIR) threshold. The **cbs**, **mbs**, and **high-prio-only** commands are used to configure the policer's PIR and CIR thresholds.

If a packet arrives at the policer while the bucket's depth is less than the threshold associated with the packet, the packet is considered to be conforming to the bucket's rate. If the bucket depth is equal to or greater than the threshold, the packet is considered to be in the exception state. For the CIR bucket, the exception state is exceeding the CIR rate while the PIR bucket's exception state is violating the PIR bucket rate. If the packet is violating the PIR, the packet is marked red and is discarded. If the packet is not red, it may be green or yellow based on the conforming or exceeding state from the CIR bucket.

When a packet is red neither the PIR or CIR bucket depths are incremented by the packets size. When the packet is yellow the PIR bucket is incremented by the packet size, but the CIR bucket is not. When the packet is green, both the PIR and CIR buckets are incremented by the packet size. This ensures that conforming packets impact the bucket depth while exceeding or violating packets do not.

The policer's **adaptation-rule** command settings are used by the system to convert the specified rates into hardware timers and decrement values for the policer's buckets.

By default, the policer's metering rate is **max** and the profiling rate is 0 kb/s (all packets out-of-profile).

The **rate** settings defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied.

The **no** form of this command restores the default metering and profiling rate to a policer.

## Parameters

### {**max** | **rate**}

Specifies the packet byte offset. Specifying the keyword **max** or an explicit **rate** (in kilobits per second) parameter directly following the rate command is required and identifies the policer's metering rate for the PIR leaky bucket. When the policer is first created, the metering rate defaults to max. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used is equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to max.

**Values** max or 1 to 2000000000

### **cir** {**max** | **rate**}

Specifies the packet byte offset. The optional **cir** keyword is used to override the default CIR rate of the policer. Specifying the keyword **max** or an explicit **rate** (in kilobits per second) parameter directly following the cir keyword is required and identifies the policer's profiling rate for the CIR leaky bucket. When the policer is first created, the profiling rate defaults to 0 kb/s. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used is equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to **max**.

**Values** max or 0 to 2000000000

## Full Context

```
configure service vpls sap egress queue-override queue rate
configure service vpls sap ingress queue-override queue rate
configure service ies interface sap egress queue-override queue rate
configure service ies interface sap ingress queue-override queue rate
```

## Description

This command overrides specific attributes of the specified queue's Peak Information Rate (PIR) and the Committed Information Rate (CIR) parameters.

The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile, then out-of-profile, packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (max, 0).

## Default

```
rate max cir 0
```

## Parameters

### *pir-rate*

Defines the administrative PIR rate, in kilobits, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and must be configured as a positive integer.

The actual PIR rate is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 6400000000, **max**

**Default** max

### *cir-rate*

Overrides the default administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and must be configured as a positive integer.

**Values** 0 to 6400000000, **max**

**Default** 0

## Platforms

All

## rate

## Syntax

**rate** *pir-rate* [**cir** *cir-rate*]

**no rate**

## Context

[\[Tree\]](#) (config>service>vpls>sap>egress>sched-override>scheduler rate)

## Full Context

configure service vpls sap egress scheduler-override scheduler rate

## Description

This command overrides specific attributes of the specified scheduler rate. The **rate** command defines the maximum bandwidth that the scheduler can offer its policers, child queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's 'within CIR' distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler because of insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler assumes that an infinite amount of bandwidth is available and allow all child queues and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the value configured in the applied scheduler policy.

## Default

rate max cir sum

## Parameters

### *pir-rate*

Specifies the PIR rates. The **pir** parameter accepts a step multiplier value that specifies the multiplier used to determine the PIR rate at which the queue operates. A value of 0 to 100000000 or the keyword **max** is accepted. Any other value results in an error without modifying the current PIR rate.

To calculate the actual PIR rate, the rate described by the queue's **rate** is multiplied by the *pir-rate*.

The SAP ingress context for PIR is independent of the defined forwarding class (fc) for the queue. The default **pir** and definable range is identical for each class. The PIR in effect for a queue defines the maximum rate at which the queue is allowed to forward packets in a given second, shaping the queue's output.

The PIR parameter for SAP ingress queues do not have a negate (**no**) function. To return the queue's PIR rate to the default value, that value must be specified as the PIR value.

**Values** 1 to 6400000000, max

**Default** max

### *cir-rate*

Specifies the CIR rate. The **cir** parameter accepts a step-multiplier value that specifies the multiplier used to determine the CIR rate at which the queue operate. A value of 0 to 250 or the keyword max is accepted. Any other value results in an error without modifying the current CIR rate.

To calculate the actual CIR rate, the rate described by the **rate pir pir-rate** is multiplied by the *cir-rate*. If the **cir** is set to max, then the CIR rate is set to infinity.

The context for CIR is dependent on the defined forwarding class (fc) for the queue. The default CIR and definable range is different for each class. The CIR in effect for a policer or queue defines both its profile (in or out) marking level as well as the relative importance compared to other queues for scheduling purposes during congestion periods.

**Values** 0 to 6400000000, max, sum

**Default** sum

## Description

This command configures the policer's metering and optional profiling rates. The metering rate is used by the system to configure the policer's PIR leaky bucket's decrement rate while the profiling rate configures the policer's CIR leaky bucket's decrement rate. The decrement function empties the bucket while packets applied to the bucket attempt to fill it based on its packet size. If the bucket fills faster than how much is decremented per packet, the bucket's depth eventually reaches its exceeded (CIR) or violate (PIR) threshold. The **pbs**, **mbs**, and **high-prio-only** commands are used to configure the policer's PIR and CIR thresholds.

If a packet arrives at the policer while the bucket's depth is less than the threshold associated with the packet, the packet is considered to be conforming to the bucket's rate. If the bucket depth is equal to or greater than the threshold, the packet is considered to be in the exception state. For the CIR bucket, the exception state is exceeding the CIR rate while the PIR bucket's exception state is violating the PIR bucket rate. If the packet is violating the PIR, the packet is marked red and will be discarded. If the packet is not red, it may be green or yellow based on the conforming or exceeding state from the CIR bucket.

When a packet is red neither the PIR nor the CIR bucket depths are incremented by the packets size. When the packet is yellow the PIR bucket is incremented by the packet size, but the CIR bucket is not. When the packet is green, both the PIR and CIR buckets are incremented by the packet size. This ensures that conforming packets impact the bucket depth while exceeding or violating packets do not.

The policer's **adaptation-rule** command settings are used by the system to convert the specified rates into hardware timers and decrement values for the policer's buckets.

By default, the policer's metering rate is **max** and the profiling rate is 0 kb/s (all packets out-of-profile).

The **rate** settings defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied.

The **no** form of this command reverts to the default metering and profiling rate of a policer.

## Parameters

**{rate | max}**

Specifying the keyword **max** or an explicit *rate* parameter directly following the *rate* command is required and identifies the policer's metering rate for the PIR leaky bucket. When the policer is first created, the metering rate defaults to max. The *kilobits-per-second* value must be expressed as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When max is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to max.

**Values** max or 1 to 2000000000

**cir {max | rate}**

The optional **cir** keyword is used to override the default CIR rate of the policer. Specifying the keyword max or an explicit *rate* parameter directly following the *cir* keyword is required and identifies the policer's profiling rate for the CIR leaky bucket. When the policer is first created, the profiling rate defaults to 0 kb/s. The *kilobits-per-second* value must be expressed as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When max is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to max.

**Values** max or 0 to 2000000000

### Syntax

**rate** *pir-rate* [**cir** *cir-rate*]

**no rate**

### Context

**[Tree]** (config>port>ethernet>access>ing>qgrp>qover>q rate)

**[Tree]** (config>port>ethernet>access>egr>qgrp>qover>q rate)

**[Tree]** (config>port>ethernet>network>egr>qover>q rate)

### Full Context

configure port ethernet access ingress queue-group queue-overrides queue rate

configure port ethernet access egress queue-group queue-overrides queue rate

configure port ethernet network egress queue-overrides queue rate

### Description

This command specifies the administrative Peak Information Rate (PIR) and the administrative Committed Information Rate (CIR) parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile then out-of-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the **rate** is performed under the **hs-wrr-group** within the egress queue group template.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

### Default

**rate max cir 0** - The max default specifies the amount of bandwidth in kilobits per second (thousand bits per second). The max value is mutually exclusive to the *pir-rate* value.

### Parameters

*pir-rate*

Defines the administrative PIR rate, in kilobits per second, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed. Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 200000000, max

**Default** max

### ***cir-rate***

The **cir** parameter overrides the default administrative CIR used by the queue, in kilobits per second. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed. Fractional values are not allowed and must be given as a positive integer.

**Values** 0 to 200000000, max

**Default** 0

## **Context**

**[Tree]** (config>port>ethernet>access>egr>qgrp>sched-override>scheduler rate)

**[Tree]** (config>port>ethernet>access>ing>qgrp>sched-override>scheduler rate)

## **Full Context**

configure port ethernet access egress queue-group scheduler-override scheduler rate

configure port ethernet access ingress queue-group scheduler-override scheduler rate

## **Description**

This command can be used to override specific attributes of the specified scheduler rate. The **rate** command defines the maximum bandwidth that the scheduler can offer its child queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's 'within CIR' distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler because of insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler assumes that an infinite amount of bandwidth is available and allow all child policers, queues, and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the value configured in the applied scheduler policy.

## Parameters

### *pir-rate*

Specifies the PIR rate, in kilobits per second. Any other value results in an error without modifying the current PIR rate.

**Values** 1 to 6400000000, **max**

### *cir-rate*

Specifies the CIR rate, in kilobits per second. If the CIR is set to **max**, then the CIR rate is set to infinity. The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers, policers, or queues.

**Values** 0 to 6400000000, **sum**, **max**

configure service ipipe sap egress policer-override policer rate

configure service epipe sap ingress policer-override policer rate

configure service ipipe sap ingress policer-override policer rate

configure service epipe sap egress policer-override policer rate

## Description

This command within the SAP ingress and egress policer-overrides contexts is used to override the sap-ingress and sap-egress QoS policy configured rate parameters for the specified policer-id.

The **no** rate command is used to restore the policy defined metering and profiling rate to a policer.

## Parameters

### rate rate

Specifies the policer instance metering rate for the PIR leaky bucket, in kilobits per second. The integer value is multiplied by 1000 to derive the actual rate in bits per second.

**Values** 1 to 6400000000

### cir rate

Specifies the overriding value for the policy-derived profiling rate of the policer, in kilobits per second. The integer value is multiplied by 1000 to derive the actual rate in bits per second.

**Values** 0 to 6400000000

### max

Uses the maximum policer rate, equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR or CIR used is equivalent to **max**.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS

configure service ipipe sap egress queue-override queue rate

configure service epipe sap ingress queue-override queue rate

configure service cpipe sap egress queue-override queue rate

configure service cpipe sap ingress queue-override queue rate

configure service epipe sap egress queue-override queue rate

configure service ipipe sap ingress queue-override queue rate

## Description

This command can be used to override specific attributes of the specified queue's Peak Information Rate (PIR) and the Committed Information Rate (CIR) parameters.

The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile and then out-of-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the **rate** is performed under the **hs-wrr-group** within the SAP egress QoS policy.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

## Default

rate max cir 0

## Parameters

### *pir-rate*

Defines the administrative PIR rate, in kilobits per second, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 6400000000, **max**

**Default** max

### *cir-rate*

The **cir** parameter overrides the default administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and must be given as a positive integer. The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers, policers, or queues.

**Values** 0 to 6400000000, **max**, **sum**

**Default** 0

configure service ipipe sap egress scheduler-override scheduler rate

configure service epipe sap egress scheduler-override scheduler rate

configure service cpipe sap ingress scheduler-override scheduler rate

configure service cpipe sap egress scheduler-override scheduler rate

## Description

This command can be used to override specific attributes of the specified scheduler rate. The **rate** command defines the maximum bandwidth that the scheduler can offer its child policers, queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's 'within CIR' distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child policers or queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler due to insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler will assume that an infinite amount of bandwidth is available and allow all child policers, queues, and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the values configured in the applied scheduler policy.

## Parameters

### *pir-rate*

The **pir** parameter accepts the **max** keyword or a value in kilobits per second. Any other value will result in an error without modifying the current PIR rate.

**Values** 1 to 6400000000, **max**

### *cir cir-rate*

The **cir** parameter accepts a value in kilobits per second or the **max** keyword. Any other value will result in an error without modifying the current CIR rate.

If the **cir** parameter is set to **max**, then the CIR rate is set to infinity but bounded by the PIR rate.

The **sum** keyword specifies that the CIR will be used as the summed CIR values of the children schedulers, policers, or queues.

**Values** 0 to 6400000000, **max**, **sum**

```
configure service vpls sap egress policer-override policer rate
configure service vpls sap ingress policer-override policer rate
```

## Description

This command within the SAP ingress and egress policer-overrides contexts is used to override the sap-ingress and sap-egress QoS policy configured rate parameters for the specified policer-id.

The **no** form of this command removes the **rate** override so that the **rate** configured for the policer in the applied SAP egress QoS policy is used.

## Parameters

**{rate | max}**

Specifying the keyword **max** or an explicit kilobits per second parameter directly following the rate override command is required and identifies the policer instance's metering rate for the PIR leaky bucket. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to **max**.

**Values** 1 to 6400000000, **max**

**cir {max | rate}**

The optional **cir** keyword is used to override the policy derived profiling rate of the policer. Specifying the keyword **max** or an explicit kilobits per second parameter directly following the **cir** keyword is required. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to **max**.

**Values** 0 to 6400000000, **max**

```

## Description

This command overrides the scheduling rate applied to the HS WRR group in kb/s. Alternatively, the keyword **max** can be specified which removes the bandwidth limitation on the HS WRR group. The override rate type must match the corresponding rate type within the applied QoS policy.

The **no** form of this command removes the rate override value from the configuration.

## Parameters

### *rate*

Specifies the scheduling rate of the HS WRR group in kb/s.

**Values** 1 to 2000000000, max

## Platforms

7750 SR-7/12/12e

## rate

## Syntax

```
rate {rate | max} [cir {max | rate}]
```

## Context

[\[Tree\]](#) (config>service>ies>if>sap>ingress>policer-override>plcr rate)

[\[Tree\]](#) (config>service>ies>if>sap>egress>policer-override>plcr rate)

## Full Context

```
configure service ies interface sap ingress policer-override policer rate
```

```
configure service ies interface sap egress policer-override policer rate
```

## Description

This command within the SAP ingress and egress policer-overrides contexts is used to override the sap-ingress and sap-egress QoS policy configured rate parameters for the specified policer-id.

The **no** form of the command removes the **rate** override so that the **rate** configured for the policer in the applied SAP egress QoS policy is used.

## Parameters

### {*rate* | **max**}

Specifying the keyword **max** or an explicit kilobits per second parameter directly following the rate override command is required and identifies the policer instance's metering rate for the PIR leaky bucket. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive

the actual rate in bits per second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to **max**.

**Values** 1 to 6400000000, **max**

#### **cir** {**max** | *rate*}

The optional **cir** keyword is used to override the policy derived profiling rate of the policer. Specifying the keyword **max** or an explicit kilobits per second parameter directly following the **cir** keyword is required. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to **max**.

**Values** 0 to 6400000000, **max**

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## rate

### Syntax

**rate** *rate*

**no rate**

### Context

**no rate**

### Context

**[Tree]** (config>service>ies>if>sap>ingress>sched-override>scheduler rate)

**[Tree]** (config>service>ies>if>sap>egress>sched-override>scheduler rate)

### Full Context

configure service ies interface sap ingress scheduler-override scheduler rate

configure service ies interface sap egress scheduler-override scheduler rate

### Description

This command can be used to override specific attributes of the specified scheduler rate. The **rate** command defines the maximum bandwidth that the scheduler can offer its child queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's 'within CIR' distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler due to insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler will assume that an infinite amount of bandwidth is available and allow all child queues and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the value configured in the applied scheduler policy.

### Parameters

#### *pir-rate*

The **pir** parameter accepts a value in kilobits per second, or the keyword **max**. Any other value will result in an error without modifying the current PIR rate.

**Values** 1 to 6400000000, **max**

#### *cir-rate*

This parameter accepts a step-multiplier value that specifies the multiplier used to determine the CIR rate at which the queue will operate. A value in kilobits per second or the keywords **max** or **sum** is accepted. Any other value will result in an error without modifying the current CIR rate.

If the **cir** is set to max, then the CIR rate is set to infinity but is restricted by the PIR rate.

The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers, policers, or queues.

For **egress>sched-override>scheduler** and **ingress>sched-override>scheduler**:

**Values** 0 to 6400000000, **max**, **sum**

configure service vprn interface sap ingress policer-override policer rate

configure service vprn interface sap egress policer-override policer rate

### Description

This command within the SAP ingress and egress policer-overrides contexts is used to override the sap-ingress and sap-egress QoS policy configured rate parameters for the specified policer-id.

The **no** form of this command restores the policy defined metering and profiling rate to a policer.

### Parameters

**{*rate* | **max**}**

Specifying the keyword **max** or an explicit kilobits per second parameter directly following the rate override command is required and identifies the policer instance's metering rate for the PIR leaky bucket. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to **max**.

**Values** 1 to 6400000000, **max**

**cir {**max** | *rate*}**

The optional **cir** keyword is used to override the policy derived profiling rate of the policer. Specifying the keyword **max** or an explicit kilobits per second parameter directly following the **cir** keyword is required. The kilobits per second value must be expressed as an integer and defines the rate in kilobits per second. The integer value is multiplied by 1,000 to derive the actual rate in bits per second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to **max**.

**Values** 0 to 6400000000, **max**

**[Tree]** (config>service>vprn>if>sap>ingress>queue-override>queue rate)

### Full Context

configure service vprn interface sap egress queue-override queue rate

configure service vprn interface sap ingress queue-override queue rate

## Description

This command can be used to override specific attributes of the specified queue's Peak Information Rate (PIR) and the Committed Information Rate (CIR) parameters. The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the rate is performed under the **hs-wrr-group** within the SAP egress QoS policy.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

## Default

rate max cir 0

## Parameters

### *pir-rate*

Defines the administrative PIR rate, in kb/s, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 6400000000, **max**

**Default** max

### *cir-rate*

Defines the administrative CIR rate, in kb/s, for the queue. The **cir** parameter overrides the default administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and must be given as a positive integer.

**Values** 0 to 6400000000, **max**

**Default** 0

## Full Context

configure service vprn interface sap ingress scheduler-override scheduler rate

configure service vprn interface sap egress scheduler-override scheduler rate

## Description

This command can be used to override specific attributes of the specified scheduler rate. The **rate** command defines the maximum bandwidth that the scheduler can offer its child queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's 'within CIR' distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child policers and queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler due to insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler will assume that an infinite amount of bandwidth is available and allow all child queues and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the value configured in the applied scheduler policy.

## Parameters

***pir-rate***

Specifies the PIR rate for the scheduler. The **pir** parameter accepts a value in kb/s, or the **max** keyword. Any other value will result in an error without modifying the current PIR rate.

**Values** 1 to 6400000000, **max**

### ***cir-rate***

Specifies the CIR rate for the scheduler. The **cir** parameter accepts a value in kb/s, or the **max** or **sum** keywords. Any other value will result in an error without modifying the current CIR rate.

If the **cir** is set to **max**, then the CIR rate is set to infinity, but is limited by the *pir-rate*.

If the **cir** is set to **sum**, then the CIR rate is set to the summed CIR values of the children schedulers, policers, or queues.

**Values** 0 to 6400000000, **max**, **sum**

### Full Context

configure application-assurance group policer tod-override rate

configure application-assurance group policer rate

### Description

This command configures the administrative PIR and CIR for bandwidth policers and flow setup rate limits for flow policers. The actual rate sustained by the flow can be limited by other policers that may be applied to that flow's traffic. This command does not apply to flow-count-limit policers.

The **cir** option is applicable only to dual-bucket bandwidth policers. It is recommended to configure flow setup rate subscriber-level policer for AA subscribers to ensure fair usage of flow resources between AA subscribers.

The **no** form of this command resets the values to defaults.

### Default

rate max cir 0

### Parameters

#### *pir-rate*

Specifies an integer for the PIR rate in kb/s for bandwidth policers.

**Values** 1 to 100000000, **max** or flows/sec

#### *cir-rate*

Specifies an integer for the CIR rate in kb/s.

**Values** 0 to 100000000, **max**

### Full Context

debug application-assurance group http-host-recorder rate

debug application-assurance group port-recorder rate

### Description

This command configures the sampling rate for the recorded http host, a sampling rate of 10 will sample one out of 10 http-host.

### Parameters

#### ***sample-rate***

Specifies the sample rate.

**Values** 1 to 10000

**Default** 100

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### Output

The following configuration records http-host entries ending with ".com" as a result of the expression filter configuration. It will not record any other HTTP host values since the default-filter-action set to no-record. The http-host entries analyzed by the recorder in the first place are http-host-app-filter-candidates.

### Sample Output

```
7750# show debug
debug
  application-assurance
    group 1:1
      http-host-recorder
        filter
          default-filter-action no-record
          expression 1 http-host eq "*.com$" record
          record http-host-app-filter-candidates
        exit
        rate 100
        no shutdown
      exit
```

```
    exit
  exit
exit
```

## rate

### Syntax

**rate** *rate*

**no rate**

### Context

**[Tree]** (config>qos>plcr-ctrl-plcy>tier>arbiter rate)

### Full Context

configure qos policer-control-policy tier arbiter rate

### Description

This command is used to define the maximum bandwidth an instance of the arbiter can receive from its parent tier 1 arbiter or the root arbiter. The arbiter instance enforces this limit by calculating the bandwidth each of its child policers should receive relative to their offered loads, parenting parameters, and individual rate limits, and using that derived rate as a child PIR decrement rate override. The override will not exceed the child policer's administrative rate limit and the aggregate of all the child PIR decrement rates will not exceed the specified arbiter rate limit.

The arbiter's policy defined rate value may be overridden at the SAP or sub-profile where the **policer-control-policy** is applied. Specifying an override prevents the arbiter from being removed from the policer control policy until the override is removed.

The **no** form of this command is used to remove a rate limit from the arbiter at the policer control policy level. The policy level rate limit for the arbiter will return to the default value of **max**. The **no rate** command has no effect on instances of the arbiter where a rate limit override has been defined.

### Default

rate max

### Parameters

#### **rate**

Enter an integer representing the rate limit in kilobits per second.

**Values** 1 to 6400000000, **max**

#### **max**

When **max** is specified, the arbiter does not enforce a rate limit on its child policers or arbiters other than the individual rate limits enforced at the child level.

### Platforms

### Full Context

```
configure qos sap-ingress policer rate
```

```
configure qos sap-egress policer rate
```

### Description

This command is used to configure the policer's metering and optional profiling rates. The metering rate is used by the system to configure the policer's PIR leaky bucket's decrement rate while the profiling rate configures the policer's CIR leaky bucket's decrement rate. The decrement function empties the bucket while packets applied to the bucket attempt to fill it based on each packet's size. If the bucket fills faster than how much is decremented per packet, the bucket's depth eventually reaches its exceed (CIR) or violate (PIR) threshold. The **cbs**, **mbs**, and **high-prio-only** commands are used to configure the policer's PIR and CIR thresholds.

If a packet arrives at the policer while the bucket's depth is less than the threshold associated with the packet, the packet is considered to be conforming to the bucket's rate. If the bucket depth is equal to or greater than the threshold, the packet is considered to be in the exception state. For the CIR bucket, the exception state is exceeding the CIR rate while the PIR bucket's exception state is violating the PIR bucket rate. If the packet is violating the PIR, the packet is marked red and will be discarded. If the packet is not red, it may be green or yellow, based on the conforming or exceeding state from the CIR bucket.

When a packet is red, neither the PIR nor CIR bucket depths are incremented by the packets size. When the packet is yellow, the PIR bucket is incremented by the packet size, but the CIR bucket is not. When the packet is green, both the PIR and CIR buckets are incremented by the packet size. This ensures that conforming packets impact the bucket depth while exceeding or violating packets do not.

The policer's **adaptation-rule** command settings are used by the system to convert the specified rates into hardware timers and decrement values for the policer's buckets.

By default, the policer's metering rate is **max** and the profiling rate is 0 kb/s (all packets out-of-profile).

The **rate** settings defined for the policer in the QoS policy may be overridden on an **sla-profile** or SAP where the policy is applied.

The **no** form of this command is used to restore the default metering and profiling rate to a policer.

### Parameters

**{max | *pir-rate*}**

Specifying the keyword **max** or an explicit *pir-rate* parameter directly following the rate command is required and identifies the policer's metering rate for the PIR leaky bucket.

When the policer is first created, the metering rate defaults to max. The *pir-rate* value must

be expressed as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to **max**.

**Values** 1 to 6400000000, **max**

#### **cir {max | *cir-rate*}**

The optional **cir** keyword is used to override the default CIR rate of the policer. Specifying the keyword **max** or an explicit *cir-rate* parameter directly following the **cir** keyword is required and identifies the policer's profiling rate for the CIR leaky bucket. When the policer is first created, the profiling rate defaults to 0 kb/s. The *cir-rate* value must be expressed as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to **max**.

**Values** 0 to 6400000000, **max**

### **Platforms**

**rate** *pir-rate* **police**

**no rate**

### **Context**

[\[Tree\]](#) (config>qos>sap-ingress>queue rate)

### **Full Context**

configure qos sap-ingress queue rate

### **Description**

This command defines the administrative Peak Information Rate (PIR), the administrative Committed Information Rate (CIR), and the administrative Fair Information Rate (FIR) parameters for the queue.

The PIR defines the maximum rate that the queue can transmit packets through the switch fabric (for SAP ingress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. For SAP ingress, the CIR also defines the rate that packets are considered in-profile by

the system, unless **cir-non-profiling** is configured. In-profile, then out-of-profile, packets are preferentially queued by the system at egress and at subsequent next-hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The FIR defines an additional rate at which the system prioritizes the queue over other queues competing for the same bandwidth above that used by the CIR.

The **rate** command can be executed at any time, altering the PIR, CIR, and FIR for all queues created through the association of the SAP ingress QoS policy with the *queue-id*.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0, 0).

## Default

rate max cir 0 fir 0

## Parameters

### *pir-rate*

Defines the administrative PIR, in kilobits per second, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and the value must be given as a positive integer.

The actual PIR is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 6400000000, **max**

**Default** max

### *cir-rate*

The **cir** parameter overrides the default administrative CIR, in kilobits per second, used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and the value must be given as a positive integer. The actual CIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 0 to 6400000000, **max**

**Default** 0

### *fir-rate*

The **fir** parameter overrides the default administrative FIR, in kilobits per second, used by the queue. When the **rate** command is executed, an FIR setting is optional. When the **rate**

command has not been executed or the **fir** parameter is not explicitly specified, the default FIR (0) is assumed.

Fractional values are not allowed and the value must be given as a positive integer. The actual FIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

FIR is only supported on FP4 hardware and is ignored when the related policy is applied to FP2- or FP3-based hardware.

**Values** 0 to 6400000000, **max**

**Default** 0

### police

Specifies that traffic feeding into the queue instance above the specified PIR rate will be dropped. When the **police** keyword is defined, only the PIR rate may be overridden.

configure qos sap-egress queue rate

## Description

This command defines the administrative Peak Information Rate (PIR) and the administrative Committed Information Rate (CIR) parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets out an egress interface (for SAP egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled as in- or out-of-profile throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR rates for all queues created through the association of the SAP egress QoS policy with the *queue-id*.

When configured on an egress HSQ queue group queue, the **cir** keyword is ignored.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the rate is performed under the **hs-wrr-group** within the SAP egress QoS policy.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

## Default

rate max cir 0

## Parameters

### *pir-rate*

Defines the administrative PIR rate, in kilobits per second, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 6400000000, **max**

**Default** max

### *cir-rate*

The **cir** parameter overrides the default administrative CIR, in kilobits per second, used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and must be given as a positive integer.

**Values** 0 to 6400000000, **max**

**Default** 0

### Full Context

configure qos network-queue queue rate

### Description

This command defines the administrative Peak Information Rate (PIR), the administrative Committed Information Rate (CIR), and the administrative Fair Information Rate (FIR) parameters for the queue.

The PIR defines the percentage that the queue can transmit packets through the switch fabric (for ingress queues) or out of an egress port (for egress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available bandwidth.

The CIR defines the percentage at which the system prioritizes the queue over other queues competing for the same bandwidth.

The CIR can be used by the queue's **port-parent** commands **cir-level** and **cir-weight** parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent port scheduler.

The FIR defines an additional percentage at which the system prioritizes the queue over other queues competing for the same bandwidth above that used by the CIR percentage.

The **rate** command can be executed at any time, altering the PIR, CIR, and FIR for all queues created through the association of the network queue policy with the *queue-id*.

When configured on an egress HSQ queue group queue, the **cir** keyword is ignored.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the rate is performed under the **hs-wrr-group** within the network queue policy.

The **no** form of the command returns all queues created with the *queue-id* by association with the network queue policy to the default PIR, CIR, and FIR parameters.

### Default

rate 100 cir 0 fir 0

### Parameters

#### *percent*

Defines the percentage of the sum of the capacities of network and hybrid ports on that FP (taking into account any **ingress-rate** configuration) or egress port speed for the rate allowed for the queue. When the **rate** command is executed, a valid *percent* (PIR setting) must be explicitly defined. When the **rate** command has not been executed, the default

PIR of **100** is assumed. Fractional values are not allowed, and the value must be given as a positive integer.

The actual PIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 100

**Default** 100

### **cir percent**

Defines the percentage of the sum of the capacities of network and hybrid ports on that FP (taking into account any **ingress-rate** configuration) or egress port speed for the CIR allowed for the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed. Fractional values are not allowed, and the value must be given as a positive integer. The actual CIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 0 to 100

**Default** 0

### **fir percent**

Defines the percentage of the sum of the capacities of network and hybrid ports on that FP (taking into account any **ingress-rate** configuration) or egress port speed for the FIR allowed for the queue. When the **rate** command is executed, a FIR setting is optional. When the **rate** command has not been executed or the **fir** parameter is not explicitly specified, the default FIR (0) is assumed. Fractional values are not allowed, and the value must be given as a positive integer. The actual FIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned. FIR is only supported on FP4 hardware and is ignored when the related policy is applied to FP2- or FP3-based hardware.

**Values** 0 to 100

**Default** 0

## Full Context

```
configure qos queue-group-templates egress queue-group policer rate
configure qos queue-group-templates ingress queue-group policer rate
```

## Description

This command is used to configure the policer's metering and optional profiling rates. The metering rate is used by the system to configure the policer's PIR leaky bucket's decrement rate while the profiling rate configures the policer's CIR leaky bucket's decrement rate. The decrement function empties the bucket while packets applied to the bucket attempt to fill it based on each packet's size. If the bucket fills faster than how much is decremented per packet, the bucket's depth eventually reaches its exceed (CIR) or violate (PIR) threshold. The **cbs**, **mbs**, and **high-prio-only** commands are used to configure the policer's PIR and CIR thresholds.

If a packet arrives at the policer while the bucket's depth is less than the threshold associated with the packet, the packet is considered to be conforming to the bucket's rate. If the bucket depth is equal to or greater than the threshold, the packet is considered to be in the exception state. For the CIR bucket, the exception state is exceeding the CIR rate while the PIR bucket's exception state is violating the PIR bucket rate. If the packet is violating the PIR, the packet is marked red and will be discarded. If the packet is not red, it may be green or yellow, based on the conforming or exceeding state from the CIR bucket.

When a packet is red, neither the PIR nor CIR bucket depths are incremented by the packets size. When the packet is yellow, the PIR bucket is incremented by the packet size, but the CIR bucket is not. When the packet is green, both the PIR and CIR buckets are incremented by the packet size. This ensures that conforming packets impact the bucket depth while exceeding or violating packets do not.

The policer's **adaptation-rule** command settings are used by the system to convert the specified rates into hardware timers and decrement values for the policer's buckets.

By default, the policer's metering rate is **max** and the profiling rate is 0 kb/s (all packets out-of-profile).

The **no** form of this command is used to restore the default metering and profiling rate to a policer.

## Parameters

**{max | *pir-rate*}**

Specifying the keyword **max** or an explicit *pir-rate* parameter directly following the rate command is required and identifies the policer's metering rate for the PIR leaky bucket. When the policer is first created, the metering rate defaults to max. The *pir-rate* value must be expressed as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When max is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the PIR used is equivalent to max.

**Values**    **max**, 1 to 2000000000

**cir {max | *cir-rate*}**

The optional **cir** keyword is used to override the default CIR rate of the policer. Specifying the keyword max or an explicit *cir-rate* parameter directly following the cir keyword is required and identifies the policer's profiling rate for the CIR leaky bucket. When the policer is first created, the profiling rate defaults to 0 kb/s. The *cir-rate* value must be expressed

as an integer and defines the rate in kilobits-per-second. The integer value is multiplied by 1,000 to derive the actual rate in bits-per-second. When **max** is specified, the maximum policer rate used will be equal to the maximum capacity of the card on which the policer is configured. If the policer rate is set to a value larger than the maximum rate possible for the card, then the CIR used is equivalent to max.

**Values** **max**, 0 to 2000000000

## Platforms

**no rate**

### Context

**[Tree]** (config>qos>queue-group-templates>ingress>queue-group>queue rate)

### Full Context

configure qos queue-group-templates ingress queue-group queue rate

### Description

This command defines the administrative Peak Information Rate (PIR), the administrative Committed Information Rate (CIR), and the administrative Fair Information Rate (FIR) parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets through the switch fabric (for SAP ingress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. For SAP ingress, the CIR also defines the rate that packets are considered in-profile by the system, unless **cir-non-profiling** is configured. In-profile, then out-of-profile, packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The FIR defines an additional rate at which the system prioritizes the queue over other queues competing for the same bandwidth above that used by the CIR.

The **rate** command can be executed at any time, altering the PIR, CIR, and FIR for all queues created through the association of the ingress queue group template with the *queue-id*.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR, CIR, and FIR parameters (**max**, 0, 0).

## Default

```
rate max cir 0 fir 0
```

## Parameters

### *pir-rate*

Defines the administrative PIR, in kilobits, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed. Fractional values are not allowed and the value must be given as a positive integer.

The actual PIR is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 2000000000 kb/s, **max**

**Default** max

### *cir-rate*

The **cir** parameter overrides the default administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed. Fractional values are not allowed and the value must be given as a positive integer. The actual CIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 2000000000 kb/s, **max**

**Default** 0

### *fir-rate*

The **fir** parameter overrides the default administrative FIR used by the queue. When the rate command is executed, an FIR setting is optional. When the rate command has not been executed or the **fir** parameter is not explicitly specified, the default FIR (0) is assumed.

Fractional values are not allowed and the value must be given as a positive integer. The actual FIR used is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

FIR is only supported on FP4 hardware and is ignored when the related policy is applied to FP2- or FP3-based hardware.

**Values** 1 to 2000000000 kb/s, **max**

**Default** 0

### **police**

Specifies that traffic feeding into the queue instance above the specified rate is dropped.

configure qos queue-group-templates egress queue-group queue rate

## Description

This command defines the administrative PIR and the administrative CIR parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets out an egress port. Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by oversubscription factors or available egress bandwidth.

The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth. In-profile packets are preferentially queued by the system at egress and at subsequent next hop nodes where the packet can traverse. To be properly handled as in- or out-of-profile throughout the network, the packets must be marked accordingly for profiling at each hop.

The CIR can be used by the queue's parent commands *cir-level* and *cir-weight* parameters to define the amount of bandwidth considered to be committed for the child queue during bandwidth allocation by the parent scheduler.

The **rate** command can be executed at any time, altering the PIR and CIR for all queues created through the association of the egress queue group template with the *queue-id*.

When configured on an egress HSQ queue group queue, the **cir** keyword is ignored.

This command is ignored for egress HSQ queue group queues which are attached to an HS WRR group within an associated HS attachment policy. In this case, the configuration of the rate is performed under the **hs-wrr-group** within the SAP egress QoS policy.

The **no** form of this command returns all queues created with the *queue-id* by association with the QoS policy to the default PIR and CIR parameters (**max**, 0).

## Default

rate max cir 0

## Parameters

*pir-rate*

Defines the administrative PIR rate, in kilobits, for the queue. When the **rate** command is executed, a valid PIR setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed.

Fractional values are not allowed and must be given as a positive integer.

The actual PIR rate is dependent on the queue's **adaptation-rule** parameters and the actual hardware where the queue is provisioned.

**Values** 1 to 200000000 kb/s, **max**

**Default** max

#### ***cir-rate***

The **cir** parameter overrides the default administrative CIR used by the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed.

Fractional values are not allowed and must be given as a positive integer.

**Values** 0 to 200000000 kb/s, **max**

**Default** 0

### **Platforms**

All

## **rate**

### **Syntax**

**rate** *pir-rate* [**cir** *cir-rate*]

**no rate**

### **Context**

**[Tree]** (config>qos>scheduler-policy>tier>scheduler rate)

### **Full Context**

configure qos scheduler-policy tier scheduler rate

### **Description**

The **rate** command defines the maximum bandwidth that the scheduler can offer its child queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the amount of bandwidth to be considered during the parent scheduler's within-CIR distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs

or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler due to insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler will assume that an infinite amount of bandwidth is available and allow all child queues and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's PIR and CIR parameters to the value configured in the applied scheduler policy.

## Parameters

### **pir** *pir*

Specifies the PIR rate of the scheduler in kb/s or it can be set to the maximum using the **max** keyword.

**Values** 1 to 6400000000, **max**

**Default** max

### **cir** *cir*

Specifies the CIR rate of the scheduler in kb/s or it can be set to the maximum using the **max** keyword. The **sum** keyword can also be used, which sets the CIR to the sum of child CIR values.

**Values** 0 to 6400000000, **max**, **sum**

**Default** sum

configure qos shared-queue queue rate
```

## Description

This command defines the administrative PIR, the administrative CIR, and the administrative FIR parameters for the queue.

The PIR defines the percentage that the queue can transmit packets through the switch fabric (for ingress queues). Defining a PIR does not necessarily guarantee that the queue can transmit at the intended rate. The actual rate sustained by the queue can be limited by over-subscription factors or available bandwidth.

The CIR defines the percentage at which the system prioritizes the queue over other queues competing for the same bandwidth.

The **rate** command can be executed at any time, altering the PIR, CIR, and FIR for the queue created with the *queue-id*.

## Parameters

### *percent*

Defines the percentage of the FP ingress capacity for the max rate allowed for the queue. When the **rate** command is executed, a valid percent (PIR) setting must be explicitly defined. When the **rate** command has not been executed, the default PIR of **max** is assumed. Fractional values are not allowed and the value must be given as a positive integer.

**Values** 1 to 100, **max**

**Default** 100

#### ***cir percent***

Defines the percentage of the FP ingress capacity for the CIR allowed for the queue. When the **rate** command is executed, a CIR setting is optional. When the **rate** command has not been executed or the **cir** parameter is not explicitly specified, the default CIR (0) is assumed. Fractional values are not allowed and the value must be given as a positive integer.

**Values** 0 to 100, **max**

**Default** 0

#### ***fir percent***

Defines the percentage of the FP ingress capacity for the FIR allowed for the queue. When the **rate** command is executed, a FIR setting is optional. When the **rate** command has not been executed or the **fir** parameter is not explicitly specified, the default FIR (0) is assumed. Fractional values are not allowed and the value must be given as a positive integer. FIR is only supported on FP4 hardware and is ignored when the related policy is applied to FP2- or FP3-based hardware.

**Values** 0 to 100

**[Tree]** (config>service>cust>multi-service-site>ingress>sched-override>scheduler rate)

### Full Context

configure service customer multi-service-site egress scheduler-override scheduler rate

configure service customer multi-service-site ingress scheduler-override scheduler rate

### Description

This command overrides specific attributes of the specified scheduler rate.

The **rate** command defines the maximum bandwidth that the scheduler can offer its child policers, queues or schedulers. The maximum rate is limited to the amount of bandwidth the scheduler can receive from its parent scheduler. If the scheduler has no parent, the maximum rate is assumed to be the amount available to the scheduler. When a parent is associated with the scheduler, the CIR parameter provides the scheduler's amount of bandwidth to be considered during the parent schedulers 'within CIR' distribution phase.

The actual operating rate of the scheduler is limited by bandwidth constraints other than its maximum rate. The scheduler's parent scheduler may not have the available bandwidth to meet the scheduler's needs or the bandwidth available to the parent scheduler could be allocated to other child schedulers or child policers or queues on the parent based on higher priority. The children of the scheduler may not need the maximum rate available to the scheduler due to insufficient offered load or limits to their own maximum rates.

When a scheduler is defined without specifying a rate, the default rate is **max**. If the scheduler is a root scheduler (no parent defined), the default maximum rate must be changed to an explicit value. Without this explicit value, the scheduler will assume that an infinite amount of bandwidth is available and allow all child queues and schedulers to operate at their maximum rates.

The **no** form of this command returns the scheduler's to the PIR and CIR parameters to the value configured in the applied scheduler policy.

### Parameters

#### *pir-rate*

Specifies the PIR rate.

**Values** 1 to 6400000000, **max**

**Default** **max**

#### *cir-rate*

Specifies the CIR rate.

If the *cir-rate* is set to **max**, then the CIR rate is set to infinity. The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers, policers or queues.

**Values** 0 to 6400000000, **max**, **sum**

**Default** **sum**

### Full Context

configure system security dist-cpu-protection policy local-monitoring-policer rate

configure system security dist-cpu-protection policy protocol dynamic-parameters rate

### Description

This command configures the rate and burst tolerance for the policer in either a packet rate or a bit rate.

The actual hardware may not be able to perfectly rate limit to the exact configured parameters. In this case, the configured parameters will be adapted to the closest supported rate. The actual (operational) parameters can be seen in CLI, for example, **show service id 33 sap 1/1/3:33 dist-cpu-protection detail**.

If the *kilobits-per-second* parameter value is configured as max, then the policer is effectively disabled (always conforming).

If the *size* parameter value is configured as 0, then all packets are considered as nonconforming.

### Default

rate packets max within 1 initial-delay 0

### Parameters

#### **packets | kbps**

specifies that the rate is either in units of packets per interval or in units of kilobits per second. The packets option would typically be used for lower rates (for example, for per-subscriber DHCP rate limiting) while the kbps option would typically be used for higher rates (for example, per-interface BGP rate limiting).

#### ***ppi***

Specifies packets per interval.

**Values** 0 to 255, max  
 max = disable the policer (always conforming)  
 packets 0 = all packets considered nonconforming

#### ***seconds***

Specifies the length of the ppi rate measurement interval.

**Values** 1 to 32767

#### ***packets***

Specifies the number of packets allowed (even at line rate) in an initial burst (or a burst after the policer bucket has drained to zero) in addition to the normal *ppi*. This would typically be set to a value that is equal to the number of received packets in several full handshakes/negotiations of the particular protocol.

**Values** 0 to 255

***kilobits-per-second***

Specifies the kilobits per second.

**Values** 1 to 20000000, max

***size***

Specifies the tolerance for the kbps rate.

**Values** 0 to 4194304

**Default** 10

**bytes | kilobytes**

Specifies that the units of the mbs size parameter are either in bytes or kilobytes.

**Platforms**

All

**rate**

**Syntax**

**rate kbps** {*kilobits-per-second* | **max**} [**mbs** *size*] [**bytes** | **kilobytes**]

**rate packets** {*ppi* | **max**} **within** *seconds* [**initial-delay** *packets*]

**no rate**

**Context**

[\[Tree\]](#) (config>sys>security>dist-cpu-protection>policy>static-policer rate)

**Full Context**

configure system security dist-cpu-protection policy static-policer rate

**Description**

This command configures the rate and burst tolerance for the policer in either a packet rate or a bit rate.

The actual hardware may not be able to perfectly rate limit to the exact configured parameters. In this case, the configured parameters will be adapted to the closest supported rate. The actual (operational) parameters can be seen in CLI, for example, **show service id 33 sap 1/1/3:33 dist-cpu-protection detail**.

If the *kilobits-per-second* parameter value is configured as max, then the policer is effectively disabled (always conforming).

If the *size* parameter is configured as 0, then all packets are considered as nonconforming.

**Default**

rate packets max within 1 initial-delay 0

## Parameters

### packets | kbps

specifies that the rate is either in units of packets per interval or in units of kilobits per second. The packets option would typically be used for lower rates (for example, for per-subscriber DHCP rate limiting) while the kbps option would typically be used for higher rates (for example, per-interface BGP rate limiting).

### *ppi*

Specifies packets per interval.

**Values** 0 to 8000, max  
max = disable the policer (always conforming)  
packets 0 = all packets considered nonconforming

### *seconds*

Specifies the length of the ppi rate measurement interval.

**Values** 1 to 32767

### *packets*

Specifies the number of packets allowed (even at line rate) in an initial burst (or a burst after the policer bucket has drained to zero) in addition to the normal *ppi*. This would typically be set to a value that is equal to the number of received packets in several full handshakes/negotiations of the particular protocol.

**Values** 0 to 255

### *kilobits-per-second*

Specifies the kilobits per second.

**Values** 1 to 20000000, max

### *size*

Specifies the tolerance for the kbps rate.

**Values** 0 to 4194304

**Default** 10

### bytes | kilobytes

Specifies that the units of the mbs size parameter are either in bytes or kilobytes.

## Platforms

## 22.29 rate-adjustment

## rate-adjustment

### Syntax

**rate-adjustment** *adjusted-percent*

**no rate-adjustment**

### Context

**[Tree]** (config>subscr-mgmt>ancp>policy>egress rate-adjustment)

**[Tree]** (config>subscr-mgmt>ancp>policy>ingress rate-adjustment)

### Full Context

configure subscriber-mgmt ancp ancp-policy egress rate-adjustment

configure subscriber-mgmt ancp ancp-policy ingress rate-adjustment

### Description

This command configures a rate adjustment for the scheduler. The **rate-adjustment** command should be used when the rate returned by the DSLAM is calculated with different encapsulation than the 7450 ESS or 7750 SR. The node will adjust the rate by the percent specified as:

$DSLAM\_RATE * \text{adjust-rate} / 100$  — rate-reduction.

The **no** form of this command reverts to the default.

### Parameters

***adjusted-percent***

Specifies a rate adjustment for the scheduler.

**Values** 1 to 200

**Default** 100

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.30 rate-calc-min-int

### rate-calc-min-int

### Syntax

**rate-calc-min-int** [**fast-queue** *percent-of-default*] [**slow-queue** *percent-of-default*]

**no rate-calc-min-int**

## Context

[Tree] (config>card>virt-sched-adj rate-calc-min-int)

## Full Context

configure card virtual-scheduler-adjustment rate-calc-min-int

## Description

This command overrides the default minimum time that must elapse before a policer or queue's offered rate may be recalculated. A minimum time between offered rate calculations is enforced to both prevent inaccurate estimation of the offered rate and excessive input to the virtual scheduler process.

In order to smooth out rapidly fluctuating offered rates, the system averages the measured offered rate with a window of previously measured offered traffic statistics and knowledge of the time between the samples.

The window size is defined by the "rate calculation minimum interval" with offered traffic statistics being read at most four times within the window. Any previous measured offered statistics within the window are used in the averaging function. Note that if there are large numbers of samples required, for example when a large number of queues are running HCoS, then it may be that a time greater than the "rate calculation minimum interval" passes before another sample of the offered statistics can be taken for a queue. In this case, in order to calculate an offered rate, HCoS will always use two samples, the current and the previous. In this case, using a smaller **rate-calc-min-int** will have no effect on the responsiveness of HCoS to queue rate changes.

The system separates policers and queues into fast and slow categories and maintains a separate "rate calculation minimum interval" for each type. The default for each type are as follows:

Slow Queue: 1.0 seconds

Fast Queue: 0.25 seconds

The actual minimum rate calculation interval may be increased or decreased by using the fast-queue and/or slow-queue keywords (which are also applicable for policers managed by HCoS) followed by a percent value which is applied to the default interval. The default slow-queue threshold rate is 1 Mb/s. Once a policer or queue is categorized as slow, its rate must rise to 1.5 Mb/s before being categorized as a fast policer or queue. The categorization threshold may be modified by using the **slow-queue-threshold** command.

The **no** form of this command restores the default fast queue and slow queue minimum rate calculation interval.

## Default

no rate-calc-min-int

## Parameters

### *percent-of-default*

Specifies that the fast-queue percent-of-default parameter is optional and is used to modify the default minimum rate calculation time for "fast" queues. Defining 100.00 percent is equivalent to removing the override (restoring the default) on the fast queue minimum rate calculation time.

**Values** 0.01% to 1000.00%

**Default** 100.00%

***percent-of-default***

Specifies that the slow-queue percent-of-default parameter is optional and is used to modify the default minimum rate calculation time for "slow" queues. Defining 100.00 percent is equivalent to removing the override (restoring the default) on the slow queue minimum rate calculation time.

**Values** 0.01% to 1000.00%

**Default** 100.00%

All

**22.31 rate-down****rate-down****Syntax**

**rate-down** *rate*

**no rate-down**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp>host>access-loop-encapsulation rate-down)

**Full Context**

configure subscriber-mgmt local-user-db ppp host access-loop-encapsulation rate-down

**Description**

This command is applicable to LAC and LNS. It provides the last mile link rate in the downstream direction that is needed for proper shaping and calculating the interleaving delay.

The rate information in the last mile will be taken from the following sources in the order of priority:

- Statically provisioned value in local user database (LUDB).
- RADIUS.
- PPPoE tags on LAC or ICRQ message (RFC 5515) /ICCN message (TX Connect Seed) on LNS.

**Default**

no rate-down

**Parameters**

***rate***

Specifies the last mile link downstream rate in the access loop

**Values** 1 to 100000 kb/s

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

## 22.32 rate-limit

### rate-limit

#### Syntax

**rate-limit** *packets-per-second*

**no rate-limit**

#### Context

[\[Tree\]](#) (config>service>nat>syslog>syslog-export-policy rate-limit)

#### Full Context

configure service nat syslog syslog-export-policy rate-limit

#### Description

This command configures the maximum rate limit at which syslog messages are sent. Once the rate limit is exceeded, NAT flow logs will be buffered. Overload condition is characterized by exhaustion of this buffer space. This condition can occur due to imposed rate limit or the software speed limit. Once the buffer space is exhausted, new flow creation will be denied, and the teardown of the existing flows will be delayed until the buffer space becomes available.

The **no** form of the command removes the maximum rate limit from the configuration.

#### Parameters

***packets-per-second***

Specifies the packet rate limit in seconds.

**Values** 10 to 2147483647

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

### rate-limit

#### Syntax

**rate-limit** *value* [**kbps** | **pps**]

**rate-limit** *value* [**kbps** | **pps**] **extracted-traffic**  
**rate-limit** *value* [**kbps** | **pps**] **packet-length** {**lt** | **gt** | **eq**} *packet-length-value*  
**rate-limit** *value* [**kbps** | **pps**] **packet-length range** *packet-length-value* *packet-length-value*  
**rate-limit** *value* [**kbps** | **pps**] **pattern expression** *expression* **mask** *mask* **offset-type** *offset-type* **offset-value** *offset-value*  
**rate-limit** *value* [**kbps** | **pps**] **ttl** {**lt** | **gt** | **eq**} *tll-value*  
**rate-limit** *value* [**kbps** | **pps**] **ttl range** *tll-value* *tll-value*

## Context

[Tree] (config>filter>ip-filter>entry>action rate-limit)

## Full Context

configure filter ip-filter entry action rate-limit

## Description

This command configures the rate limit value for traffic matching this filter entry. Rate limit policers are configured with MBS equals CBS equals 10 ms of the rate and high-prio-only equals 0.

Traffic can also be rate limited based on extracted-traffic, packet-length, packet-length range, ttl, ttl range, or a pattern of conditional match criteria.

Packets that match the filter entry match criteria, but do not match the conditional match criteria value, are implicitly forwarded with no further match in the following filter entries.

For pattern match:

- the expression is left-aligned for the odd number bytes, for example, the expression 0xABC is programmed 0x0ABC in the line card
- the 'data' offset requires protocol UDP or TCP to be selected in the filter entry match criteria.

## Parameters

### *value*

Specifies the **rate-limit** *value* in kb/s (default) or packets per second (pps). A rate of 0 results in all traffic being dropped. A rate of **max** results in all traffic being forwarded.

**Values** 0 to 2000000000 kb/s, max  
0 to 100000000 pps, max

### **extracted-traffic**

Specifies rate-limit packets both extracted to the CPM and matching the filter entry match criteria.

### **packet-length**

Specifies rate-limit packets matching both the filter entry match criteria and the *packet-length value* defined in the **rate-limit** action statement. Packets matching the filter entry match criteria and not matching the *packet-length* value, as defined in the **rate-limit** action statement, are implicitly forwarded with no further match in the following filter entries.

- Values**
- lt** — Specifies "less than". The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.
  - gt** — Specifies "greater than". The **gt** parameter cannot be used with the highest possible numerical value for the parameter.
  - eq** — Specifies "equal to".

**packet-length-value**

Specifies the packet length value for the rate limit action.

- Values** 0 to 65535

**range**

Specifies an inclusive range. When **range** is used, the start of the range (the first value entered) must be smaller than the end of the range (the second value entered).

**expression**

Specifies the hexadecimal pattern to match; up to eight bytes.

- Values** 0x0000000000000001 to 0xffffffffffffff

**mask**

Specifies the mask for the pattern expression, up to eight bytes.

- Values** 0x0000000000000001 to 0xffffffffffffff

**offset-type**

Specifies the starting point reference for the offset-value of this pattern.

- Values** layer-3, layer-4, data, dns-qtype

**offset-value**

Specifies the offset value for the pattern expression. Dns-qtype supports offset value of 0.

- Values** 0 to 255

**ttl-value**

Specifies rate-limit packets matching both the filter entry match criteria and the TTL value defined in the *rate-limit* action statement. Packets matching the filter entry match criteria and not matching the TTL value, as defined in the *rate-limit* action statement, are implicitly forwarded with no further match in the following filter entries.

- Values** 0 to 255

**Platforms**

All

## rate-limit

### Syntax

**rate-limit** *value*

### Context

[Tree] (config>filter>mac-filter>entry>action rate-limit)

### Full Context

configure filter mac-filter entry action rate-limit

### Description

This command sets the rate limit for the traffic matching both the filter entry match criteria and the *packet-length-value* defined in the **rate-limit action** statement.

Packets matching the filter entry match criteria and not matching the *packet-length-value* defined in the **rate-limit action** statement are implicitly forwarded with no further match in subsequent filter entries.

Rate limit packets matching both the filter entry match criteria and the *tll-value* are defined in the **action rate-limit** statement.

Packets matching the filter entry match criteria and not matching the *tll-value* defined in the **rate-limit action** statement are implicitly forwarded with no further match in the following filter entries.

### Parameters

*value*

Specifies the **rate-limit value** in kb/s. A rate of 0 results in all traffic being dropped. A rate of **max** results in all traffic being forwarded.

**Values** 0 to 20000000000 kb/s | max

### Platforms

## Context

[\[Tree\]](#) (config>filter>ipv6-filter>entry>action rate-limit)

## Full Context

configure filter ipv6-filter entry action rate-limit

## Description

This command configures the rate limit value for traffic matching this filter entry.

Traffic can also be rate-limited based on extracted-traffic, payload-length, payload-length range, hop-limit, hop-limit range, or a pattern of conditional match criteria.

Packets that match the filter entry match criteria, but do not match the conditional match criteria value, are implicitly forwarded with no further match in the following filter entries.

For pattern match:

- the expression is left-aligned for the odd number bytes, for example, the expression 0xABC is programmed 0x0ABC in the line card.
- the 'data' offset requires protocol UDP or TCP to be selected in the filter entry match criteria.

## Parameters

### *value*

Specifies the **rate-limit value** in kb/s (default) or packets per second (pps). A rate of 0 results in all traffic being dropped. A rate of **max** results in all traffic being forwarded.

**Values** 0 to 2000000000 kb/s, max  
0 to 100000000 pps, max

### **extracted-traffic**

Specifies packets extracted to the CPM.

### **hop-limit**

Specifies the hop limit value for the rate limit action.

**Values** **lt** — Specifies "less than". The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.  
**gt** — Specifies "greater than". The **gt** parameter cannot be used with the highest possible numerical value for the parameter.  
**eq** — Specifies "equal to".

### *hop-limit-value*

Specifies the hop limit value for the rate limit action.

**Values** 0 to 255

### **range**

Specifies an inclusive range. When the **range** parameter is used, the start of the range (the first value entered) must be smaller than the end of the range (the second value entered).

### *expression*

Specifies the hexadecimal pattern to match; up to eight bytes.

**Values** 0x0000000000000001 to 0xffffffffffff

#### ***mask***

Specifies the mask for the pattern expression, up to eight bytes.

**Values** 0x0000000000000001 to 0xffffffffffff

#### ***offset-type***

Specifies the starting point reference for the offset-value of this pattern.

**Values** layer-3, layer-4, data, dns-qtype

#### ***offset-value***

Specifies the offset value for the pattern expression. Dns-qtype supports offset value of 0.

**Values** 0 to 255

#### ***payload-length***

Specifies rate-limit packets matching both the filter entry match criteria and the *payload-length-value* defined in the **rate-limit** action statement. Packets matching the filter entry match criteria and not matching the *payload-length-value*, as defined in the **rate-limit** action statement, are implicitly forwarded with no further match in the following filter entries.

**Values** **lt** — Specifies "less than". The **lt** parameter cannot be used with the lowest possible numerical value for the parameter.  
**gt** — Specifies "greater than". The **gt** parameter cannot be used with the highest possible numerical value for the parameter.  
**eq** — Specifies "equal to".

#### ***payload-length-value***

Specifies the payload length value for the rate limit action.

**Values** 0 to 65535

### Full Context

configure subscriber-mgmt ancp ancp-policy egress rate-monitor

configure subscriber-mgmt ancp ancp-policy ingress rate-monitor

## Description

This command configures the rate monitor level.

The **no** form of this command removes the value from the configuration.

## Parameters

### *kilobit-per-second*

Specifies the rate below which the system generates an event.

**Values** 0 to 4294967295

### **alarm**

When the monitored rate is below the configured value the system generates an alarm (trap) to the management system. The trap includes the rate as well as the ANCP policy name and the ANCP string.

## Platforms

## 22.35 rate-percentage

### rate-percentage

## Syntax

**rate-percentage** *rate-percentage*

**no rate-percentage**

## Context

[\[Tree\]](#) (config>app-assure>group>policer rate-percentage)

## Full Context

configure application-assurance group policer rate-percentage

## Description

This command indirectly configures the rate used by Access-Network-Location (ANL) policers. Because ANL total bandwidth is dynamically measured and estimated by AA, this command allows the operator to configure the ratio of that measured bandwidth to be used by the ANL policer as the policer rate.

The **no** form of this command resets the values to defaults.

## Default

no rate-percentage

## Parameters

### *rate-percentage*

Specifies an integer value that specifies a percentage that is applied against the ANL estimate maximum bandwidth to produce the actual rate that is used by the policer when ANL congestion occurs.

**Values** 0 to 200 (0: means drop all traffic)

**Default** 0

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.36 rate-percentage-stage2

### rate-percentage-stage2

## Syntax

**rate-percentage-stage2** *rate-percentage*

**no rate-percentage-stage2**

## Context

**[Tree]** (config>app-assure>group>policer rate-percentage-stage2)

## Full Context

configure application-assurance group policer rate-percentage-stage2

## Description

This command indirectly configures the rate used by Access-Network-Location (ANL) policers. Because ANL stage2 total bandwidth is dynamically measured and estimated by AA, this command allows the operator to configure the ratio of that measured bandwidth to be used by the ANL stage2 policer as the policer rate.

The **no** form of this command reverts to the default.

## Parameters

### *rate-percentage*

Specifies an integer value that specifies a percentage that is applied to the ANL estimated maximum bandwidth to produce the actual rate that is used by the policer when ANL stage2 congestion occurs. A value of 0 means that all traffic is dropped.

**Values** 0 to 200

**Default** 0

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.37 rate-reduction

### rate-reduction

#### Syntax

**rate-reduction** *kilobit-per-second*

**no rate-reduction**

#### Context

**[Tree]** (config>subscr-mgmt>ancp>policy>egress rate-reduction)

**[Tree]** (config>subscr-mgmt>ancp>policy>ingress rate-reduction)

#### Full Context

configure subscriber-mgmt ancp ancp-policy egress rate-reduction

configure subscriber-mgmt ancp ancp-policy ingress rate-reduction

#### Description

This command defines a constant rate reduction to the rate specified by the DSLAM. The **rate-reduction** command should be used if the node should adjust the rate to a value that is offset (for example by a fixed multicast dedicated bandwidth) compared to the total available on the DSLAM.

When set, the rate is:

$DSLAM\_RATE * \text{adjust-rate} / 100$  — **rate-reduction**

The **no** form of this command removes the value from the configuration.

#### Parameters

***kilobits-per-second***

Specifies the rate reduction to be applied for this subscriber.

**Values** 0 to 4294967295

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**rate-thresholds high** *high-percentage* **low** *low-percentage*

**no rate-thresholds**

### Context

**[Tree]** (config>subscr-mgmt>sla-profile>egress>bonding-selection rate-thresholds)

### Full Context

configure subscriber-mgmt sla-profile egress bonding-selection rate-thresholds

### Description

This command configures the rate thresholds that are required before decreasing or increasing the preferred link's weight with the specified change percentage.

The low threshold value must be lower than the high threshold value.

The **no** form of this command reverts to the default.

### Default

rate-thresholds high 90 low 80

### Parameters

#### ***high-percentage***

Specifies the high threshold, as a percentage of the reference rate.

**Values** 56 to 99

#### ***low-percentage***

Specifies the low threshold, as a percentage of the reference rate.

**Values** 55 to 98

## 22.41 rd

**rd**

### Syntax

```
rd file-url rf
rd file-url [force]
```

### Context

[\[Tree\]](#) (file rd)

### Full Context

file rd

### Description

If the directory is empty, the **rd** command is used to remove it. The **force** option executes the command without prompting the user to confirm the action.

If the directory contains files and/or subdirectories, the **rf** parameter must be used to remove the directory.

Example:

```
A:nE1>file cf1:\ # rd test
Are you sure (y/n)? y
Deleting directory cf1:\test .MINOR: CLI Cannot delete cf1:\test.
A:nE1>file cf1:\ # rd test force
Deleting directory cf1:\test .MINOR: CLI Cannot delete cf1:\test.

A:nE1>file cf1:\ # rd testbase rf
Deleting all subdirectories and files in specified directory. y/n ?y
Deleting directory cf1:\testbase\testbase1 ..OK
Deleting directory cf1:\test .OK
```

### Parameters

#### *file-url*

Specifies the directory to be removed.

#### Values

local-url	[ <i>cflash-id</i> ]/[ <i>file-path</i> ] up to 200 characters, including <i>cflash-id</i> directory length up to 99 each
remote-url	[{ftp://   tftp://}login:pswd@remote-locn/][ <i>file-path</i> ] up to 247 characters directory length up to 99 characters each
<i>remote-locn</i>	[hostname   ipv4-address   [ipv6-address]]

<i>ipv4-address</i>	<i>a.b.c.d</i>
<i>ipv6-address</i>	<i>x:x:x:x:x:x:x[-interface]</i> <i>x:x:x:x:x:x:d.d.d.d[-interface]</i> <i>x</i> - [0 to FFFF]H <i>d</i> - [0 to 255]D interface - up to 32 characters, for link local addresses 255
<i>cflash-id</i>	cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

**rf**

Forces a recursive delete.

**force**

Forces an immediate deletion of the specified directory. The **rd file-url force** command executes the command without displaying a user prompt message.

**Platforms**

All

## 22.42 rd-entry

### rd-entry

**Syntax**

**rd-entry** *rd*

**no rd-entry** *rd*

**Context**

[\[Tree\]](#) (config>router>policy-options>route-distinguisher-list rd-entry)

**Full Context**

configure router policy-options route-distinguisher-list rd-entry

**Description**

This command creates a route distinguisher (RD) entry in the RD list, containing an IPv4 address or ASN and the assigned number.

The **no** form of the command deletes the RD entry from the list.

## Parameters

*rd*

Specifies a route distinguisher matching an entry in one of the following formats:

- *a.b.c.d/m:\** – RD in IPv4 format with a wildcard character (such as 10.0.0.0/16:\*)
- *a.b.c.d/m:n* – RD in IPv4 format with a specific number (such as 10.0.0.2/32:535)
- *asn:\** – RD in ASN format with a wildcard character (such as 65000:\*)
- *asn:n* – RD in ASN format with a specific number (such as 65000:535)

See the "Route distinguishers" section of the *7450 ESS, 7750 SR, 7950 XRS, and VSR Layer 3 Services Guide: IES and VPRN* for information about Type values.

## 22.43 rdi-alarms

### rdi-alarms

#### Syntax

**rdi-alarms** [**suppress** | **circuit**]

#### Context

[\[Tree\]](#) (config>port>aps rdi-alarms)

#### Full Context

configure port aps rdi-alarms

#### Description

This command configures how RDI alarms (line, path, section) are generated on physical circuits of an APS ports. The command configuration changes are supported only for switching-mode set to uni\_1plus1. The configuration can be changed only when no working and protecting circuit has been added. Options:

- **circuit**—RDI alarms are H/W-generated independently on each working and protect circuit based on RX failure of that circuit regardless of APS line status.
- **suppress**—RDI H/W generation on working and protect circuits is suppressed. No alarms are generated on RX failure of that circuit.

#### Default

rdi-alarms circuit

#### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 22.44 rdns-lifetime

### rdns-lifetime

#### Syntax

**rdns-lifetime** *seconds*

**rdns-lifetime** *infinite*

**no rdns-lifetime**

#### Context

**[Tree]** (config>service>vprn>sub-if>grp-if>ipv6 rdns-lifetime)

**[Tree]** (config>service>ies>sub-if>ipv6>rtr-adv rdns-lifetime)

**[Tree]** (config>subscr-mgmt>rtr-adv-plcy>dns-opt rdns-lifetime)

**[Tree]** (config>service>ies>sub-if>grp-if>ipv6 rdns-lifetime)

**[Tree]** (config>service>vprn>sub-if>ipv6>rtr-adv rdns-lifetime)

#### Full Context

configure service vprn subscriber-interface group-interface ipv6 rdns-lifetime

configure service ies subscriber-interface ipv6 rtr-adv rdns-lifetime

configure subscriber-mgmt router-advertisement-policy dns-options rdns-lifetime

configure service ies subscriber-interface group-interface ipv6 rdns-lifetime

configure service vprn subscriber-interface ipv6 rtr-adv rdns-lifetime

#### Description

This command configures the maximum time that the RDNS address may be used for name resolution.

The **no** form of this command returns the command to the default setting.

#### Default

rdns-lifetime 3600

#### Parameters

##### *seconds*

Specifies the time, in seconds, that the RDNS address is valid for this route.

**Values** 900 to 3600

##### *infinite*

Specifies that the RDNS address can be used permanently.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## rdnss-lifetime

### Syntax

**rdnss-lifetime** *seconds*

**rdnss-lifetime** **infinite**

**no rdnss-lifetime**

### Context

**[Tree]** (config>service>vprn>sub-if>ipv6>rtr-adv>dns-opt rdnss-lifetime)

**[Tree]** (config>service>vprn>sub-if>grp-if>ipv6>rtr-adv>dns-opt rdnss-lifetime)

**[Tree]** (config>service>ies>sub-if>ipv6>rtr-adv>dns-opt rdnss-lifetime)

### Full Context

configure service vprn subscriber-interface ipv6 router-advertisements dns-options rdnss-lifetime

configure service vprn subscriber-interface group-interface ipv6 router-advertisements dns-options rdnss-lifetime

configure service ies subscriber-interface group-interface ipv6 router-advertisements dns-options rdnss-lifetime

configure service ies subscriber-interface ipv6 router-advertisements dns-options rdnss-lifetime

### Description

This command configures the maximum time that the RDNSS address may be used for name resolution.

The **no** form of this command reverts to the default.

### Default

rdnss-lifetime 3600

### Parameters

#### *seconds*

Specifies the time, in seconds, that the RDNSS address is valid for this route.

**Values** 900 to 3600

#### **infinite**

The RDNSS address can be used permanently.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## rdnss-lifetime

### Syntax

**rdnss-lifetime** {*seconds* | *infinite*}

**no rdnss-lifetime**

### Context

**[Tree]** (config>service>vprn>router-advert>if>dns-options rdnss-lifetime)

**[Tree]** (config>service>vprn>router-advert>dns-options rdnss-lifetime)

### Full Context

configure service vprn router-advertisement interface dns-options rdnss-lifetime

configure service vprn router-advertisement dns-options rdnss-lifetime

### Description

This command specifies the maximum time that the RDNSS address may be used for name resolution by the client. The RDNSS Lifetime must be no more than twice MaxRtrAdvLifetime with a maximum of 3600 seconds.

### Default

rdnss-lifetime infinite

### Parameters

#### *infinite*

Specifies an infinite RDNSS lifetime.

#### *seconds*

Specifies the time in seconds.

**Values** 4to 3600

### Platforms

All

## rdnss-lifetime

### Syntax

**rdnss-lifetime** *seconds*

**rdnss-lifetime** *infinite*

**no rdnss-lifetime**

## Context

[\[Tree\]](#) (config>router>router-advert>dns-opt rdns-lifetime)

[\[Tree\]](#) (config>router>router-advert>if>dns-opt rdns-lifetime)

## Full Context

configure router router-advertisement dns-options rdns-lifetime

configure router router-advertisement interface dns-options rdns-lifetime

## Description

This command specifies the maximum time that the RDNSS address may be used for name resolution by the client.

## Default

rdns-lifetime infinite

## Parameters

### *seconds*

Specifies the time in seconds.

**Values** 4 to 3600

### *infinite*

Specifies an infinite RDNSS lifetime.

## Platforms

All

## 22.45 re-auth-period

re-auth-period

## Syntax

**re-auth-period** *seconds*

**no re-auth-period**

## Context

[\[Tree\]](#) (config>port>ethernet>dot1x re-auth-period)

## Full Context

configure port ethernet dot1x re-auth-period

## Description

This command configures the period after which re-authentication is performed. This value is only relevant if **re-authentication** is enabled.

The **no** form of this command returns the value to the default.

## Default

re-auth-period 3600

## Parameters

### *seconds*

Specifies the re-authentication delay period in seconds.

**Values** 1 to 9000

## Platforms

All

## 22.46 re-authentication

### re-authentication

## Syntax

[no] re-authentication

## Context

[\[Tree\]](#) (config>subscr-mgmt>auth-policy re-authentication)

## Full Context

configure subscriber-mgmt authentication-policy re-authentication

## Description

This command enables authentication process at every DHCP address lease renewal s only if RADIUS did not reply any special attributes (for example, authentication only, no authorization).

The **no** form of this command reverts to the default value.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## re-authentication

### Syntax

[no] re-authentication

### Context

[\[Tree\]](#) (config>port>ethernet>dot1x re-authentication)

### Full Context

configure port ethernet dot1x re-authentication

### Description

This command enables/disables periodic 802.1x re-authentication.

When **re-authentication** is enabled, the router re-authenticates clients on the port every **re-auth-period**.

The **no** form of this command returns the value to the default.

### Default

no re-authentication

### Platforms

All

## 22.47 re-establish-session

## re-establish-session

### Syntax

re-establish-session padr

no re-establish-session

### Context

[\[Tree\]](#) (config>subscr-mgmt>ppp-policy re-establish-session)

### Full Context

configure subscriber-mgmt ppp-policy re-establish-session

### Description

This command enables host to reconnect and override existing session.

If disabled and a subscriber abruptly terminates a PPP sessions without sending a PADT to the BNG, the BNG denies any reconnect attempts until the stale PPP session has expired. With this, enabled re-establish-session eliminates the waiting period by allowing immediate PPP reconnection attempts.

The **no** form of this command reverts to the default.

### Parameters

#### **padr**

Specifies that the existing session will be deleted upon reception of the PPPoE Active Discovery Request (PADR).

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.48 reachable-time

### reachable-time

#### Syntax

**reachable-time** *milli-seconds*

**no reachable-time**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>rtr-adv-plcy reachable-time)

#### Full Context

configure subscriber-mgmt router-advertisement-policy reachable-time

#### Description

This command configures the reachable time for advertisements.

The **no** form of this command returns the command to the default setting.

#### Default

reachable-time 0

#### Parameters

##### ***milli-seconds***

Specifies the time, in milliseconds, for the reachable time.

**Values** 0 to 3600000

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## reachable-time

### Syntax

**reachable-time** *milli-seconds*

**no reachable-time**

### Context

**[Tree]** (config>router>router-advert>if reachable-time)

**[Tree]** (config>service>vprn>router-advert>if reachable-time)

**[Tree]** (config>service>vprn>sub-if>grp-if>ipv6>rtr-adv reachable-time)

**[Tree]** (config>service>vprn>sub-if>ipv6>rtr-adv reachable-time)

**[Tree]** (config>service>ies>sub-if>grp-if>ipv6>rtr-adv reachable-time)

**[Tree]** (config>service>ies>sub-if>ipv6>rtr-adv reachable-time)

### Full Context

configure router router-advertisement interface reachable-time

configure service vprn router-advertisement interface reachable-time

configure service vprn subscriber-interface group-interface ipv6 router-advertisements reachable-time

configure service vprn subscriber-interface ipv6 router-advertisements reachable-time

configure service ies subscriber-interface group-interface ipv6 router-advertisements reachable-time

configure service ies subscriber-interface ipv6 router-advertisements reachable-time

### Description

This command configures how long this router should be considered reachable by other nodes on the link after receiving a reachability confirmation.

The configured value is placed in the reachable time field in router advertisement messages sent from this interface.

The **no** form of this command reverts to the default.

### Default

reachable-time 0

### Parameters

***milli-seconds***

Specifies the reachable time, in seconds, for advertisements from this interface.

**Values** 0 to 3600000

## Platforms

All

- configure router router-advertisement interface reachable-time
- configure service vprn router-advertisement interface reachable-time

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn subscriber-interface ipv6 router-advertisements reachable-time
- configure service ies subscriber-interface group-interface ipv6 router-advertisements reachable-time

## reachable-time

### Syntax

**reachable-time** *seconds*

**no reachable-time**

### Context

[\[Tree\]](#) (config>service>vprn>if>ipv6 reachable-time)

[\[Tree\]](#) (config>service>vprn>ipv6 reachable-time)

### Full Context

configure service vprn interface ipv6 reachable-time

configure service vprn ipv6 reachable-time

### Description

This command configures how long this router should be considered reachable by other nodes on the link after receiving a reachability confirmation.

### Default

no reachable-time

### Parameters

***seconds***

Specifies the length of time, in seconds the router should be considered reachable.

**Values** 30 to 3600

## Platforms

All

## reachable-time

### Syntax

**reachable-time** *milliseconds*

**no reachable-time**

### Context

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>ipv6>router-ad reachable-time)

### Full Context

configure service ies subscriber-interface group-interface ipv6 router-ad reachable-time

### Description

This command configures how long this router should be considered reachable by other nodes on the link after receiving a reachability confirmation.

### Parameters

*milliseconds*

Specifies the length of time the router should be considered reachable for default router selection.

**Values** 0 to 3600000

## reachable-time

### Syntax

**reachable-time** *seconds*

**no reachable-time**

### Context

[\[Tree\]](#) (config>router>ipv6 reachable-time)

### Full Context

configure router ipv6 reachable-time

### Description

This command configures the neighbor reachability detection timer.

The **no** form of this command reverts to the default value.

### Default

reachable-time 30

## Parameters

### *seconds*

Specifies the length of time the router should be considered reachable.

**Values** 30 to 3600

## Platforms

All

## reachable-time

## Syntax

**reachable-time** *seconds*

**no reachable-time**

## Context

[\[Tree\]](#) (config>router>if>ipv6 reachable-time)

## 22.49 reactivation-failure-threshold

## reactivation-failure-threshold

### Syntax

**reactivation-failure-threshold** *number*

**no reactivation-failure-threshold**

### Context

**[Tree]** (config>test-oam>icmp>ping-template reactivation-failure-threshold)

### Full Context

configure test-oam icmp ping-template reactivation-failure-threshold

### Description

This command configures the number of consecutive failures, without previous successes, that must occur transmitting at the reactivation-interval (recovering phase) level before changing to the standard interval and subsequently waiting for the first success.

The **no** form of this command reverts to the default value.

### Default

reactivation-failure-threshold 4

### Parameters

*number*

Specifies the number of consecutive failures without previous successes.

**Values** 1 to 10

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.50 reactivation-interval

## reactivation-interval

### Syntax

**reactivation-interval** *seconds*

**no reactivation-interval**

### Context

**[Tree]** (config>test-oam>icmp>ping-template reactivation-interval)

## Full Context

```
configure test-oam icmp ping-template reactivation-interval
```

## Description

This command configures the packet transmit interval used when the IP interface is operationally down because of a ping template failure and the previous ICMP echo request successfully received a response, recovering phase.

The **no** form of this command reverts to the default value.

## Default

```
reactivation-interval 1
```

## Parameters

### *seconds*

Specifies the packet transmit interval used when IP interface is operational down

**Values** 1 to 60

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.51 reactivation-threshold

### reactivation-threshold

## Syntax

```
reactivation-threshold number
```

```
no reactivation-threshold
```

## Context

[\[Tree\]](#) (config>test-oam>icmp>ping-template reactivation-threshold)

## Full Context

```
configure test-oam icmp ping-template reactivation-threshold
```

## Description

This command configures the count, when reached, that causes the transition of the IP interface from operationally down to operationally up because of a ping template failure. This is used in the recovering phase.

The **no** form of this command reverts to the default value.

## Default

reactivation-threshold 3

## Parameters

### *number*

Specifies a count that causes the transition of the IP interface from operationally up to operationally down because of ping-template failure.

**Values** 1 to 10

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.52 reactivation-timeout

### reactivation-timeout

## Syntax

**reactivation-timeout** *seconds*

**no reactivation-timeout**

## Context

[\[Tree\]](#) (config>test-oam>icmp>ping-template reactivation-timeout)

## Full Context

configure test-oam icmp ping-template reactivation-timeout

## Description

This command configures the time that the function waits before declaring the packet as lost. This is the timer used to time out the **reactivation-interval** transmitted packets. The **reactivation-timeout** value can be equal to or lower than the **reactivation-interval** value but not higher.

The **no** form of this command reverts to the default value.

## Default

reactivation-timeout 1

## Parameters

### *seconds*

Specifies the wait time, in seconds, before declaring the packet is lost.

**Values** 1 to 60

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.53 read-algorithm

### read-algorithm

#### Syntax

```
read-algorithm {hash | hash2 | custom| all-hash}
```

```
no read-algorithm
```

#### Context

[\[Tree\]](#) (config>system>security>management-interface>classic-cli read-algorithm)

#### Full Context

```
configure system security management-interface classic-cli read-algorithm
```

#### Description

This command specifies how encrypted configuration secrets are interpreted, and which encryption types are accepted, when secrets are input into the system or read from a configuration file (for example at system bootup time).

The **no** form of this command reverts to the default value.

#### Default

```
read-algorithm all-hash
```

#### Parameters

##### hash

Specifies hash. Use this option to transport a phrase between modules and nodes. In this case the write-algorithm should be **hash** as well.

##### hash2

Specifies hash2 which is module-specific.

##### custom

Specifies the custom encryption to management interface.

##### all-hash

Specifies that the system accepts hash or hash2.

#### Platforms

All

## 22.54 reassemble

### reassemble

#### Syntax

**reassemble**

#### Context

[\[Tree\]](#) (config>filter>ip-filter>entry>action reassemble)

#### Full Context

configure filter ip-filter entry action reassemble

#### Description

This command sets the filter entry action to reassemble.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.55 reassembly

### reassembly

#### Syntax

**reassembly** [*wait-msecs*]

**no reassembly**

#### Context

[\[Tree\]](#) (config>service>ies>if>sap>ip-tunnel reassembly)

[\[Tree\]](#) (config>service>vprn>if>sap>ip-tunnel reassembly)

#### Full Context

configure service ies interface sap ip-tunnel reassembly

configure service vprn interface sap ip-tunnel reassembly

#### Description

This command configures the maximum number of seconds to wait to receive all fragments of a particular IPsec or GRE packet for reassembly.

The **no** form of this commands removes the wait time from the configuration.

### Default

no reassembly

### Parameters

#### *wait-msecs*

Specifies the reassembly wait time in 100 increments.

**Values** 1 to 5000 ms

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## reassembly

### Syntax

**reassembly** [*wait-msecs*]

**no reassembly**

### Context

[\[Tree\]](#) (config>isa>tunnel-group reassembly)

[\[Tree\]](#) (config>service>vprn>if>sap>gre-tunnel reassembly)

[\[Tree\]](#) (config>service>ies>if>sap>gre-tunnel reassembly)

### Full Context

configure isa tunnel-group reassembly

configure service vprn interface sap gre-tunnel reassembly

configure service ies interface sap gre-tunnel reassembly

### Description

This command configures IP packet reassembly for IPsec and GRE tunnels supported by an MS-ISA. The **reassembly** command at the tunnel-group level configures IP packet reassembly for all IPsec and GRE tunnels associated with the tunnel-group. The **reassembly** command at the GRE tunnel level configures IP packet reassembly for that one specific GRE tunnel, overriding the tunnel-group configuration.

The **no** form of this command disables IP packet reassembly.

### Default

no reassembly (tunnel-group level)

reassembly (gre-tunnel level)

## Parameters

### *wait*

Specifies the maximum number of milliseconds that the ISA tunnel application will wait to receive all fragments of a particular IPsec or GRE packet. If one or more fragments are still missing when this limit is reached the partially reassembled datagram is discarded and an ICMP time exceeded message is sent to the source host (if allowed by the ICMP configuration of the sending interface). Internally, the configured value is rounded up to the nearest multiple of 100 ms.

**Values** 1 to 5000

**Default** 2000 (tunnel-group level)

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## reassemble

### Syntax

[no] reassemble

### Context

[\[Tree\]](#) (config>router>nat>inside>dual-stack-lit>address reassemble)

### Full Context

configure router nat inside dual-stack-lit address reassemble

### Description

This command enables reassembly of fragmented frames for DS-Lite. Reassembly is enabled in the upstream direction per AFTR address.

The **no** form of the command disables the reassembly.

## 22.56 reassembly-group

## reassemble-group

### Syntax

**reassemble-group** *nat-group-id* [**to-base-network**]

**no reassemble-group**

**Context**

**[Tree]** (config>service>vprn reassembly-group)

**[Tree]** (config>router reassembly-group)

**Full Context**

configure service vprn reassembly-group

configure router reassembly-group

**Description**

This command associates a reassembly-group consisting of multiple ISAs with the routing context in which the application requiring reassembly service resides.

**Default**

no reassembly-group

**Parameters*****nat-group-id***

Specifies the NAT group ID; the NAT group contains up to 10 active ISAs.

**Values** 1 to 4

***to-base-network***

Enables the reassembly context to use network interfaces in the base routing context.

**Platforms**

All

## 22.57 reassembly-timeout

### reassembly-timeout

**Syntax**

**reassembly-timeout** {*timeout*}

**no reassembly-timeout**

**Context**

**[Tree]** (config>router>l2tp>group>mlppp reassembly-timeout)

**[Tree]** (config>service>vprn>l2tp>group>tunnel>mlppp reassembly-timeout)

**[Tree]** (config>router>l2tp>group>tunnel>mlppp reassembly-timeout)

**[Tree]** (config>service>vprn>l2tp>group>mlppp reassembly-timeout)

## Full Context

```
configure router l2tp group mlppp reassembly-timeout
configure service vprn l2tp group tunnel mlppp reassembly-timeout
configure router l2tp group tunnel mlppp reassembly-timeout
configure service vprn l2tp group mlppp reassembly-timeout
```

## Description

This command is applicable only to LNS. It determines the time during which the LNS keeps fragments of the same packet in the buffer before it discards them. The assumption is that if the fragments do not arrive within certain time, the chance is that they were lost somewhere in the network. In this case the partial packet cannot be reassembled and all fragments that has arrived up to this point and are stored in the buffer IS discarded to free up the buffer. Otherwise, a condition arises in which partial packets are held in the buffer until the buffer is exhausted.

The configuration under the tunnel hierarchy overrides the configuration under the group hierarchy.

The **no** form of this command reverts to the default.

## Default

```
reassembly-timeout 1000
```

## Parameters

### *timeout*

Specifies the reassembly timeout value.

**Values** 100, 1000 milliseconds

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

## 22.58 rebind-timer

configure router dhcp6 local-dhcp-server pool prefix rebind-timer

configure service vprn dhcp6 defaults rebind-timer

configure router dhcp6 local-dhcp-server defaults rebind-timer

configure service ies subscriber-interface group-interface ipv6 dhcp6 proxy-server rebind-timer

configure subscriber-mgmt local-user-db ppp host ipv6-lease-times rebind-timer

## Description

This command configures the lease rebind timer (T2) via LUDB.

The T2 time is the time at which the client contacts any available addressing authority to extend the lifetimes of DHCPv6 leases. T2 is a time duration relative to the current time expressed in units of seconds.

The IP addressing authority controls the time at which the client contacts the addressing authority to extend the lifetimes on assigned addresses/prefixes through the T1 and T2 parameters assigned to an IA. At time T1 for an IA, the client initiates a Renew/Reply message exchange to extend the lifetimes on any addresses in the IA. The client includes an IA option with all addresses/prefixes currently assigned to the IA in its Renew message. Recommended values for T1 and T2 are .5 and .8 times the shortest preferred lifetime of the addresses/prefixes in the IA that the addressing authority is willing to extend, respectively.

The configured rebind timer should always be longer than or equal to the renew timer.

The T1 and T2 are carried in the IPv6 address option that is within the IA.

The **no** form of this command reverts to the default.

## Default

rebind-timer min 48

## Parameters

### *rebind-timer*

Specifies the preferred lifetime.

Values		
<b>days</b> <i>days</i>		0 to 14
<b>hrs</b> <i>hours</i>		0 to 23
<b>min</b> <i>minutes</i>		0 to 59

**sec seconds** 0 to 9

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure router dhcp6 local-dhcp-server pool prefix rebind-timer
- configure service vprn subscriber-interface group-interface ipv6 dhcp6 proxy-server rebind-timer
- configure service ies subscriber-interface group-interface ipv6 dhcp6 proxy-server rebind-timer
- configure service vprn dhcp6 local-dhcp-server pool prefix rebind-timer
- configure subscriber-mgmt local-user-db ppp host ipv6-lease-times rebind-timer
- configure subscriber-mgmt local-user-db ipoe host ipv6-lease-times rebind-timer

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure router dhcp6 local-dhcp-server defaults rebind-timer

## 22.59 reboot

reboot

### Syntax

**reboot** [**active** | **standby** | **upgrade**] [**now**]

### Context

[\[Tree\]](#) (admin reboot)

### Full Context

admin reboot

### Description

This command reboots the router or one CPM and can also be used to force an upgrade of the system boot ROMs.

If no options are specified, the user is prompted to confirm the reboot operation. Answering yes (y) will result in both CPMs and all IOMs rebooting.

```
ALA-1>admin# reboot
Are you sure you want to reboot (y/n)?
```

### Parameters

**active**

Reboots the active CPM.

**Default** active

### standby

Reboots the standby CPM.

**Default** active

### upgrade

Forces card firmware to be upgraded during chassis reboot. This option should only be used if it has been indicated as required in the Release Notes or by Nokia technical support. Normally, the SR-series router OS automatically performs firmware upgrades on CPMs and XCM/IOM cards without the need for the **upgrade** keyword.

When the **upgrade** keyword is specified, a chassis flag is set for the BOOT Loader (boot.ldr) and on the subsequent boot of the OS on the chassis, firmware images on CPMs, XCMs, and IOMs will be upgraded automatically.

Firmware on CPMs, XCMs, or IOMs that are installed in a running chassis will be upgraded automatically. For example, if a card is inserted as the result of a hot swap, and the card has a firmware version that is no longer compatible with the SR OS image running on the chassis, then the firmware on the card will be automatically upgraded before the card is brought online.

If the card firmware is upgraded, a chassis cardUpgraded (event 2032) log event is generated. The corresponding SNMP trap for this log event is tmnxEqCardFirmwareUpgraded.

During any firmware upgrade, automatic or manual, it is imperative that during the upgrade procedure:

- Power must not be switched off or interrupted.
- The system must not be reset.
- No cards are inserted or removed.

Any of the above conditions may render cards inoperable requiring a return of the card for resolution.

The time required to upgrade the firmware on the cards in the chassis depends on the number of cards to be upgraded. The progress of a firmware upgrade can be monitored at the console.

### now

Forces a reboot of the router immediately without an interactive confirmation.

## Platforms

All

## reboot

## Syntax

**reboot** [**now**] **upgrade**

## Context

[\[Tree\]](#) (admin>satellite>eth-sat reboot)

## Full Context

admin satellite eth-sat reboot

## Description

The command initiates an administrative reboot of the specified Ethernet-satellite chassis.

## Parameters

### now

Causes the satellite to reboot immediately without further prompts or interactive confirmation.

### upgrade

Causes the satellite to update its firmware image during chassis reboot.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.60 receive

### receive

## Syntax

[no] receive

## Context

[\[Tree\]](#) (config>port>ethernet>eth-cfm>mep>eth-bn receive)

## Full Context

configure port ethernet eth-cfm mep eth-bn receive

## Description

This command enables the reception and processing of **eth-bn** messages and the retrieval and processing of the current bandwidth field for inclusion in dynamic egress rate adjustments.

The received rate is an Layer 2 rate, and is expected to be in Mb/s. If this rate is a link rate (including preamble, start frame delimiter, and inter-frame gap), this would require the use of network egress queue groups (configured in the **configure qos queue-group-templates egress queue-group "qg1" queue 1 packet-byte-offset add 20**). The **packet-byte-offset** is not supported for default network queues.

## Default

no receive

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## receive

## Syntax

## Full Context

configure service vprn ripng receive

configure service vprn ripng group receive

configure service vprn rip receive

configure service vprn rip group receive

configure service vprn ripng group neighbor receive

configure service vprn rip group neighbor receive

## Description

This command configures the type(s) of RIP updates that will be accepted and processed.

If **both** or **version-2** is specified, the RIP instance listens for and accepts packets sent to the broadcast and multicast (224.0.0.9) addresses.

If **version-1** is specified, the router only listens for and accepts packets sent to the broadcast address.

This control can be issued at the global, group or interface level. The default behavior accepts and processes both RIPv1 and RIPv2 messages.

The **no** form of this command resets the type of messages accepted to both.

## Default

no receive

## Parameters

### *both*

Accept RIP updates in either Version 1 or Version 2 format.

### *none*

Do not accept and RIP updates.

### *version-1*

Router should only accept RIP updates in Version 1 format.

### *version-2*

Router should only accept RIP updates in Version 2 format.

## Platforms

All

configure router ripng receive

configure router rip group neighbor receive

## Description

This command configures the types of RIP updates that will be accepted and processed.

If **both** or **version-2** is specified, the RIP instance listens for and accepts packets sent to the broadcast and multicast (224.0.0.9) addresses.

If **version-1** is specified, the router only listens for and accept packets sent to the broadcast address.

This control can be issued at the global, group or interface level. The default behavior is to accept and process both RIPv1 and RIPv2 messages.

The **no** form of the command reverts to the default value.

## Default

receive both – in the config>router>rip context

receive version-1 – in the config>router>ripng context

## Parameters

### both

Specifies that RIP updates in either version 1 or version 2 format will be accepted.

### none

Specifies that RIP updates will not be accepted.

### version-1

Specifies that RIP updates in version 1 format only will be accepted.

### version-2

Specifies that RIP updates in version 2 format only will be accepted.

configure service vprn msdp group peer receive-msdp-msg-rate

configure service vprn msdp receive-msdp-msg-rate

configure service vprn msdp group receive-msdp-msg-rate

### Description

This command limits the number of Multicast Source Discovery Protocol (MSDP) messages that are read from the TCP session. It is possible that an MSDP/ RP router may receive a large number of MSDP protocol message packets in a particular source active message.

After the number of MSDP packets (including source active messages) defined in the threshold have been processed, the rate of all other MSDP packets is rate limited by no longer accepting messages from the TCP session until the time (seconds) has elapsed.

The **no** form of this command reverts this active-source limit to default operation.

### Default

no receive-msdp-msg-rate

### Parameters

#### *number*

Defines the number of MSDP messages (including source active messages) that are read from the TCP session per the number of seconds.

**Values** 10 to 10000

**Default** 0

#### **interval** *seconds*

Defines the time that, together with the *number* parameter, defines the number of MSDP messages (including source active messages) that are read from the TCP session within the configured number of seconds.

**Values** 1 to 600

**Default** 0

***threshold number***

The number of MSDP messages can be processed before the MSDP message rate limiting function described above is activated; this is particularly of use during at system startup and initialization.

**Values** 1 to 1000000

**Default** 0

**Platforms**

All

**Full Context**

configure router msdp group receive-msdp-msg-rate

configure router msdp receive-msdp-msg-rate

configure router msdp group peer receive-msdp-msg-rate

configure router msdp peer receive-msdp-msg-rate

**Description**

This command limits the number of Multicast Source Discovery Protocol (MSDP) messages that are read from the TCP session. It is possible that an MSDP/ RP router may receive a large number of MSDP protocol message packets in a particular source active message.

After the number of MSDP packets (including source active messages) defined in the threshold have been processed, the rate of all other MSDP packets is rate limited by no longer accepting messages from the TCP session until the time (seconds) has elapsed.

The **no** form of this command sets no limit on the number of MSDP and source active limit messages that will be accepted.

## Default

no receive-msdp-msg-rate

## Parameters

### *number*

Specifies the number of MSDP messages (including source active messages) that are read from the TCP session per the number of seconds.

**Values** 10 to 10000

**Default** 0

### *seconds*

Specifies the time that, together with the *number* parameter, defines the number of MSDP messages (including source active messages) that are read from the TCP session within the configured number of seconds.

**Values** 1 to 600

**Default** 0

### *number*

Specifies the number of MSDP messages can be processed before the MSDP message rate limiting function described above is activated; this is particularly of use during at system startup and initialization.

**Values** 1 to 1000000

**Default** 0

## 22.65 reclassify-using-qos

### reclassify-using-qos

## Syntax

**reclassify-using-qos** *policy-id*

**no reclassify-using-qos**

## Context

[\[Tree\]](#) (config>service>ies>if>vpls>egress reclassify-using-qos)

## Full Context

configure service ies interface vpls egress reclassify-using-qos

## Description

The reclassify-using-qos command is used to specify a sap-egress QoS policy that will be used to reclassify the forwarding class and profile of egress routed packets on the VPLS or I-VPLS service. When routed packets associated with the IP interface egress a VPLS SAP, the reclassification rules within the sap-egress QoS policy applied to the SAP are always ignored (even when reclassify-using-qos is not defined).

Any queues or policers defined within the specified QoS policy are ignored and are not created on the VPLS egress SAPs. Instead, the routed packets continue to use the forwarding class mappings, queues and policers from the sap-egress QoS policy applied to the egress VPLS SAP.

While the specified sap-egress policy ID is applied to an IP interface it cannot be deleted from the system.

The **no** form of this command removes the sap-egress QoS policy used for reclassification from the egress IP interface. When removed, IP routed packets will not be reclassified on the egress SAPs of the VPLS service attached to the IP interface.

## Parameters

### *policy-id*

Specifies the SAP egress QoS policy ID. This parameter is required when executing the reclassify-using-qos command. The specified SAP egress QoS ID must exist within the system or the command fails.

## Platforms

All

## reclassify-using-qos

## 22.67 record

record

## Syntax

[no] record

## Context

[\[Tree\]](#) (config>router>mpls>lsp>primary-p2mp-instance record)

[\[Tree\]](#) (config>router>mpls>lsp>primary record)

[\[Tree\]](#) (config>router>mpls>lsp>secondary record)

[\[Tree\]](#) (config>router>mpls>lsp>template record)

## Full Context

configure router mpls lsp primary-p2mp-instance record

configure router mpls lsp primary record  
configure router mpls lsp secondary record  
configure router mpls lsp-template record

## Description

This command enables recording of all the hops that an LSP path traverses. Enabling **record** increases the size of the PATH and RESV refresh messages for the LSP since this information is carried end-to-end along the path of the LSP. The increase in control traffic per LSP may impact scalability.

The `config>router>mpls>lsp>primary-p2mp-instance>record` command is not supported on the 7450 ESS.

The **no** form of this command disables the recording of all the hops for the given LSP. There are no restrictions as to when the **no** command can be used. The **no** form of this command also disables the **record-label** command.

## Default

record

## Platforms

All

record

## Syntax

record

## Context

[\[Tree\]](#) (debug>app-assure>group>traffic-capture record)

## Full Context

debug application-assurance group traffic-capture record

## Description

This command configures traffic recording options.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

record

## Syntax

record {all-hosts | http-host-app-filter-candidates}

## Context

[\[Tree\]](#) (debug>app-assure>group>http-host>filter record)

## Full Context

debug application-assurance group http-host-recorder filter record

## Description

This command configures which http-host are selected for the http-host-recorder. It is either any http-host values going through the AA ISA or the http-host corresponding to flows not matching a string based app-filter.

For the feature to work it is required to configure at least one app-filter to catch the HTTP protocol signature.

## Parameters

### all-hosts | http-host-app-filter-candidates

Specifies which hosts the recorder will record

**Values** all-hosts, http-host-app-filter-candidates

**Default** http-host-app-filter-candidates

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## record

## Syntax

[no] record *record-name*

## Context

[\[Tree\]](#) (config>log>accounting-policy record)

## Full Context

configure log accounting-policy record

## Description

This command adds the accounting record type to the accounting policy that is forwarded to the configured accounting file. A record name can only be used in one accounting policy. To obtain a list of all record types that can be configured, use the **show log accounting-records** command.

### Note:

aa, video, and subscriber records are not applicable to the 7950 XRS.

To configure an accounting policy for access ports, select a service record (for example, `service-ingress-octets`). To change the record name to another service record, enter the **record** command with the new record name and it replaces the old record name.

When configuring an accounting policy for network ports, select a network record. To change the record name to another network record, enter the **record** command with the new record name and it replaces the old record name.

If the change required modifies the record from network to service or from service to network, then the old record name must be removed using the **no** form of this command.

Only one record can be configured in a single accounting policy. For example, if an accounting-policy is configured with an **access-egress-octets** record, to change it to a **service-ingress-octets** record, use the **no record** command under the accounting-policy to remove the old record first, and then enter the **service-ingress-octets** record.

**Note:**

Collecting excessive statistics can adversely affect the CPU utilization and take up large amounts of storage space.

The **no** form of this command removes the record type from the policy.

**Default**

no record

**Parameters*****record-name***

Specifies the accounting record name.

**Platforms**

## 22.68 record-label

```
record-label
```

**Syntax**

```
[no] record-label
```

**Context**

```
[Tree] (config>router>mpls>lsp>primary record-label)
```

```
[Tree] (config>router>mpls>lsp-template record-label)
```

```
[Tree] (config>router>mpls>lsp>secondary record-label)
```

**Full Context**

```
configure router mpls lsp primary record-label
```

```
configure router mpls lsp-template record-label
configure router mpls lsp secondary record-label
```

### Description

This command enables recording of all the labels at each node that an LSP path traverses. Enabling the **record-label** command will also enable the **record** command if it is not already enabled.

The **no** form of this command disables the recording of the hops that an LSP path traverses.

### Default

record-label

### Platforms

All

## 22.69 record-stats

### record-stats

#### Syntax

```
record-stats {delay | loss | delay-and-loss}
no record-stats
```

#### Context

[\[Tree\]](#) (config>oam-pm>session>ip>twamp-light record-stats)

#### Full Context

```
configure oam-pm session ip twamp-light record-stats
```

#### Description

This option provides the ability to determine which statistics are recorded. The TWAMP-Light PDU can report on both delay and loss using a single packet. The operator may choose which statistics they would like to report. Only delay recording is on by default. All other metrics are ignored. In order to change what is being recorded and reported, the TWAMP-Light session must be shutdown. This is required because the single packet approach means the base statistics are shared between the various datasets. Issuing a **no shutdown** command clears previous all non-volatile memory for the session and allocate new memory blocks. All the parameters under this context are mutually exclusive.

The **no** version of the command restores the default "delay" only.

#### Default

record-stats delay

## Parameters

### delay

Specifies report on delay using a single packet..

### loss

Specifies to report on loss using a single packet..

### delay-and-loss

Specifies to report on both delay and loss using a single packet.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.70 recovery

### recovery

## Syntax

[no] recovery

## Context

**[Tree]** (debug>router>l2tp>group>event recovery)

**[Tree]** (debug>router>l2tp>peer>event recovery)

**[Tree]** (debug>router>l2tp>assignment-id>event recovery)

**[Tree]** (debug>router>l2tp>tunnel>event recovery)

**[Tree]** (debug>router>l2tp>event recovery)

## Full Context

debug router l2tp group event recovery

debug router l2tp peer event recovery

debug router l2tp assignment-id event recovery

debug router l2tp tunnel event recovery

debug router l2tp event recovery

## Description

This command configures L2TP LAC state recovery event debugging.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.71 recovery-failed

### recovery-failed

#### Syntax

[no] **recovery-failed**

#### Context

**[Tree]** (debug>router>l2tp>tunnel>event recovery-failed)

**[Tree]** (debug>router>l2tp>event recovery-failed)

**[Tree]** (debug>router>l2tp>peer>event recovery-failed)

**[Tree]** (debug>router>l2tp>group>event recovery-failed)

**[Tree]** (debug>router>l2tp>assignment-id>event recovery-failed)

#### Full Context

debug router l2tp tunnel event recovery-failed

debug router l2tp event recovery-failed

debug router l2tp peer event recovery-failed

debug router l2tp group event recovery-failed

debug router l2tp assignment-id event recovery-failed

#### Description

This command configures L2TP LAC state recovery failed event debugging.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.72 recovery-max-session-lifetime

### recovery-max-session-lifetime

#### Syntax

**recovery-max-session-lifetime** *minutes*

**no recovery-max-session-lifetime**

#### Context

**[Tree]** (config>router>l2tp>failover recovery-max-session-lifetime)

**[Tree]** (config>service>vprn>l2tp>failover recovery-max-session-lifetime)

**Full Context**

```
configure router l2tp failover recovery-max-session-lifetime
configure service vprn l2tp failover recovery-max-session-lifetime
```

**Description**

This command configures the sub-set of sessions that this system attempts to synchronize in the Session State Synchronization phase as described in RFC 4951, *Fail Over Extensions for Layer 2 Tunneling Protocol (L2TP)*.

The **no** form of this command reverts to the default.

**Default**

```
recovery-max-session-lifetime 2
```

**Parameters***minutes*

Specifies the sub-set of sessions to recover.

**Values** 2 to 4294967295

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.73 recovery-method

### recovery-method

**Syntax**

```
recovery-method method
```

```
no recovery-method
```

**Context**

**[Tree]** (config>service>vprn>l2tp>failover recovery-method)

**[Tree]** (config>service>vprn>l2tp>group>tunnel>failover recovery-method)

**[Tree]** (config>router>l2tp>group>failover recovery-method)

**[Tree]** (config>router>l2tp>group>tunnel>failover recovery-method)

**[Tree]** (config>service>vprn>l2tp>group>failover recovery-method)

**[Tree]** (config>router>l2tp>failover recovery-method)

**Full Context**

```
configure service vprn l2tp failover recovery-method
```

```

configure service vprn l2tp group tunnel failover recovery-method
configure router l2tp group failover recovery-method
configure router l2tp group tunnel failover recovery-method
configure service vprn l2tp group failover recovery-method
configure router l2tp failover recovery-method

```

## Description

This command sets the recovery method to be used for newly created tunnels. The **no** form of this command reverts to the default.

## Default

```

recovery-method mcs on config>router>l2tp>failover and config>service>vprn>l2tp>failover
recovery-method default on config>router>l2tp>group>failover
recovery-method default on config>router>l2tp>group>tunnel>failover
recovery-method default on config>service>vprn>l2tp>group>failover
recovery-method default on config>service>vprn>l2tp>group>tunnel>failover

```

## Parameters

### *method*

Describes how a pair of redundant LAC peers recover tunnel and session state (sequence numbers, for example) immediately after a failover.

#### Note:

While failover is enabled, the tunnels and sessions proper are always kept synchronized between the redundant pair, regardless of the recovery method for the sequence numbers when a failover really occurs.

- Values**
- mcs** — Specifies that the stateful information is recovered from the failover peer directly, using Multi-Chassis Redundancy Synchronization (MCS).
  - recovery-tunnel** — Specifies that the stateful information is recovered as described in RFC 4951, *Fail Over Extensions for Layer 2 Tunneling Protocol (L2TP)*. This method uses a recovery tunnel to the L2TP peer to pass the stateful information.
  - default** — Specifies that the actual value must be derived from another object of the same type with a wider scope. Takes the value of the next higher level (not available in **config>router>l2tp>failover** and **config>service>vprn>l2tp>failover**).

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.74 recovery-time

### recovery-time

#### Syntax

**recovery-time** *seconds*

**no recovery-time**

#### Context

**[Tree]** (config>router>l2tp>group>tunnel>failover recovery-time)

**[Tree]** (config>router>l2tp>failover recovery-time)

**[Tree]** (config>service>vprn>l2tp>group>failover recovery-time)

**[Tree]** (config>router>l2tp>group>failover recovery-time)

**[Tree]** (config>service>vprn>l2tp>failover recovery-time)

**[Tree]** (config>service>vprn>l2tp>group>tunnel>failover recovery-time)

#### Full Context

configure router l2tp group tunnel failover recovery-time

configure router l2tp failover recovery-time

configure service vprn l2tp group failover recovery-time

configure router l2tp group failover recovery-time

configure service vprn l2tp failover recovery-time

configure service vprn l2tp group tunnel failover recovery-time

#### Description

This command sets the recovery time to be negotiated via RFC 4951. It represents the extra time this L2TP peer (LAC or LNS) needs to recover all its tunnels.

The **no** form of this command reverts to the default.

#### Default

recovery-time 0 on config>router>l2tp>failover and config>service>vprn>l2tp>failover

#### Parameters

***seconds***

Specifies the period, expressed in seconds, an endpoint asks its peer to wait before assuming the recovery process has failed.

**Values** 0 to 900

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.75 recovery-timer

### recovery-timer

#### Syntax

**recovery-timer** *timer-value*

**no recovery-timer**

#### Context

[\[Tree\]](#) (config>service>ipipe>eth-legacy-fault-notification recovery-timer)

#### Full Context

configure service ipipe eth-legacy-fault-notification recovery-timer

#### Description

**Note:** This command is no longer supported and will be removed in a future release.

#### Parameters

##### *timer-value*

The value of the wait time in tenths of a second (100 ms). Granularity is in 500 ms increments, starting from 1 s and up to 30 s.

**Values** 10 to 300

**Default** 100

## Platforms

All

## 22.76 red

### red

#### Syntax

**red** [detail]

**no red**

### Context

[\[Tree\]](#) (debug>service>id>pim-snooping red)

### Full Context

debug service id pim-snooping red

### Description

This command enables or disables debugging for PIM messages sent to the standby CPM.

### Parameters

**detail**

Displays detailed debugging information

### Platforms

All

**red**

### Syntax

[no] red [detail]

### Context

[\[Tree\]](#) (debug>router>pim red)

### Full Context

debug router pim red

### Description

This command enables debugging for PIM redundancy messages to the standby CPM.

The **no** form of this command disables debugging for PIM redundancy messages to the standby CPM.

### Parameters

**detail**

Displays detailed redundancy information.

### Platforms

All

## 22.77 red-alarm-threshold

### red-alarm-threshold

#### Syntax

**red-alarm-threshold** *percentage*  
**no red-alarm-threshold**

#### Context

**[Tree]** (config>port>access>egress>pool red-alarm-threshold)

**[Tree]** (config>port>access>ingress>pool red-alarm-threshold)

**[Tree]** (config>port>network>egress>pool red-alarm-threshold)

#### Full Context

configure port access egress pool red-alarm-threshold

configure port access ingress pool red-alarm-threshold

configure port network egress pool red-alarm-threshold

#### Description

This command configures the threshold for the red alarm on the over-subscription allowed.

Users can selectively enable amber or red alarm thresholds. But if both are enabled (non-zero), the amber alarm threshold cannot be more than the red alarm threshold.

The **no** form of this command reverts to the default value.

#### Default

no red-alarm-threshold

#### Parameters

***percentage***

Specifies the red alarm threshold.

**Values** 1 to 1000

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### red-alarm-threshold

#### Syntax

**red-alarm-threshold** *percentage*

## no red-alarm-threshold

### Context

[\[Tree\]](#) (config>card>fp>ingress>network>pool red-alarm-threshold)

### Full Context

configure card fp ingress network pool red-alarm-threshold

### Description

This command configures the threshold for the red alarm on the over-subscription allowed.

Users can selectively enable amber or red alarm thresholds. But if both are enabled (non-zero) then the red alarm threshold must be greater than the amber alarm threshold.

The **no** form of this command reverts to the default value.

### Default

no amber-alarm-threshold

### Parameters

#### *percentage*

Specifies the red alarm threshold.

**Values** 1 to 1000

### Platforms

All

## 22.78 red-source-list

### red-source-list

### Syntax

red-source-list

### Context

[\[Tree\]](#) (config>service>vprn>mvpn red-source-list)

### Full Context

configure service vprn mvpn red-source-list

### Description

This command enables context to configure list of redundant source prefixes for preferred source selection.

## Platforms

All

## 22.79 redelegation-timer

### redelegation-timer

#### Syntax

**redelegation-timer** *seconds*

**no redelegation-timer**

#### Context

[\[Tree\]](#) (config>router>pcep>pcc redelegation-timer)

#### Full Context

configure router pcep pcc redelegation-timer

#### Description

This command configures the redelegation timer for PCE-initiated LSPs.

The **no** form of the command sets this value to the default.

#### Default

redelegation-timer 90

#### Parameters

*seconds*

Specifies the number of seconds before the redelegation timer expires.

**Values** 1 to 3600

## Platforms

All

## 22.80 redirect-https

## redirect-https

### Syntax

**redirect-https**  
**no redirect-https**

### Context

[\[Tree\]](#) (config>app-assure>group>http-redirect redirect-https)

### Full Context

configure application-assurance group http-redirect redirect-https

### Description

This command configures the http-redirect policy to redirect HTTPS sessions to the configured redirect-url. The **no** form of this command removes the redirect-https.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.81 redirect-policy

## redirect-policy

### Syntax

**redirect-policy** *redirect-policy-name* [**create**]  
**no redirect-policy** *redirect-policy-name*

### Context

[\[Tree\]](#) (config>filter redirect-policy)

### Full Context

configure filter redirect-policy

### Description

This command, creates a configuration context for the specified redirect policy.

The **no** form of the command removes the redirect policy from the filter configuration only if the policy is not referenced in a filter and the filter is not in use (applied to a service or network interface).

### Parameters

*redirect-policy-name*

Specifies the redirect policy name. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes. There is no limit to the number of redirect policies that can be configured.

### create

This keyword is required to create the configuration context. Once it is created, the context can be enabled with or without the **create** keyword.

## Platforms

All

## redirect-policy

### Syntax

**redirect-policy** *redirect-policy-name* **destination** *ip-address*

**no redirect-policy** *redirect-policy-name* [**destination** *ip-address*]

### Context

[\[Tree\]](#) (config>filter>redirect-policy-binding redirect-policy)

### Full Context

configure filter redirect-policy-binding redirect-policy

### Description

This command adds the destination (specified by its IP address) of a redirect-policy (specified by its name) to the binding. An error is thrown if either the destination does not exist for the specified redirect-policy or if the redirect-policy does not exist.

The **no** form of the command removes from the binding from all the destinations of the specified redirect-policy, or only the specified destination.

### Parameters

#### *redirect-policy-name*

Specifies the name of the redirect-policy (up to 32 characters) as the destination that is to be added to the binding.

#### *ip-address*

The IP address of the destination. This can be an IPv4 or IPv6 address.

#### Values

ipv4-address:	a.b.c.d.
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x.d.d.d.d
	x: [0 to FFFF]H

d: [0 to 255]D

## Platforms

All

## 22.82 redirect-policy-binding

### redirect-policy-binding

#### Syntax

**redirect-policy-binding** *name* [create]**no redirect-policy-binding** *name*

#### Context

[\[Tree\]](#) (config>filter redirect-policy-binding)

#### Full Context

configure filter redirect-policy-binding

#### Description

This command creates a redirect-policy binding (specified by its name) in case it does not exist and, enters the context associated with it. When a redirect-policy binding is created, no destination is associated to this binding by default and the binding operator is set to AND.

The **no** form of this command deletes the redirect-policy binding and all the associated configuration information.

#### Parameters

***name***

Specifies the name of the binding. Possible values are any string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotations.

***create***

This keyword is required to create the binding if it does not exist. This has no effect when used with an existing binding.

## Platforms

All

## 22.83 redirect-url

### redirect-url

#### Syntax

**redirect-url** *redirect-url*

**no redirect-url**

#### Context

[\[Tree\]](#) (config>app-assure>group>http-redirect redirect-url)

#### Full Context

configure application-assurance group http-redirect redirect-url

#### Description

This command configures the http redirect URL which is the URL (page) that the user is redirected to when an HTTP redirect takes effect.

The operator can select the URL arguments to include in the redirect-url using either a specific template-id or by configuring the redirect-url using any of the supported macro substitution keywords. Only ESM and ESM-MAC sub types support \$MAC, \$SAP, \$CID, and \$RID macro substitution.

The **no** form of this command removes the redirect-url field from the configuration.

#### Parameters

##### *redirect-url*

Specifies the URL of the landing page

##### Values    macro substitutions:

\$CATID	The category ID.
\$CATNAME	The category name of the URL.
\$URL	The Request-URI in the HTTP GET Request received.
\$SUB	A string that represents the subscriber ID.
\$IP	A string that represents the IP address of the subscriber host.
\$RTRID	A string that represents the router ID.
\$URLPRM	The HTTP URL parameter associated with the subscriber.
\$MAC	A string that represents the MAC address of the subscriber host.
\$SAP	A string that represents a SAP ID.

---

\$CID	A string that represents the circuit-id or interface-id of the subscriber host (hexadecimal format).
\$RID	A string that represents the remote-id of the subscriber host (hexadecimal format).

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.84 redirect-vprn

redirect-vprn

### Syntax

redirect-vprn

### Context

[\[Tree\]](#) (config>router>dns redirect-vprn)

### Full Context

configure router dns redirect-vprn

### Description

This command configures the DNS resolution to be resolved via VPRN. If configured, all packet URL resolution is done through a DNS server that is reachable in a VPRN. This includes packets in the global routing table.

### Default

redirect-vprn

### Platforms

All

## 22.85 redirection

redirection

### Syntax

redirection *level*

**no redirection**

### Context

[\[Tree\]](#) (config>system>file-trans-prof redirection)

### Full Context

configure system file-transmission-profile redirection

### Description

This command enables system to accept HTTP redirection response, along with the max level of redirection. The virtual router may send a new request to another server if the requested resources are not available (temporarily available to another server).

### Default

no redirection

### Parameters

#### *level*

Specifies the maximum level of redirection of the file transmission profile max level of HTTP redirection.

**Values** 1 to 8

### Platforms

All

## 22.86 redirection-policy

redirection-policy

### Syntax

**redirection-policy** *policy-name*

**no redirection-policy**

### Context

[\[Tree\]](#) (config>subscr-mgmt>igmp-policy redirection-policy)

### Full Context

configure subscriber-mgmt igmp-policy redirection-policy

## Description

This command will apply multicast redirection action to the subscriber. The redirection action along with the redirected interface (and possibly service id) is defined in the referenced policy-name. IGMP messages is redirected to an alternate interface if that alternate interface has IGMP enabled. The alternate interface does not have to have any multicast groups registered via IGMP. Currently all IGMP messages are redirected and there is no ability to selectively redirect IGMP messages based on match conditions (multicast-group address, source IP address, and so on). Multicast redirection is supported between VPRN services and also between interfaces within the Global Routing Context. Multicast Redirection is not supported between the VPRN services and the Global Routing Table (GRT).

IGMP state is maintained per subscriber host and per redirected interface. Traffic is however forwarded only on the redirected interface.

The **no** form of this command reverts to the default value.

## Parameters

### *policy-name*

Specifies the redirection policy to be applied to this host IGMP policy up to 32 characters. This is a policy defined in the **config>router>policy-option>policy-statement** context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## redirection-policy

## Syntax

**redirection-policy** *policy-name*

**no redirection-policy**

## Context

[\[Tree\]](#) (config>subscr-mgmt>mld-policy redirection-policy)

## Full Context

configure subscriber-mgmt mld-policy redirection-policy

## Description

This command applies multicast redirection action to the subscriber. The redirection action along with the redirected interface (and possibly service id) is defined in the referenced policy-name. MLD messages is redirected to an alternate interface if that alternate interface has MLD enabled. The alternate interface does not have to have any multicast groups registered via MLD. Currently all MLD messages are redirected and there is no ability to selectively redirect MLD messages based on match conditions (multicast-group address, source IP address, and so on). Multicast redirection is supported between VPRN services and also between interfaces within the Global Routing Context. Multicast Redirection is not supported between the VPRN services and the Global Routing Table (GRT).

MLD state is maintained per subscriber host and per redirected interface. Traffic is however forwarded only on the redirected interface.

The **no** form of this command removes the policy name from the configuration.

### Parameters

#### *policy-name*

Specifies a redirection policy name up to 32 characters. This is a regular policy defined under the **configure>router>policy-option>policy-statement** context.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.87 redirects

### redirects

### Syntax

configure service ies subscriber-interface group-interface icmp redirects

configure service ies interface ipv6 icmp6 redirects

configure service vprn interface icmp redirects

configure service vprn interface ipv6 icmp6 redirects

configure service ies interface icmp redirects

configure service vprn network-interface icmp redirects

### Description

This command configures the rate for Internet Control Message Protocol (ICMP) redirect messages issued on the router interface.

When routes are not optimal on this router and another router on the same subnetwork has a better route, the router can issue an ICMP redirect to alert the sending node that a better route is available.

The **redirects** command enables the generation of ICMP redirects on the router interface. The rate at which ICMP redirects is issued can be controlled with the optional *number* and *seconds* parameters by indicating the maximum number of redirect messages that can be issued on the interface for a given time interval.

The **no** form of this command disables the generation of ICMP redirects on the router interface.

## Default

redirects 100 10

## Parameters

### *number*

Specifies the maximum number of ICMP redirect messages to send. This parameter must be specified with the *second* parameter.

**Values** 10 to 1000

### *seconds*

Specifies the time frame in seconds used to limit the *number* of ICMP redirect messages that can be issued.

**Values** 1 to 60

## Platforms

All

- configure service ies interface ipv6 icmp6 redirects
- configure service vprn interface icmp redirects
- configure service vprn interface redirects
- configure service vprn network-interface icmp redirects
- configure service ies interface icmp redirects

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface icmp redirects

## redirects

## Syntax

**redirects** [*number number*] [*seconds seconds*]

**no redirects**

## Context

[\[Tree\]](#) (config>subscr-mgmt>git>ipv4>icmp redirects)

## Full Context

configure subscriber-mgmt group-interface-template ipv4 icmp redirects

## Description

This command configures the ICMPv4 redirect messages that are generated when routes are not optimal on the router and the node needs to be alerted that another router on the same subnetwork has a better route available.

When disabled, ICMPv4 redirects are not generated.

The **no** form of this command disables generation of redirect messages.

## Default

redirects number 100 seconds 10

## Parameters

### *number*

Specifies the number of ICMPv4 redirects that are issued in the time frame specified by the *seconds* parameter.

**Values** 10 to 1000

**Default** 100

### *seconds*

Specifies the time, in seconds, that is used to limit the number of ICMPv4 redirects issued.

**Values** 1 to 60

**Default** 10

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## redirects

## Syntax

**redirects** [*number seconds*]

**no redirects**

## Context

[\[Tree\]](#) (config>router>if>icmp redirects)

## Full Context

configure router interface icmp redirects

## Description

This command enables and configures the rate for ICMP redirect messages issued on the router interface.

When routes are not optimal on this router, and another router on the same subnetwork has a better route, the router can issue an ICMP redirect to alert the sending node that a better route is available.

The **redirects** command enables the generation of ICMP redirects on the router interface. The rate at which ICMP redirects are issued can be controlled with the optional *number* and *time* parameters by indicating the maximum number of redirect messages that can be issued on the interface for a given time interval.

By default, generation of ICMP redirect messages is enabled at a maximum rate of 100 per 10 second time interval.

The **no** form of this command disables the generation of ICMP redirects on the router interface.

## Default

redirects 100 10 — Maximum of 100 redirect messages in 10 seconds.

## Parameters

### *number*

The maximum number of ICMP redirect messages to send, expressed as a decimal integer. This parameter must be specified with the *time* parameter.

**Values** 10 to 1000

### *seconds*

The time frame, in seconds, used to limit the *number* of ICMP redirect messages that can be issued, expressed as a decimal integer.

**Values** 1 to 60

redirects

## Syntax

**redirects** [*number seconds*]

**no redirects**

## Context

[\[Tree\]](#) (config>router>if>ipv6>icmp6 redirects)

## Full Context

configure router interface ipv6 icmp6 redirects

## Description

This command configures the rate for ICMPv6 redirect messages. When configured, ICMPv6 redirects are generated when routes are not optimal on the router and another router on the same subnetwork has a better route to alert that node that a better route is available.

The **no** form of this command disables ICMPv6 redirects.

## Default

redirects 100 10 (when IPv6 is enabled on the interface)

## Parameters

### *number*

Limits the number of redirects issued per the time frame specified in *seconds* parameter.

**Values** 10 to 1000

### *seconds*

Determines the time frame, in seconds, that is used to limit the number of redirects issued per time frame.

**Values** 1 to 60

## 22.88 redistribute-delay

### redistribute-delay

## Syntax

**redistribute-delay** *redistribute-delay*

**no redistribute-delay**

## Context

**[Tree]** (config>router>ospf>timers redistribute-delay)

**[Tree]** (config>router>ospf3>timers redistribute-delay)

## Full Context

configure router ospf timers redistribute-delay

configure router ospf3 timers redistribute-delay

## Description

This command sets the internal OSPF hold down timer for external routes being redistributed into OSPF.

Shorting this delay can speed up the advertisement of external routes into OSPF but can result in additional OSPF messages if that source route is not yet stable.

The **no** form of this command resets the timer value back to the default value.

### Note:

The timer granularity is 10 ms if the value is less than 500 ms, and 100 ms if the value is greater than or equal to 500 ms. Timer values are rounded down to the nearest granularity, for example a configured value of 550 ms is internally rounded down to 500 ms.

## Default

```
redistribute-delay 1000
```

## Parameters

### *redistribute-delay*

Specifies the OSPF redistribution hold down time in milliseconds for external routes being advertised into OSPF.

**Values** 0 to 1000

## Platforms

```

## Full Context

```
configure service vprn ospf area nssa redistribute-external
```

```
configure service vprn ospf3 area nssa redistribute-external
```

## Description

This command enables the redistribution of external routes into the Not So Stubby Area (NSSA) or an NSSA area border router (ABR) that is exporting the routes into non-NSSA areas.

NSSA or Not So Stubby Areas are similar to stub areas in that no external routes are imported into the area from other OSPF areas. The major difference between a stub area and an NSSA is that the NSSA has the capability to flood external routes that it learns (providing it is an ASBR) throughout its area and via an ABR to the entire OSPF domain.

The **no** form of this command disables the default behavior to automatically redistribute external routes into the NSSA area from the NSSA ABR.

## Default

redistribute-external — External routes are redistributed into the NSSA.

## 22.90 redo

redo

### Syntax

redo [*count*]

### Context

[Tree] (candidate redo)

### Full Context

candidate redo

### Description

This command reapplies the changes to the candidate that were removed using a previous undo. All undo or redo history is lost when the operator exits **edit-cfg** mode.

A **redo** command is blocked if another user has made changes in the same CLI branches that would be impacted during the redo.

### Parameters

#### count

Specifies the number of previous changes to reapply.

**Values** 1 to 50

**Default** 1

### Platforms

All

## 22.91 reduced-prompt

reduced-prompt

### Syntax

reduced-prompt [*no-of-nodes-in-prompt*]

no reduced-prompt

### Context

[Tree] (environment reduced-prompt)

## Full Context

environment reduced-prompt

## Description

This command configures the maximum number of higher CLI context levels to display in the CLI prompt for the current CLI session. This command is useful when configuring features that are several node levels deep, causing the CLI prompt to become too long. By default, the CLI prompt displays the system name and the complete context in the CLI.

The number of *nodes* specified indicates the number of higher-level contexts that can be displayed in the prompt. For example, if reduced prompt is set to 2, the two highest contexts from the present working context are displayed by name with the hidden (reduced) contexts compressed into an ellipsis ("...").

```
A:ALA-1>environment# reduced-prompt 2
A:ALA-1>config>router# interface to-103
A:ALA-1>...router>if#
```

The setting is not saved in the configuration. It must be reset for each CLI session or stored in an **exec** script file.

The **no** form of the command reverts to the default.

## Default

no reduced-prompt

## Parameters

### *no-of-nodes-in-prompt*

Specifies the maximum number of higher-level nodes displayed by name in the prompt, expressed as a decimal integer.

**Values** 0 to 15

**Default** 2

## Full Context

```
configure isa nat-group redundancy
```

## Description

This command configures intra-chassis redundancy mode for the NAT group.

## Default

```
redundancy active-standby
```

## Parameters

### active-active

Specifies the mode in which all MS-ISAs in a NAT group are active. If one or two MS-ISAs in the system fail, the remaining active MS-ISA accepts the load from the failed MS-ISAs.

### active-standby

Specifies the mode in which one or more MS-ISAs in the NAT group are in standby mode. While in standby mode, MS-ISAs do not process traffic. Traffic is diverted to the standby MS-ISA only when the active MS-ISA fails, at which point the standby becomes active.

### l2-aware-bypass

Specifies that when an ISA MDA fails, NAT reroutes its traffic based on the regular destination address lookup. This resiliency mode is applicable only to L2-Aware NAT. When the MS-ISA fails, its traffic is routed via regular routing (destination-based lookup). The assumption is that traffic is sent to an external NAT device that serves as a backup NAT device.

**no redundant-interface**

### Context

**[Tree]** (config>subscr-mgmt>up-resiliency>fsg-template redundant-interface)

## Full Context

configure subscriber-mgmt up-resiliency fate-sharing-group-template redundant-interface

## Description

This command configures downstream traffic shunting from a standby BNG UPF to an active BNG UPF. Downstream traffic that is received for standby sessions is sent over the redundant interface to the active BNG UPF. This requires the configuration of the **multi-chassis-shunt-id** in the service that receives the session traffic.

The **no** form of the command removes the configuration.

## Parameters

### *service-id*

Specifies the name of the VPRN or IES service that contains the redundant interface, up to 64 characters. This can be different from the service where session traffic is terminated.

### *interface-name*

Specifies the redundant interface name, up to 32 characters. It must exist within the configured *service-id*.

```

### Description

This command enables the use of significant-change so only those aa-specific records which have changed in the last accounting interval are written.

The **no** form of this command disables the use of significant-change so all aa-specific records are written whether or not they have changed within the last accounting interval.

### Parameters

**any**

Indicates that a record is collected as long as any field records activity when non-zero significant-change value is configured.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.97 ref-order

```
ref-order
```

### Syntax

```
ref-order first second [third [fourth][fifth]]
```

```
no ref-order
```

### Context

[\[Tree\]](#) (config>system>sync-if-timing ref-order)

## Full Context

configure system sync-if-timing ref-order

## Description

The synchronous equipment timing subsystem can lock to different timing reference inputs, those specified in the **ref1**, **ref2**, **bits**, **synce**, and **ptp** command configuration. This command organizes the priority order of the timing references.

If a reference source is disabled, then the clock from the next reference source as defined by **ref-order** is used. If all reference sources are disabled, then clocking is derived from a local oscillator.

If a **sync-if-timing** reference is linked to a source port that is operationally down, the port is no longer qualified as a valid reference.

For 7450 ESS and 7750 SR systems with two CPM modules, the system distinguishes between the BITS inputs on the active and standby CPMs. The active CPM will use its BITS input port providing that port is qualified. If the local port is not qualified, then the active CPM will use the BITS input port from the standby CPM as the next priority reference. For example, the normal **ref-order** of **bits ref1 ref2** will actually be **bits** (active CPM), followed by **bits** (standby CPM), followed by **ref1**, followed by **ref2**.

For 7950 XRS systems with two CPMs and two CCMs, the system distinguishes between the BITS inputs on the CCMs associated with the active and standby CPMs. The active CPM will use the BITS input port on the associated CCM, provided that the port is qualified. If the local port is not qualified, then the active CPM will use the BITS input port from the CCM associated with the standby CPM as the next priority reference. For example, the normal **ref-order** of **bits ref1 ref2** will actually be **bits** (active CCM), followed by **bits** (standby CCM), followed by **ref1**, followed by **ref2**.

The **no** form of the command resets the reference order to the default values.

The SyncE/1588 port of the CPM or CCM can be used as a frequency input reference. It shares internal resources with the BITS input ports and so only one can be used at a time. The BITS port shall have priority, if BITS input is enabled, then the SyncE port cannot be enabled.

Similar to the BITS input ports, when the **synce** reference is enabled and in the **ref-order**, the system distinguishes between the **synce** inputs on the active and standby CPM/CCMs. The active CPM/CCM uses its **synce** input port if that port is qualified. If the local port is not qualified, the active CPM uses the **synce** input port from the standby CPM/CCM as the next priority reference. For example, the **ref-order** of **synce ref1 ref2** will actually be **synce** (active CPM/CCM), followed by **synce** (standby CPM/CCM), followed by **ref1**, followed by **ref2**.

## Default

bits synce ref1 ref2 ptp (7750 SR-7/12/12e with CPM-5, 7950 XRS-20/20e, SR-7s/14s, and 7450 ESS-7/12)

bits ref1 ref2 ptp (7750 SR-a4/8, SR-1e/2e/3e, SR-1, SR-1s/2s)

## Parameters

### *first*

Specifies the first timing reference to use in the reference order sequence.

**Values** bits, synce, ref1, ref2, ptp

### *second*

Specifies the second timing reference to use in the reference order sequence.

**Values** bits, synce, ref1, ref2, ptp

***third***

Specifies the third timing reference to use in the reference order sequence.

**Values** bits, synce, ref1, ref2, ptp

***fourth***

Specifies the fourth timing reference to use in the reference order sequence.

**Values** bits, synce, ref1, ref2, ptp

***fifth***

Specifies the fifth timing reference to use in the reference order sequence.

**Values** bits, synce, ref1, ref2, ptp

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.98 ref-policer

### ref-policer

**Syntax**

**ref-policer** *policer-id*

**ref-policer** all

**no ref-policer**

**Context**

**[Tree]** (config>log>acct-policy>cr ref-policer)

**Full Context**

configure log accounting-policy custom-record ref-policer

**Description**

This command creates a policer context to configure reference policer counters for significant change only reporting. The custom record is only generated when the change in the sum of all queue and policer reference counters equals or exceeds the configured (non-zero) significant change value.

The **no** form of this command deletes all policer reference counters.

**Default**

no ref-policer

## Parameters

### *policer-id*

Specifies the policer for which reference counters are configured and to which **significant-change** is applied.

**Values** 1 to 63

### **all**

Applies the **significant-change** to the specified counters for all policers.

## 22.102 reference-bandwidth

## reference-bandwidth

### Syntax

**reference-bandwidth** *bandwidth-in-kbps*

**reference-bandwidth** [**zbps** *Zetta-bps*] [**ebps** *Exa-bps*] [**pbps** *Peta-bps*] [**tbps** *Tera-bps*] [**gbps** *Giga-bps*]  
[**mbps** *Mega-bps*] [**kbps** *Kilo-bps*]

**no reference-bandwidth**

### Context

**[Tree]** (config>service>vprn>isis reference-bandwidth)

### Full Context

configure service vprn isis reference-bandwidth

### Description

This command configures the reference bandwidth that provides the basis of bandwidth relative costing.

In order to calculate the lowest cost to reach a specific destination, each configured level on each interface must have a cost. If the reference bandwidth is defined, then the cost is calculated using the following formula:

$$\text{cost} = \text{reference} - \text{bandwidth} \# \text{bandwidth}$$

If the reference bandwidth is configured as 10 Gigabits (10,000,000,000), a 100 M/bps interface has a default metric of 100. In order for metrics in excess of 63 to be configured, wide metrics must be deployed. (See **wide-metrics-only** in the **config>router>isis** context.)

If the reference bandwidth is not configured, all interfaces have a default metric of 10.

The **no** form of this command reverts to the default value.

### Default

**no reference-bandwidth** — No reference bandwidth is defined. All interfaces have a metric of 10.

### Parameters

#### **Zetta-bps**

Specifies the reference bandwidth in zettabits per second, expressed as a decimal integer.

**Values** 1 to 18

#### **Exa-bps**

Specifies the reference bandwidth in exabits per second, expressed as a decimal integer.

**Values** 1 to 999

#### **Peta-bps**

Specifies the reference bandwidth in petabits per second, expressed as a decimal integer.

**Values** 1 to 999

#### **bandwidth-in-kbps**

Specifies the reference bandwidth in kilobits per second, expressed as a decimal integer.

**Values** 1 to 18446744073709551615

### ***Tera-bps***

Specifies the reference bandwidth in terabits per second, expressed as a decimal integer.

**Values** 1 to 999

### ***Giga-bps***

Specifies the reference bandwidth in gigabits per second, expressed as a decimal integer.

**Values** 1 to 999

### ***Mega-bps***

Specifies the reference bandwidth in megabits per second, expressed as a decimal integer.

**Values** 1 to 999

### ***Kilo-bps***

Specifies the reference bandwidth in kilobits per second, expressed as a decimal integer.

**Values** 1 to 999

## **Platforms**

All

## reference-bandwidth

### **Syntax**

**reference-bandwidth** *bandwidth-inkbps*

**reference-bandwidth** [**zbps** *Zetta-bps*] [**ebps** *Exa-bps*] [**pbps** *Peta-bps*] [**tbps** *Tera-bps*] [**gbps** *Giga-bps*]  
[**mbps** *Mega-bps*] [**kbps** *Kilo-bps*]

### **Context**

**[Tree]** (config>service>vprn>ospf reference-bandwidth)

**[Tree]** (config>service>vprn>ospf3 reference-bandwidth)

### **Full Context**

configure service vprn ospf reference-bandwidth

configure service vprn ospf3 reference-bandwidth

### **Description**

This command configures the reference bandwidth in kilobits per second (kb/s) that provides the reference for the default costing of interfaces based on their underlying link speed.

The default interface cost is calculated as follows:

$$\text{cost} = \text{reference-bandwidth} \# \text{bandwidth}$$

The default *reference-bandwidth* is 100,000,000 kb/s or 100 Gb/s, so the default auto-cost metrics for various link speeds are as follows:

- 10 Mb/s link default cost of 10000
- 100 Mb/s link default cost of 1000
- 1 Gb/s link default cost of 100
- 10 Gb/s link default cost of 10
- 40 Gb/s link default cost of 2
- 100 Gb/s link default cost of 1
- 400 Gb/s link default cost of 1

**Note:**

The default **reference-bandwidth** value must be manually configured to a higher value if interface speeds are greater than 100 Gb/s, and metrics based on link speed are used. When the default **reference-bandwidth** value is used, a metric of 1 is set on all interface speeds  $\geq$  100 Gb/s. For example, 100 GE, 100 GE LAG, 400 GE, and 400 GE LAG interfaces will all have a metric of 1.

If the reference bandwidth is configured as 10 Gb (reference-bandwidth 10000000000), a 100 Mb/s interface has a default metric of 100.

When a very large reference bandwidth value is configured, a metric calculation may result in a value higher than the supported protocol cost value. If this occurs, OSPF automatically reverts to the maximum configurable cost metric.

The reference-bandwidth command assigns a default cost to the interface based on the interface speed. To override this default cost on a particular interface, use the **metric** *metric* command configured in the **config>router>ospf>area>if ip-int-name** context.

The **no** form of this command reverts the reference bandwidth to the default value.

## Default

reference-bandwidth 100000000

## Parameters

### **bandwidth-in-kbps**

Specifies the reference bandwidth in kilobits per second expressed as a decimal integer.

**Values** 1 to 4000000000

### **tbps Tera-bps**

Specifies the reference bandwidth in terabits per second expressed as a decimal integer.

**Values** 1 to 4

### **gbps Giga-bps**

Specifies the reference bandwidth in gigabits per second expressed as a decimal integer.

**Values** 1 to 999

**mbps** *Mega-bps*

Specifies the reference bandwidth in megabits per second expressed as a decimal integer.

**Values** 1 to 999

**kbps** *Kilo-bps*

Specifies the reference bandwidth in kilobits per second expressed as a decimal integer.

**Values** 1 to 999

## Platforms

### Context

[\[Tree\]](#) (config>router>isis reference-bandwidth)

### Full Context

configure router isis reference-bandwidth

### Description

This command configures the reference bandwidth that provides the basis of bandwidth relative costing.

To calculate the lowest cost to reach a specific destination, each configured level on each interface must have a cost. If the reference bandwidth is defined, then the cost is calculated using the following formula:

cost = reference-bandwidth # bandwidth

If the reference bandwidth is configured as 10 Gb (**reference-bandwidth** 10000000000), a 100 Mb/s interface has a default metric of 100. To configure metrics in excess of 63, wide metrics must be deployed (see **wide-metrics-only** in the **config>router>isis** context).

When a large **reference-bandwidth** value is configured, a metric calculation may result in a value higher than the supported protocol cost value. If this occurs, IS-IS automatically reverts to the maximum configurable cost metric.

If the reference bandwidth is not configured, then all interfaces have a default metric of 10.

The **no** form of this command reverts to the default value.

## Default

no reference-bandwidth

## Parameters

### ***bandwidth-in-kbps***

Specifies the reference bandwidth in kilobits per second, expressed as a decimal integer.

**Values** 1 to 18446744073709551615

### ***Zetta-bps***

Specifies the reference bandwidth in zettabits per second, expressed as a decimal integer.

**Values** 1 to 18

### ***Exa-bps***

Specifies the reference bandwidth in exabits per second, expressed as a decimal integer.

**Values** 1 to 999

### ***Peta-bps***

Specifies the reference bandwidth in petabits per second, expressed as a decimal integer.

**Values** 1 to 999

### ***Tera-bps***

Specifies the reference bandwidth in terabits per second, expressed as a decimal integer.

**Values** 1 to 999

### ***Giga-bps***

Specifies the reference bandwidth in gigabits per second, expressed as a decimal integer.

**Values** 1 to 999

### ***Mega-bps***

Specifies the reference bandwidth in megabits per second, expressed as a decimal integer.

**Values** 1 to 999

### ***Kilo-bps***

Specifies the reference bandwidth in kilobits per second, expressed as a decimal integer.

**Values** 1 to 999

### Context

**[Tree]** (config>router>ospf reference-bandwidth)

**[Tree]** (config>router>ospf3 reference-bandwidth)

### Full Context

configure router ospf reference-bandwidth

configure router ospf3 reference-bandwidth

### Description

This command configures the reference bandwidth in kilobits per second (kb/s) that provides the reference for the default costing of interfaces based on their underlying link speed.

The default interface cost is calculated as follows:

cost = reference-bandwidth # bandwidth

The default *reference-bandwidth* is 100,000,000 kb/s or 100 Gb/s, the default auto-cost metrics for various link speeds are as follows:

- 10 Mb/s link default cost of 10000
- 100 Mb/s link default cost of 1000
- 1 Gb/s link default cost of 100
- 10 Gb/s link default cost of 10
- 100 Gb/s link default cost of 1
- 400 Gb/s link default cost of 1

#### Note:

The default reference-bandwidth must be manually configured to a higher value if interface speeds are greater than 100 Gb/s, and metrics based on link speed are used. When the default reference-bandwidth is used, a metric of 1 is set on all interface speeds  $\geq$  100 Gb/s. For example, 100 GE, 100 GE LAG, 400 GE, and 400 GE LAG interfaces will all have a metric of 1.

If the reference bandwidth is configured as 10 Gb (reference-bandwidth 10000000000), a 100 Mb/s interface has a default metric of 100.

When a very large reference bandwidth value is configured, a metric calculation may result in a value higher than the supported protocol cost value. If this occurs, OSPF automatically reverts to the maximum configurable cost metric.

The **reference-bandwidth** command assigns a default cost to the interface based on the interface speed. To override this default cost on a particular interface, use the **metric** *metric* command configured in the **config>router>ospf>area>interface** *ip-int-name* context.

The **no** form of this command reverts to the default value.

## Default

reference-bandwidth 100000000

## Parameters

### ***bandwidth-in-kbps***

Specifies the reference bandwidth in kilobits per second, expressed as a decimal integer.

**Values** 1 to 18446744073709551615

### ***Zetta-bps***

Specifies the reference bandwidth in zettabits per second, expressed as a decimal integer.

**Values** 1 to 18

### ***Exa-bps***

Specifies the reference bandwidth in exabits per second, expressed as a decimal integer.

**Values** 1 to 999

### ***Peta-bps***

Specifies the reference bandwidth in petabits per second, expressed as a decimal integer.

**Values** 1 to 999

### ***Tera-bps***

Specifies the reference bandwidth in terabits per second, expressed as a decimal integer.

**Values** 1 to 999

### ***Giga-bps***

Specifies the reference bandwidth in gigabits per second, expressed as a decimal integer.

**Values** 1 to 999

### ***Mega-bps***

Specifies the reference bandwidth in megabits per second, expressed as a decimal integer.

**Values** 1 to 999

### ***Kilo-bps***

Specifies the reference bandwidth in kilobits per second, expressed as a decimal integer.

**Values** 1 to 999

## 22.103 reflect-pad

```
reflect-pad
```

### Syntax

```
[no] reflect-pad
```

### Context

```
[Tree] (config>oam-pm>session>mpls>dm reflect-pad)
```

### Full Context

```
configure oam-pm session mpls dm reflect-pad
```

### Description

This command enables copying the padding in each MPLS-DM query to the response.

When padding is included in the DM frame the option exists to reflect the padding back in the direction of the source or remove the padding. The removal of the pad-tlv is good practice when using unidirectional tunnels such as RSVP.

This command uses the mandatory TLV type 0, instructing the responder to include the pad TLV from the response. The no form of this command uses the optional TVL type 128, instructing the responder to remove the pad TLV from the response.

The **no** form of this command disables copying the padding in each MPLS-DM query to the response.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.104 reflector

[\[Tree\]](#) (config>router>twamp-light reflector)

## Full Context

configure service vprn twamp-light reflector

configure router twamp-light reflector

## Description

This command configures a TWAMP Light session reflector parameters and to enable TWAMP Light functionality with the **no shutdown** command. The **udp-port** keyword and value must be specified with the **create** keyword. An error message is generated if the specific UDP port is unavailable.

## Parameters

### *udp-port-number*

Specifies the UDP port number. A strictly enforced restricted range has been introduced. The TWAMP Light session reflector must be brought in line with this new restriction prior upgrading or rebooting from any previous release if there is an active TWAMP Light session reflector configured. Failure to do so prevents an ISSU operation from proceeding and fails to activate any reflector outside of the enforced range.

Note that in the Two-Way Active Measurement Protocol Light (TWAMP Light) section for a complete description. This parameter is required and specifies the destination udp-port that the session reflector uses to listen for TWAMP Light packets. The session controller launching the TWAMP Light packets must be configured with the same destination UDP port as part of the TWAMP Light test. The IES service uses the destination UDP port that is configured under the **router** context. Only one UDP port can be configured per unique context.

**Values** 862, 64364 to 64373

## 22.105 refresh-reduction

### refresh-reduction

## Syntax

[no] refresh-reduction

## Context

**[Tree]** (config>router>rsvp>interface refresh-reduction)

## Full Context

configure router rsvp interface refresh-reduction

## Description

This command enables the use of the RSVP overhead refresh reduction capabilities on this RSVP interface.

When this option is enabled, a node will enable support for three capabilities. It will accept bundles RSVP messages from its peer over this interface, it will attempt to perform reliable RSVP message delivery to its peer, and will use summary refresh messages to refresh path and resv states. The reliable message delivery must be explicitly enabled by the user after refresh reduction is enabled. The other two capabilities are enabled immediately.

A bundle message is intended to reduce overall message handling load. A bundle message consists of a bundle header followed by one or more bundle sub-messages. A sub-message can be any regular RSVP message except another bundle message. A node will only process received bundled RSVP messages but will not generate them.

When reliable message delivery is supported by both the node and its peer over the RSVP interface, an RSVP message is sent with a message\_id object. A message\_id object can be added to any RSVP message when sent individually or as a sub-message of a bundled message.

if the sender sets the ack\_desired flag in the message\_id object, the receiver acknowledges the receipt of the RSVP message by piggy-backing a message\_ack object to the next RSVP message it sends to its

peer. Alternatively, an ACK message can also be used to send the message\_ack object. In both cases, one or many message\_ack objects could be included in the same message.

The router supports the sending of separate ACK messages only but is capable of processing received message\_ack objects piggy-backed to hop-by-hop RSVP messages, such as path and resv.

The router sets the ack\_desired flag only in non-refresh RSVP messages and in refresh messages which contain new state information.

A retransmission mechanism based on an exponential backoff timer is supported in order to handle unacknowledged message\_id objects. The RSVP message with the same message\_id is retransmitted every  $2 * \text{rapid-retransmit-time}$  interval of time. The rapid-retransmit-time is referred to as the rapid retransmission interval as it must be smaller than the regular refresh interval configured in the **config>router>rsvp>refresh-time** context. There is also a maximum number of retransmissions of an unacknowledged RSVP message rapid-retry-limit. The node will stop retransmission of unacknowledged RSVP messages whenever the updated backoff interval exceeds the value of the regular refresh interval or the number of retransmissions reaches the value of the rapid-retry-limit parameter, whichever comes first. These two parameters are configurable globally on a system in the **config>router>rsvp** context.

Refresh summary consists of sending a summary refresh message containing a message\_id list object. The fields of this object are populated each with the value of the message\_identifier field in the message\_id object of a previously sent individual path or resv message. The summary refresh message is sent every refresh regular interval as configured by the user using the refresh-time command in the **config>router>rsvp** context. The receiver checks each message\_id object against the saved path and resv states. If a match is found, the state is updated as if a regular path or resv refresh message was received from the peer. If a specific message\_identifier field does not match, then the node sends a message\_id\_nack object to the originator of the message.

The above capabilities are referred to collectively as "refresh overhead reduction extensions". When the refresh-reduction is enabled on an RSVP interface, the node indicates this to its peer by setting a "refresh-reduction-capable" bit in the flags field of the common RSVP header. If both peers of an RSVP interface set this bit, all the above three capabilities can be used. Furthermore, the node monitors the settings of this bit in received RSVP messages from the peer on the interface. As soon as this bit is cleared, the router stops sending summary refresh messages. If a peer did not set the "refresh-reduction-capable" bit, a node does not attempt to send summary refresh messages.

However, if the peer did not set the "refresh-reduction-capable" bit, a node, with refresh reduction enabled and reliable message delivery enabled, will still attempt to perform reliable message delivery with this peer. If the peer does not support the message\_id object, it returns an error message "unknown object class". In this case, the node retransmits the RSVP message without the message\_id object and reverts to using this method for future messages destined to this peer. The RSVP Overhead Refresh Reduction is supported with both RSVP P2P LSP path and the S2L path of an RSVP P2MP LSP instance over the same RSVP instance.

The **no** form of this command reverts to the default value.

## Default

no refresh-reduction

## Platforms

All

## 22.106 refresh-reduction-over-bypass

### refresh-reduction-over-bypass

#### Syntax

**refresh-reduction-over-bypass** [**enable** | **disable**]

#### Context

**[Tree]** (config>router>rsvp refresh-reduction-over-bypass)

#### Full Context

configure router rsvp refresh-reduction-over-bypass

#### Description

This command enables the refresh reduction capabilities over all bypass tunnels originating on this PLR node or terminating on this Merge Point (MP) node.

By default, this is disabled. Since a bypass tunnel may merge with the primary LSP path in a node downstream of the next-hop, there is no direct interface between the PLR and the MP node and it is possible the latter will not accept summary refresh messages received over the bypass.

When disabled, the node as a PLR or MP will not set the "Refresh-Reduction-Capable" bit on RSVP messages pertaining to LSP paths tunneled over the bypass. It will also not send Message-ID in RSVP messages. This effectively disables summary refresh.

#### Default

refresh-time seconds hold-time seconds
```

```
no refresh-time
```

## Context

[\[Tree\]](#) (config>router>origin-validation>rpki-session refresh-time)

## Full Context

```
configure router origin-validation rpki-session refresh-time
```

## Description

This command is used to configure the **refresh-time** and **hold-time** intervals that are used for liveness detection of the RPKI-Router session. The **refresh-time** defaults to 300 seconds and is reset whenever a Reset Query PDU or Serial Query PDU is sent to the cache server. When the timer expires, a new Serial Query PDU is sent with the last known serial number.

The **hold-time** specifies the length of time in seconds that the session is to be considered UP without any indication that the cache server is alive and reachable. The timer defaults to 600 seconds and must be at least 2x the refresh-time (otherwise the CLI command is not accepted). Reception of any PDU from the cache server resets the hold timer. When the **hold-time** expires, the session is considered to be DOWN and the stale timer is started.

**Default**

no refresh-time

**Parameters****seconds**

Specifies a time in seconds.

**Values** 30 to 32767

### Full Context

configure service ies interface dhcp relay-proxy

configure service ies subscriber-interface group-interface dhcp relay-proxy

configure service vprn subscriber-interface dhcp relay-proxy

configure service ies subscriber-interface dhcp relay-proxy

configure service vprn subscriber-interface group-interface dhcp relay-proxy

configure service vprn interface dhcp relay-proxy

## Description

This command enables the DHCPv4 relay proxy function on the interface. The command has no effect when no dhcp servers are configured (DHCPv4 relay not configured). By default, unicast DHCPv4 release messages are forwarded transparently.

A relay proxy enhances the relay such that it also relays unicast client DHCPv4 REQUEST messages (lease renewals).

- In the upstream direction, update the source IP address and add the gateway IP address (gi-address) field before sending the message to the intended DHCP server (the message is not broadcasted to all configured DHCP servers).
- In the downstream direction, remove the gi-address and update the destination IP address to the address of the yiaddr (your IP address) field.

The optional **release-update-src-ip** parameter updates the source IP address of a DHCP RELEASE message with the address used for relayed DHCPv4 messages.

The optional **siaddr-override** *ip-address* parameter enables DHCP server IP address hiding towards the client. This parameter requires that **lease-populate** is enabled on the interface. The DHCP server ip address is required for the address hiding function and is stored in the lease state record. The client interacts with the relay proxy as if it is the DHCP server. In all DHCP messages to the client, the value of following header fields and DHCP options containing the DHCP server IP address is replaced with the configured *<ip-address>*:

- the "source IP address" field in the IP DHCPv4 packet header
- the "siaddr" field in the DHCPv4 header if not equal to zero in the message received from the server
- the Server Identification option (DHCPv4 option 54) if present in the original server message
- the source IP address field in the IP packet header

DHCP OFFER selection during initial binding is done in the relay-proxy. Only the first DHCP OFFER message is forwarded to the client. Subsequent DHCP OFFER messages from different servers are silently dropped.

## Parameters

### **release-update-src-ip**

Updates the source IP address of a DHCP RELEASE message with the address used for relayed DHCPv4 messages.

### **ip-address**

Enables DHCPv4 server address hiding towards the DHCPv4 client and activates DHCPv4 OFFER selection in case multiple DHCP servers are configured. The *ip-address* can be any local address in the same routing instance. If DHCP relay lease-split is enabled, **siaddr-override** *ip-address* has priority over the **emulated-server** *ip-address* configured in the proxy-server and is used as the source IP address.

## Platforms

All

- configure service ies interface dhcp relay-proxy
- configure service vprn interface dhcp relay-proxy

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service vpn subscriber-interface dhcp relay-proxy
- configure service ies subscriber-interface dhcp relay-proxy
- configure service ies subscriber-interface group-interface dhcp relay-proxy

## 22.118 relay-unsolicited-cfg-attribute

### relay-unsolicited-cfg-attribute

#### Syntax

**relay-unsolicited-cfg-attribute**

#### Context

[\[Tree\]](#) (config>ipsec>ike-policy relay-unsolicited-cfg-attribute)

#### Full Context

configure ipsec ike-policy relay-unsolicited-cfg-attribute

#### Description

This command enters relay unsolicited configuration attributes context. With this configuration, the configured attributes returned from source (such as a RADIUS server) will be returned to IKEv2 remote-access tunnel client regardless if the client has requested it in the CFG\_REQUEST payload.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.119 release-reason

### release-reason

#### Syntax

**[no] release-reason**

#### Context

[\[Tree\]](#) (config>aaa>isa-radius-plcy>acct-include-attributes release-reason)

#### Full Context

configure aaa isa-radius-policy acct-include-attributes release-reason

## Description

This command enables the inclusion of the release reason attributes.

The **no** form of the command excludes release reason attributes.

## Default

no release-reason

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.120 release-timeout

```
release-timeout
```

## Syntax

**release-timeout** *seconds*

**no release-timeout**

## Context

[\[Tree\]](#) (config>subscr-mgmt>pfcg-association release-timeout)

## Full Context

configure subscriber-mgmt pfcg-association release-timeout

## Description

This command configures the time to wait to clean up the PFCP association after administratively disabling it and requesting a shutdown to the BNG CPF. If the BNG CPF does not gracefully remove the PFCP association before the timer expires, the full association and all related sessions are forcefully removed.

The **no** form of this command reverts to the default.

## Default

release-timeout 3600

## Parameters

**seconds**

Specifies the wait time, in seconds, for cleanup of the PFCP association.

**Values** 30 to 3600

### Note:

The PFCP protocol encoding does not allow the full range of configured values. The system automatically rounds up

the configured value to the nearest value allowed by the protocol. For more information about the protocol encoding, see 3GPP TS 29.244 8.2.78.1.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.121 reliable-delivery

### reliable-delivery

#### Syntax

[no] **reliable-delivery**

#### Context

**[Tree]** (config>router>rsvp>if>refresh-reduction reliable-delivery)

#### Full Context

configure router rsvp interface refresh-reduction reliable-delivery

#### Description

This command enables reliable delivery of RSVP messages over the RSVP interface. When refresh-reduction is enabled on an interface and reliable-delivery is disabled, the router will send a message\_id and not set ACK desired in the RSVP messages over the interface. The router does not expect an ACK and but will accept it if received. The node will also accept message ID and reply with an ACK when requested. In this case, if the neighbor set the "refresh-reduction-capable" bit in the flags field of the common RSVP header, the node will enter summary refresh for a specific message\_id it sent regardless if it received an ACK or not to this message from the neighbor.

Finally, when 'reliable-delivery' option is enabled on any interface, RSVP message pacing is disabled on all RSVP interfaces of the system, for example, the user cannot enable the **msg-pacing** option in the **config>router>rsvp** context, and error message is returned in CLI. Conversely, when the **msg-pacing** option is enabled, the user cannot enable the reliable delivery option on any interface on this system. An error message is also generated in CLI after such an attempt.

The **no** form of this command reverts to the default value.

#### Default

no reliable-delivery

#### Platforms

All

## 22.122 reload

```
reload
```

### Syntax

```
reload type {cert | key | cert-key-pair} filename protocol protocol [key-file filename]
```

### Context

[\[Tree\]](#) (admin>certificate reload)

### Full Context

admin certificate reload

### Description

This command reloads imported certificate or key file or both at the same time. This command is typically used to update certificate or key file without shutting down **ipsec-tunnel/ipsec-gw/cert-profile/ca-profile**. Note that **type cert** and **type key** is deprecated in a future release. Use **type cert-key-pair** instead. Instead of **type cert** use **type key** instead.

- If the new file exists and valid, then for each tunnel using it:
  - If the key matches the certificate, then the new file is downloaded to the MS-ISA to be used the next time. Tunnels currently up are not affected.
  - If the key does not match the certificate:
    - If **cert** and **key** configuration is used instead of **cert-profile** then the tunnel is brought down.
    - If **cert-profile** is used, then **cert-profile** is brought down. The next authentication fails while the established tunnels are not affected.

If the new file does not exist or somehow invalid (bad format, does not contain right extension, and so on), then this command will abort.

In the case of **type cert-key-pair**, if the new file does not exist or is invalid or **cert** and **key** do not match, then this command aborts with an error message.

### Parameters

#### **type**

Specifies what item will be reloaded.

#### **cert**

Specifies that a certificate cache will be reloaded.

#### **key**

Specifies that a key cache will be reloaded.

#### **cert-key-pair**

Specifies that a paired certificate and key cache will be reloaded.

#### **filename**

Up to 95 characters.

***protocol***

Specifies which protocol the certificate will be reloaded for.

**Values** ipsec, tls

**Platforms**

All

## 22.123 rem-router-id

```
rem-router-id
```

**Syntax**

```
rem-router-id ip-addr
```

```
no rem-router-id
```

**Context**

[\[Tree\]](#) (config>service>vprn>l2tp>group>l2tpv3 rem-router-id)

**Full Context**

```
configure service vprn l2tp group l2tpv3 rem-router-id
```

**Description**

This command configures the IP address that should be used within the Remote Router-ID AVP.

The **no** form of this command removes the configured IP address.

**Default**

```
no rem-router-id
```

**Parameters**

***ip-addr***

Specifies an IP address to be used within the Remote Router-ID AVP.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.124 remark

## remark

### Syntax

**remark**

### Context

[\[Tree\]](#) (config>app-assure>group>policy>aqp>entry>action remark)

### Full Context

configure application-assurance group policy app-qos-policy entry action remark

### Description

This command configures remark action on flows matching this AQP entry.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## remark

### Syntax

**remark dscp** *dscp-name*

### Context

[\[Tree\]](#) (config>filter>ipv6-filter>entry>action>extended-action remark)

[\[Tree\]](#) (config>filter>ipv6-filter>entry>action remark)

[\[Tree\]](#) (config>filter>ip-filter>entry>action>extended-action remark)

[\[Tree\]](#) (config>filter>ip-filter>entry>action remark)

### Full Context

configure filter ipv6-filter entry action extended-action remark

configure filter ipv6-filter entry action remark

configure filter ip-filter entry action extended-action remark

configure filter ip-filter entry action remark

### Description

This command enables and configures the remarking of the DiffServ Code Points of packets matching the criteria of the IPv4/IPv6 filter policy entry, in conjunction with a PBR action. Packets are remarked regardless of QoS-based in-profile or out-of-profile classification. QoS-based DSCP remarking is overridden. If the status of the PBR target is tracked and it is down, the extended action will not be executed; otherwise, the extended action will be performed.

## Parameters

### *dscp-name*

Specifies the DSCP value to write.

**Values** be, ef, cp1, cp2, cp3, cp4, cp5, cp6, cp7, cp9, cs1, cs2, cs3, cs4, cs5, nc1, nc2, af11, af12, af13, af21, af22, af23, af31, af32, af33, af41, af42, af43, cp11, cp13, cp15, cp17, cp19, cp21, cp23, cp25, cp27, cp29, cp31, cp33, cp35, cp37, cp39, cp41, cp42, cp43, cp44, cp45, cp47, cp49, cp50, cp51, cp52, cp53, cp54, cp55, cp57, cp58, cp59, cp60, cp61, cp62, cp63

## Platforms

All

## 22.125 remarking

### remarking

#### Syntax

**remarking** [force]

**no remarking**

#### Context

[\[Tree\]](#) (config>qos>network>egress remarking)

#### Full Context

configure qos network egress remarking

#### Description

This command remarks both customer traffic and egress network IP interface traffic; VPRN customer traffic is not remarked. The remarking is based on the forwarding class to DSCP and LSP EXP bit mapping defined under the egress node of the network QoS policy.

Normally, packets that ingress on network ports have either the DSCP or, for MPLS packets, LSP EXP bit set by an upstream router. The packets are placed in the appropriate forwarding class based on the DSCP-to-forwarding class mapping or the LSP EXP-to-forwarding class mapping. The DSCP or LSP EXP bits of such packets are not altered as the packets egress this router, unless **remarking** is enabled.

Remarking can be required if this router is connected to a different DiffServ domain where the DSCP-to-forwarding class mapping is different.

Normally, no remarking is necessary when all router devices are in the same DiffServ domain.

The network QoS policy supports an egress flag that forces remarking of packets that were received on trusted IES and network IP interfaces. This provides the capability of remarking without regard to the ingress state of the IP interface on which a packet was received. The effect of the egress network remark

trusted state on each type of ingress IP interface and trust state is listed in [Table 96: Ingress IP Interface Type and Trust State Effect on Egress Network Marking](#).

The remark trusted state has no effect on packets received on an ingress VPRN IP interface.

*Table 96: Ingress IP Interface Type and Trust State Effect on Egress Network Marking*

Ingress IP Interface Type and Trust State	Egress Network IP Interface Trust Remark Disabled (Default)	Egress Network IP Interface Trust Remark Enabled
IES Non-Trusted (Default)	Egress Remarked	Egress Remarked
IES Trusted	Egress Not Remarked	Egress Remarked
VPRN Non-Trusted	Egress Remarked	Egress Remarked
VPRN Trusted (Default)	Egress Not Remarked	Egress Not Remarked
Network Non-Trusted	Egress Remarked	Egress Remarked
Network Trusted (Default)	Egress Not Remarked	Egress Remarked

The **no** form of this command resets the configuration to the default behavior.

### Default

no remarking — Remarking disabled in the Network QoS policy.

### Parameters

#### force

Specifies that all IP routed traffic egressing the associated network interface will have its EXP, DSCP, P-bit, and DE bit setting remarked as defined in the associated QoS policy. Only bit fields configured in the QoS policy will be remarked; all others will be left untouched or set based on the default if the fields were not present at ingress.

### Platforms

## 22.126 remote

remote

### Syntax

remote

**Context**

[\[Tree\]](#) (config>ipsec>ts-list remote)

**Full Context**

configure ipsec ts-list remote

**Description**

Commands in this context configure remote TS-list parameters. The TS-list is the traffic selector of the local system, such as TSi, when the system acts as an IKEv2 responder.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.127 remote-address

### remote-address

**Syntax**

**remote-address** *ip-address*

**no remote-address**

**Context**

[\[Tree\]](#) (config>subscr-mgmt>wlan-gw>tunnel-query remote-address)

**Full Context**

configure subscriber-mgmt wlan-gw tunnel-query remote-address

**Description**

This command enables matching only on the tunnel that uses the specified source IP address.

The **no** form of this command disables matching on a tunnel's source IP address.

**Default**

no remote-address

**Parameters**

***ip-address***

Specifies the IPv4 or IPv6 remote address.

**Values**

ipv4-address

a.b.c.d

ipv6-address

x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

## 22.128 remote-age

### remote-age

#### Syntax

**remote-age** *aging-timer*

**no remote-age** [*aging-timer*]

#### Context

**[Tree]** (config>service>template>vpls-template remote-age)

**[Tree]** (config>service>vpls remote-age)

#### Full Context

configure service template vpls-template remote-age

configure service vpls remote-age

#### Description

This command specifies the aging time for remotely learned MAC addresses in the forwarding database (FDB) for the Virtual Private LAN Service (VPLS) instance.

In a VPLS service, MAC addresses are associated with a Service Access Point (SAP) or with a Service Distribution Point (SDP). MACs associated with a SAP are classified as local MACs, and MACs associated with an SDP are remote MACs.

Like in a Layer 2 switch, learned MACs can be aged out if no packets are sourced from the MAC address for a period of time (the aging time). In each VPLS service instance, there are independent aging timers for local learned MAC and remote learned MAC entries in the FDB. The **remote-age** timer specifies the aging time for remote learned MAC addresses. To reduce the amount of signaling required between switches configure this timer larger than the **local-age** timer.

The **no** form of this command returns the remote aging timer to the default value.

#### Default

remote-age 900

## Parameters

### *seconds*

Specifies the aging time for remote MACs expressed in seconds

**Values** 60 to 86400

## Platforms

All

## 22.129 remote-attachment-circuit

### remote-attachment-circuit

## Syntax

**remote-attachment-circuit** *ac-name* [**endpoint** *endpoint-name*] [**create**]

## Context

[\[Tree\]](#) (config>service>epipe>bgp-evpn remote-attachment-circuit)

## Full Context

configure service epipe bgp-evpn remote-attachment-circuit

## Description

This command configures the remote attachment circuit.

The **no** form of this command disables the context.

## Default

no remote-attachment-circuit

## Parameters

### *ac-name*

Specifies the name of the remote attachment circuit, up to 32 characters.

### *endpoint-name*

Specifies the name of the endpoint, up to 32 characters.

### **create**

Keyword used to create the remote AC.

## Platforms

All

## 22.130 remote-ecid

### remote-ecid

#### Syntax

**remote-ecid** *emulated circuit identifier*

**no remote-ecid**

#### Context

**[Tree]** (config>service>epipe>sap>cem remote-ecid)

#### Full Context

configure service epipe sap cem remote-ecid

#### Description

This command defines the Emulated Circuit Identifiers (ECID) to be used for the remote (destination) end of the circuit emulation service.

#### Parameters

##### *emulated circuit identifier*

Specifies the value to be used as the remote (destination) ECID for the circuit emulation service. Upon CES packet reception, the ECID in the packet will be compared to the configured local-ecid value. These must match for the packet payload to be used for the TDM circuit. The remote-ecid value is inserted into the MEF-8 CES packet to be transmitted.

**Values** 0 to 1048575

#### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

**no remote-gateway-address**

## Context

[\[Tree\]](#) (config>router>if>ipsec>ipsec-tunnel remote-gateway-address)

## Full Context

configure router interface ipsec ipsec-tunnel remote-gateway-address

## Description

This command configures the remote IPsec tunnel endpoint address.

## Parameters

### *ip-address*

Specifies a remote unicast IPv4 address, up to 64 characters.

### *ipv6-address*

Specifies a remote unicast global unicast IPv6 address, up to 64 characters.

## Platforms

VSR

## 22.132 remote-id

### remote-id

## Syntax

**remote-id hex** *hex-string*

**remote-id string** *ascii-string*

**no remote-id**

## Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp>host>host-ident remote-id)

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident remote-id)

## Full Context

configure subscriber-mgmt local-user-db ppp host host-identification remote-id

configure subscriber-mgmt local-user-db ipoe host host-identification remote-id

## Description

This command specifies the remote ID to match for a host lookup. When the LUDB is accessed using a DHCPv4 server, the SAP-ID is matched against DHCP option 82.

**Note:**

This command is used only when **remote-id** is configured as one of the **match-list** parameters.

The **no** form of this command removes the remote ID from the configuration.

**Parameters*****hex-string***

Specifies the hexadecimal format for the remote ID.

**Values** 0x0 to 0xFFFFFFFF (maximum 254 hex nibbles)

***ascii-string***

Specifies the string format for the remote ID, up to 255 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**remote-id****Syntax**

**remote-id mac**

**remote-id string** *ASCII string*

**no remote-id**

**Context**

**[Tree]** (config>subscr-mgmt>loc-user-db>ppp>host>ali remote-id)

**Full Context**

configure subscriber-mgmt local-user-db ppp host access-loop-information remote-id

**Description**

This command specifies a remote-id for PPPoE hosts. A remote-id received in PPPoE tags has precedence over the LUDB specified remote ID.

The **no** form of this command reverts to the default.

**Parameters****mac**

Specifies MAC address of the PPPoE session as the remote ID.

***ASCII string***

Specifies the circuit ID as a string, up to 63 characters.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## remote-id

The **no** form of this command reverts to the default.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## remote-id

### Syntax

[no] **remote-id** *remote-id*

### Context

**[Tree]** (debug>service>id>ppp remote-id)

### Full Context

debug service id ppp remote-id

### Description

This command enable PPP debug for the specified remote-id.

Multiple remote-id filters can be specified in the same debug command.

### Parameters

***remote-id***

Specifies the remote-id in PADI.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## remote-id

### Syntax

[no] **remote-id**

### Context

**[Tree]** (config>aaa>isa-radius-plcy>acct-include-attributes remote-id)

**[Tree]** (config>aaa>isa-radius-plcy>auth-include-attributes remote-id)

### Full Context

configure aaa isa-radius-policy acct-include-attributes remote-id

configure aaa isa-radius-policy auth-include-attributes remote-id

### Description

This command enables the sending of remote ID option. The client DHCP Unique Identifier (DUID) is used as the remote ID.

The **no** form of the command disables the sending of remote ID option relay packet.

### Default

no remote-id

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## remote-id

### Syntax

**remote-id** [{**mac** | **string** *string*}]

**no remote-id**

### Context

[\[Tree\]](#) (config>router>if>dhcp>option remote-id)

### Full Context

configure router interface dhcp option remote-id

### Description

When enabled, the router sends the MAC address of the remote end (typically the DHCP client) in the **remote-id** suboption of the DHCP packet. This command identifies the host at the other end of the circuit. If disabled, the **remote-id** suboption of the DHCP packet will be left empty.

The **no** form of this command returns the system to the default.

### Default

no remote-id

### Parameters

**mac**

This keyword specifies the MAC address of the remote end is encoded in the suboption.

**string**

Specifies the remote ID.

### Platforms

All

## 22.133 remote-ip

## remote-ip

### Syntax

**remote-ip** *ip-address*

**no remote-ip**

### Context

[\[Tree\]](#) (config>service>ies>if>sap>ip-tunnel remote-ip)

### Full Context

configure service ies interface sap ip-tunnel remote-ip

### Description

This command configures the primary destination IPv4 or IPv6 address to use for an IP tunnel. This configuration applies to the outer IP header of the encapsulated packets. The **source** address, **remote-ip** address and **backup-remote-ip** address of a tunnel must all belong to the same address family (IPv4 or IPv6). When the remote-ip address contains an IPv6 address it must be a global unicast address.

### Default

no remote-ip

### Parameters

*ip-address*

An IPv4 address or an IPv6 address.

### Platforms

All

## remote-ip

### Syntax

**remote-ip** *ip-address*

**no remote-ip**

### Context

[\[Tree\]](#) (config>service>vprn>if>sap>ip-tunnel remote-ip)

### Full Context

configure service vprn interface sap ip-tunnel remote-ip

## Description

This command sets the primary destination IPv4 address of GRE encapsulated packets associated with a particular GRE tunnel. If this address is reachable in the delivery service (there is a route) then this is the destination IPv4 address of GRE encapsulated packets sent by the delivery service.

The **no** form of this command deletes the destination address from the GRE tunnel configuration.

## Parameters

### *ip-address*

Specifies the destination IPv4 address of the GRE tunnel.

**Values** 1.0.0.0 to 223.255.255.255

## Platforms

All

## remote-ip

## Syntax

**remote-ip** {*ip-prefix/prefix-length* | *ip-prefix netmask* | **any**}

## Context

[\[Tree\]](#) (config>router>ipsec>sec-plcy>entry remote-ip)

[\[Tree\]](#) (config>service>vprn>ipsec>sec-plcy>entry remote-ip)

## Full Context

configure router ipsec security-policy entry remote-ip

configure service vprn ipsec security-policy entry remote-ip

## Description

This command configures the remote (from the tunnel) IP prefix/mask for the policy parameter entry.

Only one entry is necessary to describe a potential flow. The **local-ip** and **remote-ip** commands can be defined only once. The system evaluates:

- the local IP as the source IP when traffic is examined in the direction of the flows from private to public and as the destination IP when traffic flows from public to private
- the remote IP as the source IP when traffic flows public to private and as the destination IP when traffic flows from private to public

## Parameters

### *ip-prefix*

Specifies the destination address of the aggregate route in dotted decimal notation.

**Values** a.b.c.d (host bits must be 0)

prefix-length 1 to 32

**netmask**

Specifies the subnet mask in dotted decimal notation.

**any**

keyword to specify that it can be any address.

**Platforms**

VSR

- configure router ipsec security-policy entry remote-ip  
7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR
- configure service vprn ipsec security-policy entry remote-ip

## 22.134 remote-ip-address

### remote-ip-address

**Syntax**

**remote-ip-address** *ip-address*

**no remote-ip-address**

**Context**

[\[Tree\]](#) (config>lag>bfd>family remote-ip-address)

**Full Context**

configure lag bfd family remote-ip-address

**Description**

This command specifies the IPv4 or IPv6 address of the BFD destination.

The **no** form of this command removes this address from the configuration.

**Default**

no remote-ip-address

**Parameters*****ip-address***

Specifies the IP address.

**Values**

ipv4-address: a.b.c.d

ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)  
x:x:x:x:x:d.d.d.d  
x:[0 to FFFF]H  
d: [0 to 255]D

## 22.135 remote-ip-range-start

### remote-ip-range-start

#### Syntax

**remote-ip-range-start** *ip-address*

**no remote-ip-range-start**

#### Context

[\[Tree\]](#) (config>isa>nat-group>inter-chassis-redundancy remote-ip-range-start)

#### Full Context

configure isa nat-group inter-chassis-redundancy remote-ip-range-start

#### Description

This command configures the first IPv4 address that is assigned to a first member ISA on the remote node. The remaining member ISAs on the remote node are assigned the consecutive IP addresses starting from the first IP address. These IP addresses are used to communicate between the ISAs on redundant nodes for the purpose of flow synchronization. Traffic from the first local IP address (member ISA), is sent to the first IP address from the remote IP range.

The **no** form of this command removes the ip-address from the configuration.

#### Default

no remote-ip-range-start

#### Parameters

***ip-address***

Specifies the first IPv4 address, in the a.b.c.d format, from the range assigned to the first member ISA on the remote node.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.136 remote-lfa

### remote-lfa

#### Syntax

**remote-lfa** [**max-pq-cost** *value*]

**no remote-lfa**

#### Context

[\[Tree\]](#) (config>router>isis>loopfree-alternates remote-lfa)

#### Full Context

configure router isis loopfree-alternates remote-lfa

#### Description

This command enables the use of the Remote LFA algorithm in the LFA SPF calculation for this ISIS instance.

The **no** form of this command disables the use of the Remote LFA algorithm in the LFA SPF calculation for this ISIS instance.

#### Default

no remote-lfa

#### Parameters

##### *value*

Specifies the integer used to limit the search of candidate P and Q nodes in the remote LFA by setting the maximum IGP cost from the router performing the remote LFA calculation to the candidate P or Q node.

**Values** 0 to 4294967295

**Default** 4261412864

#### Platforms

All

## remote-lfa

### Syntax

**remote-lfa** [**max-pq-cost** *value*]

**no remote-lfa**

### Context

**[Tree]** (config>router>ospf3>loopfree-alternates remote-lfa)

**[Tree]** (config>router>ospf>loopfree-alternates remote-lfa)

### Full Context

configure router ospf3 loopfree-alternates remote-lfa

configure router ospf loopfree-alternates remote-lfa

### Description

This command enables the use of the Remote LFA algorithm in the LFA SPF calculation in this OSPF or OSPF3 instance.

The **no** form of this command disables the use of the Remote LFA algorithm in the LFA SPF calculation in this OSPF or OSPF3 instance.

### Default

no remote-lfa

### Parameters

#### **max-pq-cost** *value*

Specifies the integer used to limit the search of candidate P and Q nodes in the remote LFA by setting the maximum IGP cost from the router performing the remote LFA calculation to the candidate P or Q node.

**Values** 0 to 4294967295

**Default** 4261412864

### Platforms

All

## 22.137 remote-loop-respond

## remote-loop-respond

### Syntax

**[no] remote-loop-respond**

### Context

[\[Tree\]](#) (config>port>tdm>ds1 remote-loop-respond)

### Full Context

configure port tdm ds1 remote-loop-respond

### Description

When enabled, the channel responds to requests for remote loopbacks.

### Default

no remote-loop-respond — The port will not respond.

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 22.138 remote-mac

## remote-mac

### Syntax

**remote-mac** *ieee-address*

**no remote-mac**

### Context

[\[Tree\]](#) (config>service>epipe>sap>cem remote-mac)

### Full Context

configure service epipe sap cem remote-mac

### Description

This command defines the destination IEEE MAC address to be used to reach the remote end of the circuit emulation service.

### Default

remote-mac 00:00:00:00:00:00

## Parameters

### *ieee-address*

Specifies the 48-bit MAC address in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 22.139 remote-management

### remote-management

## Syntax

**remote-management**

## Context

[\[Tree\]](#) (config>system>management-interface remote-management)

## Full Context

configure system management-interface remote-management

## Description

Commands in this context configure the SR OS node to use the remote management service. Configuring remote management enables the SR OS node to report itself to a remote manager service running on a remote server, so that it is included in the dynamic list of available nodes. The manager service streamlines the management of multiple SR OS nodes running different SR OS versions using the same client application providing a similar shell to the MD-CLI.

## Platforms

All

### remote-management

## Syntax

**remote-management**

**no remote-management**

**remote-management manager** [*manager-name*]

**no remote-management manager** [*manager-name*]

## Context

[\[Tree\]](#) (debug>system>management-interface remote-management)

## Full Context

debug system management-interface remote-management

## Description

This command configures the management interface to debug the **remote-management** managers.

The **no** form of this command removes the configuration.

## Parameters

***manager manager-name***

Specifies the name of the manager, up to 64 characters. If the parameter is not specified, all configured managers are debugged.

## Platforms

All

## 22.140 remote-max-checkpoints

### remote-max-checkpoints

## Syntax

**remote-max-checkpoints** [*number-of-files*]

**no remote-max-checkpoints**

## Context

[\[Tree\]](#) (config>system>rollback remote-max-checkpoints)

## Full Context

configure system rollback remote-max-checkpoints

## Description

This command configures the maximum number of rollback checkpoint files when the rollback-location is remote (for example, ftp).

## Default

no remote-max-checkpoints

## Parameters

***number of files***

Specifies the maximum rollback files saved at a remote location.

**Values** 1 to 200

### Platforms

All

## 22.141 remote-mepid

### remote-mepid

#### Syntax

**remote-mepid** *mep-id* **remote-mac** {*unicast-da* | **default**}

**no remote-mepid** *mep-id*

#### Context

[\[Tree\]](#) (config>eth-cfm>domain>assoc remote-mepid)

#### Full Context

configure eth-cfm domain association remote-mepid

#### Description

This command configures the remote MEP ID. Optionally, the operator may configure a unicast MAC address associated with the remote MEP. This unicast value replaces the default Layer 2 class 1 multicast address that is typically associated with ETH-CC packets.

#### Note:

This command is not supported with sub second CCM intervals. The *unicast-da* parameter may only be configured when a single remote MEP exists in the association.

The **no** form of this command removes the peer information.

#### Parameters

##### *mep-id*

Specifies the peer MEP ID.

**Values** 1 to 8191

##### *unicast-da*

Specifies the unicast MAC destination address.

**Values** xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx or default

**default** — Removes the remote MAC unicast address and reverts back to class 1 multicast address.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## remote-mepid

### Syntax

**remote-mepid** *mep-id*

**no remote-mepid**

### Context

[\[Tree\]](#) (config>oam-pm>session>ethernet remote-mepid)

### Full Context

configure oam-pm session ethernet remote-mepid

### Description

This command specifies the remote MEP ID as an alternative to the static **dest-mac** *ieee-address*. When the **remote-mepid** option is configured as an alternative to the **dest-mac**, the domain and association information of the **source mep** within the session is used to check for a locally-stored unicast MAC address for the peer. The local MEP must be administratively enabled. Peer MEP MAC addresses are learned and maintained by the ETH-CC protocol.

The **no** form of this command removes this session parameter.

### Parameters

*mep-id*

Specifies the remote MEP ID of the peer within the association.

**Values** 1 to 8191

### Platforms

All

## 22.142 remote-name

## remote-name

### Syntax

**remote-name** *host-name*

**no remote-name**

## Context

**[Tree]** (config>router>l2tp>group>tunnel remote-name)

**[Tree]** (config>service>vprn>l2tp>group>tunnel remote-name)

## Full Context

configure router l2tp group tunnel remote-name

configure service vprn l2tp group tunnel remote-name

## Description

This command configures a string to be compared to the host name used by the tunnel peer during the authentication phase of tunnel establishment.

## Default

no remote-name

## Parameters

### *host-name*

Specifies a remote host name for the tunnel, up to 64 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.143 remote-proxy-arp

### remote-proxy-arp

## Syntax

[no] remote-proxy-arp

## Context

**[Tree]** (config>service>vprn>if remote-proxy-arp)

**[Tree]** (config>service>ies>sub-if>grp-if remote-proxy-arp)

**[Tree]** (config>service>vprn>nw-if remote-proxy-arp)

**[Tree]** (config>service>vprn>sub-if>grp-if remote-proxy-arp)

**[Tree]** (config>service>ies>if remote-proxy-arp)

## Full Context

configure service vprn interface remote-proxy-arp

configure service ies subscriber-interface group-interface remote-proxy-arp

configure service vprn nw-if remote-proxy-arp

```
configure service vprn subscriber-interface group-interface remote-proxy-arp
configure service ies interface remote-proxy-arp
```

## Description

This command enables remote proxy ARP on the interface.

Remote proxy ARP is similar to proxy ARP. It allows the router to answer an ARP request on an interface for a subnet that is not provisioned on that interface. This allows the router to forward to the other subnet on behalf of the requester. To distinguish remote proxy ARP from local proxy ARP, local proxy ARP performs a similar function but only when the requested IP is on the receiving interface.

The **no** form of this command reverts to the default.

## Platforms

All

- configure service vprn interface remote-proxy-arp
- configure service ies interface remote-proxy-arp

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.145 remote-source

### remote-source

#### Syntax

[no] remote-source

#### Context

[\[Tree\]](#) (config>mirror>mirror-dest remote-source)

#### Full Context

configure mirror mirror-dest remote-source

#### Description

This command is used on a destination router in a remote mirroring solution. The mirroring (packet copy) is performed on the source router and sent via an SDP to the destination router. Remote mirroring requires remote source configuration on the destination router.

Remote mirroring allows a destination router to terminate SDPs from multiple remote source routers. This allows consolidation of packet sniffers or analyzers at a single or small set of points in a network (for example, a sniffer or analyze farm, or lawful interception gateway).

A **remote-source** entry must be configured on the destination router for each source router from which mirrored traffic is being sent via SDPs.

A mirror destination service that is configured for a destination router must not be configured as for a source router.

The remote source configuration is not applicable when routable LI encapsulation is being used on the mirror source router. The remote source configuration is only used when a source router is sending mirrored traffic to a destination router via SDPs.

Two types of remote-source entries can be configured:

- far end
- spoke SDP

Certain remote source types are applicable with certain SDP types. For descriptions of the command usage in the **mirror-dest** context, see the **far-end** and **spoke-sdp** commands.

The **no** form of this command removes all remote-source entries.

#### Full Context

configure router ipsec security-policy entry remote-v6-ip

configure service vprn ipsec security-policy entry remote-v6-ip

#### Description

This command specifies the remote v6 prefix for the security-policy entry.

#### Parameters

##### *ipv6-prefix/prefix-length*

Specifies the local v6 prefix and length.

##### Values

ipv6-address/prefix: ipv6-address

x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x [0 to FFFF]H

d [0 to 255]D

host bits must be 0

:: not allowed

prefix-length [1 to 28]

##### any

A keyword to specify that any address can be used.

#### Platforms

VSR

- configure router ipsec security-policy entry remote-v6-ip

## 22.147 remote-ve-name

remote-ve-name

### Syntax

[no] remote-ve-name *name*

### Context

[\[Tree\]](#) (config>service>epipe>bgp-vpws remote-ve-name)

### Full Context

configure service epipe bgp-vpws remote-ve-name

### Description

This command creates or edits a remote-ve-name. A single remote-ve-name can be created per BGP VPWS instance if the service is single-homed or uses a single pseudowire to connect to a pair of dual-homed systems. When the service requires active/standby pseudowires to be created to remote dual-homed systems then two remote-ve-names must be configured.

This context defines the remote PE to which a pseudowire will be signaled.

**remote-ve-name** commands can be added even if bgp-vpws is not shutdown.

The **no** form of this command removes the configured remote-ve-name from the bgp vpws node. It can be used when the BGP VPWS status is either shutdown or "no shutdown".

### Parameters

*name*

Specifies a site name up to 32 characters in length.

### Platforms

All

## 22.148 remove-oldest

### Context

[\[Tree\]](#) (config>subscr-mgmt>sla-profile>host-limits remove-oldest)

### Full Context

configure subscriber-mgmt sla-profile host-limits remove-oldest

### Description

This command removes the oldest subscriber host when the host limit is reached.

The **no** form of this command maintains the oldest subscriber host when the host limit is reached.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.149 remove-private

## remove-private

### Syntax

[no] remove-private

### Context

[\[Tree\]](#) (config>subscr-mgmt>bgp-prng-plcy remove-private)

### Full Context

configure subscriber-mgmt bgp-peering-policy remove-private

### Description

This command allows private AS numbers to be removed from the AS path before advertising them to BGP peers.

The OS software recognizes the set of AS numbers that are defined by IANA as private. These are AS numbers in the range 64512 through 65535, inclusive.

The **no** form of this command used at the global level reverts to default value.

Private AS numbers are included in the AS path attribute.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## remove-private

### Syntax

**remove-private** [**limited**] [**skip-peer-as**] [**replace**]

**no remove-private**

### Context

**[Tree]** (config>service>vprn>bgp remove-private)

**[Tree]** (config>service>vprn>bgp>group>neighbor remove-private)

**[Tree]** (config>service>vprn>bgp>group remove-private)

### Full Context

configure service vprn bgp remove-private

configure service vprn bgp group neighbor remove-private

configure service vprn bgp group remove-private

### Description

When this command is configured private AS numbers are removed or replaced when they are found inside the AS path of BGP routes advertised to peers within the scope of the command.

The set of AS numbers that are defined by IANA as private are in the range of 64512 to 65534, and 4200000000 to 4294967294, inclusive. In SR OS, this command also removes ASN 65535 and ASN 4294967295, which are reserved values.

The **no** form of this command (at the BGP instance level) implements the default behavior, private AS numbers are allowed without restriction or modification in routes advertised to peers.

### Default

no remove-private

### Parameters

#### limited

This keyword instructs BGP to process private ASNs only up to the first public ASN encountered. Private ASNs beyond that first public AS will not be stripped or replaced.

#### skip-peer-as

This keyword instructs BGP to not strip or replace a private ASN from the AS-Path if that ASN is the same as the BGP peer AS number.

#### replace

When this keyword is configured, private ASNs are not stripped. Each occurrence is replaced by the ASN of the advertising BGP router (the ASN the router advertised to its peer in its OPEN message). When the **replace** keyword is not configured, private ASNs

are stripped, subject to influence by the other keyword options. This generally results in a shortening of AS\_PATH length.

admin certificate est renew

### Description

This command renews an imported certificate (specified by the **cert** *cert-filename*) with a Certificate Authority (CA) using the EST protocol specified by the **est-profile** name, with an imported private key specified the key parameter. The key can be either the key of the certificate to be renewed or a new key.

The authentication between system and EST server is specified by the est-profile.

The **hash-alg** *hash-algorithm* parameter is used to generate the CSR (Certificate Signing Request) in the EST request message.

### Parameters

#### ***name***

Specifies EST profile name, up to 32 characters

#### ***cert-filename***

Specifies the certificate file name, up to 95 characters

#### ***key-filename***

Specifies the file name of a key, up to 95 characters

#### ***hash-algorithm***

Specifies the hash algorithm to be used in a certificate request.

**Values** sha1, sha224, sha256, sha384, sha512

***output-cert-filename***

Specifies the output cert file name, up to 200 characters

***validate-cert-chain***

Specifies that the the system validates the certificate chain of the result certificate before importing it

***force***

Specifies the system to overwrite the existing file with same **output** *output-cert-filename*

**Platforms**

All

## 22.151 renew-timer

### renew-timer

**Syntax**

**renew-timer** [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]

**no renew-timer**

**Context**

**[Tree]** (config>service>vprn>sub-if>grp-if>ipv6>dhcp6>proxy renew-timer)

**[Tree]** (config>service>vprn>dhcp6>server>pool>prefix renew-timer)

**[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host>ipv6-lease-times renew-timer)

**[Tree]** (config>service>ies>sub-if>grp-if>ipv6>dhcp6>proxy-server renew-timer)

**[Tree]** (config>subscr-mgmt>loc-user-db>ppp>host>ipv6-lease-times renew-timer)

**Full Context**

configure service vprn subscriber-interface group-interface ipv6 dhcp6 proxy-server renew-timer

configure service vprn dhcp6 local-dhcp-server pool prefix renew-timer

configure subscriber-mgmt local-user-db ipoe host ipv6-lease-times renew-timer

configure router dhcp6 local-dhcp-server pool prefix renew-timer

configure service ies subscriber-interface group-interface ipv6 dhcp6 proxy-server renew-timer

configure subscriber-mgmt local-user-db ppp host ipv6-lease-times renew-timer

**Description**

This command configures the lease renew time (T1) via LUDB.

The T1 is the time at which the client contacts the addressing authority to extend the lifetimes of the DHCPv6 leases (addresses or prefixes). T1 is a time duration relative to the current time expressed in units of seconds.

The IP addressing authority controls the time at which the client contacts the addressing authority to extend the lifetimes on assigned addresses through the T1 and T2 parameters assigned to an IA. At time T1 for an IA, the client initiates a Renew/Reply message exchange to extend the lifetimes on any addresses in the IA. The client includes an IA option with all addresses currently assigned to the IA in its Renew message. Recommended values for T1 and T2 are .5 and .8 times the shortest preferred lifetime of the addresses in the IA that the addressing authority is willing to extend, respectively.

The configured renew timer should always be smaller than or equal to the rebind timer.

The T1 and T2 are carried in the IPv6 address option that is within the IA.

The **no** form of this command reverts to the default.

## Default

renew-timer min 30

## Parameters

### *renew-timer*

Specifies the preferred lifetime.

Values		
<b>days</b> <i>days</i>		0 to 7
<b>hrs</b> <i>hours</i>		0 to 23
<b>min</b> <i>minutes</i>		0 to 59
<b>sec</b> <i>seconds</i>		0 to 59

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## renew-timer

## Syntax

**renew-timer** [**days** *days*] [**hrs** *hours*] [**min** *minutes*] [**sec** *seconds*]

**no renew-timer**

## Context

[\[Tree\]](#) (config>router>dhcp6>server>defaults renew-timer)

## Full Context

configure router dhcp6 local-dhcp-server defaults renew-timer

**Description**

This command configures the default renew timer.  
The **no** form of this command reverts to the default.

**Default**

renew-timer min 30

**Parameters*****renew-timer***

Specifies the timer after which the lease is renewed.

Values	
days:	0 to 7
hours:	0 to 23
minutes:	0 to 59
seconds	0 to 59

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.152 renotify

```
renotify
```

**Syntax**

```
renotify value  
no renotify
```

**Context**

**[Tree]** (config>service>vpls>mac-notification renotify)

**Full Context**

```
configure service vpls mac-notification renotify
```

**Description**

This command controls the periodic interval at which sets of MAC notification messages are sent. At each expiration of the renotify timer, a new burst of notification messages is sent, specifically <count> frames at <interval> deci-seconds.

**Default**

no renotify

**Parameters*****value***

Specifies the time interval between re-notification, in seconds

**Values** 240 to 840

**Platforms**

All

## 22.153 renum

```
renum
```

**Syntax**

**renum** *src-entry-id* **to** *dst-entry-id*

**Context**

[\[Tree\]](#) (config>service>mrp>mrp-policy renum)

**Full Context**

configure service mrp mrp-policy renum

**Description**

This command renumbers existing MRP policy entries to properly sequence policy entries. This may be required in some cases since the implementation exits when the first match is found and executes the actions according to the accompanying action command. This requires that entries be sequenced correctly from most to least explicit.

**Parameters*****src-entry-id***

Specifies the entry number of an existing entry.

**Values** 1 to 65535

***new-entry-id***

Specifies the new entry number to be assigned to the old entry. If the new entry exists, an error message is generated.

**Values** 1 to 65535

### Full Context

configure system security management-access-filter mac-filter renum

configure system security management-access-filter ip-filter renum

configure system security management-access-filter ipv6-filter renum

### Description

This command renumbers existing management access filter entries for an IP(v4), IPv6, or MAC filter to re-sequence filter entries.

The exits on the first match found and executes the actions in accordance with the accompanying **action** command. This may require some entries to be re-numbered differently from most to least explicit.

### Parameters

#### *old-entry-number*

Specifies the entry number of the existing entry.

**Values** 1 to 9999

#### *new-entry-number*

Specifies the new entry number that will replace the old entry number.

**Values** 1 to 9999

### Platforms

All

## renum

### Syntax

**renum** *old-entry-id new-entry-id*

### Context

**[Tree]** (config>sys>sec>cpm>ip-filter renum)

**[Tree]** (config>sys>sec>cpm>ipv6-filter renum)

[\[Tree\]](#) (config>sys>sec>cpm>mac-filter renum)

### Full Context

configure system security cpm-filter ip-filter renum  
configure system security cpm-filter ipv6-filter renum  
configure system security cpm-filter mac-filter renum

### Description

This command renumbers existing IP(IPv4), IPv6, or MAC filter entries to re-sequence filter entries.

This may be required in some cases since the OS exits when the first match is found and execute the actions according to the accompanying action command. This requires that entries be sequenced correctly from most to least explicit.

### Parameters

#### *old-entry-id*

Specifies the entry number of an existing entry.

**Values** 1 to 6144 for ip-filter and ipv6-filter  
1 to 2048 for mac-filter

#### *new-entry-id*

Specifies the new entry number to be assigned to the old entry.

**Values** 1 to 6144 for ip-filter and ipv6-filter  
1 to 2048 for mac-filter

### Platforms

### renumber

### Syntax

**renumber from** *entry-id* **to** *entry-id*

### Context

[\[Tree\]](#) (config>router>policy-options>policy-statement renumber)

### Full Context

configure router policy-options policy-statement renumber

### Description

This command allows the operator to renumber the existing entry ID to a new entry ID. When performing the renumbering action, the two entry IDs must be different. The existing (**from**) *entry-id* must exist. The new (**to**) *entry-id* must not exist.

Renumbering is not saved in the configuration because it is a performing action.

### Parameters

#### **from** *entry-id*

Specifies the existing entry ID to be renumbered.

**Values** 1 to 4294967295

#### **to** *entry-id*

Specifies the new entry ID to be assigned.

**Values** 1 to 4294967295

## 22.155 reorder-audio

### reorder-audio

#### Syntax

**reorder-audio** *time*

**no reorder-audio**

#### Context

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>bundle>channel>video reorder-audio)

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>bundle>video reorder-audio)

#### Full Context

configure mcast-management multicast-info-policy bundle channel video reorder-audio

configure mcast-management multicast-info-policy bundle video reorder-audio

#### Description

This command configures the time, in milliseconds, by which the audio packets are reordered in the ad stream.

Configuring this parameter depends on what is configured on the A Server and the GOP sizes of the network stream. Typically, this configuration should match the A Server configuration.

The **no** form of the command removes the time value from the configuration.

#### Default

no reorder-audio

#### Parameters

***time***

Specifies the audio reorder time, in milliseconds.

**Values** 100 to 1000

#### Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 22.160 replay-protection

### replay-protection

#### Syntax

[no] replay-protection

#### Context

[\[Tree\]](#) (config>macsec>connectivity-association replay-protection)

#### Full Context

configure macsec connectivity-association replay-protection

#### Description

Specifies the size of the replay protection window.

This command must be configured to force packet discard when it has detected a packet that is not within the replay-window-size.

When replay protection is enabled, the sequence of the ID number of the received packets are checked. If the packet arrives out of sequence and the difference between the packet numbers exceeds the replay window size, the packet is counted by the receiving port and then discarded. For example, if the replay protection window size is set to five and a packet assigned the ID of 1006 arrives on the receiving link immediately after the packet assigned the ID of 1000, the packet that is assigned the ID of 1006 is counted and discarded because it falls outside the parameters of the replay window size.

Replay protection is especially useful for fighting man-in-the-middle attacks. A packet that is replayed by a man-in-the-middle attacker on the Ethernet link will arrive on the receiving link out of sequence, so replay protection helps ensure the replayed packet is dropped instead of forwarded through the network.

Replay protection should not be enabled in cases where packets are expected to arrive out of order.

**Default**

no replay-protection

**Platforms**

All

## 22.161 replay-window

### replay-window

**Syntax**

**replay-window** *replay-window-size*

**no replay-window**

**Context**

configure ipsec tunnel-template replay-window

configure service vprn interface sap ipsec-tunnel replay-window

configure service ies interface ipsec ipsec-tunnel replay-window

configure ipsec ipsec-transport-mode-profile replay-window

**Description**

This command specifies the size of the anti-replay window. The anti-replay window protocol further secures IPsec against an entity that can inject a recorded message in a message stream from a source to a destination computer on the Internet.

**Default**

no replay-window

**Parameters**

***replay-window-size***

Specifies the size of the SA anti-replay window.

**Values** 32, 64, 128, 256, 512

## Platforms

VSR

- configure service ies interface ipsec ipsec-tunnel replay-window
- configure service vprn interface ipsec ipsec-tunnel replay-window

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn interface sap ipsec-tunnel replay-window
- configure ipsec tunnel-template replay-window
- configure ipsec ipsec-transport-mode-profile replay-window

## 22.162 replay-window-size

### replay-window-size

#### Syntax

**replay-window-size** *number-of-packets*

**no replay-window-size**

#### Context

[\[Tree\]](#) (config>macsec>connectivity-association replay-window-size)

#### Full Context

configure macsec connectivity-association replay-window-size

#### Description

This command specifies the size of the replay protection window.

This command must be configured to enable replay protection. When replay protection is enabled, the sequence of the ID number of received packets are checked. If the packet arrives out of sequence and the difference between the packet numbers exceeds the replay protection window size, the packet is dropped by the receiving port. For example, if the replay protection window size is set to five and a packet assigned the ID of 1006 arrives on the receiving link immediately after the packet assigned the ID of 1000, the packet that is assigned the ID of 1006 is dropped because it falls outside the parameters of the replay protection window.

Replay protection is especially useful for fighting man-in-the-middle attacks. A packet that is replayed by a man-in-the-middle attacker on the Ethernet link will arrive on the receiving link out of sequence, so replay protection helps ensure the replayed packet is dropped instead of forwarded through the network.

Replay protection should not be enabled in cases where packets are expected to arrive out of order.

When the *number-of-packets* variable is set to 0, all packets that arrive out-of-order are dropped.

The **no** form of this command reverts to the default value.

### Default

replay-window-size 0

### Parameters

#### *number-of-packets*

Specifies the window for which the packets can arrive out of order.

**Values** 0 to 4294967294

### Platforms

All

## 22.163 replication-segment

### replication-segment

### Syntax

[no] replication-segment *policy-name*

### Context

[\[Tree\]](#) (config>router>p2mp-sr-tree replication-segment)

### Full Context

configure router p2mp-sr-tree replication-segment

### Description

This command creates a P2MP SR tree replication segment entry for the P2MP LSP.

The **no** form of this command deletes the replication segment entry.

### Parameters

#### *policy-name*

Specifies the P2MP policy name, up to 32 characters, associated with the forwarding instructions contained in the replication segment.

### Platforms

All

## 22.164 replication-sid

### replication-sid

#### Syntax

**replication-sid** *label* [*label*]

**no replication-sid**

#### Context

[\[Tree\]](#) (config>router>p2mp-sr-tree>replication-segment>next-hop-id replication-sid)

#### Full Context

configure router p2mp-sr-tree replication-segment next-hop-id replication-sid

#### Description

This command configures the replication SID or a SID list for the next hop of the P2MP SR tree replication segment.

When a SID list is configured, the replication SID is at the bottom of the stack and the unicast node or the adjacency SID is at the top of the stack. The SID at the top of the stack must be configured first in the list and the replication SID at the bottom of the list must be configured last in the list.

The **no** form of this command removes the replication SID.

#### Parameters

***label***

Specifies the label of the replication SID; up to a maximum of 11 labels.

**Values** 3, 16 to 1048575, 4294967295

#### Platforms

All

## 22.165 replication-threshold

### replication-threshold

#### Syntax

**replication-threshold** *seconds*

**no replication-threshold**

## Context

[\[Tree\]](#) (config>isa>nat-group>inter-chassis-redundancy replication-threshold)

## Full Context

configure isa nat-group inter-chassis-redundancy replication-threshold

## Description

This command configures the minimum duration of the flow that needs to be met before it is synchronized to the standby node. This way, flow synchronization and statefulness in a multi-chassis environment are limited only to long-lived flows.

The **no** form of this command reverts to the default values.

## Default

replication-threshold 20

## Parameters

*seconds*

Specifies the minimum flow existence time before it is synchronized.

**Values** 0 to 300

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.166 reply-on-padt

reply-on-padt

## Syntax

[no] reply-on-padt

## Context

[\[Tree\]](#) (config>subscr-mgmt>ppp-policy reply-on-padt)

## Full Context

configure subscriber-mgmt ppp-policy reply-on-padt

## Description

This command enables replying to PPPoE Active Discovery Terminate (PADT) packets. Some of the PPPoE clients expect reply on PADT message before the context of the session is cleared up. To support such client, a command enabling reply to PADT is provided.

The **no** form of this command reverts to the default.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.167 report-alarm

**[Tree]** (config>port>tdm>e3 report-alarm)

#### Full Context

```
configure port tdm ds3 report-alarm
```

```
configure port tdm e3 report-alarm
```

#### Description

This command enables logging of DS-3 and E-3 alarms for a DS-3/E-3 port or channel.

The **no** form of this command disables logging of the specified alarms.

#### Parameters

##### ais

Reports alarm indication signal errors. When configured, **ais** alarms are not raised and cleared.

**Default** **ais** alarms are issued

##### los

Reports loss of signal errors. When configured, **los** traps are not raised and cleared.

**Default** **los** traps are issued

##### oof

Reports out-of-frame errors. When configured, **oof** alarms are not raised and cleared.

**Default** **oof** alarms are not issued

##### rai

Reports resource availability indicator events. When configured, **rai** events are not raised and cleared.

**Default** **rai** alarms are not issued

**looped**

Reports looped packets errors.

**Default** **looped** alarms are not issued

**Platforms**

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

[\[Tree\]](#) (config>port>ethernet report-alarm)

**Full Context**

configure port ethernet report-alarm

**Description**

This command specifies when and if to generate alarms and alarm clear notifications for this port.

**Note:**

For some DWDM transceivers, if the **configure port dwdm coherent rx-los-reaction squelch** command is disabled the signal-fail and no-am-lock alarm conditions are not reported when the media side of the transceiver has an RX LOS condition.

**Parameters****signal-fail**

Reports an Ethernet signal lost alarm.

**remote**

Reports remote faults.

**local**

Reports local faults.

**no-frame-lock**

Reports a 'not locked on the Ethernet framing sequence' alarm.

**high-ber**

Reports High Bit Error Rate.

**no-block-lock**

Reports 40G/100G PCS Lanes Not Block Locked.

**no-am-lock**

Reports 40G/100G PCS Alignment Marker Loss of Lock.

### **duplicate-lane**

Reports 40G/100G PCS Duplicate Lane Marker.

## **Platforms**

All

## **report-alarm**

## **Syntax**

[no] report-alarm [loc] [lais] [ lrdi] [ss1f] [lb2er-sd] [lb2er-sf] [slof] [ slos] [lrei]

## **Context**

[\[Tree\]](#) (config>port>sonet-sdh report-alarm)

## **Full Context**

configure port sonet-sdh report-alarm

## **Description**

This command enables logging of SONET (SDH) line and section alarms for a SONET-SDH port. Only line and section alarms can be configured in the SONET/SDH context, for path alarms see the **sonet-sdh>path** context.

The **no** form of this command disables logging of the specified alarms.

This command is supported on TDM satellites.

## **Parameters**

### **loc**

Reports a loss of clock which causes the operational state of the port to be shut down.

**Default** **loc** alarms are issued

### **lais**

Reports line alarm indication signal errors. When configured, **lais** alarms are raised and cleared.

**Default** **lais** alarms are not issued

### **lrdi**

Reports line remote defect indication errors. LRDI's are caused by remote LOF, LOC, LOS. When configured, **lrdi** alarms are raised and cleared.

**Default** **lrdi** alarms are issued

### **ss1f**

Reports section synchronization failure which is detected when the S1 byte is not consistent for 8 consecutive frames. When configured, **ss1f** alarms are raised and cleared.

**Default** **ss1f** alarms are not issued

### **lb2er-sd**

Reports line signal degradation BER (bit interleaved parity) errors. Use the threshold command to set the error rate(s) that when crossed determine signal degradation and signal failure. When configured, **lb2er-sd** alarms are raised and cleared.

**Default** **lb2er-sd** alarms are not issued

### **lb2er-sf**

Reports line signal failure BER errors. Use the threshold command to set the error rate(s) that when crossed determine signal degradation and signal failure. When configured, **lb2er-sf** alarms are raised and cleared.

**Default** **lb2er-sf** alarms are issued

### **slof**

Reports section loss of frame errors. When configured, **slof** alarms are raised and cleared.

**Default** **slof** alarms are issued

### **slos**

Reports a section loss of signal error on the transmit side. When configured, **slos** alarms are raised and cleared.

**Default** **slos** alarms are issued

### **lrei**

Reports a line error condition raised by the remote as a result of b1 errors received from this node. When configured, **lrei** traps are raised but not cleared.

**Default** **lrei** traps are not issued

## **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## report-alarm

### **Syntax**

[no] report-alarm {pais | plop | prdi | pplm | prei}

### **Context**

[\[Tree\]](#) (config>port>sonet-sdh>path report-alarm)

### **Full Context**

configure port sonet-sdh path report-alarm

## Description

This command enables logging of SONET (SDH) path alarms for a SONET-SDH port. Only path alarms can be configured in the channel context.

The **no** form of this command disables logging of the specified alarms.

## Parameters

### **pais**

Reports path alarm indication signal errors. When configured, **pais** alarms are raised and cleared.

**Default** pais alarms are not issued

### **plop**

Reports path loss of pointer (per tributary) errors. When configured, **plop** traps are raised but not cleared.

**Default** plop traps are issued

### **prdi**

Reports path remote defect indication errors. When configured, **prdi** alarms are raised and cleared.

**Default** prdi alarms are not issued

### **pplm**

Reports a path payload mismatch, as a result the channel will be brought down. When configured, **pplm** traps are raised but not cleared.

**Default** pplm traps are issued

### **prei**

Reports a path error condition raised by the remote as a result of b3 errors received from this node. When configured, **prei** traps are raised but not cleared.

**Default** prei traps are not issued

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## report-alarm

## Syntax

[no] report-alarm [ais] [los] [ oof] [rai] [looped] [ber-sd] [ber-sf]

## Context

**[Tree]** (config>port>tdm>ds1 report-alarm)

**[Tree]** (config>port>tdm>e1 report-alarm)

## Full Context

configure port tdm ds1 report-alarm

configure port tdm e1 report-alarm

## Description

This command enables logging of DS-1/DS-3 or E-1/E-3 alarms for DS-1/DS-3 or E-1/E-3 ports or channels.

The **no** form of this command disables logging of the specified alarms.

## Parameters

### ais

Reports alarm indication signal errors. When configured, **ais** alarms are not raised and cleared.

**Default** **ais** alarms are issued

### los

Reports loss of signal errors. When configured, **los** traps are not raised and cleared.

**Default** **los** traps are issued.

### oof

Reports out-of-frame errors. When configured, **oof** alarms are not raised and cleared.

**Default** **oof** alarms are not issued.

### rai

Reports resource availability indicator events. When configured, **rai** events are not raised and cleared.

**Default** **rai** alarms are not issued

### looped

Reports looped packets errors.

### looped alarms are not issuedlof

Reports loss of frame errors. When configured, **lof** traps are not raised and cleared.

**Default** **lof** traps are issued

### ber-sd

Specifies the BER that specifies signal degradation.

### ber-sf

Specifies the BER that specifies signal failure.

## Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## report-alarm

### Syntax

[no] report-alarm [stray] [malformed] [pktloss] [overrun] [underrun] [rpktloss] [rfault] [rrdi]

### Context

**[Tree]** (config>service>cpipe>sap>cem report-alarm)

**[Tree]** (config>service>epipe>sap>cem report-alarm)

### Full Context

configure service cpipe sap cem report-alarm

configure service epipe sap cem report-alarm

### Description

This command indicates the type of CEM SAP alarm.

The **no** form of this command removes the parameter from the configuration.

### Default

On: stray, malformed, pktloss and overrun

Off: rpktloss, rfault, rrdi

### Parameters

#### stray

Reports the reception of packets not destined for this CES circuit.

#### malformed

Reports the reception of packet not properly formatted as CES packets.

#### pktloss

Reports the lack of reception of CES packets.

#### overrun

Reports the reception of too many CES packets resulting in a overrun of the receive jitter buffer.

#### underrun

Reports the reception of too few CES packets resulting in a overrun of the receive jitter buffer.

#### rpktloss

Reports that the remote peer is currently in packet loss status.

#### rfault

Reports that the remote TDM interface is currently not in service.

#### rrdi

Reports that the remote TDM interface is currently in RDI status.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure service cpipe sap cem report-alarm

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

- configure service epipe sap cem report-alarm

## report-alarm

### Syntax

**report-alarm severity {tnc | qos | poa}**

**no report-alarm**

### Context

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>channel>source-override>video>analyzer>alarms report-alarm)

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>channel>video>analyzer>alarms report-alarm)

**[Tree]** (config>mcast-mgmt>mcast-info-plcy>bundle>video>analyzer>alarms report-alarm)

### Full Context

configure mcast-management multicast-info-policy bundle channel source-override video analyzer alarms report-alarm

configure mcast-management multicast-info-policy bundle channel video analyzer alarms report-alarm

configure mcast-management multicast-info-policy bundle video analyzer alarms report-alarm

### Description

This command configures the type of alarm to monitor and raise through SNMP. The severity of alarms increases from TNC, to QoS, and then to POA. For example, if QoS alarms are configured, the analyzer only raises alarms and events related to QoS. The analyzer may raise alarms for POA events if they occur, but alarms for TNC are not sent.

### Default

no report-alarm

### Parameters

#### severity

Keyword to configure the type of alarm.

#### tnc

Specifies to monitor and raise alarms for TNC events.

#### qos

Specifies to monitor and raise alarms for QoS events.

#### poa

Specifies to monitor and raise alarms for POA events.

### Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 22.168 report-alarms

### report-alarms

#### Syntax

```
[no] report-alarms [modflt] [mod] [ netrx] [ nettx] [ hosttx]
```

#### Context

[\[Tree\]](#) (config>port>dwdm>coherent report-alarms)

#### Full Context

```
configure port dwdm coherent report-alarms
```

#### Description

This command configures the alarms that will be reported for the coherent module.

#### Default

```
modflt mod netrx nettx hosttx
```

#### Parameters

##### modflt

Reports module fault alarm.

##### mod

Reports module alarm.

##### netrx

Reports network (optical side) receive alarm.

##### nettx

Reports network (optical side) transmit alarm.

##### hosttx

Reports host (electrical side) transmit alarm.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## report-alarms

### Syntax

```
[no] report-alarms [loc] [los] [ lof] [lom] [otu-ais] [otu-ber-sf] [otu-ber-sd] [otu-bdi] [otu-tim] [ otu-iae]
[otu-biae] [ fec-sf] [fec-sd] [fec-fail] [ fec-uncorr] [odu-ais] [ odu-oci] [odu-lck] [odu-bdi] [ odu-
tim] [opu-plm]
```

### Context

[\[Tree\]](#) (config>port>otu report-alarms)

### Full Context

configure port otu report-alarms

### Description

This command enables OTU alarms. Specify specific alarms to add to the list of reported alarms. The **no** form of this command disables OTU alarm reporting.

### Default

loc, los, lof, lom, otu-ber-sf, otu-bdi, fec-sf

### Parameters

#### alarms

Refer to [Table 97: Alarm Descriptions](#) for alarm descriptions.

Table 97: Alarm Descriptions

Alarm	Description
loc	Loss of clock.
lof	Loss of OTU framing.
lom	Loss of Multi-frame.
los	Loss of signal transitions on the data.
otu-ais	OTU Alarm Indication Signal (all 1s, overwrites all OTU overhead, even framing bytes).
otu-ber-sf	SM Signal Fail (based on BPI8).
otu-ber-sd	SM Signal Degrade (based on BPI8).
otu-bdi	SM Backward defect indication.
otu-tim	SM Trace Id Mismatch.
otu-iae	SM Incoming Alignment Error.

Alarm	Description
otu-biae	SM Backward Incoming Alignment Error.
fec-sf	Signal Fail (based on FEC corrected bits).
fec-sd	Signal Degrade (based on FEC corrected bits).
fec-fail	FEC Mode mismatch (EFEC-GFEC) or High Uncorrectable rate (>10E-2).
fec-uncorr	One or More Uncorrectable FEC errors.
odu-ais	ODU Alarm Indication Signal.
odu-oci	ODU Open connection Indication.
odu-lck	ODU Locked.
odu-bdi	PM Backward Defect indication.
odu-tim	PM Trace Id Mismatch.
opu-plm	OPU PSI Payload Type Mismatch.

### Platforms

## 22.169 report-ip-address-event

### report-ip-address-event

#### Syntax

[no] report-ip-address-event

#### Context

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>gx report-ip-address-event)

#### Full Context

configure subscriber-mgmt diameter-application-policy gx report-ip-address-event

#### Description

This command enables triggered CCR-u messages based on IP address allocation or de-allocation for the subscriber host.

If the requests for both IP address families (IPv4 and IPv6) arrive at approximately the same time, a single CCR-i is sent containing the IP addresses from both address families, IPv4 and IPv6 (NA, PD, or SLAAC).

When the requests for IP addresses are not nearly simultaneous, the CCR-i contains only the IP address that was allocated first (the one that triggered the session creation). The request for the second IP address family, depending on configuration, triggers an additional CCR-u that will carry the IP address allocation update to the PCRF along with the UE\_IP\_ADDRESS\_ALLOCATE (18) event. The CCR-u content mirrors the content of the CCR-i with the exception of already allocated IP address(es).

When this command is disabled, IP address-triggered CCR-u messages are not sent.

The **no** form of this command disables the command.

### Default

report-ip-address-event

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.170 report-local-routes

### report-local-routes

#### Syntax

[no] report-local-routes

#### Context

[\[Tree\]](#) (config>bmp>station report-local-routes)

#### Full Context

configure bmp station report-local-routes

#### Description

This command enables local route reporting to the BMP monitoring station.

The **no** form of this command disables the local route reporting.

#### Platforms

All

## 22.171 report-path-constraints

## report-path-constraints

### Syntax

**report-path-constraints**

**no report-path-constraints**

### Context

**[Tree]** (config>router>pcep>pcc report-path-constraints)

### Full Context

configure router pcep pcc report-path-constraints

### Description

This command enables the inclusion of LSP path constraints in the PCE report messages sent from the PCC to a PCE.

In order for the PCE to know about the original constraints for an LSP which is delegated, but for which there is no prior state in its LSP database, such as if no PCReq message was sent for the same PLSP-ID, the following proprietary behavior is observed:

- PCC appends a duplicate of each of the LSPA, METRIC, and BANDWIDTH objects in the PCRpt message. The only difference between two objects of the same type is that the P-flag is set in the common header of the duplicate object to indicate that it is a mandatory object for processing by PCE.
- The value of the metric or bandwidth in the duplicate object contains the original constraint value, while the first object contains the operational value. This is applicable to hop metrics in the METRIC and BANDWIDTH objects only. The SR OS PCC does not support configuring a boundary on the path computation IGP or TE metrics.
- The path computation on the PCE must use the first set of objects when updating a path if the PCRpt contained a single set. If the PCRpt contained a duplicate set, PCE path computation must use the constraints in the duplicate set.

The **no** form of the command disables the above behavior in case of interoperability issues with third-party PCE implementations.

### Default

report-path-constraints

### Platforms

All

## 22.172 report-rate

## report-rate

### Syntax

**report-rate agg-rate-limit**  
**report-rate scheduler** *scheduler-name*  
**report-rate pppoe-actual-rate**  
**report-rate policer** *policer-id*  
**report-rate rfc5515-actual-rate**  
**no report-rate**

### Context

**[Tree]** (config>subscr-mgmt>sla-prof>egress report-rate)  
**[Tree]** (config>subscr-mgmt>sla-prof>ingress report-rate)

### Full Context

configure subscriber-mgmt sla-profile egress report-rate  
configure subscriber-mgmt sla-profile ingress report-rate

### Description

This command configures the source for Tx and Rx connect speeds in AVP 38 (Rx Connect Speed) and AVP 24 (Tx Connect Speed) of an L2TP session established on a LAC.

The **no** form of this command reverts to the default.

### Parameters

#### **agg-rate-limit**

Specifies that the rate (egress only) is taken from:

1. the agg-rate RADIUS override (RADIUS VSA "Alc-Subscriber-QoS-Override" in a RADIUS Access-Accept message) if present
2. the configured agg-rate-limit in the **config>subscr-mgmt>sub-prof>egr** context
3. fall back to the default (no report-rate)

#### **scheduler-name**

Specifies the rate taken from the **scheduler** *scheduler-name* up to 32 characters. If the **scheduler** *scheduler-name* is not present in the scheduler-policy configured in the **config>subscr-mgmt>sub-prof>egr** context, fall back to the default (no report-rate).

#### **pppoe-actual-rate**

Specifies rates taken from the DSL Line characteristics PPPoE tags (Actual Data Rate Upstream/Downstream) if present; otherwise fall back to the default (no report-rate).

#### **policer-id**

Specifies the rate taken from the policer with the specified ID.

**Values** 1 to 63

**rfc5515-actual-rate**

Puts the same value as the transmitted Actual-Data-Rate-Upstream AVP in the Rx-Connect-Speed AVP, and the same value as the transmitted Actual-Data-Rate-Downstream AVP in the Tx-Connect-Speed AVP

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.173 report-src-ip

### report-src-ip

**Syntax**

**report-src-ip** *ip-address*

**no report-src-ip**

**Context**

**[Tree]** (config>service>vpls>igmp-snooping report-src-ip)

**Full Context**

configure service vpls igmp-snooping report-src-ip

**Description**

This command configures the source IPv4 address used when generating IGMP reports. According to the IGMPv3 standard, a zero source address is allowed in sending IGMP reports. However, for interoperability with some multicast routers, the source IP address of IGMP group reports can be configured using this command.

**Default**

report-src-ip 0.0.0.0

**Parameters**

***ip-address***

Specifies the source IPv4 address in transmitted IGMP reports.

**Values** a.b.c.d

**Platforms**

All

## report-src-ip

### Syntax

**report-src-ip** *ipv6-address*

**no report-src-ip**

### Context

[\[Tree\]](#) (config>service>vpls>mld-snooping report-src-ip)

### Full Context

configure service vpls mld-snooping report-src-ip

### Description

This command configures the source IPv6 address used when generating MLD reports. A zero source address is allowed in sending MLD reports. However, for interoperability with some multicast routers, the source IP address of MLD reports can be configured using this command.

### Default

report-src-ip 0:0:0:0:0:0:0

### Parameters

***ipv6-address***

Specifies the source IPv6 address in transmitted MLD reports.

**Values** x:x:x:x:x:x:x (eight 16-bit pieces)

### Platforms

All

## 22.174 report-wlan-location

## report-wlan-location

### Syntax

**[no] report-wlan-location**

### Context

[\[Tree\]](#) (config>subscr-mgmt>gtp>peer-profile report-wlan-location)

### Full Context

configure subscriber-mgmt gtp peer-profile report-wlan-location

## Description

This command enables reporting the WLAN location or cellular location of the UE in the signaling interface (S2a or Gn) between the WLAN GW and the mobile gateway (PGW or GGSN).

The **no** form of this command disables location reporting.

## Default

no report-wlan-location

## Platforms

## 22.175 reporting

reporting

## Syntax

[no] reporting

## Context

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>gy>efh>interim-c reporting)

## Full Context

configure subscriber-mgmt diameter-application-policy gy extended-failure-handling interim-credit reporting

## Description

This command enables reporting of the used interim credit for each rating group when a new Diameter Gy session is successfully established with the Online Charging Server (OCS). When enabled, the used interim credit report includes:

- the unreported used credit assigned via the initial Diameter Gy session when Extended Failure Handling (EFH) became active
- the used interim credits during EFH
- the used credits assigned via the new established Diameter Gy session

The **no** form of this command disables interim credit reporting. Only credit assigned via the new established Diameter Gy session is reported.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## reporting

### Syntax

[no] reporting

### Context

[\[Tree\]](#) (config>test-oam>link-meas>template reporting)

### Full Context

configure test-oam link-measurement measurement-template reporting

### Description

This command specifies whether values that reach a configured threshold are reported to the routing engine. Reaching a configured **sample-window** or **aggregate-sample-window** indicates a value of interest.

When this command is disabled, values reaching thresholds are not reported to the routing engine. In both enabled and disabled cases, the **sample-window** and **aggregate-sample-window** information and computed values are stored on the node until overwriting occurs.

### Default

reporting

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

**[Tree]** (config>service>vpls>spoke-sdp>control-channel-status request-timer)

**[Tree]** (config>service>cpipe>spoke-sdp>control-channel-status request-timer)

**Full Context**

configure service epipe spoke-sdp control-channel-status request-timer

configure service vpls spoke-sdp control-channel-status request-timer

configure service cpipe spoke-sdp control-channel-status request-timer

**Description**

This command configures the control channel status request mechanism. When it is configured, control channel status request procedures are used. These augment the procedures for control channel status messaging from RFC 6478. This command cannot be used with a non-zero refresh-timer value.

**Parameters**

***timer1***

Specifies the interval, in seconds, at which pseudowire status messages, including a reliable delivery TLV with the "request" bit set, are sent.

**Values** 10 to 65535

**timer2**

specifies the timeout interval, in seconds, if no response to a pseudowire status request is received. This parameter must be configured. A value of zero (0) disables retries.

**Values** 0, 3 to 60

**multiplier**

If a requesting node does not receive a valid response to a pseudowire status request within a number of seconds equal to the retry timer multiplied by this multiplier, then it will assume the pseudowire is down. This parameter is optional.

**Values** 3 to 20

**Platforms**

All

- configure service epipe spoke-sdp control-channel-status request-timer
  - configure service vpls spoke-sdp control-channel-status request-timer
- 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS
- configure service cpipe spoke-sdp control-channel-status request-timer

**request-timer****Syntax**

**request-timer** *request-timer-secs* **retry-timer** *retry-timer-secs* **timeout-multiplier** *multiplier*  
**no request-timer**

**Context**

[\[Tree\]](#) (config>service>vpls>spoke-sdp>control-channel-status request-timer)

**Full Context**

configure service vpls spoke-sdp control-channel-status request-timer

**Description**

This command configures the control channel status request mechanism. When it is configured, control channel status request procedures are used. These augment the procedures for control channel status messaging from RFC 6478, *Pseudowire Status for Static Pseudowires*. This command cannot be used with a non-zero refresh-timer value.

**Parameters*****request-timer-secs***

Specifies the interval, in seconds, at which pseudowire status messages, including a reliable delivery TLV with the "request" bit set, are sent.

**Values** 10 to 65535

***retry-timer-secs***

specifies the timeout interval, in seconds, if no response to a pseudowire status request is received. This parameter must be configured. A value of zero (0) disables retries.

**Values** 0, 3 to 60

***multiplier***

If a requesting node does not receive a valid response to a pseudowire status request within a number of seconds equal to the retry timer multiplied by this multiplier, then it will assume the pseudowire is down. This parameter is optional.

**Values** 3 to 20

**Platforms**

**Context**

[\[Tree\]](#) (config>service>ies>if>spoke-sdp>control-channel-status request-timer)

**Full Context**

configure service ies interface spoke-sdp control-channel-status request-timer

**Description**

This command configures the control channel status request mechanism. When it is configured, control channel status request procedures are used. These augment the procedures for control channel status messaging from RFC 6478. This command is mutually exclusive with a non-zero refresh-timer value.

**Parameters*****timer1***

Specifies the interval at which pseudowire status messages, including a reliable delivery TLV, with the "request" bit set, are sent.

**Values** 10 to 65535 seconds

**retry-timer** *timer2*

Specifies the timeout interval if no response to a pseudowire status request is received. This parameter must be configured. A value of zero (0) disables retries.

**Values** 0, 3 to 60 seconds

**timeout-multiplier** *multiplier*

If a requesting node does not receive a valid response to a pseudowire status request within this multiplier times the retry timer, then it will assume the pseudowire is down. This parameter is optional.

**Values** 3 to 20 seconds

configure service vprn redundant-interface spoke-sdp control-channel-status request-timer

### Description

This command configures the control channel status request mechanism. When it is configured, control channel status request procedures are used. These augment the procedures for control channel status messaging from RFC 6478. This command is mutually exclusive with a non-zero refresh-timer value.

### Parameters

#### **request-timer-secs**

Specifies the interval, in seconds, at which pseudowire status messages, including a reliable delivery TLV, with the "request" bit set, are sent.

**Values** 10 to 65535

#### **retry-timer** *retry-timer-secs*

Specifies the timeout interval, in seconds, if no response to a pseudowire status request is received. This parameter must be configured. A value of zero (0) disables retries.

**Values** 0, 3 to 60

#### **timeout-multiplier** *multiplier*

Specifies the multiplier, in seconds. If a requesting node does not receive a valid response to a pseudowire status request within this multiplier times the retry timer, then it assume the pseudowire is down. This parameter is optional.

**Values** 3 to 15

## Platforms

## Full Context

```
configure router mpls sr-te-resignal resignal-on-igp-event
```

## Description

This command introduces the ad-hoc resignaling of all SR-TE LSPs at the receipt of one or more IGP link down events in TE-DB. Once the re-optimization is triggered, the behavior is exactly the same as the timer based resignal or the **delay** option of the manual based resignal. MPLS forces the expiry of the resignal timer and asks TE-DB to re-evaluate the active paths of all SR-TE LSPs. The re-evaluation consists of updating the total IGP or TE metric of the current path, checking the validity of the hops and labels, and computing a new CSPF for each SR-TE LSP. MPLS programs the new path only if the total metric of the new computed path is different than the updated metric of the current path, or if one or more hops or labels of the current path are invalid. Otherwise, the current path is considered to be one of the most optimal ECMP paths and is not updated in data path.

## Platforms

## 22.192 resignal-on-igp-overload

## resignal-on-igp-overload

### Syntax

[no] **resignal-on-igp-overload**

### Context

**[Tree]** (config>router>mpls resignal-on-igp-overload)

### Full Context

configure router mpls resignal-on-igp-overload

### Description

This command enables the resignaling of all RSVP-TE LSPs at the receipt of the IS-IS overload bit in the TE-DB.

Once the re-optimization is triggered, the behavior is the same as the timer-based resignal or the **delay** option of the manual-based resignal. MPLS forces the expiry of the resignal timer and requests the TE-DB to compute a new CSPF for each RSVP-TE LSP active path.

This re-optimization effectively causes the immediate move of transit RSVP-TE LSP paths away from the IS-IS node in overload.

By default, MPLS re-optimizes, using the MBB procedure, the transit paths away from the node in an IS-IS overload state only at the time a manual or timer-based resignal is performed for the LSP paths. MPLS does not act immediately on the receipt of the IS-IS overload bit.

#### Note:

This command and the **retry-on-overload** command are mutually exclusive.

The **no** form of this command results in the MPLS not acting immediately to the request of the IS-IS overload bit.

### Default

no resignal-on-overload

### Platforms

All

## resignal-on-igp-overload

### Syntax

[no] **resignal-on-igp-overload**

### Context

**[Tree]** (config>router>mpls>sr-te-resignal resignal-on-igp-overload)

## Full Context

```
configure router mpls sr-te-resignal resignal-on-igp-overload
```

## Description

This command enables the ad-hoc re-optimization of the CSPF paths of all SR-TE LSPs when IS-IS receives an IS-IS overload bit advertisement from a remote router.

When this command is enabled on the router and an IGP overload bit is set in a Layer 1 or Layer 2 IS-IS LSP received from a remote router, MPLS performs an ad-hoc re-optimization of all the paths of all the SR-TE LSPs that have paths computed by the local CSPF. For each SR-TE LSP current path that transits the router in overload, the CSPF looks for a new path that avoids the router. For each SR-TE LSP current path that terminates on the router in overload, the CSPF checks if a better path exists. In both cases, if a new path is not found the system maintains the current path when operationally up.

The ad-hoc re-optimization triggers the timer-based re-optimization by forcing the resignal timer to expire. Therefore, the user must use the following command to configure the resignal timer for the SR-TE application.

```
configure router mpls sr-te-resignal resignal-timer
```

The **no** form of this command configures MPLS to not act immediately on an IS-IS overload bit from a remote router. MPLS will act on it at the next timer-based or manual re-optimization of the SR-TE LSPs.

## Default

```
no resignal-on-igp-overload
```

## Platforms

All

resignal-timer minutes
```

```
no resignal-timer
```

## Context

```
[Tree] (config>router>mpls resignal-timer)
```

## Full Context

```
configure router mpls resignal-timer
```

## Description

This command specifies the value for the LSP resignal timer. The resignal timer is the time, in minutes, the software waits before attempting to resignal the LSPs.

When the resignal timer expires, if the new computed path for an LSP has a better metric than the current recorded hop list, an attempt is made to resignal that LSP using the make-before-break mechanism. If the attempt to resignal an LSP fails, the LSP continues to use the existing path and a resignal will be attempted the next time the timer expires.

The **no** form of this command disables timer-based LSP resignaling.

## Default

no resignal-timer

## Parameters

### *minutes*

Specifies the time the software waits before attempting to resignal the LSPs.

**Values** 30 to 10080

## Platforms

All

## resignal-timer

## Syntax

**resignal-timer** *minutes*

**no resignal-timer**

## Context

[\[Tree\]](#) (config>router>mpls>sr-te-resignal resignal-timer)

## Full Context

configure router mpls sr-te-resignal resignal-timer

## Description

This command specifies the value for the SR-TE LSP resignal timer when the path computation method is set to the local CSPF or the PCE.

The resignal timer is the time, in minutes, MPLS waits before attempting to re-optimize all paths of all SR-TE LSPs. The re-optimization is performed by the local CSPF or the PCE, depending on the value of the parameter **path-computation-method**.

When local CSPF is used and the resignal timer expires, MPLS provides the current path of the SR-TE LSP and TE-DB updates the total IGP or TE metric of the current path and checks the validity of the hops and labels. CSPF then computes a new path for each SR-TE LSP. MPLS programs the new path only if the total metric of the new computed path is different than the updated metric of the current path, or if one or

more hops or labels of the current path are invalid. Otherwise, the current path is considered to be one of the most optimal ECMP paths and is not updated in data path.

The **no** form of this command disables timer-based LSP resignaling.

### Default

no resignal-timer

### Parameters

#### *minutes*

Specifies the time, in minutes, the software waits before attempting to resignal the SR-TE TSPs.

**Values** 30 to 10080

### Platforms

configure service vprn bgp-ipvpn segment-routing-v6 resolution

configure service vpls bgp-evpn segment-routing-v6 resolution

configure service vprn bgp-evpn segment-routing-v6 resolution

### Description

This command configures the resolution option for routes in the specified family.

The **no** form of the command reverts to the default.

## Default

resolution route-table

## Parameters

### route-table

Keyword that specifies to resolve the route to the shortest-path SRv6 tunnel. If no such SRv6 policy is found, the resolution fails.

### tunnel-table

Keyword that specifies to resolve the route directly to a tunnel in TTMv6. The system tries to find an SRv6 policy with a matching color and endpoint for BGP routes received with an SRv6 TLV and containing an SRv6 service SID in the IPv6 tunnel table. If none is found, the resolution fails.

### fallback-tunnel-to-route-table

Keyword that specifies to first try resolving the route to a tunnel in the IPv6 tunnel table. If none is found in the IPv6 tunnel table, fall back to the shortest-path SRv6 resolution. If no such SRv6 policy is found in RTM, the resolution fails.

## Full Context

configure service vpls bgp-evpn mpls auto-bind-tunnel resolution

configure service vprn bgp-ipvpn mpls auto-bind-tunnel resolution

configure service epipe bgp-evpn mpls auto-bind-tunnel resolution

configure service vprn bgp-evpn mpls auto-bind-tunnel resolution

## Description

This command configures the resolution mode in the automatic binding of a BGP-EVPN or BGP-IPVPN MPLS service to tunnels to MP-BGP peers.

## Default

resolution disabled

## Parameters

### any

Enables the binding to any supported tunnel type in a BGP-EVPN or BGP-IPVPN MPLS context following TTM preference.

### disabled

Disables the automatic binding of a BGP-EVPN or BGP-IPVPN MPLS service to tunnels to MP-BGP peers.

### filter

Enables the binding to the subset of tunnel types configured the **resolution-filter** context.

## Platforms

All

## resolution

## Syntax

**resolution** {**any** | **disabled** | **filter**}

## Context

[\[Tree\]](#) (config>router>static-route-entry>indirect>tunnel-next-hop resolution)

## Full Context

configure router static-route-entry indirect tunnel-next-hop resolution

## Description

This command determines the resolution mode for the associated static route to a tunnel next hop.

## Default

resolution any

## Parameters

### any

Allows the associated static route to be resolved to any active entry in the TTM, following the TTM preference order.

### disabled

Disables the resolution of the associated static route to any active entry in the TTM. As a result, the static route can only be resolved via IP RTM resolution of the static route's next hop.

### filter

Allows the associated static route to be resolved to active tunnels in the TTM using the resolution-filter restrictions.

## Platforms

All

## resolution

## Syntax

**resolution** {**any** | **filter** | **disabled**}

## Context

[\[Tree\]](#) (config>router>bgp>next-hop-resolution>labeled-routes>transport-tunnel>family resolution)

## Full Context

configure router bgp next-hop-resolution labeled-routes transport-tunnel family resolution

## Description

This command configures the resolution mode in the resolution of BGP label routes using tunnels to BGP peers.

## Parameters

### any

Enables the binding to any supported tunnel type in the BGP label route context following TTM preference.

### filter

Enables the binding to the subset of tunnel types configured under **resolution-filter**.

### disabled

Disables the resolution of BGP label routes using tunnels to BGP peers.

## Platforms

## resolution

## Syntax

**resolution** {**any** | **disabled** | **filter**}

## Context

[\[Tree\]](#) (config>service>vprn>auto-bind-tunnel resolution)

## Full Context

configure service vprn auto-bind-tunnel resolution

## Description

This command configures the resolution method for tunnel selection.

## Default

resolution any

## Parameters

### *any*

Allows the associated static route to be resolved to any active entry in the TTM, following the TTM preference order.

### *disabled*

Disables the associated static route to be resolved to any active entry in the TTM. As a result, the static route can only be resolved via IP RTM resolution of the static route's nexthop.

#### filter

Allows the associated static route to be resolved to active tunnels in the TTM using the resolution-filter restrictions.

## 22.195 resolution-filter

### resolution-filter

#### Syntax

**resolution-filter**

#### Context

**[Tree]** (config>service>vprn>bgp-ipvpn>mpls>auto-bind-tunnel resolution-filter)

**[Tree]** (config>service>vprn>bgp-evpn>mpls>auto-bind-tunnel resolution-filter)

configure service vprn bgp-evpn mpls auto-bind-tunnel resolution-filter

configure service vpls bgp-evpn mpls auto-bind-tunnel resolution-filter

configure service epipe bgp-evpn mpls auto-bind-tunnel resolution-filter

#### Description

Commands in this context configure the subset of tunnel types that can be used in the resolution of BGP-EVPN or BGP-IPVPN routes within the automatic binding of BGP-EVPN or BGP-IPVPN MPLS service to tunnels to MP-BGP peers.

The following tunnel types are supported in a BGP-EVPN or BGP-IPVPN MPLS context: BGP, LDP, RIB-API, RSVP, SR-ISIS, SR-OSPF, SR-policy, SR-TE, UDP, and MPLS forwarding policy.

The user must set **resolution** to **filter** to activate the list of tunnel-types configured under **resolution-filter**.

#### Note:

UDP tunnels are created through import policies with action **create-udp-tunnel**.

#### Platforms

All

## resolution-filter

### Syntax

**resolution-filter**

### Context

[\[Tree\]](#) (config>router>static-route-entry>indirect>tunnel-next-hop resolution-filter)

### Full Context

configure router static-route-entry indirect tunnel-next-hop resolution-filter

### Description

This command creates the context to configure the tunnel next-hop resolution options.

If one or more tunnel filter criteria are specified, the static route nexthop is resolved to an available tunnel from one of those LSP types. The tunnel type is selected based on the TTM preference.

### Platforms

All

## resolution-filter

### Syntax

### Syntax

**resolution-filter** [bgp] [ldp] [rsvp] [sr-isis] [sr-ospf] [sr-policy] [sr-te]

## Context

[\[Tree\]](#) (config>router>bgp>next-hop-res>shortcut-tunn>family resolution-filter)

## Full Context

configure router bgp next-hop-resolution shortcut-tunnel family resolution-filter

## Description

This command configures the subset of tunnel types that can be used to resolve BGP unlabeled routes.

## Parameters

### bgp

Selects the BGP label route tunnel type.

### ldp

Selects the LDP tunnel type.

### rsvp

Selects the RSVP-TE tunnel type.

### sr-isis

Selects the SR tunnel type programmed by an IS-IS instance in TTM.

### sr-ospf

Selects the SR tunnel type programmed by an OSPF instance in TTM.

### sr-policy

Selects the SR tunnel type programmed by an SR policy instance in TTM.

### sr-te

Selects the SR tunnel type programmed by a TE instance in TTM.

## Platforms

## 22.196 resolve

## resolve

## Syntax

**resolve** *minutes*

## Context

[\[Tree\]](#) (config>service>vpls>proxy-arp>dynamic resolve)

[\[Tree\]](#) (config>service>vpls>proxy-nd>dynamic resolve)

## Full Context

configure service vpls proxy-arp dynamic resolve

configure service vpls proxy-nd dynamic resolve

## Description

This command configures the frequency at which a resolve message is sent. The resolve message is an ARP-request or NS message flooded to all the non-EVPN endpoints in the service irrespective of the current status of the **unknown-arp-request-flood-evpn** or **unknown-ns-flood-evpn** commands.

## Default

resolve 5

## Parameters

### *minutes*

Specifies the frequency in minutes at which the **resolve** message is issued.

**Values** 1 to 60

**Default** 5

## Platforms

All

## 22.197 resolve-root-using

### resolve-root-using

## Syntax

**resolve-root-using** {**ucast-rtm** | **mcast-rtm**}

## Context

[\[Tree\]](#) (config>router>ldp resolve-root-using)

## Full Context

configure router ldp resolve-root-using

## Description

By default, MLDP resolves the FEC using the unicast RTM. When this command is set to **mcast-rtm**, MLDP will resolve the FEC using the multicast route table. The multicast route table does not include any IGP shortcuts, unlike the unicast RTM. MLDP cannot resolve a FEC using an IGP shortcut, so if IGP shortcuts are used for unicast, enable multicast MLDP lookups.

If this command is set to **mcast-rtm**:

- For FEC resolution using IGP, static or local, the ROOT in this FEC is resolved using the multicast RTM.
- A FEC being resolved using BGP is recursive, so the FEC next-hop (ASBR/ABR) is resolved using the multicast RTM first and, if this fails, it is resolved using the unicast RTM. This next-hop needs to be recursively resolved again using IGP/Static-Route or Local, this second resolution (recursive resolution) uses the multicast RTM only.
- In all cases, MLDP uses the unicast RTM to resolve the FEC and will not resolve the FEC if its next hop is resolved using an IGP shortcut.

## Default

resolve-root-using ucast-rtm

## Platforms

All

## 22.198 resolve-static

### resolve-static

## Syntax

[no] **resolve-static**

## Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>default-action resolve-static)

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>action resolve-static)

## Full Context

configure router policy-options policy-statement default-action resolve-static

configure router policy-options policy-statement entry action resolve-static

## Description

This command has an affect only in BGP route-table-import policies and applies only to BGP IPv4 and IPv6 routes created by importing static routes with indirect next-hops. When such a route matches a policy entry with this action, the BGP next-hop is the resolved next-hop of the static route.

The **no** form of this command reverts to the default behavior, which copies the indirect next-hop of the static route into the BGP next-hop without resolving it further.

**Default**

no resolve-static

**Platforms**

All

## 22.199 resolve-v6-prefix-over-shortcut

```
resolve-v6-prefix-over-shortcut
```

**Syntax**

[no] resolve-v6-prefix-over-shortcut

**Context**

[\[Tree\]](#) (config>router>ldp>targ-session resolve-v6-prefix-over-shortcut)

**Full Context**

configure router ldp targeted-session resolve-v6-prefix-over-shortcut

**Description**

This command allows an IPv6 prefix FEC to be resolved over an IGP shortcut.  
The **no** form of this command disables the resolution.

## 22.200 responder-url

```
responder-url
```

**Syntax**

responder-url *url-string*  
no responder-url

**Context**

[\[Tree\]](#) (config>system>security>pki>ca-profile>ocsp responder-url)

## Full Context

configure system security pki ca-profile oosp responder-url

## Description

This command specifies HTTP URL of the OCSP responder for the CA, this URL will only be used if there is no OCSP responder defined in the AIA extension of the certificate to be verified.

## Default

no responder-url

## Parameters

### *url-string*

Specifies the HTTP URL of the OCSP responder

## Platforms

All

## 22.201 response-signing-cert

### response-signing-cert

## Syntax

**response-signing-cert** *filename*

**no response-signing-cert**

## Context

[\[Tree\]](#) (config>system>security>pki>ca-profile>cmp2 response-signing-cert)

## Full Context

configure system security pki ca-profile cmp2 response-signing-cert

## Description

This command specifies a imported certificate that is used to verify the CMP response message if they are protected by signature. If this command is not configured, then CA's certificate will be used.

## Default

no response-signing-cert

## Parameters

### *filename*

Specifies the filename of the imported certificate.

## 22.202 restart-backoff

### restart-backoff

#### Syntax

**restart-backoff** *initial-time seconds* **max-time** *seconds*  
**no restart-backoff**

#### Context

**[Tree]** (config>subscr-mgmt>pppoe-client-policy restart-backoff)

#### Full Context

configure subscriber-mgmt pppoe-client-policy restart-backoff

#### Description

This command configures backoff timer parameters that determine how often and how long the system will attempt to restart a PPPoE client after a failure. When a client first fails, the system immediately tries to re-establish connectivity. If this attempt is also unsuccessful, the system initiates a backoff timer and waits until it expires before attempting to restart the client again, to avoid flooding the BNG. The initial duration of the backoff timer is configured with the **initial-time** parameter. With each subsequent failure, the backoff timer is doubled until the configured **max-time** is reached.

The **no** form of this command reverts to the default.

#### Default

restart-backoff initial-time 30 max-time 600

#### Parameters

##### **initial-time** *seconds*

Specifies the initial backoff time to wait before attempting a client restart.

**Values** 10 to 3600

##### **max-time** *seconds*

Specifies the maximum time to attempt client restarts.

**Values** 10 to 3600

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure subscriber-mgmt local-user-db ipoe host wpp restore-disconnected
```

## Description

This command specifies the behavior that system will restore the **initial-sla-profile**, **initial-sub-profile**, or **initial-app-profile** when hosts disconnects instead of removing them.

The **no** form of this command reverts to the default.

## Parameters

### restore

Specifies that the initial profiles must be restored after a DHCP host has disconnected.

### no-restore

Specifies that the initial profiles will not be restored after a DHCP host has disconnected.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.205 restrict-protected-src

### restrict-protected-src

#### Syntax

**restrict-protected-src discard-frame**

**restrict-protected-src [alarm-only]**

**no restrict-protected-src**

#### Context

**[Tree]** (config>service>pw-template>split-horizon-group restrict-protected-src)

**[Tree]** (config>service>vpls>mesh-sdp restrict-protected-src)

**[Tree]** (config>service>vpls>spoke-sdp restrict-protected-src)

**[Tree]** (config>service>vpls>split-horizon-group restrict-protected-src)

**[Tree]** (config>service>pw-template restrict-protected-src)

**[Tree]** (config>service>vpls>endpoint restrict-protected-src)

**[Tree]** (config>service>vpls>sap restrict-protected-src)

#### Full Context

configure service pw-template split-horizon-group restrict-protected-src

configure service vpls mesh-sdp restrict-protected-src

configure service vpls spoke-sdp restrict-protected-src

configure service vpls split-horizon-group restrict-protected-src

configure service pw-template restrict-protected-src

configure service vpls endpoint restrict-protected-src

configure service vpls sap restrict-protected-src

#### Description

This command indicates how the agent will handle relearn requests for protected MAC addresses, either manually added using the `mac-protect` command or automatically added using the **auto-learn-mac-protect** command. While enabled all packets entering the configured SAP, spoke SDP, mesh SDP, or any SAP that is part of the configured split horizon group (SHG) is verified not to contain a protected source MAC address. If the packet is found to contain such an address, the action taken depends on the parameter specified on the **restrict-protected-src** command, namely:

- **No parameter** — The packet is discarded, an alarm is generated and the SAP, spoke SDP or mesh SDP is set operationally down. The SAP, spoke SDP or mesh SDP must be shut down and enabled (**no shutdown**) for this state to be cleared.
- **alarm-only** — The packet is forwarded, an alarm is generated but the source MAC is not learned on the SAP, spoke SDP or mesh SDP.

- **discard-frame** — The packet is discarded and an alarm generated. The frequency of alarm generation is fixed to be at most one alarm per MAC address per FP per 10 minutes in a given VPLS service. This parameter is only applicable to automatically protected MAC addresses.

When the **restrict-protected-src** is enabled on an SHG the action only applies to the associated SAPs (no action is taken by default for spoke SDPs in the SHG) and is displayed in the SAP show output as the oper state unless it is overridden by the configuration of **restrict-protected-src** on the SAP itself. To enable this function for spoke SDPs within a SHG, the **restrict-protected-src** must be enabled explicitly under the spoke SDP. If required, **restrict-protected-src** can also be enabled explicitly under specific SAPs within the SHG.

When this command is applied or removed, with either the **alarm-only** or **discard-frame** parameters, the MAC addresses are cleared from the related object.

The use of **restrict-protected-src discard-frame** is mutually exclusive with the configuration of manually protected MAC addresses within a given VPLS.

The **alarm-only** parameter is not supported on the 7750 SR-a, 7750 SR-1e/2e/3e, 7950 XRS, 7750 SR-1, or 7750 SR-1s/2s/7s/14s platforms.

The **no** form of the command reverts to the default.

## Default

no restrict-protected-src

## Parameters

### alarm-only

Specifies that the packet is forwarded, an alarm is generated but the source MAC is not learned on the SAP, spoke SDP, or mesh SDP.

**Default** no alarm-only

### discard-frame

Specifies that the packet is discarded and an alarm generated. The frequency of alarm generation is fixed to be at most one alarm per MAC address per FP per 10 minutes within a given VPLS service.

**Default** no discard-frame

## Platforms

All

## restrict-protected-src

## Syntax

**restrict-protected-src discard-frame**

**no restrict-protected-src**

## Context

[\[Tree\]](#) (config>service>vpls>pbb>backbone-vpls restrict-protected-src)

## Full Context

```
configure service vpls pbb backbone-vpls restrict-protected-src
```

## Description

This command indicates how the agent handles relearn requests for protected MAC addresses, either manually added using the **mac-protect** command or automatically added using the **auto-learn-mac-protect** command. While enabled, all packets entering the configured SAP, spoke SDP, mesh SDP, or any SAP that is part of the configured split horizon group (SHG) is verified not to contain a protected source MAC address. If the packet is found to contain such an address, the action taken depends on the parameter specified on the **restrict-protected-src** command, namely:

- No parameter — The packet is discarded, an alarm is generated and the SAP, spoke SDP or mesh SDP will be set as operationally down. The SAP, spoke SDP or mesh SDP must be shutdown and enabled (no shutdown) for this state to be cleared.
- **discard-frame** — The packet is discarded and an alarm generated. The frequency of alarm generation is fixed to be at most one alarm per MAC address per FP per 10 minutes in a specified VPLS service. This parameter is only applicable to automatically protected MAC addresses.

When the **restrict-protected-src** is enabled on an SHG, the action only applies to the associated SAPs (no action is taken by default for spoke-SDPs in the SHG) and is displayed in the SAP show output as the oper state unless it is overridden by the configuration of **restrict-protected-src** on the SAP itself. To enable this function for spoke SDPs within a SHG, the **restrict-protected-src** must be enabled explicitly under the spoke SDP. If required, **restrict-protected-src** can also be enabled explicitly under specific SAPs within the SHG.

When this command is applied or removed, with the **discard-frame** parameter, the MAC addresses are cleared from the related object.

The use of **restrict-protected-src discard-frame** is mutually exclusive with the configuration of manually protected MAC addresses within a specified VPLS.

## Default

```
no restrict-protected-src
```

## Parameters

### discard-frame

Specifies that the packet is discarded and an alarm generated. The frequency of alarm generation is fixed to be at most one alarm per MAC address per FP per 10 minutes within a specified VPLS service

## Description

This command indicates how the system will forward packets destined for an unprotected MAC address, either manually added using the **mac-protect** command or automatically added using the **auto-learn-mac-protect** command. While enabled all packets entering the configured SAP or SAPs within a split horizon group (but not spoke or mesh-SDPs) will be verified to contain a protected destination MAC address. If the packet is found to contain a non-protected destination MAC, it will be discarded. Detecting a non-protected destination MAC on the SAP will not cause the SAP to be placed in the operationally down state. No alarms are generated.

If the destination MAC address is unknown, even if the packet is entering a restricted SAP, with **restrict-unprotected-dst** enabled, it will be flooded.

## Default

no restrict-unprotected-dst

### restricted-to-home

## Syntax

[no] restricted-to-home

## Context

**[Tree]** (config>system>security>user restricted-to-home)

**[Tree]** (config>system>security>user-template restricted-to-home)

## Full Context

configure system security user restricted-to-home

configure system security user-template restricted-to-home

## Description

This command prevents users from navigating above their home directories for file access (either by means of CLI sessions with the file command, '>' redirection, or by means of FTP). A user is not allowed to navigate to a directory higher in the directory tree on the home directory device. The user is allowed to create and access subdirectories below their home directory.

When enabled, this command prevents a user from being able to execute an **admin save** command for the configuration if they do not have access to the directory where the configuration file is saved. The same behavior applies for the **bof save** command and the **li save** command.

If a home-directory is not configured or the home directory is not available, then the user has no file access.

The **no** form of this command allows the user access to navigate to directories above their home directory.

### Default

no restricted-to-home

#### Syntax

**results** *file-url*

**no results**

#### Context

[\[Tree\]](#) (config>system>script-control>script-policy results)

#### Full Context

configure system script-control script-policy results

#### Description

This command is used to specify the location where the system writes the output of an event script's execution.

The **no** form of the command removes the file location from the configuration. Scripts will not execute if there is no result location defined.

#### Default

no results

#### Parameters

##### *file-url*

Specifies the location to send CLI output from script runs. The *file-url* is a location, directory, and filename prefix to which a data and timestamp suffix is added when the results files are created during a script run, as follows:

*file-url*\_YYYYMMDD-hhmmss.uuuuuu.out

where:

YYYYMMDD — date

hhmmss — hours, minutes, and seconds

uuuuuu — microseconds (padded to 6 characters with leading zeros)

**Values** *local-url | remote-url*

*local-url* — [*cflash-id*] [*file-path*] 167 chars max, including *cflash-id*  
*file-path* 166 chars max

*remote url* — [{*ftp://* | *tftp://*}*login:password@remote-location*][*file-path*]  
255 characters max directory length 99 characters max each

*remote-location* — [*hostname* | *ipv4-address* | *ipv6-address*]

*ipv4-address* — *a.b.c.d*

*ipv6-address* — *x:x:x:x:x:x[-interface] x:x:x:x:x.d.d.d.d[-interface] x*  
— [0 to FFFF]H d — [0 to 255]D *interface* — 32 characters max, for link  
local addresses

*cflash-id* — *cf1:*, *cf1-A:*, *cf1-B:*, *cf2:*, *cf2-A:*, *cf2-B:*, *cf3:*, *cf3-A:*, *cf3-B:*

### Full Context

configure port access ingress pool resv-cbs  
 configure port access egress channel pool resv-cbs  
 configure port network egress pool resv-cbs  
 configure port access egress pool resv-cbs

### Description

This command defines the percentage or specifies the sum of the pool buffers that are used as a guideline for CBS calculations for access and network ingress and egress queues. Two actions are accomplished by this command:

- A reference point is established to compare the currently assigned (provisioned) total CBS with the amount the buffer pool considers to be reserved. Based on the percentage of the pool reserved that has been provisioned, the over provisioning factor can be calculated.
- The size of the shared portion of the buffer pool is indirectly established. The shared size is important to the calculation of the instantaneous-shared-buffer-utilization and the average-shared-buffer-utilization variables used in Random Early Detection (RED) per packet slope plotting.

It is important to note that this command does not actually set aside buffers within the buffer pool for CBS reservation. The CBS value per queue only determines the point at which enqueueing packets are subject to a RED slope. Oversubscription of CBS could result in a queue operating within its CBS size and still not able to enqueue a packet due to unavailable buffers. The resv-cbs parameter can be changed at any time.

If the total pool size is 10 Mb and the resv-cbs set to 5, the 'reserved size' is 500 kb.

The **no** form of this command clears all the adaptive configurations. There cannot be any adaptive sizing enabled for default **resv-cbs**.

### Default

resv-cbs 30

### Parameters

#### *percent-or-default*

Specifies the pool buffer size percentage.

**Values** 0 to 100, **default**

#### *amber-alarm-action step percent*

Specifies the percentage step-size for the reserved CBS size of the pool. When using the default value, the adaptive CBS sizing is disabled. To enable adaptive CBS sizing, **step percent** must be set to non-default value along with the **max** parameter. When reserved CBS is default adaptive CBS sizing cannot be enabled. The reserved CBS (Committed Burst Size) defines the amount of buffer space within the pool that is not considered shared.

**Values** 1 to 100

**Default** 0

### **max percent**

Specifies the maximum percentage for the reserved CBS size of the pool. When using the default value, the adaptive CBS sizing is disabled. To enable adaptive CBS sizing, **max** value must be set to non-default value along with the **step percent**. When reserved CBS is default adaptive CBS sizing cannot be enabled. The reserved CBS (Committed Burst Size) defines the amount of buffer space within the pool that is not considered shared. Max reserved CBS must not be more than the reserved CBS.

**Values** 1 to 100

**Default** 0

**no resv-cbs**

### **Context**

[\[Tree\]](#) (config>card>fp>egress>wred-queue-control resv-cbs)

### **Full Context**

configure card fp egress wred-queue-control resv-cbs

### **Description**

This command defines the amount of buffers within the WRED mega-pool that will be set aside for WRED queues operating within their configured CBS thresholds. **Note** that the **min percentage** and **max percentage** parameters must be set to the same value. The forwarding plane protects against WRED queue buffer starvation by setting aside a portion of the buffers within the WRED mega-pool. The WRED queue CBS threshold defines when a WRED queue requests buffers from reserved portion of the WRED mega-pool and when it starts requesting buffers from the shared portion of the mega-pool. With proper oversubscription provisioning, this prevents a seldom active queue from being denied a buffer from the mega-pool when the shared portion of the mega-pool is congested.

The WRED mega-slope reserve CBS size is controlled in the same manner as the overall sizing of the WRED mega-pool. A min and max parameter is provided to scope the range that the reserved portion based on percentages of the WRED mega-pool current size.

The **no** form of this command immediately restores the default min and max percentage values for sizing the WRED mega-pool CBS reserve.

### **Default**

resv-cbs min 25.00 max 25.00

## Parameters

### **min percentage**

Specifies that the required keyword defines the minimum percentage of the WRED mega-pool buffers that will be applied to the CBS reserve. The value given for *percentage* must be less than or equal to the value given for the **max percentage**. Percentages are defined with an accuracy of hundredths of a percent in the nn.nn format (15.65 = 15.65%).

**Values** 0.00 to 99.99

**Default** 25.00

### **max percentage**

Specifies that the required keyword defines the maximum percentage of the IOM3-XP WRED mega-pool buffers that may be applied to the CBS reserve. The value given for *percentage* must be greater than or equal to the value given for the **min percentage**. Percentages are defined with an accuracy of hundredths of a percent in the nn.nn format (15.65 = 15.65%).

**Values** 0.01 to 99.99

**Default** 25.00

## 22.211 resv-ret

```
resv-ret
```

### Syntax

```
resv-ret resv-ret
```

### Context

```
[Tree] (config>isa>video-group resv-ret)
```

### Full Context

```
configure isa video-group resv-ret
```

### Description

This command provides a mechanism to reserve an explicit amount of egress bandwidth, in Mb/s, for RET for all the ISAs within a video group. If the amount of egress bandwidth is less than the reserved amount, FCC requests are discarded and only RET requests processed. The bandwidth is dynamically adjusted per ISA within the video group if an ISA becomes operational/non-operational within the group.

### Default

```
resv-ret 0
```

### Parameters

***resv-ret***

Specifies the egress bandwidth in Mb/s.

**Values** 0 to 10500

### Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 22.214 ret

```
ret
```

### Syntax

*ret percent*

### Context

[\[Tree\]](#) (config>isa>video-group>watermark>bandwidth ret)

[\[Tree\]](#) (config>isa>video-group>watermark>session ret)

### Full Context

```
configure isa video-group watermark bandwidth ret
```

```
configure isa video-group watermark session ret
```

### Description

This command sets the watermark to trigger the SNMP trap if the RET bandwidth or session exceeds the configured percentage. The bandwidth is the available egress bandwidth of the ISA. The SNMP trap is cleared when the consumption is lowered by 10%. For example, if the system resource of the bandwidth available is 10 Gb/s and the watermark is configured to be 90%, the SNMP trap is raised as the bandwidth exceeds 9 Gb/s (90% of 10 Gb/s). The SNMP trap is cleared when the bandwidth drops below 8.1 Gb/s (10% of 9 Gb/s = 0.9 Gb/s, and 9 Gb/s - 0.9 Gb/s = 8.1 Gb/s). The default value of the watermark is set at 90% of the system resources for both bandwidth and session.

### Default

```
ret 90
```

### Parameters

*percent*

Specifies the percentage of the system resources per ISA.

**Values** 1 to 99

### Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 22.220 retries

### retries

#### Syntax

**retries** *number*

**no retries**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>pfcp-association>heartbeat retries)

#### Full Context

configure subscriber-mgmt pfcp-association heartbeat retries

#### Description

This command configures the number of times the same Heartbeat Request message is sent before the PFCP path to the peer is considered down.

The **no** form of this command reverts to the default value.

#### Default

retries 4

#### Parameters

##### *number*

Specifies the number of times the same Heartbeat Request message is sent. This value should be identical on both the BNG UPF and CPF. For information about the BNG CUPS CPF configuration, refer to the *CMG BNG CUPS Control Plane Function Guide* and the *7750 SR MG and CMG CLI Reference Guide*.

**Values** 1 to 15

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## retries

### Syntax

**retries** *number*

**no retries**

### Context

[\[Tree\]](#) (config>subscr-mgmt>pfcf-association>tx retries)

### Full Context

configure subscriber-mgmt pfcf-association tx retries

### Description

This command configures the number of times a message is retried before the message is considered lost. This retry number is also known as N1.

The **no** form of this command reverts to the default value.

### Default

retries 3

### Parameters

#### *number*

Specifies the number of times a message is retried.

This value should be identical on both the BNG UPF and CPF. For information about the BNG CUPS CPF configuration, refer to the *CMG BNG CUPS Control Plane Function Guide* and the *7750 SR MG and CMG CLI Reference Guide*.

**Values** 1 to 7

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## retries

### Syntax

**retries** *count*

**no retries**

### Context

[\[Tree\]](#) (config>system>grpc>tcp-keepalive retries)

## Full Context

configure system grpc tcp-keepalive retries

## Description

This command configures the number of TCP keepalive probes sent by the router that must be unacknowledged before the connection is closed.

The **no** form of this command reverts to the default value.

## Default

retries 4

## Parameters

### *count*

Specifies the number of missed keep-alives before the TCP connection is declared down.

**Values** 3 to 100

**Default** 4

## Platforms

All

retries

## Syntax

**retries** *count*

**no retries**

## Context

[\[Tree\]](#) (config>system>grpc-tunnel>destination-group>tcp-keepalive retries)

[\[Tree\]](#) (config>system>telemetry>destination-group>tcp-keepalive retries)

## Full Context

configure system grpc-tunnel destination-group tcp-keepalive retries

configure system telemetry destination-group tcp-keepalive retries

## Description

This command configures the number of missed TCP keepalive probes before the TCP connection is closed and attempts are made to reach other destinations within the same destination group.

The **no** form of this command reverts to the default value.

**Default**

retries 4

**Parameters*****count***

Specifies the number of missed keep-alives before the TCP connection is declared down.

**Values** 3 to 100

**Default** 4

**Platforms**

All

## 22.221 retry

retry

**Syntax**

retry *count*

**Context**

[\[Tree\]](#) (config>aaa>l2tp-acct-plcy>radius-acct-server retry)

**Full Context**

configure aaa l2tp-accounting-policy radius-accounting-server retry

**Description**

This command configures the number of times the router attempts to contact the RADIUS server for authentication.

**Note:**

The retry count includes the first attempt.

The **no** form of this command reverts to the default value.

**Default**

retry 3 (the initial attempt as well as two retried attempts)

**Parameters*****count***

Specifies the retry count.

**Values** 1 to 10

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
retry
```

### Syntax

**retry** *count*

### Context

[\[Tree\]](#) (config>app-assure>rad-acct-plcy>server retry)

### Full Context

configure application-assurance radius-accounting-policy radius-accounting-server retry

### Description

This command configures the number of times the router attempts to contact the RADIUS accounting server if a response to the initial message is not received.

The **no** form of this command reverts to the default value.

### Default

retry 3

### Parameters

**count**

Specifies the retry count.

**Values** 1 to 10

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

```
retry
```

### Syntax

**retry** *count*

**no** **retry**

### Context

[\[Tree\]](#) (config>subscr-mgmt>auth-plcy>radius-auth-server retry)

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>server retry)

### Full Context

configure subscriber-mgmt authentication-policy radius-authentication-server retry

configure subscriber-mgmt radius-accounting-policy radius-accounting-server retry

### Description

This command configures the number of times the router attempts to contact the RADIUS server for authentication or accounting, if not successful the first time.

The **no** form of this command reverts to the default value.

### Default

retry 3

### Parameters

#### *count*

Specifies the retry count.

**Values** 1 to 10

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## retry

### Syntax

retry *count*

no retry

### Context

[\[Tree\]](#) (config>aaa>radius-srv-plcy>servers retry)

### Full Context

configure aaa radius-server-policy servers retry

### Description

This command configures the number of times the router attempts to contact the RADIUS server, if not successful the first time.

The **no** form of this command reverts to the default.

### Default

retry 3

## Parameters

### *count*

Specifies the number of times a signaling request message is transmitted towards the same peer.

**Values** 1 to 256

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## retry

## Syntax

**retry** *minutes*

**no retry**

## Context

[\[Tree\]](#) (config>service>vpls>bgp-evpn>mac-duplication retry)

## Full Context

configure service vpls bgp-evpn mac-duplication retry

## Description

Specifies the timer after which the MAC in hold-down state is automatically flushed and the mac-duplication process starts again. This value is expected to be equal to two times or more than that of window.

If **no** retry is configured, this implies that, when mac-duplication is detected, MAC updates for that MAC will be held down till the user intervenes or a network event (that flushes the MAC) occurs.

## Default

retry 9

## Parameters

### *minutes*

Specifies the BGP EVPN MAC duplication retry in minutes.

**Values** 2 to 60

## Platforms

All

## retry

### Syntax

**retry** *count*

**no retry**

### Context

[\[Tree\]](#) (config>service>vprn>aaa>remote-servers>radius retry)

### Full Context

configure service vprn aaa remote-servers radius retry

### Description

This command configures the number of times the router attempts to contact the RADIUS server for authentication if there are problems communicating with the server.

The **no** form of this command reverts to the default value.

### Default

retry 3

### Parameters

*count*

Specifies the retry count.

**Values** 1 to 10

### Platforms

All

## retry

### Syntax

**retry** *count*

**no retry**

### Context

[\[Tree\]](#) (config>system>file-trans-prof retry)

### Full Context

configure system file-transmission-profile retry

## Description

This command specifies the number of retries on transport protocol level.

When the virtual router does not receive any data from a server (e.g., FTP or HTTP server) after the configured **timeout seconds**, the router may repeat the request to the server. The number of retries specifies the maximum number of repeated requests.

The **no** form of this command disables the retry.

## Default

no retry

## Parameters

### *count*

Specifies the number of retries.

**Values** 1 to 256

## Platforms

All

## retry

## Syntax

**retry** *count*

## Context

[\[Tree\]](#) (config>aaa>isa-radius-plcy>servers retry)

## Full Context

configure aaa isa-radius-policy servers retry

## Description

This command configures the number of times the router attempts to contact the RADIUS server for authentication, if not successful the first time.

The **no** form of the command reverts to the default value.

## Default

retry 3

## Parameters

### *count*

Specifies the retry count.

**Values** 1 to 10

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

```
retry
```

## Syntax

**retry** *count*

**no retry**

## Context

[\[Tree\]](#) (config>system>security>radius retry)

[\[Tree\]](#) (config>system>security>dot1x>radius-plcy retry)

## Full Context

configure system security radius retry

configure system security dot1x radius-plcy retry

## Description

This command configures the number of times the router attempts to contact the RADIUS server for authentication if there are problems communicating with the server.

The **no** form of this command reverts to the default value.

## Default

retry 3

## Parameters

*count*

Specifies the retry count.

**Values** 1 to 10

## Platforms

All

```
retry
```

## Syntax

**retry** *count*

**no retry**

## Context

[\[Tree\]](#) (config>system>security>ldap retry)

## Full Context

configure system security ldap retry

## Description

This command configures the number of retries for the SR OS in its attempt to reach the current LDAP server before attempting the next server.

The **no** form of this command reverts to the default value.

## Default

retry 3

## Parameters

### *count*

Specifies the number of retransmissions.

**Values** 1 to 10

**Default** 3

## Platforms

All

## 22.222 retry-count

retry-count

## Syntax

retry-count [*count*]

no retry-count

## Context

[\[Tree\]](#) (config>subscr-mgmt>shcv-policy>periodic retry-count)

## Full Context

configure subscriber-mgmt shcv-policy periodic retry-count

## Description

This command configures the number of retransmissions.

The **no** form of this command reverts to the default.

### Default

retry-count 1 — For trigger-type ip-conflict, host-limit-exceeded and mobility

retry-count 10 — For trigger-type inactivity and MAC learning

### Parameters

#### *count*

Specifies the number of retransmissions in periodic connectivity verification.

**Values** 2 to 29

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## retry-count

### Syntax

retry-count [*count*]

no retry-count

### Context

[\[Tree\]](#) (config>subscr-mgmt>shcv-policy>trigger retry-count)

### Full Context

configure subscriber-mgmt shcv-policy trigger retry-count

### Description

This command configures the number of retransmissions in periodic connectivity verification.

The **no** form of this command reverts to the default.

### Default

retry-count 1

### Parameters

#### *count*

Specifies the number of retransmissions in periodic connectivity verification.

**Values** 1 to 29

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## retry-count

### Syntax

**retry-count** *retry-count*

**no retry-count**

### Context

**[Tree]** (config>service>epipe>spoke-sdp-fec retry-count)

### Full Context

configure service epipe spoke-sdp-fec retry-count

### Description

This optional command specifies the number of attempts software should make to reestablish the spoke SDP after it has failed. After each successful attempt, the counter is reset to zero.

When the specified number is reached, no more attempts are made and the spoke-sdp is put into the shutdown state.

Use the no shutdown command to bring up the path after the retry limit is exceeded.

The **no** form of this command reverts the parameter to the default value.

### Default

retry-count 30

### Parameters

***retry-count***

The maximum number of retries before putting the spoke-sdp into the shutdown state.

**Values** 10 to 10000

### Platforms

All

## retry-count

### Syntax

**retry-count** *retry-count*

**no retry-count**

### Context

**[Tree]** (config>test-oam>ldp-treetrace>path-probing retry-count)

**[Tree]** (config>test-oam>ldp-treetrace>path-discovery retry-count)

## Full Context

```
configure test-oam ldp-treetrace path-probing retry-count
configure test-oam ldp-treetrace path-discovery retry-count
```

## Description

In the path discovery phase of the LDP tree trace feature, this command configures the number of retransmissions of an LSP trace message to discover the path of an LDP FEC when no response is received within the **timeout** parameter.

In the path-probing phase of the LDP tree trace, this command configures the number of retransmissions of an LSP ping message to probe the path of an LDP FEC when no response is received within the **timeout** parameter.

The **no** form of this command resets the retry count to its default value.

## Default

```
no retry-count
```

## Parameters

### *retry-count*

Specifies the maximum number of consecutive time outs allowed before failing a path probe (ping).

## Platforms

All

## retry-count

## Syntax

```
retry-count [count]
```

```
no retry-count
```

## Context

```
[Tree] (config>service>pw-routing retry-count)
```

## Full Context

```
configure service pw-routing retry-count
```

## Description

This optional command specifies the number of attempts software should make to re-establish the spoke SDP after it has failed. After each successful attempt, the counter is reset to zero.

When the specified number is reached, no more attempts are made and the spoke SDP is put into the shutdown state.

Use the **no shutdown** command to bring up the path after the retry limit is exceeded.

The **no** form of this command reverts the parameter to the default value.

### Default

no retry-count

### Parameters

#### *count*

Specifies the maximum number of retries before putting the spoke SDP into the shutdown state.

**Values** 10 to 10000

### Platforms

All

## 22.223 retry-interval

### retry-interval

### Syntax

**retry-interval** min *minimum* max *maximum*

**no** retry-interval

### Context

[\[Tree\]](#) (config>aaa>route-downloader retry-interval)

### Full Context

configure aaa route-downloader retry-interval

### Description

This command sets the duration, in minutes, of the retry interval. The retry interval is the interval meant for the system to retry sending an Access Request message after the previous one was unanswered (not with an access reject but rather just a RADIUS failure or ICMP port unreachable). This timer is actually an exponential backoff timer that starts at **min** and is capped at **max** minutes.

The **no** form of this command reverts to the default values.

### Default

retry-interval min 10 max 20

### Parameters

**min** *minimum*

Specifies the duration, in minutes, of the retry interval. This duration grows exponentially after each sequential failure.

**Values** 1 to 1440

#### **max *maximum***

Specifies the maximum duration, in minutes, of the retry interval.

**Values** 1 to 1440

### **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## retry-interval

### **Syntax**

**retry-interval** *milliseconds*

**no retry-interval**

### **Context**

**[Tree]** (config>service>vprn>wpp>portals>portal retry-interval)

**[Tree]** (config>router>wpp>portals>portal retry-interval)

### **Full Context**

configure service vprn wpp portals portal retry-interval

configure router wpp portals portal retry-interval

### **Description**

This command configures the time interval between two consecutive retransmissions

The **no** form of this command reverts to the default.

### **Default**

retry-interval 2000

### **Parameters**

***milliseconds***

Specifies the time interval between two consecutive retransmissions.

**Values** 10 to 2000

### **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## retry-interval

### Syntax

**retry-interval** *seconds*

**no retry-interval**

### Context

**[Tree]** (config>system>security>pki>ca-prof>auto-crl-update retry-interval)

### Full Context

configure system security pki ca-profile auto-crl-update retry-interval

### Description

This command specifies the interval, in seconds, that the system waits before retrying the configured **url-entry** list when **schedule-type** is **next-update-based** and none of the URLs return a qualified CRL.

The **no** form of this command causes the system to retry immediately without waiting.

### Default

retry-interval 3600

### Parameters

**seconds**

Specifies an interval, in seconds, before retrying to update the CRL.

**Values** 1 to 31622400

### Platforms

All

## retry-interval

### Syntax

**retry-interval** *seconds*

### Context

**[Tree]** (config>system>security>pki>cert-upd-prof retry-interval)

### Full Context

configure system security pki certificate-update-profile retry-interval

### Description

This command configures the retry interval after the update fails.

**Default**

retry-interval 3600

**Parameters**

*seconds*

Specifies a retry interval, in seconds, after a failed update.

**Values** 60 to 36000

**Platforms**

All

## 22.224 retry-limit

retry-limit

**Syntax**

**retry-limit** *number*

**no retry-limit**

**Context**

[\[Tree\]](#) (config>router>mpls>lsp-template retry-limit)

[\[Tree\]](#) (config>router>mpls>lsp retry-limit)

**Full Context**

configure router mpls lsp-template retry-limit

configure router mpls lsp retry-limit

**Description**

This optional command specifies the number of attempts software should make to re-establish the LSP after it has failed LSP. After each successful attempt, the counter is reset to zero.

When the specified number is reached, no more attempts are made and the LSP path is put into the **shutdown** state.

Use the config router **mpls lsp *lsp-name* no shutdown** command to bring up the path after the retry-limit is exceeded.

For P2MP LSP that are created based on the LSP template, all S2Ls must attempt to retry-limit before the client application is informed of failure.

The **no** form of this command reverts to the default value.

**Default**

retry-limit 0 (no limit, retries forever)

## Parameters

### *number*

Specifies the number of times software will attempt to re-establish the LSP after it has failed. Allowed values are integers in the range of 0 to 10000.

**Values** 0 to 10000

## Platforms

All

## 22.225 retry-on-igp-overload

```
retry-on-igp-overload
```

## Syntax

```
[no] retry-on-igp-overload
```

## Context

[\[Tree\]](#) (config>router>mpls retry-on-igp-overload)

## Full Context

```
configure router mpls retry-on-igp-overload
```

## Description

This command allows for the global configuration of the handling in the ingress LER of the LSP paths which transit an LSR that advertised the IS-IS overload bit.

By default, MPLS re-optimizes using make-before-break (MBB) the transit paths away from the node in an IS-IS overload state only at the time a manual or timer-based re-signal is performed for the LSP paths. MPLS will not act immediately on the receipt of the IS-IS overload bit.

When this command is enabled, MPLS in the ingress LER immediately tears down and re-signals all LSP paths away from a transit LSR node which advertised the IS-IS overload bit.

LSP paths that terminate on the node that advertised the IS-IS overload bit are not acted on whether this command is enabled or disabled.

The **no** form of this command returns to the default behavior.

## Platforms

All

## 22.226 retry-timeout

### retry-timeout

#### Syntax

**retry-timeout** *timer*

**no retry-timeout**

#### Context

[\[Tree\]](#) (config>port>ethernet>dwl retry-timeout)

#### Full Context

configure port ethernet down-when-looped retry-timeout

#### Description

This command configures the minimum wait time before re-enabling port after loop detection.

#### Default

no retry-timeout

#### Parameters

*timer*

Specifies the minimum wait time before re-enabling port after loop detection.

**Values** 0, 10 to 160

#### Platforms

All

### retry-timeout

#### Syntax

**retry-timeout** *timeout*

**no retry-timeout**

#### Context

[\[Tree\]](#) (config>service>template>vpls-template>mac-move retry-timeout)

[\[Tree\]](#) (config>service>vpls>mac-move retry-timeout)

#### Full Context

configure service template vpls-template mac-move retry-timeout

configure service vpls mac-move retry-timeout

### Description

This indicates the time in seconds to wait before a SAP that has been disabled after exceeding the maximum relearn rate is re-enabled.

It is recommended that the retry-timeout value is larger or equal to 5s \* cumulative factor of the highest priority port so that the sequential order of port blocking will not be disturbed by re-initializing lower priority ports.

A zero value indicates that the SAP will not be automatically re-enabled after being disabled. If, after the SAP is re-enabled it is disabled again, the retry timeout is increased with the provisioned retry timeout in order to avoid thrashing. For example, when retry-timeout is set to 15, it increments (15,30,45,60...).

The **no** form of this command reverts to the default value.

### Default

retry-timeout 10 (when mac-move is enabled)

### Parameters

#### *timeout*

Specifies the time, in seconds, to wait before a SAP that has been disabled after exceeding the maximum relearn rate is re-enabled.

**Values** 0 to 120

### Platforms

All

## 22.227 retry-timer

retry-timer

### Syntax

**retry-timer** *retry-timer*

**no retry-timer**

### Context

[\[Tree\]](#) (config>service>epipe>spoke-sdp-fec retry-timer)

### Full Context

configure service epipe spoke-sdp-fec retry-timer

## Description

This command specifies a retry-timer for the spoke SDP. This is a configurable exponential back-off timer that determines the interval between retries to reestablish a spoke SDP if it fails and a label withdraw message is received with the status code "All unreachable".

The **no** form of this command reverts the timer to its default value.

## Default

retry-timer 30

## Parameters

### *retry-timer*

The initial retry-timer value in seconds.

**Values** 10 to 480

## Platforms

All

## retry-timer

## Syntax

**retry-timer** *seconds*

**no retry-timer**

## Context

[\[Tree\]](#) (config>router>mpls>lsp retry-timer)

## Full Context

configure router mpls lsp-template retry-timer

configure router mpls lsp retry-timer

## Description

This command configures the time (in s), for LSP re-establishment attempts after it has failed. The retry time is jittered to +/- 25% of its nominal value.

For P2MP LSP created based on LSP template, all S2Ls must attempt to retry-limit before client application is informed of failure.

The **no** form of this command reverts to the default value.

## Default

retry-timer 30

## Parameters

### *seconds*

Specifies the amount of time (in s), between attempts to re-establish the LSP after it has failed. Allowed values are integers in the range of 1 to 600.

**Values** 1 to 600

## Platforms

All

## retry-timer

## Syntax

**retry-timer** *secs*

**no** **retry-timer**

## Context

## 22.229 return-path-bfd-sid

### return-path-bfd-sid

#### Syntax

**return-path-bfd-sid** *ipv6-address*

**no return-path-bfd-sid**

#### Context

[\[Tree\]](#) (conf>router>segment-routing>sr-policies>policy>srv6 return-path-bfd-sid)

#### Full Context

configure router segment-routing sr-policies static-policy segment-routing-v6 return-path-bfd-sid

#### Description

This command configures the Seamless Bidirectional Forwarding Detection (S-BFD) session to echo mode and pushes an additional SRv6 SID in the SRH on S-BFD packets only.

The command applies to the initiator of the S-BFD sessions. The return path SID refers to a binding SID on a SRv6 policy configured on the far-end router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this SRv6 return path.

The **no** form of this command disables the controlled return-path SID and echo mode for S-BFD. If the command is deleted, the S-BFD session returns to asynchronous mode and the initiator node does not push a return-path SID. Any S-BFD packets for this SRv6 policy that the terminating router receives are sent back using a routed return path.

### Parameters

#### *ipv6-address*

Specifies the IPv6 address.

- Values**
- x:x:x:x:x:x:x (eight 16-bit pieces)
  - x:x:x:x:x:d.d.d.d
  - x: [0 to FFFF]H
  - d: [0 to 255]D

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 22.230 return-path-label

### return-path-label

#### Syntax

**return-path-label** *label-value*

**no return-path-label**

#### Context

**[Tree]** (config>router>mpls>lsp>primary>bfd return-path-label)

**[Tree]** (config>router>mpls>lsp>sec>bfd return-path-label)

**[Tree]** (config>router>mpls>lsp>template>bfd return-path-label)

**[Tree]** (config>router>mpls>lsp>bfd return-path-label)

**[Tree]** (config>router>segment-routing>main-plcy return-path-label)

#### Full Context

configure router mpls lsp primary bfd return-path-label

configure router mpls lsp secondary bfd return-path-label

configure router mpls lsp-template bfd return-path-label

configure router mpls lsp bfd return-path-label

configure router segment-routing maintenance-policy return-path-label

## Description

This command configures the Seamless Bidirectional Forwarding Detection (S-BFD) session to echo mode and adds an additional MPLS label, referring to an MPLS-labeled reply path for the S-BFD packet, to the bottom of the label stack for the S-BFD packet.

The command applies to the initiator of the S-BFD sessions. The return-path label may be a binding SID for an SR policy or other MPLS path configured on the reflector router. Instead of being routed through the IGP path, the S-BFD packet returns to the initiator through this MPLS return path.

The **no** form of this command disables the controlled return-path label and echo mode for S-BFD. S-BFD returns to asynchronous mode and the initiator node does not push a return-path label. Any S-BFD packets for this LSP or path that the reflector receives are sent back using a routed return path.

## Default

no return-path-label

## Parameters

### *label-value*

Specifies the label value.

**Values** 32 to 1048512

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure router mpls lsp secondary bfd return-path-label
- configure router mpls lsp primary bfd return-path-label
- configure router mpls lsp-template bfd return-path-label
- configure router mpls lsp bfd return-path-label

All

- configure router segment-routing maintenance-policy return-path-label

## 22.231 reuse

reuse

## Syntax

**reuse** *integer*

**no reuse**

## Context

[\[Tree\]](#) (config>router>policy-options>damping reuse)

## Full Context

configure router policy-options damping reuse

## Description

This command configures the reuse parameter for the route damping profile.

When the Figure of Merit (FoM) value falls below the **reuse** threshold, the route is once again considered valid and can be reused or included in route advertisements.

The **no** form of this command removes the reuse parameter from the damping profile.

## Default

no reuse

## Parameters

*integer*

Specifies the reuse value expressed as a decimal integer.

**Values** 1 to 20000

## Platforms

All

## 22.232 reuse-ext-ip

reuse-ext-ip

## Syntax

[no] reuse-ext-ip

## Context

[\[Tree\]](#) (config>service>nat>pcp-server-policy reuse-ext-ip)

## Full Context

configure service nat pcp-server-policy reuse-ext-ip

## Description

This command enables the system to reuse the external IP address assigned to a subscriber when the requested well-known port or external IP mapping is not available.

The **no** form of this command causes a request for a well-known port to be allocated exactly as requested but on a different external IP address from the one that the subscriber is already using. This occurs if the requested well-known port is already allocated to another subscriber which is sharing the same external IP address. The existing external IP address is initially allocated to the subscriber by the virtue of initial traffic flow.

**Default**

no reuse-ext-ip

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.233 reverse-path

### reverse-path

**Syntax**

[no] reverse-path

**Context**

[\[Tree\]](#) (config>router>mpls>mpls-tp>transit-path reverse-path)

**Full Context**

configure router mpls mpls-tp transit-path reverse-path

**Description**

This command enables the reverse path of an MPLS-TP reverse path to be created or edited.

The reverse path must be created after the forward path.

The **no** form of this command removes the reverse path. The reverse path must be removed before the forward path.

**Default**

no reverse-path

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.234 revert

### revert

**Syntax**

revert {latest-rb | *checkpoint-id* | rescue} [now]

## Context

**[Tree]** (admin>rollback revert)

## Full Context

admin rollback revert

## Description

This command initiates a configuration rollback revert operation that will return the configuration state of the node to a previously saved checkpoint. The rollback revert minimizes impacts to running services. There are no impacts in areas of configuration that did not change since the checkpoint. Configuration parameters that changed (or items on which changed configuration have dependencies) are first removed (revert to default) and the previous values are then restored (can be briefly service impacting in changed areas).

## Parameters

### **latest-rb**

Specifies the most recently created rollback checkpoint (corresponds to the file-url.rb rollback checkpoint file).

### **checkpoint-id**

Specifies the configuration to return to (which rollback checkpoint file to use). Checkpoint-id of 1 corresponds to the file-url.rb.1 rollback checkpoint file. The higher the id, the older the checkpoint. Max is the highest rollback checkpoint supported or configured.

**Values** 1 to 9

### **rescue**

Specifies to revert to the rescue checkpoint.

### **now**

Forces a rollback revert without any interactive confirmations (assumes 'y' for any confirmations that would have occurred).

## Platforms

All

## revert

## Syntax

[no] revert

## Context

**[Tree]** (config>system>sync-if-timing revert)

## Full Context

configure system sync-if-timing revert

## Description

This command allows the clock to revert to a higher priority reference if the current reference goes offline or becomes unstable. When the failed reference becomes operational, it is eligible for selection. When the mode is non-revertive, a failed clock source is not selected again.

## Default

no revert

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.235 revert-members

### revert-members

## Syntax

**revert-members** [*1..8*]

**no revert-members**

## Context

[\[Tree\]](#) (config>service>vprn>isis>link-group>level revert-members)

## Full Context

configure service vprn isis link-group level revert-members

## Description

This command sets the threshold for the minimum number of operational links to return the associated link group to its normal operating state and remove the associated offsets to the IS-IS metrics. If the number of operational links is equal to or greater than the configured **revert-members** threshold, the configured offsets are removed.

The **no** form of this command reverts the threshold back to the default, which is equal to the **oper-members** threshold value.

## Default

no revert-members *oper-members*

## Parameters

**1..8**

Specifies the number of revert members.

**Values** 1 to 8

## Platforms

All

## revert-members

### Syntax

**revert-members** [*1..8*]

**no revert-members**

### Context

[\[Tree\]](#) (config>router>isis>link-group>level revert-members)

### Full Context

configure router isis link-group level revert-members

### Description

This command sets the threshold for the minimum number of operational links to return the associated link group to its normal operating state and remove the associated offsets to the IS-IS metrics. If the number of operational links is equal to or greater than the configured revert-member threshold then the configured offsets are removed.

The **no** form of this command reverts the threshold back to the default which is equal to the oper-member threshold value.

### Default

no revert-members oper-members

### Parameters

*1..8*

Specifies the threshold for revertive members.

**Values** 1 to 8

## Platforms

All

## 22.236 revert-time

## revert-time

### Syntax

**revert-time** *minutes*

## no revert-time

### Context

[\[Tree\]](#) (config>port>aps revert-time)

### Full Context

configure port aps revert-time

### Description

This command configures the revert-time timer to determine how long to wait before switching back to the working circuit after that circuit has been restored into service.

A change in the *minutes* value takes effect upon the next initiation of the wait to restore (WTR) timer. It does not modify the length of a WTR timer that has already been started. The WTR timer of a non-revertive switch can be assumed to be infinite.

The **no** form of this command restores the default (non-revertive mode).

### Default

The default is to not revert back unless the protect circuit fails or there is an operator intervention.

### Parameters

#### *minutes*

Specifies the time, in minutes, to wait before reverting back to the original working circuit after it has been restored into service.

**Values** 0 to 60 minutes

**Default** 5

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## revert-time

### Syntax

**revert-time** *time*

**no revert-time**

### Context

[\[Tree\]](#) (config>eth-tunnel revert-time)

### Full Context

configure eth-tunnel revert-time

## Description

This command configure how long to wait before switching back to the primary path after it has been restored to Ethernet tunnel.

The **no** form of this command disables the revert behavior, effectively setting the revert time to zero.

## Default

no revert-time

## Parameters

### *time*

Specifies the re-activation delay, in seconds, for the primary path.

**Values** 1 to 720

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## revert-time

## Syntax

**revert-time** [*revert-time* | **infinite**]

**no revert-time**

## Context

**[Tree]** (config>service>cpipe>endpoint revert-time)

**[Tree]** (config>service>epipe>endpoint revert-time)

**[Tree]** (config>service>ipipe>endpoint revert-time)

## Full Context

configure service cpipe endpoint revert-time

configure service epipe endpoint revert-time

configure service ipipe endpoint revert-time

## Description

This command configures the time to wait before reverting back to the primary spoke SDP defined on this service endpoint, after having failed over to a backup spoke SDP.

## Parameters

### *revert-time*

Specifies the time, in seconds, to wait before reverting to the primary SDP.

**Values** 0 to 600

**Default** 0

**infinite**

Causes the endpoint to be non-revertive.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure service cpipe endpoint revert-time

All

- configure service epipe endpoint revert-time
- configure service ipipe endpoint revert-time

## revert-time

**Syntax**

**revert-time** *revert-time* | **infinite**

**no revert-time**

**Context**

[\[Tree\]](#) (config>service>vpls>endpoint revert-time)

**Full Context**

configure service vpls endpoint revert-time

**Description**

This command configures the time to wait before reverting to primary spoke-SDP.

In a regular endpoint the revert-time setting affects just the pseudowire defined as primary (precedence 0). For a failure of the primary pseudowire followed by restoration the revert-timer is started. After it expires the primary pseudowire takes the active role in the endpoint. This behavior does not apply for the case when both pseudowires are defined as secondary. For example, if the active secondary pseudowire fails and is restored it will stay in standby until a configuration change or a force command occurs.

**Parameters**

***revert-time***

Specifies the time to wait, in seconds, before reverting back to the primary spoke-SDP defined on this service endpoint, after having failed over to a backup spoke-SDP

**Values** 0 to 600

**infinite**

Specifying this keyword makes endpoint non-revertive

## Platforms

All

## revert-time

### Syntax

**revert-time** {*revert-time* | **infinite**}

**no revert-time**

### Context

[\[Tree\]](#) (config>mirror>mirror-dest>endpoint revert-time)

### Full Context

configure mirror mirror-dest endpoint revert-time

### Description

This command configures the time to wait before reverting to the primary spoke SDP. This command has an effect only when used in conjunction with an endpoint which contains a SDP of type 'primary'. It is ignored and has no effect in all other cases. The revert-timer is the delay in seconds the system waits before it switches the path of the mirror service from an active secondary SDP in the endpoint into the endpoint primary SDP after the latter comes back up.

The **no** form of this command resets the timer to the default value of 0. This means that the mirror-service path is switched back to the endpoint primary sdp immediately after it comes back up.

### Parameters

#### *revert-time*

Specifies a delay, in seconds, the system waits before it switches the path of the mirror service from an active secondary SDP in the endpoint into the endpoint primary SDP after the latter comes back up.

**Values** 0 to 600

#### **infinite**

Forces the mirror or LI service path to never revert to the primary SDP as long as the currently active secondary SDP is UP.

## Platforms

All

## revert-time

### Syntax

**revert-time** {*revert-time* | **infinite**}

**no revert-time**

### Context

[\[Tree\]](#) (config>service>sdp>mixed-lsp-mode revert-time)

### Full Context

configure service sdp mixed-lsp-mode revert-time

### Description

This command configures the delay period the SDP must wait before it reverts to a higher priority LSP type when one becomes available.

The **no** form of the command resets the timer to the default value of 0. This means the SDP reverts immediately to a higher priority LSP type when one becomes available.

### Default

no revert-time

### Parameters

#### ***revert-time***

Specifies the delay period, in seconds, that the SDP must wait before it reverts to a higher priority LSP type when one becomes available. A value of zero means the SDP reverts immediately to a higher priority LSP type when one becomes available.

**Values** 0 to 600

#### ***infinite***

This keyword forces the SDP to never revert to another higher priority LSP type unless the currently active LSP type is down.

### Platforms

All

## revert-time

### Syntax

**revert-time** *time*

**no revert-time**

### Context

[\[Tree\]](#) (config>eth-ring revert-time)

### Full Context

configure eth-ring revert-time

## Description

This command configures the revert time for an Eth-Ring. It ranges from 60 seconds to 720 second by 1 second intervals.

The **no** form of this command means non-revertive mode and revert time is essentially 0, and the revert timers are not set.

## Default

revert-time 300

## Parameters

### *time*

Specifies the guard-time, in seconds.

**Values** 60 to 720

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.237 revert-timer

### revert-timer

## Syntax

**revert-timer** *timer-value*

**no revert-timer**

## Context

[\[Tree\]](#) (config>router>mpls>lsp revert-timer)

## Full Context

configure router mpls lsp revert-timer

## Description

This command configures a revert timer on an LSP. The timer starts when the LSP primary path recovers from a failure. The LSP reverts from a secondary path to the primary path when the timer expires, or when the secondary path fails.

The **no** form of this command cancels any currently outstanding revert timer. If the LSP is up when a no revert-timer is issued, the LSP will revert to the primary path. Otherwise the LSP reverts when the primary path is restored.

## Default

no revert-timer

## Parameters

### *timer-value*

Specifies the amount of time, in one minute increments, between attempts to re-establish the LSP after it has failed.

**Values** 1 to 4320

## Platforms

All

## revert-timer

## Syntax

**revert-timer** *seconds*

**no revert-timer**

## Context

[\[Tree\]](#) (config>router>mpls>fwd-policies>fwd-policy revert-timer)

## Full Context

configure router mpls forwarding-policies forwarding-policy revert-timer

## Description

This command configures the revert timer in an MPLS forwarding policy.

When the primary direct or indirect next hop is restored and is added back into the routing table, CPM waits for an amount of time equal to the user-programmed revert timer before activating it and updating the data path. However, if the backup direct or indirect next hop fails while the timer is running, CPM activates it and updates the data path immediately.

A value of 0 disables the revert timer; meaning the policy reverts immediately.

The **no** form of this command removes the revert timer from the MPLS forwarding policy.

## Default

revert-timer 0

## Parameters

### *seconds*

Specifies the revert-timer value, in number of seconds.

**Values** 1 to 600

## Platforms

All

## revert-timer

### Syntax

**revert-timer** *revert-timer*

**no revert-timer**

### Context

[\[Tree\]](#) (config>router>segment-routing>maintenance-policy revert-timer)

### Full Context

configure router segment-routing maintenance-policy revert-timer

### Description

This command configures the revert timer for SR Policy candidate paths.

The revert timer is started when the primary path (for example, the best preference programmed candidate path) recovers (for example, after the number of S-BFD sessions that are up is  $\geq$  **threshold** and the **hold-down-timer** has expired) and switches back when the timer expires.

The **no** form of this command removes the revert timer from the SR policy.

### Default

no revert-timer

### Parameters

*revert-timer*

Specifies the revert timer, in minutes.

**Values** 1 to 4320

### Platforms

```
revertive
```

## Syntax

```
[no] revertive
```

## Context

[\[Tree\]](#) (config>redundancy>multi-chassis>ipsec-domain revertive)

## Full Context

```
configure redundancy multi-chassis ipsec-domain revertive
```

## Description

This command configures whether to allow a revertive activity state after a designated active state recovers from an ineligibility event. The revertive function allows a router in an N:M domain to automatically take over as the active router in the domain, when it becomes eligible to do so.

The **no** form of this command reverts to the default value.

## Default

```
no revertive
```

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.239 revertive-timer

## revertive-timer

### Syntax

**revertive-timer** *sec*

**no revertive-timer**

### Context

**[Tree]** (config>service>vprn>mvpn>pt>selective>umh-rm>group>source revertive-timer)

**[Tree]** (config>service>vprn>mvpn>pt>inclusive>umh-rm revertive-timer)

### Full Context

configure service vprn mvpn provider-tunnel selective umh-rate-monitoring group source revertive-timer

configure service vprn mvpn provider-tunnel inclusive umh-rate-monitoring revertive-timer

### Description

This command configures the timer value (in seconds) after which to revert to the primary UMH after traffic is restored. This value must account for the traffic flapping from the primary UMH. If there is traffic flapping, the timer resets and starts over.

The **no** form of the command means that there is no revertive behavior.

### Default

no revertive-timer

### Parameters

**sec**

Specifies the timer value (in seconds).

**Values** 1 to 3600

### Platforms

All

## 22.240 revocation-check

## revocation-check

### Syntax

**revocation-check** {crl | crl-optional}

### Context

**[Tree]** (config>system>security>pki>ca-profile revocation-check)

## Full Context

configure system security pki ca-profile revocation-check

## Description

This command specifies the revocation method system used to check the revocation status of certificate issued by the CA, the default value is **crl**, which will use CRL. But if it is **crl-optional**, then it means when the user disables the ca-profile, then the system will try to load the configured CRL (specified by the **crl-file** command). However, if the system fails to load it for following reasons, then the system still brings the ca-profile oper-up, but leaves the CRL as **non-exist**.

- CRL file does not exist
- CRL is not properly encoded - maybe due to interrupted file transfer
- CRL does not match cert
- Wrong CRL version
- CRL expired

If the system needs to use the CRL of a specific ca-profile to check the revocation status of an end-entity cert, and the CRL is non-existent due to the above reasons, then the system will treat it as being unable to get an answer from CRL and fall back to the next status-verify method or default-result.

If the system needs to check the revocation of a CA cert in cert chain, and if the CRL is non-existent due to the above reasons, then the system will skip checking the revocation status of the CA cert. For example, if CA1 is issued by CA2, if CA2's revocation-check is **crl-optional** and the CA2's CRL is non-existent, then the system will not check CA1 cert's revocation status and consider it as "good".

### Note:

Users must shutdown the ca-profile to change the revocation-check configuration.

## Default

revocation-check crl

## Parameters

**crl**

Specifies to use the configured CRL.

**crl-optional**

Specifies that the CRL is optional.

### rib-priority

## Syntax

**rib-priority high** {*prefix-list-name* | **tag** *tag*}

**no rib-priority**

## Context

[\[Tree\]](#) (config>service>vprn>isis rib-priority)

## Full Context

configure service vprn isis rib-priority

## Description

This command enabled RIB prioritization for the IS-IS protocol and specifies the prefix list or IS-IS tag value that will be used to select the specific routes that should be processed through the IS-IS route calculation process at a higher priority.

The **no** form of this command disables RIB prioritization.

## Default

no rib-priority

## Parameters

### ***prefix-list-name***

Specifies the prefix list which is used to select the routes that are processed at a higher priority through the route calculation process.

### ***tag tag-value***

Specifies the tag value that is used to match IS-IS routes that are to be processed at a higher priority through the route calculation process.

**Values** 1 to 4294967295

## Platforms

All

## rib-priority

## Syntax

**[no] rib-priority**

## Context

**[Tree]** (config>service>vprn>ospf3>area>if rib-priority)

**[Tree]** (config>service>vprn>ospf>area>if rib-priority)

## Full Context

configure service vprn ospf3 area interface rib-priority

configure service vprn ospf area interface rib-priority

## Description

This command enables RIB prioritization for the OSPF/OSPFv3 protocol. When enabled at the OSPF interface level, all routes learned through the associated OSPF interface will be processed through the OSPF route calculation process at a higher priority.

The **no** form of **rib-priority** command disables RIB prioritization at the associated level.

## Default

no rib-priority

## Platforms

All

## rib-priority

## Syntax

**rib-priority** {**high**} *prefix-list-name*

**no rib-priority**

## Context

**[Tree]** (config>service>vprn>ospf rib-priority)

**[Tree]** (config>service>vprn>ospf3 rib-priority)

## Full Context

```
configure service vprn ospf rib-priority
configure service vprn ospf3 rib-priority
```

## Description

This command enabled RIB prioritization for the OSPF protocol and specifies the prefix list that will be used to select the specific routes that should be processed through the OSPF route calculation process at a higher priority.

The **no** form of **rib-priority** command disables RIB prioritization at the associated level.

## Default

```
no rib-priority
```

## Parameters

### *prefix-list-name*

Specifies the prefix list which is used to select the routes that are processed at a higher priority through the route calculation process.

## Platforms

All

## rib-priority

## Syntax

```
rib-priority high {prefix-list-name | tag tag-value}
no rib-priority
```

## Context

[\[Tree\]](#) (config>router>isis rib-priority)

## Full Context

```
configure router isis rib-priority
```

## Description

This command enabled RIB prioritization for the IS-IS protocol and specifies the prefix list or IS-IS tag value that will be used to select the specific routes that should be processed through the IS-IS route calculation process at a higher priority.

The no rib-priority form of command disables RIB prioritization.

## Default

```
no rib-priority high
```

## Parameters

### *prefix-list-name*

Specifies the prefix list which is used to select the routes that are processed at a higher priority through the route calculation process.

### *tag tag-value*

Specifies the tag value that is used to match IS-IS routes that are to be processed at a higher priority through the route calculation process.

**Values** 1 to 4294967295

## Platforms

All

## rib-priority

## Syntax

**rib-priority** {high} *prefix-list-name*

**no rib-priority** {high}

## Context

[\[Tree\]](#) (config>router>ospf rib-priority)

[\[Tree\]](#) (config>router>ospf3 rib-priority)

## Full Context

configure router ospf rib-priority

configure router ospf3 rib-priority

## Description

This command enables RIB prioritization for the OSPF protocol and specifies the prefix list used to select the specific routes that should be processed through the OSPF route calculation process at a higher priority.

The **no** form of this command disables RIB prioritization at the associated level.

## Default

no rib-priority high

## Parameters

### *prefix-list-name*

Specifies the prefix list, up to 32 characters, which is used to select the routes that are processed at a higher priority through the route calculation process.

## Platforms

All

## rib-priority

### Syntax

**rib-priority** {high}

**no rib-priority**

### Context

**[Tree]** (config>router>ospf3>area>interface rib-priority)

**[Tree]** (config>router>ospf>area>interface rib-priority)

### Full Context

configure router ospf3 area interface rib-priority

configure router ospf area interface rib-priority

### Description

This command enables RIB prioritization for the OSPF/OSPFv3 protocol. When enabled at the OSPF interface level, all routes learned through the associated OSPF interface are processed through the OSPF route calculation process at a higher priority.

The **no** form of this command disables RIB prioritization at the associated level.

### Default

no rib-priority

### Parameters

**high**

Specifies that the name of the prefix list which contains prefixes get high priority for RIB-download. The high priority prefixes are downloaded first to the RIB. In doing so, the convergence time for these prefixes is better.

## Platforms

## 22.246 ring

## ring

### Syntax

**ring** *sync-tag* [**create**]

**no ring** *sync-tag*

### Context

[\[Tree\]](#) (config>redundancy>mc>peer>mcr ring)

### Full Context

configure redundancy multi-chassis peer mc-ring ring

### Description

This command configures a multi-chassis ring.

The **no** form of this command removes the sync-tag from the configuration.

### Parameters

#### *sync-tag*

Specifies a synchronization tag, up to 32 characters, to be used while synchronizing this port with the multi-chassis peer.

#### **create**

Creates the multi-chassis peer ring instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

### Platforms

All

## 22.247 ring-node

## ring-node

### Syntax

**ring-node** *ring-node-name* [**create**]

**no ring-node** *ring-node-name*

### Context

[\[Tree\]](#) (config>redundancy>mc>peer>mcr>ring ring-node)

### Full Context

configure redundancy multi-chassis peer mc-ring ring ring-node

## Description

This command specifies the unique name of a multi-chassis ring access node.

## Parameters

### *ring-node-name*

Specifies the unique name of a multi-chassis ring access node. The name can be up to 32 characters.

### **create**

Keyword used to create the ring node instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## Platforms

All

## ring-node

## Syntax

**ring-node** *ring-node-name*

**no ring-node**

## Context

[\[Tree\]](#) (config>service>epipe>sap ring-node)

## Full Context

configure service epipe sap ring-node

## Description

This command configures a multi-chassis ring-node for this SAP.

The **no** form of this command removes the name from the configuration.

## Platforms

#### Full Context

configure subscriber-mgmt local-user-db ppp host rip-policy

configure subscriber-mgmt local-user-db ipoe host rip-policy

#### Description

This command configures the RIP policy name. This policy is applied to a subscriber IPv4 host to enable the BNG to learn RIP routes from the host. RIP routes are never sent to the hosts.

The **no** form of this command removes the RIP policy name from the configuration.

#### Parameters

***policy-name***

Specifies the RIP policy name, up to 32 characters.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### rip-policy

#### Syntax

**rip-policy** *policy-name* [**create**]

**no rip-policy** *policy-name*

#### Context

**[Tree]** (config>subscr-mgmt rip-policy)

#### Full Context

configure subscriber-mgmt rip-policy

## Description

This command creates a RIP policy. This policy is applied to a subscriber IPv4 host to enable the BNG to learn RIP routes from the host. RIP routes are never sent to the hosts.

## Parameters

### *policy-name*

Specifies the RIP policy name up to 32 characters.

### **create**

Keyword required to create the configuration context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## rip-policy

## Syntax

**rip-policy** *rip-policy-name*

**no rip-policy**

## Context

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>sap>static-host rip-policy)

## Full Context

configure service ies subscriber-interface group-interface sap static-host rip-policy

## Description

This command specifies the name of the RIP policy up to 32 characters.

The **no** form of this command removes the policy name from the static-host configuration.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.250 ripng

## ripng

## Syntax

**[no] ripng**

**Context**

[\[Tree\]](#) (config>router ripng)

**Full Context**

configure router ripng

**Description**

This command creates the context to configure the RIPng protocol instance.

When a RIPng instance is created, the protocol is enabled by default. To start or suspend execution of the RIP protocol without affecting the configuration, use the **[no] shutdown** command.

The **no** form of this command deletes the RIP protocol instance removing all associated configuration parameters.

**Default**

no ripng

**Platforms**

## 22.251 rmon

rmon

**Syntax**

rmon

**Context**

[\[Tree\]](#) (config>system>thresholds rmon)

**Full Context**

configure system thresholds rmon

**Description**

This command creates the context to configure generic RMON alarms and events.

Generic RMON alarms can be created on any SNMP object-ID that is valid for RMON monitoring (for example, an integer-based datatype).

The configuration of an event controls the generation and notification of threshold crossing events configured with the alarm command.

**Platforms**

All

## 22.252 roaming

### roaming

#### Syntax

**roaming** *bit* [*bit*]

**no roaming**

#### Context

[\[Tree\]](#) (config subscr-mgmt gtp peer-profile charging roaming)

#### Full Context

configure subscriber-mgmt gtp peer-profile charging-characteristics roaming

#### Description

This command configures the charging characteristics for roaming UE.

The **no** form of this command removes the *bit* value from the configuration.

#### Default

no roaming

#### Parameters

*bit*

Specifies up to 16 bits to set in the Charging Characteristics Information Element (IE) for roaming UE, if not known by other means such as RADIUS.

**Values** bit0, bit1, bit2, bit3, bit4, bit5, bit6, bit7, bit8, bit9, bit10, bit11, bit12, bit13, bit14, bit15

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.253 robust-count

### robust-count

#### Syntax

**robust-count** *robust-count*

**no robust-count**

## Context

[Tree] (config>service>vpls>igmp-snooping robust-count)  
[Tree] (config>service>vpls>mesh-sdp>igmp-snooping robust-count)  
[Tree] (config>service>vpls>sap>igmp-snooping robust-count)

[Tree] (config>service>vpls>sap>mld-snooping robust-count)  
[Tree] (config>service>vpls>spoke-sdp>igmp-snooping robust-count)  
[Tree] (config>service>vpls>mesh-sdp>mld-snooping robust-count)

## Full Context

```
configure service vpls igmp-snooping robust-count
configure service vpls mesh-sdp igmp-snooping robust-count
configure service vpls sap igmp-snooping robust-count
configure service vpls spoke-sdp mld-snooping robust-count
configure service vpls sap mld-snooping robust-count
configure service vpls spoke-sdp igmp-snooping robust-count
configure service vpls mesh-sdp mld-snooping robust-count
```

## Description

If the **send-queries** command is enabled, this parameter allows tuning for the expected packet loss on a SAP or SDP. The robust-count variable allows tuning for the expected packet loss on a subnet and is comparable to a retry count. If this SAP or SDP is expected to be 'lossy', this parameter may be increased. IGMP snooping on this SAP or SDP is robust to (robust-count-1) packet losses.

If **send-queries** is not enabled, this parameter will be ignored.

## Default

robust-count 2

## Parameters

### ***robust-count***

Specifies the robust count for the SAP or SDP

**Values** 2 to 7 (for **config>service>vpls>sap>igmp-snooping**) 1 to 255 (for **config>service>vpls>igmp-snooping**)

## Platforms

All

## robust-count

### Syntax

**robust-count** *robust-count*

**no robust-count**

### Context

**[Tree]** (config>subscr-mgmt>msap-policy>vpls-only>igmp-snp robust-count)

### Full Context

configure subscriber-mgmt msap-policy vpls-only-sap-parameters igmp-snooping robust-count

### Description

This command configures the IGMP robustness variable. If the **send-queries** command is enabled, this parameter allows tuning for the expected packet loss on a SAP or SDP. The robust-count variable allows tuning for the expected packet loss on a subnet and is comparable to a retry count. If an MSAP or SDP is expected to be "lossy", this parameter may be increased. IGMP snooping on an MSAP or SDP is robust to (robust-count-1) packet losses.

If send-queries is not enabled, this parameter is ignored.

The **no** form of this command reverts to the default.

### Default

robust-count 2

### Parameters

#### ***robust-count***

Specifies the robust count for the SAP or SDP.

**Values** 2 to 7

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```

## Syntax

```
role role-type
```

## Context

[\[Tree\]](#) (config>system>satellite>port-template>port role)

## Full Context

```
configure system satellite port-template port role
```

## Description

This command configures the role that the associated port is to take on.

## Parameters

### **none**

Clears the role association for the associated port.

### **uplink**

Specifies that the associated satellite port is assigned the role of an uplink port.

**client**

Specifies that the associated satellite port is assigned the role of a satellite client port.

**system-default**

Specifies that the associated satellite port is returned to the system default.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.255 rollback

### rollback

**Syntax**

rollback

**Context**

[\[Tree\]](#) (config>system rollback)

**Full Context**

configure system rollback

**Description**

Configure parameters of the classic CLI configuration rollback functionality. Configuration rollback provides the ability to undo configuration and revert back to previous router configuration states.

**Platforms**

All

### rollback

**Syntax**

rollback

**Context**

[\[Tree\]](#) (admin rollback)

**Full Context**

admin rollback

**Description**

Commands in this context configure rollback operations.

**Platforms**

**22.256 rollback-location****rollback-location****Syntax**

**rollback-location** *file-url* /rollback *filename*

**no rollback-location**

**Context**

**[Tree]** (config>system>rollback rollback-location)

**Full Context**

configure system rollback rollback-location

**Description**

The location and name of the rollback checkpoint files is configurable to be local (on compact flash) or remote. The *file-url* must not contain a suffix (just a path/directory + filename). The suffixes for rollback checkpoint files are ".rb", ".rb.1", ..., ".rb.9" and are automatically appended to rollback checkpoint files.

**Default**

no rollback-location

**Parameters*****file-url***

Specifies the URL or rollback filename.

**Values**

*local-url* | *remote-url*

*local-url*      [*cflash-id*]/[*file-path*] up to 200 characters, including cflash-id directory length of up to 99 characters each

*remote-url*    [{ftp://}login:pswd@ *remote-locn*]/[*file-path*] up to 255 characters, directory length of up to 99 characters each

*remote-locn*    [*hostname* | *ipv4-address* | *ipv6-address*]

*ipv4-address*   *a.b.c.d*

*ipv6-address* *x:x:x:x:x:x[-interface]*  
*x:x:x:x:x:d.d.d.d[-interface]*  
*x* - [0 to FFFF]H  
*d* - [0 to 255]D  
*interface* - up to 32 characters each, for link local addresses

*cflash-id* cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

**rollback-filename**

Specifies the rollback file name.

**Values** suffixed with .rb, .rb.1 up to .9 during rollback checkpoint creation

**Platforms**

All

## 22.257 rollback-sync

### rollback-sync

**Syntax**

**rollback-sync**

**Context**

[\[Tree\]](#) (admin>redundancy rollback-sync)

**Full Context**

admin redundancy rollback-sync

**Description**

This command copies the entire set of rollback checkpoint files from the active CPM CF to the standby CPM CF.

**Platforms**

All

## rollback-sync

### Syntax

[no] rollback-sync

### Context

[\[Tree\]](#) (config>redundancy rollback-sync)

### Full Context

configure redundancy rollback-sync

### Description

The operator can enable automatic synchronization of rollback checkpoint files between the active CPM and standby CPM. When this automatic synchronization is enabled, a rollback save will cause the new checkpoint file to be saved on both the active and standby CPMs. The suffixes of the old checkpoint files on both active and standby CPMs are incremented. Note that automatic sync only causes the one new checkpoint file to be copied to both CFs (the other 9 checkpoints are not automatically copied from active to standby but that can be done manually with **admin red rollback-sync**).

Automatic synchronization of rollback checkpoint files across CPMs is only performed if the rollback-location is configured as a local file-url (for example, "cf3:/rollback-files/rollback). Synchronization is not done if the rollback-location is remote.

The **config red sync {boot-env | config}** and **admin red sync {boot-env | config}** do not apply to rollback checkpoint files. These commands do not manually or automatically sync rollback checkpoint files. The dedicated **rollback-sync** commands must be used to sync rollback checkpoint files.

### Default

no rollback-sync

### Platforms

All

## 22.258 rollover

## rollover

### Syntax

rollover *minutes* [**retention** *hours*]

no rollover

### Context

[\[Tree\]](#) (config>log>file-id rollover)

## Full Context

configure log file-id rollover

## Description

This command configures how often an event or accounting log is rolled over or partitioned into a new file.

An event or accounting log is actually composed of multiple, individual files. The system creates a new file for the log based on the **rollover** time, expressed in minutes.

The *retention* option, expressed in hours, allows you to modify the default time to keep the file in the system. The retention time is based on the rollover time of the file.

If logs are needed to be retained for more than 16 days, use a CRON job to move the logs to a different location, either on a local drive or a remote server. For more information, contact Nokia support.

When multiple **rollover** commands for a *file-id* are entered, the last command overwrites the previous command.

The **no** form of this command reverts to the default values.

## Default

rollover 1440 retention 12

## Parameters

### *minutes*

Specifies the rollover time, in minutes.

**Values** 5 to 10080

### *retention hours*

Specifies the retention period in hours, expressed as a decimal integer. The retention time is based on the time creation time of the file. The file becomes a candidate for removal once the creation timestamp + rollover time + retention time is less than the current timestamp.

**Default** 12

**Values** 1 to 500

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

## 22.260 root-address

### root-address

## Syntax

**root-address** *ip-address*

**no root-address**

## Context

[\[Tree\]](#) (config>router>p2mp-sr-tree>p2mp-policy root-address)

## Full Context

configure router p2mp-sr-tree p2mp-policy root-address

## Description

This command configures the IP address of the P2MP SR tree root node of the P2MP policy. The root tree ID and the root address uniquely identify the P2MP policy on the root node.

The **no** form of this command removes the root address entry.

## Parameters

*ip-address*

Specifies the IPv4 address of the root node.

**Values** a.b.c.d

## Platforms

All

## root-address

### Syntax

**root-address** *ip-address*

**no root address**

### Context

**[Tree]** (config>router>p2mp-sr-tree>replication-segment root-address)

### Full Context

configure router p2mp-sr-tree replication-segment root-address

### Description

This command configures the replication segment with the IP address of the root node of the P2MP SR tree replication segment.

The **no** form of this command removes the root node address.

### Parameters

***ip-address***

Specifies the IPv4 address.

**Values** a.b.c.d

## Platforms

All

## 22.261 root-and-leaf

## root-and-leaf

### Syntax

**[no] root-and-leaf**

### Context

**[Tree]** (config>service>vpls>provider-tunnel>inclusive root-and-leaf)

## Full Context

```
configure service vpls provider-tunnel inclusive root-and-leaf
```

## Description

This command configures the node to operate as both root and leaf of the I-PMSI in a specified VPLS/B-VPLS instance.

By default, a node will behave as a leaf-only node. When the node is leaf only for the I-PMSI of type P2MP RSVP LSP, no PMSI Tunnel Attribute is included in BGP-AD route update messages and therefore no RSVP P2MP LSP is signaled but the node can join RSVP P2MP LSP rooted at other PE nodes participating in this VPLS/B-VPLS service. The user must still configure a LSP template even if the node is a leaf only.

For the I-PMSI of type mLDP, the leaf-only node will join I-PMSI rooted at other nodes it discovered but will not include a PMSI Tunnel Attribute in BGP-AD route update messages. This way a leaf-only node will forward packets to other nodes in the VPLS/B-VPLS using the point-to-point spoke-SDPs.

The **no** version of this command re-instates the default value.

**Context**

[\[Tree\]](#) (config>service>pw-template>stp root-guard)

**Full Context**

configure service pw-template stp root-guard

**Description**

This command specifies whether this port is allowed to become an STP root port. It corresponds to the restrictedRole parameter in 802.1Q. If set, it can cause lack of spanning tree connectivity.

**Default**

no root-guard

**Platforms**

All

## 22.263 root-pool

**root-pool****Syntax**

[no] root-pool *root-pool-id*

**Context**

[\[Tree\]](#) (config>qos>hs-pool-policy>root-tier root-pool)

**Full Context**

configure qos hs-pool-policy root-tier root-pool

## Description

Commands in this context configure root tier parameters. Within the **root-tier** context, root pools can be sized using the **allocation-weight** command or a slope policy can be associated with a root pool.

The **no** form of the command restores the default **allocation-weight** value and default slope policy to the specified root pool. Root pool 1 has a different default weight than root pools 2 through 16. The **no root-pool** command fails for root pools 2 through 16 if the root pool is currently the parent of a mid-tier pool.

## Parameters

### *root-pool-id*

Specifies the root pool ID. This is a required parameter when executing the **root-pool** command and specifies which root pool context is being entered.

**Values** 1 to 16

## Platforms

7750 SR-7/12/12e

## 22.264 root-tier

root-tier

## Syntax

root-tier

## Context

[\[Tree\]](#) (config>qos>hs-pool-policy root-tier)

## Full Context

configure qos hs-pool-policy root-tier

## Description

Commands in this context configure root pool parameters. Within the **root-tier** context, root pools can be sized using the **allocation-weight** command or a slope policy can be associated with a root pool.

## Platforms

7750 SR-7/12/12e

## 22.265 root-tree-id

## root-tree-id

### Syntax

**root-tree-id** *tree-id*

**no root-tree-id**

### Context

**[Tree]** (config>router>p2mp-sr-tree>p2mp-policy root-tree-id)

### Full Context

configure router p2mp-sr-tree p2mp-policy root-tree-id

### Description

This command configures the P2MP SR tree ID on the root node of the P2MP policy. The root tree ID and the root address uniquely identify the P2MP policy on the root node.

The **no** form of this command removes the root tree ID entry.

### Parameters

***tree-id***

Specifies the ID of the tree.

**Values** 8193 to 16286

### Platforms

All

## root-tree-id

### Syntax

**root-tree-id** *tree-id*

**no root-tree-id**

### Context

**[Tree]** (config>router>p2mp-sr-tree>replication-segment root-tree-id)

### Full Context

configure router p2mp-sr-tree replication-segment root-tree-id

### Description

This command configures the root-tree ID for the replication segment of the P2MP SR tree.

The **no** form of this command removes the root-tree ID.

## Parameters

### *tree-id*

Specifies the root-tree ID.

**Values** 8193 to 16286

## Platforms

All

## 22.266 round-robin-inactive-records

### round-robin-inactive-records

#### Syntax

[no] **round-robin-inactive-records**

#### Context

**[Tree]** (config>mcast-mgmt>chassis-level round-robin-inactive-records)

#### Full Context

configure mcast-management chassis-level round-robin-inactive-records

#### Description

This command specifies whether initially inactive multicast records use the IOM default secondary multicast path or not. When enabled, the system redistributes newly populated inactive records among all available IOM multicast paths and multicast switch fabric planes. When disabled, the system continues to set all initially inactive multicast records to use the IOM default secondary multicast path.

The **no** form of this command reverts to the default.

#### Platforms

7450 ESS, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

## 22.267 route

### route

#### Syntax

**route index** *index* [**realm** *realm-string*] [**application** *application*] [**create**]

**no route index** *index*

## Context

[\[Tree\]](#) (config>aaa>diam>node>peer route)

## Full Context

configure aaa diameter node peer route

## Description

This command configures the index of the static route within the Diameter peer used to reach remote realms that are not directly connected to the origin realm, or to override the route preference (peer preference) of the directly-connected realms.

The **no** form of this command removes the route index information from the configuration.

## Parameters

### *index*

Specifies the index of the static route within the Diameter peer.

**Values** 1 to 15

### *realm-string*

Specifies the destination realm reachable through this static route, up to 80 characters.

### *application*

Specifies the ID of the Diameter application of the static route.

**Values** nasreq, gy, gx

### *create*

Keyword used to create the route index. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.268 route-admin-tag-policy

### route-admin-tag-policy

## Syntax

[no] route-admin-tag-policy *policy-name*

## Context

[\[Tree\]](#) (config>router>admin-tags route-admin-tag-policy)

### Full Context

```
configure router admin-tags route-admin-tag-policy
```

### Description

This command configures a route admin tag policy.

Up to 2,000 policies can be configured per system.

The **no** form of this command removes the route admin tag policy.

### Parameters

#### *policy-name*

The name of the route admin tag policy, up to 32 characters.

### Platforms

All

## 22.269 route-advertisement

### route-advertisement

### Syntax

```
[no] route-advertisement
```

### Context

[\[Tree\]](#) (config>router>bgp>group>neighbor>srv6 route-advertisement)

[\[Tree\]](#) (config>router>bgp>group>srv6 route-advertisement)

### Full Context

```
configure router bgp group neighbor segment-routing-v6 route-advertisement
```

```
configure router bgp group segment-routing-v6 route-advertisement
```

### Description

Commands in this context configure the route advertisement options.

The **no** form of this command deletes the context.

### Default

```
no route-advertisement
```

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## 22.270 route-distinguisher

```
route-distinguisher
```

### Syntax

```
route-distinguisher auto-rd
```

```
route-distinguisher rd
```

```
no route-distinguisher
```

### Context

[\[Tree\]](#) (config>subscr-mgmt>isa-svc-chain>evpn>bgp route-distinguisher)

### Full Context

```
configure subscriber-mgmt isa-service-chaining evpn bgp route-distinguisher
```

### Description

This command configures the Route Distinguisher (RD) field that is signaled in NLRI in EVPN routes.

The **no** form of this command reverts to the default.

### Parameters

#### **auto-rd**

Specifies that the system automatically generates an RD.

#### **rd**

Specifies the RD.

**Values** rd: *ip-addr:comm-val* | *2byte-asnumber:ext-comm-val* | *4byte-asnumber:comm-val*

*ip-addr*: a.b.c.d

*comm-val*: [0 to 65535]

*2byte-asnumber*: [1 to 65535]

*ext-comm-val*: [0 to 4294967295]

*4byte-asnumber*: [1 to 4294967295]

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## route-distinguisher

### Syntax

**route-distinguisher auto-rd**

**no route-distinguisher**

**route-distinguisher rd**

### Context

**[Tree]** (config>service>epipe>bgp route-distinguisher)

**[Tree]** (config>service>vpls>bgp route-distinguisher)

### Full Context

configure service epipe bgp route-distinguisher

configure service vpls bgp route-distinguisher

### Description

This command configures the Route Distinguisher (RD) component that will be signaled in the MP-BGP NLRI for L2VPN and EVPN families. This value will be used for BGP-AD, BGP VPLS and BGP multi-homing NLRI if these features are configured.

If this command is not configured, the RD is automatically built using the BGP-AD VPLS ID. The following rules apply:

- if BGP AD VPLS-id is configured and no RD is configured under BGP node - RD=VPLS-ID
- if BGP AD VPLS-id is not configured then an RD value must be configured under BGP node (this is the case when only BGP VPLS is configured)
- if BGP AD VPLS-id is configured and an RD value is also configured under BGP node, the configured RD value prevails

Values and format (6 bytes, other 2 bytes of type will be automatically generated)

Alternatively, the **auto-rd** option allows the system to automatically generate an RD based on the **bgp-auto-rd-range** command configured at the service level. For **BGP-EVPN** enabled VPLS and Epipe services, the **route-distinguisher** value can also be auto-derived from the **evi** value (**config>service>vpls>bgp-evpn>evi** or **config>service>epipe>bgp-evpn>evi**) if this command is not configured. See the **config>service>system>bgp-evpn>eth-seg>service-carving>manual evi** command description for more information.

### Parameters

**ip-addr:comm-val**

Specifies the IP address.

**Values** *ip-addr:* a.b.c.d

*comm-val:* 0 to 65535

**as-number:ext-comm-val**

Specifies the AS number.

**Values** *as-number*: 1 to 65535  
*ext-comm-val*: 0 to 4294967295

### auto-rd

The system will generate an RD for the service according to the IP address and range configured in the **bgp-auto-rd-range** command.

### Platforms

All

## route-distinguisher

### Syntax

**route-distinguisher** [*ip-addr:comm-val* | *as-number:ext-comm-val*]  
**no route-distinguisher**

### Context

[\[Tree\]](#) (config>service>system>bgp-evpn route-distinguisher)

### Full Context

configure service system bgp-evpn route-distinguisher

### Description

This command configures the Route Distinguisher (RD) component that will be signaled in the MP-BGP NLRI for EVPN corresponding to the base EVPN instance (Ethernet Segment routes). If the route-distinguisher component is not configured, the system will use system:ip-address as the default route-distinguisher

### Default

no route-distinguisher

### Parameters

#### *ip-addr:comm-val*

Specifies the IP address.

**Values** *ip-addr*: a.b.c.d  
*comm-val*: 0 to 65535

#### *as-number:ext-comm-val*

Specifies the AS number.

**Values** *as-number*: 1 to 65535  
*ext-comm-val*: 0 to 4294967295

## Platforms

All

## route-distinguisher

### Syntax

**route-distinguisher** *rd*

**route-distinguisher auto-rd**

**no route-distinguisher**

### Context

**[Tree]** (config>service>vprn>bgp-ipvpn>srv6 route-distinguisher)

**[Tree]** (config>service>vprn>bgp-ipvpn>mpls route-distinguisher)

**[Tree]** (config>service>vprn>bgp-evpn>mpls route-distinguisher)

### Full Context

configure service vprn bgp-ipvpn segment-routing-v6 route-distinguisher

configure service vprn bgp-ipvpn mpls route-distinguisher

configure service vprn bgp-evpn mpls route-distinguisher

### Description

This command specifies an identifier attached to a route, which enables the user to identify the VPN to which the route belongs. Each routing instance must have a unique (within the carrier's domain) route distinguisher (RD) associated with it.

Alternatively, the **auto-rd** option allows the system to automatically generate an RD based on the **bgp-auto-rd-range** command configured at the service level.

The **no** form of this command removes the RD configuration.

### Default

no route-distinguisher

### Parameters

#### auto-rd

Keyword that allows the system to generate an RD for the service according to the IP address and range configured in the **bgp-auto-rd-range** command.

#### rd

Specifies the route distinguisher.

**Values** *rd: ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val*

*ip-addr:* a.b.c.d

*comm-val:* [0 to 65535]

2byte-asnumber: [1 to 65535]  
ext-comm-val: [0 to 4294967295]  
4byte-asnumber: [1 to 4294967295]

## Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

- configure service vprn bgp-ipvpn segment-routing-v6 route-distinguisher
- All
- configure service vprn bgp-ipvpn mpls route-distinguisher
  - configure service vprn bgp-evpn mpls route-distinguisher

## 22.271 route-distinguisher-list

### route-distinguisher-list

#### Syntax

**route-distinguisher-list** *name*  
**no route-distinguisher-list** *name*

#### Context

[\[Tree\]](#) (config>router>policy-options route-distinguisher-list)

#### Full Context

configure router policy-options route-distinguisher-list

#### Description

This command creates a list of entries used to match the RD in BGP routes of specific address families.

#### Parameters

*name*

Specifies the name of the RD list, up to 64 characters.

#### Platforms

All

## route-distinguisher-list

### Syntax

**route-distinguisher-list** *name*  
**no route-distinguisher-list** *name*

### Context

[\[Tree\]](#) (config>router>policy-options>policy-statement>entry>from route-distinguisher-list)

### Full Context

configure router policy-options policy-statement entry from route-distinguisher-list

### Description

This command configures a route distinguisher (RD) list as a match criterion for the policy statement entry. This match condition is supported by policies applied as VRF import or BGP peer import policies. A BGP route can match a policy entry with this match criterion if the NLRI field contains an RD that is matched by at least one of the entries in the **route-distinguisher-list**.

BGP routes belonging to address families other than VPN-IPv4, VPN-IPv6, MCAST-VPN-IPv4, MCAST-VPN-IPv6, EVPN, FlowSpec-VPN IPv4, FlowSpec-VPN IPv6, MVPN-IPv4 or MVPN-IPv6 routes do not match policy entries with this match criterion.

### Parameters

*name*

Specifies the (possibly parameterized) name of an RD list.

### Platforms

All

## 22.272 route-downloader

## route-downloader

### Syntax

**route-downloader** *name* [create]  
**no route-downloader** *name*

### Context

[\[Tree\]](#) (config>aaa route-downloader)

### Full Context

configure aaa route-downloader

## Description

Commands in this context configure a route-downloader instance. The route-downloader is a process that uses radius access-request messages to a particular server. The server returns either an access-accept or access-deny message. Access-accept messages also contain the prefixes (in the form of static blackhole routes in various formats). Only a single route-downloader object can be created.

The **no** form of this command removes the name from the configuration. The object must be shutdown prior to deletion. No prefix is needed to delete an existing route-download object.

## Parameters

### *name*

Specifies the name of this RADIUS route downloader.

### **create**

This keyword is mandatory while creating an instance of the route-download object.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.273 route-entry

### route-entry

## Syntax

[no] **route-entry** {*ip-prefix/length* | *ip-prefix netmask*}

[no] **route-entry** {*ipv6-prefix/prefix-length* [**metric** *metric-value*]}

## Context

**[Tree]** (config>service>ies>sub-if>grp-if>sap>static-host>managed-routes route-entry)

**[Tree]** (config>service>vprn>sub-if>grp-if>sap>static-host>managed-routes route-entry)

## Full Context

configure service ies subscriber-interface group-interface sap static-host managed-routes route-entry

configure service vprn subscriber-interface group-interface sap static-host managed-routes route-entry

## Description

This command assigns managed-route to a given subscriber-host. As a consequence, a static route pointing subscriber-host ip address as a next hop will be installed in FIB. Up to 16 managed routes per subscriber-host can be configured.

The **no** form of this command removes the respective route. Per default, there are no managed-routes configured.

**Parameters*****ip-prefix/length***

Specifies the IP prefix and length.

**Syntax:**

ip-prefix/length:	ip-prefix	a.b.c.d
	ip-prefix-length	0 to 32

***netmask***

Specifies the subnet mask in dotted decimal notation.

**Values** a.b.c.d (0.0.0.0 not allowed)

***ipv6-prefix/prefix-length***

The IP prefix in dotted decimal notation.

<b>Values</b>	ipv6-prefix	x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D
	ipv6-prefix-length	0 to 128

***metric-value***

Specifies the metric value.

**Values** 0 to 4294967295

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**22.274 route-exists****route-exists****Syntax**

**route-exists** *expression*

**no route-exists**

**Context**

**[Tree]** (config>router>policy-options>policy-statement>entry>cond-expr route-exists)

## Full Context

configure router policy-options policy-statement entry conditional-expression route-exists

## Description

This command is used to specify a route existence expression to control evaluation of the policy entry. If the route existence expression evaluates to 'true' the matching and action commands of the policy entry are applied as normal. If the route existence expression evaluates to 'false' the entire policy entry is skipped and processing continues with the next entry; however, conditional expressions are only parsed when the route policy is used as a BGP export policy or VRF export policy.

## Default

no route-exists

## Parameters

### *expression*

"["<px-list-name>"]" [all | none]

If neither the **all** nor the **none** keyword are used the match logic is 'any' – that is, the route expression evaluates as 'true' if any exact match entry in the referenced prefix-list has an active route in the route table associated with the policy.

**all** – the route expression evaluates as 'true' only if all the exact match entries in the referenced prefix-list have an active route in the route table associated with the policy.

**none** – the route expression evaluates as 'true' only if none of the exact match entries in the referenced prefix-list have an active route in the route table associated with the policy.

## Platforms

All

## 22.275 route-limit

route-limit

## Syntax

**route-limit** [*limit*]

## Context

**[Tree]** (config>service>vprn>nat>outside>dnat-only route-limit)

**[Tree]** (config>router>nat>outside>dnat-only route-limit)

## Full Context

configure service vprn nat outside dnat-only route-limit

configure router nat outside dnat-only route-limit

## Description

This command limits the number of source routes (inside routes) that are installed on the outside in **dnat-only** case. In case that the number of actual routes is larger than the number of configured routes, the excess of the routes will not be installed in the routing table and a log will be raised.

The source IP addresses on the inside must be known in advance in a **dnat-only** instance. This is required so that the corresponding routes can be installed in the routing table and thus the downstream traffic is properly routed towards the MS-ISAs where the original translation was performed (and state is kept).

In the dnat-only case, it is mandatory that the inside (private side) and the outside (public side) are in separated VPRNs.

## Default

route-limit 32768

## Parameters

**[1..131072]**

Specifies the maximum number of source routes installed on the outside the **dnat-only** scenario.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.276 route-monitoring

### route-monitoring

## Syntax

**route-monitoring pre-policy [post-policy]**

**route-monitoring post-policy**

**no route-monitoring**

## Context

**[Tree]** (config>service>vprn>bgp>monitor route-monitoring)

**[Tree]** (config>router>bgp>group>monitor route-monitoring)

**[Tree]** (config>router>bgp>monitor route-monitoring)

**[Tree]** (config>service>vprn>bgp>group>monitor route-monitoring)

## Full Context

configure service vprn bgp monitor route-monitoring

configure router bgp group neighbor monitor route-monitoring

```
configure router bgp group monitor route-monitoring
configure router bgp monitor route-monitoring
configure service vprn bgp group monitor route-monitoring
```

### Description

This command specifies if BMP sends pre-policy route monitoring messages, post-policy route monitoring messages, both types of messages, or none.

The **no** form of this command disables sending of route-monitoring messages.

### Parameters

#### pre-policy

Enables sending pre-policy route monitoring messages using the pre-policy path attribute values, if available.

#### post-policy

Enables sending post-policy route monitoring messages using the post-policy path attribute values, if available.

### Platforms

All

```

```
configure service vpls bgp-evpn segment-routing-v6 route-next-hop
```

```
configure service epipe bgp-evpn segment-routing-v6 route-next-hop
```

## Description

This command configures the next hop of the EVPN routes.

## Default

route-next-hop system-ipv4

## Parameters

### **system-ipv4**

Specifies the system IPv4 address as the next hop for the service EVPN routes.

### **system-ipv6**

Specifies the system IPv6 address as the next hop for the service EVPN routes.

### **ip-address**

Specifies the IPv4 address value as the next hop for the service EVPN.

**Values** a.b.c.d

## Platforms

All

- configure service vpls bgp-evpn mpls route-next-hop
- configure service epipe bgp-evpn mpls route-next-hop

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

- configure service vpls bgp-evpn segment-routing-v6 route-next-hop
- configure service epipe bgp-evpn segment-routing-v6 route-next-hop

## route-next-hop

## Syntax

**route-next-hop** {*ip-address* | *ipv6-address*}

**no route-next-hop**

## Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg route-next-hop)

## Full Context

configure service system bgp-evpn ethernet-segment route-next-hop

## Description

This command modifies the next hop to the configured IP address value, for the following routes:

- ES
- AD per-ES (irrespective of the **evi-rt-set** or **evi-rt configuration mode**)

The **no** form of the command changes the originating IP address back to the system-ip.

### Default

no route-next-hop

### Parameters

#### *ip-address*

Specifies an IPv4 or IPv6 address.

**Values** *ip-address* | *ipv6-address*

### Platforms

All

## 22.278 route-next-hop-policy

route-next-hop-policy

### Syntax

route-next-hop-policy

### Context

[\[Tree\]](#) (config>router route-next-hop-policy)

### Full Context

configure router route-next-hop-policy

### Description

This command creates the context to configure route next-hop policies.

### Platforms

All

## 22.279 route-preference

route-preference

### Syntax

route-preference primary {inband | outband} secondary {inband | outband | none}

## no route-preference

### Context

[Tree] (config>log route-preference)

### Full Context

configure log route-preference

### Description

This command specifies the primary and secondary routing preference for traffic generated for SNMP notifications and syslog messages. If the remote destination is not reachable through the routing context specified by primary route preference then the secondary routing preference will be attempted.

The **no** form of this command reverts to the default values.

### Default

no route-preference

### Parameters

#### primary

Specifies the primary routing preference for traffic generated for SNMP notifications and syslog messages.

**Default** outband

#### secondary

Specifies the secondary routing preference for traffic generated for SNMP notifications and syslog messages. The routing context specified by the secondary route preference will be attempted if the remote destination was not reachable by the primary routing preference, specified by primary route preference. The value specified for the secondary routing preference must be distinct from the value for primary route preference.

**Default** inband

#### inband

Specifies that the logging utility will attempt to use the base routing context to send SNMP notifications and syslog messages to remote destinations.

#### outband

Specifies that the logging utility will attempt to use the management routing context to send SNMP notifications and syslog messages to remote destinations.

#### none

Specifies that no attempt will be made to send SNMP notifications and syslog messages to remote destinations.

### Platforms

All

## route-preference

### Syntax

**route-preference** {**both** | **inband** | **outband**}

**no route-preference**

### Context

**[Tree]** (config>system>security>ldap route-preference)

**[Tree]** (config>system>security>tacplus route-preference)

**[Tree]** (config>system>security>radius route-preference)

### Full Context

configure system security ldap route-preference

configure system security tacplus route-preference

configure system security radius route-preference

### Description

This command specifies the routing preference to reach the AAA server. If the configured option is to use both in-band and out-of-band routes, the out-of-band routes in the management routing instance are used to reach the server before the in-band routes in the Base routing instance.

The **no** form of this command reverts to the default value.

### Default

route-preference both

### Parameters

#### **both**

Specifies the use of out-of-band routes before in-band routes.

#### **inband**

Specifies the use of in-band routes only.

#### **outband**

Specifies the use of out-of-band routes only.

### Platforms

All

## route-preference

### Syntax

**route-preference** {**both** | **inband** | **outband**}

**no route-preference**

## Context

[\[Tree\]](#) (config>router>pcep>pcc>peer route-preference)

## Full Context

configure router pcep pcc peer route-preference

## Description

This command specifies the routing preference to reach the PCE server. If the configured option is to use both in-band and out-of-band routes, the out-of-band routes in the management routing instance are used to reach the server before the in-band routes in the Base routing instance.

The **no** form of this command reverts to the default value.

## Default

route-preference both

## Parameters

### both

Specifies the use of out-of-band routes before in-band routes.

### inband

Specifies the use of in-band routes only.

### outband

Specifies the use of out-of-band routes only.

## Platforms

## Full Context

configure log app-route-notifications route-recovery-wait

## Description

The time delay that must pass before notifying specific CPM applications after the recovery or change of a route during normal operation.

The **no** form of this command disables the time-delay configuration.

## Default

no route-recovery-wait

## Parameters

### *seconds*

Time delay in seconds.

**Values** 1 to 100

## Platforms

All

## 22.281 route-refresh

### route-refresh

## Syntax

**route-refresh** [*neighbor ip-address* | **group name**]

**no route-refresh**

## Context

[\[Tree\]](#) (debug>router>bgp route-refresh)

## Full Context

debug router bgp route-refresh

## Description

This command enables debugging for BGP route-refresh.

The **no** form of this command disables debugging.

## Parameters

### *neighbor ip-address*

Debugs only events affecting the specified BGP neighbor.

**Values** ipv4-address:

- a.b.c.d (host bits must be 0)

ipv6-address:

- x:x:x:x:x:x [-interface] (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: up to 32 characters for link local addresses

### group name

Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

#### Full Context

debug router ip route-table

#### Description

This command configures route table debugging.

#### Parameters

##### *ip-prefix/prefix-length*

The IP prefix for prefix list entry in dotted decimal notation.

**Values** The following values apply to the 7750 SR and 7950 XRS:

ipv4-prefix            a.b.c.d (host bits must be 0)

ipv4-prefix-length    0 to 32

ipv6-prefix	x::x::x::x::x::x (eight 16-bit pieces)	
	x::x::x::x::d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D
ipv6-prefix-length	0 to 128	

**Values** The following values apply to the 7450 ESS:

ipv4-prefix	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32

### longer

Specifies the prefix list entry matches any route that matches the specified *ip-prefix* and prefix *mask* length values greater than the specified *mask*.

#### Full Context

configure service vprn bgp rib-management ipv4 route-table-import

configure service vprn bgp rib-management ipv6 route-table-import

configure service vprn bgp rib-management label-ipv4 route-table-import

## Description

This command specifies the name of a route policy to control the importation of active routes from the IP route table into one of the BGP RIBs.

If the **route-table-import** command is not configured, or if the command refers to an empty policy, all non-BGP routes from the IP route table are imported into the applicable RIB.

If the **route-table-import** command is configured, then routes dropped or rejected by the configured policy are not installed in the associated RIB. Rejected routes cannot be advertised to BGP peers associated with the RIB, but they can still be used to resolve BGP next-hops of routes in that RIB. If the active route for a prefix is rejected by the **route-table-import** policy, then the best BGP route for that prefix in the BGP RIB can be advertised to peers as though it is used.

Aggregate routes are always imported into each RIB, independent of the **route-table-import** policy.

Route modifications specified in the actions of a **route-table-import** policy are ignored and have no effect on the imported routes.

## Default

no route-table-import

## Parameters

### *policy-name*

Specifies the name of a policy-statement (up to 64 characters).

## Platforms

All

## route-table-import

## Syntax

Specifies the name of a policy-statement (up to 64 characters).

## Platforms

All

## 22.284 route-target

### route-target

## Syntax

**route-target export** *ext-community* **import** *ext-community*

**no route-target**

## Context

[\[Tree\]](#) (config>subscr-mgmt>isa-svc-chain>evpn>bgp route-target)

## Full Context

configure subscriber-mgmt isa-service-chaining evpn bgp route-target

## Description

This command configures route target attributes to be signaled in EVPN routes used for service chaining.

The **no** form of this command removes the parameters from the configuration.

## Parameters

### export

Specifies the route target to be used by BGP in this EVPN service when exporting EVPN routes.

### import

Specifies the route target to be used by BGP in this EVPN service when importing EVPN routes.

### ext-community

Specifies the extended community.

**Values** rd: *ip-addr:comm-val* | *2byte-asnumber:ext-comm-val* | *4byte-asnumber:comm-val*  
*ip-addr*: a.b.c.d  
 comm-val: [0 to 65535]  
 2byte-asnumber: [1 to 65535]  
 ext-comm-val: [0 to 4294967295]  
 4byte-asnumber: [1 to 4294967295]

## Platforms

## route-target

### Syntax

**route-target** {*ext-community* | **{[export *ext-community*][import *ext-community*]}**}

**no route-target**

### Context

**[Tree]** (config>service>epipe>bgp route-target)

**[Tree]** (config>service>vpls>bgp route-target)

**[Tree]** (config>service>vpls>bgp-ad route-target)

### Full Context

configure service epipe bgp route-target

configure service vpls bgp route-target

configure service vpls bgp-ad route-target

### Description

This command configures the route target (RT) component that will be signaled in the related MP- BGP attribute to be used for BGP auto-discovery, BGP VPLS, BGP multi-homing and EVPN if these features

are configured in this VPLS service, or for BGP multi-homing, BGP-VPWS and EVPN in case of Epipe services.

If this command is not used in VPLS services, the RT is built automatically using the VPLS ID. The extended community can have the same two formats as the VPLS ID, a two-octet AS-specific extended community, IPv4 specific extended community. For BGP EVPN enabled VPLS and Epipe services, the route target can also be auto-derived from the **evi** value (**config>service>vpls>bgp-evpn>evi** or **config>service>epipe>bgp-evpn>evi**) if this command is not configured.

## Parameters

### **export** *ext-community*

Specifies communities allowed to be sent to remote PE neighbors.

### **import** *ext-community*

Specifies communities allowed to be accepted from remote PE neighbors.

## Platforms

All

## 22.285 route-target-list

### route-target-list

## Syntax

**route-target-list** *comm-id* [*comm-id*]

**no route-target-list** [*comm-id*]

## Context

[\[Tree\]](#) (config>router>bgp route-target-list)

## Full Context

configure router bgp route-target-list

## Description

This command specifies the route target(s) to be accepted from or advertised to peers. If the **route-target-list** is a non-null list, only routes with one or more of the given route targets are accepted from or advertised to peers.

The **route-target-list** is assigned at the global level and applies to all peers connected to the system.

This command is only applicable if the router is a route-reflector server.

The **no** form of this command with a specified route target community removes the specified community from the **route-target-list**. The **no** form of this command entered without a route target community removes all communities from the list.

## Default

no route-target-list

## Parameters

### *comm-id*

Specifies up to 15 route target communities.

**Values** [target: {*ip-address:comm-val* | *2byte-asnumber:ext-comm-val* | *4byte-asnumber:comm-val*}

where:

- *ip-address* — a.b.c.d
- *comm-val* — 0 to 65535
- *2byte-asnumber* — 0 to 65535
- *ext-comm-val* — 0 to 4294967295
- *4byte-asnumber* — 0 to 4294967295

## Platforms

## 22.286 route-unknown

### route-unknown

## Syntax

[no] route-unknown [{*ip-prefix/mask* | *ipv6-address/prefix-length*}]

## Context

[\[Tree\]](#) (config>vrrp>policy>priority-event route-unknown)

## Full Context

configure vrrp policy priority-event route-unknown

## Description

This command creates a context to configure a route unknown priority control event that monitors the existence of a specific active IP route prefix within the routing table.

The **route-unknown** command configures a priority control event that defines a link between the VRRP priority control policy and the Route Table Manager (RTM). The RTM registers the specified route prefix as monitored by the policy. If any change (add, delete, new next hop) occurs relative to the prefix, the policy is notified and takes correct action according to the priority event definition. If the route prefix exists and is active in the routing table according to the conditions defined, the event is in the cleared state. If the route prefix is removed, becomes inactive or fails to meet the event criteria, the event is in the set state.

The command creates a **route-unknown** node identified by *prefix/mask-length* and containing event control commands.

Multiple unique (different *prefix/mask-length*) **route-unknown** event nodes can be configured within the **priority-event** node up to the maximum limit of 32 events.

The **route-unknown** command can reference any valid IP address mask-length pair. The IP address and associated mask length define a unique IP router prefix. The dynamic monitoring of the route prefix results in one of the event operational states listed in [Table 98: Route-unknown Operational States](#).

*Table 98: Route-unknown Operational States*

<b>route-unknown Operational State</b>	<b>Description</b>
Set – non-existent	The route does not exist in the route table
Set – inactive	The route exists in the route table but is not being used
Set – wrong next hop	The route exists in the route table but does not meet the <b>next-hop</b> requirements
Set – wrong protocol	The route exists in the route table but does not meet the <b>protocol</b> requirements
Set – less specific found	The route exists in the route table but does is not an exact match and does not meet any <b>less-specific</b> requirements
Set – default best match	The route exists in the route table as the default route but the default route is not allowed for route matching
Cleared – less specific found	A less specific route exists in the route table and meets all criteria including the <b>less-specific</b> requirements
Cleared – found	The route exists in the route table manager and meets all criteria

An existing route prefix in the RTM must be active (used by the IP forwarding engine) to clear the event operational state. It may be less specific (the defined prefix may be contained in a larger prefix according to Classless Inter-Domain Routing (CIDR) techniques) if the event has the **less-specific** statement defined. The less specific route that incorporates the router prefix may be the default route (0.0.0.0) if the **less-specific allow-default** statement is defined. The matching prefix may be required to have a specific next hop IP address if defined by the event **next-hop** command. Finally, the source of the RTM prefix may be required to be one of the dynamic routing protocols or be statically defined if defined by the event **protocol** command. If an RTM prefix is not found that matches all the above criteria (if defined in the event control commands), the event is considered to be set. If a matching prefix is found in the RTM, the event is considered to be cleared.

When an event transitions from clear to set, the set is processed immediately and must be reflected in the associated virtual router instances in-use priority value. As the event transitions from clear to set, a hold-set timer is loaded with the value configured by the events **hold-set** command. This timer prevents the event from clearing until it expires, damping the effect of event flapping. If the event clears and becomes set again before the hold-set timer expires, the timer is reset to the **hold-set** value, extending the time before another clear can take effect.

The **no** form of the command is used to remove the specific *prefix/mask-length* monitoring event. The event can be removed at anytime. When the event is removed, the in-use priority of all associated virtual router instances must be reevaluated. The events **hold-set** timer has no effect on the removal procedure.

## Default

no route-unknown — No route unknown priority control events are defined for the priority control event policy.

## Parameters

### *ip-prefix/mask*

The IP prefix address in dotted decimal notation and the subnet mask length expressed as a decimal integer associated with the IP *prefix* defining the route prefix to be monitored by the route unknown priority control event.

**Values** The following values apply to the 7750 SR, 7950 XRS, and 7450 ESS:

<i>ip-prefix/</i>	ip-prefix	a.b.c.d (host bits must
<i>mask:</i>		be 0)
	mask	0 to 32

### *ipv6-address/prefix-length*

The IPv6 address of the host for which the specific event will monitor connectivity. The *ipv6-address* can only be monitored by a single event in this policy. The IPv6 address can be monitored by multiple VRRP priority control policies. The IPv6 address can be used in one or multiple **ping** requests. Each VRRP priority control **host-unreachable** and **ping** destined to the same *ipv6-address* is uniquely identified on a per message basis. Each session originates a unique identifier value for the ICMP echo request messages it generates. This allows received ICMP echo reply messages to be directed to the appropriate sending application.

**Values** The following values apply to the 7750 SR and 7950 XRS:

<i>ipv6-address</i>	x:x:x:x:x:x:x (eight 16-bit
	pieces)
	x:x:x:x:x:d.d.d.d
	x: [0..FFFF]H
<i>prefix-length</i>	0 to 128

Specifies the identifier of the virtual router instance where the tunneled UE traffic is routed.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## router

## Syntax

**router** [*router-instance*] [**create**]

**no router** [*router-instance*]

## Context

[\[Tree\]](#) (config router)

## Full Context

configure router

## Description

Commands in this context configure router parameters including interfaces, route policies and protocols. This command is also used to create CPM router instances.

For CPM router instances, this command enters or creates a user-created CPM router instance. A CPM router instance is not a VPRN router instance. VPRN router instances are configured under **configure service vprn**. CPM router instances are the only type of non-VPRN router instances that can be created by a user, and they have a user-defined name. CPM router instances only use CPM/CCM ethernet ports as interfaces.

## Parameters

### *router-instance*

Specifies the router name or CPM router instance.

### Values

*router-instance* : *router name*

*router-name*      Base | management | *cpm-vr-name*

*cpm-vr-name*      [32 characters maximum]

**Default**      Base

### **create**

Mandatory keyword when creating a router instance. The create keyword requirement can be enabled or disabled in the **environment>create** context.

## Platforms

All

## router

### Syntax

```

router router-instance group tunnel-group-name
router group tunnel-group-name service-name service-name
no router

```

### Context

**[Tree]** (config>service>epipe>sap>l2tpv3-session router)

**[Tree]** (config>service>vpls>sap>l2tpv3-session router)

### Full Context

configure service epipe sap l2tpv3-session router

configure service vpls sap l2tpv3-session router

### Description

This command configures the service and L2TPv3 group to which this L2TPv3 session should be associated. The associated services are used to provide transport for the L2TPv3 tunnel. The service can be specified with either the service-name or router ID. The group name specifies the L2TPv3 group parameters that should be associated with the session.

The **no** form of this command deletes the router configuration.

### Parameters

#### ***router-instance***

Specifies the router name or service ID used to identify the router instance.

#### **Values**

*router-instance*: *router-name* or *vprn-svc-id*

*router-name* "Base"

*vprn-svc-id* 1 to 2147483647

**Default** Base

#### ***tunnel-group-name***

Specifies the tunnel group name, up to 32 characters.

#### ***service-name***

Specifies the service name, up to 64 characters.

**no router**

## Context

[\[Tree\]](#) (config>system>management-interface>remote-management router)

## Full Context

configure system management-interface remote-management router

## Description

This command defines the router instance in which all remote managers are reachable.

If this command is also configured for a specific manager in the **config>system> management-interface>remote-management>manager** context, that configuration takes precedence.

The **no** form of this command configures management as the router (default).

## Default

router management

## Parameters

### *router-instance*

Specifies a router instance on which the remote management connection is established, up to 32 characters.

### *service vprn-service-instance*

Specifies a VPRN service instance, up to 64 characters.

## Platforms

All

router

## Syntax

**router** *router-instance*

**router service** *vprn-service-instance*

**no router**

## Context

[\[Tree\]](#) (config>system>management-interface>remote-management>manager router)

## Full Context

configure system management-interface remote-management manager router

## Description

This command defines the router instance in which this manager is reachable.

This command takes precedence over the same command configured in the global context (**config>system>management-interface>remote-management**).

The **no** form of this command causes the router to be inherited from the global context (**config>system>management-interface>remote-management**).

## Default

management

## Parameters

### *router-instance*

Specifies the router instance on which the remote management connection is established for this manager, up to 32 characters.

### *service vprn-service-instance*

Specifies a VPRN service instance, up to 64 characters.

## Platforms

All

## router

## Syntax

**router** *router-instance*

**no router**

## Context

[\[Tree\]](#) (config>isa>nat-group>inter-chassis-redundancy router)

## Full Context

configure isa nat-group inter-chassis-redundancy router

## Description

This command configures routing instance through which ISAs communicate between redundant nodes and synchronize their flow state.

The **no** form of this command removes the router instance from the configuration.

## Default

no router

## Parameters

### *router-instance*

Specifies the router name or service ID for the router instance.

**Values** <router-name>| <vprn-svc-id>

router-name: "Base"

vprn-svc-id: 1 to 2147483647

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

```
router
```

## Syntax

**router** *router-instance*

**router** **service-name** *service-name*

**no router**

## Context

[\[Tree\]](#) (config>aaa>isa-radius-plcy>servers router)

## Full Context

configure aaa isa-radius-policy servers router

## Description

This command specifies the number of times the router attempts to contact the RADIUS server for authentication, if not successful the first time.

The **no** form of the command reverts to the default value.

## Default

no router

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

```
router
```

## Syntax

**router** *router-instance*

**router** **service-name** *service-name*

**no router**

## Context

[\[Tree\]](#) (config>mirror>mirror-dest>encap>layer-3-encap router)

## Full Context

configure mirror mirror-dest encap layer-3-encap router

## Description

This command specifies the routing instance into which to inject the mirrored packets. The packets are forwarded in the routing instance based on the configurable destination IP address in the inserted IP header. If a mirror-dest is configured to inject into a VPRN service, then that VPRN service cannot be deleted. A mirror-dest with layer-3-encap is set to operationally down if the configured destination IP address is not reachable via an interface in the routing instance or service configured for the mirror-dest. No changes are allowed to the router configuration once a gateway is configured. A service must already exist before it is specified as a router-instance. VPRN and IES services share the same number space for the service-id, but IES services cannot be specified as the router-instance for routable LI encap.

Forwarding of routable encapsulated LI packets out an R-VPLS interface is not supported. A mirror-dest configured with routable encapsulation can be bound to a routing instance that also has an R-VPLS bound to it but the operator must ensure that the destination of the LI packets is not reachable via any R-VPLS interfaces. Any routable encapsulated LI packets that arrive at the egress of an R-VPLS interface are discarded. Parallel use of routable LI encapsulation and R-VPLS in the same routing instance is supported as long as the mirrored packets do not egress out the R-VPLS interface.

## Default

router Base

## Parameters

### ***router-instance***

Specifies the router instance.

Values	<router-name>   <service-id>
<i>router-name</i>	"Base", <i>name</i>
<i>service-id</i>	1 to 2147483647

### ***service-name***

Specifies the service name, up to 64 characters.

## Platforms

All

## router

## Syntax

**router** *router-instance*

**no router**

## Context

[\[Tree\]](#) (config>li>mirror-dest-template>layer-3-encap router)

## Full Context

```
configure li mirror-dest-template layer-3-encap router
```

## Description

This command specifies the routing instance into which to inject the mirrored packets. The packets will be forwarded in the routing instance based on the configurable destination IP address in the inserted IP header. This parameter can be overridden by RADIUS.

If a mirror destination is configured to inject into a VPRN service, that VPRN service cannot be deleted. A mirror destination with Layer 3 encapsulation will be set to operationally down if the configured destination IP address is not reachable via an interface in the routing instance or service configured for the mirror destination. A service must exist before it is specified as a router instance. VPRN and IES services share the same number space for the service ID; however, IES services cannot be specified as the router instance for routable LI encapsulation.

## Default

```
router "Base"
```

## Parameters

### *router-instance*

Specifies the router instance using the router name or service ID.

Values	<i>router-instance</i>	<i>router-name</i>   <i>vprn-svc-id</i>
		<i>router-name</i> "Base"
		<i>vprn-svc-id</i> 1 to 2147483647

## Platforms

All

```
router
```

## Syntax

```
router router-name
```

```
no router
```

## Context

[\[Tree\]](#) (config>li>x-interfaces>lics>lic router)

## Full Context

```
configure li x-interfaces lics lic router
```

## Description

This command configures the router instance that the X-interfaces must use for communication. The **no** form of this command reverts to the default.

## Parameters

### *router-name*

Specifies the router name or VPRN service ID.

<b>Values</b>	<router-name>, <vprn-svc-id>	
	<i>router-name</i>	Base
	<i>vprn-svc-id</i>	1 to 2147483647

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## router

## Syntax

```
router router-or-service
router service-name service-name
no router
```

## Context

[\[Tree\]](#) (config>oam-pm>session>ip router)

## Full Context

```
configure oam-pm session ip router
```

## Description

This command numerically references the source context from which the TWAMP Light packet is launched. The **router-instance** *router-instance* configuration, under the same context as the **router** command, is the preferred method for referencing. This method references the launch context by name, and not number, or alias that converts **service-name** to a number.

The **no** form of this command restores the default value.

## Parameters

### *router-or-service*

Specifies the numerical reference to the router instance or service. Well known router-name "Base" is allowed for convenience, but mapped numerically.

<b>Values</b>	{ <i>router-name</i>   <i>vprn-svc-id</i> }
---------------	---

*router-name*: Base  
*vprn-svc-id*: 1 to 2147483647

The parameter *router-instance* is preferred for specifying the router or service.

### **service-name**

Specifies the alias function that allows the service-name to be used converted and stored as service ID, up to 64 characters. The parameter *router-instance* is preferred for specifying the router or service.

### **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## **router**

### **Syntax**

[no] **router** *router-instance* **interface** *interface-name*

### **Context**

[\[Tree\]](#) (config>cflowd>collector>exp-filter>if-list router)

### **Full Context**

configure cflowd collector export-filter interface-list router

### **Description**

This command identifies an interface for which ingress sampled data flows should be sent to the associated collector.

The **no** form of this command removes the specified interface from the **interface-list** filter.

### **Parameters**

#### ***router-instance***

Specifies the router instance ID associated with the interface name

**Values** *router-name* | *vprn-svc-id*

*router-name*: Base, management Default - Base

*vprn-svc-id*: 1 to 2147483647

#### ***interface-name***

Specifies the interface name, up to 32 characters and must start with a letter, for the desired router to the service interface or SAP

### **Platforms**

All

## router

### Syntax

[no] **router** *router-instance*

### Context

[\[Tree\]](#) (config>cflowd>collector>export-filter router)

### Full Context

configure cflowd collector export-filter router

### Description

This command allows the flow data from only specific router instances to be sent to the associated collector.

Multiple router instances can be configured by issuing the command multiple times with the different router-instances.

The **no** form of this command removes the specified router-instance restriction, which means flows from that router-instance will no longer be exported. If all router-instances are removed, then flows from all router instances are sent to the associated collector.

### Default

no router

### Parameters

#### *router-instances*

Specifies the router name or router instance VPRN service ID. Only "Base" is supported.

**Values** router-name: Base, management Default - management  
vprn-svc-id: 1 to 2147483647

### Platforms

All

## router

### Syntax

**router** {*router-name* | *vprn-svc-id*}

### Context

[\[Tree\]](#) (config>cflowd>collector router)

## Full Context

configure cflowd collector router

## Description

This command configures the flow data sent to the associated collector to be sent within the specified router context. If this parameter is not specified, flow data is exported using the management routing context.

## Default

router management

## Parameters

### *router-name*

Specifies the router name.

**Values** Base, management

**Default** management

### *vprn-svc-id*

Specifies the router instance VPRN service ID.

**Values** 1 to 2147483647

## Platforms

All

router

## Syntax

**router** *router-instance*

**router service-name** *service-name*

**no router**

## Context

[\[Tree\]](#) (config>filter>redirect-policy router)

## Full Context

configure filter redirect-policy router

## Description

This command enhances VRF support in redirect policies. When a router instance is specified, the configured destination tests are run in the specified router instance, and the PBR action is executed in the specified router instance. If no destination is active or if the hardware does not support PBR action "next-

hop router”, action forward will be executed (i.e. routing will be performed in the context of the incoming interface routing instance).

The **no** form of the command preserves backward-compatibility. Tests always run in the "Base" routing instance context, and the PBR action executes in the routing context of the ingress interface that the filter using this redirect policy is deployed on.

## Default

no router

## Parameters

### *router-instance*

Specifies a router instance in the form of **router-name** or **service-id**.

**Values** **router-name** — Base

**service-id** — Specifies an existing Layer 3 service [1 to 2147483647]

### *service-name*

Specifies the name of a configured Layer 3 service.

## Platforms

All

router

## Syntax

**router** {**eq** | **neq**} *router-instance* [**regexp**]

**no router**

## Context

[\[Tree\]](#) (config>log>filter>entry>match router)

## Full Context

configure log filter entry match router

## Description

This command specifies the log event matches for the router instance using a special vrtr-name format used by the logging system.

The **no** form of this command removes the log event matches.

## Parameters

**eq**

Determines if the matching criteria should be equal to the specified value.

**neq**

Determines if the matching criteria should not be equal to the specified value.

#### ***router-instance***

Specifies a router name, up to 32 characters, to be used in the match criteria. The router-instance in this command is a name for a router instance in a special format used in the logging system (called the vrtr-name). Examples of vrtr-names include **Base** and **vprn101** (where 101 is the service-id of the VPRN service). It represents the router instance that generated the log event.

#### **regex**

Specifies the type of string comparison to use to determine if the log event matches the value of the specified router instance. When the **regex** keyword is specified, the string in the **router** command is a regular expression string that is matched against the vrtr-name string in the log event being filtered.

### **Platforms**

All

## **router**

### **Syntax**

**router service-name** *service-name*

**router** *router-instance*

**no router**

### **Context**

### **Full Context**

configure system security management-access-filter ipv6-filter entry router

configure system security management-access-filter ip-filter entry router

### **Description**

This command configures a router name or service ID to be used as a management access filter match criterion.

The **no** form the command removes the router name or service ID from the match criteria.

### **Parameters**

#### ***router-instance***

Specifies one of the following parameters for the router instance:

*router-name* — Specifies a router name or CPM router instance, up to 32 characters to be used in the match criteria.

**Values** "Base" | "management" | "vpls-management"

**Default** Base

*vprn-svc-id* — Specifies a CPM router instance to be used in the match criteria.

**Values** 1 to 2147483647

***service name***

Specifies an existing service name, up to 64 characters.

## Platforms

All

## router

## Syntax

**router service-name** *service-name*

### Full Context

```
configure service vprn ospf router-id
```

```
configure service vprn bgp router-id
```

```
configure service vprn router-id
```

### Description

This command sets the router ID for a specific VPRN context.

When configuring the router ID in the base instance of OSPF it overrides the router ID configured in the **config>router** context. The default value for the base instance is inherited from the configuration in the **config>router** context. If the router ID in the **config>router** context is not configured, the following applies:

- The system uses the system interface address (which is also the loopback address).
- If a system interface address is not configured, use the last 32 bits of the chassis MAC address.

If neither the router ID nor system interface are defined, the router ID from the base router context is inherited.

This is a **required** command when configuring multiple instances and the instance being configured is not the base instance.

When configuring a new router ID, the instance is not automatically restarted with the new router ID. The next time the instance is initialized, the new router ID is used.

To force the new router ID to be used, issue the **shutdown** and **no shutdown** commands for the instance, or reboot the entire router.

It is possible to configure an SR OS to operate with an IPv6 only BOF and no IPv4 system interface address. When configured in this manner, the operator must explicitly define IPv4 router IDs for protocols such as OSPF and BGP as there is no mechanism to derive the router ID from an IPv6 system interface address.

The **no** form of this command removes the router ID definition from the given VPRN context.

## Default

no router-id

## Parameters

### *ip-address*

The IP address must be given in dotted decimal notation.

## Platforms

All

## router-id

## Syntax

**router-id** *ip-address*

**no router-id**

## Context

[\[Tree\]](#) (config>service>vprn>isis router-id)

## Full Context

configure service vprn isis router-id

## Description

This command sets the router ID for a specific VPRN context.

If neither the router ID nor system interface are defined, the router ID from the base router context is inherited.

The **no** form of this command removes the router ID definition from the given VPRN context.

## Default

no router-id

## Parameters

### *ip-address*

The IP address must be given in dotted decimal notation.

## Platforms

All

## router-id

## Syntax

[no] **router-id** *ip*

## Context

[\[Tree\]](#) (config>router>mpls>srlg-database router-id)

## Full Context

configure router mpls srlg-database router-id

## Description

Commands in this context configure the link members of SRLG groups for a specific router in the network. The user must also use this command to enter the local interface SRLG membership into the user SRLG database. Use by CSPF of all interface SRLG membership information of a specific router ID may be temporarily disabled by shutting down the node. If this occurs, CSPF assumes these interfaces have no SRLG membership association.

The **no** form of this command will delete all interface entries under the router ID.

## Parameters

### *ip-address*

Specifies the router ID for this system. This must be the router ID configured under the base router instance, the base OSPF instance or the base IS-IS instance.

## Platforms

All

## router-id

## Syntax

**router-id** *ip-address*

**no router-id**

## Context

[\[Tree\]](#) (config>router router-id)

## Full Context

```
configure router router-id
```

## Description

This command configures the router ID for the router instance.

The router ID is used by both OSPF and BGP routing protocols in this instance of the routing table manager. IS-IS uses the router ID value as its system ID.

When configuring a new router ID, protocols are not automatically restarted with the new router ID. The next time a protocol is initialized, the new router ID is used. This can result in an interim period of time when different protocols use different router IDs.

It is possible to configure SR OS to operate with an IPv6 only BOF and no IPv4 system interface address. When configured in this manner, the operator must explicitly define IPv4 router IDs for protocols such as OSPF and BGP as there is no mechanism to derive the router ID from an IPv6 system interface address.

To force the new router ID to be used, issue the **shutdown** and **no shutdown** commands for each protocol that uses the router ID, or restart the entire router.

The system uses the system interface address which is also the loopback address. If a system interface address is not configured, use the last 32 bits of the chassis MAC address.

The **no** form of this command removes the configured value and the last 32 bits of the chassis MAC address are used.

## Default

```
no router-id
```

## Parameters

### *ip-address*

Specifies the 32 bit router ID expressed in dotted decimal notation or as a decimal value.

## Platforms

All

```
router-id
```

## Syntax

```
router-id ip-address
```

```
no router-id
```

## Context

[\[Tree\]](#) (config>router>bgp router-id)

## Full Context

```
configure router bgp router-id
```

## Description

This command specifies the router ID to be used with this BGP instance.

Changing the BGP router ID on an active BGP instance causes the BGP instance to restart with the new router ID.

It is possible to configure an SR OS to operate with an IPv6 only BOF and no IPv4 system interface address. When configured in this manner, the operator must explicitly define IPv4 router IDs for protocols such as OSPF and BGP as there is no mechanism to derive the router ID from an IPv6 system interface address.

When no **router-id** is configured for BGP, the system interface IP address is used.

## Default

no router-id

## Parameters

### *ip-address*

Specifies the router ID, expressed as any non-zero value in the range 0.0.0.1 to 255.255.255.255 (or when converted to decimal it can have any value in the range 1-4294967295). It is recommended to use the system IPv4 address.

## 22.293 router-instance

### router-instance

#### Syntax

**router-instance** *router-instance*

**no router-instance**

#### Context

**[Tree]** (config>oam-pm>session>ip router-instance)

#### Full Context

configure oam-pm session ip router-instance

#### Description

This command references the source context from which the TWAMP Light packet is launched by name. The **router-instance** *router-instance* configuration is the preferred method for referencing and references the launch context by name, not number or alias that converts **service-name** to a number.

The **no** form of this command restores the default value.

#### Parameters

##### *router-instance*

Specifies the preferred method for entering a service name. Stored as the service name. Only the service linking function is allowed for both mixed-mode and model-driven configuration modes, up to 64 characters.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

### router-instance

#### Syntax

**router-instance** *router-instance*

**router-instance service** *vprn-service-instance*

**no router-instance**

#### Context

**[Tree]** (config>system>grpc-tunnel>destination-group>destination router-instance)

**[Tree]** (config>system>telemetry>destination-group>destination router-instance)

### Full Context

configure system grpc-tunnel destination-group destination router-instance  
configure system telemetry destination-group destination router-instance

### Description

This command configures the router instance for the destination group.  
The **no** form of this command reverts to the default value.

### Default

router-instance management

### Parameters

#### *router-instance*

Specifies the router instance type, up to 32 characters.

**Values** management, base

#### *vprn-service-instance*

Specifies the VPRN service instance, up to 64 characters.

### Platforms

All

## 22.294 router-lifetime

router-lifetime

### Syntax

**router-lifetime** *seconds*  
**router-lifetime no-default-router**  
**no router-lifetime**

### Context

[\[Tree\]](#) (config>subscr-mgmt>rtr-adv-plcy router-lifetime)

### Full Context

configure subscriber-mgmt router-advertisement-policy router-lifetime

### Description

This command specifies the router lifetime.  
The **no** form of this command returns the command to the default setting.

## Default

router-lifetime 4500

## Parameters

### *seconds*

Specifies the time, in seconds, for the prefix to remain preferred.

**Values** 2700 to 9000

### **no-default-router**

Specifies that the router is not to be used as a default router.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## router-lifetime

## Syntax

**router-lifetime** *seconds*

**router-lifetime no-default-router**

**no router-lifetime**

## Context

**[Tree]** (config>service>ies>sub-if>grp-if>ipv6>rtr-adv router-lifetime)

**[Tree]** (config>service>ies>sub-if>ipv6>rtr-adv router-lifetime)

**[Tree]** (config>service>vprn>sub-if>grp-if>ipv6>rtr-adv router-lifetime)

**[Tree]** (config>service>vprn>sub-if>ipv6>rtr-adv router-lifetime)

## Full Context

configure service ies subscriber-interface group-interface ipv6 router-advertisements router-lifetime

configure service ies subscriber-interface ipv6 router-advertisements router-lifetime

configure service vprn subscriber-interface group-interface ipv6 router-advertisements router-lifetime

configure service vprn subscriber-interface ipv6 router-advertisements router-lifetime

## Description

This command configures the value to be placed in the router lifetime field of router advertisements sent from this interface. A value of zero indicates this router should not be used by hosts as a default router.

The **no** form of this command reverts to the default.

## Default

router-lifetime 4500

## Parameters

### *seconds*

Specifies the router lifetime in seconds for this group-interface.

**Values** 2700 to 9000

### **no-default-router**

Specifies that the router is not to be used as a default router.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## router-lifetime

## Syntax

**router-lifetime** *seconds*

**no router-lifetime**

## Context

[\[Tree\]](#) (config>router>router-advert>if router-lifetime)

[\[Tree\]](#) (config>service>vprn>router-advert>if router-lifetime)

## Full Context

configure router router-advertisement interface router-lifetime

configure service vprn router-advertisement interface router-lifetime

## Description

This command sets the router lifetime.

## Default

router life-time 1800

## Parameters

### *seconds*

The length of time, in seconds, (relative to the time the packet is sent) that the prefix is valid for route determination.

**Values** 0, 4 to 9000 seconds. 0 means that the router is not a default router on this link.

## Platforms

All

## 22.295 router-solicit

### router-solicit

#### Syntax

**router-solicit**

#### Context

**[Tree]** (config>service>ies>sub-if>ipv6 router-solicit)

**[Tree]** (config>service>ies>sub-if>grp-if>ipv6 router-solicit)

**[Tree]** (config>service>vprn>sub-if>grp-if>ipv6 router-solicit)

**[Tree]** (config>service>vprn>sub-if>ipv6 router-solicit)

#### Full Context

configure service ies subscriber-interface ipv6 router-solicit

configure service ies subscriber-interface group-interface ipv6 router-solicit

configure service vprn subscriber-interface group-interface ipv6 router-solicit

configure service vprn subscriber-interface ipv6 router-solicit

#### Description

Commands in this context configure parameters used for router-solicit based authentication.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.296 router-solicitation

### router-solicitation

#### Syntax

**[no] router-solicitation**

#### Context

**[Tree]** (config>service>ies>sub-if>grp-if>ipv6>auto-reply router-solicitation)

**[Tree]** (config>service>vprn>sub-if>grp-if>ipv6>auto-reply router-solicitation)

### Full Context

```
configure service ies subscriber-interface group-interface ipv6 auto-reply router-solicitation  
configure service vprn subscriber-interface group-interface ipv6 auto-reply router-solicitation
```

### Description

This command enables auto-reply router solicitation.

The **no** form of this command disables auto-reply router solicitation.

### Default

```
router-solicitation
```

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.297 router-target-as-number

```
router-target-as-number
```

### Syntax

```
router-target-as-number as-number
```

```
no router-target-as-number
```

### Context

[\[Tree\]](#) (config>subscr-mgmt>vrgw>lanext router-target-as-number)

### Full Context

```
configure subscriber-mgmt vrgw lanext router-target-as-number
```

### Description

This command specifies the AS number for the HLE service. It is used to derive the route target (RT) and route distinguisher (RD) for the HLE EVPN service only when the RADIUS server does not return a specific route target or route distinguisher.

The derived RT is in the "target:<configured-router-target-as-number>:<returned Alc-Bridge-Id>" format.

The derived RD is in the "<configured-router-target-as-number>:<returned Alc-Bridge-Id>" format.

The **no** form of this command removes the AS number from the configuration.

### Parameters

***as-number***

Specifies the AS number of the HLE service.

**Values** 1 to 65535

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.298 router-unsolicited-na-flood-evpn

```
router-unsolicited-na-flood-evpn
```

### Syntax

```
[no] router-unsolicited-na-flood-evpn
```

### Context

[\[Tree\]](#) (config>service>vpls>proxy-nd router-unsolicited-na-flood-evpn)

### Full Context

```
configure service vpls proxy-nd router-unsolicited-na-flood-evpn
```

### Description

This command controls whether the system floods router unsolicited Neighbor Advertisements to EVPN. The NA messages impacted by this command are NA messages with the following flags: S=0 and R=1.

The **no** form of the command will only flood to local SAPs/binds but not to EVPN destinations. This is only recommended in networks where CEs are routers directly connected to the PEs. Networks using aggregation switches between the host/routers and the PEs should flood unsolicited NA messages in EVPN to ensure that the remote caches are updated and BGP does not miss the advertisement of these entries.

### Default

```
router-unsolicited-na-flood-evpn
```

### Platforms

All

## 22.299 routing-type0

```
routing-type0
```

### Syntax

```
routing-type0 {true | false}
```

## no routing-type0

### Context

[\[Tree\]](#) (config>filter>ipv6-filter>entry>match routing-type0)

### Full Context

configure filter ipv6-filter entry match routing-type0

### Description

This command enables match on existence of Routing Type Extension Header type 0 in the IPv6 filter policy.

The **no** form of this command ignores Routing Type Extension Header type 0 presence/absence in a packet when evaluating match criteria of a given filter policy entry.

### Default

no routing-type0

### Parameters

#### true

Specifies whether a packet contains Routing Type Extension Header type 0.

#### false

Specifies whether a packet does not contain Routing Type Extension Header type 0.

### Platforms

All

## 22.300 rp

rp

### Syntax

rp

### Context

[\[Tree\]](#) (config>service>vprn>pim rp)

### Full Context

configure service vprn pim rp

## Description

This command enables access to the context to configure the rendezvous point (RP) of a PIM protocol instance.

A Nokia PIM router acting as an RP must respond to a PIM register message specifying an SSM multicast group address by sending stop register message(s) to the first hop router. It does not build an (S, G) shortest path tree toward the first hop router. An SSM multicast group address can be either from the SSM default range of 232/8 or from a multicast group address range that was explicitly configured for SSM.

## Default

rp enabled when PIM is enabled.

## Platforms

All

```
rp
```

## Syntax

```
rp
```

## Context

[\[Tree\]](#) (config>router>pim rp)

## Full Context

```
configure router pim rp
```

## Description

Commands in this context configure rendezvous point (RP) parameters. The address of the root of the group's shared multicast distribution tree is known as its RP. Packets received from a source upstream and join messages from downstream routers rendezvous at this router.

If this command is not enabled, then the router can never become the RP.

## Platforms

All

## 22.301 rp-candidate

```
rp-candidate
```

## Syntax

```
rp-candidate
```

## Context

[\[Tree\]](#) (config>service>vprn>pim>rp rp-candidate)

[\[Tree\]](#) (config>service>vprn>pim>rp>ipv6 rp-candidate)

## Full Context

configure service vprn pim rp rp-candidate

configure service vprn pim rp ipv6 rp-candidate

## Description

Commands in this context configure the candidate rendezvous point (RP) parameters.

## Default

enabled when PIM is enabled

## Platforms

All

## rp-candidate

## Syntax

**rp-candidate**

## Context

[\[Tree\]](#) (config>router>pim>rp>ipv6 rp-candidate)

[\[Tree\]](#) (config>router>pim>rp rp-candidate)

## Full Context

configure router pim rp ipv6 rp-candidate

configure router pim rp rp-candidate

## Description

Commands in this context configure the Candidate RP parameters.

Routers use a set of available rendezvous points distributed in Bootstrap messages to get the proper group-to-RP mapping. A set of routers within a domain are also configured as candidate RPs (C-RPs); typically, these will be the same routers that are configured as candidate BSRs.

Every multicast group has a shared tree through which receivers learn about new multicast sources and new receivers learn about all multicast sources. The rendezvous point (RP) is the root of this shared tree.

## Default

rp-candidate shutdown

## Platforms

All

## 22.302 rp-set-peer

### rp-set-peer

#### Syntax

[no] **rp-set-peer** *ip-address*

#### Context

[\[Tree\]](#) (config>service>vprn>pim>rp>anycast rp-set-peer)

#### Full Context

configure service vprn pim rp anycast rp-set-peer

#### Description

This command configures a peer in the anycast RP-set. The address identifies the address used by the other node as the RP candidate address for the same multicast group address range as configured on this node.

This is a manual procedure. Caution should be taken to produce a consistent configuration of an RP-set for a given multicast group address range. The priority should be identical on each node and be a higher value than any other configured RP candidate that is not a member of this RP-set.

Although there is no set maximum of addresses that can be configured in an RP-set, up to 15 multicast addresses is recommended.

The **no** form of this command removes an entry from the list.

#### Parameters

##### *ip-address*

Specifies the address used by the other node as the RP candidate address for the same multicast group address range as configured on this node.

## Platforms

All

### rp-set-peer

#### Syntax

[no] **rp-set-peer** *ipv6-address*

## Context

**[Tree]** (config>service>vprn>pim>rp>ipv6>anycast rp-set-peer)

## Full Context

configure service vprn pim rp ipv6 anycast rp-set-peer

## Description

This command configures an IPv6 peer in the anycast rp-set. The address identifies the address used by the other node as the RP candidacy address for the same multicast group address range as configured on this node.

This is a manual procedure. Caution should be taken to produce a consistent configuration of an RP- set for a given multicast group address range. The priority should be identical on each node and be a higher value than any other configured RP candidate that is not a member of this rp-set.

Although there is no set maximum of addresses that can be configured in an rp-set, up to 15 multicast addresses is recommended.

The **no** form of this command removes an entry from the list.

## Parameters

### *ipv6-address*

Specifies the address used by the other node as the RP candidacy address for the same multicast group address range as configured on this node.

Values	ipv6-address	
	:	x:x:x:x:x:x:x (eight 16-bit pieces)
	:	x:x:x:x:x:d.d.d.d
		x [0 to FFFF]H
		d [0 to 255]D

## Platforms

All

## rp-set-peer

## Syntax

**[no]** **rp-set-peer** *ip-address*

## Context

**[Tree]** (config>router>pim>rp>anycast rp-set-peer)

## Full Context

configure router pim rp anycast rp-set-peer

## Description

This command configures an IP peer in the anycast RP-set. The address identifies the address used by the other node as the RP candidate address for the same multicast group address range as configured on this node.

This is a manual procedure. Caution should be taken to produce a consistent configuration of an RP-set for a given multicast group address range. The priority should be identical on each node and be a higher value than any other configured RP candidate that is not a member of this RP-set.

Although there is no set maximum number of addresses that can be configured in an RP-set, up to 15 IP addresses is recommended.

The **no** form of this command removes an entry from the list.

## Parameters

### *ip-address*

Specifies an IP peer in the anycast RP-set.

## Platforms

All

## rp-set-peer

## Syntax

[no] **rp-set-peer** *ipv6-address*

## Context

[\[Tree\]](#) (config>router>pim>rp>ipv6>anycast rp-set-peer)

## Full Context

configure router pim rp ipv6 anycast rp-set-peer

## Description

This command configures a peer in the anycast RP-set. The address identifies the address used by the other node as the RP candidate address for the same multicast group address range as configured on this node.

This is a manual procedure. Caution should be taken to produce a consistent configuration of an RP-set for a given multicast group address range. The priority should be identical on each node and be a higher value than any other configured RP candidate that is not a member of this RP-set.

Although there is no set maximum number of addresses that can be configured in an RP-set, up to 15 IP addresses is recommended.

The **no** form of this command removes the IPv6 address from the anycast RP set.

## Parameters

### *ipv6-address*

Specifies an IPv6 peer in the anycast RP-set.

**Platforms**

All

**22.303 rpc-authorization****rpc-authorization****Syntax****rpc-authorization****Context**[\[Tree\]](#) (config>system>security>profile>grpc rpc-authorization)**Full Context**

configure system security profile grpc rpc-authorization

**Description**

This command opens a configuration context for configuring user privileges related to RPCs.

**Platforms**

## 22.305 rpf-table

### rpf-table

#### Syntax

**rpf-table** {**rtable-m** | **rtable-u** | **both**}

**no rpf-table**

#### Context

[\[Tree\]](#) (config>service>vprn>msdp rpf-table)

#### Full Context

configure service vprn msdp rpf-table

#### Description

This command configures the sequence of route tables used to find a Reverse Path Forwarding (RPF) interface for a particular multicast route.

By default, only the unicast route table is looked up to calculate RPF interface towards the source/rendezvous point. However, the operator can specify the following:

- use the unicast route table only
- use the multicast route table only or
- use both the route tables

The **no** form of this command reverts to the default.

#### Default

rpf-table rtable-u

#### Parameters

##### **rtable-m**

Specifies that only the multicast route table will be used by the multicast protocol (PIM) for IPv4 RPF checks. This route table will contain routes submitted by static routes, ISIS and OSPF.

##### **rtable-u**

Specifies only that the unicast route table will be used by the multicast protocol (PIM) for IPv4 RPF checks. This route table will contain routes submitted by all the unicast routing protocols.

##### **both**

Will always look up first in the multicast route table and, if there is a route, it will use it. If PIM does not find a route in the first lookup, it will try to find it in the unicast route table. Rtable-m is checked before rtable-u.

## Platforms

All

## rpf-table

## Syntax

**rpf-table** {**rtable-m** | **rtable-u** | **both**}

**no rpf-table**

## Context

**[Tree]** (config>service>vprn>pim rpf-table)

**[Tree]** (config>router>msdp rpf-table)

## Full Context

configure service vprn pim rpf-table

configure router msdp rpf-table

## Description

This command configures the sequence of route tables used to find a Reverse Path Forwarding (RPF) interface for a particular multicast route.

By default, only the unicast route table is looked up to calculate RPF interface towards the source/rendezvous point. However, the operator can specify the following:

- use the unicast route table only
- use the multicast route table only
- use both the route tables

## Default

rpf-table rtable-u

## Parameters

### rtable-m

Specifies that only the multicast route table will be used by the multicast protocol (PIM) for IPv4 RPF checks. This route table will contain routes submitted by static routes, IS-IS and OSPF.

### rtable-u

Specifies only that the unicast route table will be used by the multicast protocol (PIM) for IPv4 RPF checks. This route table will contain routes submitted by all the unicast routing protocols.

**both**

Specifies that the multicast route table will be used first by the multicast protocol (PIM) for checks, and then the unicast route table will be used if the multicast route table lookup fails. `rtable-m` is checked before `rtable-u`.

**Platforms**

All

**rpf-table****Syntax**

`rpf-table {rtable-m | rtable-u | both}`

`no rpf-table`

**Context**

[\[Tree\]](#) (config>router>pim rpf-table)

**Full Context**

configure router pim rpf-table

**Description**

This command configures the sequence of route tables used to find a Reverse Path Forwarding (RPF) interface for a particular multicast route.

By default, only the unicast route table is looked up to calculate RPF interface towards the source or rendezvous point. However, the operator can specify one of the following:

- use the unicast route table only
- use the multicast route table only
- use both the route tables

The **no** form of this command reverts to the default value.

**Default**

`rpf-table rtable-u`

**Parameters****rtable-m**

Specifies that only the multicast route table will be used by the multicast protocol (PIM) for IPv4 RPF checks. This route table will contain routes submitted by static routes, ISIS and OSPF.

**rtable-u**

Specifies only that the unicast route table will be used by the multicast protocol (PIM) for IPv4 RPF checks. This route table will contain routes submitted by all the unicast routing protocols.

**both**

Specifies to always lookup first in the multicast route table and if there is a route, it will use it. If PIM does not find a route in the first lookup, it will try to find it in the unicast route table. Rtable-m is checked before rtable-u.

## 22.307 rpfv

rpfv

**Syntax**

rpfv [detail]

no rpfv

**Context**

[\[Tree\]](#) (debug>router>pim rpfv)

**Full Context**

debug router pim rpfv

**Description**

This command enables debugging for PIM RPF vector.

The **no** form of this command disables debugging for PIM RPF vector.

**Parameters**

**detail**

Debugs detailed RPF vector information.

**Platforms**

All

rpfv

**Syntax**

rpfv core

```
rpfv mvpn
rpfv core mvpn
no rpfv [core] [mvpn]
```

### Context

[\[Tree\]](#) (config>router>pim rpfv)

### Full Context

```
configure router pim rpfv
```

### Description

This command enables RPF Vector processing for Inter-AS Rosen MVPN Option-B and Option-C. The **rpfv** must be enabled on every node for Inter-AS Option B/C MVPN support.

If **rpfv** is configured, MLDP inter-AS resolution cannot be used. These two features are mutually exclusive.

The **no** form of this command reverts to the default.

### Default

```
no rpfv
```

### Parameters

#### mvpn

Enables MVPN RPF vector processing for Inter-AS Option B/C MVPN based on RFC 5496 and RFC 6513. If a core RPF vector is received, it will be dropped before a message is processed.

#### core

Enables core RPF vector (no RD) processing for Inter-AS Option B/C MVPN, which allows SR OS interoperability as P-router with third-party vendors that do not encode RD in the RPF vector for Inter-AS MVPN.

#### core mvpn

Enables core RPF vector (no RD) processing for Inter-AS Option B/C MVPN, which allows SR OS interoperability as P-router with third-party vendors that do not encode RD in the RPF vector for Inter-AS MVPN.

The **no** version of this command disables RPF Vector processing. If RPF vector is received in a PIM join message, the vector will be removed before local processing of PIM message starts.

### Platforms

## 22.308 rpki-session

## rpki-session

### Syntax

[no] **rpki-session** *ip-address*

### Context

**[Tree]** (config>router>origin-validation rpki-session)

### Full Context

configure router origin-validation rpki-session

### Description

This command configures a session with an RPKI local cache server by using the RPKI-Router protocol. It is over these sessions that the router learns dynamic VRRP entries expressing valid origin AS and prefix associations. SR OS supports the RPKI-Router protocol over TCP/IPv4 or TCP/IPv6 transport. The router can set up an RPKI-Router session using the base routing table (in-band) or the management router (out-of-band). Configure the command in the **config>router management** instance to configure a session using the management port.

### Default

no rpki-session

### Parameters

#### *ip-address*

Specifies the IPv4 address or an IPv6 address. If the IPv6 address is link-local then the interface name must be appended to the IPv6 address after a hyphen (-).

### Platforms

All

## rpki-session

### Syntax

[no] **rpki-session** *ip-address*

### Context

**[Tree]** (debug>router rpki-session)

### Full Context

debug router rpki-session

### Description

This command enables and configures debugging for RPKI session.

The **no** form of this command disables debugging for RPKI session.

## Parameters

### *ip-address*

Debugs the RPKI session associated with the specified IP address.

Values			
ipv4-address:	a.b.c.d		
ipv6-address	x:x:x:x:x:x:x		[-interface]
	x:x:x:x:x:d.d.d.d		[-interface]
	x:		[0 to FFFF]H
	d:		[0 to 255]D
	interface		up to 32 characters, mandatory for link local addresses

configure eth-ring path rpl-end

## Description

This command configures the G.8032 path as a ring protection link end. The ring should be declared as either a RPL owner or RPL neighbor for this command to be allowed. Only path a or path b can be declared an RPL-end.

The **no** form of this command sets the rpl-end to default no rpl-end.

## Default

no rpl-end

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.310 rpl-node

### rpl-node

#### Syntax

**rpl-node** [owner | nbr]

**no rpl-node**

#### Context

[\[Tree\]](#) (config>eth-ring rpl-node)

#### Full Context

configure eth-ring rpl-node

#### Description

This command configures the G.8032 ring protection link type as owner or neighbor. The **no** form of the command means this node is not connected to an RPL link. When RPL owner or neighbor is specified either the a or b path must be configured with the **rpl-end** command. An owner is responsible for operation of the rpl link. Configuring the RPL as neighbor is optional (can be left as no rpl-node) but if the command is used the nbr is mandatory.

On a sub-ring without virtual channel it is mandatory to configure sub-ring non-virtual-link on all nodes on the sub-ring to propagate the R-APS messages around the sub-ring.

The **no** form of this command removes the RPL link.

#### Default

no rpl-node

#### Parameters

##### owner

Specifies the owner link type.

##### nbr

Specifies the neighbor link type.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.311 rr

```
rr
```

### Syntax

```
[no] rr
```

### Context

```
[Tree] (debug>router>rsvp>event rr)
```

### Full Context

```
debug router rsvp event rr
```

### Description

This command debugs refresh reduction events.

The **no** form of the command disables the debugging.

### Platforms

## 22.312 rr-use-route-table

```
rr-use-route-table
```

### Syntax

```
rr-use-route-table
```

```
no rr-use-route-table
```

### Context

```
[Tree] (config>router>bgp>next-hop-res>labeled-routes rr-use-route-table)
```

### Full Context

```
configure router bgp next-hop-resolution labeled-routes rr-use-route-table
```

### Description

This command enables BGP to perform a lookup of IGP routes in the route table to resolve the BGP next-hop of label-IPv4 and label-IPv6 routes. This is useful for a Route Reflector (RR) that does not participate in tunnel signaling protocols such as LDP and RSVP and therefore, does not have tunnels to resolve the BGP next-hops of label-unicast routes.

Configure the **disable-route-table-install** command before you configure the **rr-use-route-table** command because forwarding would otherwise be incorrect for cases where label routes are resolved this way.

**Default**

no rr-use-route-table

**Platforms**

All

## 22.313 rs-fec-mode

rs-fec-mode

**Syntax**

**rs-fec-mode** *rs-fec-mode*

**no rs-fec-mode**

**Context**

[\[Tree\]](#) (config>port>connector rs-fec-mode)

**Full Context**

configure port connector rs-fec-mode

**Description**

This command is used for breakout connectors when all connector ports must use the same **rs-fec-mode** setting.

In all other cases, the **rs-fec-mode** is set using the **configure port ethernet rs-fec-mode** command for each individual connector port.

See "Forward Error Correction" in the *Interface Configuration Guide* for more information about **rs-fec-mode** settings.

**Default**

no rs-fec-mode

**Parameters**

***rs-fec-mode***

Specifies the RS-FEC mode to support.

**Values** cl91-514-528, cl91-514-544

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## rs-fec-mode

### Syntax

**rs-fec-mode** *rs-fec-mode*

**no rs-fec-mode**

### Context

[\[Tree\]](#) (config>port>ethernet rs-fec-mode)

### Full Context

configure port ethernet rs-fec-mode

### Description

This command enables RS-FEC on the Ethernet port. RS-FEC Clause 91 is required for QSFP28, CFP4, 100GBase-SR4, 100GBase-ER4 lite, and CWDM4 for the QSFP28 package optics for short-reach optics.

See "Forward Error Correction" in the *Interface Configuration Guide* for more information about **rs-fec-mode** settings.

### Default

no rs-fec-mode

### Parameters

***rs-fec-mode***

Specifies the RS-FEC mode to support.

**Values** cl91-514-528, cl74, cl108

configure service epipe bgp-evpn mpls auto-bind-tunnel resolution-filter rsvp

configure service vprn bgp-evpn mpls auto-bind-tunnel resolution-filter rsvp

### Description

This command selects the RSVP-TE tunnel type.

The **rsvp** value instructs BGP to search for the best metric RSVP LSP to the address of the BGP next hop. This address can correspond to the system interface or to another loopback interface used by the BGP instance on the remote node. The LSP metric is provided by MPLS in the tunnel table. In the case of multiple RSVP LSPs with the same lowest metric, BGP selects the LSP with the lowest **tunnel-id**.

The **no** form of this command removes the RSVP-TE tunnel type.

### Default

no rsvp

### Platforms

configure service vprn mvpn provider-tunnel inclusive rsvp

### Description

Commands in this context configure the RSVP P2MP LSP for the provider tunnel.

The **no** form of this command removes the rsvp context including all the statements in the context.

### Default

no rsvp

### Platforms

All

## rsvp

### Syntax

**[no] rsvp**

### Context

[\[Tree\]](#) (config>router rsvp)

### Full Context

configure router rsvp

### Description

Commands in this context configure RSVP protocol parameters. RSVP is not enabled by default and must be explicitly enabled (**no shutdown**).

RSVP is used to set up LSPs. RSVP should be enabled on all router interfaces that participate in signaled LSPs.

The **no** form of this command deletes this RSVP protocol instance and removes all configuration parameters for this RSVP instance. To suspend the execution and maintain the existing configuration, use

the **shutdown** command. RSVP must be shutdown before the RSVP instance can be deleted. If RSVP is not shutdown, the **no rsvp** command does nothing except issue a warning message on the console indicating that RSVP is still administratively enabled.

### Default

no shutdown

### Platforms

All

## rsvp

### Syntax

**rsvp** [**lsp** *lsp-name*] [**sender** *source-address*] [**endpoint** *endpoint-address*] [**tunnel-id** *tunnel-id*] [**lsp-id** *lsp-id*] [**interface** *ip-int-name*]

**no rsvp**

### Context

[\[Tree\]](#) (debug>router rsvp)

### Full Context

debug router rsvp

### Description

This command enables and configures debugging for RSVP.

### Parameters

**lsp** *lsp-name*

Specifies the LSP name up to 64 characters in length.

**sender** *source-address*

Specifies the IP address of the sender.

**endpoint** *endpoint-address*

Specifies the far-end IP address.

**tunnel-id** *tunnel-id*

Specifies the RSVP tunnel ID.

**Values** 0 to 4294967295

**lsp-id** *lsp-id*

Specifies the LSP ID.

**Values** 1 to 65535

**interface** *ip-int-name*

Specifies the interface name. The interface name can be up to 32 characters long and must be unique. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

## 22.319 rsvp-resv-style

### rsvp-resv-style

## Syntax

**rsvp-resv-style** [se | ff]

## Context

[\[Tree\]](#) (config>router>mpls>lsp rsvp-resv-style)

## Full Context

configure router mpls lsp rsvp-resv-style

## Description

This command specifies the RSVP reservation style, shared explicit (se) or fixed filter (ff). A reservation style is a set of control options that specify a number of supported parameters. The style information is part of the LSP configuration.

## Default

rsvp-resv-style se

## Parameters

### **ff**

Fixed filter is single reservation with an explicit scope. This reservation style specifies an explicit list of senders and a distinct reservation for each of them. A specific reservation request is created for data packets from a particular sender. The reservation scope is determined by an explicit list of senders.

### **se**

Shared explicit is shared reservation with a limited scope. This reservation style specifies a shared reservation environment with an explicit reservation scope. This reservation style creates a single reservation over a link that is shared by an explicit list of senders. Because each sender is explicitly listed in the RESV message, different labels can be assigned to different sender-receiver pairs, thereby creating separate LSPs.

```

## Description

This command enables LSP Self Ping on all RSVP-TE LSPs, unless an individual LSP is explicitly disabled under the **lsp>lsp-self-ping** command or in the LSP template.

The **no** form of this command reverts to the default value.

## Default

rsvp-te disable

## Parameters

### *rsvp-te*

Specifies whether LSP Self Ping is enabled on RSVP-TE LSPs.

**Values** enable, disable

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## rsvp-te

## Syntax

**rsvp-te** *value*

**no rsvp-te**

## Context

[\[Tree\]](#) (config>router>mpls>tunnel-table-pref rsvp-te)

## Full Context

configure router mpls tunnel-table-pref rsvp-te

## Description

This command configures the tunnel table preference for RSVP-TE LSP tunnel type away from its default value.

The tunnel table preference applies to the next-hop resolution of BGP routes of the following families: EVPN, IPv4, IPv6, VPN-IPv4, VPN-IPv6, label-IPv4, and label-IPv6 in the tunnel table.

This feature does not apply to a VPRN, VPLS, or VLL service with explicit binding to an SDP that enabled the **mixed-lsp-mode** option. The tunnel preference in such an SDP is fixed and is controlled by the service manager. The configuration of the tunnel table preference parameter does not modify the behavior of such an SDP and the services that bind to it.

It is recommended to not set two or more tunnel types to the same preference value. In such a situation, the tunnel table prefers the tunnel type which was first introduced in SR OS implementation historically.

The **no** form of this command reverts to the default.

## Default

rsvp-te 7

## Parameters

*value*

Specifies the tunnel table preference value for RSVP-TE LSP.

**Values** 1 to 255

**Default** 7

## Platforms

All

rsvp-te

## Syntax

[no] rsvp-te

## Context

[\[Tree\]](#) (config>router>static-route-entry>indirect>tunnel-next-hop>resolution-filter rsvp-te)

## Full Context

configure router static-route-entry indirect tunnel-next-hop resolution-filter rsvp-te

## Description

This command enables the use of RSVP-TE sourced tunnel entries in the TTM to resolve the associated static route next-hop.

The rsvp-te value instructs the code to search for the set of lowest metric RSVP-TE LSPs to the address of the indirect next-hop. The LSP metric is provided by MPLS in the tunnel table. The static route treats a set of RSVP-TE LSPs with the same lowest metric as an ECMP set. The user has the option of configuring a list of RSVP-TE LSP names to be used exclusively instead of searching in the tunnel table. In that case, all LSPs must have the same LSP metric in order for the static route to use them as an ECMP set. Otherwise, only the LSPs with the lowest common metric value will be selected.

A P2P auto-lsp that is instantiated via an LSP template can be selected in TTM when resolution is set to any. However, Nokia does not recommend configuring an auto-lsp name explicitly under the rsvp-te node as the auto-generated name can change if the node reboots, which will blackhole the traffic of the static route.

## Default

no rsvp-te

## Platforms

All

## rsvp-te

### Syntax

[no] rsvp-te

### Context

[\[Tree\]](#) (config>oam-pm>session>ip>tunnel>mpls rsvp-te)

### Full Context

configure oam-pm session ip tunnel mpls rsvp-te

### Description

This command configures the specification of RSVP-TE specific tunnel information that is used to transport the test packets. Entering this context removes all other tunnel type options configured under the **configure oam-pm session ip tunnel mpls** context. Only a single **mpls** type can be configured for an OAM-PM session.

The **no** form of this command deletes the context and all configurations under it.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## rt-payload-type

### Syntax

**rt-payload-type** *payload-type*

**no rt-payload-type**

### Context

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if rt-payload-type)

### Full Context

configure mcast-management multicast-info-policy video-policy video-interface rt-payload-type

### Description

This command describes the format to be used by Retransmission (RT) server to send retransmission packets. The RET server interface allows the payload type within the retransmission packets to be configured.

### Default

rt-payload-type 99 — Indicates that the frames will be sent in the RFC 4588, *RTP Retransmission Payload Format*, format.

### Parameters

#### *payload-type*

Indicates the format expected for received retransmission packets. The value 33 indicates that the frames will be received as originally sent. A value between 96 and 127 indicates the dynamic payload type value (per RFC 3551) to be used for RFC 4588 formatted retransmission packets.

**Values** 33, 96 to 127

### Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## Full Context

configure mcast-management multicast-info-policy bundle channel video rt-server

configure mcast-management multicast-info-policy bundle channel source-override video rt-server

configure mcast-management multicast-info-policy bundle video rt-server

## Description

This command enables and configures the upstream retransmission server configuration parameters.

The **no** form of the command removes the upstream retransmission server configuration and implies the configuration is inherited from a higher context or from the default policy.

## Default

no rt-server – The upstream retransmission server settings are inherited.

## Parameters

### disable

This keyword explicitly disables the upstream retransmission server within the policy. For the default bundle within the default Multicast Information Policy, the **no** form of the command and the disable keyword have the same meaning and imply the server is disabled.

### ip-address

The IP address of the upstream retransmission server.

### port num

The UDP port to use to send RET requests to the upstream RET server.

**Values** 1024 to 5999, 6251 to 65535

## Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## Full Context

debug service id video-interface rt-server

## Description

This command enables debugging for the RET server.

## Parameters

### client *client-ip*

Specifies the client IP address.

### source *src-port*

Specifies the source port.

**Values** 1 to 65535

## Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 22.327 rtm

rtm

## Syntax

rtm [*rp-address*]

no rtm

## Context

[\[Tree\]](#) (debug>router>msdp rtm)

## Full Context

debug router msdp rtm

## Description

This command enables debugging for Multicast Source Discovery Protocol (MSDP) route table manager (RTM).

The **no** form of the command disables MSDP RTM debugging.

## Parameters

### *rp-address*

Debugs the IP multicast address for which this entry contains information.

## Platforms

All

```
rtm
```

## Syntax

```
rtm [detail]
```

```
no rtm
```

## Context

[\[Tree\]](#) (debug>router>pim rtm)

## Full Context

```
debug router pim rtm
```

## Description

This command enables debugging for PIM RTM.

The **no** form of this command disables debugging for PIM RTM.

## Parameters

**detail**

Displays detailed RTM information.

## Platforms

All

```
rtm
```

## Syntax

```
rtm [neighbor ip-address | group name]
```

```
no rtm
```

## Context

[\[Tree\]](#) (debug>router>bgp rtm)

## Full Context

```
debug router bgp rtm
```

## Description

This command logs RTM changes in the debug log.

The **no** form of this command disables debugging.

## Parameters

### **neighbor *ip-address***

Debugs only events affecting the specified BGP neighbor.

- Values**
- ipv4-address:
- a.b.c.d (host bits must be 0)
- ipv6-address:
- x:x:x:x:x:x [-interface] (eight 16-bit pieces)
  - x:x:x:x:x:d.d.d.d [-interface]
  - x: [0 to FFFF]H
  - d: [0 to 255]D
  - interface: up to 32 characters for link local addresses

### **group *name***

Debugs only events affecting the specified peer group name, up to 64 characters, and associated neighbors.

## Platforms

All

rtm

## Syntax

**rtm** [*ip-address*]

**no rtm**

## Context

[\[Tree\]](#) (debug>router>isis rtm)

## Full Context

debug router isis rtm

## Description

This command enables debugging for IS-IS route table manager (RTM).

The **no** form of the command disables debugging.

## Parameters

### ***ip-address***

The specified IP address.

- Values**
- ipv4-address:
- a.b.c.d (host bits must be 0)

ipv6-address:

- x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

## Platforms

All

## rtm

## Syntax

**rtm** [*ip-address*]

**no rtm**

## Context

[\[Tree\]](#) (debug>router>ospf3 rtm)

[\[Tree\]](#) (debug>router>ospf rtm)

## Full Context

debug router ospf3 rtm

debug router ospf rtm

## Description

This command enables debugging for OSPF RTM.

## Parameters

### *ip-address*

Specifies the IP address to debug.

**Values** ipv4-address:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D

## 22.328 rtm-debounce-time

### rtm-debounce-time

#### Syntax

**rtm-debounce-time** *debounce-time*

**no rtm-debounce-time**

#### Context

**[Tree]** (config>router>l2tp rtm-debounce-time)

**[Tree]** (config>service>vprn>l2tp rtm-debounce-time)

#### Full Context

configure router l2tp rtm-debounce-time

configure service vprn l2tp rtm-debounce-time

#### Description

This command configures the amount of time, in milliseconds, that the system waits before declaring an L2TP tunnel down when the remote endpoint IP address cannot be resolved to an active IP route in the local routing table.

The default behavior is for the L2TP tunnel to not be declared down based on the remote endpoint IP address reachability.

The **no** form of this command returns the **rtm-debounce-time** to a value of 0.

#### Default

no rtm-debounce-time

#### Parameters

##### *debounce-time*

Specifies the amount of time, in milliseconds, that the system waits before declaring the associated L2TP tunnel as down.

**Values** 0 to 5000

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.329 rtp-header

## rtp-header

### Syntax

[no] rtp-header

### Context

[\[Tree\]](#) (config>service>epipe>sap>cem rtp-header)

[\[Tree\]](#) (config>service>cpipe>sap>cem rtp-header)

### Full Context

configure service epipe sap cem rtp-header

configure service cpipe sap cem rtp-header

### Description

This command specifies whether an RTP header is used when packets are transmitted to the packet service network (PSN) by the CEM SAP. This mode must be enabled for differential-timed DS1/E1s. It can optionally be enabled for other DS1/E1s for interoperability purposes.

### Default

no rtp-header

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## rtp-header

### Syntax

[no] rtp-header

### Context

[\[Tree\]](#) (config>mirror>mirror-dest>sap>cem rtp-header)

### Full Context

configure mirror mirror-dest sap cem rtp-header

### Description

This command specifies whether an RTP header is used when packets are transmitted to the packet service network (PSN) by the CEM SAP.

### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

## 22.330 rtp-performance

### rtp-performance

#### Syntax

**rtp-performance**

#### Context

[\[Tree\]](#) (config>app-assure>group>cflowd rtp-performance)

#### Full Context

configure application-assurance group cflowd rtp-performance

#### Description

This command configures the cflowd RTP performance export.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.331 rtr-adv-lsa-limit

### rtr-adv-lsa-limit

#### Syntax

**rtr-adv-lsa-limit** [*1..4294967295*] [**log-only**] [**threshold** *percent*]  
**rtr-adv-lsa-limit** [*1..4294967295*] [**log-only**] [**threshold** *percent*] **overload-timeout forever**  
**rtr-adv-lsa-limit** [*1..4294967295*] [**log-only**] [**threshold** *percent*] **overload-timeout seconds**  
**no rtr-adv-lsa-limit**

#### Context

[\[Tree\]](#) (config>service>vprn>ospf rtr-adv-lsa-limit)

#### Full Context

configure service vprn ospf rtr-adv-lsa-limit

#### Description

This command configures the maximum number of LSAs OSPF can learn from another router, in order to protect the system from a router that accidentally advertises a large number of LSAs. When the number

of advertised LSAs reaches the configured percentage of this limit, an SNMP trap is sent. If the limit is exceeded, OSPF goes into overload.

The **overload-timeout** option allows the administrator to control how long OSPF is in overload as a result of the advertised LSA limit being reached. At the end of this duration of time the system automatically attempts to restart OSPF. One possible value for the **overload-timeout** is **forever**, which means OSPF is never restarted automatically and this corresponds to the default behavior when the **overload-timeout** option is not configured.

The **no** form of this command removes the **rtr-adv-lsa-limit**.

## Default

rtr-adv-lsa-limit forever

## Parameters

### log-only

Enables the warning message to be sent at the specified threshold percentage, and also when the limit is exceeded. However, overload is not set.

### percent

The threshold value (as a percentage) that triggers a warning message to be sent.

**Values** 0 to 100

### seconds

Specifies duration in seconds before restarting OSPF.

**Values** 1 to 1800

## Platforms

All

## rtr-adv-lsa-limit

## Syntax

**rtr-adv-lsa-limit** *limit* [**log-only**] [**threshold** *percent*]

**rtr-adv-lsa-limit** *limit* [**log-only**] [**threshold** *percent*] [**overload-timeout** {*seconds* | **forever**}]

**no** rtr-adv-lsa-limit

## Context

**[Tree]** (config>router>ospf rtr-adv-lsa-limit)

**[Tree]** (config>router>ospf3 rtr-adv-lsa-limit)

## Full Context

configure router ospf rtr-adv-lsa-limit

configure router ospf3 rtr-adv-lsa-limit

## Description

This command configures the maximum number of LSAs OSPF can learn from another router, in order to protect the system from a router that accidentally advertises a large number of LSAs. When the number of advertised LSAs reaches the configured percentage of this limit, an SNMP trap is sent. If the limit is exceeded, OSPF goes into overload.

The **overload-timeout** option allows the administrator to control how long OSPF is in overload as a result of the advertised LSA limit being reached. At the end of this duration of time, the system automatically exits overload. One possible value for the **overload-timeout** is **forever**, which means OSPF is never exiting overload.

The **no** form of this command removes the **rtr-adv-lsa-limit**.

## Default

no rtr-adv-lsa-limit

## Parameters

### log-only

Enables the warning message to be sent at the specified threshold percentage, and also when the limit is exceeded. However, overload is not set.

### percent

Specifies the threshold value (as a percentage) that triggers a warning message to be sent.

**Values** 0 to 100

### limit

Specifies the number of LSAs, expressed as a decimal integer, that can be learned.

**Values** 1 to 4294967295

### second

Specifies duration in minutes before restarting OSPF.

**Values** Values 1 to 1800

### forever

Specifies that OSPF is restarted only after the **clear router ospf | ospf3 overload rtr-adv-lsa-limit** command is executed.

## Platforms

All

## 22.332 rtr-solicit-user-db

## rtr-solicit-user-db

### Syntax

**rtr-solicit-user-db** *local-user-db*

**no rtr-solicit-user-db**

### Context

**[Tree]** (config>service>vpls>sap rtr-solicit-user-db)

### Full Context

configure service vpls sap rtr-solicit-user-db

### Description

This command enabled access to LUDB for SLAAC hosts under the capture SAP. The name of this luidb must match the name of luidb configured under the **configure>service>vprn/ies>sub-if>group-if>ipv6>router-solicit** hierarchy.

The **no** form of this command reverts to the default.

### Parameters

***local-user-db***

Specifies the name of the local-user-database up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 22.333 rtsp

## rtsp

### Syntax

**[no] rtsp**

### Context

**[Tree]** (config>service>nat>up-nat-policy>alg rtsp)

**[Tree]** (config>service>nat>nat-policy>alg rtsp)

**[Tree]** (config>service>nat>firewall-policy>alg rtsp)

### Full Context

configure service nat up-nat-policy alg rtsp

configure service nat nat-policy alg rtsp

```
configure service nat firewall-policy alg rtsp
```

### Description

This command enables RTSP ALG.

The **no** form of the command disables RTSP ALG.

### Default

```
no rtsp
```

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- `configure service nat nat-policy alg rtsp`
- `configure service nat up-nat-policy alg rtsp`

7750 SR, 7750 SR-e, 7750 SR-s, VSR

- `configure service nat firewall-policy alg rtsp`

## 22.334 rtt-threshold

### rtt-threshold

#### Syntax

```
rtt-threshold threshold
```

```
no rtt-threshold
```

#### Context

```
[Tree] (config>app-assure>group>anl>source rtt-threshold)
```

```
[Tree] (config>app-assure>group>aa-sub-cong rtt-threshold)
```

#### Full Context

```
configure application-assurance group access-network-location source rtt-threshold
```

```
configure application-assurance group aa-sub-congestion-detection rtt-threshold
```

#### Description

This command configures the roundtrip delay threshold used by the DEM gateway algorithm to determine ANL congestion or subscriber congestion for NLB-DEM.

#### Default

```
rtt-threshold 173
```

**Parameters*****threshold***

Specifies the maximum acceptable round trip time (RTT), in milliseconds, for TCP connections with no congestion. Any measured RTT above the threshold is considered an indication of possible congestion.

**Values** 0 to 500

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**22.335 rtt-threshold-rat****rtt-threshold-rat****Syntax**

**rtt-threshold-rat** **rat-type** *rat-type* **rtt-threshold** *rtt-threshold*

**no** **rtt-threshold-rat** **rat-type** *rat-type*

**Context**

**[Tree]** (config>app-assure>group>anl>source rtt-threshold-rat)

**[Tree]** (config>app-assure>group>aa-sub-cong rtt-threshold-rat)

**Full Context**

configure application-assurance group access-network-location source rtt-threshold-rat

configure application-assurance group aa-sub-congestion-detection rtt-threshold-rat

**Description**

This command configures the roundtrip delay threshold for each RAT type to be used for a congestion detection algorithm (if applicable).

The **no** form of this command reverts to the default value.

**Default**

rtt-threshold-rat 173

**Parameters*****rat-type***

Specifies the 3GPP RAT type.

**Values** utran, geran, wlan, gan, hspa-evol, eutran, virtual, eutran-nb, ehrpd, hrpd, cdma-1x, umb, wifi, nr, lte-m

***rtt-threshold***

Specifies the parameter used by the DEM-GW algorithm that determines ANL congestion or subscriber congestion in the case of NLB-DEM. It specifies the maximum acceptable round trip time (RTT), under no congestion, in milliseconds. Any measured RTT above the threshold is considered an indication of possible congestion.

**Values** 0 to 500

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.336 rtt-threshold-tolerance

### rtt-threshold-tolerance

**Syntax**

**rtt-threshold-tolerance** *tolerance*

**no rtt-threshold-tolerance**

**Context**

**[Tree]** (config>app-assure>group>anl>source rtt-threshold-tolerance)

**[Tree]** (config>app-assure>group>aa-sub-cong rtt-threshold-tolerance)

**Full Context**

configure application-assurance group access-network-location source rtt-threshold-tolerance

configure application-assurance group aa-sub-congestion-detection rtt-threshold-tolerance

**Description**

This command configures the ANL roundtrip delay threshold tolerance used by the DEM gateway algorithm to determine ANL-level or subscriber-level congestion.

**Default**

rtt-threshold-tolerance 50

**Parameters*****tolerance***

Specifies the ratio, in percentage, of RTTs above the configured threshold (**rtt-threshold**) over the total RTT measurements.

The ratio is calculated as follows, measured across a one-minute period:

**rtt-threshold-tolerance** = #(RTTs > **rtt-threshold**) / (Total #RTTs)

If the **rtt-threshold-tolerance** ratio is exceeded, the ANL is declared congested.

**Values** 0 to 100

**Default** 50

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 22.337 rule-prefix

### rule-prefix

#### Syntax

**rule-prefix** *rule-prefix*

**no rule-prefix**

#### Context

**[Tree]** (config>service>nat>map-domain>mapping-rule rule-prefix)

#### Full Context

configure service nat map-domain mapping-rule rule-prefix

#### Description

This command configures a MAP rule prefix.

#### Parameters

##### **rule-prefix**

Specifies the IPv6 MAP rule prefix.

**Values** <*ipv6-prefix/prefix-length*> :  
*ipv6-prefix* — *x:x:x:x:x:x:x* (eight 16-bit pieces)  
*x:x:x:x:x:d.d.d.d*  
*x*—[0 to FFFF]H  
*d*—[0 to 255]D  
*prefix-length*—[0 to 64]

### Platforms

## 22.338 run-as-user

```
run-as-user
```

### Syntax

```
run-as-user user-name
```

```
no run-as-user
```

### Context

[\[Tree\]](#) (config>python>python-script run-as-user)

### Full Context

```
configure python python-script run-as-user
```

### Description

This command configures a user that is different from the current user of the session. Script authentication, authorization, accounting, and any activity within the script, is run as the specified user.

The **no** form of this command specifies that the current user of the session is used.

### Default

```
no run-as-user
```

### Parameters

*user-name*

Specifies the name of the user, up to 32 characters, that is used to run the script.

### Platforms

All

## 22.339 rx-discard-on-ndf

```
rx-discard-on-ndf
```

### Syntax

```
rx-discard-on-ndf {bm | bum | none}
```

### Context

[\[Tree\]](#) (config>service>vpls>vxlan rx-discard-on-ndf)

## Full Context

```
configure service vpls vxlan rx-discard-on-ndf
```

## Description

This command, supported by static and BGP-EVPN VXLAN binds, determines the type of traffic that the Non Designated Forwarder (NDF) PE discards in an EVPN multi-homed Ethernet Segment. It is only relevant when the VXLAN instance is associated to a network-interconnect-vxlan ES. The option BM is the default option and discards BM on reception (unicast, known and known is allowed). The option BUM discards any BUM frame on reception. Option none allows any BUM traffic on reception.

## Default

```
rx-discard-on-ndf bm
```

## Parameters

### *bm*

Discards Broadcast and Multicast on the EVPN Non Designated Forwarder (NDF) router, but not Unknown Unicast.

### *bum*

Discards Broadcast, Multicast and Unknown Unicast traffic on the NDF.

### *none*

Allows Broadcast, Multicast or Unknown Unicast traffic on the NDF.

## 22.342 rx-los-reaction

rx-los-reaction

### Syntax

**rx-los-reaction** {**squelch**}  
**no rx-los-reaction**

### Context

[\[Tree\]](#) (config>port>dwdm>coherent rx-los-reaction)

### Full Context

configure port dwdm coherent rx-los-reaction

### Description

This command configures the reaction to an RX LOS.

#### Note:

If **rx-los-reaction squelch** is disabled for some coherent DWDM transceivers, the transceiver only reports local fault alarms when an RX LOS condition occurs; however, the port returns to service faster after the LOS condition is cleared. For these transceivers, if **rx-los-reaction squelch** is enabled, there is better visibility of individual alarms (for example, signal-fail, local fault, and no-am-lock), but the port takes longer to return to service after the LOS condition is cleared.

### Parameters

**squelch**

Specifies to squelch (turn off) the transmit signal on RX LOS.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.343 rx-los-thresh

rx-los-thresh

### Syntax

**rx-los-thresh** *threshold*

### Context

[\[Tree\]](#) (config>port>dwdm>coherent rx-los-thresh)

### Full Context

```
configure port dwdm coherent rx-los-thresh
```

### Description

This command configures the average input power LOS threshold.

### Default

-23.00

### Parameters

#### *threshold*

Specifies the RX LOS threshold.

**Values** -30.00 to -13.00

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 22.344 rx-must-be-encrypted

```
rx-must-be-encrypted
```

### Syntax

```
[no] rx-must-be-encrypted
```

### Context

[\[Tree\]](#) (config>port>ethernet>dot1x>macsec rx-must-be-encrypted)

### Full Context

```
configure port ethernet dot1x macsec rx-must-be-encrypted
```

### Description

When the **rx-must-be-encrypted** option is enabled, all traffic that is not MACsec-secured that is received on the port is dropped.

When the **rx-must-be-encrypted** option is disabled, all arriving traffic, whether MACsec secured or not, will be accepted.

#### Note:

This command is only available on the NULL port level and does not have per-VLAN granularity.

The **no** form of this command disables the **rx-must-be encrypted** option.

**Default**

rx-must-be-encrypted

**Platforms**

All

## 22.345 rx-update-pacing

### rx-update-pacing

**Syntax**

**rx-update-pacing** *seconds*

**Context**

[\[Tree\]](#) (config>port>ethernet>eth-cfm>mep>eth-bn rx-update-pacing)

**Full Context**

configure port ethernet eth-cfm mep eth-bn rx-update-pacing

**Description**

This command sets the pace for update messages to and from the **eth-cfm** subsystem to the QoS subsystem. The most recent update messages are held by the ETH-CFM subsystem, but the most recent update is held until the expiration of the pacing timer.

**Parameters*****seconds***

The time to wait before sending subsequent updates (in seconds).

**Values** 1 to 600

**Default** 5

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23 s Commands

### 23.1 s-pmsi

```
s-pmsi
```

#### Syntax

```
s-pmsi [{vpnSrcAddr [vpnGrpAddr]} [mdSrcAddr]]
```

```
no s-pmsi
```

#### Context

[\[Tree\]](#) (debug>router>pim s-pmsi)

#### Full Context

```
debug router pim s-pmsi
```

#### Description

This command enables debugging for PIM selective provider multicast service interface.

The **no** form of this command disables the debugging.

#### Parameters

***vpnSrcAddr***

Specifies the VPN source address.

***vpnGrpAddr***

Specifies the VPN group address.

***mdSrcAddr***

Specifies the source address of the multicast domain.

#### Platforms

All

### 23.2 s-tag

## s-tag

### Syntax

**s-tag** *qtag1* **c-tag-range** *qtag2* [**to** *qtag2*]

**no s-tag** *qtag1* **c-tag-range** *qtag2*

### Context

**[Tree]** (config>service>system>bgp-evpn>eth-seg>qinq s-tag)

### Full Context

configure service system bgp-evpn ethernet-segment qinq s-tag

### Description

This command determines the inner VIDs (for a specified outer VID) associated with the virtual Ethernet Segment on a specific qinq port or LAG based on the following:

- Values \*, null, 0 to 4094 are allowed.
- Any SAP for which the outer and inner service-delimiting qtags match the range is associated with the virtual ES, and only those, for example, SAP 1/1/1:10.\* will not match port 1/1/1, s-tag 10 c-tag-range 10 to 100.
- A maximum of 8 ranges (including the s-tag ranges) are allowed in the qinq context.
- A c-tag range can be composed of a single qtag.
- Shutting down the ES is not required before making changes.
- A qtag included in the **s-tag-range** command cannot be included in the s-tag qtag of this command.

#### Note:

Not all qtag1 and qtag2 combinations are valid for values 0, \*, and null. The following combinations are allowed:

- s-tag 0 c-tag-range \*
- s-tag \* c-tag-range \*
- s-tag \* c-tag-range null
- s-tag null c-tag-range null
- s-tag X c-tag-range 0 (where: X=1 to 4094)
- s-tag X c-tag-range \* (where: X=1 to 4094)

The **no** form of the command removes the configured range. Only the first qtag1 value is required to remove the range.

### Parameters

#### *qtag1*

Specifies the outer VID for the c-tag range.

**Values** \*, null, 0 to 4094

#### *qtag2*

Specifies the inner VID for the c-tag range. When configuring a range of qtags (and not a single value), the second qtag1 value must be greater than the value of the first qtag1.

**Values** \*, null, 0 to 4094

### Platforms

All

## 23.3 s-tag-range

### s-tag-range

#### Syntax

**s-tag-range** *qtag1* [*to qtag1*]

**no s-tag-range** *qtag1*

#### Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg>qinq s-tag-range)

#### Full Context

configure service system bgp-evpn ethernet-segment qinq s-tag-range

#### Description

This command determines the VIDs associated with the virtual Ethernet Segment on a specific qinq port or LAG based on the following considerations:

- Values \*, 0 to 4094 are allowed.
- Any SAP for which the service-delimiting qtag matches the range is associated with the virtual ES, and only those, for example, SAP 1/1/1:0.\* will not match port 1/1/1, s-tag-range 100.
- Maximum 8 ranges are allowed in the qinq context.
- A range can be composed of a single qtag.
- Shutting down the ES is not required before making changes in the q-tag-range.

The **no** form of the command removes the configured range. Only the first qtag1 value is required to remove the range.

#### Parameters

##### *qtag1*

Specifies the outer VID. When configuring a range of qtags (and not a single value), the second qtag1 value must be greater than the first qtag1.

**Values** \*, 0 to 4094

## Platforms

## 23.4 s1-release

### s1-release

#### Syntax

[no] s1-release

#### Context

[\[Tree\]](#) (config>subscr-mgmt>acct-plcy>triggered-updates>gc s1-release)

#### Full Context

configure subscriber-mgmt radius-accounting-policy triggered-updates gtp-change s1-release

#### Description

This command configures the router to send an interim accounting update when an S1 release (idle) procedure is performed.

The **no** form of the command configures the router not to send an interim accounting update when an S1 release (idle) procedure is performed.

#### Default

no s1-release

#### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.5 s11

### s11

#### Syntax

s11

#### Context

[\[Tree\]](#) (config>service>vprn>gtp s11)

[\[Tree\]](#) (config>router>gtp s11)

### Full Context

```
configure service vprn gtp s11
configure router gtp s11
```

### Description

This command enables GTP configuration related to S11 termination in this VRF.

### Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.6 s2l-path

### s2l-path

#### Syntax

```
[no] s2l-path path-name to ip-address
```

#### Context

[\[Tree\]](#) (config>router>mpls>lsp>primary-p2mp-instance s2l-path)

#### Full Context

```
configure router mpls lsp primary-p2mp-instance s2l-path
```

#### Description

This command creates a root-to-leaf (S2L) sub-LSP path for the primary instance of a P2MP LSP. The primary instance of a P2MP LSP is modeled as a set of root-to-leaf (S2L) sub-LSPs. The root, for example, head-end node, triggers signaling using one path message per S2L path. The leaf sub-LSP paths are merged at branching points.

Each S2L sub-LSP is signaled in a separate path message. Each leaf node will respond with its own RESV message. A branch LSR node will forward the path message of each S2L sub-LSP to the downstream LSR without replicating it. It will also forward the RESV message of each S2L sub-LSP to the upstream LSR without merging it with the RESV messages of other S2L sub-LSPs of the same P2MP LSP. The same is done for subsequent refreshes of the path and RESV states.

The S2L paths can be empty paths or can specify a list of explicit hops. The path name must exist and must have been defined using the **config>router>mpls>path** command. The same path name can be re-used by more than one S2L of the primary P2MP instance. However, the **to** keyword must have a unique argument per S2L as it corresponds to the address of the egress LER node.

This command is not supported on the 7450 ESS.

#### Parameters

##### *path-name*

Specifies the name of the path which consists of up to 32 alphanumeric characters.

**to *ip-address***

Specifies the IP address of the egress router.

**Platforms**

All

## 23.7 sa-db

**sa-db****Syntax**

**sa-db** [**group** *grpAddr*] [**source** *srcAddr*] [**rp** *rpAddr*]

**no sadb**

**Context**

[\[Tree\]](#) (debug>router>msdp sa-db)

**Full Context**

debug router msdp sa-db

**Description**

This command enables debugging for Multicast Source Discovery Protocol (MSDP) source-active requests.

The **no** form of the command disables the MSDP source-active database debugging.

**Parameters*****grpAddr***

Debugs the IP address of the group.

***srcAddr***

Debugs the source IP address.

***rpAddr***

Debugs the specified rendezvous point RP address.

**Platforms**

All

## 23.8 sa-mac

## sa-mac

### Syntax

**sa-mac** *ieee-address* **da-mac** *ieee-address*

**no sa-mac**

### Context

[\[Tree\]](#) (config>mirror>mirror-dest>sap>egress>ip-mirror sa-mac)

### Full Context

configure mirror mirror-dest sap egress ip-mirror sa-mac

### Description

This command configures the source and destination MAC addresses for IP mirroring.

The **no** form of this command reverts to the default.

### Parameters

**sa-mac** *ieee-address*

Specifies the source MAC address. Multicast, Broadcast and zeros are not allowed.

**da-mac** *ieee-address*

Specifies the destination MAC address. Zeros are not allowed.

### Platforms

All

## 23.9 sa-timeout

## sa-timeout

### Syntax

**sa-timeout** *seconds*

**no sa-timeout**

### Context

[\[Tree\]](#) (config>service>vprn>msdp sa-timeout)

### Full Context

configure service vprn msdp sa-timeout

## Description

This command configures the value for the SA entries in the cache. If these entries are not refreshed within the timeout value, they are removed from the cache. Normally, the entries are refreshed at least once a minute. But under high load with many of MSDP peers, the refresh cycle could be incomplete. A higher timeout value (more than 90) could be useful to prevent instabilities in the MSDP cache.

## Default

90

## Parameters

### *seconds*

Specifies the time, in seconds, to wait for a response from the peer before declaring the peer unavailable.

**Values** 90 to 600

## Platforms

All

## sa-timeout

## Syntax

**sa-timeout** *seconds*

**no sa-timeout**

## Context

[\[Tree\]](#) (config>router>msdp sa-timeout)

## Full Context

configure router msdp sa-timeout

## Description

This command configures the value for the SA entries in the cache. If these entries are not refreshed within the timeout value, they are removed from the cache. Normally, the entries are refreshed at least once a minute. But under high load with many of MSDP peers, the refresh cycle could be incomplete. A higher timeout value (more than 90) could be useful to prevent instabilities in the MSDP cache.

## Default

sa-timeout 90

## Parameters

### *seconds*

Specifies the time, in seconds, to wait for a response from the peer before declaring the peer unavailable.

**Values** 90 to 600

## Platforms

## 23.10 saa

```
saa
```

### Syntax

```
saa
```

### Context

[\[Tree\]](#) (config saa)

### Full Context

configure saa

### Description

Commands in this context configure the Service Assurance Agent (SAA) tests.

## Platforms

All

```
saa
```

### Syntax

```
saa test-name [owner test-owner] {start | stop} [no-accounting]
```

### Context

[\[Tree\]](#) (oam saa)

### Full Context

oam saa

### Description

This command starts or stops an SAA test that is not configured as continuous.

### Parameters

*test-name*

Specifies the name of the SAA test, up to 32 characters. The test name must already be configured in the **config>saa>test** context.

#### **test-owner**

Specifies the owner of an SAA operation, up to 32 characters. If a *test-owner* value is not specified, the default owner is used.

**Default** "TiMOS CLI"

#### **start**

Starts the test. A test cannot be started if the same test is still running.

A test cannot be started if it is in a shut-down state. An error message and log event is generated to indicate a failed attempt to start an SAA test run. A test cannot be started if it is in a continuous state.

#### **stop**

Stops a test in progress. A test cannot be stopped if it is not in progress. A log message is generated to indicate that an SAA test run has been aborted. A test cannot be stopped if it is in a continuous state.

#### **no-accounting**

Disables the recording results in the accounting policy. When specifying **no-accounting** the MIB record produced at the end of the test is not added to the accounting file. It uses one of the three MIB rows available for the accounting module for collection.

### **Platforms**

All

## **23.11 saii-type2**

### **saii-type2**

#### **Syntax**

**saii-type2** *global-id:node-id:ac-id*

**no saii-type2**

#### **Context**

**[Tree]** (config>service>epipe>spoke-sdp>pw-path-id saii-type2)

**[Tree]** (config>service>cpipe>spoke-sdp>pw-path-id saii-type2)

**[Tree]** (config>service>vpls>spoke-sdp>pw-path-id saii-type2)

#### **Full Context**

configure service epipe spoke-sdp pw-path-id saii-type2

configure service cpipe spoke-sdp pw-path-id saii-type2

```
configure service vpls spoke-sdp pw-path-id saii-type2
```

### Description

This command configures the Source Individual Attachment Identifier (SAII) for an MPLS-TP spoke-sdp. If this is configured on a spoke-sdp for which vc-switching is also configured (for example, it is at an S-PE), then the values must match those of the taii-type2 of the mate spoke-sdp.

### Parameters

#### *global-id*

Specifies the global ID at the source PE or T-PE for the MPLS-TP PW for a spoke SDP.

**Values** 0 to 4294967295

#### *node-id*

Specifies the node ID at the source PE or T-PE for the MPLS-TP PW for a spoke SDP.

**Values** a.b.c.d or 0 to 4294967295

#### *ac-id*

Specifies the attachment circuit ID at the source PE or T-PE for the MPLS-TP PW for a spoke SDP. If this node is the source of the PW, then the AC ID must be set to a locally unique value.

**Values** 1 to 4294967295

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## saii-type2

### Syntax

```
saii-type2 global-id:prefix:ac-id
```

```
no saii-type2
```

### Context

**[Tree]** (config>service>epipe>spoke-sdp-fec saii-type2)

### Full Context

```
configure service epipe spoke-sdp-fec saii-type2
```

### Description

This command configures the source attachment individual identifier for the spoke-sdp. This is only applicable to FEC129 All type 2.

## Parameters

### *global-id*

A Global ID of this router T-PE. This value must correspond to one of the `global_id` values configured for a local-prefix under **config>service>pw-routing>local-prefix** context.

**Values** 1 to 4294967295

### *prefix*

The prefix on this router T-PE that the spoke-sdp SDP is associated with. This value must correspond to one of the prefixes configured under **config>service>pw-routing>local-prefix** context.

**Values** an IPv4-formatted address a.b.c.d or 1 to 4294967295

### *ac-id*

An unsigned integer representing a locally unique identifier for the spoke SDP.

**Values** 1 to 4294967295

## Platforms

[\[Tree\]](#) (config>service>vprn>if>spoke-sdp>pw-path-id saii-type2)

## Full Context

configure service vprn redundant-interface spoke-sdp pw-path-id saii-type2

configure service vprn interface spoke-sdp pw-path-id saii-type2

## Description

This command configures the source individual attachment identifier (SAII) for an MPLS-TP spoke SDP. If this is configured on a spoke SDP for which vc-switching is also configured (for example, it is at an S-PE), then the values must match those of the `taii-type2` of the mate spoke SDP.

## Parameters

### *global-id*

Specifies the global ID at the source PE or T-PE for the MPLS-TP PW for a spoke SDP.

**Values** 0 to 4294967295

***node-id***

Specifies the node ID at the source PE or T-PE for the MPLS-TP PW for a spoke SDP.

**Values** a.b.c.d or 1 to 4294967295

***ac-id***

Specifies the attachment circuit ID at the source PE or T-PE for the MPLS-TP PW for a spoke SDP. If this node is the source of the PW, then the AC ID must be set to a locally unique value.

**Values** 1 to 4294967295

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

- configure service vprn redundant-interface spoke-sdp pw-path-id saii-type2

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure service vprn interface spoke-sdp pw-path-id saii-type2

## saii-type2

### Syntax

**saii-type2** *global-id:node-id:ac-id*

**no saii-type2**

### Context

**[Tree]** (config>mirror>mirror-dest>spoke-sdp>pw-path-id saii-type2)

**[Tree]** (config>mirror>mirror-dest>remote-src>spoke-sdp>pw-path-id saii-type2)

### Full Context

configure mirror mirror-dest spoke-sdp pw-path-id saii-type2

configure mirror mirror-dest remote-source spoke-sdp pw-path-id saii-type2

### Description

This command configures the source individual attachment identifier (SAII) for an MPLS-TP spoke SDP. If this is configured on a spoke SDP for which vc-switching is also configured (for example, it is at an S-PE), then the values must match those of the taii-type2 of the mate spoke SDP.

### Parameters

***global-id***

Specifies the global ID at the source PE or T-PE for the MPLS-TP PW for a spoke SDP.

**Values** 0 to 4294967295

***node-id***

Specifies the node ID at the source PE or T-PE for the MPLS-TP PW for a spoke SDP.

**Values** a.b.c.d or 1 to 4294967295

***ac-id***

Specifies the attachment circuit ID at the source PE or T-PE for the MPLS-TP PW for a spoke SDP. If this node is the source of the PW, then the AC ID must be set to a locally unique value.

**Values** 1 to 4294967295

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.12 same-recipnonce-for-pollreq

### same-recipnonce-for-pollreq

**Syntax**

[no] same-recipnonce-for-pollreq

**Context**

[\[Tree\]](#) (config>system>security>pki>ca-profile>cmpv2 same-recipnonce-for-pollreq)

configure system security pki ca-profile cmpv2 same-recipnonce-for-pollreq

**Description**

This command enables the system to use same recipNonce as the last CMPv2 response for poll request.

**Default**

no same-recipnonce-for-pollreq

**Platforms**

All

## same-recipnonce-for-pollreq

### Syntax

**[no] same-recipnonce-for-pollreq**

### Context

**[Tree]** (config>system>security>pki>ca-profile>cmp2 same-recipnonce-for-pollreq)

### Full Context

configure system security pki ca-profile cmp2 same-recipnonce-for-pollreq

### Description

This command enables the system to use same recipNonce as the last CMPv2 response for poll request.

The **no** form of this command disables system to use same recipNonce as the last CMPv2 response for poll request.

### Default

no same-recipnonce-for-pollreq

## 23.13 sample-interval

## sample-interval

### Syntax

**sample-interval** *interval*

### Context

**[Tree]** (config>router>rsvp>dbw-accounting sample-interval)

### Full Context

configure router rsvp dbw-accounting sample-interval

### Description

This command sets the dark bandwidth sample interval to the specified value. Changing this parameter in the course of dark bandwidth accounting restarts the accounting cycle. The user is encouraged to specify values as multiples of 10. Selecting other values may lead to inconsistent estimation of Dark Bandwidth.

### Default

sample-interval 30

## Parameters

### *interval*

Specifies the sample interval, expressed in seconds.

**Values** 10 to 600

## Platforms

7750 SR, 7750 SR-s, 7950 XRS, VSR

## sample-interval

## Syntax

**sample-interval** *sample-period*

**no sample-interval**

## Context

[\[Tree\]](#) (config>qos>adv-config-policy>child-control>offered-measurement sample-interval)

## Full Context

configure qos adv-config-policy child-control offered-measurement sample-interval

## Description

This command defines the number of intervening sample periods before a new offered rate is measured and is only applicable when the policy is applied to a policer. By decreasing the sampling interval, the system measures a child's new offered rate more frequently. Inversely, increasing the sampling interval causes the child's offered rate to be measured less frequently.

The overall number of offered rate measurements the system attempts within a specified timeframe is not affected by the **sample-interval** command. If the system is asked to perform offered rate measurements more often on some policers, it takes longer to get to all children.

When this command is not specified or removed, the system evaluates the offered rate of each child after 1 sampling period.

The **no** form of this command is used to restore the sampling interval default of 1 sample period.

## Parameters

### *sample-period*

The sample-periods parameter is specified as a whole number between 1 and 8. The value '1' represents the fastest sampling rate available and the value '8' represents the slowest sampling period available.

**Default** 1

**Values** 1 to 8

## Platforms

All

## sample-interval

### Syntax

**sample-interval** *interval*

### Context

[\[Tree\]](#) (config>system>telemetry>persistent-subscriptions>subscription sample-interval)

### Full Context

configure system telemetry persistent-subscriptions subscription sample-interval

### Description

This command configures the sample interval for persistent subscription.

This sampling interval only applies when the **mode** command is set to either **target-defined** or **sample**.

### Default

sample-interval 10000

### Parameters

*interval*

Specifies the sample interval, in milliseconds.

**Values** 1000 to 4294967295

## Platforms

All

## 23.14 sample-multiplier

## sample-multiplier

### Syntax

**sample-multiplier** *multiplier*

### Context

[\[Tree\]](#) (config>router>rsvp>dbw-accounting sample-multiplier)

## Full Context

```
configure router rsvp dbw-accounting sample-multiplier
```

## Description

This command sets the dark bandwidth sample interval multiplier to the specified value. Changing this parameter in the course of dark bandwidth accounting restarts the accounting cycle.

## Default

```
sample-multiplier 3
```

## Parameters

### *multiplier*

Specifies the sample interval multiplier, expressed as an integer.

**Values** 1 to 10

## Platforms

7750 SR, 7750 SR-s, 7950 XRS, VSR

## 23.15 sample-profile

### sample-profile

## Syntax

```
sample-profile profile-id [create]
```

```
no sample-profile profile-id
```

## Context

[\[Tree\]](#) (config>cflowd sample-profile)

## Full Context

```
configure cflowd sample-profile
```

## Description

Commands in this context create and define sampling parameters.

The **no** form of this command removes the associated sample-profile. **sample-profile 1** cannot be deleted.

## Parameters

### *profile-id*

Specifies the rate profile.

**Values** 1 to 5

### **create**

Mandatory keyword when creating a sample profile. The create keyword requirement can be enabled or disabled in the **environment>create** context.

### **Platforms**

All

## sample-profile

### **Syntax**

**sample-profile** *sample-profile-id*

**no sample-profile**

### **Context**

**[Tree]** (config>filter>ip-filter>entry sample-profile)

**[Tree]** (config>filter>ipv6-filter>entry sample-profile)

### **Full Context**

configure filter ip-filter entry sample-profile

configure filter ipv6-filter entry sample-profile

### **Description**

This command allows traffic matching of an IPv4 or IPv6 filter to be sampled for cflowd processing using a specific sample profile.

This command is only compatible if the associated interface is configured for interface-based sampling and is only supported for ingress sampling.

An IP filter can only specify a single alternate sample profile for cflowd sampling, but that sample profile can be used in multiple entries.

The **no** form of this command removes the specified sampling profile from the configuration. Cflowd continues to process traffic based on the default or configured interface cflowd sampling profile.

### **Default**

no sample-profile

### **Parameters**

***sample-profile-id***

Specifies the cflowd sample profile to be used for packets matching this filter entry.

**Values** 1 to 5

## Platforms

All

## 23.16 sample-rate

### sample-rate

#### Syntax

**sample-rate** [*rate*]

#### Context

**[Tree]** (config>cflowd>sample-profile sample-rate)

#### Full Context

configure cflowd sample-profile sample-rate

#### Description

This command defines the cflowd sampling rate for the sample profile ID.

The sample rate indicates that the associated interface samples 1 in N packets for cflowd analysis. Only one rate profile below 1:256 with a specific IOM, IMM, or XMA can be associated.

#### Default

sample-rate 1000

#### Parameters

*rate*

Specifies the rate at which traffic is sampled and forwarded for cflowd analysis.

**Values** 1 to 60000

## Platforms

All

## 23.17 sample-window

### sample-window

#### Syntax

**sample-window** *seconds*

## no sample-window

### Context

[\[Tree\]](#) (config>oam-pm>streaming>delay-template sample-window)

### Full Context

configure oam-pm streaming delay-template sample-window

### Description

This command specifies the sample window duration in seconds for the template. This configuration option represents time over which the average will be calculated and subsequently streamed.

The **no** form of this command reverts to the default.

### Default

sample-window 60

### Parameters

#### *seconds*

Specifies the sample window duration.

**Values** 10 to 60

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## sample-window

### Syntax

**sample-window**

### Context

[\[Tree\]](#) (config>test-oam>link-meas>template sample-window)

### Full Context

configure test-oam link-measurement measurement-template sample-window

### Description

Commands in this context configure sample window parameters to be used when the **measurement-template** is assigned to an IP interface. The sample window is the collection of individual probe results, over a defined period.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.18 sampling

### sampling

#### Syntax

```

sampling {unicast | multicast} type {acl | interface} [direction { ingress-only | egress-only | both}]
    [sample-profile [profile-id]]
no sampling {unicast | multicast}

```

#### Context

**[Tree]** (config>service>vprn>nw-if>cflowd-parameters sampling)

**[Tree]** (config>service>ies>sub-if>grp-if>cflowd-parameters sampling)

**[Tree]** (config>service>vprn>sub-if>grp-if>cflowd-parameters sampling)

**[Tree]** (config>service>vprn>if>cflowd-parameters sampling)

**[Tree]** (config>service>ies>if>cflowd-parameters sampling)

#### Full Context

```

configure service vprn network-interface cflowd-parameters sampling
configure service ies subscriber-interface group-interface cflowd-parameters sampling
configure service vprn subscriber-interface group-interface cflowd-parameters sampling
configure service vprn interface cflowd-parameters sampling
configure service ies interface cflowd-parameters sampling

```

#### Description

This command enables and configures the cflowd sampling behavior to collect traffic flow samples through a router for analysis.

This command can be used to configure the sampling parameters for unicast and multicast traffic separately. If sampling is not configured for either **unicast** or **multicast** traffic, then that type of traffic will not be sampled.

If cflowd is enabled without either **egress-only** or **both** keywords specified or with the **ingress-only** keyword specified, then only ingress sampling is enabled on the associated IP interface.

The **no** form of this command disables the associated type of traffic sampling.

#### Parameters

##### unicast | multicast

Specifies unicast or multicast sampling.

##### type

Specifies the cflowd sampling type on the specific virtual router interface.

**Values** `acl` — Specifies ACL cflowd analysis be applied to the specified virtual router interface.

`interface` — Specifies interface cflowd analysis be applied to the specified virtual router interface

### **direction**

Specifies the direction of the cflowd analysis that is applied to the specified virtual router interface.

**Values** `ingress-only` — Specifies an ingress only direction of the cflowd analysis be applied to the specified virtual router interface.

`egress-only` — Specifies an egress only direction of the cflowd analysis be applied to the specified virtual router interface.

`both` — Specifies both ingress and egress direction of the cflowd analysis be applied to the specified virtual router interface.

### **profile-id**

Defines the sampling rate profile to be associated with this interface.

**Values** 1 to 5

## **Platforms**

All

- `configure service ies interface cflowd-parameters sampling`
- `configure service vprn interface cflowd-parameters sampling`
- `configure service vprn network-interface cflowd-parameters sampling`

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- `configure service vprn subscriber-interface group-interface cflowd-parameters sampling`
- `configure service ies subscriber-interface group-interface cflowd-parameters sampling`

## sampling

### **Syntax**

`sampling {unicast | multicast} type {acl | interface} [direction { ingress-only | egress-only | both}]`  
`[sample-profile profile]`

`no sampling {unicast | multicast}`

### **Context**

[\[Tree\]](#) (config>router>if>cflowd-parameters sampling)

### **Full Context**

configure router interface cflowd-parameters sampling

## Description

This command enables and configures the cflowd sampling behavior to collect traffic flow samples through a router for analysis.

This command can be used to configure the sampling parameters for unicast and multicast traffic separately. If sampling is not configured for either unicast or multicast traffic, then that type of traffic will not be sampled.

If cflowd is enabled without either **egress-only** or **both** specified or with the **ingress-only** keyword specified, then only ingress sampling will be enabled on the associated IP interface.

The **no** form of this command disables the associated type of traffic sampling on the associated interface.

## Default

no sampling

## Parameters

### unicast

Specifies that the sampling command will control the sampling of unicast traffic on the associated interface/SAP.

### multicast

Specifies that the sampling command will control the sampling of multicast traffic on the associated interface/SAP.

### type

Specifies whether the traffic sampling is based on an **acl** match, or all traffic entering or exiting the associated interface.

**Values** **acl** — Specifies that the sampled traffic is controlled via an IP traffic filter entry with the action "filter-sample" configured.  
**interface** — Specifies that all traffic entering or exiting the interface is subject to sampling.

### direction

Specifies the direction to collect traffic flow samples.

**Values** **ingress-only** — Enables ingress sampling only on the associated interface.  
**egress-only** — Enables egress sampling only on the associated interface.  
**both** — Enables both ingress and egress cflowd sampling.

### profile

Specifies the sampling profile to be associated with this interface.

**Values** 1 to 5

## Platforms

All

## 23.19 sampling-rate

### sampling-rate

#### Syntax

**sampling-rate** *sampling-rate*

**no sampling-rate**

#### Context

[\[Tree\]](#) (config>mirror>mirror-dest sampling-rate)

#### Full Context

configure mirror mirror-dest sampling-rate

#### Description

This command configures the packet sampling rate for mirrored traffic and is supported with **config** and **debug** mirror sources. The sampling rate is common to all endpoints on a specified line card FP per mirror destination service.

The **no** form of this command disables the packet sampling rate for mirrored traffic.

#### Default

no sampling-rate

#### Parameters

***sampling-rate***

Specifies the sampling rate.

**Values** 256 to 100000

#### Platforms

All

## 23.20 sap

### sap

#### Syntax

**sap** *sap-id* [**split-horizon-group** *group-name*] [**create**] [**capture-sap**] [**eth-ring** *ring-index*]

```
sap sap-id [split-horizon-group group-name] [create] [capture-sap] [eth-ring ring-index] root-leaf-tag  
leaf-tag leaf-tag  
no sap sap-id
```

## Context

[Tree] (config>service>vpls sap)

## Full Context

```
configure service vpls sap
```

## Description

This command creates a Service Access Point (SAP) within a service. A SAP is a combination of port and encapsulation parameters which identifies the service access point on the interface and within the 7450 ESS or 7750 SR. Each SAP must be unique. All SAPs must be explicitly created within a service or on an IP interface.

Enter an existing SAP without the **create** keyword to edit SAP parameters. The SAP is owned by the service in which it was created.

A SAP can only be associated with a single service. A SAP can only be defined on a port that has been configured as an access port using the **config interface** *port-type port-id mode access* command. Channelized TDM ports are always access ports (TDM applies to the 7750 SR only).

If a port is shut down, all SAPs on that port become operationally down. When a service is shut down, SAPs for the service are not displayed as operationally down although all traffic traversing the service is discarded. The operational state of a SAP is relative to the operational state of the port on which the SAP is defined.

The **no** form of this command deletes the SAP with the specified port. When a SAP is deleted, all configuration parameters for the SAP are also deleted. For Internet Ethernet Service (IES), the IP interface must be shut down before the SAP on that interface may be removed.

## Parameters

### *sap-id*

Specifies the physical port identifier portion of the SAP definition.

### *port-id*

Specifies the physical port ID in the *slot/mda/port* format.

If the card in the slot has Media Dependent Adapters (MDAs) installed, the *port-id* must be in the *slot\_number/MDA\_number/port\_number [.channel]* format. For example 6/2/3 specifies port 3 on MDA 2 in slot 6.

The *port-id* must reference a valid port type. When the *port-id* parameter represents SONET/SDH and TDM channels, the port ID must include the channel ID. A period "." separates the physical port from the *channel-id*. The port must be configured as an access port.

If the SONET/SDH port is configured as clear-channel then only the port is specified.

### *group-name*

Specifies the name of the split horizon group to which the SAP belongs. This parameter applies to the 7450 ESS or 7750 SR only.

**capture-sap**

Specifies a capturing SAP in which triggering packets are sent to the CPM. Non-triggering packets captured by the capture SAP are dropped. This parameter applies to the 7450 ESS or 7750 SR only.

**create**

Keyword used to create a SAP instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

**root-leaf-tag**

Specifies a SAP as a root leaf tag SAP. Only SAPs of the form dot1q (for example, 1/1/1:X) or qinq (for example, 1/1/1:X.Y, 1/1/1:X.\*) are supported. The default E-Tree SAP type is a root AC, if *root-leaf-tag* (or *leaf-ac*) is not specified at SAP creation. This option is only available when the VPLS is designated as an E-Tree VPLS.

**leaf-tag-vid**

Specifies to replace the outer SAP-ID for leaf traffic. The leaf tag VID is only significant between peering VPLS but the values must be consistent on each end.

**leaf-ac**

Specifies a SAP as a leaf access (AC) SAP. The default E-Tree SAP type is root AC if **leaf-ac** (or **root-leaf-tag**) is not specified at SAP creation. This option is only available when the VPLS is designated as an E-Tree VPLS.

**[Tree]** (config>service>cpipe sap)

### Full Context

```
configure service epipe sap
configure service ipipe sap
configure service cpipe sap
```

### Description

This command creates a Service Access Point (SAP) within a service. A SAP is a combination of port and encapsulation parameters which identifies the service access point on the interface and within the device. Each SAP must be unique.

All SAPs must be explicitly created. If no SAPs are created within a service or on an IP interface, a SAP will not exist on that object.

Enter an existing SAP without the **create** keyword to edit SAP parameters. The SAP is owned by the service in which it was created.

A SAP can only be associated with a single service. A SAP can only be defined on a port that has been configured as an access port. Channelized TDM ports are always access ports.

If a port is shutdown, all SAPs on that port become operationally down. When a service is shutdown, SAPs for the service are not displayed as operationally down although all traffic traversing the service will be discarded.

The operational state of a SAP is relative to the operational state of the port on which the SAP is defined.

Ethernet SAPs support null, dot1q, and qinq is supported for all routers.

The **no** form of this command deletes the SAP with the specified port. When a SAP is deleted, all configuration parameters for the SAP will also be deleted. For Internet Enhanced Service (IES), the IP interface must be shutdown before the SAP on that interface may be removed.

By default, no SAPs are defined.

### Parameters

**sap-id**

Specifies the physical port identifier portion of the SAP.

**port-id**

Specifies the physical port ID.

If the card in the slot has Media Dependent Adapters (MDAs) installed, the *port-id* must be in the *slot\_number/MDA\_number/port\_number* format. For example 6/2/3 specifies port 3 on MDA 2 in slot 6.

The *port-id* must reference a valid port type. When the *port-id* parameter represents SONET/SDH and TDM channels, the port ID must include the channel ID. A period "." separates the physical port from the *channel-id*. The port must be configured as an access port.

If the SONET/SDH port is configured as clear-channel then only the port is specified.

### Description

This command creates a Service Access Point (SAP) within a service. A SAP is a combination of port and encapsulation parameters which identifies the service access point on the interface and within the router. Each SAP must be unique.

All SAPs must be explicitly created. If no SAPs are created within a service or on an IP interface, a SAP will not exist on that object.

Enter an existing SAP without the **create** keyword to edit SAP parameters. The SAP is owned by the service in which it was created.

A SAP can only be associated with a single service. A SAP can only be defined on a port that has been configured as an access port using the **config interface port-type port-id mode access** command. For the 7750 SR, channelized TDM ports are always access ports.

If a port is shutdown, all SAPs on that port become operationally down. When a service is shutdown, SAPs for the service are not displayed as operationally down although all traffic traversing the service will be discarded. The operational state of a SAP is relative to the operational state of the port on which the SAP is defined.

**Note:**

Configure an IES interface as a loopback interface by issuing the **loopback** command instead of the **sap sap-id** command. The loopback flag cannot be set on an interface where a SAP is already defined and a SAP cannot be defined on a loopback interface.

The **no** form of this command deletes the SAP with the specified port. When a SAP is deleted, all configuration parameters for the SAP are also deleted. For Internet Enhanced Service (IES), the IP interface must be shutdown before the SAP on that interface may be removed. The no form of this command causes the ptp-hw-assist to be disabled.

## Default

No SAPs are defined.

## Parameters

### **sap-id**

Specifies the physical port identifier portion of the SAP definition.

### **port-id**

Specifies the physical port ID in the *slot/mda/port* format.

If the card in the slot has Media Dependent Adapters (MDAs) installed, the *port-id* must be in the *slot\_number/MDA\_number/port\_number* format. For example 61/2/3 specifies port 3 on MDA 2 in slot 61.

Table 99: Port ID Syntax

null	<i>port-id</i>   <i>lag-id</i>	
dot1q	{ <i>port-id</i>   <i>lag-id</i> }: <i>qtag1</i>   <i>cp-conn-prof-id</i>	
qinq	{ <i>port-id</i>   <i>lag-id</i> }: <i>qtag1</i>   <i>cp-conn-prof-id</i> }.{ <i>qtag2</i>   <i>cp-conn-prof-id</i> } cp: keyword <i>conn-prof-id</i> : 1 to 8000	
port-id	slot/mda/port [.channel]	
	eth-sat-id	esat-id/slot/port

		esat: keyword
		id: 1 to 20
	pxc-id	psc-id.sub-port
		pxc psc-id.sub-port
		pxc: keyword
		id: 1 to 64
		sub-port: a, b
lag-id	lag-id	lag: keyword
		id: 1 to 800
qtag1	0 to 4094	
qtag2	*   null   0 to 4094	

The *port-id* must reference a valid port type. When the *port-id* parameter represents SONET/SDH and TDM channels (7750 SR), the port ID must include the channel ID. A period "." separates the physical port from the *channel-id*. The port must be configured as an access port.

If the SONET/SDH port is configured as clear-channel then only the port is specified.

#### create

Keyword used to create a SAP instance. The **create** keyword requirement can be enabled/disabled in the **environment>create** context.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## sap

### Syntax

**sap** *sap-id* [**create**]

**no sap** *sap-id*

### Context

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if sap)

### Full Context

configure service vprn subscriber-interface group-interface sap

### Description

This command creates a SAP for the interface.

The **no** form of this command removes the SAP.

### Parameters

*sap-id*

Specifies the SAP ID.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

sap

### Syntax

**sap** *sap-id* [**create**]

**no sap** *sap-id*

### Context

[\[Tree\]](#) (config>service>vprn>if sap)

### Full Context

configure service vprn interface sap

### Description

This command creates a Service Access Point (SAP) within a service. A SAP is a combination of port and encapsulation parameters which identifies the service access point on the interface and within the router. Each SAP must be unique.

All SAPs must be explicitly created. If no SAPs are created within a service or on an IP interface, a SAP will not exist on that object. Enter an existing SAP without the **create** keyword to edit SAP parameters. The SAP is owned by the service in which it was created.

A SAP can only be associated with a single service. A SAP can only be defined on a port that has been configured as an access port using the **config interface port-type port-id mode access** command. Channelized TDM ports are always access ports.

If a port is shut down, all SAPs on that port become operationally down. When a service is shut down, SAPs for the service are not displayed as operationally down although all traffic traversing the service will

be discarded. The operational state of a SAP is relative to the operational state of the port on which the SAP is defined.

The **no** form of this command deletes the SAP with the specified port. When a SAP is deleted, all configuration parameters for the SAP will also be deleted. The **no** form of this command causes the ptp-h-assist to be disabled.

## Default

No SAPs are defined.

## Parameters

### *sap-id*

Specifies the physical port identifier portion of the SAP definition.

### *port-id*

Specifies the physical port ID.

If the card in the slot has Media Dependent Adapters (MDAs) installed, the *port-id* must be in the slot\_number/MDA\_number/port\_number format. For example 6/2/3 specifies port 3 on MDA 2 in slot 6.

The *port-id* must reference a valid port type. When the *port-id* parameter represents SONET/SDH and TDM channels the port ID must include the channel ID. A period "." separates the physical port from the *channel-id*. The port must be configured as an access port.

If the SONET/SDH port is configured as clear-channel then only the port is specified.

<i>port-id</i>	<i>slot/mda/port [.channel]</i>		
	eth-sat-id	<i>esat-id/slot/port</i>	
		esat	keyword
		<i>id</i>	1 to 20
	pxc-id	<i>pxc-id.sub-port</i>	
		pxc	keyword
		<i>id</i>	1 to 64
		<i>sub-port</i>	a, b

### **create**

Keyword used to create a SAP instance.

### **split-horizon-group** *group-name*

Specifies the name of the split horizon group to which the SAP belongs.

**sap** *sap-id* [**create**] **endpoint** *name*

**no sap**

### Context

[\[Tree\]](#) (config>mirror>mirror-dest sap)

### Full Context

configure mirror mirror-dest sap

## Description

This command creates a service access point (SAP) within a mirror destination service. The SAP is owned by the mirror destination service ID.

The SAP is defined with port and encapsulation parameters to uniquely identify the (mirror) SAP on the interface and within the box. The specified SAP may be defined on an Ethernet access port with a dot1q, null, or q-in-q encapsulation type.

Only one SAP can be created within a **mirror-dest** service ID. If the defined SAP has not been created on any service within the system, the SAP is created and the context of the CLI will change to the newly created SAP. In addition, the port cannot be a member of a multi-link bundle, APS group or IMA bundle.

If the defined SAP exists in the context of another service ID, **mirror-dest** or any other type, an error is generated.

Mirror destination SAPs can be created on Ethernet interfaces that have been defined as an access interface. If the interface is defined as network, the SAP creation returns an error.

When the **no** form of this command is used on a SAP created by a mirror destination service ID, the SAP with the specified port and encapsulation parameters is deleted.

## Parameters

### *sap-id*

Specifies the physical port identifier portion of the SAP definition.

### **no-endpoint**

Removes the association of a SAP or a sdp with an explicit endpoint name.

### *name*

Specifies the name of the endpoint associated with the SAP.

## Platforms

All

## sap

## Syntax

```
sap sap-id {[egress] [ingress]}
```

```
no sap sap-id [egress] [ingress]
```

## Context

[\[Tree\]](#) (config>mirror>mirror-source sap)

## Full Context

```
configure mirror mirror-source sap
```

## Description

This command enables mirroring of traffic ingressing or egressing a service access port (SAP). A SAP that is defined within a mirror destination cannot be used in a mirror source. The mirror source SAP referenced

by the *sap-id* is owned by the service ID of the service in which it was created. The SAP is only referenced in the mirror source name for mirroring purposes. The mirror source association does not need to be removed before deleting the SAP from its service ID. If the SAP is deleted from its service ID, the mirror association is removed from the mirror source.

More than one SAP can be associated within a single **mirror-source**. Each SAP has its own **ingress** and **egress** parameter keywords to define which packets are mirrored to the mirror destination.

The SAP must be valid and properly configured. If the associated SAP does not exist, an error occurs and the command will not execute.

The same SAP cannot be associated with multiple mirror source definitions for ingress packets.

The same SAP cannot be associated with multiple mirror source definitions for egress packets.

If a particular SAP is not associated with a mirror source name, then that SAP will not have mirroring enabled for that mirror source.

Note that the ingress and egress options cannot be supported at the same time on a CEM encap-type SAP. The options must be configured in either the ingress **or** egress contexts (applies to the 7750 SR and 7950 XRS).

The **no** form of this command disables mirroring for the specified SAP. All mirroring for that SAP on ingress and egress is terminated. Mirroring of packets on the SAP can continue if more specific mirror criteria is configured. If the **egress** or **ingress** parameter keywords are specified in the **no** command, only the ingress or egress mirroring condition is removed.

## Parameters

### *sap-id*

Specifies the physical port identifier portion of the SAP definition.

### **egress**

Specifies that packets egressing the SAP should be mirrored. Egress packets are mirrored to the mirror destination after egress packet modification.

### **ingress**

Specifies that packets ingressing the SAP should be mirrored. Ingress packets are mirrored to the mirror destination before the ingress packet modification.

## Platforms

All

## sap

## Syntax

```
sap sap-id {[ingress] [egress]}
```

```
no sap sap-id [ingress] [egress]
```

## Context

[\[Tree\]](#) (config>li>li-source sap)

## Full Context

```
configure li li-source sap
```

## Description

This command creates a service access point (SAP) within an LI configuration. The specified SAP must define a FastE, GigE, or XGigE, or XGigE access port with a dot1q, null, or q-in-q encapsulation type.

When the **no** form of this command is used on a SAP, the SAP with the specified port and encapsulation parameters is deleted.

## Parameters

### *sap-id*

Specifies the physical port identifier portion of the SAP definition.

### **egress**

Specifies that the router perform lawful intercept on egress traffic. Packets egressing the SAP are mirrored to the mirror destination after egress packet modification.

### **ingress**

Specifies that the router perform lawful intercept on ingress traffic. Packets ingressing the SAP are mirrored to the mirror destination before ingress packet modification.

## Platforms

All

```
sap
```

## Syntax

```
sap sap-id {[egress] [ingress]}
```

```
no sap sap-id [egress] [ingress]
```

## Context

[\[Tree\]](#) (debug>mirror-source sap)

## Full Context

```
debug mirror-source sap
```

## Description

This command enables mirroring of traffic ingressing or egressing a service access port (SAP). A SAP that is defined within a mirror destination cannot be used in a mirror source. The mirror source SAP referenced by the *sap-id* is owned by the service ID of the service in which it was created. The SAP is only referenced in the mirror source name for mirroring purposes. The mirror source association does not need to be removed before deleting the SAP from its service ID. If the SAP is deleted from its service ID, the mirror association is removed from the mirror source.

More than one SAP can be associated within a single **mirror-source**. Each SAP has its own **ingress** and **egress** parameter keywords to define which packets are mirrored to the mirror destination.

The SAP must be valid and properly configured. If the associated SAP does not exist, an error occurs and the command does not execute.

The same SAP cannot be associated with multiple mirror source definitions for ingress packets.

The same SAP cannot be associated with multiple mirror source definitions for egress packets.

If a particular SAP is not associated with a mirror source name, then that SAP does not have mirroring enabled for that mirror source.

Note that the ingress and egress options cannot be supported at the same time on a CEM encap-type SAP. The options must be configured in either the ingress **or** egress contexts (applies to the 7750 SR and 7950 XRS).

The **no** form of this command disables mirroring for the specified SAP. All mirroring for that SAP on ingress and egress is terminated. Mirroring of packets on the SAP can continue if more specific mirror criteria is configured. If the **egress** or **ingress** parameter keywords are specified in the **no** command, only the ingress or egress mirroring condition is removed.

## Parameters

### *sap-id*

Specifies the physical port identifier portion of the SAP definition.

### **egress**

Specifies that packets egressing the SAP should be mirrored. Egress packets are mirrored to the mirror destination after egress packet modification.

### **ingress**

Specifies that packets ingressing the SAP should be mirrored. Ingress packets are mirrored to the mirror destination before the ingress packet modification.

## 23.21 sap-egress

### sap-egress

#### Syntax

**sap-egress** {*policy-id* | *policy-name*} [**create**] [**name** *name*]

**no sap-egress** {*policy-id* | *policy-name*}

#### Context

[\[Tree\]](#) (config>qos sap-egress)

#### Full Context

configure qos sap-egress

#### Description

This command is used to create or edit a Service Egress QoS policy. The egress policy defines the SLA for service packets as they egress on the SAP.

Policies are templates that can be applied to multiple services as long as the scope of the policy is template. The queues defined in the policy are not instantiated until a policy is applied to a service.

Sap-egress policies determine queue mappings based on ingress DSCP, IP precedence, dot1p, and IPv4 or IPv6 match criteria. Multiple queues can be created per forwarding class and each queue can have different CIR or PIR parameters.

Egress SAP QoS policies allow the definition of queues and the mapping of forwarding classes to those queues. Each queue needs to have a relative CIR for determining its allocation of QoS resources during periods of congestion. A PIR can also be defined that forces a hard limit on the packets transmitted through the queue. When the forwarding class is mapped to the queue, a DSCP, IP precedence, or dot1p value can optionally be specified.

The sap-egress policy with *policy-id* 1 is the default sap-egress QoS policy and is applied to service egress SAPs when an explicit policy is not specified or removed. The default sap-egress policy cannot be modified or deleted.

By default, all forwarding classes map to queue 1.

Any changes made to an existing policy, using any of the sub-commands, will be applied immediately to all egress SAPs where this policy is applied. For this reason, when many changes are required on a policy, it is highly recommended that the policy be copied to a work area *policy-id*. That work-in-progress policy can be modified until complete, then written over the original *policy-id*. Use the **config qos copy** command to maintain policies in this manner.

The **no** form of this command deletes the sap-egress policy. A policy cannot be deleted until it is removed from all service SAPs where it is applied. When a sap-egress policy is removed from a SAP, the SAP will revert to the default sap-egress *policy-id* 1.

## Parameters

### *policy-id*

The *policy-id* uniquely identifies the policy on the router.

**Values** 1 to 65535

### *policy-name*

The *policy-name* uniquely identifies the policy.

**Values** 64 characters maximum.

### **create**

Required parameter when creating a SAP QoS egress policy.

### *name*

Configures an optional policy name which adds a name identifier to a specific policy to then use that policy name in configuration references as well as display and use policy names in show commands throughout the system. This helps the service provider or administrator to identify and manage sap-egress policies within the SR OS platforms.

All sap-egress policies are required to assign a policy ID to initially create a policy. However, either the policy ID or the policy name can be used to identify and reference a specific policy once it is initially created.

If a name is not specified at creation time, then SR OS assigns a string version of the *policy-id* as the name.

**Values** 64 characters maximum

## Platforms

All

## sap-egress

## Syntax

**sap-egress** *src-pol dst-pol* [**overwrite**]

## Context

[\[Tree\]](#) (config>qos>copy sap-egress)

## Full Context

configure qos copy sap-egress

## Description

This command copies existing QoS policy entries for a QoS policy-id to another QoS policy-id.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

## Parameters

### overwrite

Specifies to replace the existing destination policy. Everything in the existing destination policy will be overwritten with the contents of the source policy. If **overwrite** is not specified, an error will occur if the destination policy ID exists.

### Example:

```
- SR>config>qos# copy sap-egress 1 1010
- MINOR: CLI Destination "1010" exists use {overwrite}.
- SR>config>qos# copy sap-egress 1 1010 overwrite
```

### *src-pol dst-pol*

Indicates that the source policy ID and the destination policy ID are SAP egress policy IDs. Specify the source policy ID that the copy command will attempt to copy from and specify the destination policy ID to which the command will copy a duplicate of the policy.

**Values** 1 to 65535

#### Full Context

configure service vprn subscriber-interface group-interface arp-host sap-host-limit

configure service ies subscriber-interface group-interface arp-host sap-host-limit

#### Description

This command configures the maximum number of ARP hosts per SAP.

The **no** form of this command reverts to the default.

#### Default

sap-host-limit 1

#### Parameters

##### *max-num-hosts-sap*

Specifies the maximum number of ARP hosts per SAP allowed on this interface.

##### **Note:**

The operational maximum value may be smaller because of equipped hardware dependencies.

**Values** 1 to 131071

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

configure qos sap-ingress

## Description

This command is used to create or edit the ingress policy. The ingress policy defines the SLA enforcement that service packets receive as they ingress a SAP. SLA enforcement is accomplished through the definition of queues that have Forwarding Class (FC), Fair Information Rate (FIR), Committed Information Rate (CIR), Peak Information Rate (PIR), Committed Burst Size (CBS), and Maximum Burst Size (MBS) characteristics.

Policies in effect are templates that can be applied to multiple services as long as the **scope** of the policy is template. Queues defined in the policy are not instantiated until they are assigned to at least one forwarding class and a policy is applied to a service SAP.

It is possible that a SAP ingress policy will include the **dscp** map command, the **dot1p** map command, and an IP or MAC match criteria. When multiple matches occur for the traffic, the order of precedence will be used to arrive at the final action. The order of precedence is as follows:

1. 802.1p bits
2. DSCP
3. IP quintuple or MAC headers

The SAP ingress policy with *policy-id* 1 is a system-defined policy applied to services when no other policy is explicitly specified. The system SAP ingress policy cannot be modified or deleted. The default SAP ingress policy defines one unicast and one multipoint queue associated with all forwarding classes, with an FIR of zero, a CIR of zero, and a PIR of line rate.

Any changes made to the existing policy, using any of the sub-commands, are applied immediately to all services where this policy is applied. For this reason, when many changes are required on a policy, it is recommended that the policy be copied to a work area policy ID. That work-in-progress policy can be modified until complete, then written over the original policy-id. Use the **config>qos>copy** command to maintain policies in this manner.

The **no** form of this command deletes the SAP ingress policy. A policy cannot be deleted until it is removed from all services where it is applied.

## Parameters

### *policy-id*

The *policy-id* uniquely identifies the policy.

**Values** 1 to 65535

### *policy-name*

The *policy-name* uniquely identifies the policy.

**Values** 64 characters maximum

### **create**

Required parameter when creating a SAP QoS ingress policy.

### **name name**

Configures an optional policy name which adds a name identifier to a specific policy to then use that policy name in configuration references as well as display and use policy names in show commands throughout the system. This helps the service provider and administrator to identify and manage sap-ingress policies within the SR OS platforms.

All sap-ingress policies are required to assign a policy ID to initially create a policy. However, either the policy ID or the policy name can be used to identify and reference a specific policy after it is initially created.

If a name is not specified at creation time, then SR OS assigns a string version of the *policy-id* as the name.

**Values** 64 characters

## Platforms

All

## sap-ingress

## Syntax

**sap-ingress** *src-pol dst-pol* [**overwrite**]

## Context

**[Tree]** (config>qos>copy sap-ingress)

## Full Context

configure qos copy sap-ingress

## Description

This command copies existing QoS policy entries for a QoS policy-id to another QoS policy-id.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

## Parameters

### overwrite

Specifies to replace the existing destination policy. Everything in the existing destination policy will be overwritten with the contents of the source policy. If **overwrite** is not specified, an error will occur if the destination policy ID exists.

### Example:

```
- SR>config>qos# copy sap-egress 1 1010
- MINOR: CLI Destination "1010" exists use {overwrite}.
- SR>config>qos# copy sap-egress 1 1010 overwrite
```

### src-pol dst-pol

Indicates that the source policy ID and the destination policy ID are SAP ingress policy IDs. Specify the source policy ID that the copy command will attempt to copy from and specify the destination policy ID to which the command will copy a duplicate of the policy.

**Values** 1 to 65535

## Platforms

All

## 23.25 sap-limit

sap-limit

## Syntax

sap-limit [*limit*]

no sap-limit

## Context

**[Tree]** (config>service>dynsvc>policy sap-limit)

## Full Context

configure service dynamic-services dynamic-services-policy sap-limit

## Description

This command specifies a limit for the number of dynamic data service instances (SAPs) that can be setup simultaneously using a specific dynamic services policy.

A value of zero (0) means the policy is drained: existing dynamic data services can be modified and torn down but no new dynamic data services can be setup.

## Default

sap-limit 1

## Parameters

### *limit*

Specifies the number of dynamic data service SAPs that can be setup simultaneously using this dynamic services policy.

**Values** 0 to 131072

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.26 sap-parameters

### sap-parameters

## Syntax

sap-parameters

## Context

**[Tree]** (config>service>vprn>sub-if>grp-if sap-parameters)

**[Tree]** (config>service>ies>sub-if>grp-if sap-parameters)

## Full Context

configure service vprn subscriber-interface group-interface sap-parameters

configure service ies subscriber-interface group-interface sap-parameters

## Description

Commands in this context configure parameters that can be applied to automatically-generated internal SAPs.

## Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.27 sap-session-index

### sap-session-index

#### Syntax

[no] **sap-session-index**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>auth-policy>include-radius-attribute sap-session-index)

#### Full Context

configure subscriber-mgmt authentication-policy include-radius-attribute sap-session-index

#### Description

This command includes **sap-session-index** attributes.

The **no** form of this command excludes **sap-session-index** attributes.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.28 sap-session-limit

### sap-session-limit

#### Syntax

**sap-session-limit** *sap-session-limit*

**no sap-session-limit**

#### Context

[\[Tree\]](#) (config>service>ies>sub-if>grp-if>pppoe sap-session-limit)

[\[Tree\]](#) (config>service>vprn>sub-if>grp-if>pppoe sap-session-limit)

#### Full Context

configure service ies subscriber-interface group-interface pppoe sap-session-limit

configure service vprn subscriber-interface group-interface pppoe sap-session-limit

#### Description

This command specifies the number of PPPoE hosts per SAP allowed for this group-interface.

The **no** form of this command reverts to the default.

## Default

sap-session-limit 1

## Parameters

### *sap-session-limit*

Specifies the number of PPPoE hosts per SAP allowed.

#### Note:

The operational maximum value may be smaller due to equipped hardware dependencies.

**Values** 1 to 131071

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## sap-session-limit

## Syntax

**sap-session-limit** *sap-session-limit*

**no sap-session-limit**

## Context

**[Tree]** (config>service>vprn>sub-if>grp-if>ipoe-session sap-session-limit)

**[Tree]** (config>service>ies>sub-if>grp-if>ipoe-session sap-session-limit)

## Full Context

configure service vprn subscriber-interface group-interface ipoe-session sap-session-limit

configure service ies subscriber-interface group-interface ipoe-session sap-session-limit

## Description

This command specifies the number of IPoE sessions per SAP allowed for this group-interface.

The **no** form of this command reverts to the default.

## Default

sap-session-limit 1

## Parameters

### *sap-session-limit*

Specifies the number of allowed IPoE sessions.

**Note:**

The operational maximum value may be smaller due to equipped hardware dependencies.

**Values** 1 to 131071 131071 on wlan-gw group interfaces

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.29 sap-template

sap-template

**Syntax**

**sap-template** *sap-template*

**no sap-template**

**Context**

[\[Tree\]](#) (config>service>vpls>wlan-gw sap-template)

**Full Context**

configure service vpls wlan-gw sap-template

**Description**

This command specifies the VPLS SAP template that is applied on the internal SAPs created for communication between the VPLS and the ISAs.

The **no** form of this command removes the SAP template.

**Parameters**

**sap-template**

Specifies the existing SAP template to apply. The template is created in the **config>service>template** context.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

sap-template

**Syntax**

**sap-template** *name* [**create**]

**no sap-template** *name*

### Context

[\[Tree\]](#) (config>subscr-mgmt sap-template)

### Full Context

configure subscriber-mgmt sap-template

### Description

This command configures a template that specifies parameters for automatically generated subscriber SAPs, for example, when creating CUPS sessions. A template with the name "default" is used if no specific name is provided, but this must be manually provisioned.

The **no** form of this command removes the template.

### Parameters

#### *name*

Specifies the name of the PFCP association, up to 32 characters.

#### **create**

Keyword used to create the SAP template.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.30 sap-template-binding

### sap-template-binding

### Syntax

**sap-template-binding** *name/id*

**no sap-template-binding**

### Context

[\[Tree\]](#) (config>service>vpls>vpls-group sap-template-binding)

### Full Context

configure service vpls vpls-group sap-template-binding

### Description

This command configures the binding to a SAP template to be used to instantiate SAPs in the data VPLS using as input variables the VLAN IDs generated by the vid-range command.

The **no** form of this command removes the binding and deletes the related SAP instances. The command will fail if any of the affected VPLS instances have either a provisioned SAP or an active MVRP declaration/registration or if the related vpls-group is in no shutdown state. Any changes to the **sap-template-binding** require the **vpls-group** to be in **shutdown** state. New control SAP additions to the management VPLS are allowed as long as data VPLS instantiations/removals for vpls-groups are not in progress. Control SAPs can be removed at any time generating the removal of related data SAPs from the data VPLS. The **shutdown** or **no shutdown** state for the control SAPs does not have any effect on data SAPs instantiated with this command.

### Default

no sap-template-binding

### Parameters

#### *name*

Specifies the name of the VPLS template

**Values** ASCII character string

#### *id*

Specifies the ID of the VPLS template

**Values** 1 to 8196

### Platforms

All

## 23.31 saps

### saps

### Syntax

saps {qset-size size | non-shaper-queues}

### Context

[\[Tree\]](#) (config>qos>fp-resource-policy>aggregate-shapers>queue-sets>default-size saps)

### Full Context

configure qos fp-resource-policy aggregate-shapers queue-sets default-size saps

### Description

This command configures the default queue-set size for SAPs.

### Parameters

#### *size*

Specifies the size of the queue sets.

**Values** 2 to 8

#### **non-shaper-queues**

Specifies that subscribers will not use hardware aggregate shapers on FPs where the FP resource policy is applied.

#### **Platforms**

7750 SR-1, 7750 SR-s

## 23.32 sat-type

### sat-type

#### **Syntax**

**sat-type** *sat-type* [**port-template** *template-name*]

**no sat-type**

#### **Context**

**[Tree]** (config>system>satellite>eth-sat sat-type)

**[Tree]** (config>system>satellite>tdm-sat sat-type)

#### **Full Context**

configure system satellite eth-sat sat-type

configure system satellite tdm-sat sat-type

#### **Description**

This command configures the type of satellite variant for the associated satellite chassis.

The **no** form of the command deletes the **sat-type** configuration.

#### **Default**

no sat-type

#### **Parameters**

##### **sat-type**

Specifies the satellite type. Configuration of the following variants is supported:

##### **es24-1gb-sfp**

Specifies the 24xGE (SFP) + 4x10GE Ethernet satellite.

##### **es48-1gb-sfp**

Specifies the 48xGE (SFP) + 4x10GE Ethernet satellite.

**es24-sass-1gb-sfp**

Specifies the SAS-S 24xGE (SFP) + 4x10GE Ethernet satellite.

**es48-sass-1gb-sfp**

Specifies the SAS-S 48xGE (SFP) + 4x10GE Ethernet satellite.

**es24-1gb-tx**

Specifies the 24xGE (copper) + 4x10GE Ethernet satellite.

**es48-1gb-tx**

Specifies the 48xGE (copper) + 4x10GE Ethernet satellite.

**es24-1gb-tx**

Specifies the 24-port copper + PoE Ethernet satellite.

**es48-1gb-tx**

Specifies the 48-port copper + PoE Ethernet satellite.

**es64-10gb-sfpp+4-100gb-cfp4**

Specifies the 64x10GE + 4x100GE Ethernet satellite.

**es64-10gb-sfpp+4-100gb-qsfp28**

Specifies the 64x10GE + 4xQSFP28 Ethernet satellite.

**es24-sasmxp-1gb-sfp**

Specifies the 7210 SAS-Mxp as an ethernet satellite.

**ts4-choc3-sfp**

Specifies the 4-port OC3 TDM satellite.

**ts4-chstm1-sfp**

Specifies the 4-port STM1 TDM satellite.

**ts1-choc12-sfp**

Specifies the 1-port OC12 TDM satellite.

**ts1-chstm4-sfp**

Specifies the 1-port STM4 TDM satellite.

***template-name***

Specifies the name for the associated port template.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- configure system satellite eth-sat sat-type

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

- configure system satellite tdm-sat sat-type

## 23.33 satellite

## satellite

### Syntax

**satellite**

### Context

[\[Tree\]](#) (config>system satellite)

### Full Context

configure system satellite

### Description

This command enables the satellite configuration context. Within the satellite context, the administrator can specify the configuration details for a satellite chassis that is hosted by the associated local system.

## 23.34 save

## save

### Syntax

**save**

### Context

**[Tree]** (config>li save)

### Full Context

configure li save

### Description

This command is required to save LI configuration parameters.

### Platforms

All

## save

### Syntax

**save** [*cf-flash-id*]

### Context

**[Tree]** (bof save)

### Full Context

bof save

### Description

This command uses the boot option parameters currently in memory and writes them from the boot option file to the specified compact flash.

The BOF must be located in the root directory of the internal or external compact flash drives local to the system and have the mandatory filename of *bof.cfg*.

If a location is not specified, the BOF is saved to the default compact flash drive (cf3:) on the active CPM (typically the CPM in slot A, but the CPM in slot B could also be acting as the active CPM). The slot name is not case-sensitive. You can use upper or lowercase "A" or "B".

Command usage:

- **bof save** — saves the BOF to the default drive (cf3:) on the active CPM (either in slot A or B)
- **bof save cf3:** — saves the BOF to cf3: on the active CPM (either in slot A or B)

To save the BOF to a compact flash drive on the standby CPM (for example, the redundant (standby) CPM is installed in slot B), specify *-A* or *-B* option.

Command usage:

- **bof save cf3-A:** — saves the BOF to cf3: on CPM in slot A whether it is active or standby
- **bof save cf3-B:** — saves the BOF to cf3: on CPM in slot B whether it is active or standby

The slot name is not case-sensitive. You can use upper or lowercase "A" or "B".

The **bof save** and **show bof** commands allow you to save to or read from the compact flash of the standby CPM. Use the **show card** command to determine the active and standby CPM (A or B).

### Default

Saves must be explicitly executed. The BOF is saved to cf3: if a location is not specified.

### Parameters

#### *flash-id*

Specifies the compact flash ID where the *bof.cfg* is to be saved.

**Values** cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

**Default** cf3:

### Platforms

All

## save

### Syntax

**save** *file-url*

### Context

[\[Tree\]](#) (candidate save)

### Full Context

candidate save

### Description

This command saves the current candidate to a file.

### Parameters

#### *file-url*

Specifies the directory and filename.

### Platforms

All

## save

### Syntax

**save** [**comment** *comment*] [**rescue**]

### Context

**[Tree]** (admin>rollback save)

### Full Context

admin rollback save

### Description

If the optional **rescue** keyword is not used, this command saves a rollback checkpoint at the location and with the filename specified by the rollback-location with a suffix of .rb. The previously saved checkpoints will have their suffixes incremented by one (.rb.1 becomes .rb.2, and so on). If there are already as many checkpoint files as the maximum number supported, then the last checkpoint file is deleted.

If the **rescue** keyword is used, then this command saves the current operational configuration as a rescue configuration at the location and with the filename specified by the rescue location. The filename will have the suffix .rc appended.

### Parameters

#### ***comment-string***

Specifies a comment, up to 255 characters, that is associated with the checkpoint.

#### **rescue**

Saves the rescue checkpoint instead of a normal rollback checkpoint.

### Platforms

All

## save

### Syntax

**save** [*file-url*] [**detail**] [**index**]

### Context

**[Tree]** (admin save)

### Full Context

admin save

## Description

This command saves the running configuration to a configuration file. For example:

```
A:ALA-1>admin# save ftp://test:test@192.168.x.xx/./100.cfg
Saving configuration .....Completed.
```

By default, the running configuration is saved to the primary configuration file.

## Parameters

### *file-url*

Specifies the file URL location to save the configuration file.

#### Values

*local-url* |  
*remote-url*

*local-url* [cflash-id/][file-path] 200 chars max, including cflash-id

directory length 99 chars max each

*remote-url* [{ftp:// | tftp://}login:pswd@remote-locn/][file-path]

243 chars max

directory length 99 chars max each

*remote-locn* [hostname | ipv4-address | ipv6-address]

*ipv4-address* a.b.c.d

*ipv6-address* x:x:x:x:x:x[-interface]

x:x:x:x:x:d.d.d.d[-interface]

x - [0 to FFFF]H

d - [0 to 255]D

interface - 32 chars max, for link local addresses

*cflash-id* cf1:, cf1-A:, cf1-B:, cf2:, cf2-A:, cf2-B:, cf3:, cf3-A:, cf3-B:

**Default** the primary configuration file location

### detail

Saves both default and non-default configuration parameters.

### index

Forces a save of the persistent index file regardless of the persistent status in the BOF file. The index option can also be used to avoid an additional boot required while changing your system to use the persistence indexes.

## Platforms

## 23.35 save-deterministic-script

```
save-deterministic-script
```

### Syntax

```
save-deterministic-script
```

### Context

[\[Tree\]](#) (admin>nat save-deterministic-script)

### Full Context

```
admin nat save-deterministic-script
```

### Description

This command saves the script that calculates Deterministic NAT map entries.

Once the location for the Python deterministic NAT script is configured, the script is generated/updated every time deterministic NAT configuration is modified. However, the script must be manually exported to the remote location. This command triggers the export of the script to a remote location.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.36 save-when-restricted

## 23.38 scaling-profile

### scaling-profile

#### Syntax

**scaling-profile** *scaling-profile-id*

#### Context

[\[Tree\]](#) (config>isa>nat-group scaling-profile)

#### Full Context

configure isa nat-group scaling-profile

#### Description

This command determines profiles for NAT scaling. Lower profile numbers allocate less resources, therefore, supporting lower scaling.

Contact your Nokia representative for more information about NAT scaling figures in each profile.

#### Default

scaling-profile profile1

#### Parameters

##### ***scaling-profile-id***

Specifies the name of the profile, up to 32 characters.

- Values** ESA-VM supports three scaling profiles, while VSR-I supports only two.
- profile1 is a low scaling profile that requires 8 CPU cores and 32 GB of DRAM memory per ESA-VM
  - profile2 is a medium scaling profile that requires 11 CPU cores and 96 GB of DRAM memory per ESA-VM
  - profile3 is a high scaling profile that requires 15 CPU cores and 115 GB of DRAM memory per ESA-VM

For the number of required CPU control cores on a VSR-I in relation to profiles, see to the Sysinfo section in the Virtualized Service Router Installation and Setup Guide

.For the amount of required memory on VSR-I in relation to profiles, see the Software Release Notes, section VM Memory Requirements by Function Mix.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.39 sched-class

### sched-class

#### Syntax

**sched-class** *sched-class* **group** *name* [**weight** *weight*]

**no sched-class** *sched-class*

#### Context

[\[Tree\]](#) (config>qos>hw-agg-shap-sched-plcy sched-class)

#### Full Context

configure qos hw-agg-shaper-scheduler-policy sched-class

#### Description

This command configures the scheduling class for the hardware aggregate shaper scheduler policy.

The **no** form of this command removes the scheduling class configuration.

#### Parameters

##### *sched-class*

Specifies the scheduling class ID.

**Values** 3 to 6

##### *name*

Assigns the specified scheduling class to a group within the hardware aggregate shaper scheduler policy.

##### *weight*

Specifies the weight for a scheduling class within the specified group.

**Values** 3 to 8

**Default** 1

#### Platforms

7750 SR-1, 7750 SR-s

### sched-class

#### Syntax

**sched-class** *sched-class*

## no sched-class

### Context

[\[Tree\]](#) (config>qos>sap-egress>queue sched-class)

### Full Context

configure qos sap-egress queue sched-class

### Description

This command configures the scheduling class for the hardware aggregate shaper scheduler policy. The **no** form of this command removes the scheduling class configuration.

### Parameters

#### *sched-class*

Specifies the scheduling class ID.

**Values** 3 to 6

### Platforms

7750 SR-1, 7750 SR-s

## 23.40 sched-class-elevation

### sched-class-elevation

### Syntax

**sched-class-elevation sched-class *sched-class* weight *weight***

**no sched-class-elevation sched-class *sched-class***

### Context

[\[Tree\]](#) (config>qos>sap-egress sched-class-elevation)

### Full Context

configure qos sap-egress sched-class-elevation

### Description

This command configures the scheduling class elevation.

The **no** form of this command removes the scheduling class elevation configuration.

### Parameters

#### *sched-class*

Specifies the scheduling class ID.

**Values** 3 to 6

### ***weight***

Specifies the weight for the scheduling class.

**Values** 3 to 8

## **Platforms**

7750 SR-1, 7750 SR-s

## **23.41 sched-run-min-int**

### **sched-run-min-int**

#### **Syntax**

**sched-run-min-int** *percent-of-default*

**no sched-run-min-int**

#### **Context**

[\[Tree\]](#) (config>card>virt-sched-adj sched-run-min-int)

#### **Full Context**

configure card virtual-scheduler-adjustment sched-run-min-int

#### **Description**

This command overrides the default minimum time that must elapse before a virtual scheduler may redistribute bandwidth based on changes to the offered rates of member policers or queues. A minimum run interval is enforced to allow a minimum amount of "batching" queue changes before reacting to the changed rates. This minimum interval is beneficial since the periodic function of determining policer or queue offered rates is performed sequentially and the interval allows a number policer and queue rates to be determined before determining the distribution of bandwidth to the policers and queues.

The default minimum scheduler run interval is 0.5 seconds. The sched-run-min-int command uses a percent value to modify the default interval.

The **no** form of this command restores the default minimum scheduler run interval for all virtual schedulers on the card.

#### **Default**

no sched-run-min-int

#### **Parameters**

***percent-of-default***

Specifies that the percent-of-default parameter is required and is used to modify the default minimum scheduler run interval for all virtual schedulers on the card. Defining 100.00 percent is equivalent to removing the override (restoring the default) for the minimum scheduler run interval.

**Values** 0.01% to 1000.00%

**Default** 100.00%

### Platforms

All

## 23.42 schedule

### schedule

#### Syntax

[no] **schedule** *schedule-name* [owner *schedule-owner*]

#### Context

[\[Tree\]](#) (config>system>cron schedule)

#### Full Context

configure system cron schedule

#### Description

This command configures the type of schedule to run, including one-time only (oneshot), periodic or calendar-based runs. All runs are determined by month, day of month or weekday, hour, minute and interval (seconds).

The **no** form of the command removes the context from the configuration.

#### Parameters

##### *schedule-name*

Specifies the name of the schedule. The name can be up to 32 characters.

##### *schedule-owner*

Specifies the owner name of the schedule. The name can be up to 32 characters.

**Default** TiMOS CLI

### Platforms

All

## 23.43 schedule-type

### schedule-type

#### Syntax

**schedule-type** *schedule-type*

#### Context

[\[Tree\]](#) (config>system>security>pki>ca-prof>auto-crl-update schedule-type)

#### Full Context

configure system security pki ca-profile auto-crl-update schedule-type

#### Description

This command specifies the schedule type for auto CRL update. The system supports two types:

- **periodic**: — The system will download a CRL periodically at the interval configured via the **periodic-update-interval** command. For example, if the periodic-update-interval is 1 day, then the system will download a CRL every 1 day. The minimal periodic-update-interval is 1 hour.
- **next-update-based** — The system will download a CRL at the time = Next\_Update\_of\_existing\_CRL *minus* pre-update-time. For example, if the Next-Update of the existing CRL is 2015-06-30 06:00 and pre-update-time is 1 hour, then the system will start downloading at 2015-06-30, 05:00.

#### Default

schedule-type next-update-based

#### Parameters

**schedule-type**

Specifies the type of time scheduler to update the CRL.

**Values** periodic, next-update-based

## scheduler

### Syntax

**scheduler** *scheduler-name* **rate** *pir-rate* [**cir** *cir-rate*]

**no scheduler** *scheduler-name*

### Context

[Tree] (config>subscr-mgmt>sub-prof>egr>sched scheduler)

[Tree] (config>subscr-mgmt>sub-prof>ing>sched scheduler)

### Full Context

configure subscriber-mgmt sub-profile egress scheduler-policy scheduler

configure subscriber-mgmt sub-profile ingress scheduler-policy scheduler

### Description

This command provides a way to override parameters of the existing scheduler associated with the egress or ingress scheduler policy. A scheduler defines bandwidth controls that limit each child (other schedulers and queues) associated with the scheduler. Scheduler objects are created within the hierarchical tiers of the policy. It is assumed that each scheduler created will have queues or other schedulers defined as child associations. The scheduler can be a child (take bandwidth from a scheduler in a higher tier).

The **no** form of this command reverts to the default.

### Parameters

#### *scheduler-policy-name*

Specify an existing scheduler policy name.

#### *pir-rate*

Specify the *pir-rate*, in kilobits, to override the administrative PIR used by the scheduler. When the **rate** command is executed, a valid PIR setting must be explicitly defined. Fractional values are not allowed and must be specified as a positive integer.

**Values** 1 to 3200000000, max

#### *cir-rate*

The **cir** parameter overrides the administrative CIR used by the scheduler. When the **rate** command is executed, a CIR setting is optional. The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers or queues. Fractional values are not allowed and must be given as a positive integer.

**Values** 0 to 3200000000, sum, max

**Default** sum

### Platforms

## scheduler

### Syntax

**scheduler** *scheduler-name* [**create**]

**no scheduler** *scheduler-name*

### Context

**[Tree]** (config>service>vpls>sap>egress>sched-override scheduler)

### Full Context

configure service vpls sap egress scheduler-override scheduler

### Description

This command overrides specific attributes of the specified scheduler name.

A scheduler defines a bandwidth control that limits each child (other schedulers, policers and queues) associated with the scheduler. Scheduler objects are created within the hierarchical tiers of the policy. It is assumed that each scheduler created has policers, queues or other schedulers defined as child associations. The scheduler can be a child which takes bandwidth from a scheduler in a higher tier. A total of 32 schedulers can be created within a single scheduler policy with no restriction on the distribution between the tiers.

Each scheduler must have a unique name within the context of the scheduler policy; however the same name can be reused in multiple scheduler policies. If *scheduler-name* already exists within the policy tier level (regardless of the inclusion of the keyword **create**), the context changes to that scheduler name for the purpose of editing the scheduler parameters. Modifications made to an existing scheduler are executed on all instantiated schedulers created through association with the policy of the edited scheduler. This can cause policers, queues or schedulers to become orphaned (invalid parent association) and adversely affect the ability of the system to enforce service level agreements (SLAs).

If the *scheduler-name* exists within the policy on a different tier (regardless of the inclusion of the keyword **create**), an error occurs and the current CLI context does not change.

If the *scheduler-name* does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. The success of the command execution is dependent on the following:

1. The maximum number of schedulers has not been configured.
2. The provided *scheduler-name* is valid.
3. The **create** keyword is entered with the command if the system is configured to require it (enabled in the **environment create** command).

When the maximum number of schedulers has been exceeded on the policy, a configuration error occurs and the command does not execute, nor does the CLI context change.

If the provided scheduler-name is invalid according to the criteria below, a name syntax error occurs, the command does not execute, and the CLI context does not change.

The **no** form of this command removes the scheduler name from the configuration.

## Parameters

### *scheduler-name*

Specifies name of the scheduler

**Values** Valid names consist of any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### **create**

This optional keyword explicitly specifies that it is acceptable to create a scheduler with the given *scheduler-name*. If the **create** keyword is omitted, **scheduler-name** is not created when the system environment variable create is set to true. This safeguard is meant to avoid accidental creation of system objects (such as schedulers) while attempting to edit an object with a mistyped name or ID. The keyword has no effect when the object already exists.

configure qos scheduler-policy tier scheduler

### Description

This command creates a new scheduler or edits an existing scheduler within the scheduler policy tier. A scheduler defines bandwidth controls that limit each child (other schedulers and queues) associated with the scheduler. Scheduler objects are created within the hierarchical tiers of the policy. It is assumed that each scheduler created will have queues or other schedulers defined as child associations. The scheduler can be a child which takes bandwidth from a scheduler in a higher tier. A total of 32 schedulers can be created within a single scheduler policy with no restriction on the distribution between the tiers.

Each scheduler must have a unique name within the context of the scheduler policy; however, the same name can be reused in multiple scheduler policies. If *scheduler-name* already exists within the policy tier level (regardless of the inclusion of the keyword **create**), the context changes to that scheduler name for the purpose of editing the scheduler parameters. Modifications made to an existing scheduler are executed on all instantiated schedulers created through association with the policy of the edited scheduler. This can cause queues or schedulers to become orphaned (invalid parent association) and adversely affect the ability of the system to enforce SLAs.

If the *scheduler-name* exists within the policy on a different tier (regardless of the inclusion of the keyword **create**), an error occurs and the current CLI context will not change.

If the *scheduler-name* does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. The success of the command execution is dependent on the following:

1. The maximum number of schedulers has not been configured.
2. The provided *scheduler-name* is valid.
3. The **create** keyword is entered with the command if the system is configured to require it (enabled in the **environment create** command).

When the maximum number of schedulers has been exceeded on the policy, a configuration error occurs, the command will not execute, nor will the CLI context change.

If the provided scheduler-name is invalid according to the criteria below, a name syntax error will occur, the command will not execute, and the CLI context will not change.

### Parameters

***scheduler-name***

Specifies the scheduler name.

**Values** Valid names consist of any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

### create

This optional keyword explicitly specifies that it is acceptable to create a scheduler with the given *scheduler-name*. If the **create** keyword is omitted, **scheduler-name** is not created when the system environment variable `create` is set to true. This safeguard is meant to avoid accidental creation of system objects (such as schedulers) while attempting to edit an object with a mistyped name or ID. The keyword has no effect when the object already exists.

configure service customer multi-service-site ingress scheduler-override scheduler

## Description

This command override specifics attributes of the specified scheduler name.

A scheduler defines bandwidth controls that limit each child (other schedulers, policers and queues) associated with the scheduler. Scheduler objects are created within the hierarchical tiers of the policy. It is assumed that each scheduler created will have policers, queues or other schedulers defined as child associations. The scheduler can be a child which takes bandwidth from a scheduler in a higher tier. A total of 32 schedulers can be created within a single scheduler policy with no restriction on the distribution between the tiers.

Each scheduler must have a unique name within the context of the scheduler policy; however the same name can be reused in multiple scheduler policies. If *scheduler-name* already exists within the policy tier level (regardless of the inclusion of the keyword `create`), the context changes to that scheduler name for the purpose of editing the scheduler parameters. Modifications made to an existing scheduler are executed on all instantiated schedulers created through association with the policy of the edited scheduler. This can cause policer, queues or schedulers to become orphaned (invalid parent association) and adversely affect the ability of the system to enforce service level agreements (SLAs).

If the *scheduler-name* exists within the policy on a different tier (regardless of the inclusion of the keyword `create`), an error occurs and the current CLI context will not change.

If the *scheduler-name* does not exist in this or another tier within the scheduler policy, it is assumed that an attempt is being made to create a scheduler of that name. The success of the command execution is dependent on the following:

1. The maximum number of schedulers has not been configured.
2. The provided *scheduler-name* is valid.
3. The **create** keyword is entered with the command if the system is configured to require it (enabled in the **environment create** command).

When the maximum number of schedulers has been exceeded on the policy, a configuration error occurs and the command will not execute, nor will the CLI context change.

If the provided scheduler-name is invalid according to the criteria below, a name syntax error will occur, the command will not execute, and the CLI context will not change.

The **no** form of the command disables the scheduler override.

## Parameters

### *scheduler-name*

Specifies the name of the scheduler.

**Values** Valid names consist of any string up to 32 characters in length, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

### *create*

This optional keyword explicitly specifies that it is acceptable to create a scheduler with the given *scheduler-name*. If the **create** keyword is omitted, **scheduler-name** is not created when the system environment variable `create` is set to true. This safeguard is meant to avoid accidental creation of system objects (such as schedulers) while attempting to edit an object with a mistyped name or ID. The keyword has no effect when the object already exists.

configure subscriber-mgmt sla-profile egress scheduler-policy scheduler

## Description

This command provides a way to override parameters of the existing scheduler associated with the egress scheduler policy. A scheduler defines bandwidth controls that limit each child (other schedulers and queues) associated with the scheduler. Scheduler objects are created within the hierarchical tiers of the policy. It is assumed that each scheduler created will have queues or other schedulers defined as child associations. The scheduler can be a child (take bandwidth from a scheduler in a higher tier).

The **no** form of this command reverts to the default.

## Parameters

### *scheduler-name*

Specify an existing scheduler policy name up to 32 characters.

### *pir-rate*

Specifies the PIR rate in kb/s. This parameter overrides the administrative PIR used by the scheduler. When the rate command is executed, a valid PIR setting must be explicitly defined. Fractional values are not allowed and must be given as a positive integer.

**Values** 1 to 3200000000, max

### *cir-rate*

Specifies the CIR rate in kb/s. This parameter overrides the administrative CIR used by the scheduler. When the rate command is executed, a CIR setting is optional. The **sum** keyword specifies that the CIR be used as the summed CIR values of the children schedulers or queues. Fractional values are not allowed and must be given as a positive integer.

**Values** 0 to 3200000000, sum, max

**Default** sum

### scheduler-parent

## Syntax

**scheduler-parent** *scheduler-name* [**weight** *weight*] [**level** *level*] [**cir-weight** *cir-weight*] [**cir-level** *cir-level*]  
**no scheduler-parent**

## Context

**[Tree]** (config>qos>sap-egress>policer scheduler-parent)

## Full Context

configure qos sap-egress policer scheduler-parent

## Description

This command defines an optional parent scheduler that governs the available bandwidth given to a policer in addition to the PIR setting of the policer. When multiple schedulers, queues, or policers share a child status with the parent scheduler, the **weight** or **level** parameters define how this policer contends with the other children for the bandwidth of the parent. This command and the configuration of a SAP policer **port-parent** or **parent** arbiter are mutually exclusive.

Multiple schedulers can exist in different scheduler policies with the same *scheduler-name*; in this command, the associated *scheduler-name* pertains to a scheduler that should exist on the SAP as the policy is applied and the policer is created. When the policer is created on the SAP, the existence of the *scheduler-name* is dependent on a scheduler policy containing the *scheduler-name* being directly applied or indirectly applied (through a multiservice customer site) to the SAP. The policer accepts packets, but is not bandwidth limited by a virtual scheduler or the scheduler hierarchy applied to the SAP. The SAP to which the policer belongs displays an orphan policer status with the SapEgressPolicerMismatch flag in the **show service sap-using** output. The orphaned state of the policer is automatically cleared when the *scheduler-name* becomes available on the SAP.

The parent scheduler can be made unavailable by the removal of a scheduler policy or scheduler. When an existing parent scheduler is removed or inoperative, the policer enters the orphaned state. The policer automatically returns to normal operation when the parent scheduler is available again.

The **no** form of this command removes a child association with a parent scheduler. If a parent association does not currently exist, the command has no effect and no error message is returned. When a parent association has been removed, the former child policer attempts to operate based on its configured rate parameter.

Removing the parent association on the policer within the policy takes effect immediately on all policers using the SAP QoS policy.

## Default

no scheduler-parent

## Parameters

### *scheduler-name*

Scheduler names are configured in the **config>qos>scheduler-policy>tier** context. There are no checks performed at the time of definition to ensure that the *scheduler-name* exists within an existing scheduler policy. For the policer to use the defined *scheduler-name*, the scheduler must exist on each SAP that the policer is created on. If a *scheduler-name* does not exist on the SAP, the policer operates in an orphaned state. Each parental association must be explicitly defined.

**Values** Any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

### *weight*

Defines the relative weight of this policer in comparison with other child policers, queues, and schedulers when competing for bandwidth on the parent *scheduler-name* at the above-CIR priority level defined by the **level** parameter.

All weight values from all weighted active policers, queues, and schedulers with a common parent are added together. Then, each individual active weight is divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit. All child policers, queues, and schedulers with a weight of 0 are considered to have the lowest priority at the configured level and are not serviced until all non-zero weighted policers, queues, and schedulers at that level are operating at the maximum bandwidth or are idle.

**Values** 0 to 100

**Default** 1

### *level*

Defines the level of hierarchy when compared with other policers, queues, and schedulers when competing for bandwidth on the parent *scheduler-name*.

Children of the parent scheduler with a lower priority will not receive bandwidth until all children with a higher priority have either reached their maximum bandwidth or are idle. Children with the same level are serviced in relation to their relative weights.

**Values** 1 to 8 (8 is the highest priority)

**Default** 1

### ***cir-weight***

Defines the relative weight of this policer in comparison with other child policers, queues, or schedulers competing for bandwidth on the parent *scheduler-name* at the within-CIR priority level defined by the **cir-level** parameter.

All **cir-weight** values from all weighted active policers, queues, and schedulers with a common parent are added together. Then, each individual active weight is divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit.

The weight is specified as an integer value from 0 to 100, with 100 being the highest weight. When the **cir-weight** parameter is set to a value of 0, the policer receives bandwidth only after the other children with a non-zero weight at this level.

**Values** 0 to 100

**Default** 1

### ***cir-level***

Defines the level of hierarchy when compared with other policers, queues, and schedulers that the policer uses to receive bandwidth for its within-CIR offered load. If the **cir-level** parameter is set to a value of 0 (the default value), the policer does not receive bandwidth during the schedulers within-CIR pass and the **cir-weight** parameter is ignored. If the **cir-level** parameter is 1 or greater, the **cir-weight** parameter is used.

**Values** 0 to 8 (8 is the highest priority)

**Default** 0

## **Platforms**

## **scheduler-parent**

## **Syntax**

**scheduler-parent** *scheduler-name* [**weight** *weight*] [**level** *level*] [**cir-weight** *cir-weight*] [**cir-level** *cir-level*]

**no scheduler-parent**

## Context

[Tree] (config>qos>sap-ingress>policer scheduler-parent)

## Full Context

```
configure qos sap-ingress policer scheduler-parent
```

## Description

This command defines an optional parent scheduler that governs the available bandwidth given to a policer in addition to the PIR setting of the policer. When multiple schedulers, queues, or policers share a child status with the parent scheduler, the **weight** or **level** parameters define how this policer contends with the other children for the bandwidth of the parent. This command and the configuration of a SAP policer **scheduler-parent** or **parent** arbiter are mutually exclusive.

Multiple schedulers can exist in different scheduler policies with the same *scheduler-name*; in this command, the associated *scheduler-name* pertains to a scheduler that should exist on the SAP as the policy is applied and the policer is created. When the policer is created on the SAP, the existence of the *scheduler-name* is dependent on a scheduler policy containing the *scheduler-name* being directly applied or indirectly applied (through a multiservice customer site) to the SAP. The policer accepts packets, but is not bandwidth limited by a virtual scheduler or the scheduler hierarchy applied to the SAP.

The parent scheduler can be made unavailable by the removal of a scheduler policy or scheduler. When an existing parent scheduler is removed or inoperative, the policer enters the orphaned state. The policer automatically returns to normal operation when the parent scheduler is available again.

The **no** form of this command removes a child association with a parent scheduler. If a parent association does not currently exist, the command has no effect and no error message is returned. When a parent association has been removed, the former child policer attempts to operate based on its configured rate parameter.

Removing the parent association on the policer within the policy takes effect immediately on all policers using the SAP QoS policy.

## Default

no scheduler-parent

## Parameters

### *scheduler-name*

Scheduler names are configured in the **config>qos>scheduler-policy>tier** context. There are no checks performed at the time of definition to ensure that the *scheduler-name* exists within an existing scheduler policy. For the policer to use the defined *scheduler-name*, the scheduler must exist on each SAP that the policer is created on. If a *scheduler-name* does not exist on the SAP, the policer operates in an orphaned state. Each parental association must be explicitly defined.

**Values** Any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

### *weight*

Defines the relative weight of this policer in comparison with other child policers, queues, and schedulers when competing for bandwidth on the parent *scheduler-name* at the above-CIR priority level defined by the **level** parameter.

All weight values from all weighted active policers, queues, and schedulers with a common parent are added together. Then, each individual active weight is divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit. All child policers, queues, and schedulers with a weight of 0 are considered to have the lowest priority at the configured level and are not serviced until all non-zero weighted policers, queues, and schedulers at that level are operating at the maximum bandwidth or are idle.

**Values** 0 to 100

**Default** 1

### **level**

Defines the level of hierarchy when compared with other policers, queues, and schedulers when competing for bandwidth on the parent *scheduler-name*.

Children of the parent scheduler with a lower priority will not receive bandwidth until all children with a higher priority have either reached their maximum bandwidth or are idle. Children with the same level are serviced in relation to their relative weights.

**Values** 1 to 8 (8 is the highest priority)

**Default** 1

### **cir-weight**

Defines the relative weight of this policer in comparison with other child policers, queues, or schedulers competing for bandwidth on the parent *scheduler-name* at the within-CIR priority level defined by the **cir-level** parameter.

All **cir-weight** values from all weighted active policers, queues, and schedulers with a common parent are added together. Then, each individual active weight is divided by the total to determine the percentage of remaining bandwidth provided to the policer, queue, or scheduler after the higher priority level children have been serviced. A weight is considered to be active when the applicable policer, queue, or scheduler has not reached its maximum rate and still has packets to transmit.

The weight is specified as an integer value from 0 to 100, with 100 being the highest weight. When the **cir-weight** parameter is set to a value of 0, the policer receives bandwidth only after the other children with a non-zero weight at this level.

**Values** 0 to 100

**Default** 1

### **cir-level**

Defines the level of hierarchy when compared with other policers, queues, and schedulers that the policer uses to receive bandwidth for its within-CIR offered load. If the **cir-level** parameter is set to a value of 0 (the default value), the policer does not receive bandwidth

during the schedulers within-CIR pass and the **cir-weight** parameter is ignored. If the **cir-level** parameter is 1 or greater, the **cir-weight** parameter is used.

**Values** 0 to 8 (8 is the highest priority)

**Default** 0

## 23.47 scheduler-policy

### scheduler-policy

#### Syntax

**scheduler-policy** *scheduler-policy-name*

**no scheduler-policy**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>sla-prof>egress scheduler-policy)

#### Full Context

configure subscriber-mgmt sla-profile egress scheduler-policy

#### Description

This command specifies a scheduler policy to associate to the sla profile. Scheduler policies are configured in the **configure>qos>scheduler>policy** context. Each scheduler policy is divided up into groups of schedulers based on the tier each scheduler is created under. A tier is used to give structure to the schedulers within a policy and define rules for parent scheduler associations. The policy defines the hierarchy and operating parameters for virtual schedulers.

The **no** form of this command removes the scheduler-policy-name from the configuration.

#### Parameters

***scheduler-policy-name***

Specifies an existing scheduler policy name up to 32 characters.

#### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### Full Context

```
configure service ies subscriber-interface group-interface sap egress scheduler-policy
configure service vprn subscriber-interface group-interface sap ingress scheduler-policy
configure service ies sap egress scheduler-policy
configure service vprn subscriber-interface group-interface sap egress scheduler-policy
configure service ies sap ingress scheduler-policy
configure service ies subscriber-interface group-interface sap ingress scheduler-policy
```

### Description

This command applies an existing scheduler policy to an ingress or egress scheduler used by ingress SAP queues or egress SAP policers and queues associated with this multi-service customer site. The schedulers defined in the scheduler policy can only be created once the customer site has been appropriately assigned to a chassis port, channel or slot. Scheduler policies are defined in the **config>qos>scheduler-policy** *scheduler-policy-name* context.

The **no** form of this command removes the configured ingress or egress scheduler policy from the multi-service customer site. When the policy is removed, the schedulers created due to the policy are removed also making them unavailable for the SAP policers or queues associated with the customer site. Policers and queues that lose their parent scheduler association are deemed to be orphaned and are no longer subject to a virtual scheduler. The SAPs that have policers or queues reliant on the removed schedulers enter into an operational state depicting the orphaned status of one or more policers or queues. When the **no** form of this command executed, the customer site ingress or egress node will not contain an applied scheduler policy.

### Parameters

#### ***scheduler-policy-name:***

Specifies the scheduler policy name to apply to an existing scheduler policy that was created in the **config>qos>scheduler-policy** *scheduler-policy-name* context to create the hierarchy of ingress or egress virtual schedulers. The scheduler names defined within the policy are created and made available to any ingress queues or egress policers and queues created on associated SAPs.

**Values** Any existing valid scheduler policy name.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## scheduler-policy

### Syntax

**scheduler-policy** *scheduler-policy-name*

**no scheduler-policy**

## Context

**[Tree]** (config>port>ethernet>access>egress>vport scheduler-policy)

## Full Context

configure port ethernet access egress vport scheduler-policy

## Description

This command specifies a scheduler policy to associate to the Vport. Scheduler policies are configured in the **configure>qos>scheduler>policy** context. Each scheduler policy is divided up into groups of schedulers based on the tier each scheduler is created under. A tier is used to give structure to the schedulers within a policy and define rules for parent scheduler associations. The policy defines the hierarchy and operating parameters for virtual schedulers.

The **no** form of this command removes the configured egress scheduler policy from the Vport.

The **agg-rate rate**, **port-scheduler-policy** and **scheduler-policy** commands are mutually exclusive. Changing between the use of a scheduler policy and the use of an agg-rate/port-scheduler-policy involves removing the existing command and applying the new command.

The configuration of a scheduler policy under a Vport is mutually exclusive with the configuration of the egress-rate-modify parameter.

The **no** form of this command reverts to the default.

## Parameters

### *scheduler-policy-name*

Specifies the *scheduler-policy-name* parameter applies an existing scheduler policy that was created in the **config>qos>scheduler-policy scheduler-policy-name** context to create the hierarchy of egress virtual schedulers.

## Platforms

All

## scheduler-policy

## Syntax

```

## Description

This command applies an existing scheduler policy to an ingress or egress scheduler used by SAP queues associated with this multi-service customer site. The schedulers defined in the scheduler policy can only be created once the customer site has been appropriately assigned to a chassis port, channel or slot. Scheduler policies are defined in the **config>qos>scheduler-policy** *scheduler-policy-name* context.

The **no** form of this command removes the configured ingress or egress scheduler policy from the multi-service customer site. When the policy is removed, the schedulers created due to the policy are removed also making them unavailable for the ingress SAP queues and egress SAP policers and queues associated with the customer site. Policers and queues that lose their parent scheduler association are deemed to be orphaned and are no longer subject to a virtual scheduler. The SAPs that have policers or queues reliant on the removed schedulers enter into an operational state depicting the orphaned status of one or more policers or queues. When the **no scheduler-policy** command is executed, the customer site's ingress or egress node will not contain an applied scheduler policy.

## Parameters

### *scheduler-policy-name*

Specifies that the *scheduler-policy-name* is applied to an existing scheduler policy that was created in the **config>qos>scheduler-policy** *scheduler-policy-name* context to create the hierarchy of ingress or egress virtual schedulers. The scheduler names defined within the policy are created and made available to any ingress or egress queues created on associated SAPs.

**Values** Any existing valid scheduler policy name.

**scheduler-policy** *scheduler-policy-name* [**create**]

**no scheduler-policy** *scheduler-policy-name*

### Context

**[Tree]** (config>qos scheduler-policy)

## Full Context

configure qos scheduler-policy

## Description

Each scheduler policy is divided up into groups of schedulers based on the tier each scheduler is created under. A tier is used to give structure to the schedulers within a policy and define rules for parent scheduler associations.

The **scheduler-policy** command creates a scheduler policy or allows editing of an existing policy. The policy defines the hierarchy and operating parameters for virtual schedulers. Creating a policy does not create the schedulers; it only provides a template for the schedulers to be created when the policy is associated with a SAP or multiservice site.

Each scheduler policy must have a unique name within the context of the system. Modifications made to an existing policy are executed on all schedulers that use the policy. This can cause queues or schedulers to become orphaned (invalid parent association) and adversely affect the ability of the system to enforce SLAs.

If a *scheduler-policy-name* does not exist, it is assumed that an attempt is being made to create a new policy. The success of the command execution is dependent on the following:

1. The maximum number of scheduler policies has not been configured.
2. The provided scheduler-policy-name is valid.
3. The **create** keyword is entered with the command if the system is configured to require it (enabled in the **environment create** command).

When the maximum number of scheduler policies has been exceeded, a configuration error occurs, the command will not execute, and the CLI context will not change.

If the provided scheduler-policy-name is invalid according to the criteria below, a name syntax error occurs, the command will not execute, and the CLI context will not change.

## Parameters

### *scheduler-policy-name*

The name of the scheduler policy.

**Values** Valid names consist of any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

## Platforms

All

## scheduler-policy

## Syntax

**scheduler-policy** *scheduler-policy-name*

**no scheduler-policy**

## Context

[\[Tree\]](#) (config>service>cust>multi-service-site>ingress scheduler-policy)

[\[Tree\]](#) (config>service>cust>multi-service-site>egress scheduler-policy)

## Full Context

configure service customer multi-service-site ingress scheduler-policy

configure service customer multi-service-site egress scheduler-policy

## Description

This command applies an existing scheduler policy to an ingress or egress scheduler used by SAP queues or, at egress only, policers associated with this multi-service customer site. The schedulers defined in the scheduler policy can only be created once the customer site has been appropriately assigned to a chassis port, channel or slot. Scheduler policies are defined in the **config>qos>scheduler-policy scheduler-policy-name** context.

The **no** form of this command removes the configured ingress or egress scheduler policy from the multi-service customer site. When the policy is removed, the schedulers created due to the policy are removed also making them unavailable for the SAP policers and queues associated with the customer site. Policers and queues that lose their parent scheduler association are deemed to be orphaned and are no longer subject to a virtual scheduler.

The SAPs that have ingress queues reliant on the removed schedulers enter into an operational state depicting the orphaned status of one or more policers and queues. When the **no scheduler-policy** command is executed, the customer site ingress or egress node will not contain an applied scheduler policy.

## Parameters

### *scheduler-policy-name*

Applies an existing scheduler policy that was created in the **config>qos>scheduler-policy scheduler-policy-name** context to create the hierarchy of ingress or egress virtual schedulers. The scheduler names defined within the policy are created and made available to any ingress or egress queues and egress policers managed by HQoS created on associated SAPs.

**Values** Any existing valid scheduler policy name up to 32 characters in length.

## Platforms

All

## scheduler-policy

## Syntax

**scheduler-policy** *src-name dst-name* [**overwrite**]

## Context

[\[Tree\]](#) (config>qos>copy scheduler-policy)

## Full Context

```
configure qos copy scheduler-policy
```

## Description

This command copies existing QoS policy entries for a QoS policy to another QoS policy.

The **copy** command is a configuration-level maintenance tool used to create new policies using existing policies. It also allows bulk modifications to an existing policy with the use of the **overwrite** keyword.

If **overwrite** is not specified, an error will occur if the destination policy exists.

## Parameters

### *src-name dst-name*

Indicates that the source policy and the destination policy are scheduler policy. Specify the source policy that the copy command will attempt to copy from and specify the destination policy to which the command will copy a duplicate of the policy.

### **overwrite**

Forces the destination policy name to be copied as specified. When forced, everything in the existing destination policy will be completely overwritten with the contents of the source policy.

## Platforms

All

## 23.48 scheduling-class

### scheduling-class

## Syntax

```
scheduling-class class rate rate
```

```
scheduling-class class weight weight-in-group
```

```
no scheduling-class class
```

## Context

[\[Tree\]](#) (config>port>ethernet>egress>hs-sched-ovr scheduling-class)

## Full Context

```
configure port ethernet egress hs-scheduler-overrides scheduling-class
```

## Description

This command overrides the scheduling class configuration in the HS scheduler policy applied to the port egress. The scheduling class rate or weight within the WRR group can be overridden.

The **no** form of this command removes the scheduling class override parameters from the port egress configuration.

## Parameters

### *class*

Specifies the scheduling class.

**Values** 1 to 6

### *rate*

Specifies the explicit maximum frame based bandwidth limit, in megabits per second, for this HS scheduler policy scheduling class. The **rate** keyword must be followed by either the keyword **max** or a rate specified in megabits per second.

**Values** 1 to 100000, max

The **max** keyword specifies that a limit is not enforced for the specified class. The **max** keyword is mutually exclusive to the rate value and when specified, must directly follow the **rate** keyword. Setting the rate of the class will fail when the class is currently a member of a group.

### *weight-in-group*

Specifies the weight the HS scheduler policy should apply to this scheduling class within the group in which it belongs. The *weight-in-group* parameter must follow the **weight** keyword and is used to specify the relative weight of class to the other scheduling classes within the group. Setting the weight will fail if the scheduling class is not currently configured in a group.

**Values** 1 to 127

## Platforms

7750 SR-7/12/12e

## scheduling-class

## Syntax

**scheduling-class** *class-id*

**no scheduling-class**

## Context

[\[Tree\]](#) (config>service>vprn>if>sap scheduling-class)

## Full Context

configure service vprn interface sap scheduling-class

## Description

This command specifies the scheduling class to use for this SAP.

## Parameters

### *class-id*

Specifies the scheduling class to use for this SAP.

**Values** 0 to 3

**Default** 0

## Platforms

All

## scheduling-class

## Syntax

**scheduling-class** *class-id* **group** *group-id* [**weight** *weight-in-group*]

**scheduling-class** *class-id* **rate** *rate*

**no scheduling-class** *class-id*

## Context

[\[Tree\]](#) (config>qos>hs-scheduler-policy scheduling-class)

## Full Context

configure qos hs-scheduler-policy scheduling-class

## Description

This command configures the behavior of a specific scheduling class on all HSQ schedulers associated with the policy. The **scheduler-class** command performs one of two operations: it configures a maximum rate for the scheduling class or places the scheduling class into the weighted scheduling group. The two operations are mutually exclusive.

By default, none of the scheduling classes are members of the weighted scheduling group and each class is set to a rate limit of **max** (no rate limit applied).

Specifying Scheduling Class Rate (or Removing the Scheduling Class from Group) — If the **scheduling-class** command is executed with the **rate** keyword specified, either **max** or a specified rate value must follow. If a *class-id* was previously mapped into the weighted scheduling group, the class is removed from the group. However, if removing the class from the group causes the group to no longer have contiguous class members, the command fails with no effect on the specified class. A "non-contiguous grouping error" is returned. The lowest or highest members within a weighted group must be removed prior to removing the middle members. For example, if scheduling classes 3, 4, and 5 were members of weighted group 1, class 4 cannot be removed first.

This command using the **rate** keyword also fails when an override for the group weight is in place on the scheduling class within a scheduler associated with the policy. The override expects the class to be associated with a weighted scheduling group and the policy rate definition is attempting to remove the class from the group. An "override mismatch" error is generated, specifying the scheduling object where the override exists.

After a rate has been successfully defined for a scheduling class, the specified rate is automatically updated on all HSQ scheduler instances associated with the scheduling policy. The exception is where the scheduler instance has a local override for the rate on the scheduling class.

**Specifying Scheduling Class Weighted Group Membership** — If the **scheduling-class** command is executed with the **group** keyword specified, the group ID value of 1 must follow. The corresponding optional **weight** keyword is used to specify the weight of the scheduling class within the group. If weight is not specified, the default weight of 1 is used. If the specified scheduling class is not contiguous with the other scheduling classes in the group, the command fails with no change to the current state of the scheduling class and a "non-contiguous grouping" error is returned, specifying the weighted scheduling group and the current group members.

The **scheduling-class** command fails using the **group** keyword when a rate override for the scheduling class exists on an HSQ scheduler instance associated with the policy. The rate override for the scheduling class indicates the class is directly attached to a strict priority level, conflicting with the policy **group** keyword trying to place the class in the specified group. The command fails without affecting the scheduling class definition on the policy and returns an error specifying the scheduling object where the override exists.

**Other Override Constraints** — The scheduling overrides cannot change or remove a scheduling class from a policy-defined weighted group membership.

The **no** form of the command returns the scheduling class represented by *class-id* to the default behavior. The default behavior for a scheduling class is to not be a member of the weighted scheduling class group and have a rate set to **max**. The **no scheduling-class** command fails if the scheduling class is currently a member of the weighted scheduling class group and a weight override is in effect on a scheduling object for the class, in which case an error is returned.

## Parameters

### *class-id*

Specifies the scheduling class for HS scheduler policy. The *class-id* value is a required parameter that specifies which scheduling class the scheduling-class command is acting upon.

**Values** 1 to 6

### *group-id*

Specifies the group this HS scheduler policy scheduling class belongs to. The **group** and the **rate** keywords are mutually exclusive when executing this command. A group ID value of 1 must follow the **group** keyword. The **group** keyword removes the class ID from its inherent strict scheduling level and places it into the specified group ID. The associated **weight** parameter is optional and is used to specify the weight of a class ID within the weighted scheduling class group. Specifying the **group** parameter while an override for the scheduling class exists for rate causes the **scheduling-class** command to fail.

**Values** 1

### *weight-in-group*

Specifies the weight the HS scheduler policy should apply to this scheduling class within the group in which it belongs. This keyword is optional and must follow the **group** parameter when specified. The *weight-in-group* parameter must follow the **weight** keyword and is used to specify the relative weight of the *class-id* to the other scheduling classes

within the group. If the group is specified without the **weight** parameter, a default weight of 1 is used.

**Values** 1 to 127

### **rate**

Specifies the explicit maximum frame-based bandwidth limit, in megabits per second, for this HS scheduler policy scheduling class. The **rate** and **group** keywords are mutually exclusive. Either the **rate** or **group** keyword must be specified when executing this command. When specified, the **rate** keyword must be followed by either the keyword **max** or a rate specified in megabits per second. The specified rate can be overridden at the port Ethernet egress using the scheduler override functions. A newly-created HS scheduler policy defaults each scheduling class to have its rate set to **max** and the weighted scheduling class group has no members.

**Values** 1 to 100000, max

The **max** keyword specifies that a limit is not enforced for the specified class ID and that the class ID is not a member of a weighted scheduling class group. The **max** keyword and the *rate* value are mutually exclusive; when **max** is specified, it must directly follow the **rate** keyword. Setting the rate of the class fails when the class currently has a group weight override defined on a scheduling object.

### **Platforms**

7750 SR-7/12/12e

## 23.49 schema-path

### schema-path

#### **Syntax**

**schema-path** *url-string*

**no schema-path**

#### **Context**

**[Tree]** (config>system>management-interface schema-path)

#### **Full Context**

configure system management-interface schema-path

#### **Description**

This command specifies the schema path where the SR OS YANG modules can be placed by the user before using a <get-schema> request. Nokia recommends that the URL string not exceed 135 characters for the <get-schema> request to work correctly with all schema files.

If this command is not configured, the software upgrade process manages the YANG schema files to ensure the schema files are synchronized with the software image on both the primary and standby CPM.

The **no** form of this command reverts to the default value.

### Default

no schema-path

### Parameters

#### *url-string*

Specifies the schema path URL up to 180 characters. However, Nokia recommends that the string shall not exceed 135 characters to ensure that the <get-schema> request works properly with *all* schema files.

### Platforms

All

## 23.50 scope

scope

### Syntax

scope {exclusive | template}

no scope

### Context

[\[Tree\]](#) (config>service>mrp>mrp-policy scope)

### Full Context

configure service mrp mrp-policy scope

### Description

This command configures the filter policy scope as exclusive or template. If the scope of the policy is template and is applied to one or more services, the scope cannot be changed.

The **no** form of this command sets the scope of the policy to the default of template.

### Default

scope template

### Parameters

**exclusive**

When the scope of a policy is defined as exclusive, the policy can only be applied to a single entity (SAP or SDP). Attempting to assign the policy to a second entity will result in an error message. If the policy is removed from the entity, it will become available for assignment to another entity.

### template

When the scope of a policy is defined as template, the policy can be applied to multiple SAPs or network ports.

## Platforms

All

## scope

## Syntax

**scope** {**exclusive** | **template**}

**no scope**

## Context

[\[Tree\]](#) (config>qos>sap-ingress scope)

## Full Context

configure qos sap-ingress scope

## Description

This command configures the Service Ingress QoS policy scope as exclusive or template.

The policy's scope cannot be changed if the policy is applied to a service.

The **no** form of this command sets the scope of the policy to the default of **template**.

## Default

scope template

## Parameters

### exclusive

When the scope of a policy is defined as exclusive, the policy can only be applied to one SAP. If a policy with an exclusive scope is assigned to a second SAP, an error message is generated. If the policy is removed from the exclusive SAP, it will become available for assignment to another exclusive SAP.

The system default policies cannot be put into the exclusive scope. An error will be generated if scope exclusive is executed in any policies with a policy-id equal to 1.

### template

When the scope of a policy is defined as template, the policy can be applied to multiple SAPs on the router.

Default QoS policies are configured with template scopes. An error is generated when the template scope parameter to exclusive scope on default policies is modified.

## Platforms

All

## scope

## Syntax

**scope {exclusive | template}**

**no scope**

## Context

[\[Tree\]](#) (config>qos>sap-egress scope)

## Full Context

configure qos sap-egress scope

## Description

Enter the scope of this policy. The scope of the policy cannot be changed if the policy is applied to one or more services.

The no form of this command sets the scope of the policy to the default of template.

## Default

scope template

## Parameters

### exclusive

When the scope of a policy is defined as exclusive, the policy can only be applied to a single SAP. Attempting to assign the policy to a second SAP will result in an error message. If the policy is removed from the exclusive SAP, it will become available for assignment to another exclusive SAP.

The system default policies cannot be put into the exclusive scope. An error will be generated if scope exclusive is executed in any policies with a policy-id equal to 1.

### template

When the scope of a policy is defined as template, the policy can be applied to multiple SAPs on the router.

## Platforms

All

## scope

### Syntax

**scope** {**exclusive** | **template**}

**no scope**

### Context

**[Tree]** (config>qos>network scope)

### Full Context

configure qos network scope

### Description

This command configures the network policy scope as exclusive or template. The policy's scope cannot be changed if the policy is applied to an interface.

The **no** form of this command sets the scope of the policy to the default of **template**.

### Default

scope template

### Parameters

#### **exclusive**

When the scope of a policy is defined as exclusive, the policy can only be applied to one interface. If a policy with an exclusive scope is assigned to a second interface, an error message is generated. If the policy is removed from the exclusive interface, it will become available for assignment to another exclusive interface.

The system default policies cannot be put into the exclusive scope. An error will be generated if the **scope exclusive** command is executed in any policies with a policy-id equal to 1.

#### **template**

When the scope of a policy is defined as template, the policy can be applied to multiple interfaces on the router.

Default QoS policies are configured with template scopes. An error is generated if the template scope parameter is modified to exclusive scope on default policies.

### Platforms

All

## scope

### Syntax

**scope** {**exclusive** | **template** | **embedded** | **system**}

**scope** {**exclusive** | **template**}

**no scope**

### Context

**[Tree]** (config>filter>mac-filter scope)

**[Tree]** (config>filter>ip-filter scope)

**[Tree]** (config>filter>ipv6-filter scope)

**[Tree]** (config>filter>ip-exception scope)

### Full Context

configure filter mac-filter scope

configure filter ip-filter scope

configure filter ipv6-filter scope

configure filter ip-exception scope

### Description

This command configures the filter policy scope as **exclusive**, **template**, **embedded** or **system**.

The scope of the policy cannot be changed when:

- the scope is **template** and the policy is applied to one or more services or network interfaces
- the scope is **embedded** and the policy is embedded by another policy

Changing the scope to/from **system** is only allowed when a policy is not active and the policy has no entries configured.

The **no** form of the command sets the scope of the policy to the default of **template**.

### Default

scope **template**

### Parameters

#### **exclusive**

Specifies that the policy can only be applied to a single entity. Attempting to assign the policy to a second entity will result in an error message.

#### **template**

Specifies that the policy can be applied to multiple entities.

#### **embedded**

Specifies that the policy cannot be applied directly. The policy defines embedded filter rules, which are embedded by other **exclusive**/**template**/**system** filter policies. The **embedded** scope is supported for IPv4 and IPv6 filter policies only.

#### **system**

Specifies that the policy defines system-wide filter rules. To apply system policy rules, activate system filter and chain **exclusive**/**template** ACL filter policy to the system filter. The **system** scope is supported for IPv4 and IPv6 filter policies only.

## Platforms

All

- configure filter mac-filter scope
- configure filter ip-filter scope
- configure filter ipv6-filter scope

VSR

- configure filter ip-exception scope

## 23.51 scp

scp

### Syntax

**scp** *local-file-url destination-file-url* [**router** *router-instance*] [**force**]

**scp** *local-file-url destination-file-url* [**force**] **service** *service-name*

### Context

[\[Tree\]](#) (file scp)

### Full Context

file scp

### Description

This command copies a local file to a remote host file system. It uses `ssh` for data transfer, and uses the same authentication and provides the same security as `ssh`. The following prompt appears:

"Are you sure (y/n)?" The destination must specify a user and a host.

### Parameters

#### ***local-file-url***

Specifies the local source file or directory.

#### **Values**

*[cflash-id/] file-path* up to 200 characters

`cflash-id` `cf1:`, `cf1-A:`, `cf1-B:`, `cf2:`, `cf2-A:`, `cf2-B:`, `cf3:`, `cf3-A:`, `cf3-B:`

#### ***destination-file-url***

Specifies the destination file.

#### **Values**

*destination-file-\**: `user@hostname:file-path` - up to 255 characters

<i>user</i>	up to 32 characters
<i>hostname</i>	[ <i>dns-name</i>   <i>ipv4-address</i>   "[" <i>ipv6-address</i> "]"]
<i>ipv4-address</i>	<i>a.b.c.d</i>
<i>ipv6-address</i>	<i>x:x:x:x:x:x[-interface]</i> <i>x:x:x:x:x:d.d.d.d[-interface]</i> <i>x</i> - [0 to FFFF]H <i>d</i> - [0 to 255]D <i>interface</i> - up to 32 characters, mandatory for link local addresses
<i>dns-name</i>	up to 128 characters
<i>file-path</i>	up to 200 characters, directory length up to 99 characters

***user***

Specifies the SSH user.

***hostname***

Specifies the remote host IP address of DNS name.

***file-path***

Specifies the destination path.

***router-instance***

Specifies the router name or service ID used to specify the router instance.

**Values**

<i>router-name</i>	"Base", "management", "vpls-management"
<i>vprn-service-id</i>	1 to 2147483647

**Default** Base

***force***

Forces an immediate copy of the specified file. The command **file scp** *local-file-url destination-file-url* [**router** *router-instance*] **force** executes the command without displaying a user prompt message.

***service-name***

Specifies the service name used to identify the router instance. The service name can be a maximum of 64 characters long.

**Platforms**

All

## 23.52 scramble

### scramble

#### Syntax

[no] **scramble**

#### Context

[\[Tree\]](#) (config>port>tdm>ds3 scramble)

[\[Tree\]](#) (config>port>tdm>e3 scramble)

#### Full Context

configure port tdm ds3 scramble

configure port tdm e3 scramble

#### Description

This command enables payload scrambling on channel groups.

Scrambling randomizes the pattern of 1s and 0s carried in a SONET frame. Rearranging or scrambling the pattern prevents continuous strings of all 1s or all 0s and meets the needs of physical layer protocols that rely on sufficient transitions between 1s and 0s to maintain clocking.

The **no** form of this command disables scrambling.

#### Default

no scramble

#### Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

### scramble

#### Syntax

[no] **scramble**

#### Context

[\[Tree\]](#) (config>port>sonet-sdh>path scramble)

#### Full Context

configure port sonet-sdh path scramble

## Description

This command enables SONET/SDH payload scrambling. Scrambling randomizes the pattern of 1s and 0s carried in a SONET frame. Rearranging or scrambling the pattern prevents continuous strings of all 1s or all 0s and meets the needs of physical layer protocols that rely on sufficient transitions between 1s and 0s to maintain clocking.

For ATM, this command enables or disables ATM cell-level payload scrambling/descrambling using  $x^{43}+1$  polynomial as defined in ITU-T I.432.1. Scrambling is enabled by default for the ATM path/channel. Note that this scrambling is done in addition to SONET/SDH frame scrambling/descrambling, which is always enabled in the framer.

The **no** form of this command disables scrambling.

## Default

no scramble

## Platforms

debug dynamic-services scripts script
```

## Description

Commands in this context configure dynamic services script debugging for a specific script.

## Parameters

*script*

Specifies the script name.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## script

### Syntax

**script** *script-name* [**owner** *script-owner*]

**no script**

### Context

**[Tree]** (config>system>script-control>script-policy script)

**[Tree]** (config>system>script-control script)

### Full Context

configure system script-control script-policy script

configure system script-control script

### Description

This command is used to configure a script to be run.

The **no** form of the command removes the script.

### Default

no script

### Parameters

#### *script-name*

Specifies the name of the script. Can be up to 32 characters.

#### *script-owner*

Specifies the name of the script owner. Can be up to 32 characters.

The owner is an arbitrary name and not necessarily a user name. Commands in the scripts are not authorized against the owner. The **configure system security cli-script authorization x cli-user** command determines the user context against which commands in the scripts are authorized.

**Default** "TiMOS CLI"

### Context

**[Tree]** (config>service>dynsvc>ladb>user>idx script-parameters-3)

### Full Context

configure service dynamic-services local-auth-db user-name index script-parameters-3

### Description

This command specifies the third part of parameters as input to the dynamic data service Python script. The concatenation of all four script-parameters strings are passed to the Python script and must be formatted as function-key <dictionary>. The function-key specifies which Python functions is called, and <dictionary> contains the actual parameters in a Python dictionary structure format. The **no** form of this command removes the **script-parameters-3** from the configuration.

### Parameters

#### *param-string3*

Specifies string representing parameters that are used as input for the dynamic service Python script, up to 250 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.63 script-parameters-4

## script-parameters-4

### Syntax

**script-parameters-4** *param-string4*

**no script-parameters-4**

### Context

**[Tree]** (config>service>dynsvc>ladb>user>idx script-parameters-4)

### Full Context

configure service dynamic-services local-auth-db user-name index script-parameters-4

## Description

This command specifies the fourth part of parameters as input to the dynamic data service Python script. The concatenation of all four script-parameters strings are passed to the Python script and must be formatted as function-key <dictionary>. The function-key specifies which Python functions is called, and <dictionary> contains the actual parameters in a Python dictionary structure format. The **no** form of this command removes the **script-parameters-4** from the configuration.

## Parameters

### *param-string4*

Specifies a string representing parameters that are used as input for the dynamic service Python script, up to 250 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.64 script-policy

### script-policy

## Syntax

**script-policy** *name*

**no script-policy**

## Context

[\[Tree\]](#) (config>service>dynsvc>policy script-policy)

## Full Context

configure service dynamic-services dynamic-services-policy script-policy

## Description

This command specifies the radius script policy to be used to setup the dynamic data services. The script-policy configuration cannot be changed when there are active dynamic data services referencing the policy.

The **no** form of this command removes the script-policy from the configuration. This is only allowed when there are no active dynamic data services referencing this policy.

## Parameters

### *name*

Specifies the RADIUS script policy name.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## script-policy

### Syntax

**script-policy** *policy-name* [**owner** *policy-owner*]

**no script-policy**

### Context

**[Tree]** (config>system>cron>schedule script-policy)

### Full Context

configure system cron schedule script-policy

### Description

This command is used to configure the CLI script policy.

### Parameters

#### *policy-name*

Specifies the name of the policy. Can be up to 32 characters.

#### *policy-owner*

Specifies the name of the policy owner. Can be up to 32 characters.

The owner is an arbitrary name and not necessarily a user name. Commands in the scripts are not authorized against the owner. The **configure system security cli-script authorization x cli-user** command determines the user context against which commands in the scripts are authorized.

**Default** "TiMOS CLI"

### Platforms

All

## script-policy

### Syntax

[**no**] **script-policy** *policy-name* [**owner** *policy-owner*]

### Context

**[Tree]** (config>system>script-control script-policy)

### Full Context

configure system script-control script-policy

## Description

This command is used to configure the CLI script policy.

## Parameters

### *policy-name*

Specifies the name of the policy, up to 32 characters.

### *policy-owner*

Specifies the name of the policy owner, up to 32 characters.

The owner is an arbitrary name and not necessarily a user name. Commands in the scripts are not authorized against the owner. The **configure system security cli-script authorization x cli-user** command determines the user context against which commands in the scripts are authorized.

**Default** "TIMOS CLI"

## Platforms

All

## script-policy

## Syntax

**script-policy** *policy-name* [**owner** *policy-owner*]

**no script-policy**

## Context

[\[Tree\]](#) (config>log>event-handling>handler>action-list>entry script-policy)

## Full Context

configure log event-handling handler action-list entry script-policy

## Description

This command configures the script policy parameters to use for this EHS handler action-list entry. The associated script is launched when the handler is triggered.

## Default

no script-policy

## Parameters

### *policy-name*

Specifies the script policy name. Can be up to 32 characters maximum.

### *owner policy-owner*

Specifies the script policy owner. Can be up to 32 characters maximum.

**Default** "TIMOS CLI"

### Platforms

All

## 23.65 script-runtime-error

script-runtime-error

### Syntax

[no] script-runtime-error

### Context

[\[Tree\]](#) (debug>python>py-script script-runtime-error)

### Full Context

debug python python-script script-runtime-error

### Description

This command generates log information when detecting a script runtime error.

### Platforms

All

script-runtime-error

### Syntax

[no] script-runtime-error

### Context

[\[Tree\]](#) (debug>subscr-mgmt>sub-ident-plcy script-runtime-error)

### Full Context

debug subscriber-mgmt sub-ident-policy script-runtime-error

### Description

This command sends the traceback of the Python script failure to the logger.

The **no** form of this command disables debugging.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.66 script-url

```
script-url
```

### Syntax

**script-url** *primary-script-url*

**no script-url**

### Context

[\[Tree\]](#) (config>aaa>radius-scr-plcy>primary script-url)

### Full Context

configure aaa radius-script-policy primary script-url

### Description

This command configures the URL of the primary script.

The **no** form of this command removes the URL from the configuration.

### Parameters

***primary-script-url***

Specifies the URL of the secondary script to change RADIUS attributes of the RADIUS message.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

```
script-url
```

### Syntax

**script-url** *secondary-script-url*

**no script-url**

### Context

[\[Tree\]](#) (config>aaa>radius-scr-plcy>secondary script-url)

### Full Context

configure aaa radius-script-policy secondary script-url

## Description

Specifies the URL of the secondary script to change RADIUS attributes of the RADIUS message. The **no** form of this command removes the URL from the configuration.

## Parameters

### *secondary-script-url*

Specifies the URL of the secondary script to change RADIUS attributes of the RADIUS message.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## script-url

## Syntax

**script-url** *dhcp-script-url*

**no script-url**

## Context

[\[Tree\]](#) (config>subscr-mgmt>sub-ident-pol>tertiary script-url)

[\[Tree\]](#) (config>subscr-mgmt>sub-ident-pol>secondary script-url)

[\[Tree\]](#) (config>subscr-mgmt>sub-ident-pol>primary script-url)

## Full Context

configure subscriber-mgmt sub-ident-policy tertiary script-url

configure subscriber-mgmt sub-ident-policy secondary script-url

configure subscriber-mgmt sub-ident-policy primary script-url

## Description

This command specifies the URL of the identification scripts. The **no** form of this command reverts to the default.

## Parameters

### *dhcp-primary-script-url*

Specifies the URL of the primary identification script up to 180 characters.

### *dhcp-secondary-script-url*

Specifies the URL of the secondary identification script up to 180 characters.

### *dhcp-tertiary-script-url*

Specifies the URL of the tertiary identification script up to 180 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## script-url

### Syntax

**script-url** *script-url-name*

**no script-url**

### Context

[\[Tree\]](#) (config>app-assure>group>http-notif script-url)

### Full Context

configure application-assurance group http-notification script-url

### Description

This command configures the URL of the script used by the http notification policy.

The **no** form of this command removes the script URL from the http-notification policy.

### Default

no script-url

### Parameters

#### ***script-url-name***

Specifies the string representing the URL of the script used in the http notification policy, up to 255 characters.

#### **create**

Keyword to create the script URL.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.67 scripts

## scripts

### Syntax

**scripts**

## Context

[\[Tree\]](#) (debug>dynsvc scripts)

## Full Context

debug dynamic-services scripts

## Description

Commands in this context configure dynamic services script debugging.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.68 scte35-action

### scte35-action

## Syntax

**scte35-action** {forward | drop}

## Context

[\[Tree\]](#) (config>service>vprn>video-interface>channel scte35-action)

[\[Tree\]](#) (config>service>ies>video-interface>channel scte35-action)

## Full Context

configure service vprn video-interface channel scte35-action

configure service ies video-interface channel scte35-action

## Description

This command specifies whether the Society of Cable Telecommunications Engineers 35 (SCTE 35) cue avails in the stream need to be forwarded or not. When specified to forward, SCTE 35 messages will be forwarded downstream. When specified to drop, SCTE 35 messages will not be forwarded downstream. They will be still be processed for local splicing decisions.

## Parameters

### forward

Forwards SCTE 35 messages downstream.

### drop

Drops SCTE 35 messages.

## Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 23.69 sctp-filter

```
sctp-filter
```

### Syntax

```
sctp-filter sctp-filter-name
```

```
no sctp-filter
```

### Context

[\[Tree\]](#) (config>app-assure>group>policy>aqp>entry>action sctp-filter)

### Full Context

```
configure application-assurance group policy app-qos-policy entry action sctp-filter
```

### Description

This command assigns an existing SCTP filter as an action on flows matching this AQP entry.

The **no** form of this command removes this SCTP filter from actions on flows matching this AQP entry.

### Default

```
no sctp-filter
```

### Parameters

***sctp-filter-name***

Specifies the name of the existing SCTP filter for this application assurance profile. The *sctp-filter-name* is configured in the **config>app-assure>group[:partition]>sctp-filter** context.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

```
sctp-filter
```

### Syntax

```
sctp-filter sctp-filter-name
```

### Context

[\[Tree\]](#) (config>app-assure>group>statistics>tca sctp-filter)

### Full Context

```
configure application-assurance group statistics threshold-crossing-alert sctp-filter
```

## Description

This command configures TCA generation for an SCTP filter.

## Parameters

### *sctp-filter-name*

Specifies the name of the SCTP filter, up to 32 characters

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## sctp-filter

## Syntax

**sctp-filter** *sctp-filter-name* [**create**]

**no sctp-filter** *sctp-filter-name*

## Context

[\[Tree\]](#) (config>app-assure>group sctp-filter)

## Full Context

configure application-assurance group sctp-filter

## Description

Commands in this context configure Stream Control Transmission Protocol (SCTP) parameters.

The **no** form of this command removes this filter.

## Parameters

### *sctp-filter-name*

Specifies the SCTP filter name, up to 32 characters.

### **create**

Keyword used to create the SCTP filter.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.70 sctp-filter-stats

## sctp-filter-stats

### Syntax

[no] sctp-filter-stats

### Context

[\[Tree\]](#) (config>app-assure>group>statistics>aa-admit-deny sctp-filter-stats)

### Full Context

configure application-assurance group statistics aa-admit-deny sctp-filter-stats

### Description

This command configures whether to include or exclude SCTP filter admit-deny statistics in accounting records.

### Default

no sctp-filter-stats

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.71 sd

## sd

### Syntax

sd

### Context

[\[Tree\]](#) (config>mcast-mgmt>mcast-info-plcy>video-policy>video-if sd)

### Full Context

configure mcast-management multicast-info-policy video-policy video-interface sd

### Description

Commands in this context configure within a video interface policy the properties relating to requests received by the video interface for Standard Definition (SD) channel requests.

### Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

## 23.72 sd-offset

### sd-offset

#### Syntax

**sd-offset** *offset-value*

**no sd-offset**

#### Context

[\[Tree\]](#) (config>service>vprn>isis>if>level sd-offset)

#### Full Context

configure service vprn isis interface level sd-offset

#### Description

If the pre-FEC error rate of the associated DWDM port crosses the configured **sd-threshold**, this offset-value is added to the IS-IS interface metric. This parameter is only effective if the interface is associated with a DWDM port and the **sd-threshold** value is configured under that port.

The **no** form of this command reverts the offset value to 0.

#### Default

no sd-offset

#### Parameters

**offset-value**

Specifies the amount the interface metric is increased by if the **sd-threshold** is crossed.

**Values** 0 to 16777215

#### Platforms

All

### sd-offset

#### Syntax

**sd-offset** *sd-offset*

**no sd-offset**

#### Context

[\[Tree\]](#) (config>router>isis>if>level sd-offset)

## Full Context

configure router isis interface level sd-offset

## Description

If the pre-FEC error rate of the associated DWDM port crosses the configured **sd-threshold**, this offset-value is added to the IS-IS interface metric. This parameter is only effective if the interface is associated with a DWDM port and the **sd-threshold** value is configured under that port.

The **no** form of this command reverts the offset value to 0.

## Default

no sd-offset

## Parameters

### **sd-offset**

Specifies the amount the interface metric is increased by if the **sd-threshold** is crossed.

**Values** 0 to 16777215

## Platforms

All

## 23.73 sd-threshold

### sd-threshold

## Syntax

**sd-threshold** *threshold* [**coefficient** *coefficient*]

## Context

[\[Tree\]](#) (config>port>otu sd-threshold)

## Full Context

configure port otu sd-threshold

## Description

This command defines the error rate at which to declare the signal degrade (SD) condition.

The parameters define an error rate of  $(\text{coefficient}/10) * 10\text{E-}\text{threshold}$ . For example, **sd-threshold 5 coefficient 20** defines an error rate of  $(20/10) * 10\text{E-}5$ , or  $2 * 10\text{E-}5$ , or 0.000 02.

The SD threshold must be:

- greater than the SF threshold.
- 5 or higher before setting **sf-sd-method** to **bip8**.

The **coefficient** parameter is only used when **sf-sd-method** is set to **fec**. When **sf-sd-method** is set to **bip8**, **coefficient** is considered to have the value of 10.

## Parameters

### *threshold*

Specifies the exponent for the SD threshold value.

**Values** 5 to 9 when **sf-sd-method** is **bip8**  
3 to 9 when **sf-sd-method** is **fec**

**Default** 7

### *coefficient*

Specifies the coefficient for the SD threshold value.

**Values** 10 to 99

**Default** 10

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## sd-threshold

### Syntax

**sd-threshold** *errored-frames*

**no sd-threshold**

### Context

[\[Tree\]](#) (config>port>ethernet>efm-oam>link-mon>errored-frame sd-threshold)

### Full Context

configure port ethernet efm-oam link-monitoring errored-frame sd-threshold

### Description

The option defines the number of errored frames within the configured window which indicates the port has gone beyond an acceptable error rate and should be considered degraded. This is a first level warning that a port may be suspect. This generates an information log event message only and will be recorded in the Port event index but has no port level actions when the error count is equal to or greater than the threshold. This value must be lower than or equal to the sf-threshold value.

The **no** value of this option disables the sd-threshold.

### Default

no sd-threshold

## Parameters

### *errored-frames*

Specifies the number of errored frames within the configured window which indicates the port has become degraded.

**Values** 1 to 1000000

## Platforms

All

## sd-threshold

## Syntax

**sd-threshold** *errored-frames*

## Context

[\[Tree\]](#) (config>port>ethernet>efm-oam>link-mon>errored-frame-period sd-threshold)

## Full Context

configure port ethernet efm-oam link-monitoring errored-frame-period sd-threshold

## Description

The option defines the number of errored frames within the configured window which indicates the port has gone beyond an acceptable error rate and should be considered degraded. This is a first level warning that a port may be suspect. This generates an information log event message only and will be recorded in the Port event index but has no port level actions when the error count is equal to or greater than the threshold. This value must be lower than or equal to the sf-threshold value.

The **no** value of this option disables the sd-threshold

## Default

no sd-threshold

## Parameters

### *errored-frames*

Specifies the number of errored frames within the configured window which indicates the port has become degraded.

**Values** 1 to 1000000

## Platforms

All

## sd-threshold

### Syntax

**sd-threshold** *errored-frames*

**no sd-threshold**

### Context

[\[Tree\]](#) (config>port>ethernet>efm-oam>link-mon>errored-frame-seconds sd-threshold)

### Full Context

configure port ethernet efm-oam link-monitoring errored-frame-seconds sd-threshold

### Description

This command defines the number of errored frame seconds within the configured window which indicates the port has gone beyond an acceptable error rate and should be considered degraded. This is a first level warning that a port may be suspect. This event is raised when the error count is equal to or greater than the configured threshold. This is an information log event message only and will be recorded in the Port event index but has no port level actions. This value must be lower than or equal to the sf-threshold value.

The **no** version of this command disables the sd-threshold.

### Parameters

#### *errored-frames*

Specifies the number of errored seconds within the configured window which indicates the port has become degraded.

**Values** 1 to 900

### Platforms

All

## sd-threshold

### Syntax

**sd-threshold** *errored-symbols*

**no sd-threshold**

### Context

[\[Tree\]](#) (config>port>ethernet>efm-oam>link-mon>errored-symbols sd-threshold)

### Full Context

configure port ethernet efm-oam link-monitoring errored-symbols sd-threshold

## Description

This command defines the number of errored frames within the configured window which indicates the port has gone beyond an acceptable error rate and should be considered degraded. This is a first level warning that a port may be suspect. An event is raised when the error count is equal to or greater than this value. This is an information log event message only and will be recorded in the Port event index but has no port level actions. This value must be lower than or equal to the sf-threshold value. Specific to symbol errors, this value must be configured with the value that indicates anything less is acceptable and the port can be returned to service. If this value is not configured then manual operation is required to return the port to service.

The **no** value of this option means there is there is no automatic return to service.

## Default

no sd-threshold

## Parameters

### ***errored-symbols***

Specifies the number of errored symbols which indicates the port has become degraded.

**Values** 1 to1000000

## Platforms

All

## sd-threshold

## Syntax

**sd-threshold** *threshold* [**multiplier** *multiplier*]

**no sd-threshold**

## Context

[\[Tree\]](#) (config>port>ethernet>sym-mon sd-threshold)

## Full Context

configure port ethernet symbol-monitor sd-threshold

## Description

This command specifies the error rate at which to declare the Signal Degrade condition on an Ethernet interface. The value represents  $M \cdot 10E-N$  a ratio of symbol errors over total symbols received over  $W$  seconds of the sliding window. The symbol errors on the interface are sampled once per second. A default of 10 seconds is used when there is no additional window-size configured. The multiplier keyword is optional. If the multiplier keyword is omitted or no sd-threshold is specified the multiplier will return to the default value of 1.

## Default

no sd-threshold

## Parameters

### *threshold*

Specifies the rate of symbol errors.

**Values** 1 to 9

### *multiplier*

Specifies the multiplier used to scale the symbol error ratio.

**Values** 1 to 9

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## sd-threshold

## Syntax

**sd-threshold** *threshold* [**multiplier** *multiplier*]

**no sd-threshold**

## Context

[\[Tree\]](#) (config>port>ethernet>crc-monitor sd-threshold)

## Full Context

configure port ethernet crc-monitor sd-threshold

## Description

This command specifies the error rate at which to declare the Signal Degrade condition on an Ethernet interface. The value represents  $M \cdot 10E-N$  a ratio of errored frames over total frames received over  $W$  seconds of the sliding window. The CRC errors on the interface are sampled once per second. A default of 10 seconds is used when there is no additional window-size configured. The multiplier keyword is optional. If the multiplier keyword is omitted or **no sd-threshold** is specified the multiplier will return to the default value of 1.

## Default

no sd-threshold

## Parameters

### *threshold*

Specifies the threshold value.

**Values** 1 to 9

***multiplier***

Specifies the multiplier value.

**Values** 1 to 9

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.74 sd-threshold-clear

### sd-threshold-clear

**Syntax**

**sd-threshold-clear** *threshold* [**coefficient** *coefficient*]

**Context**

[\[Tree\]](#) (config>port>otu sd-threshold-clear)

**Full Context**

configure port otu sd-threshold-clear

**Description**

This command defines the signal degrade (SD) threshold clear value.

When the bit error rate falls below this value, the SD condition is cleared. The parameters define an error rate of  $(\text{coefficient}/10) * 10\text{E-}\text{threshold}$ . For example, **sd-threshold-clear 7 coefficient 10** defines an error rate of  $(10/10) * 10\text{E-}7$ , or  $10\text{E-}7$ , or 0.000 000 1.

This SD threshold clear setting is valid only when **sf-sd-method** is set to **fec**.

**Parameters*****threshold***

Specifies the exponent for the SD threshold clear value.

**Values** 3 to 10

**Default** 8

***coefficient***

Specifies the coefficient for the SD threshold clear value.

**Values** 10 to 99

**Default** 10

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## 23.75 sdp

```
sdp
```

### Syntax

```
sdp sdp-id [sync-tag sync-tag] [create]
```

```
no sdp sdp-id
```

### Context

[\[Tree\]](#) (config>redundancy>multi-chassis>peer>sync sdp)

### Full Context

```
configure redundancy multi-chassis peer sync sdp
```

### Description

This command specifies the manually configured spoke SDPs to be synchronized with the multi-chassis peer and a synchronization tag to be used while synchronizing these spoke SDPs with the multi-chassis peer.

Manually configured spoke SDPs with the specified *sdp-id* are synchronized according to the synchronization tag. If synchronization is required only for a subset of the spoke SDPs using the configured SDP, the **range** sub-command should be used. The **range** command and the **sync-tag** parameters are mutually exclusive.

The synchronization of PIM snooping is only supported for manually configured spoke SDPs but is not supported for spoke SDPs configured within an endpoint.

The synchronization of PIM snooping is not supported on any of the following when used with the configured *sdp-id*:

- Mesh SDPs
- Spoke SDPs in non-VPLS services
- BGP-AD/BGP-VPLS (FEC 129) spoke SDPs
- Spoke SDPs configured in endpoints
- Pseudowire SAPs
- ESM-over-MPLS Pseudowires

Non-existent spoke SDPs may be specified. If these spoke SDPs are created at a later time, then all states on the spoke SDPs are synchronized according to the synchronization tag and the synchronization protocols enabled.

A synchronization tag can be changed by entering the same command with a different synchronization tag. Changing the synchronization tag removes all states relating to the previous synchronization tag for the SDP and a new synchronization tag state is created.

## Parameters

### *sdp-id*

Specifies the SDP of the spoke SDPs to be synchronized with the multi-chassis peer.

**Values** 1 to 32767

### *sync-tag*

Specifies a synchronization tag, up to 32 characters, to be used when synchronizing with the multi-chassis peer.

### **create**

Creates the SDP instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## Platforms

All

sdp

## Syntax

**sdp** *sdp-id*

**no sdp**

## Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg sdp)

## Full Context

configure service system bgp-evpn ethernet-segment sdp

## Description

This command configures an *sdp-id* associated to the Ethernet-Segment. If the Ethernet-Segment is configured as **all-active**, then only a lag or PW port can be associated to the Ethernet-Segment. If the Ethernet-Segment is configured as **single-active**, then lag, port or sdp can be associated to the Ethernet-Segment. In any case, only one of the four objects can be configured in the Ethernet-Segment. A specified SDP can be part of only one Ethernet-Segment. Only user-configured SDPs can be added to an Ethernet-Segment.

## Default

no sdp

## Parameters

### *sdp-id*

Specifies the IP address.

**Values** 1 to 17407

## Platforms

All

sdp

## Syntax

[no] sdp *sdp-id:vc-id*

## Context

[\[Tree\]](#) (config>service>vpls>pbb>backbone-vpls sdp)

## Full Context

configure service vpls pbb backbone-vpls sdp

## Description

This command configures attributes of a SDP binding on the B-VPLS service.

## Parameters

*sdp-id*

Specifies the SDP ID.

**Values** 1 to 17407

*vc-id*

Specifies the VC ID.

**Values** 1 to 4294967295

## Platforms

All

sdp

## Syntax

[no] sdp *sdp-id:vc-id*

## Context

[\[Tree\]](#) (debug>service>id>mrp sdp)

## Full Context

```
debug service id mrp sdp
```

## Description

This command filters debug events and only shows events for the particular SDP.

The **no** form of this command removes the debug filter.

## Parameters

### *sdp-id*

Specifies the SDP ID for which to display information

**Default** All SDPs

**Values** 1 to 17407

### *vc-id*

Displays information about the virtual circuit identifier.

**Values** 1 to 4294967295

## Platforms

All

```
sdp
```

## Syntax

```
[no] sdp sdp-id:vc-id
```

## Context

**[Tree]** (debug>service>id>stp sdp)

**[Tree]** (debug>service>id sdp)

**[Tree]** (debug>service>id>dhcp sdp)

## Full Context

```
debug service id stp sdp
```

```
debug service id sdp
```

```
debug service id dhcp sdp
```

## Description

This command enables STP debugging for a specific SDP.

The **no** form of the command disables debugging.

## Parameters

### *sdp-id:vc-id*

Specifies the SDP ID and VC ID.

**Values** sdp-id: 1 to 17407  
vc-id: 1 to 4294967295

## Platforms

All

sdp

## Syntax

[no] sdp *sdp-id:vc-id*

## Context

[\[Tree\]](#) (debug>service>id>igmp-snooping sdp)

## Full Context

debug service id igmp-snooping sdp

## Description

This command shows IGMP packets for a specific SDP.

The **no** form of this command disables the debugging for the SDP.

## Parameters

### *sdp-id*

Displays only IGMP snooping entries associated with the specified mesh SDP or spoke-SDP. For a spoke-SDP, the VC ID must be specified, for a mesh SDP, the VC ID is optional.

**Values** 1 to 17407

### *vc-id*

Displays information for the specified virtual circuit ID on the SDP ID

**Values** 1 to 4294967295

## Platforms

configure service sdp

### Description

This command creates or edits a Service Distribution Point (SDP). SDPs must be explicitly configured.

An SDP is a logical mechanism that ties a far-end router to a particular service without having to specifically define far-end SAPs. Each SDP represents a method to reach another router.

One method is IP Generic Router Encapsulation (GRE), which has no state in the core of the network. GRE does not specify a specific path to the far-end router. A GRE-based SDP uses the underlying IGP routing table to find the best next hop to the far-end router.

The second method is Multi-Protocol Label Switching (MPLS) encapsulation. A router supports both signaled and non-signaled Label Switched Paths (LSPs) through the network. Non-signaled paths are defined at each hop through the network. Signaled paths are communicated by protocol from end-to-end using Resource Reservation Protocol (RSVP). Paths may be manually defined or a constraint-based routing protocol (such as OSPF-TE or CSPF) can be used to determine the best path with specific constraints. An LDP LSP can also be used for an SDP when the encapsulation is MPLS. The use of an LDP LSP type or an RSVP/Static LSP type are mutually exclusive except when the mixed-lsp option is enabled on the SDP.

Segment routing is another MPLS tunnel type and is used to allow service binding to an SR tunnel programmed in TTM by OSPF or IS-IS. The SDP of type **sr-isis** or **sr-ospf** can be used with the **far-end** option. The **tunnel-far-end** option is not supported. In addition, the **mixed-lsp-mode** option does not support the **sr-isis** and **sr-ospf** tunnel types.

L2TPv3-over-IPv6 transport is also an option for 7750 SR and 7950 XR Ethernet Pipe (Epipe) Services. Like GRE, L2TPv3 is stateless in the core of the network, as well as on the service nodes as the L2TPv3 control plane functionality is disabled for this SDP type. A unique source and destination IPv6 address combined with TX and RX Cookie values are used to ensure that the SDP is bound to the correct service.

SDPs are created and then bound to services. Many services may be bound to a single SDP. The operational and administrative state of the SDP controls the state of the SDP binding to the service.

If the *sdp-id* does not exist, a new SDP is created. When creating an SDP, either the **gre**, **mpls**, or **l2tpv3** keyword must be specified. SDPs are created in the admin down state (**shutdown**) and the **no shutdown** command must be executed once all relevant parameters are defined and before the SDP can be used.

If *sdp-id* exists, the current CLI context is changed to that SDP for editing and modification. For editing an existing SDP, neither the **gre**, **mpls**, or **l2tpv3** keyword is specified. If a keyword is specified for an existing *sdp-id*, an error is generated and the context of the CLI will not be changed to the specified *sdp-id*.

The **no** form of this command deletes the specified SDP. Before an SDP can be deleted, it must be administratively down (shutdown) and not bound to any services. If the specified SDP is bound to a service, the **no sdp** command will fail generating an error message specifying the first bound service found during the deletion process. If the specified *sdp-id* does not exist an error will be generated.

## Parameters

### *sdp-id*

Specifies the SDP identifier.

**Values** 1 to 32767

### **gre**

Specifies the SDP will use GRE to reach the far-end router. The GRE encapsulation of the MPLS service packet uses the base 4-byte header as per RFC 2890. The optional fields Checksum (plus Reserved field), Key, and Sequence Number are not inserted. Only one GRE SDP can be created to a given destination address. Multiple GRE SDPs to a single destination address serve no purpose as the path taken to reach the far end is

determined by the IGP which will be the same for all SDPs to a given destination and there is no bandwidth reservation in GRE tunnels.

#### **mpls**

Specifies the SDP will use MPLS encapsulation and one or more LSP tunnels to reach the far-end device. Multiple MPLS SDPs may be created to a given destination device. Multiple MPLS SDPs to a single destination device are helpful when they use divergent paths.

#### **l2tpv3**

Specifies the SDP will use L2TPv3-over-IPv6 encapsulation for the 7750 SR or 7950 XRS. One SDP is created per service, regardless of whether the far-end node is common or not. Unique local and far-end addresses are configured for every L2TPv3 SDP type. The local address must exist on the local node.

#### **eth-gre-bridged**

Configures the SDP as an L2oGRE tunnel that is terminated on an FPE-based PW port. Only the end-points of such a tunnel (the far-end IPv4/IPv6 address or local-end IPv4/IPv6 address) are allowed to be configured under this SDP.

### **Platforms**

All

## **23.76 sdp-exclude**

### **sdp-exclude**

#### **Syntax**

**[no] sdp-exclude** *group-name*

#### **Context**

**[Tree]** (config>service>pw-template sdp-exclude)

#### **Full Context**

configure service pw-template sdp-exclude

#### **Description**

This command configures SDP admin group constraints for a pseudowire template.

The admin group name must have been configured or the command is failed. The user can execute the command multiple times to include or exclude more than one admin group. The **sdp-include** and **sdp-exclude** commands can only be used with the **use-provisioned-sdp** or **prefer-provisioned-sdp** options. If the same group name is included and excluded within the same pseudowire template, only the exclude option will be enforced.

Any changes made to the admin group **sdp-include** and **sdp-exclude** constraints will only be reflected in existing spoke-sdps after the following command has been executed:

**tools>perform>service>eval-pw-template>allow-service-impact**

When the service is bound to the pseudowire template, the SDP selection rules will enforce the admin group constraints specified in the `sdp-include` and `sdp-exclude` commands.

In the SDP selection process, all provisioned SDPs with the correct far-end IP address, the correct tunnel-far-end IP address, and the correct service label signaling are considered. The SDP with the lowest admin metric is selected. If more than one SDP with the same lowest metric are found then the SDP with the highest `sdp-id` is selected. The type of SDP, GRE or MPLS (BGP/RSVP/LDP) is not a criterion in this selection.

The selection rule with SDP admin groups is modified such that the following admin-group constraints are applied upfront to prune SDPs that do not comply:

- if one or more **sdp-include** statement is part of the PW template, then an SDP that is a member of one or more of the included groups will be considered. With the **sdp-include** statement, there is no preference for an SDP that belongs to all included groups versus one that belongs to one or fewer of the included groups. All SDPs satisfying the admin-group constraint will be considered and the selection above based on the lowest metric and highest `sdp-id` is applied.
- if one or more **sdp-exclude** statement is part of the PW template, then an sdp that is a member of any of the excluded groups will not be considered.

SDP admin group constraints can be configured on all router services that makes use of the pseudowire template (BGP-AD VPLS service, BGP-VPLS service, and FEC129 VLL service). In the latter case, only support at a T-PE node is provided.

The **no** form of this command removes the SDP admin group constraints from the pseudowire template.

## Parameters

### *group-name*

Specifies the name of the SDP admin group. A maximum of 32 characters can be entered.

## Platforms

All

## 23.77 sdp-group

### sdp-group

## Syntax

**sdp-group**

## Context

[\[Tree\]](#) (config>service sdp-group)

## Full Context

configure service sdp-group

## Description

This command configures the SDP membership in admin groups.

The user can enter a maximum of one (1) admin group name at once. The user can execute the command multiple times to add membership to more than one admin group. The admin group name must have been configured or the command is failed. Admin groups are supported on an SDP of type GRE and of type MPLS (BGP/RSVP/LDP). They are also supported on an SDP with the mixed-lsp-mode option enabled.

The **no** form of this command removes this SDP membership to the specified admin group.

## Platforms

All

## 23.78 sdp-id-range

### sdp-id-range

## Syntax

**sdp-id-range** from *id* to *id*

**no sdp-id-range**

## Context

[\[Tree\]](#) (config>fwd-path-ext sdp-id-range)

## Full Context

configure fwd-path-ext sdp-id-range

## Description

This command reserves an SDP ID range used by the FPE based PW-Port and VXLAN termination applications.

Each configured FPE based PW-Port is associated with two internal SDPs (one in each direction) whose id(s) are allocated from the configured sdp-id-range.

When the FPE is associated to VXLAN termination, an internal SDP is allocated from the configured sdp-id-range and is used for R-VPLS services that terminate VXLAN IPv6. A spoke-sdp per VXLAN IPv6 R-VPLS service is created on that SDP for egress processing of the packets. Sdp-id-range cannot be modified if any of its IDs are currently in use.

## Default

no sdp-id-range

## Parameters

**from *id***

Specifies the start of the SDP ID range (inclusive).

**Values** 1 to 32767

**to id**

Specifies the end of the SDP ID range.

**Values** 1 to 32767

## Platforms

All

## 23.79 sdp-include

### sdp-include

#### Syntax

**[no] sdp-include** *group-name*

#### Context

[\[Tree\]](#) (config>service>pw-template sdp-include)

#### Full Context

configure service pw-template sdp-include

#### Description

This command configures SDP admin group constraints for a pseudowire template.

The admin group name must have been configured or the command is failed. The user can execute the command multiple times to include or exclude more than one admin group. The sdp-include and sdp-exclude commands can only be used with the **use-provisioned-sdp** or **prefer-provisioned-sdp** options. If the same group name is included and excluded within the same pseudowire template, only the exclude option will be enforced.

Any changes made to the admin group sdp-include and sdp-exclude constraints will only be reflected in existing spoke-sdps after the following command has been executed:

**tools>perform>service>eval-pw-template>allow-service-impact**

When the service is bound to the pseudowire template, the SDP selection rules will enforce the admin group constraints specified in the sdp-include and sdp-exclude commands.

In the SDP selection process, all provisioned SDPs with the correct far-end IP address, the correct tunnel-far-end IP address, and the correct service label signaling are considered. The SDP with the lowest admin metric is selected. If more than one SDP with the same lowest metric are found then the SDP with the highest sdp-id is selected. The type of SDP, GRE or MPLS (BGP/RSVP/LDP) is not a criterion in this selection.

The selection rule with SDP admin groups is modified such that the following admin-group constraints are applied upfront to prune SDPs that do not comply:

- if one or more **sdp-include** statement is part of the PW template, then an SDP that is a member of one or more of the included groups will be considered. With the **sdp-include** statement, there is no preference for an SDP that belongs to all included groups versus one that belongs to one or fewer of the included groups. All SDPs satisfying the admin-group constraint will be considered and the selection above based on the lowest metric and highest sdp-id is applied.
- if one or more **sdp-exclude** statement is part of the PW template, then an sdp that is a member of any of the excluded groups will not be considered.

SDP admin group constraints can be configured on all router services that make use of the pseudowire template (BGP-AD VPLS service, BGP-VPLS service, and FEC129 VLL service). In the latter case, only support at a T-PE node is provided.

The **no** form of this command removes the SDP admin group constraints from the pseudowire template.

### Parameters

#### *group-name*

Specifies the name of the SDP admin group. A maximum of 32 characters can be entered.

### Platforms

All

## 23.80 sdp-mtu

### sdp-mtu

### Syntax

**sdp-mtu** *orig-sdp-id* **size-inc** *start-octets end-octets* [**step** *step-size*] [**timeout** *timeout*] [**interval** *interval*]

### Context

[\[Tree\]](#) (oam sdp-mtu)

### Full Context

oam sdp-mtu

### Description

Performs MTU Path tests on an SDP to determine the largest path-mtu supported on an SDP. The **size-inc** parameter can be used to easily determine the **path-mtu** of a given SDP-ID. The forwarding class is assumed to be Best-Effort Out-of-Profile. The message reply is returned with IP/GRE encapsulation from the far-end router. OAM request messages sent within an IP/GRE SDP must have the 'DF' IP header bit set to 1 to prevent message fragmentation.

To terminate an **sdp-mtu** in progress, use the CLI break sequence <Ctrl-C>.

### Parameters

#### *orig-sdp-id*

Specifies the *sdp-id* to be used by **sdp-ping**, expressed as a decimal integer. The far-end address of the specified **sdp-id** is the expected *responder-id* within each reply received. The specified *sdp-id* defines the encapsulation of the SDP tunnel encapsulation used to reach the far end. This can be IP/GRE or MPLS. If *orig-sdp-id* is invalid or administratively down or unavailable, the SDP echo request message is not sent and an appropriate error message is displayed (once the **interval** timer expires, **sdp-ping** attempts to send the next request, if required).

**Values** 1 to 32767

#### **start-octets**

Specifies the beginning size in octets of the first message sent for an incremental MTU test, expressed as a decimal integer.

**Values** 40 to 9786

#### **end-octets**

Specifies the ending size in octets of the last message sent for an incremental MTU test, expressed as a decimal integer. The specified value must be greater than *start-octets*.

**Values** 40 to 9786

#### **step-size**

Specifies the number of octets to increment the message size request for each message sent for an incremental MTU test, expressed as a decimal integer. The next size message is not sent until a reply is received or three messages have timed out at the current size.

If the incremented size exceeds the *end-octets* value, no more messages are sent.

**Values** 1 to 512

**Default** 32

#### **timeout**

Specifies the *timeout* parameter in seconds, expressed as a decimal integer. This value is used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the message request. Upon the expiration of the message time out, the requesting router assumes that the message response is not received. A **request timeout** message is displayed by the CLI for each message request sent that expires. Any response received after the request times out is silently discarded.

**Values** 1 to 10

**Default** 5

#### **interval**

Specifies the *interval* parameter in seconds, expressed as a decimal integer. This parameter is used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

If the *interval* is set to 1 second, and the *timeout* value is set to 10 seconds, then the maximum time between message requests is 10 seconds and the minimum is 1 second. This depends upon the receipt of a message reply corresponding to the outstanding message request.

**Values** 1 to 10

**Default** 1

## 23.81 sdp-ping

### sdp-ping

#### Syntax

```
sdp-ping orig-sdp-id [resp-sdp resp-sdp-id] [fc fc-name [profile { in | out }]] [size octets] [count send-countf] [timeout timeoutf] [interval intervalf]
```

#### Context

[\[Tree\]](#) (oam sdp-ping)

[\[Tree\]](#) (config>saa>test>type sdp-ping)

#### Full Context

oam sdp-ping

configure saa test type sdp-ping

## Description

This command tests SDPs for uni-directional or round trip connectivity and performs SDP MTU Path tests.

The **sdp-ping** command accepts an originating SDP-ID and an optional responding SDP-ID. The size, number of requests sent, message time-out and message send interval can be specified. All **sdp-ping** requests and replies are sent with PLP OAM-Label encapsulation, as a *service-id* is not specified.

For round trip connectivity testing, the **resp-sdp** keyword must be specified. If **resp-sdp** is not specified, a uni-directional SDP test is performed.

To terminate an **sdp-ping** in progress, use the CLI break sequence <Ctrl-C>.

An **sdp-ping** response message indicates the result of the **sdp-ping** message request. When multiple response messages apply to a single SDP echo request/reply sequence, the response message with the highest precedence is displayed. [Table 100: sdp-ping Response Messages](#) shows the response messages sorted by precedence.

Table 100: sdp-ping Response Messages

Result of Request	Displayed Response Message	Precedence
Request time out without reply	Request Timeout	1
Request not sent due to non-existent <i>orig-sdp-id</i>	Orig-SDP Non-Existent	2
Request not sent due to administratively down <i>orig-sdp-id</i>	Orig-SDP Admin-Down	3
Request not sent due to operationally down <i>orig-sdp-id</i>	Orig-SDP Oper-Down	4
Request terminated by user before reply or time out	Request Terminated	5
Reply received, invalid <i>origination-id</i>	Far End: Originator-ID Invalid	6
Reply received, invalid <i>responder-id</i>	Far End: Responder-ID Error	7
Reply received, non-existent <i>resp-sdp-id</i>	Far End: Resp-SDP Non-Existent	8
Reply received, invalid <i>resp-sdp-id</i>	Far End: Resp-SDP Invalid	9
Reply received, <i>resp-sdp-id</i> down (admin or oper)	Far-end: Resp-SDP Down	10
Reply received, No Error	Success	11

## Parameters

### *orig-sdp-id*

Specifies the SDP ID to be used by **sdp-ping**, expressed as a decimal integer. The far-end address of the specified SDP-ID is the expected *responder-id* within each reply received. The specified SDP-ID defines the encapsulation of the SDP tunnel encapsulation used to

reach the far end. This can be IP/GRE or MPLS. If *orig-sdp-id* is invalid or administratively down or unavailable for some reason, the SDP Echo Request message is not sent and an appropriate error message is displayed (once the **interval** timer expires, **sdp-ping** attempts to send the next request if required).

**Values** 1 to 32767

### ***resp-sdp-id***

Specifies the return SDP-ID to be used by the far-end router for the message reply for round trip SDP connectivity testing. If *resp-sdp-id* does not exist on the far-end router, terminates on another router different than the originating router, or another issue prevents the far-end router from using *resp-sdp-id*, the SDP echo reply is sent using generic IP/GRE OAM encapsulation. The received forwarding class (as mapped on the ingress network interface for the far end) defines the forwarding class encapsulation for the reply message.

**Values** 1 to 32767

**Default** null. Use the non-SDP return path for message reply.

### ***fc-name***

Specifies the parameter to be used to indicate the forwarding class of the SDP encapsulation. The actual forwarding class encoding is controlled by the network egress DSCP or LSP-EXP mappings.

The DSCP or LSP-EXP mappings on the receive network interface controls the mapping back to the internal forwarding class used by the far-end router that receives the message request. The egress mappings of the egress network interface on the far-end router controls the forwarding class markings on the return reply message.

The DSCP or LSP-EXP mappings on the receive network interface controls the mapping of the message reply at the originating router. This is displayed in the response message output upon receipt of the message reply.

**Values** be, l2, af, l1, h2, ef, h1, nc

**Default** be

### **profile {in | out}**

Specifies the profile state of the SDP encapsulation.

**Default** out

### ***octets***

Specifies the **size** parameter in octets. This parameter is used to override the default message size for the **sdp-ping** request. Changing the message size is a method of checking the ability of an SDP to support a **path-mtu**. The size of the message does not include the SDP encapsulation, VC-Label (if applied) or any DLC headers or trailers.

When the OAM message request is encapsulated in an IP/GRE SDP, the IP 'DF' (Do Not Fragment) bit is set. If any segment of the path between the sender and receiver cannot handle the message size, the message is discarded. MPLS LSPs are not expected to fragment the message either, as the message contained in the LSP is not an IP packet.

**Values** 72 to 9786

**Default** 72

### ***send-count***

Specifies the number of messages to send. The **count** parameter is used to override the default number of message requests sent. Each message request must either time out or receive a reply before the next message request is sent. The message **interval** value must have expired before the next message request is sent.

**Values** 1 to 100

**Default** 1

### ***timeout***

Specifies the time, in seconds, used to override the default *timeout* value and is the amount of time that the router waits for a message reply after sending the last probe for a specific test. Upon the expiration of time out, the test is marked complete and no more packets is processed for any of those request probes.

**Values** 1 to 10

**Default** 5

### ***interval***

Specifies the time, in seconds, used to override the default request message send interval and defines the minimum amount of time that must expire before the next message request is sent.

**Values** 1 to 10

**Default** 1

___  Profile               In        In

```

**Multiple Response Connectivity Tests** — When the connectivity test count is greater than one (1), a single line is displayed per SDP echo request send attempt.

The request number is a sequential number starting with 1 and ending with the last request sent, incrementing by one (1) for each request. This should not be confused with the *message-id* contained in each request and reply message.

A response message indicates the result of the message request. Following the response message is the round trip time value. If any reply is received, the round trip time is displayed.

After the last reply has been received or response timed out, a total is displayed for all messages sent and all replies received. A maximum, minimum and average round trip time is also displayed. Error response and timed out requests do not apply towards the average round trip time.

## 23.82 seamless-bfd

### seamless-bfd

#### Syntax

```
seamless-bfd
```

#### Context

[\[Tree\]](#) (config>bfd seamless-bfd)

#### Full Context

```
configure bfd seamless-bfd
```

#### Description

This command specifies the context for the configuration of a seamless BFD reflector.

## Platforms

All

## seamless-bfd

## Syntax

**seamless-bfd**

## Context

[\[Tree\]](#) (config>router>bfd seamless-bfd)

## Full Context

configure router bfd seamless-bfd

## Description

This command specifies the context for the configuration of seamless BFD initiator parameters that are global to this router.

The **no** form of this command removes the context.

## Platforms

All

## 23.83 search

## search

## Syntax

**search** *base-dn*

**no search**

## Context

[\[Tree\]](#) (config>system>security>ldap>server search)

## Full Context

configure system security ldap server search

## Description

This command configures the LDAP **search** command. The search *base-dn* tells the server which part of the external directory tree to search. The search DN uses the same LDAP attribute as *root-dn*. For

example, to search a public-key for an SSH generated for a Nokia vendor, one might use "dc=public-key,dc=nokia,dc=com".

The **no** version of this command removes the search DN; as such, no search is possible on the LDAP server.

### Parameters

#### *base-dn*

Specifies the base domain name used in the search, up to 512 characters.

## Syntax

**secondary** *ip-address[/mask]* [*netmask* ] [**broadcast** {**all-ones** | **host-ones**}] [**igp-inhibit**] [**track-srrp** *srrp-instance*]

**no secondary** *ip-address[/mask]*

## Context

[\[Tree\]](#) (config>service>ies>if secondary)

## Full Context

configure service ies interface secondary

## Description

This command assigns a secondary IP address or IP subnet/broadcast address format to the interface.

The **no** form of this command reverts to the default.

## Parameters

### *ip-address*

The IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that is used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

### *mask*

The subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the *ip-address* from a traditional dotted decimal mask. The *mask* parameter indicates the complete mask that is used in a logical and function to derive the local subnet of the IP address. Allowed values are dotted decimal addresses in the range 128.0.0.0 – 255.255.255.254.

### **Note:**

A mask of 255.255.255.255 is reserved for system IP addresses.

### *netmask*

Specifies a string of 0s and 1s that mask or screen out the network part of an IP address so that only the host computer part of the address remains.

### **broadcast**

Overrides the default broadcast address used by the IP interface when sourcing IP broadcasts on the IP interface. If no broadcast format is specified for the IP address, the default value is **host-ones** which indicates a subnet broadcast address. Use this parameter to change the broadcast address to **all-ones** or revert back to a broadcast address of **host-ones**.

The broadcast format on an IP interface can be specified when the IP address is assigned or changed.

This parameter does not affect the type of broadcasts that can be received by the IP interface. A host sending either the local broadcast (**all-ones**) or the valid subnet broadcast address (**host-ones**) is received by the IP interface. (Default: host-ones)

### **all-ones**

Specifies the broadcast address used by the IP interface for this IP address is 255.255.255.255, also known as the local broadcast.

### **host-ones**

Specifies that the broadcast address used by the IP interface for this IP address is the subnet broadcast address. This is an IP address that corresponds to the local subnet described by the *ip-address* and the *mask-length* or *mask* with all the host bits set to binary one. This is the default broadcast address used by an IP interface. The **broadcast** parameter within the **address** command does not have a negate feature, which is usually used to revert a parameter to the default value. To change the **broadcast** type to **host-ones** after being changed to **all-ones**, the **address** command must be executed with the **broadcast** parameter defined.

### **igp-inhibit**

Signals that the given secondary IP interface should not be recognized as a local interface by the running IGP. For OSPF and IS-IS, this means that the specified secondary IP interfaces are not injected and used as passive interfaces and are not advertised as internal IP interfaces into the IGP's link state database. For RIP, this means that these secondary IP interfaces do not source RIP updates.

### **track-srrp *srrp-instance***

Specifies the SRRP instance ID that this interface route needs to track.

**Values** 1 to 4294967295

## **Platforms**

All

## **secondary**

## **Syntax**

**secondary** *ip-address*[/*mask*] [*netmask*] [**broadcast** {**all-ones** | **host-ones**}] [**igp-inhibit**] [**track-srrp** *srrp-instance*]

**no secondary** *ip-address[/mask]*

## Context

[Tree] (config>service>vprn>nw-if secondary)

[Tree] (config>service>vprn>if secondary)

## Full Context

configure service vprn network-interface secondary

configure service vprn interface secondary

## Description

This command assigns a secondary IP address to the interface. Up to 16 total primary and secondary IPv4 and IPv6 addresses can be assigned to network interfaces, and up to 256 to access interfaces. Each address can be configured in an IP address, IP subnet or broadcast address format.

### Caution:

Configurations must not exceed 16 secondary IP addresses when IPsec, GRE, L2TPv3, or IP in IP protocols are active on an access interface.

## Parameters

### *ip-address*

The IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

### *mask*

The subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the *ip-address* from a traditional dotted decimal mask. The *mask* parameter indicates the complete mask that will be used in a logical 'AND' function to derive the local subnet of the IP address. Allowed values are dotted decimal addresses in the range 128.0.0.0 – 255.255.255.254. A mask of 255.255.255.255 is reserved for system IP addresses.

### *netmask*

Specifies a string of 0s and 1s that mask or screen out the network part of an IP address so that only the host computer part of the address remains.

### **broadcast**

The optional **broadcast** parameter overrides the default broadcast address used by the IP interface when sourcing IP broadcasts on the IP interface. If no broadcast format is specified for the IP address, the default value is **host-ones** which indicates a subnet broadcast address. Use this parameter to change the broadcast address to **all-ones** or revert back to a broadcast address of **host-ones**.

The broadcast format on an IP interface can be specified when the IP address is assigned or changed. This parameter does not affect the type of broadcasts that can be received by the IP interface. A host sending either the local broadcast (**all-ones**) or the valid subnet broadcast address (**host-ones**) will be received by the IP interface. (Default: *host-ones*)

### all-ones

The **all-ones** keyword following the **broadcast** parameter specifies the broadcast address used by the IP interface for this IP address will be 255.255.255.255, also known as the local broadcast.

### host-ones

The **host-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be the subnet broadcast address. This is an IP address that corresponds to the local subnet described by the *ip-address* and the *mask-length* or *mask* with all the host bits set to binary one. This is the default used by an IP interface.

The **broadcast** parameter within the **address** command does not have a negate feature, which is usually used to revert a parameter to the default value. To change the **broadcast** type to **host-ones** after being changed to **all-ones**, the **address** command must be executed with the **broadcast** parameter defined.

### igp-inhibit

The optional **igp-inhibit** parameter signals that the given secondary IP interface should not be recognized as a local interface by the running IGP. For OSPF and IS-IS, this means that the specified secondary IP interfaces will not be injected and used as passive interfaces and will not be advertised as internal IP interfaces into the IGP's link state database. For RIP, this means that these secondary IP interfaces will not source RIP updates.

### track-srrp *srrp-instance*

Specifies the SRRP instance ID that this interface route needs to track.

## Platforms

All

## secondary

## Syntax

[no] **secondary** *path-name*

## Context

**[Tree]** (config>router>mpls>lsp secondary)

## Full Context

configure router mpls lsp secondary

## Description

This command specifies an alternative path that the LSP uses if the primary path is not available. This command is optional and is not required if the **config router mpls lsp *lsp-name* primary *path-name*** command is specified. After the switch over from the primary to the secondary, the system continuously tries to revert to the primary path. The switch back to the primary path is based on the **retry-timer** interval.

For RSVP-TE LSPs, up to eight secondary paths can be specified (or seven if a primary is configured). For SR-TE LSPs, up to three paths of any type (with a maximum of one primary) can be configured. By default,

a secondary path is non-standby unless the **standby** keyword is configured. All non-standby secondary paths are considered equal and the first available path is used.

The system does not switch among secondary paths. The system starts the signaling (RSVP-TE) or programming (SR-TE) of all non-standby secondary paths at the same time. Retry counters are maintained for each unsuccessful attempt. After the retry limit is reached on a path, the system does not attempt to signal the path and administratively shuts down the path. The first successfully established non-standby secondary path is made the active path for the LSP.

The **no** form of this command removes the association between this *path-name* and *lsp-name*. All specific configurations for this association are deleted. The secondary path must be shut down prior to deleting it. The **no secondary path-name** command does not result in any action except a warning message on the console indicating that the secondary path is administratively up.

## Parameters

### *path-name*

Specifies the case-sensitive alphanumeric name label for the LSP path, up to 64 characters.

## Platforms

All

## secondary

## Syntax

**secondary** {*ip-address/mask* | *ip-address netmask*} [**broadcast** {**all-ones** | **host-ones**}] [**igp-inhibit**] [**track-srrp** *srrp-instance*]

**no secondary** {*ip-address/mask* | *ip-address netmask*}

## Context

[\[Tree\]](#) (config>router>if secondary)

## Full Context

configure router interface secondary

## Description

This command assigns additional IP addresses to the interface. Up to 16 total primary and secondary IPv4 and IPv6 addresses can be assigned to network interfaces, and up to 256 to access interfaces. Each address can be configured in an IP address, IP subnet, or broadcast address format.

### Caution:

Configurations must not exceed 16 secondary IP addresses when IPsec, GRE, L2TPv3, or IP in IP protocols are active on an access interface.

## Parameters

### *ip-address*

Specifies the IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that will be used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation.

**Values** 1.0.0.0 to 223.255.255.255

*/*

The forward slash is a parameter delimiter that separates the *ip-address* portion of the IP address from the mask that defines the scope of the local subnet. No spaces are allowed between the *ip-addr*, the */* and the *mask-length* parameter. If a forward slash does not immediately follow the *ip-addr*, a dotted decimal mask must follow the prefix.

**mask**

Specifies the subnet mask length when the IP prefix is specified in CIDR notation. When the IP prefix is specified in CIDR notation, a forward slash (*/*) separates the *ip-address* from the *mask* parameter. The *mask* parameter indicates the number of bits used for the network portion of the IP address; the remainder of the IP address is used to determine the host portion of the IP address. Allowed values are integers in the range 1 to 32. A mask length of 32 is reserved for system IP addresses.

**Values** 1 to 32

**netmask**

Specifies the subnet mask in dotted decimal notation. When the IP prefix is not specified in CIDR notation, a space separates the *ip-address* from a traditional dotted decimal mask. The *mask* parameter indicates the complete mask that will be used in a logical 'AND' function to derive the local subnet of the IP address. A mask of 255.255.255.255 is reserved for system IP addresses.

**Values** 128.0.0.0 to 255.255.255.255

**broadcast**

The optional **broadcast** parameter overrides the default broadcast address used by the IP interface when sourcing IP broadcasts on the IP interface. If no broadcast format is specified for the IP address, the default value is **host-ones**, which indicates a subnet broadcast address. Use this parameter to change the broadcast address to **all-ones** or revert back to a broadcast address of **host-ones**.

The **broadcast** parameter within the **address** command does not have a negate feature, which is usually used to revert a parameter to the default value. To change the **broadcast** type to **host-ones** after being changed to **all-ones**, the **address** command must be executed with the **broadcast** parameter defined.

The broadcast format on an IP interface can be specified when the IP address is assigned or changed.

This parameter does not affect the type of broadcasts that can be received by the IP interface. A host sending either the local broadcast (**all-ones**) or the valid subnet broadcast address (**host-ones**) will be received by the IP interface.

**all-ones**

The **all-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be 255.255.255.255, also known as the local broadcast.

#### **host-ones**

The **host-ones** keyword following the **broadcast** parameter specifies that the broadcast address used by the IP interface for this IP address will be the subnet broadcast address. This is an IP address that corresponds to the local subnet described by the *ip-address* and the *mask* with all the host bits set to binary 1. This is the default broadcast address used by an IP interface.

#### **igp-inhibit**

The secondary IP address should not be recognized as a local interface by the running IGP.

#### **srrp-instance**

Specifies the SRRP instance ID that this interface route needs to track.

## 23.87 secondary-fast-retry-timer

### secondary-fast-retry-timer

#### Syntax

**secondary-fast-retry-timer** *seconds*

**no secondary-fast-retry-timer**

#### Context

**[Tree]** (config>router>mpls secondary-fast-retry-timer)

#### Full Context

configure router mpls secondary-fast-retry-timer

#### Description

This command specifies the value used as the fast retry timer for a secondary path. If the first attempt to set up a secondary path fails due to a path error, the fast retry timer will be started for the secondary path so that the path can be retried sooner. If the next attempt also fails, further retries for the path will use the configured value for LSP retry timer.

If retry-timer for the LSP is configured to be less than the MPLS secondary-fast-retry-timer, all retries for the secondary path will use the LSP retry-timer.

The **no** form of this command reverts to the default.

#### Default

no secondary-fast-retry-timer

#### Parameters

***seconds***

Specifies the value (in seconds), used as the fast retry timer for a secondary path

**Values** 1 to 10

#### Platforms

## 23.88 secondary-image

## secondary-image

### Syntax

**secondary-image** *file-url*

**no secondary-image**

### Context

[\[Tree\]](#) (bof secondary-image)

### Full Context

bof secondary-image

### Description

This command specifies the secondary directory location for runtime image file loading.

The system attempts to load all runtime image files configured in the **primary-image** first. If this fails, the system attempts to load the runtime images from the location configured in the **secondary-image**. If the secondary image load fails, the tertiary image specified in **tertiary-image** is used.

All runtime image files (\*.tim files) must be located in the same directory.

The **no** form of this command removes the **secondary-image** configuration.

### Parameters

#### *file-url*

Specifies the file URL; can be either local (this CPM) or a remote FTP server.

#### Values

<i>file-url</i>	{ <i>local-url</i>   <i>remote-url</i> } (up to 180 characters)
<i>local-url</i>	[ <i>cflash-id</i> ]/[ <i>file-path</i> ]
<i>remote-url</i>	[{ftp://  tftp://} <i>login:pswd@remote-locn</i> ]/[ <i>file-path</i> ]

## Syntax

**secondary-url** *url*

**no secondary-url**

## Context

[\[Tree\]](#) (config>python>py-script secondary-url)

## Full Context

configure python python-script secondary-url

## Description

This command specifies the location of secondary Python script. The system supports three locations for each Python-script. Users can store scripts file on either a local CF card or a FTP server.

The **no** form of this command removes the URL.

## Parameters

**url**

Specifies the secondary URL of the Python script, up to 180 characters, either a local CF card URL or a FTP server URL.

## Platforms

All

## 23.98 secret

```
secret
```

### Syntax

```
secret secret [hash | hash2 | custom]
```

```
no secret
```

### Context

```
[Tree] (config>service>vprn>wpp>portals>portal secret)
```

```
[Tree] (config>router>wpp>portals>portal secret)
```

### Full Context

```
configure service vprn wpp portals portal secret
```

```
configure router wpp portals portal secret
```

### Description

This command configures the secret that is used by WPPv2 to authenticate the messages between portal and BRAS.

The **no** form of this command removes the secret and hash from the configuration.

### Parameters

#### **secret**

Specifies the secret key to access the server, up to 64 characters.

#### **hash**

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

#### **hash2**

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

#### **custom**

Specifies the custom encryption to management interface.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## secret

### Syntax

**no secret**

### Context

**[Tree]** (config>service>vprn>radius-proxy>server secret)

**[Tree]** (config>router>radius-proxy>server secret)

### Full Context

configure service vprn radius-proxy server secret

configure router radius-proxy server secret

### Description

This command configures the shared secret key. The RADIUS client must have the same key to communicate with the RADIUS-proxy server.

The **no** form of this command removes the parameters from the configuration.

### Parameters

#### secret key

Specifies the secret key up to 64 characters to access the RADIUS server. This secret key must match the password on the RADIUS server.

**Values** hash-key: Up to 33 characters  
hash2-key: Up to 55 characters.

#### hash

Specifies that the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

#### hash2

Specifies that the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

#### custom

Specifies the custom encryption to management interface.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## secret

### Syntax

**secret** *secret-key* | *hash-key* [**hash** | **hash2** | **custom**]

**no secret**

### Context

**[Tree]** (config>aaa>isa-radius-plcy>servers>server secret)

### Full Context

configure aaa isa-radius-policy servers server secret

### Description

This command configures the secret key to access the RADIUS server. This secret key must match the password on the RADIUS server.

### Default

no secret

### Parameters

#### hash

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

#### hash2

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

#### custom

Specifies the custom encryption to management interface.

## 23.99 section-trace

## section-trace

### Syntax

**section-trace** {**increment-z0** | **byte** *value* | **string** *string*}

### Context

[\[Tree\]](#) (config>port>sonet-sdh section-trace)

### Full Context

configure port sonet-sdh section-trace

### Description

This command configures the section trace bytes in the SONET section header to inter-operate with some older versions of ADMs or regenerators that require an incrementing STM ID. You can explicitly configure an incrementing STM value rather than a static one in the SDH overhead by specifying the z0-increment.

This command is supported on TDM satellite.

### Default

section-trace byte *0x1*

### Parameters

#### **increment-z0**

Configures an incrementing STM ID instead of a static value.

#### **value**

Sets values in SONET header bytes.

**Default** 0x1

**Values** 0 to 255 or 0x00 to 0xFF

#### **string**

Specifies a text string that identifies the section. The string can be a maximum of 16 characters.

configure service vprn interface sap ipsec-tunnel manual-keying security-association

configure service ies interface ipsec ipsec-tunnel manual-keying security-association

configure service vprn interface ipsec ipsec-tunnel manual-keying security-association

## Description

This command configures the information required for manual keying SA creation.

The **no** form of this command removes the **security-association** parameters from the configuration.

## Parameters

### **security-entry-id**

Specifies the ID of an SA entry.

**Values** 1 to 16

### **authentication-key hex-string**

Specifies an authentication key.

**Values** none or 0x0 to 0xFFFFFFFF...(max 128 hex nibbles)

#### **encryption-key *hex-string***

Specifies the key used for the encryption algorithm.

**Values** none or 0x0 to 0xFFFFFFFF...(max 64 hex nibbles)

#### **spi *spi***

Specifies the Security Parameter Index (SPI) used to look up the instruction to verify and decrypt the incoming IPsec packets when the direction is inbound. When the direction is outbound, the SPI that will be used in the encoding of the outgoing packets. The remote node can use this SPI to lookup the instruction to verify and decrypt the packet.

**Values** 256 to 16383

#### **transform *transform-id***

Specifies the transform entry that will be used by this SA entry. This object should be specified for all the entries created which are manual SAs. If the value is dynamic, then this value is irrelevant and will be zero.

**Values** 1 to 2048

#### **direction**

Specifies the direction of an IPsec tunnel.

## **security-association**

### **Syntax**

**security-association spi *spi* authentication-key *authentication-key* encryption-key *encryption-key* [crypto]**

**no security-association spi *spi***

### **Context**

[\[Tree\]](#) (config>grp-encryp>encryp-keygrp security-association)

### **Full Context**

configure group-encryption encryption-keygroup security-association

## Description

This command is used to create a security association for a specific SPI value in a key group. The command is also used to enter the authentication and encryption key values for the security association, or to delete a security association.

The SPI value used for the security association is a node-wide unique value, meaning that no two security associations in any key group on the node may share the same SPI value.

Keys are entered in cleartext. After configuration, they are never displayed in their original, cleartext form. Keys are displayed in an encrypted form, which is indicated by the system-appended **crypto** keyword when an **info** or an **admin>save** command is run. For security reasons, keys encrypted on one node are not usable on other nodes (that is, keys are not exchangeable between nodes).

The **no** form of the command removes the security association and related key values from the list of security associations for the key group. If the **no** form of the command is attempted using the same SPI value that is configured for **active-outbound-sa**, then a warning is issued and the command is blocked. If the **no** form of the command is attempted on the last SPI in the key group and the key group is configured on a service, then the command is blocked.

## Parameters

### *spi*

Specifies the SPI ID of the SPI being referenced for the security association.

**Values** 1 to 127

### *authentication-key*

Specifies the authentication key for the SPI, in hexadecimal format. The number of characters in the hexadecimal string must be 64 or 128, depending on whether the authentication algorithm is set to sha256 or sha512, respectively.

### *encryption-key*

Specifies the encryption key for the SPI, in hexadecimal format. The number of characters in the hexadecimal string must be 32 or 64, depending on whether the encryption algorithm is set to aes128 or aes256, respectively.

### *crypto*

Displays the keys showing on the CLI **info** display in an encrypted form.

**security-policy** *security-policy-id* [**create**]

**no security-policy** *security-policy-id*

**Context**

[\[Tree\]](#) (config>service>vpn>ipsec security-policy)

[\[Tree\]](#) (config>router>ipsec security-policy)

**Full Context**

configure service vpn ipsec security-policy

configure router ipsec security-policy

**Description**

This command configures a security policy to use for an IPsec tunnel.

The **no** form of this command removes the security policy ID from the configuration.

**Parameters**

***security-policy-id***

specifies a value to be assigned to a security policy.

**Values** 1 to 32768

### create

Keyword used to create the security policy instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vprn ipsec security-policy

VSR

- configure router ipsec security-policy

## security-policy

## Syntax

**security-policy** *security-policy-id* [**strict-match**]

**no security-policy**

## Context

**[Tree]** (config>service>ies>if>ipsec>ipsec-tunnel security-policy)

**[Tree]** (config>service>vprn>if>ipsec>ipsec-tunnel security-policy)

**[Tree]** (config>service>vprn>if>sap>ipsec-tunnel security-policy)

**[Tree]** (config>router>if>ipsec>ipsec-tunnel security-policy)

## Full Context

configure service ies interface ipsec ipsec-tunnel security-policy

configure service vprn interface ipsec ipsec-tunnel security-policy

configure service vprn interface sap ipsec-tunnel security-policy

configure router interface ipsec ipsec-tunnel security-policy

## Description

This command configures an IPsec security policy. The policy may then be associated with static IPsec tunnels defined in the same routing instance.

With **strict-match** parameter enabled, when a CREATE\_CHILD exchange request is received for a static IPsec tunnel, and this request is not a re-key request, then ISA matches the received TSi and TSr with the configured security policy. This can be a match only when a received TS (in TSi or TSr) address range matches exactly with the subnet in a security policy entry.

If there is no match, then the setup fails, and TS\_UNACCEPTABLE is sent.

If there is a match, but there is an existing CHILD\_SA for the matched security policy, then the setup fails, and NO\_PROPOSAL\_CHOSEN.

If there is a match, and there is not CHILD\_SA for the matched entry, then the subnet is sent in the matched security-policy entry as TSi and TSr, and the CHILD\_SA is created.

### Default

no security-policy

### Parameters

#### ***security-policy-id***

Specifies the IPsec security policy entry that the tunnel will use.

**Values** 1 to 32768

#### **strict-match**

Enables strict match of security-policy entry.

### Platforms

VSR

- configure service vpn interface ipsec ipsec-tunnel security-policy
- configure service ies interface ipsec ipsec-tunnel security-policy
- configure router interface ipsec ipsec-tunnel security-policy

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

- configure service vpn interface sap ipsec-tunnel security-policy

## 23.108 seen-ip-radius-acct-policy

**segment-routing**

**no segment-routing**

## Context

**[Tree]** (config>router>isis segment-routing)

## Full Context

configure router isis segment-routing

## Description

Commands in this context configure segment routing parameters within a given IGP instance.

Segment routing adds to IS-IS and OSPF routing protocols the ability to perform shortest path routing and source routing using the concept of abstract segment. A segment can represent a local prefix of a node, a specific adjacency of the node (interface or next-hop), a service context, or a specific explicit path over the network. For each segment, the IGP advertises an identifier referred to as Segment ID (SID).

When segment routing is used together with MPLS data plane, the SID is a standard MPLS label. A router forwarding a packet using segment routing will thus push one or more MPLS labels.

Segment routing using MPLS labels can be used in both shortest path routing applications and in traffic engineering applications. This feature implements the shortest path forwarding application.

After segment routing is successfully enabled in the IS-IS or OSPF instance, the router will perform the following operations:

1. Advertise the Segment Routing Capability Sub-TLV to routers in all areas/levels of this IGP instance. However, only neighbors with which it established an adjacency interprets the SID or label range information and use it for calculating the label to swap to or push for a given resolved prefix SID.
2. Advertise the assigned index for each configured node SID in the new prefix SID sub-TLV with the N-flag (node-SID flag) set. Then the segment routing module programs the incoming label map (ILM) with a pop operation for each local node SID in the data path.
3. Assign and advertise automatically an adjacency SID label for each formed adjacency over a network IP interface in the new adjacency SID sub-TLV. The segment routing module programs the incoming label map (ILM) with a pop operation, in effect with a swap to an implicit null label operation, for each advertised adjacency SID.
4. Resolve received prefixes and if a prefix SID sub-TLV exists, the Segment Routing module programs the ILM with a swap operation and also an LTN with a push operation both pointing to the primary/LFA NHLFE. An SR tunnel is also added to the TTM.

When the user enables segment routing in a given IGP instance, the main SPF and LFA SPF are computed normally and the primary next-hop and LFA backup next-hop for a received prefix are added to RTM without the label information advertised in the prefix SID sub-TLV.

[\[Tree\]](#) (config>router>ospf3 segment-routing)

## Full Context

configure router ospf segment-routing

configure router ospf3 segment-routing

## Description

Commands in this context configure segment routing parameters within an IGP instance.

Segment routing adds to IS-IS, OSPF, or OSPF3 routing protocols the ability to perform shortest path routing and source routing using the concept of abstract segment. A segment can represent a local prefix of a node, a specific adjacency of the node (interface or next hop), a service context, or a specific explicit path over the network. For each segment, the IGP advertises an identifier referred to as a segment ID (SID).

When segment routing is used together with the MPLS data plane, the SID is a standard MPLS label. A router forwarding a packet using segment routing will thus push one or more MPLS labels.

Segment routing using MPLS labels can be used in both shortest path routing applications and traffic engineering applications. This feature implements the shortest path forwarding application.

After segment routing is successfully enabled in the IS-IS, OSPF, or OSPF3 instance, the router will perform the following operations:

- Advertise the Segment Routing Capability sub-TLV to routers in all areas or levels of the IGP instance. However, only neighbors with which the IGP instance established an adjacency will interpret the SID and label range information and use it for calculating the label to swap to or push for a particular resolved prefix SID.
- Advertise the assigned index for each configured node SID in the new prefix SID sub-TLV with the N-flag (node SID flag) set. The segment routing module then programs the incoming label map (ILM) with a pop operation for each local node SID in the data path.
- Automatically assign and advertise an adjacency SID label for each formed adjacency over a network IP interface in the new adjacency SID sub-TLV. The segment routing module programs the incoming label map (ILM) with a pop operation, in effect with a swap to an implicit null label operation, for each advertised adjacency SID.
- Resolve received prefixes, and if a prefix SID sub-TLV exists, the segment routing module programs the ILM with a swap operation and programs an LSP ID to NHLFE (LTN) with a push operation, both pointing to the primary/LFA NHLFE. An SR tunnel is also added to the TTM.

When the user enables segment routing in an IGP instance, the main SPF and LFA SPF are computed normally and the primary next hop and LFA backup next hop for a received prefix are added to the RTM without the label information advertised in the prefix SID sub-TLV.

configure router segment-routing segment-routing-v6

### Description

Commands in this context configure global SRv6 parameters.

The **no** form of this command deletes the context.

### Default

no segment-routing-v6

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## segment-routing-v6

### Syntax

[no] segment-routing-v6

### Context

[\[Tree\]](#) (config>router>isis segment-routing-v6)

### Full Context

configure router isis segment-routing-v6

### Description

Commands in this context configure SRv6 parameters specific to this IS-IS instance.

#### Note:

This context has its own **shutdown** command. The **config>router>segment-routing>shutdown** command only applies to SR-MPLS and does not impact this context.

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## segment-routing-v6

### Syntax

**[no] segment-routing-v6**

### Context

**[Tree]** (config>router>bgp segment-routing-v6)

**[Tree]** (config>service>vprn>bgp-ipvpn segment-routing-v6)

### Full Context

configure router bgp segment-routing-v6

configure service vprn bgp-ipvpn segment-routing-v6

### Description

Commands in this context configure SRv6 parameters specific to this BGP or BGP-IPVPN instance.

The **no** form of this command deletes the context.

### Default

no segment-routing-v6

### Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## segment-routing-v6

### Syntax

**[no] segment-routing-v6**

### Context

**[Tree]** (config>router>bgp>group>neighbor segment-routing-v6)

**[Tree]** (config>router>bgp>group segment-routing-v6)

### Full Context

configure router bgp group neighbor segment-routing-v6

configure router bgp group segment-routing-v6

### Description

Commands in this context configure SRv6 parameters.

The **no** form of this command deletes the context.

**Note:**

When configuring this command at the neighbor level, by default, the neighbor inherits route advertisement options from its BGP peer group. However, after this command is configured, there is no inheritance of any route advertisement options from the group level.

**Default**

no segment-routing-v6

**Platforms**

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

## segment-routing-v6

**Syntax**

**segment-routing-v6** *instance* [**create**]

**no segment-routing-v6** *instance*

**Context**

[\[Tree\]](#) (config>service>vprn segment-routing-v6)

[\[Tree\]](#) (config>service>vpls segment-routing-v6)

configure service epipe bgp-evpn segment-routing-v6

configure service vpls bgp-evpn segment-routing-v6

## Description

Commands in this context configure the SRv6 instance that is used in the service.

The **no** form of this command removes the configured SRv6 instance.

## Parameters

### *bgp-instance*

Specifies the SRv6 instance that is configured in the service and associated to an EVPN control plane.

**Values** 1, 2 (for Epipe)  
1 (for VPLS)

### *srv6-instance*

Specifies the SRv6 instance ID that exists in the service and is associated to a BGP EVPN control plane.

**Values** 1

### *default-locator*

Keyword that refers to a regular or micro-segment locator that exists in the service SRv6 instance and is used as the default locator for the service.

### *name*

Specifies a locator that exists in the service SRv6 instance and is used as the default locator for the service, up to 64 characters.

### *create*

Keyword used to create the SRv6 instance. The **create** keyword requirement can be enabled or disabled in the **environment>create** context.

## Platforms

## 23.113 sel-mcast-advertisement

```
sel-mcast-advertisement
```

### Syntax

```
[no] sel-mcast-advertisement
```

### Context

```
[Tree] (config>service>vpls>bgp-evpn sel-mcast-advertisement)
```

### Full Context

```
configure service vpls bgp-evpn sel-mcast-advertisement
```

## Description

This command enables the advertisement of BGP EVPN Selective Multicast Ethernet Tag (SMET) routes. The **no** form of this command disables the advertisement of BGP EVPN SMET routes.

## Default

no sel-mcast-advertisement

## Platforms

All

## 23.114 selection-criteria

### selection-criteria

## Syntax

**selection-criteria** [**best-port** | **highest-count** | **highest-weight**] [**slave-to-partner**] [**subgroup-hold-time** *hold-time*]

**no selection-criteria**

## Context

[\[Tree\]](#) (config>lag selection-criteria)

## Full Context

configure lag selection-criteria

## Description

This command specifies which selection criteria should be used to select the active sub-group. If there is a tie for highest-count or highest-weight, the LAG will prefer the port with the lowest priority. If that does not break the tie, the currently active subgroup will stay active (that is, non-revertive behavior).

The **no** form of this command reverts to the default value.

## Default

selection-criteria highest-count

## Parameters

### highest-count

Selects a sub-group with the highest number of eligible members as an active sub-group (not applicable to "power-off" mode of operations).

### highest-weight

Selects a sub-group with the highest aggregate weight as an active subgroup (not applicable to "power-off" mode of operations). Aggregate weight is calculated as the sum of (65535 - port priority) all ports within a sub-group.

#### **best-port**

Selects a sub-group containing the port with highest priority port as an active subgroup. In case of equal port priorities, the sub-group containing the port with the lowest port-id is chosen.

#### **slave-to-partner**

The **slave-to-partner** keyword specifies that it, together with the selection criteria, should be used to select the active sub-group. An eligible member is a LAG-member link which can potentially become active. This means it is operationally up (not disabled) for use by the remote side. The **slave-to-partner** keyword can be used to control whether or not this latter condition is taken into account.

#### **hold-time**

Applicable with LACP enabled. Specifies the optional delay timer for switching to a newly selected active sub-group from the existing active sub-group. The timer delay applies only if the existing sub-group remains operationally up.

#### **Values**

not specified	Equivalent to specifying a value of 0. Specifies no delay and to switchover immediately to a new candidate active sub-group.
0 to 2000	Integer specifying the timer value in 10ths of a second.
infinite	Do not switchover from existing active sub-group if the subgroup remains UP. Manual switchover possible using tools perform lag force command.

## 23.116 selective-label-ip

**selective-label-ip****Syntax**

**selective-label-ip** {no-install | route-table-install-only}  
**no selective-label-ip**

**Context**

[\[Tree\]](#) (config>router>bgp selective-label-ip)

**Full Context**

configure router bgp selective-label-ip

## Description

This command configures **selective-label-ip** for the BGP level.

The **no-install** option conserves labeled route table space on BGP-LU **next-hop-self** route reflectors. This option causes BGP-LU routes to be reflected downstream via the ABR with the **next-hop-self** update. BGP-LU routes are not installed to local MPLS tables or routing tables for use by local services.

The **route-table-install-only** option conserves labeled route table space on BGP-LU **next-hop-self** route reflectors and allows these routes to be used for IP transport, unlike the **no-install** option. When the **route-table-install-only** option is used, learned BGP-LU routes are also reflected downstream via the ABR with the **next-hop-self** update. BGP-LU routes are not installed to local MPLS tables for use by local services. These routes are installed to the RTM and used for the best route selection process.

**Note:** If local services need to use BGP-LU routes, the **no-install** and **route-table-install-only** options should not be used.

The default **no** form of this command installs BGP-LU routes to the datapath for local services and makes them available to the RTM for IP next-hop selection.

## Default

no selective-label-ip

## Parameters

### no-install

Specifies that BGP-LU routes are not installed to local MPLS tables or routing tables.

### route-table-install-only

Specifies the installation of BGP-LU routes to the RTM. BGP-LU routes are not installed to local MPLS tables for use by local services.

## Platforms

All

## 23.117 selective-label-ip-prioritization

selective-label-ip-prioritization

## Syntax

[no] selective-label-ip-prioritization

## Context

**[Tree]** (config>router>bgp selective-label-ip-prioritization)

## Full Context

configure router bgp selective-label-ip-prioritization

## Description

This command enables selective-label IP prioritization for BGP labeled IPv4 and IPv6 routes.

When this command is configured, every received labeled IPv4 and IPv6 route that is potentially usable by a local service is automatically prioritized for fast control plane reconvergence. When the reachability of a BGP next-hop changes, these labeled IPv4 and IPv6 routes are updated into the route table first, along with other routes manually tagged as high priority by import policies.

A /32 or /128 labeled unicast route (and associated BGP-LU tunnel) is determined to be potentially usable by a local service if one of the following conditions is met:

- the route matches the far-end address of a user-provisioned SDP of an Layer 2 service and the SDP is configured to use BGP tunnels as transport
- the route matches the BGP next-hop address of a BGP-EVPN or IP VPN route, and this VPN route is either imported into a local service or readvertised by the router acting as a next-hop-self route-reflector or a model-B ASBR

The **no** form of this command disables selective-label IP prioritization for BGP.

## Default

no selective-label-ip-prioritization

```
configure router bgp selective-label-ipv4-install
```

```
configure router bgp group selective-label-ipv4-install
```

```
configure router bgp group neighbor selective-label-ipv4-install
```

## Description

This command enables selective download for BGP label-ipv4 routes.

When this command is configured so that it applies to a BGP session, label-ipv4 routes received on this session are marked as invalid if they are not needed for any eligible service. A /32 label-ipv4 route is determined to be required if one of the following applies:

1. It matches the far-end address of a manually configured or auto-created SDP Layer 2 VLL or VPLS service and the SDP is configured to use BGP tunnels as transport.
2. It matches the IPv4 BGP next hop of a BGP-EVPN route and this EVPN route is either imported into a VPLS service or re-advertised by the router acting as a next-hop-self route-reflector or a model-B ASBR.
3. It matches the IPv4 BGP next hop of a VPN-IPv4 route and this VPN-IP route is either imported into a VPRN service or re-advertised by the router acting as a next-hop-self route-reflector or a model-B ASBR.
4. It matches the IPv4 address in the IPv4-mapped IPv6 address of a VPN IPv6 route and this VPN-IP route is either imported into a VPRN service or re-advertised by the router acting as a next-hop-self route-reflector or a model-B ASBR.

The **no** form of this command at the top (**config>router>bgp**) level disables the selective installation functionality. The **no** form of this command at the **group** or **neighbor** level causes the setting to be inherited from a higher level configuration.

### Default

no selective-label-ipv4-install

### Platforms

## 23.119 selective-learned-fdb

### selective-learned-fdb

#### Syntax

[no] selective-learned-fdb

#### Context

**[Tree]** (config>service>vpls selective-learned-fdb)

#### Full Context

configure service vpls selective-learned-fdb

#### Description

This command determines which line cards FDB entries are allocated on for MAC addresses in the VPLS service in which the command is configured.

By default, FDB entries for MAC addresses in VPLS services are allocated on all line cards in the system. Enabling **selective-learned-fdb** causes FDB entries to be allocated only on the line cards on which the service has a configured object, which includes all line cards:

- on which a SAP is configured
- which have ports configured in a LAG SAP
- which have ports configured in an Ethernet tunnel SAP
- which have ports configured on a network interface (which also may be on a LAG) when the service has a mesh or spoke-SDP, VXLAN or EVPN-MPLS configured

Only MAC addresses with a type "L" or "Evpn" in the **show** output displaying the FDB can be allocated selectively, unless a MAC address configured as a conditional static MAC address is learned dynamically on an object other than its monitored object; this can be displayed with type "L" or "Evpn" but is allocated as global because of the conditional static MAC configuration.

The **no** form of this command returns the FDB MAC address entry allocation mode to its default where FDB entries for MAC addresses are allocated on all line cards in the system.

### Default

no selective-learned-fdb

configure service vprn ripng group neighbor send

configure service vprn ripng group send

```
configure service vprn rip send
configure service vprn ripng send
configure service vprn rip group neighbor send
configure service vprn rip group send
```

## Description

This command configures the type of RIP messages sent to RIP neighbors. This control can be issued at the global, group or interface level. The default behavior sends RIPv2 messages with the multicast (224.0.0.9) destination address.

If **version-1** is specified, the router only listens for and accepts packets sent to the broadcast address. The **no** form of this command resets the type of messages sent back to the default value.

## Default

```
no send
```

## Parameters

### ***broadcast***

Send RIPv2 formatted messages to the broadcast address.

### ***multicast***

Send RIPv2 formatted messages to the multicast address.

### ***none***

Do not send any RIP messages (i.e. silent listener).

### ***version-1***

Send RIPv1 formatted messages to the broadcast address.

### ***both***

Send both RIP v1 & RIP v2 updates to the broadcast address.

configure router ripng group neighbor send

configure router ripng send

### Description

This command specifies if RIPng are sent to RIP neighbors or not and what type of IPv6 address is to be used to deliver the messages.

This control can be issued at the global, group or interface level.

The **no** form of the command reverts to the default value.

### Default

send ripng

### Parameters

#### ripng

Specifies RIPng messages to be sent to the standard multicast address (FF02::9).

#### none

Specifies not to send any RIPng messages (i.e. silent listener).

#### unicast

Specifies to send RIPng updates as unicast messages to the defined unicast address configured through the **unicast-address** command. This option is only allowed within the neighbor context.

## Description

This command results in the system to always generate RADIUS accounting-response to acknowledge RADIUS accounting-request received from the RADIUS client.

The **no** form of this command disables the command.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.122 send-acct-stop-on-fail

### send-acct-stop-on-fail

## Syntax

```
send-acct-stop-on-fail {[on-request-failure] [on-reject] [on-accept-failure]}
no send-acct-stop-on-fail
```

## Context

[\[Tree\]](#) (config>subscr-mgmt>auth-policy send-acct-stop-on-fail)

## Full Context

```
configure subscriber-mgmt authentication-policy send-acct-stop-on-fail
```

## Description

This command activates the reporting of RADIUS authentication failures of a PPPoE session to a RADIUS accounting server with an Accounting Stop message.

Three failure categories can be enabled separately:

- **on-request-failure**: All failure conditions between the sending of an Access-Request and the reception of an Access-Accept or Access-Reject.
- **on-reject**:
- **on-accept-failure**: All failure conditions that appear after receiving an Access-Accept and before successful instantiation of the host or session.

The RADIUS accounting policy to be used for sending the Accounting Stop messages must be obtained prior to RADIUS authentication via local user database pre-authentication.

The **no** form of this command reverts to the default.

## Parameters

### on-request-failure

Specifies that an accounting stop message is sent when a RADIUS Access-Request message could not be sent (for example, there is no server configured, or timeout).

### on-reject

Specifies that an accounting stop message is sent when an Access-Reject is received.

### on-accept-failure

Specifies that an accounting stop message is sent a failure occurred after the reception of a RADIUS Access-Accept message (such as a duplicate IP address).

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.123 send-bvpls-evpn-flush

### send-bvpls-evpn-flush

## Syntax

[no] send-bvpls-evpn-flush

## Context

[\[Tree\]](#) (config>service>vpls>pbb send-bvpls-evpn-flush)

## Full Context

configure service vpls pbb send-bvpls-evpn-flush

## Description

This command triggers ISID-based C-MAC flush signaling in the PBB-EVPN. When the command is enabled in an I-VPLS service, a B-MAC/ISID route is sent for the I-VPLS ISID.

## Default

no send-bvpls-evpn-flush

## Platforms

All

## 23.124 send-bvpls-flush

## send-bvpls-flush

### Syntax

**send-bvpls-flush** {[all-but-mine] [all-from-me]}

**no send-bvpls-flush**

### Context

**[Tree]** (config>service>vpls>pbb send-bvpls-flush)

### Full Context

configure service vpls pbb send-bvpls-flush

### Description

This command enables generation of LDP MAC withdrawal "flush-all-from-me" in the B-VPLS domain when the following triggers occur in the related IVPLS:

- MC-LAG failure
- Failure of a local SAP
- Failure of a local pseudowire/SDP binding

A failure means transition of link SAP/pseudowire to either down or standby status.

This command does not require send-flush-on-failure in B-VPLS to be enabled on an IVPLS trigger to send an MAC flush into the BVPLS.

### Default

no send-bvpls-flush

### Parameters

#### all-but-mine

Specifies to send an LDP flush all-but-mine and also sent into the B-VPLS. Both parameters can be set together.

#### all-from-me

Specifies to send an LDP flush-all-from and when STP initiates a flush, it is sent into the B-VPLS using LDP MAC flush all-from-me. Both parameters can be set together.

## 23.125 send-chain

## send-chain

### Syntax

[no] send-chain

### Context

[\[Tree\]](#) (config>ipsec>cert-profile>entry send-chain)

### Full Context

configure ipsec cert-profile entry send-chain

### Description

Commands in this context configure the send-chain in the **cert-profile entry**.

The configuration of this command is optional, by default system will only send the certificate specified by **cert** command in the selected entry to the peer. This command allows system to send additional CA certificates to the peer. These additional CA certificates must be in the certificate chain of the certificate specified by the **cert** command in the same entry.

### Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## send-chain

### Syntax

[no] send-chain

### Context

[\[Tree\]](#) (config>system>security>tls>cert-profile>entry send-chain)

### Full Context

configure system security tls cert-profile entry send-chain

### Description

This command enables the sending of certificate authority (CA) certificates, and enters the context to configure send-chain information.

By default, the system only sends the TLS server certificate or TLS client certificate specified by the **cert** command. If CA certificates are to be sent using send-chain, they must be in the chain of certificates specified by the **config>system>security>pki>ca-profile** command. The specification of the send-chain is not necessary for a working TLS profile if the TLS peer has the CA certificate used to sign the server or client certificate in its own trust anchor.

For example, given a TLS client running on SR OS, the ROOT CA certificate resides on the TLS server, but the subsequent SUB-CA certificate needed to complete the chain resides within SR OS. The **send-chain** command allows these SUB-CA certificates to be sent from SR OS to the peer to be authenticated using the ROOT CA certificate that resides on the peer.

The **no** form of the command disables the send-chain.

**Default**

no send-chain

**Platforms**

All

## 23.126 send-count

### send-count

**Syntax**

**send-count** *send-count*

**no send-count**

#### Full Context

configure router bgp group send-default

configure router bgp group neighbor send-default

configure router bgp send-default

#### Description

This command enables the advertisement of a default route. When this command is configured to apply to an IBGP or EBGP session, the default route for IPv4 or IPv6 is automatically added to the Adj\_RIB-OUT of that peer. The advertised default routes are unrelated to any default routes installed in the FIB of the local router.

If a BGP export policy allows an active default route in the FIB of the local router to be advertised and conflict with this command, the artificially generated default route overrides the advertisement of the installed default route.

The artificially generated default route is not matched by BGP export policies. To modify its attributes or decide whether it should be advertised (based on a conditional expression), a route policy must be created and referenced by the **export-policy** parameter. Only conditional entries with an action and no from or to criteria are parsed. If there are no such entries, only the default action is applied.

The **no** form of this command restores the default behavior. At the group and neighbor levels, the default behavior is to inherit the configuration from a higher level. At the instance level, the default behavior is to neither generate nor inject a default route.

#### Default

no send-default

## Parameters

### ipv4

Generates and advertises an IPv4 default route (0/0).

### ipv6

Generates and advertises an IPv6 default route (::/0).

### *export-policy*

Specifies the name of a route policy, up to 64 characters. Only the route modifications in the matching conditional-expression entry or the default action are applied. These modifications change the attributes of the advertised default routes.

## Platforms

## Full Context

configure service ies subscriber-interface group-interface srrp send-fib-population-packets

configure service vprn subscriber-interface group-interface srrp send-fib-population-packets

## Description

This command configures the mode used to send Fib population packets. When SRRP becomes master it generates gratuitous ARPs (GARPs) used by the Layer 2 access network to populate the correct SRRP gateway.

The **no** form of this command disables sending FDB population packets.

## Default

send-fib-population-packets all

## Parameters

### *mode*

Specifies on which VLANs the gratuitous ARPs are sent.

**Values**   **all**: Generates, on SSRP master assignment, the GARPs on all VLANs  
**out-tag-only**: Generates, on SRRP master assignment, the GARPs only on SAPs with unique outer VLAN and lowest VLAN tags

## 23.129 send-flush-on-bvpls-failure

```
send-flush-on-bvpls-failure
```

### Syntax

```
[no] send-flush-on-bvpls-failure
```

### Context

```
[Tree] (config>service>vpls>pbb send-flush-on-bvpls-failure)
```

### Full Context

```
configure service vpls pbb send-flush-on-bvpls-failure
```

### Description

This command enables the generation in the local I-VPLS of an LDP MAC flush-all-from-me following a failure of SAP/the whole endpoint/spoke-SDP in the related B-VPLS. The failure of mesh-SDP in B-VPLS does not generate the I-VPLS MAC flush.

The **no** form of this command disables the generation of LDP MAC flush in I-VPLS on failure of SAP/endpoint/spoke-SDP in the related B-VPLS.

### Default

```
no send-flush-on-bvpls-failure
```

### Platforms

## 23.130 send-flush-on-failure

## send-flush-on-failure

### Syntax

**[no] send-flush-on-failure**

### Context

**[Tree]** (config>service>vpls send-flush-on-failure)

### Full Context

configure service vpls send-flush-on-failure

### Description

This command enables sending out flush-all-from-me messages to all LDP peers included in affected VPLS, in the event of physical port failures or "operationally down" events of individual SAPs. This feature provides an LDP-based mechanism for recovering a physical link failure in a dual-homed connection to a VPLS service. This method provides an alternative to RSTP solutions where dual homing redundancy and recovery, in the case of link failure, is resolved by RSTP running between a PE router and CE devices. If the endpoint is configured within the VPLS and send-flush-on-failure is enabled, flush-all-from-me messages will be sent out only when all spoke-SDPs associated with the endpoint go down.

This feature cannot be enabled on management VPLS.

### Default

no send-flush-on-failure

## Full Context

```
configure service vpls bgp-evpn vxlan send-imet-ir-on-ndf
```

## Description

This command controls the advertisement of Inclusive Multicast Ethernet Tag (IMET) routes for ingress replication in the case where the PE is Non-DF for a specified network interconnect VXLAN virtual ES. When enabled, the router will advertise IMET-IR routes even if the PE is NDF. This attracts BUM traffic but also speeds up convergence in case of DF failure.

The **no** form of this command withdraws the advertisement of the IMET-IR route on the network interconnect VXLAN NDF router.

## Default

send-imet-ir-on-ndf

## 23.133 send-orf

### send-orf

#### Syntax

**send-orf** [*comm-id*]

**no send-orf** [*comm-id*]

#### Context

**[Tree]** (config>router>bgp>group>outbound-route-filtering>extended-community send-orf)

**[Tree]** (config>router>bgp>group>neighbor>outbound-route-filtering>extended-community send-orf)

**[Tree]** (config>router>bgp>outbound-route-filtering>extended-community send-orf)

#### Full Context

configure router bgp group outbound-route-filtering extended-community send-orf

configure router bgp group neighbor outbound-route-filtering extended-community send-orf

configure router bgp outbound-route-filtering extended-community send-orf

#### Description

This command instructs the router to negotiate the send capability in the BGP outbound route filtering (ORF) negotiation with a peer.

This command also causes the router to send a community filter, prefix filter, or AS path filter configured as an inbound filter on the BGP session to its peer as an ORF Action ADD.

The **no** form of this command causes the router to remove the send capability in the BGP ORF negotiation with a peer.

The **no** form also causes the router to send an ORF remove action for a community filter, prefix filter, or AS path filter configured as an inbound filter on the BGP session to its peer.

If the *comm-id* parameters are not exclusively route target communities then the router will extract appropriate route targets and use those. If, for some reason, the *comm-id* parameters specified contain no route targets, then the router will not send an ORF.

#### Default

no send-orf

#### Parameters

##### *comm-id*

Specifies up to 32 community policies, which must consist exclusively of route target extended communities. If it is not specified, then the ORF policy is automatically generated from configured route target lists, accepted client route target ORFs and locally configured route targets.

**Values** [target: {*ip-address:comm-val* | *2byte-asnumber.ext-comm-val* | *4byte-asnumber.comm-val*}

where:

- *ip-address* — a.b.c.d
- *comm-val* — 0 to 65535
- *2byte-asnumber* — 0 to 65535
- *ext-comm-val* — 0 to 4294967295
- *4byte-asnumber* — 0 to 4294967295

configure service vpls sap mld-snooping send-queries

configure service vpls spoke-sdp mld-snooping send-queries

configure service vpls mesh-sdp mld-snooping send-queries

configure service vpls spoke-sdp igmp-snooping send-queries

#### Description

This command specifies whether to send IGMP general query messages on the SAP or SDP.

When send-queries is configured, all type of queries generate ourselves are of the configured version. If a report of a version higher than the configured version is received, the report will get dropped and a new wrong version counter will get incremented. If send-queries is not configured, the version command has no

effect. The version used will be the version of the querier. This implies that, for example, when we have a v2 querier, we will never send out a v3 group or group-source specific query when a host wants to leave a certain group.

If **mrouter-port** is enabled on this SAP or spoke SDP, the **send-queries** command parameter cannot be set.

The **no** form of this command disables the IGMP general query messages.

### Default

no send-queries

```

### Full Context

```
configure service vprn bgp group neighbor link-bandwidth send-to-ebgp
```

```
configure service vprn bgp group link-bandwidth send-to-ebgp
```

### Description

This command configures BGP to allow link-bandwidth extended community to be sent in routes advertised to EBGp peers in the scope of the command, as long the routes belong to one of the listed address families.

The link-bandwidth extended community is encoded as a non-transitive type. This means that by default it should not be attached to any route advertised to an EBGp peer and it should be discarded when received in any route from an EBGp peer. This command overrides the standard behavior.

Up to three families may be configured.

The **no** form of this command restores the default behavior of stripping the link-bandwidth extended community from any route advertised to an EBGp peer.

### Default

```
no send-to-ebgp
```

### Parameters

#### *family*

Specifies the address families for which receiving the link-bandwidth extended community from EBGp peers should be supported.

- Values**
- ipv4 — Adds a link-bandwidth extended community to unlabeled unicast IPv4 routes.
  - label-ipv4 — Adds a link-bandwidth extended community to labeled-unicast IPv4 routes.
  - ipv6 — Adds a link-bandwidth extended community to unlabeled unicast IPv6 routes.

## Platforms

All

## send-to-ebgp

### Full Context

configure router bgp group neighbor link-bandwidth send-to-ebgp

configure router bgp group link-bandwidth send-to-ebgp

### Description

This command configures BGP to allow link-bandwidth extended community to be sent in routes advertised to EBGp peers in the scope of the command, as long the routes belong to one of the listed address families.

The link-bandwidth extended community is encoded as a non-transitive type. This means that by default it should not be attached to any route advertised to an EBGp peer and it should be discarded when received in any route from an EBGp peer. This command overrides the standard behavior.

Up to six families may be configured.

The **no** form of this command restores the default behavior of stripping the link-bandwidth extended community from any route advertised to an EBGp peer.

### Default

no send-to-ebgp

### Parameters

#### *family*

Specifies the address families for which receiving the link-bandwidth extended community from EBGp peers should be supported.

- Values**
- ipv4 — Adds a link-bandwidth extended community to unlabeled unicast IPv4 routes.
  - label-ipv4 — Adds a link-bandwidth extended community to labeled-unicast IPv4 routes.
  - vpn-ipv4 — Adds a link-bandwidth extended community to IPv4 VPN (SAFI 128) routes.

ipv6 — Adds a link-bandwidth extended community to unlabeled unicast IPv6 routes.

label-ipv6 — Adds a link-bandwidth extended community to labeled-unicast IPv6 routes.

vpn-ipv6 — Adds a link-bandwidth extended community to IPv6 VPN (SAFI 128) routes.

configure service vpls bgp-evpn mpls send-tunnel-encap

configure service epipe bgp-evpn vxlan send-tunnel-encap

configure service vprn bgp-evpn mpls send-tunnel-encap

configure service vpls bgp-evpn vxlan send-tunnel-encap

#### Description

This command configures the encapsulation to be advertised with the EVPN routes for the service. The encapsulation is encoded in RFC5512-based tunnel encapsulation extended communities.

When used in the **bgp-evpn>mpls** context, the supported options are none (**no send-tunnel-encap**), **mpls**, **mplsoudp** or both.

When used in the **bgp-evpn>vxlan** context, the supported options are **send-tunnel-encap** (the router signals a VXLAN value) or **no send-tunnel-encap** (no encapsulation extended community is sent).

## Default

send-tunnel-encap mpls (in the **config>service>vpls>bgp-evpn>mpls** context)

send-tunnel-encap (in the **config>service>vpls>bgp-evpn>vxlan** context)

## Parameters

### *mpls*

Specifies the MPLS-over-UDP encapsulation value in the RFC5512 encapsulation extended community.

### *mplsoudp*

Specifies the MPLS encapsulation value in the RFC5512 encapsulation extended community.

**sender-id system**

**no sender-id**

## Context

[\[Tree\]](#) (config>eth-cfm>system sender-id)

## Full Context

configure eth-cfm system sender-id

## Description

This command allows the operator to include the configured "system name" (chassis3) or a locally configured value in ETH-CFM PDUs sent from MEPs and MIPs. The operator may only choose one of these options to use for ETH-CFM. MEPs include the **sender-id** TLV for CCM (not sub second CCM enabled MEPs), LBM/LBR, and LTM/LTR. MIPs include this value in the LBR and LTR PDUs.

### Note:

LBR functions reflect all TLVs received in the LBM unchanged, including the SenderID TLV.

## Parameters

*local-name*

Specifies a local alphanumeric string different from the "system name" chassis(3) value that can be used for other means, up to 45 characters.

**system**

Allows ETH-CFM to use the configured "system name" value as the chassis(3).

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## server

## Syntax

**server** *server-index* **address** *ip-address* **secret** *key* [**hash** | **hash2** | **custom**] [**port** *port-num*] [**coa-only**]  
[**pending-requests-limit** *limit*]

**no server** *index*

## Context

[\[Tree\]](#) (config>subscr-mgmt>auth-plcy>radius-auth-server server)

## Full Context

configure subscriber-mgmt authentication-policy radius-authentication-server server

## Description

This command adds a RADIUS server and configures the RADIUS server IP address, index, and key values.

Up to sixteen RADIUS servers can be configured at any one time in a RADIUS authentication policy. Only five can be used for authentication, all other servers should be configured as coa-only servers. RADIUS servers are accessed in order from lowest to highest index for authentication or accounting requests until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other RADIUS servers are queried.

The **no** form of this command removes the server index from the configuration.

## Parameters

### **server-index**

Specifies the index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

**Values** 1 to 16 (a maximum of 5 authentication servers)

### **ip-address**

Specifies the IP address of the RADIUS server. Two RADIUS servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

**key**

Specifies the secret key to access the RADIUS server. This secret key must match the password on the RADIUS server.

**Values** secret-key: Up to 20 characters.  
hash-key: Up to 33 characters.  
hash2-ke: Up to 55 characters.

**hash**

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**hash2**

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**custom**

Specifies the custom encryption to management interface.

**port-num**

Specifies the UDP port number on which to contact the RADIUS server for authentication.

**Values** 1 to 65535

**coa-only**

Specifies Change-of-Authorization Messages only. Servers that are marked with the coa-only flag will not be used for authentication, but they are able to accept RADIUS CoA messages, independent of the accept-authorization-change setting in the authentication policy.

For authentication purposes, the maximum number of servers is 5. All other servers may only be used as coa-only servers.

**limit**

Specifies the maximum number of outstanding RADIUS authentication requests for this authentication server.

**Values** 1 to 4096

**Default** The default value when not configured is 4096

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## server

### Syntax

**server** *ip-address*

**no server**

### Context

**[Tree]** (config>subscr-mgmt>loc-user-db>ipoe>host server)

### Full Context

configure subscriber-mgmt local-user-db ipoe host server

### Description

This command configures the IP address of the DHCP server to relay to.

The configured DHCP server IP address must reference one of the addresses configured under the DHCP CLI context of an IES/VP RN subscriber or group interface.

The **no** form of this command reverts to the default.

### Parameters

***ip-address***

Specifies the IP address of the DHCP server.

**Values** a.b.c.d

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## server

### Syntax

**server** *ip-address*

**no server**

### Context

**[Tree]** (config>service>vprn>sub-if>grp-if>ipv6>dhcp6>relay server)

### Full Context

configure service vprn subscriber-interface group-interface ipv6 dhcp6 relay server

### Description

This command configures the IPv6 address of the DHCP6 server to relay to.

The configured DHCP6 server IPv6 address must reference one of the addresses configured under the DHCP6 CLI context of an IES/VPDN subscriber or group interface.

The **no** form of this command reverts to the default.

## Parameters

### ***ip-address***

Specifies up to eight IPv6 addresses of the DHCP6 server.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## server

## Syntax

**server** [**service** *service-id*] **name** *server-name*

**no server**

## Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe>host>match-radprox-cache server)

## Full Context

configure subscriber-mgmt local-user-db ipoe host match-radius-proxy-cache server

## Description

This command specifies the name of radius-proxy-server and optionally id of the service that the radius-proxy-server resides in.

The **no** form of this command removes the parameters from the configuration.

## Parameters

### **service** *service-id*

Specifies the ID or name of the service.

**Values** 1 to 214748365  
svc-name up to 64 char maximum

### **name** *server-name*

Specifies the name of radius-proxy-server up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## server

### Syntax

**server** *ipv6z-address* [*ipv6z-address*]

**no server** [*ipv6z-address*]

### Context

**[Tree]** (config>service>ies>if>ipv6>dhcp6 server)

### Full Context

configure service ies interface ipv6 dhcp6 server

### Description

This command specifies a list of servers where DHCP6 requests are forwarded. The list of servers can be entered as either IP addresses or fully qualified domain names. There must be at least one server specified for DHCP6 relay to work. If there are multiple servers then the request is forwarded to all servers in the list.

The **no** form of this command reverts to the default.

### Parameters

#### *ipv6z-address*

Specifies up to eight non-global IPv4 addresses including a zone index as defined by the InetAddressIPv4z textual convention.

#### Values

ipv6z-address: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

## server

### Syntax

**server** *server1* [*server2*]

### Context

**[Tree]** (config>service>ies>if>dhcp server)

**[Tree]** (config>service>vprn>if>dhcp server)

**[Tree]** (config>service>ies>sub-if>grp-if>dhcp server)

## Full Context

```
configure service ies interface dhcp server
configure service vprn interface dhcp server
configure service ies subscriber-interface group-interface dhcp server
```

## Description

This command specifies a list of servers where requests are forwarded. The list of servers can be entered as either IP addresses or fully qualified domain names. There must be at least one server specified for DHCP relay to work. If there are multiple servers then the request is forwarded to all servers in the list.

There can be a maximum of 8 DHCP servers configured.

The **no** form of this command reverts to the default.

## Parameters

### **server**

Specifies up to eight DHCP server IP addresses.

## Platforms

All

- configure service ies interface dhcp server
- configure service vprn interface dhcp server

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure service ies subscriber-interface group-interface dhcp server

## server

```

## Full Context

```
configure service ies subscriber-interface group-interface local-address-assignment server
configure service vprn subscriber-interface local-address-assignment server
configure service vprn subscriber-interface group-interface local-address-assignment server
```

configure service ies subscriber-interface local-address-assignment server

## Description

This command designates a local DHCPv4 server for local pools management where IPv4 addresses for PPPoXv4 clients are allocated without the need for the internal DHCP relay-agent. Those addresses are tied to PPPoX sessions and they are de-allocated when the PPPoX session is terminated.

## Parameters

### ***server-name***

Specifies the name of the local DHCP server.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## server

## Syntax

**server** *server-index* **address** *ip-address* **secret** *key* [**hash** | **hash2** | **custom**] [**port** *port*] [**create**]

**no server** *server-index*

## Context

[\[Tree\]](#) (config>aaa>l2tp-acct-plcy>radius-acct-server server)

## Full Context

configure aaa l2tp-accounting-policy radius-accounting-server server

## Description

This command adds a RADIUS server and configures the RADIUS server IP address, index, and key values.

Up to five RADIUS servers can be configured at any one time. RADIUS servers are accessed in order from lowest to highest index for authentication requests until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other RADIUS servers are queried.

The **no** form of this command removes the server from the configuration.

## Parameters

### ***server-index***

The index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

**Values** 1 to 16 (a maximum of 5 accounting servers)

### ***address ip-address***

The IP address of the RADIUS server. Two RADIUS servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

#### **secret key**

The secret key to access the RADIUS server. This secret key must match the password on the RADIUS server.

**Values** secret-key — A string up to 20 characters.  
 hash-key — A string up to 33 characters.  
 hash2-key — A string up to 55 characters.

#### **hash**

Specifies the key is entered in an encrypted form. If the hash parameter is not used, the key is assumed to be in a non-encrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the hash parameter specified.

#### **hash2**

Specifies the key is entered in a more complex encrypted form. If the hash2 parameter is not used, the less encrypted hash form is assumed.

#### **custom**

Specifies the custom encryption to management interface.

#### **port**

Specifies the UDP port number on which to contact the RADIUS server for authentication.

**Values** 1 to 65535

### **Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## **server**

### **Syntax**

**server** *server-index* **address** *ip-address* **secret** *key* [**hash** | **hash2** | **custom**] [**port** *port*] [**create**]  
**no server** *server-index*

### **Context**

[\[Tree\]](#) (config>app-assure>rad-acct-plcy>server server)

### **Full Context**

configure application-assurance radius-accounting-policy radius-accounting-server server

### **Description**

This command adds a RADIUS server and configures the RADIUS server IP address, index, and key values.

Up to five RADIUS servers can be configured at any one time. RADIUS servers are accessed in order from lowest to highest index for authentication requests until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other RADIUS servers are queried.

The **no** form of this command removes the server from the configuration.

## Parameters

### *server-index*

The index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

**Values** 1 to 16 (a maximum of 5 accounting servers)

### *ip-address*

The IP address of the RADIUS server. Two RADIUS servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

### *secret key*

The secret key to access the RADIUS server. This secret key must match the password on the RADIUS server.

**Values** secret-key — A string up to 20 characters  
hash-key — A string up to 33 characters  
hash2-key — A string up to 55 characters

### *hash*

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### *hash2*

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### *custom*

Specifies the custom encryption to management interface.

### *port*

Specifies the UDP port number on which to contact the RADIUS server for authentication.

**Values** 1 to 65535

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## server

### Syntax

**server** *server-name*

**no server**

### Context

**[Tree]** (config>service>vprn>sub-if>grp-if>lcl-addr-assign>ipv6 server)

**[Tree]** (config>service>ies>sub-if>grp-if>lcl-addr-assign>ipv6 server)

### Full Context

configure service vprn subscriber-interface group-interface local-address-assignment ipv6 server

configure service ies subscriber-interface group-interface local-address-assignment ipv6 server

### Description

This command designates a local router DHCPv6 server for local pools management where IPv6 prefixes or address for PPPoXv6 clients or IPEv6 clients are allocated without the need for the internal router DHCP relay-agent. Those addresses are tied to PPPoX or IPE sessions and they are de-allocated when the PPPoX or IPE session is terminated.

### Parameters

***server-name***

The name of the local router DHCPv6 server.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## server

### Syntax

**server** *server-index* **name** *server-name*

**no server** *server-index*

### Context

**[Tree]** (config>aaa>radius-srv-plcy>servers server)

### Full Context

configure aaa radius-server-policy servers server

### Description

This command adds a RADIUS server.

The **no** form of this command removes a RADIUS server.

### Parameters

#### *index*

Specifies the index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

**Values** 1 to 5

#### *server-name*

Specifies the server name, up to 32 characters.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## server

### Syntax

**server** *server-name* [**address** *ip-address*] [**secret** *key*] [**hash** | **hash2** | **custom**] [**create**]

**no server** *server-name*

### Context

[\[Tree\]](#) (config>router>radius-server server)

[\[Tree\]](#) (config>service>vprn>radius-server server)

### Full Context

configure router radius-server server

configure service vprn radius-server server

### Description

This command either specifies an external RADIUS server in the corresponding routing instance or enters configuration context of an existing server. The configured server could be referenced in the radius-server-policy.

The **no** form of this command removes the parameters from the server configuration.

### Parameters

#### *server-name*

Specifies the name of the external RADIUS server.

#### *ip-address*

Specifies the IPv4 or IPv6 IP address of the external RADIUS server.

#### *key*

Specifies the shared secret key of the external RADIUS server, up to 64 characters.

**hash**

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**hash2**

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**custom**

Specifies the custom encryption to management interface.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**server****Syntax**

**server** *server-name* [**create**] [**purpose** {[**accounting** | **authentication**]}] [**wlan-gw-group** *group-id*]

**no server** *server-name*

**Context**

[\[Tree\]](#) (config>router>radius-proxy server)

[\[Tree\]](#) (config>service>vprn>radius-proxy server)

**Full Context**

configure router radius-proxy server

configure service vprn radius-proxy server

**Description**

This command creates a RADIUS-proxy server in the corresponding routing instance. The proxy server can be configured for the purpose of proxying authentication or accounting or both.

If a WLAN-GW ISA group is specified, then the RADIUS proxy server is instantiated on the set of ISAs in the specified wlan-gw group. The RADIUS messages from the AP are load-balanced to these ISAs. The ISA that processes the RADIUS message then hashes this message to the ISA that anchors the UE. The hash is based on UE MAC address (required to be present in the calling-station-id attribute) in the RADIUS message.

If the **create** parameter is not specified, then this command enters configuration context of the specified RADIUS-proxy server.

The **no** form of this command removes the server-name and parameters from the radius-proxy configuration.

**Parameters*****server-name***

Specifies the name of the RADIUS-proxy server.

**create**

Specifies that the system will create the specified RADIUS-proxy server.

**purpose**

Specifies the purpose the RADIUS-proxy server.

**Values**    accounting — proxy accounting packets  
              authentication — proxy authentication packets

***group-id***

Specifies the WLAN-GW ISA group.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

**server****Syntax**

**server** *ipv6-address* [ *ipv6-address*]

**no server** [*ipv6-address* [*ipv6-address*]]

**Context**

[\[Tree\]](#) (config>service>vprn>sub-if>wlan-gw>pool-manager>dhcp6-client server)

[\[Tree\]](#) (config>service>ies>sub-if>wlan-gw>pool-manager>dhcp6-client server)

**Full Context**

configure service vprn subscriber-interface wlan-gw pool-manager dhcpv6-client server

configure service ies subscriber-interface wlan-gw pool-manager dhcpv6-client server

**Description**

This specifies the DHCPv6 servers that are used for requesting addresses.

The **no** form of this command removes the server. This cannot be executed while any DHCPv6 client application is not shut down.

**Parameters*****ipv6-address***

Specifies up to 8 unicast IPv6 addresses of a DHCP6 server.

**Platforms**

7750 SR, 7750 SR-e, 7750 SR-s, VSR

## server

### Syntax

**server** *index* **address** *ip-address* **secret** *key* [{**hash** | **hash2** | **custom**}] [**port** *port*]

**no server** *index*

### Context

[\[Tree\]](#) (config>service>vprn>aaa>remote-servers>tacplus server)

### Full Context

configure service vprn aaa remote-servers tacplus server

### Description

This command adds a TACACS+ server and configures the TACACS+ server IP address, index, and key values.

Up to five TACACS+ servers can be configured at any one time. TACACS+ servers are accessed in order from lowest index to the highest index for authentication requests.

The **no** form of this command removes the server from the configuration.

### Default

No TACACS+ servers are configured.

### Parameters

#### *index*

Specifies the index for the TACACS+ server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from the lowest index to the highest index.

**Values** 1 to 5

#### *ip-address*

Specifies the IP address of the TACACS+ server. Two TACACS+ servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

**Values**

ipv4-address	a.b.c.d (host bits must be 0)
ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0..FFFF]H
	d: [0..255]D

#### *key*

Specifies the secret key, up to 128 characters, for access to the TACACS+ server. This secret key must match the password on the TACACS+ server.

**Values** Up to 128 characters in length.

#### **hash**

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

#### **hash2**

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

#### **custom**

Specifies the custom encryption to management interface.

#### **port**

Specifies the port ID.

**Values** 0 to 65535

### **Platforms**

[\[Tree\]](#) (config>service>vpn>if>sap>ipsec-gw>dhcp server)

## Full Context

```
configure service ies interface sap ipsec-gw dhcp server
configure service vprn interface sap ipsec-gw dhcp server
```

## Description

This command specifies up to eight DHCPv4 server addresses for DHCPv4-based address assignment. If multiple server addresses are specified, the first advertised DHCPv6 address received is chosen.

## Default

no server

## Parameters

### *ip-address*

Specifies up to eight unicast IPv4 addresses.

**Values**            ipv4-address    a.b.c.d

### *router-instance*

Specifies the router instance ID used to reach the configured server address.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **server ip-address service-name service-name** variant can be used in all configuration modes.

**Values**    {router-name | vprn-svc-id}

*vprn-svc-id*:    1 to 2147483647

*router-name*:    *router-name* is an alias for input only.  
The *router-name* gets replaced with an id automatically by SR OS in the configuration).

**Default**    Base

### *service-name*

Specifies the name of the IES or VPRN service used to reach the configured server address, up to 64 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## server

## Syntax

```
server ipv6-address [ipv6-address] router router-instance
```

**no server** *server-index*

**Context**

[\[Tree\]](#) (config>aaa>isa-radius-plcy>servers server)

**Full Context**

configure aaa isa-radius-policy servers server

**Description**

This command adds a RADIUS server and configures the RADIUS server IP address, index, and key values.

Up to five RADIUS servers can be configured at any one time. RADIUS servers are accessed in order from lowest to highest index for authentication requests until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other RADIUS servers are queried.

The **no** form of the command removes the server from the configuration.

**Parameters****server-index**

The index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

**Values** 1 to 10 (a maximum of 5 accounting servers)

**create**

Keyword used to create the server index.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## server

### Syntax

**server**

### Context

[\[Tree\]](#) (config>test-oam>twamp server)

### Full Context

configure test-oam twamp server

### Description

This command configures the node for TWAMP server functionality.

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

## server

### Syntax

**server** *server* [*server*]

### Context

[\[Tree\]](#) (config>router>if>dhcp server)

### Full Context

configure router interface dhcp server

### Description

This command specifies a list of servers where requests will be forwarded. The list of servers can be entered as either IP addresses or fully qualified domain names. There must be at least one server specified for DHCP relay to work. If there are multiple servers then the request is forwarded to all of the servers in the list. There can be a maximum of eight DHCP servers configured.

The flood command is applicable only in the VPLS case. There is a scenario with VPLS where the VPLS node only wants to add Option 82 information to the DHCP request to provider per-subscriber information, but it does not do full DHCP relay. In this case, the server is set to "flood". This means the DHCP request is still a broadcast and is sent through the VPLS domain. A node running at Layer 3 further upstream then can perform the full Layer 3 DHCP relay function.

### Default

no server

## Parameters

### *server*

Specifies the DHCP server IP address. A maximum of eight servers can be specified in a single statement.

## Platforms

All

```
server
```

## Syntax

```
server ipv6-address [ipv6-address]
```

```
no server
```

## Context

```

configure router pcp-server server

## Description

Commands in this context configure a PCP server.

The **no** form of this command deletes the specified PCP server.

## Parameters

### *pcp-server-name*

Specifies the PCP server name, up to 32 characters.

### **create**

Creates a PCP server before entering the context to configure it.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

server

## Syntax

**server** [**router** *router-instance* | **service-name** *service-name*] {*ip-address* | *ipv6-address* | **ptp**} [**key-id** *key-id*] [**version** *version*] [**prefer**]

**no server** [**router** *router-instance* | **service-name** *service-name*] {*ip address* | *ipv6-address* | **ptp**}

## Context

[\[Tree\]](#) (config>system>time>ntp server)

## Full Context

configure system time ntp server

## Description

This command configures the node to operate in client mode with the NTP server specified in the address field of this command.

If the internal PTP process is to be used as a source of time for System Time and OAM time then it must be specified as a server for NTP. If PTP is specified, then the prefer parameter must also be specified.

After PTP has established a UTC traceable time from an external grandmaster then it will always be the source for time into NTP, even if PTP goes into time holdover. PTP applies only to the 7450 ESS and 7750 SR.

Using the internal PTP time source for NTP promotes the internal NTP server to stratum 1 level, which may impact the NTP network topology.

The **no** form of this command removes the server with the specified address from the configuration.

## Parameters

### ***router-instance***

Specifies the routing context that contains the interface in the form of *router-name* or *service-id*.

**Values** *router-name* — Base | Management  
*service-id* — 1 to 2147483647

**Default** Base

### ***service name***

Specifies the service name for the VPRN. The name can be up to 64 characters. CPM routing instances are not supported.

### ***ip-address***

Configures the IPv4 address of an external NTP server.

**Values** a.b.c.d

### ***ipv6-address***

Configures the IPv6 address of an external NTP server.

**Values**

- x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x: [0 to FFFF] H
- d: [0 to 255] D

### ***key-id***

Specifies the key ID that identifies the configured authentication key and authentication type used by this node to transmit NTP packets to an NTP server. If an NTP packet is received by this node, the authentication key-id, type, and key value must be valid, otherwise the packet is rejected and an event/trap generated. This is an optional parameter.

**Values** 1 to 255

### ***version***

Configures the NTP version number that is expected by this node. This is an optional parameter.

**Values** 2 to 4

**Default** 4

### ***ptp***

Configures the internal PTP process as a time server into the NTP process. The **prefer** parameter is mandatory with this server option.

### ***prefer***

Specifies that, when configuring more than one peer, one remote system can be configured as the preferred peer. When a second peer is configured as preferred, then the new entry overrides the old entry.

## Platforms

[\[Tree\]](#) (config>system>security>radius server)

## Full Context

```
configure service vpn aaa remote-servers radius server
```

```
configure system security radius server
```

## Description

This command adds a RADIUS server and configures the IP address, index, and key values.

Up to five RADIUS servers can be configured at any one time. For authentication requests, RADIUS servers are accessed in order from the lowest to highest index until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other RADIUS servers are queried. It is assumed that there are multiple identical servers configured as backups and that the servers do not have redundant data.

The **no** form of this command removes the server from the configuration.

## Default

no server

## Parameters

### *index*

Specifies the index for the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

**Values** 1 to 5

### *ip-address*

Specifies the IP address of the RADIUS server. Two RADIUS servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

<b>Values</b>		
ipv4-address		a.b.c.d (host bits must be 0)
ipv6-address		x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:d.d.d.d
		x: [0..FFFF]H
		d: [0..255]D

### *key*

Specifies the secret key to access the RADIUS server, up to 64 characters. This secret key must match the password on the RADIUS server.

### *hash*

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### *hash2*

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### *custom*

Specifies the custom encryption to management interface.

**tls-client-profile**

Specifies the TLS profile for the RADIUS server.

**profile**

Specifies the TLS profile name, up to 32 characters.

**md5**

Specifies the MD5 hash algorithm for the RADIUS server.

**sm3**

Specifies the SM3 hash algorithm for the RADIUS server.

**Platforms**

All

**server****Syntax**

**server** *index* **address** *ip-address* **secret** *key* [**hash** | **hash2** | **custom**] [**port** *port*]

**no server** *index*

**Context**

[\[Tree\]](#) (config>system>security>tacplus server)

**Full Context**

configure system security tacplus server

**Description**

This command adds a TACACS+ server and configures the TACACS+ server IP address, index, and key values.

Up to five TACACS+ servers can be configured at any one time. TACACS+ servers are accessed in order from lowest index to the highest index for authentication requests.

The **no** form of this command removes the server from the configuration.

**Parameters*****index***

Specifies the index for the TACACS+ server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from the lowest index to the highest index.

**Values** 1 to 5

***ip-address***

Specifies the IP address of the TACACS+ server. Two TACACS+ servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

Values	ipv4-address	a.b.c.d (host bits must be 0)
	ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x: [0..FFFF]H d: [0..255]D

**key**

Specifies the secret key, up to 128 characters, to access the TACACS+ server. This secret key must match the password on the TACACS+ server.

**hash**

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**hash2**

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

**custom**

Specifies the custom encryption to management interface.

**port**

Specifies the port ID.

**Values** 0 to 65535

**Platforms**

All

**server****Syntax**

**server** *server-index* [ **create**]

**no server** *server-index*

**Context**

[\[Tree\]](#) (config>system>security>ldap server)

## Full Context

configure system security ldap server

## Description

This command configures an LDAP server. Up to five servers can be configured, which can then work in a redundant manner.

The **no** version of this command removes the server connection.

## Parameters

### *server-index*

Specifies a unique LDAP server connection.

**Values** 1 to 5

## Platforms

All

server

## Syntax

**server** *server-index* **address** *ip-address* **secret** *key* [**hash** | **hash2** | **custom**] [**auth-port** *auth-port*] [**acct-port** *acct-port*] [**type** *server-type*]

## Context

[\[Tree\]](#) (config>system>security>dot1x>radius-plcy server)

## Full Context

configure system security dot1x radius-plcy server

## Description

This command adds a Dot1x server and configures the Dot1x server IP address, index, and key values.

Up to five Dot1x servers can be configured at any one time. Dot1x servers are accessed in order from lowest to highest index for authentication requests until a response from a server is received. A higher indexed server is only queried if no response is received from a lower indexed server (which implies that the server is not available). If a response from a server is received, no other Dot1x servers are queried. It is assumed that there are multiple identical servers configured as backups and that the servers do not have redundant data.

The **no** form of this command removes the server from the configuration.

## Default

no server

## Parameters

### *server-index*

Specifies the index for the Dot1x server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.

**Values** 1 to 5

### *ip-address*

Specifies the IP address of the Dot1x server. Two Dot1x servers cannot have the same IP address. An error message is generated if the server address is a duplicate.

### *key*

Specifies the secret key, up to 128 characters, to access the Dot1x server. This secret key must match the password on the Dot1x server.

### *hash*

Specifies the key is entered in an encrypted form. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### *hash2*

Specifies the key is entered in a more complex encrypted form that involves more variables than the key value alone, meaning that the **hash2** encrypted variable cannot be copied and pasted. If the **hash** or **hash2** parameter is not used, the key is assumed to be in an unencrypted, cleartext form. For security, all keys are stored in encrypted form in the configuration file with the **hash** or **hash2** parameter specified.

### *custom*

Specifies the custom encryption to management interface.

### *acct-port*

Specifies the UDP port number on which to contact the RADIUS server for accounting requests.

### *auth-port*

Specifies a UDP port number to be used as a match criteria.

**Values** 1 to 65535

### *server-type*

Specifies the server type.

**Values** authorization, accounting, combined

**no server**

## Context

[\[Tree\]](#) (config>system>security>pki>est-profile server)

## Full Context

configure system security pki est-profile server

## Description

Commands in this context configure EST server parameters.

The **no** form of the command reverts to the default value.

## Parameters

### *ip-address*

Specifies the IP address of the server.

#### Values

ipv4-address a.b.c.d (host bits must be 0)

ipv6-address x:x:x:x:x:x

x:x:x:x:x:d.d.d.d

x: [0..FFFF]H

d: [0..255]D

### **fqdn**

Specifies to use the Fully Qualified Domain Name (FQDN) of the EST server, up to 255 characters.

### **port**

Specifies the port number of the EST server.

**Values** 1 to 65535

**Default** 443

#### **Context**

[\[Tree\]](#) (config>app-assure>group>dns-ip-cache>dns-match server-address)

#### **Full Context**

configure application-assurance group dns-ip-cache dns-match server-address

#### **Description**

This command configures a DNS server address. DNS responses from this DNS server are used to populate the dns-ip-cache. Up to 64 server addresses can be configured.

#### **Parameters**

##### ***server-address***

Specifies the IPv4 or IPv6 address of the DNS.

**Values** ipv4-address a.b.c.d[/mask]

	mask - [1 to 32]
ipv6-address	x:x:x:x:x:x/prefix-length
	x:x:x:x:x:d.d.d.d
	x - [0 to FFFF]H
	d - [0 to 255]D
prefix-length	[1 to 128]

**server-name**

Specifies an optional server name for a given server address.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

**server-address****Syntax**

**server-address** {**eq** | **neq**} *ip-address*

**server-address** {**eq** | **neq**} **ip-address** *masked-ip-address* **netmask** *netmask*

**server-address** {**eq** | **neq**} **dns-ip-cache** *dns-ip-cache-name*

**no server-address**

**Context**

[\[Tree\]](#) (config>app-assure>group>policy>app-filter>entry server-address)

**Full Context**

configure application-assurance group policy app-filter entry server-address

**Description**

This command configures the server address to use in application definition. The server IP address may be the source or destination, network or subscriber IP address and may include the use of netmasks.

The **no** form of this command restores the default (removes the server address from application criteria defined by this entry).

**Default**

no server-address

**Parameters**

**eq**

Specifies a comparison operator that the value configured and the value in the flow are equal.

**neq**

Specifies a comparison operator that the value configured differs from the value in the flow.

**ip-address**

Specifies a valid unicast address.

Values		
	ipv4-address	a.b.c.d[/mask] mask - [1..32]
	ipv6-address	x:x:x:x:x:x/x/prefix-length x:x:x:x:x:d.d.d.d x - [0..FFFF]H d - [0..255]D prefix-length [1..128]

**netmask**

Specifies an IPv4 or IPv6 address mask.

Values		
	ipv4-address	a.b.c.d
	ipv6-address	x:x:x:x:x:x (eight 16-bit) x:x:x:x:x:d.d.d.d x - [0..FFFF]H d - [0..255]D

**masked-ip-address**

Specifies a valid unicast IPv4 or IPv6 address.

Values		
	ipv4-address	a.b.c.d
	ipv6-address	x:x:x:x:x:x (eight 16-bit) x:x:x:x:x:d.d.d.d x - [0..FFFF]H d - [0..255]D

**dns-ip-cache-name**

Specifies a DNS IP cache name, up to 32 characters.

**ip-prefix-list-name**

Specifies the name of an IP prefix list, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## server-address

### Syntax

```
server-address ip-address [version version-number] [normal | preferred]  
[interval seconds]  
no server-address ip-address
```

### Context

[\[Tree\]](#) (config>system>time>ntp server-address)

### Full Context

configure system time ntp server-address

### Description

This command creates an SNTP server for unicast client mode.

### Parameters

#### *ip-address*

Specifies the IP address of the SNTP server.

**Values** a.b.c.d

#### *version-number*

Specifies the SNTP version supported by this server.

**Values** 1 to 3

**Default** 3

#### **normal** | **preferred**

Specifies the preference value for this SNTP server. When more than one time-server is configured, one server can have preference over others. The value for that server should be set to **preferred**. Only one server in the table can be a preferred server.

**Default** normal

#### *seconds*

Specifies the frequency at which this server is queried.

**Values** 64 to 1024

**Default** 64

## Platforms

## 23.147 server-cipher-list

### server-cipher-list

#### Syntax

**server-cipher-list**

#### Context

[\[Tree\]](#) (config>system>security>ssh server-cipher-list)

#### Full Context

configure system security ssh server-cipher-list

#### Description

Commands in this context configure a list of allowed ciphers by the SSH server.

## Platforms

All

### server-cipher-list

#### Syntax

**server-cipher-list** *name* [create]

**no server-cipher-list** *name*

#### Context

[\[Tree\]](#) (config>system>security>tls server-cipher-list)

#### Full Context

configure system security tls server-cipher-list

#### Description

This command creates the cipher list that is compared against cipher lists sent by the client to the server in the client hello message. The list contains all ciphers that are supported and desired by SR OS for use in the TLS session. The first common cipher found in both the server and client cipher lists will be chosen. As such, the most desired ciphers should be added at the top of the list.

The **no** form of the command removes the cipher list.

## Parameters

### *name*

Specifies the name of the server cipher list, up to 32 characters in length.

### **create**

Keyword used to create the server cipher list.

## Platforms

All

## 23.148 server-group-list

### server-group-list

## Syntax

**server-group-list** *name* [**create**]

**no server-group-list** *name*

## Context

[\[Tree\]](#) (config>system>security>tls server-group-list)

## Full Context

configure system security tls server-group-list

## Description

This command configures a list of TLS 1.3-supported group suite codes that the server sends in a server Hello message.

The **no** form of this command removes the server group list.

## Parameters

### *name*

Specifies the name of the server group list, up to 32 characters.

### **create**

Keyword used to create the server group list.

## Platforms

All

## 23.149 server-id

### server-id

#### Syntax

**server-id** **duid-en** **hex** *hex-string*

**server-id** **duid-en** **string** *ascii-string*

**server-id** **duid-ll**

**no server-id**

#### Context

[Tree] (config>service>vprn>sub-if>grp-if>ipv6>dhcp6>proxy server-id)

[Tree] (config>router>dhcp6>server server-id)

[Tree] (config>service>ies>sub-if>grp-if>ipv6>dhcp6>proxy server-id)

[Tree] (config>service>vprn>dhcp6>server server-id)

#### Full Context

configure service vprn subscriber-interface group-interface ipv6 dhcp6 proxy-server server-id

configure router dhcp6 local-dhcp-server server-id

configure service ies subscriber-interface group-interface ipv6 dhcp6 proxy-server server-id

configure service vprn dhcp6 local-dhcp-server server-id

#### Description

This command allows the operator to customize the **server-id** attribute of a DHCPv6 message (such as DHCPv6 advertise and reply). By default, the **server-id** uses DUID-ll derived from the chassis link layer address. Operators have the option to use a unique identifier by using the **duid-en** (vendor based on an enterprise number). There is a maximum length associated with the customizable hex-string and ascii-string.

The **no** form of this command reverts to the default.

#### Default

server-id duid-ll

#### Parameters

##### **hex-string**

Specifies a DUID system ID in a hex format.

**Values** 0x0 to 0xFFFFFFFF (maximum 116 hex nibbles)

##### **ascii-string**

Specifies a DUID system ID in an ASCII format, up to 58 characters.

##### **duid-ll**

Specifies that the DUID system ID is derived from the system link layer address.

**duid-en**

Specifies the enterprise number.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.150 server-ip

### server-ip

**Syntax**

**server-ip** {**eq** | **neq**} *ip-address*

**no server-ip**

**Context**

[\[Tree\]](#) (debug>app-assure>group>traffic-capture>match server-ip)

**Full Context**

debug application-assurance group traffic-capture match server-ip

**Description**

This command configures debugging on a servicer IP address.

**Platforms**

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.151 server-kex-list

### server-kex-list

**Syntax**

**server-kex-list**

**Context**

[\[Tree\]](#) (config>system>security>ssh server-kex-list)

**Full Context**

configure system security ssh server-kex-list

**Description**

This command allows the user to configure SSH KEX algorithms for SR OS as an SSH server.

An empty list is the default list that the SSH KEX advertises. The default list contains the following:

diffie-hellman-group16-sha512

diffie-hellman-group14-sha256

diffie-hellman-group14-sha1

diffie-hellman-group1-sha1

**Platforms**

## 23.152 server-mac-list

server-mac-list

**Syntax**

server-mac-list

**Context**

[\[Tree\]](#) (config>system>security>ssh server-mac-list)

**Full Context**

configure system security ssh server-mac-list

**Description**

This command allows the user to configure SSH MAC algorithms for SR OS as an SSH server.

**Platforms**

All

## 23.153 server-policy

## server-policy

### Syntax

**server-policy** *policy-name*

**no server-policy**

### Context

[\[Tree\]](#) (config>service>dynsvc>acct-1 server-policy)

[\[Tree\]](#) (config>service>dynsvc>acct-2 server-policy)

### Full Context

configure service dynamic-services dynamic-services-policy accounting-1 server-policy

configure service dynamic-services dynamic-services-policy accounting-2 server-policy

### Description

This command configures the radius server policy to be used for dynamic data services RADIUS accounting.

The **no** form of this command removes the radius server policy from the configuration. This is only allowed when there are no active dynamic data services referencing this policy.

### Parameters

***policy-name***

Specifies the name of the radius server policy.

**Values** Up to 32 characters maximum

### Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## server-policy

### Syntax

**server-policy** *policy-name*

**no server-policy**

### Context

[\[Tree\]](#) (config>service>dynsvc>plcy>auth server-policy)

### Full Context

configure service dynamic-services dynamic-services-policy authentication server-policy

## Description

This command configures the RADIUS server policy to be used for RADIUS authentication of data-triggered dynamic services.

Local authentication and RADIUS authentication are mutually exclusive.

The **no** form of this command removes the server policy from the configuration and disables RADIUS authentication.

## Parameters

### *policy-name*

Specifies a RADIUS server policy name, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.154 server-port

### server-port

## Syntax

**server-port** {**eq** | **neq** | **gt** | **lt**} *port-num*

**server-port** {**eq** | **neq**} **range** *start-port-num end-port-num*

**server-port** {**eq**} {*port-num* | **range** *start-port-num end-port-num*} {**first-packet-trusted** | **first-packet-validate**}

**server-port** {**eq** | **neq**} **port-list** *port-list-name*

**server-port** {**eq**} **port-list** *port-list-name* {**first-packet-trusted** | **first-packet-validate**}

**no server-port**

## Context

[\[Tree\]](#) (config>app-assure>group>policy>app-filter>entry server-port)

## Full Context

configure application-assurance group policy app-filter entry server-port

## Description

This command specifies the server TCP or UDP port number to use in the application definition.

The **no** form of this command restores the default (removes server port number from application criteria defined by this app-filter entry).

## Default

no server-port (the server port is not used in the application definition)

## Parameters

### **eq**

Specifies that the value configured and the value in the flow are equal.

### **neq**

Specifies that the value configured differs from the value in the flow.

### **gt**

Specifies all port numbers greater than server-port-number match.

### **lt**

Specifies all port numbers less than server-port-number match.

### **port-list-name**

Specifies a named port list containing a set or range of ports.

### **port-num**

Specifies a valid server port number.

**Values** 0 to 65535

### **start-port-num, end-port-num**

Specifies the starting or ending port number.

**Values** 0 to 65535

### **Server Port Options:**

The following options are available:

- **No option specified:** TCP/UDP port applications with full signature verification:
  - AA ensures that other applications that can be identified do not run over a well-known port.
  - Application-aware policy applied once signature-based identification completes (likely requiring several packets).
- **first-packet-validate:** TCP/UDP trusted port applications with signature verification:
  - Application identified using well known TCP/UDP port based filters and re-identified once signature identification completes.
  - AA policy applied from the first packet of a flow while continuing signature-based application identification. Policy re-evaluated once the signature identification completes, allowing to detect improper/unexpected applications on a well-known port.
- **first-packet-trusted:** TCP/UDP trusted port applications - no signature verification:
  - Application identified using well known TCP/UDP port based filters only.
  - Application Aware policy applied from the first packet of a flow.
  - No signature processing assumes operator/customer trusts that no other applications can run on the well-known TCP/UDP port (statistics collected against trusted\_tcp or trusted\_udp protocol).

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## server-port

### Syntax

**server-port** {**eq** | **neq**} *port-num*

**no server-port**

### Context

[\[Tree\]](#) (debug>app-assure>group>traffic-capture>match server-port)

### Full Context

debug application-assurance group traffic-capture match server-port

### Description

This command configures debugging on a server port.

## Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

## 23.155 server-shutdown

## server-shutdown

### Syntax

[**no**] **server-shutdown**

### Context

[\[Tree\]](#) (config>system>security>ssh server-shutdown)

### Full Context

configure system security ssh server-shutdown

### Description

This command enables the SSH servers running on the system.

### Default

no server-shutdown

## Platforms

All

## 23.156 server-signature-list

```
server-signature-list
```

### Syntax

```
server-signature-list name [create]
```

```
no server-signature-list name
```

### Context

[\[Tree\]](#) (config>system>security>tls server-signature-list)

### Full Context

```
configure system security tls server-signature-list
```

### Description

This command configures a list of TLS 1.3-supported signature suite codes for the digital signature that the server sends in a server Hello message.

The **no** form of this command removes the server signature list.

### Parameters

*name*

Specifies the name of the server signature list, up to 32 characters.

**create**

Keyword used to create the server signature list.

## Platforms

All

## 23.157 server-timeout

```
server-timeout
```

### Syntax

```
server-timeout seconds
```

```
no server-timeout
```

## Context

[\[Tree\]](#) (config>port>ethernet>dot1x server-timeout)

## Full Context

configure port ethernet dot1x server-timeout

## Description

This command configures the period during which the router waits for the RADIUS server to respond to its access request message. When this timer expires, the router will re-send the access request message, up to the specified number times.

The **no** form of this command returns the value to the default.

## Default

server-timeout 30

## Parameters

*seconds*

Specifies the server timeout period, in seconds.

**Values** 1 to 300

## Platforms

All

## 23.158 server-tls-profile

### server-tls-profile

## Syntax

**server-tls-profile** *name* [create]

**no server-tls-profile** *name*

## Context

[\[Tree\]](#) (config>system>security>tls server-tls-profile)

## Full Context

configure system security tls server-tls-profile

## Description

This command creates a TLS server profile. This profile can be used by applications that support TLS for encryption. The applications should not send any PDUs until the TLS handshake has been successful.

The **no** form of the command removes the TLS server profile.

### Parameters

#### *name*

Specifies the name of the TLS server profile, up to 32 characters in length.

#### **create**

Keyword used to create the TLS server profile.

### Platforms

All

## 23.159 server6

### server6

### Syntax

**server6** *ipv6-address*

**no server6**

### Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe>host server6)

### Full Context

configure subscriber-mgmt local-user-db ipoe host server6

### Description

This command allows DHCP6 server selection based on the host entry in LUDB.

The configured DHCP6 server IP address must reference one of the v6 addressees configured under the **config>service>vprn>sub-if>grp-if>ipv6>dhcpv6>relay** or **config>service>ies>sub-if>grp-if>ipv6>dhcpv6>relay** context.

The **no** form of this command reverts to the default.

### Parameters

#### *ipv6-address*

Specifies the retailer service ID.

#### Values

ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H

d: [0 to 255]D

## 23.161 service

service

### Syntax

**service** *service-id*

**no service**

### Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe>host>msap-defaults service)

[\[Tree\]](#) (config>service>vpls>sap>msap-defaults service)

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ppp>host>msap-defaults service)

## Full Context

configure subscriber-mgmt local-user-db ipoe host msap-defaults service  
 configure service vpls sap msap-defaults service  
 configure subscriber-mgmt local-user-db ppp host msap-defaults service

## Description

This command sets default service for all subscribers created based on trigger packets received on the given capture SAP in case the corresponding VSA is not included in the RADIUS authentication response. This command is applicable to capture SAP only.

The **no** form of this command reverts to the default.

## Parameters

### *service-id*

Specifies the service ID as an integer or a name.

**Values**    *service-id* - 1 to 2147483648  
               *service-name* - up to 64 characters

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

- configure subscriber-mgmt local-user-db ppp host msap-defaults service
- configure subscriber-mgmt local-user-db ipoe host msap-defaults service

All

- configure service vpls sap msap-defaults service

## service

## Syntax

**service** *service-id*

**no service**

## Context

**[Tree]** (config>service>ies>sub-if>grp-if>bonding-parameters>connection service)

**[Tree]** (config>service>vprn>sub-if>grp-if>bonding-parameters>connection service)

## Full Context

configure service ies subscriber-interface group-interface bonding-parameters connection service  
 configure service vprn subscriber-interface group-interface bonding-parameters connection service

## Description

This command binds a specified service to this connection. ESM subscribers created under this service are eligible for bonding in this group interface and are identified by the provisioned connection ID. All connections in one bonding context must use subscriber interfaces in separate router instances.

The **no** form of this command removes the service from this bonding context, which can only be done when bonding is administratively disabled.

## Parameters

### *service-id*

Specifies the service ID of the service containing this subscriber interface.

## service

## Syntax

**service**

## Context

[\[Tree\]](#) (config>cflowd>collector>exp-filter>if-list service)

## Full Context

configure cflowd collector export-filter interface-list service

## Description

Commands in this context configure which service interfaces' flow data is being sent to this collector

## Platforms

## service

## Syntax

**service** *service-id* **preference** *preference*

**no service** *service-id*

## Context

[\[Tree\]](#) (config>router>dns>redirect-vprn service)

## Full Context

configure router dns redirect-vprn service

## Description

This command configures the VPRN DNS redirection for the specified service.

The **no** form of this command removes the service from the VPRN DNS resolution configuration.

## Parameters

### *service-id*

Specifies the unique service identification number or string identifying the service in the service domain.

**Values** *service-id*: 1 to 2147483647  
*svc-name*: 64 characters maximum

### *preference*

Specifies the service preference.

**Values** 0 to 255

## Platforms

All

## service

## Syntax

[no] **service** *service-id*

## Context

[\[Tree\]](#) (config>log>services-all-events service)

## Full Context

configure log services-all-events service

## Description

This command enables access to the entire system-wide set of log events (VPRN and non-VPRN) in the logs configured within the management VPRN specified by the service ID.

The **no** form of the command enables the display of VPRN events only.

## Parameters

### *service-id*

Identifies the VPRN.

**Values** {*id* | *svc-name*}

*id*: 1 to 2147483647  
*svc-name*: up to 64 characters

## Platforms

All

## service

## Syntax

**service** *service-id*

**service name** *service-name*

**no service**

## Context

[\[Tree\]](#) (config>system>security>pki>ca-profile>ocsp service)

## Full Context

configure system security pki ca-profile ocs service

## Description

This command specifies the service or routing instance that used to contact OCSP responder. This applies to OCSP responders that either configured in CLI or defined in AIA extension of the certificate to be verified.

The responder-url will also be resolved by using the DNS server configured in the configured routing instance.

With VPRN services, the system checks whether the specified service ID or service name is an existing VPRN service at the time of CLI configuration. Otherwise the configuration fails.

## Parameters

### *service-id*

Specifies an existing service ID to be used in the match criteria.

This variant of this command is only supported in 'classic' configuration-mode (**configure system management-interface configuration-mode classic**). The **service name** *service-name* variant can be used in all configuration modes.

**Values** service-id: 1 to 2147483647 base-router: 0

### *name service-name*

Identifies the service, up to 64 characters.

## Platforms

All

## 23.162 service-carving

### service-carving

#### Syntax

**service-carving**

#### Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg service-carving)

#### Full Context

configure service system bgp-evpn ethernet-segment service-carving

#### Description

Commands in this context configure service-carving in the Ethernet-Segment. The service-carving algorithm determines which PE is the Designated Forwarder (DF) in a specified Ethernet Segment and for a specific service.

#### Platforms

All

## 23.163 service-context-id

### service-context-id

#### Syntax

**service-context-id** *name*

**no service-context-id**

#### Context

[\[Tree\]](#) (config>subscr-mgmt>diam-appl-plcy>gy>include-avp service-context-id)

#### Full Context

configure subscriber-mgmt diameter-application-policy gy include-avp service-context-id

#### Description

This command configures the value of the service context ID AVP.

The **no** form of this command returns the command to the default setting.

## Parameters

### *name*

Specifies the service context ID AVP value, up to 32 characters.

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

## 23.164 service-id

### service-id

## Syntax

**service-id** *service-id*

**no service-id**

## Context

[\[Tree\]](#) (config>subscr-mgmt>loc-user-db>ipoe>host>host-ident service-id)

## Full Context

configure subscriber-mgmt local-user-db ipoe host host-identification service-id

## Description

This command specifies the service ID to match for a host lookup. When the LUDB is accessed using a DHCPv4 server, the SAP ID is matched against the Nokia vendor-specific sub-option in DHCP Option 82.

The **no** form of this command removes the service ID from the configuration.

## Parameters

### *service-id*

Specifies an existing service ID or service name.

**Values** *service-id* — 1 to 2147483647

*service-name* — up to 64 characters

## Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

### service-id

## Syntax

**[no] service-id**

## Context

## Full Context

configure redundancy multi-chassis peer mc-ring ring in-band-control-path service-id

configure redundancy multi-chassis peer mc-ring l3-ring in-band-control-path service-id

## Description

This command specifies the service ID if the interface used for the inband control connection belongs to a VPRN service. If not specified, the service-id is zero and the interface must belong to the Base router. This command supersedes the configuration of a service name.

The no form of this command removes the service ID from the IBC configuration.

## Parameters

**service-id**

Specifies a service ID or an existing service name.

**Values** 1 to 214748364 - Only supported in 'classic' configuration-mode  
(**configure>system>management-interface>configuration-mode classic**)

## Platforms

All

**service-id**

## Syntax

**service-id** *service-id*

**no service-id**

## Context

**[Tree]** (config>redundancy>mc>peer>mcr>node>cv service-id)

**[Tree]** (config>redundancy>mc>peer>mcr>l3-ring>node>cv service-id)

## Full Context

configure redundancy multi-chassis peer mc-ring ring ring-node connectivity-verify service-id

configure redundancy multi-chassis peer mc-ring l3-ring ring-node connectivity-verify service-id

## Description

This command specifies the service ID of the SAP used for the ring-node connectivity verification of this ring node. This command supersedes the configuration of a service name.

The **no** form of the command removes the service ID from the CV configuration.

## Default

no service-id

## Parameters

**service-id**

Specifies the service ID or an existing service name.

**Values** 1 to 2147483647- Only supported in "classic" configuration mode  
(**configure system management-interface configuration-mode classic**)

## Platforms

All

**service-id**

## Syntax

**service-id**

## Context

[\[Tree\]](#) (config>service>system>bgp-evpn>eth-seg service-id)

## Full Context

configure service system bgp-evpn ethernet-segment service-id

## Description

## Platforms

All

## 23.165 service-id-lag-hashing

### service-id-lag-hashing

## Syntax

[no] service-id-lag-hashing

## Context

[\[Tree\]](#) (config>system>load-balancing service-id-lag-hashing)

## Full Context

configure system load-balancing service-id-lag-hashing

## Description

This command enables enhanced VLL LAG service ID hashing. This command improves the LAG spraying of VLL service packets and is applied only when both ECMP and LAG hashing are performed by the same router. By default, the ECMP interface and LAG link for all packets on the VLL service are selected based on a direct modulo operation of the service ID. This command enhances distribution and hashes the service ID prior to the LAG link modulo operation when an ECMP link modulo operation is performed.

The **no** form of the command preserves the default behavior of VLL LAG service ID hashing.

## Default

no service-id-lag-hashing

## Platforms

All

## 23.166 service-id-range

### service-id-range

#### Syntax

**service-id-range start** *service-id* **end** *service-id*  
**no service-id-range**

#### Context

[\[Tree\]](#) (config>service>md-auto-id service-id-range)

#### Full Context

configure service md-auto-id service-id-range

#### Description

This command specifies the range of IDs used by SR OS to automatically assign an ID to services that are created in model-driven interfaces without an ID explicitly specified by the user or client.

A service created with an explicitly-specified ID cannot use an ID in this range. In the classic CLI and SNMP, the ID range cannot be changed while objects exist inside the previous or new range. In MD interfaces, the range can be changed, which causes any previously existing objects in the previous ID range to be deleted and re-created using a new ID in the new range.

The **no** form of this command removes the range values.

See the **config>service md-auto-id** command for further details.

#### Default

no service-id-range

#### Parameters

##### **start** *service-id*

Specifies the lower value of the ID range. The value must be less than or equal to the **end** value.

**Values** 1 to 2147483647

##### **end** *service-id*

Specifies the upper value of the ID range. The value must be greater than or equal to the **start** value.

**Values** 1 to 2147483647

#### Platforms

All

## 23.167 service-mtu

### service-mtu

#### Syntax

**service-mtu** *octets*

**no service-mtu**

#### Context

**[Tree]** (config>service>vpls service-mtu)

**[Tree]** (config>service>template>vpls-template service-mtu)

#### Full Context

configure service vpls service-mtu

configure service template vpls-template service-mtu

#### Description

This command configures the service payload (Maximum Transmission Unit – MTU), in bytes, for the service. This MTU value overrides the service-type default MTU. The **service-mtu** defines the payload capabilities of the service. It is used by the system to validate the SAP and SDP binding's operational state within the service.

The service MTU and a SAP's service delineation encapsulation overhead (4 bytes for a dot1q tag) is used to derive the required MTU of the physical port or channel on which the SAP was created. If the required payload is larger than the port or channel MTU, then the SAP will be placed in an inoperative state. If the required MTU is equal to or less than the port or channel MTU, the SAP will be able to transition to the operative state.

When binding an SDP to a service, the service MTU is compared to the path MTU associated with the SDP. The path MTU can be administratively defined in the context of the SDP. The default or administrative path MTU can be dynamically reduced due to the MTU capabilities discovered by the tunneling mechanism of the SDP or the egress interface MTU capabilities based on the next hop in the tunnel path. If the service MTU is larger than the path MTU, the SDP binding for the service will be placed in an inoperative state. If the service MTU is equal to or less than the path MTU, then the SDP binding will be placed in an operational state.

If a service MTU, port or channel MTU, or path MTU is dynamically or administratively modified, then all associated SAP and SDP binding operational states are automatically re-evaluated.

For i-VPLS and Epipes bound to a b-VPLS, the service-mtu must be at least 18 bytes smaller than the b-VPLS service MTU to accommodate the PBB header.

The **no** form of this command returns the default **service-mtu** for the indicated service type to the default value.

#### Default

service-mtu 1514

## Parameters

### octets

The following table displays MTU values for specific VC types

VC-Type	Example Service MTU	Advertised MTU
Ethernet	1514	1500
Ethernet (with preserved dot1q)	1518	1504
VPLS	1514	1500
VPLS (with preserved dot1q)	1518	1504
VLAN (dot1p transparent to MTU value)	1514	1500
VLAN (qinq with preserved bottom qtag)	1518	1504

The size of the MTU in octets, expressed as a decimal integer

**Values** 1 to 9194
