 - *origin* — route origin
 - *ip-address* — a.b.c.d
 - *ext-comm-val* — 0 to 4294967295
 - *ext-asnum* — 0 to 4294967295
 - **bandwidth** — bandwidth
 - *val-in-mbps* — 0 to 16777215
 - **ext** — extended
 - **ext:4300** — origin verification
 - *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
 - *value1* — 0000 to FFFF
 - *value2* — 0 to FFFFFFFFFF
 - **flowspec-set** — flow-spec set
 - *group-id* — 0 to 16383
- *well-known-comm* — **null | no-export | no-export-subconfed | no-advertise | blackhole**
- *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

rd

Displays information for the route distinguisher.

Values *ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val*

brief

Displays the BGP flow L2-VPN route information in a brief format.

l2vpn-type

Specifies a 12-byte Virtual Switch Instance identifier (VSI-ID) type.

Values *bgp-ad, bgp-vpls, bgp-vpws, and multi-homing*

veid

Specifies a two byte identifier that represents the local bridging instance in a VPLS and is advertised through the BGP NLRI. This value must be lower than or equal to the *max-ve-id*.

Values 0 to 4294967295

vpls-base-offset

Specifies a two byte identifier advertised through the NLRI that is used to indicate which VE-ID should use the advertised NLRI at the receiving PE according to the following rule: if the offset \leq local VE-ID \leq offset+VBS-1 (VBS = virtual block size = 8 in our implementation) then the NLRI is processed. Otherwise it is ignored. The NLRI with this offset is generated as soon as the first VE-ID value between (offset, offset + VBS-1) is advertised in the network.

Values 0 to 4294967295

site-id

Specifies a two byte identifier usually employed for the BGP multi-homing solution. This value identifies the BGP multi-homing site associated with one or a set of objects (SAPs, pseudowires, or a combination). The *site-id* must be identical between the two PEs carrying the connection to the access device multi-homed to the PEs.

Values 0 to 4294967295

Table 234: Show L2PT Fields describes show L2PT output fields.

Table 234: Show L2PT Fields

Label	Description
Service id	Displays the 24 bit (0 to 16777215) service instance identifier for the service.
L2pt-term enabled	Indicates if L2-PT-termination and/or Bpdu-translation is in use in this service by at least one SAP or spoke-SDP binding. If in use, at least one of L2PT-termination or Bpdu-translation is enabled. When enabled it is not possible to enable STP on this service.
L2pt-term disabled	Indicates that L2-PT-termination is disabled.
Bpdu-trans auto	Specifies the number of L2-PT PDUs are translated before being sent out on a port or sap.
Bpdu-trans disabled	Indicates that Bpdu-translation is disabled.

Label	Description
SAPs	Displays the number of SAPs with L2PT or BPDU translation enabled or disabled.
SDPs	Displays the number of SDPs with L2PT or BPDU translation enabled or disabled.
Total	Displays the column totals of L2PT entities.
SapId	The ID of the access point where this SAP is defined.
L2pt-termination	Indicates whether L2pt termination is enabled or disabled.
Admin Bpdu-translation	Specifies whether Bpdu translation is administratively enabled or disabled.
Oper Bpdu-translation	Specifies whether Bpdu translation is operationally enabled or disabled.
Sdpld	Specifies the SAP ID.

14.12 label

label

Syntax

label start-label [end-label | in-use | owner]

Context

[Tree] (show>router>mpls-labels label)

Full Context

show router mpls-labels label

Description

This command displays MPLS labels exchanged.

Parameters

start-label

Specifies the label value assigned at the ingress router.

end-label

Specifies the label value assigned for the egress router.

in-use

Specifies the number of in-use labels displayed.

Platforms

All

Output

The following output is an example of MPLS label information.

[Table 235: MPLS Label Output Fields](#) describes MPLS label output fields.

Table 235: MPLS Label Output Fields

Label	Description
Label	Displays the value of the label being displayed.
Label Type	Specifies whether the label value is statically or dynamically assigned.

Label	Description
Label Owner	The label owner.
In-use labels in entire range	The total number of labels being used by RSVP.

Output Example

```

Context

[\[Tree\]](#) (show>router>p2mp-sr-tree label)

Full Context

show router p2mp-sr-tree label

Description

This command displays P2MP SR label information.

Parameters

start-label

specifies the starting label value from which to display the P2MP SR label information. If only *start-label* is specified, only labels using *start-label* are displayed.

Values 32 to 524287

end-label

Specifies the ending label value for which to display P2MP SR label information.

Values 32 to 524287

in-use

Displays labels that are in use.

owner

Displays labels owned by the specified owner.

static

Displays labels owned by the static owner.

pce

Displays labels owned by the PCE.

sr-pol

Displays labels owned by the SR policy.

Platforms

Context

[\[Tree\]](#) (monitor>router>rib-api label)

Full Context

monitor router rib-api label

Description

This command monitors the egress statistics of the specified RIB-API label.

Parameters

label

Specifies the label of the specified RIB-API entry.

Values 0 to 4294967295

preference

Specifies the preference of the specified RIB-API entry.

Values 0 to 4294967295

client-tag

Specifies the client tag of the specified RIB-API entry.

Values 0 to 4294967295

egress-stats

Specifies to monitor the egress statistics of the specified RIB-API label.

seconds

Configures the interval for each display in seconds.

Values 3 to 60

repeat

Configures how many times the command is repeated.

Values 1 to 999

absolute

Displays the absolute statistics of the specified RIB-API label.

rate

Displays the rate-per-second statistics of the specified RIB-API label.

Platforms

All

label-ipv4 [**detail** | **longer**] [**aspath-regex** *reg-exp*] [**community** *comm-id*] [**origin-val** *originState*] [**leaked**]
[**leakable**] [**all**]

Context

[\[Tree\]](#) (show>router>bgp>routes label-ipv4)

Full Context

show router bgp routes label-ipv4

Description

This command displays BGP IPv4 routes.

Parameters

reg-exp

Displays routes with an AS path matching the specified regular expression *reg-exp*, up to 80 characters.

comm-id

Specifies community IDs, up to 72 characters.

Values [*as-num:comm-val* | *ext-comm* | *well-known-comm*]

where:

- *as-num* — 0 to 65535

- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:
 - *{target | origin}:ip-address:comm-val*
 - *{target | origin}:asnum:ext-comm-val*
 - *{target | origin}:ext-asnum:comm-val*
 - **bandwidth:asnum:val-in-mbps**
 - **ext:4300:ovstate**
 - **ext:value1:value2**
 - **flowspec-set:ext-asnum:group-id**
- where:
 - *target* — route target
 - *origin* — route origin
 - *ip-address* — a.b.c.d
 - *ext-comm-val* — 0 to 4294967295
 - *ext-asnum* — 0 to 4294967295
 - **bandwidth** — bandwidth
 - *val-in-mbps* — 0 to 16777215
 - **ext** — extended
 - **ext:4300** — origin verification
 - *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
 - *value1* — 0000 to FFFF
 - *value2* — 0 to FFFFFFFFFF
 - **flowspec-set** — flow-spec set
 - *group-id* — 0 to 16383
- *well-known-comm* — **null | no-export | no-export-subconfed | no-advertise | blackhole**

originState

Filters the BGP routes displayed by the command to those routes with a particular RPKI route origin validation state.

- Values**
- valid — Displays valid validation state information.
 - invalid — Displays invalid validation state information.
 - notfound — Displays state information for unfound origin values.

hunt

Displays entries for the specified route.

leaked

Filters the BGP routes displayed by the command to those routes leaked into this router's BGP instance from another BGP instance.

leakable

Filters the BGP routes displayed by the command to those routes eligible for leaking from this router's BGP instance to another BGP instance.

brief

Provides a summarized display of the set of peers to which a BGP route is advertised.

longer

Displays the specified route and subsets of the route.

detail

Display the longer, more detailed version of the output.

all

Displays output for all label BGP IPv4 routes.

Platforms

label-ipv6 [**detail** | **longer**] [**aspath-regex** *reg-exp*] [**community** *comm-id*] [**origin-val** *originState*] [**leaked**] [**leakable**] [**all**]

Context

[\[Tree\]](#) (show>router>bgp>routes label-ipv6)

Full Context

show router bgp routes label-ipv6

Description

This command displays information about BGP IPv6 routes.

Parameters

reg-exp

Displays routes with an AS path matching the specified regular expression *reg-exp*, up to 80 characters.

comm-id

Specifies community IDs, up to 72 characters.

Values [*as-num:comm-val* | *ext-comm* | *well-known-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:
 - *{target | origin}:ip-address:comm-val*
 - *{target | origin}:asnum:ext-comm-val*
 - *{target | origin}:ext-asnum:comm-val*
 - **bandwidth:asnum:val-in-mbps**
 - **ext:4300:ovstate**
 - **ext:value1:value2**
 - **flowspec-set:ext-asnum:group-id**
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**

where:

- *target* — route target
- *origin* — route origin
- *ip-address* — a.b.c.d
- *ext-comm-val* — 0 to 4294967295
- *ext-asnum* — 0 to 4294967295
- **bandwidth** — bandwidth
- *val-in-mbps* — 0 to 16777215
- **ext** — extended
- **ext:4300** — origin verification
- *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
- *value1* — 0000 to FFFF
- *value2* — 0 to FFFFFFFFFF
- **flowspec-set** — flow-spec set
- *group-id* — 0 to 16383

originState

Filters the BGP routes displayed by the command to those routes with a particular RPKI route origin validation state.

Values valid — Displays valid validation state information.
invalid — Displays invalid validation state information.
notfound — Displays state information for unfound origin values.

hunt

Displays entries for the specified route.

leaked

Filters the BGP routes displayed by the command to those routes leaked into this router's BGP instance from another BGP instance.

leakable

Filters the BGP routes displayed by the command to those routes eligible for leaking from this router's BGP instance to another BGP instance.

brief

Provides a summarized display of the set of peers to which a BGP route is advertised.

longer

Displays the specified route and subsets of the route.

detail

Display the longer, more detailed version of the output.

all

Displays output for all label BGP IPv6 routes.

Platforms

All

Output

The following output an example of BGP routes label IPv6 information.

Output Example

```
show router bgp routes label-ipv6 hunt

14.15 label-range

label-range

Syntax

label-range

Context

[Tree] (show>router>mpls-labels label-range)

Full Context

show router mpls-labels label-range

Description

This command displays the MPLS label range.

Platforms

All

Output

The following output is an example of MPLS label range information.

[Table 236: MPLS Label Range Output Fields](#) describes the MPLS label range output fields.

Table 236: MPLS Label Range Output Fields

Label	Description
Label Type	Displays the information about static-lsp , static-svc , and dynamic label types.
Start Label	The label value assigned at the ingress router.
End Label	The label value assigned for the egress router.
Aging	The number of labels released from a service which are transitioning back to the label pool. Labels are aged 15 s.
Total Available	The number of label values available.

Output Example

```
*A:Atlanta 224>show>router>mpls-labels># label-range

label-type

Syntax

label-type *start-label* [*end-label end-label*] *label-type* [*family*]

Context

[\[Tree\]](#) (show>router>ldp>bindings label-type)

Full Context

show router ldp bindings label-type

Description

This command displays LDP FEC bindings by matching labels.

Parameters

start-label

Specifies a label value to begin the display.

Values 16 to 1048575

end-label

Specifies a label value to end the display.

Values 17 to 1048575

family

Displays either IPv4 or IPv6 LDP information.

Platforms

All

Context

[\[Tree\]](#) (show lag)

Full Context

show lag

Description

This command displays Link Aggregation Group (LAG) information.

If no command line options are specified, a summary listing of all LAGs is displayed.

Parameters

lag-id

Displays only information on the specified LAG ID.

Values 1 to 800

Default Displays information for all LAG IDs.

detail

Displays detailed LAG information.

Default Displays summary information.

statistics

Displays LAG statistics information.

lACP-statistics

Displays the number of LACP PDUs transmitted and received per LAG port.

description

Displays the user-defined description for the LAG.

egress-rate-distribution

Displays the egress traffic rate in kb/s per LAG port.

port

Displays port information.

associations

Displays a list of current router interfaces to which the LAG is assigned.

interface

Displays interface information.

bfd

Displays per-member BFD information.

eth-cfm

Displays a list of Ethernet tunnels to which the LAG is assigned.

tunnel-id

Filters ETH-CFM MEP information to one tunnel.

Values 1 to 4094

flow-distribution

Displays the flow distribution per active LAG port in a given LAG. The operator can control the flow distribution per LAG by configuring a **hash-weight** value on each ports of a LAG.

Inactive LAG ports are not displayed.

per-link-hash

Displays information about a SAP or interface associated with this LAG sends traffic over a single link of a LAG auto-re-balancing as links are added and removed from this LAG.

lACP-partner

Displays LACP partner information.

link-map-profile

Displays information about a specified LAG link map profile.

Values 1 to 64

sap

Displays SAP information.

port-id

Specifies the port ID.

Values *slot/mda/port*

Output Fields: show lag

[Table 238: Output Fields: show lag](#) describes the output fields for the **show lag** command.

Table 238: Output Fields: show lag

Label	Description
Lag-id	The LAG or multi-link bundle ID that the port is assigned to.
Lag-name	The LAG name.
Adm	Up — The LAG is administratively up. Down — The LAG is administratively down.
Opr	Up — The LAG is operationally up. Down—The LAG is operationally down.
Threshold	The number of operational links for the LAG at or below which the configured action is invoked.
Up-Count	The number of ports that are physically present and have physical links present.
MC Act/Stdby	Member port is selected as active or standby link.

Output Example: show lag <lag-id> detail

```
A:Dut-B# show lag 1 detail
```

```

Output Fields: show lag <lag-id> detail

Table 239: Output Fields: show lag <lag-id> detail describes the output fields for the **show lag lag-id detail** command. The output is dependent on whether or not the LAG was configured as a multi-chassis (MC) LAG.

Table 239: Output Fields: show lag <lag-id> detail

Label	Description
Lag-id	The LAG identification.
Lag-name	The LAG name.
Mode	The LAG mode: <ul style="list-style-type: none"> • access • hybrid • network
Adm	Administrative state of the LAG. Up — The LAG is administratively up. Down — The LAG is administratively down.
Opr	Operational state of the LAG. Up — The LAG is operationally up. Down — The LAG is operationally down.
Thres. Last Cleared	The last time that port or weight thresholds were cleared: <ul style="list-style-type: none"> • when there is a falling or rising hit • when they are configured and immediately reached • when they are not configured when reached Not cleared by the threshold cfg or deconfig command when the port or weight threshold is removed. The port or weight threshold can then be configured but not immediately reached.
Thres. Exceeded Cnt	The number of times that the weight or port threshold rising counter was reached. The Thresh. Exceed counter displays the rising counter, as the falling counter is only available via SNMP. When we configure or deconfigure the port or weight threshold, the Thresh. Exceed counter is set to 0.
Dynamic Cost	Enabled — Dynamic cost is enabled. Disabled — Dynamic cost is disabled.
Encap Type	The LAG port encapsulation type: <ul style="list-style-type: none"> • dot1q • null • qinq
Configured Address	The configured Ethernet MAC address.

Label	Description
Lag-IfIndex	A box-wide unique number assigned to this interface.
Hardware Address	The Ethernet MAC address.
Adapt Qos (access)	Displays the configured QoS mode: <ul style="list-style-type: none"> • distribute • link • port-fair
Hold-Time Down	The timer, in tenths of seconds, which controls the delay between detecting that a LAG is down and reporting it to the higher levels.
Port Type	The port type: <ul style="list-style-type: none"> • hs • standard
Per-Link-Hash	Enabled — Per link hash is enabled. Disabled — Per link hash is disabled.
Include-Egr-Hash-Cfg	The explicitly configured hashing that is included to the egress buffering and rate distribution.
Per FP Ing Queuing	The per FP ingress queuing status.
Per FP Egr Queuing	The per FP egress queuing status.
Per FP SAP Instance	The per FP SAP instance status.
Access Bandwidth	The LAG access bandwidth value.
Access Booking Factor	The LAG access booking factor.
Access Available BW	The access available bandwidth.
Access Booked BW	The access booked bandwidth.
LACP	Enabled — LACP is enabled. Down — LACP is disabled.
LACP Transmit Intvl	The LACP transmit interval mode.
LACP xmit stdby	The LACP transmit standby mode.
Selection Criteria	Configured LAG selection criteria.
Slave-to-partner	The LACP slave-to-partner enabled or disabled state.
MUX control	Configured type of multiplexing machine control used in a LAG with LACP in active/passive modes. coupled — TX and RX activate together.

Label	Description
	independent — RX activates independent of TX.
Subgrp hold time	The sub-group hold time value.
Remaining time	The sub-group remaining time value.
Subgrp selected	The number of sub-group selected in this LAG.
Subgrp candidate	The sub-group candidate.
Subgrp count	The number of sub-group configured in this LAG.
System Id	System ID used by actor in LACP messages.
System Priority	System priority used by actor in LACP messages.
Admin Key	Configured LAG key.
Oper Key	Key used by actor in LACP messages.
Prtr System Id	System ID used by partner in LACP messages.
Prtr System Priority	System priority used by partner in LACP messages.
Prtr Oper Key	Key used by partner in LACP messages.
Standby Signaling	The standby signaling mode used in this LAG.
Port hashing	Displays the LAG port hashing mechanism for flow distribution per LAG port. <ul style="list-style-type: none"> • port-speed — the port hashing value is inherited from the port speed • hash-weight — the LAG port hash-weight value is used to customize flow distribution per port
Port weight speed	The LAG port weight speed value for mixed-speed LAG.
Ports Up	The number of ports that are operationally up for this LAG.
Weights Up	Sum of weights for ports that are operationally up in this LAG.
Hash-Weights Up	Sum of hash weights for ports that are operationally up in this LAG.
Threshold Type	The type of threshold used in this LAG: <ul style="list-style-type: none"> • hash-weight-threshold • port-threshold • weight-threshold
Monitor oper group	The name of the operational group being monitored for this LAG.
Adaptive loadbal	The adaptive load balancing status. Enabled — The adaptive load balancing is enabled.

Label	Description
	Disabled — The adaptive load balancing is disabled.
Tolerance	The adaptive load balancing tolerance value.
Interval	The adaptive load balancing statistics pooling interval.
MC Peer Address	The multi-chassis peer IP address.
MC Peer Lag-id	The LAG ID for the multi-chassis peer.
MC System Id	The multi-chassis LAG system identifier MAC address.
MC System Priority	The multi-chassis LAG system priority.
MC Admin Key	The multi-chassis LAG administrative key.
MC Active/Standby	The multi-chassis LAG active or standby state.
MC Lacp ID in use	The multi-chassis LAG in use state.
MC extended timeout	The multi-chassis LAG extended timeout value.
MC Selection Logic	The multi-chassis LAG selection logic state.
MC Config Mismatch	The multi-chassis LAG configuration mismatch state.

Output Example: Show LAG Statistics

```

```

Output Fields: Show LAG Statistics

Table 240: [Output Fields: Show LAG Statistics](#) describes the output fields for the **show lag statistics** command.

Table 240: Output Fields: Show LAG Statistics

Label	Description
Lag-id	The LAG or multi-link trunk (MLT) that the port is assigned to.
Lag-name	The LAG name.
Port-id	The port ID.
Input Bytes	The number of incoming bytes for the LAG on a per-port basis.
Input Packets	The number of incoming packets for the LAG on a per-port basis.
Output Bytes	The number of outbound bytes for the LAG on a per-port basis.
Output Packets	The number of outbound packets for the LAG on a per-port basis.
Input/Output Errors	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol. For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors.
Totals	Displays the column totals for bytes, packets, and errors.

Output Example: show lag <lag-id> egress-rate-distribution

```
A:7750# show lag 1 egress-rate-distribution
=====
Distribution of egress rate by adaptive load balancing
=====

lag

Syntax

lag *lag-id* network-aggregate-qos-stats

Context

[\[Tree\]](#) (show>qos lag)

Full Context

show qos lag

Description

This command displays the aggregate QoS statistics for the default ingress and egress queues configured on a network interface LAG.

Parameters

lag-id

Displays only information about the specified LAG ID.

Values 1 to 800

network-aggregate-qos-stats

Displays the aggregate QoS statistics about network interface LAG queues.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following output is an example of network aggregate QoS statistics information.

[Table 245: QoS Lag Field Descriptions](#) describes the output fields.

Output Example

```
*A:PE# show qos lag 1 network-aggregate-qos-stats
=====
Network Aggregate QoS Statistics for LAG ID 1

lag

Syntax

```

lag lag-id bfd-session family {ipv4 | ipv6} lag-port port-id
lag lag-id lacp-statistics
lag lag-id statistics
    
```

Context

[\[Tree\]](#) (clear lag)

Full Context

clear lag

Description

This command clears statistics for the specified LAG ID.

Parameters

lag-id

Clears the LAG ID.

Values 1 to 800

bfd-session

Clears the specified BFD session.

family

Clears the IP address family.

ipv4

Clears IPv4.

ipv6

Clears IPv6.

port-id

Clears the port ID.

Values *slot* [/mda [/port]]

lACP-statistics

Clears the LACP PDUs statistics.

statistics

Clears the statistics or the BFD session for the specified LAG ID.

Platforms

All

lag

Syntax

lag lag-id *lag-id*

Context

[\[Tree\]](#) (tools>dump lag)

Full Context

tools dump lag

Description

This command dumps LAG information.

Parameters

lag-id

Specifies the LAG ID.

Values 1 to 800

Platforms

All

lag

Syntax

lag

Context

[\[Tree\]](#) (tools>perform lag)

Full Context

tools perform lag

Description

This command provides tools for controlling LAG.

Platforms

All

lag

Syntax

lag *lag-id* [*lag-id*] [**bytes** | **packets** | **errors** | **utilization**] [*interval seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

lag *lag-id* **network-aggregate-qos-stats** [*interval seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

Context

[\[Tree\]](#) (monitor lag)

Full Context

monitor lag

Description

This command monitors traffic statistics for Link Aggregation Group (LAG) ports. Statistical information for the specified LAG ID(s) displays at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified LAG ID. The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

Parameters

lag-id

Specifies the number of the LAG, with a maximum of five LAG numbers specified in a single statement.

Values 1 to 200

bytes

Displays the statistics in bytes only.

packets

Displays the statistics in packets only.

errors

Displays the statistics for errors only.

utilization

Displays the statistics in percentage utilization only.

network-aggregate-qos-stats

Monitors the aggregate QoS statistics on network interface LAG default ingress and egress queues.

seconds

Configures the interval for each display in seconds.

Values 3 to 60

Default 10 seconds

repeat

Configures how many times the command is repeated.

Values 1 to 999

Default 10

absolute

Specifies raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic instead of the delta.

Platforms

All

Output

The following output is an example of monitor lag command information.

Output Example

```
A:Dut-B# monitor lag 1 interval 3 repeat 1
=====
Monitor statistics for LAG ID 1

14.21 lbm-svc-act-responder

lbm-svc-act-responder

Syntax

```
lbm-svc-act-responder [domain {md-index | md-admin-name}] [association {ma-index | ma-admin-name}] [mep mep-id]
```

Context

[\[Tree\]](#) (show>eth-cfm lbm-svc-act-responder)

Full Context

```
show eth-cfm lbm-svc-act-responder
```

Description

This command displays the MEPs created with the optional **lbm-svc-act-responder** configuration command, which allocates additional resources to facilitate high-speed LBM-to-LBR processing typically used during service activation testing. The optional filters are cumulative. These filters can be used to narrow the focus of the display to a specific area.

Parameters

md-index

Specifies the the MD index.

Values 1 to 4294967295

md-admin-name

Specifies the administrative name for the domain, up to 64 characters.

ma-index

Specifies the the MA index.

Values 1 to 4294967295

ma-admin-name

Specifies the administrative name for the association, up to 64 characters.

mep-id

Specifies the local MEP ID.

Values 1 to 8191

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following output is an example of ETH CFM LBM service activation responder information, and [Table 246: Output fields: LBM service activation responder](#) describes the output fields.

Output example

```
*A:node-2# show eth-cfm lbm-svc-act-responder

14.26 learned-remote-mac

learned-remote-mac

Syntax

```
learned-remote-mac [domain {md-index | md-admin-name}] [association {ma-index | ma-admin-name}]  
[mep mep-id] [remote-mepid mep-id]
```

Context

[\[Tree\]](#) (show>eth-cfm learned-remote-mac)

Full Context

```
show eth-cfm learned-remote-mac
```

Description

This command displays the local MEP and remote MEP MAC address information relationship. The MAC address information in this table is populated and used in place of the remote *mep-id* in various ETH-CFM tests that opt to use the **remote-mepid** *mep-id* configuration instead of specifying the remote peer MAC address. This table is maintained by the ETH-CC process. If a CCM has not been received for a remote peer, there is no entry in the **learned-remote-mac** table. However, when a CCM is received for an expected peer, an entry in the **learned-remote-mac** table is populated and maintained. This entry remains until the remote peer statement is deleted from the association, the local MEP is deleted, or if a manual **clear>eth-cfm>learned-remote-mac** command has been executed for the specified local MEP.

The optional parameters are treated as independent filters that are combined to refine the output. Omitting all optional parameters produces output that includes the entire table.

Parameters

md-index

Specifies the MD index.

Values 1 to 4294967295

md-admin-name

Specifies the MD name, up to 64 characters.

ma-index

Specifies the MA index.

Values 1 to 4294967295

ma-admin-name

Specifies the MD name, up to 64 characters.

mep *mep-id*

Specifies the local *mep-id*.

Values 1 to 8191

remote-mepid *mep-id*

Specifies the remote *mep-id*.

Values 1 to 8191

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following output is an example of learned remote MAC information, and [Table 247: Learned Remote MAC Field Descriptions](#) describes the output fields.

Output example

```

Table 247: Learned Remote MAC Field Descriptions

Label	Description
MdIndex	Specifies the local MEP domain index
MaIndex	Specifies the local MEP association index
L-MepId	Specifies the local MEP identifier
R-MepId	Specifies the remote MEP identifier
Learned Remote MAC	Specifies the learned MAC address of the remote peer
Stale	Results of the comparison between the CCM database and the learned-remote-mac table False — match True — mismatch
Updated	Whether the learned MAC in this table has been updated in the last CCM interval
md-admin-name	Displays the administrative MD name.
ma-admin-name	Displays the administrative MA name.

learned-remote-mac

Syntax

learned-remote-mac [**mep** *mep-id* [**remote-mepid** *mep-id*]] **domain** *md-index* **association** *ma-index*

Context

[\[Tree\]](#) (clear>eth-cfm learned-remote-mac)

Full Context

clear eth-cfm learned-remote-mac

Description

This command clears the stored MAC addresses in the CFM **learned-remote-mac** address table. A valid MAC address must exist in the **learned-remote-mac** table for a successful PDU generation when that test uses the **remote-mepid** *mep-id* option in place of a *mac-address*.

The local **domain** and **association** parameters must be included as part of the clear command. The **mep** and **remote-mepid** parameters are optional. The clear command clears all matching entries based on the configured parameters. The table is populated based on the reception and processing of ETH-CC PDUs.

Parameters

mep *mep-id*

Specifies the local MEP ID.

Values 1 to 8191

remote-mepid *mep-id*

Specifies the remote MEP ID.

Values 1 to 8191

md-index

Specifies the MD index.

Values 1 to 4294967295

ma-index

Specifies the MA index.

Values 1 to 4294967295

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

14.27 lease-state

lease-state

Syntax

```
lease-state [wholesaler service-id] [sap sap-id | sdp sdp-id:vc-id | interface interface-name | ip-address ip-address [/mask] | chaddr ieee-address | mac ieee-address | {[port port-id] [no-inter-dest-id | inter-dest-id inter-dest-id]}] [session { none | ipoe}] [detail]
```

Context

[\[Tree\]](#) (show>service>id>dhcp lease-state)

Full Context

```
show service id dhcp lease-state
```

Description

This command displays DHCP lease state related information.

Parameters

service-id

Specifies the service ID of the wholesaler.

Values 1 to 2148278316, *svc-name*: up to 64 characters

sap-id

Specifies the physical port identifier portion of the SAP definition.

sdp-id

The SDP identifier.

Values 1 to 17407

vc-id

The virtual circuit ID on the SDP ID for which to display information.

Values 1 to 4294967295

interface-name

Displays information for the specified IP interface.

ip-address[/mask]

Displays information associated with the specified IP address.

ieee-address

Specifies the source MAC address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx (cannot be all zeros)

port-id

Specifies the port ID.

no-inter-dest-id

Displays the information about no intermediate destination ID.

inter-dest-id

Displays information about the specified intermediate destination ID, up to 64 characters.

session

Shows DHCPv4 lease states for hosts that are associated with an IPoEsession or for hosts that are not associated with an IPoE session.

Values none, ipoe

detail

Displays detailed information.

Platforms

All

Output

The following output is an example of the DHCP **lease-state** command.

Output Example

```

[Table 248: Service DHCP Lease-state Field Descriptions](#) describes service DHCP lease-state information.

Table 248: Service DHCP Lease-state Field Descriptions

Field	Description
Service ID	The service ID
IP Address	The IP address
Client HW Address	The client hardware address
Subscriber-interface	The subscriber interface name
Group-interface	The group interface name
SAP	The SAP
Termination Type	The termination type
Up Time	The up time
Remaining Lease Time	The remaining lease time
Remaining SessionTime	The remaining session time
Persistence Key	The persistence key
Sub-Ident	The name of the subscriber identification policy
Sub-Profile-String	The subscriber profile string
SLA-Profile-String	The name of the SLA profile
App-Profile-String	The application profile string
Lease ANCP-String	The lease ANCP string
Lease Int Dest Id	The lease internal destination ID
Category-Map-Name	The category map name
Lease Info origin	The origin of the lease
Ip-Netmask	The IP netmask address
Broadcast-Ip-Addr	The broadcast IP address

Field	Description
Default-Router	The default router
Primary-Dns	The primary DNS address
Secondary-Dns	The secondary DNS address
Primary-Nbns	The primary NBNS
Secondary-Nbns	The secondary NBNS
ServerLeaseStart	The date and time of the start of the server lease
ServerLastRenew	The date and time of the renewal of the server lease
ServerLeaseEnd	The date and time of the end of the server lease
Session-Timeout	The session timeout value
IPoE PPP session	The type of session
Lease-Time	The lease time
DHCP Server Addr	The DHCP server IP address
Relay Agent Information	
Circuit Id	The circuit ID
Radius Class 1	The RADIUS Class 1 value
Radius User-Name	The RADIUS user name
Overrides: (only shown when overrides are active)	
Dir Type	The direction type
Id	The ID
PIR	The PIR value
CIR	The CIR value
CBS	The CBS value
MBS	The MBS value
WRR	The WRR value
Class-Weight	The class weight
No. of Overrides	The total number of overrides
Subscriber Host Limit Overrides and SLA Profile Instance Host Limit Overrides:	

Field	Description
(only shown when overrides are active)	
ipv4-arp	The total number of IPv4 ARP hosts limit
ipv4-dhcp	The total number of IPv4 DHCP hosts limit
ipv4-ppp	The total number of IPv4 PPP hosts limit
ipv4-overall	The total number of IPv4 hosts limit
ipv6-pd-ipoe-dhcp	The total number of IPv6 IPoE DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-pd-ppp-dhcp	The total number of IPv6 PPPoE DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-pd-overall	The total number of IPv6 DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-wan-ipoe-dhcp	The total number of IPv6 IPoE DHCP WAN hosts (IA-NA) limit
ipv6-wan-ipoe-slaac	The total number of IPv6 IPoE SLAAC WAN hosts limit
ipv6-wan-ppp-dhcp	The total number of IPv6 PPPoE DHCP WAN hosts (IA-NA) limit
ipv6-wan-ppp-slaac	The total number of IPv6 IPoE SLAAC WAN hosts limit
ipv6-wan-overall	The total number of IPv6 WAN hosts limit
ipv6-overall	The total number of IPv6 hosts limit
lac-overall	The total number of L2TP LAC hosts limit
overall	The total number of subscriber hosts limit
Subscriber Session Limit Overrides and SLA Profile Instance Session Limit Overrides: (only shown when overrides are active)	
ipoe	The total number of IPoE sessions limit
ppoe-local	The total number of PPPoE local terminated sessions (PTA) limit
ppoe-lac	The total number of PPPoE L2TP LAC sessions limit
ppoe-overall	The total number of PPPoE sessions limit
l2tp-lns	The total number of L2TP LNS sessions limit
l2tp-lts	The total number of L2TP LTS sessions limit

Field	Description
l2tp-overall	The total number of L2TP sessions limit
overall	The total number of subscriber sessions limit
Number of lease states	The total number of lease states

lease-state

Syntax

lease-state [**detail**] [**wholesaler** *service-id*] [**session** {**none** | **ipoe** | **ppp**}] [**router-advertisement-policy** *policy-name*]

lease-state [**detail**] **interface** *interface-name* [**wholesaler** *service-id*] [**session** {**none** | **ipoe** | **ppp**}] [**router-advertisement-policy** *policy-name*]

lease-state [**detail**] *ipv6-address* *ipv6-prefix* [*prefix-length*] [**wholesaler** *service-id*] [**session** {**none** | **ipoe** | **ppp**}] [**router-advertisement-policy** *policy-name*]

lease-state [**detail**] **mac** *ieee-address* [**wholesaler** *service-id*] [**session** {**none** | **ipoe** | **ppp**}] [**router-advertisement-policy** *policy-name*]

Context

[\[Tree\]](#) (show>service>id>dhcp6 lease-state)

Full Context

```
show service id dhcp6 lease-state
```

Description

This command displays DHCPv6 lease state information.

Note:

The **wholesaler** *service-id* parameter is applicable only in the VPRN context.

Parameters

detail

Displays detailed lease state information.

service-id

The service ID of the wholesaler. When specified in this context, SAP, SDP, interface, IP address and MAC parameters are ignored. This parameter only applies to the 7750 SR.

Values *service-id*: 1 to 2147483647

session

Shows DHCPv6 lease states for clients that are associated with an IPoE session or for clients that are associated with a PPP session or for clients that are not associated with an IPoE session.

Values none, ipoe, ppp

policy-name

Specifies the name of the router advertisement policy.

interface-name

Specifies the interface name, up to 32 characters.

ipv6-address[/mask]

Shows information for the specified IPv6 address and mask.

ieee-address

Shows information for the specified 48-bit MAC address, expressed in the form *aa:bb:cc:dd:ee:ff* or *aa-bb-cc-dd-ee-ff*, where *aa*, *bb*, *cc*, *dd*, *ee* and *ff* are hexadecimal numbers.

Platforms

All

Output

The following output is an example of DHCP6 lease state information.

Output Example

```

Table 249: DHCPv6 Lease State Router Advertisement Field Descriptions describes DHCPv6 lease state router advertisement policy output fields.

Table 249: DHCPv6 Lease State Router Advertisement Field Descriptions

Field	Description
Service ID	The service ID provided by the access node to which this subnet is bound
IP Address	The IP address of the service
Client HW Address	The MAC address of the client
Subscriber-Interface	The subscriber interface for the service
Group-interface	The group interface for the service
Sap/Sdp ID	The service SAP and SDP IDs
Termination Type	The PPP session type
Up Time	The value of the up time at the time of the last modification of an entry
Remaining Lease Time	The time left before the DHCPv6 lease expires. The client should renew its lease before this timer expires. (Lease Split) indicates that DHCPv6 lease split is active.
Remaining SessionTime	The time left for this session
Persistence Key	The persistence key
Sub-Ident	The subscriber identification policy name
Sub-Profile-String	The subscriber profile policy name

Field	Description
App-Profile-String	The application profile policy name
Lease ANCP-String	The ANCP string
Category-Map-Name	The category map name
Dhcp6 ClientID (DUID)	The DHCP client ID
Dhcp6 IAID	The DHCPv6 Identity Association Identifier (IAID) assigned by the client
Dhcp6 IAID Type	The DHCPv6 Identity Association type of this lease (non-temporary or prefix)
Dhcp6 Client Ip	The DHCPv6 IP address of the client
Primary-Dns	The primary DNS, if configured
Secondary-Dns	The secondary DNS, if configured
Pool Name	The pool name
Dhcp6 Server Addr	The DHCPv6 server address
Dhcp6 ServerID (DUID)	The DHCPv6 server ID
Dhcp6 InterfaceId	The DHCPv6 interface ID
Dhcp6 RemoteId	The DHCPv6 remote ID
Radius sub-if prefix	The RADIUS subscriber interface prefix
Router adv. policy	The router advertisement policy
Lease Info origin	The lease info origin
ServerLeaseStart	The date and time the lease was created
ServerLastRenew	The last renew was done for this lease
ServerLeaseEnd	The time left for this lease
Session-Timeout	The session timeout interval
IPoE PPP	IPoE or PPP
Radius User-Name	The RADIUS user name
Overrides: (only shown when overrides are active)	
Dir Type	The direction type
Id	The ID

Field	Description
PIR	The PIR value
CIR	The CIR value
CBS	The CBS value
MBS	The MBS value
WRR	The WRR value
Class-Weight	The class weight
No. of Overrides	The total number of overrides
Subscriber Host Limit Overrides and SLA Profile Instance Host Limit Overrides: (only shown when overrides are active)	
ipv4-arp	The total number of IPv4 ARP hosts limit
ipv4-dhcp	The total number of IPv4 DHCP hosts limit
ipv4-ppp	The total number of IPv4 PPP hosts limit
ipv4-overall	The total number of IPv4 hosts limit
ipv6-pd-ipoe-dhcp	The total number of IPv6 IPoE DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-pd-ppp-dhcp	The total number of IPv6 PPPoE DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-pd-overall	The total number of IPv6 DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-wan-ipoe-dhcp	The total number of IPv6 IPoE DHCP WAN hosts (IA-NA) limit
ipv6-wan-ipoe-slaac	The total number of IPv6 IPoE SLAAC WAN hosts limit
ipv6-wan-ppp-dhcp	The total number of IPv6 PPPoE DHCP WAN hosts (IA-NA) limit
ipv6-wan-ppp-slaac	The total number of IPv6 PPPoE SLAAC WAN hosts limit
ipv6-wan-overall	The total number of IPv6 WAN hosts limit
ipv6-overall	The total number of IPv6 hosts limit
lac-overall	The total number of L2TP LAC hosts limit
overall	The total number of subscriber hosts limit
Subscriber Session Limit Overrides and SLA Profile Instance Session Limit Overrides:	

Field	Description
(only shown when overrides are active)	
ipoe	The total number of IPoE sessions limit
ppoe-local	The total number of PPPoE local terminated sessions (PTA) limit
ppoe-lac	The total number of PPPoE L2TP LAC sessions limit
ppoe-overall	The total number of PPPoE sessions limit
l2tp-lns	The total number of L2TP LNS sessions limit
l2tp-lts	The total number of L2TP LTS sessions limit
l2tp-overall	The total number of L2TP sessions limit
overall	The total number of subscriber sessions limit
Number of lease states	The total number of lease states

lease-state

Syntax

lease-state all [**no-dhcp-release**]

lease-state [**port** *port-id*] **inter-dest-id** *intermediate-destination-id* [**no-dhcp-release**]

lease-state [**port** *port-id*] **no-inter-dest-id** [**no-dhcp-release**]

lease-state ip-address *ip-address* [*/mask*] [**no-dhcp-release**]

lease-state mac *ieee-address* [**no-dhcp-release**]

lease-state port *port-id* [**no-dhcp-release**]

lease-state sap *sap-id* [**no-dhcp-release**]

lease-state sdp *sdp-id:vc-id* [**no-dhcp-release**]

Context

[\[Tree\]](#) (clear>service>id>dhcp lease-state)

Full Context

clear service id dhcp lease-state

Description

This command removes the DHCPv4 lease state information from the system and sends a DHCP release message on behalf of the client to the DHCP server. A DHCP release is not sent when the remaining lease-time is less than 5 minutes or when the **no-dhcp-release** parameter is specified.

Parameters

all

Clears all lease state statistics.

port-id

Displays information about the specified port ID.

intermediate-destination-id

Displays information about the specified intermediate destination ID, up to 32 characters.

no-inter-dest-id

Displays the information about no intermediate destination ID.

ip-address[/mask]

The IP address of the IP interface. The *ip-address* portion of the **address** command specifies the IP host address that is used by the IP interface within the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

Values a.b.c.d.
mask: 1 to 32

ieee-address

Specifies the 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

sap-id

Specifies the physical port identifier portion of the SAP definition.

sdp-id

The SDP ID to be cleared.

Values 1 to 17407

vc-id

The virtual circuit ID on the SDP ID to be cleared.

Values 1 to 4294967295

no-dhcp-release

Specifies that the node clears the state without sending the DHCP release message.

Platforms

All

lease-state

Syntax

lease-state all [**no-dhcp-release**]

lease-state ipv6-address *ipv6-prefix*[/*prefix-length*] [**no-dhcp-release**]

lease-state mac *ieee-address* [**no-dhcp-release**]

lease-state sap *sap-id* [**no-dhcp-release**]

Context

[Tree] (clear>service>id>dhcp6 lease-state)

Full Context

clear service id dhcp6 lease-state

Description

This command removes the DHCPv6 lease state information from the system and sends a DHCP release message on behalf of the client to the DHCP server. A DHCP release is not sent when the remaining lease-time is less than 5 minutes or when the no-dhcp-release parameter is specified.

Parameters

all

Clears all lease-states.

no-dhcp-release

Specifies that the node clears the state without sending the DHCP release message.

ipv6-prefix[/*prefix-length*]

Clears routes only matching the specified IP address and length and only applies to the 7750 SR.

Values

ipv6	ipv6-prefix[/pref*:	x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D
	prefix-length:	1 to 128

ieee-address

Clears DHCP6 MAC address lease state information. The 48-bit MAC address for the static ARP in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee, and ff are hexadecimal numbers. Allowed values are any non-broadcast, non-multicast MAC and non-IEEE reserved MAC addresses.

sap-id

Clears the specified lease state SAP information.

Platforms

All

14.28 leases

leases

Syntax

leases [**detail**]

leases *ip-address*[/*mask*] **address-from-user-db** [**detail**]

leases *ip-address*[/*mask*] **dhcp-host** *dhcp-host-name* [**detail**]

leases *ip-address*[/*mask*] **ppp-host** *ppp-host-name* [**detail**]

leases *ip-address*[/*mask*] [**detail**]

Context

[\[Tree\]](#) (show>router>dhcp>local-dhcp-server leases)

Full Context

show router dhcp local-dhcp-server leases

Description

This command displays the DHCP leases.

Parameters

ip-address

Specifies the base IP address of the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

mask

The subnet mask in dotted decimal notation.

Values 0 to 32

address-from-user-db

Displays only leases that have IP addresses from the local-user-db.

dhcp-host-name

Shows the leases that match a certain DHCP host from the local-user-db.

ppp-host-name

Displays the leases that match a certain PPPoE host from the local-user-db.

detail

Displays detailed information of all leases that fall into the indicated subnet.
 The command with no parameters shows all leases from the local-user-db.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of lease information

Output Example

```
*A:ALA-48>show>router>dhcp>local-dhcp-server# leases ip-address 10.0.0.4
=====
Leases for DHCP server test router Base
=====
IP Address      Lease State      Mac Address      Remaining Clnt
  PPPoE user name/Opt82 Circuit Id                    LifeTime  Type
-----
No leases found
*A:ALA-48>show>router>dhcp>local-dhcp-server#
```

[Table 250: Leases Field Descriptions](#) describes leases output fields.

Table 250: Leases Field Descriptions

Field	Description
IP Address	The IP address for the specified lease
Lease State	The lease state of the IP address
Mac Address	The MAC address of the lease
Remaining Lifetime	The remaining lifetime of the lease
Clnt Type	The address type
PPPoE user name	The PPPoE user name
Opt82	The option number that the DHCP server uses to send the identification strings to the PPPoE client
Circuit ID	The circuit ID from Option 82

leases

Syntax

leases [*ipv6-address/prefix-length*] [*type*] [*state*] [**detail**]

Context

[Tree] (show>router>dhcp6>local-dhcp-server leases)

Full Context

show router dhcp6 local-dhcp-server leases

Description

This command displays the DHCP6 leases.

Parameters

ipv6-address

Specifies the base IP address of the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

mask

The subnet mask in dotted decimal notation.

Values 0 to 32

type

Displays the lease type.

Values pd, wan-host

state

Displays the state of the lease.

Values advertised, remove-pending, held

detail

Displays detailed information of all leases that fall into the indicated subnet.

The command with no parameters shows all leases from the local user database.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of lease information.

Output Example

```
show router 600 dhcp6 local-dhcp-server "d6" leases
=====
Leases for DHCPv6 server d6
=====
IP Address/Prefix          Lease State    Remaining    Fail

```

[Table 251: DHCP6 Lease Field Descriptions](#) describes DHCP6 lease fields.

Table 251: DHCP6 Lease Field Descriptions

Field	Description
IP Address/Prefix	The IP address and prefix of the lease
Link-local Address	The link local address of the lease
Lease State	The lease state of the lease
Remaining Lifetime	The remaining lifetime of the lease
Fail Ctrl	The type of failover control
No. leases found	The total number of leases

leases

Syntax

leases *ip-address[/mask]* [*state*]

leases all [*state*]

Context

[\[Tree\]](#) (clear>router>dhcp>server leases)

Full Context

clear router dhcp local-dhcp-server leases

Description

This command clears DHCP leases.

Parameters

ip-address[/mask]

Clears the specified IP address and mask.

state

Clears the state of the lease to be removed.

Values offered, stable, force-renew-pending, remove-pending, held, internal, internal-orphan, internal-held, sticky

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

leases

Syntax

leases [*ipv6-address/prefix-length*] [*type*] [*state*]

leases all [*type*] [*state*]

Context

[Tree] (clear>router>dhcp6>server leases)

Full Context

clear router dhcp6 local-dhcp-server leases

Description

This command removes the specified leases in the specified local DHCPv6 server.

Parameters

ipv6-address/prefix-length

Specifies the prefix of the leases to be removed.

type

Specifies the type of the lease to be removed.

Values pd, slaac, wan-host

state

Specifies the state of the lease to be removed.

Values advertised, remove-pending, held, internal, internal-orphan, internal-offered

all

Removes all leases of specified type or state.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

14.29 Ifa-coverage

lfa-coverage

Syntax

lfa-coverage

Context

[\[Tree\]](#) (show>router>isis lfa-coverage)

Full Context

show router isis lfa-coverage

Description

This command displays IS-IS LFA coverage information. This information corresponds to the backup next hops for prefixes and nodes written in RTM by the base LFA feature.

Platforms

All

Output

The following output is an example of LFA coverage information.

Output Example

```
*A:SR# show router isis lfa-coverage

licensing

Syntax

licensing *port-id*

licensing audit [**monitored**]

licensing entitlements

Context

[\[Tree\]](#) (show licensing)

Full Context

show licensing

Description

This command displays information related to the active application licenses on the system. The licenses are either monitored RTUs or entitlement ASLs, both of which cover features and scale in use in the SR OS system.

For monitored RTUs, there is a legal requirement to purchase the RTU parts to cover the administrative enabling of the related features and scale; however, the SR OS does not block the activation or scale of the feature.

For entitlement ASLs, feature activation on the SR OS system requires the installation of the ASL via the license-file mechanism before the related feature can be enabled. See the *7750 SR and 7950 XRS Pay-as-You-Grow Licensing Reference Guide* for more information.

When the **audit** keyword is used, the display shows all the monitored RTUs and entitlement ASLs of the node. Using the optional **monitored** keyword together with **audit** restricts the display to only the monitored RTUs.

When the **entitlements** keyword is used, the display shows all the entitlements in the active licenses in the system, the type of license, the quantity of POOL licenses, and the number of each that is in use or available for use.

Parameters

audit

Specifies that the state of all features covered by licenses is displayed.

monitored

Specifies that only the monitored RTUs are included in the audit display.

entitlements

Specifies that the number of instances allowed by the active license is displayed.

port-id

Specifies the port identifier in the format *slot[/mda[/connector[/port]]]*.

<i>slot</i>	1 to 10
<i>mda</i>	1 to 2
<i>connector</i>	c1 to c36
<i>port</i>	1 to 10

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following outputs are examples of the **show licensing** command output and the corresponding tables describe the output fields:

- [Output Example: show licensing](#); [Output Fields Table 252: Output Fields: Show Licensing](#)
- [Output Example: show licensing audit](#); [Output Fields Table 253: Output Fields: Show Licensing Audit](#)
- [Output Example: show licensing entitlements](#); [Output Fields Table 254: Output Fields: Show Licensing entitlement](#)

Output Example: show licensing

```
# show licensing 2/1

Output Fields

Table 252: Output Fields: Show Licensing describes the output fields for the **show licensing** command.

Table 252: Output Fields: Show Licensing

Label	Description
Connector	The identity of connector for the license limits.
MAC	The index of the MAC on the card or MDA to which the connector is attached.
Licensed	Whether or not the connector is licensed. Yes — the connector is included in the licensed level of the card or MDA and may be configured for a breakout. Other rules may apply as described in the restrictions field. No — this connector is not included in the licensed level of the card or MDA and it cannot be configured for breakout.
Restrictions	Additional license rules that may apply to the use of the connector, for example, bandwidth limits to the set of connectors on the same MAC.

Output Example: show licensing audit

```
# show licensing audit
```

Output Fields

Table 253: Output Fields: Show Licensing Audit describes the output fields for the **show licensing audit** command.

Table 253: Output Fields: Show Licensing Audit

Label	Description
License	The name of the entitlement ASL or the monitored RTU, grouped by category
Current Allocated	The number of instances of the license that are currently in use
Current Max	The maximum number of instances of the license that were recorded as in use within the current 24-hour monitoring period
Previous 24 Hr Max	The maximum number of instances of the license that were recorded in the previous full 24-hour monitoring period; shows as "n/a" if it has been less than 24 hours since startup
Last 24 Hr Interval Ended	Indicates the end time of the last 24-hour monitoring period; not displayed if it is less than 24 hours since startup

Output Example: show licensing entitlements

```

# show licensing entitlements

Full Context

show router bgp routes bgp-ls link

Description

This command displays BGP-LS NLRIs for link types.

Platforms

All

14.39 link-check

link-check

Syntax

link-check

Context

[\[Tree\]](#) (tools>perform>chassis link-check)

Full Context

tools perform chassis link-check

Description

This command checks the connection between an XCM and XMA cards on a SR-2/7/14s chassis. The function checks the connection between all XCM and XMA cards present in the system and outputs one of the following for each XMA:

- OK — the connection is good and no action is required
- NOK — the connection is suspect, re-seat the XMA to determine if this corrects the issue. If this issue persists, contact Nokia support.

Platforms

7750 SR-1s, 7750 SR-2s, 7750 SR-2se, 7750 SR-7s, 7750 SR-14s

lldp

Syntax

lldp [**bridge-mac**] [**remote-info**] [**detail**]

Context

[\[Tree\]](#) (show>port>ethernet lldp)

Full Context

show port ethernet lldp

Description

This command displays LLDP information.

Parameters

bridge-mac

Specifies a keyword to filter the output.

remote-info

Displays remote information on the bridge MAC.

detail

Displays detailed information.

Platforms

All

14.45 Imm

Imm

Syntax

Imm [**interval seconds**] [**repeat repeat**] [**absolute | rate**]

Context

[\[Tree\]](#) (monitor>oam-pm>session Imm)

Full Context

monitor oam-pm session Imm

Description

This command monitors the Ethernet Loss Measurement Message (LMM) statistics for the specified test's raw measurement interval.

Parameters

seconds

Specifies the time interval, in seconds.

Values 3 to 60

Default 10

repeat

Specifies the number of times the command is repeated.

Values 1 to 999

Default 10

absolute

Specifies that the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

rate

Specifies that the rate-per-second is displayed.

Default delta

Platforms

All

Imm

Syntax

Imm

Context

[\[Tree\]](#) (show>oam-pm>stats>session Imm)

14.46 Ins-group

Ins-group

Syntax

Ins-group *Ins-group-id* [**associations**]

Ins-group *Ins-group-id* **statistics** *esa-vm vapp-id*

Ins-group [*Ins-group-id*] **esa-vm**

Ins-group *Ins-group-id* **mda** *mda-id* **statistics**

Ins-group [*Ins-group-id*] **mda**

Ins-group

Context

[\[Tree\]](#) (show>isa Ins-group)

Full Context

show isa Ins-group

Description

This command shows information such as the number of ESAs provisioned and in service, the LNS group operational status, and the number of L2TP sessions and ESA VM associated to the LNS group, as well as the detailed statistics of the ESA VM in relation to the LNS group.

Parameters

Ins-group-id

Specifies the LNS group identifier.

Values 1 to 4

associations

Displays information associated with the LNS group in the ISA context.

statistics

Displays statistics information.

mda-id

Specifies the ESA and VM identifying an LNS group.

Values	<i>mda-id:</i>	<i>slot/mda</i>	
		slot	1 to 10
		<i>mda</i>	1 to 2

vapp-id

Specifies the ESA and VM identifying an LNS group.

Values	<i>vapp-id:</i>	<i>esa-id/vm-id</i>	
		<i>esa-id</i>	1 to 16
		<i>vm-id</i>	1 to 4

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following outputs are examples of the number of ESAs provisioned, the LNS group information status, and the statistics of the ESA VM in relation to the LNS group.

Output Example

```
*A:LNS# show isa lns-group esa-vm
=====

Ins-group *Ins-group-id* **mda** *mda-id* **statistics**

Context

[\[Tree\]](#) (clear>isa Ins-group)

Full Context

clear isa Ins-group

Description

This command clears the statistics for the identified VM within the specified LNS group.

Parameters

Ins-group-id

Specifies the LNS group identifier.

Values 1 to 4

statistics

Displays statistics information.

mda-id

Specifies the ESA and VM identifying an LNS group.

Values	<i>mda-id:</i>	<i>slot/mda</i>	
		slot	1 to 10
		<i>mda</i>	1 to 2

vapp-id

Specifies the ESA and VM identifying an LNS group.

Values	<i>vapp-id:</i>	<i>esa-id/vm-id</i>

load-balance

Syntax

load-balance lag-id *lag-id* [**class** {1 | 2 | 3}]

Context

[\[Tree\]](#) (tools>perform>lag load-balance)

Full Context

tools perform lag load-balance

Description

Load balance specified LAG's links when per-link-hash weighted is deployed. Load balancing can be per specified class or on all classes if no class is specified.

Parameters

lag-id

Specifies the LAG ID.

Values 1 to 800

class

Specifies the class.

Values 1, 2, 3

Platforms

All

load-balance

Syntax

load-balance [**service** *service-id*]

Context

[\[Tree\]](#) (tools>perform>app-assure>group load-balance)

Full Context

tools perform application-assurance group load-balance

Description

This command rebalances AA subscribers between ISAs within a group, in case imbalance occurs such as with the addition of new cards.

Parameters

service *service-id*

Specifies the service

Values 1 to 2147483648

Platforms

All

14.48 load-balancing-alg

load-balancing-alg

Syntax

Syntax

local-bfd-discrim *bfd-discriminator*

Context

[\[Tree\]](#) (tools>dump>router>lsp-bfd local-bfd-discrim)

Full Context

tools dump router lsp-bfd local-bfd-discrim

Description

This command displays information for the BFD-on-LSP session with a specified local discriminator.

Parameters

bfd-discriminator

Specifies the BFD discriminator.

Values to 4294967295

Platforms

All

14.50 local-dhcp-db

local-dhcp-db

Syntax

local-user-db *local-user-db-name*

Context

[\[Tree\]](#) (tools>perform>subscr-mgmt>local-user-db local-dhcp-db)

Full Context

tools perform subscriber-mgmt local-user-db local-dhcp-db

Description

This command enables tools to control the local user database.

Parameters

local-user-db-name

Specifies the name of a local user database.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

14.51 local-dhcp-server

[\[Tree\]](#) (tools>perform>router>dhcp6 local-dhcp-server)

Full Context

tools perform router dhcp local-dhcp-server

tools perform router dhcp6 local-dhcp-server

Description

This command enables tools to control the local DHCP server.

Parameters

server-name

Specifies the name of the local DHCP server.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

14.52 local-forward

local-forward

Syntax

local-forward [*local-forward-id*]

Context

[\[Tree\]](#) (show>system>satellite local-forward)

Full Context

show system satellite local-forward

Description

This command displays satellite local forward services information.

Parameters

local-forward-id

Specifies the local forward ID.

Values 1 to 10240

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

local-forward

Syntax

local-forward

Context

[\[Tree\]](#) (show>system>satellite>eth-sat local-forward)

Full Context

show system satellite eth-sat local-forward

Description

This command displays information for Ethernet satellite local forward services.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

14.53 local-sid

local-sid

Syntax

local-sid [*ipv6-address*] [*prefix-length*] [**locator** *locator-name*] [**longer**] [**end**] [**end-x**] [**end-dt4**] [**end-dt6**] [**end-dt46**] [**end-dx2**] [**context** *context*] [**end-dt2u**] [**end-dt2m**]

Context

[\[Tree\]](#) (show>router>srv6 local-sid)

Full Context

show router segment-routing-v6 local-sid

Description

This command displays SRv6 local-SID information.

Parameters

ipv6-address

Specifies the IPv6 address.

Values x:x:x:x:x:x:x (eight 16-bit pieces)
 x:x:x:x:x:d.d.d.d
 x - [0 to FFFF]H
 d - [0 to 255]D

locator-name

Specifies the locator name, up to 64 characters.

longer

Displays the specified route and subsets of the route.

end

Displays the End SID function of a locator.

end-x

Displays the End.X SID function associated with a P2P interface.

end-dt4

Displays the End.DT4 function associated with the Base routing instance.

end-dt6

Displays the End.DT6 function associated with the Base routing instance.

end-dt46

Displays the End.DT46 function associated with the Base routing instance.

end-dx2

Displays the End.DX2 function associated with the SRv6 instance in the service.

context

Specifies the router context.

Values vprn-svc-name | 'Base' | vprn-svc-id

end-dt2u

Displays the End.DT2U function associated with the SRv6 instance in the service.

end-dt2m

Displays the End.DT2M function associated with the SRv6 instance in the service.

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

Output

The following output is an example of local SID information

Output Example

Context	The context of the SID
Type	The type of SRv6 behavior
Function	The function value
SIDs	The total number of SIDs

14.54 local-tx-pdu

local-tx-pdu

Syntax

local-tx-pdu [domain {*md-index* | *md-admin-name*}] [association {*ma-index* | *ma-admin-name*}] [mep *mep-id*]

Context

[\[Tree\]](#) (show>eth-cfm local-tx-pdu)

Full Context

```
show eth-cfm local-tx-pdu
```

Description

This command displays the transmission for ETH-CC, ETH-AIS, and ETH-CFM Grace (ETH-VSM or ETH-ED) using a character representation for each protocol per MEP. ETH-CC is expanded to include columns for RDI, Port Status TLV, and Interface Status TLV. The additional ETH-CC columns represent the actual transmitting value of the TLV, or "Absent" if not present in the ETH-CC PDU. These additional ETH-CC columns are represented with a series of dashes if the ETH-CC column under the TxPDU is a dash ("-") or "c".

The optional parameters are treated as independent and cumulative filters that are combined to refine the output. Rows in the output are populated for matches against all specified filters. Omitting all optional parameters produces output that includes all MEPs.

Parameters

md-index

Specifies the MD index.

Values 1 to 4294967295

md-admin-name

Specifies the MD name, up to 64 characters.

ma-index

Specifies the MA index.

Values 1 to 4294967295

ma-admin-name

Specifies the MD name, up to 64 characters.

mep-id

Specifies the local MEP ID.

Values 1 to 8191

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following output is an example of local PDU transmission information, and [Table 256: Output fields: ETH-CFM local PDU transmission](#) describes the output fields.

Output example

```
show eth-cfm local-tx-pdu
```

```

Table 256: Output fields: ETH-CFM local PDU transmission

Label	Description
MdIndex	The local MEP domain index
MaIndex	The local MEP association index
MepId	The local MEP identifier
SrcMacAddress	The local MEP source MAC address
TxRdi	The RDI value
PortTLV	The Port Status TLV value
IfTLV	The Interface Status TLV value
TxPDU	The transmission, summarized in three single-character columns. The left column displays ETH-CC, the middle column displays ETH-AIS, and the right column displays ETH-CFM Grace (ETH-VSM or ETH-ED).

Label	Description
	For ETH-AIS, "A" is displayed when a facility MEP has determined that the AIS state is active, regardless of interaction, linkages, or active transmission of associated MEPs.
md-admin-name	Displays the administrative MD name.
ma-admin-name	Displays the administrative MA name.

Context

[\[Tree\]](#) (show>subscr-mgmt local-user-db)

Full Context

```
show subscriber-mgmt local-user-db
```

Description

This command displays local user database information.

Parameters

local-user-db-name

Specifies the name of a local user database up to 32 characters.

association

Displays entities associated with the specified local user database.

dhcp

Displays entities associated with the specified local user database for DHCP clients or server.

ppp

Displays entities associated with the specified local user database for PPP sessions.

l2tp

Displays entities associated with the specified local user database for L2TP sessions.

radius

Displays entities associated with the specified local user database for RADIUS fallback.

pppoe

Displays entities associated with the specified local user database for PPPoE sessions.

dhcp6

Displays entities associated with the specified local user database for DHCPv6 clients.

capture-sap

Displays capture-saps associated with the specified local user database.

rt-solicit

Displays entities associated with the specified local user database for rtr-solicit session.

wpp

Displays entities associated with the specified local user database for WPP.

ipoe

Displays entities associated with the specified local user database for IPoE sessions.

gtp

Displays GTP APN policies associated with the specified local user database.

ipoe-all-hosts

Displays a summary overview of all IPoE hosts .

ipoe-host-name

Displays detailed information about the specified IPoE host.

ipoe-unmatched-hosts

Displays unmatched IPoE hosts and the reason why they cannot be matched in the specified local user database.

ppp-all-hosts

Displays a summary overview of all PPP hosts.

ppp-hosts

Displays detailed information about the specified PPP host.

ppp-unmatched-hosts

Displays unmatched PPP hosts and the reason why they cannot be matched in the specified local user database.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Table 257: Local User Database Field Descriptions

Field	Description
Name	The local user database name
Admin State	The administrative state of the local user database
Host Count	The number of hosts associated with the local user database
Description	The user-provided description of the local user database
Number of Local User Databases	The number of local user databases configured on the node
Number of Hosts	The number of hosts configured on the node
Last Mgmt Change	The sysUpTime at the time of the last modification
DHCP Match Types	The DHCP match type
DHCP CirclD Mask Pfx	The DHCP circuit ID mask prefix
DHCP CirclD Mask Sfx	The DHCP circuit ID mask suffix
PPPoE Match Types	The PPPoE match types; circuit-id, derived-id, dual-stack-remote-id, encap-tag-range, ip, mac, option60, remote-id, sap-id, service-id, string, system-id
PPPoE CirclD Mask Pfx	The PPPoE circuit ID mask prefix
PPPoE CirclD Mask Sfx	The PPPoE circuit ID mask suffix
Circuit Id	The circuit ID to match during host identification
Mac Address	The MAC address to matching during host identification

Field	Description
Remote Id	The remote ID from option 82 to match against
Sap Id	The SAP ID from the Nokia vendor specific sub-option in option 82 to match against
Service Id	The service ID to match during host identification
String	The string from the Nokia vendor specific sub-option in option 82 to match against
Option 60	The Vendor-Identifying Vendor Option to match against
System Id	The system ID from the Nokia vendor specific sub-option in option 82 to match against
Subscriber Id	The subscriber ID which is encoded in the identification strings
SLA Profile String	The SLA profile string which is encoded in the identification strings
Sub Profile String	The subscriber profile string which is encoded in the identification strings
App Profile String	The application profile string which is encoded in the identification strings
ANCP String	The ANCP string which is encoded in the identification strings
Inter Destination Id	The intermediate destination identifier which is encoded in the identification strings
Name	The unmatched host name
Reason	Indicates why this host is not matched
Duplicate Host	The name of the host that is already matched and that has the same values, configured for the objects that correspond with the match types, as this unmatched host
Server-Name	The service name of the unmatched host
Router-Name	The router name of the unmatched host
Interface-Name	The interface name of the unmatched host
Service-Id	The service ID that matches the host identification the Nokia vendor specific sub-option in option 82, or the service where the IPoE session is established
Interface-Name	The interface name associated with the local user database

Field	Description
Svc-Id Svc-Id	The service ID associated with the local user database
Type	The service type
SAP	The capture SAP associated with the local user database
PPPoE	PPPoE associated with the capture SAP; Y or N
PPP	PPPoE associated with the capture SAP; Y or N
IpoE	IPoE associated with the capture SAP; Y or N
DHCP	DHCP associated with the capture SAP; Y or N
DHCP6	DHCP6 associated with the capture SAP; Y or N
RS	RS associated with the capture SAP; Y or N
No. of SAP(s)	The total number of SAPs
Keepalive	
Interval	The LCP keepalive interval override value configured for this PPP host. N/A means no override is configured
Hold up multiplier	The LCP keepalive hold up multiplier override value configured for this PPP host. N/A means no override is configured

local-user-db

Syntax

local-user-db *local-user-db-name*

Context

[\[Tree\]](#) (tools>perform>subscr-mgmt local-user-db)

Full Context

tools perform subscriber-mgmt local-user-db

Description

This command provides tools to control the local user database.

Parameters

local-user-db-name

Specifies the name of a local user database up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

14.56 locator

locator

Syntax

locator [**mt** {0 | 2}] [**prefix** *ipv6-prefix[/prefix-length]*] [**adv-router** *system-id | hostname*] [**algo** *algo-id*]

Context

[\[Tree\]](#) (show>router>isis>srv6 locator)

Full Context

show router isis segment-routing-v6 locator

Description

This command displays IS-IS SRv6 locators.

Parameters

ipv6-prefix[/prefix-length]

Displays routes only matching the specified *ip-address* and length.

Values *ipv6-prefix[/prefix]*: x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:d.d.d.d
x: [0 to FFFF]H
d: [0 to 255]D
prefix-length: 1 to 128

system-id | hostname

Displays information for the specific IS-IS advertising router. The host name can be up to 38 characters.

algo-id

Displays information for the specified algorithm.

Values 0 to 255

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

locator

Syntax

locator [*locator-name*]

Context

[\[Tree\]](#) (show>router>srv6 locator)

Full Context

show router segment-routing-v6 locator

Description

This command displays the SRv6 locator status.

Parameters

locator-name

Specifies the locator name, up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

14.57 lockout

lockout

Syntax

lockout *aps-id*

Context

[\[Tree\]](#) (tools>perform>aps lockout)

Full Context

tools perform aps lockout

Description

This command locks out the protection circuit.

Parameters

aps-id

Specifies the APS ID.

Values	<i>aps-id</i>	<i>aps-group-id</i>
	aps	keyword
	group-id	1 to 128

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

lockout

Syntax

lockout id *tunnel-id*

lockout *lsp-name*

Context

[\[Tree\]](#) (tools>perform>router>mpls>tp-tunnel lockout)

Full Context

tools perform router mpls tp-tunnel lockout

Description

This command performs a lockout of protection for an MPLS-TP LSP. This prevents a switchover to the protect path.

Parameters

tunnel-id

Specifies the tunnel number of the MPLS-TP LSP.

Values 0 to 42949667295

lsp-name

Specifies the name of the MPLS-TP LSP, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

lockout

Syntax

lockout router *router-id* **local-gateway-address** *local-gateway-address* **mda** *mda*

lockout router *router-id* **local-gateway-address** *local-gateway-address* **esa-vm** *esa-id/vm-id*

lockout router *router-id* **local-gateway-address** *local-gateway-address* **remote** *ip-address[:port]*
lockout router *router-id* **mda** *mda*

Context

[\[Tree\]](#) (show>ipsec lockout)

Full Context

show ipsec lockout

Description

This command displays the lockout status for the specified IPsec clients. If remote address information is not specified, the system displays a list of clients that have been locked out on the specified ISA, along with the IPsec gateway if *local-gateway-address* is specified.

Parameters

router-id

Specifies the ID of the router where the IPsec gateway is configured.

local-gateway-address

Specifies the IP address of the local IPsec gateway.

mda

Specifies the MDA ID of the ISA.

ip-address

Specifies the IP address of the remote client.

port

Specifies the port of the remote client.

esa-vm

Displays the ID of the configured ESA and ESA VM.

Values

esa-vm:	<i>esa-id/vm-id</i>	
	<i>esa-id</i>	1 to 16
	<i>vm-id</i>	1 to 4

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of lockout information.

Output Example

```
show ipsec lockout router 300 local-gateway-address 172.16.100.1 remote  
192.168.61.100:500  
=====
```

```
IPsec Lockout Client
=====
Lockout           : True
Router ID         : 300
Local Gateway Address : 172.16.100.1
Lockout Client Address: 192.168.61.100
Lockout Client Port  : 500
No. of Failed Attempts: 2
No. of Dropped Packets: 2
Remaining Block Time : 289 seconds
=====
```

lockout

Syntax

lockout router *router-id*

lockout router *router-id* **local-gateway-address** *local-gateway-address*

lockout router *router-id* **local-gateway-address** *local-gateway-address* **remote** *ip-address[:port]*

Context

[\[Tree\]](#) (clear>ipsec lockout)

Full Context

clear ipsec lockout

Description

This command clears the lockout state for the specified clients. If remote address information is not specified, the system clears the lockout state for all clients within the specified routing instance, along with all clients within the specified IPsec gateway if *local-gateway-address* is specified.

Parameters

router-id

Specifies the ID of the router where the IPsec gateway is configured.

local-gateway-address

Specifies the IP address of the local IPsec gateway.

ip-address

Specifies the IP address of the remote client.

port

Specifies the port of the remote client.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

14.58 lockout-annexb

lockout-annexb

Syntax

lockout-annexb *aps-id*

Context

[\[Tree\]](#) (tools>perform>aps lockout-annexb)

Full Context

tools perform aps lockout-annexb

Description

This command locks out the Annex B APS group.

Parameters

aps-id

Specifies the APS ID.

Values

<i>aps-id</i>	<i>aps-group-id</i>
aps	keyword
group-id	1 to 128

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

14.59 log

log

Syntax

Syntax

log *log-id*

Context

[Tree] (clear>li log)

Full Context

clear li log

Description

This command clears LI event log information.

Parameters

log-id

Specifies the log ID.

Values 1 to 100

Platforms

All

log

Syntax

log [*bindings*]

log *log-id* [*match string*]

Context

[Tree] (show>filter log)

Full Context

show filter log

Description

This command shows the contents of a memory-based or a file-based filter log.

If the optional keyword **match** and *string* parameter are given, the command displays the given filter log from the first occurrence of the given string.

Parameters

bindings

Displays the number of filter logs currently instantiated.

log-id

Specifies the filter log ID destination expressed as a decimal integer.

Values 101 to 199

string

Specifies to start displaying the filter log entries from the first occurrence of *string*.

Platforms

All

Output

The following output is an example of filter log entry information, and [Table 258: Filter Log Output Fields](#) describes the fields. If log summary is active, the filter log mini-tables contain the information described in [Table 259: Filter Log Summary Mini-Table Fields](#).

Output Example

Log Message Formatting — Each filter log entry contains the following information in case summary log feature is not active (as appropriate).

Table 258: Filter Log Output Fields

Label	Description
yyyy/mm/dd hh:mm:ss	The date and timestamp for the log filter entry where <i>yyyy</i> is the year, <i>mm</i> is the month, <i>dd</i> is the day, <i>hh</i> is the hour, <i>mm</i> is the minute and <i>ss</i> is the second
Filter	The filter ID and the entry ID which generated the filter log entry in the form <i>Filter_ID:Entry_ID</i>
Desc	The description of the filter entry ID which generated the filter log entry
Interface	The IP interface on which the filter ID and entry ID was associated which generated the filter log entry
Action	The action of the filter entry on the logged packet
Src MAC	The source MAC address of the logged packet
Dst MAC	The destination MAC of the logged packet
EtherType	The Ethernet type of the logged Ethernet type II packet
Src IP	The source IP address of the logged packet; the source port is displayed after the IP address as appropriate separated with a colon

Label	Description
Dst IP	The destination IP address of the logged packet; the source port is displayed after the IP address as appropriate separated with a colon
Flags (IP flags)	M — the more fragments IP flag is set in the logged packet DF — the do not fragment IP flag is set in the logged packet
TOS	The ToS byte value in the logged packet
Protocol	The IP protocol of the logged packet (TCP, UDP, ICMP or a protocol number in hex)
Flags (TCP flags)	URG — Urgent bit set ACK — Acknowledgment bit set RST — Reset bit set SYN — Synchronize bit set FIN — Finish bit set
HEX	If an IP protocol does not have a supported decode, the first 32 bytes following the IP header are printed in a hex dump Log entries for non-IP packets include the Ethernet frame information and a hex dump of the first 40 bytes of the frame after the Ethernet header
Total Log Instances (Allowed)	Specifies the maximum allowed instances of filter logs allowed on the system
Total Log Instances (In Use)	Specifies the instances of filter logs presently existing on the system
Total Log Bindings	Specifies the count of the filter log bindings presently existing on the system
Type	The type of service of the service ID
Filter ID	Uniquely identifies an IP filter as configured on the system
Entry ID	The identifier which uniquely identifies an entry in a filter table
Log	Specifies an entry in the filter log table
Instantiated	Specifies if the filter log for this filter entry has or has not been instantiated

If the packet being logged does not have a source or destination MAC address (that is, POS) then the MAC information output line is omitted from the log entry.

If log summary is active, the filter log mini-tables contain the information described in [Table 259: Filter Log Summary Mini-Table Fields](#).

Table 259: Filter Log Summary Mini-Table Fields

Label	Description
<i>Summary Log LogID</i>	Displays the log ID
Crit1	Summary criterion that is used as index into the mini-tables of the log
TotCnt	The total count of logs
ArpCnt	Displays the total number of ARP messages logged for this log ID
Src... Dst...	The address type indication of the key in the mini-table
count	The number of messages logged with the specified source/destination address
address	The address for which count messages were received

Output

The following output is an example of log collector information.

[Table 260: Show Log-Collector Output Fields](#) describes log-collector output fields.

Output Example

```

A:ALA-1# show log log-collector
=====
Log Collectors
=====
Main          Logged   : 1224          Dropped   : 0
  Dest Log Id: 99   Filter Id: 0      Status: enabled  Dest Type: memory
  Dest Log Id: 100 Filter Id: 1001   Status: enabled  Dest Type: memory

Security      Logged   : 3          Dropped   : 0

Change        Logged   : 3896       Dropped   : 0

Debug         Logged   : 0          Dropped   : 0

=====

Table 260: Show Log-Collector Output Fields

Label	Description
<Collector Name>	<p>Main — The main event stream contains the events that are not explicitly directed to any other event stream.</p> <p>Security — The security stream contains all events that affect attempts to breach system security such as failed login attempts, attempts to access MIB tables to which the user is not granted access or attempts to enter a branch of the CLI to which access has not been granted.</p> <p>Change — The change event stream contains all events that directly affect the configuration or operation of this node.</p> <p>Debug — The debug-trace stream contains all messages in the debug stream.</p>
Dest. Log ID	Specifies the event log stream destination.
Filter ID	The value is the index to the entry which defines the filter to be applied to this log's source event stream to limit the events output to this log's destination. If the value is 0, then all events in the source log are forwarded to the destination.
Status	<p>Enabled — Logging is enabled.</p> <p>Disabled — Logging is disabled.</p>
Dest. Type	<p>Console — A log created with the console type destination displays events to the physical console device.</p> <p>Events are displayed to the console screen whether a user is logged in to the console or not.</p> <p>Session — A user logged in to the console device or connected to the CLI via a remote telnet or SSH session can also create a log with a destination type of 'session'. Events are displayed to the session device until the user logs off.</p>

Label	Description
	Syslog — Log events are sent to a syslog receiver. SNMP traps — Events defined as SNMP traps are sent to the configured SNMP trap destinations and are logged in NOTIFICATION-LOG-MIB tables. File — All selected log events are directed to a file on one of the compact flash disks. Memory — All selected log events are directed to an in-memory storage area.

Full Context

```
show service id log log-id
```

Description

This command displays an event log summary with settings and statistics or the contents of a specific log file, SNMP log, or memory log.

If the command is specified with no command line options, a summary of the defined system logs is displayed. The summary includes log settings and statistics.

If the log ID of a memory, SNMP, or file event log is specified, the command displays the contents of the log. Additional command line options control what and how the contents are displayed.

Contents of logs with console, session or syslog destinations cannot be displayed. The actual events can only be viewed on the receiving syslog or console device.

Parameters

log-id

Displays the contents of the specified file log or memory log ID. The log ID must have a destination of an SNMP or file log or a memory log for this parameter to be used.

Values 1 to 100

Default Displays the event log summary.

severity-level

Displays only events with the specified and higher severity.

Values cleared, indeterminate, critical, major, minor, warning

Default All severity levels.

application

Displays only events generated by the specified application.

Values application_assurance, aps, atm, bfd, bgp, calltrace, ccag, cflowd, chassis, cpmhwfilter, cpmhwqueue, debug, dhcp, dhcps, diameter, dot1x, dynsvc, efm_oam, elmi, ering, eth_cfm, etun, filter, fpe, gsmp, gtungrp, igh, igmp, igmp_snooping, ip, ipfix, ipsec, ipsec_cpm, isis, l2tp, lag, ldap, ldp, li, lldp, logger, mcac, mcpath, mc_redundancy, mirror, mld, mld_snooping, mpls, mpls_tp, mrrp, msdp, nat, ntp, oam, open_flow, ospf, pcep, pim, pim_snooping, port, ppp, pppoe, pppoe_clnt, ptp, pxc, python, qos, radius, rip, rip_ng, route_next_hop, route_policy, rpki, rsvp, security, sflow, snmp, stp, subscr_mgmt, sub_host_trk, svcmgr, system, tip, tls, user, user_db, video, vrrp, vrtr, wlan_gw, wpp

Default All applications.

from-seq [to-seq]

Displays the log entry numbers from a particular entry sequence number (*from-seq*) to another sequence number (*to-seq*). The *to-seq* value must be larger than the *from-seq* value.

If the *to-seq* number is not provided, the log contents to the end of the log is displayed unless the **count** parameter is present in which case the number of entries displayed is limited by the **count**.

Values 1 to 4294967295

Default All sequence numbers.

count

Limits the number of log entries displayed to the *number* specified.

Values 1 to 4294967295

Default All log entries.

subject

Displays only log entries matching the specified text *subject* string, up to 32 characters. The subject is the object affected by the event, for example the port-id would be the subject for a link-up or link-down event.

regexp

Specifies to use a regular expression as parameters with the specified **subject** string.

ascending | descending

Specifies sort direction. Logs are normally shown from the newest entry to the oldest in **descending** sequence number order on the screen. When using the **ascending** parameter, the log is shown from the oldest to the newest entry.

Default Descending.

format

Specifies a message string, up to 400 characters, to be used in the display criteria.

msg-regexp

Specifies to use a regular expression as parameters with the specified message string.

Platforms

All

Output

[Table 261: Show Log-ID Field Descriptions](#) describes the log ID field output.

Table 261: Show Log-ID Field Descriptions

Label	Description
Log Id	An event log destination.

Label	Description
Source	no — The event log filter is not currently in use by a log ID. yes — The event log filter is currently in use by a log ID.
Filter ID	The value is the index to the entry which defines the filter to be applied to this log's source event stream to limit the events output to this log's destination. If the value is 0, then all events in the source log are forwarded to the destination.
Admin State	Up — Indicates that the administrative state is up. Down — Indicates that the administrative state is down.
Oper State	Up — Indicates that the operational state is up. Down — Indicates that the operational state is down.
Logged	The number of events that have been sent to the log source(s) that were forwarded to the log destination.
Dropped	The number of events that have been sent to the log source(s) that were not forwarded to the log destination because they were filtered out by the log filter.
Dest. Type	Console — All selected log events are directed to the system console. If the console is not connected, then all entries are dropped. Syslog — All selected log events are sent to the syslog address. SNMP traps — Events defined as SNMP traps are sent to the configured SNMP trap destinations and are logged in NOTIFICATION-LOG-MIB tables. File — All selected log events are directed to a file on one of the CPM's compact flash disks. (7750 SR and 7450 ESS only). Memory — All selected log events are directed to an in-memory storage area.
Dest ID	The event log stream destination.
Size	The allocated memory size for the log.
Time format	The time format specifies the type of timestamp format for events sent to logs where log ID destination is either syslog or file. When the time format is UTC, timestamps are written using the Coordinated Universal Time value. When the time format is local, timestamps are written in the system's local time.

log-id

Syntax

```
log-id [log-id | log-name] [severity severity-level] [application application] [sequence from-seq [to-seq]] [count count] [router router-instance [expression]] [subject subject [regexp]] [{ ascending | descending}] [message message [msg-regexp]]
```

Context

[Tree] (show>li>log log-id)

Full Context

show li log log-id

Description

This command displays information for specified log.

Parameters

log-id | log-name

Specifies the log ID or name.

Values 1 to 100

severity-level

Specifies the severity level.

Values cleared, indeterminate, critical, major, minor, warning

application

Specifies the application name.

Values application_assurance, aps, atm, auto_prov, bfd, bgp, bier, bmp, calltrace, ccag, cflowd, chassis, cpmhwfilter, cpmhwqueue, debug, dhcp, dhcps, diameter, dot1x, dynsvc, efm_oam, elmi, ering, eth_cfm, etun, filter, fpe, gsmp, gtp, gtungrp, icl, igh, igmp, igmp_snooping, ip, ipfix, ipsec, ipsec_cpm, isis, l2tp, lag, ldap, ldp, li, lldp, logger, macsec, mcac, mcpath, mc_redundancy, mgmt_core, mirror, mld, mld_snooping, mpls, mpls_tp, mpls_lmgr, mrp, msdp, nat, nge, ntp, oam, open_flow, ospf, pcap, pcep, pfc, pim, pim_snooping, port, ppp, pppoe, pppoe_clnt, profile, ptp, pxc, python, qos, radius, rib_api, rip, rip_ng, route_next_hop, route_policy, rpki, rsvp, security, sflow, snmp, sr_policy, stp, subscr_mgmt, sub_host_trk, svcmgr, system, tip, tls, user, user_db, video, vrrp, vrtr, wlan_gw, wpp

from-seq [to-seq]

Specifies the sequence value.

Values 1 to 4294967295

count

Specifies the count.

Values 1 to 4294967295

router-instance

Specifies the router instance.

subject

Specifies a subject string to match.

regexp

Specifies to use a regular expression match.

ascending | descending

Specifies the sort direction.

message

Specifies the message, up to 400 characters.

msg-regexp

Specifies to use a message regular expression match.

Platforms

All

log-id

Syntax

log-id [*log-id* | *log-name*] [**severity** *severity-level*] [**application** *application*] [**sequence** *from-seq* [*to-seq*]] [**count** *count*] [**router** *router-instance* [**expression**]] [**subject** *subject* [**regexp**]] [**ascending** | **descending**] [**message** *message* [**msg-regexp**]]

Context

[\[Tree\]](#) (show>log log-id)

Full Context

show log log-id

Description

This command displays an event log summary with settings and statistics or the contents of a specific log file, SNMP log, or memory log.

If the command is specified with no command line options, a summary of the defined system logs is displayed. The summary includes log settings and statistics.

If the log ID of a memory, SNMP, or file event log is specified, the command displays the contents of the log. Additional command line options control what and how the contents are displayed.

Contents of logs with console, session or syslog destinations cannot be displayed. The actual events can only be viewed on the receiving syslog or console device.

Parameters

log-id* | *log-name

Displays the contents of the specified file log or memory log ID. The log ID, or optional log name (up to 64 characters), must have a destination of an SNMP or file log or a memory log for this parameter to be used.

Default Displays the event log summary

Values 1 to 101

severity-level

Displays only events with the specified and higher severity.

Default All severity levels

Values cleared, indeterminate, critical, major, minor, warning

application

Displays only events generated by the specified application.

Default All applications

The following values are examples of applications:

Values bgp, cflowd, chassis, dhcp, debug, filter, igmp, ip, isis, lag, ldp, lldp, logger, mirror, mpls, oam, ospf, pim, port, ppp, rip, route_policy, rsvp, security, snmp, stp, svcmgr, system, user, vrrp, vrtr, ospf_ng, ntp

expression

Specifies to use a regular expression as match criteria for the router instance string.

from-seq [to-seq]

Displays the log entry numbers from a particular entry sequence number (*from-seq*) to another sequence number (*to-seq*). The *to-seq* value must be larger than the *from-seq* value.

If the *to-seq* number is not provided, the log contents to the end of the log is displayed unless the **count** parameter is present in which case the number of entries displayed is limited by the **count**.

Default All sequence numbers

Values 1 to 4294967295

count

Limits the number of log entries displayed to the *number* specified.

Default All log entries

Values 1 to 4294967295

router-instance

Specifies a router name up to 32 characters in length to be used in the display criteria.

message

Specifies a message string up to 400 characters in length to be used in the display criteria.

msg-regex

Specifies to use a regular expression as parameters with the specified *message* string.

subject

Displays only log entries matching the specified text *subject* string. The subject is the object affected by the event, for example the port-id would be the subject for a link-up or link-down event.

regex

Specifies to use a regular expression as parameters with the specified *subject* string.

ascending | descending

Specifies sort direction. Logs are normally shown from the newest entry to the oldest in **descending** sequence number order on the screen. When using the **ascending** parameter, the log is shown from the oldest to the newest entry.

Default Descending

Platforms

All

Output

The following output is an example of log ID information.

Table 262: Log-Id Output Field Descriptions

Label	Description
Log Name/Id	An event log destination.
Source	no — The event log filter is not currently in use by a log ID. yes — The event log filter is currently in use by a log ID.
Filter ID	The value is the index to the entry which defines the filter to be applied to this log's source event stream to limit the events output to this log's destination. If the value is 0, then all events in the source log are forwarded to the destination.
Admin State	Up — Indicates that the administrative state is up. Down — Indicates that the administrative state is down.
Oper State	Up — Indicates that the operational state is up. Down — Indicates that the operational state is down.
Logged	The number of events that have been sent to the log source(s) that were forwarded to the log destination.
Dropped	The number of events that have been sent to the log source(s) that were not forwarded to the log destination because they were filtered out by the log filter.
Dest. Type	Console — All selected log events are directed to the system console. If the console is not connected, then all entries are dropped. Syslog — All selected log events are sent to the syslog address. SNMP traps — Events defined as SNMP traps are sent to the configured SNMP trap destinations and are logged in NOTIFICATION-LOG-MIB tables. File — All selected log events are directed to a file on one of the CPM's compact flash disks. Memory — All selected log events are directed to an in-memory storage area.

Label	Description
Dest ID	The event log stream destination.
Size	The allocated memory size for the log.
Time format	The time format specifies the type of timestamp format for events sent to logs where log ID destination is either syslog or file. When the time format is UTC, timestamps are written using the Coordinated Universal Time value. When the time format is local, timestamps are written in the system's local time.

log-id

Syntax

log-id *log-id*

Context

[\[Tree\]](#) (clear>log log-id)

Full Context

clear log log-id

Description

Reinitializes or rolls over the specified memory/file event log ID. Memory logs are reinitialized and cleared of contents. File logs are manually rolled over by this command.

This command is only applicable to event logs that are directed to file destinations and memory destinations.

SNMP, syslog, console, or session logs are not affected by this command.

Parameters

log-id

Specifies the event log ID to be initialized or rolled over.

Values 1 to 100

14.67 Isn-blocks

Isn-blocks

Syntax

```
Isn-blocks [inside-router router-instance] [inside-ip ip-address] [outside-ip-prefix ip-prefix/length]
[outside-port [0..65535]] [pool pool-name]
```

Context

[\[Tree\]](#) (show>router>nat Isn-blocks)

Full Context

```
show router nat Isn-blocks
```

Description

This command displays large scale NAT blocks.

Parameters

router-instance

Specifies the router instance name and service ID.

Values

router-name:	Base , management
service-id:	1 to 2147483647

svc-name: A string up to 64 characters.

ip-address

Specifies the IP address in a.b.c.d format.

ip-prefix

Specifies the IP prefix.

Values a.b.c.d (host bits must be 0)

length

Specifies the IP prefix length.

Values 1 to 32

pool-name

Specifies the pool name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of this command.

Output Example

```
*A:SR12_PPP0E>show>router>nat# show router Base nat lsn-blocks
=====
Large-Scale NAT blocks for Base
=====
10.0.0.5 [1024..1527]
Pool                : privpool
Policy              : priv-nat-policy
Started             : 2012/01/28 19:10:17
Inside router       : vprn100
Inside IP address   : 2001:db8:470:1f00:ffff:189
-----
Number of blocks: 1

```

14.68 lsp

lsp

Syntax

lsp [*lsp-name*] [**status** {up | down}] [**from** ip-address | **to** ip-address] [**detail**] [**auto-lsp** {all | mesh-p2p | one-hop-p2p}]

```
lsp {transit | terminate} [status {up | down}] [from ip-address | to ip-address | lsp-name name] [detail]  
lsp count  
lsp [lsp-name] activepath [auto-lsp {all | mesh-p2p | one-hop-p2p}]  
lsp [lsp-name] path [path-name] [status {up | down}] [detail] [auto-lsp {all | mesh-p2p | one-hop-p2p}]  
lsp [lsp-name] path [path-name] mbb [auto-lsp {all | mesh-p2p | one-hop-p2p}]  
lsp [lsp-name] auto-bandwidth [auto-lsp {all | mesh-p2p | one-hop-p2p}]
```

Context

[\[Tree\]](#) (show>router>mpls lsp)

Full Context

```
show router mpls lsp
```

Description

This command displays LSP details.

Parameters

lsp-name

Specifies the name of the LSP used in the path, up to 64 characters.

status up

Displays an LSP that is operationally up.

status down

Displays an LSP that is operationally down.

from *ip-address*

Displays the IP address of the ingress router for the LSP.

to *ip-address*

Displays the IP address of the egress router for the LSP.

detail

Displays detailed information.

auto-lsp all

Displays all the auto LSP types.

auto-lsp mesh-p2p

Displays the mesh-p2p auto LSP types.

auto-lsp one-hop-p2p

Displays the one-hop-p2p auto LSP types.

transit

Displays the number of static LSPs that transit through the router.

terminate

Displays the number of static LSPs that terminate at the router.

count

Displays the total number of LSPs.

path-name

Specifies the LSP path name.

activepath

Displays the present path being used to forward traffic.

mbb

Displays make-before-break (MBB) information.

Platforms

All

Output

The following output is an example of MPLS LSP information.

[Table 263: MPLS LSP Output Fields](#) and [Table 264: LSP Detail Output Fields](#) describe the MPLS LSP output fields.

Output Example

```

Table 263: MPLS LSP Output Fields

Label	Description
LSP Name	The name of the LSP used in the path.
To	The IP address of the egress router for the LSP.
Adm State	Down — The path is administratively disabled. Up — The path is administratively enabled.
Oper State	Down — The path is operationally down. Up — The path is operationally up.
LSPs	The total number of LSPs configured.
From	The IP address of the ingress router for the LSP.
LSP Up Time	The length of time the LSP has been operational.
Transitions	The number of transitions that have occurred for the LSP.
Retry Limit	The number of attempts that the software should make to re-establish the LSP after it has failed.
Signaling	Specifies the signaling style.
Hop Limit	The maximum number of hops that an LSP can traverse, including the ingress and egress routers.
Fast Reroute/Fast Fail Config	enabled — Fast reroute is enabled. In the event of a failure, traffic is immediately rerouted on the pre-computed detour LSP, thus minimizing packet loss. disabled — There is no detour LSP from each node on the primary path.
PathCompMethod	pce — PCE path computation method is configured. local-cspf — Local CSPF path computation method is configured.
Adspec/ADSPEC	enabled — The LSP includes advertising data (ADSPEC) objects in RSVP messages. disabled — The LSP does not include advertising data (ADSPEC) objects in RSVP messages.
FallbkPathComp	none — No fallback method is configured. local-cspf — Local CSPF fallback is configured.
Primary	The preferred path for the LSP.
Secondary	The alternate path that the LSP uses if the primary path is not available.
Bandwidth	The amount of bandwidth in Mb/s reserved for the LSP path.
LSP Up Time	The total time in increments that the LSP path has been operational.

Label	Description
LSP Tunnel ID	The value which identifies the label switched path that is signaled for this entry.
To	The IP address of the egress router for the LSP.
LSP Down Time	The total time in increments that the LSP path has not been operational.
Path Changes	The number of path changes this LSP has had. For every path change (path down, path up, path change), a corresponding syslog/trap (if enabled) is generated.
Retry Timer	The time in s, for LSP re-establishment attempts after an LSP failure.
Resv Style	se — Specifies a shared reservation environment with a limited reservation scope. This reservation style creates a single reservation over a link that is shared by an explicit list of senders. ff — Specifies a shared reservation environment with an explicit reservation scope. Specifies an explicit list of senders and a distinct reservation for each of them.
Negotiated MTU	The size of the maximum transmission unit (MTU) that is negotiated during establishment of the LSP.
FR Hop Limit	The total number of hops a detour LSP can take before merging back onto the main LSP path.
LastResignal Attempt	Displays the system up time when the last attempt to resignal this LSP was made.
MBB Type	Displays an enumerated integer that specifies the type of make-before-break (MBB). If none displays then there is no MBB in progress or no last MBB.
MBB State	Displays the state of the most recent invocation of the make-before-break functionality.
End at	Displays the system up time when the last MBB ended.
Old Metric	Displays the cost of the traffic engineered path for the LSP path prior to MBB.
NextRetryIn	Displays the amount of time (in s) remaining, before the next attempt is made to retry the in-progress MBB.
RetryAttempt	Displays the number attempts for the MBB is in progress.
Failure Code	Displays the reason code for in-progress MBB failure. A value of none indicates that no failure has occurred. See "LSP Failure Codes" in the <i>7450 ESS</i> , <i>7750 SR</i> , <i>7950 XRS</i> , and <i>VSR MPLS Guide</i> for more information.
Failure Node	Displays the IP address of the node in the LSP path at which the in-progress MBB failed. When no failure has occurred, this value is none .
Static LSPs	Displays the number of static LSPs.
Dynamic LSPs	Displays the number of dynamic RSVP LSPs.

Label	Description
P2P LSPs	Displays the number of P2P RSVP LSPs.
Detour LSPs	Displays the number of detour RSVP LSPs.
P2MP S2Ls	Displays the number of P2MP RSVP S2Ls.
MPLS-TP LSPs	Displays the number of MPLS-TP LSPs.
Mesh-P2P LSPs	Displays the number of Mesh-P2P RSVP LSPs.
One Hop-P2P LSPs	Displays the number of one hop P2P RSVP LSPs.
SR-TE LSPs	Displays the number of SR-TE LSPs.
Mesh-P2P SR-TE LSPs	Displays the number of Mesh-P2P SR-TE LSPs.
One Hop-P2P SR-TE LSPs	Displays the number of one hop SR-TE LSPs.
PCE Init SR-TE LSPs	Displays the number of PCE initiated SR-TE LSPs.

Table 264: LSP Detail Output Fields

Label	Description
Auto BW	Enabled — Auto-bandwidth adjustment is configured on this LSP.
AB OpState	Up – Auto-bandwidth is operationally enabled on this LSP Down – Auto-bandwidth is operationally disabled on this LSP
Auto BW Min	The minimum bandwidth of the LSP that auto-bandwidth can request (in Mb/s).
Auto BW Max	The maximum bandwidth of the LSP that auto-bandwidth can request (in Mb/s).
AB Up Thresh	The percent threshold for increasing LSP bandwidth.
AB Down Thresh	The percent threshold for decreasing LSP bandwidth.
AB Up BW	The absolute bandwidth threshold for increasing LSP bandwidth (in Mb/s).
AB Down BW	The absolute bandwidth threshold for decreasing LSP bandwidth (in Mb/s).
AB Coll Intv	The auto-bandwidth collection interval.
AB Adj Mul	The adjust-multiplier for this LSP (may be configured or inherited).

Label	Description
AB Samp Mul	The sample-multiplier for this LSP (may be configured or inherited).
AB Adj Time	The adjust-multiplier times the collection-interval (in minutes).
AB Sample Time	The sample-multiplier times the collection-interval (in minutes).
AB Adj Cnt	The adjust count (number of whole collection intervals since the start of the current adjust interval).
AB Samp Cnt	The sample count (number of whole collection intervals since the start of the current sample interval).
AB Last Adj	The system time of the last auto-bandwidth adjustment.
AB Next Adj	The approximate remaining time in the current adjust interval (adjust-multiplier – adjust count) times the collection interval (in min). This overstates the actual remaining time because the elapsed time in the current collection interval is not accounted for.
AB Adj Cause	The cause of the last auto-bandwidth adjustment: <ul style="list-style-type: none"> • none – no adjustment has occurred • manual • adj-count • overflow
AB Max AvgR*	The maximum average data rate in any sample interval of the current adjust interval.
AB Lst AvgR*	The average data rate measured in the sample interval that ended most recently.
AB Ovfl Lmt	The configured value of the auto-bandwidth overflow-limit.
AB Ovfl Cnt	The number of overflow samples since the last reset.
ABOvflThres	The percent threshold for declaring an overflow sample.
AB Ovfl BW	The absolute bandwidth threshold for declaring an overflow sample (in Mb/s).
AB Monitor BW	True – monitor bandwidth is enabled on the LSP. False – monitor bandwidth is not enabled on the LSP.
BFD Enable	The operational state of BFD on the LSP.
BFD failure-action	The failure action that is configured for the BFD LSP.
Lsp Self Ping	Enabled – LSP Self-ping on this RSVP LSP or RSVP LSPs (one-hop-p2p or mesh-p2p) using this LSP template is enabled.

Label	Description
	Disabled – LSP Self-ping on this RSVP LSP or RSVP LSPs (one-hop-p2p or mesh-p2p) using this LSP template is disabled. Inherited – inherits the value configured under config>router>mpls>lsp-self-ping>rsvp-te
OperPathComp Method	Displays the path computation method in use (pce, local, or none).
Self ping timeouts	Specifies the count of the number of LSP Self-ping timeouts.

lsp

Syntax

lsp *lsp-name*

Context

[\[Tree\]](#) (clear>router>mpls lsp)

Full Context

clear router mpls lsp

Description

This command resets and restarts an LSP.

Parameters

lsp-name

Specifies the LSP to clear, up to 64 characters in length.

Platforms

All

lsp

Syntax

lsp [*plsp-id plsp-id*]

lsp **lsp-type** *lsp-type* [*tunnel-id tunnel-id*]

Context

[\[Tree\]](#) (tools>dump>router>pcep>pcc lsp)

Full Context

tools dump router pcep pcc lsp

Description

This command displays LSP information.

Parameters

plsp-id

Specifies the PLSP ID.

Values 1 to 1048575

lsp-type

Specifies the LSP type.

Values rsvp-p2p, rsvp-p2mp, seg-rt

tunnel-id

Specifies the tunnel ID.

Values 1 to 1048575

Platforms

All

14.69 lsp-autobandwidth

lsp-autobandwidth

Syntax

lsp-autobandwidth [*lsp-name*]

Context

[\[Tree\]](#) (clear>router>mpls lsp-autobandwidth)

Full Context

clear router mpls lsp-autobandwidth

Description

This command clears the following counters/timers, as follows:

- The sample count is reset to zero, and the average data rate of the current sample interval is discarded.
- The adjust count is reset to zero.
- The maximum average data rate is zeroed.

- The overflow count is zeroed.

Parameters

isp-name

Specifies the LSP to clear, up to 64 characters.

Platforms

All

14.70 lsp-bfd

lsp-bfd

Syntax

lsp-bfd [*prefix-list-name* [**prefixes**]]

Context

[\[Tree\]](#) (show>router>ldp lsp-bfd)

Full Context

show router ldp lsp-bfd

Description

This command displays information about prefixes that have LSP BFD configured.

Parameters

prefixes

Shows all FECs that the system has received a label mapping message for and which are also eligible for LSP BFD.

prefix-list-name

Specifies a prefix list for which to display prefix information, and whether BFD is active for each prefix.

Platforms

All

Output

The following output is an example of LSP BFD information for prefixes.

Output Example

```
A:b1# show router ldp lsp-bfd "prefixListName_12345678901234567"  
=====
```

```
BFD on LDP LSP Configuration Detail

show test-oam Isp-bfd

Description

This command displays information about Bidirectional Forwarding Detection (BFD) sessions on LSPs.

Parameters

ip-prefix/prefix-length

Specifies an IP prefix for which to display BFD session information, and the length of the prefix.

Values *ipv4-prefix* — a.b.c.d
 ipv4-prefix-length — 0 to 32
 ipv6-prefix — x:x:x:x:x:x:x (eight 16-bit pieces)
 x:x:x:x:x:d.d.d.d
 x — 0 to FFFF (hexadecimal)
 d — 0 to 255 (decimal)
 ipv6-prefix-length — 0 to 128

bfd-discriminator

Displays information about the unique local discriminator for this session.

lsp-name

Specifies information about the specified LSP name up to 64 characters in length.

```

Context

[\[Tree\]](#) (show>router>pcep>pcc Isp-db)

Full Context

```
show router pcep pcc lsp-db
```

Description

This command displays the PCEP LSP-DB information.

Parameters

lsp-type

Specifies the LSP type.

Values rsvp-p2p, rsvp-p2mp, seg-rt

Note:

The LSP type, **rsvp-p2mp**, is not supported for PCE controlled or PCE initiated LSPs.

ip-address

Specifies the IP address.

Values a.b.c.d

lsp-name

Specifies the LSP name, up to 80 characters.

tunnel-id

Specifies the tunnel ID.

Values 1 to 65535

Platforms

All

Output

LSP-DB Output

[Table 265: LSP-DB Output Fields](#) describes LSP-DB output fields.

Output Example

```
*A:Dut-C>config>router>mpls# show router pcep pcc lsp-db
=====

Oper Status     : active
=====
```

Table 265: LSP-DB Output Fields

Label	Description
PCEP-specific LSP ID	Specifies the PCEP specific LSP ID.
LSP ID	Specifies the LSP ID.
LSP Type	rsvp-p2p — Indicates the LSP type is rsvp-p2p. rsvp-p2mp — Indicates the LSP type is rsvp-p2mp. seg-rt — Indicates the LSP type is seg-rt. pce-init-seg-rt — Indicates the LSP type is pce-init-seg-rt.
Tunnel ID	Specifies the tunnel ID.
Extended Tunnel Id	Specifies the extended tunnel ID.
LSP Name	Specifies the LSP name
Source Address	Specifies the source IP address.
Destination Address	Specifies the destination IP address.
LSP Delegated	True — Specifies that LSP Delegation is true. False— Specifies that LSP Delegation is false.
Delegate PCE Address	Specifies the delegate PCE IP address.
Oper Status	active — Specifies that the operational status is active. down — Specifies that the operational status is down.

Context

[\[Tree\]](#) (show>router>mpls>mpls-tp lsp-egress-stats)

Full Context

show router mpls mpls-tp lsp-egress-stats

Description

This command displays MPLS-TP LSP egress statistics information.

Parameters

active

Displays statistics for all active LSPs.

lsp-name

Displays statistics for the specified LSP name, up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

lsp-egress-stats

Syntax

lsp-egress-stats

lsp-egress-stats *lsp-name*

Context

[\[Tree\]](#) (clear>router>mpls lsp-egress-stats)

Full Context

clear router mpls lsp-egress-stats

Description

This command clears MPLS LSP egress statistics information.

Parameters

lsp-name

Specifies the LSP to clear, up to 64 characters.

Platforms

All

lsp-egress-stats

Syntax

lsp-egress-stats **lsp** *lsp-name* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**] [**bits**]

Context

[\[Tree\]](#) (monitor>router>mpls lsp-egress-stats)

Full Context

monitor router mpls lsp-egress-stats

Description

This command displays egress statistics for LSP interfaces at the configured interval until the configured count is reached.

Default

no lsp-egress-stats

Parameters

lsp-name

Specifies the LSP name, up to 64 characters.

repeat

Specifies how many times the command is repeated.

Values 1 to 999

Default 10

seconds

Specifies the interval for each display, in seconds.

Values 3 to 60

Default 10

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic instead of the delta.

bits

Displays the output values in bits rather than in octets.

Platforms

All

Output

The following output is an example of LSP egress statistics information.

Output Example

```

 B:Dut-C-cpm2#

14.73 lsp-history

lsp-history

Syntax

lsp-history [*lsp-name*]

Context

[\[Tree\]](#) (tools>dump>router>mpls lsp-history)

Full Context

tools dump router mpls lsp-history

Description

This command displays the recorded history of LSP events for all RSVP-TE LSPs if no LSP name is provided, or only the named LSP if an LSP name is provided.

Parameters

lsp-name

Specifies the LSP name, up to 64 characters.

Platforms

All

Output

The following example shows the LSP history output, and [Table 266: Output fields: tools dump router mpls lsp-history command](#) describes the output fields.

```
tools dump router mpls lsp-history "C_F_5"
```

Output Example

```
Info: lsp history recording is Enabled

[Tree] (show>router>mpls>mpls-tp lsp-ingress-stats)

Full Context

show router mpls mpls-tp lsp-ingress-stats

Description

This command displays MPLS-TP LSP ingress statistics information.

Parameters

active

Displays statistics for all active LSPs.

lsp-name

Displays statistics for the specified LSP name, up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

lsp-ingress-stats

Syntax

lsp-ingress-stats

lsp-ingress-stats *ip-address* **lsp** *lsp-name*

lsp-ingress-stats *sender-address:lsp-name*

Context

[\[Tree\]](#) (clear>router>mpls lsp-ingress-stats)

Full Context

clear router mpls lsp-ingress-stats

Description

This command clears MPLS LSP ingress statistics information.

Platforms

All

lsp-ingress-stats

Syntax

lsp-ingress-stats **lsp** *lsp-name* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**] *ip-address* [**bits**]

Context

[\[Tree\]](#) (monitor>router>mpls lsp-ingress-stats)

Full Context

monitor router mpls lsp-ingress-stats

Description

This command displays ingress statistics for LSP interfaces at the configured interval until the configured count is reached.

Parameters

lsp-name

Specifies the LSP name up to 64 characters.

repeat

Specifies how many times the command is repeated.

Values 1 to 999

Default 10

seconds

Specifies the interval for each display, in seconds.

Values 3 to 60

Default 10

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic instead of the delta.

ip-address

Specifies the IP address.

Values *a.b.c.d*

bits

Displays the output values in bits rather than in octets.

Platforms

All

Output

The following output is an example of LSP ingress statistics information.

Output Example

```

14.75 Isp-ldp

Isp-ldp

Syntax

Isp-ldp prefix *ip-prefix/ip-prefix-length*

Context

[Tree] (tools>dump>router>bfd Isp-ldp)

Full Context

```
tools dump router bfd lsp-ldp
```

Description

This command displays the local and remote discriminator values for LSP BFD sessions for a given prefix, as well as the BFD session state.

Parameters

prefix *ip-prefix/ip-prefix-length*

Specifies information for the specified IP prefix and mask length.

Values	
ipv4-address	- a.b.c.d
ipv6-address	- x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x - [0 to FFFF]H d - [0 to 255]D

Platforms

All

14.76 lsp-rsvp

lsp-rsvp

Syntax

```
lsp-rsvp {head | tail} [tunnel-id tunnel-id]
```

Context

[\[Tree\]](#) (tools>dump>router>bfd lsp-rsvp)

Full Context

```
tools dump router bfd lsp-rsvp
```

Description

This command displays the local and remote discriminator values for LSP RSVP sessions.

Parameters

head

Specifies information for the head of the LSP LDP link.

tail

Specifies information for the tail of the LSP LDP link.

tunnel-id *tunnel-id*

Displays information about the specified tunnel.

Values 0 to 4294967295

Platforms

All

14.77 Isp-self-ping

Isp-self-ping

Syntax

Isp-self-ping

Context

[\[Tree\]](#) (show>router>mpls Isp-self-ping)

Full Context

show router mpls Isp-self-ping

Description

This command displays LSP Self-ping timeout statistics.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following output is an example of MPLS LSP Self-ping information.

[Table 267: MPLS LSP Self-ping Output Fields](#) describes the MPLS LSP Self-ping output fields.

Table 267: MPLS LSP Self-ping Output Fields

Label	Description
RSVP-TE LSP Self Ping	Specifies the status of LSP Self-ping
LSP Self Ping Timeout	Specifies the value of the LSP timeout in seconds
LSP Self Ping Interval	Specifies the LSP Self-ping interval in seconds

Label	Description
Number of LSP Self Ping Timeouts	Specifies the total number of LSP Self-ping timeouts

Output Example

```
*A:Dut-C>config>router>mpls# show router mpls lsp-self-ping
=====
MPLS LSP Self Ping Timeout Statistics
=====
RSVP-TE LSP Self Ping           : Enabled
LSP Self Ping Timeout          : 60 seconds
LSP Self Ping Interval         : 1 seconds
LSP Self Ping Timeout Action   : switch
Number of LSP Self Ping Timeouts : 0
OAM Resource Failures          : 0
=====
*A:Dut-C>config>router>mpls#
```

lsp-self-ping

Syntax

lsp-self-ping

Context

[\[Tree\]](#) (clear>router>mpls>lsp lsp-self-ping)

Full Context

clear router mpls lsp lsp-self-ping

Description

This command resets or clears counters and timers for MPLS LSP self ping at the LSP level.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

lsp-self-ping

Syntax

lsp-self-ping

Context

[\[Tree\]](#) (clear>router>mpls lsp-self-ping)

14.78 lsp-template

lsp-template

Syntax

```
lsp-template [lsp-template-name] [detail]
```

```
lsp-template [lsp-template-name] bindings
```

Context

[\[Tree\]](#) (show>router>mpls lsp-template)

Full Context

```
show router mpls lsp-template
```

Description

This command displays MPLS LSP template information.

Parameters

lsp-template-name

Specifies the LSP template name, up to 32 characters.

detail

Displays detailed information.

bindings

Displays any bindings associated with the LSP template.

Platforms

All

Output

The following outputs are examples of LSP template information, and [Table 268: LSP Template Output Fields](#) describes the output fields.

Output Example

```

Table 268: LSP Template Output Fields

Label	Description
Name	Specifies the name.
Type	Specifies the type.
Admin State	Specifies the up or down administrative state.
No of LSPs	Specifies the number of LSPs.
LSP Templates	Specifies the number of LSP templates.
LSP Template	Specifies the name of the LSP template.
From	Specifies the from IP address.
Template ID	Specifies the template ID.
Default Path	Specifies the default path value.
Bandwidth	Specifies the bandwidth value in Mbps.
Hop Limit	Specifies the maximum number of hops.
CSPF	Specifies the enabled or disabled status for CSPF.
Use TE metric	Specifies the enabled or disabled status for use TE metric.
Include Groups	Specifies the included groups or none for no included groups.
Exclude Groups	Specifies the excluded groups or none for no excluded groups.
Record Route	Specifies the record route value.
Record Label	Specifies the record label value.
Retry Limit	Specifies the retry limit value.
Retry Timer	Specifies the retry timer value.
LSP Count	Specifies the LSP count.

Label	Description
Ref Count	Specifies the reference count number.
Load Bal Wt	Specifies the load balance weight value.
ClassForwarding	Specifies the enabled or disabled status for class forwarding.
VprnAutoBind	Specifies the enabled or disabled status for VPRN autobind.
IGP Shortcut	Specifies the enabled or disabled status for IGP shortcut.
IGP LFA	Specifies the enabled or disabled status for IGP LFA.
IGP Rel Metric	Specifies the enabled or disabled status for IGP Rel metric.
Metric	Specifies the metric value.
BGP Transport Tunn	Specifies the enabled or disabled status for BGP transport tunnels.
Entropy Label	Specifies the enabled or disabled status for entropy label.
PCE Report	Specifies the enabled or disabled status for PCE reports.
Admin Tags	Specifies the administrative tag names or none.
PCE Control	Specifies the enabled or disabled status for the PCE control.
FallbkPathComp	none — No fallback method is configured. local-cspf— Local CSPF fallback is configured.

14.79 Ispinfo

Ispinfo

Syntax

Ispinfo [*isp-name*] [**detail**]

Context

[\[Tree\]](#) (tools>dump>router>mpls Ispinfo)

Full Context

tools dump router mpls Ispinfo

Description

This command dumps MPLS LSP information.

Parameters

lsp-name

Specifies the LSP name, up to 64 characters.

detail

Specifies detailed LSP information.

Platforms

All

Output

The following output is an example of a BFD session that is up (LSPS UP).

Output Example

```
*A:Dut-B# tools dump router mpls lspinfo
LSP "lsp1" LspIdx 1 LspType Dynamic State LSPS_UP Flags 0x2000
NumPaths 3 NumSdps 0 NumCBFSdps 0 NumFltrEntries 0
HoldTimeRemaining 0secs ClassType 0 Metric 0 OperMetric 2000

15 m Commands

15.1 mac

mac

Syntax

mac all | *ieee-address* | unknown

Context

[\[Tree\]](#) (show>subscr-mgmt>errors mac)

Full Context

show subscriber-mgmt errors mac

Description

This command sorts all the subscriber errors by MAC address.

Parameters

all

Shows all errors starting with the lowest MAC address.

ieee-address

Shows only the error of a specific MAC address.

unknown

Shows errors with unknown MAC addresses.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of subscriber management listed by MAC addresses.

Output Example

```
*A:eng-BNG-2# show subscriber-mgmt errors mac all
=====
Subscriber management errors
=====
-----
MAC          : 00:00:10:10:12:13
-----
```

mac [**filter-type** *filter-type*]

mac *mac-filter-id* **type** *entry-type*

Context

[\[Tree\]](#) (show>filter mac)

Full Context

show filter mac

Description

This command displays MAC filter information.

When **effective-action** is specified, this command displays what effectively happens to a packet that matches the criteria associated with the MAC filter policy.

Parameters

mac-filter-id

Displays detailed information for the specified filter ID and its filter entries.

Values 1 to 65535

associations

Appends information as to where the filter policy ID is applied to the detailed filter policy ID output.

entry-type

Specifies the type of filter entries as "fixed" or "embedded".

counters

Displays counter information for the specified filter ID.

detail

Displays detailed information.

entry-id

Displays information on the specified filter entry ID for the specified filter ID only.

Values 1 to 2097151

effective-action

Displays the action that the system will effectively apply to the packet.

ingress

Filters the output and only displays the information for filter policies applied on ingress.

egress

Filters the output and only displays the information for filter policies applied on egress.

router

Filters the output and only displays the information for that specific service ("Base" instance).

service-id

Filters the output and only displays the information for the specified service. The specified value must correspond to an existing service in which the filter has been applied.

filter-type

Specifies the type of filter entries as "config".

Platforms

All

Output

No Parameters Specified — A brief listing of MAC filters is produced when no parameters are specified; [Table 270: Filter MAC Output Fields](#) describes the output fields.

Output Example

```
*A:Dut-C# show filter mac
=====
Configured Mac Filters                               Total:    1

```

Table 271: Filter MAC with Filter-ID Specified Output Fields

Label	Description
MAC Filter Filter Id	The MAC filter policy ID
Scope	Template — the filter policy is of type Template
	Exclusive — the filter policy is of type Exclusive
Description	The MAC filter policy description
Applied	No — the filter policy ID has not been applied
	Yes — the filter policy ID is applied
Def. Action	Forward — the default action for the filter ID for packets that do not match the filter entries is to forward
	Drop — the default action for the filter ID for packets that do not match the filter entries is to drop
Filter Match Criteria	MAC — indicates the filter is an MAC filter policy
Entry	The filter entry ID; if the filter entry ID indicates the entry is (Inactive), then the filter entry is incomplete as no action has been specified
Description	The filter entry description
FrameType	Ethernet — the entry ID match frame type is Ethernet IEEE 802.3
	Ethernet II — the entry ID match frame type is Ethernet Type II
Src MAC	The source MAC address and mask match criterion; when both the MAC address and mask are all zeros, no criterion specified for the filter entry

Label	Description
Dest MAC	The destination MAC address and mask match criterion; when both the MAC address and mask are all zeros, no criterion specified for the filter entry
Dot1p	The IEEE 802.1p value for the match criteria; undefined indicates no value is specified
Ethertype	The Ethertype value match criterion
DSAP	The DSAP value match criterion; undefined indicates no value specified
SSAP	SSAP value match criterion; undefined indicates no value specified
Snap-pid	The Ethernet SNAP PID value match criterion; undefined indicates no value specified
Esnap-oui-zero	Non-Zero — filter entry matches a non-zero value for the Ethernet SNAP OUI
	Zero — filter entry matches a zero value for the Ethernet SNAP OUI
	Undefined — no Ethernet SNAP OUI value specified
Match action	Default — the filter does not have an explicit forward or drop match action specified; if the filter entry ID indicates the entry is Inactive, the filter entry is incomplete, no action was specified
	Drop — packets matching the filter entry criteria will be dropped
	Forward — packets matching the filter entry criteria is forwarded
Ing. Matches	The number of ingress filter matches/hits for the filter entry
Egr. Matches	The number of egress filter matches/hits for the filter entry

Filter Associations — The associations for a filter ID will be displayed if the **associations** keyword is specified. The association information is appended to the filter information.

The following output is an example of MAC filter information when the associations keyword is specified, and [Table 272: Filter MAC Associations Output Fields](#) describes the fields.

Output Example

```
A:ALA-49# show filter mac 3 associations
=====
Mac Filter
=====
Filter ID      : 3                Applied       : Yes
Scope         : Template        Def. Action   : Drop
Entries       : 1
-----
Filter Association : Mac
-----
Service Id    : 1001            Type          : VPLS
```

```
- SAP          1/1/1:1001          (Egress)
=====
```

Table 272: Filter MAC Associations Output Fields

Label	Description
Filter Association	Mac — the filter associations displayed are for a MAC filter policy ID
Service Id	The service ID on which the filter policy ID is applied; the output also provides a list of service points where the filter has been applied
SAP	The Service Access Point or spoke/mesh SDP on which the filter policy ID is applied
Type	The type of service of the Service ID
(Ingress)	The filter policy ID is applied as an ingress filter policy on the interface
(Egress)	The filter policy ID is applied as an egress filter policy on the interface

Filter Entry Counters Output — When the **counters** keyword is specified, the filter entry output displays the filter matches/hit information. The following table describes the command output for the command.

```
A:ALA-49# show filter mac 8 counters
=====
Mac Filter
=====
Filter Id   : 8                               Applied      : Yes
Scope      : Template                         Def. Action  : Forward
Entries    : 2
Description : Description for Mac Filter Policy id # 8
-----
Filter Match Criteria : Mac
-----
Entry       : 8                               FrameType    : Ethernet
Ing. Matches: 80 pkts (5440 bytes)
Egr. Matches: 62 pkts (3968 bytes)

Entry       : 10                              FrameType    : Ethernet
Ing. Matches: 80 pkts (5440 bytes)
Egr. Matches: 80 pkts (5120 bytes)
=====
```

Table 273: Filter MAC Counters Output Field Descriptions

Label	Description
Mac Filter Filter Id	The MAC filter policy ID

Label	Description
Scope	Template — the filter policy is of type Template
	Exclusive — the filter policy is of type Exclusive
Description	The MAC filter policy description
Applied	No — the filter policy ID has not been applied
	Yes — the filter policy ID is applied
Def. Action	Forward — the default action for the filter ID for packets that do not match the filter entries is to forward
	Drop — the default action for the filter ID for packets that do not match the filter entries is to drop
Filter Match Criteria	Mac — indicates the filter is an MAC filter policy
Entry	The filter entry ID; if the filter entry ID indicates the entry is (Inactive), then the filter entry is incomplete as no action has been specified
FrameType	Ethernet — the entry ID match frame type is Ethernet IEEE 802.3
	802.2LLC — the entry ID match frame type is Ethernet IEEE 802.2 LLC
	802.2SNAP — the entry ID match frame type is Ethernet IEEE 802.2 SNAP
	Ethernet II — the entry ID match frame type is Ethernet Type II
Ing. Matches	The number of ingress filter matches/hits for the filter entry
Egr. Matches	The number of egress filter matches/hits for the filter entry

Show Filter MAC Output (with effective-action specified) — The following output is an example of MAC filter information when the **effective-action** keyword is specified. [Table 274: Filter MAC effective-action Output Fields](#) describes the command output fields.

If the main action (either primary or secondary) cannot be performed, a reason will be given. This will be displayed on the same line as the Effective Action. The reason codes as currently defined are:

- entry-default
- filter-default-action
- pbr-down-action-override
- action not supported on egress
- target does not exist

Output Example

```

show filter mac 1 effective-action
=====
Mac Filter
=====
Filter Id       : 1                Applied       : Yes
Scope          : Template         Def. Action   : Drop
Entries        : 1                Type          : normal
Description    : (Not Specified)
-----
Entry           : 2
-----
Stickiness     : No

PBR Down Action : Drop (entry-default)

Configuration
Primary Action  : Forward (SAP)
  Next Hop     : 1/1/3
  Service Id   : Not configured
Secondary Action : None

Status
Target status based on extended checks
  Primary Action : Target does not exist
  Secondary Action : None
Downloaded Action : Forward
Stickiness Timer : Not Running

Effective Action based on application context
Service Id      : 10                Type          : VPLS
  Ingress
  Effective Action: Forward (target does not exist)
=====
    
```

Table 274: Filter MAC effective-action Output Fields

Label	Description
Filter Id	The MAC filter policy ID
Applied	No — the filter policy ID has not been applied
	Yes — the filter policy ID is applied
Scope	Template — the filter policy is of type Template
	Exclusive — the filter policy is of type Exclusive
Def. Action	Forward — the default action for the filter ID for packets that do not match the filter entries is to forward
	Drop — the default action for the filter ID for packets that do not match the filter entries is to drop
Entries	The number of entries configured in this filter ID
Type	The type of entries configures in this filter

Label	Description
Description	The MAC filter policy description
Entry	The filter entry ID; if the filter entry ID indicates the entry is (Inactive), then the filter entry is incomplete as no action has been specified
Stickiness	No — stickiness is not configured
	Yes — stickiness is configured
PBR Dwn Act Override	Indicates whether or not the action to take when the PBR target is down has been overridden
PBR Down Action	The action to take in case the target is down
Configuration	Section of the output providing information on the configured parameters
Primary Action	The configured action, if any; indented sub-labels in the show output provide configured parameters for this action
Secondary Action	The configured secondary action, if any; indented sub-labels in the show output provide configured parameters for this action
Status/Target status based on extended checks	Section of the output providing information on the operational status of certain parameters
Primary Action	The status of the target of the primary action, if configured, based on extended checks
Secondary Action	The status of the target of the secondary action, if configured, based on extended checks
Downloaded Action	The action downloaded by the CPM to the IOM
Stickiness Timer	The status of the stickiness timer, if any
Effective Action based on application context	Section of the output providing the effective action, in the context of services, that a packet matching the criteria will be subject to
Service Id	The service ID on which the filter policy ID is applied; the output also provides a list of service points where the filter has been applied
Type	The service type in which the service has been applied
Ingress/Egress	The direction in which the service has been applied
Effective Action	Indicates the effective action the packet will be subject to

mac

Syntax

```
mac mac-filter-id [entry entry-id] [{ingress | egress}]
```

Context

[Tree] (clear>filter mac)

Full Context

```
clear filter mac
```

Description

Clears the counters associated with the entries of the specified MAC filter policy.

By default, the counters associated with each entry of the specified filter policy are all cleared. The scope of which counters are cleared can be narrowed using the command line parameters.

Default

Clears all counters associated with each entry of the specified MAC filter policy.

Parameters

mac-filter-id

The MAC filter policy ID for which to clear the entry counters. Values can either be expressed as a decimal integer or as an ASCII string of up to 64 characters. The following values only shows decimal integer.

Values 1 to 65535

entry-id

Specifies that only the counters associated with the specified filter policy entry will be cleared. The values are expressed as a decimal integer.

Values 1 to 2097151

ingress

Specifies to only clear the ingress counters.

egress

Specifies to only clear the egress counters.

Platforms

All

mac

Syntax

mac *mac-filter-id*

Context

[\[Tree\]](#) (tools>dump>filter>resources mac)

Full Context

tools dump filter resources mac

Description

This command displays information about the specified MAC filter including resource utilization on CPM and IOM, the IOMs on which the filter is used, and the entries using the most resources.

Parameters

mac-filter-id

Specifies that only the filter resource utilization associated with this IPv6 filter will be displayed.

Values 1 to 65535

Platforms

All

Output

The following output is an example of MAC filter resource utilization information.

Output Example

```
*A:Dut-C>tools>dump>filter>resources># mac 1
=====
Resource utilization details for Mac filter 1
=====
CPM entries used           : 1
CPM subentries used       : 1
TCAM entries used (per FlexPath) : 1
Associated with IOMs      : 1

-----
Largest 5 entries
-----
Entry ID                    Active          TCAM entries
                           (per FlexPath)
-----
1                            Yes             1
No more entries defined

mac

Syntax

mac *mac-filter-id* **entry** *entry-id* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

Context

[\[Tree\]](#) (monitor>filter mac)

Full Context

monitor filter mac

Description

This command enables MAC filter monitoring. The statistical information for the specified MAC filter entry displays at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified MAC filter. The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

Parameters

mac-filter-id

Specifies the MAC filter policy ID.

Values *filter-id* | *filter-name*
filter-id: 1 to 65535
filter-name: 64 chars max

entry-id

Displays information on the specified filter entry ID for the specified filter ID only.

Values 1 to 65535

seconds

Configures the interval for each display in seconds.

Values 3 to 60

Default 10 seconds

repeat

Configures how many times the command is repeated.

Values 1 to 999

Default 10

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic instead of the delta.

Platforms

Description

This command displays monitor command statistics for MAC filter entries.

Parameters

entry-id

Displays information on the specified filter entry ID for the specified filter ID only.

Values 1 to 2048

seconds

Configures the interval for each display in seconds.

Values 3 to 60

Default 10 seconds

repeat

Configures how many times the command is repeated.

Values 1 to 999

Default 10

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic instead of the delta.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Full Context

show router bgp routes evpn mac

Description

This command displays BGP-EVPN MAC routes.

Parameters

hunt

Displays entries for the specified route.

detail

Displays detailed information.

rd

Displays information for the route distinguisher.

Values *ip-addr:comm-val* | *2byte-asnumber:ext-comm-val* | *4byte-asnumber:comm-val*

next-hop

Specifies the IPv4 or IPv6 BGP next-hop address.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

mac-address

Specifies the MAC address in *xx:xx:xx:xx:xx:xx* or *xx-xx-xx-xx-xx-xx* format.

comm-id

Specifies the community ID, up to 72 characters.

Values [*as-num:comm-val* | *ext-comm* | *well-known-comm*]
where:

- *as-num* — 0 to 65535
 - *comm-val* — 0 to 65535
 - *ext-comm* — the extended community, defined as the following:
type:{*ip-address:comm-val1* | *as-number1:comm-val2* | *as-number2:comm-val1*}
- where:
- *as-number1* — 0 to 65535
 - *comm-val1* — 0 to 65535
 - **type** — target, origin
 - *ip-address* — a.b.c.d
 - *comm-val2* — 0 to 4294967295
 - *as-number2* — 0 to 4294967295
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** |

tag

Specifies the MAC route tag.

Values 0 to 4294967295 | MAX-ET

reg-exp

Displays routes matching the specified regular expression, up to 80 characters.

15.6 mac-status

mac-status

Syntax

mac-status [*mac ieee-address*] [*card slot-id*] [*pending*]

Context

[\[Tree\]](#) (tools>dump>service>id>fdb mac-status)

Full Context

tools dump service id fdb mac-status

Description

This command displays the status of MAC addresses within the service, displaying the line cards on which FDB entries are allocated for the MAC addresses (if a MAC address has been allocated an entry on all cards provisioned in the system, it is displayed as "All") and those for which there are pending FDB entry updates (allocate, displayed as "PendAlloc", or free, displayed as "PendFree") for each MAC address. The MAC address status is displayed per service or line card and for a single MAC address. In addition, only MAC addresses with pending updates can be displayed.

Parameters

ieee-address

The 48-bit MAC address for which the FDB entry will be displayed in the form aa:bb:cc:dd:ee:ff or aa-bb-cc-dd-ee-ff where aa, bb, cc, dd, ee and ff are hexadecimal numbers.

slot-id

The slot ID of the card in the chassis. The maximum slot ID is platform-dependent. See the hardware installation guides for more information.

pending

Displays only those MAC address with pending FDB entry line card updates (allocate or free).

Platforms

All

Output

Output Example

```

15.9 managed-hosts

managed-hosts

Syntax

managed-hosts type {aaa | bonding | data-triggered | gtp} [ip ip-address] [mac ieee-address]

Context

[\[Tree\]](#) (show>service>id managed-hosts)

Full Context

show service id managed-hosts

Description

This command displays information about hosts that are not yet linked to an in-band control plane protocol, such as DHCP or DHCPv6. Examples include hosts installed by data-triggers and hosts installed by RADIUS.

Parameters

aaa

Displays information about managed hosts installed and removed only by RADIUS.

bonding

Displays information about managed hosts installed in a connection bonding subscriber context.

data-triggered

Displays information about managed hosts installed by data-triggers.

gtp

Displays information about managed hosts installed via GTP access.

ip-address

Displays information about a managed host with the specified IPv4 or IPv6 address.

ieee-address

Displays information about a managed host with the specified MAC address.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of managed host information.

Output Example

```
# show service id 100 managed-hosts type data-triggered
=====
Managed data-triggered hosts
=====
IP address                               MAC address
-----
10.0.0.9/32                               fa:ac:a6:02:11:01
2001:a:b:5::1/128                         fa:ac:a6:02:11:01
-----
No. of Managed hosts: 2
=====
```

managed-hosts

Syntax

managed-hosts type {data-triggered} [**sap** *sap-id*] [**mac** *ieee-address*] [**ip** *ip-prefix*[/*prefix-length*]] [**port** *port-id*]

no manual-switch-path **lsp** *lsp-name*

manual-switch-path **sr-te-lsp** *sr-te-lsp-name*

no manual-switch-path **sr-te-lsp** *sr-te-lsp-name*

Context

[\[Tree\]](#) (tools>perform>router>mpls manual-switch-path)

Full Context

tools perform router mpls manual-switch-path

Description

This command forces a manual degraded state on the active primary path, which triggers a switchover to another best-preference non-degraded secondary path that is already up. Non-degraded standby paths are preferred over secondary paths. If non-degraded standby paths do not exist, a setup is triggered for secondary paths.

For LSPs, the **revert-timer** and **hold-timer** apply to any switchover triggered by the **manual-switch-path** command. For SR-TE LSPs, only the revert-timer applies to any switchover triggered by the **manual-switch-path sr-te-lsp** command. The revert timer is started in the case where both the primary and standby paths are initially degraded and the system is using a second secondary path, and the primary path then comes back up.

The revert timer is started only when switching from a non-degraded secondary or standby path to the primary path. If the active secondary or standby path is degraded and then the primary path comes up, the system does not start the revert timer because the intention is to move the LSP away from the degraded active path as quickly as possible.

The manually degraded state remains in effect if the path goes down or is resigned, either by make-before-break (MBB) or break-before-make (BBM). BBM applies regardless of whether the resignalling is due to a locally initiated change or through PCEP. To reset the manually degraded state, use the **no manual-switch-path** CLI command or the **delete manual-switch-path** MD-CLI command.

To revert to the primary path when the revert timer is configured prior to the expiry of the revert timer, use the following commands:

- **no manual-switch-path lsp** or **no manual-switch-path sr-te-lsp** to reset the manual degraded state on the primary path
- **tools perform router mpls revert lsp** to revert the LSP to the primary path
- **tools perform router mpls revert sr-te-lsp** to revert the SR-TE LSP to the primary path

Parameters

lsp-name

Specifies the LSP name, up to 64 characters.

sr-te-lsp-name

Specifies the SR-TE LSP name, up to 64 characters.

show service nat map map-domain

Description

This command displays the MAP domains configured in the system and shows whether the domain is instantiated (that is, shows the association with the routing context). It also provides information about the domain and the specific rules configured within the domain

Parameters

domain-name

Specifies the MAP domain name.

Values 32 chars maximum

map-rule-name

Specifies the MAP rule name.

Values 32 chars maximum

mapping-rule

Keyword; displays the router instances and/or subscriber profiles associated with the NAT policy.

statistics

Keyword; displays statistics of the specified MAP domain.

Platforms

15.19 map-to-phy-port

map-to-phy-port

Syntax

map-to-phy-port {**lag** *lag-id* | **eth-tunnel** *tunnel-index*} {**isid** *isid* [**end-isid** *isid*] | **service** *service-id* | *svc-name* [**end-service** *service-id* | *svc-name*]} [**summary**]

Context

[\[Tree\]](#) (tools>dump map-to-phy-port)

Full Context

tools dump map-to-phy-port

Description

This command provides the ability to respond to a query to provide the link in a LAG/Ethernet tunnel (load sharing protection mode)/CCAG that is currently assigned to a given service-id or ISID.

Parameters

lag-id

Specifies the LAG ID.

Values 1 to 800

isid

Specifies the ISID.

Values 0 to 16777215

service-id

Specifies the service ID.

Values 1 to 2148278381, svc-name: 64 char max

tunnel-index

Specifies the tunnel index.

Values 1 to 1024

summary

Displays summary information.

mapping-server

Syntax

mapping-server [**prefix** *ip-address[/mask]*] [**index** *index*] [**level** *level*] [**flag** {s}]

Context

[\[Tree\]](#) (show>router>isis mapping-server)

Full Context

show router isis mapping-server

Description

This command displays IS-IS mapping-server information.

Parameters

ip-address[/mask]

Specifies the IP address and mask of a prefix that has received a node-sid in a SID/Label binding TLV.

Values *ip-address*: **a.b.c.d.** (host bits must be 0)
mask: **0 to 32**

index

Specifies the node-sid index value for the generated SID/Label binding TLV.

Values 0 to 4294967295

Default none

level

Specifies a match on the mapping server's own flooding scope for the generated SID/Label binding TLV.

Values 1, 2, 1/2

flag

Specifies a match on the flooding scope of the generated SID/Label binding TLV.

Values s — Specifies to match on the S flag value of 1. A SID/Label Binding TLV with the S flag set is flooded across the entire IS-IS routing domain, except across another IS-IS instance. If the S flag is not set (value of zero), the SID/Label Binding TLV is not leaked between levels.

15.22 match-criteria-overload

match-criteria-overload

Syntax

match-criteria-overload

match-criteria-overload card slot-number fp fp-number

match-criteria-overload card slot-number fp fp-number network network-policy-id direction direction

match-criteria-overload card slot-number fp fp-number sap-egress policy-id

match-criteria-overload card slot-number fp fp-number sap-ingress policy-id

Context

[\[Tree\]](#) (tools>dump>qos match-criteria-overload)

Full Context

tools dump qos match-criteria-overload

Description

This command, when used without parameters, allows the operator to identify QoS match-criteria memory banks with one or more policies in overload in the system by slot number, FP number, type (IP-MAC or IPv6), SAP ingress, SAP egress, network, and direction (ingress or egress).

This command, when used with the **card** and **fp** parameters, lists the QoS policy with match criteria in overload on a specified FP when the optional parameters *slot-number* and *fp-number* are specified.

This command, when used with the **network**, **sap-egress**, or **sap-ingress** parameters, displays the match-criteria entries not programmed for a specified QoS policy due to an overload condition.

Parameters

card slot-number

Specifies the IOM slot number for the overload command.

Values 1 to 10

fp fp-number

Specifies the FP number.

Values 1 to 8

network network-policy-id

Specifies the network policy ID.

Values 1 to 65538

direction direction

Specifies the memory bank ingress or egress direction.

Values ingress or egress

sap-egress policy-id

Specifies the SAP policy ID.

Values 1 to 65535

sap-ingress policy-id

Specifies the SAP policy ID.

Values 1 to 65535

Platforms

All

Output

The following output is an example of filter overload status.

Output Example

```
*A:Dut# tools dump qos match-criteria-overload
=====
QoS Match Criteria Status Overload
=====
Slot  FP  Direction          Type
-----
1     1   Ingress            ip-mac
=====
```

The following output is an example with **card** and **fp** parameters only.

Output Example

```
*A:Dut# tools dump qos match-criteria-overload card 1 fp 1
=====
```

```

15.25 mc-ecmp-rebalance

mc-ecmp-rebalance

Syntax

mc-ecmp-rebalance [*ecmp-opt-threshold*]

Context

[\[Tree\]](#) (tools>perform>router>pim mc-ecmp-rebalance)

Full Context

tools perform router pim mc-ecmp-rebalance

Description

This command triggers an immediate rebalance, regardless if the hold timer has triggered or if any changes have occurred.

Parameters

ecmp-opt-threshold

Forces a rebalance of all multicast streams with a priority equal or less then the specified value.

Specifying the value of 7 forces all multicast streams to be re-balanced regardless of the configured value.

Values 1 to 7

Context

[\[Tree\]](#) (clear>redundancy>multi-chassis mc-endpoint)

Full Context

clear redundancy multi-chassis mc-endpoint

Description

This command clears multi-chassis endpoint statistics.

Parameters

mcep-id

Clears information for the specified multi-chassis endpoint ID.

Values 1 to 4294967295

ip-address

Clears information for the specified peer IP address.

Values ipv4-address: a.b.c.d
ipv6-address:

- x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x – [0 to FFFF] H
- d – [0 to 255] D

statistics

Clears statistics for this multi-chassis endpoint.

15.27 mc-ipsec

mc-ipsec

Syntax

```
mc-ipsec peer ip-address domain ipsec-domain-id  
mc-ipsec peer ip-address tunnel-group tunnel-group-id  
mc-ipsec peer ip-address
```

Context

[\[Tree\]](#) (show>redundancy>multi-chassis mc-ipsec)

Full Context

```
show redundancy multi-chassis mc-ipsec
```

Description

This command displays the 7750 SR IPsec multi-chassis states. Optionally, only the state of the specified tunnel-group is displayed.

Parameters

- ipsec-domain-id***
Specifies the IPsec domain ID.
- ip-address***
Specifies the peer address.
- tunnel-group-id***
Specifies the tunnel-group.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

[Table 280: Show MC-IPsec Peer Output Fields](#) describes **show redundancy multi-chassis mc-ipsec** output fields.

Table 280: Show MC-IPsec Peer Output Fields

Label	Description
Peer Name	The name of the peer.
Peer Addr	The IP address of the peer.
Keep Alive Intvl	The interval at which keepalive messages are exchanged.
Hold on Nbr Fail	The number keep-alives lost before declaring the peer as failed to reach.
Discovery Intvl	The duration of the discovery interval.
Discovery Boot Intvl	The duration of the discovery boot interval.
BFD	Bi-directional forward enabled or disabled.
Last update	The date and time of the last update.
ID	The tunnel group table ID.
Peer Group	The peer group ID.
Priority	The priority for the IPsec domain.
Admin State	The administrative state of the tunnel group.
Mastership/Master State	The current mastership state.
Protection Status	Displays nominal or notReady . notReady means the system is not ready for a switchover. There could be major traffic impact if switchover happens in the case of notReady. nominal means the tunnel-group is in a better situation to switchover than notReady. However, there still might be traffic impact.
Installed	The number of tunnels that have been successfully installed on MS-ISA.
Installing	The number of tunnels that are being installed on MS-ISA.
Awaiting Config	The number of synchronized tunnels that do not have a corresponding configuration ready.
Failed	The number of tunnels that failed to be installed on MS-ISA.
Active Tunnel-Group	The specific active tunnel group.
Peer Ex Tnl Grp	The external tunnel group.

Label	Description
Priority	The priority of the tunnel-group
Oper State	The operational state
Installed	The number of tunnels that have been successfully installed
Installing	The number of tunnels that are being installed
Awaiting Config	The number of synchronized tunnels that do not have a corresponding configuration ready
Failed	The number of tunnels that failed to be installed

Table 283: Redundancy Multi-chassis MC-Lag Peer Statistics Field Descriptions

Label	Description
Packets Rx	Indicates the number of MC-Lag packets received from the peer.
Packets Rx Keepalive	Indicates the number of MC-Lag keepalive packets received from the peer.
Packets Rx Config	Indicates the number of received MC-Lag configured packets from the peer.
Packets Rx Peer Config	Indicates the number of received MC-Lag packets configured by the peer.
Packets Rx State	Indicates the number of MC-Lag "lag" state packets received from the peer.
Packets Dropped State Disabled	Indicates the number of packets that were dropped because the peer was administratively disabled.
Packets Dropped Packets Too Short	Indicates the number of packets that were dropped because the packet was too short.
Packets Dropped Tlv Invalid Size	Indicates the number of packets that were dropped because the packet size was invalid.
Packets Dropped Tlv Invalid LagId	Indicates the number of packets that were dropped because the packet referred to an invalid or non multi-chassis lag.
Packets Dropped Out of Seq	Indicates the number of packets that were dropped because the packet size was out of sequence.
Packets Dropped Unknown Tlv	Indicates the number of packets that were dropped because the packet contained an unknown TLV.
Packets Dropped MD5	Indicates the number of packets that were dropped because the packet failed MD5 authentication.
Packets Tx	Indicates the number of packets transmitted from this system to the peer.

Label	Description
Packets Tx Keepalive	Indicates the number of keepalive packets transmitted from this system to the peer.
Packets Tx Peer Config	Indicates the number of configured packets transmitted from this system to the peer.
Packets Tx Failed	Indicates the number of packets that failed to be transmitted from this system to the peer.

mc-lag

Syntax

```
mc-lag [peer ip-address [lag lag-id]]
```

Context

[\[Tree\]](#) (clear>redundancy>multi-chassis mc-lag)

Full Context

```
clear redundancy multi-chassis mc-lag
```

Description

This command clears multi-chassis Link Aggregation Group (LAG) information.

Parameters

ip-address

Clears the specified address of the multi-chassis peer.

- Values**
- ipv4-address: a.b.c.d
 - ipv6-address:
 - x:x:x:x:x:x (eight 16-bit pieces)
 - x:x:x:x:x:d.d.d.d
 - x – [0 to FFFF] H
 - d – [0 to 255] D

lag-id

Clears the specified LAG on this system.

- Values** 1 to 200

All

15.29 mc-ring

mc-ring

Syntax

mc-ring

mc-ring peer *ip-address* [**ring sync-tag**]

Context

[\[Tree\]](#) (tools>dump>redundancy>multi-chassis mc-ring)

Full Context

tools dump redundancy multi-chassis mc-ring

Description

This command dumps multi-chassis ring information.

Parameters

ip-address

Specifies the peer IP address.

sync-tag

Specifies the ring's synchronization tag created in the **config>redundancy>mc>peer>mcr> ring** context. The tag can be up to 32 characters.

Platforms

All

mc-ring

Syntax

mc-ring peer *ip-address* **statistics**

mc-ring peer *ip-address* [**ring sync-tag** [**detail** | **statistics**]]

mc-ring peer *ip-address* **ring sync-tag ring-node** [*ring-node-name* [**detail** | **statistics**]]

mc-ring global-statistics

Context

[\[Tree\]](#) (show>redundancy>multi-chassis mc-ring)

Full Context

show redundancy multi-chassis mc-ring

Description

This command displays multi-chassis ring information.

Parameters

ip-address

Specifies the address of the multi-chassis peer to display.

- Values**
- ipv4-address: a.b.c.d
 - ipv6-address:
 - x:x:x:x:x:x (eight 16-bit pieces)
 - x:x:x:x:x:d.d.d.d
 - x: [0 to FFFF] H
 - d: [0 to 255] D

sync-tag

Specifies a synchronization tag to be displayed that was used while synchronizing this port with the multi-chassis peer up to 32 characters.

ring-node-name

Specifies a ring-node name up to 32 characters.

global-statistics

Displays global statistics for the multi-chassis ring.

detail

Displays detailed peer information for the multi-chassis ring.

Platforms

All

Output Fields: show redundancy multi-chassis mc-ring peer <ip-address> ring

Table 284: Output Fields: show redundancy multi-chassis mc-ring peer <ip-address> ring describes the output fields for the **show redundancy multi-chassis mc-ring peer <ip-address> ring** command.

Table 284: Output Fields: show redundancy multi-chassis mc-ring peer <ip-address> ring

Label	Description
Sync Tag	Displays the synchronization tag that was used while synchronizing this port with the multi-chassis peer.
Oper State	noPeer — The peer has no corresponding ring configured. connected — The in-band control connection with the peer is operational.

Label	Description
	broken — The in-band control connection with the peer has timed out. conflict — The in-band control connection with the peer has timed out but the physical connection is still OK; the failure of the in-band signaling connection is caused by a misconfiguration. For example, a conflict between the configuration of this system and its peer, or a misconfiguration on one of the ring access node systems. testingRing — The in-band control connection with the peer is being set up. Waiting for result. waitingForPeer — Verifying if this ring is configured on the peer. configErr — The ring is administratively up, but a configuration error prevents it from operating properly. halfBroken — The in-band control connection indicates that the ring is broken in one direction (towards the peer). localBroken — The in-band control connection with the peer is known to be broken due to local failure or local administrative action. shutdown — The ring is shutdown.
Failure Reason	Displays the failure reason.
Last Debounce	Displays the last time that the debounce mechanism (protecting the router from overload situations in case of a flapping ring) was activated.
Debounce Period	Displays the duration that the debounce mechanism was in action since the "Last Debounce".

Output Example: show redundancy multi-chassis mc-ring peer <ip-address> statistics

```
*A:ALA-48>show>redundancy>multi-chassis# mc-ring peer 192.168.10.104 statistics
=====

Output Fields: show redundancy multi-chassis mc-ring peer <ip-address> statistics

Table 285: Output Fields: [show redundancy multi-chassis mc-ring peer <ip-address> statistics](#) describes the output fields for the **show redundancy multi-chassis mc-ring peer <ip-address> statistics** command.

Table 285: Output Fields: show redundancy multi-chassis mc-ring peer <ip-address> statistics

Label	Description
Message	Displays the message type.
Received	Indicates the number of valid MC-Ring signaling messages received from the peer.
Transmitted	Indicates the number of valid MC-Ring signaling messages transmitted from the peer.
MCS ID Request	Displays the number of valid MCS ID requests were received from the peer.
MCS ID Response	Displays the number of valid MCS ID responses were received from the peer.
Ring Exists Request	Displays the number of valid 'ring exists' requests were received from the peer.
Ring Exists Response	Displays the number of valid ring exists' responses were received from the peer.
Keepalive	Displays the number of valid MC-Ring control packets of type 'keepalive' were received from the peer.

Output Example: show redundancy multi-chassis mc-ring global-statistics

```
*A:ALA-48>show>redundancy>multi-chassis# mc-ring global-statistics

```

Output Fields: show redundancy multi-chassis mc-ring ring-node

Table 286: Output Fields: Show redundancy multi-chassis mc-ring ring-node describes the output fields for the mc-ring ring-node command.

Table 286: Output Fields: Show redundancy multi-chassis mc-ring ring-node

Label	Description
Oper State	Displays the state of the connection verification (both local and remote). notProvisioned — Connection verification is not provisioned. configErr — Connection verification is provisioned but a configuration error prevents it from operating properly. notTested — Connection verification is administratively disabled or is not possible in the current situation. testing — Connection Verification is active, but no results are yet available. connected — The ring node is reachable. disconnected — Connection verification has timed out.
In Use	Displays "True" if the ring node is referenced on an e-pipe or as an inter-dest-id on a static host or dynamic lease.

Output Fields: show redundancy multi-chassis mc-ring global-statistics

Table 287: Output Fields: [show redundancy multi-chassis mc-ring global-statistics](#) describes the output fields for the **show redundancy multi-chassis mc-ring global statistics** command.

Table 287: Output Fields: show redundancy multi-chassis mc-ring global-statistics

Label	Description
Rx	Displays the number of MC-ring signaling packets were received by this system.
Rx Too Short	Displays the number of MC-ring signaling packets were received by this system that were too short.
Rx Wrong Authentication	Displays the number of MC-ring signaling packets were received by this system with invalid authentication.
Rx Invalid TLV	Displays the number of MC-ring signaling packets were received by this system with invalid TLV.
Rx Incomplete	Displays the number of MC-ring signaling packets were received by this system that were incomplete.
Rx Unknown Type	Displays the number of MC-ring signaling packets were received by this system that were of unknown type.
Rx Unknown Peer	Displays the number of MC-ring signaling packets were received by this system that were related to an unknown peer.
Rx Unknown Ring	Displays the number of MC-ring signaling packets were received by this system that were related to an unknown ring.

Label	Description
Rx Unknown Ring Node	Displays the number of MC-ring signaling packets were received by this system that were related to an unknown ring node.
Tx	Displays the number of MC-ring signaling packets were transmitted by this system.
Tx No Buffer	Displays the number of MC-ring signaling packets could not be transmitted by this system due to a lack of packet buffers.
Tx Transmission Failed	Displays the number of MC-ring signaling packets could not be transmitted by this system due to a transmission failure.
Tx Unknown Destination	Displays the number of MC-ring 'unknown destination' signaling packets were transmitted by this system.
Missed Configuration Events	Displays the number of missed configuration events on this system.
Missed BFD Events	Displays the number of missed BFD events on this system.

mc-ring

Syntax

mc-ring

Context

[\[Tree\]](#) (clear>redundancy>multi-chassis mc-ring)

15.31 mcast-ipv4

mcast-ipv4

Syntax

mcast-ipv4 [**aspath-regex** *reg-exp*] [**community** *comm-id*] [**brief**] [**all**]

mcast-ipv4 [**aspath-regex** *reg-exp*] **hunt** [**community** *comm-id*] [**brief**] [**all**]

mcast-ipv4 [**detail** | **longer**] [**aspath-regex** *reg-exp*] [**community** *comm-id*] [**all**]

Context

[\[Tree\]](#) (show>router>bgp>routes mcast-ipv4)

Full Context

show router bgp routes mcast-ipv4

Description

This command displays BGP multicast IPv4 routes.

Parameters

reg-exp

Displays routes matching the specified regular expression, up to 80 characters.

hunt

Displays entries for the specified route.

comm-id

Specifies the community ID, up to 72 characters.

Values *[as-num:comm-val | ext-comm | well-known-comm | large-comm]*

where:

- *as-num* — 0 to 65535
 - *comm-val* — 0 to 65535
 - *ext-comm* — the extended community, defined as one of the following:
 - *{target | origin}:ip-address:comm-val*
 - *{target | origin}:asnum:ext-comm-val*
 - *{target | origin}:ext-asnum:comm-val*
 - **bandwidth:asnum:val-in-mbps**
 - **ext:4300:ovstate**
 - **ext:value1:value2**
 - **flowspec-set:ext-asnum:group-id**
- where:
- *target* — route target
 - *origin* — route origin
 - *ip-address* — a.b.c.d
 - *ext-comm-val* — 0 to 4294967295
 - *ext-asnum* — 0 to 4294967295
 - **bandwidth** — bandwidth
 - *val-in-mbps* — 0 to 16777215
 - **ext** — extended
 - **ext:4300** — origin verification
 - *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
 - *value1* — 0000 to FFFF
 - *value2* — 0 to FFFFFFFFFF
 - **flowspec-set** — flow-spec set
 - *group-id* — 0 to 16383
- *well-known-comm* — **null | no-export | no-export-subconfed | no-advertise | blackhole**
 - *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

brief

Displays the BGP multicast IPv4 route information in a brief format.

all

Displays all output for imported routes.

Platforms

All

15.32 mcast-ipv6

mcast-ipv6

Syntax

mcast-ipv6 [**aspath-regex** *reg-exp*] [**community** *comm-id*] [**brief**] [**all**]

mcast-ipv6 [**aspath-regex** *reg-exp*] **hunt** [**community** *comm-id*] [**brief**] [**all**]

mcast-ipv6 [**detail** | **longer**] [**aspath-regex** *reg-exp*] [**community** *comm-id*] [**all**]

Context

[\[Tree\]](#) (show>router>bgp>routes mcast-ipv6)

Full Context

show router bgp routes mcast-ipv6

Description

This command displays BGP multicast IPv6 routes.

Parameters

reg-exp

Displays routes matching the specified regular expression, up to 80 characters.

hunt

Displays entries for the specified route.

comm-id

Specifies the community ID, up to 72 characters.

Values [*as-num:comm-val* | *ext-comm* | *well-known-comm* | *large-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:
 - *{target | origin}:ip-address:comm-val*

- *{target | origin}:asnum:ext-comm-val*
- *{target | origin}:ext-asnum:comm-val*
- **bandwidth**:*asnum:val-in-mbps*
- **ext:4300**:*ovstate*
- **ext**:*value1:value2*
- **flowspec-set**:*ext-asnum:group-id*

where:

- *target* — route target
- *origin* — route origin
- *ip-address* — a.b.c.d
- *ext-comm-val* — 0 to 4294967295
- *ext-asnum* — 0 to 4294967295
- **bandwidth** — bandwidth
- *val-in-mbps* — 0 to 16777215
- **ext** — extended
- **ext:4300** — origin verification
- *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
- *value1* — 0000 to FFFF
- *value2* — 0 to FFFFFFFFFF
- **flowspec-set** — flow-spec set
- *group-id* — 0 to 16383
- *well-known-comm* — **null | no-export | no-export-subconfed | no-advertise | blackhole**
- *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

brief

Displays the BGP multicast IPv6 route information in a brief format.

all

Displays all output for imported routes.

Platforms

All

15.33 mcast-join-synch

mcast-join-synch

Syntax

```
mcast-join-synch [hunt | detail] [rd rd] [community comm-id] [tag tag] [next-hop next-hop] [aspath-  
regex reg-exp] [originator-ip ip-address | ipv6-address]
```

Context

[\[Tree\]](#) (show>router>bgp>routes>evpn mcast-join-synch)

Full Context

```
show router bgp routes evpn mcast-join-synch
```

Description

This command displays BGP-EVPN multicast join sync routes.

Parameters

hunt

Displays entries for the specified route.

detail

Displays detailed information.

rd

Displays information for the route distinguisher.

Values *ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-
asnumber:comm-val*

comm-id

Specifies the community ID, up to 72 characters.

Values *[as-num:comm-val | ext-comm | well-known-comm]*

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as the following:
*type:{ip-address:comm-val1 | as-number1:comm-val2 | as-
number2:comm-val1}*

where:

- *as-number1* — 0 to 65535
- *comm-val1* — 0 to 65535
- **type** — target, origin
- *ip-address* — a.b.c.d
- *comm-val2* — 0 to 4294967295
- *as-number2* — 0 to 4294967295

- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** |

tag

Specifies the multicast join sync route tag.

Values 0to 4294967295 | MAX-ET

next-hop

Specifies the IPv4 or IPv6 BGP next-hop address.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

reg-exp

Displays routes matching the specified regular expression, up to 80 characters.

ip-address | ipv6-address

Specifies the originator IPv4 or IPv6 address, up to 64 characters.

Platforms

All

15.34 mcast-leave-synch

mcast-leave-synch

Syntax

mcast-leave-synch [hunt | detail] [rd *rd*] [community *comm-id*] [tag *tag*] [next-hop *next-hop*] [aspath-regex *reg-exp*] [originator-ip *ip-address* | *ipv6-address*]

Context

[\[Tree\]](#) (show>router>bgp>routes>evpn mcast-leave-synch)

Full Context

show router bgp routes evpn mcast-leave-synch

Description

This command displays BGP-EVPN multicast leave sync routes.

Parameters

hunt

Displays entries for the specified route.

detail

Displays detailed information.

rd

Displays information for the route distinguisher.

Values *ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val*

comm-id

Specifies the community ID, up to 72 characters.

Values [*as-num:comm-val | ext-comm | well-known-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as the following:
type:{ip-address:comm-val1 | as-number1:comm-val2 | as-number2:comm-val1}
where:
 - *as-number1* — 0 to 65535
 - *comm-val1* — 0 to 65535
 - **type** — target, origin
 - *ip-address* — a.b.c.d
 - *comm-val2* — 0 to 4294967295
 - *as-number2* — 0 to 4294967295
- *well-known-comm* — **null | no-export | no-export-subconfed | no-advertise |**

tag

Specifies the multicast leave sync route tag.

Values 0to 4294967295 | MAX-ET

next-hop

Specifies the IPv4 or IPv6 BGP next-hop address.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H

d: [0 to 255]D

reg-exp

Displays routes matching the specified regular expression, up to 80 characters.

ip-address* | *ipv6-address

Specifies the originator IPv4 or IPv6 address, up to 64 characters.

Platforms

show mcast-management

Description

This command shows multicast path management related information.

Platforms

All

15.36 mcast-path-mgr

mcast-path-mgr

Syntax

mcast-path-mgr cpm [unmanaged]

Context

[\[Tree\]](#) (tools>dump mcast-path-mgr)

Full Context

tools dump mcast-path-mgr

Description

This command dumps multicast path manager CPM information.

Parameters

unmanaged

Displays multicast path manager unmanaged and Multiple MAC Registration Protocol information.

Platforms

7450 ESS, 7750 SR-1x-48D, 7750 SR-1x-92S, 7750 SR-7/12/12e, 7750 SR-s, 7950 XRS, VSR

Output

The following output is an example of CPM information.

Output Example

```
*A:PE-1# tools dump mcast-path-mgr cpm

15.37 mcast-reporting-dest

mcast-reporting-dest

Syntax

mcast-reporting-dest [*mcast-reporting-dest-name*]

Context

[\[Tree\]](#) (show>mcast-mgmt mcast-reporting-dest)

Full Context

show mcast-management mcast-reporting-dest

Description

This command displays multicast path management reporting destination information.

Parameters

mcast-reporting-dest-name

Specifies the multicast reporting destination name, up to 32 characters.

Platforms

All

mcast-reporting-dest

Syntax

mcast-reporting-dest [*mcast-reporting-dest-name*]

Context

[\[Tree\]](#) (clear>mcast-mgmt mcast-reporting-dest)

Full Context

```
clear mcast-management mcast-reporting-dest
```

Description

This command clears multicast reporting destination statistics.

Parameters

mcast-reporting-dest-name

Specifies the multicast reporting destination name, up to 32 characters.

Platforms

All

15.38 mcast-reporting-statistics

mcast-reporting-statistics

Syntax

```
mcast-reporting-statistics ip-address
```

Context

[\[Tree\]](#) (show>router>igmp mcast-reporting-statistics)

Full Context

```
show router igmp mcast-reporting-statistics
```

Description

This command displays IGMP multicast reporting statistics.

Parameters

ip-address

Displays the information associated with the specified IP address.

Platforms

All

mcast-reporting-statistics

Syntax

```
mcast-reporting-statistics [ip-address]
```

Context

[\[Tree\]](#) (clear>router>igmp mcast-reporting-statistics)

Full Context

clear router igmp mcast-reporting-statistics

Description

This command clears IGMP multicast reporting statistics.

Parameters

ip-address

Specifies the IP address.

Values a.b.c.d

Platforms

All

15.39 mcast-umh-red

mcast-umh-red

Syntax

mcast-umh-red *pair-id*

Context

[\[Tree\]](#) (tools>dump>router mcast-umh-red)

Full Context

tools dump router mcast-umh-red

Description

This command displays upstream multi-homing (UMH) information.

Parameters

pair-id

Displays the information associated with the specified pair of primary and backup UMH.

Values 1 to 1000

Platforms

All

Output

The following output is an example of UMH information.

Output Example

```
*A:DUT-B# tools dump router mcast-umh-red 100

mcast-vpn-ipv4 [**brief**] [**rd** *rd*] [**community** *comm-id*] [**aspath-regex** *reg-exp*] [**all**]

mcast-vpn-ipv4 **hunt** [**brief**] [**rd** *rd*] [**community** *comm-id*] [**aspath-regex** *reg-exp*] [**all**]

Context

[\[Tree\]](#) (show>router>bgp>routes mcast-vpn-ipv4)

Full Context

show router bgp routes mcast-vpn-ipv4

Description

This command displays BGP multicast VPN IPv4 routes.

Parameters

detail

Displays detailed information.

longer

Displays the specified route and subsets of the route.

rd

Displays information for the route distinguisher.

Values *ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val*

comm-id

Specifies the community ID, up to 72 characters.

Values [*as-num:comm-val | ext-comm | well-known-comm | large-comm*]

where:

- *as-num* — 0 to 65535
 - *comm-val* — 0 to 65535
 - *ext-comm* — the extended community, defined as one of the following:
 - *{target | origin}:ip-address:comm-val*
 - *{target | origin}:asnum:ext-comm-val*
 - *{target | origin}:ext-asnum:comm-val*
 - **bandwidth:asnum:val-in-mbps**
 - **ext:4300:ovstate**
 - **ext:value1:value2**
 - **flowspec-set:ext-asnum:group-id**
- where:
- *target* — route target
 - *origin* — route origin
 - *ip-address* — a.b.c.d
 - *ext-comm-val* — 0 to 4294967295
 - *ext-asnum* — 0 to 4294967295
 - **bandwidth** — bandwidth
 - *val-in-mbps* — 0 to 16777215
 - **ext** — extended
 - **ext:4300** — origin verification
 - *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
 - *value1* — 0000 to FFFF
 - *value2* — 0 to FFFFFFFFFF
 - **flowspec-set** — flow-spec set
 - *group-id* — 0 to 16383
- *well-known-comm* — **null | no-export | no-export-subconfed | no-advertise | blackhole**
 - *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

reg-exp

Displays routes matching the specified regular expression, up to 80 characters.

all

Displays all output for imported routes.

Platforms

All

15.41 mcast-vpn-ipv6

mcast-vpn-ipv6

Syntax

mcast-vpn-ipv6 [detail | longer] [rd rd] [community comm-id] [aspath-regex reg-exp] [all]

Output Fields: show mda <slot/mda> detail

[Table 292: Output Fields: show mda <slot/mda> detail](#) describes the output fields for the **show mda <slot/mda> detail** command.

Table 292: Output Fields: show mda <slot/mda> detail

Label	Description
Slot	The chassis slot number.
Mda	The MDA slot number.
Provisioned Mda-type	The provisioned MDA type.
Equipped Mda-type	The MDA type that is physically inserted into this slot in this chassis.
Admin State	Up — The MDA is administratively up. Down — The MDA is administratively down.
Operational State	Up — The MDA is operationally up. Down — The MDA is operationally down.
Failure Reason	This hardware component has failed.
Maximum port count	The maximum number of ports that can be equipped on the MDA card.
Number of ports equipped	The number of ports that are actually equipped on the MDA.
Transmit timing selected	Indicates the source for the timing used by the MDA.
Sync interface timing status	Indicates whether the MDA has qualified one of the timing signals from the CPMs.
Network Ingress Queue Policy	Specifies the network queue policy applied to the MDA to define the queueing structure for this object.
Capabilities	Specifies the minimum size of the port that can exist on the MDA.
Egress XPL error threshold	The Egress XPL Error Threshold value used by the fail-on-error feature.
Egress XPL error window	The Egress XPL Error Window value used by the fail-on-error feature.
Max channel size	Specifies the maximum size of the channel that can exist on the channelized MDA.
Channels in use	Applicable for SONET and TDM MDAs only. Indicates the total number of leaf SONET paths, TDM channels and bundles on the MDA which are presently provisioned for passing traffic.
Part number	The hardware part number.
CLEI code	The code used to identify the MDA.

Label	Description
Serial number	The MDA part number. Not user modifiable.
Manufacture date	The MDA manufacture date. Not user modifiable.
Manufacturing string	Factory-inputted manufacturing text string. Not user modifiable.
Administrative state	Up — The MDA is administratively up. Down — The MDA is administratively down.
Operational state	Up — The MDA is operationally up. Down — The MDA is operationally down.
Time of last boot	The date and time the most recent boot occurred.
Current alarm state	Displays the alarm conditions for the specific MDA.
Base MAC address	The base chassis Ethernet MAC address. Special purpose MAC addresses used by the system software are constructed as offsets from this base address.

mda

Syntax

mda *mda-id* [statistics]

Context

[\[Tree\]](#) (clear mda)

Full Context

clear mda

Description

This command reinitializes the specified MDA in a particular slot.

Parameters

mda-id

Clears the specified slot and MDA.

Values

slot/mda	slot: 1 to 10 mda: 1, 2
slot/xiom/mda	slot: 1 to 10 xiom: "x1" or "x2"

mda: 1, 2

statistics

Clears statistics for the specified MDA.

Platforms

All

```

Context

[\[Tree\]](#) (show>router>bgp>routes mdt-safi)

Full Context

```
show router bgp routes mdt-safi
```

Description

This command displays BGP MDT-SAFI routes.

Parameters

rd

Displays information for the route distinguisher.

Values *ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-
asnumber:comm-val*

mcast-grp-address

Specifies the multicast group address.

Values a.b.c.d

ip-address

Specifies the source IP address.

Values a.b.c.d

detail

Displays detailed information.

comm-id

Specifies the community ID, up to 72 characters.

Values [*as-num:comm-val | ext-comm | well-known-comm | large-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:
 - *{target | origin}:ip-address:comm-val*
 - *{target | origin}:asnum:ext-comm-val*
 - *{target | origin}:ext-asnum:comm-val*
 - **bandwidth:asnum:val-in-mbps**
 - **ext:4300:ovstate**

- **ext:value1:value2**
 - **flowspec-set:ext-asnum:group-id**
- where:
- *target* — route target
 - *origin* — route origin
 - *ip-address* — a.b.c.d
 - *ext-comm-val* — 0 to 4294967295
 - *ext-asnum* — 0 to 4294967295
 - **bandwidth** — bandwidth
 - *val-in-mbps* — 0 to 16777215
 - **ext** — extended
 - **ext:4300** — origin verification
 - *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
 - *value1* — 0000 to FFFF
 - *value2* — 0 to FFFFFFFFFF
 - **flowspec-set** — flow-spec set
 - *group-id* — 0 to 16383
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**
 - *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

reg-exp

Displays routes matching the specified regular expression, up to 80 characters.

show oam-pm statistics session lmm meas-interval

show oam-pm statistics session slm meas-interval

show oam-pm statistics session dmm meas-interval

show oam-pm statistics session dm meas-interval

Description

This command selects a measurement interval for the statistical display.

Parameters

raw

Specifies that the interval number is not to be included because there is only one raw cumulative bin.

{5-mins | 15-mins | 1-hour | 1-day}

Identifies the measurement interval to query for the statistics.

interval-number

Specifies the numerical reference that indicates the position from the latest sample window. The number 1 is the most recent interval with all higher numbers being that position in the past from current.

Values 1 to 97

[all | bins | summary]

Specifies a keyword to filter the output.

Platforms

All

- show oam-pm statistics session dmm meas-interval
- show oam-pm statistics session lmm meas-interval

meas-interval

Syntax

meas-interval raw [loss]

meas-interval raw [all | bins | summary]

meas-interval {5-mins | 15-mins | 1-hour | 1-day} interval-number *interval-number* [loss]

meas-interval {5-mins | 15-mins | 1-hour | 1-day} interval-number *interval-number* delay [all | bins | summary]

Context

[Tree] (show>oam-pm>stats>session>twamp-light meas-interval)

Full Context

show oam-pm statistics session twamp-light meas-interval

Description

This command selects a measurement interval for the statistical display.

Parameters

raw

Specifies that the interval number is not to be included because there is only one raw cumulative bin.

{5-mins | 15-mins | 1-hour | 1-day}

Identifies the measurement interval to query for the statistics.

interval-number

Specifies the numerical reference that indicates the position from the latest sample window. The number 1 is the most recent interval with all higher numbers being that position in the past from current.

Values 1 to 97

delay

Indicates that the statistics being queried are for delay. TWAMP-light PDUs carry both delay and loss informational elements and it is not clear from only the test type name which statistic the operator requires.

loss

Indicates the statistics being queried are for loss. TWAMP-light PDUs carry both delay and loss informational elements and it is not clear from only the test type name which statistic the operator requires.

[all | bins | summary]

Specifies a keyword to filter the output.

15.46 measurement-template

measurement-template

Syntax

measurement-template [*measurement-template*]

Context

[\[Tree\]](#) (show>test-oam>link-measurement measurement-template)

Full Context

show test-oam link-measurement measurement-template

Description

This command displays basic link measurement template information, such as the administrative state and number of interfaces referencing the template.

The base command can filter and produce output for a single measurement template. When the measurement template name is specified, delayed information about the template is displayed.

Parameters

measurement-template

Specifies the link measurement template name, up to 64 characters, for which to display a filtered list.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following outputs are examples of link measurement template information. The associated tables describe the output fields.

Output Example

```
show test-oam link-measurement measurement-template

Table 294: Output Fields: Measurement Template with Template Name Specified

Label	Description
Template Name	Displays the name of the link measurement template
Description	Displays the configured description of the link measurement template
Admin State	Displays the administrative state of the measurement template
Unidirectional Measurement	Displays the computational method used to calculate the delay metric actual — forward delay derived — half the roundup
Delay Measurement	Displays the delay metric compared to the threshold min — minimum recorded value max — maximum recorded value avg — average recorded value
Interval	Displays the probe frequency of the test packet
Last Reported Delay Hold	Displays the configured value that determines the time a reported delay measurement should be cleared if the operational state of the test transitions to down and remains there at least the length of this timer
Protocol	Displays the type of test packet used to report delay
Destination UDP Port	Displays the configured destination UDP port for test packets
Timestamp Format	Displays the format of the timestamp encoded in the test packet packetntp — Network Time Protocol format 32 seconds, 32 fractional secondsptp — Truncated Precision Time Protocol format 32 seconds, 32 nanoseconds
DSCP	Displays the configured DSCP in the IP header of the test packet
FC	Displays the configured forwarding class in the local node
Profile	Displays the profile of the test packet in the local node
Allow Egress Remark	Displays whether the egress QoS policy can remark the DSCP of the test

Label	Description
	packetNo — the egress QoS policy is bypassed unless force-remark is enabled Yes — the egress QoS policy is applied
TTL	Displays the IP header time to live (IPv4) or hop limit (IPv6)
IPv6 UDP Checksum 0	Displays whether processing of IPv6 packets that arrive with UDP checksum 0 is allowed or disallowed Disallow — packets are discarded Allow — the arriving packets are processed
Sample Window	Displays the header for sample window objects
Interval Multiplier	Displays the number of probes in the sample window, multiplying this value and the interval
Aggregate Sample Window	Displays the calculated length of the window in seconds
Sample Multiplier	Displays the number of sample windows in the aggregate sample window
Duration	Displays the calculated length of the window, in seconds
Relative Threshold	Displays the configured percentage difference comparing the current and previously reported measurements
Absolute Threshold	Displays the configured microsecond difference comparing the current and previously reported measurements
Window Integrity	Displays the minimum number of measurements, expressed as a percentage, before the window is consider integral
Active Interfaces	Displays the number of interfaces actively (Oper Up) referencing the link measurement template
Total Interfaces	Displays the number of interfaces referencing the link measurement template, regardless of operational state

15.48 megapools

megapools

Syntax

megapools *slot-number* **fp** *fp-number* **wred** [**detail**] **queue-group** *queue-group-name* [**instance** *instance-id*]

megapools *slot-number* **fp** *fp-number*

megapools *slot-number* **fp** *fp-number* **wred** [**detail**] [**service-id** *service-id*]

Context

[\[Tree\]](#) (show megapools)

Full Context

show megapools

Description

This command displays megapool information. A megapool is a mechanism the forwarding plane uses to allow over subscription of buffer pools. Every buffer pool is created in the context of a megapool.

By default, all buffer pools are associated with a single megapool and the pools are not oversubscribed. When WRED queue support is enabled on the FP, three megapools are used.

- The original megapool services the default pools.
- The second megapool services the system internal use pools.
- The third megapool is used by the buffer pools used by the WRED queues.

The traffic manager buffers are allocated to the three megapools without oversubscription. The WRED queue pools are allowed to oversubscribe their megapool, but the megapool protects the pools associated with the other megapools from buffer starvation that could be caused by that over subscription.

Parameters

slot-number

Displays information for the specified card slot.

Values 1 to 10

fp-number

Displays information for the specified FP.

Values 1 to 8

wred

Displays WRED queue pool information.

detail

Displays detailed information.

queue-group-name

Displays information for the specified port queue group name, up to 32 characters.

instance-id

Specifies the identification of a specific instance of the queue group.

Values 1 to 65535

service-id

Specifies the service ID.

Values 1 to 2148278381

service-name

Specifies a service name up to 64 characters.

Platforms

All

15.49 memory-allocation-failure-rate

memory-allocation-failure-rate

Syntax

memory-allocation-failure-rate *mda* [**history-stats-in-count** *count*] [**history-stats-in-min** *minutes*]

Context

[\[Tree\]](#) (show>isa>stats>tunnel-isa memory-allocation-failure-rate)

Full Context

show isa statistics tunnel-isa memory-allocation-failure-rate

Description

This command displays memory allocation failure rate of the specified ISA. The system collects usage information every hour for last 24 hours. The output also includes a current value.

Parameters

mda

Displays information about the specified ISA.

Values slot/mda

count

Displays information for the number of statistics intervals to be displayed (starting with the most recent).

Values 1 to 24

minutes

Displays information about the specified period covered by the statistics to be displayed (starting with the most recent).

Values 1 to 1440

current

Displays information about the current statistic value. The values of count and minutes are ignored by the system once this parameter is specified.

show-oid

Displays information about the Object Identifier (OID) of the current statistical value.

esa-vm

Displays the ID of the configured ESA and ESA VM.

Values

esa-vm:	<i>esa-id/vm-id</i>	
	<i>esa-id</i>	1 to 16
	<i>vm-id</i>	1 to 4

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

Table 296: System Memory-Pools Field Descriptions

Label	Description
Name	The name of the system or process.
Max Allowed	Integer — The maximum allocated memory size. No Limit — No size limit.
Current Size	The current size of the memory pool.
Max So Far	The largest amount of memory pool used.
In Use	The current amount of the memory pool currently in use.
Current Total Size	The sum of the Current Size column.
Total In Use	The sum of the In Use column.
Available Memory	The amount of available memory.

15.51 memory-usage

memory-usage

Syntax

memory-usage

Context

[\[Tree\]](#) (tools>dump>router>ldp memory-usage)

Full Context

tools dump router ldp memory-usage

Description

This command dumps memory usage information for LDP.

Platforms

All

memory-usage

Syntax

memory-usage

Context

[\[Tree\]](#) (tools>dump>router>mpls memory-usage)

Full Context

tools dump router mpls memory-usage

Description

This command dumps memory usage information for MPLS.

Platforms

All

15.52 mep

mep

Syntax

```
mep mep-id domain {md-index | md-admin-name} association {ma-index | ma-admin-name} [ loopback ]  
[linktrace] [statistics]  
mep mep-id domain {md-index | md-admin-name} association {ma-index | ma-admin-name} remote-  
mepid mep-id  
mep mep-id domain {md-index | md-admin-name} association {ma-index | ma-admin-name} remote-  
mepid all-remote-mepids  
mep mep-id domain {md-index | md-admin-name} association {ma-index | ma-admin-name} eth-test-  
results [remote-peer mac-address]  
mep mep-id domain {md-index | md-admin-name} association {ma-index | ma-admin-name} one-way-

delay-test [remote-peer mac-address]  
mep mep-id domain {md-index | md-admin-name} association {ma-index | ma-admin-name} two-way-  
slm-test [remote-peer mac-address]
```

Context

[\[Tree\]](#) (show>eth-cfm mep)

Full Context

```
show eth-cfm mep
```

Description

This command displays Maintenance Endpoint (MEP) information.

The **show eth-cfm mep** *mep-id* **domain** *md-id* **association** *ma-id* command does not display CCM ERROR, CCM XCON frames in the output.

The **show eth-cfm mep** *mep-id* **domain** *md-id* **association** *ma-id* **remote-mep** *rmep-id* command does not display some TLVs details.

Parameters

mep-id

Specifies the integer that is unique among all the MEPs in the same MA.

Values 1 to 8191

domain *md-index*

Specifies the index of the MD to which the MP is associated, or 0, if none.

Values 1 to 4294967295

md-admin-name

Specifies the MD name, up to 64 characters.

association *ma-index*

Specifies the index to which the MP is associated, or 0, if none.

Values 1 to 4294967295

ma-admin-name

Specifies the MA name, up to 64 characters.

loopback

Keyword to display loopback information for the specified MEP.

linktrace

Keyword to display linktrace information for the specified MEP.

remote-mepid *mep-id*

Keyword to display specified remote MEP ID information for specified the MEP.

all-remote-mepids

Keyword to display all remote MEP ID information for the specified MEP.

eth-test-results

Keyword to display eth-test-result information for the specified MEP.

eth-bn-notification

Specifies to display ETH-bandwidth information for the specified MEP.

one-way-delay-test

Keyword to display one-way-delay-test information for the specified MEP.

two-way-delay-test

Keyword to display two-way-delay-test information for the specified MEP.

two-way-slm-test

Keyword to display two-way-slm-test information for the specified MEP.

remote-peer *mac-address*

Keyword to include remote MEP ID information for the specified MEP.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following outputs are examples of ETH-CFM MEP information, and the associated tables describe the output fields.

- [Output Example \(MEPs, linktrace, and loopback\), Table 297: Output fields: MEP, linktrace, and loopback](#)
- [Output Example \(delay test\), Table 298: Output fields: ETH-CFM MEP delay test](#)

Output Example (MEPs, linktrace, and loopback)

```

Table 297: Output fields: MEP, linktrace, and loopback

Label	Description
Mep Information	
Md-index	Displays the MD index of the domain
Direction	Displays the direction of OAMPDU transmission
Ma-index	Displays the MA index of the association
Admin	Displays the administrative status of the MEP
Md-admin-name	Displays the administrative MD name.
Ma-admin-name	Displays the administrative MA name.
MepId	Displays the MEP identifier
CCM-Enable	Displays the status of the CCM (enabled or disabled)
IflIndex	Displays the index of the interface
PrimaryVid	Displays the identifier of the primary VLAN
FngState	Indicates the different states of the Fault Notification Generator

Label	Description
LowestDefectPri	Displays the lowest priority defect (a configured value) that is allowed to generate a fault alarm
HighestDefect	Identifies the highest defect that is present For example, if defRDICCM and defXconCCM are present, the highest defect is defXconCCM.
Defect Flags	Displays the number of defect flags
Mac Address	Displays the MAC address of the MEP
CcmLtmPriority	Displays the priority value transmitted in the linktrace messages (LTM)s and CCMs for this MEP The MEP must be configured on a VLAN.
CcmTx	Displays the number of Continuity Check Messages (CCM) sent The count is taken from the last polling interval (every 10 s).
CcmSequenceErr	Displays the number of CCM errors
Eth-1DM Threshold	Displays the one-way-delay threshold value
Eth-Ais	Displays the state of the ETH-AIS test (enabled or disabled)
Eth-Tst	Displays the state of the ETH-Test (enabled or disabled)
CcmLastFailure Frame	Displays the frame that caused the last CCM failure
XconCcmFailure Frame	Displays the frame that caused the XconCCMFailure
Mep Linktrace Message Information	
LtRxUnexplained	Displays the number of unexplained linktrace messages (LTM) that have been received
LtNextSequence	Displays the sequence number of the next linktrace message
LtStatus	Displays the status of the linktrace
LtResult	Displays the result of the linktrace
TargIsMepId	Identifies whether the target interface has a MEP-ID (true or false)
TargMepId	Displays the MEP-ID of the target interface
TargMac	Displays the MAC address of the target interface

Label	Description
TTL	Displays the TTL value
EgressId	Displays the egress ID of the linktrace message
SequenceNum	Displays the sequence number of the linktrace message
LtFlags	Displays the linktrace flags
Mep Linktrace Replies	
SequenceNum	Displays the sequence number returned by a previous transmit linktrace message, indicating which linktrace message response is returned
ReceiveOrder	Displays the order in which the linktrace initiator received the linktrace replies
Ttl	Displays the TTL field value for a returned linktrace reply
Forwarded	Indicates whether the linktrace message was forwarded by the responding MEP
LastEgressId	Displays the last egress identifier returned in the linktrace reply egress identifier TLV of the linktrace reply The last egress identifier identifies the MEP linktrace initiator that initiated, or the linktrace responder that forwarded, the linktrace message for which this linktrace reply is the response. This is the same value as the egress identifier TLV of that linktrace message.
TerminalMep	Indicates whether the forwarded linktrace message reached a MEP enclosing its MA
NextEgressId	Displays the next egress identifier returned in the linktrace reply egress identifier TLV of the linktrace reply The next egress identifier identifies the linktrace responder that transmitted this linktrace reply and can forward the linktrace message to the next hop. This is the same value as the egress identifier TLV of the forwarded linktrace message, if any.
Relay	Displays the value returned in the Relay Action field
IngressMac	Displays the MAC address returned in the ingress MAC address field
Ingress Action	Displays the value returned in the Ingress Action field of the linktrace message
IngressPortIdSubType	Displays the format of the ingress port ID

Label	Description
IngressPortId	Displays the ingress port ID; the format is determined by the value of the IngressPortIdSubType
EgressMac	Displays the MAC address returned in the egress MAC address field
Egress Action	Displays the value returned in the Egress Action field of the linktrace message
EgressPortIdSubType	Displays the format of the egress port ID
EgressPortId	Displays the egress port ID; the format is determined by the value of the EgressPortIDSubType
Org Specific TLV	Displays all organization-specific TLVs returned in the linktrace reply, if any Includes all octets including and following the TLV length field of each TLV, concatenated
Mep Loopback Information	
LbRxReply	Displays the number of received loopback (LB) replies
LbRxBadOrder	Displays the number of received loopback messages that are in a bad order
LbRxBadMsdU	Displays the number of loopback replies that have been received with the wrong destination MAC address (MSDU = MAC Service Data Unit)
LbTxReply	Displays the number of loopback replies transmitted out this MEP
LbSequence	Displays the sequence number in the loopback message
LbNextSequence	Displays the next loopback sequence
LbStatus	True — Loopback is in progress False — No loopback is in progress
LbResultOk	Displays the result of the loopback test
DestIsMepId	Identifies whether the destination interface has a MEP-ID (true or false)
DestMepId	Displays the MEP-ID of the destination interface
DestMac	Displays the MAC address of the destination interface

Table 298: Output fields: ETH-CFM MEP delay test

Label	Description
Peer Mac Addr	Displays the MAC address of the peer (remote) entity
Delay (us)	Displays the measured delay (in microseconds) for the DM test
Delay Variation (us)	Displays the measured delay variation (in microseconds) for the DV test

mep

Syntax

mep *mep-id* **domain** *md-index* **association** *ma-index* **statistics**

Context

[\[Tree\]](#) (clear>eth-cfm mep)

Full Context

clear eth-cfm mep

Description

This command clears the MEP parameters.

Parameters

mep-id

Specifies the MEP ID.

Values 1 to 8191

md-index

Specifies the MD index.

Values 1 to 4294967295

ma-index

Specifies the MA index.

Values 1 to 4294967295

statistics

Clears the MEP statistics.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

15.53 mesh-sdp

mesh-sdp

Syntax

mesh-sdp *sdp-id*[:*vc-id*] { **all** | **counters** | **stp** | **mrp**}

Context

[\[Tree\]](#) (clear>service>statistics>id mesh-sdp)

Full Context

clear service statistics id mesh-sdp

Description

This command clears the statistics for a particular mesh SDP bind.

Parameters

sdp-id

Specifies the SDP ID for which to display information

Default All SDPs.

Values 1 to 17407

vc-id

Displays information about the virtual circuit identifier.

Values 1 to 4294967295

all

Clears all queue statistics and STP statistics associated with the SDP

counters

Clears all queue statistics associated with the SDP

stp

Clears all STP statistics associated with the SDP

mrp

Clears all MRP statistics associated with the SDP

Platforms

All

mesh-sdp

Syntax

mesh-sdp *sdp-id*[:*vc-id*] **ingress-vc-label**

mesh-sdp *sdp-id*[:*vc-id*] **vccv-bfd** {**session** | **statistics**}

Context

[\[Tree\]](#) (clear>service>id mesh-sdp)

Full Context

clear service id mesh-sdp

Description

This command clears and resets the mesh SDP binding.

Parameters

sdp-id

The spoke-SDP ID for which to clear statistics.

Values 1 to 17407

vc-id

The virtual circuit ID on the SDP ID to be reset.

Values 1 to 4294967295

ingress-vc-label

Specifies to clear the ingress VC label.

vccv-bfd session

Specifies to clear the session mismatch flag on the mesh-SDP binding after the flag was set to true by a detected mismatch between the configured parameters and the received parameters.

vccv-bfd statistics

Specifies to clear a VCCV BFD session statistics for a specified mesh-SDP.

mfib

Syntax

mfib [**ipv4** | **ipv6** | **mac**]

mfib brief

mfib group *group-address* [**statistics**]

mfib statistics [**ipv4** | **ipv6** | **mac**]

Context

[\[Tree\]](#) (show>service>id mfib)

Full Context

show service id mfib

Description

This command displays the multicast FIB on the VPLS service.

Parameters

brief

Displays a brief output

statistics

Displays statistics on the multicast FIB

ipv4

Displays IPv4 address information

ipv6

Displays IPv6 address information

mac

Displays MAC address information

group-address

Displays the multicast FIB for a specific multicast group address

Platforms

All

Output

The following command displays multicast FIB information and [Table 299: Multicast FIB Fields](#) describes the output fields.

```
show service id mfib
```

Output Example

```

The following command shows which ISIDs are local and [Table 299: Multicast FIB Fields](#) describes the output fields. The **mfib** command option displays ISIDs that are local and advertised. Static ISIDs are included in this display. However, ISID policy can override the ISIDs that are designated to use the default multicast tree and these do not show up in the MFIB. This is displayed on a B-VPLS control service.

```
show service id mfib
```

Output Example

```

Table 299: Multicast FIB Fields

Label	Description
Multicast FIB, Service	
Source Address	IPv4 unicast source address
Group Address	IPv4 multicast group address
SAP ID	Indicates the SAP/SDP to which the corresponding multicast stream are forwarded or blocked
Forwarding/Blocking	Indicates whether the corresponding multicast stream is blocked or forwarded

Label	Description
Number of Entries	Specifies the number of entries in the MFIB
Forwarded Packets	Indicates the number of multicast packets forwarded for the corresponding source/group
Forwarded Octets	Indicates the number of octets forwarded for the corresponding source/group
Svc ID	Indicates the service to which the corresponding multicast stream is forwarded or blocked. Local means that the multicast stream is forwarded or blocked to a SAP or SDP local to the service.
Multicast FIB Statistics, Service	
Matched Pkts	The number of matched packets
Matched Octets	The number of matched octets
Forwarding Rate	The forwarding rate
Isid Policy Range	
Entry	ISID policy entry number
Range	ISID policy range
AdvLocal	The AdvLocal state
UseDefMCTree	The UseDefMCTree state

mfib

Syntax

mfib [*group-mac ieee-address*] [**isid** *isid*]

Context

[\[Tree\]](#) (show>service>id>spb mfib)

Full Context

show service id spb mfib

Description

This command displays multicast forwarding data-base (MFIB) information.

Parameters

ieee-address

Specifies a MAC address

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

isid

Specifies an I-SID

Values 0 to 16777215

Platforms

All

Output

The following output is an example of service SPB MFIB information.

Output Example

```
*A:Dut-A# show service id 100001 spb mfib
=====
User service MFIB information
=====
MacAddr          ISID      Status
-----

mfib

Syntax

mfib

Context

[\[Tree\]](#) (clear>service>id mfib)

Full Context

clear service id mfib

Description

Commands in this context clear multicast FIB info for the VPLS service.

Platforms

All

15.55 mgmt-ethernet

mgmt-ethernet

Syntax

mgmt-ethernet

Context

[\[Tree\]](#) (show>redundancy mgmt-ethernet)

Full Context

show redundancy mgmt-ethernet

Description

This command shows the management Ethernet port redundancy status. The show router "management" interface command also shows the CPM Ethernet port used by the management interface. If the primary CPM's port is active, then it shows "A/1" under the Port field,. If the secondary CPM's port is active, then it shows "B/1 -> A/1" in the Port field.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

Output

The following output is an example of redundancy mgmt-Ethernet information, and [Table 300: Redundancy Mgmt-Ethernet Field Descriptions](#) describes the output fields.

Output Example

```
A:SR12# show redundancy mgmt-ethernet
=====
Management Ethernet Redundancy
=====
Admin Status   : Enabled
Oper Status    : Management port operating on active CPM
Revert Time    : 5 seconds
=====
```

Show Router "Management" Interface Detail Output

The following is an output example that shows "A/1" when the primary CPM's Ethernet port is active and "B/1 ->A/1" if the secondary CPM's port is active.

```
*B:Dut-A# show router "management" interface

Table 300: Redundancy Mgmt-Ethernet Field Descriptions

Label	Description
Admin Status	Enabled — Administrative status is enabled. Disabled — Administratively disabled.
Oper Status	The CPM on which the management Ethernet port is operating
Revert Time	The revert time
Interface Name	The interface name
Adm/Admin State	Up — The interface is administratively enabled Down — The interface is administratively shutdown
Opr (v4/v6)/Oper	Up — The interface is operationally enabled Down — The interface is operationally shutdown

Label	Description
Port/SAP Id	The physical network port or the SAP identifier associated with the interface
IP-Address	The IP address
PfxState	The prefix state associated with the interface
If Name	The interface name
Protocols	Protocols associated with the interface
IP Addr/mask	The IP address and mask
Address Type	The address type of the IP address. n/a — No IP address has been assigned to the IP interface, so the IP address type is not applicable Primary — The IP address for the IP interface is the Primary address on the IP interface Secondary — The IP address for the IP interface is a secondary address on the IP interface
IGP Inhibit	IGP inhibit enabled or disabled
Broadcast Address	The broadcast address used by the IP interface when sourcing IP broadcasts on the IP interface
HoldUp-Time	The number of seconds to wait before notifying clients monitoring this group when its operational status transitions from down to up
Track Srrp Inst	The SRRP instance identification
IPv6 Address	The IPv6 address
IPv6 Addr State	The IPv6 address state
CGA modifier	The CGA modifier for the link-local addresses
Link Lcl Address	The link local IP address of the virtual router interface
Link Lcl State	The address state of the virtual router interface
Description	The text string description of the interface
If Index	The interface index
Virt. If Index	The virtual interface index
Last Oper Chg	The date and time of the last operational change
Global If Index	The global interface index
Lag Link Map Prof	The LAG link map profile identifier

Label	Description
Port Id	The port ID of the interface
TOS Marking	The ToS trusted state
If Type	The interface type
Egress Filter	The egress filter associated with the interface
Ingress Filter	The ingress filter associated with the interface
Egr IPv6 Flt	The egress IPv6 filter associated with the interface
Ingr IPv6 Flt	The ingress IPv6 filter associated with the interface
BGP IP FlowSpec	BGP IP FlowSpec enabled or disabled
BGP IPv6 FlowSpec	BGP IPv6 FlowSpec enabled or disabled
SNTP B.Cast	Whether or not NTP/SNTP broadcasts are received on this interface
Network QoS Policy	The network QoS policy name
MAC Address	The IEEE MAC address
Mac Accounting	Whether or not MAC accounting functionality for the interface is enabled

mgmt-ethernet

Syntax

mgmt-ethernet

Context

[\[Tree\]](#) (tools>perform>redundancy mgmt-ethernet)

Full Context

tools perform redundancy mgmt-ethernet

Description

This command triggers redundancy mode, just as if the management Ethernet port of the primary CPM has gone down. The router will revert if the management Ethernet port of the primary CPM has been up for the revert duration.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

15.56 mgw-address-cache

mgw-address-cache

Syntax

mgw-address-cache

Context

[\[Tree\]](#) (clear>router>gtp>uplink mgw-address-cache)

Full Context

clear router gtp uplink mgw-address-cache

Description

This command clears the DNS resolution cache for all APNs known in this router. After execution, every APN to address mapping is learned again using DNS.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

mgw-address-cache

Syntax

mgw-address-cache

Context

[\[Tree\]](#) (clear>router>wlan-gw mgw-address-cache)

Full Context

clear router wlan-gw mgw-address-cache

Description

This command clears the mobile gateway's DNS lookup address cache.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

mgw-address-cache

Syntax

```
mgw-address-cache [arec] [snaptr] [srv]  
mgw-address-cache apn apn-domain-string
```

Context

[\[Tree\]](#) (show>router>gtp>uplink mgw-address-cache)

Full Context

```
show router gtp uplink mgw-address-cache
```

Description

This command displays the mobile gateway's DNS lookup address cache.

Parameters

arec

Displays A-records.

snaptr

Displays Straightforward-NAPTR information.

srv

Displays SRV records.

apn-domain-string

Specifies the Access Point Name (APN) of this DNS cache entry.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

mgw-address-cache

Syntax

```
mgw-address-cache [arec] [snaptr] [srv]  
mgw-address-cache apn apn-domain-string
```

Context

[\[Tree\]](#) (show>router>gtp>uplink mgw-address-cache)

Full Context

```
show router gtp uplink mgw-address-cache
```

Description

This command displays the mobile gateway's DNS lookup address cache.

Parameters

apn-domain-string

Specifies the Access Point Name (APN) of this DNS cache entry, up to 108 characters.

arec

Displays A-records.

snaptr

Displays Straightforward-NAPTR information.

srv

Displays SRV records.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

15.57 micro-segment-local-sid

micro-segment-local-sid

Syntax

```
micro-segment-local-sid [ipv6-prefix[/prefix-length]] [longer] [micro-segment-locator ms-locator-name]  
[context contextf] [ua] [udt4] [udt6] [udt46] [udx2] [udt2u] [udt2m] [un]
```

Context

[\[Tree\]](#) (show>router>srv6 micro-segment-local-sid)

Full Context

```
show router segment-routing-v6 micro-segment-local-sid
```

Description

This command displays SRv6 locally-configured micro-SID information.

Parameters

ipv6-prefix[/prefix-length]

Displays routes only matching the specified IP address and length.

Values *ipv6-prefix[/prefix]*: x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:d.d.d.d
x: [0 to FFFF]H

d: [0 to 255]D
prefix-length: 1 to 128

longer

Displays the specified route and subsets of the route.

ms-locator-name

Specifies the micro-segment locator name, up to 64 characters.

context

Specifies the context for which to display micro-segment local micro-SID information.

Values vprn-svc-name, vprn-svc-id, 'Base'

ua

Displays the uA SID associated with a P2P interface.

udt4

Displays the uDT4 function associated with the Base routing instance.

udt6

Displays the uDT6 function associated with the Base routing instance.

udt46

Displays the uDT46 function associated with the Base routing instance.

udx2

Displays the uDX2 function associated with the SRv6 instance in the service.

udt2u

Displays the uDT2U function associated with the SRv6 instance in the service.

udt2m

Displays the uDT2M function associated with the SRv6 instance in the service.

un

Displays the uN SID function of a locator.

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

15.58 micro-segment-locator

micro-segment-locator

Syntax

micro-segment-locator [mt {0 | 2}] [prefix ipv6-prefix[/prefix-length]] [adv-router system-id | hostname]
[algo algo-id]

Context

[\[Tree\]](#) (show>router>isis>srv6 micro-segment-locator)

Full Context

show router isis segment-routing-v6 micro-segment-locator

Description

This command displays the IS-IS SRv6 micro-segment locators.

Parameters

ipv6-prefix[/prefix-length]

Displays routes only matching the specified *ip-address* and length.

Values *ipv6-prefix[/prefix]*: x:x:x:x:x:x:x (eight 16-bit pieces)
 x:x:x:x:x:d.d.d.d
 x: [0 to FFFF]H
 d: [0 to 255]D
prefix-length: 1 to 128

system-id | hostname

Displays information for the specific IS-IS advertising router. The host name can be up to 38 characters.

algo-id

Displays information for the specified algorithm.

Values 0 to 255

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

Output

[Table 301: Micro-segment locator output](#) describes the micro-segment locator output fields.

Use the following command to display micro-segment locator information.

```
show router isis segment-routing-v6 micro-segment-locator
```

Output Example

```

Table 301: Micro-segment locator output

Label	Description
Prefix	Displays the prefix
AdvRtr	Displays the advanced router information
MT	Displays the MT information
Lvl/Typ	Displays the level or type information
AttributeFlags	Displays the attribute flag information
Tag	Displays the tag information
Flag	Displays the flag information
Algo	Displays the algorithm information
No. of Micro Segment Locators	Displays the number of micro-segment locators

15.59 migration

migration

Syntax

migration [**interface** *ip-int-name*]

Context

[Tree] (tools>dump>router>ipoe-session migration)

Full Context

tools dump router ipoe-session migration

Description

This command displays details on the IPoE session migration progress. It shows per group interface the number of hosts per type (DHCPv4, DHCPv6 and SLAAC) that are associated with an IPoE session or that are not associated with an IPoE session.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of IPoE session migration information.

Output Example

```
# tools dump router ipoe-session migration interface group-int-1-1
=====
Type                Total      IPoE session   Non IPoE session
=====
Group-interface: group-int-1-1 (IPoE session enabled)
-----
DHCPv4              2          1              1
DHCPv6              3          2              1
SLAAC                0          0              0
-----
IPoE sessions       1

Label	Description
Sap	The service SAP ID
qtag1	The outer CFM VLAN tag
qtag2	The inner CFM VLAN tag
PVLAN	The configured primary VLAN
Enabled	The state of the MIP
Mac Address	The configured MAC address of the MIP
Sdp	The service SDP ID
Svclid	The service ID
Type	The SDP type
Far End	The IP address of the far-end peer for the SDP

15.61 mip-instantiation

mip-instantiation

Syntax

```
mip-instantiation [level level] [{sap sap-id | sdp sdp-id}]
```

Context

[\[Tree\]](#) (show>eth-cfm mip-instantiation)

Full Context

```
show eth-cfm mip-instantiation
```

Description

This command displays the active MIPs created on the node, their related object values, and the SAP or SDP binding. The attributes include a column that indicates which MIP table was responsible and authoritative for the specific active attribute. Authorities can be the association (asn), default-domain (def), or the global read-only values (sys).

Parameters

level

The level for which all created MIPs will be displayed

Values 0 to 7

sap-id

The SAP for which created MIPs will be displayed

sdp-id

The SDP binding for which created MIPs will be displayed

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following output is an example of ETH CFM MIP instantiation information.

[Table 303: ETH-CFM MIP Instantiation Field Descriptions](#) describes the show MIP instantiation command output fields.

Output Example

```
show eth-cfm mip-instantiation
=====

Table 303: ETH-CFM MIP Instantiation Field Descriptions

Label	Description
VLAN	Displays the primary <i>vlan-id</i> associated with the MIP, or "none" if <i>primary-vlan-enable</i> is not configured
L	Displays the numerical value indicating the CFM level of the MIP
LA	Displays the level authority indicating the creation routine responsible for the level
Creation	Displays the MIP creation mode that was used to create the MIP
CA	Displays the creation authority
IdPerm	Indicates whether the SenderID TLV is being included (chassis) or not (none)
IdA	Displays the IdPermission authority
Pri	Displays the numerical value that indicates the mip-ltr-priority
PA	Displays the mip-ltr-priority authority

15.62 mirror

mirror

Syntax

mirror mirror-dest *service-id*

mirror global-sampling-rate

mirror mirror-source *service-id*

Context

[\[Tree\]](#) (show mirror)

Full Context

show mirror

Description

This command displays mirror configuration and operation information.

Parameters

service-id

Specify the mirror service ID.

Values 1 to 2148278385

global-sampling-rate

Displays the global sampling rate as well as all mirror destination services that use the global sampling rate.

Platforms

All

Table 304: Show mirror output fields lists and describes the mirroring output fields:

Table 304: Show mirror output fields

Label	Description
Service Id	The service ID associated with this mirror destination.
Type	Entries in this table have an implied storage type of "volatile". The configured mirror source information is not persistent.
Admin State	Up — The mirror destination is administratively enabled. Down — The mirror destination is administratively disabled.
Oper State	Up — The mirror destination is operationally enabled.

Label	Description
	Down — The mirror destination is operationally disabled.
Forwarding Class	The forwarding class for all packets transmitted to the mirror destination.
Remote Sources	Yes — A remote source is configured.
	No — A remote source is not configured.
Enable Port Id	Yes — PPP Port ID Mirroring is enabled.
	No — PPP Port ID Mirroring is disabled.
Slice	The value of the slice-size, the maximum portion of the mirrored frame that will be transmitted to the mirror destination. Any frame larger than the slice-size will be truncated to this value before transmission to the mirror destination. A value of 0 indicates that mirrored packet truncation based on slice size is disabled.
Destination SAP	The ID of the access port where the Service Access Point (SAP) associated with this mirror destination service is defined.
Egr QoS Policy	This value indicates the egress QoS policy ID. A value of 0 indicates that no QoS policy is specified.

The following output is an example of global-sampling-rate information, and [Table 305: Show mirror global-sampling-rate fields](#) describes the output fields.

```

15.63 mirror-dest

mirror-dest

Syntax

mirror-dest [*service-id*]

Context

[\[Tree\]](#) (show>li mirror-dest)

Full Context

show li mirror-dest

Description

This command displays LI mirror destination information.

Parameters

service-id

Identifies the service in the service domain. This ID is unique to this service and cannot be used by any other service, regardless of service type. The same service ID must be configured on every router that this particular service is defined on.

Values		
<i>service-id</i> :	1 to 2148278381	
<i>svc-name</i> :	64 characters maximum	

Platforms

All

Output

Output Example

```

 RADIUS LI mirror dest: indicated by [<svc-id>]

mirror-dest

Syntax

mirror-dest [*service-id*]

Context

[\[Tree\]](#) (clear>li>radius mirror-dest)

Full Context

clear li radius mirror-dest

Description

This command deletes the mirror destination created by RADIUS.

LI configuration changes, such as updating or replacing a mirror-destination template, may prevent the RADIUS VSA "Alc-li-action" from deleting a mirror destination. To remove the mirror destination from RADIUS, the parameters for the mirror destination (a combination of the RADIUS LI VSAs and the mirror destination template) must match the parameters used during the mirror destination creation. This CLI command removes LI destinations in these cases.

Parameters

service-id

Specifies the mirror destination service that was created through RADIUS, which can be displayed with the **show li mirror-dest** command.

Values 1 to 2148278385

Platforms

All

Output Fields: show macsec mka-session port detail

Table 307: [Output Fields: show macsec mka-session port detail](#) describes the output fields for the following commands:

- **show macsec mka-session port**
- **show macsec mka-session detail**
- **show macsec mka-session statistics**

Table 307: Output Fields: show macsec mka-session port detail

Label	Description
MKA Oper State	Specifies the operational state of the MKA participant on this port. The operational MKA state will be up if MKA hellos are received on this port and have a valid session.
Oper Cipher Suite	Specifies the operational encryption algorithm used for data path PDUs when all parties in the CA have the (SAK). This value is specified by the key server:gcm-aes-128, gcm-aes-256, gcm-aes-xpn-128, gcm-aes-xpn-256.
Oper Encrypt Offset	Specifies the operational encryption offset used for the data path PDUs when all parties in the CA have the SAK. This value is specified by the key server: 0, 30, 50.
CAK Name	Specifies the name of the CAK in use by this MKA which is used to find the correct CAK.
MKA Member ID	Specifies indicates the Member Identifier (MI) for the MKA instance.
Transmit Interval	Specifies the time interval (in ms) at which the MKA broadcasts its liveness to its peers and is non-configurable.
Outbound SCI	Specifies the Secure Channel Identifier (SCI) information for transmitting MACsec frames and consists of the outgoing port MAC Address and a port identifier.
Message Number	Specifies the current count of MKA messages that is attached to MKA PDUs.
Key Number	Specifies the number of the currently assigned CAK. When a new CAK is generated, this number is incremented. A SAK is identified by 128-bit Key Identifier (KI) and 32-bit Key-Number (KN).
Key Server	Specifies whether this server is the highest priority server in the peer group: no, yes.
Key Server Priority	Specifies the priority of the active key server: 0-255 (default 16).
Latest SAK AN	Specifies the Association Number (AN) of the latest Secure Association Key (SAK). This number is concatenated with an SCI to identify a Secure Association (SA). In SR OS, only 2 SAKs are supported.
Latest SAK KI	Specifies the Key Identifier (KI) of the latest SAK. This number is derived from the MI of the key server and the key number.
Previous SAK AN	Specifies the AN of the previous SAK. This number is concatenated with an SCI to identify an SA.

Label	Description
Previous SAK KI	Specifies the KI of the previous SAK. This number is derived from the MI of the key server and the key number.
Peer Removed Due to Timeout	Specifies the number of peers removed from the live/potential peer list due to not receiving an MKPDU within the MKA Live Time (6.0 seconds) and is not configurable.
CKN Not Found	Specifies the number of MKPDUs received with a CKN that does not match the CA configured for the port.
New Live Peer	Specifies the number of validated peers that have been added to the live peer list.
SAK Generated by Server	Specifies the number of SAKs generated by this MKA instance.
SAK Installed for TX	Specifies the number of SAKs installed for transmitting.
SAK Installed for RX	Specifies the number of SAKs installed for receiving.
PDU Too small	Indicates that the number of MKPDUs received that are less than 32 octets.
PDU Too big	Indicates the number of MKPDUs received where the EAPOL header indicates a size larger than the received packet.
PDU Not Quad Size	Indicates the number of MKPDUs received with a size that is not a multiple of 4 octets long.
PDU Message Number Invalid	Indicates the number of MKPDUs received out of order as indicated by the Message Number.
PDU Param Set Size Invalid	Indicates the number of MKPDUs received which contain a parameter set body length that exceeds the remaining length of the MKPDU.
PDU Liveness Check Fail	Indicates the number of MKPDUs received which contain an MN that is not acceptably recent.
Param Set Not Quad Size	Indicates the number of MKPDUs received which contain a parameter set that is not a multiple of 4 octets long.
Unsupported Agility	Indicates the number of MKPDUs received which contain an unsupported Algorithm Agility value.
Invalid CAK Name Length	Indicates the number of MKPDUs received which contain a CAK name that exceeds the maximum CAK name length.
ICV Check Failed	Indicates the number of MKPDUs received which contain an ICV value that does not authenticate.

Label	Description
Peer Using Same MID	Indicates the number of MKPDUs received which contain a peer list with an MI entry which conflicts with the local MI.
SAK From Non-Live Peer	Indicates the number of SAKs received from peer that is not a member of the Live Peers List.
SAK From Non-Key Server	Indicates the number of SAKs received from an MKA participant that has not been designated as the Key Server. Only the key server should distribute SAK.
SAK Decrypt Fail	Indicates the number of AES Key Wrap SAK decryption failures that have occurred.
SAK Encrypt Fail	Indicates the number of AES Key Wrap SAK encryption failures that have occurred.
Key Number Invalid	Indicates the number of SAKs received with an invalid Key Number.
SAK Installation Failed	Indicates the number of Secy SAK installation failures that have occurred.
CAK Info Missing	Indicates the number of times internal CAK data is not available for the generation of the SAK.
Max Peers Set as Zero	Indicates the number of Secy SAK installations that have failed due to the max peer entry being set to 0.

Output Example: show macsec mka-session detail

```
A:Dut-C# show macsec mka-session detail

mka-session

Syntax

```
mka-session [port-id]
```

Context

[\[Tree\]](#) (clear>macsec mka-session)

Full Context

```
clear macsec mka-session
```

Description

This command displays MACsec MKA session information.

Parameters

port-id

Specifies the port ID, up to 17 characters

Platforms

All

15.65 mld

mld

Syntax

```
mld [subscriber sub-ident-string] [detail]
```

Context

[\[Tree\]](#) (show>service>active-subscribers mld)

Full Context

show service active-subscribers mld

Description

This command displays active subscriber MLD information.

Parameters

sub-ident-string

Displays the subscriber ID of the active subscriber, up to 64 characters.

detail

Displays detailed output.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of MLD information for active subscribers

Output Example

```
*A:eng-BNG-2# show service active-subscribers mld
=====
Active Subscribers
=====
Subscriber
MLD-Policy
HostAddr                GrpItf                NumGroups
-----

  mld-policy-01
  2001::1                grp-int-01
-----
Number of Subscribers : 1
=====
```

Table 308: MLD Active Subscribers Field Descriptions

Label	Descriptions
Subscriber	The name of the subscriber
MLD-Policy	The name of the policy associated with the subscriber as specified by the external policy server or local user database
HostAddr	The subscriber's individual host IPv6 address or prefix.
GrpItf	The group interface on which the subscriber is created
NumGroups	The number of multicast groups that the subscriber is currently joined with

Label	Descriptions
Number of Subscribers	The total number of subscribers associated with this show command

mld

Syntax

mld

Context

[\[Tree\]](#) (show>router mld)

Full Context

show router mld

Description

Commands in this context show MLD entities.

Platforms

All

mld

Syntax

mld

Context

[\[Tree\]](#) (clear>router mld)

Full Context

clear router mld

Description

Commands in this context clear and reset MLD entities.

Platforms

15.66 mld-policy

mld-policy

Syntax

mld-policy

mld *policy-name* **association**

mld *policy-name*

Context

[\[Tree\]](#) (show>subscr-mgmt mld-policy)

Full Context

show subscriber-mgmt mld-policy

Description

This command displays MLD policy information.

Parameters

policy-name

Specifies the MLD policy name, up to 32 characters.

association

Displays information associated with the MLD policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

15.67 mld-snooping

mld-snooping

Syntax

mld-snooping

Context

[\[Tree\]](#) (show>service>id mld-snooping)

Full Context

show service id mld-snooping

Description

This command displays MLD snooping information.

Platforms

All

mld-snooping

Syntax

mld-snooping

Context

[\[Tree\]](#) (clear>service>id mld-snooping)

Full Context

clear service id mld-snooping

Description

Commands in this context clear MLD snooping-related data.

Platforms

All

15.68 mlppp

mlppp

Syntax

mlppp

Context

[\[Tree\]](#) (show>router>l2tp mlppp)

Full Context

show router l2tp mlppp

Description

This command displays L2TP MLPPP operational information.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s

15.69 mmrp

mmrp

Syntax

```
mmrp mac [ieee-address]
```

Context

[\[Tree\]](#) (show>service>id mmrp)

Full Context

```
show service id mmrp
```

Description

This command displays information on MACs. If a MAC address is specified, information will be displayed relevant to the specific group. No parameter will display information on all group MACs on a server.

Parameters

ieee-address

Specifies a MAC address as a hex string in the form of xx:xx:xx:xx:xx:xx: or xx-xx-xx-xx-xx-xx

Platforms

All

Output

The following output is an example of service MRRP MAC information.

Output Example

```
*A:PE-A# show service id 10 mmrp mac 01:1E:83:00:00:65

15.70 mobile-gateway

mobile-gateway

Syntax

mobile-gateway remote-address *ip-address* [udp-port *port*] statistics

Context

[Tree] (clear>router>wlan-gw mobile-gateway)

Full Context

clear router wlan-gw mobile-gateway

Description

This command clears Mobile Gateway data.

Parameters

ip-address

Specifies the IP address.

- Values** ipv4-address: a.b.c.d
 ipv6-address:
- x:x:x:x:x:x (eight 16-bit pieces)
 - x:x:x:x:x:d.d.d.d
 - x: [0 to FFFF] H
 - d: [0 to 255] D

port

Specifies the port number.

- Values** 1 to 65535

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

15.71 module

module

Syntax

module *cpm-slot* **action** {**reboot** | **disconnect**}

Context

[\[Tree\]](#) (tools>perform>system>bluetooth module)

Full Context

tools perform system bluetooth module

Description

This command performs reboots or disconnects on the Bluetooth module on the specified CPM.

Parameters

cpm-slot

Specifies the CPM slot.

- Values** {A | B | C | D}

reboot

Triggers a reboot of the Bluetooth subsystem on the module.

disconnect

Forces a disconnect of any active Bluetooth session.

Platforms

7750 SR-1, 7750 SR-s

module

Syntax

module [*cpm-slot*] [**detail**]

Context

[\[Tree\]](#) (show>system>bluetooth module)

Full Context

show system bluetooth module

Description

This command displays information for Bluetooth modules.

Parameters

cpm-slot

Specifies the CPM slot.

Values A, B

detail

Displays detailed information.

Platforms

7750 SR-1, 7750 SR-s

Output

The following output is an example of Bluetooth module information, and [Table 309: Output fields: Bluetooth module](#) describes the output fields.

Use the following command for Bluetooth module information.

```
show system bluetooth module
```

Output Example

```
=====  
System-wide Bluetooth Configuration  
=====  
Passkey           : 123456           Advertising Timeout: 30  
Power State       : off             Pairing Button     : Disabled  
=====
```

```

=====
Bluetooth Modules
=====
Module           : A
Device Connected : No
Configured Identifier : (Not Configured)
Given Identifier  : 7750-SR-1-CPM-A-card-2
=====
    
```

Table 309: Output fields: Bluetooth module

Label	Description
Passkey	The Bluetooth passkey in use by the system
Advertising Timeout	The amount of time, in seconds, that the Bluetooth module advertises it is ready to pair.
Power State	The operating mode for Bluetooth
Pairing Button	Displays whether the pairing button is enabled for use
Module	Displays which CPM contains the Bluetooth module
Device Connected	Displays if there is a device actively paired to the module
Configured Identifier	The customer-defined Bluetooth identifier for the module
Given Identifier	The Bluetooth identifier in use for the module

[Table 310: IGMP Snooping Mrouter Field Descriptions](#) describes the show igmp-snooping mrouter output fields:

Table 310: IGMP Snooping Mrouter Field Descriptions

Label	Description
MRouter	The multicast router port
Sap/Sdp Id	The SAP and SDP ID multicast router ports
Up Time	The length of time the mrouter has been up
Expires	The amount of time left before the query interval expires
Version	The configured version of IGMP running on this interface

15.77 mrp

mrp

Syntax

mrp

Context

[\[Tree\]](#) (show>service>id mrp)

Full Context

show service id mrp

Description

This command displays information on a per service MRP configuration.

Platforms

All

Output

The following output is an example of service MRP information.

Output Example

```
*A:PE-A# show service id 10 mrp
-----
MRP Information
-----
Admin State      : Up                Failed Register Cnt: 0
Max Attributes   : 2048             Attribute Count     : 10
Flood Time      : Off
-----

Syntax

```
mrp-policy [mrp-policy]
mrp-policy mrp-policy [association]
mrp-policy mrp-policy [entry entry-id]
```

Context

[\[Tree\]](#) (show>service mrp-policy)

Full Context

```
show service mrp-policy
```

Description

This command displays information on an MRP policy.

Parameters

mrp-policy

Specifies the MRP policy name

Values 32 chars max

entry-id

Specifies the entry ID number

Values 1 to 65535

Platforms

All

Output

The following output is an example of service MRP policy information.

Output Example

```
*A:PE-B# show service mrp-policy

15.79 ms-pw

ms-pw

Syntax

ms-pw [*rd rd*] [**aii-type2** *aii-type2*] [**brief**] [**hunt**] [**aspath-regex** *reg-exp*] [**community** *comm-id*]

Context

[\[Tree\]](#) (show>router>bgp>routes ms-pw)

Full Context

show router bgp routes ms-pw

Description

This command displays BGP Multi-Segment Pseudowire (MS-PW) routes.

Parameters

rd

Displays information for the route distinguisher.

Values *ip-addr:comm-val* | *2byte-asnumber:ext-comm-val* | *4byte-asnumber:comm-val*

aii-type2

Filters the MS-PW routes based on the All Type 2 value.

reg-exp

Displays routes matching the specified regular expression, up to 80 characters.

comm-id

Specifies the community ID, up to 72 characters.

Values [*as-num:comm-val* | *ext-comm* | *well-known-comm* | *large-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:
 - *{target | origin}:ip-address:comm-val*
 - *{target | origin}:asnum:ext-comm-val*
 - *{target | origin}:ext-asnum:comm-val*
 - **bandwidth:asnum:val-in-mbps**
 - **ext:4300:ovstate**

- **ext:value1:value2**
 - **flowspec-set:ext-asnum:group-id**
- where:
- *target* — route target
 - *origin* — route origin
 - *ip-address* — a.b.c.d
 - *ext-comm-val* — 0 to 4294967295
 - *ext-asnum* — 0 to 4294967295
 - **bandwidth** — bandwidth
 - *val-in-mbps* — 0 to 16777215
 - **ext** — extended
 - **ext:4300** — origin verification
 - *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
 - *value1* — 0000 to FFFF
 - *value2* — 0 to FFFFFFFFFF
 - **flowspec-set** — flow-spec set
 - *group-id* — 0 to 16383
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**
 - *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

Platforms

15.80 msap

msap

Syntax

msap {*msap-id* | **idle-only**}

Context

[\[Tree\]](#) (clear>service>id msap)

Full Context

clear service id msap

Description

This command clears Managed SAP (MSAP) information.

This command can remove an MSAP with active subscribers still associated with the MSAP. You can specify the **idle-only** parameter to clear only MSAPs in an idle state; MSAPs with active subscribers are not cleared.

Parameters

msap-id

Specifies a Managed SAP ID.

Values	
dot1q	[port-id lag-id]:qtag1
qinq	[port-id lag-id]:qtag1.qtag2
qtag1	0 to 4094
qtag2	0 to 4094

idle-only

Specifies to clear only MSAPs in an idle state.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

msap

Syntax

msap [**service** *service-id*]

Context

[\[Tree\]](#) (tools>dump>service msap)

Full Context

tools dump service msap

Description

This command provides MSAP-related statistics for the chassis and tracks the number of sticky MSAPs. The statistics include the total number of MSAPs, sticky MSAPs, and idle MSAPs. When a subscriber disconnects from a sticky MSAP, it transitions to an idle MSAP. The idle MSAP transitions back to a sticky MSAP when the subscriber reconnects. A large number of idle MSAPs during peak network hours indicate that an idle MSAP cleanup is required. The total MSAP statistic counts both the total number of traditional MSAPs (non-sticky) and total number of sticky MSAPs. Idle MSAPs are counted towards the total number of sticky MSAPs.

Parameters

service-id

Specifies the service for which to show the MSAP-related statistics. The service is indicated in the chassis.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

msap

Syntax

msap

Context

[\[Tree\]](#) (show>service>id msap)

Full Context

show service id msap

Description

This command displays information for the managed SAPs associated with the service.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of managed SAP information.

Output Example

```

[Table 311: MSAP Policy Field Descriptions](#) describes subscriber management MSAP policy output fields.

Table 311: MSAP Policy Field Descriptions

Field	Description
Name	The name of the MSAP policy
Num MSAPs	The number of MSAPs
Description	The user-provided description of the MSAP policy
Number of MSAP Policies	The total number of MSAP policies
Number of MSAPs	The total number of MSAPs

msap-policy

Syntax

msap-policy *msap-policy-name* [**idle-only**]

Context

[\[Tree\]](#) (clear>subscr-mgmt msap-policy)

Full Context

clear subscriber-mgmt msap-policy

Description

This command deletes Managed SAPs (MSAPs) created by the MSAP policy.

This command can remove an MSAP with active subscribers still associated with the MSAP. Use the **idle-only** parameter to remove only MSAPs in an idle state.

Parameters

msap-policy-name

Specifies an existing managed SAP policy name. A string up to 32 characters long composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

idle-only

Specifies to remove only the MSAPs in an idle state.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

msap-policy

Syntax

msap-policy *msap-policy-name*

Context

[\[Tree\]](#) (clear>service>id msap-policy)

Full Context

clear service id msap-policy

Description

This command clears Managed SAPs created by the Managed SAP policy.

Parameters

msap-policy-name

Clears an existing MSAP policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

multi-chassis

Syntax

multi-chassis

Context

[\[Tree\]](#) (clear>redundancy multi-chassis)

Full Context

clear redundancy multi-chassis

Description

Commands in this context clear multi-chassis parameters.

Platforms

All

15.85 multi-chassis-shunt-interface

multi-chassis-shunt-interface

Syntax

multi-chassis-shunt-interface

Context

[\[Tree\]](#) (show>ipsec multi-chassis-shunt-interface)

Full Context

show ipsec multi-chassis-shunt-interface

Description

This command displays information about configured multi-chassis shunt interfaces or the multi-chassis shunt interface information in the specified routing instance or service.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of IPsec multi-chassis shunt interfaces. [Table 312: Multi-Chassis Shunt Interface Field Descriptions](#) describes the output fields

Output Example

```
show>ipsec# multi-chassis-shunt-interface
=====
IPsec Multi-Chassis Shunt Interfaces
=====
Service Id  MC Shunt Interface Name      Next Hop      Resolved
-----
Base        to84                          130.100.14.4  Yes
Base        to85                          130.110.15.5  Yes
400         to84                          130.100.14.4  Yes
400         to85                          130.110.15.5  Yes
-----
No. of IPsec MC Shunt Interfaces: 4
```

Table 312: Multi-Chassis Shunt Interface Field Descriptions

Label	Description
Service Id	The service ID
MC Shunt Interface Name	The multi-chassis shunt interface name
Next Hop	The next hop
Resolved	Resolved: Yes or No
No. of IPsec MC Shunt Interfaces	The total number of MC shunt interfaces

multicast-info-policy

Syntax

multicast-info-policy [*policy-name*] [*detail*]

Context

[\[Tree\]](#) (show>mcast-management multicast-info-policy)

Full Context

show mcast-management multicast-info-policy

Description

This command displays multicast path management policy information.

Parameters

policy-name

Specifies the bandwidth policy name, up to 32 characters.

detail

Displays detailed information.

Platforms

All

Output

The following output is an example of multicast management bandwidth policy information.

Output Example

```
A:PE1# show mcast-management multicast-info-policy "default" detail

Context

[\[Tree\]](#) (show>router>bgp>routes mvpn-ipv4)

Full Context

show router bgp routes mvpn-ipv4

Description

This command displays BGP MVPN IPv4 routes.

Parameters

reg-exp

Displays routes matching the specified regular expression, up to 80 characters.

hunt

Displays entries for the specified route.

comm-id

Specifies the community ID, up to 72 characters.

Values [*as-num:comm-val* | *ext-comm* | *well-known-comm* | *large-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:
 - *{target | origin}:ip-address:comm-val*
 - *{target | origin}:asnum:ext-comm-val*
 - *{target | origin}:ext-asnum:comm-val*

- **bandwidth:asnum:val-in-mbps**
- **ext:4300:ovstate**
- **ext:value1:value2**
- **flowspec-set:ext-asnum:group-id**

where:

- *target* — route target
- *origin* — route origin
- *ip-address* — a.b.c.d
- *ext-comm-val* — 0 to 4294967295
- *ext-asnum* — 0 to 4294967295
- **bandwidth** — bandwidth
- *val-in-mbps* — 0 to 16777215
- **ext** — extended
- **ext:4300** — origin verification
- *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
- *value1* — 0000 to FFFF
- *value2* — 0 to FFFFFFFFFF
- **flowspec-set** — flow-spec set
- *group-id* — 0 to 16383
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**
- *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

rd

Displays information for the route distinguisher.

Values *ip-addr:comm-val* | *2byte-asnumber:ext-comm-val* | *4byte-asnumber:comm-val*

brief

Displays the BGP MVPN IPv4 route information in a brief format.

mvpn-type

Displays information for the specified MVPN route type.

Values *intra-ad* | *inter-ad* | *spmsi-ad* | *leaf-ad* | *source-ad* | *shared-join* | *source-join*

ip-address

Specifies the originator IP address.

Values a.b.c.d

ipv4 address | **ipv6 address**

Displays the IPv4 or IPv6 address expressed in dotted decimal notation.

Values	ipv4-address:	a.b.c.d
	ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D

as-number

Specifies the source AS number.

Values	0 to 4294967295
--------	-----------------

Platforms

Context

[Tree] (show>router>bgp>routes mvpn-ipv6)

Full Context

show router bgp routes mvpn-ipv6

Description

This command displays BGP MVPN IPv6 routes.

Parameters

mvpn-type

Displays information for the specified MVPN route type.

Values intra-ad | inter-ad | spmsi-ad | leaf-ad | source-ad | shared-join | source-join

rd

Displays information for the route distinguisher.

Values *ip-addr:comm-val* | *2byte-asnumber:ext-comm-val* | *4byte-asnumber:comm-val*

ip-address

Specifies the originator IP address.

Values a.b.c.d

ipv4 address | *ipv6 address*

Displays the IPv4 or IPv6 address expressed in dotted decimal notation.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

as-number

Specifies the source AS number.

Values 0 to 4294967295

detail

Displays detailed information.

longer

Displays the specified route and subsets of the route.

brief

Displays the BGP MVPN IPv6 route information in a brief format.

reg-exp

Displays routes matching the specified regular expression, up to 80 characters.

comm-id

Specifies the community ID, up to 72 characters.

Values [*as-num:comm-val* | *ext-comm* | *well-known-comm* | *large-comm*]
where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535

Description

Commands in this context clear NAT commands.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat

Syntax

nat

Context

[\[Tree\]](#) (show>router nat)

Full Context

show router nat

Description

Commands in this context display NAT related information.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

nat

Syntax

nat

Context

[\[Tree\]](#) (show>service nat)

Full Context

show service nat

Description

Commands in this context display NAT information.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

16.2 nat-group

nat-group

Syntax

nat-group

nat-group *nat-group-id* [associations]

nat-group *nat-group-id* [associations]

nat-group *nat-group-id* inter-chassis-redundancy

nat-group *nat-group-id* statistics inter-chassis-redundancy

nat-group *nat-group-id* statistics mda *mda-id* [non-zero-value-only]

nat-group *nat-group-id* member *member-number*

nat-group *nat-group-id* member *member-number* inter-chassis-redundancy

nat-group *nat-group-id* member *member-number* statistics inter-chassis-redundancy

nat-group *nat-group-id* member *member-number* reassembly-statistics [non-zero-value-only]

nat-group *nat-group-id* member *member-number* statistics [non-zero-value-only]

nat-group [*nat-group-id*] members

Context

[Tree] (show>isa nat-group)

Full Context

show isa nat-group

Description

This command lists all active member ISAs (or group members). Up to 16 group members can be displayed (16 is the supported number of LAG links). Members can share physical ISAs (MDAs) and the physical locality of the group members can be determined from the **Mda** column in the output.

The number of group members will be <=X and the actual number of displayed group members will depend on the configuration based calculation.

Parameters

nat-group-id

Specifies the NAT group ID.

Values 1 to 4

associations

Displays associations applicable to the specified NAT group.

statistics

Displays NAT group statistics.

member

Displays statistics information about the resources of a member of a NAT ISA group.

member-number

Specifies the member number.

Values 1 to 255

non-zero-value-only

Displays statistics information display whose value is bigger than zero.

reassembly-statistics

Displays statistics information about IP datagram reassembly on NAT-capable ISA groups.

inter-chassis-redundancy

Displays information about inter-chassis redundancy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following shows output examples.

Output Example

```

show isa nat-group
=====
ISA NAT Group Summary
=====
Mda Group 1 Group 2 Group 3
-----
3/1 active - -
3/2 - active busy
4/1 - busy active
4/2 - standby standby

no resource                                     : 0
[eNatFlowNoResource]                          "no resource",\
->the default, all errors without more specific reason

[eNatFlowWrongPort]                           "pkt rx on wrong port",\
-> packet came in on wrong port on ISA

[eNatFlowWrongProt]                          "unsupported protocol",\
-> protocol is not UDMP/TCP/ICMP

[eNatFlowNoHostGrp]                          "no host or host group",\
-> cannot create new host group because out of resources, or
current host group is not usable at the moment (because in a transient
state)

[eNatFlowNoIpOrPort]                         "no ip or port",\
-> no Ip or port range available

[eNatFlowNoMatchingFlow]                    "no matching flow",\
-> no matching flow found

[eNatFlowMaxExceeded]                       "max flow exceeded",\
-> max flows for subscriber exceeded

[eNatFlowTcpUnexpectedRst]                   "TCP no flow for RST",\
[eNatFlowTcpUnexpectedFin]                  "TCP no flow for FIN",\
[eNatFlowTcpUnexpected]                     "TCP no flow",\
-> TCP state machine problem

[eNatFlowAddressDependentFiltering]         "addr. dep. filtering",\
-> pkt dropped because of addr. dependent filtering

[eNatFlowUnsupportedICMP]                   "ICMP type unsupported",\
-> unsupported icmp type

[eNatFlowUnsupportedLocalICMP]              "ICMP local unsupported",\
-> packet to ip address on ISA is not an echo request

[eNatFlowIcmpChecksumError]                 "ICMP checksum error",\
-> ICMP checksum error

[eNatFlowIcmpEmbeddedPktChecksumError]     "ICMP embedded checksum
error",\
-> checksum error on embedded IP header

[eNatFlowIcmpEmbeddedPktUnsupportedL4]     "ICMP unsupported L4",\
-> embedded IP packet is not UDP/TCP

[eNatFlowIcmpTooShort]                      "ICMP too short",\
-> packet too short to include the ICMP header

[eNatFlowIcmpLengthError]                   "ICMP length error",\
-> packet too short to include the embedded header

[eNatFlowPacketErrorNotIp]                  "Pkt not IPv4 or IPv6",\
[eNatFlowPacketErrorRecv]                  "Pkt rcv error",\
[eNatFlowPacketError]                       "Pkt error",\

```

```

[eNatFlowPacketErrorIpv4HdrChk]          "IPv4 header checksum
violation",\
[eNatFlowPacketErrorIpv4HdrMal]          "IPv4 header malformed",\
[eNatFlowPacketErrorIpv4PktMal]          "IPv4 malformed packet",\
[eNatFlowPacketErrorIpv4TtlZero]          "IPv4 ttl zero",\
[eNatFlowPacketErrorIpv4Optv6Ext]          "IPv4 opt /IPv6 ext headers",\
[eNatFlowPacketErrorIpv4Bad]              "IPv4 undefined error", \
[eNatFlowPacketErrorIpv6Frag]             "IPv6 fragments unsupported",\
[eNatFlowPacketErrorTcpUdpMal]            "TCP/UDP malformed",\
[eNatFlowPacketErrorTcpUdpChk]            "TCP/UDP checksum failure",\
[eNatFlowPacketErrorTcpUdpLen]            "TCP/UDP length error",\
-> malformed incoming packet

[eNatFlowPacketSendError]                 "Pkt send error",\
-> failed to tx the packet

[eNatFlowPacketNoCpyBuf]                  "no buf to copy pkt",\
-> failed to copy the packet to another buffer needed for
correct processing

[eNatFlowLockedByMgmtCore]                 "locked by mgmt core",\
-> resources temp. locked by the mgmt core

[eNatFlowPRLogFailed]                      "port range log failed",\
-> port range log failed

[eNatFlowMtuExceeded]                      "MTU exceeded",\
-> outgoing packet too big for DS-Lite tunnel or nat64 mtu

[eNatFlowDslUnrecNextHdr]                  "DS Lite unrecognized next
hdr",\
->ipv6 pkt has wrong next header

[eNatFlowDslUnknownAFTR]                   "DS Lite unknown AFTR",\
-> AFTR address is unrecognized

[eNatFlowTooManyFrgsForIpPkt]              "too many fragments for IP
packet",\
[eNatFlowTooManyFragmentedPkts]            "too many fragmented
packets",\
[eNatFlowTooManyFragHoles]                  "too many fragment holes",\
[eNatFlowFragListExpire]                    "fragment list expired",\
[eNatFlowTooManyFragBufs]                   "too many frags buffered",\
[eNatFlowFragRateTooHigh]                   "fragment rate too high",\
-> various fragment problems

[eNatFlowNoPolicy]                          "no policy",\
->vrf not mapped to a policy

[eNatFlowLogFailed]                         "flow log failed",\
-> flow logging cannot follow the setup rate

[eNatFlowMultiHostOrSubscrIp]               "no multiple host or
subscr. IPs allowed",\
->multiple hosts or subscribers on the inside in use without
port translation

[eNatFlowToLocalError]                      "to local ignored",\
-> radius authentication failure (?)

[eNatFlow64Disabled]                         "NAT64 disabled",\
-> nat64 was disabled

[eNatFlow64InvalidSource]                   "NAT64 invalid src addr",\

```

```

-> source address matches pref64

[eNatFlow64FragZeroChecksum]          "NAT64 frag has zero
checksum",\
-> v4 UDP frag has zero checksum

[eNatFlow64ZeroChecksum]              "NAT64 v4 has zero checksum",\
-> v4 UDP has zero checksum, and policy configured to drop

[eNatFlow64FragIcmp]                  "NAT64 ICMP frag unsupported"\
->v4 fragmented ICMP
    
```

```

Table 315: ISA Statistics Descriptions

Field	Description
State	Displays the state of the NAT inter-chassis redundancy member.
Peer state	Displays the state of the peer.
Local IP address	Displays the local IP address.

Field	Description
Remote IP address	Displays the IP address of the remote client.
Unsupported flows	Displays the flows other than TCP/UDP/ICMP in 1:1 NAT that are agnostic and by default created per subscriber by configuration on both nodes. There is no need to synchronize such flows.
Tracked flows	Displays the TCP/UDP/ICMP flows.
Tracked flows not synced	Displays the outstanding flows on the active node waiting to be synchronized (transient condition). On the standby node, all flows are in this state.
Tracked flows pending	Displays the flows waiting to be acknowledged.
Flows synced	Displays the flows that are synchronized.
Flows marked to delete	Displays the flows marked to be deleted due to a timeout, deleted pinhole or simply as a result of an invoked clear command.
Flows delete pending	Displays the flows waiting to be deleted due to a timeout, deleted pinhole or simply as a result of an invoked clear command.
Time of last failure	Displays the time of the last ISA failure.
Failure cause	Displays the cause of the ISA failure.

Table 317: Member State Descriptions

State	Descriptions
Active	The member is actively serving traffic.
Failed	The member is in a failed state where forwarding is not possible and L2-aware bypass redundancy mode is disabled. This event is normally associated with an MS-ISA failure.

State	Descriptions
failedBypass	<p>The member is in failed state and the subscribers that it was serving before the failover occurred are in a bypass mode. In a bypass mode, subscribers are normally routed according to the routing table in the inside routing context (as opposed to steered to MS-ISA where NAT is performed). The operator should ensure that the routing leads those subscribers to a centralized CGN node that serve as a backup device.</p> <p>This event is normally associated with an MS-ISA failure while the L2-aware bypass redundancy mode is enabled.</p>
activeBypass	<p>The member transitions in this state after a recovery while the L2-aware bypass mode of operation is enabled. Some subscribers that this member was serving before the failover are in bypass mode, while others that came on-line after the restoration are actively being served by this member.</p>

nat-group

Syntax

nat-group *nat-group-id* **member** *member-number* **l2-aware-subscribers**

nat-group *nat-group-id* **statistics** **mda** *mda-id*

nat-group *nat-group-id* **statistics** **inter-chassis-redundancy**

nat-group *nat-group-id* **member** *member-number* **statistics** **inter-chassis-redundancy**

Context

[\[Tree\]](#) (clear>nat>isa nat-group)

Full Context

clear nat isa nat-group

Description

This command clears ISA nat-group commands related statistics or removes all the subscribers that are associated with a specific NAT group member.

Parameters

nat-group-id

Specifies the NAT group ID to clear.

Values 1 to 4

member-number

Specifies the member number.

Values 1 to 255

mda-id

Specifies the MDA for which to clear performance measurements in *slot/mda* format.

Values slot — 1
mda — 1 to 4

l2-aware-subscribers

Specifies to clear the NAT group ID's l2-aware subscribers.

statistics

Specifies to clear the NAT group ID's statistics.

resource-peak-values

Specifies to reset the resource peak values to the current resource measurements.

inter-chassis-redundancy

Specifies to clear the inter-chassis redundancy data.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

16.3 nat-policy

nat-policy

Syntax

nat-policy

Context

[\[Tree\]](#) (show>service>nat nat-policy)

Full Context

show service nat nat-policy

Description

This command displays NAT policy information.

Parameters

nat-policy-name

Specifies the NAT Policy name.

Values 32 chars max

associations

Keyword; displays the router instances and/or subscriber profiles associated with the NAT policy.

statistics

Keyword; displays statistics of the specified NAT policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of this command.

Output Example

```
show service nat nat-policy

Context

[\[Tree\]](#) (show>isa nat-system-resources)

Full Context

show isa nat-system-resources

Description

This command displays ISA NAT system resources.

Parameters

mda-id

Specifies the card and slot identifying a provisioned ISA.

Values	<i>mda-id:</i>	<i>slot [xiom]/mda</i>
		slot
		1 to 2 (7750 SR-2s)
		1 to 5 (7750 SR-7)
		1 to 6 (7750 SR-14s)
		1 to 10 (7450 ESS, 7750 SR-12)
		1 to 14 (VSR)
		1 to 20 (VSR)
	xiom	x1 to x2
	mda	1 to 2 (7450 ESS, 7750 SR-1, SR-2s, SR-7, SR-12, SR-14s)
		1 to 4 (VSR)

nat-group-id

Specifies the NAT group ID.

Values	
1 to 4 (7450 ESS, 7750 SR-1, SR-2s, SR-7, SR-12, SR-14s, VSR)	
1 to 8 (7750 SR-12)	
1 to 15 (VSR)	

vapp-id

Specifies the ID of the configured ESA and ESA VM.

Values	<i>vapp-id:</i>	<i>esa-id/vm-id</i>
	esa-id	1 to 16
	vm-id	1 to 4

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

16.5 nat64-lsn-sub

nat64-lsn-sub

Syntax

nat64-lsn-sub **router** *router-instance* **ipv6-address-prefix** *ipv6-prefix*

Context

[\[Tree\]](#) (clear>nat nat64-lsn-sub)

Full Context

clear nat nat64-lsn-sub

Description

This command clears NAT mappings for NAT64 LSN subscribers.

Parameters

router-instance

Specifies the router instance, up to 32 characters.

ipv6-prefix

Specifies the IPv6 prefix and length.

- Values**
- x:x:x:x:x:x:x (eight 16-bit pieces)
 - x:x:x:x:x:d.d.d.d
 - x: [0 to FFFF]H
 - d: [0 to 255]D

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

16.6 neighbor

neighbor

Syntax

neighbor *service-id*

Context

[\[Tree\]](#) (clear>service>id neighbor)

Full Context

clear service id neighbor

Description

This command clears commands for a specific service.

For the 7450 ESS or 7750 SR, it clears the discovered IPv6 address of the neighboring CE associated with an lpipe SAP. When IPv6CP comes back up following the execution of this command on an IPv6CP SAP, the node checks if an IPv6 address has been learned for the remote CE attached to the lpipe service. If one has been learned, then this is used to bring up IPv6CP.

Parameters

service-id

The ID that uniquely identifies a service.

Values service-id: 1 to 214748364
 svc-name: A string up to 64 characters long.

service-name

Neighboring IPv6 address, for the 7450 ESS or 7750 SR only.

Platforms

All

neighbor

Syntax

neighbor [{*sap sap-id* | *sdp sdp-id:vc-id*} [**address** *ip-address*]] [**detail**] [*family*]

Context

[\[Tree\]](#) (show>service>id>pim-snooping neighbor)

Full Context

show service id pim-snooping neighbor

Description

This command displays PIM neighbor information.

Parameters

ip-int-name

Only displays the interface information associated with the specified IP interface name

sap-id

Displays the neighbor information associated with the specified SAP

sdp-id:vc-id

Displays the neighbor information associated with the specified SDP

ip-address

Displays information for the neighbor with the specified IP address

detail

Displays detailed neighbor information

family

Displays either IPv4 or IPv6 information for the specified neighbor

Values ipv4 or ipv6

Platforms

All

Output

The following output is an example of service PIM snooping neighbor information.

Output Example

```
*A:PE# show service id 1 pim-snooping neighbor
=====
PIM Snooping Neighbors ipv4

[**family**]

Context

[Tree] (clear>service>id>pim-snooping neighbor)

Full Context

clear service id pim-snooping neighbor

Description

This command clears PIM snooping neighbor information.

Parameters

ip-address

Clears information for the neighbor with the specified IP address

sap sap-id

Clears PIM snooping entries associated with the specified SAP

sdp sdp-id:vc-id

Clears PIM entries associated with the specified SDP. For a spoke-SDP, the VC ID must be specified; for a mesh SDP, the VC ID is optional.

Values 1 to 17407

family

Displays either IPv4 or IPv6 information

Values ipv4 or ipv6

evpn-mpls

Clears PIM snooping statistics for EVPN-MPLS destinations

Platforms

All

Context

[\[Tree\]](#) (show>router>bgp neighbor)

Full Context

show router bgp neighbor

Description

This command displays BGP neighbor information and can be entered with or without any parameters. Issuing the command without any parameters displays information for all BGP peers. When the command is issued with a specific IP address or ASN, information is displayed only for the specified peer or peers with the same AS.

When either **received-routes** or **advertised-routes** is specified, the routes exchanged with the specified peer are listed (see the second output example, below).

When either **history** or **suppressed** is specified, the routes learned from those peers that either have a history or are suppressed (respectively) are listed.

The "State" field displays the BGP peer's protocol state. In addition to the standard protocol states, this field can also display the "Disabled" operational state, which indicates the peer is operationally disabled and must be restarted by the operator.

Note:

The information generated by this command is not available by SNMP.

Parameters

as-number

Displays information for the specified AS number.

Values 1 to 4294967295

brief

Displays information in a brief format. This parameter is only supported with **received-routes** and **advertised-routes**.

community

Displays all routes with the specified BGP community.

comm-id

Specifies community IDs, up to 72 characters.

Values [*as-num:comm-val* | *ext-comm* | *well-known-comm*]

where:

- *as-num* — 0 to 65535

- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:
 - *{target | origin}:ip-address:comm-val*
 - *{target | origin}:asnum:ext-comm-val*
 - *{target | origin}:ext-asnum:comm-val*
 - **bandwidth:asnum:val-in-mbps**
 - **ext:4300:ovstate**
 - **ext:value1:value2**
 - **flowspec-set:ext-asnum:group-id**where:
 - *target* — route target
 - *origin* — route origin
 - *ip-address* — a.b.c.d
 - *ext-comm-val* — 0 to 4294967295
 - *ext-asnum* — 0 to 4294967295
 - **bandwidth** — bandwidth
 - *val-in-mbps* — 0 to 16777215
 - **ext** — extended
 - **ext:4300** — origin verification
 - *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
 - *value1* — 0000 to FFFF
 - *value2* — 0 to FFFFFFFFFF
 - **flowspec-set** — flow-spec set
 - *group-id* — 0 to 16383
- *well-known-comm* — **null | no-export | no-export-subconfed | no-advertise | llgr-stale | no-llgr | blackhole**

detail

Displays detailed information.

dynamic

Displays information for dynamic BGP neighbors.

evpn-type

Displays information for the specified EVPN route type.

- Values**
- auto-disc** — Displays the auto discovery routes for this peer.
 - mac** — Displays the MAC routes for this peer.
 - inclusive-mcast** — Displays the inclusive multicast routes for this peer.

- eth-seg** — Displays the Ethernet segment routes for this peer.
- ip-prefix** — Displays the IPv4 routes for this peer.
- ipv6-prefix** — Displays the IPv6 routes for this peer.
- smet** — Displays the Selective Multicast Ethernet Tag routes for this peer.
- mcast-join-synch** — Displays the Multicast Join Synch routes for this peer.
- mcast-leave-synch** — Displays the Multicast Leave Synch routes for this peer.

family

Specifies the type of routing information to display.

- Values**
- evpn** — Displays the BGP EVPN routes for this peer.
 - flow-ipv4** — Displays the BGP IPv4 flow-spec routes for this peer.
 - flow-ipv6** — Displays the BGP IPv6 flow-spec routes for this peer.
 - ipv4** — Displays the BGP IPv4 routes for this peer.
 - ipv6** — Displays the BGP IPv6 routes for this peer.
 - l2-vpn** — Displays the BGP L2 VPN routes for this peer.
 - label-ipv4** — Displays the BGP IPv4 labeled unicast routes for this peer.
 - label-ipv6** — Displays the BGP IPv6 labeled unicast routes for this peer.
 - mcast-ipv4** — Displays the BGP multicast IPv4 routes for this peer.
 - mcast-ipv6** — Displays the BGP multicast IPv6 routes for this peer.
 - mcast-vpn-ipv4** — Displays the BGP multicast VPN IPv4 routes for this peer.
 - mcast-vpn-ipv6** — Displays the BGP multicast VPN IPv6 routes for this peer.
 - mdt-safi** — Displays the BGP multicast VPN MDT-SAFI routes for this peer.
 - ms-pw** — Displays the BGP Multi-segment PW routes for this peer.
 - mvpn-ipv4** — Displays the BGP NG-MVPN IPv4 routes for this peer.
 - mvpn-ipv6** — Displays the BGP NG-MVPN IPv6 routes for this peer.
 - route-target** — Displays the BGP route-target constrain routes for this peer.
 - vpn-ipv4** — Displays the BGP VPN IPv4 routes for this peer.
 - vpn-ipv6** — Displays the BGP VPN IPv6 routes for this peer.

received-routes

Displays the number of routes received from this peer.

advertised-routes

Displays the number of routes advertised to this peer.

damping

Displays damping information for the specified AS number or neighbor IP address.

- Values**
- history** — Display statistics for dampened routes.
 - suppressed** — Display the number of paths from this peer that have been suppressed by damping.

paths

Displays ORF path information for the specified neighbor IP address.

- Values**
- send** — Displays the number of paths sent to this peer.
 - receive** — Displays the number of paths received from this peer.

graceful-restart

Displays neighbors configured for graceful restart.

ip-address

Displays information for the specified neighbor IP address.

- Values**
- ipv4-address:
 - a.b.c.d (host bits must be 0)
 - ipv6-address:
 - x:x:x:x:x:x [-interface]
 - x:x:x:x:x:d.d.d.d [-interface]
 - x: [0 to FFFF]H
 - d: [0 to 255]D
 - interface: up to 32 characters, mandatory for link local addresses

mvpn-type

Displays information for the specified MVPN route type.

- Values**
- intra-ad** — Displays the intra-ad routes for this peer.
 - inter-ad** — Displays the inter-ad routes for this peer.
 - spmsi-ad** — Displays the spmsi-ad routes for this peer.
 - leaf-ad** — Displays the leaf-ad routes for this peer.
 - source-ad** — Displays the source-ad routes for this peer.
 - shared-join** — Displays the shared-join routes for this peer.
 - source-join** — Displays the source-join routes for this peer.

orf

Displays outbound route filtering for the BGP instance. Outbound Route Filtering (ORF) is used to inform a neighbor of targets (using **target-list**) that it is willing to receive. This mechanism helps lessen the update exchanges between neighbors and saves CPU cycles

to process routes that could have been received from the neighbor only to be dropped or ignored.

epe-statistics

Displays egress peer engineering (EPE) statistics for the specified IP address.

Platforms

All

Output

[Table 318: BGP neighbor fields](#) describes the standard and detailed command output fields for a BGP neighbor.

The following outputs are examples of BGP neighbor information.

Output Example

Table 318: BGP neighbor fields

Label	Description
Peer	The IP address of the configured BGP peer.
Group	The BGP peer group to which this peer is assigned.
Peer AS	The configured or inherited peer AS for the peer group.
Peer Address	The configured address for the BGP peer.
Peer Port	The TCP port number used on the far-end system.
Local AS	The configured or inherited local AS for the peer group.

Label	Description
Local Address	The configured or inherited local address for originating peering for the peer group.
Local Port	The TCP port number used on the local system.
Peer Type	External — Peer type configured as external BGP peers. Internal — Peer type configured as internal BGP peers.
Bfd	Yes — BFD is enabled. No — BFD is disabled.
Dynamic Peer	Yes — The session is dynamic (unconfigured). No — The session is statically configured.
State	Idle — The BGP peer is not accepting connections. (<i>Shutdown</i>) is displayed in addition, if the peer is administratively disabled. Active — BGP is listening for and accepting TCP connections from this peer. Connect — BGP is attempting to establish a TCP connections from this peer. Open Sent — BGP has sent an OPEN message to the peer and is waiting for an OPEN message from the peer. Open Confirm — BGP has received a valid OPEN message from the peer and is awaiting a KEEPALIVE or NOTIFICATION. Established — BGP has successfully established a peering and is exchanging routing information.
Last State	Idle — The BGP peer is not accepting connections. Active — BGP is listening for and accepting TCP connections from this peer. Connect — BGP is attempting to establish a TCP connections from this peer. Open Sent — BGP has sent an OPEN message to the peer and is waiting for an OPEN message from the peer. Open Confirm — BGP has received a valid OPEN message from the peer and is awaiting a KEEPALIVE or NOTIFICATION.
Last Event	start — BGP has initialized the BGP neighbor. stop — BGP has disabled the BGP neighbor. open — BGP transport connection opened. close — BGP transport connection closed. openFail — BGP transport connection failed to open. error — BGP transport connection error.

Label	Description
	connectRetry — Connect retry timer expired. holdTime — Hold time timer expired. keepAlive — Keepalive timer expired. rcvOpen — Receive an OPEN message. revKeepalive — Receive a KEEPALIVE message. rcvUpdate — Receive an UPDATE message. rcvNotify — Receive a NOTIFICATION message. None — No events have occurred.
Last Error	Displays the last BGP error and subcode to occur on the BGP neighbor.
Connect Retry	The configured or inherited connect retry timer value.
Local Pref.	The configured or inherited local preference value.
Min Route Advt.	The minimum amount of time that must pass between route updates for the same IP prefix.
Min AS Originate	The minimum amount of time that must pass between updates for a route originated by the local router.
Multihop	The maximum number of router hops a BGP connection can traverse.
Damping	Disabled — BGP neighbor is configured not to dampen route flaps. Enabled — BGP neighbor is configured to dampen route flaps.
Loop Detect	Ignore — The BGP neighbor is configured to ignore routes with an AS loop. Drop — The BGP neighbor is configured to drop the BGP peering if an AS loop is detected. Off — AS loop detection is disabled for the neighbor.
MED Out	The configured or inherited MED value assigned to advertised routes without a MED attribute.
Authentication	None — No authentication is configured. MD5 — MD5 authentication is configured.
Next Hop Self	Disabled — BGP is not configured to send only its own IP address as the BGP nexthop in route updates to the specified neighbor. Enabled — BGP will send only its own IP address as the BGP nexthop in route updates to the neighbor.

Label	Description
AggregatorID Zero	Disabled — The BGP Neighbor is not configured to set the aggregator ID to 0.0.0.0 in all originated route aggregates. Enabled — The BGP Neighbor is configured to set the aggregator ID to 0.0.0.0 in all originated route aggregates.
Remove Private	Disabled — BGP will not remove all private AS numbers from the AS path attribute, in updates sent to the specified neighbor. Enabled — BGP will remove all private AS numbers from the AS path attribute, in updates sent to the specified neighbor.
Passive	Disabled — BGP will actively attempt to establish a BGP connection with the specified neighbor. Enabled — BGP will not actively attempt to establish a BGP connection with the specified neighbor.
Prefix Limit	No Limit — No route limit assigned to the BGP peer group. 1 to 4294967295 — The maximum number of routes BGP can learn from a peer.
Hold Time	The configured hold time setting.
Keep Alive	The configured keepalive setting.
Active Hold Time	The negotiated hold time, if the BGP neighbor is in an established state.
Active Keep Alive	The negotiated keepalive time, if the BGP neighbor is in an established state.
Cluster Id	The configured route reflector cluster ID. None — No cluster ID has been configured.
Client Reflect	Disabled — The BGP route reflector is configured not to reflect routes to this neighbor. Enabled — The BGP route reflector is configured to reflect routes to this neighbor.
Preference	The configured route preference value for the peer group.
Num of Flaps	The number of route flaps in the neighbor connection.
Recd. Prefixes	The number of routes received from the BGP neighbor.
Active Prefixes	The number of routes received from the BGP neighbor and active in the forwarding table.
Recd. Paths	The number of unique sets of path attributes received from the BGP neighbor.

Label	Description
Suppressed Paths	The number of unique sets of path attributes received from the BGP neighbor and suppressed due to route damping.
Input Queue	The number of BGP messages to be processed.
Output Queue	The number of BGP messages to be transmitted.
i/p Messages	Total number of packets received from the BGP neighbor.
o/p Messages	Total number of packets sent to the BGP neighbor.
i/p Octets	Total number of octets received from the BGP neighbor.
o/p Octets	Total number of octets sent to the BGP neighbor.
Export Policy	The configured export policies for the peer group.
Import Policy	The configured import policies for the peer group.
Egress Engineering	Enabled — EPE is enabled for the BGP neighbor. Disabled — EPE is disabled for the BGP neighbor.

Table 319: Standard and detailed BGP neighbor output fields describes the command output for both the standard and detailed information for a neighbor.

The following output is an example of information about routes received from a specific BGP neighbor.

Output Example

```

Table 319: Standard and detailed BGP neighbor output fields

Label	Description
BGP Router ID	The local BGP router ID.
AS	The configured autonomous system number.
Local AS	The configured local AS setting. If not configured, then it is the same value as the AS.
Flag	u — used s — suppressed h — history d — decayed * — valid i — igp e — egp ? — incomplete > — best
Network	Route IP prefix and mask length for the route.
Next Hop	BGP nexthop for the route.
LocalPref	BGP local preference path attribute for the route.
MED	BGP Multi-Exit Discriminator (MED) path attribute for the route.
AS Path	The BGP AS path for the route.
Egress Engineering	Enabled — EPE is enabled for the BGP neighbor. Disabled — EPE is disabled for the BGP neighbor.

neighbor

Syntax

neighbor [*ip-address* | *ip-int-name*] [**detail**] [**advertised-routes**]

Context

[\[Tree\]](#) (show>router>rip neighbor)

Full Context

show router rip neighbor

Description

Displays RIP neighbor interface information.

Parameters

ip-address | *ip-int-name*

Displays information for the specified IP interface.

Values i[-address: a.b.c.d
 ip-int-name: 32 chars max

Default all neighbor interfaces

advertised-routes

Displays the routes advertised to RIP neighbors. If no neighbors are specified, then all routes advertised to all neighbors are displayed. If a specific neighbor is given then only routes advertised to the given neighbor/interface are displayed.

Default displays RIP information

Platforms

All

Output

The following output is an example of standard RIP group information, and [Table 320: Standard Show RIP Neighbor Field Descriptions](#) describes the output fields.

Output Example

Table 320: Standard Show RIP Neighbor Field Descriptions

Label	Description
Neighbor	The RIP neighbor interface name.
Adm	Down — The RIP neighbor interface is administratively down. Up — The RIP neighbor interface is administratively up.
Opr	Down — The RIP neighbor interface is operationally down. Up — The RIP neighbor interface is operationally up.
Primary IP	The primary IP address of the RIP neighbor interface.
Send Mode	Bcast — Specifies that RIPv2 formatted messages are sent to the broadcast address Mcast — Specifies that RIPv2 formatted messages are sent to the multicast address None — Specifies that no RIP messages are sent (i.e., silent listener). RIPv1 — Specifies that RIPv1 formatted messages are sent to the broadcast address.
Recv Mode	Both — Specifies that RIP updates in either version 1 or version 2 format will be accepted. None — Specifies that RIP updates will not be accepted. RIPv1 — Specifies that RIP updates in version 1 format only will be accepted. RIPv2 — Specifies that RIP updates in version 2 format only will be accepted.
Metric In	The metric added to routes received from a RIP neighbor.

Table 321: Detailed Show RIP Neighbor Field Descriptions

Label	Description
Neighbor	The RIP neighbor name.
Description	The RIP neighbor description. No Description Available indicates no description is configured.
Primary IP	The RIP neighbor interface primary IP address.
Group	The RIP group name of the neighbor interface.
Admin State	Down — The RIP neighbor interface is administratively down. Up — The RIP neighbor interface is administratively up.
Oper State	Down — The RIP neighbor interface is operationally down. Up — The RIP neighbor interface is operationally up.
Send Mode	Bcast — Specifies that RIPv2 formatted messages are sent to the broadcast address. Mcast — Specifies that RIPv2 formatted messages are sent to the multicast address. None — Specifies that no RIP messages are sent (i.e., silent listener). RIPv1 — Specifies that RIPv1 formatted messages are sent to the broadcast address.
Recv Mode	Both — Specifies that RIP updates in either version 1 or version 2 format will be accepted. None — Specifies that RIP updates will not be accepted. RIPv1 — Specifies that RIP updates in version 1 format only will be accepted.

Label	Description
	RIPv2 — Specifies that RIP updates in version 2 format only will be accepted.
Metric In	The metric value added to routes received from a RIP neighbor.
Metric Out	The value added to routes exported into RIP and advertised to RIP neighbors.
Split Horizon	Disabled — Split horizon disabled for the neighbor. Enabled — Split horizon and poison reverse enabled for the neighbor.
Check Zero	Disabled — Checking of the mandatory zero fields in the RIPv1 and RIPv2 specifications are not checked allowing receipt of RIP messages even if mandatory zero fields are non-zero for the neighbor. Enabled — Checking of the mandatory zero fields in the RIPv1 and RIPv2 specifications and rejecting noncompliant RIP messages is enabled for the neighbor.
Message Size	The maximum number of routes per RIP update message.
Preference	The preference of RIP routes from the neighbor.
Auth. Type	Specifies the authentication type.
Update Timer	The current setting of the RIP update timer value expressed in seconds.
Timeout Timer	The current RIP timeout timer value expressed in seconds.
Export Policies	The export route policy that is used to determine routes advertised to all peers.
Import Policies	The import route policy that is used to determine which routes are accepted from RIP neighbors.

neighbor

Syntax

neighbor {*ip-address* | **as** *as-number* | **external** | **all**} [**soft** | **soft-inbound** | **hard**]

neighbor {*ip-address* | **as** *as-number* | **external** | **all**} **soft-route-refresh** [*family*]

neighbor {*ip-address* | **as** *as-number* | **external** | **all**} **statistics**

neighbor *ip-address* **end-of-rib**

Context

[\[Tree\]](#) (clear>router>bgp neighbor)

Full Context

clear router bgp neighbor

Description

This command resets the specified BGP peer or set of peers. By default, or when the hard option is specified, the TCP connection is brought down and the state of the BGP session returns to IDLE.

If the **soft-route-refresh** option is specified without an accompanying *family* parameter, then the session remains established and one ROUTE_REFRESH message is transmitted to the peer for each address family active on the session. If the **soft-route-refresh** option is specified with an accompanying *family* parameter, the session remains established and a single ROUTE_REFRESH message is transmitted to the peer requesting that it resend only its routes belonging to that one address family.

SR OS routers respond to route refresh requests for any supported AFI/SAFI.

Parameters

ip-address

Resets the BGP neighbor with the specified IP address.

Values ipv4-address:

- a.b.c.d

ipv6-address:

- x:x:x:x:x:x [-interface]
- x:x:x:x:x:d.d.d.d [-interface]
- x: [0 to FFFF]H
- d: [0 to 255]D
- interface: up to 32 characters, mandatory for link local addresses

as as-number

Resets all BGP neighbors with the specified peer AS.

Values 1 to 65535

external

Resets all EBGp neighbors.

all

Resets all BGP neighbors.

soft

Specifies that BGP neighbors re-evaluate all routes in the Local-RIB against the configured export policies.

soft-inbound

Specifies that BGP neighbors re-evaluate all routes in the RIB-In against the configured import policies.

hard

Initiates a hard reconfiguration.

statistics

Clears BGP neighbor statistics.

end-of-rib

Clears the routing information base (RIB). This command applies when the router is helping the BGP neighbor through a BGP graceful restart. When the **clear router bgp neighbor** command is issued without the end-of-rib option and the neighbor is in the process of restarting, stale routes from the neighbor will be retained until the stale-routes-time is reached or else the neighbor exits graceful restart. When the command is issued with the **end-of-rib** option, stale routes from the neighbor are deleted immediately and graceful restart procedures are aborted.

soft-route-refresh

Clears the session by sending one or more ROUTE_REFRESH messages to the peer, but the session stays up.

family

Specifies the one address family that should be encoded in the ROUTE_REFRESH request sent to the peer.

Values ipv4, vpn-ipv4, ipv6, mcast-ipv4, vpn-ipv6, l2-vpn, mvpn-ipv4, mdt-safi, flow-ipv4, ms-pw, route-target, mcast-vpn-ipv4, mvpn-ipv6, flow-ipv6, evpn, mcast-ipv6, label-ipv4, label-ipv6, mcast-vpn-ipv6, bgp-ls, sr-policy-ipv4, sr-policy-ipv6, flow-vpn-ipv4, flow-vpn-ipv6

neighbor

Syntax

```
neighbor [ip-address | ip-int-name [address neighbor-ip-address]] [detail] [family]
```

Context

[\[Tree\]](#) (show>router>pim neighbor)

Full Context

```
show router pim neighbor
```

Description

This command displays PIM neighbor information. This can be important if an interface has more than one adjacency. For example, a LAN-interface configuration with three routers connected and all are running PIM on their LAN interfaces. These routers then have two adjacencies on their LAN interface, each with different neighbors. If the **address** *ip-address* parameter is not defined in this example, then the **show** command output would display two adjacencies.

Parameters

ip-int-name

Displays interface information associated with the specified IP interface name.

ip-address

Displays interface information associated with the specified IP address.

neighbor-ip-address

Displays information about the IP address of the neighbor, on the other side of the interface.

detail

Displays detailed neighbor information.

family

Displays family information for the specified neighbor.

Values ipv4, ipv6

Platforms

All

Output

The following output is an example of a PIM neighbor configuration. [Table 322: PIM Neighbor Fields](#) provides PIM neighbor field descriptions.

Output Example

```
ALA-1# show router pim neighbor

Table 322: PIM Neighbor Fields

Label	Description
Interface	The neighbor's interface name. (W) indicates wildcard tunnels.
Nbr DR Priority	The value of the neighbor's DR priority which is received in the hello message.
Nbr Address	The neighbor's address.
Up Time	The time since this PIM neighbor (last) became a neighbor of the local router
Expiry Time	The minimum time remaining before this PIM neighbor is aged out 0 — Means that this neighbor never ages out. This happens when the PIM neighbor sends a Hello message with holdtime set to `0xffff`.
Hold Time	The value of the hold time present in the hello message
DR Priority	The value of the neighbor's DR priority which is received in the hello message
Tracking Support	Indicates if the T bit in the LAN prune delay option was present in the hello message. This indicates the neighbor's capability to disable join message suppression.
LAN Delay	The value of the LAN delay field present in the hello message received from the neighbor
Gen Id	A randomly generated 32-bit value that is regenerated each time PIM forwarding is started or restarted on the interface, including when the router itself restarts. When a hello message with a new GenID is received from a neighbor, any old hello

Label	Description
	information about that neighbor is discarded and superseded by the information from the new hello message.
Override Intvl (ms)	The value of the override interval present in the Hello message

neighbor

Syntax

neighbor [*ip-int-name* | *ip-address* | *mpls-if-name*] [*family*]

Context

[\[Tree\]](#) (clear>router>pim neighbor)

Full Context

clear router pim neighbor

Description

This command clears PIM neighbor data on a specified interface or IP address.

Parameters

ip-int-name

Clears PIM neighbor on the specified interface.

ip-address

Clears PIM neighbor on the specified IP address.

mpls-if-name

Clears information associated with the specified MPLS interface.

Values mpls-if-*index*

family

Clears neighbor family information.

Values ipv4, ipv6

Platforms

All

neighbor

Syntax

```
neighbor [{{ip-int-name | ip-address} | mac ieee-mac-address | summary}] [{dynamic | static | managed}]
```

Context

[\[Tree\]](#) (show>router neighbor)

Full Context

```
show router neighbor
```

Description

This command displays information about the IPv6 neighbor cache.

Parameters

ip-int-name

Specifies the IP interface name.

ip-address

Specifies the address of the IPv6 interface address.

ieee-mac-address

Specifies the MAC address.

summary

Displays summary neighbor information.

dynamic

Displays dynamic neighbor information.

static

Displays static neighbor information.

managed

Displays managed neighbor information.

Platforms

All

Output

Neighbor Output — The following output is an example of IPv6 neighbor information, and [Table 323: Neighbor Fields](#) describes the fields.

Output Example

```
B:CORE2# show router neighbor

Table 323: Neighbor Fields

Label	Description
IPv6 Address	Displays the IPv6 address
Interface	Displays the name of the IPv6 interface name
MAC Address	Specifies the link-layer address
State	Displays the current administrative state
Exp	Displays the number of seconds until the entry expires
Type	Displays the type of IPv6 interface
Interface	Displays the interface name
Rtr	Specifies whether a neighbor is a router
Mtu	Displays the MTU size

neighbor

Syntax

neighbor {all | ipv6-address [interface interface-name]}

neighbor interface {ip-int-name | ipv6-address}

Context

[\[Tree\]](#) (clear>router neighbor)

Full Context

clear router neighbor

Description

This command clears IPv6 neighbor information.

Parameters

all

Clears all IPv6 neighbors.

ipv6-address

Clears the specified IPv6 neighbors.

Values

ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

interface-name

Specifies the interface name.

ip-int-name

Clears the specified neighbor interface information, up to 32 characters.

Platforms

All

neighbor

Syntax

neighbor [detail]

Context

[\[Tree\]](#) (show>ospf neighbor)

[\[Tree\]](#) (show>ospf3 neighbor)

Full Context

show ospf neighbor

show ospf3 neighbor

Description

This command shows all OSPFv2 or OSPFv3 neighbor information.

Parameters

detail

Displays the detailed OSPF and OSPF3 neighbor status for all routers and all instances.

Platforms

All

Output

The following output is an example of OSPF and OSPF3 neighbor information.

Output Example

```

neighbor

Syntax

neighbor [*ip-int-name* | *ip-address*] [**detail**]

neighbor [*ip-int-name*] [*router-id*] [**detail**]

neighbor overview

neighbor [**remote** *ip-address*] [**detail**]

Context

[\[Tree\]](#) (show>router>ospf neighbor)

[\[Tree\]](#) (show>router>ospf3 neighbor)

Full Context

show router ospf neighbor

show router ospf3 neighbor

Description

This command displays neighbor information. To reduce the amount of output, the user can select the neighbors on a given interface by address or name.

The **detail** option produces a large amount of data. It is recommended to use **detail** only when requesting a specific neighbor.

Parameters

ip-int-name

Displays neighbor information only for neighbors of the interface identified by the interface name.

ip-address

Displays neighbor information only for neighbors of the interface identified by the IP address.

router-id

Displays neighbor information for the neighbor identified by the specified router ID in the **show> router>ospf3** context.

remote

Displays neighbor information for the neighbor identified by the specified remote IP address in the **show>router>ospf** context.

Platforms

All

Output

Standard OSPF Neighbor Output

Table 324: OSPF Neighbor Output Fields describes the standard command output fields for an OSPF neighbor.

Table 324: OSPF Neighbor Output Fields

Label	Description
Nbr IP Addr	The IP address this neighbor is using in its IP Source Address. On addressless links, this will not be 0.0.0.0, but the address of another of the neighbor's interfaces.
Nbr Rtr Id	A 32-bit integer uniquely identifying the neighboring router in the Autonomous System.
Nbr State	<p>Down — This is the initial state of a neighbor conversation. It indicates that there has been no recent information received from the neighbor.</p> <p>Attempt — This state is only valid for neighbors attached to NBMA networks. It indicates that no recent information has been received from the neighbor, but that a more concerted effort should be made to contact the neighbor.</p> <p>Init — In this state, an Hello packet has recently been seen from the neighbor. However, bidirectional communication has not yet been established with the neighbor (the router itself did not appear in the neighbor's Hello packet).</p> <p>Two Way — In this state, communication between the two routers is bidirectional.</p> <p>ExchStart — This is the first step in creating an adjacency between the two neighboring routers. The goal of this step is to decide which router is the master, and to decide upon the initial Database Descriptor sequence number.</p> <p>Exchange — In this state the router is describing its entire link state database by sending Database Description packets to the neighbor.</p> <p>Loading — In this state, Link State Request packets are sent to the neighbor asking for the more recent LSAs that have been discovered (but not yet received) in the Exchange state.</p> <p>Full — In this state, the neighboring routers are fully adjacent. These adjacencies will now appear in router-LSAs and network-LSAs.</p>
Priority	The priority of this neighbor in the designated router election algorithm. The value 0 signifies that the neighbor is not eligible to become the designated router on this particular network.
RetxQ Len	The current length of the retransmission queue.

Label	Description
Dead Time	The time until this neighbor is declared down, this timer is set to the dead router interval when a valid hello packet is received from the neighbor.
No. of Neighbors	The number of adjacent OSPF neighbors on this interface.

Output Example

```
A:ALA-A# show router ospf 1 neighbor

Detailed OSPF Neighbor Output

[Table 325: Detailed OSPF Neighbor Output Fields](#) describes the detailed command output fields for an OSPF neighbor.

Table 325: Detailed OSPF Neighbor Output Fields

Label	Description
Neighbor IP Addr	The IP address this neighbor is using in its IP source address. On addressless links, this will not be 0.0.0.0, but the address of another of the neighbor's interfaces.
Local IF IP Addr	The IP address of this OSPF interface.
Area Id	A 32-bit integer uniquely identifying the area to which this interface is connected. Area ID 0.0.0.0 is used for the OSPF backbone
Designated Rtr	The IP Interface address of the router identified as the Designated Router for the network in which this interface is configured. Set to 0.0.0.0 if there is no Designated router.
Neighbor Rtr Id	A 32-bit integer uniquely identifying the neighboring router in the AS.
Neighbor State	Down — This is the initial state of a neighbor conversation. It indicates that there has been no recent information received from the neighbor. Attempt — This state is only valid for neighbors attached to NBMA networks. It indicates that no recent information has been

Label	Description
	<p>received from the neighbor, but that a more concerted effort should be made to contact the neighbor.</p> <p>Init — In this state, an Hello packet has recently been seen from the neighbor. However, bidirectional communication has not yet been established with the neighbor (the router itself did not appear in the neighbor's Hello packet).</p> <p>Two Way — In this state, communication between the two routers is bidirectional.</p> <p>Exchange start — This is the first step in creating an adjacency between the two neighboring routers. The goal of this step is to decide which router is the master, and to decide upon the initial Database Descriptor sequence number.</p> <p>Exchange — In this state the router is describing its entire link state database by sending Database Description packets to the neighbor.</p> <p>Loading — In this state, Link State Request packets are sent to the neighbor asking for the more recent LSAs that have been discovered (but not yet received) in the Exchange state.</p> <p>Full — In this state, the neighboring routers are fully adjacent. These adjacencies will now appear in router-LSAs and network-LSAs.</p>
Priority	The priority of this neighbor in the designated router election algorithm. The value 0 signifies that the neighbor is not eligible to become the designated router on this particular network.
Retrans Q Length	The current length of the retransmission queue.
Options	<p>E — External Routes Support</p> <p>MC — Multicast Support</p> <p>N/P — Type 7 LSA Support</p> <p>EA — External Attribute LSA Support</p> <p>DC — Demand Circuit Support</p> <p>O — Opaque LSA Support</p>
Backup Desig Rtr	The IP Interface address of the router identified as the Backup Designated Router for the network in which this interface is configured. Set to 0.0.0.0 if there is no backup designated router.
Events	The number of times this neighbor relationship has changed state, or an error has occurred.
Last Event Time	The time when the last event occurred that affected the adjacency to the neighbor.

Label	Description
Up Time	This value represents the uninterrupted time, in hundredths of seconds, the adjacency to this neighbor has been up. To evaluate when the last state change occurred see last event time.
Time Before Dead	The time until this neighbor is declared down, this timer is set to the dead router interval when a valid hello packet is received from the neighbor.
Bad Nbr States	The total number of OSPF packets received when the neighbor state was not expecting to receive this packet type since this interface was last enabled.
LSA Inst fails	The total number of times an LSA could not be installed into the LSDB due to a resource allocation issue since this interface was last enabled.
Bad Seq Nums	The total number of times when a database description packet was received with a sequence number mismatch since this interface was last enabled.
Bad MTUs	The total number of times when the MTU in a received database description packet was larger than the MTU of the receiving interface since this interface was last enabled.
Bad Packets	The total number of times when an LS update was received with an illegal LS type or an option mismatch since this interface was last enabled.
LSA not in LSDB	The total number of times when an LS request was received for an LSA not installed in the LSDB of this router since this interface was last enabled.
Option Mismatches	The total number of times when a LS update was received with an option mismatch since this interface was last enabled.
Nbr Duplicates	The total number of times when a duplicate database description packet was received during the exchange state since this interface was last enabled.

Output Example

```
*A:Dut-C# show router ospf neighbor detail

```

neighbor

Syntax

neighbor [*ip-int-name* | *ip-address*]

neighbor [*ip-int-name*] [*router-id*]

Context

[\[Tree\]](#) (clear>router>ospf3 neighbor)

[\[Tree\]](#) (clear>router>ospf neighbor)

Full Context

clear router ospf3 neighbor

clear router ospf neighbor

Description

This command marks the neighbor as dead and re-initiates the affected adjacencies.

Parameters

ip-int-name

Clears all neighbors for the interface specified by this interface name.

ip-address

Clears all neighbors for the interface specified by this IP address.

router-id

Clears all neighbors for the interface specified by this router ID.

Platforms

All

neighbor

Syntax

neighbor [*ip-int-name* | *ipv6-address*] [**detail**]

neighbor [**detail**] **advertised-routes** [*ip-int-name* | *ipv6-link-local-address*]

Context

[\[Tree\]](#) (show>router>ripng neighbor)

Full Context

show router ripng neighbor

Description

This command displays RIPng neighbor interface information.

Parameters

ip-int-name | *ipv6-address*

Displays information for the specified IPv6 interface and address.

Default all neighbor interfaces

advertised-routes

Displays the routes advertised to RIPng neighbors. If no neighbors are specified, then all routes advertised to all neighbors are displayed. If a specific neighbor is given then only routes advertised to the given neighbor/interface are displayed.

Default displays RIPng information

ipv6-link-local-address

Displays information about the of the IPv6 link local address for the neighbor.

detail

Displays detailed information.

Platforms

All

Output

The following output is an example of RIPng neighbor information.

Output Example

```
*A:Dut-C>config>router>if# show router ripng neighbor "one"

neighbor

Syntax

neighbor *ip-addr* [*ip-addr*] [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

Context

[\[Tree\]](#) (monitor>router>bgp neighbor)

Full Context

monitor router bgp neighbor

Description

This command displays statistical BGP neighbor information at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified neighbor(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

Parameters

ip-addr

Displays damping information for entries received from the BGP neighbor. Up to five IP addresses can be specified.

Values *a.b.c.d*

seconds

Configures the interval for each display in seconds.

Values 3 to 60

Default 10 seconds

repeat

Configures how many times the command is repeated.

Values 1 to 999

Default 10

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic instead of the delta.

Platforms

All

Output

The following output is an example of BGP neighbor information.

Output Example

```
A:ALA-12>monitor>router>bgp# neighbor 192.0.2.10 interval 3 repeat 3 absolute

neighbor

Syntax

neighbor *ip-address* [*ip-address*] [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

Context

[\[Tree\]](#) (monitor>router>ospf neighbor)

Full Context

monitor router ospf neighbor

Description

This command displays statistical OSPF neighbor information at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified OSPF neighbors. The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

Parameters

ip-address

Specifies the IP address to display information for entries received from the specified OSPF neighbor. Up to five IP addresses can be specified.

Values a.b.c.d

seconds

Configures the interval for each display, in seconds.

Values 3 to 60

Default 10

repeat

Configures the number of times the command is repeated.

Values 1 to 999

Default 10

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

neighbor

Syntax

neighbor *router-id interface-name* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**] **area** *area-id*

Context

[\[Tree\]](#) (monitor>router>ospf3 neighbor)

Full Context

monitor router ospf3 neighbor

Description

This command displays statistical OSPF3 neighbor information at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified OSPF3 neighbor(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

Parameters

router-id

Specifies the IP address.

Values a.b.c.d

interface-name

Specifies the interface name, up to 32 characters.

seconds

Configures the interval for each display, in seconds.

Values 3 to 60

Default 10

repeat

Configures the number of times the command is repeated.

Values 1 to 999

Default 10

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic instead of the delta.

area-id

Specifies the OSPF area, up to 256 characters.

Platforms

All

monitor router ripng neighbor

monitor router rip neighbor

Description

This command displays statistical RIP neighbor information at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified RIP neighbor(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

Parameters

neighbor

Specifies the IP interface name or the IP address of the neighbor to be monitored. Up to five can be specified in a single statement.

Values *ip-int-name, ip-address*

seconds

Configures the interval for each display, in seconds.

Values 3 to 60

Default 10

repeat

Configures how many times the command is repeated.

Values 1 to 999

Default 10

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic instead of the delta.

Platforms

Full Context

clear system ptp port neighbor

Description

This command clears PTP port neighbor information.

Parameters

ieee-address

Specifies the MAC address.

Values xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xxx: [0 to FFFF]H

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

16.7 neighbor-table

neighbor-table

Syntax

neighbor-table [**ip6** *ipv6-address*] [**class** *class*] [**next-index** *index*]

Context

[\[Tree\]](#) (tools>dump>wlan-gw>lanext>bd neighbor-table)

Full Context

tools dump wlan-gw lanext bd neighbor-table

Description

This command dumps neighbor table entries for the specified HLE BD.

Parameters

ipv6-address

Specifies the IPv6 address of the neighbor entry to be displayed.

class

Specifies the source on which to filter the neighbor table entries.

Values access, network, remote

index

Specify the **next-index** *index* parameter to display the next set of results If there are more results than the current output. The additional results are indicated at the bottom of the current output.

Values 0 to 4294967295

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

16.8 neighbors

neighbors

Syntax

```
neighbors group [name] [ip-address]
```

Context

[\[Tree\]](#) (show>service>id>gsmp neighbors)

Full Context

```
show service id gsmp neighbors
```

Description

This command display GSMP neighbor information.

Parameters

group

A GSMP group defines a set of GSMP neighbors which have the same properties.

name

Specifies a GSMP group name is unique only within the scope of the service in which it is defined.

ip-address

Specifies the ip-address of the neighbor.

Platforms

All

Output

The following output is an example of service GSMP neighbor information.

Output Example

These commands show the configured neighbors per service, regardless that there exists an open TCP connection with this neighbor. The admin state is shown because for a neighbor to be admin enabled, the service, gsmp node, group node and the neighbor node in this service must all be in the **no shutdown** state. Session gives the number of session (open TCP connections) for each configured neighbor.

The following table describes show service-id gsmp neighbors group output fields:

Table 326: Service-ID GSMP Neighbors Group Field Descriptions

Label	Description
Group	The GSMP group name
Neighbor	The neighbor IP address
AdminState	The administrative state of the neighbor
Sessions	The number of sessions (open TCP connections) for each configured neighbor

16.9 netconf

netconf

Syntax

netconf

netconf connection
netconf counters
netconf schema-path

Context

[\[Tree\]](#) (show>system netconf)

Full Context

show system netconf

Description

This command displays NETCONF information.

Parameters

connection

Keyword to display active NETCONF sessions.

counters

Keyword to display NETCONF counters.

schema-path

Keyword to display the four state leafs that relate to a schema path.

Platforms

All

Output

The following output is an example of NETCONF information.

[Table 327: NETCONF Output Fields](#) describes the NETCONF output fields.

Output Example

```
# show system netconf
=====
NETCONF Server
=====
Administrative State      : Enabled
Operational State        : Up
=====
```

Table 327: NETCONF Output Fields

Label	Description
Administrative State	Enabled — Indicates that NETCONF is enabled. Disabled — Indicates that NETCONF is disabled.
Operational State	Up — Indicates that NETCONF is operational.

Label	Description
	Down — Indicates that NETCONF is not operational.

The following output is an example of NETCONF connection information.

[Table 328: NETCONF Connection Output Fields](#) describes the NETCONF connection output fields.

Output Example

```
# show system netconf connection
=====
NETCONF Server connections
=====
Connection      Username      Session Status      Running      Candidate
Id              Locked?       Locked?
-----
135.121.197.102  admin        56    connected    no          no
-----
Number of NETCONF sessions : 1
=====
```

Table 328: NETCONF Connection Output Fields

Label	Description
Connection	The IP address of the connected routers (remote client).
Username	The name of the user.
Session ID	The NETCONF session ID.
Status	Connected or not connected.
Running Locked?	Yes — Indicates the <running> datastore is locked. No — Indicates the <running> datastore is not locked.
Candidate Locked?	Yes — Indicates the <candidate> datastore is locked. No — Indicates the <candidate> datastore is not locked.
Number of NETCONF sessions	Total NETCONF sessions

The following output is an example of NETCONF counter information.

[Table 329: NETCONF Counters Output Fields](#) describes the NETCONF counter output fields.

Output Example

```
# show system netconf counters
=====
NETCONF counters:
=====

```

Table 329: NETCONF Counters Output Fields

Label	Description
RX Messages	Types and numbers of received messages
RX Total	Total of all received messages
TX Messages	Types and numbers of sent messages
TX Total	Total of all sent messages
failed edit-configs	Number of failed <edit-config> requests due to a lock (including implicit ones) being taken by other netconf sessions
failed locks	Number of failed <lock> requests due to a lock (including implicit ones) being taken by other netconf sessions

The following output is an example of NETCONF schema path information.

Table 330: NETCONF Schema Path Output Fields describes the NETCONF schema path output fields.

Output Example

```

#show system netconf schema-path
=====
NETCONF Schema Path
=====
Configured   :
Operational  : cf3:/Nokia-7750_SR_TiMOS-20.10.R1/cflash/support/YANG
Primary      : cf3:/Nokia-7750_SR_TiMOS-20.10.R1/cflash/support/YANG
Secondary    : cf3:/SR_TiMOS-20.7.R1/cflash/support/YANG
Tertiary     : cf3:/SR_TiMOS-20.5.R1/cflash/support/YANG
=====
    
```

Table 330: NETCONF Schema Path Output Fields

Label	Description
Configured	State leaf representing the configured value (if configured) in the context configure system management-interface schema-path
Operational	Operational schema-path state leaf, indicating the current path of the SR OS schema files. This value is updated at boot time or at configuration time.
Primary	Primary schema-path state leaf. The value is the configured primary-image concatenated with <code>./support/YANG/</code> . If the primary schema-path is not configured, this field displays an error.
Secondary	Secondary schema-path state leaf. The value is the configured secondary-image concatenated with <code>./support/YANG/</code> . If the secondary schema-path is not configured, this field displays an error.
Tertiary	Tertiary schema-path state leaf. The value is the configured tertiary-image concatenated with <code>./support/YANG/</code> . If the tertiary schema-path is not configured, this field displays an error.

16.10 network

network

Syntax

network [*policy-id*] [**detail**] [**match-criteria**]

Context

[\[Tree\]](#) (show>qos network)

Full Context

show qos network

Description

This command displays network policy information.

Parameters

policy-id

Displays information for the specific policy ID.

Values 1 to 65535

Default all network policies

detail

Includes information about ingress and egress DSCP and LSP EXP bit mappings and network policy interface associations.

match-criteria

Includes the match-criteria.

Platforms

All

Output

The following output is an example of network QoS Policy information, and [Table 331: Show QoS Network Output Fields](#) describes the network QoS Policy output fields.

Output Example

```
A:PE1# show qos network

Table 331: Show QoS Network Output Fields

Label	Description
Policy-Id	The ID that uniquely identifies the policy.
Remark	True — Remarking is enabled for all packets that egress this router where the network policy is applied. The remarking is based on the forwarding class to DSCP and LSP EXP bit mapping defined under the egress node of the network QoS policy. False — Remarking is disabled.
Description	A text string that helps identify the policy context in the configuration file.
Forwarding Class/ FC Name	Specifies the default ingress forwarding class (configured using the network ingress default-action command) assigned to

Label	Description
	packets for which there is no other configured forwarding class classification.
Profile	Specifies the default ingress packet profile (configured using the network ingress default-action command) assigned to packets for which there is no other configured packet profile classification.
DSCP Mapping:	
Out-of-Profile	Displays the DSCP used for out-of-profile traffic.
In-Profile	Displays the DSCP used for in-profile traffic.
LSP EXP Bit Mapping:	
Out-of-Profile	Displays the LSP EXP value used for out-of-profile traffic.
In-Profile	Displays the LSP EXP value used for in-profile traffic.
Interface	Displays the interface name.
IP Addr	Displays the interface IP address.
Port-Id	Specifies the physical port identifier that associates the interface.

16.11 network-domains

network-domains

Syntax

network-domains [**detail**] [*network-domain-name*]

network-domains *network-domain-name* **interface-association**

network-domains [*network-domain-name*] **mcast-association** [**state** {**consistent** | **inconsistent**}]

Context

[\[Tree\]](#) (show>router network-domains)

Full Context

show router network-domains

Description

This command displays network-domains information.

Parameters

detail

Displays detailed network-domains information.

network-domain-name

Displays information for a specific network domain.

interface-association

Displays information for an interface network domain association.

mcast-association

Displays information for a multicast network domain association.

state

Displays information for the state of a network domain.

Values consistent, inconsistent

sdp-association

Displays information for an SDP network domain association

Platforms

All

Output

The following output is an example of network domain information.

Output Example

```
*A:Dut-T>config>router# show router network-domains

16.12 network-queue

network-queue

Syntax

network-queue [*network-queue-policy-name*] [**detail**]

Context

[\[Tree\]](#) (show>qos network-queue)

Full Context

show qos network-queue

Description

This command displays network queue policy information.

Parameters

network-queue-policy-name

The name of the network queue policy.

Values Valid names consist of any string, up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, and so on), the entire string must be enclosed within double quotes.

detail

Includes each queue's rates and adaptation-rule and cbs details. It also shows FC-to-queue mapping details.

Platforms

All

Output

The following output is an example of network-queue information.

Output Example

```
*A:PE# show qos network-queue

16.13 next-hop

next-hop

Syntax

next-hop [*family* [**service-id** *service-id*]] [*ip-address*[**detail**]]

Context

[\[Tree\]](#) (show>router>bgp next-hop)

Full Context

show router bgp next-hop

Description

This command displays BGP next-hop information.

Parameters

family

Specifies the type of routing information to be distributed by the BGP instance.

Values ipv4, mcast-ipv4, ipv6, mcast-ipv6, label-ipv4, label-ipv6, vpn-ipv4, vpn-ipv6, evpn, mcast-vpn-ipv4, mcast-vpn-ipv6

ip-address

Displays the next hop information for the specified IP address.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x[-interface]
	x:x:x:x:x:d.d.d.d[-interface]
	x - [0 to FFFF]H
	d - [0 to 255]D
	interface - 32 characters maximum, mandatory for link local addresses

detail

Displays the longer, more detailed version of the output.

service-id service-id

Specifies the service ID.

Values 1 to 2147483647

Platforms

All

Output

[Table 332: BGP Next Hop Output Fields](#) describes the command output fields for a BGP next hop.

The following output is an example of BGP next-hop information.

Output Example

```
A:node-2>show>router>bgp# next-hop 10.20.1.2
=====
BGP Router ID:10.20.1.3      AS:2      Local AS:2
=====
BGP Next Hop
=====

Table 332: BGP Next Hop Output Fields

Label	Description
BGP ID	The local BGP router ID
AS	The configured autonomous system number
Local AS	The configured local AS setting. If not configured, then the value is the same as the AS
Next Hop	The next-hop address
Resolving Prefix	The prefix of the best next hop
Owner	The routing protocol used to derive the best next hop
Preference	The BGP preference attribute for the routes
Reference Count	The number of routes using the resolving prefix
Resolved Next Hop	The IP address of the next hop
Last Modified	The time elapsed since the next hop was modified
Created (only visible in detailed output)	The time elapsed since the next hop was created
Bfd-strict-mode	Y — The next hop becomes unresolved when a Strict-Mode BFD session goes down.
Reason (if the next hop is unresolvable because the BFD session is down)	BfdStrictDown — The next hop is unresolvable until a Strict-Mode BFD session to a peer with the same address comes back up after going down.

16.14 next-hop-id

next-hop-id

Syntax

```
next-hop-id [id] [nh-addr ip-address] [nh-ifName interface-name] [replication-sid label] [oper {up |  
down}]
```

Context

[\[Tree\]](#) (show>router>p2mp-sr-tree>replication-segment next-hop-id)

Full Context

```
show router p2mp-sr-tree replication-segment next-hop-id
```

Description

This command displays information for the specified replication segment next-hop of the P2MP SR tree.

Parameters

id

Specifies the next-hop ID.

Values 1 to 4096

ip-address

Specifies the root IPv4 address.

interface-name

Specifies the interface name, up to 32 characters.

label

Displays the specified label number.

Values 0, 16 to 1048576

oper up

Displays the next-hop with operational status up.

oper down

Displays the next-hop with operational status down.

Platforms

All

16.15 node

node

Syntax

node

Context

[\[Tree\]](#) (show>router>bgp>routes>bgp-ls node)

Full Context

show router bgp routes bgp-ls node

Description

This command displays BGP-LS NLRIs for node types.

Platforms

All

16.16 ntp

ntp

Syntax

ntp [{**peers** | **peer** [**router** *router-instance* | **service-name** *service-name*] *peer-address*] | {**servers** | **server** [**router** *router-instance* | **service-name** *service-name*] *server-address*} | [**all**]}] [**detail**]

Context

[\[Tree\]](#) (show>system ntp)

Full Context

show system ntp

Description

This command displays NTP protocol configuration and state.

Parameters

peers

Generates a list of known peers.

peer-address

Specifies the address of a specific peer.

Values ipv4-address: a.b.c.d

ipv6-address:

- x:x:x:x:x:x
- x:x:x:x:x:d.d.d.d
- x – [0 to FFFF] H
- d – [0 to 255] D

servers

Generates a list of known servers.

server-address

Specifies the address of a specific server.

Values ipv4-address: a.b.c.d

ipv6-address:

- x:x:x:x:x:x
- x:x:x:x:x:d.d.d.d
- x – [0 to FFFF] H
- d – [0 to 255] D

ptp: shows information about the internal PTP server.

router-instance

Specifies the routing context that contains the interface in the form of *router-name* or *service-id*.

Values *router-name* — Base | Management
service-id — 1 to 2147483647

Default Base

service name

Specifies the service name for the VPRN. The name can be up to 64 characters in length. Note that CPM routing instances are not supported.

all

Generates information for all clients, servers, and peers.

detail

Provides detailed information.

Platforms

All

Output

The following output is an example of NTP information, and [Table 333: Show NTP Field Description](#) describes the output fields.

Output Example

```
*A:Dut-A# show system ntp

Table 333: Show NTP Field Description

Label	Description
Configured	Yes — NTP is configured. No — NTP is not configured.
Admin Status	up — Administrative state is enabled. down — Administrative state is disabled.
Server Enabled	Yes — This node is configured to serve external clients. No — This node is not configured to server external clients.
Stratum	Displays stratum level of this node.
Oper Status	up — The operational state is enabled. down — The operational state is disabled.
Auth Check	Displays the authentication requirement.
Server Authenticate	Yes — Authentication is mandatory on received requests. No — Authentication is not mandatory on received requests.
Clock Source	Address of the chosen server.
Auth Errors	Displays the number of authentication errors.
Auth Errors Ignored	Displays the number of authentication errors ignored.
Auth key Id Errors	Displays the number of key identification errors.
Auth Key Type Errors	Displays the number of authentication key type errors.

Label	Description
Current Date & Time	Current date and time as determined by the NTP process in the node.
vRouter	The router instance containing the interface.
Router	The router instance containing the address.
Interface	The interface configured in NTP.
Address	The address used for transmitted messages.
Type	bcast — broadcast interface mcast — multicast interface bcInt — broadcast client svr — server actpr — active peer paspr — passive peer
Auth	yes — Authentication in use. no — Authentication not in use.
Poll	# — Current poll interval used on the interface.
State	Reject — The peer is rejected and will not be used for synchronization. Rejection reasons could be the peer is unreachable, the peer is synchronized to this local server so synchronizing with it would create a sync loop, or the synchronization distance is too large. This is the normal startup state. Invalid — The peer is not maintaining an accurate clock. This peer will not be used for synchronization. Excess — The peer's synchronization distance is greater than ten other peers. This peer will not be used for synchronization. Outlier — The peer is discarded as an outlier. This peer will not be used for synchronization. Candidate — The peer is accepted as a possible source of synchronization. Selected — The peer is an acceptable source of synchronization, but its synchronization distance is greater than six other peers. Chosen — The peer is chosen as the source of synchronization. ChosenPPS — The peer is chosen as the source of synchronization, but the actual synchronization is occurring from a pulse-per-second (PPS) signal.

Label	Description
Remote	The IP address of the remote NTP server or peer with which this local host is exchanging NTP packets.
Reference ID	<p>When stratum is between 0 and 15 this field shows the IP address of the remote NTP server or peer with which the remote is exchanging NTP packets. For reference clocks, this field shows the identification assigned to the clock, such as, ".GPS." For an NTP server or peer, if the client has not yet synchronized to a server/peer, the status cannot be determined and displays the following codes:</p> <p>Peer Codes:</p> <p>ACST — The association belongs to any cast server.</p> <p>AUTH — Server authentication failed. Wait while the association is restarted.</p> <p>AUTO — Autokey sequence failed. Wait while the association is restarted.</p> <p>BCST — The association belongs to a broadcast server.</p> <p>CRPT— Cryptographic authentication or identification failed. The details should be in the system log file or the cryptostats statistics file, if configured. No further messages will be sent to the server.</p> <p>DENY — Access denied by remote server. No further messages will be sent to the server.</p> <p>DROP — Lost peer in symmetric mode. Wait while the association is restarted.</p> <p>RSTR — Access denied due to local policy. No further messages will be sent to the server.</p> <p>INIT — The association has not yet synchronized for the first time.</p> <p>MCST — The association belongs to a manycast server.</p> <p>NKEY — No key found. Either the key was never installed or is not trusted.</p> <p>RATE — Rate exceeded. The server has temporarily denied access because the client exceeded the rate threshold.</p> <p>RMOT — The association from a remote host running the ntpdc utility has had unauthorized attempted access.</p> <p>STEP — A step change in system time has occurred, but the association has not yet resynchronized.</p> <p>System Codes:</p> <p>INIT — The system clock has not yet synchronized for the first time.</p> <p>STEP — A step change in system time has occurred, but the system clock has not yet resynchronized.</p>

Label	Description
St	Stratum level of this node.
A	y — Authentication is enabled. n — Authentication is disabled.
Poll	Polling interval.
Reach	Shows the reachability for the most recent polls (up to 8): Y — The NTP peer or server did respond in the indicated poll. No — The NTP peer or server did not respond in the indicated poll.
Offset	The time between the local and remote UTC time, in milliseconds.
Time Last Request Rx	The time at which the last request was received from the client.

16.17 number-of-tunnels

number-of-tunnels

Syntax

```
number-of-tunnels tunnel-type tunnel-type isa mda
number-of-tunnels tunnel-type tunnel-type esa-vm esa-id/vm-id
number-of-tunnels tunnel-type tunnel-type system
number-of-tunnels tunnel-type tunnel-type tunnel-group tunnel-group-id
```

Context

[\[Tree\]](#) (show>isa>stats>ip-tunnel-stats number-of-tunnels)

Full Context

```
show isa statistics ip-tunnel-stats number-of-tunnels
```

Description

This command displays the number of tunnels that are operationally up for the specified tunnel and scope.

The following scope types are supported:

- per ISA
- per tunnel group
- per system

Note that L2TPv2 does not have a per-ISA scope.

The system collects statistics every hour for the past 24 hours per wall clock. A current value is also included in the output.

Parameters

tunnel-type

Displays information about the tunnel type.

Values gre, ip-in-ip, l2tpv3

mda

Displays information about the ISA ID.

Values slot/mda

system

Displays information about the system.

tunnel-group-id

Displays information about the tunnel group ID.

Values 1 to 16

esa-vm

Displays the ID of the configured ESA and ESA VM.

Values	esa-vm:	<i>esa-id/vm-id</i>	
		<i>esa-id</i>	1 to 16
		<i>vm-id</i>	1 to 4

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

```

Context

[\[Tree\]](#) (show>isa>stats>ipsec-stats number-of-tunnels)

Full Context

```
show isa statistics ipsec-stats number-of-tunnels
```

Description

This command displays information for the number of IPsec tunnel statistics of the specified tunnel type and scope. The system collects statistics every hour for the last 24 hour according to the wall clock. The current value is also included in the output.

This command supports following scopes:

- per system
- per ISA
- per tunnel group
- per IPsec GW

The **start time** value in the output indicates the time when the results are collected.

Parameters

tunnel-type

Displays information about the specified the tunnel type.

Values all, sl2l, dl2l, ra

mda

Displays information about the specified ISA ID.

Values slot/mda

tunnel-group-id

Displays information about the specified tunnel group ID.

Values 1 to 16

name

Displays information about the specified IPsec GW name up to 32 characters in length.

count

Displays information for the number of statistics intervals to be displayed (starting with the most recent).

Values 1 to 96

minutes

Displays information about the specified period covered by the statistics to be displayed (starting with the most recent).

Values 1 to 1440

current

Displays information about the current value. The values of count and minutes are ignored by the system once this parameter is specified.

show-oid

Displays information about the Object Identifier (OID) of the current statistical value.

esa-vm

Displays the ID of the configured ESA and ESA VM.

Values

esa-vm:	<i>esa-id/vm-id</i>	
	<i>esa-id</i>	1 to 16
	<i>vm-id</i>	1 to 4

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of the **show isa statistics ipsec-stats number** of tunnels command.

Output Example

```
show>isa>stats>ipsec-stats# number-of-tunnels tunnel-group 1

17 o Commands

17.1 oam-config-summary

oam-config-summary

Syntax

`oam-config-summary`

Context

[\[Tree\]](#) (show>test-oam oam-config-summary)

Full Context

show test-oam oam-config-summary

Description

This command displays the OAM configuration resources in use, as well as the percentage of available and per-system limits for the platform. The lines produced by the **show** command output vary by platform and may account for resource allocation in different ways. The resource accounting is tied to different resource pools across different platforms.

Platforms

All

Output

The following output is an example of OAM configuration information and [Table 334: Test OAM configuration limit fields](#) describes the output fields.

This example is for platforms that have separate resource pools for OAM-PM (tests and packet per second). OAM-PM resources are tracked separately from the background OAM and SAA tests and transmit capacity. The limits are platform-specific.

```
show test-oam oam-config-summary
```

Output Example

```
-----  
OAM-Managed Test Capacity (tests)  
-----  
Resource                                     InUse %InUse  Limit  
-----  
Background ICMP Bridged Residential Gateway tests      0    0.0  50000  
Background ICMP Interface Control tests                 0    0.0   4000
```

```

Background OAM and SAA tests                0   0.0  10000
Background Static Host CPE Check tests      0   0.0   5000
Background Static Route CPE Check tests     0   0.0  10000
LSP Self Ping tests                         0   0.0   1250
OAM-PM tests                               0   0.0  24000
-----
OAM-Managed Transmit Capacity (pps)
-----
Resource                                     InUse %InUse  Limit
-----
Shared Resource Pool Maximum                0   0.0  24000
  Background Shared Pool Maximum            0   0.0  10000
    Background OAM and SAA-continuous Tx capacity 0   0.0   6000
    Background Static Route CPE Check Tx capacity 0   0.0  10000
  OAM-PM Tx capacity                       0   0.0  18000
Dedicated Resources
  LSP Self Ping Tx capacity                 0   0.0   125
-----
    
```

The following output is an example of those platforms that have a common resource pool (tests and packet per second) for background OAM, OAM-PM and SAA and [Table 334: Test OAM configuration limit fields](#) describes the output fields.

```
show test-oam oam-config-summary
```

Output Example

```

-----
OAM-Managed Test Capacity (tests)
-----
Resource                                     InUse %InUse  Limit
-----
Background OAM, OAM-PM, and SAA tests        0   0.0
Background ICMP Interface Control tests      0   0.0
LSP Self Ping tests                         0   0.0
-----
OAM-Managed Transmit Capacity (pps)
-----
Resource                                     InUse %InUse  Limit
-----
Background OAM, OAM-PM, and SAA-continuous Tx capacity 0   0.2
LSP Self Ping Tx capacity                   0   0.0
-----
    
```

The following output is an example of CPE check information and [Table 334: Test OAM configuration limit fields](#) describes the output fields.

```
show test-oam oam-config-summary
```

Output Example

```

-----
OAM-Managed Test Capacity (tests)
-----
Resource                                     InUse %InUse  Limit
-----
Background ICMP Bridged Residential Gateway tests 0   0.0  50000
Background ICMP Interface Control tests          0   0.0   4000
Background OAM and SAA tests                   0   0.0  10000
    
```

```

Background Static Host CPE Check tests          0   0.0  5000
Background Static Route CPE Check tests        0   0.0 10000
LSP Self Ping tests                            0   0.0  1250
OAM-PM tests                                  0   0.0 24000
-----
OAM-Managed Transmit Capacity (pps)
-----
Resource                                         InUse %InUse  Limit
-----
Shared Resource Pool Maximum                    0   0.0 24000
  Background Shared Pool Maximum                0   0.0 10000
    Background OAM and SAA-continuous Tx capacity 0   0.0  6000
    Background Static Route CPE Check Tx capacity 0   0.0 10000
  OAM-PM Tx capacity                           0   0.0 18000
Dedicated Resources
  LSP Self Ping Tx capacity                     0   0.0   125
-----
    
```

The following table describes the test OAM configuration limit fields.

Table 334: Test OAM configuration limit fields

Label	Description
InUse	Indicates the number of resources in use
%InUse	Indicates the percentage of resources in use
Limit	Indicates the total number of available resources

17.2 oam-perf

oam-perf

Syntax

oam-perf [detail]

Context

[\[Tree\]](#) (show>test-oam oam-perf)

Full Context

show test-oam oam-perf

Description

This command displays OAM performance information, including packet per second rates and the cumulative packets receive and transmitted. Statistics are cleared using the **clear>test-oam>oam-perf** command to properly interpret current data rate. The counts are displayed since the last clear and may be skewed because of irrelevant historical data.

Parameters

detail

Displays detailed information.

Platforms

All

Output

The following output is an example of OAM performance information.

Output Example

```

show test-oam oam-perf
Current Time      : 12/20/2018 20:22:49
Last Clear       : 12/20/2018 20:21:08
Period Duration  : 0d 00:01:41 (101.43 seconds)
Local Tests (Tx) :      251 packets,      2.47 packets/second
Remote Tests (Rx):         0 packets,      0.00 packets/second
show test-oam oam-perf detail
Current Time      : 12/20/2018 20:22:53
Last Clear       : 12/20/2018 20:21:08
Period Duration  : 0d 00:01:45 (105.29 seconds)
=====
OAM packets Tx by locally initiated tests and Rx from remotely initiated tests
=====

oam-perf

Syntax

oam-perf

Context

[\[Tree\]](#) (clear>test-oam oam-perf)

Full Context

clear test-oam oam-perf

Description

This command clears OAM performance statistics.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

oam-perf

Syntax

```
oam-perf [interval seconds] [ repeat repeat] [{absolute | rate}]
```

Context

[\[Tree\]](#) (monitor>test-oam oam-perf)

Full Context

```
monitor test-oam oam-perf
```

Description

This command monitors the OAM performance statistics.

Parameters

seconds

Specifies the time interval, in seconds.

Values 3 to 60

repeat

Specifies the number of times the command is repeated.

Values 1 to 999

Default 10

absolute

Specifies that the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

rate

Specifies that the rate-per-second is displayed.

Default delta

Platforms

All

17.3 oam-pm

oam-pm

Syntax

oam-pm

Context

[\[Tree\]](#) (show oam-pm)

Full Context

show oam-pm

Description

Commands in this context show Operations, Administration, and Maintenance Performance Management information.

Platforms

All

oam-pm

Syntax

oam-pm session *session-name* {dm | dmm | lmm | slm | twamp-light}

Context

[\[Tree\]](#) (clear oam-pm)

Full Context

clear oam-pm

Description

This command clears OAM performance statistics reported by the **show>test-oam >oam-perf [detail]**.

Parameters

session-name

Identifies the session name, up to 32 characters, that the test is associated with.

dm

Specifies the MPLS delay measurement test that is affected by the command.

dmm

Specifies the DMM test that is affected by the command.

Imm

Specifies the LMM test that is affected by the command.

slm

Specifies the SLM test that is affected by the command.

twamp-light

Specifies the TWAMP-light test that is affected by the command.

Platforms

All

oam-pm

Syntax

oam-pm

Context

[\[Tree\]](#) (monitor oam-pm)

Full Context

monitor oam-pm

Description

Commands in this context monitor Operations, Administration, and Maintenance Performance Management information.

Platforms

All

17.4 oam-template

oam-template

Syntax

oam-template

Context

[\[Tree\]](#) (show>router>mpls>mpls-tp oam-template)

Full Context

show router mpls mpls-tp oam-template

Description

This command displays MPLS-TP OAM template information.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following output is an example of MPLS OAM template detail information.

Output Example

```
*A:mlstp-dutA# show router mpls mpls-tp oam-template
=====
MPLS-TP OAM Templates
=====
Template Name : privatebed-oam-template Router ID      : 1
BFD Template  : privatebed-bfd-template  Hold-Down Time: 0 centiseconds
                                           Hold-Up Time  : 20 deciseconds
=====
```

17.5 ocsp-cache

ocsp-cache

Syntax

ocsp-cache [*entry-id*]

Context

[\[Tree\]](#) (show>certificate ocsp-cache)

Full Context

show certificate ocsp-cache

Description

This command displays the current cached OCSP results. The output includes the following information:

Certificate issuer

Certificate serial number

OCSP result

Cache entry expire time

Parameters

entry-id

Specifies the local cache entry identifier of the certificate that was validated by the OCSP responder.

Values 1 to 2000

Platforms

All

17.6 of-switch

of-switch

Syntax

of-switch

of-switch *ofs-name* **controller** *ip-address:port* **detail**

of-switch *ofs-name* **status controller** [*ip-address:port*]

of-switch *ofs-name* **controller**

of-switch *ofs-name* **flowtable**

of-switch *ofs-name* **status**

of-switch *ofs-name* **port**

Context

[\[Tree\]](#) (show>open-flow of-switch)

Full Context

show open-flow of-switch

Description

This command displays information related to H-OFS configuration and operations as per the parameters specified.

If no parameter is specified, this command displays a summary for H-OFS instances configured.

Parameters

ofs-name

Specifies the name of the configured H-OFS instance, up to 32 characters.

ip-address:port

Displays information on the controller for the specified H-OFS instance.

Values ip-address: a.b.c.d
port: 1 to 65535

detail

Displays detailed information.

flowtable

Displays information about flowtables for the specified H-OFS instance.

status

Displays status information for the specified H-OFS switch or its controller.

port

Displays information about the logical OpenFlow ports registered with the specified H-OFS instance.

Platforms

All

Output

Output Example

```

of-switch

Syntax

of-switch *ofs-name* [**flowtable** *of-table-id*] [**controller** *ip-address:port*] [{**grt** | **system** | **service-id** *service-id*}] [**cookie** *hex-string*] [**priority** *priority*]

of-switch *ofs-name* [**flowtable** *of-table-id*] [**controller** *ip-address:port*] **service-id** *service-id* **sap** *sap-id* [**cookie** *hex-string*] [**priority** *priority*]

of-switch *ofs-name* [**flowtable** *of-table-id*] [**controller** *ip-address:port*] **summary**

Context

[\[Tree\]](#) (tools>dump>open-flow of-switch)

Full Context

tools dump open-flow of-switch

Description

This command can be used to dump information for a given OpenFlow switch or its flowtable. Priority and cookie filters are provided no focus on part of a flow table.

Usage examples:

- a. **tools>dump>open-flow>of-switch ofs-test** — This command displays detailed flow information for a given OpenFlow switch. If the switch has **switch-defined-cookie** enabled, the flows with all cookie-types are displayed.
- b. **tools>dump>open-flow>of-switch ofs summary** — This command displays a summary of each cookie context and the number of flows in it for the switch that has **switch-defined-cookie** enabled. If **switch-defined-cookie** is disabled, then the total number of entries is displayed (single context).
- c. Options like **grt**, **system**, **service-id**, **sap-id**, **cookie**, and **priority** can be used to limit display entries to the specified options.

Parameters

ofs-name

Specifies the name of the OFS instance, up to 32 characters.

of-table-id

Specifies the identifier for the OpenFlow table.

Values 0

ip-address:port

Specifies the IP address and TCP port for the OpenFlow channel to the controller.

Values ip-address: a.b.c.d
port: 1 to 65535

grt

Flowtable rules applicable to GRT instance (IES, Router).

system

Flowtable rules applicable to system filters.

service-id

Specifies the identifier for the service.

Values 1 to 2148007978 | *svc-name*: 64 characters max

hex-string

Specifies the identifier for the OpenFlow cookies.

Values 0x0 to 0xFFFFFFFFFFFFFFFF

priority

Specifies the priority for the OpenFlow switch.

Values 0 to 65535

sap-id

Specifies the identifier for the Ethernet SAP.

17.8 on-change-paths

on-change-paths

Syntax

on-change-paths

on-change-paths {**open-config** | **nokia**}

Context

[\[Tree\]](#) (tools>dump>system>telemetry on-change-paths)

Full Context

tools dump system telemetry on-change-paths

Description

This command lists all paths supporting on-change notifications. The keywords **open-config** and **nokia** indicate which model should be used as a reference for the output.

Parameters

open-config

Indicates that the open-config model will be used as the output reference.

nokia

Indicates that the Nokia model will be used as the output reference.

Platforms

All

Output

Output Example

```
A:node-6# tools dump system telemetry on-change-paths nokia

17.9 opaque-database

opaque-database

Syntax

```
opaque-database [area area-id | as] [ adv-router router-id] [ls-id] [detail]
```

Context

[\[Tree\]](#) (show>router>ospf opaque-database)

Full Context

```
show router ospf opaque-database
```

Description

This command displays OSPF opaque database information.

Parameters

area *area-id*

Displays all opaque databases configured in this area.

Values ip-address — a.b.c.d
area — 0 to 4294967295

as

Displays opaque databases configured in the autonomous system (AS).

adv-router *router-id* [*ls-id*]

Displays opaque database information associated with the specified advertising router. To further narrow the number of items displayed, the *ls-id* can optionally be specified.

Platforms

All

Output

OSPF Opaque Database Output

[Table 335: OSPF Opaque Database Output Fields](#) describes the OSPF opaque database output fields.

Table 335: OSPF Opaque Database Output Fields

Label	Description
Area Id	A 32-bit integer uniquely identifying an area. Area ID 0.0.0.0 is used for the OSPF backbone.
Type	NSSA — This area is configured as an NSSA area. Area — This area is configured as a standard area (not NSSA or stub). Stub — This area is configured as an NSSA area.
Link State Id	The link state ID is an LSA type specific field containing either a Router-Id or an IP Address; it identifies the piece of the routing domain being described by the advertisement.
Adv Rtr Id	The router identifier of the router advertising the LSA.
Age	The age of the link state advertisement in seconds.
Sequence	The signed 32-bit integer sequence number.
Cksum	The 32-bit unsigned sum of the link-state advertisements' LS checksums.

Output Example

```
*A:Dut-C# show router ospf opaque-database

17.10 open-flow

open-flow

Syntax

open-flow

Context

[\[Tree\]](#) (show open-flow)

Full Context

show open-flow

Description

Displays OpenFlow switch hybrid information.

Platforms

All

open-flow

Syntax

open-flow of-switch *ofs-name* **controller** *ip-address:port* [**channel** *channel-id*] **statistics**
open-flow of-switch *ofs-name* **controller** *ip-address:port* [**vprn** *service-id* **ofc-loopback** *ip-address*]
statistics

Context

[\[Tree\]](#) (clear open-flow)

Full Context

clear open-flow

Description

This command clears the OpenFlow statistics.

Parameters

ofs-name

Specifies the name of the OFS instance, up to 32 characters.

ip-address:port

Specifies the IP address and TCP port for the OpenFlow channel to the controller.

Values		
ipv4-address:	a.b.c.d:port	
ipv6-address:	[x:x:x:x:x:x]:port (eight 16-bit pieces)	
	x:x:x:x:x.d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D
	port	1 to 65535

channel-id

Specifies the channel ID.

Values 1 to 65535

service-id

Specifies the service ID.

Values 1 to 2147483647

ip-address

Specifies the IP address for the OpenFlow channel to the controller.

Values		
ipv4-address:	a.b.c.d	
ipv6-address:	x:x:x:x:x:x (eight 16-bit pieces)	
	x:x:x:x:x.d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

Platforms

All

open-flow

Syntax

open-flow

Context

[Tree] (tools>dump open-flow)

Full Context

tools dump open-flow

Description

This command enables dumping of the OpenFlow information.

Platforms

All

17.11 oper-group

oper-group

Syntax

oper-group [*group-name*]

oper-group [*group-name*] **detail**

oper-group [*group-name*] **members** [**sap**] [**sdp**] [**site**] [**bgp-evpn**]

oper-group [*group-name*] **monitoring** [**sap**] [**sdp**] [**site**] [**mvrp**]

Context

[Tree] (show>service oper-group)

Full Context

show service oper-group

Description

This command displays oper-group information, member count, monitor-client count, and status in a single line for each of the configured oper-groups.

Parameters

group-name

Displays oper-group information.

detail

Displays detailed information for each of the configured oper-groups.

members

Displays the members of the specified oper-group, or all oper-groups. A filter can be applied on the output to display only required member type, by specifying an optional parameter.

Values sap, sdp, site, bgp-evpn

monitoring

displays the clients that are monitoring the specified oper-group, or all oper-groups. A filter can be applied on the output to display only required client type, by specifying an optional parameter.

Values sap, sdp, site, mvrp

Platforms

All

Output

The following output is an example of server oper group information. [Table 336: oper-group detail Field Descriptions](#) describes the output fields.

Output Example

```

Table 336: oper-group detail Field Descriptions

Label	Description
PortId	The port ID being monitored.

Label	Description
Adm Admin-state	Displays the administrative state.
Opr Oper-state	Displays the operational state.
Oper Group	The name of the operational group being monitored.
Creation Origin	Displays how the operational group was created.
Oper Status	Displays the operational status.
Hold Downtime	Displays the time, in seconds, that the system waits before declaring the status as "down".
Hold UpTime	Displays the time, in seconds, that the system waits before declaring the status as "up".
Members	Displays the number of members.
Monitoring	Displays the number of objects monitoring the operational group.
Sdpld	Displays the SDP ID.
Svcld	Displays the SVC ID.
Type	Displays the type of SDP binding.
IP address	Displays the IP address
Svcld:Instance	Displays the SVC ID and EVPN instance number.
(Type)	Displays the instance type.
Status	Displays the status of the EVPN instance.
Lag-Id	Displays the monitoring LAG ID.
Weighted	Displays whether or not the LAG is weighted.
Threshold	Displays the threshold number.
Up-Count	Displays the up-count number.
Act/Stdby	Displays whether the LAG is active or standby.

overload card slot-number fp fp-number ipv6 ipv6-filter-id direction direction
overload card slot-number fp fp-number mac mac-filter-id direction direction
```

Context

[\[Tree\]](#) (tools>dump>filter overload)

Full Context

tools dump filter overload

Description

This command, when used without parameters, allows the operator to identify filter memory banks with one or more policies in overload in the system by slot number, FP number, direction (ingress or egress), and type (IP-MAC or IPv6).

The command, when used with only the **card** and **fp** parameters, lists the filter policy ID as well as the number of entries in overload on a specified FP when the optional parameters *slot-number* and *fp-number* are specified.

This command, when used with the **ip**, **ipv6**, or **mac** parameters in conjunction with the **direction** parameter, displays the entries not programmed for a specified filter policy due to an overload condition.

This command, when used with the **cpm-ip**, **cpm-ipv6**, or **cpm-mac** parameters, displays the entries not programmed for a specified CPM filter policy. This command is available on applicable platforms only. Refer to the *7450 ESS, 7750 SR, 7950 XRS, and VSR System Management Guide, CPM Filters and Traffic Management* section for more details.

Parameters

slot-number

Specifies the IOM slot number or CPM for the overload command.

Values 1 to 10

Values A (when used with **cpm-ip**, **cpm-ipv6**, or **cpm-mac** parameters)

fp-number

Specifies the FP number.

Values 1 to 8

ip-filter-id

Specifies the IP filter policy ID or name for which to display information.

Values 1 to 65535 (Specifies the policy ID)

name (Specifies a string of up to 64 characters uniquely identifying this filter policy name)

direction

Specifies the direction.

Values ingress or egress

ipv6-filter-id

Specifies the IPv6 filter policy ID or name for which to display information.

Values 1 to 65535 (Specifies the policy ID)

name (Specifies a string of up to 64 characters uniquely identifying this filter policy name)

mac-filter-id

Specifies the MAC filter ID policy for which to display information. Values can be expressed in different formats and refer to static or dynamic filters. The following values only shows decimal integer format.

Values 1 to 65535

filter-name (Specifies a string of up to 64 characters uniquely identifying this filter policy name)

Platforms

All

Output

The following output is an example of filter overload status.

Output Example

```
*A:Dut# tools dump filter overload
=====
Filter Overload Status
=====
Slot FP Dir Type
-----
1 1 Ing ip-mac
1 1 Egr ipv6
=====
```

The following output is an example with **card** and **fp** parameters only.

```
A:Dut# tools dump filter overload card 1 fp 1
=====
Filter Overload Status
=====
Slot FP Dir Type Filter #Entries
-----
1 1 Ing ip 5 1
1 1 Egr ipv6 40008 10
=====
```

The following output is an example with **card**, **fp**, **{cpm-ip, cpm-ipv6}**, or **cpm-mac** parameters only.

```
*A:Dut# tools dump filter overload card "a" fp 1 cpm-ipv6
=====
Filter Overload Status
=====
Slot FP  Dir  Type                      Filter      Entry
-----
A     1     cpm-ipv6                      168
```

The following output is an example with **card**, **fp**, **{ip, ipv6}**, or **mac** and **direction** parameters only.

```
*A:Dut# tools dump filter overload card 1 fp 1 ip 9 direction ingress
=====
Filter Overload Status
=====
Slot FP  Dir  Type                      Filter      Entry
-----
1     1  Ing  ip                          9          100
```

overload

Syntax

overload {rtm | fib | prefix-limit}

Context

[\[Tree\]](#) (clear>router>isis overload)

Full Context

clear router isis overload

Description

This command clears the IS-IS overload.

Parameters

rtm

Clears the overload because IS-IS reached the configured maximum route limit set with **maximum-routes** or **maximum-ipv6-routes** in a VPRN.

fib

Clears the overload because adding routes to the hardware FIB failed.

prefix-limit

Clears the overload when IS-IS has reached the configured maximum prefix limit set with the **prefix-limit** command.

Platforms

All

overload

Syntax

overload {**rtm** | **fib** | **rtr-adv-lsa-limit**}

Context

[\[Tree\]](#) (clear>router>ospf overload)

[\[Tree\]](#) (clear>router>ospf3 overload)

Full Context

clear router ospf overload

clear router ospf3 overload

Description

This command clears the OSPF or OSPF3 overload.

Parameters

rtm

Clears the overload because OSPF or OSPF3 reached the configured maximum route limit set with **maximum-routes** or **maximum-ipv6-routes** in a VPRN.

fib

Clears the overload because adding routes to the hardware FIB failed.

rtr-adv-lsa-limit

Clears the overload because OSPF or OSPF3 exceeded the configured maximum limit on LSAs advertised by another router, which was set with **rtr-adv-lsa-limit**.

Context

[\[Tree\]](#) (show>router>ldp>bindings p2mp)

Full Context

```
show router ldp bindings p2mp
```

Description

This command displays LDP P2MP FEC bindings.

Parameters

detail

Displays detailed information.

family

Displays either IPv4 or IPv6 active LDP information.

group *mcast-address*

Displays the P2MP group multicast address bindings.

inner-root *ip-address*

Displays recursive FECs whose inner root address matches the specified address.

innermost-root *ip-address*

Displays recursive FECs whose inner root address matches the specified address and non-recursive FECs that have a root address that matches the specified address.

opaque-type *opaque-type*

Specifies the type of a Multi-Point Opaque Value Element.

Values generic, ssm, vpn-ssm, recursive-ssm, vpn-recursive, grt-recursive

p2mp-id *identifier*

Displays LDP active P2MP identifier bindings.

Values 0 to 4294967295

rd *rd*

Displays information for the route distinguisher.

Values *ip-addr:comm-val* | *2byte-asnumber:ext-comm-val* | *4byte-asnumber:comm-val*

root *ip-address*

Displays root IP address information.

session *ip-addr*[*label-space*]

Displays information for the LDP session IP address and label space.

source *ip-address*

Displays LDP active P2MP source bindings.

Values

ipv4-address	- a.b.c.d
ipv6-address	- x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x - [0 to FFFF]H
	d - [0 to 255]D

stitching

Displays stitching information for LDP P2MP FEC bindings.

summary

Displays information in a summarized format.

Platforms

All

Output

```

Context

[\[Tree\]](#) (show>router>ldp>bindings>active p2mp)

Full Context

```
show router ldp bindings active p2mp
```

Description

This command displays LDP active P2MP bindings.

Parameters

identifier

Specifies the P2MP ID.

Values 0 to 4294967295

ip-address

Specifies the IPv4 or IPv6 address.

Values	ipv4-address:	a.b.c.d
	ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
		x:x:x:x:x:d.d.d.d
		x: [0 to FFFF]H
		d: [0 to 255]D

mcast-address

Displays the P2MP group multicast address bindings.

Values	ipv4-mcast-addr, ipv6-mcast-addr
---------------	----------------------------------

rd

Displays information for the route distinguisher.

Values	<i>ip-addr:comm-val 2byte-asnumber:ext-comm-val 4byte-asnumber:comm-val</i>
---------------	---

family

Specifies the address family.

Values	ipv4, ipv6
---------------	------------

port-id

Specifies the port ID.

Values	<i>slot[/mda[/port]] or slot/mda/port [.channel]</i>	
	aps-id	aps-group-id [.channel]
	aps	keyword
	<i>group-id</i>	1 to 128
eth-sat-id	esat-id [/slot/[u]port]	
	esat	keyword
	<i>id</i>	1 to 20
	<i>u</i>	keyword for up-link port
tdm-sat-id	tsat-id [/slot/[u]port.channel]	
	tsat	keyword
	<i>id</i>	1 to 20
	u	keyword for up-link port

pxc-id	pxc-id.sub-port	
	pxc	keyword
	<i>id</i>	1 to 64
	<i>sub-port</i>	a to b

tunnel-id

Specifies the tunnel ID.

Values 0 to 4294967295

opaque-type

Specifies the multi-point opaque value element type.

Values generic, ssm, vpn-ssm, recursive-ssm, vpn-recursive, grt-recursive

Platforms

All

18.2 p2mp-candidate-path

p2mp-candidate-path

Syntax

p2mp-candidate-path [*path-name*] [**oper** { **up** | **down**}] [**in-use**]

Context

[Tree] (show>router>p2mp-sr-tree>p2mp-policy p2mp-candidate-path)

Full Context

show router p2mp-sr-tree p2mp-policy p2mp-candidate-path

Description

This command displays candidate path information.

Parameters

path-name

Specifies the candidate path name, up to 32 characters.

oper up

Displays the candidate paths with operational status up.

oper down

Displays the candidate paths with operational status down.

in-use

Displays candidate paths that are in use.

Platforms

All

18.3 p2mp-info

p2mp-info

Syntax

p2mp-info [**type** {**originate** | **transit** | **terminate**}] [**s2l-endpoint** *ip-address*]

Context

[Tree] (show>router>mpls p2mp-info)

Full Context

show router mpls p2mp-info

Description

This command displays P2MP cross-connect information.

Parameters

type

Specifies the P2MP type.

- Values**
- originate** — Displays the static LSPs that originate at this virtual router.
 - transit** — Displays the static LSPs that transit through this virtual router.
 - terminate** — Displays the static LSPs that terminate at this virtual router

Platforms

All

Output

The following output is an example of MPLS p2mp information.

Output Example

```
*A:Dut-C# show router mpls p2mp-info

18.4 p2mp-lsp

p2mp-lsp

Syntax

p2mp-lsp [*lsp-name*] [**detail**]

p2mp-lsp [*lsp-name*] **p2mp-instance** [*p2mp-instance-name*] [**mbb**]

p2mp-lsp [*lsp-name*] **p2mp-instance** [*p2mp-instance-name*] **s2l** [*s2l-name* [**to** *s2l-to-address*]] [**status** {**up** | **down**}] [**detail**]

p2mp-lsp [*lsp-name*] **p2mp-instance** [*p2mp-instance-name*] **s2l** [*s2l-name* [**to** *s2l-to-address*]] **mbb**

Context

[Tree] (show>router>mpls p2mp-lsp)

Full Context

```
show router mpls p2mp-lsp
```

Description

This command displays MPLS P2MP LSP information.

Parameters

lsp-name

Specifies the LSP name, up to 64 characters, used in the path.

p2mp-instance [*p2mp-instance-name*]

Specifies the administrative name for the P2MP instance which must be unique within a virtual router instance.

mbb

Specifies to display make-before-break (MBB) information.

s2l

Specifies the source-to-leaf (S2L) name.

to s2l-to-address

Indicates the IP address of the destination address of the S2L sub-LSP.

status

Displays the status of the p2mp LSP.

Values up — Displays the total time that this S2L has been operational.
down — Displays the total time that this S2L has not been operational.

Platforms

All

Output

The following output is an example of MPLS p2mp LSP information.

Output Example

```
*A:Dut-C# show router mpls p2mp-lsp
- p2mp-lsp [<lsp-name>] [detail]
- p2mp-lsp [<lsp-name>] p2mp-instance [<p2mp-instance-name>] [mbb]
- p2mp-lsp [<lsp-name>] p2mp-instance [<p2mp-instance-name>] s2l [<s2l-name>]
  [to <s2l-to-address>][status {up | down}] [detail]
- p2mp-lsp [<lsp-name>] p2mp-instance [<p2mp-instance-name>] s2l [<s2l-name>]
  [to <s2l-to-address>]] <mbb>
- p2mp-lsp using-template [lsp-template <template-name>] [detail]

<lsp-name>           : [64 chars max] - accepts * as wildcard char
<p2mp-instance>     : keyword
<p2mp-instance-name> : [max 32 chars]

18.5 p2mp-policy

p2mp-policy

Syntax

p2mp-policy [**root-address** *ip-address*] [**tree-id** *tree-id*] [**candidate-path** *path-name*] [**detail**]

Context

[Tree] (show>router>p2mp-sr-tree>database p2mp-policy)

Full Context

show router p2mp-sr-tree database p2mp-policy

Description

This command displays the policy information present in the P2MP SR tree database.

Parameters

ip-address

Specifies the root IPv4 address.

tree-id

Specifies the P2MP SR tree ID.

Values 8193 to 16286

path-name

Specifies the candidate path name, up to 64 characters.

detail

Displays detailed information.

Platforms

All

Output

The following output is an example of P2MP SR tree database policy information.

Output Example

```
A:node-2>show>router>p2mp-sr-tree>database# p2mp-policy

18.6 p2mp-sr-tree

p2mp-sr-tree

Syntax

p2mp-sr-tree

Context

[Tree] (show>router p2mp-sr-tree)

Full Context

show router p2mp-sr-tree

Description

Commands in this context display P2MP SR tree information.

Platforms

All

18.7 packet

packet

Syntax

packet *packet-number*

Context

[Tree] (show>test-oam>build-packet packet)

Full Context

```
show test-oam build-packet packet
```

Description

This command displays the OAM egress port finder information for a specific packet.

Parameters

packet-number

Specifies the packet number.

Values 1 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

18.8 packet-size

packet-size

Syntax

```
packet-size protocol [clear]
```

Context

[\[Tree\]](#) (tools>dump>cflowd packet-size)

Full Context

```
tools dump cflowd packet-size
```

Description

This command displays packet size distribution for sampled IP traffic. Values are displays in decimal format (1.0 = 100%, .500 = 50%). Separate statistics are maintained and shown for IPv4 and IPv6 traffic.

Platforms

All

Output

The following output is an example of cflowd packet size information.

Output Example

```
SR-12# tools dump cflowd packet-size ipv4
IP packet size distribution (801600 total packets):
 1-32  64  96 128 160 192 224 256 288 320 352 384 416 448 480

.000 .000 .000 .050 .000 .000 .000 .000 .000 .000 .000 .000
```

18.9 parameters

parameters

Syntax

parameters

Context

[\[Tree\]](#) (show>router>ldp parameters)

Full Context

show router ldp parameters

Description

This command displays configuration information about LDP parameters.

Platforms

All

Output

LDP Parameters Output

[Table 337: LDP Parameters Output Fields](#) describes the LDP parameters output fields.

Table 337: LDP Parameters Output Fields

Label	Description
Keepalive Timeout	The time interval (in s), that LDP waits before tearing down a session. If no LDP messages are exchanged during this time interval, the LDP session is torn down. Generally the value is configured to be 3 times the keepalive time (the time interval between successive LDP keepalive messages).
Timeout Factor	The value by which the keepalive timeout should be divided to give the keepalive time, for example, the time interval (in s), between LDP keepalive messages. LDP keepalive messages are sent to keep the LDP session from timing out when no other LDP traffic is being sent between the neighbors.
Hold Time	The hello time, also known as hold time. It is the time interval (in s), that LDP waits before declaring a neighbor to be down. Hello timeout is local to the system and is sent in the hello messages to a neighbor.

Label	Description
Hello Factor	The value by which the hello timeout should be divided to give the hello time, for example, the time interval (in s), between LDP hello messages. LDP uses hello messages to discover neighbors and to detect loss of connectivity with its neighbors.
Auth	Enabled — Authentication using MD5 message based digest protocol is enabled. Disabled — No authentication is used.
Admin Status	inService — The LDP is administratively enabled. outService — The LDP is administratively disabled.
Deaggregated FECs	False — LDP aggregates multiple prefixes into a single Forwarding Equivalence Class (FEC) and advertises a single label for the FEC. This value is only applicable to LDP interfaces and not for targeted sessions. True — LDP de-aggregates prefixes into multiple FECs.
Propagate Policy	The Propagate Policy value specifies whether the LSR should generate FECs and which FECs it should generate. system — LDP distributes label bindings only for the router's system IP address. interface — LDP distributes label bindings for all LDP interfaces. all — LDP distributes label bindings for all prefixes in the routing table. none — LDP does not distribute any label bindings.
Transport Address	interface — The interface's IP address is used to set up the LDP session between neighbors. If multiple interfaces exist between two neighbors, the 'interface' mode cannot be used because only one LDP session is actually set up between the two neighbors. system — The system's IP address is used to set up the LDP session between neighbors.
Label-Retention	liberal — All advertised label mappings are retained whether they are from a valid next hop or not. When the label distribution value is downstream unsolicited, a router may receive label bindings for the same destination for all its neighbors. Labels for the non-next hops for the FECs are retained in the software but not used. When a network topology change occurs where a non-nexthop becomes a true next hop, the label received earlier is then used. conservative — Advertised label mappings are retained only if they are used to forward packets; for example, if the label came from a valid next hop. Label bindings received from non-next hops for each FEC are discarded.
Control Mode	ordered — Label bindings are not distributed in response to a label request until a label binding has been received from the next hop for the destination. independent — Label bindings are distributed immediately in response to a label request even if a label binding has not yet been received from the next hop for the destination.

Label	Description
Route Preference	The route preference assigned to LDP routes. When multiple routes are available to a destination, the route with the lowest preference is used. This value is only applicable to LDP interfaces and not for targeted sessions.
Loop Detection	<p>none — Loop detection is not supported on this router. This is the only valid value because Path Vector based loop detection is not supported.</p> <p>other — Loop detection is supported but by a method other than hopCount, path Vector, or hopCountAndPathVector.</p> <p>hopCount — Loop detection is supported by hop count only.</p> <p>pathVector — Loop detection is supported by path vector only.</p> <p>hopCountAndPathVector — Loop detection is supported by both path vector and hop count.</p>
Keepalive Timeout	The factor used to derive the Keepalive interval.
Keepalive Factor	The time interval (in s), that LDP waits before tearing down the session.
Hold-Time	The time left before a neighbor is declared to be down.
Hello Factor	The value by which the hello timeout should be divided to give the hello time, for example, the time interval (in s), between LDP hello messages. LDP uses hello messages to discover neighbors and to detect loss of connectivity with its neighbors.
Auth	<p>Enabled — Authentication using MD5 message based digest protocol is enabled.</p> <p>Disabled — No authentication is used.</p>
Passive-Mode	<p>true — LDP responds only when it gets a connect request from a peer and does not attempt to actively connect to its neighbors.</p> <p>false — LDP actively tries to connect to its peers.</p>
Targeted-Sessions	<p>true — Targeted sessions are enabled.</p> <p>false — Targeted sessions are disabled.</p>

Output Example

```

18.10 partition

partition

Syntax

partition summary

Context

[\[Tree\]](#) (show>app-assure>group partition)

Full Context

show application-assurance group partition

Description

This command displays partition information.

Parameters

summary

Displays partition summary information.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.11 passive-dns

passive-dns

Syntax

`passive-dns`

Context

[\[Tree\]](#) (tools>dump>app-assure>group>ipassist passive-dns)

Full Context

tools dump application-assurance group ip-identification-assist passive-dns

Description

Commands in this context dump passive DNS monitoring statistics.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.12 password-options

password-options

Syntax

`password-options`

Context

[\[Tree\]](#) (show>system>security password-options)

Full Context

show system security password-options

Description

This command displays configured password options.

Platforms

All

Output

The following output is an example of password options information, and [Table 338: Show Password Options Output Fields](#) describes the output fields.

Output Example

```
A:ALA-7# show system security password-options
=====
Password Options
=====
Password aging in days                : none
Time required between password changes : 0d 00:10:00

Number of invalid attempts permitted per login : 3
Time in minutes per login attempt           : 5
Lockout period (when threshold breached)    : 10
Authentication order                     : radius tacplus local
User password history length              : disabled
Password hashing                          : bcrypt
Accepted password length                  : 6..56 characters
Credits for each character type            : none
Required character types                   : none
Minimum number different character types    : 0
Required distance with previous password    : 5
Allow consecutively repeating a character  : always
Allow passwords containing username         : yes
Palindrome allowed                        : no
=====
A:ALA-7#
```

Table 338: Show Password Options Output Fields

Label	Description
Password aging in days	Displays the number of days a user password is valid before the user must change their password.
Time required between password changes	Displays the time interval between changed passwords.
Number of invalid attempts permitted per login	Displays the number of unsuccessful login attempts allowed for the specified time .
Time in minutes per login attempt	Displays the period of time, in minutes, that a specified number of unsuccessful attempts can be made before the user is locked out.
Lockout period (when threshold breached)	Displays the number of minutes that the user is locked out if the threshold of unsuccessful login attempts has been exceeded.
Authentication order	Displays the sequence in which password authentication is attempted among RADIUS, TACACS+, and local passwords.
User password history length	Displays the size of the password history file to be stored.

Label	Description
Password hashing	Displays the system hashing algorithm for passwords.
Accepted password length	Displays the minimum length required for local passwords.
Credits for each character type	Displays the credit for each character type. A credit is obtained for a specific character type; for example, uppercase, lowercase, numeric, or special character. Credits per character type are configurable. Credits can be used toward the minimum length of the password, so a trade-off can be made between a very long, simple password and a short, complex one.
Required character types	Displays the character types that are required in a password; for example, uppercase, lowercase, numeric, or special character.
Minimum number different character types	Displays the minimum number of each different character types in a password.
Required distance with previous password	Displays the minimum Levenshtein distance between a new password and the old password.
Allow consecutively repeating a character	Displays the number of times the same character is allowed to be repeated consecutively.
Allow passwords containing username	Displays whether the user name is allowed as part of the password.
Palindrome allowed	Displays whether palindromes are allowed as part of the password.

```

Table 339: Show Password-Options Output Fields

Label	Description
Password aging in days	Displays the number of days a user password is valid before the user must change his password.
Number of invalid attempts permitted per login	Displays the maximum number of unsuccessful login attempts allowed for a user.
Time in minutes per login attempt	Displays the time in minutes that user is to be locked out.
Lockout period (when threshold breached)	Displays the number of minutes the user is locked out if the threshold of unsuccessful login attempts has exceeded.
Authentication order	Displays the most preferred method to authenticate and authorize a user.
User password hashing algorithm	Displays the algorithm with which the system hashes the user passwords.
Configured complexity options	Displays the complexity requirements of locally administered passwords, HMAC-MD5-96, HMAC-SHA-96 and DES-keys configured in the authentication section.
Minimum password length	Displays the minimum number of characters required in the password.

18.13 path

path

Syntax

path [*path-name*] [*isp-binding*]

path *path-name* *p2mp-isp-binding*

Context

[\[Tree\]](#) (show>router>mpls path)

Full Context

show router mpls path

Description

This command displays MPLS paths.

Parameters

path-name

Specifies the unique name label for the LSP path.

isp-binding

Displays binding information.

p2mp-isp-binding

Displays binding information.

Platforms

All

Output

The following output is an example of MPLS path information.

[Table 340: MPLS Path Output Fields](#) describes MPLS Path output fields.

Table 340: MPLS Path Output Fields

Label	Description
Path Name	The unique name label for the LSP path.
Adm	Down — The path is administratively disabled. Up — The path is administratively enabled.
Hop Index	The value used to order the hops in a path.

Label	Description
IP Address	The IP address of the hop that the LSP should traverse on the way to the egress router.
Strict/Loose	Strict — The LSP must take a direct path from the previous hop router to the next router. Loose — The route taken by the LSP from the previous hop to the next hop can traverse through other routers.
LSP Name	The name of the LSP used in the path.
Binding	Primary — The preferred path for the LSP. Secondary — The standby path for the LSP.
Paths	Total number of paths configured.

Output Example

```
*A:SRU4>config>router>mpls# show router mpls path

18.14 path-request

path-request

Syntax

path-request [*lsp-type* *lsp-type*] [*dest ip-address*] [*detail*]

Context

[\[Tree\]](#) (show>router>pcep>pcc path-request)

Full Context

show router pcep pcc path-request

Description

This command displays the PCEP path request information.

Parameters

lsp-type

Specifies the LSP type.

Values rsvp-p2p, rsvp-p2mp, seg-rt

Note:

The LSP type, **rsvp-p2mp**, is not supported for PCE controlled or PCE initiated LSPs.

ip-address

Specifies the IP address.

Values a.b.c.d

detail

Specifies detailed information.

Platforms

All

18.15 paths

paths

Syntax

paths

Context

[\[Tree\]](#) (show>router>bgp paths)

```

Table 341: Show Router BGP Path Field Descriptions

Label	Description
BGP Router ID	The local BGP router ID.
AS	The configured autonomous system number.
Local AS	The configured local AS setting. If not configured, then the value is the same as the AS.
Path	The AS path attribute.
Origin	EGP — The NLRI is learned by an EGP protocol. IGP — The NLRI is interior to the originating AS. INCOMPLETE — NLRI was learned another way.
Next Hop	The advertised BGP nexthop.
MED	The Multi-Exit Discriminator value.
Local Preference	The local preference value.
Refs	The number of routes using a specified set of path attributes.
ASes	The number of autonomous system numbers in the AS path attribute.
Segments	The number of segments in the AS path attribute.
Flags	EBGP-learned — Path attributes learned by an EBGP peering. IBGP-Learned — Path attributes learned by an IBGP peering.
Aggregator	The route aggregator ID.
Community	The BGP community attribute list.
Originator ID	The originator ID path attribute value.
Cluster List	The route reflector cluster list.

18.19 pcap

pcap

Syntax

pcap [*session-name*] [**detail**]

Context

[\[Tree\]](#) (show pcap)

Full Context

show pcap

Description

This command shows the information about the packet capture session and confirms if the packet is reliable.

Parameters

session-name

Specifies the session name up to 32 characters.

Platforms

All

Output

The following output is an example of information about the packet capture session.

Output Example

```

=====
Pcap Session "1" Information
=====
Application Type   : mirror-dest      Session State    : ready
Capture           : stop                Last Changed    : 02/06/2018 19:52:07
Capture File Url  : ftp://*:*@192.168.40.1/pcap.pcap
Buffer Size       : 0 Bytes           File Size        : 0 Bytes
Write Failures    : 0                 Read Failures    : 0
Proc Time Bailouts : 0                 Last File Write  : 02/06/2018 19:52:07
Dropped Packets   : 0 Packets
=====
    
```

Table 342: Show PCAP Output Fields

Label	Description
Buffer Size	The maximum buffer size is 20 Mb. If the number of packets in the buffer exceeds 20 Mb, packets are dropped.

Label	Description
File Size	The current size of the capture file.
Write Failures	The number of errors that occurred when packets were written into the buffer. A number greater than zero indicates that some packets were not captured.
Read Failures	The errors occurred when packets were read from the buffer for exporting to FTP or TFTP. A number greater than zero indicates that some packets were not captured.
Process Time Bailouts	A system process timeout. Some packets were not captured.
Dropped Packets	The number of packets dropped from the buffer due to errors.

show subscriber-mgmt pcc-rule

Description

This command displays a list of PCC rules and associated monitoring keys in the system.

Parameters

key

Displays details about a specific monitoring-key.

id

Displays details about a specific PCC rule.

rule-name

Displays information about a specific PCC rule.

summary

Displays summarized information for active rules in the system.

key

Displays information about a specific monitoring-key.

detail

Displays detailed information.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of subscriber management PCC rule information.

Output Example

```
show subscriber-mgmt pcc-rule summary

Table 343: Policy and Charging Control Rule Field Descriptions describes subscriber management PCC rule output fields.

Table 343: Policy and Charging Control Rule Field Descriptions

Field	Description
Nbr Active PCC Rules	The number of active PCC rules
Nbr Active Combinations	The number of active IP PCC rule combinations
IPv4 Filter	The number of IPv4 filter combinations
IPv6 Filter	The number of IPv6 filter combinations
Egress QoS	The number of active egress QoS PCC rule combinations
Ingress QoS	The number of active ingress QoS PCC rule combinations
Id	The PCC ID

Field	Description
Dir	The flow direction on which the PCC-rule acts
ForwardAction	The filter action of the PCC-rule
QoSAction	The QoS action of the PCC-rule. The value account(3) is only relevant if the PCC-rule was received by the system as part of a RADIUS Subscriber Service attribute
name	The PCC rule name
monitorKey	The monitor key name that can be received in a PCC rule. An empty string (length 0) indicates that no monitor key is defined in the PCC rule
PCC rule name	The name of a PCC rule
PCC rule id	The PCC rule ID
Monitoring key	The monitoring key defined in this PCC-rule. This value is only considered if monitor is set in the QoS action.
Flow status	The PCC rule flow status; enabled or disabled
Nbr of Flows	The number of flow rules defined in this PCC rule
HTTP-Redirect	The URL to which all data flows that pertain to this PCC-rule must be redirected
Next-Hop Redir. IPv4	The IPv4 address to which all IPv4 data flows that pertain to this PCC-rule be redirected
Next-Hop Redir. IPv6	The IPv6 address to which all IPv6 data flows that pertain to this PCC-rule be redirected
QoS Ingr. CIP/PIR	The ingress QoS CIP and PIR values
QoS Egr. CIP/PIR	The egress QoS CIP and PIR values
FC change	The forwarding class (FC) that is assigned to all data flows that pertain to this PCC-rule
Src. IP	The address type of the source address
Src. Port	The port type of the source address
Dst. IP	The address type of the destination address
Protocol	The IPv4 protocol value, and for IPv6 the next header type used in the match criteria for this flow <ul style="list-style-type: none"> • 6 — TCP • 7 — UDP

Field	Description
DSCP	The DSCP to be matched for this flow
Subscriber	The subscriber SAP
SLA Profile Instance sap	The SLA profile instance SAP
Ingr QoS Policy Override	The ID of the overriding ingress Qos policy
Egr QoS Policy Override	The ID of the overriding egress Qos policy
IP Address	The subscriber IP address
MAC Address	The subscriber MAC address
PPPoE-SID	The PPPoE session ID of this subscriber host
Origin	The origin of this subscriber host
Preference	The preference with respect to other PCC rules
Rule ID	The PCC rule ID
Rule Name	The PCC rule name

pcc-rule

Syntax

pcc rule [**subscriber** *sub-ident-string*]

pcc rule [**subscriber** *sub-ident-string*] **detail**

Context

[\[Tree\]](#) (show>service>active-subscribers pcc-rule)

Full Context

show service active-subscribers pcc-rule

Description

This command specifies the PCC rule.

Parameters

sub-ident-string

Specifies the sub-ident-string, up to 32 characters.

detail

Displays detailed information for the specified PCC rule.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

18.22 pce-associations

pce-associations

Syntax

pce-associations

Context

[\[Tree\]](#) (show>router>pcep>pcc pce-associations)

Full Context

show router pcep pcc pce-associations

Description

Commands in this context display information about PCE associations configured under the PCC.

Platforms

All

Context

[\[Tree\]](#) (tools>dump>router pcep)

Full Context

tools dump router pcep

Description

Commands in this context dump tools for PCEP.

Platforms

All

18.24 pcm

pcm

Syntax

pcm [*pcm-slot*] [**chassis** *chassis-id*] [**detail**]

Context

[\[Tree\]](#) (show pcm)

Full Context

show pcm

Description

This command displays PCM information.

Parameters

pcm-slot

Specifies the PCM slot identifier.

Values 1 to 12

chassis-id

Specifies the chassis ID for the router chassis.

Values 1 to 2

detail

Displays detailed information.

Platforms

7950 XRS-20e

Output

The following output is an example of PCM information.

Output Example: show pcm

```
*A:Dut-A# show pcm
=====
PCM Summary

pcp-server *server-name*

pcp-server *server-name* **statistics** **interface** *interface-name*

pcp-server *server-name* **statistics**

Context

[\[Tree\]](#) (show>router pcp-server)

Full Context

show router pcp-server

Description

This command displays PCP server information.

Parameters

server-name

Specifies the PCP server name, up to 32 characters.

statistics

Displays PCP server statistics information.

interface-name

Specifies the interface name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following outputs are examples of router PCP server information.

Output Example

```

pcp-server

Syntax

```
pcp-server server-name interface interface-name statistics
```

Context

[\[Tree\]](#) (clear>router pcp-server)

Full Context

clear router pcp-server

Description

This command clears NAT PCP server data.

Parameters

server-name

Clears NAT PCP server data for the specified PCP server, up to 32 characters.

interface-name

Clears NAT PCP server data for the specified interface, up to 32 characters.

statistics

Clears NAT PCP server statistics.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

pcp-server

Syntax

pcp-server *server-name*

Context

[\[Tree\]](#) (tools>perform>router pcp-server)

Full Context

tools perform router pcp-server

Description

This command configures performance tools for a specified NAT port control policy server.

Parameters

server-name

Specifies the PCP server name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.26 pcp-server-policy

pcp-server-policy

Syntax

pcp-server-policy

pcp-server-policy *name*

Context

[\[Tree\]](#) (show>service>nat pcp-server-policy)

Full Context

show service nat pcp-server-policy

Description

This command displays PCP server policy information.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.27 pcs

pcs

Syntax

pcs[clear]

Context

[\[Tree\]](#) (tools>dump>port pcs)

Full Context

tools dump port pcs

Description

This command dumps the Physical Coding Sublayer (PCS) information for the port.

Platforms

All

18.28 peak

peak

Syntax

peak

peak application *license-app*

Context

[\[Tree\]](#) (show>system>license-statistics peak)

Full Context

show system license-statistics peak

Description

This command displays peak values of application license statistics.

Parameters

license-app

Specifies the application license.

Values Ins, nat, sub-mgmt, wlan-gw, aa, ipsec

Platforms

VSR

18.29 peakvalue-stats

peakvalue-stats

Syntax

peakvalue-stats iom (*slot* | all) [recursive]

peakvalue-stats mda (*mda* | all) [recursive]

peakvalue-stats port (*port-id* | all)

peakvalue-stats pw-port (*pw-port* | all)

peakvalue-stats system [recursive]

peakvalue-stats service {*svc-id* | all} [recursive]

peakvalue-stats service {*svc-id*} subscriber-interface { *sub-itf* | all} [recursive]

peakvalue-stats service {*svc-id*} **group-interface** { *grp-itf* | **all**}

Context

[\[Tree\]](#) (clear>subscriber-mgmt peakvalue-stats)

Full Context

clear subscriber-mgmt peakvalue-stats

Description

This command resets the most recent peak enhanced subscriber management counter per port, PW port, MDA, IOM, system, service, subscriber interface, or group interface.

Note:

Clearing one counter will not impact other counters. For example, clearing the most recent peak value for an IOM will not impact chassis peak value.

Parameters

slot

Clears IOM host peak value statistics for the specified IOM.

mda

Clears MDA host peak value statistics for the specified MDA.

port-id

Clears port host peak value statistics for the specified port ID.

pw-port

Clears pseudowire port host peak value statistics for the specified port.

Values 1 to 10239

system

Clears system host peak value statistics.

all

Clears all host peak value statistics.

recursive

Resets the sub-level counters. For example, clearing IOM counters with the **recursive** keyword also clears counters of all port counters on that IOM.

service *svc-id*

Clears service host peak value statistics for the specified service.

Values 1 to 2148278386 | *svc-name*: up to 64 characters

subscriber-interface *sub-itf*

Clears subscriber interface host peak value statistics for the specified subscriber interface, up to 32 characters.

group-interface *grp-itf*

Clears group interface host peak value statistics for the specified group interface, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

18.30 peer

peer

Syntax

peer [**peer-profile** *profile-name*] [**local-address** *ip-address*] [**control protocol**] [**interface-type** *interface-type*]

peer remote-address {*ip-address* | *ipv6-address*} [**udp-port** *port*] [**dsm-local-ip-address** {*ip-address* | *ipv6-address*}]

peer remote-address {*ip-address* | *ipv6-address*} [**udp-port** *port*] **statistics** [**dsm-local-ip-address** {*ip-address* | *ipv6-address*}]

Context

[\[Tree\]](#) (show>router>gtp peer)

Full Context

show router gtp peer

Description

This command displays GTP peer information.

Parameters

profile-name

Specifies the name that identifies the profile.

ip-address

Specifies the local IP address.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x - [0 to FFFF]H
	d - [0 to 255]D

protocol

Specifies the control plane protocol used for the connection with this Mobile Gateway.

Values gtpv1-c, gtpv2-c

interface-type

Specifies the interface type used in the context of this peer.

Values gn — Gn interface
s2a — S2a interface
s2b —S2b interface
s11 —S11 interface

ip-address

Specifies the remote IP address.

Values ipv4-address: a.b.c.d
ipv6-address: x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:d.d.d.d
x - [0 to FFFF]H
d - [0 to 255]D

port

Specifies the UDP port.

Values 1 to 65535

statistics

Displays statistics information about the Mobile Gateways connected to this system.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of peer GTP information.

Output Example

```
Node# show router 10 gtp peer
=====

```

peer

Syntax

```
peer remote-address ip-address [remote-udp-port port]
peer remote-address ip-address [remote-udp-port port] statistics
```

Context

[\[Tree\]](#) (clear>router>gtp peer)

Full Context

```
clear router gtp peer
```

Description

This command clears all states for a given peer in this routing context. The system no longer sends keep-alive messages to the peer, and all active sessions are terminated.

If the optional statistics parameter is specified, only the peer statistics are cleared and all sessions remain.

Parameters

ip-address

Specifies the IP address of the peer.

Values

ipv4-address: a.b.c.d (host bits must be 0)

ipv6-address: x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x - [0 to FFFF]H

d - [0 to 255]D

port

Specifies the UDP port used by the peer.

statistics

Specifies to clear only the peer statistics with all sessions remaining active.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

peer

Syntax

```
peer ip-address [udp-port port] [ip]  
peer ip-address statistics [ udp-port port] [ip]  
peer [draining] [{blacklisted | selectable | unreachable}]
```

Context

[\[Tree\]](#) (show>router>l2tp peer)

Full Context

```
show router l2tp peer
```

Description

This command displays information regarding all configured L2TP peers.

If this command is executed without specifying a peer IP address, then a list of all L2TP peers are listed along with the type of transport used and statistics on the total number of tunnels and sessions, as well as the number of active tunnels and sessions.

If this command is executed with a specific peer IP address, then a detailed view for that peer is displayed.

Parameters

ip-address

Specifies the L2TP peer address.

port

Specifies the UDP port for the L2TP peer. This parameter is only supported with L2TPv2 peers.

ip

Displays peers using IP transport.

statistics

Displays the statistics for the given IP address.

draining

Displays only peers with draining tunnels.

blacklisted

Displays peers that are denylisted.

selectable

Displays peers that are selectable.

unreachable

Displays peers that are deemed unreachable.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of L2TP peer operational information.

Output Example

```
A:Dut-A# show router 200 l2tp peer

peer

Syntax

```

peer ip-address [udp-port port]
peer ip-address statistics [udp-port port]
peer [draining] [blacklisted | selectable | unreachable]
  
```

Context

[\[Tree\]](#) (show>router>l2tp peer)

Full Context

```
show router l2tp peer
```

Description

This command displays L2TP peer operational information.

Parameters

ip-address

Specifies the IP dress for the L2TP peer.

Values

ipv4-address	a.b.c.d
ipv6-address	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x - [0 to FFFF]H
	d - [0 to 255]D
draining	keyword
statistics	keyword
<i>port</i>	[1 to 65535]

port

Specifies the local UDP port of this L2TP.

Values 1 to 65535

draining

Specifies to display information about the L2TP peer being drained.

blacklisted

Specifies to display information about the peer has been deemed unreachable and has been put in the tunnel selection denylist.

selectable

Specifies to display information about the peer has been deemed unreachable for the time specified in `tmnxL2tpXtTuSelBlacklistMaxTime` and can now be selected for a single session, after which the reachability of the peer is reevaluated.

unreachable

Specifies to display information about the `sysUpTime` when the peer was deemed unreachable for the last time.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of L2TP peer information.

Output Example

```

peer

Syntax

```
peer ip-address [udp-port port] [ip]
```

Context

[\[Tree\]](#) (clear>router>l2tp peer)

Full Context

```
clear router l2tp peer
```

Description

This command clears L2TP peer data.

Parameters

ip-address

Clears the peers associated with the specified IP address.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x::x::x::x::x::x (eight 16-bit pieces)
	x::x::x::x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

port

Clears the peers associated with the specified UDP port.

Values 1 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

peer

Syntax

peer *ip-address* [**udp-port** *port*] [**ip**]

Context

[\[Tree\]](#) (tools>perform>router>l2tp peer)

Full Context

tools perform router l2tp peer

Description

This command configures performance tools for an L2TP peer.

Parameters

ip-address

Specifies the IP address of the L2TP peer.

port

Specifies the UDP port for the L2TP peer. This parameter is only supported with L2TPv2 peers.

ip

Enables performance tools for peers using IP transport.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

peer

Syntax

peer [*ip-int-name*]

Context

[\[Tree\]](#) (show>router>rip peer)

Full Context

show router rip peer

Description

This command displays RIP peer information.

Parameters

ip-int-name

Displays peer information for the specified IP peer interface name, up to 32 characters.

Default display peers for all interfaces

Platforms

All

Output

[Table 344: RIP Peer Output Fields](#) describes the command output fields for a RIP peer.

Table 344: RIP Peer Output Fields

Label	Description
Peer IP Addr	The IP address of the peer router.
Interface Name	The peer interface name.
Version	The version of RIP running on the peer.
Last Update	The number of days since the last update.
No. of Peers	The number of RIP peers.

The following output is an example of RIP peer information.

Output Example

```
A:ALA-A# show router rip peers
=====
RIP Peers
=====
Peer IP Addr      Interface Name      Version      Last Update
-----
10.0.5.13         router-2/2          RIPv2        0
10.0.6.16         router-2/3          RIPv2        2
10.0.9.14         router-2/5          RIPv2        8

```

Table 345: PCEP Peer Output Fields

Label	Description
IP Address	Specifies the IP address.
Peer Capabilities	Specifies the peer capabilities.
Speaker ID	Specifies the sender IP address.
Sync State	Specifies the synchronization state.
Peer Overload	Specifies the peer overload.
Session Establish Time	Specifies the session establish time.
Oper Keepalive	Specifies the operational keepalive value.
Oper DeadTimer	Specifies the operational dead timer value.

peer

Syntax

peer [*ip-address*] [**group** *group-name*] [**detail**]

Context

[\[Tree\]](#) (show>router>msdp peer)

Full Context

show router msdp peer

Description

This command displays information about an MSDP peer.

Parameters

ip-address

Displays information about the specified IP address. If no IP address specified, information about all MSDP IP addresses display.

group group-name

Displays information about the specified group name. If no *group-name* is specified, information about all MSDP peers display.

detail

Displays detailed MSDP peer information.

Platforms

All

Output

peer

Syntax

peer *ip-address* [**router** *router-instance* | **service-name** *service-name*] [**detail**]

Context

[\[Tree\]](#) (show>system>ptp peer)

Full Context

show system ptp peer

Description

This command displays PTP information for a specific peer.

Parameters

ip-address

Specifies the IPv4 or IPv6 address.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d
	x: [0 to FFFF]H
	d: [0 to 255]D

router-instance

Displays the information for the specified router instance.

Values

router-name – Base
vprn-svc-id – 1 to 2147483647

service-name

Specifies the service name, up to 64 characters, used to identify the router instance.

detail

Displays detailed information.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following output is an example of IPv6 peer information and [Table 347: Output fields: PTP peer](#) describes the output fields.

Table 347: Output fields: PTP peer

Label	Description
IEEE 1588/PTP Peer Information	
Router	The name of the router instance
IP Address	The IP address of the PTP peer
Announce Direction Anno Flow	The direction from which PTP announce messages were sent or received
Admin State	The administrative state of the PTP peer
G.8265.1 Priority	The priority used in the best master clock algorithm (BMCA) for the local PTP port when the clock profile is G.8265.x
G.8275 Priority	The priority used in the BTCA for the local port when the clock profile is G.8275.1 or G.8275.2
Sync Interval	The message rate for Sync messages for this peer
Local PTP Port	The number of local PTP ports
PTP Port State	The state of the PTP port
Clock Id	The clockIdentity value of the local PTP clock
Remote PTP Port	The number of remote PTP ports
GM Clock Id	The clockIdentity value of the grandmaster clock advertised by the parent clock
GM Clock Class	The clockClass value of the grandmaster clock advertised by the parent clock
GM Clock Accuracy	The clockAccuracy value of the grandmaster clock advertised by the parent clock
GM Clock Variance	The offsetScaledLogVariance value of the grandmaster clock advertised by the parent clock
GM Clock Priority1	The priority1 value of the grandmaster clock advertised by the parent clock
GM Clock Priority2	The priority2 value of the grandmaster clock advertised by the parent clock

Label	Description
Steps Removed	The number of steps removed the PTP peer is from a grandmaster clock
Parent Clock	Indicates if this is the parent clock. May differ from the Best Master if there is a local GNSS.
Tx Timestamp Point	The transmit timestamp point
Rx Timestamp Point	The receive timestamp point
Last Tx Port	The <i>port-id</i> of the last port from which a synchronization packet was transmitted
Last Rx Port	The <i>port-id</i> of the last port into which a synchronization packet was received
Port Asymmetry	The configured asymmetry for the port (either Tx or Rx port)
Best Master	Indicates if this peer was selected as the best master clock by the BTCA
Backup Source	Indicates if this port is operating as a backup slave to the parent clock
APTS ASymmetry	The asymmetry computed by the backup source. This is used to compensate if the clock switches to this backup.
Last Calc	The date and time at which the APTS Asymmetry was last updated
Profile Name	The profile in use with this peer
Profile	The underlying standard profile used in the profile identified by profile name
Domain	The domain number used for this peer
IEEE 1588/PTP Unicast Negotiation Information	
Dir	The direction (transmitted or received) of the unicast negotiation packet
Type	The unicast negotiation packet type
Rate	The rate of packet transmission or reception
Duration	The duration of the packet transmission or reception interval, in seconds
State	The state of the negotiation
Time	The date and time that the negotiation state was changed

Label	Description
IEEE 1588/PTP Packet Statistics	
Input	The number of input packets within the specified category
Output	The number of output packets within the specified category

peer

Syntax

peer *ip-address* [**detail**]

Context

[\[Tree\]](#) (show>service>id>ptp peer)

Full Context

show service id ptp peer

Description

This command displays PTP information for a specific peer.

Parameters

ip-address

Specifies the IP address.

Values a.b.c.d

detail

Displays detailed information.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following command displays PTP information for a single peer and [Table 348: Output fields: service PTP peer](#) describes the output fields.

```
show service id ptp peer detail
```

```

Table 348: Output fields: service PTP peer

Label	Description
IEEE 1588/PTP Peer Information	
Router	The name or ID of the router instance
IP Address	The IP address of the PTP peer
Announce Direction	The configured directions (transmit, receive, or both) for Announce messages
Admin State	The administrative state of the PTP peer
G.8265.1 Priority	Displays if the G.8265.1 profile has priority
Local PTP Port	The local PTP port number
PTP Port State	The PTP port state
Clock ID	The ID of the referenced clock
Remote PTP Port	The remote PTP port number
GM Clock Id	The clockIdentity value of the grandmaster clock advertised by the parent clock
GM Clock Class	The clockClass value of the grandmaster clock advertised by the parent clock
GM Clock Accuracy	The clockAccuracy value of the grandmaster clock advertised by the parent clock
GM Clock Variance	The offsetScaledLogVariance value of the grandmaster clock advertised by the parent clock
GM Clock Priority1	The priority1 value of the grandmaster clock advertised by the parent clock
GM Clock Priority2	The priority2 value of the grandmaster clock advertised by the parent clock
Steps Removed	The number of steps removed the PTP peer is from a grandmaster clock
Parent Clock	Displays whether a parent clock is referenced
IEEE 1588/PTP Unicast Negotiation Information	
IP Address	The IP address of the PTP peer
Dir	The direction (transmitted or received) of the unicast negotiation packet

Label	Description
Type	The unicast negotiation packet type
Rate	The rate of packet transmission or reception
Duration	The duration of the packet transmission or reception interval, in seconds
State	The state of the negotiation
Time	The date and time that the negotiation state was changed
IEEE 1588/PTP Packet Statistics	
Input	The number of input packets within the specified category
Output	The number of output packets within the specified category
PTP Packets	The total number of PTP packets across all PTP packet categories
Announce	The number of PTP Announce packets
Sync	The number of PTP Sync packets
Follow Up	The number of PTP Follow Up packets
Delay Request	The number of PTP Delay Request packets
Delay Response	The number of PTP Delay Response packets
Signaling	The number of PTP signaling packets
Request TLVs	The total number of Request TLV packets of all types (Announce, Sync, and Delay Response)
Grant TLVs (Granted)	The total number of granted Grant TLV packets of all types (Announce, Sync, and Delay Response)
Grant TLVs (Rejected)	The total number of rejected Grant TLV packets of all types (Announce, Sync, and Delay Response)
Cancel TLVs	The total number of Cancel TLV packets of all types (Announce, Sync, and Delay Response)
Ack Cancel TLVs	The total number of Ack Cancel TLV packets of all types (Announce, Sync, and Delay Response)
Announce	The number of Announce packets of the specified TLV category
Sync	The number of Sync packets of the specified TLV category

Label	Description
Delay Response	The number of Delay Response packets of the specified TLV category
Other TLVs	The total number of other TLV packets that do not match the other categories or types
Other	The number of PTP packets that do not match the other categories or types
Discards	The total number of discarded packets across all categories
Bad PTP domain	The number of packets discarded because of a bad PTP domain
Alternate Master	The number of packets discarded because of an alternate master being referenced
Out of Sequence	The number of out-of-sequence packets discarded
Peer Disabled	The number of packets discarded because of the peer being disabled
Other	The number of packets discarded for reasons not matching the other categories or types

peer

Syntax

peer *ip-address*

Context

[\[Tree\]](#) (clear>redundancy>multi-chassis>mcr>statistics peer)

Full Context

clear redundancy multi-chassis mc-ring statistics peer

Description

This command clears multi-chassis ring peer statistics.

Parameters

ip-address

Clears ring peer statistics for the specified IP address.

Values ipv4-address: a.b.c.d
 ipv6-address:

- x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x – [0 to FFFF] H
- d – [0 to 255] D

Platforms

All

```
peer
```

Syntax

```
peer ip-address [router router-instance | service name service-name] statistics
```

Context

[\[Tree\]](#) (clear>system>ptp peer)

Full Context

```
clear system ptp peer
```

Description

This command clears PTP peer information.

Parameters

ip-address

Specifies the IPv4 or IPv6 address.

Values

ipv4-address:	a.b.c.d
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x: [0 to FFFF]H d: [0 to 255]D

router-instance

Clears information that is specific to a virtual router instance, up to 32 characters.

service-name

Clears information that is specific to a service name, up to 64 characters.

statistics

Clears statistics information of the specified IP address.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

peer

Syntax

peer [*ip-int-name*]

Context

[\[Tree\]](#) (show>router>ripng peer)

Full Context

show router ripng peer

Description

This command displays RIPng peer information.

Parameters

ip-int-name

Displays peer information for peers on the specified IPv6 interface.

Default Display peers for all interfaces

Platforms

All

Output

The following output is an example of RIPng peer information.

Output Example

```
*A:Dut-C>config>router>if# show router ripng peer
=====
RIP-NG Peers

peer

Syntax

peer [**peer-address** {*ip-address* | *ipv6-address*}] [**router** *router-instance*] [**local-address** {*ip-address* | *ipv6-address*}]

Context

[\[Tree\]](#) (show>subscr-mgmt>pfcpeer)

Full Context

show subscriber-mgmt pfcpeer

Description

This command displays connectivity details for a specific PFCP connection to a peer and the PFCP association to which the peer is linked. Multiple connections can exist per PFCP association.

Parameters

ip-address

Specifies the peer or local IPv4 address.

Values a.b.c.d

ipv6-address

Specifies the peer or local IPv6 address.

Values x:x:x:x:x:x:x (eight 16-bit pieces)
 x:x:x:x:x:d.d.d.d
 x - [0 to FFFF]H
 d - [0 to 255]D

router-instance

Specifies the identifier of the router where the peer is terminated.

Values *router-name* – base
vprn-svc-id – 1 to 2147483647

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of output of the **show subscriber-mgmt PFCP peer** command.

Output Example

```
A:BNG-UPF# show subscriber-mgmt pfcf peer
=====
PFCF Peers
=====
Peer router           : 990002
Peer Address          : 17.17.17.10

peer

Syntax

peer *ip-address* **statistics**

Context

[\[Tree\]](#) (clear>service>id>ptp peer)

Full Context

clear service id ptp peer

Description

This command clears PTP peer information.

Parameters

ip-address

Specifies the IP address.

Values a.b.c.d

statistics

Clears statistics information of the specified peer.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

peer

Syntax

peer [*ip-address*] **statistics**

Context

[\[Tree\]](#) (clear>router>pcep>pcc peer)

Full Context

clear router pcep pcc peer

Description

This command clears PCEP PCC peer statistics.

Parameters

ip-address

Specifies the IP address.

Values a.b.c.d

statistics

Clears PCEP PCC peer statistics.

Platforms

All

18.31 peer-profile

peer-profile

Syntax

peer-profile [*profile-name*]

peer-profile *profile-name* **associations**

Context

[\[Tree\]](#) (show subscr-mgmt gtp peer-profile)

Full Context

show subscriber-mgmt gtp peer-profile

Description

This command displays GTP peer profile information.

Parameters

profile-name

Specifies the name that identifies the profile.

associations

Specifies the associated contexts for the specified peer profile.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of GTP peer profile information.

Output Example

```
Node# show subscriber-mgmt gtp peer-profile

Table 349: Output fields: PTP peers

Label	Description
Router	The name of the router instance
IP Address	The IP address of the PTP peer
Announce Direction Anno Flow	The direction from which PTP announce messages were sent or received
Admin State	The administrative state of the PTP peer
G.8275 Priority	The priority used in the best master clock algorithm (BMCA) for the local PTP port when the clock profile is G.8275.x
Sync Interval	The network synchronization interval, in packets per second
Local PTP Port	The number of local PTP ports
PTP Port State	The state of the PTP port
Clock Id	The clockIdentity value of the local PTP clock

Label	Description
Remote PTP Port	The number of remote PTP ports
GM Clock Id	The clockIdentity value of the grandmaster clock advertised by the parent clock
GM Clock Class	The clockClass value of the grandmaster clock advertised by the parent clock
GM Clock Accuracy	The clockAccuracy value of the grandmaster clock advertised by the parent clock
GM Clock Variance	The offsetScaledLogVariance value of the grandmaster clock advertised by the parent clock
GM Clock Priority1	The priority1 value of the grandmaster clock advertised by the parent clock
GM Clock Priority2	The priority2 value of the grandmaster clock advertised by the parent clock
Steps Removed	The number of steps removed the PTP peer is from a grandmaster clock
Last Tx Port	The <i>port-id</i> of the last port from which a synchronization packet was transmitted
Last Rx Port	The <i>port-id</i> of the last port into which a synchronization packet was received
Port Asymmetry	The asymmetry value of the PTP peer, in nanoseconds
Best Master	Whether the clock has been deemed to be the best master clock
Parent Clock	Whether there is an external parent clock
APTS Asymmetry	The APTS asymmetry value of the PTP peer, in nanoseconds
Last Calc	The date and time of the last asymmetry value calculation
Profile Name	The name of the alternate profile configuration. If an alternate profile is not configured, Primary is displayed as the profile name.
Profile	The PTP profile used for the alternate profile configuration. <ul style="list-style-type: none"> • g8275dot1-2014 — The PTP profile specified in the ITU-T G.8275.1 recommendation. • g8275dot2-2016 — The PTP profile specified in the ITU-T G.8275.2 recommendation.
Domain	The domain in which PTP 1588 runs on the system.

Table 350: Output fields: service PTP peers

Label	Description
Router	The name of the router instance
IP Address	The IP address of the PTP peer
Announce Direction Anno Flow	The direction from which PTP announce messages were sent or received
Admin State	The administrative state of the PTP peer
G.8265 Priority	The priority used in the best master clock algorithm (BMCA) for the local PTP port when the clock profile is G.8265.x
Sync Interval	The network synchronization interval, in packets per second
Alarms	The alarms that are active for the PTP peer
Tx Timestamp Point	The transmission timestamp point
Rx Timestamp Point	The reception timestamp point
Last Tx Port	The <i>port-id</i> of the last port from which a synchronization packet was transmitted
Last Rx Port	The <i>port-id</i> of the last port into which a synchronization packet was received
Port Asymmetry	The asymmetry value of the PTP peer, in nanoseconds
Best Master	Whether the clock has been deemed to be the best master clock
Parent Clock	Whether there is an external parent clock

Label	Description
Profile Name	The name of the alternate profile configuration. If an alternate profile is not configured, Primary is displayed as the profile name.
Profile	The PTP profile used for the alternate profile configuration. <ul style="list-style-type: none">• g8275dot1-2014 — The PTP profile specified in the ITU-T G.8275.1 recommendation.• g8275dot2-2016 — The PTP profile specified in the ITU-T G.8275.2 recommendation.
Domain	The domain in which PTP 1588 runs on the system.

18.34 peq

peq

Syntax

peq [*peq-slot*] [**chassis** *chassis-id*] [**detail**]

Context

[\[Tree\]](#) (show peq)

Full Context

show peq

Description

This command displays APEQ information.

Parameters

peq-slot

Specifies the APEQ slot identifier.

Values 1 to 12

chassis-id

Specifies the chassis ID for the router chassis.

Values 1 to 2

detail

Displays detailed information.

Platforms

7750 SR-12e, 7750 SR-s, 7950 XRS

Output

The following outputs are examples of PEQ information, and [Table 351: Output Fields: show peq](#) describes the output fields.

Output Example: show peq

```
*A:Dut-A# show peq

Table 351: Output Fields: show peq

Label	Description
Slot	The number of the slot in which the APEQ is installed.
Provisioned Type Equipped Type (if different)	The APEQ type provisioned.
Admin State	The administrative state.
Operational State	The operational state.
Input	Specifies the input battery feed: A, or B.
Zone	Specifies the chassis power zone.

Label	Description
Hardware Data:	
Part number	The APEQ part number.
CLEI code	The APEQ CLEI code.
Serial number	The APEQ serial number.
Manufacture date	The date the APEQ was manufactured.
Manufacturing deviations	Specifies any manufacturing deviations.
Manufacturing assembly number	The APEQ assembly number.
Administrative state	Specifies the administrative state of the APEQ.
Operational state	Specifies the operational state of the APEQ.
Time of last boot	Indicates the time stamp of the last system restart.
Current alarm state	Indicates the current alarm state.

18.35 per-link-hash

per-link-hash

Syntax

per-link-hash [class {1 | 2 | 3}]

per-link-hash port *port-id*

Context

[\[Tree\]](#) (show>lag per-link-hash)

Full Context

show lag per-link-hash

Description

This command displays LAG per-link hash information.

Parameters

port-id

Displays information about a specified LAG link-map profile.

Values 1 to 32 (VSR)

1 to 64 (all other platforms)

Platforms

All

Output

The following output is an example of per-link hash SAP information.

[Table 352: Show Per-Link-Hash SAP Output Fields](#) describes per-link hash SAP output fields.

Output Example

18.36 per-peer-queuing

per-peer-queuing

Syntax

per-peer-queuing [detail]

Context

[\[Tree\]](#) (show>system>security per-peer-queuing)

Full Context

show system security per-peer-queuing

Description

This command enables or disables CPM hardware queuing per peer. TTL security only operates when per-peer-queuing is enabled.

Platforms

All

Output

The following output is an example of per peer queuing information.

[Table 355: Show Per-Peer-Queuing Output Fields](#) describes per-peer-queuing output fields.

Output Example

```
A:ALA-48# show system security per-peer-queuing
=====
CPM Hardware Queuing
=====
Per Peer Queuing      : Enabled
Total Num of Queues   : 8192
Num of Queues In Use  : 2
=====
A:ALA-48# configure
```

Table 355: Show Per-Peer-Queuing Output Fields

Label	Description
Per Peer Queuing	Displays the status (enabled or disabled) of CPM hardware queuing per peer.
Total Num of Queues	Displays the total number of hardware queues.
Num of Queues In Use	Displays the total number of hardware queues in use.

per-peer-queuing

Syntax

per-peer-queuing

Context

[\[Tree\]](#) (show>system>security per-peer-queuing)

Full Context

show system security per-peer-queuing

Description

This command displays the number of queues in use by the Qchip, which in turn is used by PPQ, CPM filter, SAP, and so on.

Platforms

All

Output

The following output is an example of per peer queuing information.

[Table 356: Show per-peer-queuing Output Fields](#) describes the per-peer-queuing output fields.

Output Example

```
A:ALA-48>show>system>security# per-peer-queuing
=====
CPM Hardware Queuing
=====
Per Peer Queuing      : Enabled
Total Num of Queues   : 8192
Num of Queues In Use  : 0
=====
A:ALA-48>show>system>security#
```

Table 356: Show per-peer-queuing Output Fields

Label	Description
Per Peer Queuing	Displays whether per-peer-queuing is enabled or disabled. When enabled, a peering session is established and the router will automatically allocate a separate CPM hardware queue for that peer. When disabled, no hardware queuing per peer occurs.
Total Num of Queues	Displays the total number of CPM hardware queues.
Num of Queues In Use	Displays the number of CPM hardware queues that are in use.

18.37 perform

perform

Syntax

perform

Context

[\[Tree\]](#) (tools perform)

Full Context

tools perform

Description

Commands in this context perform troubleshooting operations.

Platforms

All

18.38 performance

performance

Syntax

performance mda *mda-id* **last** *time-span* *time-unit*

Context

[\[Tree\]](#) (tools>dump>wlan-gw>isa performance)

Full Context

tools dump wlan-gw isa performance

Description

This command generates an overview of the processing load and data processed by the specified ISA over a period of time. The following time periods are supported:

- last minute with seconds granularity
- last hour with minutes granularity
- last day with hours granularity
- last day with days granularity

Parameters

mda-id

Specifies the MDA for getting performance measurements in *slot/mda* format.

Values slot — 1 to 10
mda — 1 to 2

time-span

Specifies the period for which to get measurements.

Values 1 to 60 (sec), 1 to 60 (min), 1 to 24 (hrs), 1 (days)

time-unit

Specifies the period for which to get measurements.

Values sec, min, hrs, days

Platforms

7750 SR, 7750 SR-e, 7750 SR-s

Output

This command displays performance information.

Output Example

```
Node# /tools dump wlan-gw isa performance mda 2/1 last 5 min
=====
Measurements for last 5 minutes on Slot #2 MDA #1
=====
Timestamp          |      Wait      Idle      Work | Total jobs |      Total data

performance

Syntax

performance mda *mda-id last time-span time-unit*

Context

[\[Tree\]](#) (tools>dump>nat>isa performance)

Full Context

tools dump nat isa performance

Description

This command generates an overview of the processing load and data processed by the specified ISA over a period of time. The following time periods are supported:

- last minute with seconds granularity
- last hour with minutes granularity
- last day with hours granularity
- last 31 days with days granularity

Parameters

mda-id

Specifies the MDA for getting performance measurements in format *slot/mda*.

Values slot — 1 to 10
 mda — 1 to 2

time-span

Specifies the period for which to get measurements.

Values 1 to 60 (sec) | 1 to 60 (min) | 1 to 24 (hrs) | 1 to 31 (days)

time-unit

Specifies the period for which to get measurements.

Values sec | min | hrs | days

pfcf-session sap sap-id mac mac-address
```

Context

[\[Tree\]](#) (clear>subscr-mgmt pfcf-session)

Full Context

```
clear subscriber-mgmt pfcf-session
```

Description

This command locally clears a PFCP session, either by providing the session ID or the associated SAP ID and MAC address.

Note:

This command does not delete the session on the BNG CPF and should only be used as a last attempt to delete the PFCP sessions. It is always recommended to first attempt to gracefully delete the session from the BNG CPF.

Parameters

session-id

Specifies the locally assigned PFCP session ID, up to 20 characters.

sap-id

Specifies the SAP ID associated with the session.

ping-template

Syntax

ping-template *template-name*

ping-template

Context

[\[Tree\]](#) (show>test-oam>icmp ping-template)

Full Context

show test-oam icmp ping-template

Description

This command displays a summary of configured ping templates and the total number service interfaces that reference the template. By specifying template name, the values for the specified interface and the total and active references for that specific template are displayed.

Parameters

template-name

Specifies the name of the ping template to be queried, up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following output is an example of ping template information.

Output Example

```
show test-oam icmp ping-template
=====

18.48 ping-template-sync

ping-template-sync

Syntax

ping-template-sync *template-name*

Context

[\[Tree\]](#) (tools>perform>test-oam>icmp ping-template-sync)

Full Context

tools perform test-oam icmp ping-template-sync

Description

This command updates all values for service IP interfaces that reference the specified **config>test-oam>icmp>ping-template** *template-name*. Changes to the **ping-template** in this context are not automatically pushed to service IP interfaces. Values imported by the service interface are those configured when the service IP interface referenced the ping- template.

Parameters

template-name

Specifies the ping template name, up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

18.49 ping-template-using

ping-template-using

Syntax

ping-template-using [*template-name*]

Context

[\[Tree\]](#) (show>test-oam>icmp ping-template-using)

Full Context

show test-oam icmp ping-template-using

Description

This command displays information about service IP interfaces that reference a ping template, the associated router instance, and the administrative state of the ping template under that interface.

Parameters

template-name

Displays the interfaces mapped to the **ping-template** *template-name*, up to 64 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following output is an example ping template output information.

Output Example

```

Context

[\[Tree\]](#) (show>router policy)

Full Context

show router policy

Description

This command displays configured policy statement information.

Parameters

admin

When this keyword is specified, the entire policy option configuration is displayed, including any uncommitted configuration changes. This command is similar to the **info** command.

Note:

This parameter is not available in the MD-CLI.

as-path

When this keyword is specified, the parameter displays configured as-path regular expressions (optionally filtered by name).

as-path-group

When this keyword is specified, the command displays configured as-path-groups, optionally filtered by name.

community

When this keyword is specified, the command displays configured community lists, optionally filtered by name.

damping

When this keyword is specified, the information about the route policy damping configurations is displayed.

entry *entry-id*

Displays the configuration (with parameter value substitution) of the subroutine policy called by the entry with entry ID.

exclusive-access

Displays the policy that edits exclusive access and lock information.

Note:

This parameter is not available in the MD-CLI.

expand-variables

Displays the variables that are replaced with values in main policies or in sub-policies.

prefix-list *name*

Displays the prefix lists configured in the route policy.

policy *name*

Displays information similar to the info command for a specific policy-statement. If a *name* is provided, the matching policy-statement displays. If no *statement* name is specified, a list of all policies statements and descriptions display.

route-distinguisher *rd-list-name*

Keyword to display all the configured route distinguisher lists. If an *rd-list-name* is provided, the specified route distinguisher list is displayed.

sub-policy

When this keyword is specified, the configuration of a subroutine policy is displayed.

subpol-name

Specifies the policy name up to 64 characters.

entry-id

Specifies the numeric entry identifier of the policy.

Values 1 to 4294967295

Platforms

All

show router policy admin
```

Note: This command option is similar to the **info** command, which displays information about the route policies and parameters.

Output Example

```
prefix-list "All-Routes"
  prefix 0.0.0.0/0 longer
  prefix 2.0.0.0/8 longer
  prefix 3.0.0.0/8 longer
  prefix 4.0.0.0/8 longer
  prefix 5.0.0.0/8 longer
  prefix 6.0.0.0/8 exact
  prefix 224.0.0.0/24 longer
exit
...
```

Use the following command to display information about a specific route policy.

```
show router policy name
```

Output Example

```
description "Policy Statement For 'BGP To RIP'"
  entry 10
    description "Entry For Policy 'BGP To RIP'"
    from
      protocol bgp
    exit
    to
      protocol rip
    exit
    action accept
      metric set 1
      next-hop 10.0.18.200
      tag 805
    exit
  exit
  default-action reject
```

Use the following command to display information about the route policy damping configurations.

```
show router policy damping
```

Output Example

```
=====
Route Damping Profiles
=====
damping "TEST-LOW"
  half-life 22
  max-suppress 720
  reuse 10000
  suppress 15000
exit
damping "TEST-HIGH"
  half-life 22
  max-suppress 720
  reuse 1000
  suppress 5000
exit
damping "TEST-MEDIUM"
  half-life 22
  max-suppress 720
  reuse 5000
  suppress 11000
exit
=====
```

Use the following command to display information about the subroutine called by an entry of the route policy.

```
show router policy "poll" sub-policy entry 10 name "pol2"
```

Output Example

```
=====
poll entry 10 sub-policies
=====
-----
Level1 Sub-policy : pol2   Parent-policy : poll, Parent-entry 10
-----
  entry 20
    from
      community "telnet"
    exit
  exit
=====
```

Table 358: Route Policy Output Fields

Label	Description
Policy	Displays a list of route policy names.
Description	Displays the description of each route policy.
Policies	The total number of policies configured.

policy

Syntax

policy [*policy-id* [**event** *event-type specific-qualifier*]]

Context

[\[Tree\]](#) (show>vrrp policy)

Full Context

show vrrp policy

Description

This command displays VRRP priority control policy information.

If no command line options are specified, a summary of the VRRP priority control event policies displays.

Parameters

policy-id

Displays information on the specified priority control policy ID.

Default All VRRP policies IDs

Values 1 to 9999

event-type

Displays information on the specified VRRP priority control event within the policy ID.

Default All event types and qualifiers

Values port-down, lag-port-down, host-unreachable, route-unknown, mc-ipsec-non-forwarding

specific-qualifier

Display information about the specified qualifier.

Values port-id, lag-id, host-ip-addr, route-prefix/mask, tunnel-group-id

Platforms

All

Output

VRRP Policy Output — The following output is an example of VRRP policy information, and [Table 359: Show VRRP Policy Output Fields](#) describes the fields.

Table 359: Show VRRP Policy Output Fields

Label	Description
Policy Id	The VRRP priority control policy associated with the VRRP virtual router instance A value of 0 indicates that no control policy is associated with the virtual router instance
Current Priority & Effects	
Current Explicit	When multiple explicitly defined events associated with the priority control policy happen simultaneously, the lowest value of all the current explicit priorities will be used as the in-use priority for the virtual router
Current Delta Sum	The sum of the priorities of all the delta events when multiple delta events associated with the priority control policy happen simultaneously; this sum is subtracted from the base priority of the virtual router to give the in-use priority
Delta Limit	The delta-in-use-limit for a VRRP policy; once the total sum of all delta events has been calculated and subtracted from the base-priority of the virtual router, the result is compared to the delta-in-use-limit value; if the result is less than this value, the delta-in-use-limit value is used as the virtual router in-use priority value; if an explicit priority control event overrides the delta priority control events, the delta-in-use-limit has no effect If the delta-in-use-limit is 0, the sum of the delta priority control events to reduce the virtual router's in-use-priority to 0 can prevent it from becoming or staying master
Current Priority	The configured delta-in-use-limit priority for a VRRP priority control policy or the configured delta or explicit priority for a priority control event
Applied	The number of virtual router instances to which the policy has been applied; the policy cannot be deleted unless this value is 0
Description	A text string which describes the VRRP policy
Event Type & ID	A delta priority event is a conditional event defined in a priority control policy that subtracts a given amount from the base priority to give the current in-use priority for the VRRP virtual router instances to which the policy is applied An explicit priority event is a conditional event defined in a priority control policy that explicitly defines the in-use priority for the VRRP virtual router instances to which the policy is applied

Label	Description
	Explicit events override all delta events; when multiple explicit events occur simultaneously, the event with the lowest priority value defines the in-use priority
Event Oper State	The operational state of the event
Hold Set Remaining	The amount of time that must pass before the set state for a VRRP priority control event can transition to the cleared state to dampen flapping events
Priority & Effect	Delta — the <i>priority-level</i> value is subtracted from the associated virtual router instance's base priority when the event is set and no explicit events are set; the sum of the priority event <i>priority-level</i> values on all set delta priority events are subtracted from the virtual router base priority to derive the virtual router instance in-use priority value If the delta priority event is cleared, the <i>priority-level</i> is no longer used in the in-use priority calculation
	Explicit — the <i>priority-level</i> value is used to override the base priority of the virtual router instance if the priority event is set and no other explicit priority event is set with a lower <i>priority-level</i> The set explicit priority value with the lowest <i>priority-level</i> determines the actual in-use protocol value for all virtual router instances associated with the policy
In Use	Specifies whether the event is currently affecting the in-use priority of some virtual router

Output Example

```
A:ALA-A# show vrrp policy

Table 360: Show VRRP Policy Event Output Fields

Label	Description
Description	A text string which describes the VRRP policy
Policy Id	The VRRP priority control policy associated with the VRRP virtual router instance A value of 0 indicates that no control policy is associated with the virtual router instance
Current Priority	The base router priority for the virtual router instance used in the master election process
Current Explicit	When multiple explicitly defined events associated with the priority control policy happen simultaneously, the lowest value of all the current explicit priorities will be used as the in-use priority for the virtual router

Label	Description
Applied	The number of virtual router instances to which the policy has been applied; the policy cannot be deleted unless this value is 0
Current Delta Sum	The sum of the priorities of all the delta events when multiple delta events associated with the priority control policy happen simultaneously; this sum is subtracted from the base priority of the virtual router to give the in-use priority
Delta Limit	The delta-in-use-limit for a VRRP policy; once the total sum of all delta events has been calculated and subtracted from the base-priority of the virtual router, the result is compared to the delta-in-use-limit value; if the result is less than this value, the delta-in-use-limit value is used as the virtual router in-use priority value; if an explicit priority control event overrides the delta priority control events, the delta-in-use-limit has no effect If the delta-in-use-limit is 0, the sum of the delta priority control events to reduce the virtual router's in-use-priority to 0 can prevent it from becoming or staying master
Applied to Interface Name	The interface name where the VRRP policy is applied
VR ID	The virtual router ID for the IP interface
Opr	Up — indicates that the operational state of the VRRP instance is up
	Down — indicates that the operational state of the VRRP instance is down
Base Pri	The base priority used by the virtual router instance
InUse Priority	The current in-use priority associated with the VRRP virtual router instance
Master Priority	The priority of the virtual router instance which is the current master
Priority	The base priority used by the virtual router instance
Priority Effect	Delta — a delta priority event is a conditional event defined in a priority control policy that subtracts a given amount from the base priority to give the current in-use priority for the VRRP virtual router instances to which the policy is applied
	Explicit — a conditional event defined in a priority control policy that explicitly defines the in-use priority for the VRRP virtual router instances to which the policy is applied

Label	Description
	Explicit events override all delta events; when multiple explicit events occur simultaneously, the event with the lowest priority value defines the in-use priority
Current Priority	The configured delta-in-use-limit priority for a VRRP priority control policy or the configured delta or explicit priority for a priority control event
Event Oper State	The operational state of the event
Hold Set Remaining	The amount of time that must pass before the set state for a VRRP priority control event can transition to the cleared state to dampen flapping events
Priority	The base priority used by the virtual router instance
Priority Effect	Delta — the <i>priority-level</i> value is subtracted from the associated virtual router instance's base priority when the event is set and no explicit events are set; the sum of the priority event <i>priority-level</i> values on all set delta priority events are subtracted from the virtual router base priority to derive the virtual router instance in-use priority value If the delta priority event is cleared, the <i>priority-level</i> is no longer used in the in-use priority calculation
	Explicit — the <i>priority-level</i> value is used to override the base priority of the virtual router instance if the priority event is set and no other explicit priority event is set with a lower <i>priority-level</i> The set explicit priority value with the lowest <i>priority-level</i> determines the actual in-use protocol value for all virtual router instances associated with the policy
Hold Set Config	The configured number of seconds that the hold-set timer waits after an event enters a set state or enters a higher threshold set state, depending on the event type
Value In Use	Yes — the event is currently affecting the in-use priority of some virtual router
	No — the event is not affecting the in-use priority of some virtual router
# trans to Set	The number of times the event has transitioned to one of the 'set' states
Last Transition	The time and date when the operational state of the event last changed

policy

Syntax

policy [*policy-id*] **association**

Context

[\[Tree\]](#) (show>system>security>cpu-protection policy)

[\[Tree\]](#) (show>system>security>dist-cpu-protection policy)

Full Context

show system security cpu-protection policy

show system security dist-cpu-protection policy

Description

This command displays CPU protection policy information.

Parameters

policy-id

Displays CPU protection policy information for the specified policy ID.

association

This keyword displays associations for the specified policy ID.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-7s, 7750 SR-14s, 7950 XRS

- show system security cpu-protection policy

All

- show system security dist-cpu-protection policy

policy

Syntax

policy *policy-assoc-name*

Context

[\[Tree\]](#) (show>router>pcep>pcc>pce-assoc policy)

Full Context

show router pcep pcc pce-associations policy

Description

This command displays the policy association information.

If a policy association name is not specified, the information for all configured policy associations is displayed.

Parameters

policy-assoc-name

Specifies the name of the policy association, up to 32 characters.

Platforms

All

Output

The following output is an example of policy association information, and [Table 361: Show Policy Association Descriptions](#) describes the output fields.

Output Example

```
*A:Dut-C>config>router>mpls>lsp# show router pcep pcc pce-associations policy "test_pol"
=====
PCEP PCC Policy Associations Info
=====
Association Name      : test_pol
Association ID        : 10
Association Source    : 192.168.213.59
=====
```

Table 361: Show Policy Association Descriptions

Label	Description
Association Name	The policy association name
Association ID	The policy association ID
Association Source	The source IP address of the policy association. Both IPv4 and IPv6 are supported.

18.56 policy-edits

policy-edits

Syntax

policy-edits

Context

[\[Tree\]](#) (show>router policy-edits)

Full Context

show router policy-edits

Description

This command displays edited policy information that was entered in the classic CLI.

Note:

This command is not available in the MD-CLI.

Platforms

All

18.57 policy-test

policy-test

Syntax

policy-test *plcy-or-long-expr* [*plcy-or-expr* [*plcy-or-expr*...{up tp 14 max}] [**family** *family*] [**rd** *rd*] **prefix** *ip-prefix/ip-prefix-length* [**longer**] [**neighbor** *ip-address*] [**display-rejects**] [{**detail** | **brief**}] [**display-rejects-only**] [**export**] [**protocol** *protocol*]

Context

[\[Tree\]](#) (show>router>bgp policy-test)

Full Context

show router bgp policy-test

Description

This command allows the operator to evaluate existing route policy or chain of route policies or route policy logical expression effects, as a BGP import or export policy, by identifying the routes that would be accepted or rejected after the complete evaluation.

When the policy, list of policies or logical expression is used as a BGP export policy, the **export** keyword must be included. When the policy is used as a BGP import policy, the **export** keyword should not be included.

Parameters

plcy-or-long-expr

Specifies up to 14 policy names or a long expression.

Values policy-name: a policy name, up to 64 characters
 long-expr: a long expression, up to 255 characters.

plcy-or-expr

Specifies the policy name or expression.

Values policy-name: a policy name, up to 64 characters
expr: an expression, up to 64 characters

family

ipv4, ipv6, vpn-ipv4, vpn-ipv6, label-ipv4, label-ipv6.

Default ipv4

rd

Specifies the route distinguisher value in one of the following formats:

- *ip-addr.comm-val*
- *2byte-asnumber.ext-comm-val*
- *4byte-asnumber.comm-val*

ip-prefix/ip-prefix-length

Specifies an IPv4 or IPv6 prefix/mask to be evaluated. The keyword **longer** may be specified to evaluate longer prefix matches (optional).

ip-address

Specifies the IPv4 or IPv6 address of a peer from which the BGP routes to be evaluated were sent, up to 64 characters.

longer

Matches prefixes with a longer prefix-length.

display-rejects

Displays routes that were rejected by the policy. If not specified, only a count of rejected routes are shown.

detail

When the policy modifies route attributes, it displays the modifications made to the routes. This command requires an exact prefix to be specified.

brief

Provides a summarized display of the route attributes modifications. This command requires an exact prefix to be specified.

display-rejects-only

Displays only routes rejected by the policy test.

export

Indicates that the policy test is conducted in the context of a BGP export policy. The analyzed set of routes also include non-BGP routes that can be redistributed by BGP.

protocol

Displays routes by the protocol type. This keyword is only applicable when the **export** keyword is also present.

Platforms

All

Output

The following output is an example of policy test information, and [Table 362: Show Policy Test Field Descriptions](#) describes the output fields.

Output Example

Table 362: Show Policy Test Field Descriptions

Field	Description
Status codes	Codes used for used, suppressed, history, decayed or valid status

Field	Description
Origin codes	Codes used for IGP, EGP, incomplete, best or backup origin
Flag	Indicator for network, nexthop or as-path routes

18.58 pool

pool

Syntax

pool *pool-name*

Context

[\[Tree\]](#) (tools>perform>router>dhcp>server pool)

[\[Tree\]](#) (tools>perform>router>dhcp6>server pool)

Full Context

tools perform router dhcp local-dhcp-server pool

tools perform router dhcp6 local-dhcp-server pool

Description

This command performs local DHCP or DHCP6 server IP address pool tasks.

Parameters

pool-name

Specifies the pool name.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

pool

Syntax

pool *pool-name*

pool

Context

[\[Tree\]](#) (show>router>nat pool)

Full Context

```
show router nat pool
```

Description

This command displays NAT pool information.

Parameters

pool-name

Specifies the pool name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of this command.

Output Example

```
show router nat pool
=====
NAT pools
=====
Pool NAT-group Type Admin-state
-----
MyPool 1 l2Aware inService
MyPool2 1 l2Aware inService
-----
No. of pools: 2

18.59 pool-ext-stats

pool-ext-stats

Syntax

```
pool-ext-stats [pool-name]
```

Context

[\[Tree\]](#) (show>router>dhcp>server pool-ext-stats)

Full Context

```
show router dhcp local-dhcp-server pool-ext-stats
```

Description

This command displays extended statistics per DHCPv4 pool in local DHCPv4 server.

The following statistics are included in output:

- The number of stable leases in the pool
- The number of provisioned address in the pool
- The number of used address in the pool
- The number of free address in the pool
- The percentage of used address
- The percentage of free address

For each statistic (except for provisioned addresses), there is current value and peak value, peak value is the highest value since pool creation or last reset via the **clear router *rt-id* dhcp local-dhcp-server *svr-name* pool-ext-stats** command.

Parameters

pool-name

Specifies the name of DHCPv4 local server pool.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of pool extended statistics information.

Output Example

```

show router 500 dhcp local-dhcp-server "d4" pool-ext-stats "pool-1"
=====
Extended pool statistics for server "d4"

[Table 363: Extended Pool Statistics Field Descriptions](#) describes extended pool statistics output fields.

Table 363: Extended Pool Statistics Field Descriptions

Field	Description
Current	The current pool statistics
Peak	The peak value since the last reset
Timestamp	The date and time of the last reset
Pool	The pool name
Stable Leases	The number of stable leases in the pool
Provisioned Addresses	The number of provisioned addresses in the pool
Used Addressed	The number of used addresses in the pool
Free Addresses	The number of free addresses in the pool
Used Pct	The percentage of subnets in use in the pool
Free Pct	The percentage of unused subnets in the pool
Last Reset Time	The date and time of the last reset in the pool
Number of entries	The total number of entries

pool-ext-stats

Syntax

pool-ext-stats [*pool-name*]

Context

[\[Tree\]](#) (show>router>dhcp6>server pool-ext-stats)

Full Context

show router dhcp6 local-dhcp-server pool-ext-stats

Description

This command displays extended statistics per DHCPv6 pool in local DHCPv6 server.

The following statistics are included in output:

- The number of stable leases in the pool
- The number of provisioned /64 address block in the pool
- The number of used /64 address block in the pool
- The number of free /64 address block in the pool
- The percentage of used address (with /64 address block)
- The percentage of free address (with /64 address block)

For each statistic (except for Provisioned Addresses), there is current value and peak value, peak value is the highest value since pool creation or last reset via command "clear router <rt-id> dhcp6 local-dhcp-server <svr-name> pool-ext-stats".

Parameters

pool-name

Specifies the name of DHCPv6 local server pool.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of subnet statistics information.

Output Example

```
show router 500 dhcp6 local-dhcp-server "d6" pool-ext-stats "pool-v6"
=====
Extended pool statistics for server "d6"

Table 365: Failover Pool Statistics Field Descriptions describes pool statistics output field descriptions.

Table 365: Failover Pool Statistics Field Descriptions

Field	Description
Failover Admin State	Identifiers the failover state of the DHCP server instance inService — The failover admin state is in service outOfService — The failover admin state is out of service
Failover Oper State	The operational state of a DHCP server instance
Failover Persist Key	The maximum amount of time that one server can extend a lease for a client's binding beyond the time known by the partner server
Administrative MCLT	The administrative Maximum Client Lead Time (MCLT)
Operational MCLT	Indicates the operational MCLT
Startup Wait Time	The startup wait time. The startup wait time is the time that one IP address pool attempts to contact the partner

Field	Description
	IP address pool. During this time, the IP address pool is unresponsive to DHCP client requests.
Partner Down Delay	The minimum safe-time after the beginning of COMMUNICATIONS-INTERRUPTED state. After the expiry of this time, the server enters the PARTNER-DOWN state.
Ignore McLT	The ignore McLT status. If, after the transition COMMUNICATIONS-INTERRUPTED-to-PARTNER-DOWN state, the DHCP server instance ignores the safety period with a duration of Maximum Client Lead Time; a 'true' value has the effect that the DHCP server starts offering IP addresses from the partner's scope immediately after this transition, without waiting for existing leases allocated by the partner and not known by this system to time out. A 'true' value increases the risk that duplicate addresses are offered; if the transition to PARTNER-DOWN state is likely to be caused by a failure of the partner system rather than a communications problem, this risk is reduced.
Failover statistics for pool	The failover statistics for each pool
Dropped Invalid Packets	The number of BNDUPD packets that were dropped because the packet was malformed
Failover Shutdown	The number of BNDUPD packets that were dropped because the failover state if the DHCP server instance is shut down
Lease Already Expired	The number of BNDUPD packets that were dropped because the corresponding lease has expired
Maximum Lease Count Reached	The number of BNDUPD packets that were dropped because the maximum number of leases were reached
Subnet Not Found	The number of BNDUPD packets that were dropped because a valid subnet could not be found for the lease
Range Not Found	The number of BNDUPD packets that were dropped because a valid include range could not be found for the lease.
Host Conflict	The number of BNDUPD packets that were dropped because this DHCP server instance has already leased this address to another host

Field	Description
Address Conflict	The number of BNDUPD packets that were dropped because this DHCP server instance has already leased another address to this host
Peer Conflict	The number of BNDUPD packets that were dropped because the failover peer has leased an address within a subnet range of which the failover control is set to local on this local DHCP server instance
Persist Congestion	The number of BNDUPD packets that were dropped because of persistence congestion on this DHCP server instance
No Lease Hold Time Configured	The number of BNDUPD packets that were dropped because the lease hold time is zero on this DHCP server instance
Lease Not Found	The number of Binding Database Update (BNDUPD) remove packets were dropped because the corresponding lease could not be found.
Number of pools found	The total number of pools found

18.61 pool-threshold-stats

pool-threshold-stats

Syntax

```
pool-threshold-stats [pool-name] detail [ format {exact | scientific}]
pool-threshold-stats [pool-name]
```

Context

[\[Tree\]](#) (show>router>dhcp6>server pool-threshold-stats)

Full Context

```
show router dhcp6 local-dhcp-server pool-threshold-stats
```

Description

This commands displays pool level threshold stats of local DHCPv6 server. A minimum-free threshold needs to be configured before system collects threshold stats for the prefix.

The stats for each threshold are calculated based on the configured minimum-free prefix length.

For example, a /59 prefix is provision in the local DHCPv6 server, and the server allocated two PD leases, one /62 and one /63. And there is a /63 minimum threshold configured. The threshold stats are calculated

based on /63 as the base unit (block). Then the value of current used block would be 3 because there is one /62 lease and one /63 lease, that equals to a total of three /63.

Parameters

pool-name

Specifies the name of the pool in local DHCPv6 server.

detail

Displays detailed output.

format

Specifies the format in the display to be either **exact** or **scientific**.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of pool threshold statistics information.

Output Example

```
show router 500 dhcp6 local-dhcp-server "d6" pool-threshold-stats "1"
=====
Server "d6"
=====
Operational state      : inService
-----
Pool                   : 1
-----

```

The above command displays detailed statistics of all pool level thresholds in the specified pool:

- **Blks** in the output means the minimum free prefix length.
- **Valid Data** output indicates whether the data you see is valid or not. The data is invalid when a background stats update is scheduled or busy.

[Table 366: Pool Threshold Statistics Field Descriptions](#) describes pool threshold statistics output fields.

Table 366: Pool Threshold Statistics Field Descriptions

Field	Description
Operational state	The operational state of the local DHCP server instance unknown — The operational state is unknown inService — The operational state is in service outOfService — The operational state is out of service transition — The operational state is in transition waitPersistence — The DHCP server instance is waiting for a persistence action to complete.
Pool	The pool ID
Stable Leases	The number of stable leases
Advertised leases	The number of advertised leases
Threshold	The prefix level threshold
Current Provisioned Blks	The number of provisioned blocks in this pool
Current Used Blks	The number of used blocks in this pool
Current Free Blks	The number of free blocks in this pool
Current Used Percent	The percentage of used prefixes with the minimum free threshold length in the pool compared to the number of provisioned prefixes
Current Used Peak Blks	A 64-bit word of the peak value of the number of used blocks in the pool with a prefix length
Current Used Peak Percent	The peak value of the number of used prefixes with the minimum free threshold length in the pool as a percentage of the provisioned prefixes. This depends on the current failover state of the DHCP server or pool
Current Used Peak Time	The time at which the peak value of the number of used prefixes in the pool was reached
Current Free Percent	The percentage of free prefixes with the minimum free threshold length in the pool compared to the number of provisioned prefixes. This depends on the current failover state of the DHCP server or pool
Current Free Too Low	The number of free prefixes with the minimum free threshold length available in the pool that is below the configured number of prefixes with the minimum free threshold length

Field	Description
Current Free Depleted	The number of prefixes with the minimum free threshold length available in the pool
Local Provisioned Blks	A 64-bit word of the number of provisioned prefixes with the minimum free threshold length local in the pool
Local Used Blks	A 64-bit word of the number of used prefixes with the minimum free threshold length local in the pool
Local Free Blks	A 64-bit word of the number of free prefixes with the minimum free threshold length local in the pool
Local Used Peak Blks	A 64-bit word of the peak value of the number of used prefixes with the minimum free threshold length local in the pool
Local Used Peak Percent	The peak value of the number of used prefixes with the minimum free threshold length local in the pool as a percentage of the provisioned prefixes
Local Used Peak Time	The time at which the peak value of the number of used prefixes local in the pool was reached
Remote Provisioned Blks	A 64-bit word of the number of provisioned prefixes with the minimum free threshold length remote in the pool
Remote Used Blks	A 64-bit word of the number of used prefixes with the minimum free threshold length remote in the pool
Remote Free Blks	A 64-bit word of the number of free prefixes with the minimum free threshold length remote in the pool

show pools

Description

This command displays pool information.

Parameters

mda-id[/port]

Displays the pool information of the specified MDA and port.

Values slot/mda[/port]

access-app

Specifies the pool application as either access ingress or egress.

Values access-ingress, access-egress

pool-name

Displays the pool information of the specified pool. If specified, the name must be **default**.

service-id

Displays pool information for the specified service.

Values 1 to 2148278386, *svc-name*: 64 char max

queue-group-name

Displays information for the specified queue group.

Values 32 chars max

instance-id

Specifies the identification of a specific instance of the queue group.

Values 1 to 65535

network-egress

Displays network egress information.

direction

Displays information for the ingress or egress direction.

Values ingress, egress

slot-number

Displays information for the specified card slot.

Values 1 to 10

fp-number

Displays information for the specified FP.

Values 1 to 8

app-ingress

Displays network ingress or access ingress information.

Values network-ingress, access-ingress

Platforms

All

Output

The following outputs are example of pool information, and [Table 367: Output Fields: show pools](#) describes the output fields.

Note:

The pool shared in use stat only increases when a queue is asking for a buffer outside its reserved size. If all the buffers in a pool are assigned to queues within their reserved size, then only the reserved in use size will increase. In case of resv CBS over subscription (CBS sum for all queues is bigger than pool resvCbs), it is possible that pool resv in use stat can increase above the actual pool reserved size.

Output Example: show pools

```

Output Fields: show pools

Table 367: [Output Fields: show pools](#) describes the output fields for the **show pools** command.

Table 367: *Output Fields: show pools*

Label	Description
Type	Specifies the pool type.
ID-FP	Specifies the card-FP or MDA-FP or card, MDA, or port designation.

Label	Description
Application/Type	Specifies what the pool would be used for. The pools could be used for access or network traffic at either ingress or egress.
Pool Name	Specifies the name of the pool being used.
Resv CBS	Specifies the percentage of pool size reserved for CBS.
Utilization	Specifies the type of the slope policy.
State	The administrative status of the port.
Start-Avg	Specifies the percentage of the buffer utilized after which the drop probability starts to rise above 0.
Max-Avg	Specifies the percentage of the buffer utilized after which the drop probability is 100 percent. This implies that all packets beyond this point will be dropped.
Time Avg Factor	Specifies the time average factor the weighting between the previous shared buffer average utilization result and the new shared buffer utilization in determining the new shared buffer average utilization.
Actual ResvCBS	Specifies the actual percentage of pool size reserved for CBS.
Admin ResvCBS	Specifies the percentage of pool size reserved for CBS.
PoolSize	Specifies the size in percentage of buffer space. The value '-1' implies that the pool size should be computed as per fair weighting between all other pools.
Pool Total	Displays the total pool size.
Pool Shared	Displays the amount of the pool which is shared.
Pool Resv	Specifies the percentage of reserved pool size.
Pool Total In Use	Displays the total amount of the pool which is in use.
Pool Shared In Use	Displays the amount of the pool which is shared that is in use.

Full Context

show port

Description

This command displays port or channel information.

If the *port-id* parameter only specifies a portion of a port identifier, a summary of all ports that start with that portion is displayed. For example, specifying a slot number and MDA number displays a summary of all ports on that MDA. If no *port-id* is provided, a summary of all ports in the system is displayed.

If the **detail** keyword is specified without any *port-id*, the detailed output of every port is displayed. This is useful for generating a complete report or as an input into the "| match" post-filtering command to display only specific fields for all ports (customized summaries).

If the *port-id* specifies a unique port, information about that port is displayed. The specific information displayed depends on the type of port. Additional information can be displayed if the **detail** keyword is included. In addition, information subsets can be displayed by using various keywords. For example, the **otu** keyword displays only the OTU interface information for the port.

When the **associations** keyword is specified and the *port-id* is a member of a LAG, the command is interpreted as a request to display the associations of that LAG (see the **show lag lag-id associations** command).

Parameters

port-id

Specifies the physical port ID in the form *slot/mda/port*. The following table describes the port ID values.

Table 368: Port ID values

Product	Slot	MDA	Port	Values
7750 SR-12	1 to 10	1, 2	1 to 60 (depending on the MDA type)	—
7750 SR-7	1 to 5	1, 2		—
7950 XRS	1 to 20	—		—
7450 ESS-7	—	—		1 to 4
7450 ESS-12	—	—		1 to 0
7750 SR single-slot FP5	—	—		A/gnss
7750 SR-2se	—	—		A/gnss B/gnss
Channelized MDAs				
CHOC12-SFP	—			<i>slot/mda/port</i> [1 to 4]. [1 to 3]. [1 to 28]. [..24] For example, 7/2/1.1.1.28.24
CHOC3-SFP	—			<i>slot/mda/port</i> . [1 to 3]. [1 to 28]. [..24] For example, 7/2/1.1.28.24
DS3	—			<i>slot/mda/port</i> . [1 to 28] . [..24]

Product	Slot	MDA	Port	Values
				For example, 7/1/1.1.1

Values

<i>port-id</i>	<i>slot[/mda[/port]]</i> or <i>slot/mda/port</i> [.channel]		
<i>aps-id</i>	<i>aps-group-id</i> [.channel]		
	<i>aps</i>		keyword
	<i>group-id</i>		1 to 64
<i>ccag-id</i>	<i>slot/mda/path-id</i> [cc-type]		
	<i>path-id</i>		a,b
	<i>cc-type</i>		.sap-net, .net-sap
<i>eth-sat-id</i>	<i>esat-id</i> [/slot/[u]port]		
	<i>esat</i>		keyword
	<i>id</i>		1 to 20
	<i>u</i>		keyword for up-link port
<i>pxc-id</i>	<i>pxc-id.sub-port</i>		
	<i>pxc</i>		keyword
	<i>id</i>		1 to 64
	<i>sub-port</i>		a, b
<i>esa-port</i>	<i>esa-esa-id</i> [/vm-id[/esa-keyword]]		
	<i>esa</i>		keyword
	<i>esa-id</i>		1 to 16
	<i>vm-id</i>		1 to 4
	<i>esa-keyword</i>	fm-sub	Information/statistics on the internal interface toward an AA ESA-VM for from-subscriber traffic
		to-sub	Information/statistics on the internal interface toward an AA ESA-VM for to-subscriber traffic
		aa-svc	Information/statistics on the internal interface toward an AA ESA-VM for aa-service traffic

private	Information/statistics on the internal interface toward a tunnel ESA-VM for private traffic
public	Information/statistics on the internal interface toward a tunnel ESA-VM for public traffic
ike	Information/statistics on the internal interface toward a tunnel ESA-VM for IKE traffic
icmp	Information/statistics on the internal interface toward a tunnel ESA-VM for ICMP traffic
frag	Information/statistics on the internal interface toward a tunnel ESA-VM for fragmented traffic
nat-in-ip	Information/statistics on the internal interface toward a BB ESA-VM for NAT44 and NAT64 upstream/downstream traffic on the inside, for WLAN-GW tunnel traffic from/towards access points, or for a reassembly traffic over a SAP-based interface
nat-out-ip	Information/statistics on the internal interface toward a BB ESA-VM for NAT44, DS-Lite, NAT64 and L2-aware NAT upstream/downstream traffic on the outside, or for WLAN-GW UE traffic from/towards the network
nat-in-l2	Information/statistics on the internal interface toward a BB ESA-VM for L2-aware NAT
lns-net	Information/statistics on the internal interface toward a LNS ESA-VM, L2TP encapsulated packets from the LAC undergoes L2TP header removal
lns-esm	Information/statistics on the internal interface toward a LNS ESA-VM, IP packets from the network which undergoes L2TP encapsulation
nat-in-ds	Information/statistics on the internal interface toward a BB ESA-VM for DS-lite upstream/downstream traffic on the inside

lo-gre Information/statistics on the internal interface between a WLAN-GW anchor ESA VM and tunnel ESA VM, for both up and downstream traffic

access

Specifies that the queue group name is on an access port.

active

Keyword to display only active events.

aps

Displays ports on APS groups.

associations

Displays a list of port association.

cem

Displays CEM encap ports and channels.

cleared

Keyword to display remote information on the bridge MAC.

degraded

Keyword to display degrade severity events.

description

Displays port description strings.

detail

Provides detailed information.

dot1x

Displays information about 802.1x status and statistics.

egress

Specifies whether the queue group name is an egress policy.

egress-aggregate

Displays aggregate egress statistics.

ethernet

Displays Ethernet port information.

failure

Keyword to display failure severity events.

A/gnss

Displays interface information for the GNSS port on CPM A.

B/gnss

Displays interface information for the GNSS port on CPM B.

hs-secondary-shaper

Displays information about a specific HS secondary shaper on a port.

ingress

Specifies whether the queue group name is an ingress policy.

instance-id

Specifies the identification of a specific instance of the queue group.

Values 1 to 65535

macsec

Displays the MACsec information for the port.

monitor-threshold

Displays the exceed-count for the port-scheduler under Vport (if specified) or for a physical port.

optical

Displays optical information.

otu

Displays optical transport unit (OTU) information.

nearest-bridge

Displays nearest bridge information.

nearest-customer

Displays nearest customer information.

nearest-non-tpmr

Displays nearest Two-Port MAC Relay (TPMR) information.

network

Specifies that the queue group name is on a network port.

port-scheduler

Displays the packet and octet counters for traffic exiting the specified port with an applied port scheduler policy, showing the total forwarded and dropped packets and octets, and the forwarded and dropped packets and octets per level.

queue

Displays the queue information.

queue-depth

Displays queue depth information for the specified queue group queue.

queue-group

Displays the queue group information.

queue-group-name

Specifies the name of an existing queue group template, up to 32 characters.

queue-id

Specifies the queue identification.

Values 1 to 16

remote-info

Displays remote information on the bridge MAC.

secondary-shaper-name

Displays information about the HS secondary name, up to 32 characters.

statistics

Displays port statistics.

vport-name

Specifies the name of the Vport up, to 32 characters in length.

Platforms

All

Output

The following sections provide output examples. [Table 369: Output Fields: show port <port-id>](#) provides an alphabetized list of descriptions for the output fields.

A:ALA-48#
  
```

Output Example: show port <port-id> [statistics [egress-aggregate]] [detail]

The output displays the aggregate egress queue statistics for ports configured with monitor-agg-egress-queue-stats which have non-zero counters. This can be shown for a single port, or all ports on an MDA or card. When the detail parameter is added, the output includes those ports with counters that are all zero.

```

If the Vport name is omitted, statistics for all Vports are displayed (bulk read). The statistics are displayed only for the levels, groups, and agg-eps for which the monitor-threshold is enabled. The output information filtering per level, group, or agg-eps is not embedded in the show commands natively. Instead, the output can be filtered with the match extensions for the show command. For example, **show port 1/1/1 vport test monitor-threshold | match Lvl-1**.

Table 369: Output Fields: show port <port-id> describes the output fields for the **show port <port-id>** command.

Table 369: Output Fields: show port <port-id>

Label	Description
50GHz Ch Min/Max	The 50 GHz channel minimum and maximum
100GHz Ch Min/Max	The 100 GHz channel minimum and maximum
Acct Pol	The accounting policy for the egress queue-group
ACL Filter Discards	The packet was dropped by a filter (ACL) on the line card (such as IP or MAC filter). Packets dropped by CPM filters or ESM anti-spoof filters do not increment this counter.
Active Pre-Shared Key CKN	The active PSK CAK name
Active Pre-Shared Key Index	The active pre-shared key index: 1 to 2 (default 1)
Adapter Type	The type of adapter module
Addr Ctrl Invalid	The number of invalid address control received
Address	The IP address associated with the index
Admin CIR	The administrative Committed Information Rate (CIR) parameters for the queue. The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth.
Admin FIR	The admin queue FIR rate
Admin PIR	The administrative Peak Information Rate (PIR) parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets through the switch fabric out an egress interface.
Admin State	Up — The entity is administratively up Down — The entity is administratively down
Agg. Limit	The agg-rate adaptation rule setting
AIS	The number of AIS cells transmitted and received on this connection for both end to end and segment
AIS-P	The number of AIS-P packets received
Alarm Status	The bits used to indicate alarms: loc — A loss of clock which causes the operational state of the port to be downed lais — Line alarm indication signal errors Irdi — Line remote defect indication errors. LRDIs are caused by remote LOF, LOC, and LOS

Label	Description
	ss1f — Section synchronization failure as reported by the S1 byte sb1err — Section B1 errors lb2erSd — Line signal degradation BER errors lb2erSf — Line signal failure BER errors slof — Section loss of frame errors slos — Section loss of signal errors stxptr — Section synchronization error on the transmit side. Indicates if there is a positive or negative justification count per channel srxptr — Section synchronization error on the receive side. Indicates if there is a positive or negative justification count per SONET path lrei — Line error condition raised by the remote as a result of B1 errors received from this node
Alignment Errors	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets
Altitude (m MSL)	The altitude of the GNSS antenna above mean sea level, in meters
AN	The AN for identifying the receiving SA
Ant. Cable Delay	The amount of time, in nanoseconds, compensated for signal delay due to cable length Refer to the cable manufacturer data to determine accurate signal delay statistics for the type and length of cable used
Antenna status	ok: valid antenna connection under-current: open condition. The port remains operationally up in the event that any GNSS splitters used do not provide a load. over-current: short circuit, or maximum power limits for the receiver have been exceeded no-bias voltage: antenna power disabled
Assigned ports	Specifies all ports that contain this CA
authentication method	The 802.1x session authentication method
Authenticator PAE state	The 802.1x port authenticator PAE state
Auto-negotiate	True — The link attempts to automatically negotiate the link speed and duplex parameters False — The duplex and speed values are used for the link

Label	Description
Average Elapsed Time	The average elapsed time
Backend state	The 802.1x port backend state
Bad Tag Packets	The number of received packets discarded with an invalid SecTAG or a zero value Packet Number (PN) or an invalid Integrity Check Value (ICV)
BFD Spoof Check Failed	The received BFD packet either failed the TTL check (single hop BFD TTL should be 255) or failed the source IP address lookup of known sessions. This counter may increment when BFD sessions are first configured since one side may start sending before the other is completely programmed and ready.
Broadcast Packets Input/Output	The number of packets, delivered by this sub-layer to a higher (sub-) layer, which were addressed to a broadcast address at this sub-layer. The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses.
Broadcast Packets	Input — The number of input broadcast packets Output — The number of output broadcast packets
Broadcast Pckts	The number of packets, delivered by this sub-layer to a higher (sub-) layer, which were addressed to a broadcast address at this sub-layer. The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses.
CA name/ca-name	The CA name assigned to the port
Cast Type	The connection topology type
CBS	The CBS value defining the reserved size for the queue
Cells	The number of input and output cells HEC discarded cells are not included in the input cell numbers
Cfg Alarm	The alarms that are reported when raised or cleared. Alarms that are not in this list are not reported when they are raised or cleared but appear in the Alarm Status. pais — Path alarm indication signal errors plop — Path loss of pointer (per tributary) errors prdi — Path remote defect indication errors pb3err — Path B3 errors pplm — Path payload mismatch. As a result, the path can be operationally downed

Label	Description
	<p>prei — Path error condition raised by the remote as a result of B3 errors received from this node</p> <p>puneq — Unequipped path errors.</p> <p>plcd — Path loss of codegroup delineation error. It is applicable only when the value of tmnxPortEtherXGigMode is set to 'wan'.</p>
Cfg MTU	The configured MTU
Cfg Rx Channel	The configured DWDM ITU channel at which the coherent optical module is expected to operate
Cfg Rx LOS Thresh	The configured LOS threshold of the average input power
Cfg Tx Pwr Maximum	The maximum power setting supported by the transceiver (only displayed if the equipped optical module supports configurable transmit power)
Cfg Tx Pwr Minimum	The minimum power setting supported by the transceiver (only displayed if the equipped optical module supports configurable transmit power)
Cfg Tx Target power	The manually-configured average target output power
Chan-Grp IfIndex	The channel group's interface index number which reflects its initialization sequence
Cipher Suite	The cipher suite used for encrypting the SAK: gcm-aes-128, gcm-aes-256, gcm-aes-xpn-128, gcm-aes-xpn-256
CIR Rule	<p>min — The operational CIR for the queue is equal to or greater than the administrative rate specified using the rate command except where the derived operational CIR is greater than the operational PIR. If the derived operational CIR is greater than the derived operational PIR, the operational CIR will be made equal to the operational PIR.</p> <p>max — The operational CIR for the queue is equal to or less than the administrative rate specified using the rate command.</p> <p>closest — The operational CIR for the queue is the rate closest to the rate specified using the rate command without exceeding the operational CIR.</p>
CIR Weight	The weight the queue or scheduler uses at the within-CIR port priority level
Clear Tag Mode	<p>In the case of VLAN-tagged traffic, if the traffic is crossing a network, one or two VLAN tags can be transmitted in clear text so that this traffic can receive preferential treatment over the network based on 802.1 q-tag or p-bits.</p> <p>Values: single-tag, dual-tag</p>
Coherent Optical Module	Information for the coherent optical module
Coherent Optical Port Statistics	<p>Statistics for the coherent optical port</p> <p>For Coherent CFP, the Rx Power field displays per-channel power.</p>

Label	Description
Collect-stats Collect Stats	Enabled — The collection of accounting and statistical data for the network Ethernet port is enabled. When applying accounting policies the data by default will be collected in the appropriate records and written to the designated billing file. Disabled — Collection is disabled. Statistics are still accumulated by the IOM cards, however, the CPU will not obtain the results and write them to the billing file.
Collisions	The best estimate of the total number of collisions on this Ethernet segment
Config Duplex	Full — The link is set to full duplex mode Half — The link is set to half duplex mode
Config Revision	The configuration revision
Config Speed	The configured speed of the interface
Configured Address	The configured Ethernet MAC address
Configured Freq	The configured frequency for the transceiver
Configured Mode	network — The port is configured for transport network use access — The port is configured for service access
Configured Mode	network — The port is configured for transport network use access — The port is configured for service access. Channelized ports are always access ports
Configured VCs	The number of configured VCs
Connector Code	The vendor organizationally unique identifier field (OUI) contains the IEEE company identifier for the vendor
Constellation	The type of GNSS satellite navigation system used
CRC	The precision of the cyclic redundancy check. 16 — A 16-bit CRC calculation. 32 — A 32-bit CRC calculation. 32-bit CRC increases the error detection ability, but it also adds some performance overhead.
CRC Mon SD Thresh	The error rate (for CRC errors) at which to declare the Signal Degrade (SD) condition on an Ethernet interface. If the field displays Disabled, no error rate has been specified.
CRC Mon SF Thresh	The CRC error rate at which to declare the Signal Fail (SF) condition on an Ethernet interface. If the field displays Disabled, no error rate has been specified.
CRC Mon Window	The size of the sliding window, in seconds, over which the Ethernet frames are sampled to detect signal fail or signal degrade conditions.
CRC/Align Errors	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, but had either a

Label	Description
	bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error).
CRC-10 Errors	The number of cells discarded on this VPL with CRC 10 errors
CRC-32 Errors	The number of valid AAL-5 SDUs and AAL-5 SDUs with CRC-32 errors received by the AAL-5 VCC
CSE	The number of times that the carrier sense condition was lost or never asserted when attempting to transmit a frame on a particular interface
CV-P	The number of Coding Violations
Current Freq	The current frequency
Current Penalties	The current accumulated penalties for port dampening
DAC Percent	The DAC percentage of the transceiver
Dampening State	The port dampening state: Disabled, Idle, or Active
Data Rate	The data rate at which the port is operating. When OTU is encapsulating 10-Gigabit Ethernet WAN, the data rate is 10.709 Gb/s, the G.709 standard OTU2 data rate. When OTU is encapsulating 10-Gigabit Ethernet LAN, the data rate is either 11.049 Gb/s or 11.096 Gb/s, depending on the otu2-lan-data-rate configuration parameter of the port's OTU parameters. These data rates (11.049 Gb/s and 11.096 Gb/s) are considered OTU2e data rates that are non-standard or over-clocked with respect to G.709, but have become widely used in optical networking to transport un-altered 10-Gigabit Ethernet LAN payloads.
DDM Events	Enabled — DDM events are enabled Disabled — DDM events are disabled
Decrypted Octets	The number of octets of plain text recovered from received packets that were integrity protected and encrypted
Delayed Packets	The number of received packets with the condition a PN lower than the lower bound of the replay protection on this SC
Description	A text description for the entity
Diag Capable	Indicates whether the transceiver is capable of performing diagnostics
Discards	Input — The number of discarded input packets Output — The number of discarded output packets
Discards Input/ Output	The number of inbound packets chosen to be discarded to possibly free up buffer space
Disp Control Mode	The current operational mode of the tunable dispersion compensation module
DOIE Tx Disable	Enabled — Laser is enabled if an internal MAC transmit error is encountered

Label	Description
	Disabled — Laser is disabled if an internal MAC transmit error is encountered
Dot1Q Ethertype	The Ethertype expected when the port's encapsulation type is Dot1Q
Down On Int. Error	Enabled — Down on internal error feature is enabled Disabled — Down on internal error feature is disabled
Down-when-looped	The feature is enabled or disabled
Drop Count	The number of keepalive or LQR messages that were missed before the line was brought down
Dropped	The number of dropped packets and octets
Drop Events	The total number of events in which packets were dropped by the probe due to lack of resources. Note that this number is not necessarily the number of packets dropped; it is just the number of times this condition has been detected.
Dropped CLP	The number of times the CLP1 cells have been dropped. CLP1 cells have lower priority than CLP0 cells and are expected to be discarded first in times of congestion.
Dying Gasp	Indicates whether dying gasp is enabled or disabled
Dying Gasp on Reset	EFM OAM dying gasp messages on reset: true or false
eapol-destination-address	The destination MAC address used in the EAPoL packet for MACsec Key Agreement (MKA) PDUs
Encryption Offset	The encryption offset configured on this node: 0, 30, 50. In the case of IP traffic, the IP header can be transmitted in clear text so that the traffic is routed accordingly when crossing the network. A value of 30 is used for IPv4 and 50 for IPv6.
EFM OAM	Enabled — EFM OAM is enabled Disabled — EFM OAM is disabled
EFM OAM Link Mon	Enabled — Link monitoring functionality is enabled Disabled — Link monitoring functionality is disabled
Egr. Sched. Pol	The port scheduler policy or that the default policy default is in use
Egress CBR	The total CBR bandwidth consumed on this interface in the egress direction
Egress NRT-VBR	The total non-real-time variable bit rate (nrt-VBR) bandwidth consumed on this interface in the egress direction
Egress Octets	The egress octets on a per-port basis
Egress Packets	The egress packets on a per-port basis

Label	Description
Egress Rate	The maximum amount of egress bandwidth (in kilobits per second) that this Ethernet interface can generate
Egress RT-VBR	The total real-time variable bit rate (rt-VBR) bandwidth consumed on this interface in the egress direction
Egress UBR	The total unspecified bit rate (UBR) bandwidth consumed on this interface in the egress direction
Elev. Mask Angle	The configured elevation angle below which satellites are ignored. The default elevation mask angle is 10°. Five or more satellites must be in view of the GNSS receiver antenna at all times when the receiver is in the process of obtaining a position fix, and these satellites must be above the configured elevation mask angle.
Encap-match	Specifies which types of traffic MACsec is enabled for
Encap Type	Null — Ingress frames will not use any tags or labels to delineate a service dot1q — Ingress frames carry 802.1Q tags where each tag signifies a different service
Encap Value	The dot1q or QinQ encapsulation value on the port for this IP interface
Encrypted Octets	The number of plain text octets that are integrity protected and encrypted on the transmitting SC
Encrypted Packets	The number of packets that are integrity protected and encrypted for this transmitting SA
Encrypted SA Packets	The number of packets that are integrity protected and encrypted for this SA
Encryption Offset	Specifies the encryption offset configured on this node: 0, 30, 50. In the case of IP traffic, the IP header can be transmitted in clear text so that the traffic is routed accordingly when crossing the network. A value of 30 will be used for IPv4 and 50 for IPv6.
Endpoint Type	The endpoint type
Errored Frame Enabled	Specifies whether errored frames are enabled
Errored Frame Event Notify	Specifies whether errored frame events notification is enabled
Errored Frame Period Enabled	Specifies whether an errored frame period is enabled
Errored Frame Period Event Notify	Specifies whether an errored frame period event notification is enabled

Label	Description
Errors Input/Output	For packet-oriented interfaces, the number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the number of inbound transmission units that contained errors preventing them from being deliverable to a higher-layer protocol. For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors.
ESMC Tunnel	Indicates whether ESMC frames are tunneled in Epipe or VPLS service
ES-P	The number of Errored Seconds
Exceed Drop	The queue depth beyond which exceed-profile packets are not accepted into the queue and are discarded
Excess Collisns	The number of frames for which transmission on a particular interface fails due to excessive collisions
Far End	The SONET path far end
FCS Errors	The number of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check
FEC Corrected 0s	The number of bits that were received as 0s but corrected to 1s
FEC Corrected 1s	The number of bits that were received as 1s but corrected to 0s
FEC Mode	Type of FEC (Forward Error Correction) in effect: g709, enhanced or disabled. When g709 is selected, the standard FEC method is used. When enhanced is selected, a proprietary FEC algorithm is used that extends optical reach in long haul applications. When disabled the bytes that are reserved for FEC in the OTU frame are transmitted as zeros and the FEC decoder is bypassed, but OTU framing is still in effect.
FEC SES	The number of severely Errored seconds were the number of uncorrectable sub-rows was greater than 15% of the maximum
FEC Uncorrectable Sub-Rows	The number of sub-rows that were not corrected because too many errors were detected
Fifo Error	The number of FIFO errors
Fine Tuning	Indicates whether the transceiver supports fine tuning for the frequency
FIR Rule	The queue FIR rule
Firmware Version	Firmware version of the GNSS receiver

Label	Description
FR Interface Status	The status of the Frame Relay interface as determined by the performance of the DLCMI. If no DLCMI is running, the Frame Relay interface stays in the running state indefinitely.
Forwarded	The number of forwarded packets and octets
Fragments	The total number of packets received that were less than 64 octets in length (excluding framing bits but including FCS octets) and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error)
Frame Based Acc	Frame-based accounting for queues parented to the scheduling policy and for the schedulers within the scheduler policy
Grace Tx Enable	Specifies whether grace Tx is enabled
Grace Vendor OUI	The EFM OAM grace vendor Organizationally Unique Identifier (OUI)
Grp-<name> Group Name	The group name
Half Life	The time, in seconds, that must pass before penalties decay to one-half the initial amount
Hardware Address	The interface's hardware or system assigned MAC address at its protocol sub-layer
HEC Errors (Dropped)	The number of cells with uncorrectable HEC errors on this interface
HEC Errors (Fixed)	The number of fixed HEC errors on this interface
HiPlus Drop Tail	The queue depth beyond which in-plus-profile packets are not accepted into the queue and are discarded
Hi Drop Tail	The queue depth beyond which in-profile packets are not accepted into the queue and are discarded
Hold Time	The EFM OAM hold-time
Hold time down	The link down dampening time in seconds. The down timer controls the dampening timer for link down transitions
Hold Time Down Rmng	The time remaining for a hold down timer. If the hold timer is not active, this displays zero.
Hold time up	The link up dampening time in seconds. The port link dampening timer value which reduces the number of link transitions reported to upper layer protocols.
Hold Time Up Rmng	The time remaining for a hold up timer. If the hold timer is not active, this displays zero.

Label	Description
HS Turbo Queues	HS turbo queues that allow the corresponding HSQ queue group queues for higher throughput
IfIndex	The interface's index number which reflects its initialization sequence
Ignore Efm State	The suppress port operational state changes due to EFM OAM: true or false
Ignr EFM OAM State	Enabled — Any failure in the protocol state machine does not impact the state of the port Disabled — The port state is affected by any existing EFM-OAM protocol fault condition
Index 1	Management IP information, one per type maximum (system IPv4, IPv6 system, oob, oob IPv6)
In Packets	The number of echo-reply packets received
In Pause Frames	The number of In Pause frames
Ingress CBR	The total CBR bandwidth consumed on this interface in the ingress direction
Ingress NRT-VBR	The total non-real-time variable bit rate (nrt-VBR) bandwidth consumed on this interface in the ingress direction
Ingress Octets	The ingress octets on a per-port basis
Ingress Packets	The ingress packets on a per-port basis
Ingress Port Forwarding Engine Drop Reason Statistics	When any of the packet counters increments, it indicates that a packet was dropped in the ingress data path or extracted to the control plane for further processing. The detailed per-reason drop statistics are available per-port for Ethernet ports (local on the 7450 ESS, 7750 SR, 7950 XRS, or satellite client ports) and for PXC sub-ports. An aggregate forwarding engine drop counter (packet and byte) is available per-SAP.
Ing. QGroup	The ingress queue group name
Ingress Rate	The maximum amount of ingress bandwidth (in mb/s) that this Ethernet port can receive with the configured sub-rate using packet-based accounting
Ingress RT-VBR	The total real-time variable bit rate (rt-VBR) bandwidth consumed on this interface in the ingress direction
Ingress UBR	The total unspecified bit rate (UBR) bandwidth consumed on this interface in the ingress direction
Host-Matches	A string optionally used by subscriber management to map subscriber's and subscriber host's queued traffic to a specific egress port virtual port
Input/Output	When the collection of accounting and statistical data is enabled, then octet, packet, error, and utilization statistics are displayed

Label	Description
Instance-Id	The queue-group instance ID
Int MAC Rx Errs	The number of frames for which reception on a particular interface fails due to an internal MAC sublayer receive error
Int MAC Tx Errs	The number of frames for which transmission on a particular interface fails due to an internal MAC sublayer transmit error
Interface	The port ID displayed in the <i>slot/mda/port</i> format
Interface-name port-id	The interface name of the port
ip ip-address	The IP address
IP Route Blackholed	The destination IP address of the packet matches a black hole route
IPv4 Header Error	The IPv4 packet header contains an error such as an IPv4 header checksum error, an invalid IP version number (not 4 or 6), or an incorrect Total Length field
IPv4 Invalid Address	An error in the source (SA) or destination (DA) IPv4 address was detected. For example class D or class E IPv4 DAs, loopback SA (127.0.0.0/8), 0.0.0.0/8 DA, SA is a subnet broadcast or network address and cases where the IPv4 address is a multicast address but the Ethernet destination address is not RFC1112 compliant. RFC1112 checks are also carried out on lpipe traffic.
IPv6 Header Error	The IPv6 packet header contains an error such as an incorrect Payload Length field or an IP version not equal to '6' when the Ethernet etype indicates it is IPv6
IPv6 Invalid Address	An error in the source (SA) or destination (DA) IPv6 address was detected. For example, an unspecified IPv6 DA, an IPv6 multicast SA and cases where the IPv6 address is a multicast address but the Ethernet destination address is not RFC2464 compliant. RFC 2464 checks are also carried out on IPIPE traffic.
Jabbers	The total number of packets received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either a bad Frame Check Sequence (FCS) with an integral number of octets (FCS Error) or a bad FCS with a non-integral number of octets (Alignment Error)
Keep Alive	The time interval, in seconds, between keep-alive PDUs
L2 Service MTU Exceeded	The length of the packet received on a SAP bound to a layer 2 service (such as VPLS or EPIPE) exceeded the configured MTU for the service
LACP Tunnel	Indicates whether LACP packet tunneling is enabled or disabled
LAG ID	The LAG or multi-link trunk (MLT) that the port is assigned to
Laser Tunability	The laser tune-ability of the transceiver

Label	Description
Last Changed	The date and time when the interface connection entered its current operational state
Last Cleared Last Cleared Time	The date and time the restart count reset to zero
Last cleared time Last Cleared Time	The time of the last clear
last session id	The 802.1x last session ID
last session term cause	The 802.1x last session term cause
last session time	The 802.1x last session time
last session username	The 802.1x last session username
Last State Change	The system time moment that the entity is up
Last Unknown VPI/ VCI	The last unknown VPI/VCI that was received on this interface
Late Collisions	The number of times that a collision is detected on a particular interface later than one slot time into the transmission of a packet
Late Packets	The number of received packets that have been discarded due to replay window protection on this SC
Latitude	The latitude of the GNSS antenna
LCD-P	The number of LCD-P packets received
Level	The level number
Limit Unused BW	The aggregate rate overrun protection on the aggregate context
Link Length support	The link length support for the transceiver
Link Monitoring	The EFM OAM link monitoring parameters: enabled or disabled
Link-level	Ethernet — The port is configured as Ethernet SONET — The port is configured as SONET-SDH
LMI Type	The LMI type
Load-balance-algo	The load balancing algorithm used on the port
Local Magic Number	The local magic number to be sent to the peer. The magic number provides a method to detect loopbacks. If the value of the local magic number is the same as

Label	Description
	the value of remote magic number, then it is possible that the link might be looped back. If the two magic numbers do not match, then the link is not looped back.
Longitude	The longitude of the GNSS antenna
Loopback	The number of loopback requests and responses transmitted and received on this connection for both end to end and segment
Loop Detected	True — Loop detected False — No loop detected
LOP-P	The number of Loss Of Pointer path (LOP) occurrences
Low Drop Tail	The low drop tail percent reduction from MBS
mac mac-address	The MAC address
Macsec Encrypt	Enabled — MACsec encryption is enabled on the traffic. All fields behind source or destination MAC addresses are encrypted on each packet. Disabled — MACsec encryption is disabled for the traffic. The packet fields are sent in clear text but data integrity is checked on each packet, and the MACsec overhead (header and ICV) is still added to each packet.
macsec-enabled	The MACsec is enabled or disabled
Manufacture date	The manufacturing date of the hardware component in the mmddyyyy ASCII format
Max auth requests	The 802.1x port maximum authorization requests
Max Packet Error	The number of maximum packet errors
Min Packet Error	The number of minimum packet errors
Max Penalties	The maximum penalty value for port dampening
Maximum Frequency	The supported maximum frequency for the transceiver
Max Suppress Time	Elapsed time, in seconds, after the link comes up before the worst case accumulated penalties have decayed to the reuse threshold
MBS	The MBS value defining the maximum size for the queue
Media	The media supported for the SFP
Min Frame Length	The configured minimum transmitted frame length
Minimum Frequency	The supported minimum frequency for the transceiver

Label	Description
MKA Key Server Priority	The MKA key server priority: 0 to 255 (default 16). A priority of 0 means more it is more likely to become the MKA server. If multiple participants have the same priority, the MAC address becomes the differentiator for electing the MKA server.
Mode	The mode of the interface. It can be set as Data Terminal Equipment (DTE) or Data Circuit-terminating Equipment (DCE)
Mode	The mode of OAM operation for an Ethernet port: active or passive
Model Number	The model number of the transceiver or adapter
Monitor Depth	Queue depth monitoring for the specified queue enabled or disabled
Monitor Oper Group	Operational group being monitored
Monitor Port Sched	Enabled — Congestion monitoring on an Egress Port Schedule (EPS) is enabled Disabled — Congestion monitoring on an EPS is disabled
MTU	The size of the largest packet which can be sent/received on the Ethernet physical interface, specified in octets
Mult Collisions	The number of frames that are involved in more than one collision and are subsequently transmitted successfully
Multicast MAC With Unicast Dest IP	The Ethernet destination (MAC) address is multicast but the IP address is unicast
Multicast Packets Input/Output	The number of packets, delivered by this sub-layer to a higher (sub-) layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both group and functional addresses. The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses.
Multicast Packets	Input — The number of input multicast packets Output — The number of output multicast packets
Multicast Pckts	The number of packets, delivered by this sub-layer to a higher (sub-) layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses.
Name	The entity name
Needs ICMP	The received packet requires the router to generate an ICMP message. For example, the IP packet TTL is expired or the destination host, network, or ESM

Label	Description
	subscriber is unreachable. Host unreachable can occur, among other reasons, if the destination address (for example, 10.0.1.2) of a packet resolves to a loopback interface subnet (for example, 10.0.1.1/24) but does not match the specific loopback address (for example, 10.0.1.1). Destination unreachable can also occur, for example, in response to an IPv6 packet received by a router from a point-to-point link (a non-Ethernet link) destined to an address within a subnet assigned to that same link (other than one of the receiving router's own addresses) as described in RFC 4443.
Net. Egr. Queue Pol	The network egress queue policy or that the default policy is used
No SCI Packets	The number of received packets discarded with unknown SCI information when the C bit in the SecTAG is set
No Tag Packets	The number of received packets discarded without the MAC security tag (SecTAG)
No Using SA Packets	The number of received packets that have been discarded on this SA which is not currently in use
Notifications	LLDP notifications (enabled, disabled)
Not Valid Packets	The number of not valid packets that have been discarded on this active SA
Number OCD Events	The number of times the Out of Cell Delineation (OCD) events occurred
Number of Lanes	The number of lanes of the transceiver
Number of Logs	The number of logs
Octets	The number of input and output octets. HEC discarded cells are not included in the input octet numbers.
Octets	The total number of octets received
OctetsIn Dropped	The number dropped egress octets that were in-profile
OctetsIn Forwarded	The number of forwarded egress octets that were in-profile
OctetsIn Total	The total number of egress octets that were forwarded and dropped
OctetsOut Dropped	The number of dropped egress octets that were out-of-profile
OctetsOut Forwarded	The number of forwarded egress octets that were in-profile
OctetsOut Total	The total number of egress octets that were forwarded and dropped
OK Packets	The number of validated packets on this SA
Oper Duplex	full — The link is set to full duplex mode half — The link is set to half duplex mode

Label	Description
Oper Egress Rate	The operational egress bandwidth (in kilobits per second) that the Ethernet interface can generate
Oper MTU	The negotiated size of the largest packet that can be sent on the port SONET/SDH, channel, specified in octets. For channels that are used for transmitting network datagrams, this is the size of the largest network datagram that can be sent on the channel.
Oper Speed	The operating speed of the interface
Oper State	up — The entity is operationally up down — The entity is operationally down Additionally, the <i>lag-id</i> of the LAG it belongs to in addition to the status of the LAG member (active or standby) is specified
Oper Status	The operational status of the port
Oper Status	up: the port is operationally up (communication between the main board and the GNSS receiver is established and the port is ready to receive GNSS signals) down: the port is operationally down (none of the up conditions have been met)
Operational Channel	The operational channel for the transceiver
Operational Frequency	The operational frequency for the transceiver
Optical Compliance	The optical compliance code of the transceiver
Optical Compliance	The optical compliance code of the transceiver
Other	The number of OAM cells that are received but not identified
OTU Status	The status of the OTU (Optical Transport Unit): enabled or disabled. When OTU is enabled, an additional layer of framing encapsulates an MDA's natively programmed mode of operation, 10-Gigabit Ethernet LAN or WAN, adding SONET-Like Framing with FEC (Forward Error Correction). When OTU is disabled, the MDA operates in a 10-Gigabit Ethernet LAN or WAN as per Ethernet provisioning.
Out packets	The number of echo-request packets sent
Out Pause Frames	The number of Out Pause frames
Over Sized SDUs	The total number of oversized SDU discards
Overrun Packets	The number of packets discarded because the number of received packets exceeded the cryptographic performance capabilities

Label	Description
Oversize Pckts	The total number of packets received that were longer than can be accepted by the physical layer of that port (9900 octets excluding framing bits, but including FCS octets for GE ports) and were otherwise well formed
Packet Abort Error	The number of packets aborted due to errors received
Packets	The total number of packets received
Packets	The number of input and output packets. Packets discarded due to HEC or oversize discards are not counted. CRC errors are also in the packet counts show up on the VC level statistics but not on the port level.
PacketsIn Dropped	The number dropped egress packets that were out-of-profile
PacketsIn Forwarded	The number of forwarded egress packets that were in-profile
PacketsIn Total	The total number of egress packets that were forwarded and dropped
PacketsOut Dropped	The number of dropped egress packets that were out-of-profile
PacketsOut Forwarded	The number of forwarded egress packets that were in-profile
PacketsOut Total	The total number of egress packets that were forwarded and dropped
Parity Error	The number of parity errors received
Part Number	The vendor part number contains ASCII characters, defining the vendor part number or product name
PBB Ethertype	The Ethertype used for PBB encapsulation
Per Threshold MDA Discard Statistics	See the 7450 ESS, 7750 SR, 7950 XRS, and VSR Interface Configuration Guide, "Packet Classification and Scheduling" section
Phy Link	Yes — A physical link is present
Physical Link	No — A physical link is not present
Phys State Chng Cnt	Increments when a fully qualified (de-bounced) transition occurs at the physical layer of an Ethernet port which includes the following transitions of the Port State as shown in the show port summary: - from "Down" to either "Link Up" or "Up" - from either "Link Up" or "Up" to "Down" This counter does not increment for changes purely in the link protocol states (for example, "Link Up" to "Up"). The counter is reset if the container objects for the port are deleted (for example, MDA deconfigured, or IOM type changes).

Label	Description
PIR Rule	<p>min — The operational PIR for the queue is equal to or greater than the administrative rate specified using the rate command</p> <p>max — The operational PIR for the queue is equal to or less than the administrative rate specified using the rate command</p> <p>closest — The operational PIR for the queue is the rate closest to the rate specified using the rate command</p>
Physical Link	<p>Yes — A physical link is present</p> <p>No — A physical link is not present</p> <p>For GNSS ports:</p> <p>Yes — The port is operationally up (communication between the main board and the GNSS receiver is established and the port is ready to receive GNSS signals. For example, if the GNSS port is configured, the operational status is up, the receiver status is 3D FIX, and you disconnect the GNSS RF cable from the port, the physical link on the port still shows as up.</p> <p>No — The port is operationally down (none of the up conditions apply)</p>
PLM-P	The number of PLM-P packets received
PM BEI	The number of backward error indications received from the far end in the path monitor overhead
PM BIP8	The number of detected BIP-8 errors in the path monitor overhead
PM SES	The section monitor severely errored seconds where the number of PM-BIP8 was greater than 15% of the maximum
Policy-Name	The policy name
Port control	The 802.1x port control: auto, force-auth, force-unauth
Port Encap	<p>Null — Ingress frames will not use tags or labels to delineate a service</p> <p>dot1q — Ingress frames carry 802.1Q tags where each tag signifies a different service</p>
Port ID	The port ID that is configured or displayed.
Port <id>	Bridge nearest-bridge
Port <id>	Bridge nearest-non-tpmr
Port <id>	Bridge nearest-customer
Port IfIndex	The GNSS interface index number, which reflects its initialization sequence
Port Mode	<p>Network — The port is configured for transport network use</p> <p>Access — The port is configured for service access</p> <p>Hybrid — The port is configured for both access and network use</p>

Label	Description
Port State	<p>Up — The port is physically present and has physical link present</p> <p>Down — The port is physically present but does not have a link. This state may also be considered as Link Down</p> <p>Ghost — A port that is not physically present</p> <p>None — The port is in its initial creation state or about to be deleted</p> <p>Link Up — A port that is physically present and has physical link present</p> <p>Note that when Link Up appears at the lowest level of a SONET/SDH path or a TDM tributary, it means the physical connection is active but the port is waiting on some other state before data traffic can flow. It is a waiting state and indicates that data traffic will not flow until it transitions to the Up state.</p>
Port status	The 802.1x port status
PortID TLV Subtype	The encoding of the port identifier TLVs transmitted to the peer (tx-if-alias, tx-if-name, tx-local)
Port Type	The type of port or optics installed
Present Channel	The channel that the transceiver is currently on
Protected Octets	The number of plain text octets that are integrity protected but not encrypted on the transmitting SC
Protected Packets	The number of packets that are integrity protected but not encrypted for this transmitting SA
Protected SA Packets	The number of packets that are integrity protected but not encrypted for this SA
Protocol	The applicable protocols for the specified port
PTP TS Capability	<p>The encapsulation format for 1588 port-based timestamping</p> <ul style="list-style-type: none"> • ethernet • ipv4 (PTP in UDP/IPv4) • ipv6 (PTP in UDP/IPv6)
QinQ Ethertype	The Ethertype expected when the port's encapsulation type is QinQ
Queue	The queue information
Queue Depths (percentage)	The queue depth percentages
Queue-Id	The <i>queue-id</i> that uniquely identifies the queue
Quiet period	The 802.1x port quiet period: 1 to 3600 seconds
Radius-plcy	The 802.1x port RADIUS policy name

Label	Description
Range	The usable range to fine tune the frequency
RDI	The number of RDI cells transmitted and received on this connection for both end to end and segment
RDI-P	The number of RDI-P packets received
Reassembly Timeouts	The number of reassembly timeout occurrences
Reauth enabled	no — The 802.1x port reauth enabled is not up yes — The 802.1x port reauth enabled is up
Reauth period	The 802.1x port reauthorization period
Receiver status	Acquiring Satellites: GNSS receiver is attempting to track satellite Position Hold: GNSS receiver position is determined and GNSS receiver is no longer solving for position; TRAIM algorithm is correcting for time bias 2D Fix: GNSS receiver is attempting to obtain a two-dimensional position (latitude, longitude) solution 3D Fix: GNSS receiver is attempting to obtain a three-dimensional position (latitude, longitude, altitude) solution Unknown: default state on power-up Communication Lost: occurs after 30 s of missing Channel/Data/Status messages or TRAIM status messages from the GNSS receiver Communication Established: occurs after a successful reestablishment of communication following a Communication Lost status
Remote Error	The number of remote error received
Remote Magic Number	The magic number sent by the peer. If the value of remote magic number is the same as the value of the local magic number, then it is possible that the link might be looped back. If the two magic numbers do not match, then the link is not looped back.
Replay Protection	Enabled — Replay Protection is enabled Disabled — Replay Protection is disabled If replay protection is enabled for this CA, the out of replay-window packets will be discarded. Otherwise, the Replay Window Size value is ignored. The default value is disabled, so that when adding MACsec to an interface, it will not affect traffic immediately.
Replay Window Size	The size, in packets, of the replay window. Each packet is assigned a unique packet number. Replay protection enforces strict ordering of the packets and protects against replay attacks. In networks where out-of-order packets are expected, the window size can be set up to 4294967295.

Label	Description
Request Interval	The time interval in seconds at which keepalive requests are issued
Resolution	The resolution used to fine tuning the frequency
Restart Count	The number of times that this Control Protocol has reached the 'open' state
Retry	The minimum wait time, in seconds, before re-enabling the port after loop detection
Reuse Threshold	The threshold at which the port up state is no longer suppressed, after the port has been in a suppressed state and the accumulated penalties decay drops below this threshold
RS-FEC Mode	The RS-FEC mode to support
RxDTV Adjust	The Rx DTV adjust status
Rx Ageouts	The number of LLDP frames received on the port with a properly formatted TLV that was not supported on the receiving port
Rx Frames	The number of LLDP frames received on the port
Rx Frame Discard	The number of LLDP frames received but discarded on the port
Rx Frame Errors	The number of LLDP frames received with errors on the port
Rx TLV Discard	The number of LLDP frames received on the port discarded because of the TLV
Rx TLV Unknown	The number of LLDP frames received on the port with a properly formatted TLV that was not supported on the receiving port
Rx Quality Level	Indicates which QL value has been received from the interface
Rx Signal Label	The received signal label
Rx Trace Str (Hex)	The received SONET path trace string in hexadecimal
sap	The physical port identifier portion of the SAP definition
Sched Policy	The name of the scheduler policy assigned to the virtual port
SCI	The Secure Channel Identifier (SCI)
SD Threshold	The configured error rate threshold at which the SD (Signal Degrade) alarm is raised
Security Zone	The security zone this port belongs
Serial Number	The vendor serial number of the hardware component
Server timeout	The 802.1x port server timeout

Label	Description
Service-id port-id	The service IDs affected by the encap-match configured under this sub-port. One or more services can be affected by the match (by using * or by targeting ports with traffic aggregations, for example).
SES-P	The number of Severely Errored Seconds
SF Threshold	The configured error rate threshold at which the SF (Signal Fail) alarm is raised
SF/SD Method	The selected method for declaring the SF (Signal Fail) or SD (Signal Degrade) alarm. When BIP8 is selected, the error rate of SM-BIP8 errors in the OTU frames declares SF or SD (This is very similar to SONET SF/SD which uses a rate of B2 errors). When FEC is selected, the rate of corrected bits declares SF or SD. This effectively indicates that the link would be degraded (SD) or failed (SF) if FEC was disabled and gives the user an early warning that the link is degrading or is about to fail.
Sflow	Enabled — sFlow data collection for the port is enabled Disabled — sFlow data collection is disabled
C/QS/S/XFP/MDI MDX	Additional information related to the port. This can include optical compliance and the link length if available from the installed optics. If there is no optical compliance information programmed in the part, "Unspecified" is displayed. GIGE — The GigE SFP type FASTE — The FastE SFP type GIGX — The GigX SFP type MDI — Indicates that the Ethernet interface is of type MDI (Media Dependent Interface) MDX — Indicates that the Ethernet interface is of type MDX (Media Dependent Interface with crossovers)
Shaped Bandwidth	The total shaped bandwidth consumed on this interface in the egress direction
Signal Label	The C2 byte value
Single Fiber Mode	Yes - Single fiber option is configured No - Single fiber option is not configured
Slot ID	The slot number of the card in the chassis
SM BEI	The number of backward error indications received from the far end in the section monitor overhead
SM BIP8	The number of detected BIP-8 errors in the section monitor overhead
SM SES	Section monitor severely errored seconds where the number of SM-BIP8 was greater than 15% of the maximum
SM-TTI Rx	This is the SM-TTI (Section Monitor Trail Trace Identifier received by this port. When the received TTI is a printable string of characters, it will be displayed as a

Label	Description
	text string. When the received TTI contains one or more non-printable characters, it will be displayed at a sequence of 64 hex bytes. When the received TTI is all zeros, the string "Not Specified" will be displayed.
SM-TTI Tx (<mode>)	This is the configured SM-TTI (Section Monitor Trail Trace Identifier) to be transmitted by this port in the OTU overhead bytes. The modes are auto, string, or bytes. In the auto and string modes, a printable character string will be displayed. In bytes mode, up to 64 hex bytes are displayed.
Sngl Collisions	The number of frames that are involved in a single collision, and are subsequently transmitted successfully
Speed	The speed of the DS0 channels used in the associated channel-group
SQE Errors	The number of times that the SQE TEST ERROR is received on a particular interface
SSM Code Type	The SSM code type in use on the port
Subport	The MACsec sub-port used. Multiple MACsec instances can be configured under one port, matching traffic based on the encap-match parameter.
subscr Subscriber	The subscriber ID
Supplicant timeout	The 802.1x port supplicant timeout
Supported Grids	A list of supported grids for the transceiver
Suppress Threshold	The threshold at which the port up state is suppressed until the accumulated penalties drop below the reuse threshold again
Svc ID svc-id	The service identifier
Symbol Errors	For an interface operating at 100 Mb/s, the number of times there was an invalid data symbol when a valid carrier was present
Sym Mon SD Thresh	The error rate (for symbol errors) at which to declare the Signal Degrade (SD) condition on an Ethernet interface. If the field displays Disabled, no error rate has been specified
Sym Mon SF Thresh	The symbol error rate at which to declare the Signal Fail (SF) condition on an Ethernet interface. If the field displays Disabled, no error rate has been specified
Sym Mon Window	The size of the sliding window, in seconds, over which the errors are measured
Sync Status	locked: GNSS time is within alarm limits not locked: GNSS time is outside of the alarm limits and/or there is an insufficient number of tracked satellites

Label	Description
Sync. Status Msg	Whether synchronization status messages are enabled or disabled
Tagged Cells	The number of cells that have been demoted from CLP0 to CLP1
Threshold exceeded	The number of times that the drop count was reached
Time	GPS date and time
Time to link drop	The time remaining before the link will be declared dropped if a keepalive echo reply packet is not received
TimeSlots	The DS0 time slot used in the T1/E1 channel-group
Too long Frames	The number of frames received on a particular interface that exceed the maximum permitted frame size
Too Long Packets	The number of transmitted packets discarded because the packet length is greater than the Maximum Transmission Unit (MTU) of the Ethernet physical interface
Total number of access-egress queue groups	The total number of access-egress queue groups associated with the queue-group summary
Total number of network-egress queue groups	The total number of network-egress queue groups associated with the queue-group summary
Total number of access-ingress queue groups	The total number of access-ingress queue groups associated with the queue-group summary
Tot Sym Mon Errs	The total number of symbol errors
Trace String	The SONET path trace string
Traffic Statistics	See the <i>7450 ESS, 7750 SR, 7950 XRS, and VSR Interface Configuration Guide</i> , "Statistics on Physical PXC Ports" section
Transceiver Code	The code for the transmission media
Transceiver Digital Diagnostic Monitoring (DDM)	Transceiver Digital Diagnostic Monitoring (DDM) information, such as temperature and supply voltage
Transceiver Lane Digital Diagnostic Monitoring (DDM)	Transceiver lane DDM information, such as lane temperature and Tx bias current
Transceiver Status	The status of the transceiver
Transceiver Type	The type of transceiver
Transmit Interval	The transmit interval of OAMPDUs

Label	Description
Transmit period	The 802.1x port transmit period
Transmit TLVs	The LLDP TLV to transmit (port-desc, sys-name, sys-desc, sys-cap)
Trigger Fault	The triggered EFM OAM fault
Tunneling	true — The 802.1x port tunneling is on false — The 802.1x port tunneling is not on.
Tunnel Nearest Bridge	The nearest bridge tunneling frames (enabled, disabled)
Tx DUS/DNU	Whether the QL value is forcibly set to QL-DUS/QL-DNU
Tx Frames	The number of LLDP frames transmitted from the port
TX Laser Frequency	The transceiver laser frequency
TX Laser Wavelength	The transceiver laser wavelength
Tx Length Err Frames	The number of LLDP frames transmitted with length error from the port
Tx Quality Level	The QL value being transmitted out of the interface
Type	The connection type
UAS-P	The number of Unavailable Seconds
Unchecked Packets	The number of packets that have failed the integrity check on this SC
Unequipped	The number of unequipped packets received
Undersize Pckts	The total number of packets received that were less than 64 octets long (excluding framing bits, but including FCS octets) and were otherwise well formed
Unicast MAC Destination Address Mismatch	The unicast destination MAC address is a null address or does not match any of the expected MAC addresses associated with the receiving interface. Packets with multicast or broadcast MAC addresses do not increment this counter
Unicast Packets	Input — The number of input unicast packets Output — The number of output unicast packets
Unicast Packets Input/Output	The number of packets, delivered by this sub-layer to a higher (sub-) layer, which were not addressed to a multicast or broadcast address at this sub-layer. The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent.
Unicast Packets Input/Output	The number of packets, delivered by this sub-layer to a higher (sub-) layer, which were not addressed to a multicast or broadcast address at this sub-layer

Label	Description
Unicast RPF Check Failed	The IP packet failed the unicast reverse path forwarding (uRPF) check
Unknown MAC Destination Address Discarded in VPLS	The MAC destination address lookup in the MAC FDB failed and the VPLS service is configured to discard packets with unknown destination MAC addresses
Unknown Proto Discards Input/ Output	For packet-oriented interfaces, the number of packets received through the interface which were discarded because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that support protocol multiplexing the number of transmission units received via the interface which were discarded because of an unknown or unsupported protocol. For any interface that does not support protocol multiplexing, this counter will always be 0.
Unknown Proto Discards	Input — The number of discarded unknown protocol packets
Untagged Packets	The number of transmitted packets without the MAC security tag (SecTAG) when the value of <code>oftmnxMacsecConnAssocReplayProtect</code> for the configured CA is set to 'false'
Use Broadcast Addr	True — Indicates that the broadcast address is to be used for the destination MAC address False — Indicates that the local port MAC address is to be used for the destination MAC address
Used Satellites	Displays the number of tracked satellites
user rx frames	The 802.1x session user Rx frames
user rx octets	The 802.1x session user Rx octets
user tx frames	The 802.1x session user Tx frames
user tx octets	The 802.1x session user Tx octets
UTC offset	Displays the difference between GPS time and UTC time $UTC\ time = GPS\ time - UTC\ offset$
Utilization Input/ Output	The value computed as the average of the traffic observed over the configured interval, presented as a percentage of the maximum possible traffic
Validated Octets	The number of octets of plain text recovered from received packets that were integrity protected but not encrypted
Vendor OUI	The vendor-specific Organizationally Unique Identifier (OUI) field containing the IEEE company identifier for the vendor
Violation Last Seen	The date and time of the last violation

Label	Description
Violation Threshold Percent	The violation threshold percentage
Violation Total Count	The violation total count
Visable Satellites	The number of satellites that the GNSS receiver should see at the current time. This number can be 0 if the GNSS receiver has not yet downloaded an almanac, even if Used Satellites is more than 0.
VPI/VCI	The VPI/VCI values
Vport Name	The virtual port name
Weight	The relative weight of this scheduler in comparison to other child schedulers and queues at the same strict level
Wghtd Avg Queue Poll Interval	The weighted average queue poll interval
Wghtd Avg HiWtr Mark Poll Interval	The weighted average high water mark queue poll interval

Context

[\[Tree\]](#) (clear port)

Full Context

clear port

Description

This command clears port statistics for the specified ports.

Parameters

port-id

Specifies the physical port identifier.

Values *slot* [/*mda*[/*port*]] or *slot/mda/port* [*channel*]]

aps-id

Specifies the APS group identifier.

aps-group-id[*channel*]

aps keyword

group-id 1 to 64

esa-vm-id

Specifies the ESA VM identifier.

Values

<i>esa-esa-id/vm-id/vm-port</i>	
<i>esa</i>	keyword
<i>esa-id</i>	1 to 16
<i>vm-id</i>	1 to 4

vm-port

vm-type specific [fm-sub|to-
sub|..]

statistics

Clears the statistics for the specified port.

cp

Clears Connection Profile statistics.

Values 1 to 8000

interface-connection

Clears interface-connection statistics.

ilmi

Clears ILMI information. This parameter is only applicable for ports/bundles that support ILMI.

pvc

Clears PVC statistics.

pvp

Clears PVP statistics.

pvt

Clears PVT statistics.

slot

Specifies the slot number.

Values 1 to 10

mda

The MDA number.

Values 1, 2

Default All MDAs

port-connection

Clears port-connection statistics.

phys-state-change-count

Clears the counter that tracks physical port state transitions for ethernet ports ("Phys State Chng Cnt" in "show port" output, or tmnxPortPhysStateChangeCount in the TIMETRA-PORT-MIB).

port-scheduler

Clears the packet and octet counters for the port scheduler that is applied to the specified port.

queue-group-name

Clears the specified port queue group name. It uniquely identifies a port ingress queue group in the managed system, up to 32 characters.

instance-id

Specifies the specific instance of a queue group.

Values 1 to 65535

ingress

Clears ingress queue group information.

egress

Clears egress queue group information.

access

Clears access mode statistics for the queue group.

network

Clears network mode statistics for the queue group.

ethernet

Specifies that an Ethernet port will have the clear functions executed.

dampening

Clears the current accumulated penalties of the exponential port dampening feature for the port. The accumulated penalties can be cleared only with this command keyword.

efm-oam

Clears efm-oam statistics on the port.

events

Specifies an efm-oam event will be cleared.

local

Specifies that only local EFM OAM events will be cleared.

remote

Specifies that only remote (received from peer) events will be cleared. Local and remote is not specified.

Default Without specifying an option, both local and remote are cleared.

shaper-name

Clears information about the specified shaper name, up to 32 characters.

name

Clears information about the specified Vport name up to 32 characters.

standard *value*

Clears high water marks within specific standard port class pools using the standard parameters.

Values 1 to 6

alternate *value*

Clears high water marks within specific alternative port class pools using the alternative parameters.

Values 1 to 6

Full Context

show service id pim-snooping port

Description

This command displays PIM port information.

Parameters

sap-id

Displays the port information associated with the specified SAP

sdp-id:vc-id

Displays the port information associated with the specified SDP

grp-ip-address

Specifies the IP multicast group address for which this entry contains information

detail

Displays detailed port information

family

Displays either IPv4 or IPv6 information for the specified port

Values ipv4 or ipv6

Platforms

show qos policer-hierarchy port

Description

This command displays information about the policer hierarchy per port.

Parameters

port-id

Displays information about the specified port.

Values *slot/mda/port[.channel]*

ingress

Displays ingress port information.

egress

Displays egress port information.

access

Displays policer-hierarchy statistics applied on the specified access port.

network

Displays policer hierarchy statistics applied on the specified network port.

queue-group-name

Displays information about the specified queue group name, up to 32 characters.

instance-id

Displays information about the instance of the named queue group.

Values 1 to 65535

detail

Displays detailed information.

root-detail

Displays detailed information about the arbiter root.

thresholds

Displays the threshold, parenting, rate, and traffic information related to a policer.

priority-info

Displays the threshold information related to the root arbiter.

depth

Displays the bucket depth, parenting, rate, and traffic information related to a policer.

name

Displays information about the name of the QoS arbiter of this forwarding plane.

root

Displays information about the arbiter root.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

show qos scheduler-hierarchy port

Description

This command displays scheduler hierarchy information per port.

Parameters

port-id

Specifies the port ID.

<i>port-id</i>	<i>slot/mda/port</i> [<i>.channel</i>]		
	eth-sat-id	<i>esat-id/slot/port</i>	
		esat	keyword
		<i>id</i>	1 to 20
	pxc-id	<i>pxc-id.sub-port</i>	
		pxc	keyword
		<i>id</i>	1 to 64
		<i>sub-port</i>	a, b

detail

Displays detailed information.

queue-group-name

Displays information about the specified queue group on the port.

scheduler-name

Displays information about the specified scheduler policy on the port.

ingress

Specifies to display ingress queue group information.

egress

Specifies to display egress queue group information.

access

Displays scheduler-hierarchy statistics applied on an access port.

network

Displays scheduler-hierarchy statistics applied on a network port.

instance-id

Specifies the identification of a specific instance of the queue group.

vport name

Displays statistics for the named VPORT.

Platforms

Table 370: Show QoS Schedule-Hierarchy Port Output Fields

Label	Description
S	Displays the scheduler name.
Q	Displays the queue ID and information.
Admin CIR/PIR:	Specifies the configured value of CIR/PIR.
Assigned CIR/PIR:	Specifies the on-the-wire PIR/CIR rate given to a member by that parent level.
Offered CIR/PIR:	Specifies the on-the-wire offered load on that member.
Consumed CIR/PIR:	Specifies the amount of scheduler bandwidth used by this member.

port

Syntax

port *port-id* **queue-group** *queue-group-name* [**egress**] [{**access** | **network**}] [**instance** *instance-id*] [**detail**]

port *port-id* **vport** *name* [**detail**]

Context

[\[Tree\]](#) (show>qos>agg-rate port)

Full Context

show qos agg-rate port

Description

This command displays the H-QoS aggregate rate limit per port or Vport.

Parameters

port-id

Specifies the port ID.

<i>port-id</i>	<i>slot/mda/port</i> [<i>.channel</i>]		
	<i>eth-sat-id</i>	<i>esat-id/slot/port</i>	
		<i>esat</i>	keyword
		<i>id</i>	1 to 20
	<i>pxc-id</i>	<i>pxc-id.sub-port</i>	
		<i>pxc</i>	keyword
		<i>id</i>	1 to 64
		<i>sub-port</i>	a, b

queue-group *queue-group-name*

Displays information about the specified queue group on the port.

egress

Displays egress queue group information.

access

Displays H-QoS aggregate rate limit information on an access port.

network

Displays H-QoS aggregate rate limit information on a network port.

instance *instance-id*

Specifies the identification of a specific instance of the queue-group.

Values 1 to 65535

vport *name*

Displays H-QoS aggregate rate limit information for the specified Vport.

detail

Displays detailed information.

Platforms

All

Output

The following output is an example of QoS port aggregation rate output, and [Table 371: Show QoS Aggregation Rate Port Output Fields](#) describes the QoS port aggregation rate fields.

Output Example

```
*A:PE# show qos agg-rate port 1/1/1 queue-group "qg1" instance 1 access egress

port

Syntax

port *port-id* **neighbor** *ieee-address* **ptsf-unusable** **statistics**

Context

[\[Tree\]](#) (clear>system>ptp port)

Full Context

clear system ptp port

Description

This command clears PTP port information.

Parameters

port-id

Clears the specified port ID.

Values *slot/mda/port*

ieee-address

Specifies the MAC address.

Values *xx:xx:xx:xx:xx:xx* or *xx-xx-xx-xx-xx-xx*

ptsf-unusable

Keyword used to clear the PTSF-unusable condition associated with a neighbor port.

statistics

Keyword used to clear statistics information of the specified port ID.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

port

Syntax

port *port-id* [*port-id*] [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**] [**multiclass**]

port **all-ethernet-rates** [*interval seconds*] [**repeat** *repeat*]

Context

[Tree] (monitor port)

Full Context

monitor port

Description

This command enables port traffic monitoring. The specified port(s) statistical information displays at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified port(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the **rate** is specified, the "rate per second" for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

Parameters

port-id

Specify up to 5 port IDs. Port-IDs are only MLPPP bundles or bundle protection groups when the multiclass is specified.

<i>port-id</i>	<i>slot/mdal/port [.channel]</i>		
	eth-sat-id	<i>esat-id/slot/port</i>	
		esat	keyword
		<i>id</i>	1 to 20
	pxc-id	<i>pxc-id.sub-port</i>	
		pxc	keyword
		<i>id</i>	1 to 64
		<i>sub-port</i>	a, b
	aps-id	<i>aps-group-id[.channel]</i>	
		aps	keyword
		<i>group-id</i>	1 to 64

seconds

Configures the interval for each display in seconds.

Values 3 to 60

Default 10 seconds

repeat

Configures how many times the command is repeated.

Values 1 to 999

Default 10

absolute

When the **absolute** is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

rate

When the **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

all-ethernet-rates

Enables port traffic monitoring and utilization output for all data Ethernet ports enabled in the system, in a table output format.

Platforms

All

Output

The following outputs are examples of port information.

Output Example

```

Full Context

monitor port

Description

This command enables port traffic monitoring. Various keywords can be used to monitor specific attributes of the ATM port. The specified port(s) statistical information displays at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified port(s). The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the **rate** is specified, the "rate per second" for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

Parameters

port-id

Specifies up to five port IDs. Port-IDs are only be MLPPP bundles or bundle protection groups when the multiclass is specified.

<i>port-id</i>	<i>slot/mda/port [.channel]</i>		
	<i>aps-id</i>	<i>aps-group-id[.channel]</i>	
		<i>aps</i>	<i>keyword</i>
		<i>group-id</i>	<i>1 to 64</i>

seconds

Configures the interval for each display in seconds.

Values 3 to 60

Default 10 seconds

repeat

Configures how many times the command is repeated.

Values 1 to 999

Default 10

absolute

Displays raw statistics without processing. No calculations are performed on the delta or rate statistics.

rate

Displays the rate-per-second for each statistic, instead of the delta.

monitor-threshold

Displays the exceed count for the port-scheduler under Vport (if specified) or for a physical port.

multiclass

Monitors multiclass statistics.

port-scheduler

Monitors the packet and octet counters for traffic exiting the specified port for the applicable applied port scheduler policy.

atm

Monitors ATM statistics.

aal-5

Monitors the AAL-5 statistics for the port.

cp-id

Monitors ATM connection profile statistics.

Values 1 to 8000

ilmi

Monitors ATM ILMI statistics.

interface-connection

Monitors ATM interface connection statistics.

pvc vpi/vci

Monitors ATM PVC statistics.

Values vpi -[0 to 4095] (NNI)
[0 to 255] (UNI)
vci - [1| 2| 5 to 65535]

pvp vpi

Monitors ATM PVP statistics

Values vpi [0 to 4095] (NNI) [0 to 255] (UNI)

pvt vpi1.vpi2

Monitors ATM PVT statistics.

Values [0 to 4095].[0 to 4095] (NNI)[0 to 255].[0 to 255] (UNI)

oam

Monitors ATM PVC/PVP OAM statistics.

port

Syntax

```
port port-id egress network queue-group queue-group-name instance instance-id [ interval seconds ]  
[repeat repeat] [absolute | rate] [arbiter [root | name]]
```

Context

[\[Tree\]](#) (monitor>qos>arbiter-stats port)

Full Context

monitor qos arbiter-stats port

Description

This command monitors arbiter statistics in an egress port queue group.

Parameters

port *port-id*

<i>port-id</i>	<i>slot/mda/port [.channel]</i>		
	eth-sat-id	<i>esat-id/slot/port</i>	
		esat	keyword
		<i>id</i>	1 to 20
	pxc-id	<i>pxc-id.sub-port</i>	
		pxc	keyword
		<i>id</i>	1 to 64
		<i>sub-port</i>	a, b

Values slot/mda/port

egress *network*

Specifies statistics are for an egress network queue group.

queue-group *queue-group-name*

Specifies the name of the queue group up to 32 characters.

instance *instance-id*

Specifies the identification of a specific instance of the queue-group.

Values 1 to 65535

interval *seconds*

Configures the interval for each display in seconds.

Default 11 seconds

Values 11 to 60

repeat repeat

Configures how many times the command is repeated.

Default 10

Values 1 to 999

absolute

When the **absolute** keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

rate

When the **rate** keyword is specified, the rate-per-second for each statistic is displayed.

arbiter name

Specify the name of the policer control policy arbiter.

Values An existing arbiter-name in the form of a string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

root

Specify the root arbiter.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

port

Syntax

port *port-id* **queue-group** *queue-group-name* [**ingress** | **egress**] [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**] [**access** | **network**] [**instance** *instance-id*]

port *port-id* **vport** *name* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

Context

[\[Tree\]](#) (monitor>qos>scheduler-stats port)

Full Context

monitor qos scheduler-stats port

Description

This command enables port traffic monitoring.

Parameters

port *port-id*

Specifies the port ID.

Values

slot/mda/port [.channel]

eth-sat-id *esat-id/slot/port*

esat

keyword

id

1 to 20

pxc-id *pxc-id.sub-port*

pxc

keyword

id

1 to 64

sub-port

a, b

queue-group *queue-group-name*

Specifies the name of the queue group up to 32 characters.

instance *instance-id*

Specifies the identification of a specific instance of the queue-group.

Values 1 to 65535

ingress

Specifies statistics are for an ingress queue group.

egress

Specifies statistics are for an egress queue group.

interval *seconds*

Configures the interval for each display in seconds.

Default 11 seconds

Values 11 to 60

repeat *repeat*

Configures how many times the command is repeated.

Default 10

Values 1 to 999

absolute

When the **absolute** keyword is specified, the raw statistics are displayed, without processing. No calculations are performed on the delta or rate statistics.

rate

When the **rate** keyword is specified, the rate-per-second for each statistic is displayed.

access

Displays scheduler statistics applied on an access port.

network

Displays scheduler statistics applied on a network port.

Platforms

All

port

Syntax

port *port-id* **exp-secondary-shaper** *shaper-name* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

port *port-id* **vport** *name* [**interval** *seconds*] [**repeat** *repeat*]

Context

[\[Tree\]](#) (monitor>qos port)

Full Context

monitor qos port

Description

This command monitors expanded secondary shaper statistics.

Parameters

port-id

Specifies the port ID.

Values *slot/mda/port*
esat-id/slot/port
pxc-id.sub-port

shaper-name

Displays statistics for the named exp secondary shaper.

seconds

Configures the interval for each display in seconds.

Values 11 to 60

Default 11 seconds

repeat

Configures how many times the command is repeated.

Values 1 to 999

Default 10

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic.

vport name

Displays statistics for the named Vport.

Platforms

All

Full Context

clear qos arbiter-stats port

Description

This command clears the arbiter statistics per port.

Parameters

port-id

Specifies the port ID.

Values

slot/mda/port [*.channel*]

pxc-id *pxc-id.sub-port*

pxc

keyword

id

1 to 64

sub-port

a, b

queue-group-name

Specifies the queue group name, up to 32 characters.

network

Clears the egress network queue group statistics.

instance-id

Specifies the ID of a specific instance for the queue group.

Values 1 to 65535

name

Specifies the arbiter name, up to 32 characters.

root

Specifies the arbiter root, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

port

Syntax

port *port-id* **queue-group** *queue-group-name* [**ingress** | **egress**] [**access** | **network**] [**instance** *instance-id*] [**scheduler** *scheduler-name*]

port *port-id* **vport** *name* [**scheduler** *scheduler-name*]

Context

[\[Tree\]](#) (clear>qos>scheduler-stats port)

Full Context

clear qos scheduler-stats port

Description

This command clears the scheduler statistics per port.

Parameters

port-id

Specifies the ID of a specific instance for the queue group.

Values *slot/mda/port* [*.channel*]

queue-group-name

Specifies the queue group name, up to 32 characters.

ingress

Clears statistics for the ingress queue group.

egress

Clears statistics for the egress queue group.

access

Clears scheduler statistics applied on an access port.

network

Clears scheduler statistics applied on a network port.

instance-id

Specifies the ID of a specific instance for the queue group.

Values 1 to 65535

name

Specifies the Vport name, up to 32 characters.

scheduler-name

Specifies the scheduler name, up to 32 characters.

Platforms

All

Full Context

```
show service id igmp-snooping port-db
```

Description

This command displays information on the IGMP snooping port database for the VPLS service.

Parameters

grp-ip-address

Displays the IGMP snooping port database for a specific multicast group address

sap-id

Displays the IGMP snooping port database for a specific SAP

sdp-id

Displays only IGMP snooping entries associated with the specified mesh SDP or spoke-SDP. For a spoke-SDP, the VC ID must be specified, for a mesh SDP, the VC ID is optional.

Values 1 to 17407

vc-id

The virtual circuit ID on the SDP ID for which to display information

Default For mesh SDPs only, all VC IDs

Values 1 to 4294967295

grp-address

Displays IGMP snooping statistics matching the specified group address.

ip-address

Displays IGMP snooping statistics matching one particular source within the multicast group.

vxlan vtep ip-address vni <1..16777215>

Displays the IGMP snooping entries associated with a specific VXLAN binding, given by the VXLAN Termination Endpoint (VTEP) and VXLAN Network Identifier (VNI).

vni

The VXLAN Network Identifier (VNI) for which to display information.

Values 1 to 16777215

Table 375: IGMP Snooping Port Database Fields describes the show output fields.

Table 375: IGMP Snooping Port Database Fields

Label	Description
Group Address	The IP multicast group address for which this entry contains information.
Mode	Specifies the type of membership reports received on the interface for the group. In the include mode, reception of packets sent to the specified multicast address is requested only from those IP source addresses listed in the source-list parameter of the IGMP membership report. In the exclude mode, reception of packets sent to the specified multicast address is requested from all IP source addresses except those listed in the source-list parameter.
Type	Indicates how this group entry was learned. If this group entry was learned by IGMP, the value is set to dynamic. For statically configured groups, the value is set to static.
Compatibility mode	Specifies the IGMP mode. This is used for routers to be compatible with older-version routers. IGMPv3 hosts must operate in Version 1 and Version 2 compatibility modes. IGMPv3 hosts must keep state per local interface regarding the compatibility mode of each attached network. A host's compatibility mode is determined from the host compatibility mode variable which can be in one of three states: IGMPv1, IGMPv2 or IGMPv3. This variable is kept per interface and is dependent on the version of general queries heard on that

Label	Description
	interface as well as the older-version querier present timers for the interface.
V1 host expires	The time remaining until the local router will assume that there are no longer any IGMP Version 1 members on the IP subnet attached to this interface. Upon hearing any IGMPv1 membership report, this value is reset to the group membership timer. While this time remaining is non-zero, the local router ignores any IGMPv2 leave messages for this group that it receives on this interface.
V2 host expires	The time remaining until the local router will assume that there are no longer any IGMP Version 2 members on the IP subnet attached to this interface. Upon hearing any IGMPv2 membership report, this value is reset to the group membership timer. While this time remaining is non-zero, the local router ignores any IGMPv3 leave messages for this group that it receives on this interface.
Source address	The source address for which this entry contains information.
Up Time	The time since the source group entry was created.
Expires	The amount of time remaining before this entry will be aged out.
Number of sources	Indicates the number of IGMP group and source specific queries received on this SAP.
Forwarding/Blocking	Indicates whether this entry is on the forward list or block list.
Number of groups	Indicates the number of groups configured for this SAP.

port-db

Syntax

port-db sap *sap-id* [**group** *grp-ip-address*]

port-db sap *sap-id* **group** *grp-ip-address* **source** *src-ip-address*

port-db sdp *sdp-id:vc-id* [**group** *grp-ip-address*]

port-db sdp *sdp-id:vc-id* **group** *grp-ip-address* **source** *src-ip-address*

port-db [**group** *grp-ip-address*] **vxlan vtep** *ip-address* **vni** *vni-id*

port-db group *grp-ip-address* **source** *src-ip-address* **vxlan vtep** *ip-address* **vni** *vni-id*

Context

[\[Tree\]](#) (clear>service>id>igmp-snooping port-db)

Full Context

clear service id igmp-snooping port-db

Description

This command clears the information on the IGMP snooping port database for the VPLS service.

Parameters

sap-id

Clears IGMP snooping statistics matching the specified SAP ID and optional encapsulation value

sdp-id

Clears only IGMP snooping entries associated with the specified mesh SDP or spoke-SDP. For a spoke-SDP, the VC ID must be specified, for a mesh SDP, the VC ID is optional.

Values 1 to 17407

vc-id

Clears information for the specified virtual circuit ID on the SDP ID

Default For mesh SDPs only, all VC IDs

Values 1 to 4294967295

grp-ip-address

Clears IGMP snooping statistics matching the specified group address

src-ip-address

Clears IGMP snooping statistics matching the specified particular source

vxlan vtep ip-address vni <1..16777215>

Clears the IGMP snooping statistics associated with a specific VXLAN destination given by the VXLAN Termination Endpoint (VTEP) and VXLAN Network Identifier (VNI).

vni-id

Displays information for the specified VXLAN Network Identifier (VNI)

Values 1 to 16777215

Platforms

All

port-db

Syntax

port-db sap *sap-id* [**group** *grp-ip-address*]

port-db sap *sap-id* **group** *grp-ip-address* **source** *src-ip-address*

port-db sdp *sdp-id:vc-id* [**group** *grp-ip-address*]

```
port-db sdp sdp-id:vc-id group grp-ip-address source src-ip-address  
port-db [group grp-ip-address] vxlan vtep ip-address vni vni-id  
port-db group grp-ip-address source src-ip-address vxlan vtep ip-address vni vni-id
```

Context

[\[Tree\]](#) (clear>service>id>mld-snooping port-db)

Full Context

```
clear service id mld-snooping port-db
```

Description

This command clears MLD snooping port-db group data.

Parameters

sap-id

Clears IGMP snooping statistics matching the specified SAP ID and optional encapsulation value

sdp-id

Clears only IGMP snooping entries associated with the specified mesh SDP or spoke-SDP. For a spoke-SDP, the VC ID must be specified, for a mesh SDP, the VC ID is optional.

Values 1 to 17407

vc-id

Clears information for the specified virtual circuit ID on the SDP ID

Default For mesh SDPs only, all VC IDs

Values 1 to 4294967295

grp-ip-address

Clears IGMP snooping statistics matching the specified group address

src-ip-address

Clears IGMP snooping statistics matching the specified particular source

vxlan vtep *ip-address* **vni** <1..16777215>

Clears the IGMP snooping statistics associated with a specific VXLAN destination given by the VXLAN Termination Endpoint (VTEP) and VXLAN Network Identifier (VNI).

vni-id

Displays information for the specified VXLAN Network Identifier (VNI)

Values 1 to 16777215

18.67 port-list

port-list

Syntax

port-list [*port-list-name*]

port-list *port-list-name* **references**

Context

[\[Tree\]](#) (show>filter>match-list port-list)

Full Context

show filter match-list port-list

Description

This command displays TCP/UDP/SCTP port values or ranges for match criteria in IPv4 and IPv6 ACL and CPM filter policies.

Parameters

port-list-name

A string of up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

references

Displays the filter policies, policy entries and source/destination/port match type per entry referring to this match list.

Platforms

All

port-list

Syntax

port-list

port-list *port-list-name* [**association**]

Context

[\[Tree\]](#) (show>qos>match-list port-list)

Full Context

show qos match-list port-list

Description

This command displays the list of configured QoS port lists or the details of a specific QoS port list together with the network QoS policies in which it is used and the entry number within that policy.

Parameters

port-list-name

Displays a port list, up to 32 characters of printable ASCII characters. If special characters are used, the string must be enclosed within double quotes.

association

Displays the network QoS policy and entry number in which the specified port list is used.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following output is an example of QoS port list information. [Table 376: Output Fields: show qos match-list port-list](#) describes the output fields.

Num Ports/Range	Displays the number of ports or range of ports.
No. of Port-List	Displays the number of port lists.
QoS Policy ID	Displays the QoS policy ID.

18.68 port-map

port-map

Syntax

port-map [*client-map-id*]

Context

[Tree] (show>system>satellite>tdm-sat port-map)

[Tree] (show>system>satellite>eth-sat port-map)

Full Context

show system satellite tdm-sat port-map

show system satellite eth-sat port-map

Description

This command displays information about configured satellites port maps.

Parameters

client-map-id

Specifies the client map to display. If a client port is associated with a resilient secondary uplink, a second line shows the current secondary uplink association.

Platforms

7450 ESS, 7750 SR-7/12/12e, 7750 SR-a, 7750 SR-e

- show system satellite tdm-sat port-map

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

- show system satellite eth-sat port-map

Output

The following output is an example of TDM satellite port map information.

Output Example

```
A:admin@Dut-A# show system satellite eth-sat 1 port-map

port-policy

Syntax

port-policy

port-policy *policy-name*

port-policy *policy-name* **associations**

Context

[\[Tree\]](#) (show port-policy)

Full Context

show port-policy

Description

This command displays port policy information.

Parameters

policy-name

Specifies the port policy name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.70 port-queues

port-queues

Syntax

port-queues **queue-depth** [**queue** *queue-id*]

Context

[\[Tree\]](#) (clear>port port-queues)

Full Context

clear port port-queues

Description

This command clears the port queues and queue depth.

Parameters

queue-depth

Clears the queue depth.

queue-id

Specifies the queue ID.

Values 1 to 16

Platforms

All

port-queues

Syntax

port-queues queue *queue-id*

port-queues queue-depth [**queue** *queue-id*]

Context

[\[Tree\]](#) (show>port port-queues)

Full Context

show port port-queues

Description

This command displays port queues, queue override, and queue depth information.

Parameters

queue-depth

Displays queue depth information for the specified queue group queue.

queue-id

Specifies the queue ID.

Values 1 to 16

Platforms

All

18.71 port-recorder

port-recorder

Syntax

port-recorder detail [**flow-count** *flows*] [**byte-count** *kbytes*] [**isa** *mda-id /esa-vm-id*] **url** *file-url*

port-recorder status [**isa** *mda-id/esa-vm-id*]

port-recorder top *granularity* [**max-count** *max-count*] [**isa** *mda-id*]

Context

[Tree] (tools>dump>app-assure>group port-recorder)

Full Context

tools dump application-assurance group port-recorder

Description

This command saves the port recorded by the tool into a file. The port-recorder is configured using debug commands.

Parameters

flow-count *flows*

Match ports with flow count greater than the specified value.

Values slot 1 to 4294967295

bytes-count *kbytes*

Match ports with bytes count greater than the specified value.

Values slot 1 to 4294967295

status

Displays the current status of the port-recorder with current-time, start-time, stop-time, sample-rates as well as number of bytes and flows for UDP and TCP traffic on the specified AA ISA card. The port-recorder is configured using debug commands.

top

Displays by bytes or flows the top ports recorded by the tool on a particular AA ISA.

mda-id/esa-vm-id

Specifies the AA ISA.

Values slot 1 to 10, mda 1 to 2

file-url

Specifies the URL for the file to direct the port-recorder output to.

Values	local-url:	<cflash-id>/[<file-path>] 200 chars max, including cflash-id directory length 99 chars max each
	remote-url:	[[ftp:// tftp://]<login>:<pswd>@<remote-locn>][<file-path>] 255 chars max directory length 99 chars max each
	remote-locn:	<hostname> <ipv4-address> <ipv6-address>] ipv4-address a.b.c.d ipv6-address x:x:x:x:x:x[-interface] x:x:x:x:x:d.d.d.d[-interface] x - [0..FFFF]H d - [0..255]D interface 32 chars max, for link local addresses cflash-id flash slot ID

granularity

Specifies if the output is sorted by bytes or flows.

Values bytes, flows

max-count

Specifies the maximum number of values to display.

Values 1 to 25

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

18.72 port-scheduler

port-scheduler

Syntax

port-scheduler [*interval seconds*] [*repeat repeat*] [*absolute| rate*]

Context

[\[Tree\]](#) (monitor>port port-scheduler)

Full Context

monitor port port-scheduler

Description

This command monitors port scheduler statistics.

Parameters

seconds

Configures the interval for each display in seconds.

Values 11 to 60

repeat

Configures how many times the command is repeated.

Values 1 to 999

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic instead of the delta.

Platforms

All

port-scheduler

Syntax

port-scheduler statistics

Context

[\[Tree\]](#) (clear>port port-scheduler)

Full Context

clear port port-scheduler

Description

This command clears port scheduler statistics.

Parameters

statistics

Clears port scheduler statistics.

Platforms

All

port-scheduler

Syntax

port-scheduler statistics

Context

[\[Tree\]](#) (show>lag port-scheduler)

Full Context

show lag port-scheduler

Description

This command displays port scheduler policy information applied to the LAG.

Parameters

statistics

Displays statistics for the port scheduler policy applied to the LAG.

Platforms

All

port-scheduler

Syntax

port-scheduler statistics

Context

[\[Tree\]](#) (show>port port-scheduler)

Full Context

show port port-scheduler

Description

This command displays port schedule policy information applied to the port.

Parameters

statistics

Displays port schedule policy statistics.

Platforms

All

18.73 port-scheduler-policy

port-scheduler-policy

Syntax

port-scheduler-policy [*port-scheduler-policy-name*] [**association**]

policy-id

Context

[\[Tree\]](#) (show>qos port-scheduler-policy)

Full Context

show qos port-scheduler-policy

Description

This command displays port-scheduler policy information

Parameters

port-scheduler-policy-name

Displays information for the specified existing port scheduler policy.

association

Displays associations related to the specified port scheduler policy.

network-policy ***network-queue-policy-name***

Displays information for the specified existing network queue policy.

sap-egress ***policy-id***

Displays information for the specified existing SAP egress policy.

scheduler-policy ***scheduler-policy-name***

Displays information for the specified existing scheduler policy.

Platforms

All

Output

The following output is an example of QoS port scheduler policy information, and [Table 377: Show QoS Port Scheduler Output Fields](#) describes the QoS port scheduler policy fields.

Table 377: Show QoS Port Scheduler Output Fields

Label	Description
Policy Name	Displays the port scheduler policy name.
HQOS Algorithm	Displays the port scheduler H-QoS algorithm used to calculate the operational rates for the children connected to the port scheduler.
Max Rate	Displays the explicit maximum frame-based bandwidth limit of this port scheduler.
Lvlx PIR	Displays the total bandwidth limit, PIR, for the specified priority level.
Lvlx CIR	Displays the within-CIR bandwidth limit for the specified priority level.
Orphan Lvl	Displays above-CIR port priority of orphaned queues and scheduler.
Orphan Weight	Displays the weight of orphaned queues and schedulers that are above-CIR.
Orphan CIR-Lvl	Displays the port priority of orphaned queues and schedulers that are within-CIR.
Orphan CIR-Weight	Displays the weight of orphaned queues and schedulers that are within-CIR.
Associations	Displays associations related to the specified port scheduler policy.
Mode	Displays the port scheduler policy mode (STRICT, RR, WRR, WDRR).

Label	Description
Accounting	Displays whether the accounting mode is frame-based or packet-based
Last Changed	Displays the last time the configuration changed.
Queue #	Displays the weight of the queue if configured.

18.74 port-topology

port-topology

Syntax

port-topology [uni-dir]

Context

[Tree] (show>system port-topology)

Full Context

show system port-topology

Description

This command generates a listing of the internal connections within the router. These include connections to satellite ports. Use of the **uni-dir** keyword will list each connection twice; once for each direction.

Parameters

uni-dir

Specifies to list each direction as a separate row.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following output is an example of port topology information.

Output Example

```
*A:Dut-A# show system port-topology
=====
Port Topology
=====
Port Far-end
Id Port Id
-----
esat-1/1/u1 1/1/1
```

```

18.75 port-tree

port-tree

Syntax

port-tree *port-id*

Context

[\[Tree\]](#) (show port-tree)

Full Context

show port-tree

Description

This command displays the tree for SONET/SDH or TDM ports/channels WAN PHY mode (xgig wan) Ethernet ports.

Parameters

port-id

Specifies the physical port ID.

Values slot/mda/port [.channel]

[Table 378: Port ID Values](#) describes the port ID values.

Table 378: Port ID Values

Product	Slot	MDA	Port	Values
7750 SR-12	1 to 10	1, 2	1 to 60	—
7750 SR-7	1 to 5	1, 2	(depending on the MDA type)	—
7950 XRS	1 to 20	—		—
7450 ESS-7	—	—		1 to 4

Product	Slot	MDA	Port	Values
7450 ESS-12	—	—		1 to 10
Channelized MDAs				
CHOC12-SFP	—			slot/mda/port. [1 to 4] . [1 to 3] . [1 to 28] . [..24] For example, 7/2/1.1.1.28.24
CHOC3-SFP	—			slot/mda/port. [1 to 3] . [1 to 28] . [..24] For example, 7/2/1.1.28.24
DS3	—			slot/mda/port. [1 to 28] . [..24] For example, 7/1/1.1.1

Platforms

All

Output

The following output is an example of port information, and [Table 379: Output Fields: show port-tree <port-id>](#) describes the output fields.

Output Example: show port-tree <port-id>

```

```

Table 379: Output Fields: show port-tree <port-id>

Label	Description
lflindex	Displays the interface index number which reflects its initialization sequence.
type	Specifies the type.
sonet-sdh-index	Specifies the sonet-sdh-index.
*	When an asterisk (*) is displayed after the sonet-sdh-index, the port/channel is provisioned.

18.76 port-xc

```
port-xc
```

Syntax

```
port-xc [pxc pxc-id]
```

Context

[\[Tree\]](#) (show>port-xc port-xc)

Full Context

```
show port-xc
```

Description

This command displays information about Port Cross-Connect (PXC) information.

Parameters

pxc-id

Specifies the PXC ID.

Values 1 to 64

Platforms

All

Output

The following output is an example of PXC information, and [Table 380: Output Fields: port-xc](#) describes the output fields.

Output Example

```
*A:cses-B04# show port-xc

=====
```

Table 380: Output Fields: port-xc

Label	Description
PXC Id	The port cross-connect identifier
Admin State	The administrative state of the port
Oper State	The operational state of the port
Port Id	The port ID
Description	The PXC ID description
Interface	The port ID
MAC Chip Number	The MAC chip number for this port

Label	Description
Licensed	Yes — The port is licensed and can be used in a service configuration. No — The port is unlicensed and may not be used
IFIndex	Displays the interface's index number which reflects its initialization sequence.
Last State Change	Displays the last time the operational status of the port changed state.
Ing. Pool % Rate	The increment or decrement of the active bandwidth associated with the ingress port. This active bandwidth affects the amount of ingress buffer space managed by the port.
Egr. Pool % Rate	The increment or decrement of the active bandwidth associated with the egress port. This active bandwidth affects the amount of egress buffer space managed by the port.

18.77 post-policer-mapping

post-policer-mapping

Syntax

post-policer-mapping [*post-policer-name*] [**association** | **detail**]

Context

[\[Tree\]](#) (show>qos post-policer-mapping)

Full Context

show qos post-policer-mapping

Description

This command displays information about post-policer mapping policies. Omitting the policy name will list all policies.

Parameters

post-policer-name

Specifies the name of the post-policer mapping policy, up to 32 characters.

association

Displays the entities associated with the post-policer mapping policy.

detail

Displays the detailed information for the post-policer mapping policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

Output

This section shows output example for post-policer mapping.

Output Example

```

18.78 power-management

power-management

Syntax

power-management [zone]

Context

[\[Tree\]](#) (show>chassis power-management)

Full Context

show chassis power-management

Description

This command shows the power management requirement and utilization information for the 7950 XRS.

Parameters

zone

The chassis power zone.

Values 1, 2

Platforms

7750 SR-12e, 7750 SR-s, 7950 XRS

Output

The following output is an example of power management information, and [Table 381: Output Fields: show chassis power-management](#) describes the output fields.

Output Example: show chassis power-management

```

Table 381: Output Fields: show chassis power-management

Label	Description
Power Management Mode	Specifies the configured power management mode: None, Basic, or Advanced.
Power Safety Level	Specifies the configured Power Safety Level, which is a percentage of the worst case power consumption level.
Power Safety Alert	Specifies the configured power level in watts, which causes the system to raise an alarm if the available power level drops below a set level.
Power-Zone	Specifies the chassis power zone.
Number of PEQs	Specifies the total number of APEQs installed.
PEQ number:	Specifies the APEQ to which the information is associated
PEQ Equipped Type	Specifies the APEQ type installed.
PEQ Provisioned Type	Specifies the APEQ type provisioned.
Status	Specifies the APEQ status.
Input Feed Status	Specifies the feed status. This field indicates that power is detected on all inputs or lists the inputs where no power is detected.
PCM Equipped Type	<p>Indicates the type of PCM installed in the specified PIM or PCM slot:</p> <ul style="list-style-type: none"> • (empty slot) • indeterminate • quad-pcm <p>Some PCMs can only be verified for presence based on power available at the associated APEQ. These are indicated as indeterminate.</p> <p>When the equipped type is quad-pcm, the additional fields of Power-Zone, Status, and Input Feed Status and Hardware Data are displayed.</p>
PCM Provisioned Type	<p>One of the following types:</p> <ul style="list-style-type: none"> • (not specified) • dual-pcm • quad-pcm

Label	Description
	For a given PCM number, if the equipped type is not detected and the provisioned type is not specified, the PCM is not displayed.
Hardware Data:	
Part number	The APEQ part number.
CLEI code	The APEQ CLEI code.
Serial number	The APEQ serial number.
Manufacture date	The date the APEQ was manufactured.
Manufacturing deviations	Specifies any manufacturing deviations.
Manufacturing assembly number	The APEQ assembly number.
Administrative state	Specifies the administrative state of the APEQ.
Operational state	Specifies the operational state of the APEQ.
Time of last boot	Indicates the time stamp of the last system restart.
Current alarm state	Indicates the current alarm state.

power-module

Syntax

power-module *power-module-id*

Context

[\[Tree\]](#) (clear>chassis>power-shelf power-module)

Full Context

clear chassis power-shelf power-module

Description

This command toggles the output power of the power module, turning it off for two seconds then on. This procedure can be used to clear an ovSD (output voltage shutdown) fault. The only alternative method to clear the ovSD fault is to physically remove the power module from the power shelf and re-insert. Running this command does not clear the latched faults.

Parameters

power-module-id

Specifies the power-module ID.

Values 1 to 10

Platforms

7750 SR-s

power-module

Syntax

power-module *power-module-id* **telemetry**

Context

[\[Tree\]](#) (tools>dump>power-shelf power-module)

Full Context

tools dump power-shelf power-module

Description

This command displays the specified power module information, telemetry, and fault data. When a fault is no longer active it remains marked as a latched fault for tracking purposes until manually cleared.

Parameters

power-module-id

Displays information about the specified power-module ID.

Values 1 to 10

telemetry

Displays telemetry and fault data for the specified power module.

Platforms

7750 SR-s

power-module

Syntax

power-module *power-module-id* **clear-faults**

Context

[\[Tree\]](#) (tools>perform>power-shelf power-module)

Full Context

tools perform power-shelf power-module

Description

This command clears all the latched faults for inactive faults.

Parameters

power-module-id

Specifies power-module ID.

Values 1 to 10

clear-faults

Clears fault conditions against the specified power module.

Platforms

7750 SR-s

18.80 power-shelf

power-shelf

Syntax

power-shelf [*power-shelf-id*] [**detail**] [**chassis** *chassis-name*]

Context

[\[Tree\]](#) (show>chassis power-shelf)

Full Context

show chassis power-shelf

Description

This command displays the power shelf.

Parameters

power-shelf-id

Specifies the power shelf ID.

Values 1 to 2

detail

Displays detailed power shelf information.

chassis-name

Specifies the chassis name, up to 256 characters maximum.

Platforms

7750 SR-s

Output

The following output is an example of power shelves

Output Example: show chassis power-shelf

```
A:DUT-A# show chassis power-shelf
=====
Power Shelf Summary
=====
Slot      Provisioned Type      Admin Operational   Zone  Input Output
          Equipped Type (if diff) State State              Mode
-----
1         ps-a10-shelf-dc      up   up                1     80A   on
2         ps-b10-shelf-ac/hv   up   up                1     N/A   on
=====
```

```

Syntax

```
ppp
```

Context

[\[Tree\]](#) (show>call-trace ppp)

Full Context

```
show call-trace ppp
```

Description

Commands in this context display Point-to-Point Protocols (PPP) call trace information.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

18.82 ppp-policy

```
ppp-policy
```

Syntax

```
ppp-policy [ppp-policy-name [association]]
```

Context

[\[Tree\]](#) (show>subscr-mgmt ppp-policy)

Full Context

```
show subscriber-mgmt ppp-policy
```

Description

This command displays PPP policy information.

Parameters

ppp-policy-name

Specifies an existing PPP policy.

association

Displays the object the PPP policy is associated.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of PPP policy information and [Table 382: Show Subscriber Management PPP Policy Field Descriptions](#) describes the field descriptions.

Table 382: Show Subscriber Management PPP Policy Field Descriptions

Label	Description
Description	Specifies the description.
Last Mgmt Change	Specifies the date and time of the last management change.
PPP-mtu	Specifies the configured maximum PPP MTU size.
Force PPP-mtu >1492	Specifies if PPPoE MRU negotiations greater than 1492 bytes are enabled without receiving a "PPP-Max-Payload" tag in the PADI/PADR client message (Yes, No).
Keepalive Interval	Specifies the keepalive interval, in seconds.
Keepalive Multiplier	Specifies the keepalive multiplier value.
Disable AC-Cookies	Specifies to disable AC cookies (Yes, No).
PADO Delay	Specifies the PADO delay value, in milliseconds.
Max Sessions-Per-Mac	Specifies the maximum number of sessions with the same client MAC address and active on the same SAP or MSAP.
Reply-On-PADT	Specifies to reply on PADT (Yes, No).
Allow Same CID	Specifies to allow the same Circuit ID for multiple PPPoE sessions with the same client MAC address and active on the same SAP when using the internal DHCPv4 client for IPv4 address allocation (Yes, No).
Re-establish Session	Specifies if a PPPoE session can be re-established upon receiving a PADR from a PPPoE client that previously

Label	Description
	disconnected without sending a PADT and for which a session is still active in the BNG (PADR, Disabled).
PPP-Authentication	Specifies the PPP Authentication method (PAP, CHAP, pref-PAP or pref-CHAP).
PPP-CHAP Challenge	Specifies the minimum and maximum length of a PPP CHAP Challenge (in bytes).
PPP-Init-Delay (ms)	Specifies the delay in milliseconds for sending an LCP configure request after the discovery phase.
IPCP negotiate subnet	Specifies if IPCP subnet negotiation is enabled (Yes, No).
Unique SIDs-Per-SAP	Specifies the unique SIDs per-SAP (disabled, per-capture-sap, per-msap).
Reject-Disabled-Ncp	Specifies if an LCP protocol reject is sent for an unconfigured NCP (Yes, No).
Ignore-Magic-Num	Specifies if the LCP peer magic number should be ignored (Yes, No).
Session Timeout	Specifies the session timeout value in seconds (default = unlimited).
SID Allocation	Specifies the PPPoE Session ID allocation method (sequential, random).
PADO AC-Name	Specifies the AC name used in PADO messages.
Default username	Specifies the default username for PAP or CHAP authentication.
Default password	Specifies the default PAP password (Specified, Not specified).
Accept MRRU	Specifies to accept MRRU (true, false).
Request short sequence nr.	Specifies to request short sequence numbers (true, false).
Endpoint class	Specifies the endpoint class (null, ipv4-address or mac-address).
Endpoint address	Specifies the endpoint IPv4 or mac address.

This command displays information of PPPoE clients started by the vRGW.

Parameters

brg-ident

Specifies the string identifying the BRG, up to 32 characters maximum.

detail

Displays detailed PPPoE client information.

statistics

Displays PPPoE client statistics.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of PPPoE client information.

Output Example

```

Node# show subscriber-mgmt vrgw brg pppoe-client

pppoe-client

Syntax

pppoe-client

Context

[Tree] (tools>perform>subscr-mgmt>brg pppoe-client)

Full Context

tools perform subscriber-mgmt vrgw brg pppoe-client

Description

This command enables tools for controlling PPPoE clients in a BRG.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

18.85 pppoe-client-policy

```
pppoe-client-policy
```

Syntax

```
pppoe-client-policy [name]  
pppoe-client name associations
```

Context

```
[Tree] (show>subscr-mgmt pppoe-client-policy)
```

Full Context

```
show subscriber-mgmt pppoe-client-policy
```

Description

This command displays PPPoE client policy information.

Parameters

name

Specifies the PPPoE client policy name, up to 32 characters.

associations

Displays information associated with the policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

18.86 prefix-ext-stats

```
prefix-ext-stats
```

Syntax

```
prefix-ext-stats ipv6-address/prefix-length  
prefix-ext-stats pool pool-name
```

Context

```
[Tree] (show>router>dhcp6>server prefix-ext-stats)
```

Full Context

```
show router dhcp6 local-dhcp-server prefix-ext-stats
```

Description

This command displays extended statistics per DHCPv6 prefix in local DHCPv6 server.

The following statistics are included in output:

- The number of stable leases in the prefix
- The number of provisioned /64 address block in the prefix
- The number of used /64 address block in the prefix
- The number of free /64 address block in the prefix
- The percentage of used address (with /64 address block)
- The percentage of free address (with /64 address block)

For each statistic (except for Provisioned Addresses), there is current value and peak value, peak value is the highest value since prefix creation or last reset via command **clear>router *rt-id*>dhcp6>local-dhcp-server *svr-name*>prefix-ext-stats**.

When the **pool** parameter is used, the statistics of each prefix in the pool are displayed.

Parameters

ipv6-address/prefix-length

Specifies the IPv6 prefix.

pool-name

The name of DHCPv6 local server pool.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of prefix extended stats information.

Output Example

```
show router 500 dhcp6 local-dhcp-server "d6" prefix-ext-stats 2001:ABCD::/62
=====
Extended statistics for prefix 2001:ABCD::/62
=====
-----

Last Reset Time      01/07/2013 19:54:52
-----
Number of entries    1
```

[Table 384: Prefix Extended Statistics Field Descriptions](#) describes extended prefix statistics output fields.

Table 384: Prefix Extended Statistics Field Descriptions

Field	Description
Current	The current extended prefix statistics
Peak	The peak value since the last reset
TimeStamp	The date and time of the last reset
Failover Oper State	The operational state of the DHCP specified prefix
Stable Leases	The number of stable leases
Provisioned Blks	The number of provisioned blocks
Used Blks	The number of used blocks
Free Blks	The number of free blocks
Used Pct	The percentage of extended prefixes in use
Free Pct	The percentage of free prefixes in use
Last Reset Time	The date and time of the last reset
Number of entries	The total number of entries

prefix-ext-stats

Syntax

prefix-ext-stats *ipv6-address/prefix-length*

prefix-ext-stats pool *pool-name*

Context

[\[Tree\]](#) (clear>router>dhcp6>server prefix-ext-stats)

Full Context

clear router dhcp6 local-dhcp-server prefix-ext-stats

Description

This command reset the begin time of peak values in output of the **show router *rt-id* dhcp6 local-dhcp-server *svr-name* prefix-ext-stats** command/

Parameters

ipv6-address/prefix-length

Clears information about the specified IPv6 prefix.

pool-name

Clears information about the specified local DHCPv6 server pool name.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

18.87 prefix-label

```
prefix-label
```

Syntax

```
prefix-label
```

Context

[\[Tree\]](#) (show>router>bgp prefix-label)

Full Context

```
show router bgp prefix-label
```

Description

This command displays BGP Prefix label information.

Platforms

All

18.88 prefix-sids

```
prefix-sids
```

Syntax

```
prefix-sids [ipv4-unicast | ipv6-unicast | ipv4-multicast | ipv6-multicast | mt mt-id-number] [ ip-  
prefix[/prefix-length]] [sid sid] [ adv-router system-id | hostname] [srms | no-srms] [algo algo-id]
```

Context

[\[Tree\]](#) (show>router>isis prefix-sids)

Full Context

show router isis prefix-sids

Description

This command displays IS-IS prefix SIDs.

Parameters

ipv4-unicast

Displays IPv4 unicast parameters.

ipv6-unicast

Displays IPv6 unicast parameters.

ipv4-multicast

Displays IPv4 multicast parameters.

ipv6-multicast

Displays IPv6 multicast parameters.

mt-id-number

Displays multi-topology parameters.

Values 0, 2, 3, 4

ip-prefix[/prefix-length]

Displays information about the specified IP prefix and length.

Values ipv4-prefix:

- a.b.c.d (host bits must be 0)

ipv4-prefix-length: [0 to 32]

ipv6-prefix-length:

- x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x: [0 to FFFF]H
- d: [0 to 255]D
- ipv6-prefix-length: [0 to 128]

sid

Displays information for the specific segment identifier.

Values 0 to 524287

system-id | hostname

Displays information for the specific IS-IS advertising router. Host name up to 38 characters.

srms

Displays parameters filtered for segment routing mapping server.

no-srms

Displays parameters filtered for no segment routing mapping server.

algo-id

Displays information for the specified algorithm.

Values 0 to 255

Platforms

All

Output

The following outputs are examples of prefix SID information, and [Table 385: IS-IS Prefix SIDs Output Fields](#) describes the output fields.

Output Example

Table 385: IS-IS Prefix SIDs Output Fields

Label	Description
Prefix	Displays the IP prefix for the SID
SID	Displays the SID value
Adv-Rtr	Displays the IP address of the advertised router
SRMS	Displays whether the prefix SID is advertised by the SR mapping server (Y or N) or selected to be programmed (S)
Flags	Displays the SID flags
No. of Prefix/SIDs	Displays the number of Prefix/SIDs

prefix-sids

Syntax

prefix-sids [*ip-prefix[/prefix-length]*] [**sid** *sid*] [**adv-router** *router-id*] [**algo** *algo-id*]

Context

[Tree] (show>router>ospf prefix-sids)

Full Context

show router ospf prefix-sids

Description

This command displays OSPF prefix SIDs.

Parameters

ip-prefix[/prefix-length]

Displays information about the specified IP prefix and length, up to 64 characters.

sid

Displays information for the specific segment identifier.

Values 0 to 524287

router-id

Displays information for the specific advertising router identified by its router identifier.

algo-id

Displays the algorithm identifier.

Values 0 to 255

Platforms

All

Output

The following outputs are examples of OSPF prefix SIDs information, and [Table 386: OSPF Prefix SIDs Output Fields](#) describes the output fields.

Output Example

```
*A:Dut-F# show router ospf prefix-sids
=====
Rtr Base OSPFv2 Instance 0 Prefix-Sids
=====
```

Table 386: OSPF Prefix SIDs Output Fields

Label	Description
Prefix	Displays the IP prefix for the SID
Area	Displays the OSPF area
RtType	Displays the route type (INTRA-AREA or INTER-AREA)
SID	Displays the SID value
Adv-Rtr	Displays the IP address of the advertised router
SRMS	Displays whether the prefix SID is advertised by the SR mapping server (Y or N) or selected to be programmed (S)

Label	Description
Flags	Displays the SID flags
No. of Prefix/SIDs	Displays the number of Prefix/SIDs

prefix-sids

Syntax

prefix-sids [*ip-prefix[/prefix-length]*] [**sid** *sid*] [**adv-router** *router-id*]

Context

[\[Tree\]](#) (show>router>ospf3 prefix-sids)

Full Context

show router ospf3 prefix-sids

Description

This command displays OSPF prefix SIDs.

Parameters

ip-prefix[/prefix-length]

Displays information about the specified IP prefix and length, up to 64 characters.

sid

Displays information for the specific segment identifier.

Values 0 to 524287

router-id

Displays information for the specific advertising router identified by its router ID.

Platforms

All

Output

The following outputs are examples of OSPFv3 prefix SIDs information, and [Table 387: OSPFv3 Prefix SIDs Output Fields](#) describes the output fields.

Output Example

```
*A:Dut-F# show router ospf prefix-sids

Table 387: OSPFv3 Prefix SIDs Output Fields

Label	Description
Prefix	Displays the IP prefix for the SID
Area	Displays the OSPF area
RtType	Displays the route type (INTRA-AREA or INTER-AREA)
SID	Displays the SID value
Adv-Rtr	Displays the IP address of the advertised router
SRMS	Displays whether the prefix SID is advertised by the SR mapping server (Y or N) or selected to be programmed (S)
Flags	Displays the SID flags
No. of Prefix/SIDs	Displays the number of Prefix/SIDs

prefix-sids

Syntax

prefix-sids [**interface** *ip-int-name*] [**ipv4** | **ipv6**]

Context

[\[Tree\]](#) (show>router>seg-rt>sr-mpls prefix-sids)

Full Context

show router segment-routing sr-mpls prefix-sids

Description

This command displays information about the prefix SIDs and their state on the router.

Parameters

ip-int-name

Displays information about the specified interface, up to 32 characters.

ipv4

Displays the prefix SIDs that are IPv4 capable.

ipv6

Displays the prefix SIDs that are IPv6 capable.

Platforms

All

Output

The following output is an example of prefix SIDs information, and [Table 388: Prefix SIDs Output Fields](#) describes the output fields.

Output Example

```
*A:Dut-A# show router segment-routing sr-mpls prefix-sids
=====
Rtr Base SR-MPLS Prefix-SIDs
=====
Interface Name          AF      SID      Label      State

```

Table 388: Prefix SIDs Output Fields

Label	Description
Interface Name	The name of the loopback or system interface
AF	The address family associated with the prefix SID
SID	The SID index
Label	The SID label
State	The operational state of the prefix SID <ul style="list-style-type: none"> • enabled — Operational state up • adminDown — Administrative state down (for example, no SID configured) • failed — Operational state down due to failure (for example, resource allocation failure) • ifDown — The interface is down • ifFailed — Interface configuration failure (for example, the interface is not a loopback)

18.89 prefix-stats

prefix-stats

Syntax

prefix-stats *ipv6-address/prefix-length*

prefix-stats pool *pool-name*

Context

[\[Tree\]](#) (show>router>dhcp6>local-dhcp-server prefix-stats)

Full Context

show router dhcp6 local-dhcp-server prefix-stats

Description

This command displays prefix statistics.

Parameters

ipv6-address

Specifies the base IP address of the subnet. This address must be unique within the subnet and specified in dotted decimal notation. Allowed values are IP addresses in the range 1.0.0.0 – 223.255.255.255 (with support of /31 subnets).

pool-name

Specifies the name of DHCPv6 local server pool.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

18.90 prefix-threshold-stats

prefix-threshold-stats

Syntax

prefix-threshold-stats pool *pool-name detail* [**format** {**exact** | **scientific**}]

prefix-threshold-stats pool *pool-name*

prefix-threshold-stats *ipv6-address/prefix-length detail* [**format** {**exact** | **scientific**}]

prefix-threshold-stats *ipv6-address/prefix-length*

Context

[\[Tree\]](#) (show>router>dhcp6>server prefix-threshold-stats)

Full Context

```
show router dhcp6 local-dhcp-server prefix-threshold-stats
```

Description

This command displays prefix level threshold stats of local DHCPv6 server prefix. A minimum-free threshold needs to be configured before system collects threshold stats for the prefix.

The stats for each threshold are calculated based on the configured minimum-free prefix length.

For example, a /59 prefix is provisioned in the local DHCPv6 server, and the server allocated two PD leases, one /62 and one /63. And there is a /63 minimum threshold configured. The threshold stats are calculated based on /63 as the base unit (block). Then the value of the current used block would be 3 because there is one /62 lease and one /63 lease, that equals to a total three /63.

Parameters

pool *pool-name*

Specifies the name of the pool in local DHCPv6 server, up to 32 characters.

detail

Displays detailed output statistics.

format

Specifies that the number format in the display is either **exact** or **scientific**.

ipv6-address/prefix-length

Specifies the IPv6 prefix with prefix length.

Values

ipv6-address x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x [0 to FFFF]H

d [0 to 255]D

prefix-length [1 to 128]

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of prefix threshold information.

Output Example

```
show router 500 dhcp6 local-dhcp-server "d6" leases

The command displayed above displays detailed statistics of prefix level thresholds in the specified provision prefix.

[Table 389: Prefix Threshold Statistics Field Descriptions](#) describes prefix threshold statistics output fields.

Table 389: Prefix Threshold Statistics Field Descriptions

Field	Description
Operational state	The operational state of the local DHCP server instance unknown — The operational state is unknown inService — The operational state is in service outOfService — The operational state is out of service transition — The operational state is in transition waitPersistence — The DHCP server instance is waiting for a persistence action to complete.
Pool	The number of pools in the specified prefix
Stable leases	The number of stable leases associated with the prefix
Advertised leases	The advertised leases associated with the prefix
Prefix	The specified prefix
Draining	The draining state

Field	Description
	Y — enabled N — disabled
Threshold	The prefix level threshold
Current Provisioned Blks	The number of provisioned blocks for this prefix
Current Used Blks	The number of used blocks for this prefix
Current Free Blks	The number of free blocks for this prefix
Current Used Percent	The percentage of used prefixes with the minimum free threshold length for this prefix
Current Used Peak Blks	A 64-bit word of the peak value of the number of used blocks for this prefix
Current Used Peak Percentage	The peak value of the number of used prefixes with the minimum free threshold length in the pool as a percentage of the provisioned prefixes.
Current Used Peak Time	The time at which the peak value of the number of used prefixes in the pool was reached
Current Free Percent	The percentage of free prefixes with the minimum free threshold length in the pool compared to the number of provisioned prefixes.
Current Free Too Low	The number of free prefixes with the minimum free threshold length available in the pool that is below the configured number of prefixes with the minimum free threshold length
Current Free Depleted	The number of prefixes with the minimum free threshold length available
Local Provisioned Blks	A 64-bit word of the number of provisioned prefixes with the minimum free threshold length local
Local Used Blks	The higher 64-bits word of the number of used prefixes with the minimum free threshold length
Local Free Blks	A 64-bit word of the number of free prefixes with the minimum free threshold length
Local Used Peak Blks	A 64-bit word of the peak value of the number of used prefixes with the minimum free threshold length
Local Used Peak Percent	The peak value of the number of used prefixes with the minimum free threshold length local in the pool as a percentage of the provisioned prefixes

Field	Description
Local Used Peak Time	The time at which the peak value of the number of used prefixes local in the pool was reached
Remote Provisioned Blks	A 64-bit word of the number of provisioned prefixes with the minimum free threshold length
Remote Used Blks	A 64-bit word of the number of used prefixes with the minimum free threshold length remote in the pool
Remote Free Blks	A 64-bit word of the number of free prefixes with the minimum free threshold length remote in the pool
Remote Used Peak Blks	The higher 64-bit word of the number of used prefixes with the minimum free threshold length
Remote Used Peak Percent	The peak value of the number of used prefixes with the minimum free threshold length remote in the pool as a percentage of the provisioned prefixes
Remote Used Peak Time	The time at which the peak value of the number of used prefixes remote in the pool was reached.
Peak Reset Time	The time at which the peak values have been reset
Valid Dada	The actual status of the threshold statistics data of the pool. Y — the data is up to date and may be used. N — the data is being recalculated in the background and is not stable for further use

prefix-threshold-stats

Syntax

prefix-threshold-stats *ipv6-address/prefix-length*

prefix-threshold-stats pool *pool-name*

Context

[Tree] (clear>router>dhcp6>server prefix-threshold-stats)

Full Context

clear router dhcp6 local-dhcp-server prefix-threshold-stats

Description

This commands resets the peak stats in the prefix level threshold stats in the specified provision prefix or pool.

Parameters

pool-name

Clears information about the specified pool in local DHCPv6 server.

ipv6-address/prefix-length

Clears information about the specified IPv6 prefix with prefix length.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Context

[\[Tree\]](#) (show>router>ldp>bindings prefixes)

Full Context

show router ldp bindings prefixes

Description

This command displays LDP Prefix fec bindings.

Parameters

prefix *ip-prefix/ip-prefix-length*

Specify information for the specified IP prefix and mask length.

Values

ipv4-prefix

- a.b.c.d

ipv4-prefix-length	[0 to 32]
ipv6-address	- x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x - [0 to FFFF]H d - [0 to 255]D
ipv6-prefix-length	[0 to 128]

session *ip-addr[label-space]*

Specify information for the specified IP address and label space.

Values	ipv4-address	- a.b.c.d: <i>label-space</i>
	ipv6-address	- x:x:x:x:x:x:x: <i>label-space</i>
	label-space	0 to 65535

detail

Displays detailed information.

summary

Displays information in a summarized format.

family

Displays either IPv4 or IPv6 active LDP information.

Values	ipv4 or ipv6
---------------	--------------

egress-lsp *tunnel-id*

Specifies the tunnel identifier for this egress LSP.

Values	0 to 4294967295
---------------	-----------------

egress-nh *ip-address*

Displays LDP active bindings by matching egress-nh.

Values	ipv4-address	- a.b.c.d
	ipv6-address	- x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x - [0 to FFFF]H d - [0 to 255]D

egress-if *port-id*

Displays LDP active bindings by matching egress-if.

community

The string defining the LDP community assigned to the session. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains spaces, use double quotes to delimit the start and end of the string.

Values up to 32 characters | no-community (selects FEC with no community string)

Context

[\[Tree\]](#) (show>router>ldp>bindings>active prefixes)

Full Context

show router ldp bindings active prefixes

Description

This command displays LDP active prefix bindings.

Parameters

ip-prefix/ip-prefix-length

Specifies information for the IP prefix and mask length.

Values		
	ipv4-prefix:	a.b.c.d
	ipv4-prefix-length:	0 to 32
	ipv6-prefix:	x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x: [0 to FFFF]H d: [0 to 255]D
	ipv6-prefix-length:	1 to 128

ip-address

Specifies the IPv4 or IPv6 address.

Values		
	ipv4-address:	a.b.c.d
	ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d x: [0 to FFFF]H d: [0 to 255]D

family

Specifies the address family.

Values	
	ipv4, ipv6

port-id

Specifies the port ID.

Values		
	<i>slot[/mda[/port]] or slot/mda/port [.channel]</i>	
aps-id	aps-group-id [.channel]	
	aps	keyword
	<i>group-id</i>	1 to 128
eth-sat-id	esat-id [/slot/[u]port]	
	esat	keyword
	<i>id</i>	1 to 20
	<i>u</i>	keyword for up-link port
tdm-sat-id	tsat-id [/slot/[u]port.channel]	
	tsat	keyword

	<i>id</i>	1 to 20
	u	keyword for up-link port
pxc-id	pxc-id.sub-port	
	pxc	keyword
	<i>id</i>	1 to 64
	<i>sub-port</i>	a to b

tunnel-id

Specifies the tunnel ID.

Values 0 to 4294967295

community

The string defining the LDP community assigned to the session. Allowed values are any string up to 32 characters long composed of printable, 7-bit ASCII characters excluding double quotes. If the string contains spaces, use double quotes to delimit the start and end of the string.

Values up to 32 characters | no-community (selects FEC with no communitystring

Table 390: Show User Profile Output Fields

Label	Description
User Profile	Displays the profile name used to deny or permit user console access to a hierarchical branch or to specific commands.
Def. action	Permit all — Permits access to all commands. Deny — Denies access to all commands. None — No action is taken.
Entry	The entry ID in a policy or filter table.
Description	Displays the text string describing the entry.
Match Command	Displays the command or subtree commands in subordinate command levels.
Action	Permit all — Commands matching the entry command match criteria are permitted.

Label	Description
	Deny — Commands not matching the entry command match criteria are not permitted.
No. of profiles	The total number of profiles listed.

profile

Syntax

Action     : permit
=====

No. of profiles: 3
=====
A:ALA-48>config>system>snmp#
    
```

Table 391: Show Profile Output Fields

Label	Description
User Profile	default — Displays the action to be given to the user profile if none of the entries match the command. administrative — Specifies the administrative state for this profile.
Def. Action	none — No action is given to the user profile when none of the entries match the command. permit-all — The action to be taken when an entry matches the command.
Entry	10 - 80 — Displays an entry which represents the configuration for a system user.

Label	Description
Description	A text string describing the entry.
Match Command	administrative — Enables the user to execute all commands. configure system security — Enables the user to execute the config system security command. enable-admin — Enables the user to enter a special administrative mode by entering the enable-admin command. exec — Enables the user to execute (exec) the contents of a text file as if they were CLI commands entered at the console. exit — Enables the user to execute the exit command. help — Enables the user to execute the help command. logout — Enables the user to execute the logout command. password — Enables the user to execute the password command. show config — Enables the user to execute the show config command. show — Enables the user to execute the show command. show system security — Enables the user to execute the show system security command.
Action	permit — Enables the user access to all commands. deny-all — Denies the user access to all commands.

Table 392: Show provider tunnel output fields

Label	Description
Service Provider Tunnel Information	
Type	The provider tunnel type (inclusive or selective)
Root and Leaf	The root and leaf status
Admin State	The administrative state
Data Delay Intvl	The data delay interval in seconds
PMSI Type	The PMSI type
LSP Template	The LSP template name
Remain Delay Intvl	The remaining delay interval in seconds

Label	Description
LSP Name used	The LSP name
PMSI Owner	The PMSI owner
Oper State	The operational state
Root Bind Id	The root binding ID
wildcard-spmsi/ Wildcard SPMSI	The wildcard SPMSI status
Maximum-p2mp- spmsi/Max P2MP SPMSI	The maximum P2MP SPMSI value
Group-range/Group range	The group range
s-pmsi-threshold/ S- PMSI Threshold	The SPMSI threshold so that the root node attempts to setup an S-PMSI tree, in Kbps
Pe-threshold-add/ PE Threshold add	The PE threshold add value
Pe-threshold-delete/ PE Threshold del	The PE threshold delete value
LDP Spmsi tunnels	
LSP ID	The LSP ID
Root Addr/Root Address	The root address
Spmsi IfIndex/S-PMSI If Index	The SPMSI If Index value
Num. Leaf PEs	The number of leaf PEs
Number of SGs	The number of SGs
Uptime	The cumulative up time
Group Address	The group address
Source Address	The source address
Origin IP Address	The origin IP address
State	The state value
S-pmsi Threshold	The SPMSI threshold value

Label	Description
Remain Delay Intvl	The remaining delay interval in seconds
Group Receiver PE	The group receiver PE IP address
Leaf Address	The Leaf IP addresses
Pe-threshold-add	The PE threshold add value
Pe-threshold-delete	The PE threshold delete value
Current Receiver PE Count	The current receive PE count value
LDP Spmsi Tunnels	The total number of SPMSI tunnels

provider-tunnel-using

Syntax

provider-tunnel-using leaf-only [bgp-ad | bgp-vpls | bgp-evpn-mpls]

provider-tunnel-using root-and-leaf [bgp-ad | bgp-vpls | bgp-evpn-mpls]

Context

[\[Tree\]](#) (show>service provider-tunnel-using)

Full Context

show service provider-tunnel-using

Description

This command displays the list of provider tunnels existing in the router for all services. The output can be filtered based on the provider tunnel owner.

Parameters

leaf-only

Displays the leaf-only provider tunnels for all services.

root-and-leaf

Displays the root and leaf provider tunnels for all services.

bgp-ad

Filters the provider tunnels owned by BGP AD services.

bgp-vpls

Filters the provider tunnels owned by BGP VPLS services.

bgp-evpn-mpls

Filters the provider tunnels owned by BGP EVPN-MPLS services.

Platforms

All

Output

The following output is an example of provider tunnel using information.

Output Example

```
A:PE-76# show service provider-tunnel-using root-and-leaf

```
proxy-arp
```

Syntax

- proxy-arp** [*ip-address*] [*detail*]
- proxy-arp** [*ip-address*] **dynamic**

Context

[\[Tree\]](#) (show>service>id proxy-arp)

Full Context

show service id proxy-arp

Description

This command displays, in a table, the existing proxy-ARP entries for a particular service. The table is populated by EVPN MAC routes that contain a MAC and an IP address, as well as static entries or dynamic entries from snooped ARP messages on access SAP or SDP-bindings.

A 7750 SR, 7450 ESS, or 7950 XRS that receives an ARP request from a SAP or SDP-binding performs a lookup in the proxy-ARP table for the service. If a match is found, the router replies to the ARP and does not allow ARP flooding in the VPLS service. If a match is not found, the ARP is flooded within the service if the configuration allows it.

The command allows for specific IP addresses to be displayed. Dynamic IP entries associated to a MAC list are displayed with the corresponding MAC list and resolve timers information.

Parameters

ip-address

Specifies an IP address.

Values a.b.c.d

detail

Displays detailed information.

dynamic

Displays detailed information about dynamic entries.

proxy-arp

Syntax

proxy-arp [**ip-address** *ip-address*] [**detail**]

Context

[\[Tree\]](#) (show>service>id proxy-arp)

Full Context

show service id proxy-arp

Description

This command displays the proxy-ARP entries existing for a particular service. A 7750 SR, 7450 ESS or 7950 XRS router receiving an ARP request from a SAP or SDP-binding will perform a lookup in the proxy-arp table for the service. If the router finds a match, it will reply to the ARP and will not let the ARP be flooded in the VPLS service. If the router does not find a match, the ARP will be flooded within the service. The command allows for specific IP addresses to be shown.

The **detail** parameter allows the user to display all the entries. An individual IP address entry can also be shown.

Table 393: IGMP Snooping proxy Fields describes the show output fields.

Table 393: IGMP Snooping proxy Fields

Label	Description
Group Address	The IP multicast group address for which this entry contains information.
Mode	Specifies the type of membership report(s) received on the interface for the group. In the include mode, reception of packets

Label	Description
	<p>sent to the specified multicast address is requested only from those IP source addresses listed in the source-list parameter of the IGMP membership report.</p> <p>In the "exclude" mode, reception of packets sent to the specified multicast address is requested from all IP source addresses except those listed in the source-list parameter.</p>
Up Time	The total operational time in seconds.
Num Sources	Indicates the number of IGMP group and source specific queries received on this interface.
Number of groups	Number of IGMP groups.
Source Address	The source address for which this entry contains information.

proxy-nd [ipv6-address] dynamic
```

Context

[\[Tree\]](#) (show>service>id proxy-nd)

Full Context

```
show service id proxy-nd
```

Description

This command displays, in a table, the existing proxy-ND entries for a particular service. The table is populated by the EVPN MAC routes containing a MAC and an IPv6 address, as well as static entries or dynamic entries from snooped NA messages on access SAP or SDP-bindings.

A 7750 SR, 7450 ESS, or 7950 XRS that receives a Neighbor Solicitation (NS) from a SAP or SDP-binding performs a lookup in the proxy-ND table for the service. If a match is found, the router replies to the NS and does not allow NS flooding in the VPLS service. If a match is not found, the NS is flooded in the service if the configuration allows it.

The command allows for specific IPv6 addresses to be shown. Dynamic IPv6 entries associated to a MAC list are shown with the corresponding MAC list and resolve timers information.

Parameters

ipv6-address

Specifies an IPv6 address.

Values ipv6-address:
x:x:x:x:x:x:x (eight 16-bit pieces)
x:x:x:x:x:d.d.d.d
where:
x - [0 to FFFF]H
d - [0 to 255]D

detail

Displays detailed information.

dynamic

Displays detailed information about dynamic entries.

Platforms

All

Output

The following command displays proxy ND information and [Table 394: Output Fields: show service proxy-nd detail <ipv6-address>](#) describes the output fields.

```
show service id proxy-nd
```

Table 394: Output Fields: show service proxy-nd detail <ipv6-address>

Label	Description
Proxy ND	
Admin State	The administrative state of proxy-nd
Dyn Populate	The addition of dynamic entries to the table
Age Time	The aging timer for proxy entries, where entries are flushed upon timer expiry
Send Refresh	The time at which to send a refresh message in seconds
Table Size	The maximum number of learned and static entries allowed in the proxy table of the service
Total	The total number of entries in the service
Static Count	The current number of static entries in the service
EVPN Count	The current number of EVPN entries in the service
Dynamic Count	The current number of dynamic entries in the service
Duplicate Count	The current number of duplicate entries in the service
Process DAD NS	The response to DAD neighbor solicitations
Dup Detect	
Detect Window	The window size in minutes
Num Moves	The number of moves required to declare a duplicate entry
Hold down	The hold-down time for a duplicate entry
Anti Spoof MAC	The MAC address to replace the proxy-nd offending entry's MAC
EVPN	

Label	Description
Unknown NS Flood	Displays if unknown Neighbor Solicitation messages floods into the EVPN network
ND Advertise	The advertisement of static or dynamic entries that are learned as host or routers
Rtr Unsol NA Flood	Displays if system floods router unsolicited Neighbor Advertisements to EVPN
Host Unsol NA Fld	Displays if the system floods host unsolicited Neighbor Advertisements to the EVPN
EVPN Route Tag	The route tag of the entry
IP Address	The IP address of proxy-nd
Mac Address	The optional anti-spoof-mac to use
Type	The type of entry
Status	The status of entry
Rtr/Host	The static or dynamic entries are learned as host or routers
Immutable	-
EVPN Override	The EVPN override context

proxy-nd

Syntax

proxy-nd

proxy-nd duplicate [*ipv6-address*]

proxy-nd dynamic [*ipv6-address*]

Context

[\[Tree\]](#) (clear>service>id proxy-nd)

Full Context

clear service id proxy-nd

Description

This command allows all the duplicate or dynamic proxy-ND entries to be cleared from the table. Individual IPv6 entries can also be specified.

Platforms

All

proxy-nd

Syntax

proxy-nd usage

Context

[\[Tree\]](#) (tools>dump>service proxy-nd)

Full Context

tools dump service proxy-nd

Description

This command provides information about the usage and limit of the system-wide proxy-nd table for all the services. The command also shows if the limit has been exceeded and a trap raised.

Platforms

All

Output

Output Example

```
*A:Dut# tools dump service proxy-nd usage
Proxy nd Usage
Current Usage      :          0
System Limit       :      511999
High Usage Trap Raised:      No
High Usage Threshold:    95 percent
High Usage Clear Threshold: 90 percent
```

18.104 psb

psb

Syntax

```
psb [endpoint endpoint-address] [sender sender-address] [tunnelid tunnel-id] [lspid lsp-id] [detail]
      [status {up | down}]
```

Context

[\[Tree\]](#) (tools>dump>router>rsvp psb)

Full Context

```
tools dump router rsvp psb
```

Description

This command displays path state block (PSB) information for RSVP.

When a PATH message arrives at an LSR, the LSR stores the label request in the local PSB for the LSP. If a label range is specified, the label allocation process assigns a label from that range.

The PSB contains the IP address of the previous hop, and the session, sender, and TSPEC. This information is used to route the corresponding RESV message back to LSR 1.

Parameters

endpoint *endpoint-address*

Specifies the IP address of the last hop.

sender *sender-address*

Specifies the IP address of the sender.

tunnelid *tunnel-id*

Specifies the SDP ID.

Values 0 to 4294967295

lspid *lsp-id*

Specifies the label switched path that is signaled for this entry.

Values 1 to 65535

detail

Displays detailed RSVP PSB information.

status {up | down}

Specifies the LSP status.

Platforms

All

Output

The following output is an example of MPLS RSVP PSB information, and Table xxx describes the output fields.

Output Example

```
*A:Dut-C# tools dump router rsvp psb detail

show system ptp

Description

This command displays Precision Time Protocol (PTP) configuration and state information. This information can be displayed for the entire node or on a per router instance basis.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following output is an example of PTP information, and [Table 397: System PTP Field Descriptions](#) describes the output fields.

Output Example

```
show system ptp

Table 397: System PTP Field Descriptions

Label	Description
Local Clock	
Clock Type	The type of clock of the network element. <ul style="list-style-type: none"> ordinarySlave — The system is always a TimeReceiver clock in the PTP hierarchy. The system derives its timing from one or more TimeTransmitter clocks in the network. ordinaryMaster — The system is a grandmaster clock in the PTP hierarchy. The system provides timing to multiple TimeReceiver clocks in the network. boundary — The system is a boundary clock, which may be anywhere in the PTP clock hierarchy. It can obtain timing from a TimeTransmitter clock, and provide timing to multiple Time Receiver clocks.
PTP Profile	The Precision Time Protocol (PTP) profile specifies the standard to which PTP conforms <ul style="list-style-type: none"> g8265dot1-2010 — The PTP profile specified in the ITU-T G.8265.1 recommendation ieee1588-2008 — The default PTP profile specified in the IEEE 1588-2008 standard g8275dot1-2014 — The PTP profile specified in the ITU-T G.8275.1 recommendation
Domain	The domain in which PTP 1588 runs on the system

Label	Description
Network Type	The SR OS is configured to use PTP clock classes corresponding to either SONET or SDH quality levels
Admin State	The administrative state of PTP
Oper State	The operational state of PTP
Announce Interval	The packet rate requested in REQUEST_UNICAST_TRANSMISSION signaling messages for announce packets
Announce Rx Timeout	The number of announce intervals that have to occur without receiving a PTP announce message before the PTP event ANNOUNCE_RECEIPT_TIMEOUT_EXPIRES occurs
Peer Limit	The maximum number of PTP peers that may be automatically created by the system on this router instance
G.8275.1 Priority	The priority used in the best TimeTransmitter clock algorithm for the local (internal) PTP port when Clock Profile is g8275dot1-2014
PTSF-unusable	The PTSF unusable administrative state
Clock ID	The clock Identity value of the local PTP clock (defaultDS)
Clock Class	The clockClass value of the local PTP clock (defaultDS)
Clock Accuracy	The clockAccuracy value accuracy of the local PTP clock (defaultDS)
Clock Variance	The offsetScaledLogVariance value of the local PTP clock (defaultDS)
Clock Priority1	The priority1 value of the local PTP clock (defaultDS)
Clock Priority2	The priority2 value of the local PTP clock (defaultDS)
Steps Removed	The steps removed value used in Announce messages sent from this PTP clock
Sync Uncertain	For the local clock: the value of the synchronization uncertainty that is used in Announce messages transmitted by this node. For the parent clock: the value received in the Announce messages from that clock.
Reason Uncertain	Provides an explanation for a Sync Uncertain true indication. <ul style="list-style-type: none"> • parent uncertain — Parent clock has syncUncertain true in its Announce messages • parent clock class — Parent clock quality is not clockClass 6 • local clock class — Local clock is the parent clock and the local clock quality is not clockClass 6 • sets not locked — Central frequency clock is not locked to a reference

Label	Description
	<ul style="list-style-type: none"> • sets quality — Central frequency clock is locked to a reference that is not PRC or PRS • time not locked — PTP time algorithm is not locked • freq not locked — PTP frequency algorithm is not locked
TxWhileSync Uncertain	The value of the tx-while-sync-uncertain configuration item
PTP Port State	The PTP port state. Only shown for ordinary clocks which contain only one PTP port
Last Changed	The date and time of the last change of the PTP port state
Parent Clock	
Port	The port that is being used as a backup to a local GNSS time source
Remote MAC Address	The MAC address of the parent clock port sending PTP message to the local PTP clock
Parent Clock ID	The clock Identity of the parent clock
Remote PTP Port	The port number of the PTP port on the parent clock that is used to communicate with the local PTP clock
Local Clock is Parent Clock	Displayed if there is no external parent clock
GM Clock Id	The clockIdentity value of the grandmaster clock advertised by the parent clock
GM Clock Class	The clockClass value of the grandmaster clock advertised by the parent clock
GM Clock Accuracy	The clockAccuracy value of the grandmaster clock advertised by the parent clock
GM Clock Variance	The offsetScaledLogVariance value of the grandmaster clock advertised by the parent clock
GM Clock Priority1	The priority1 value of the grandmaster clock advertised by the parent clock
GM Clock Priority2	The priority2 value of the grandmaster clock advertised by the parent clock
Backup Clock Source	
IP Address	The address of the external clock that is being used as a backup to a local GNSS time source

Label	Description
Router	The routing instance that contains the external PTP clock being used as a backup
Time Properties	
Timescale	The time scale of the time distributed by PTP
Frequency Traceable	Indicates if the time distributed by PTP is traceable a primary reference
Time Traceable	Indicates if the time distributed by PTP is traceable to a primary reference
Time Source	The source of time used by the grandmaster clock
UTC Offset	The current offset between the International Atomic Time (TAI) and Universal Coordinated Time (UTC) timescales
Leap Second	Indicates if there is a leap second pending
Central Frequency Clock	
Status	The state of the central frequency clock
Quality	The quality level of the source into the central frequency clock
Reference Selected	The reference currently in use as the source into the central frequency clock
PTP Frequency Recovery	
Frequency Recovery State	<p>The state of the frequency recovery algorithm.</p> <ul style="list-style-type: none"> notApplicable — The system is not attempting to recover a clock. initial — The system is configured to recover a clock, but not enough information has yet been received to adjust the local clock to match a TimeTransmitter clock. acquiring — The system has enough information to attempt clock recovery, and has started the process of adjusting its local clock frequency to match the TimeTransmitter clock. phaseTracking — The system has adjusted its local clock to the approximate frequency of the TimeTransmitter clock, and is adjusting the local clock to minimize the phase difference between the two clocks. holdover — The system has stopped receiving useful information from the chosen TimeTransmitter clock, and is maintaining the last estimated frequency for its local clock. locked — The system is locked to the chosen TimeTransmitter clock and the phase error between the TimeTransmitter clock and the local clock is relatively small.

Label	Description
Last Changed	The date and time of the last change of the PTP Recovery State
Frequency Offset	The offset computed by the frequency recovery algorithm required to align the local oscillator to the frequency of the parent clock. The value is provided in parts per billion. Positive values indicate that the recovered clock is faster than nominal, and negative values indicate that the recovered clock is slower than nominal.
PTP Time Recovery	
Current Time	The date and time. If the timescale is PTP, then the time is converted to UTC time based on the current offset between UTC and PTP time.
Time Recovery State	The state of the time recovery algorithm. <ul style="list-style-type: none"> acquiring — The time recovery is active but it is not in locked or holdover state locked — The time recovery algorithm is generating time adjustments within the locked performance range holdover — No adjustment has been made out of the time recovery algorithm for a period of time
Last Packet Offset From Master	The offsetFromMaster calculated from the last packet exchange with the parent clock
Last Calc	The time at which the previous field was calculated
Last Packet Mean Path Delay	The meanPathDelay calculated from the last packet exchange with the parent clock
Last Adjustment	The nanosecond change to the local time scale that last came out of the time recovery algorithm

Context

[\[Tree\]](#) (show>subscr-mgmt>vrgw>brg>gateway public-static-devices)

Full Context

show subscriber-mgmt vrgw brg gateway public-static-devices

Description

This command displays public static device mappings.

Parameters

ieee-address

Specifies the MAC address, up to 30 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

18.108 pw

pw

Syntax

pw

Context

[\[Tree\]](#) (tools>perform>service>id>loopback pw)

[\[Tree\]](#) (tools>perform>service>id>admin-lock pw)

Full Context

tools perform service id loopback pw

tools perform service id admin-lock pw

Description

In the admin-lock context, this command administratively locks the specified spoke SDP by locking the host service. The command must be executed at both ends of the PW or MS-PW represented by the spoke SDP. Test traffic can then be injected using a test SAP.

In the loopback context, this command enters the MPLS-TP PW context for starting or stopping a loopback on a specified spoke SDP. An administrative lock should first be applied to both ends of the PW or MS-PW represented by the spoke SDP prior to configuring the loopback.

Interactions: Loopback functions for MPLS-TP pseudowire can be specified for either a T-PE or S-PE.

pw-port

Syntax

```
pw-port [pw-port-id] [detail]  
pw-port sdp sdp-id  
pw-port sdp none  
pw-port [pw-port-id] statistics
```

Context

[\[Tree\]](#) (show pw-port)

Full Context

```
show pw-port
```

Description

Displays pseudo-wire port information.

If no optional parameters are specified, the command displays a summary of all defined PW ports. The optional parameters restrict output to only ports matching the specified properties.

Parameters

pw-port-id

Specifies the pseudo-wire port identifier.

Values 1 to 10239

detail

Displays detailed port information that includes all the **pw-port** output fields.

sdp-id

The SDP ID for which to display matching PW port information.

Values 1 to 17407

statistics

Displays port statistics information.

Platforms

Context

[\[Tree\]](#) (show pw-port)

Full Context

```
show pw-port
```

Description

This command displays FPE-based PW-port configuration information, state information and forwarding statistics.

Parameters

pw-port-id

Specifies the PW-port ID.

Values 1 to 10239

sdp-id

Displays PW port information based on the known internal SDP ID

sdp none

Displays information about FPE-based PW-ports that are not associated with any internal SDPs

statistics

Displays forwarding statistics, such as the number of forwarded or dropped frames (Ethernet, VLANs, payload)

Platforms

All

Output

The following output is an example of PW port information.

[Table 401: PW-Port Field Descriptions](#) describes the **show pw-port** command output fields.

Output Example

```
*A:vSIM# show pw-port 1

Table 401: PW-Port Field Descriptions

Label	Description
PW-Port	Displays the PW port ID.
Encap	Displays the PW port encapsulation (dot1q or qinq).
SDP	Displays the Internal SDP to which this PW port is bound.
IfIndex	Displays the Internal interface index.
VC-Id	Displays the VC-id of the internal spoke SDP that interconnects external PW to this PW port.
Description	Displays the description of this PW port.
SDP Binding Port	Displays the PXC sub-port to which this PW port is bound. This is termination side of PXC, always denoted as .b side.
VC Type	Displays the VC type of the PW port.
Admin Status	Displays the admin status of the internal SDP.
Oper Status	Displays the operational status of the internal SDP.
Admin Ingress Label	Displays the ingress VC-label associated with this PW port.
Admin Egress Label	Displays the egress VC-label associated with this PW port.
Oper Flags	Displays the operational flags on the internal SDP.
Monitor Oper-Group	Displays the operational group that is being monitored by this PW port.

Label	Description
I. Fwd. Pkts.	Displays the number of forwarded packets ingressing this PW port.
I. Fwd. Octs.	Displays the number of forwarded octets ingressing this PW port.
E. Fwd. Pkts.	Displays the number of forwarded packets egressing this PW port.
I. Dro. Pkts.	Displays the number of dropped packets on ingress.
I. Dro. Octets.	Displays the number of dropped octets on ingress.
E. Fwd. Octets.	Displays the number of forwarded octets egressing this PW port.

python-policy

Syntax

python-policy *name* **cache**

python-policy *name* **cache** **hex-key** *hex-string*

python-policy *name* **cache** **string-key** *string-key*

Context

[\[Tree\]](#) (tools>dump>python python-policy)

Full Context

tools dump python python-policy

Description

This command dumps all cached entries or a specified entry of a specified Python policy.

The DDP key in the output is the python cache persistency record key.

Note:

The DDP Key in the output could be used for the **tools>dump>persistence>python** command.

Parameters

name

Specifies the name of the Python policy, up to 32 characters.

string-key

Specifies the key of the entry to be updated in ASCII strong format, up to 512 characters maximum.

hex-key

Specifies the key of the entry to be updated in hex string format.

Values 0x0..0xFFFFFFFF...(988 hex nibbles maximum)

Platforms

All

python-policy

Syntax

python-policy *name* **cache** **hex-key** *hex-string* **set-lifetime** [*lifetime*]

python-policy *name* **cache** *string-key* [512 chars max] **set-lifetime** [*lifetime*]

Context

[\[Tree\]](#) (tools>perform python-policy)

tools perform python-policy

Description

This command set the lifetime of a specified python cache entry.

Parameters

name

Specifies the name of the Python policy, up to 32 characters.

string-key

Specifies the key of the entry to be updated in ASCII strong format.

hex-string

Specifies the key of the entry to be updated in hex string format.

set-lifetime

Specifies the new lifetime of the entry.

Values 1 to 2147483647

Platforms

All

python-policy

Syntax

python-policy

python-policy *policy-name* [**association**]

Context

[\[Tree\]](#) (show>python python-policy)

Full Context

show python python-policy

Description

This command displays information about the currently configured Python policy.

The system will display a list of currently configured Python policy names if no parameter is specified.

Parameters

policy-name

Specifies the Python policy name, up to 32 characters, to display.

association

Displays the associations of the specified Python policy.

Platforms

All

Output

The following output is an example of DHCP Python policy information

Output Example

```
show python python-policy "dhcp"

clear python python-script

Description

This command clears Python script statistics.

Parameters

script-name

Specifies the Python script name, up to 32 characters, to display information.

wlan-gw-group-id

Specifies the WLAN-GW group ID.

Values 1 to 4

nat-group-id

Specifies the NAT group ID.

Values 1 to 8 (7750 SR-12)
1 to 4 (all other platforms)

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s

18.117 python-script protect

```
python-script protect
```

Syntax

```
python-script protect input file-url hmac-sha256 key secret-key output file-url
```

Context

[\[Tree\]](#) (tools>perform python-script protect)

Full Context

tools perform python-script protect

Description

This command converts a normal (unprotected) Python script file into an SRPY format with specified key.

Parameters

input *file-url*

Specifies the URL of the input script file, up to 180 characters.

key *secret-key*

Specifies the key used to compute the hash, up to 128 characters.

output *file-url*

Specifies the URL of the output script file, up to 180 characters.

Platforms

All

18.118 python-script reload

```
python-script reload
```

Syntax

```
python-script reload name
```

Context

[\[Tree\]](#) (tools>perform python-script reload)

Full Context

tools perform python-script reload

Description

This command reloads and recompiles the primary, secondary, and tertiary scripts in the specified Python script, in that order. The system uses the first script that comes up.

Note:

Executing this command may update the last modified time for the system configuration.

Parameters

name

Specifies the name of the Python script to be reloaded, up to 32 characters.

19.4 queue

queue

Syntax

queue queue-group *queue-group-name* *port-id* { **ingress** | **egress** } [**id** *queue-id*] [**instance** *instance-id*]

queue sap *sap-id* {**ingress** | **egress**} [**id** *queue-id*]

queue subscriber *sub-ident-string* [**sla-profile** *sla-profile-name*] {**ingress** | **egress**} [**id** *queue-id*]

Context

[\[Tree\]](#) (show>qos queue)

Full Context

show qos queue

Description

The **show qos queue** command outputs the Burst Control Group (BCG) name and slowest accurate visitation time for the specified queues.

For each queue specified, the system may find multiple hardware queues. This may be true for ingress queues on multipoint services (VPLS, IES, VPRN) or for queues created on an Ethernet Link Aggregation Group (LAG). When this is true, the show command displays the BCG name for each individual hardware queue.

The BCG name associated with a queue may be specified in the **show bcg** command to display the historical and current visitation time for the BCG managing the burst tolerance of the queue. If the output visitation time is greater (longer time) than the queue returned slowest accurate visitation time, the queue's shaping rate may be negatively impacted.

Parameters

queue-group-name *port-id*

Specifies that the system should find and display the BCG and calculate the slowest accurate visitation time for the queues within the specified *queue-group-name* on the specified *port-id*. If the specified *port-id* is not provisioned on the system or the specified *queue-group-name* is not found on the port's specified direction, the show command will fail.

Values port-id: up to 17 characters
queue-group-name: up to 32 characters

{**ingress** | **egress**}

Specifies the direction to display and are mutually exclusive.

queue-id

Limits the return queues to a single *queue-id*.

Values 1 to 16

instance-id

Specifies which instance of a queue group with template queue-group-name to which this queue should be redirected. This parameter is only valid for queue groups on egress ports where policy-based redirection is required.

Values 1 to 65535

sap-id

Specifies that the system should find and display the BCG and calculate the slowest accurate visitation time for the queues within the specified *sap-id*. If the specified *sap-id* is not found, the show command will fail.

Values up to 64 characters

sub-ident-string

Specifies that the system should find and display the BCG and calculate the slowest accurate visitation time for the queues associated with the specified *sub-ident-string*. If the specified *sub-ident-string* does not exist, the show command will fail.

Values up to 32 characters

sla-profile-name

Specifies that the system should find and display the BCG and calculate the slowest accurate visitation time for the queues associated with the specified subscriber and sla-profile *sla-profile-name*. If the specified *sla-profile-name* does not exist, the show command will fail.

Platforms

All

19.5 queue-depth

queue-depth

Syntax

queue-depth [*queue queue-id*] [**ingress** | **egress**]

Context

[Tree] (clear>service>id>sap queue-depth)

Full Context

clear service id sap queue-depth

Description

This command clears queue depth information for the specified SAP.

Parameters

queue-id

Specifies the queue ID.

Values 1 to 32

ingress

Clears information for the ingress policy.

egress

Clears information for the egress policy.

Platforms

All

19.6 queue-depth-violations

queue-depth-violations

Syntax

queue-depth-violations *mda-id[/port]* [**non-zero-counts-only**]

queue-depth-violations *mda-id[/port]* **access-egress** [**non-zero-counts-only**]

queue-depth-violations *mda-id[/port]* **access-egress service** *service-id* [**non-zero-counts-only**]

queue-depth-violations *mda-id[/port]* **access-egress queue-group** *queue-group-name* [**instance** *instance-id*] [**non-zero-counts-only**]

queue-depth-violations *mda-id[/port]* **network-egress queue-group** *queue-group-name* [**instance** *instance-id*] [**non-zero-counts-only**]

Context

[\[Tree\]](#) (show>qos queue-depth-violations)

Full Context

show qos queue-depth-violations

Description

This command displays queue depth violation information, with the option of requesting only the information with a non-zero violation count.

Parameters

mda-id[/port]

Displays the pool information associated with the specified XMA or MDA and port.

Values slot/mda[/port]

non-zero-counts-only

Displays only non-zero counts.

access-egress

Displays access egress information.

service-id

Specifies that the system should find and display queue depth violation information for the queues associated with the specified *service-id*.

Values 1 to 2147483648, *svc-name*: up to 64 characters

queue-group-name

Specifies that the system should find and display information for the queues within the specified *queue-group-name*, up to 32 characters, on the specified *mda-id*.

instance-id

Specifies which instance of a queue group with template queue-group-name to which this queue should be redirected. This parameter is only valid for queue groups on egress ports where policy-based redirection is required.

Values 1 to 65535

network-egress

Displays network egress information.

queue-group

Syntax

queue-group [*queue-group-name*] {**ingress** | **egress**} [{**association** | **detail**}]

queue-group summary

Context

[\[Tree\]](#) (show>qos queue-group)

Full Context

show qos queue-group

Description

This command displays queue-group information.

Parameters

queue-group-name

Specifies the name of an existing queue group template up to 32 characters.

ingress

Specifies whether the queue group name is an ingress policy.

egress

Specifies whether the queue group name is an egress policy.

association

Displays the entities associated with the specified queue group name.

detail

Displays detailed queue group information for the specified queue group name.

summary

Displays the total number of queue-group instances per card (IOM or XCM).

Platforms

Context

[\[Tree\]](#) (monitor>port queue-group)

Full Context

monitor port queue-group

Description

This command enables queue-group monitoring for the specified parameters.

Parameters

queue-group-name

Specifies the name of the queue-group up to 32 characters.

access

Specifies the access type.

Values access

network

Specifies the network type.

Values network

instance-id

Specifies the identification of a specific instance of the queue group.

Values 1 to 65535

policer-id

The specified policer ID must exist within the queue-group template applied to the ingress context of the forwarding plane.

Values 1 to 8

egress-queue-id

Monitors statistics fir this queue.

Values 1 to 8

ingress-queue-id

Monitors statistics for this queue.

Values 1 to 32

seconds

Configures the interval for each display, in seconds.

Values 11 to 60

Default 11

repeat

Configures how many times the command is repeated.

Values 1 to 999

Default 10

absolute

When the absolute keyword is specified, the raw statistics are displayed without processing. No calculations are performed on the delta or rate statistics.

rate

When the rate keyword is specified, the rate-per-second for each statistic is displayed instead of the delta.

Platforms

All

radius [**user** *user-name*] [**policy** *policy-name*] [**server-index** *index*] **statistics**

Context

[\[Tree\]](#) (show radius)

Full Context

show radius

Description

This command displays RADIUS server related information.

Parameters

user-name

Specifies the RADIUS username, up to 32 characters.

policy-name

Specifies the policy name, up to 32 characters.

index

Specifies the server index.

Values 1 to 16

Platforms

All

20.2 radius-accounting

radius-accounting

Syntax

radius-accounting [*policy-name*]

Context

[\[Tree\]](#) (clear>subscriber-mgmt radius-accounting)

Full Context

clear subscriber-mgmt radius-accounting

Description

This command clears RADIUS accounting data for the specified policy.

Parameters

policy-name

The name of the policy. The string is case sensitive and limited to 32 ASCII 7-bit printable characters with no spaces.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

20.3 radius-accounting-policy

radius-accounting-policy

Syntax

radius-accounting-policy *name* **association**

radius-accounting-policy [*name*]

radius-accounting-policy *name* **statistics**

Context

[\[Tree\]](#) (show>subscr-mgmt radius-accounting-policy)

Full Context

show subscriber-mgmt radius-accounting-policy

Description

This command displays RADIUS accounting policy information.

Parameters

name

Specifies the RADIUS accounting policy name.

association

Displays parameters associated with this RADIUS accounting policy.

statistics

Displays statistics associated with this RADIUS accounting policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of subscriber management RADIUS accounting policy information.

Output Example

```
*B:asd-tr0610-dr421# show subscriber-mgmt radius-accounting-policy "ZiggoAcct1813"
statistics

[Table 404: RADIUS Accounting Policy Field Descriptions](#) describes subscriber management RADIUS accounting policy output fields.

Table 404: RADIUS Accounting Policy Field Descriptions

Label	Description
Tx Requests/TX Reqs	Displays the number of accounting requests transmitted for this policy.
Rx Responses/Rx Resps	Displays the number of accounting responses received for this policy.
Request Timeouts/Req Timeouts	Displays the number of accounting requests which have timed out for this policy.
Send Retries	Displays the number of retries to a different server for a single accounting request for this policy.

Label	Description
Send Failed Req Send Failed	Displays how many accounting requests failed because the packet could not be sent out for this policy.
Radius Servers	<p>Displays a table in which the statistics associated with this RADIUS accounting policy are broken down by individual RADIUS server.</p> <p>The table columns are:</p> <p>Index—displays the index number assigned to the RADIUS server. The index determines the sequence in which the servers are queried for authentication requests. Servers are queried in order from lowest to highest index.</p> <p>IP Address—the address of the RADIUS server.</p> <p>TX Reqs—see TX Requests in this table.</p> <p>Rx Resps—see RX Responses in this table.</p> <p>Req Timeouts—see Request Timeouts in this table.</p> <p>Req Send Failed—see Send Failed in this table.</p>

radius-accounting-policy

Syntax

radius-accounting-policy [*rad-acct-plcy-name*]
radius-accounting-policy *rad-acct-plcy-name* **associations**
radius-accounting-policy *rad-acct-plcy-name* **statistics**

Context

[\[Tree\]](#) (show>app-assure radius-accounting-policy)

Full Context

show application-assurance radius-accounting-policy

Description

This command displays RADIUS accounting policy information.

Parameters

rad-acct-plcy-name

Specifies the RADIUS accounting policy.

associations

Specifies to show what contexts are associated with this policy.

statistics

Specifies to show statistics related to this policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

radius-accounting-policy

Syntax

radius-accounting-policy *rad-acct-plcy-name* [**server** *server-index*] **statistics**

Context

[\[Tree\]](#) (clear>app-assure radius-accounting-policy)

Full Context

clear application-assurance radius-accounting-policy

Description

This command clears application assurance RADIUS accounting statistics for the specified policy.

Parameters

policy-name

The name of the policy. The string is case sensitive and limited to 32 ASCII 7-bit printable characters with no spaces.

server-index

The index for the RADIUS server.

Values 1 to 5 (a maximum of 5 accounting servers)

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

radius-accounting-policy

Syntax

radius-accounting-policy [*name*]

Context

[\[Tree\]](#) (show>ipsec radius-accounting-policy)

Full Context

show ipsec radius-accounting-policy

Description

This command displays RADIUS accounting-policy related information.

Parameters

name

Specifies an existing RADIUS accounting policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of the **show ipsec radius-accounting-policy** command.

Output Example

```
show ipsec radius-accounting-policy
=====

```

20.4 radius-acct

radius-acct

Syntax

radius-acct

Context

[Tree] (show>service>active-subscribers>hierarchy radius-acct)

Full Context

show service active-subscribers hierarchy radius-acct

Description

This command provides information about subscriber RADIUS accounting sessions including: the accounting policy name, the accounting mode, the interim intervals, the accounting session ID, and the multi-session ID. If there are no RADIUS accounting sessions enabled for subscribers, this command still shows the session ID that can be used by CoA.

PD hosts modeled as routes are not considered hosts, and therefore, are not shown in the output of this command.

This command only shows a numeric RADIUS session ID even if the RADIUS accounting policy is configured using the descriptive format.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of subscriber RADIUS accounting session information.

Output Example

```
# show service active-subscribers hierarchy radius-acct

20.5 radius-acct-terminate-cause

radius-acct-terminate-cause

Syntax

radius-acct-terminate-cause

Context

[\[Tree\]](#) (tools>dump>aaa radius-acct-terminate-cause)

Full Context

tools dump aaa radius-acct-terminate-cause

Description

This command shows all available termination causes and their respective number values. The TermCause is equivalent to VSA 226 Alc-Error-Code numeric values. The description is equivalent to VSA 227Alc-Error-Message string.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

20.6 radius-attr-username

radius-attr-username

Syntax

radius-attr-username [*user-name*] [*summary*]

Context

[\[Tree\]](#) (tools>dump>subscr-mgmt radius-attr-username)

Full Context

```
tools dump subscriber-mgmt radius-attr-username
```

Description

This command displays a list of subscriber IDs associated to each username and statistics associated to the username.

Parameters

user-name

Specifies the username that matches the RADIUS attribute VSA [1] username. A single username can also be specified to query the list of associated subscriber IDs.

summary

Displays summary RADIUS attribute username information.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

20.7 radius-authentication-policy

radius-authentication-policy

Syntax

```
radius-authentication-policy [name]
```

Context

[\[Tree\]](#) (show>ipsec radius-authentication-policy)

Full Context

```
show ipsec radius-authentication-policy
```

Description

This command displays IPsec RADIUS authentication policy information.

Parameters

name

Specifies an existing RADIUS authentication policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

20.8 radius-configuration

radius-configuration

Syntax

radius-configuration

Context

[Tree] (show>aaa radius-configuration)

Full Context

show aaa radius-configuration

Description

This command displays RADIUS configuration information.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of AAA RADIUS configuration information.

Output Example

```
# show aaa radius-configuration
=====
RADIUS configuration
=====
CoA Port                : 3799
=====
```

[Table 405: AAA ISA RADIUS Policy Field Descriptions](#) provides a description of the counters in the output of the **show aaa isa-radius-policy** command.

Table 405: AAA ISA RADIUS Policy Field Descriptions

Label	Description
CoA Port	The RADIUS Change of Authorization (CoA) port

20.9 radius-proxy-server

radius-proxy-server

Syntax

```
radius-proxy-server server-name  
radius-proxy-server server-name cache  
radius-proxy-server server-name cache hex-key hex-string  
radius-proxy-server server-name cache string-key string  
radius-proxy-server server-name cache summary  
radius-proxy-server server-name statistics  
radius-proxy-server
```

Context

[\[Tree\]](#) (show>router radius-proxy-server)

Full Context

```
show router radius-proxy-server
```

Description

This command displays RADIUS proxy server information.

Parameters

server-name

Specifies the default RADIUS proxy server name created in the **config>router>radius-proxy** context.

cache

Displays cached information.

hex-string

Displays the hex key string.

Values [0x0 to 0xFFFFFFFF (max 64 hex nibbles)]

string

Displays the packet type of the RADIUS messages to use to generate the key for the cache of this RADIUS proxy server.

summary

Displays summarized information.

statistics

Displays statistics for the specified RADIUS proxy server.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of subscriber RADIUS proxy server.

Output Example

[Table 406: Proxy Server Field Descriptions](#) describes subscriber RADIUS proxy server output fields.

Table 406: Proxy Server Field Descriptions

Label	Description
Invalid response Authenticator Rx packet	The number of packets received by this RADIUS proxy server
Rx Access-Request	The number of Access-Request packets received by this RADIUS proxy server
Rx Accounting-Request	The number of Accounting-Request packets received by this RADIUS proxy server
Rx dropped	The number of packets received by this RADIUS proxy server but dropped
Retransmit	The number of packets received by this RADIUS proxy server that were rejected because they are retransmitted
Wrong purpose	The number of packets received by this RADIUS proxy server that were rejected because the value of tmnxRadProxSrv Purpose is set to a value not matching the type of packet
No UE MAC to cache	The number of packets received by this RADIUS proxy server that were rejected because the UE MAC address was not present in the packet
Client context limit reached	The number of packets received by this RADIUS proxy server that were rejected because the limit of client contexts was

Label	Description
	reached. For each RADIUS transaction a client context is created, and are deleted once the transaction is finished.
No ISA RADIUS policy configured	The number of packets received by this RADIUS proxy server that were rejected because it has no ISA RADIUS server policy configured for that type of packet
Server admin down	The number of packets received by this RADIUS proxy server that were rejected because it is administratively shut down
No RADIUS policy configured	The number of packets received by this RADIUS proxy server that were rejected because it has no RADIUS server policy configured for that type of packet
No load-balance-key configured	The number of packets received by this RADIUS proxy server that were rejected because the selected RADIUS server policy's algorithm is set to hashBased and no load balance key is configured
Invalid length	The number of packets received by this RADIUS proxy server that were rejected because their length was invalid
Invalid Code field	The number of packets received by this RADIUS proxy server that were rejected because they had an invalid Code field
Invalid attribute encoding	The number of packets received by this RADIUS proxy server that were rejected because one of the attributes was incorrectly encoded
Invalid User-Name	The number of packets received by this RADIUS proxy server that were rejected because they contained an invalid User-Name attribute
Invalid password	The number of packets received by this RADIUS proxy server that were rejected because the User-Password attribute could not be decoded
Invalid accounting Authenticator	The number of accounting packets received by this RADIUS proxy server that were rejected because they contained an invalid Authenticator field
Invalid Message-Authenticator	The number of packets received by this RADIUS proxy server that were rejected because they contained an invalid Message-Authenticator attribute
Management core overload	The number of packets that were rejected by this RADIUS server because the ISA management core is not able to process any new RADIUS requests because of overload
No memory	The number of packets that were rejected by this RADIUS server because there was not enough memory to store them

Label	Description
Accounting-Request with invalid Acct-Status-Type	The number of accounting packets received by this RADIUS proxy server that were rejected because they contained an invalid Acct-Status-Type attribute
Accounting-Request with no Acct-Status-Type	The number of accounting packets received by this RADIUS proxy server that were rejected because they contained no Acct-Status-Type attribute
Registered user overload	The number of packets that were rejected by this RADIUS server because the registered user indicated to be in overload
Dropped by Python	The number of packets received by this RADIUS proxy server but dropped by Python
Tx Access-Accept	The number of Access-Accept packets transmitted by this RADIUS proxy server
Tx Access-Reject	The number of Access-Reject packets transmitted by this RADIUS proxy server
Tx Access-Challenge	The number of Access-Challenge packets transmitted by this RADIUS proxy server
Tx Accounting-Response	The number of Accounting-Response packets transmitted by this RADIUS proxy server
Tx dropped	The number of packets dropped by this RADIUS proxy server before transmission
No key to cache	The number of packets that could not be cached by this RADIUS proxy server because the key information was not present in the packet
Cache key too long	The number of packets that could not be cached by this RADIUS proxy server because the key information present in the packet was too long
Cache attributes too long	The number of packets that could not be cached by this RADIUS proxy server because the total length of the attributes is too long
Reached maximum number of cache entries	The number of packets that could not be cached by this RADIUS proxy server because the limit has been reached
No memory	The number of packets that could not be transmitted by this RADIUS proxy server because there was not enough memory
Server timeout	The number of packets that were dropped because the RADIUS servers have timed out

Label	Description
Server authentication failure	The number of packets that were dropped because the RADIUS server replied with a packet which failed authentication (invalid response Authenticator or Message Authenticator attribute)
Server invalid Code	The number of packets that were dropped because the RADIUS server replied with a packet with an invalid Code field
Invalid attribute encoding	The number of packets that were dropped because the RADIUS server replied with a packet with an invalid attribute
Registered user overload	The number of packets that were dropped because the registered user indicated to be in overload
No RADIUS server configured	The number of packets that were dropped by this RADIUS server because the RADIUS server policy has no servers configured
RADIUS server send failure	The number of packets that were dropped by this RADIUS server because the packet could not get transmitted to one of the servers in the RADIUS server policy
Dropped by Python	The number of packets that were dropped by this RADIUS server because the packet was dropped by the Python script
Invalid response Authenticator	The number of packets that were dropped because the RADIUS server replied with a packet which failed authentication

radius-proxy-server

Syntax

radius-proxy-server *server-name* **statistics**

Context

[\[Tree\]](#) (clear>router radius-proxy-server)

Full Context

clear router radius-proxy-server

Description

This command clears RADIUS proxy server data.

Parameters

server-name

Specifies the proxy server name.

statistics

Clears statistics for the specified server.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

20.10 radius-script-policy

radius-script-policy

Syntax

radius-script-policy [*policy-name*]

radius-script-policy *policy-name* **association**

radius-script-policy *policy-name* **script** {**primary** | **secondary**}

Context

[\[Tree\]](#) (show>aaa radius-script-policy)

Full Context

show aaa radius-script-policy

Description

This command displays RADIUS script policy information.

Parameters

policy-name

Specifies the RADIUS script policy name, up to 32 characters.

association

Displays the associations related to the RADIUS script policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

20.11 radius-server

radius-server

Syntax

radius-server *server-name*

radius-server *server-name* **associations**

radius-server

Context

[\[Tree\]](#) (show>router radius-server)

Full Context

show router radius-server

Description

This command displays RADIUS server configuration information.

Parameters

server-name

Specifies the RADIUS server name, up to 32 characters.

associations

Displays the RADIUS server policy associations for the specified server.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following outputs are examples of RADIUS server information.

Output Example

```

20.12 radius-server-policy

radius-server-policy

Syntax

radius-server-policy *policy-name* [**acct-on-off**]
radius-server-policy *policy-name* **associations**
radius-server-policy *policy-name* **msg-buffer-stats**
radius-server-policy *policy-name* **statistics**
radius-server-policy [**acct-on-off**]

Context

[\[Tree\]](#) (show>aaa radius-server-policy)

Full Context

show aaa radius-server-policy

Description

This command displays RADIUS server policy configuration information.

Parameters

policy-name

Displays information for the specified RADIUS server policy.

association

Displays the information configured with the RADIUS server policy.

msg-buffer-stats

Displays statistics related to the RADIUS messages that are buffered for each specified RADIUS server policy.

statistics

Displays statistics for the specified RADIUS server policy.

act-on-off

Displays the admin state of the acct-on-off feature.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of AAA RADIUS server policy information.

Output Example

```
*B:asd-tr0610-dr421# show aaa radius-server-policy "ZiggoAAA_anycast" statistics
=====
RADIUS server policy "ZiggoAAA_anycast" statistics

```

Table 407: RADIUS Server Policy Statistics Field Descriptions describes RADIUS server policy statistics output fields.

Table 407: RADIUS Server Policy Statistics Field Descriptions

Label	Description
Tx transaction requests	The number of RADIUS transaction requests transmitted
Rx transaction responses	The number of RADIUS transaction responses received
Transaction requests timed out	The number of RADIUS transaction requests that have timed out
Transaction requests send failed	The number of RADIUS transaction requests that could not be transmitted
Packet retries	The number of times a RADIUS request packet was retransmitted to a server
Transaction requests send rejected	The number of RADIUS transaction requests that were not transmitted due to unacceptable configuration
Authentication requests failed	The number of authentication failures for this policy
Accounting requests failed	The number of accounting failures for this policy
Ratio of access-reject over auth responses	The ratio of access-rejects in the auth responses for this policy
Transaction success ratio	The transaction success ratio for this policy

Label	Description
Transaction failure ratio	The transaction failure ratio for this policy
Statistics last reset at	Indicated the date and time at which the statistics for this policy were last reset

radius-server-policy

Syntax

radius-server-policy *policy-name* **msg-buffer** [**session-id** *acct-session-id*]

Context

[\[Tree\]](#) (tools>dump>aaa radius-server-policy)

Full Context

tools dump aaa radius-server-policy

Description

This command dumps the RADIUS message buffer content for the specified radius-server-policy:

- message-type (acct-interim or acct-stop)
- Acct-Session-Id
- Remaining lifetime

When specifying the session-id, the message details are displayed.

Parameters

policy-name

Specifies the **radius-server-policy** for which the message buffer content should be displayed.

acct-session-id

Displays the RADIUS message details for the message with specified session-id that is stored in the RADIUS message buffer.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

radius-server-policy

Syntax

radius-server-policy *policy-name* **msg-buffer** [**acct-session-id** *acct-session-id*]

radius-server-policy *policy-name* **statistics** [**msg-buffer-only**]
radius-server-policy *policy-name* **server** *server-index* **statistics**

Context

[\[Tree\]](#) (clear>aaa radius-server-policy)

Full Context

clear aaa radius-server-policy

Description

This command dumps the RADIUS message buffer content for the specified radius-server-policy:

- message-type (acct-interim or acct-stop)
- Acct-Session-Id
- Remaining lifetime

When specifying the session-id, the message details are displayed.

Parameters

policy-name

Specifies the radius-server-policy for which the information should be cleared.

acct-session-id

Deletes all RADIUS messages or the RADIUS message with specified session-id from the RADIUS message buffer.

msg-buffer-only

Clears all statistics for the specified radius-server-policy: radius-server-policy statistics, RADIUS server statistics and RADIUS message buffer statistics. With the optional keyword **msg-buffer-only**, only the RADIUS message buffer statistics are cleared.

server-index

Clears the RADIUS server statistics for the specified server-index in the specified radius-server-policy.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

20.13 range

range

Syntax

range [*area-id*]

Context

[\[Tree\]](#) (show>router>ospf range)

[\[Tree\]](#) (show>router>ospf3 range)

Full Context

show router ospf range

show router ospf3 range

Description

This command displays ranges of addresses on an Area Border Router (ABR) for the purpose of route summarization or suppression.

Parameters

area-id

Displays the configured ranges for the specified area.

Values ip-address — a.b.c.d
 area — 0 to 4294967295

Platforms

All

Output

OSPF Range Output

[Table 408: OSPF Range Output Fields](#) describes the OSPF range output fields.

Table 408: OSPF Range Output Fields

Label	Description
Area Id	A 32-bit integer uniquely identifying an area. Area ID 0.0.0.0 is used for the OSPF backbone.
Address/Mask	The mask for the range expressed as a decimal integer mask length or in dotted decimal notation.
Advertise	False — The specified address/mask is not advertised outside the area. True — The specified address/mask is advertised outside the area.
LSDB Type	NSSA — This range was specified in the NSSA context, and specifies that the range applies to external routes (via type-7 LSAs) learned within the NSSA when the routes are advertised to other areas as type-5 LSAs.

Label	Description
	Summary — This range was not specified in the NSSA context, the range applies to summary LSAs even if the area is an NSSA.

Output Example

```
A:ALA-A# show router ospf 1 range
=====
Rtr Base OSPFv2 Instance 1 Ranges
=====
Area Id          Address/Mask      Advertise  LSDB Type
-----
No. of Ranges: 0
=====
A:ALA-A#

A:ALA-A# show router ospf range 180.0.7.9
=====
Rtr Base OSPFv2 Instance 0 Ranges for Area-Id 180.0.7.9
=====
Area Id          Address/Mask      Advertise  LSDB Type
-----
No. of Ranges: 0
=====
A:ALA-A#
```

20.14 reassembly-statistics

reassembly-statistics

Syntax

reassembly-statistics group *nat-group-id* **member** [*member*]

Context

[\[Tree\]](#) (clear reassembly-statistics)

Full Context

clear reassembly-statistics

Description

This command clears IP reassembly statistics.

Parameters

nat-group-id

Specifies the NAT group ID.

Values 1 to 8 (7750 SR-12)

1 to 15 (VSR)
1 to 4 (all other platforms)

member

Specifies the member ID.

Values 1 to 255

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

20.15 recover-l2aw-bypass

recover-l2aw-bypass

Syntax

recover-l2aw-bypass *mda*

Context

[\[Tree\]](#) (tools>perform>nat recover-l2aw-bypass)

Full Context

tools perform nat recover-l2aw-bypass

Description

This command restores NAT resources to the recovered MS-ISA and resumes forwarding subscriber traffic.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

20.16 redirect

redirect

Syntax

redirect statistics

Context

[Tree] (tools>dump>system>cpm-http-redirect redirect)

Full Context

tools dump system cpm-http-redirect redirect

Description

This command displays system level statistics for all redirected TCP sessions in **optimized- mode**. These include the following:

- Close requests to TCP: TCP layer requested to send a FIN
- Abort requests to TCP: error in the received packet and the TCP layer needs to send a RST
- Data requests to TCP: number of redirects sent to the TCP layer
- Connections deleted: number of connections closed without a successful redirect performed
- HTTP GET parse errors: formatting error in the HTTP request
- HTTP GET process errors: HTTP GET is formatted properly but the redirect still fails. Example: system unable to find a corresponding host
- HTTP Response dropped: communication error; the redirect failed to be sent to the TCP layer

Parameters

statistics

Specifies system level statistics for all redirected TCP sessions.

Platforms

All

Output

The following output is an example of the **statistics** command information.

Output Example

```
A# tools dump system cpm-http-redirect redirect statistics
=====
CPM HTTP Redirect statistics
=====
Close requests to TCP                : 2
Abort requests to TCP                : 0
Data requests to TCP                : 2
Requests rejected - out of memory   : 0
Connections deleted                 : 0
HTTP GET parse errors                : 0
HTTP GET process errors              : 0
HTTP Response dropped                : 0
```

20.17 redirect-policy

redirect-policy

Syntax

```
redirect-policy [redirect-policy-name {dest ip-address | associations}]
```

Context

[\[Tree\]](#) (show>filter redirect-policy)

Full Context

```
show filter redirect-policy
```

Description

This command shows redirect filter information.

Parameters

redirect-policy-name

Displays information for the specified redirect policy, up to 32 characters.

dest *ip-address*

Directs the router to use a specified IP address for communication.

Values

ipv4-address:

a.b.c.d.

ipv6-address:

x:x:x:x:x:x:x (eight 16-bit pieces)

x:x:x:x:x:d.d.d.d

x: [0 to FFFF]H

d: [0 to 255]D

associations

Appends association information.

Platforms

All

Output

Redirect Policy Output — The following output is an example of redirect policy information, and [Table 409: Filter Redirect-Policy Output Fields](#) describes the fields.

Output Example

```
A:ALA-A>config>filter# show filter redirect-policy
```

```

=====
Redirect Policies
=====
Redirect Policy          Applied Description
-----
wccp                   Yes

=====
A:ALA-A>config>filter#
    
```

Table 409: Filter Redirect-Policy Output Fields

Label	Description
Redirect Policy	Specifies a specific redirect policy
Applied	Specifies whether the redirect policy is applied to a filter policy entry
Description	Displays the user-provided description for this redirect policy
Active Destination	IP address — specifies the IP address of the active destination
	none — indicates that there is currently no active destination
Destination	Specifies the destination IP address
Oper Priority	Specifies the operational value of the priority for this destination; the highest operational priority across multiple destinations is used as the preferred destination
Admin Priority	Specifies the configured base priority for the destination
Admin State	Specifies the configured state of the destination

Label	Description
	Out of Service — tests for this destination will not be conducted
Oper State	Specifies the operational state of the destination
Ping Test	Specifies the name of the ping test
Source Address	Specifies the source address of the ping test (if any)
Timeout	Specifies the amount of time in seconds that is allowed for receiving a response from the far-end host; if a reply is not received within this time the far-end host is considered unresponsive
Interval	Specifies the amount of time in seconds between consecutive requests sent to the far end host
Drop Count	Specifies the number of consecutive requests that must fail for the destination to declared unreachable
Hold Down	Specifies the amount of time in seconds that the system should be held down if any of the test has marked it unreachable
Hold Remain	Specifies the amount of time in seconds that the system will remain in a hold down state before being used again
Last Action at	Displays a time stamp of when this test received a response for a probe that was sent out

redirect-policy

Syntax

redirect-policy *redirect-policy-name*

Context

[\[Tree\]](#) (tools>perform>filter redirect-policy)

20.21 refresh-lsas

refresh-lsas

Syntax

refresh-lsas [*lsa-type*] [*area-id*]

Context

[Tree] (tools>perform>router>ospf3 refresh-lsas)

[Tree] (tools>perform>router>ospf refresh-lsas)

Full Context

tools perform router ospf3 refresh-lsas
tools perform router ospf refresh-lsas

Description

This command refreshes LSAs for OSPF.

Platforms

All

20.22 release-hold-down

release-hold-down

Syntax

release-hold-down interface *interface-name* [**protocol** *protocol*] [**static-policer** *name*]
release-hold-down sap *sap-id* [**protocol** *protocol*] [**static-policer** *name*]

Context

[\[Tree\]](#) (tools>perform>security>dist-cpu-protection release-hold-down)

Full Context

tools perform security dist-cpu-protection release-hold-down

Description

This command releases a Distributed CPU Protection (DCP) policer from a hold-down countdown (or indefinite hold-down if configured as such).

Parameters

interface *interface-name*

Specifies Router interface name.

sap *sap-id*

Specifies sap identifier.

protocol *protocol*

Specifies DCP protocol name (for example, arp, dhcp).

static-policer *name*

Specifies DCP static policer name as defined in the DCP policy.

Platforms

All

20.23 remap-lease-state

remap-lease-state

Syntax

remap-lease-state old-mac *ieee-address* **mac** *ieee-address*

remap-lease-state sap *sap-id* [**mac** *ieee-address*]

Context

[Tree] (tools>perform>subscr-mgmt remap-lease-state)

Full Context

tools perform subscriber-mgmt remap-lease-state

Description

This command allows the remapping of all existing hosts if network card on CMTS/WAC side is changed is required.

When this command is executed, the following restrictions apply:

- When **sap** is taken, all leases associated with the SAP are re-written.
 - For a SAP with a configured MAC in **lease-populate** command, this MAC is taken.
 - For a SAP without a configured MAC the MAC from tools command is taken.
 - For a SAP without a configured MAC and no MAC in tools command no action is performed.
- When using the **old-mac** option, providing a new MAC *ieee-address* is mandatory.

This command is applicable only when dealing with DHCP lease states which were instantiated using I2header mode of DHCP operation.

Parameters

old-mac *ieee-address*

Specifies the old MAC address to remap.

mac *ieee-address*

Specifies that the provisioned MAC address is used in the anti-spoofing entries for this SAP when I2-header is enabled. The parameter may be changed mid-session. Existing sessions will not be re-programmed unless a **tools perform** command is issued for the lease.

sap-id

Specifies the physical port identifier portion of the SAP definition.

When configured, the SAP parameter remaps all MAC addresses of DHCP lease states on the specified SAP. When no optional MAC parameter is specified, the **sap sap-id** command remaps all MAC addresses of lease states towards the MAC address specified in the I2-header configuration.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

20.24 remote-bfd-discrim

remote-bfd-discrim

Syntax

remote-bfd-discrim *bfd-discriminator*

Context

[\[Tree\]](#) (tools>dump>router>lsp-bfd remote-bfd-discrim)

Full Context

tools dump router lsp-bfd remote-bfd-discrim

Description

This command displays information the BFD-on-LSP sessions with a specified remote discriminator.

Parameters

bfd-discriminator

Specifies the BFD discriminator.

Values to 4294967295

Platforms

All

20.25 remote-management

remote-management

Syntax

remote-management

Context

[\[Tree\]](#) (clear>system>management-interface remote-management)

20.26 replication-segment

replication-segment

Syntax

```
replication-segment [root-address ip-address] [tree-id tree-id] [inst-id instance-id] [origin {Static | PCEP | SR-Policy}] [detail]
```

Context

[Tree] (show>router>p2mp-sr-tree>database replication-segment)

Full Context

```
show router p2mp-sr-tree database replication-segment
```

Description

This command displays information for the replication segments in the P2MP SR tree database.

Parameters

ip-address

Displays replication segment information for the root with the specified IPv4 address.

tree-id

Displays replication segment information for the P2MP SR tree with the specified ID.

Values 8193 to 16286

instance-id

Displays replication segment information for the instance with the specified ID.

Values 0 to 4294967295

origin

Displays information for policies created using the specified method.

Static

Displays static policies.

PCEP

Displays PCEP policies.

SR-Policy

Displays SR policies.

detail

Displays detailed information.

Platforms

All

Output

The following output is an example of P2MP SR tree database replication segment information.

Output Example

```

replication-segment

Syntax

replication-segment [*segment-name*] [*inst-id instance-id*] [*incoming-sid static-label*] [*origin* { **Static** | **PCEP** | **SR-Policy**}] [*oper* { **up** | **down**}] [*tree-id root-tree-id*] [*root-addr ip-address*]

Context

[Tree] (show>router>p2mp-sr-tree replication-segment)

Full Context

show router p2mp-sr-tree replication-segment

Description

This command displays the information for the specified replication segment of the P2MP SR tree.

Parameters

segment-name

Specifies the name, up to 32 characters.

instance-id

Specifies the instance ID.

Values 0 to 4294967295

static-label

Specifies the static label ID.

Values 0 to 4294967295

origin

Displays information for policies created using the specified method.

Static

Displays static policies.

PCEP

Displays PCEP policies.

SR-Policy

Displays SR policies.

oper up

Displays replication segments with operational status up.

oper down

Displays replication segments with operational status down.

root-tree-id

Specifies the P2MP SR tree ID.

Values 8193 to 16286

ip-address

Specifies the root IPv4 address.

Platforms

All

Output

The following output is an example of replication segment information.

Output Example

```
A:swsim103>show>router>p2mp-sr-tree# replication-segment

request

Syntax

request *aps-id* {**protect** | **working**}

Context

[Tree] (tools>perform>aps request)

Full Context

tools perform aps request

Description

This command requests a manual switch to protection or working circuit.

Parameters

aps-id

Specifies the APS ID.

Values

aps-id *aps-group-id*

aps	keyword
group-id	1 to 128

protect

This command requests a manual switch to a port that is acting as the protection circuit for the APS group.

working

This command requests a manual switch to a port that is acting as the working circuit for this APS group.

=====
    
```

Table 414: Output Fields: show chassis power-management requirements

Label	Description
SUPPLY	
Power Capacity	Specifies the total amount of power available to the chassis.
Safety Level	Specifies the configured Power Safety Level, which is a percentage of the worst case power consumption level.
Alert Level	Specifies the configured power level in Watts, which causes the system to raise an alarm if the available power level drops below a set level.
Mode	Specifies the configured mode: none, basic, advanced.
Reserved Power	Signifies the amount of power in reserve. For basic and advanced modes, the system keeps an additional margin of reserve power capacity. This margin is the provisioned capacity of the highest-rated power module. In advanced mode, the system will shed load to always keep this amount of power in reserve. In basic mode, it won't shed load to maintain the reserve, but it only allows cards or MDAs to load as long as the reserve power margin can be maintained.
Reqd. + Reserve	Specifies the Safety Level (Watts) + Reserved Power.
Remaining Power	Specifies the excess capacity. It is equal to ("Power Capacity" - "Reqd + Reserve").
REQUIREMENTS	
Fan	Specifies the amount of power required for each fan tray.
IO Module	Specifies the amount of power required for each IO Module.
CPM Module	Specifies the amount of power required for each CPM.
Fabric Module	Specifies the amount of power required for each SFM.
MDA Module	Specifies the amount of power required for each line card.

Label	Description
Total Required	Specifies the total amount of power required for all system elements.
Safety Level	Specifies the percentage configured with configure system power-management power-safety-level <i>percent</i> . This is a percentage of the total system requirement (Total Required). The corresponding value in Watts is also shown for information.
Safety Alert	Specifies the output of configure system power-management power-safety-alert <i>wattage</i> . A non-zero value indicates that the user wants to receive a warning when the system power capacity drops to within this number of Watts of the system level. If the power safety is 0, "N/A" is displayed in the output since no alert will be produced.
Alert Level	Specifies the value when the safety alert will be issued (= safety-level + safety alert). If the power safety alert is 0, "N/A" is displayed in the output since no alert will be produced.

20.29 resignal

resignal

Syntax

resignal {lsp *lsp-name* path *path-name* | delay *minutes*}

resignal {p2mp-lsp *p2mp-lsp-name* p2mp-instance *p2mp-instance-name* | p2mp-delay *p2mp-minutes*}

resignal {sr-te-lsp *sr-te-lsp-name* path *path-name* | sr-te-delay *sr-te-minutes*}

Context

[\[Tree\]](#) (tools>perform>router>mpls resignal)

Full Context

tools perform router mpls resignal

Description

This command resignals a specific path of a RSVP-TE P2P LSP, a RSVP P2MP LSP tree, or a SR-TE LSP. When an **lsp-name** and **path-name** are provided, a manual resignal is performed for the named path of the named LSP only. In this case, the new path is always programmed in data path regardless of the metric comparison between the new path and the current path.

The **delay**, **p2mp-delay**, or the **sr-te-delay** parameters override the global resignal timer value of all LSPs of the corresponding type for resignal. At the expiry of this override timer, the procedures of the timer based resignal are applied to all LSPs of the corresponding type. The resignal timer is then reset to its

configured value in MPLS configuration. In this case, the new path is programmed in data path only if the metric of the new path is different from one of the current path.

Parameters

lsp lsp-name

Specifies an existing LSP name, up to 64 characters in length, to resignal.

path path-name

Specifies an existing path name to resignal.

delay minutes

Configures an override of the global resignal timer or all RSVP-TE P2P LSPs.

Values 0 to 30

p2mp-lsp p2mp-lsp-name

Specifies an existing point-to-multipoint RSVP-TE LSP name, up to 64 characters, to resignal.

p2mp-instance p2mp-instance-name

Specifies a name, up to 32 characters, that identifies the P2MP LSP instance.

p2mp-delay p2mp-minutes

Configures an override of the global resignal timer or all RSVP-TE P2MP LSPs.

Values 0 to 60

sr-te-delay sr-te-minutes

Configures an override of the global resignal timer or all SR-TE LSPs.

Values 0 to 30

sr-te-lsp sr-te-lsp-name

Specifies the name of a SR-TE LSP to resignal. The name must be 64 characters maximum.

Platforms

All

20.30 resignal-bypass

resignal-bypass

Syntax

resignal-bypass {*lsp bypass-lsp-name* [**force**] | **delay** *minutes*}

Context

[\[Tree\]](#) (tools>perform>router>mpls resignal-bypass)

Full Context

tools perform router mpls resignal-bypass

Description

This command performs a manual re-optimization of a specific dynamic or manual bypass LSP, or of all dynamic bypass LSPs.

The name of a manual bypass LSP is the one provided by the user at configuration time. The name of a dynamic bypass LSP is shown in the output of **show>router>mpls>bypass-tunnel dynamic detail**.

The **delay** option triggers the global re-optimization of all dynamic bypass LSPs at the expiry of the specified delay. Effectively, this option forces the global bypass resignal timer to expire after an amount of time equal to the value of the **delay** parameter. This option has no effect on a manual bypass LSP.

However, when *bypass-lsp-name* is specified, the named dynamic or manual bypass LSP is signaled and the associations are moved only if the new bypass LSP path has a lower cost than the current one. This behavior is different from that of the similar command for the primary or secondary active path of an LSP, which signals and switches to the new path regardless of the cost comparison. This handling is required because a bypass LSP may have a large number of PSB associations and the processing churn is much higher.

In the specific case where the name corresponds to a manual bypass LSP, the LSP is torn down and resignaled using the new path provided by CSPF if no PSB associations exist. If one or more PSB associations exist but no PLR is active, the command fails and the user is required to explicitly enter the **force** option. In this case, the manual bypass LSP is torn down and resignaled, leaving temporarily the associated LSP primary paths unprotected. If one or more PLRs associated with the manual bypass LSP is active, the command fails.

Finally, and as with the timer based resignal, the PSB associations are checked for the SRLG and admin group constraints using the updated information provided by CSPF for the current path and new path of the bypass LSP.

Parameters

lsp bypass-lsp-name [force]

Specifies the name of the dynamic or manual bypass LSP. The force option is required when the name corresponds to a manual bypass LSP and the LSP has PSB associations.

delay minutes

Specifies the time, in minutes, MPLS waits before attempting to re-signal dynamic bypass LSP paths originated on the system.

Values 0 to 30

20.36 revert

revert

Syntax

```
revert [lsp lsp-name]
```

Context

[\[Tree\]](#) (tools>perform>router>mpls revert)

Full Context

```
tools perform router mpls revert
```

Description

Use this command to cause a named LSP, which is currently using a secondary path and for which the revert-timer has been configured, to switch back to using the primary path. Any outstanding revert-timer is canceled.

The primary path must be up for this command to be successful.

Parameters

lsp-name

Specifies an existing LSP name, up to 64 characters in length.

Platforms

All

20.37 rib-api

rib-api

ring

Syntax

ring peer *ip-address* ring *sync-tag*

Context

[\[Tree\]](#) (clear>redundancy>multi-chassis>mcr>statistics ring)

Full Context

clear redundancy multi-chassis mc-ring statistics ring

Description

This command clears multi-chassis ring statistics.

Parameters

ip-address

Clears ring statistics for the specified IP address.

- Values**
- ipv4-address: a.b.c.d
 - ipv6-address:
 - x:x:x:x:x:x:x (eight 16-bit pieces)
 - x:x:x:x:x:d.d.d.d
 - x – [0 to FFFF] H
 - d – [0 to 255] D

sync-tag

Clears ring statistics for the specified sync tag. 32 characters maximum.

Platforms

All

20.39 ring-node

ring-node

Syntax

ring-node peer *ip-address* **ring** *sync-tag* **node** *ring-node-name*

Context

[\[Tree\]](#) (clear>redundancy>multi-chassis>mcr>statistics ring-node)

Full Context

clear redundancy multi-chassis mc-ring statistics ring-node

Description

This command clears multi-chassis ring statistics.

Parameters

ip-address

Clears ring-node peer statistics for the specified IP address.

- Values** ipv4-address: a.b.c.d
 ipv6-address:
- x:x:x:x:x:x:x (eight 16-bit pieces)
 - x:x:x:x:x:d.d.d.d
 - x – [0 to FFFF] H
 - d – [0 to 255] D

sync-tag

Clears ring-node peer statistics for the specified synchronization tag. The tag can be up to 32 characters.

ring-node-name

Clears ring-node peer statistics for the specified ring node name. The ring node name can be up to 32 characters.

Platforms

All

20.40 ring-nodes

ring-nodes

Syntax

ring-nodes peer *ip-address* ring *sync-tag*

Context

20.45 root-objects

root-objects

Syntax

root-objects

Context

[Tree] (show>service>dynsvc root-objects)

Full Context

show service dynamic-services root-objects

Description

This command displays the root objects created by dynamic data services.

Note:

This command is not available in the MD-CLI.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of dynamic services root object information.

Output Example

```
# show service dynamic-services root-objects
=====
Dynamic Service Root Objects
=====
OID prefix           : svcRowStatus
OID index            : .100000
Snippet name         : vprn
Snippet instance     : VRF-1
Orphan time          : N/A
-----
No. of Root Objects: 1
=====
```

[Table 415: Root Objects Field Descriptions](#) describes the Root Objects fields.

Table 415: Root Objects Field Descriptions

Output field	Description
OID prefix	The corresponding SNMP OID prefix for this root object.

Output field	Description
OID index	The corresponding SNMP OID index for this root object.
Snippet name	The name of the python function that created this root object. The name is set to N/A when the root-object is orphaned.
Snippet instance	The instance for which the python function with "Snippet name" created this root object. If the snippet is a result from a dynamic reference, then the snippet instance is the reference-id string passed in the dyn.reference(). If the snippet is not the result from a dynamic reference, then the snippet instance is the dynamic data service SAP-ID. The instance is set to N/A when the root object is orphaned.
Orphan time	The timestamp when the root-object became orphaned (root-object not deleted when corresponding teardown function is called) or N/A if the root-object is not orphaned.

20.46 route

route

Syntax

route [*family*] [*ip-prefix/prefix-length*] [**detail**]
route next-hop {*ip-address* | *ipv6-address*} [**detail**]

Context

[\[Tree\]](#) (show>router>rib-api route)

Full Context

show router rib-api route

Description

This command displays RIB-API route information.

Parameters

family

Specifies the IPv4 or IPv6 address route family.

Values ipv4, ipv6

ip-prefix/prefix-length

Displays RIB-API route entries only matching the specified IP prefix and length.

Values		
ipv4-prefix:	a.b.c.d	(host bits must be 0)
ipv4-prefix-length	0 to 32	
ipv6-prefix:	x:x:x:x:x:x:x	(eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D
ipv6-prefix-length:	0 to 128	

detail

Displays detailed RIB-API route information.

ip-address

Specifies the next-hop IPv4 address of the RIB-API route.

Values	
ipv4-address:	a.b.c.d

ipv6-address

Specifies the next-hop IPv6 address of the RIB-API route.

Values		
ipv6-address:	x:x:x:x:x:x:x	(eight 16-bit pieces)
	x:x:x:x:x:d.d.d.d	
	x:	[0 to FFFF]H
	d:	[0 to 255]D

Table 416: RIB-API Route Fields

Label	Description
Family	The route family: <ul style="list-style-type: none"> • ipv4 • ipv6
Prefix	The IP prefix for the route RTM entry
Rib-API Pref	The RIB-API preference opposing to the routes from different clients with the same prefix
Client IP	The IP address of the gRPC client that configured the RIB-API route entry
Act	The boolean (YES or NO) that indicates whether the status of the RIB-API route in RTM is active or not
Next Hop	The next-hop IP address of the RIB-API route entry
No. of Rib-API Routes	The total number of the displayed RIB-API routes
Client Tag	The client tag unique identifier assigned to each gRPC connection by the gRPC server

Label	Description
Stale client	The stale client (Y or N) that indicates if the route is from a disconnected gRPC client
Metric	The metric of the route
RTM Preference	The RTM preference opposing to the routes having the same prefix from different protocols (BGP, OSPF)
Last Updated	The time stamp of when the route was added or modified from a gRPC client
Nexthop	The next-hop IP address of the RIB-API route entry
Active In RTM	The boolean (Y or N) that indicates whether the status of the RIB-API route is active or not in RTM
Inactive Reason	The inactive reason or the route not active in RTM

20.47 route-downloader

route-downloader

Syntax

route-downloader *route-downloader-name* [**router** *router-instance* | **service-name** *service-name*] [**family** *family*]

Context

[\[Tree\]](#) (clear>aaa route-downloader)

Full Context

clear aaa route-downloader

Description

This command clears all the radius-downloaded routes from the internal downloader cache (or protocol RIB/db) (and thus eventually from the RTM itself). The parameters **vprn** and/or **family** allow to restrict the deletion of those routes learned in a particular address family (IPv4 or IPv6) and/or a particular VPRN.

By default, all VPRNs and both IPv4 and IPv6 families are affected.

Note:

Clearing the internal protocol DB means the corresponding prefixes that were deleted should be removed from the RTM (and from any other exports) as well.

Parameters

route-downloader-name

Specifies the route downloader name, up to 32 characters.

router-instance

Specifies the router instance name (Base) or service ID.

service-name

Specifies the configured service name for the routing instance, up to 64 characters

family

Specifies to limit the removal or prefixes only belonging to the address family IPv4 or IPv6. Only these two values are accepted.

Values ipv4, ipv6

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

route-downloader

Syntax

route-downloader

Context

[\[Tree\]](#) (tools>perform>aaa route-downloader)

Full Context

tools perform aaa route-downloader

Description

Commands in this context configure route downloader parameters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

route-downloader

Syntax

route-downloader [*route-downloader-name*]

route-downloader *route-downloader-name* **statistics**

Context

[\[Tree\]](#) (show>aaa route-downloader)

Full Context

```
show aaa route-downloader
```

Description

This command displays RADIUS route downloader information.

Parameters

route-downloader-name

Specifies the route downloader name, up to 32 characters.

statistics

Displays RADIUS route downloader information.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

20.48 route-next-hop-policy

route-next-hop-policy

Syntax

```
route-next-hop-policy
```

Context

[\[Tree\]](#) (show>router route-next-hop-policy)

Full Context

```
show router route-next-hop-policy
```

Description

This command displays route next-hop policies related information.

Platforms

All

20.49 route-table

route-table

Syntax

route-table [*family*] [*ip-prefix/prefix-length*] [**longer** | **exact** | **protocol** *protocol-name*] [**instance** *instance-id*] [**all**] [**next-hop-type** *type*] [**qos**] [**alternative**] [**accounting-class**]

route-table [*family*] [**summary**]

route-table *tunnel-endpoints* [*ip-prefix* [*/prefix-length*]] [**longer** | **exact**] [**detail**]

route-table [*family*] [*ip-prefix/prefix-length*] [**longer** | **exact** | **protocol** *protocol-name*] [**instance** *instance-id*] [**extensive** [**all**]]

Context

[\[Tree\]](#) (show>router route-table)

Full Context

show router route-table

Description

This command displays the active routes in the routing table.

If no command line arguments are specified, all routes are displayed, sorted by prefix.

Parameters

family

Displays the specified family.

Values ipv4, ipv6, mcast-ipv4, mcast-ipv6

ip-prefix/prefix-length

Displays routes only matching the specified *ip-prefix* and optional *mask*.

Values ipv4-prefix: a.b.c.d (host bits must be 0)

ipv4-prefix-le: 0 to 32

ipv6-prefix:

- x:x:x:x:x:x:x (eight 16-bit pieces)
- x:x:x:x:x:d.d.d.d
- x: [0 to FFFF] H
- d: [0 to 255] D

ipv6-prefix-le: 0 to 128

longer

Displays routes matching the *ip-prefix/mask* and routes with longer masks.

exact

Displays the exact route matching the ip-prefix/mask.

protocol-name

Displays routes learned from the specified protocol.

Values aggregate, arp-nd, bgp, bgp-label, bgp-vpn, dhcpv6-na, dhcpv6-pd, dhcpv6-pd-exc, dhcpv6-ta, evpn-iff, evpn-ift, host, ipsec, isis, ldp, local, managed, nat, nd-ra, ospf, ospf3, periodic, rib-api, rip, ripng, srv6, srv6-policy, static, sub-mgmt, video, vpn-leak

Note:

It is possible that a specific platform only supports a subset of the above protocol values.

instance-id

Specifies the IGP instance of the route table.

Values For isis — 0 to 127
For ospf — 0 to 31
For ospfv3 —

- 0 to 31 (when ospfv3 is used for IPv6)
- 64 to 95 (when ospfv3 is used for IPv4)

Note:

It is possible that a specific platform only supports a subset of the above values.

all

Displays all routes, including inactive routes.

type

Displays only the tunneled next-hops. For each route entry, the tunnel owner and tunnel ID is shown.

Values tunneled

qos

Displays QoS active routes in the routing table.

alternative

Displays LFS and backup route details.

accounting-class

Displays accounting class information.

Note:

Not all platforms support this parameter.

summary

Displays route table summary information.

tunnel-endpoints

Displays tunnel endpoint information.

extensive

Displays detailed information.

Platforms

All

Output

The following output are examples of route table information, and [Table 417: Standard Show Route Table Field Descriptions](#) describes the output fields.

20.50 route-target

route-target

Syntax

```

route-target [source-as as-number] [brief] [ aspath-regex reg-exp] [community comm-id]
route-target [rtc-prefix rtc-prefix] [hunt] [ brief] [aspath-regex reg-exp] [ community comm-id]
route-target rtc-prefix rtc-prefix [aspath-regex reg-exp] [community comm-id]
route-target [rtc-prefix rtc-prefix] [detail | longer] [aspath-regex reg-exp] [community comm-id]
    
```

Context

[\[Tree\]](#) (show>router>bgp>routes route-target)

Full Context

```
show router bgp routes route-target
```

Description

This command displays BGP route target routes.

Parameters

as-number

Specifies the source AS number.

Values 0 to 4294967295

rtc-prefix

Filters the route-target constraint routes to include only those routes matching a specific NLRI string.

Values *source-as:{ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val}/prefix-length*

ip-addr: a.b.c.d

comm-val: 0 to 65535

2byte-asnumber: 0 to 65535

ext-comm-val: 0 to 4294967295

4byte-asnumber: 0 to 4294967295

prefix-length: 0 to 96

detail

Displays detailed information.

longer

Displays the specified route and subsets of the route.

reg-exp

Displays routes matching the specified regular expression, up to 80 characters.

comm-id

Specifies the community ID, up to 72 characters.

Values [*as-num:comm-val | ext-comm | well-known-comm | large-comm*]

where:

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:
 - *{target | origin}:ip-address:comm-val*
 - *{target | origin}:asnum:ext-comm-val*
 - *{target | origin}:ext-asnum:comm-val*
 - **bandwidth:asnum:val-in-mbps**
 - **ext:4300:ovstate**
 - **ext:value1:value2**
 - **flowspec-set:ext-asnum:group-id**

where:

- *target* — route target

- *origin* — route origin
- *ip-address* — a.b.c.d
- *ext-comm-val* — 0 to 4294967295
- *ext-asnum* — 0 to 4294967295
- **bandwidth** — bandwidth
- *val-in-mbps* — 0 to 16777215
- **ext** — extended
- **ext:4300** — origin verification
- *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
- *value1* — 0000 to FFFF
- *value2* — 0 to FFFFFFFFFF
- **flowspec-set** — flow-spec set
- *group-id* — 0 to 16383
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**
- *large-comm* — *asn-or-ex:val-or-ex:val-or-ex*

20.51 router

router

Syntax

router [*router-instance*]

router service-name *service-name*

Context

[\[Tree\]](#) (show router)

Full Context

show router

Description

Commands in this context display various types of information for the specified router instance.

Parameters

router-instance

specifies the router name, CPM router instance, or VPRN service ID.

Values

router-instance : *router name* | *vprn-svc-id*

router-name Base | management | *cpm-vr-name* |
vpls-management

cpm-vr-name [32 characters maximum]

vprn-svc-id [1..2147483647]

Default Base

service-name

specifies the service name, up to 64 characters.

Platforms

All

Output

The following outputs are examples of router information.

Output Example: show router with PIM and S-PMSI

```
*A:Dut-D# \show router 100 pim s-pmsi

router **service-name** *service name*

Context

[\[Tree\]](#) (monitor router)

Full Context

monitor router

Description

Commands in this context configure criteria to monitor statistical information for a variety of routing protocols.

Parameters

router-instance

Specifies the router name or service ID.

Values

router-name: Base, management, *cpm-vr-name*, vpls-management

vprn-service-id: 1 to 2147483647
cpm-vr-name up to 32 characters

Default Base

service-name

Specifies the service name used to identify the router instance. The name can be up to 64 characters long.

Platforms

All

router

Syntax

router [**Base**] [**security-policy-id** *security-policy-id*]

Context

[\[Tree\]](#) (show>ipsec>security-policy router)

Full Context

show ipsec security-policy router

Description

This command displays IPsec security policy information for the router.

Parameters

security-policy-id

Specifies the security policy ID.

Values 1 to 32768

Platforms

VSR

20.52 router-advertisement

router-advertisement

Syntax

router-advertisement

Context

[\[Tree\]](#) (clear>router>autoconfigure router-advertisement)

Full Context

clear router autoconfigure router-advertisement

Description

Commands in this context clear router advertisement information.

Platforms

router-advertisement

Syntax

router-advertisement all

router-advertisement interface *interface-name*

Context

[\[Tree\]](#) (clear>router router-advertisement)

Full Context

clear router router-advertisement

Description

This command clears all router advertisement counters.

Parameters

all

Clears all router advertisement counters for all interfaces.

interface-name

Clears router advertisement counters for the specified interface.

Platforms

All

router-advertisement

Syntax

router-advertisement
router-advertisement routes

Context

[\[Tree\]](#) (show>router>autoconfigure router-advertisement)

Full Context

show router autoconfigure router-advertisement

Description

This command displays router advertisement information.

Parameters

routes
Displays routes received from router advertisements.

Platforms

7450 ESS-7, 7750 SR-1, 7750 SR-7, 7750 SR-1e, 7750 SR-2e, 7750 SR-s

20.53 router-advertisement-policy

router-advertisement-policy

Syntax

router-advertisement-policy [*name*]

Context

[\[Tree\]](#) (show>subscr-mgmt router-advertisement-policy)

Full Context

show subscriber-mgmt router-advertisement-policy

Description

This command displays IPv6 router advertisement policy information.

Parameters

name
Specifies the router advertisement policy name, up to 32 characters.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Context

[\[Tree\]](#) (show>router>bgp routes)

Full Context

```
show router bgp routes
```

Description

This command displays routes in the BGP Routing Information Base (RIB). When this command is issued without any command options, the output displays all learned BGP routes belonging to the IPv4 address family. When this command is issued with other parameters, the output can display a narrower or wider set of routes, including routes belonging to other address families.

Parameters

bgp-ls

Displays BGP-LS routes.

bgp-ls ipv4-prefix

Displays BGP-LS IPv4-prefix NLRI routes.

bgp-ls link

Displays BGP-LS link NLRI routes.

bgp-ls node

Displays BGP-LS node NLRI routes.

evpn auto-disc

Displays EVPN autodiscovery routes.

evpn eth-seg

Displays EVPN Ethernet Segment (ES) routes.

evpn incl-mcast

Displays EVPN IMET routes.

evpn ip-prefix

Displays EVPN IP prefix routes (type 5).

evpn ipv6-prefix

Displays EVPN IPv6 prefix routes (type 5).

evpn mac

Displays EVPN MAC routes (type 2).

evpn mcast-join-synch

Displays EVPN multicast join sync routes.

evpn mcast-join-leave

Displays EVPN multicast join leave routes.

evpn smet

Displays EVPN SMET routes.

flow-ipv4

Displays IPv4 flow-spec routes.

flow-ipv6

Displays IPv6 flow-spec routes.

ipv4

Displays unlabeled unicast IPv4 routes.

ipv6

Displays unlabeled unicast IPv6 routes.

I2-vpn

Displays BGP-VPLS, BGP-VPWS, BGP multihoming and BGP-AD routes (or some subset).

label-ipv4

Displays labeled-unicast IPv4 routes (AFI1, SAFI4).

label-ipv6

Displays labeled-unicast IPv6 routes (AFI2, SAFI4).

mcast-ipv4

Displays multicast IPv4 routes (AFI1, SAFI2).

mcast-ipv6

Displays multicast IPv6 routes (AFI2, SAFI2).

mcast-vpn-ipv4

Displays multicast VPN IPv4 routes.

mcast-vpn-ipv6

Displays multicast VPN IPv6 routes.

mdt-safi

Displays MVPN MDT SAFI routes.

ms-pw

Displays multisegment pseudowire routes.

mvpn-ipv4

Displays MVPN IPv4 routes.

mvpn-ipv6

Displays MVPN IPv6 routes.

route-target

Displays RT constraint routes.

sr-policy-ipv4

Displays BGP segment routing policy routes (IPv4 endpoint).

sr-policy-ipv6

Displays BGP segment routing policy routes (IPv6 endpoint).

vpn-ipv4

Displays unicast IPv4 VPN routes (AFI1, SAFI128).

vpn-ipv6

Displays unicast IPv6 VPN routes (AFI2, SAFI128).

brief

Displays summary information about the BGP routes.

detail

Displays detailed information about the BGP routes, including information about the original path attribute values.

hunt

Displays detailed information about the BGP routes, including information about the advertised routes (RIB-OUT).

longer

When used within a command that also provides a specific IP prefix value, this filters the output to include all routes that match the prefix with the same or a longer prefix length.

as-path-regex

Filters the BGP routes to include only those routes with an AS path matching the specified regular expression.

community

Filters the BGP routes to include only those routes with a community value matching the specified value.

all

Includes active routes of other (non-BGP) protocols that BGP has imported into its RIB.

leakable

Filters the BGP routes to include only those routes that have been marked as leakable to other BGP instances (by means of a BGP import policy).

leaked

Filters the BGP routes to include only those routes that have been leaked from other BGP instances (by means of a leak-import policy).

original-val

Filters the BGP routes to include only those routes that have a specific RPKI route origin validation state (Not-Found, Valid, Invalid).

esi

Filters the BGP EVPN routes to include only those routes with a specific Ethernet Segment identifier value.

next-hop

Filters the BGP EVPN routes to include only those routes with a specific BGP next-hop address.

rd

Filters the BGP routes to include only those routes with a specific route distinguisher value.

tag

Filters the BGP EVPN routes to include only those routes with a specific administrative tag value.

originator-ip

Filters the BGP EVPN or MVPN routes to include only those routes with a specific originator IP address (in the NLRI).

prefix

Filters the BGP type 5 EVPN routes to include only those routes with a specific IPv4 or IPv6 prefix.

mac-address

Filters the BGP type 2 EVPN routes to include only those routes that have a specific MAC address.

grp-address

Filters the MDT-SAFI routes to include only those routes matching a specific multicast group address.

source-as

Filters the MVPN or RT-constraint routes to include only those routes matching a specific source AS number (in the NLRI).

source-ip

Filters the multicast routes to include only those routes matching a specific source address.

group-ip

Filters the MVPN routes to include only those routes matching a specific group address.

type

Filters the MVPN routes based on type (intra-ad, inter-ad, spmsi-ad, leaf-ad, source-ad, shared-join, source-join).

aii-type2

Filters the MS-PW routes based on All type 2 value.

offset

Filters BGP-VPLS routes based on offset value.

siteid

Filters BGP multi-homing routes based on the site ID value.

veid

Filters BGP-VPLS routes based on VEID value.

rtc-prefix

Filters the RT-constraint routes to include only those routes matching a specific NLRI string (formatted as *source-as:route-target/prefix-length*).

color

Filters the SR policy routes to include only those routes matching a specific color value.

endpoint

Filters the SR policy routes to include only those routes matching a specific endpoint address.

mvpn-type

Specifies the MVPN type.

Values intra-ad, inter-ad, spmsi-ad, leaf-ad, source-ad, shared-join, and source-join.

ip-prefix

Specifies an IP prefix to match. For some address families this parameter has no meaning and should be omitted.

Values ip-address: a.b.c.d
ipv4-prefix: a.b.c.d
ipv4-prefix-length: [0 to 32]
ipv6-prefix [/pref* ipv6-prefix]:
• x:x:x:x:x:x:x (eight 16-bit pieces)
• x:x:x:x:x:d.d.d.d
• x: [0 to FFFF]H
• d: [0 to 255]D
prefix-length: [0 to 128]

reg-exp

An AS path regular expression to match routes based on their AS path attribute *reg-exp*, up to 80 characters.

comm-id

Specifies a community value, up to 72 characters.

Values [*as-num:comm-val* | *ext-comm* | *well-known-comm*]
where

- *as-num* — 0 to 65535
- *comm-val* — 0 to 65535
- *ext-comm* — the extended community, defined as one of the following:
 - {*target* | *origin*}:*ip-address:comm-val*
 - {*target* | *origin*}:*asnum:ext-comm-val*

- *{target | origin}:ext-asnum:comm-val*
- **bandwidth**:*asnum:val-in-mbps*
- **ext:4300**:*ovstate*
- **ext** \t:*value1:value2*
- **flowspec-set**:*ext-asnum:group-id*

where:

- *target* — route target
 - *origin* — route origin
 - *ip-address* — a.b.c.d
 - *ext-comm-val* — 0 to 4294967295
 - *ext-asnum* — 0 to 4294967295
 - **bandwidth** — bandwidth
 - *val-in-mbps* — 0 to 16777215
 - **ext** — extended
 - **ext:4300** — origin verification
 - *ovstate* — 0, 1, or 2 (0 for valid, 1 for not found, 2 for invalid)
 - *value1* — 0000 to FFFF
 - *value2* — 0 to FFFFFFFFFF
 - **flowspec-set** — flow-spec set
 - *group-id* — 0 to 16383
- *well-known-comm* — **null** | **no-export** | **no-export-subconfed** | **no-advertise** | **blackhole**

rd

Specifies a route distinguisher value.

Values ip-addr:comm-val
2byte-asnumber:ext-comm-val
4byte-asnumber:comm-val}

veid

Specifies a two-byte identifier that represents the local bridging instance in a VPLS and is advertised through the BGP NLRI. This value must be lower than or equal to the max-ve-id.

Values 0 to 4294967295

vpls-base-offset

Specifies a two-byte identifier advertised through the NLRI that is used to indicate which VE-ID should use the advertised NLRI at the receiving PE according to the following rule: if the offset <= local VE-ID <= offset+VBS-1 (VBS = virtual block size = 8 in our implementation), then the NLRI is processed. Otherwise, it is ignored. The NLRI with this

offset is generated as soon as the first VE-ID value between (offset, offset + VBS-1) is advertised in the network.

Values 0 to 4294967295

site-id

Specifies a two-byte identifier usually employed for the BGP multihoming solution. It identifies the BGP multihoming site associated with one or a set of objects (SAPs, pseudowires or combination). The site-id must be identical between the two PEs carrying the connection to the access device multihomed to the PEs.

Values 0 to 4294967295

l2vpn-type

Specifies a 12-byte Virtual Switch Instance identifier (VSI-ID) type.

Values bgp-ad, bgp-vpls, bgp-vpws, and multi-homing

rtc-prefix

source-as:{ip-addr:comm-val | 2byte-asnumber:ext-comm-val | 4byte-asnumber:comm-val}/prefix-length

Values *ip-addr:* a.b.c.d
comm-val: 0 to 65535
2byte-asnumber: 0 to 65535
ext-comm-val: 0 to 4294967295
4byte-asnumber: 0 to 4294967295
prefix-length: 0 to 96

origin-val

Filters the BGP routes displayed by the command to those routes with a particular RPKI route origin validation state.

Values valid — Displays valid validation state information.
invalid — Displays invalid validation state information.
notfound — Displays state information for not found origin values.

Table 418: BGP Routes Output Fields

Label	Description
BGP Router ID	The local BGP router ID.
AS	The configured autonomous system number.
Local AS	The configured local AS setting. If not configured, then the value is the same as the AS.
Route Dist.	Displays the route distinguisher identifier attached to routes that distinguishes the VPN it belongs.
VPN Label	Displays the label generated by the PEs label manager.
Network	The IP prefix and mask length.
Nexthop	The BGP nexthop.
From	The advertising BGP neighbor's IP address.
Res. Nexthop	The resolved nexthop.
Local Pref.	The local preference value. This value is used if the BGP route arrives from a BGP peer without the Local Pref attribute set. It is overridden by any value set via a route policy.
Flag	u — used

Label	Description
	s — suppressed h — history d — decayed * — valid i — igp e — egp ? — incomplete > — best S — sticky
Aggregator AS	The aggregator AS value. none — Aggregator AS attributes are not present.
Aggregator	The aggregator attribute value. none — Aggregator attributes are not present.
Atomic Aggr.	Atomic — Not Atomic — The atomic aggregator flag is not set. The atomic aggregator flag is set.
MED	The MED metric value. none — MED metrics are present.
Community	The BGP community attribute list.
Cluster	The route reflector cluster list.
D-Path	The D-Path.
Originator Id	The originator ID path attribute value. none — The originator ID attribute is not present.
Peer Router Id	The router ID of the advertising router.
AS-Path	The BGP AS path attribute.
VPRN Imported	Displays the VPRNs where a particular BGP-VPN received route has been imported and installed.
TieBreakReason	Displays the step in the BGP decision process where a BGP route lost the tie-break with the next better BGP route for the same prefix. LocalPref — This route is not the best because the next better route has a higher LOCAL_PREF. AIGP — This route is not the best because the next better route has a lower derived AIGP metric value.

Label	Description
	<p>ASPathLen — This route is not the best because the next better route has a shorter AS PATH length.</p> <p>Origin — This route is not the best because the next better route has a lower Origin value.</p> <p>MED — This route is not the best because the next better route has a lower MED, and MED comparison of the routes was allowed.</p> <p>IBGP — This IBGP route is not the best because the next better route is an EBGP route.</p> <p>NHCost — This route is not the best because the next better route has a lower metric value to reach the BGP NEXT HOP.</p> <p>BGPID — This route is not the best because the next better route has a lower Originator ID or BGP Identifier.</p> <p>ClusterLen — This route is not the best because the next better route has a shorter Cluster list length.</p> <p>PeerIP — This route is not the best because the next better route has a lower neighbor IP address.</p>

routes

Syntax

routes [**ipv4-unicast** | **ipv6-unicast** | **ipv4-multicast** | **ipv6-multicast** | **mt** *mt-id-number*] [*ip-prefix[/prefix-length]*] [**alternative**] [**exclude-shortcut**] [**flex-algo** {*flex-algo-id* | **all**}] [**detail**]

Context

[\[Tree\]](#) (show>router>isis routes)

Full Context

show router isis routes

Description

This command displays the routes in the IS-IS route table.

Parameters

ipv4-unicast

Displays IPv4 unicast parameters.

ipv6-unicast

Displays IPv6 unicast parameters.

mt *mt-id-number*

Displays multi-topology parameters.

Values 0, 2

alternative

Displays LFA details.

exclude-shortcut

Displays the routes without shortcuts.

detail

Displays detailed information.

flex-algo flex-algo-id

Displays the flexible algorithm aware forwarding path.

Values 128 to 255, all

flex-algo all

Displays all the flexible algorithms-aware forwarding paths.

Platforms

All

Output

The following outputs are examples of IS-IS route information, and [Table 419: IS-IS Route Output Fields](#) describes the output fields.

Output Example

```
*A:Dut-C# show router isis routes

Table 419: IS-IS Route Output Fields

Label	Description
Prefix	Displays the route prefix and mask
Algorithm	Displays the algorithm
Status	Displays the status
Level	Displays the IS-IS level
Metric	Displays the route's metric
Lvl/Typ	Displays the level (1 or 2) and the route type, Internal (Int) or External (Ext)
Ver.	Displays the SPF version that generated route
SysID/Hostname	Displays the hostname for the specific <i>system-id</i>
NextHop	Displays the system ID of nexthop, give hostname if possible
MT	Displays the IS-IS topology for the route
AdminTag	Displays the number of administrative tags
SID[F]	<p>Displays the segment identifier flags of a Prefix-SID as defined by IETF segment routing</p> <p>R: Re-advertisement flag. If set, the prefix to which this Prefix-SID is attached has been propagated by the router either from another level (in other words, from level-1 to level-2 or the opposite) or from redistribution (for example, from another protocol).</p> <p>N: Node-SID flag. The N-Flag is set on Prefix-SIDs attached to a router loopback address.</p> <p>nP: no-PHP flag. If set, the penultimate hop must not pop the Prefix-SID before delivering the packet to the node that advertised the Prefix-SID.</p> <p>E: Explicit-Null Flag. If set, any upstream neighbor of the Prefix-SID originator must replace the Prefix-SID with a Prefix-SID</p>

Label	Description
	having an Explicit-NULL value (0 for IPv4 and 2 for IPv6) before forwarding the packet. V: Value flag. If set, the Prefix-SID carries a value (instead of an index). L: Local Flag. If set, the value/index carried by the Prefix-SID has local significance.
No. of Routes	Displays the total number of routes

routes

Syntax

routes [*ip-prefix*[/*prefix-length*]] [**type**] [**detail**] [**alternative**] [**summary**] [**exclude-shortcut**] [**flex-algo** {*flex-algo-id* | **all**}]

Context

[\[Tree\]](#) (show>router>ospf routes)

Full Context

show router ospf routes

Description

This command displays information about OSPF routes.

Parameters

ip-prefix[/*prefix-length*]

Displays information about the specified IP prefix and length.

flex-algo-id

Displays information about the specified flexible algorithm identifier.

Values 128 to 255

type

Displays information about the specified type.

Values intra-area, inter-area, external-1, external-2, nssa-1, nssa-2

detail

Displays detailed information about the routes.

alternative

Displays the level of protection per prefix (ref. show router OSPF routes alternative).

summary

Displays summarized information about the routes.

exclude-shortcut

Displays routes without shortcut, in the **show>router>ospf** context.

flex-algo

Displays the OSPFv2 routes associated with a segment routing algorithm specified by the flexible algorithm identifier.

all

Displays the OSPFv2 routes associated with all flexible algorithms.

Platforms

All

Output

The following output shows an example of OSPF routes information.

Output Example

```
*A:Dut-C# show router ospf routes flex-algo 128

routes

Syntax

routes [*ip-prefix[/prefix-length]*] [**type**] [**detail**] [**alternative**] [**summary**] [**exclude-shortcut**]

Context

[\[Tree\]](#) (show>router>ospf3 routes)

Full Context

show router ospf3 routes

Description

This command displays information about OSPF routes.

Parameters

ip-prefix[/prefix-length]

Displays information about the specified IP prefix and length.

type

Displays information about the specified type.

Values intra-area, inter-area, external-1, external-2, nssa-1, nssa-2

detail

Displays detailed information about the routes.

alternative

Displays the level of protection per prefix (ref. show router OSPF routes alternative).

summary

Displays summarized information about the routes.

exclude-shortcut

Displays routes without shortcut, in the **show>router>ospf** context.

Platforms

All

Output

The following output shows an example of OSPF information.

20.55 routing

routing

Syntax

routing [*sub-domain sub-domain*] [*bsl bsl*] [*neighbor-prefix ip-address*] [*dest-prefix ip-address*]

Context

[\[Tree\]](#) (show>router>bier routing)

Full Context

show router bier routing

Description

This command shows the BIER routing table.

Parameters

sub-domain

Specifies a sub-domain.

Values 0 to 255

bsl

Specifies a bit string length.

Values 256 to 1024

ip-address

Specifies a prefix in IP address format.

Platforms

All

Output

The following output is an example of a BIER router table. [Table 420: BIER Routing Fields](#) provides BIER routing field descriptions.

Output Example

```
*A:Dut-A# show router bier routing sub-domain 0
=====
Destination Prefix          Bfr-ID    Age
Neighbor
  Nexthop
  Interface
-----
BIER Routing Database Sub-Domain 0 BSL 256
=====

*A:Dut-A#
    
```

Table 420: BIER Routing Fields

Label	Description
Destination Prefix	The destination prefix
BFR-ID	The BFR ID
Age	The tunnel age
Neighbor	The neighbor IP address
Nexthop	The next-hop IP address
Interface	The egress interface name for the programmed tunnel

20.56 rp

rp

Syntax

rp [family | ip-address]

Context

[\[Tree\]](#) (show>router>pim rp)

Full Context

show router pim rp

Description

This command displays the rendezvous point (RP) set information built by the router.

Parameters

family

Displays information about RP family.

Values ipv4, ipv6

ip-address

Specifies the IP address of the RP.

Platforms

All

Output

The following output is an example of a PIM RP configuration.

Output Example

```
A:ALA-1# show router pim rp
=====
PIM RP Set
=====
Group Address      RP Address      Type           Priority  Holdtime
-----
224.0.0.0/4       239.200.200.4  Dynamic        192      150
                  10.1.7.1       Static         1         N/A

PIM RP Set
=====
Group Address      RP Address      Type           Priority  Holdtime
-----
224.0.0.0/4       10.1.7.1       Static         1         N/A
-----
Group Prefixes : 1
=====
A:ALA-1#
```

Table 421: PIM RP Fields

Label	Description
Group Address	The multicast group address of the entry.
RP Address	The address of the Rendezvous Point (RP)

Label	Description
Type	Displays whether the entry was learned through the Bootstrap mechanism or if it was statically configured.
Priority	The priority for the specified group address. The higher the value, the higher the priority.
Holdtime	The value of the hold time present in the BSM message

20.57 rp-hash

rp-hash

Syntax

rp-hash *ip-address*

Context

[\[Tree\]](#) (show>router>pim rp-hash)

Full Context

show router pim rp-hash

Description

This command hashes the RP for the specified group from the RP set.

Parameters

ip-address

Displays specific multicast group addresses.

Platforms

All

Output

The following output is an example of a PIM RP-Hash configuration. [Table 422: RP-Hash Fields](#) provides RP-Hash output field descriptions.

Output Example

```
A:ALA-1# show router pim rp-hash 239.101.0.0
=====
PIM Group-To-RP mapping
=====
Group Address      RP Address      Type
-----

A:ALA-1#
A:ALA-1# show router pim rp-hash 239.101.0.6
=====
PIM Group-To-RP mapping
=====
Group Address      RP Address      Type
-----
239.101.0.6       239.200.200.4  Bootstrap
=====
A:ALA-1#
    
```

Table 422: RP-Hash Fields

Label	Description
Group Address	The multicast group address of the entry
RP Address	The address of the Rendezvous Point (RP)
Type	Specifies whether the entry was learned through the Bootstrap mechanism or if it was statically configured.

20.58 rpki-session

rpki-session

Syntax

rpki-session [*ip-address*] [**detail**]

Context

[\[Tree\]](#) (show>router>origin-validation rpki-session)

Full Context

show router origin-validation rpki-session

Description

This command displays RPKI session information.

Parameters

ip-address

Displays RPKI session information for the specified IP address.

Values

ipv4-address:	a.b.c.d
ipv6-address	x:x:x:x:x:x:x

x:x:x:x:x:d.d.d.d

where:

x: [0 to FFFF]H

d: [0 to 255]D

interface: 32 chars max, and mandatory for link local addresses.

detail

Displays the longer, more detailed version of the output.

Platforms

All

Output

The following output is an example of RPKI session information.

Output Example

```
A:Dut-C# show router origin-validation rpki-session detail
=====
RPKI Session Information

20.59 rs-fec

rs-fec

Syntax

rs-fec [clear]

Context

[\[Tree\]](#) (tools>dump>port rs-fec)

Full Context

tools dump port rs-fec

Description

This command dumps the Reed-Solomon Forward Error Correction (RS-FEC) information for port.

Platforms

All

20.60 rsb

```
rsb
```

Syntax

```
rsb
```

Context

[\[Tree\]](#) (tools>dump>router>rsvp rsb)

Full Context

```
tools dump router rsvp rsb
```

Description

This command displays RSVP RSB information.

Platforms

All

Output

The following output is an example of MPLS RSVP RSB detail fields.

Output Example

```
4)*A:Dut-A>config>router>mpls>lsp$ /tools dump router rsvp rsb detail

20.63 rtp-session

rtp-session

Syntax

```
rtp-session [service service-id] [source ip-address] [detail [stats {rt-server | fcc-server}]]  
rtp-session [service service-id] summary
```

Context

[\[Tree\]](#) (show>video rtp-session)

Full Context

show video rtp-session

Description

This command displays video session information.

Parameters

service *service-id*

Displays video session information pertaining to the specified service ID.

Values 1 to 2148278317

svc-name — a string up to 64 characters.

source *ip-address*

Displays session information for the specified IP address.

detail

The output displays detailed video session information.

stats

Displays video session statistics.

Values **rt-server** — Displays video session statistics for the RT server.

fcc-server — Displays video session statistics for the FCC server.

summary

The output displays summarized video session information.

Platforms

7450 ESS, 7750 SR-1, 7750 SR-7/12/12e, 7750 SR-1s, 7750 SR-2s, 7750 SR-7s, 7750 SR-14s

Output

The following output is an example of this command.

Output Example

```

20.64 rtr-advertisement

rtr-advertisement

Syntax

rtr-advertisement [**interface** *interface-name*] [**prefix** *ipv6-prefix[/prefix-length]*]

rtr-advertisement [**conflicts**]

Context

[\[Tree\]](#) (show>router rtr-advertisement)

Full Context

show router rtr-advertisement

Description

This command displays router advertisement information.

If no command line arguments are specified, all routes are displayed, sorted by prefix.

Parameters

interface-name

Specifies the interface name, up to 32 characters.

ipv6-prefix[/prefix-length]

Displays routes only matching the specified *ip-address* and length and only applies to the 7750 SR and 7950 XRS.

Values

ipv6 ipv6-prefix[/pref*]: x:x:x:x:x:x:x (eight 16-bit pieces)
 x:x:x:x:x:d.d.d.d
 x: [0 to FFFF]H
 d: [0 to 255]D
 prefix-length: 1 to 128

Platforms

All

Output

A:Dut - A#

Table 423: Router Advertisement Table Fields

Label	Description
Rtr Advertisement Tx/ Last Sent	The number of router advertisements sent and time since they were sent
Nbr Solicitation Tx	The number of neighbor solicitations sent and time since they were sent
Nbr Advertisement Tx	The number of neighbor advertisements sent and time since they were sent
Rtr Advertisement Rx	The number of router advertisements received and time since they were received
Nbr Advertisement Rx	The number of neighbor advertisements received and time since they were received
Max Advert Interval	The maximum interval between sending router advertisement messages
Managed Config	True — indicates that DHCPv6 has been configured
	False — indicates that DHCPv6 is not available for address configuration
Reachable Time	The time, in milliseconds, that a node assumes a neighbor is reachable after receiving a reachability confirmation
Retransmit Time	The time, in milliseconds, between retransmitted neighbor solicitation messages
Link MTU	The MTU number the nodes use for sending packets on the link
Rtr Solicitation Rx	The number of router solicitations received and time since they were received
Nbr Solicitation Rx	The number of neighbor solicitations received and time since they were received
Min Advert Interval	The minimum interval between sending ICMPv6 neighbor discovery router advertisement messages
Other Config	True — indicates there are other stateful configurations
	False — indicates there are no other stateful configurations
Router Lifetime	Displays the router lifetime in seconds
Hop Limit	Displays the current hop limit

Router-Advertisement Conflicts Output — The following output is an example of router advertisement conflicts, and [Table 424: Router-Advertisement Conflicts Fields](#) describes the fields.

Output Example

```

Table 424: Router-Advertisement Conflicts Fields

Label	Description
Advertisement from	The address of the advertising router
Reachable Time	The time, in milliseconds, that a node assumes a neighbor is reachable after receiving a reachability confirmation
Router Lifetime	Displays the router lifetime in seconds
Retransmit Time	The time, in milliseconds, between retransmitted neighbor solicitation messages
Hop Limit	Displays the current hop limit
Link MTU	The MTU number the nodes use for sending packets on the link

20.65 run-manual-spf

run-manual-spf

Syntax

run-manual-spf

Context

[\[Tree\]](#) (show>router>pim s-pmsi)

Full Context

show router pim s-pmsi

Description

This command displays information about selective provider multicast service interfaces that are currently active.

Parameters

group-ip

Displays group IP address information.

source-ip

Displays source IP address information.

h

mdSrcAddr

Displays source address information of the multicast sender.

mdGrpAddr

Displays group address information of the multicast sender.

ext-tunnel-id

Displays information about the extended tunnel address.

tunnel-id

Displays information about the tunnel identifier.

Values 0 to 4294967295

root-addr

Displays information about the root address.

lsp-id

Displays information about the specified LSP ID.

Values 0 to 4294967295

sub-domain

Displays information about the BIER sub-domain ID.

bfr-id

Displays information about the BIER-ID of the router.

Values 1 to 4096

mpls-lbl

Displays information about the specified MPLS service label.

detail

Displays detailed output.

Platforms

All

Output

The following output is an example of a PIM data MDT configuration. [Table 425: PIM Data MDT](#) provides PIM data MDT descriptions.

Output Example PIM Selective Provider Tunnel

```

Table 425: PIM Data MDT

Label	Description
MD Grp Address	The IP multicast group address for which this entry contains information
MD Src Address	The source address of the multicast sender. The value is 0 if the type is configured as starg . The address of the Rendezvous Point (RP) displays if the type is configured as starRP .
MT Index	The index number
Num VP SGs	The VPN number

s-pmsi

Syntax

s-pmsi [**source** *mdSrcAddr*] [**group** *mdGrpAddr*] [**vprn-source** *vprnSrcAddr* **vprn-group** *vprnGrpAddr*]

Context

[Tree] (clear>router>pim s-pmsi)

Full Context

```
clear router pim s-pmsi
```

Description

This command clears PIM selective provider multicast service interface cache.

Parameters

mdSrcAddr

Clears the specified source address used for Multicast Distribution Tree (MDT).

mdGrpAddr

Clears the specified group address used for Multicast Distribution Tree (MDT).

vprnSrcAddr

Clears the specified source address of the multicast sender.

vprnGrpAddr

Clears the specified multicast group address.

Platforms

All

21.2 s11

s11

Syntax

```
s11
```

Context

[\[Tree\]](#) (show>subscr-mgmt>gtp s11)

Full Context

```
show subscriber-mgmt gtp s11
```

Description

Commands in this context display information related to established S11 connections.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

s11

Syntax

s11

Context

[\[Tree\]](#) (show>router>gtp s11)

Full Context

show router gtp s11

Description

Commands in this context display S11 information.

Platforms

7750 SR, 7750 SR-e, 7750 SR-s, VSR

21.3 saa

saa

Syntax

saa [*test-name*] [*owner test-owner*]

Context

[\[Tree\]](#) (show saa)

Full Context

show saa

Description

This command displays information about the SAA test.

If no specific test is specified a summary of all configured tests is displayed.

If a specific test is specified then detailed test results for that test are displayed for the last three occurrences that this test has been executed, or since the last time the counters have been reset via a system reboot or clear command.

Parameters

test-name

Specifies the optional parameter is used to enter the name of the SAA test for which the information needs to be displayed. The test name must already be configured in the **config>saa>test** context.

test-owner

Specifies the owner of an SAA operation, up to 32 characters. If a **test-owner** value is not specified, tests created by the CLI have a default owner "TiMOS CLI".

Default "TiMOS CLI"

Platforms

All

Output

The following output is an example of SAA test information. [Table 426: SAA Field Descriptions](#) describes the SAA test fields.

Output Example

```

Table 426: SAA Field Descriptions

Label	Description
Test Name	Specifies the name of the test.
Owner Name	Specifies the owner of the test.
Description	Specifies the description for the test type.
Accounting policy	Specifies the associated accounting policy ID.
Administrative status	Specifies whether the administrative status is enabled or disabled.

Label	Description
Test type	Specifies the type of test configured.
Trap generation	Specifies the trap generation for the SAA test.
Test runs since last clear	Specifies the total number of tests performed since the last time the tests were cleared.
Number of failed tests run	Specifies the total number of tests that failed.
Last test run	Specifies the last time a test was run.
Threshold type	Indicates the type of threshold event being tested, jitter-event, latency-event, or loss-event, and the direction of the test responses received for a test run: in — inbound out — outbound rt — roundtrip
Direction	Indicates the direction of the event threshold, rising or falling.
Threshold	Displays the configured threshold value.
Value	Displays the measured crossing value that triggered the threshold crossing event.
Last event	Indicates the time that the threshold crossing event occurred.
Run #	Indicates what test run produced the specified values.

saa

Syntax

saa-test [*test-name* [**owner** *test-owner*]]

Context

[\[Tree\]](#) (clear saa)

Full Context

clear saa

Description

This command clears the SAA results for the latest and the history for this test. If the test name is omitted, all the results for all tests are cleared.

Parameters

test-name

Specifies the name of the SAA test. The test name must already be configured in the **config>saa>test** context.

test-owner

Specifies the owner of an SAA operation up to 32 characters.

Default If a **test-owner** value is not specified, tests created by the CLI have a default owner "TiMOS CLI".

Platforms

All

21.4 saii-type2-using

saii-type2-using

Syntax

saii-type2-using *global-id[:prefix[:ac-id]]*

Context

[\[Tree\]](#) (show>service saii-type2-using)

Full Context

show service saii-type2-using

Description

This command displays the SDP used by a spoke SDP FEC with a specified FEC129 Type 2 SAIL.

Parameters

global-id[:prefix[:ac-id]]

Specifies the switch-point information using SAIL-Type2.

Values	<global-id[:prefix*> : <global-id>[:<prefix>[:<ac-id>]]
global-id	1 to 4294967295
prefix	a.b.c.d 1 to 4294967295
ac-id	1 to 4294967295

Platforms

All

Output

The following output is an example of SAII information.

Output Example

```
*A:Dut-E# show service sai-type2-using 3:10.20.1.3:1
=====

21.5 sap

sap

Syntax

sap {all | *sap-id*}

Context

[\[Tree\]](#) (show>subscr-mgmt>errors sap)

Full Context

show subscriber-mgmt errors sap

Description

This command sorts all the subscriber errors by SAP.

Parameters

all

Shows all errors starting with the lowest SAP index.

sap-id

Shows only the error of a specific SAP index.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of subscriber management errors listed by SAP.

Output Example

```
A:BNG-2# show subscriber-mgmt errors sap all
=====
Subscriber management errors
=====
-----
SAP      : 1/1/20:841
-----

=====
```

[Table 427: Subscriber Management SAP Error Field Descriptions](#) describes subscriber management SAP error output fields.

Table 427: Subscriber Management SAP Error Field Descriptions

Field	Description
SAP	The SAP ID associated with the error
Time	The time this error was reported to the subscriber management errors subsystem
Service	The service ID associated with the error
MAC	The MAC address associated with the error
Error	The error that occurred on the SAP
Extra	Extra information about the error that occurred

```
sap queue-depth [queue queue-id] [ingress | egress]  
sap  
sap sap-id static-isids mfib  
sap sap-id queue-group-redirect [ingress | egress]
```

Context

[\[Tree\]](#) (show>service>id sap)

Full Context

```
show service id sap
```

Description

Displays information for the SAPs associated with the service.

If no optional parameters are specified, a summary of all associated SAPs is displayed.

Parameters

sap-id

The ID that displays SAPs for the service.

detail

Displays detailed information for the SAP. For **dist-cpu-protection**, **detail** includes the adapted operational rate parameters in the CLI output. The adapted Oper. parameters are only applicable if the policer is instantiated (for example, if the associated forwarding plane is operational, or for an interface if there is a physical port configured for the interface, or if the dynamic policers are allocated), otherwise values of 0 kb/s, and so on, are displayed.

static-isids

Displays static ISIDs for the SAP.

range-id

Specifies the range ID.

Values 1 to 4294967295

dist-cpu-protection

Displays information about the distributed CPU protection policy and parameters associated with the SAP.

group-name

Specifies the group name, up to 32 characters in length.

encap-id

Specifies the encapsulation ID.

Values 0 to 16777215

encap-detail

Displays encapsulation details for the specified encapsulation ID.

encap-stats

Displays encapsulation statistics.

encap-group

Displays the encapsulation group.

base

Displays base information.

dhcp

Displays DHCP information.

mc-ring

Displays MC ring information.

mcac

Displays MCAC information.

mrp

Displays MRP information.

qos

Displays QoS information.

sap-stats

Displays SAP statistics.

stats

Displays statistics.

stp

Displays STP information.

sub-mgmt

Displays subscriber management information.

ipsec-gw

Displays IPSEC gateway information.

circuit-id

Specifies the circuit ID, up to 256 characters.

ieee-address

Specifies the IEEE address, up to 30 characters.

remote-id

Specifies the remote-ID, up to 256 characters.

host-lockout-policy

Displays the host lockout policy.

summary

Displays summary information.

queue-id

Specifies the queue ID.

Values 1 to 32

ingress

Displays ingress information.

egress

Displays egress information.

mfib

Displays MFIB information.

queue-group-redirect

The output lists the queue group name and the instances configured in the related queue group redirect list. For each instance, the FP (for ingress) and port (for egress) is displayed. If there is a mismatch between the SAP and redirect list configuration and the queue group instance configuration, this is highlighted.

ingress

Displays information for the ingress policy.

egress

Displays information for the egress policy.

Platforms

All

Output

The following output is an example of SAP information, and [Table 428: Show Service-ID SAP Field Descriptions](#) describes the output fields.

Output Example

```

Table 428: Show Service-ID SAP Field Descriptions

Label	Description
Service Access Points(SAP)	
Service Id	The service identifier.
SAP	The SAP and qtag.
Encap	The encapsulation type of the SAP.
Ethertype	Specifies an Ethernet type II Ethertype value.
Admin State	The administrative state of the SAP.
Oper State	The operating state of the SAP.
Flags	Specifies the conditions that affect the operating status of this SAP. Display output includes: ServiceAdminDown, SapAdminDown, Interface AdminDown, PortOperDown, PortMTUTooSmall, L2OperDown, SapIngress

Label	Description
	QoSMismatch, SapEgressQoSMismatch, RelearnLimitExceeded, RxProtSrc Mac, ParentIfAdminDown, NoSapIpipeCelpAddr, SapParamMismatch, CemSap NoEcidOrMacAddr, StandByForMcRing, ServiceMTUTooSmall, NoSapEpipeRing Node.
Last Status Change	Specifies the time of the most recent operating status change to this SAP.
Last Mgmt Change	Specifies the time of the most recent management-initiated change to this SAP.
Admin MTU	The desired largest service frame size (in octets) that can be transmitted through the SAP to the far-end router, without requiring the packet to be fragmented.
Oper MTU	The actual largest service frame size (in octets) that can be transmitted through the SAP to the far-end router, without requiring the packet to be fragmented.
Restr MacUnpr Dst	The administrative and operational state of the restrict unprotected destination MAC (restrict-unprotected-dst) functionality.
Auto Learn Mac Prot	The administrative and operational state of the protected MAC auto learning (auto-learn-mac-protect) functionality.
RestMacProtSrc Act	The administrative and operational state of the restrict protected source MAC (restrict-protected-src) functionality.
QOS	
Ingress qos-policy	The ingress QoS policy ID assigned to the SAP.
Egress qos-policy	The egress QoS policy ID assigned to the SAP.
Ingress Filter-Id	The ingress filter policy ID assigned to the SAP.
Egress Filter-Id	The egress filter policy ID assigned to the SAP.
Acct. Pol	The accounting policy ID assigned to the SAP.
Collect Stats	Specifies whether collect stats is enabled.
Dropped	The number of packets and octets dropped due to SAP state, ingress MAC or IP filter, same segment discard, bad checksum, etc.
Received Valid	The number of valid packets and octets received on the SAP.
Off. HiPrio	The number of high priority packets and octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.
Off. LowPrio	The number of low priority packets and octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.
Off. Uncolor	The number of uncolored packets and octets, as determined by the SAP ingress QoS policy, offered by the Pchip to the Qchip.

Label	Description
Dro. HiPrio	The number of high priority packets and octets, as determined by the SAP ingress QoS policy, dropped by the Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.
Dro. LowPrio	The number of low priority packets and octets, as determined by the SAP ingress QoS policy, dropped by the Qchip due to: MBS exceeded, buffer pool limit exceeded, etc.
For. InProf	The number of in-profile packets and octets (rate below CIR) forwarded by the ingress Qchip.
For. OutProf	The number of out-of-profile packets and octets discarded by the egress Qchip due to MBS exceeded, buffer pool limit exceeded, etc.
Dro. InProf	The number of in-profile packets and octets discarded by the egress Qchip due to MBS exceeded, buffer pool limit exceeded, etc.
Dro. OutProf	The number of out-of-profile packets and octets discarded by the egress Qchip due to MBS exceeded, buffer pool limit exceeded, etc.
For. InProf	The number of in-profile packets and octets (rate below CIR) forwarded by the egress Qchip.
For. OutProf	The number of out-of-profile packets and octets (rate above CIR) forwarded by the egress Qchip.
Ingress TD Profile	The profile ID applied to the ingress SAP.
Egress TD Profile	The profile ID applied to the egress SAP.
Alarm Cell Handling	The indication that OAM cells are being processed.
AAL-5 Encap	The AAL-5 encapsulation type.
Mult Svc Site	Specifies the customer's multiservice site name.
I. Sched Pol	The ingress scheduler policy applied to the customer's multiservice site.
E. Sched Pol	The egress scheduler policy applied to the customer's multiservice site.
HW Agg Shaper Q Set	Whether the hardware aggregate shaper queue sets are in use.
HW Add Shpr QSet Sz	The size of the hardware aggregate shaper queue set.
HW Agg Shpr In-Use	Whether hardware aggregate shapers are in use.
LLF Admin State	Displays the Link Loss Forwarding administrative state.
LLF Oper State	Displays the Link Loss Forwarding operational state.
pw-port	pw-id[:qtag1[.qtag2]] pw-id[:qtag1[.qtag2]] pw-2:1.1

Table 429: Show Distributed CPU Protection Policer Output Fields

Label	Description
Distributed CPU Protection Policy	The DCP policy assigned to the object.
Policer-Name	The configured name of the static policer
Card/FP	The card and FP identifier. FP identifies the instance of the FP (FastPath) chipset. Some cards have a single FP (for example, IOM3-XP-3) and some cards can contain multiple FPs (for example, an XCM can house multiple FPs via its two XMA's).
Policer-State	The state of the policer with the following potential values: Exceed — The policer has been detected as not conforming to the associated DCP policy parameters (for example, packets exceeded the configured rate and the DCP polling process identified this occurrence) Conform — The policer has been detected as conforming to the associated DCP policy parameters (rate) not-applicable — Newly-created policers or policers that are not currently instantiated. This includes policers configured on line cards that are not in service.
Protocols Mapped	A list of protocols that are configured to map to the particular policer.
Oper. xyz fields	The actual hardware may not be able to perfectly rate limit to the exact configured rate parameters in a DCP policy. In this case the configured rate parameters will be adapted to the closest supported rate. These adapted operational values are displayed in CLI when the detail keyword is included in the show command. The adapted Oper. parameters are only applicable if the policer is instantiated (for example, if the associated forwarding plane is operational, or for an interface

Label	Description
	if there is a physical port configured for the interface, or if the dynamic policers are allocated), otherwise values of 0 kb/s, and so on, are displayed.
	Oper. Kbps - The adapted "kilobits-per-second" value for DCP "kbps" rates
	Oper. MBS - The adapted "mbs size" value for DCP "kbps" rates
	Oper. Depth - The calculated policer bucket depth in packets (for DCP "packets" rates) or in bytes (for DCP "kbps" rates)
	Oper. Packets - The adapted "ppi" value for DCP "packets" rates
	Oper. Within - The adapted "within seconds" value for DCP "packets" rates
	Oper. Init. Delay - The adapted "initial-delay packets" value for DCP "packets" rates
Exceed-Count	The count of packets exceeding the policing parameters since the given policer was previously declared as conforming or newly-instantiated. This counter has the same behavior as the exceed counter in the DCP the log events, they are baselined (reset) when the policer transitions to conforming.
Detec. Time Remain	The remaining time in the detection-time countdown during which a policer in the exceed state is being monitored to see if it conforms again.
Hold-Down Remain	The remaining time in the hold-down countdown during which a policer is treating all packets as exceeding.
All Dyn-Plcr Alloc.	Indicates that all the dynamic enforcement policers have been allocated and instantiated for a given local-monitor.
Dyn-Policer Alloc.	Indicates that a dynamic policer has been instantiated.

sap

Syntax

sap *sap-id* {all | counters | stp| l2pt | mrp}

Context

[\[Tree\]](#) (clear>service>statistics>id sap)

Full Context

```
clear service statistics id sap
```

Description

This command clears statistics for the SAP.

Parameters

sap-id

The SAP ID for which to clear statistics

all

Clears all queue statistics and STP statistics associated with the SAP

counters

Clears all queue statistics associated with the SAP

stp

Clears all STP statistics associated with the SAP

l2pt

Clears all L2PT statistics associated with the SAP

mrp

Clears all MRP statistics associated with the SAP

Platforms

All

```
sap
```

Syntax

```
sap sap-id
```

Context

[\[Tree\]](#) (clear>service>id sap)

Full Context

```
clear service id sap
```

Description

This command clears information for the specified SAP.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition

Platforms

All

sap

Syntax

```
sap sap-id {all | cem | counters | stp | l2pt | mrp}  
sap sap-id encap-group group-name [member encap-id]
```

Context

[\[Tree\]](#) (clear>service>statistics sap)

Full Context

```
clear service statistics sap
```

Description

This command clears SAP statistics for a SAP.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

all

Clears all SAP queue statistics and STP statistics.

counters

Clears all queue statistics associated with the SAP.

stp

Clears all STP statistics associated with the SAP.

l2pt

Clears all L2PT statistics associated with the SAP.

mrp

Clears all MRP statistics associated with the SAP.

group-name

Specifies the group name, up to 32 characters.

encap-id

Specifies the encapsulation ID.

Values 0 to 16777215

Platforms

All

sap

Syntax

```
sap [sap-id] [level level] [primary-vlan-enabled vlan-id]  
sap port port-id [level level] [primary-vlan-enabled vlan-id]
```

Context

[\[Tree\]](#) (show>eth-cfm>mip-instantiation sap)

Full Context

```
show eth-cfm mip-instantiation sap
```

Description

This command displays MIP creation information for SAPs.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

level

Specifies the MIP instantiation level.

Values 0 to 7

vlan-id

Specifies the VLAN ID to display.

Values 1 to 4094, or all

port-id

Specifies the port ID.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

sap

Syntax

```
sap sap-id [{ingress | egress}] [{detail | root-detail | thresholds | priority-info | depth}] [port port-id] [arbiter {name | root}]
```

Context

[\[Tree\]](#) (show>qos>policer-hierarchy sap)

Full Context

```
show qos policer-hierarchy sap
```

Description

This command displays information about the policer hierarchy per SAP.

Parameters

sap-id

Displays information about the specified SAP.

ingress

Displays ingress SAP information.

egress

Displays egress SAP information.

detail

Displays detailed information.

root-detail

Displays detailed information about the arbiter root.

thresholds

Displays the threshold, parenting, rate, and traffic information related to a policer.

priority-info

Displays the threshold information related to the root arbiter.

depth

Displays the bucket depth, parenting, rate, and traffic information related to a policer.

port-id

Displays information about the specified port.

Values *slot/mda/port[.channel]*

name

Displays information about the name of the QoS arbiter.

root

Displays information about the arbiter root.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

Output

The following output is an example of SAP policer hierarchy information.

Output Example

```
*A:PE-1# show qos policer-hierarchy sap 1/1/3:1

Table 430: Show QoS Policer Hierarchy SAP Output Fields

Label	Description
Policer Hierarchy - SAP	Displays the SAP ID
slot	Displays the slot number
(A)	An arbiter, an object that is configured in the policy
a3	Displays the name of the arbiter
(P)	Displays the policer name
[Level X Weight XX]	Displays the CIR level and weight configured in the policy
Assigned PIR	Displays the assigned PIR value
Offered	Displays the Offered PIR value
Consumed	Displays the amount of bandwidth consumed by the policer
Assigned FIR	Displays the assigned FIR based on weights of individual policers and the offered traffic

sap

Syntax

sap *sap-id* [**scheduler** *scheduler-name*] [{**ingress** | **egress**}] [**detail**]

sap *sap-id* **encap-group** *group-name* [**scheduler** *scheduler-name*] [**member** *encap-id*] [**detail**]

Context

[\[Tree\]](#) (show>qos>scheduler-hierarchy sap)

Full Context

show qos scheduler-hierarchy sap

Description

This command displays the scheduler hierarchy per SAP.

Parameters

sap-id

Specifies the SAP assigned to the service.

Values The following values apply to the 7750 SR and 7950 XRS:

<i>sap-id</i>	null	[<i>port-id</i> <i>lag-id</i>]
	dot1q	[<i>port-id</i> <i>lag-id</i>]: <i>qtag1</i>
	qinq	[<i>port-id</i> <i>bundle-id</i> <i>bpgrp-id</i> <i>lag-id</i>]: <i>qtag1.qtag2</i>
	<i>port-id</i>	<i>slot/mda/port</i> [. <i>channel</i>]
		<i>esat-id/slot/</i> <i>port</i>
	<i>esat</i>	keyword
	<i>id</i>	1 to 20
		<i>pxc-id.sub-port</i>
	<i>pxc</i>	keyword
	<i>id</i>	1 to 64
	<i>sub-port</i>	a, b
	<i>lag-id</i>	<i>lag-id</i>
		<i>lag</i> keyword
		<i>id</i> 1 to 800
	<i>qtag1</i>	0 to 4094
	<i>qtag2</i>	*, 0 to 4094

Values The following values apply to the 7750 SR only:

<i>sap-id</i>	null	[<i>port-id</i> <i>bundle-id</i> <i>bpgrp-id</i> <i>lag-id</i> <i>aps-id</i>]
	dot1q	[<i>port-id</i> <i>bundle-id</i> <i>bpgrp-id</i> <i>lag-id</i> <i>aps-id</i>]: <i>qtag1</i>
	qinq	[<i>port-id</i> <i>bundle-id</i> <i>bpgrp-id</i> <i>lag-id</i>]: <i>qtag1.qtag2</i>
	<i>cem</i>	<i>slot/mda/port.channel</i>
	<i>ima-grp</i>	[<i>bundle-id</i> [: <i>vpi/vci</i> <i>vpi</i> <i>vpi1.vpi2</i>]

port-id	<i>slot/mda/port[.channel]</i>
aps-id	<i>aps-group-id[.channel]</i>
aps	keyword
group-id	1 to 64
ccag-id	<i>ccag-id.path-id[cc-type]:cc-id</i>
ccag	keyword
id	1 to 8
path-id	a, b
cc-type	.sap-net, .net-sap
cc-id	0 to 4094
lag-id	lag-id
lag	keyword
id	1 to 800
qtag1	0 to 4094
qtag2	*, 0 to 4094
ipsec-id	<i>ipsec-id.[private public]:tag</i>
ipsec	keyword
id	1 to 4
tag	0 to 4094

Values The following values apply to the 7450 ESS only:

<i>sap-id</i>	null	<i>[port-id lag-id]</i>
dot1q		<i>[port-id lag-id]:qtag1</i>
qinq		<i>[port-id lag-id]:qtag1.qtag2</i>
port-id		<i>slot/mda/port[.channel]</i>
aps-id		<i>aps-group-id[.channel]</i>
aps	keyword	
group-id	1 to 64	
ccag-id		<i>ccag-id.path-id[cc-type]:cc-id</i>
ccag	keyword	
id	1 to 8	

	<i>path-id</i>	a, b
	<i>cc-type</i>	.sap-net, .net-sap
	<i>cc-id</i>	0 to 4094
lag-id	<i>lag-id</i>	
	lag	keyword
	<i>id</i>	1 to 800
qtag1		0. to 4094
qtag2		*, 0 to 4094

scheduler-name

The unique scheduler name created in the context of the scheduler policy

ingress

The keyword to display ingress SAP scheduler stats.

egress

The keyword to display egress SAP scheduler stats.

group-name

Specifies the name of the encap-group and can be up to 32 ASCII characters.

encap-id

Specifies the value of the single encap-id.

Values 1 to 16777215

detail

Displays detailed information.

Platforms

All

Output

The following output is an example of SAP scheduler hierarchy information, and [Table 431: Show QoS Scheduler-Hierarchy SAP Output Fields](#) describes the SAP scheduler hierarchy fields.

Output Example

```

Table 431: Show QoS Scheduler-Hierarchy SAP Output Fields

Label	Description
Admin CIR/PIR	Specifies the configured value of CIR/PIR.
Assigned CIR/PIR	Specifies the PIR/CIR rate given to a member by that parent level.
Offered CIR/PIR	Specifies the offered load on that member.
Consumed CIR/PIR	Specifies the amount of scheduler bandwidth used by this member.
S	Displays the scheduler name and information.
Q	Displays the queue ID and information.

Label	Description
P	Displays the policer ID and information.

sap

Syntax

sap *sap-id* [**scheduler** *scheduler-name*] [{**ingress** | **egress**}]

sap *sap-id* **encap-group** *group-name* [**scheduler** *scheduler-name*] [**member** *encap-id*]

Context

[\[Tree\]](#) (show>qos>scheduler-stats sap)

Full Context

show qos scheduler-stats sap

Description

This command displays information about the scheduler stats per SAP.

Parameters

sap-id

Displays information about the SAP and encapsulation value used to identify the SAP.

Values The following values apply to the 7750 SR and 7950 XRS:

<i>sap-id</i>	null	[<i>port-id</i> <i>lag-id</i>]
	dot1q	[<i>port-id</i> <i>lag-id</i>]: <i>qtag1</i>
	qinq	[<i>port-id</i> <i>lag-id</i>]: <i>qtag1.qtag2</i>
	lag-id	lag-id
	lag	keyword
	id	1 to 800
	qtag1	0 to 4094
	qtag2	*, 0 to 4094
	ipsec-id	ipsec- <i>id</i> . [private public]: <i>tag</i>
	ipsec	keyword
	id	1 to 4
	tag	0 to 4094

Values The following values apply to the 7750 SR only:

<i>sap-id</i>	null	[<i>port-id</i> <i>bundle-id</i> <i>bpgrp-id</i> <i>lag-id</i> <i>aps-id</i>]
	dot1q	[<i>port-id</i> <i>bundle-id</i> <i>bpgrp-id</i> <i>lag-id</i> <i>aps-id</i>]: <i>qtag1</i>

lag-id	lag-id
	lag keyword
	id 1 to 800
qtag1	0. to 4094
qtag2	*, 0 to 4094

scheduler-name

Displays information about the specified schedule.

ingress

Display only the policy displayed on the ingress SAP.

egress

Display only the policy displayed on the egress SAP.

group-name

Specifies the name of the encap-group and can be up to 32 ASCII characters.

encap-id

Specifies the value of the single encap-id.

Values 1 to 16777215

Platforms

All

Output

The following output is an example of scheduler-stats SAP information, and [Table 432: Show QoS Scheduler-Stats SAP Output Fields](#) describes the scheduler-stats SAP fields.

Output Example

```

egress

Displays egress SAP customer scheduler stats.

group-name

Specifies the name of the encap-group and can be up to 32 ASCII characters.

encap-id

Specifies the value of the single encap-id.

Values 1 to 16777215

detail

Displays detailed information.

Output

The following output is an example of H-QoS aggregate rate limit per SAP output, and [Table 433: Show H-QoS Aggregate Rate Limit per SAP Output Fields](#) describes the H-QoS aggregate rate limit per SAP fields.

Output Example

```
*A:PE# show qos agg-rate sap 1/1/1:1 egress
=====
Aggregate Rate Information - Sap 1/1/1:1
=====
-----
Root (Egr)
| slot(1)
|   AdminRate           : 10000
|   OperRate            : 0
|   Limit Unused Bandwidth : disabled
|   OnTheWireRates      : false
|   LastMileOnTheWireRates : false
|
=====
*A:PE#
```

Table 433: Show H-QoS Aggregate Rate Limit per SAP Output Fields

Label	Description
AdminRate	Displays the configured aggregate rate in the subscriber profile.
OperRate	Displays the actual downstream rate.
Limit Unused Bandwidth	Indicates whether the limit-unused-bandwidth command is enabled to protect against exceeding the aggregated bandwidth
OnTheWireRates	Indicates whether the displayed rates are on-the-wire rates.
LastMileOnTheWireRates	Indicates whether the displayed rates are on-the-wire rates for the last mile only.

sap

Syntax

sap *sap-id* [**scheduler** *scheduler-name*] [{**ingress** | **egress**}]

Context

[\[Tree\]](#) (clear>qos>scheduler-stats sap)

Full Context

clear qos scheduler-stats sap

Description

This command clears scheduler statistics.

Parameters

sap-id

Specifies the SAP assigned to the service.

Values The following values apply to the 7750 SR and 7950 XRS:

null	[<i>port-id</i> <i>lag-id</i>]
dot1q	[<i>port-id</i> <i>lag-id</i>]: <i>qtag1</i>
qinq	[<i>port-id</i> <i>lag-id</i>]: <i>qtag1.qtag2</i>
cem	<i>slot/mda/port.channel</i>

	lag	keyword	
	id	1 to 800	
qtag1	0. to 4094		
qtag2	*, 0 to 4094		

scheduler-name

Displays the scheduler name.

Values Valid names consist of any string up to 32 characters, composed of printable, 7-bit ASCII characters. If the string contains special characters (#, \$, spaces, etc.), the entire string must be enclosed within double quotes.

ingress

Display only the policy displayed on the ingress SAP.

egress

Display only the policy displayed on the egress SAP.

Platforms

All

sap

Syntax

sap *sap-id* **start** *mode* [**mac-swap**] [**mac** *ieee-address*] [**all**]

sap *sap-id* **stop**

Context

[\[Tree\]](#) (tools>perform>service>id>loopback>eth sap)

Full Context

tools perform service id loopback eth sap

Description

This command places and removes the specific SAP in loopback mode for reflecting Ethernet traffic back in the direction of the received stream. This is only applicable to Ethernet-based SAPs.

Parameters

sap-id

Specifies the SAP ID.

Values

null	<i>port-id</i> <i>lag-id</i>	
dot1q	{ <i>port-id</i> <i>lag-id</i> }:{ <i>qtag1</i> <i>cp-conn-prof-id</i> }	
qinq	{ <i>port-id</i> <i>lag-id</i> }:{ <i>qtag1</i> <i>cp-conn-prof-id</i> }.{ <i>qtag2</i> <i>cp-conn-prof-id</i> }	
	cp: keyword	
	<i>conn-prof-id</i> : 1..8000

		id: 1 to 20
	pxc-id	pxc-id.sub-port
		pxc pxc-id.sub-port
		pxc: keyword
		id: 1 to 64
		sub-port: a, b
lag-id	<i>lag-id</i>	
	lag: keyword	
	<i>id</i> : 1..800	
qtag1	0..4094	
qtag2	* null 0..4094	

start

Keyword that places the sap in loopback mode.

mode

Keywords that specify the location on the loopback in relation to the SAP.

Values **ingress** — Traffic arriving at the sap-ingress will be reflected back out the same SAP.

egress — Traffic arriving at the sap-egress will be reflected back into the service in the direction of the original source.

stop

Removes the SAP from loopback mode.

mac-swap

Enable source address and destination address swapping for the reflected packets when the arriving packet is unicast. Any broadcast and multicast packets arriving on a looped point will be dropped.

mac *ieee-address*

Optionally configures the source MAC address used in the reflected packet when the arriving packet is a broadcast or multicast. This does not apply to arriving unicast packets.

6-byte unicast mac-address in the form xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx.

all

Configured *ieee-address* is used as the source address for all reflected packets regardless of the arriving destination.

Platforms

All

sap

Syntax

sap *sap-id* [**arbiter** {**root** | *name*}] [**ingress** | **egress**] [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

Context

[\[Tree\]](#) (monitor>qos>arbiter-stats sap)

Full Context

monitor qos arbiter-stats sap

Description

This command monitors arbiter statistics for a SAP.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

name

Specifies the name of the policer control policy arbiter, up to 32 characters. This parameter is mandatory if the SAP resides on a LAG in adapt-qoslink or port-fair mode.

root

Specifies the arbiter to which this queue would be feeding.

ingress

Displays *scheduler-name* statistics applied on the ingress SAP.

egress

Displays *scheduler-name* statistics applied on the egress SAP.

seconds

Configures the interval for each display in seconds.

Values 11 to 60

Default 11 seconds

repeat

Configures the number of times the command is repeated.

Values 1 to 999

Default 10

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic instead of the delta.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, 7950 XRS, VSR

sap

Syntax

```
sap sap-id [scheduler scheduler-name] [ ingress | egress] [interval seconds] [ repeat repeat] [absolute | rate]
```

Context

[\[Tree\]](#) (monitor>qos>scheduler-stats sap)

Full Context

```
monitor qos scheduler-stats sap
```

Description

Use this command to monitor scheduler statistics for a SAP at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the specified SAP. The subsequent statistical information listed for each interval is displayed as a delta to the previous display.

When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

scheduler-name

Specifies an existing *scheduler-name*, up to 32 characters. Scheduler names are configured in the **config>qos>scheduler-policy>tier level** context. This parameter is mandatory if the SAP resides on a LAG in adapt-qoslink or port-fair mode.

ingress

Displays *scheduler-name* statistics applied on the ingress SAP.

egress

Displays *scheduler-name* statistics applied on the egress SAP.

seconds

Configures the interval for each display in seconds.

Values 11 to 60

Default 11 seconds

repeat

Configures how many times the command is repeated.

Values 1 to 999

Default 10

absolute

Displays raw statistics, without processing. No calculations are performed on the delta or rate statistics.

rate

Displays rate-per-second for each statistic instead of the delta.

Platforms

All

sap

Syntax

sap *sap-id* [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

sap *sap-id* **encap-group** *group-name* [**member** *encap-id*] [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

Context

[\[Tree\]](#) (monitor>service>id sap)

Full Context

monitor service id sap

Description

This command monitors statistics for a SAP associated with this service.

This command displays statistics for a specific SAP, identified by the *port-id* and encapsulation value, at the configured interval until the configured count is reached.

The first screen displays the current statistics related to the SAP. The subsequent statistical information listed for each interval is displayed as a delta to the previous display. When the keyword **rate** is specified, the rate-per-second for each statistic is displayed instead of the delta.

Monitor commands are similar to **show** commands but only statistical information displays. Monitor commands display the selected statistics according to the configured number of times at the interval specified.

Parameters

sap-id

Specifies the physical port identifier portion of the SAP definition.

Values		
null	<i>port-id</i> <i>bundle-id</i> <i>bpgrp-id</i> <i>lag-id</i> <i>aps-id</i>

	pw	keyword
	<i>id</i>	1 to 10239
qtag1	* 0 to 4094	
qtag2	* null 0 to 4094	
tunnel-id	tunnel-id.private public:tag	
	tunnel	keyword
	<i>id</i>	1 to 16
	<i>tag</i>	0 to 4094

port-id

Specifies the physical port ID in the *slot/mda/port*, **esat-id/slot/ port** or **pxc-id.sub-port** format.

If the card in the slot has XMA/MDAs installed, the *port-id* must be in the *slot_number/MDA_number/port_number* format. For example, 6/2/3 specifies port 3 on XMA/MDA 2 in slot 6.

The *port-id* must reference a valid port type. When the *port-id* parameter represents SONET/SDH and TDM channels, the port ID must include the channel ID. A period "." separates the physical port from the *channel-id*. The port must be configured as an access port. Channels are supported on the 7750 SR.

If the SONET/SDH port is configured as clear-channel then only the port is specified.

bundle-id

Specifies the multilink bundle to be associated with this IP interface. The **bundle** keyword must be entered at the beginning of the parameter. This parameter applies to the 7750 SR.

The command syntax must be configured as follows:

bundle-id: **bundle-type-slot-id/mda-slot.bundle-num**

bundle-id value range: 1 to 128

For example:

```
*A:ALA-12>config# port bundle-ppp-5/1.1
*A:ALA-12>config>port# multilink-bundle
```

bgprp-id

Specifies the bundle protection group ID to be associated with this IP interface. The **bgprp** keyword must be entered at the beginning of the parameter. This parameter applies to the 7750 SR.

The command syntax must be configured as follows:

```
bgprp-id:                bgprp-type-bgprp-num
type:                    ima
bgprp-num value range:  1 to 1280
```

Example:

```
*A:ALA-12>config# port bgprp-ima-1
*A:ALA-12>config>service>vpls$ sap bgprp-ima-1
```

qtag1, qtag2

Specifies the encapsulation value used to identify the SAP on the port or sub-port. If this parameter is not specifically defined, the default value is 0.

Values	qtag1:	0 to 4094
	qtag2 :	* 0 to 4094

The values depends on the encapsulation type configured for the interface. [Table 434: qtag values by port and encapsulation type](#) describes the allowed values for the port and encapsulation types.

Table 434: qtag values by port and encapsulation type

Port Type	Encap-Type	Allowed Values	Comments
Ethernet	Null	0	The SAP is identified by the port.
Ethernet	Dot1q	0 to 4094	The SAP is identified by the 802.1Q tag on the port. Note that a 0 qtag1 value also accepts untagged packets on the dot1q port.
Ethernet	QinQ	qtag1: 0 to 4094 qtag2: 0 to 4094	The SAP is identified by two 802.1Q tags on the port. Note that a 0 qtag1 value also accepts

Port Type	Encap-Type	Allowed Values	Comments
			untagged packets on the dot1q port.
SONET/SDH	IPCP	—	The SAP is identified by the channel. No BCP is deployed and all traffic is IP.
SONET/SDH TDM	BCP-Null	0	The SAP is identified with a single service on the channel. Tags are assumed to be part of the customer packet and not a service delimiter.
SONET/SDH TDM	BCP-Dot1q	0 to 4094	The SAP is identified by the 802.1Q tag on the channel.
SONET/SDH TDM	Frame Relay	16 to 991	The SAP is identified by the data link connection identifier (DLCI).
SONET/SDH ATM	ATM	vpi (NNI) 0 to 4095 vpi (UNI) 0 to 255 vci 1, 2, 5 to 65535	The SAP is identified by port or by PVPC or PVCC identifier (vpi, vpi/vci, or vpi range).

group-name

Specifies the name of the encap group, up to 32 characters.

encap-id

Specifies the value of the encapsulation ID to be displayed.

Values 0 to 16777215

seconds

Configures the interval for each display, in seconds.

Values 11 to 60

Default 11

repeat

Configures how many times the command is repeated.

Values 1 to 999

Default 10

absolute

Displays absolute rate-per-second value for each statistic.

rate

Displays rate-per-second for each statistic instead of the delta.

Table 435: Show QoS SAP Egress Output Fields

Label	Description
Policy-Id	The ID that uniquely identifies the policy.
Scope	Exclusive — Specifies that this policy can only be applied to a single SAP. Template — Specifies that this policy can be applied to multiple SAPs on the router.
Description	A text string that helps identify the policy context in the configuration file.
Queue	
CIR Admin	Specifies the administrative Committed Information Rate (CIR) parameters for the queue. The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth.
CIR Oper	The operational value derived by computing the CIR value from the administrative CIR and PIR values and their corresponding adaptation rules.
CIR Rule	min — The operational CIR for the queue will be equal to or greater than the administrative rate specified using the rate command except where the derived operational CIR is greater

Label	Description
	<p>than the operational CIR. If the derived operational CIR is greater than the derived operational PIR, the operational CIR will be made equal to the operational PIR.</p> <p>max — The operational CIR for the queue will be equal to or less than the administrative rate specified using the rate command.</p> <p>closest — The operational CIR for the queue will be the rate closest to the rate specified using the rate command without exceeding the operational CIR.</p>
PIR Admin	<p>Specifies the administrative Peak Information Rate (PIR) parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets through the switch fabric (for SAP ingress queues) or out an egress interface (for SAP egress queues).</p>
PIR Oper	<p>The administrative PIR specified by the user.</p>
PIR Rule	<p>min — The operational PIR for the queue will be equal to or greater than the administrative rate specified using the rate command.</p> <p>max — The operational PIR for the queue will be equal to or less than the administrative rate specified using the rate command.</p> <p>closest — The operational PIR for the queue will be the rate closest to the rate specified using the rate command.</p>
CBS	<p>def — Specifies that the CBS value reserved for the queue.</p> <p>value — Specifies the value to override the default reserved buffers for the queue.</p>
MBS	<p>def — Specifies that the MBS value is set by the def-mbs function.</p> <p>value — Specifies the value to override the default maximum size for the queue.</p>
HiPrio	<p>Specifies the percentage of buffer space for the queue, used exclusively by high-priority packets.</p>
PIR Lvl/Wt	<p>Specifies the priority level of the scheduler when compared to other child schedulers and queues vying for bandwidth on the parent schedulers during the above-CIR distribution phase of bandwidth allocation.</p> <p>Weight defines the relative weight of this scheduler in comparison to other child schedulers and queues at the same level.</p>
CIR Lvl/Wt	<p>Specifies the level of hierarchy when compared to other schedulers and queues when vying for bandwidth on the parent scheduler. Weight defines the relative weight of this queue in</p>

Label	Description
	comparison to other child schedulers and queues while vying for bandwidth on the parent scheduler.
Parent	Specifies the parent scheduler that governs the available bandwidth given the queue aside from the queue's PIR setting.
FC Name	Specifies the forwarding class queue mapping or dot1p marking is to be edited.
Queue-id	Specifies the <i>queue-id</i> that uniquely identifies the queue within the policy.
Explicit/Default	Explicit — Specifies the egress IEEE 802.1p (dot1p) bits marking for <i>fc-name</i> . Default — Specifies that the default dot1p value (0) is used.
Service Association	
Service-Id	The unique service ID number that identifies the service in the service domain.
Customer-Id	Specifies the customer ID that identifies the customer to the service.
SAP	Specifies the Service Access Point (SAP) within the service where the policy is applied.
Mirror SAPs	
Mirror Dest	Specifies the mirror service ID that identifies the service in the service domain.
SAP	Specifies the Service Access Point (SAP) within the service where the SAP egress policy is applied.

Table 436: Show QoS SAP Ingress Output Fields

Label	Description
Policy-Id	The ID that uniquely identifies the policy.
Scope	Exclusive — Specifies that this policy can only be applied to a single SAP. Template - Specifies that this policy can be applied to multiple SAPs on the router.
Description	A text string that helps identify the policy context in the configuration file.
Default FC	Specifies the default forwarding class for the policy.
Priority	Specifies the enqueueing priority when a packet is marked with a <i>dot1p-value</i> specified.
Criteria-type	IP — Specifies that an IP criteria-based SAP ingress policy is used to select the appropriate ingress queue and corresponding forwarding class for matched traffic. MAC — Specifies that a MAC criteria-based SAP is used to select the appropriate ingress queue and corresponding forwarding class for matched traffic.
Mode	Specifies the configured mode of the meter (trTcm or srTcm).
CIR Admin	Specifies the administrative Committed Information Rate (CIR) parameters for the queue. The CIR defines the rate at which the system prioritizes the queue over other queues competing for the same bandwidth.

Label	Description
CIR Oper	The operational value derived by computing the CIR value from the administrative CIR and PIR values and their corresponding adaptation rules.
CIR Rule	<p>min — The operational CIR for the queue will be equal to or greater than the administrative rate specified using the rate command.</p> <p>max — The operational CIR for the queue will be equal to or less than the administrative rate specified using the rate command.</p> <p>closest — The operational CIR for the queue will be the rate closest to the rate specified using the rate command without exceeding the operational CIR.</p>
PIR Admin	Specifies the administrative Peak Information Rate (PIR) parameters for the queue. The PIR defines the maximum rate that the queue can transmit packets through the switch fabric (for SAP ingress queues) or out an egress interface (for SAP egress queues).
PIR Oper	The administrative PIR specified by the user.
PIR Rule	<p>min — The operational PIR for the queue will be equal to or greater than the administrative rate specified using the rate command.</p> <p>max — The operational PIR for the queue will be equal to or less than the administrative rate specified using the rate command.</p> <p>closest — The operational PIR for the queue will be the rate closest to the rate specified using the rate command.</p>
CBS	<p>def — Specifies the default CBS value for the queue.</p> <p>value — Specifies the value to override the default reserved buffers for the queue.</p>
MBS	<p>def — Specifies the default MBS value.</p> <p>value — Specifies the value to override the default MBS for the queue.</p>
HiPrio	Specifies the percentage of buffer space for the queue, used exclusively by high-priority packets.
PIR Lvl/Wt	<p>Specifies the priority level of the scheduler when compared to other child schedulers and queue vying for bandwidth on the parent schedulers during the above-CIR distribution phase of bandwidth allocation.</p> <p>Weight defines the relative weight of this scheduler in comparison to other child schedulers and queue at the same level.</p>

Label	Description
CIR Lvl/Wt	Specifies the level of hierarchy when compared to other schedulers and queue when vying for bandwidth on the parent scheduler. Weight defines the relative weight of this queue in comparison to other child schedulers and queue while vying for bandwidth on the parent scheduler.
Parent	Specifies the parent scheduler that governs the available bandwidth given the queue, aside from the queue's PIR setting.
Dot1p	Specifies the forwarding class or enqueueing priority when a packet is marked with a <i>dot1p-value</i> specified.
FC	Specifies the forwarding class overrides.
Priority	The optional priority setting overrides the default enqueueing priority for the packets received on an ingress SAP that uses the policy that matches this rule. High — Specifies that the high enqueueing parameter for a packet increases the likelihood of enqueueing the packet when the ingress queue is congested. Low — Specifies that the low enqueueing parameter for a packet decreases the likelihood of enqueueing the packet when the ingress queue is congested.
DSCP	Specifies the forwarding class or enqueueing priority when a packet is marked with the DiffServ Code Point (DSCP) value.
FC	Specifies one of the predefined forwarding classes in the system. When a packet matches the rule, the forwarding class is only overridden when the fc <i>fc-name</i> parameter is defined on the rule.
Priority	This parameter specifies the default enqueueing priority overrides for all packets received on an ingress SAP using this policy that matches this rule. High — Specifies that the high enqueueing parameter for a packet increases the likelihood of enqueueing the packet when the ingress queue is congested. Low — Specifies that the low enqueueing parameter for a packet decreases the likelihood of enqueueing the packet when the ingress queue is congested.
Prec	Specifies the forwarding class or enqueueing priority when a packet is marked with an IP precedence value (<i>ip-prec-value</i>).
UCastQ	Specifies the default unicast forwarding type queue mapping.
MCastQ	Specifies the overrides for the default multicast forwarding type queue mapping.

Label	Description
BCastQ	Specifies the default broadcast forwarding type queue mapping.
UnknownQ	Specifies the default unknown unicast forwarding type queue mapping.
Match Criteria	Specifies an IP or MAC criteria entry for the policy.
Entry	
Source IP	Specifies a source IP address range used for an ingress SAP QoS policy match.
Source Port	Specifies a source TCP or UDP port number or port range used for an ingress SAP QoS policy match.
Protocol	Specifies the IP protocol number to be used for an ingress SAP QoS policy match.
DSCP	Specifies a DiffServ Code Point (DSCP) name used for an ingress SAP QoS policy match.
Fragment	True — Configures a match on all fragmented IP packets. False — Configures a match on all non-fragmented IP packets.
FC	Specifies the entry's forwarding class.
Priority	Specifies the default enqueueing priority overrides for all packets received on an ingress SAP using this policy.
Src MAC	Specifies a source MAC address or range to be used as a Service Ingress QoS policy match.
Dst MAC	Specifies a destination MAC address or range to be used as a Service Ingress QoS policy match.
Dot1p	Specifies a IEEE 802.1p value to be used as the match.
Snap-pid	Specifies an IEEE 802.3 LLC SNAP Ethernet Frame PID value to be used as a Service Ingress QoS policy match.
Ethernet-type	Specifies an Ethernet type II Ethertype value to be used as a Service Ingress QoS policy match.
ESnap-oui-zero	Specifies an IEEE 802.3 LLC SNAP Ethernet Frame OUI zero or non-zero value to be used as a Service Ingress QoS policy match.
DSAP	Specifies an Ethernet 802.2 LLC DSAP value or range for an ingress SAP QoS policy match.
SSAP	Specifies an Ethernet 802.2 LLC DSAP value or range for an ingress SAP QoS policy match.

Label	Description
FC	Specifies the entry's forwarding class.
Priority	Specifies the default enqueueing priority overrides for all packets received on an ingress SAP using this policy.
Service Association	
Service-Id	The unique service ID number that identifies the service in the service domain.
Customer-Id	Specifies the customer ID that identifies the customer to the service.
SAP	Specifies the Service Access Point (SAP) within the service where the SAP ingress policy is applied.

21.8 sap-template

sap-template

Syntax

sap-template *template-name* **idle-saps**

Context

[\[Tree\]](#) (clear>subscr-mgmt sap-template)

Full Context

clear subscriber-mgmt sap-template

Description

This command deletes any SAPs created with the specified SAP template that are no longer in use by any subscriber sessions.

Parameters

template-name

Specifies the name of a template, up to 256 characters, configured under **configure subscriber-mgmt sap-template**.

idle-saps

Keyword that specifies to delete any idle SAPs associated with this template.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

21.9 sap-using

sap-using

Syntax

sap-using [ingress | egress]

Context

[\[Tree\]](#) (show>service sap-using)

Full Context

show service sap-using

Description

Displays SAP information.

If no optional parameters are specified, the command displays a summary of all defined SAPs.

The optional parameters restrict output to only SAPs matching the specified properties.

Parameters

ingress

Specifies matching an ingress policy.

egress

Specifies matching an egress policy.

qos-policy *qos-policy-id*

The ingress or egress QoS Policy ID for which to display matching SAPs.

Values 1 to 65535

filter *filter-id*

The ingress or egress Filter Policy ID for which to display matching SAPs.

Values 1 to 65535

sap-id

Specifies the physical port identifier portion of the SAP definition.

Values The following values apply to the 7750 SR and 7950 XRS:

null [port-id | bundle-id | bpgrp-id | lag-id | aps-id]

dot1q [port-id | bundle-id | bpgrp-id | lag-id | aps-id]:qtag1

qinq [port-id | bundle-id | bpgrp-id | lag-id]:qtag1.qtag2

<i>cem</i>	<i>slot/mda/port.channel</i>
<i>ima-grp</i>	<i>bundle-id[:vpi/vci vpi vpi1.vpi2]</i>
<i>port-id</i>	<i>slot/mda/port[.channel]</i>
<i>aps-id</i>	aps-group-id [.channel]
	aps keyword
	<i>group-id</i> 1 to 128
<i>ccag-id</i>	<i>ccag-id.path-id[cc-type]:cc-id</i>
	<i>ccag</i> keyword
	<i>id</i> 1 to 8
	<i>path-id</i> a, b
	<i>cc-type</i> .sap-net, .net-sap
	<i>cc-id</i> 0 to 4094
<i>lag-id</i>	<i>lag-id</i>
	<i>lag</i> keyword
	<i>id</i> 1 to 800
<i>qtag1</i>	0 to 4094
<i>qtag2</i>	*, 0 to 4094

The following values apply to the 7450 ESS:

Values	null <i>[port-id lag-id]</i> dot1q <i>[port-id lag-id]:qtag1</i> qinq <i>[port-id lag-id]:qtag1.qtag2</i> port-id <i>slot/mda/port[.channel]</i> ccag-id <i>ccag-id.path-id[cc-type]:cc-id</i> ccag keyword <i>id</i> 1 to 8 <i>path-id</i> a, b <i>cc-type</i> .sap-net, .net-sap <i>cc-id</i> 0 to 4094 lag-id <i>lag-id</i>
---------------	--

	lag	keyword
	id	1 to 800
qtag1		0. to 4094
qtag2		*, 0 to 4094

interface

Specifies matching SAPs with the specified IP interface.

ip-addr

The IP address of the interface for which to display matching SAPs.

Values 1.0.0.0 to 223.255.255.255

ip-int-name

The IP interface name for which to display matching SAPs.

Platforms

All

Output

The following output is an example of service SAP information, and [Table 437: SAP Output Fields](#) describes show service SAP output fields.

Output Example

```

```

Context

[\[Tree\]](#) (show>service sap-using)

Full Context

```
show service sap-using
```

Description

This command displays SAP information.

If no optional parameters are specified, the command displays a summary of all defined SAPs.

The optional parameters restrict output to only SAPs matching the specified properties.

Parameters

ingress

Specifies matching an ingress policy.

egress

Specifies matching an egress policy.

qos-policy-id

The ingress or egress QoS Policy ID for which to display matching SAPs.

Values 1 to 65535

td-profile-id

Displays SAPs using this traffic description for the 7750 SR only.

filter-id

The ingress or egress filter policy ID for which to display matching SAPs.

Values 1 to 65535

sap-id

Specifies the physical port identifier portion of the SAP definition.

dyn-script

Displays dynamic service SAPs information.

msap

Displays MSAPs.

vlan-translation

Displays VLAN translation information.

anti-spoof

Displays anti-spoof information.

squelch-ingress-level

Displays ETH-CFM squelching information of the type matching the service delimited configuration.

all

Displays all squelch ingress levels information regardless of type.

ctag-space

Displays all squelch-ingress-levels information that is skipping additional VLAN space.

Platforms

All

Output

The following output is an example of sap-using using information, and [Table 438: Show Service SAP Output Fields](#) describes the output fields.

Output Example

```
*A:Dut-A# show service sap-using
```

```

Svc ID	The service identifier
Sap MTU	The SAP MTU value
Ing. QoS	The SAP ingress QoS policy number specified on the ingress SAP

Label	Description
Ing Fltr	The MAC or IP filter policy ID applied to the ingress SAP
Egr. QoS	The SAP egress QoS policy number specified on the egress SAP for the 7450 ESS and 7750 SR only
Egr. Fltr	The MAC or IP filter policy ID applied to the egress SAP
Adm	The administrative state of the SAP
Opr	The operational state of the SAP
Sapld	The ID that displays SAPs for the service
Squelch Level	The CFM levels configured for silent discard

sap-using

Syntax

sap-using [ingress | egress] **atm-td-profile** *td-profile-id*

Context

[\[Tree\]](#) (show>service sap-using)

Full Context

show service sap-using

Description

Displays **atm-td-profile** SAP information.

If no optional parameters are specified, the command displays a summary of all defined SAPs.

The optional parameters restrict output to only SAPs matching the specified properties.

Parameters

ingress

Specifies matching an ingress policy.

egress

Specifies matching an egress policy.

qos-policy *qos-policy-id*

The ingress or egress QoS Policy ID for which to display matching SAPs.

Values 1 to 65535

filter *filter-id*

The ingress or egress Filter Policy ID for which to display matching SAPs.

Values 1 to 65535

sap-id

Specifies the physical port identifier portion of the SAP definition.

Values The following values apply to the 7750 SR and 7950 XRS:

null	[<i>port-id</i> <i>bundle-id</i> <i>bpgrp-id</i> <i>lag-id</i> <i>aps-id</i>]
dot1q	[<i>port-id</i> <i>bundle-id</i> <i>bpgrp-id</i> <i>lag-id</i> <i>aps-id</i>]: <i>qtag1</i>
qinq	[<i>port-id</i> <i>bundle-id</i> <i>bpgrp-id</i> <i>lag-id</i>]: <i>qtag1.qtag2</i>
cem	<i>slot/mda/port.channel</i>
ima-grp	<i>bundle-id</i> [: <i>vpi/vci</i> <i>vpi</i> <i>vpi1.vpi2</i>]
port-id	<i>slot/mda/port</i> [. <i>channel</i>]
aps-id	<i>aps-group-id</i> [. <i>channel</i>]
	<i>aps</i> keyword
	<i>group-id</i> 1 to 64
ccag-id	<i>ccag-id.path-id</i> [<i>cc-type</i>]: <i>cc-id</i>
	<i>ccag</i> keyword
	<i>id</i> 1 to 8
	<i>path-id</i> a, b
	<i>cc-type</i> .sap-net, .net-sap
	<i>cc-id</i> 0 to 4094
lag-id	<i>lag-id</i>
	<i>lag</i> keyword
	<i>id</i> 1 to 800
qtag1	0 to 4094
qtag2	*, 0 to 4094

The following values apply to the 7450 ESS:

Values	null	[<i>port-id</i> <i>lag-id</i>]
	dot1q	[<i>port-id</i> <i>lag-id</i>]: <i>qtag1</i>
	qinq	[<i>port-id</i> <i>lag-id</i>]: <i>qtag1.qtag2</i>
	frame	[<i>port-id</i>]: <i>dldci</i>

port-id	slot/mda/port[.channel]
ccag-id	ccag-id.path-id[cc-type]:cc-id
	ccag keyword
	id 1 to 8
	path-id a, b
	cc-type .sap-net, .net-sap
	cc-id 0 to 4094
lag-id	lag-id
	lag keyword
	id 1 to 800
qtag1	0. to 4094
qtag2	*, 0 to 4094
dlci	16 to 1022

interface

Specifies matching SAPs with the specified IP interface.

ip-addr

The IP address of the interface for which to display matching SAPs.

Values 1.0.0.0 to 223.255.255.255

ip-int-name

The IP interface name for which to display matching SAPs.

td-profile-id

Profile ID that identifies a specific profile to display.

Platforms

All

sap-using transit-policy prefix transit-prefix-policy
```

Context

[\[Tree\]](#) (show>service sap-using transit-policy)

Full Context

```
show service sap-using transit-policy
```

Description

This command displays SAP information for a specific transit IP policy or transit prefix policy.

Parameters

transit-ip-policy

Specifies the transit IP policy ID.

Values 1 to 65535

transit-prefix-policy

Specifies a transit prefix policy ID.

Values 1 to 65535

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

21.13 saps

saps

Syntax

```
saps [control-session acct-session-id] [ port port-id] [dynsvc-policy policy-name] [ summary] [sap sap-id] [svc-id service-id]
```

Context

[\[Tree\]](#) (show>service>dynsvc saps)

Full Context

```
show service dynamic-services saps
```

Description

This command displays Dynamic Services SAPs (instances) details.

Note:

This command is not available in the MD-CLI.

Parameters

summary

Displays a summary view only.

acct-session-id

Specifies control session accounting session id.

port-id

Specifies Ethernet port.

policy-name

Specifies dynamic services policy.

sap *sap-id*

Specifies dynamic services SAP id.

service-id

The service ID of the dynamic service.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of dynamic service SAP information.

Output Example

Table 441: Cron Schedule Field Descriptions

Label	Description
Schedule	Displays the schedule name.
Schedule owner	Displays the owner name of the action.
Description	Displays the schedule's description.
Administrative status	Enabled — The administrative status is enabled. Disabled — Administratively disabled.
Operational status	Enabled — The operational status is enabled. Disabled — Operationally disabled.
Action	Displays the action name.
Action owner	Displays the name of action owner.
Script	Displays the name of the script.
Script owner	Displays the name of the script.
Script owner	Displays the name of the of script owner.
Script source location	Displays the location of scheduled script.
Script results location	Displays the location where the script results have been sent.
Schedule type	Periodic — Displays a schedule which ran at a given interval. Calendar — Displays a schedule which ran based on a calendar. Oneshot — Displays a schedule which ran one time only.
Interval	Displays the interval between runs of an event.

Label	Description
Next scheduled run	Displays the time for the next scheduled run.
Weekday	Displays the configured weekday.
Month	Displays the configured month.
Day of Month	Displays the configured day of month.
Hour	Displays the configured hour.
Minute	Displays the configured minute.
Number of scheduled runs	Displays the number of scheduled sessions.
Last scheduled run	Displays the last scheduled session.
Number of scheduled failures	Displays the number of scheduled sessions that failed to execute.
Last scheduled failure	Displays the last scheduled session that failed to execute.
Last failure time	Displays the system time of the last failure.

show qos scheduler-name

Description

This command displays the scheduler policies using the specified scheduler.

Parameters

scheduler-name

The name of a scheduler configured in the **config>qos>scheduler-policy>tier** context.

Platforms

All

Output

The following output is an example of scheduler name information.

Output Example

```
A:ALA-12# show qos scheduler-name NetworkControl
=====
Scheduler : NetworkControl
=====
Scheduler Policy   : SLA1
Scheduler Policy   : alpha
Scheduler Policy   : beta
=====
A:ALA-12#
```

21.18 scheduler-policy

scheduler-policy

Syntax

```
scheduler-policy [scheduler-policy-name] [ association | sap-ingress policy-id | sap-egress policy-id ]  
scheduler-policy scheduler-policy-name { ingress | egress } queue-group queue-grp-name
```

Context

[\[Tree\]](#) (show>qos scheduler-policy)

Full Context

```
show qos scheduler-policy
```

Description

Use this command to display scheduler policy information.

Parameters

scheduler-policy-name

The name of a scheduler policy configured in the **config>qos>scheduler-policy** context.

association

Displays the associations related to the specified scheduler name.

sap-ingress *policy-id*

Specifies the SAP ingress QoS policy information.

sap-egress *policy-id*

Specifies the SAP egress QoS policy information.

{ingress | egress}

Specifies the direction to display and are mutually exclusive.

queue-grp-name

Displays information for the specified queue group.

Platforms

All

Output

The following output is an example of scheduler policy information, and [Table 442: Show QoS Scheduler-Policy Output Fields](#) describes the customer scheduler hierarchy fields.

Output Example

```
A:ALA-12# show qos scheduler-policy SLA1  
=====
```

QoS Scheduler Policy	
=====	
Policy-Name	: SLA1
Description	: NetworkControl(3), Voice(2) and NonVoice(1) have strict priorities

Tier/Scheduler	Lvl/Wt CIR Lvl/Wt	PIR CIR	Parent
1 All_traffic	1/1 -/-	11000 max	None
2 NetworkControl	3/1 3/-	100 max	All_traffic

```

Table 442: Show QoS Scheduler-Policy Output Fields

Label	Description
Policy-Name	Specifies the scheduler policy name.
Description	Specifies a text string that helps identify the policy context in the configuration file.
Tier	Specifies the level of hierarchy that a group of schedulers are associated with.
Scheduler	Specifies the scheduler name.
Lvl/Wt	Specifies the priority level of the scheduler when compared to other child schedulers and queues vying for bandwidth on the parent schedulers during the above-CIR distribution phase of bandwidth allocation. Weight defines the relative weight of this scheduler in comparison to other child schedulers and queues at the same level.
Cir Lvl/Wt	Specifies the level of hierarchy when compared to other schedulers and queues when vying for bandwidth on the parent scheduler. Weight defines the relative weight of this queue in comparison to other child schedulers and queues while vying for bandwidth on the parent scheduler.
PIR	Specifies the PIR rate.
CIR	Specifies the CIR rate.
Parent	Specifies the parent scheduler that governs the available bandwidth given the queue aside from the PIR setting of the queue.
Service-Id	Specifies the ID that uniquely identifies the policy.
Customer-Id	Specifies the ID that uniquely identifies the customer.

Label	Description
SAP	Specifies the Service Access Point (SAP) within the service where the policy is applied.
Multi Service Site	Specifies the multiservice site name.
Orphan Queues	Specifies the number of queues in an orphaned state.
Hierarchy	Displays the scheduler policy tree structure.

21.19 scheduler-stats

```

Context

[\[Tree\]](#) (show>system>script-control script)

Full Context

```
show system script-control script
```

Description

This command displays script parameters.

Parameters

script-name

Displays information for the specified script. 32 characters maximum.

script-owner

Displays information for the specified script owner. 32 characters maximum.

Platforms

All

Output

The following output is an example of show script command information, and [Table 443: Show Script Output](#) describes the output fields.

Output Example

```
A:sim1>show>system>script-control# script
=====
Script Information
=====
Script           : test
Owner name      : TiMOS CLI
Description     : asd
Administrative status : enabled
Operational status : enabled
Script source location : ftp://*****:*****@192.168.100.1/home/testlab_bgp
                  /test1.cfg
Last script error : none
Last change     : 2015/01/07 17:10:03
=====
A:sim1>show>cron#
```

Table 443: Show Script Output

Label	Description
Script	Displays the name of the script.
Script owner	Displays the owner name of script.
Administrative status	Enabled — Administrative status is enabled. Disabled — Administratively disabled.
Operational status	Enabled — Operational status is enabled. Disabled — Operationally disabled.
Script source location	Displays the location of scheduled script.
Last script error	Displays the system time of the last error.
Last change	Displays the system time of the last change.

Table 444: Script Policy Output

Label	Description
Script policy	Displays the name of the script policy.
Script policy owner	Displays the name of the script policy owner.
Administrative status	Enabled — Administrative status is enabled. Disabled — Administrative status is disabled.
Script	Displays the name of the script.
Script owner	Displays the name of the script owner.
Script source location	Displays the location of scheduled script.
Max running allowed	Displays the maximum number of allowed sessions.
Max completed run histories	Displays the maximum number of sessions previously run.
Max lifetime allowed	Displays the maximum amount of time the script may run.

Label	Description
Completed run histories	Displays the number of completed sessions.
Executing run histories	Displays the number of sessions in the process of executing.
Initializing run histories	Displays the number of sessions ready to run/queued but not executed.
Max time tun history saved	Displays the maximum amount of time to keep the results from a script run.
Last change	Displays the system time a change was made to the configuration.
Script start error	Displays the error found while executing the script.
Max row empire time	Reserved for SNMP.
Last application	Displays the last application used to execute the script.
Last auth. user account	Displays the last user used to execute the script. If no user is specified in "configure system cli-script authorization event-handler/cron" then the user is not specified.

21.25 sctp-filter

sctp-filter

Syntax

sctp-filter *sctp-filter-name*

Context

[\[Tree\]](#) (show>app-assure>group sctp-filter)

Full Context

show application-assurance group sctp-filter

Description

This command displays Stream Control Transmission Protocol (SCTP) filter information

Parameters

sctp-filter-name

Specifies an SCTP filter, up to 256 characters. When a filter is specified, all traffic is examined as described in the tmnxBsxSctpFltrTable.

Platforms

7450 ESS, 7750 SR, 7750 SR-e, 7750 SR-s, VSR

21.26 sdp

sdp

Syntax

sdp all | *sdp-id:vc-id*

Context

[\[Tree\]](#) (show>subscr-mgmt>errors sdp)

Full Context

show subscriber-mgmt errors sdp

Description

This command sorts all the subscriber errors by SDP.

Parameters

all

Shows all errors beginning with the lowest SDP index.

sdp-id:vc-id

Shows only the error of a specific SDP index.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

[Table 445: Subscriber Management SDP Error Field Descriptions](#) describes subscriber management SDP error output fields.

Table 445: Subscriber Management SDP Error Field Descriptions

Field	Description
SDP	The SDP ID associated with the error
Time	The time this error was reported to the subscriber management errors subsystem
Service	The service ID associated with the error
MAC	The MAC address associated with the error
Error	The error that occurred on the SDP
Extra	Extra information about the error that occurred

sdp

Syntax

```
sdp [sdp-id [:vc-id]] [detail]  
sdp far-end {ip-address | ipv6-address} [detail]  
sdp sdp-id [vc-id] l2tpv3  
sdp sdp-id [:vc-id] static-isids [range-id range-id]  
sdp sdp-id [:vc-id] static-isids mfib  
sdp sdp-id [:vc-id] [detail] vccv-bfd [session]  
sdp sdp-id [:vc-id] mrp
```

Context

[\[Tree\]](#) (show>service>id sdp)

Full Context

```
show service id sdp
```

Description

Displays information for the SDPs associated with the service. If no optional parameters are specified, a summary of all associated SDPs is displayed.

Parameters

***sdp-id* [:*vc-id*]**

Displays only information for the specified SDP ID.

Values sdp-id: 1 to 17407
vc-id: 1 to 4294967295

Default all SDPs

detail

Displays detailed SDP information.

ip-address* | *ipv6-address

Displays only SDPs matching with the specified far-end IP address. 64 characters maximum.

Default SDPs with any far-end IP address

l2tpv3

Indicates that the user wants to display l2tpv3 specific information for SDPs that are of type l2tpv3.

static-isids

Specifies the I-Component service IDs created on the SDP.

range-id

Displays the service using the specified I-component Service ID (ISID).

Values 1 to 4294967295

mfib

Display MFIB related information. This parameter applies to the 7450 ESS or 7750 SR only.

vccv-bfd

Displays detailed information about the VCCV BFD session for a spoke SDP.

session

displays a summary of all VCCV sessions.

mrp

Displays detailed MRP information.

Platforms

All

Output

The following command displays SDP information and [Table 446: Show Service-ID SDP Field Descriptions](#) describes the output fields.

```
show service id sdp
```

Output Example

```

Table 446: Show Service-ID SDP Field Descriptions

Label	Description
Sdp Id	The SDP identifier.
Type	Indicates whether the SDP is a spoke or a mesh.
Split Horizon Group	Name of the split horizon group that the SDP belongs to.
VC Type	Displays the VC type: ether or vlan.
VC Tag	Displays the explicit dot1Q value used when encapsulating to the SDP far end.

Label	Description
I. Lbl	The VC label used by the far-end device to send packets to this device in this service by the SDP.
Admin Path MTU	The operating path MTU of the SDP is equal to the admin path MTU (when one is set) or the dynamically computed tunnel MTU, when no admin path MTU is set (the default case).
Oper Path MTU	The actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.
Far End addr/Far End	Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP.
Delivery	Specifies the type of delivery used by the SDP: GRE or MPLS.
Adm/Admin State	The administrative state of this SDP.
Adv Service MTU	Displays the configured advertise service MTU value (for Epipe services only).
Opr/Oper State	The operational state of this SDP.
I.Lbl/Ingress Label	The label used by the far-end device to send packets to this device in this service by this SDP.
E.Lbl/Egress Label	The label used by this device to send packets to the far-end device in this service by the SDP.
BFD Template	The BFD template name.
BFD-Enabled	The BFD enabled status.
BFD-Encap	The BFD encapsulation type.
BFD Fail Action	The BFD fail action.
BFD Oper State	The BFD operational state.
BFD WaitFor UpTimer	The BFD wait for up timer value.
Last Changed	The date and time of the most recent change to the SDP.
Signaling	Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on this SDP.
Admin State	The administrative state of the keepalive process.
Oper State	The operational state of the keepalive process.
Hello Time	Specifies how often the SDP echo request messages are transmitted on this SDP.

Label	Description
Max Drop Count	Specifies the maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault.
Hello Msg Len	Specifies the length of the SDP echo request messages transmitted on this SDP.
Hold Down Time	Specifies the amount of time to wait before the keepalive operating status is eligible to enter the alive state.
I. Fwd. Pkts.	Specifies the number of forwarded ingress packets.
I. Dro. Pkts.	Specifies the number of dropped ingress packets.
E. Fwd. Pkts.	Specifies the number of forwarded egress packets.
Associated LSP List	When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the far end field. If the SDP type is GRE, then the following message displays: SDP delivery mechanism is not MPLS.

sdp

Syntax

```

sdp sdp-id pw-port [pw-port-id]
sdp sdp-id pw-port
sdp sdp-id pw-port [pw-port-id] [ statistics]

```

Context

[Tree] (show>service sdp)

Full Context

```
show service sdp
```

Description

This command displays SDP information.

If no optional parameters are specified, a summary SDP output for all SDPs is displayed.

Parameters

sdp-id

The SDP ID for which to display information.

Values 1 to 17407

Default All SDPs

pw-port-id

Displays the SAP identifier for PW-SAPs.

Values 1 to 10239

ip-address

Displays only SDPs matching with the specified far-end IP address.

Default SDPs with any far-end IP address

detail

Displays detailed SDP information.

Default SDP summary output

keep-alive-history

Displays the last fifty SDP keepalive events for the SDP.

Default SDP summary output

Platforms

All

Output

The following output is an example of service SDP information.

Output Example

```

show service sdp

Description

This command displays information for the SDPs associated with the service.

If no optional parameters are specified, a summary of all associated SDPs is displayed.

Parameters

sdp-id

Specifies the SDP ID for which to display information.

Values 1 to 17407

pw-port-id

Specifies the pseudowire port identifier.

Values 1 to 10239

ip-address

Displays only SDPs with the specified far-end IPv4 address. 64 characters maximum.

ipv6-address

Displays only SDPs with the specified far-end IPv6 address. 64 characters maximum.

detail

Displays detailed SDP information.

Default SDP summary output

keep-alive-history

Displays the last fifty SDP keepalive events for the SDP.

Context

[\[Tree\]](#) (show>service sdp)

Full Context

show service sdp

Description

This command displays information for the SDPs associated with the service.

If no optional parameters are specified, a summary of all associated SDPs is displayed.

Parameters

sdp-id

Specifies the SDP ID for which to display information.

Values 1 to 17407

Default All SDPs.

pw-port-id

Specifies the pseudo-wire port identifier.

Values 1 to 10239

statistics

Displays SDP statistics information.

consistent

Indicates that the network-domains for all the egress network interfaces that can carry traffic on this SDP are consistent.

inconsistent

Indicates that the network-domain for one or more egress network interfaces that can carry traffic on this SDP are inconsistent.

na

Indicates that there is no egress network interface that can carry traffic on this SDP.

egressifs

Indicates whether all the egress network interfaces that can carry traffic on this SDP are associated with the network-domain configured on this SDP.

ip-address* | *ipv6-address

Displays only SDPs matching with the specified far-end IP address up to 64 characters.

Default SDPs with any far-end IP address.

keep-alive-history

Displays the last fifty SDP keepalive events for the SDP.

Default SDP summary output.

detail

Displays detailed SDP information.

Default SDP summary output.

Platforms

All

Output

The following output is an example of SDP information, and [Table 447: Show Service SDP Field Descriptions](#) describes the output fields.

Output Example

Table 447: Show Service SDP Field Descriptions

Label	Description
SDP Id	The SDP identifier.

Label	Description
Adm MTU	Specifies the desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.
Opr MTU	Specifies the actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.
IP address	Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP.
Adm	Admin State — Specifies the administrative state of the SDP.
Opr	Oper State — Specifies the operational state of the SDP.
Deliver	Specifies the type of delivery used by the SDP: GRE or MPLS.
Flags	Specifies the conditions that affect the operating status of this SDP.
Signal Signaling	Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on the SDP.
Last Status Change	Specifies the time of the most recent operating status change to this SDP.

sdp far-end {ip-address | ipv6-address} [detail]
    
```

Context

[\[Tree\]](#) (show>service sdp)

Full Context

```
show service sdp
```

Description

This command displays information for the SDPs associated with the service.

If no optional parameters are specified, a summary of all associated SDPs is displayed.

Parameters

sdp-id

Specifies the SDP ID for which to display information.

Values 1 to 17407

Default All SDPs.

pw-port-id

Specifies the pseudo-wire port identifier.

Values 1 to 10239

statistics

Displays SDP statistics information.

consistent

Indicates that the network-domains for all the egress network interfaces that can carry traffic on this SDP are consistent.

inconsistent

Indicates that the network-domain for one or more egress network interfaces that can carry traffic on this SDP are inconsistent.

na

Indicates that there is no egress network interface that can carry traffic on this SDP.

egressifs

Indicates whether all the egress network interfaces that can carry traffic on this SDP are associated with the network-domain configured on this SDP.

ip-address* | *ipv6-address

Displays only SDPs matching with the specified far-end IP address. 64 characters maximum.

Default SDPs with any far-end IP address.

keep-alive-history

Displays the last fifty SDP keepalive events for the SDP.

Default SDP summary output.

detail

Displays detailed SDP information.

Default SDP summary output.

Platforms

All

Output

The following output is an example of SDP information.

Table 448: Show Service SDP Field Descriptions

Label	Description
SDP Id	The SDP identifier.
Adm MTU	Specifies the largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.
Opr MTU	Specifies the actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end router, without requiring the packet to be fragmented.
IP address	Specifies the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP.
Adm	Admin State — Specifies the state of the SDP.
Opr	Oper State — Specifies the operating state of the SDP.
Flags	Specifies all the conditions that affect the operating status of this SDP.
Signal	Signaling — Specifies the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on the SDP.

Label	Description
Last Status Change	Specifies the time of the most recent operating status change to this SDP.
Last Mgmt Change	Specifies the time of the most recent management-initiated change to this SDP.
Number of SDPs	Specifies the total number of SDPs displayed according to the criteria specified.
Hello Time	Specifies how often the SDP echo request messages are transmitted on this SDP.
Deliver	Delivered — Specifies the type of delivery used by the SDP: GRE or MPLS.
Number of SDPs	Specifies the total number of SDPs displayed according to the criteria specified.
Hello Time	Specifies how often the SDP echo request messages are transmitted on this SDP.
Hello Msg Len	Specifies the length of the SDP echo request messages transmitted on this SDP.
Hello Timeout	Specifies the number of seconds to wait for an SDP echo response message before declaring a timeout.
Unmatched Replies	Specifies the number of SDP unmatched message replies.
Max Drop Count	Specifies the maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault.
Hold Down Time	Specifies the maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault.
TX Hello Msgs	Specifies the number of SDP echo request messages transmitted since the keepalive was administratively enabled or the counter was cleared.
Rx Hello Msgs	Specifies the number of SDP echo request messages received since the keepalive was administratively enabled or the counter was cleared.
Associated LSP List	When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the far end field. If the SDP type is GRE, then the following message displays: SDP delivery mechanism is not MPLS.

Full Context

show service sdp

Description

This command displays SDP information.

If no optional parameters are specified, a summary SDP output for all SDPs is displayed.

Parameters

sdp-id

The SDP ID for which to display information.

Default All SDPs.

Values 1 to 17407

far-end *ip-address*

Displays only SDPs matching with the specified far-end IP address.

detail

Displays detailed SDP information.

keep-alive-history

Displays the last fifty SDP keepalive events for the SDP.

pw-port *pw-port-id*

Displays the SAP identifier for PW-SAPs.

Platforms

All

Output

The following output is an example of SDP information.

[Table 449: Service Commands SDP Field Descriptions](#) describes the **show service SDP** output fields.

Table 449: Service Commands SDP Field Descriptions

Label	Description
SDP Id	Displays the SDP identifier.
Description	Displays a text string describing the SDP.
Admin Path MTU	Displays the desired largest service frame size (in octets) that can be transmitted through this SDP to the far-end ESR, without requiring the packet to be fragmented. The default value of zero indicates that the path MTU should be computed dynamically from the corresponding MTU of the tunnel.
Opr Path MTU	Displays the actual largest service frame size (in octets) that can be transmitted through this SDP to the far-end ESR, without requiring the packet to be fragmented. In order to be able to bind this SDP to a given service, the value of this object minus the control word size (if applicable) must be equal to or larger than the MTU of the service, as defined by its service MTU.
Far End	Displays the far end IP address.
Local End	Displays the local end IP address.
Delivery	Displays the type of delivery used by the SDP: GRE or MPLS.
IP address	Displays the IP address of the remote end of the GRE or MPLS tunnel defined by this SDP.
Adm Admin State	Displays the desired state of the SDP.
Opr Oper State	Displays the operating state of the SDP.
Flags	Displays all the conditions that affect the operating status of this SDP.

Label	Description
Signal Signaling	Displays the signaling protocol used to obtain the ingress and egress labels used in frames transmitted and received on the SDP.
Last Status Change	Displays the time of the most recent operating status change to this SDP.
Adv. MTU Over	Specifies whether the advertised MTU of a VLL spoke SDP bind includes the 14-byte Layer 2 header.
Last Mgmt Change	Displays the time of the most recent management-initiated change to this SDP.
KeepAlive Information	Displays Keepalive information.
Hello Time	Displays how often the SDP echo request messages are transmitted on this SDP.
Hello Msg Len	Displays the length of the SDP echo request messages transmitted on this SDP.
Hello Timeout	Displays the number of seconds to wait for an SDP echo response message before declaring a timeout.
Unmatched Replies	Displays the number of SDP unmatched message replies timer expired.
Max Drop Count	The maximum number of consecutive SDP echo request messages that can be unacknowledged before the keepalive protocol reports a fault.
Hold Down Time	The amount of time to wait before the keepalive operating status is eligible to enter the alive state.
TX Hello Msgs	The number of SDP echo request messages transmitted since the keepalive was administratively enabled or the counter was cleared.
Rx Hello Msgs	The number of SDP echo request messages received since the keepalive was administratively enabled or the counter was cleared.
Associated LSP List	When the SDP type is MPLS, a list of LSPs used to reach the far-end router displays. All the LSPs in the list must terminate at the IP address specified in the far end field. If the SDP type is GRE, the following message displays: SDP Delivery Mechanism is not MPLS.
Lsp Name	Displays the LSP name.
Time Since Last Transaction	Displays the time of the last transaction.
Signaling	Displays the signaling type.
Collect Stats	Specifies whether the agent collects accounting statistics for this SDP. When the value is true the agent collects accounting statistics on this SDP.

Label	Description
VLAN VC Etype	Displays the VLAN VC type.
BW Booking Factor	Displays the value used to calculate the max SDP available bandwidth. The value specifies the percentage of the SDP max available bandwidth for VLL call admission. When the value of is set to zero (0), no new VLL spoke SDP bindings with non-zero bandwidth are permitted with this SDP. Overbooking, >100% is allowed.
PBB Etype	Displays the Ethertype used in frames sent out on this SDP when specified as vlan for Provider Backbone Bridging frames.
Oper Max BW (kb/s)	Displays the operational bandwidth in kilobits per seconds (kb/s) available for this SDP. The value is determined by the sum of the bandwidth of all the RSVP LSPs used by the SDP.
Avail BW (kb/s)	Displays the bandwidth that is still free for booking by the SDP bindings on the SDP.
Net-Domain	Displays the network-domain name configured on this SDP. The default value of this object is the default network-domain.
Egr Interface	Indicates whether all the egress network interfaces that can carry traffic on this SDP are associated with the network-domain configured on this SDP. not applicable: Indicates that there is no egress network interface that can carry traffic on this SDP. consistent: Indicates that the network-domains for all the egress network interfaces that can carry traffic on this SDP are consistent. inconsistent: Indicates that the network-domain for one or more egress network interfaces that can carry traffic on this SDP are inconsistent.
Revert Time	Specifies the time to wait before reverting back from LDP to the configured LSPs, after having failed over to LDP.
Revert Count Down	Indicates the timer countdown before reverting back from LDP on this SDP. The timer countdown begins after the first configured LSP becomes active.
Flags	Displays all the conditions that affect the operating status of this SDP.
Class Forwarding	Indicates the admin state of class-based forwarding on this SDP. When the value is true, class-based forwarding is enabled.
EnforceDSTELspFc	Specifies whether service manager must validate with RSVP the support of the FC by the LSP.
Default LSP	Specifies the LSP ID that is used as a default when class-based forwarding is enabled on this SDP. This object must be set when enabling class-based forwarding.
Multicast LSP	Displays the LSP ID that all multicast traffic will be forwarded on when class-based forwarding is enabled on this SDP. When this object has its default

Label	Description
	value, multicast traffic will be forwarded on an LSP according to its forwarding class mapping.
Number of SDPs	Displays the metric to be used within the Tunnel Table Manager for decision making purposes. When multiple SDPs going to the same destination exist, this value is used as a tie-breaker by Tunnel Table Manager users like MP-BGP to select route with lower value.

sdp

Syntax

sdp *sdp-id* **keep-alive**

sdp *sdp-id* **pw-port** *sdp-id*

Context

[\[Tree\]](#) (clear>service>statistics sdp)

Full Context

clear service statistics sdp

Description

This command clears keep-alive statistics associated with the SDP ID.

Parameters

sdp-id

The SDP ID for which to clear keepalive statistics.

Values 1 to 32767

keep-alive

Clears keep-alive information associated with the SDP ID. The keep-alive history is not cleared.

Platforms

All

sdp

Syntax

sdp [*sdp-id*[:*vc-id*]] [**level** *leve*] [**primary-vlan-enabled** *vlan-id*]

Context

[\[Tree\]](#) (show>eth-cfm>mip-instantiation sdp)

Full Context

show eth-cfm mip-instantiation sdp

Description

This command displays MIP creation information for SDP bindings.

Parameters

sdp-id

Specifies the value identifying the SDP.

Values 1 to 32767

vc-id

Specifies the value identifying the virtual circuit identifier.

Values 1 to 4294967295

level

Displays the MD level of the maintenance point.

Values 0 to 7

vlan-id

Specifies the Dot1Q VLAN ID.

Values T0 to 4095, all

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

sdp

Syntax

sdp *sdp-id:vc-id* [**test-service-id** *service-id*] **start**

sdp *sdp-id:vc-id* **stop**

Context

[\[Tree\]](#) (tools>perform>service>id>admin-lock>pw sdp)

Full Context

tools perform service id admin-lock pw sdp

Description

This command specifies the spoke SDP binding to which an administrative lock will be applied for the MPLS-TP pseudowire. The administrative lock can be placed on a spoke SDP that is bound to a VLL SAP, another spoke SDP or a VPLS interface. Once the pseudowire is locked it may be put into loopback mode. The command must be executed at both ends of the pseudowire or MS-PW represented by the spoke SDP. Test traffic can then be injected using a configured test SAP on an Epipe, Apipe or Cpipe.

Parameters

sdp-id:vc-id

Specifies the SDP-ID and VC-ID.

Values sdp-id 1 to 17407]
vc-id1 to 4294967295]

test-service-id

Keyword that specifies the ID of a test service (SAP) to which the SDP is bound.

Platforms

All

sdp

Syntax

sdp *sdp-id:vc-id* **start** *mode* [**mac-swap**] [**mac** *ieee-address*] [**all**]

sdp *sdp-id:vc-id* **stop**

Context

[\[Tree\]](#) (tools>perform>service>id>loopback>eth sdp)

Full Context

tools perform service id loopback eth sdp

Description

This command places the specific MPLS SDP binding in loopback mode for reflecting Ethernet traffic back in the direction of the received stream. This is only applicable to MPLS SDP Bindings.

Parameters

sdp-id:vc-id

Specifies the SDP ID and VC-ID.

Values sdp-id 1 to 17407
vc-id1 to 4294967295

start mode

Specifies the loopback in relation to the MPLS SDP Binding.

Values **ingress** — Traffic arriving at the sap-ingress will be reflected back out the same **sap**.

egress — Traffic arriving at the sap-egress will be reflected back into the service in the direction of the original source.

stop

Keyword that removes the MPLS SD-binding from loopback mode.

mac-swap

Enable source address and destination address swapping for the reflected packets when the arriving packet is unicast. Any broadcast and multicast packets arriving on a looped point will be dropped.

mac ieee-address

Optionally configure the source MAC address used in the reflected packet when the arriving packet is a broadcast or multicast. This does not apply to arriving unicast packets.

Values 6-byte unicast mac-address in the form
xx:xx:xx:xx:xx:xx or xx-xx-xx-xx-xx-xx

all

Configured ieee-address is used as the source address for all reflected packets regardless of the arriving destination.

mac-swap

No swapping of MAC addresses are performed without specifying this option and any non-unicast destined packets will not be reflected back to the source.

Platforms

All

sdp

Syntax

sdp *sdp-id:vc-id* {**start** | **stop**}

Context

[\[Tree\]](#) (tools>perform>service>id>loopback>pw sdp)

Full Context

tools perform service id loopback pw sdp

Description

This command places or removes the specified MPLS-TP SDP binding in loopback mode for the purpose of an MPLS-TP pseudowire test service.

Note:

The loopback is created at the PW level so everything under the PW label is looped back. It is recommended to configure an administrative lock for the MPLS-TP pseudowire for the specified test service prior to configuring the loopback.

Parameters

sdp-id:vc-id

Specifies the SDP-ID and VC-ID.

Values sdp-id 1 to 17407
 vc-id1 to 4294967295

start

Keyword that places the specified MPLS-TP PW in loopback mode for the purpose of an MPLS_TP PW test service.

stop

Keyword that removes the SDP binding from the loopback mode for the MPLS-TP pseudowire test service.

Platforms

All

sdp

Syntax

sdp {*sdp-id* [:*vc-id*] | **far-end** *ip-address*} [**interval** *seconds*] [**repeat** *repeat*] [**absolute** | **rate**]

Context

[\[Tree\]](#) (monitor>service>id sdp)

Full Context

monitor service id sdp

Description

This command monitors statistics for an SDP binding associated with this service.

Parameters

sdp-id

Specifies the SDP identifier.

Values sdp-id: 1 to 17407
 vc-id: 1 to 4294967295

ip-address

Specifies the system address of the far-end router for the SDP in dotted decimal notation. The string may be up to 32 characters.

seconds

Configures the interval for each display, in seconds.

Values 11 to 60

Default 11

repeat

Configures how many times the command is repeated.

Values 1 to 999

Default 10

absolute

Displays absolute rate-per-second value for each statistic.

rate

Displays rate-per-second for each statistic instead of the delta.

Platforms

All

Output

The following output is an example of SDP information.

21.29 sdp-using

sdp-using

Syntax

```
sdp-using etree
sdp-using node-id node-id [global-id global-id]
sdp-using aarp aarpID
sdp-using app-profile app-profile-name
sdp-using far-end {ip-address | ipv6-address}
sdp-using [sdp-id[:vc-id]]
sdp-using transit-policy ip transit-ip-policy
sdp-using transit-policy prefix transit-prefix-policy
```

Context

[\[Tree\]](#) (show>service sdp-using)

Full Context

```
show service sdp-using
```

Description

This command displays services using SDP or far-end address options.

Parameters

node-id

Specifies the node ID.

Values a.b.c.d, 1 to 4294967295

global-id

Specifies the global ID.

Values 1 to 4294967295

aarpID

Specifies the AARP instance ID.

Values 1 to 65535

app-profile-name

32 characters max.

sdp-id

Displays only services bound to the specified SDP ID.

Values 1 to 17407

vc-id

The virtual circuit identifier.

Values 1 to 4294967295

ip-address

Displays only services matching with the specified far-end IP address. 64 characters maximum.

Default Services with any far-end IP address.

ipv6-address

Displays only services matching with the specified far-end IPv6 address. 64 characters maximum.

transit-ip-policy

Specifies a transit IP policy ID.

Values 1 to 65535

transit-prefix-policy

Specifies a transit prefix policy ID.

Values 1 to 65535

Platforms

All

Output

The following output is an example of SDP using information, and [Table 450: Show Service SDP Using Output Fields](#) describes the output fields.

Output Example

```
*A:ALA-1# show service sdp-using 300

Table 450: Show Service SDP Using Output Fields

Label	Description
Svc ID	The service identifier.
Sdp ID	The SDP identifier.
Type	Type of SDP: spoke or mesh.
Far End	The far end address of the SDP.
Oper State	The operational state of the service.
Ingress Label	The label used by the far-end device to send packets to this device in this service by this SDP.
Egress Label	The label used by this device to send packets to the far-end device in this service by this SDP.
Etree SDP Bind Information	
Svc ID	The service identifier.
SDP-Bind	The leaf tag SDP bind identifier.
Type	The type SDP bind.
Root-Leaf-Tag	The state of the root leaf tag SDP bind,
Leaf-AC	The state of the leaf AC SDP bind.

[**udt2m**] [**udt2u**] [**udt4**] [**udt6**] [**udt46**]

Context

[\[Tree\]](#) (show>service>id segment-routing-v6)

Full Context

show service id segment-routing-v6

Description

This command displays SRv6 service information.

Parameters

instance

Specifies the instance ID for display.

Values 1 to 2

locator-name

Specifies the locator name for display, up to 64 characters.

end-dt4

Displays the End.DT4 function associated with the SRv6 instance in the service.

end-dt6

Displays the End.DT6 function associated with the SRv6 instance in the service.

end-dt46

Displays the End.DT46 function associated with the SRv6 instance in the service.

end-dx2

Displays the End.DX2 function associated with the SRv6 instance in the service.

end-dt2u

Displays the End.DT2U function associated with the SRv6 instance in the service.

end-dt2m

Displays the End.DT2M function associated with the SRv6 instance in the service.

destinations

Specifies that all destinations for display are included.

esi

Specifies a 10-byte ESI by which to filter the displayed information. For example, ESI-0 | ESI-MAX or 00-11-22-33-44-55-66-77-88-99 with any of these separators ('-',':',' ').

ms-locator-name

Specifies the micro-segment locator name for display, up to 64 characters.

udt4

Displays the uDT4 function associated with the SRv6 instance in the service.

udt6

Displays the uDT6 function associated with the SRv6 instance in the service.

udt46

Displays the uDT46 function associated with the SRv6 instance in the service.

udx2

Displays the uDX2 function associated with the SRv6 instance in the service.

udt2u

Displays the uDT2U function associated with the SRv6 instance in the service.

udt2m

Displays the uDT2M function associated with the SRv6 instance in the service.

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS, VSR

Output

Output Example

[Table 451: SRv6 instance Field Descriptions](#) describes the SRv6 instance field descriptions.

Use the following command to display SRv6 instance and destination information.

```
show service id "bd-1900-srv6" segment-routing-v6 instance 1 destinations
```

```

21.37 selective-fib-log

selective-fib-log

Syntax

selective-fib-log

Context

[\[Tree\]](#) (tools>dump>router selective-fib-log)

Full Context

tools dump router selective-fib-log

Description

This command configures the dump tools for selective FIB log information for a specific IOM.

Platforms

7450 ESS, 7750 SR, 7750 SR-s, 7950 XRS

Output

The following output is an example of selective FIB log information.

Output Example

```
*A:Dut-C# /tools dump router selective-fib-log
1 : 2020/01/08 13:32:59.100 : Creating Base router
2 : 2020/01/08 13:32:59.101 : Adding port system to if=system Base router
2 : 2020/01/08 13:32:59.103 : Creating management router
3 : 2020/01/08 13:32:59.103 : Creating vpls-management instance
4 : 2020/01/08 13:32:59.103 : Adding port A/1 to if=management management router
4 : 2020/01/08 13:40:55.404 : Adding port 1/1/5 to if=ip-10.10.5.5 Base router
4 : 2020/01/08 13:40:55.407 : Adding port 2/1/6 to if=ip-10.10.7.7 Base router
4 : 2020/01/08 13:40:55.411 : Adding port 2/1/2 to if=ip-10.10.11.11 Base router
4 : 2020/01/08 13:40:55.414 : Adding port 2/1/2 to if=ip-10.10.13.13 Base router
```

```
4 : 2020/01/08 13:40:55.417 : Adding port 2/1/2 to if=ip-10.10.15.15 Base router

21.38 send-force-renew

send-force-renew

Syntax

send-force-renew *ip-address*

Context

[\[Tree\]](#) (tools>perform>router>dhcp>server send-force-renew)

Full Context

tools perform router dhcp local-dhcp-server send-force-renew

Description

This command sends a DHCP FORCERENEW message on behalf of the DHCP server to the DHCP client with specified IP address. A DHCP lease with the specified IP address must exist in the DHCP server.

Parameters

ip-address

Specifies the DHCP client's IP address in dotted notation a.b.c.d.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

21.39 sensor-group

sensor-group

Syntax

sensor-group *name*

sensor-group

Context

[\[Tree\]](#) (show>system>telemetry sensor-group)

Full Context

show system telemetry sensor-group

Description

This command displays the sensor group information.

Parameters

name

Specifies the sensor group name, up to 32 characters.

Platforms

All

Output

The following output is an example of telemetry sensor group information and [Table 452: Show Sensor Group Field Descriptions](#) describes the output fields.

Output Example

```
# show system telemetry sensor-group
=====
Telemetry sensor-groups
=====
Name                                     Valid  Invalid
paths                                     paths
-----
miro                                     1      0
-----
No. of Telemetry sensor-groups: 1
=====
```

Table 452: Show Sensor Group Field Descriptions

Label	Description
Name	Displays the name of the telemetry sensor group name.
Valid paths	Displays the number of valid sensor group paths.
Invalid paths	Displays the number of invalid sensor group paths.
No. of Telemetry sensor-groups	Displays the total number of telemetry sensor groups.

21.40 server

server

Syntax

server all

server capability

server prefix *ip-prefix/prefix-length*

server

Context

[Tree] (show>test-oam>twamp server)

Full Context

show test-oam twamp server

Description

This command displays TWAMP server information.

Parameters

all

Displays all server information.

ip-prefix/prefix-length

Specifies the IP address prefix of the TWAMP server.

Values

ipv4-address:	a.b.c.d (host bits must be 0)
ipv4-prefix-length	0 to 32
ipv6-address:	x:x:x:x:x:x:x (eight 16-bit pieces) x:x:x:x:x:d.d.d.d
x:	[0 to FFFF]H
d:	[0 to 255]D

capability

Displays the modes referenced or supported by the TWAMP server, with an RFC reference where those modes are defined.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, 7950 XRS

Output

The following output is an example of TWAMP server information.

Output Example

```
*A:ALA-48# show test-oam twamp server

Table 453: Server Stats Field Descriptions describes server stats show command output fields.

Table 453: Server Stats Field Descriptions

Field	Description
RX Discover Packets	The number of discover packets received by the DHCP server instance
Rx Request Packets	The number of request packets received by the DHCP server instance.

Field	Description
Rx Release Packets	The number of released packets received by the DHCP server instance
Rx Decline Packets	The number of declined packets received by the DHCP server instance
Rx Inform Packets	The number of inform packets received by the DHCP server instance
Tx Offer Packets	The number of offer packets sent by the DHCP server instance
Tx Ack Packets	The number of DHCP ACK packets sent by the DHCP server instance
Tx Nak Packets	The number of DHCP NAK packets sent by the DHCP server instance
Tx Forcerenew Packets	The number of DHCP force renew packets sent by the server instance
Client Ignored Offers	The number of DHCP offer packets sent by the DHCP server instance that were ignored by clients
Leases Timed Out	The number of leases timed out
Dropped Bad Packet	The number of dropped of DHCP packets received that were corrupt
Dropped Invalid Type	The number of DHCP packets received that had an invalid message type
Dropped No User Database	The number of DHCP packets dropped because the value of this server instance is not equal to the default value and a local user database with that name could not be found
Dropped Unknown Host	The number of DHCP packets dropped from hosts which were not found in the user database
Dropped User Not Allowed	The number of DHCP packets dropped from hosts which are found in the user database, but which have no address or pool specified
Dropped Lease Not Ready	The number of DHCP packets dropped by the server instance before the lease database was ready
Dropped Lease Not Found	The number of DHCP packets dropped by the server instance because no (valid) lease was found
Dropped Not Serving Pool	The number of DHCP packets dropped by the server instance because there were no more free addresses in the pool

Field	Description
Dropped Invalid User	The number of DHCP packets dropped by the server instance because the MAC address of the sender or the option 82 didn't match the host lease state
Dropped Overload	The number of DHCP packets dropped by the server instance because they were received more than the server instance can handle
Dropped Persistence Overload	The number of DHCP packets dropped by the server instance because they were received in more than the DHCP persistence system can handle. If this occurs, only releases and declines are still processed.
Dropped Generic Error	The number of DHCP packets dropped by the server instance because of a generic error
Dropped Destined To Other	The number of DHCP requests dropped by the server instance because the (broadcast) request was not destined to this server
Dropped Address Unavailable	The number of DHCP requests dropped by the server instance because the requested address is not available
Dropped Max Leases Reached	The number of DHCP packets dropped by the server instance because the maximum number of leases was reached
Dropped Server Shutdown	The number of DHCP packets dropped by the server instance during server instance shutdown
Dropped No Subnet for Fixed IP	The number of DHCP packets dropped by the server instance for user-db hosts with a fixed address because the subnet to which the address belongs is not configured

server-stats

Syntax

server-stats

Context

[\[Tree\]](#) (clear>router>dhcp>server server-stats)

[\[Tree\]](#) (clear>router>dhcp6>server server-stats)

Full Context

clear router dhcp local-dhcp-server server-stats

clear router dhcp6 local-dhcp-server server-stats

Description

This command clears all local DHCP or DHCPv6server statistics.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

21.42 server-tls-profile

server-tls-profile

Syntax

```
server-tls-profile [server-tls-profile]  
server-tls-profile server-tls-profile association
```

Context

[\[Tree\]](#) (show system security tls server-tls-profile)

Full Context

```
show system security tls server-tls-profile
```

Description

This command displays TLS server profile information.

Parameters

server-tls-profile

Specifies the name of a TLS server profile for which to display information, up to 32 characters.

Platforms

All

Full Context

show router dhcp servers

show router dhcp6 servers

Description

This command lists the local DHCP or DHCP6 servers.

Parameters

all

Displays a complete list of local DHCP or DHCP6 servers.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of local DHCP or DHCP6 server information.

Output Example

```
*A:ALA-49>show>router>dhcp# servers
=====
Overview of DHCP Servers
=====
Active Leases:      0
Maximum Leases:    159744

Router              Server                               Admin State
-----
Router: Base        base_router_dhcp_server             outOfService
Service: 3          s1                                   inService

21.46 service-using

service-using

Syntax

```
service-using [epipe] [ies] [vpls] [vprn] [ mirror] [apipe] [fpipe] [ipipe] [cpipe] [ etree] [b-vpls] [i-vpls]  
[m-vpls] [ sdp sdp-id] [customer customer-id] [creation creation-origin]
```

Context

[\[Tree\]](#) (show>service service-using)

Full Context

```
show service service-using
```

Description

This command displays the services matching certain usage properties. Not all syntax options are available for each router type.

If no optional parameters are specified, all services defined on the system are displayed.

Parameters

epipe

Displays Epipe services.

ies

Displays IES services.

vpls

Displays VPLS services.

vprn

Displays VPRN services.

mirror

Displays mirror services.

apipe

- fpipe** Displays Apipe services.
- ipipe** Displays Fpipe services.
- lpipe** Displays Lpipe services.
- cpipe** Displays Cpipe services.
- etree** Displays etree services.
- b-vpls** Specifies the B-component instance of the Provider Backbone Bridging (PBB/IEEE 802.1ah) feature. It represents the multi-point tunneling component that multiplexes multiple customer VPNs (ISIDs) together. It is similar to a regular VPLS instance that operates on the backbone MAC addresses.
- i-vpls** Specifies the I-component instance of the Provider Backbone Bridging (PBB/IEEE 802.1ah) feature. It identifies the specific VPN entity associated to a customer multipoint (E-LAN) service. It is similar to a regular VPLS instance that operates on the customer MAC addresses.
- m-vpls** Specifies the M-component (managed VPLS) instance of the Provider Backbone Bridging (PBB/IEEE 802.1ah) feature.
- sdp-id** Displays only services bound to the specified SDP ID.
- Values** 1 to 17407
- Default** Services bound to any SDP ID.
- customer-id** Displays services only associated with the specified customer ID.
- Values** 1 to 2147483647
- Default** Services associated with any customer.
- creation-origin** Specifies the method by which the service was created.
- Values** manual, multi-segment-p-w, dyn-script

Context

[\[Tree\]](#) (show>router>ldp>bindings services)

Full Context

show router ldp bindings services

Description

This command displays LDP service FEC bindings.

Parameters

vc-type vc-type

Displays information about the VC type associated with this service FEC.

ethernet, vlan, mirror, frdci, atmsdu, atmcell, atmvc, atmvc, ipipe, satop-e1, satop-t1, cesopsn, cesopsn-cas

vc-id vc-id

Displays information about the VC ID associated with this service FEC.

saii *global-id:prefix:ac-id*

Specifies the a SAII (Source Attachment Individual Identifier).

Values <number>:<number> | <a.b.c.d>:<number>

taii

Specifies the TAII ID, up to 256 characters, associated with this service FEC.

svc-fec-type

Specifies the FEC type.

Values fec128, fec129

agi *agi*

Specifies the Attachment Group identifier TLV associated with this service FEC.

Values <ip-addr:comm-val> | <2byte-asnumber:ext-comm-val> | <4byte-asnumber:comm-val> ip-addr - a.b.c.d comm-val - [0 to 65535] 2byte-asnumber - [1 to 65535] ext-comm-val - [0 to 4294967295] 4byte-asnumber - [1 to 4294967295] null - means all value is 0

detail

Displays detailed information.

service-id

Specifies the service ID number to display.

Values 1 to 2147483647

svc-fec-type

Specifies the FEC type.

Values fec128, fec129

session *ip-addr*

displays configuration information about LDP sessions.

label-space

Specifies the label space identifier that the router is advertising on the interface.

Values 0 to 65535

```

Context

[\[Tree\]](#) (show>service>id>ppp session)

Full Context

```
show service id ppp session
```

Description

This command displays PPP session information.

Parameters

user-name

Displays session information about the PPP user name.

sub-ppp-type

Displays session information about the sub PPP type.

Values oe, ol2tp

ip-int-name

Displays session information about the specified interface.

ip-address

Displays session information about the IP address.

intermediate-destination-id

Displays session information about the intermediate destination identifier, up to 32 characters, which is encoded in the identification strings.

no-inter-dest-id

Displays session information about no intermediate destination ID.

ip-prefix/prefix-length

Displays session information about the specified IP address and mask.

port-id

Displays session information about the specified port.

sap-id

Displays session information about the specified SAP.

ppp-session-type

Displays session information about the specified PPP session type.

Values local, wholesale-local, retail-local, l2tp

mlppp

Displays session information about MLPPP.

steering-profile

Displays session information about the specified steering profile, up to 32 characters.

circuit-id

Displays session information about the specified circuit ID, up to 256 characters.

remote-id

Displays session information about the specified remote ID, up to 256 characters.

detail

Displays detailed session information.

statistics

Displays PPP session statistics.

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of service PPP session information.

Table 456: Service PPP Session Field Descriptions describes PPP session field information.

Table 456: Service PPP Session Field Descriptions

Field	Description
User-Name	The user name
Description	The description
Up Time	The time of the last modification
Type	The PPP type
Termination	The termination type
IP/L2TP-Id/If-Id	The IP/L2TP or IF ID
MC-Standby	The MC standby
Session Time Left	The time remaining for the session timeout
LCP State	The LCP open/closed state
IPCP State	The IP CP open/closed state
IPv6CP State	The IPv6 CP open/closed state
PPP MTU	The PPP MTU value
PPP Auth-Protocol	The PPP authentication protocol
PPP User-Name	The PPP user name
Subscriber-interface	The subscriber interface name
Group-interface	The group interface name
IP Origin	The IP origin
DNS Origin	The DNS origin
NBNS Origin	The NBNS origin
Subscriber	The subscriber identification string
Sub-Profile-String	The subscriber profile name
SLA-Profile-String	The SLA profile name
SPI group ID	The SPI group ID
ANCP-String	The value of the ancp-string received from either the DHCP or the RADIUS server
Int-Dest-Id	Intermediate destination identifier received from the RADIUS server

Field	Description
App-Profile-String	The application profile string
Category-Map-Name	The value of the category map name received from the RADIUS server
Acct-Session-Id	The accounting session ID
Sap-Session-Index	The sap session index of the PPP session
IP Address	The IP address
Primary DNS	The primary DNS server
Secondary DNS	The secondary DNS server
Primary NBNS	The primary NBNS server
Secondary NBNS	The secondary NBNS server
Address-Pool	The IP address pool used to search for an IP address for this session
IPv6 Prefix	The IPv6 prefix
IPv6 Prefix Origin	The origin of the IPv6 prefix
IPv6 Prefix Pool	The DHCP server pool from which the IPv6 prefix is allocated
IPv6 Del.Pfx.	The IPv6 delegated prefix
IPv6 Del.Pfx. Origin	The origin of the IPv6 delegated prefix
IPv6 Del.Pfx. Pool	The DHCP server pool from which the delegated prefix is allocated
IPv6 Address	The IPv6 address
IPv6 Address Origin	The origin of the IPv6 address
IPv6 Address Pool	The DHCP server pool from which the address is allocated
Primary IPv6 DNS	The primary IPv6 DNS server
Secondary IPv6 DNS	The secondary IPv6 DNS server
Router adv. policy	The router advertisement policy
Ignoring DF bit	The true/false status of ignoring DF bit
Radius sub-if prefix	The RADIUS subscriber interface prefix
Circuit-Id	The circuit ID of the PPP session

Field	Description
Remote-Id	The remote ID of the PPP session
Radius Session-TO	The value to interpret the session timeout VSA from RADIUS
Radius Class 1	The Class attribute returned by the RADIUS server in an Access-Accept message
Radius User-Name	The User-Name attribute returned by the RADIUS server in an Access-Accept message
Logical-Line-Id	The logical line ID
Subscriber Host Limit Overrides and SLA Profile Instance Host Limit Overrides: (only shown when overrides are active)	
ipv4-arp	The total number of IPv4 ARP hosts limit
ipv4-dhcp	The total number of IPv4 DHCP hosts limit
ipv4-ppp	The total number of IPv4 PPP hosts limit
ipv4-overall	The total number of IPv4 hosts limit
ipv6-pd-ipoe-dhcp	The total number of IPv6 IPoE DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-pd-ppp-dhcp	The total number of IPv6 PPPoE DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-pd-overall	The total number of IPv6 DHCP Prefix Delegation hosts (IA-PD) limit
ipv6-wan-ipoe-dhcp	The total number of IPv6 IPoE DHCP WAN hosts (IA-NA) limit
ipv6-wan-ipoe-slaac	The total number of IPv6 IPoE SLAAC WAN hosts limit
ipv6-wan-ppp-dhcp	The total number of IPv6 PPPoE DHCP WAN hosts (IA-NA) limit
ipv6-wan-ppp-slaac	The total number of IPv6 IPoE SLAAC WAN hosts limit
ipv6-wan-overall	The total number of IPv6 WAN hosts limit
ipv6-overall	The total number of IPv6 hosts limit
lac-overall	The total number of L2TP LAC hosts limit
overall	The total number of subscriber hosts limit
Subscriber Session Limit Overrides and SLA Profile Instance Session Limit Overrides:	

Field	Description
(only shown when overrides are active)	
ipoe	The total number of IPoE sessions limit
ppoe-local	The total number of PPPoE local terminated sessions (PTA) limit
ppoe-lac	The total number of PPPoE L2TP LAC sessions limit
ppoe-overall	The total number of PPPoE sessions limit
l2tp-lns	The total number of L2TP LNS sessions limit
l2tp-lts	The total number of L2TP LTS sessions limit
l2tp-overall	The total number of L2TP sessions limit
overall	The total number of subscriber sessions limit
Managed Routes	
Status	The installation status
Metric	The metric value
Tag	The tag value
Pref	The preference value
Number of session	The number of sessions returned from the search criteria

session

Syntax

session connection-id *connection-id* [{**detail** | **ppp-statistics**}]

session [{**detail** | **ppp-statistics**}] [**session-id** *session-id*] [**state** *session-state*] [**peer** *ip-address*] [**group** *group-name*] [**assignment-id** *assignment-id*] [**local-name** *local-host-name*] [**remote-name** *remote-host-name*] [**tunnel-id** *tunnel-id*] [**service** *service-id*] [**interface** {*ip-int-name* | *ip-address*}] [**ip-prefix** *ip-prefix/mask*]

session [{**detail** | **ppp-statistics**}] [**state** *session-state*] [**peer** *ip-address*] [**group** *group-name*] [**assignment-id** *assignment-id*] [**local-name** *local-host-name*] [**remote-name** *remote-host-name*] [**control-connection-id** *connection-id*] [**service** *service-id*] [**interface** {*ip-int-name* | *ip-address*}]

Context

[\[Tree\]](#) (show>router>l2tp session)

Full Context

show router l2tp session

Description

This command displays L2TP session operational information.

Parameters

connection-id

Specifies the identification number for a Layer Two Tunneling Protocol connection.

Values 1 to 429496729

detail

Displays detailed L2TP session information.

ppp-statistics

Displays PPP statistics for the session.

session-id

Specifies the identification number for a Layer Two Tunneling Protocol session.

Values 1 to 65535

session-state

Specifies the values to identify the operational state of the L2TP session.

Values closed, closed-by-peer, established, idle, wait-reply, wait-tunnel

ip-address

Specifies the IP address of the peer.

Values The following values apply to the 7750 SR:

ipv4-address a.b.c.d (host bits must be 0)

ipv6-address x:x:x:x:x:x:x[-interface]

x:x:x:x:x:d.d.d.d[-interface]

x: [0 to FFFF]H

d: [0 to 255]D

interface: 32 characters maximum, mandatory for link local addresses

Values The following values apply to the 7450 ESS:

ipv4-address: a.b.c.d (host bits must be 0)

group-name

Specifies a string to identify a Layer Two Tunneling Protocol Tunnel group.

assignment-id

Specifies a string that distinguishes this Layer Two Tunneling Protocol tunnel.

local-host-name

Specifies the host name used by this system during the authentication phase of tunnel establishment.

remote-host-name

Specifies a string that is compared to the host name used by the tunnel peer during the authentication phase of tunnel establishment.

tunnel-id

Specifies the local identifier of this Layer Two Tunneling Protocol tunnel, when L2TP version 2 is used.

Values 1 to 65535

service-id

Specifies the service identification number.

ip-int-name

Specifies the IP interface name.

ip-address

Specifies the IPv4 or IPv6 addresses.

ip-prefix/mask

Specifies information for the specified IP prefix and mask length.

connection-id

Specifies an identification number for a Layer Two Tunneling Protocol session.

Values 1 to 429496729

Platforms

7450 ESS, 7750 SR, 7750 SR-a, 7750 SR-e, 7750 SR-s, VSR

Output

The following output is an example of L2TP session operational information.

Output Example

```
*A:Dut-C# show router l2tp session
