| Description | This command assigns a preconfigured LAG link map profile to a SAP or network interface configured on a LAG or a PW port that exists on a LAG. After an operator |

assigns a LAG link map profile, the system rehashes the SAP or network interface egress traffic over the LAG as required by the new configuration.

If the LAG link map profile for a SAP or network interface is deleted, the system reverts back to per-flow hashing.

| Tree | soft-quota-exhausted-filter |
| Description | This command applies a filter when a soft volume quota is reached. The filter replaces the currently applied filter (which can be preconfigured using the ip-filter command in the configure service vprn subscriber-interface group-interface wlan-gw vlan-range dsm ingress ip-filter context or be set using a RADIUS CoA message) for the UE upon quota exhaustion. If the quota is extended using a RADIUS CoA message, the filter is automatically reverted. Configuration changes apply only to new DSM UEs and not to existing UEs. |

Specifying the GI address allows the user to choose a secondary address. For group interfaces, a GI address must be specified under the group interface DHCP context or subscriber interface DHCP context for DHCP to function.</p> |

| Description | This command sets the local termination point for the BFD session to allow for fast timers down to 10 ms granularity.
The options to specify where the BFD session runs are: <ul style="list-style-type: none"> • auto (default) – the system chooses and uses the line card CPU only for single-hop BFD sessions with timer intervals equal to or greater than 100ms. All others are placed on the cpm-np. • cpm-np – BFD session runs on the FP complex associated with the CPM. This is either the FP on the CPM or the one elected on smaller systems. • fp – BFD session runs on the line card CPU. This option can only be used for single-hop BFD sessions with timers equal to or greater than 100ms. |
| Default | auto |
| Options | cpm-np, auto, fp |

|----------------|---|
| Synopsis | Enter the monitor-oper-group list instance |
| Context | configure service vprn <i>string</i> subscriber-mgmt up-resiliency monitor-oper-group <i>reference</i> |
| Tree | monitor-oper-group |
| Description | Commands in this context define parameters to derive the service health based on monitored operational groups. The BNG UPF sends the health value to the BNG CPF. The BNG CPF uses the value to determine the need for a BNG UPF status change (active or standby).

Note:
The following is only applicable for the configure service vpls capture-sap context. If the configured groups are not the same for all capture SAPs sharing the same underlying port or LAG, the configuration of a Layer 2 access ID alias is required, or else the system chooses arbitrarily one set of configured groups. |

| | |
|----------------|---|
| Synopsis | Enter the accu-stats-policy list instance |
| Context | configure subscriber-mgmt accu-stats-policy <i>string</i> |
| Tree | accu-stats-policy |
| Description | <p>Commands in this context configure a storage policy for cumulative statistics for subscribers.</p> <p>The policy defines the direction for the policer or the queue to be stored.</p> <p>The policy stores subscriber statistics even if the subscriber session has ended. The subscriber statistics can be viewed even if the subscriber is offline.</p> <p>When the subscriber session ends, the statistics are added to the past statistics stored in memory so that all previous session statistics are accumulated. The accumulated statistics are not persistent; they are only stored in memory and reset to zero when the chassis reboots.</p> |
| Max. Instances | 32 |
| Introduced | 16.0.R1 |
| Platforms | 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR |

| | |
|-------------|---|
| Synopsis | Enter the ancp-policy list instance |
| Context | configure subscriber-mgmt ancp ancp-policy <i>string</i> |
| Tree | ancp-policy |
| Description | <p>Commands in this context configure the specified ANCP policy, which can be associated with either an ANCP string (static) or a subscriber-profile (dynamic), and define the behavior of hosts belonging to these profiles.</p> <p>ANCP policies control rates and subscribers based on port-up/port-down messages from the access node. When configured, the node stops SHCV to a host that is part of a port that is down (by port-down message). When a port-up message is received for the port that was down, the node initiates the SHCV process immediately to verify connectivity.</p> <p>When ANCP is used with ESM, all hosts of a subscriber are updated with the ANCP string last associated with the subscriber.</p> |

| | |
|-------------|--|
| Synopsis | Constant rate reduction to specified DSLAM rate |
| Context | configure subscriber-mgmt ancp ancp-policy <i>string</i> egress rate-reduction <i>number</i> |
| Tree | rate-reduction |
| Description | This command configures a constant rate reduction to the rate specified by the DSLAM. This setting is used if the node must adjust the rate to a value that is offset (for example by a fixed multicast dedicated bandwidth) compared to the total available on the DSLAM. The rate is calculated as:

$\text{DSLAM_RATE} * (\text{adjustment rate})/100 - (\text{rate reduction})$ |

| | |
|-------------|--|
| Synopsis | Maximum sessions per Agent Circuit ID and per SAP |
| Context | configure subscriber-mgmt ppp-policy <i>string</i> max-sessions-per-cid limit <i>number</i> |
| Tree | limit |
| Description | <p>This command configures the maximum number of PPPoE sessions that can be active with the same Agent Circuit ID on the same SAP or MSAP. This limit is enforced in the discovery phase, prior to PAP or CHAP authentication, based on the Agent Circuit ID sub-option present in the vendor-specific PPPoE access loop identification tag added in PADI and PADR messages by a PPPoE intermediate agent.</p> <p>PPPoE sessions without an Agent Circuit ID are not subject to the configured limit; however, sessions without an Agent Circuit ID can only be established when the allow-sessions-without-cid command is configured to true.</p> |
| Range | 1 to 8190 |
| Notes | This element is mandatory. |

legacy-dns-nbns *boolean*

Synopsis Restrict authentication origins for name servers

Context **configure** [subscriber-mgmt](#) [system-behavior](#) **legacy-dns-nbns** *boolean*

Tree [legacy-dns-nbns](#)

Description When configured to **true**, this command enables legacy DNS NBNS behavior, which restricts the supported default extended authentication origins for DNS and NBNS name servers. The main differences include:

- only support DHCP server as origin for DHCP relay: IPoE DHCPv4/DHCPv6 and PPPoE DHCPv6
- Local Address Assignment (LAA) is highest priority origin: IPoE and PPPoE SLAAC DNSv6 and PPPoE DNSv4
- no default DNS for IPoE DHCPv4 proxy

When configured to **false**, this command reverts to the recommended default extended DNS and NBNS name server origin priorities.

| | |
|------------|---|
| Synopsis | Enable the wlan-gw-group context |
| Context | configure subscriber-mgmt wlan-gw queries ue <i>string</i> wlan-gw-group |
| Tree | wlan-gw-group |
| Introduced | 19.5.R1 |
| Platforms | 7750 SR, 7750 SR-e, 7750 SR-s, VSR |

id *number*

| | |
|------------|--|
| Synopsis | WLAN-GW ISA group ID |
| Context | configure subscriber-mgmt wlan-gw queries ue <i>string</i> wlan-gw-group id <i>number</i> |
| Tree | id |
| Range | 1 to 4 |
| Notes | This element is mandatory. |
| Introduced | 19.5.R1 |
| Platforms | 7750 SR, 7750 SR-e, 7750 SR-s, VSR |

member number

| | |
|------------|--|
| Synopsis | The member of the WLAN-GW ISA group |
| Context | configure subscriber-mgmt wlan-gw queries ue <i>string</i> wlan-gw-group member <i>number</i> |
| Tree | member |
| Range | 1 to 1024 |
| Introduced | 19.5.R1 |
| Platforms | 7750 SR, 7750 SR-e, 7750 SR-s, VSR |

virtual-chassis-identifier string

| | |
|---------------|---|
| Synopsis | WLAN Gateway virtual chassis ID or dual homing key |
| Context | configure subscriber-mgmt wlan-gw virtual-chassis-identifier <i>string</i> |
| Tree | virtual-chassis-identifier |
| String Length | 1 to 16 |
| Introduced | 16.0.R4 |
| Platforms | 7750 SR, 7750 SR-e, 7750 SR-s, VSR |

| Synopsis | Send Grace TLVs for soft reset graceful recovery events |
| Context | configure system efm-oam grace-tx <i>boolean</i> |
| Tree | grace-tx |

| | |
|-------------|---|
| Description | <p>When configured to true, the system sends the Nokia Vendor specific Grace TLV in the information PDU after an ISSU or a soft reset. The Grace TLV informs a remote peer to ignore the negotiated interval and multiplier and instead use the new timeout interval.</p> <p>By default, the command is disabled at the system level and enabled at the port level. Both the system and port level must be enabled to support grace on a specific port. When configured to true, the EFM-OAM protocol does not enter a non-operational state when both nodes acknowledge the grace function. This feature minimizes service interruption by giving the restarting router time to become operationally and administratively up within the grace period.</p> <p>The peer receiving the Grace TLV must be able to parse and process the vendor-specific messaging. Do not configure grace if the Nokia Vendor Specific Grace TLV is not supported on the remote peer.</p> <p>When configured to false, the Nokia Vendor Specific Grace TLV is not sent.</p> |

custom-type *string*

| | |
|---------------|--|
| Synopsis | Custom string for target type |
| Context | configure system grpc-tunnel tunnel <i>string</i> handler <i>string</i> target-type custom-type <i>string</i> |
| Tree | custom-type |
| Description | This command configures a custom string for the target type. This string can correspond to specific values used by the gRPC tunnel protocol, such as GNMI_GNOI or SSH. If a custom string is defined, the gRPC tunnel client must specify the string to request a session for that handler. The string must be unique within a tunnel. |
| String Length | 1 to 64 |

configuration-backups *number*

| | |
|-------------|--|
| Synopsis | Maximum number of configuration versions maintained |
| Context | configure system management-interface configuration-save configuration-backups <i>number</i> |
| Tree | configuration-backups |
| Description | This command configures the maximum number of saved configuration file versions the router maintains.

When the configuration is saved, configuration file names are appended with a numeric extension. Each subsequent configuration save creates a new configuration file version with an incremented numeric extension until the maximum count is reached, after which the next configuration save overwrites the oldest file version.

Each persistent index file is updated at the same time as the associated configuration file. The system synchronizes the active and standby CPM for all configurations and their associated persistent index files. |
| Range | 1 to 200 |

port number

Synopsis Port on which NETCONF server listens for connections

Context **configure system management-interface netconf port number**

Tree [port](#)

Description This command specifies the port on which the SR OS NETCONF server listens for new connections. One port can be configured for NETCONF management.

The configured port applies to both non-VPRN and VPRN management. New NETCONF connections are able to use the configured port.

For NETCONF connections not using VPRN management, active NETCONF connections are not disconnected if the connection port changes. For NETCONF connections using VPRN management, active NETCONF connections are disconnected if the connection port changes.

Platforms All

asynchronous-execution (*number* | *keyword*)

Synopsis Timeout for asynchronous operation execution

Context **configure** [system management-interface operations global-timeouts asynchronous-execution](#) (*number* | *keyword*)

Tree [asynchronous-execution](#)

Description This command configures the period of time that operations launched as “asynchronous” are allowed to execute before being automatically stopped by the SR OS.

An asynchronous operation is not deleted from the system when it is stopped. See the **asynchronous-retention** command.

If a specific execution timeout is not included in the request for a particular asynchronous operation, this system-level timeout applies.

Note: This execution timeout is part of the general global operations infrastructure and is separate and independent from any operation-specific timeouts (for example, the **ping** operation also has its own timeout parameter).

If a specific retention timeout is not included in the request for a particular asynchronous operation, this system-level timeout applies.

| | |
|----------|--|
| Synopsis | Schema path URL |
| Context | configure system management-interface schema-path <i>string</i> |
| Tree | schema-path |

| | |
|---------------|---|
| Description | This command specifies the schema path where the SR OS YANG modules can be placed by the user before using a <get-schema> request. Nokia recommends that the URL string not exceed 135 characters for the <get-schema> request to work correctly with all schema files.

If this command is not configured, the software upgrade process manages the YANG schema files to ensure the schema files are synchronized with the software image on both the primary and standby CPM. |

admin-state *keyword*

| | |
|-------------|---|
| Synopsis | Administrative state of the SNMP agent |
| Context | configure system management-interface snmp admin-state <i>keyword</i> |
| Tree | admin-state |
| Description | This command administratively enables or disables SNMP agent operations. Disabling SNMP does not prevent the agent from sending SNMP notifications to configured SNMP trap destinations.

In classic and mixed configuration mode, the agent is administratively disabled in the event of a reboot when the processing of the configuration file fails to complete or when an SNMP persistent index file fails while the bof system persistent-indices command is set to true . This prevents an SNMP-based management system from accessing and possibly synchronizing with a partially booted or incomplete network element. This auto-disable behavior is not applicable to model-driven configuration mode. |
| Default | enable |
| Options | enable, disable |
| Introduced | 16.0.R1 |
| Platforms | All |

engine-id *string*

| | |
|---------------|--|
| Synopsis | SNMP engine ID that identifies the SNMPv3 node |
| Context | configure system management-interface snmp engine-id <i>string</i> |
| Tree | engine-id |
| Description | <p>This command sets the SNMP engine ID that uniquely identifies the SNMPv3 node.</p> <p>If unconfigured, the system uses an engine ID based on the information from the system backplane.</p> <p>If the SNMP engine ID is changed, the current configuration must be saved and a reboot must be executed. Otherwise, the previously configured SNMP communities and logger trap-target notify communities will not be valid for the new engine ID.</p> <p>Note: Changing the SNMP engine ID invalidates all SNMPv3 MD5 and SHA security digest keys, which may render the node unmanageable.</p> <p>When replacing a chassis, configure the new router to use the same engine ID as the previous router. This preserves SNMPv3 security keys and allows management stations to use their existing authentication keys for the new router.</p> <p>Ensure that the engine ID of each router is unique. A management domain can only maintain one instance of a specific engine ID.</p> |

| Synopsis | Maximum process duration before responses are returned |
|----------|--|

| | |
|-------------|---|
| Context | configure system management-interface snmp max-bulk-duration <i>number</i> |
| Tree | max-bulk-duration |
| Description | This command sets the maximum duration to process an SNMP request before bulk responses are returned to avoid a timeout on the management system when a lot of information is returned in the response. |
| Range | 100 to 5000 |
| Units | milliseconds |
| Introduced | 23.3.R1 |

admin-state *keyword*

| | |
|-------------|--|
| Synopsis | Administrative state of SNMP streaming |
| Context | configure system management-interface snmp streaming admin-state <i>keyword</i> |
| Tree | admin-state |
| Description | This command enables or disables the proprietary SNMP request and response bundling as well as the TCP-based transport mechanism for optimizing network management of the router nodes. In higher latency networks, synchronizing router MIBs from network management using streaming takes less time than synchronizing using |

| | |
|------------|--|

| | |
|-------------|--|
| Synopsis | Support access to combined Nokia YANG models |
| Context | configure system management-interface yang-modules nokia-combined-modules <i>boolean</i> |
| Tree | nokia-combined-modules |
| Description | When configured to true , the system supports the combined Nokia YANG files for both configuration and state data in the NETCONF server.
When the system is operating in classic configuration mode, attempts to access (read or write) the configuration using the Nokia configuration modules or namespace via NETCONF result in errors, even if this command is set to true .
When configured to false , access to the combined Nokia YANG files is not supported.
This command and the nokia-submodules command cannot both be set to true at the same time. |
| Introduced | 16.0.R4 |

| Description | This command configures the profile to be used for the internal PTP clock. It defines the Best Master Clock Algorithm (BMCA) behavior.

Profile changes may affect the settings of other configuration elements, such as the clock type and default settings for the delay interval, announce interval, and the Sync interval.

The following clock types are supported for the indicated profiles: <ul style="list-style-type: none"> • G.8265.1: slave only, master only • IEEE 1588 2008: slave only, master only, boundary • G.8275.1: slave only, boundary, master only (master only, only if the platform includes an embedded GNSS receiver) • G.8275.2: slave only, boundary, master only (master only, only if the platform includes an embedded GNSS receiver) |

| | |
|-------------|--|
| Synopsis | Enter the monitor-ptsf-unusable context |
| Context | configure system ptp ptsf monitor-ptsf-unusable |
| Tree | monitor-ptsf-unusable |
| Description | <p>Commands in this context configure monitoring of neighbor clocks for the PTSF-unusable state (condition) when the profile is set to g8275dot1-2014.</p> <p>When administratively enabled, the local clock monitors the noise level of PTP event messages between external neighbor PTP ports and the local clock. If it detects a high variation in the network path between the external neighbor port and the local port, it considers the neighbor port unusable. Announce messages from the neighbor are discarded and excluded from the BMCA and the port cannot be selected as the parent clock. The unusable condition must be manually cleared.</p> <p>When administratively disabled, the monitor PTSF function of the PTP clock clears PTSF-unusable states from all neighbor PTP ports. If no PTP messages are received from a neighbor for 15 minutes, the neighbor information is purged and the PTSF-unusable state is cleared.</p> |

| Context | configure system ptp router <i>string peer</i> (<i>ipv4-address-no-zone</i> <i>ipv6-address-no-zone</i>)
local-priority <i>number</i> |
| Tree | local-priority |
| Description | This command configures the local priority for the peer, which is used to choose between PTP masters in the best master clock algorithm (BMCA). This setting applies |

when the PTP profile is configured for G.8265.1, G.8275.1, or G.8275.2 and is ignored for any other profile.

For G.8265.1, this command configures the priority used to choose between master clocks with the same quality (see G.8265.1 for more details).

For G.8275.1 or G.8275.2, this command configures the localPriority parameter associated with the Announce messages received from the external clocks (**ptp router peer** context). See G.8275.1 or G.8275.2 for detailed information.

| | |
|-------------|--|
| Synopsis | PTP peer interval for Sync messages in log form |
| Context | configure system ptp router <i>string peer (ipv4-address-no-zone ipv6-address-no-zone) log-sync-interval number</i> |
| Tree | log-sync-interval |
| Description | This command configures the message interval used for Sync and Delay_Resp messages that are requested during unicast negotiation to the peer. The setting controls messages sent from remote peers to the local node but the packet rate from the local node to remote peers is not affected. Remote peers may request a packet rate within the acceptable range.

The interval value is specified as the logarithm to the base 2. |
| Range | -6 to 0 |

peer-limit *number*

| | |
|-------------|---|
| Synopsis | Number of discovered peers allowed for routing instance |
| Context | configure system ptp router <i>string peer-limit number</i> |

| Description | This command specifies the maximum number of discovered peers permitted within the routing instance. This ensures that a routing instance does not consume all the possible |

discovered peers and prevents the routing instance from blocking discovered peers in other routing instances.

The sum of all peer limit values for all routing instances cannot exceed the maximum number of discovered peers supported by the system.

For IPv6, the existence of the IPv6 Fragmentation Extension Header results in a fragmented packet match.</p> <p>Matching on non-fragmented IPv4 packets occurs when all packets have the MF bit set to zero and the Fragment Offset field is also set to zero. For IPv6, the absence of an IPv6 Fragmentation Extension Header results in a non-fragmented packet match.</p> |

fragment *keyword*

| | |
|-------------|---|
| Synopsis | Match criterion based on presence of fragmented packets |
| Context | configure system security cpm-filter ipv6-filter entry <i>number</i> match fragment <i>keyword</i> |
| Tree | fragment |
| Description | This command specifies the match criterion based on the existence or absence of fragmented IP packets.
Matching on fragmented IPv4 packets occurs when all packets have either the MF (more fragment) bit set or have the Fragment Offset field of the IP header set to a non-zero value. For IPv6, the existence of the IPv6 Fragmentation Extension Header results in a fragmented packet match.
Matching on non-fragmented IPv4 packets occurs when all packets have the MF bit set to zero and the Fragment Offset field is also set to zero. For IPv6, the absence of an IPv6 Fragmentation Extension Header results in a non-fragmented packet match. |

protocol-protection

| | |
|-------------|--|
| Synopsis | Enable the protocol-protection context |
| Context | configure system security cpu-protection protocol-protection |
| Tree | protocol-protection |
| Description | When enabled, the network processor on the CPM discards all packets received for protocols that are not configured on the interface. This action helps to mitigate DoS attacks by filtering invalid control traffic before it ingresses the CPU. For example, if |

IS-IS is not configured on an interface, protocol protection discards any IS-IS packets received on the interface.

Commands in this context further define the action when the context is enabled.

source-address

Synopsis Enter the **source-address** context

Context **configure system security source-address**

Tree [source-address](#)

Description Commands in this context configure the IP source address that is used in all unsolicited packets sent by the specified applications.

This configuration applies to packets transmitted in-band (for example, a network port on an IOM) and does not apply to packets transmitted out-of-band on the management interface on the CPM Ethernet port. Packets transmitted using the CPM Ethernet port use the address of the CPM Ethernet port as the IP source address in the packet.

When a source address is specified for the PTP application, the port-based 1588 hardware timestamping assist function is applied to PTP packets matching the IPv4 address of the router interface used to ingress the SR/ESS or IP address specified in this command. If the IP address is removed, the port-based 1588 hardware timestamping assist function is only applied to PTP packets matching the IPv4 address of the router interface.

admin-password *string*

Synopsis Context to configure system passwords

Context **configure** [system](#) [security](#) [system-passwords](#) [admin-password](#) *string*

Tree [admin-password](#)

Description This command allows a user with administrative permissions to configure a password that enables a user to become an administrator.

This password is valid only for one session. When enabled, no authorization to TACACS + or RADIUS is performed and the user is locally regarded as an administrative user.

If the **admin-password** is configured in the **configure system security system-passwords admin-password** context, then any user can enter the special mode by entering the **enable** command.

enable is in the default profile. By default, all users are given access to this command.

After the **enable** command is entered, the user is prompted for a password. If the password matches, user is given unrestricted access to all commands.

The minimum length of the password is determined by the **minimum-length** command. The complexity requirements for the password are determined by the **complexity** command.

Note: This command applies to a local user, in addition to users on RADIUS, TACACS, and LDAP.

| | |
|-------------|---|
| Synopsis | Threshold of consecutive failures at reactivation |
| Context | configure test-oam icmp ping-template <i>string</i> reactivation-failure-threshold <i>number</i> |
| Tree | reactivation-failure-threshold |
| Description | This command configures the number of consecutive failures that must occur when transmitting at the reactivation interval without success before the transmission interval is changed to the standard interval. |
| Range | 1 to 10 |
| Default | 4 |
| Introduced | 20.10.R1 |
| Platforms | 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS |

| | |
|-------------|--|
| Synopsis | Ping reactivation interval |
| Context | configure test-oam icmp ping-template <i>string</i> reactivation-interval <i>number</i> |
| Tree | reactivation-interval |
| Description | This command configures the packet transmit interval used when the IP interface becomes operationally down because of a ping template failure after receiving a successful response to the previous ICMP echo request. |

| | |
|------------|--|
| Range | 1 to 60 |
| Default | 1 |
| Units | seconds |
| Introduced | 20.10.R1 |
| Platforms | 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS |

reactivation-threshold *number*

| | |
|-------------|---|
| Synopsis | Success threshold to declare inter-connectivity up |
| Context | configure test-oam icmp ping-template <i>string</i> reactivation-threshold <i>number</i> |
| Tree | reactivation-threshold |
| Description | This command configures the minimum number of consecutive successful responses of ICMP replies that must occur before the IP interface transitions from operationally down (due to ping validation failure) to operationally up. This value is a stability metric intended to prevent flapping. |
| Range | 1 to 10 |
| Default | 3 |
| Introduced | 20.10.R1 |
| Platforms | 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS |

reactivation-timeout *number*

| | |

ttl *number*

| | |
|-------------|---|
| Synopsis | TTL value for the outgoing ping packet |
| Context | configure test-oam icmp ping-template <i>string</i> tll <i>number</i> |
| Tree | ttl |
| Description | This command configures the TTL value used in the outgoing ping packet. The tested interface must be directly connected on the same subnet. |
| Range | 1 to 255 |
| Default | 1 |
| Introduced | 20.10.R1 |
| Platforms | 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS |

| | |
|-------------|---|
| Synopsis | Enter the aggregate-sample-window context |
| Context | configure test-oam link-measurement measurement-template <i>string</i> aggregate-sample-window |
| Tree | aggregate-sample-window |
| Description | Commands in this context configure the attributes of the aggregate sample window used with the measurement template assigned to an IP interface. The aggregate sample window is the collection of sample windows. |
| Introduced | 21.7.R1 |
| Platforms | 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS |

| Introduced | 21.7.R1 |
| Platforms | 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS |

absolute number

| | |
|-------------|---|
| Synopsis | Absolute delta for delay measurement reporting |
| Context | configure test-oam link-measurement measurement-template <i>string</i> aggregate-sample-window threshold absolute number |
| Tree | absolute |
| Description | This command configures the absolute minimum delta by which a new delay measurement must differ from the previously reported measurement to be reported to the routing engine.

If an absolute value is not configured the threshold is disabled. |
| Range | 1 to 100000 |
| Units | microseconds |
| Introduced | 21.7.R1 |
| Platforms | 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS |

relative number

| | |
|-------------|---|
| Synopsis | Relative delta for measurement reporting |
| Context | configure test-oam link-measurement measurement-template <i>string</i> aggregate-sample-window threshold relative number |
| Tree | relative |
| Description | This command configures the relative minimum delta by which a new delay measurement must differ from the previously reported measurement to be reported to the routing engine.

If a relative value is not configured, the threshold is disabled. |
| Range | 1 to 100 |
| Units | percent |
| Introduced | 21.7.R1 |
| Platforms | 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS |

window-integrity number

| | |
|-------------|--|
| Synopsis | Sample percentage required for window integrity report |
| Context | configure test-oam link-measurement measurement-template <i>string</i> aggregate-sample-window window-integrity number |
| Tree | window-integrity |
| Description | This command configures the percentage value that is used to determine whether the aggregate sample window is integral, by comparing the number of samples received from the sample window to the percentage configured. |

The configured percentage translates to a required sample window count that must be included in the aggregate sample window. The number of samples is computed as follows:

$$(\text{window-integrity (\%)}) \times (((\text{aggregate-sample-window length (s)}) / (\text{sample-window length (s)}))$$

If the number of samples in the aggregate sample window is equal to or greater than the computed number of required samples, the sample window has integrity and the aggregate sample window result is compared to the configured sample window thresholds.

If the count is less than the computed number of required samples, the aggregate sample window does not have integrity and the value is not considered as representative. In this case the aggregate sample window results are not compared to the configured sample window thresholds.

If this parameter is not configured, integrity checking is disabled and all results are compared to the configured thresholds.

last-reported-delay-hold *number*

| | |
|-------------|---|
| Synopsis | Time to wait to flush the last reported delay |
| Context | configure test-oam link-measurement measurement-template <i>string</i> last-reported-delay-hold <i>number</i> |
| Tree | last-reported-delay-hold |
| Description | <p>This command configures the timer that specifies the wait time before the last reported delay measurement is flushed after a link measurement test enters the operationally down state.</p> <p>The aging timer delays the flushing of the last reported delay metric to the routing engine. This timer starts a countdown to zero when an administrative function causes the operational state of the test on that specific interface to transition from up to down. If the timer expires before the operational state transitions to up, the previously reported value is flushed. The Delay Measurement Last Reported indicates "Cleared". The timestamp indicates the time of the clear event. The Triggered By indicates "Expired". If the administrative state recovers to operationally up before the expiration of the timer, the previous reported value is not flushed.</p> <p>The aging timer does not apply to failure conditions that do not affect the administrative state of the interface, for example interface failure or routing changes.</p> |
| Range | 0 1 to 86400 |
| Default | 86400 |
| Units | seconds |
| Introduced | 21.7.R1 |
| Platforms | 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS |

reporting *boolean*

| | |
|-------------|--|
| Synopsis | Report behavior for values for the configured threshold |
| Context | configure test-oam link-measurement measurement-template <i>string</i> reporting <i>boolean</i> |
| Tree | reporting |
| Description | <p>When configured to true, the system reports a reached threshold to the routing engine. Reaching a configured sample-window or aggregate-sample-window indicates a value of interest.</p> <p>When configured to false, values reaching thresholds are not reported to the routing engine. In both enabled and disabled cases, the sample-window and aggregate-sample-window information and computed values are stored on the node until overwriting occurs.</p> |
| Default | true |
| Introduced | 22.7.R1 |
| Platforms | 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS |

sample-window

| | |
|-------------|---|
| Synopsis | Enter the sample-window context |
| Context | configure test-oam link-measurement measurement-template <i>string</i> sample-window |
| Tree | sample-window |
| Description | Commands in this context configure sample window attributes used when the measurement template is assigned to an IP interface. The sample window is the collection of individual probe results over a defined period. |
| Introduced | 21.7.R1 |
| Platforms | 7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS |

multiplier *number*

| | |
|-------------|---|
| Synopsis | Multiplier of interval used for sample window length |
| Context | configure test-oam link-measurement measurement-template <i>string</i> sample-window multiplier <i>number</i> |
| Tree | multiplier |
| Description | This command configures the number of probe results that should be in the sample window. For example, a multiplier of 10 and an interval of 5 equals 50 probes being transmitted from an individual sample window. Consequently, 50 probe results are expected within the 50 second duration that the sample window is "In-progress". |

link *boolean*

Synopsis The Return Path sub-TLV specifying link

Context **configure test-oam link-measurement measurement-template** *string twamp-light return-path link* *boolean*

Tree [link](#)

Description When configured to **true**, the system includes the **return-path** TLV link. The link sub-tlv instructs a Session-Reflector configured for type **stamp** to use the receiving logical IP interface for the transmission of the response packet from the reflector to the **session-sender**. The destination of the reflected packet must be installed in the forwarding table and reachable out the IP interface or the packet is dropped by the Session-Reflector. When there are parallel non-equal cost return paths between the Session-Reflector and the Session-Sender the response packet can only be returned on the lowest cost path.

When configured to **false**, the Return Path TLV carried in the STAMP PDU is not included with the test packet.

Default false

src-udp-port *number*

Synopsis Fixed source UDP port for link measurement tests

Context **configure test-oam link-measurement measurement-template** *string twamp-light src-udp-port* *number*

Tree [src-udp-port](#)

Description This command specifies a source UDP port for link measurement tests.

Unless required, Nokia suggests that the link measurement dynamically select an available source UDP port from the dynamic range. Before a UDP port in the configurable range can be configured as a source it must be owned by the application. Use the **configure test-oam twamp twamp-light source-udp-port-pools port pool-type** command to map the port range to the application.

By default a source UDP port allocates from the dynamic range. The configuration of the source port should only be configured when required for interoperability. When the source IP, destination IP, and destination UPD port are the same for a test, the source UDP port must be different in order to uniquely identify the session.

The OAM-PM IP family of tests can only configure the source UDP port when the port pool UDP source port is configured with a pool-type oam-pm. The test-oam link-measurement measurement-template can only configure the src-udp-port when the port pool UDP source port is configured with a pool-type link-measurement. A pool-type cannot be changed if its current application is a test (either an oam-pm session or link-measurement template) and is configured to use the specified port, regardless of the administrative or operational state. 4 Deprecated and obsolete commands

This section lists the deprecated and obsolete commands in this major release.

4.1 Deprecated commands

This chapter provides a list of commands that are marked as “status deprecated” in the Nokia YANG models and the MD-CLI and should no longer be used. Only releases in which commands are initially deprecated are included in this section. If applicable, the equivalent configuration groups command is also deprecated (but not explicitly listed).

See the SR OS Software Release Notes for more information.

4.1.1 23.3.R1

subscriber-mgmt commands:

- configure subscriber-mgmt radius-accounting-policy triggered-updates gtp-mobility

4.2 Obsolete commands

This chapter provides a list of commands that are marked as “status obsolete” in the Nokia YANG models and the MD-CLI. These commands can no longer be used and are considered invalid. Only releases in which commands are initially obsoleted are included in this section. If applicable, the equivalent configuration groups command is also obsoleted (but not explicitly listed).

See the SR OS Software Release Notes for more information.

4.2.1 23.3.R1

aaa commands:

- configure aaa diameter peer-policy
- configure aaa diameter peer-policy applications
- configure aaa diameter peer-policy applications gx
- configure aaa diameter peer-policy applications gy
- configure aaa diameter peer-policy applications nasreq
- configure aaa diameter peer-policy apply-groups
- configure aaa diameter peer-policy apply-groups-exclude
- configure aaa diameter peer-policy connection-timer
- configure aaa diameter peer-policy description
- configure aaa diameter peer-policy ipv4-source-address
- configure aaa diameter peer-policy ipv6-source-address
- configure aaa diameter peer-policy name
- configure aaa diameter peer-policy origin-host
- configure aaa diameter peer-policy origin-realm
- configure aaa diameter peer-policy peer
- configure aaa diameter peer-policy peer address
- configure aaa diameter peer-policy peer admin-state
- configure aaa diameter peer-policy peer apply-groups
- configure aaa diameter peer-policy peer apply-groups-exclude
- configure aaa diameter peer-policy peer connection-timer
- configure aaa diameter peer-policy peer destination-host
- configure aaa diameter peer-policy peer destination-realm
- configure aaa diameter peer-policy peer peer-name
- configure aaa diameter peer-policy peer preference
- configure aaa diameter peer-policy peer statistics
- configure aaa diameter peer-policy peer transaction-timer

- configure aaa diameter peer-policy peer transport
- configure aaa diameter peer-policy peer transport port-number
- configure aaa diameter peer-policy peer watchdog-timer
- configure aaa diameter peer-policy proxy
- configure aaa diameter peer-policy proxy admin-state
- configure aaa diameter peer-policy proxy local-address
- configure aaa diameter peer-policy proxy mcs-peer
- configure aaa diameter peer-policy proxy mcs-peer address
- configure aaa diameter peer-policy proxy mcs-peer apply-groups
- configure aaa diameter peer-policy proxy mcs-peer apply-groups-exclude
- configure aaa diameter peer-policy proxy mcs-peer sync-tag
- configure aaa diameter peer-policy proxy router-instance
- configure aaa diameter peer-policy python-policy
- configure aaa diameter peer-policy role
- configure aaa diameter peer-policy router-instance
- configure aaa diameter peer-policy transaction-timer
- configure aaa diameter peer-policy vendor-support
- configure aaa diameter peer-policy watchdog-timer

isa commands:

- configure isa video-group ad-insert
- configure isa video-group rt-client

lag commands:

- configure lag port-weight-speed
- configure lag weight-threshold
- configure lag weight-threshold action
- configure lag weight-threshold cost
- configure lag weight-threshold value

python commands:

- configure python python-policy vsd
- configure python python-policy vsd apply-groups
- configure python python-policy vsd apply-groups-exclude
- configure python python-policy vsd script

redundancy commands:

- configure redundancy multi-chassis peer sync diameter-proxy

router commands:

- configure router interface ip-tunnel

- configure router interface ip-tunnel remote-ip
- configure router nat inside large-scale dual-stack-lite deterministic policy-map
- configure router nat inside large-scale dual-stack-lite deterministic policy-map admin-state
- configure router nat inside large-scale dual-stack-lite deterministic policy-map apply-groups
- configure router nat inside large-scale dual-stack-lite deterministic policy-map apply-groups-exclude
- configure router nat inside large-scale dual-stack-lite deterministic policy-map map
- configure router nat inside large-scale dual-stack-lite deterministic policy-map map apply-groups
- configure router nat inside large-scale dual-stack-lite deterministic policy-map map apply-groups-exclude
- configure router nat inside large-scale dual-stack-lite deterministic policy-map map first-outside-address
- configure router nat inside large-scale dual-stack-lite deterministic policy-map map from
- configure router nat inside large-scale dual-stack-lite deterministic policy-map map to
- configure router nat inside large-scale dual-stack-lite deterministic policy-map nat-policy
- configure router nat inside large-scale dual-stack-lite deterministic policy-map source-prefix
- configure router nat inside large-scale nat44 deterministic policy-map
- configure router nat inside large-scale nat44 deterministic policy-map admin-state
- configure router nat inside large-scale nat44 deterministic policy-map apply-groups
- configure router nat inside large-scale nat44 deterministic policy-map apply-groups-exclude
- configure router nat inside large-scale nat44 deterministic policy-map map
- configure router nat inside large-scale nat44 deterministic policy-map map apply-groups
- configure router nat inside large-scale nat44 deterministic policy-map map apply-groups-exclude
- configure router nat inside large-scale nat44 deterministic policy-map map first-outside-address
- configure router nat inside large-scale nat44 deterministic policy-map map from
- configure router nat inside large-scale nat44 deterministic policy-map map to
- configure router nat inside large-scale nat44 deterministic policy-map nat-policy
- configure router nat inside large-scale nat44 deterministic policy-map source-prefix

service commands:

- configure service ies video-interface adi
- configure service ies video-interface adi scte30
- configure service ies video-interface adi scte30 ad-server
- configure service ies video-interface adi scte30 ad-server address
- configure service ies video-interface adi scte30 local-address
- configure service ies video-interface adi scte30 local-address apply-groups
- configure service ies video-interface adi scte30 local-address apply-groups-exclude
- configure service ies video-interface adi scte30 local-address control
- configure service ies video-interface adi scte30 local-address data
- configure service ies video-interface rt-client

- configure service ies video-interface rt-client apply-groups
- configure service ies video-interface rt-client apply-groups-exclude
- configure service ies video-interface rt-client src-address
- configure service vprn nat inside large-scale dual-stack-lite deterministic policy-map
- configure service vprn nat inside large-scale dual-stack-lite deterministic policy-map admin-state
- configure service vprn nat inside large-scale dual-stack-lite deterministic policy-map apply-groups
